In the decade immediately following the end of World War II, public schools throughout the United States became enmeshed in a suffocating frenzy. The period continues to be known as the red scare or the McCarthy era. Seeds of this red scare, however, were sown long before Senator Joseph McCarthy officially entered his foray into Communist witch-hunting in February of 1950. Indeed, attacks on public education from the end of World War II to the late 1950s used the potent arsenal of red scare and assumed a prominent feature of American life. These attacks on public education often had a deeply disturbing and severely damaging impact in many school districts throughout the United States. Essentially, they wrought havoc to individual educational systems and disturbed the civic harmony of local communities. In major cities such as Houston, Denver, Los Angeles, St. Louis, and Chicago, public schools and their personnel were subjected to intense and zealous criticism. From Pasadena and Seattle on the West Coast to New York and Miami in the East, superintendents, teachers, and other school officials were dismissed abruptly by boards of education for un-American activities. Textbooks identified and criticized as subversive were withdrawn from use, campaigns for school bonds were frustrated, and curriculum materials and teaching practices were subjected to vigorous and often debilitating scrutiny.

As the representative of half a million educators and the world’s largest organization, the National Education Association (NEA) recognized these damaging attacks on public education and public school personnel, many but not all of them NEA members, as deeply troubling. As an institutional response, the NEA assigned responsibility to protect the interests of teachers and to respond to the red scare attacks to its National Commission for the Defense of Democracy through Education.

Originally formed in 1941, this Commission’s charter charged its members to protect and defend the professional rights of teachers in individual cases and selected school districts. By the beginning of the postwar period, the Commission swiftly became the organized teaching profession’s primary means to blunt concerted red scare attacks on education in towns and cities throughout the nation. From the late 1940s to the mid-1950s, the Defense Commission, as it was known, concentrated the attention of its staff on efforts to defend teaching from critics who used red scare tactics and rhetoric to discredit public education and to serve the interests of reactionary forces in American society.

In this postwar period, the Defense Commission worked relentlessly to track, suppress, investigate, and challenge individuals and organizations that employed red scare tactics to undermine public education. For example, it organized conferences to elevate the status of education in the public arena; produced a plethora of materials which lauded the achievements of the public schools; urged local, state, and national politicians to support educators; and conducted 16 full-scale investigations in education in cities such as Houston, Pasadena, and Miami. The Defense Commission also used a network of NEA local and state affiliates to conduct national surveys, research projects, and opinion polls on educational issues. By mid-century, the NEA’s Defense Commission had become the teaching profession’s major defender of public schools from acerbic and damaging attacks.

A key component in the Defense Commission’s drive to protect teachers from vitriolic attack was the regular publication of its Defense Bulletin, a newsletter for NEA members. Early issues of the Defense Bulletin, mimeographed on letter sized paper, were confidential in general content and were distributed to no more than 300 select individuals. By mid-century, however, the Bulletin boasted a national circulation of more than 20,000 educators, and it quickly became an important and valuable mouthpiece for the Defense Commission.

The Defense Bulletin reported on a wide range of topics, including issues such as intercultural education, UNESCO, federal aid to education, universal military training, and education for American citizenship. From the mid 1940s to the mid 1950s, however, the Defense Bulletin most notably reflected the Defense Commission’s mounting concern over the impact of the red scare on public school education in the United States. Significantly, in all of the issues of the Bulletin between December 1941 and May 1945, only two notes refer to red scare attacks. By the late 1940s and early 1950s, the trickle of criticism developed into a raging torrent of vicious assault. Indeed, from 1945 to 1955, scarcely an issue of the Defense Bulletin appeared without direct and often dramatic and prolonged reference to red scare propaganda. Accordingly, as a window on the socio-political climate of the age and as a barometer to the rising intensity of red scare criticism of the
schools, the contents of the *Defense Bulletin* offer a rich and fascinating insight into American education in the postwar era.

**Origins of Red Scare Attacks**

The period immediately following the end of World War II was a time of transition for American society. It was distinguished by a curious dichotomy. On the one hand, the United States emerged from the global conflict as the strongest and most prosperous nation in the world. To most Americans, the nation's and their personal futures appeared bright. On the other hand, the postwar era was characterized by widespread anxiety and frustration. New domestic and foreign problems challenged a troubled generation. These anxieties and frustrations became manifest in a people who attempted to cope with an unfamiliar military action in Korea, tensions with the Soviet Union and Soviet bloc nations, rapid urbanization, intense struggles over issues of race, and the advancement of a society consumed with increased commercialism and modernization. In addition, through its policy to contain Communism, the United States undertook the role of the world's police officer. Thus, the nation and its people became aware of its continuing and awesome burden of responsibility in world affairs and the harrowing and persistent threat of nuclear war.

To explain the causes of national and personal uncertainty and anxiety, many Americans sought to blame their fears and frustrations on the internal and external influences of Soviet Communist ideology and the military forces of the Soviet Union. Conditions in American culture were ripe for the reemergence of a red scare. This postwar red scare, however, was more than a simple clash of competing ideologies. As a political weapon, the red scare effectively suppressed political dialogue, limited free speech and free inquiry, and tainted the agenda of Americans who supported liberal or social democratic politics. Innuendo, allegation, and accusation replaced rational political debate and critical deliberation. The propagation of anti-Communist sentiment, therefore, became a powerful tool of ideologues from the political right. By stirring up emotive and often paranoiac anti-Communist sentiment, powerful individuals and interest groups sought to create a socio-political climate in which their own politically conservative or reactionary agendas might be served.

The mood of the age induced public disaffection and uncertainty. This anxiety was manifested by the emergence of a "sudden proliferation of societies, leagues, committees, councils, and crusades which sought to stop the clock of social change." The nation's public schools became one of the principal targets of these anti-Communist leagues. During the postwar red scare era, schools throughout the United States encountered savage and venomous attacks unprecedented in American educational history. For example, right wing groups and individuals used the convenience of the red scare to oppose federal aid to education, to deride campaigns for racially integrated schools, to ridicule progressive education, and perhaps most important of all, to undermine calls for tax increases to support public education.

To serve their own political ends and to blunt those espousing more liberal and progressive approaches to education, right wing critics repeatedly used the emotive and damaging rhetoric of the red scare. Many public school teachers were accused of subversion, advancing the work of the Kremlin, promoting Communism, and being disloyal or un-American. Critics poured their invective on educators who supported the philosophy of progressive education. Additionally, these critics claimed that public schools did not teach the fundamentals, failed to teach appropriate morals, and subverted the traditions and values of American society.

Not wishing to appear overly sensitive to the arguments of all critics of education, writers for the *Defense Bulletin* repeatedly asserted that they welcomed and valued reasoned and sensible criticism of public education. The *Defense Bulletin*, however, precisely pointed out the difference between those who used acceptable methods to criticize public education and those who adopted a more aggressive, unprincipled, and dishonest approach.

Critics who used the rhetoric and tactics of the red scare encompassed a curious assortment of individuals and groups. The pages of the *Defense Bulletin* are replete with references to this vast and influential array of red scare critics, and on many occasions, entire issues were devoted specifically to call attention to their practices. The attackers of America's schools during the postwar period may be separated into three major categories: first, groups that specifically focused on education and which had emerged amid the frenzy of the cold war or red scare era (e.g., Friends of the Public Schools, National Council for American Education); second, pre-war business, religious, and patriotic groups which fervently adopted red scare tactics and propaganda to attack public schools (e.g., Sons of the American Revolution, the Minute Women); third, politicians who used their influential positions publicly to accuse the teaching profession of subversion and who introduced legislation to undermine the academic freedoms of American educators (e.g., Senator Patrick McCarran, Nevada; Congressman George A. Dondero, Michigan).
Responding to the threat of the newly created education organizations, the Defense Bulletin accorded them repeated and exhaustive attention. It identified their personnel and their tactics and commented about their negative influence on American education. Issue after issue testified to the plethora of right wing groups attacking public education during this period. However, one organization, the National Council for American Education, led by A. Allen Zoll, received extensive scrutiny. Zoll's group typified the nature and rhetoric of many other red scare groups.

As several issues of the Bulletin reveal, Zoll's personal rhetoric and publications sought to convince the American public that public schools throughout the United States were infiltrated by subversive teachers and Communist sympathizers and that they fervently promoted the cause of socialism. In widely distributed pamphlets such as "How Red Are the Schools?" and "Progressive Education Increases Delinquency," Zoll attacked John Dewey and other prominent educators, described U.S. history textbooks as instruments of Marxist propaganda, and claimed that the philosophy and methods of progressive education were contrary to the ideals of American society. For example, in "They Want Your Child," Zoll contended that infiltrating American education is Communists' prime objective.6

Although the Defense Bulletin treated critics such as National Council for American Education contemptuously, the Defense Commission and its staff understood the damaging, widespread and negative impact that these organizations could have on public education. For example, the Defense Bulletin of November 1950 noted with some alarm that a fervent right wing organization and a frequent critic of education, the Committee for Constitutional Government, had spent almost $2,000,000 for lobbying purposes and distributed 82 million booklets and pamphlets over a seven year period.7 In the eyes of the Defense Commission, such organizations were a direct and acute threat to the stability and continuance of American public education. Repeated reference to this organization in the Defense Bulletin attests to the perceived seriousness and possible destructiveness of their attacks.

The second category of critics included those organizations whose formation had preceded the red scare era. Many of these organizations were business groups and taxpayers' organizations opposed to federal involvement in and tax support for public education. Accordingly, the Defense Bulletin noted attacks from diverse organizations such as the National Hardware Manufacturers' Association, the Conference of State Taxpayers' Organizations, The Employers Association of Chicago, and the American Bottlers of Carbonated Beverages. Typically, these and other groups contended that educators routinely advanced the cause of Communism through their subversive classroom practices. For example, Les Allman, Vice-President of the Fruehauf Trailer Company told the Michigan Trucking Association that textbooks in modern high schools in the Midwest were definitely and poisonously colored with communistic thinking.8

Other organizations exhibited similar concerns. For example, many issues of the Defense Bulletin reveal that both the Daughters and the Sons of the American Revolution were highly critical of several textbooks used in public schools. Indeed, Defense Bulletin 26, September 1948, noted that the president of the DAR described the authors of an eighth grade history book as being New Deal Democrats, pinks, or socialists. Further, the Defense Commission held that an article entitled "Your Child is Their Target," in the American Legion Magazine, June 1952 accused public school teachers of a conspiracy to commit American public schools to the services of Communism.9 The contents of the Defense Bulletin portrayed the nature, scope, and intensity of red scare attacks by many established groups in American society.

The third group which received serious attention in a substantial number of Defense Bulletin issues included individual politicians who actively sought to suppress what they perceived to be subversive activity in the schools. Significantly, many references to red scare attacks by politicians were voiced long before Senator Joseph McCarthy made his renowned and widely publicized accusations in Wheeling, West Virginia in February 1950. For example, in September 1946, the Defense Bulletin revealed a sweeping indictment of education articulated by Republican Congressman George A. Dondero of Michigan, who asserted that this country was being systematically communized through its educational institutions.

On many other occasions the Defense Bulletin portrayed the accusatorial rhetoric of state representatives such as Ealum E. Bruffet and Erastic Davis of Missouri and Hamer McKenzie of Mississippi. National politicians such as Sam Hobbs of Alabama, Joseph McCarthy of Wisconsin, and Harold H. Velde of Illinois were also featured prominently. The majority of these vocal politicians were identified as Republicans. Indeed, a 1946 Defense Bulletin specifically noted that, at the annual convention for the National Federation of Republican Clubs, charges were made that "subversive literature is being distributed in the nation's public schools and that certain faculty members are deliberately misrepresenting American ideals."10 However, passionate anti-Communist sentiment was not solely the preserve of the Republican Party. Senator Patrick McCarran, a Nevada Democrat, charged in September 1952 that "nests of Communists" existed in many
colleges and secondary schools. In addition, as early as March 1947, the aggressive rhetoric of Representative John E. Rankin, a Mississippi Democrat, was brought to the attention of readers of the *Defense Bulletin* because of his demands that Congress investigate pink teachers and the subversive influences of some of the leading educational institutions. Many issues of the *Defense Bulletin* testify to the consistently damaging rhetoric of local, state, and national politicians who alleged subversive and un-American activities in schools throughout the United States.

Deeply troubled by the proliferation of organizations that attacked public schools, *Defense Bulletin* writers regularly warned educators of their dangerous influence. In particular, the *Bulletin of the Friends of the Public School*, written by General Amos A. Fries, boasted regular distribution to 33,000 individuals by 1942. According to an issue of the *Defense Bulletin*, Fries attempted to send copies of his *Bulletin* "free to as many city school boards as possible, to county superintendents, and to members of Congress and other government officials." His charges were familiar ones: teachers were advancing Communism, instilling un-American values in children and youth, and generally advocating acts of subversion.

The *Defense Bulletin* monitored the growing number of attacks on school textbooks. It repeatedly scrutinized, for example, calls from right wing organizations for the withdrawal from school use of the popular *Building America* series and the widely adopted *Magruder* text on American Government. The *Defense Bulletin* informed readers about such issues as the Texas' textbook adoption committee vote to remove any materials from Texas' schools that contained references to the United Nations. It contained a story about a Congressional Committee's anger over a photograph of Stalin that appeared in a World History textbook. It published an Indiana state textbook commission member's attempt to ban *Robin Hood* because she believed that it was a Communist directive in education to stress that he robbed from the rich to give to the poor.

The Defense Commission intended to keep educators abreast of local, state, and national political actions which impacted their professional lives and careers. Accordingly, the *Bulletin* informed readers of the progress of "loyalty legislation" in states throughout the United States. For example, the May 1952 issue of the *Defense Bulletin* summarized mandates for teachers to swear loyalty to the United States and its institutions in 30 different states. In many *Bulletin* issues, the actual loyalty oaths were reprinted verbatim. The preeminence of the topics of loyalty oaths and of Congressional investigations in many editions of the *Defense Bulletin* attest to the NEA's growing concern for the academic freedom of teachers and the climate of fear which pervaded educational circles.

As a central component in the Defense Commission's quest to blunt red scare attacks, the *Defense Bulletin* performed several important functions. Three in particular appear salient. First, the *Defense Bulletin* acted as a national source of information for educators at the local level. It intended to provide teachers across the country with a central forum for information, opinion, and support. Many issues devoted considerable attention to exposing organizations such as the National Council for American Education and the Conference of American Small Businessmen. It emphasized to teachers and administrators that local red scare attacks were not isolated and atypical acts, but elements of a sinister and damaging national picture. The *Defense Bulletin* argued that if the attackers were to be stopped, educators must learn more about their methods and practices.

The second function of the *Defense Bulletin* followed directly from the first. Under banner headlines, such as "Let's Nip this Propaganda in the Bud," and "What You Can Do To Stop the Attacks," the Defense Commission published information which advocated that local groups take positive steps to confront red scare propaganda. The *Bulletin* reported local examples of the withdrawal by powerful business organizations, prominent politicians, and influential pressure groups of their accusations against the public schools as a direct consequence of bold and assertive challenges from local NEA affiliates.

Issue after issue of the *Defense Bulletin* offered educators, often at no cost, an enormous range of information sheets, books, leaflets, and articles that set out arguments in support of notable causes such as academic freedom, federal aid to education, UNESCO, and freedom of inquiry. In addition, as a further testament to the NEA's concern that educators be informed and protected from direct attack, the *Defense Bulletin* even advertised the availability of an NEA sponsored movie, "The Truth Which Keeps Us Free," and a 44 minute vinyl record entitled "A Reply to the Attacks on Education." By the late 1940s and early 1950s, therefore, the *Defense Bulletin* routinely provided local and state Education Associations with a wealth of information to support the cause of public education, highlighted and championed cases in which red scare attacks had been challenged, and offered practical advice and action plans for NEA members who sought to confront red
scares practices in school districts throughout the United States.

The third function of the Defense Bulletin was arguably its most important. At a time when some teachers and administrators encountered personal accusations of subversion and many faced threats of dismissal, morale of the nation’s teaching force sank to low and desperate levels. In an effort to elevate the status of educators and to raise the morale of the teaching profession, the Defense Bulletin reminded teachers of the enormously important work they were undertaking.

At every opportunity, the Defense Bulletin published accounts of prominent individuals and organizations who publicly supported American education. Many issues reported the supportive words of individuals such as Henry Steele Commager and President Truman and the fortifying declarations of organizations such as the CIO and the NAM. It also reported on a range of successful conferences that focused on major educational issues such as academic freedom, civil liberties, and the increasing threat of the red scare. The over-arching purpose of these conferences clearly was to induce a feeling of collective unity within the teaching profession. Indeed, inured by the shared experience of confronting red scare attacks, the Defense Bulletin claimed that many educators grew more confident in their ability both to deal with and to confront the rising tide of venomous attack.

In many respects, much of the information in the Defense Bulletin was intended as a comfort and as a support to America’s teachers. For example, it published summaries of research studies that revealed that modern schools were significantly superior to schools of the pre-war era. In addition, teachers learned through the pages of the Defense Bulletin that fights over textbooks, the imposition of loyalty oaths, and the persistence of red scare attacks were not peculiar to their local situation. Rather, they discovered that other teachers throughout the United States encountered similar opposition and endured similar attacks.

An overall evaluation of the Defense Bulletin’s impact, influence, and effectiveness in quieting red scare attacks appears problematic. The extent to which the Defense Bulletin encouraged local teachers to stand up to critics of education and the degree to which educators found the Bulletin’s advice helpful, informative, and provocative remains open to conjecture. In addition, how little or how much the Defense Bulletin instilled confidence and feelings of collective unity among the American teaching profession may never be assessed.

It seems likely, however, that the Defense Bulletin influenced teachers wishing to confront the excesses of the postwar red scare. Indeed, correspondence received by the editors of the Defense Bulletin and the testimony of many teachers during the Defense Commission’s investigations reveal that many professional educators welcomed the role played by the Defense Bulletin in its tracking, investigation, and suppression of red scare attacks.

Yet, despite these accolades, the Defense Bulletin exhibited a peculiar feature which betrayed itself as a victim of the fear and paranoia of the red scare era. In an almost myopic desire to appear respectable and professional to the American public, the Defense Bulletin often proclaimed the essentially social and political conservatism of the National Education Association. For example, it reminded readers on many occasions that it did not support the increasing wave of teacher strikes in the country and that it explicitly opposed the employment of members of the Communist Party as teachers in American public schools. Furthermore, although the Defense Commission repeatedly objected to loyalty oaths and Congressional investigations, not once did the Defense Bulletin encourage teachers to refuse to sign the loyalty oaths or to shun cooperation with state and federal investigations.

What is clear, however, is that the pages of the Defense Bulletin offer an intriguing and comprehensive insight into the influence of the red scare on education at the local, state, and national level. Indeed, the scale of political content and the enormously widespread geographic distribution of the Defense Bulletin indicate that the red scare’s impact was more dramatic, more debilitating, and more profound than many educational historians have hitherto recognized.

Endnotes

Carleton's description of the red scare as "a widespread series of actions by individuals and groups whose intentions were to frighten Americans with false and highly exaggerated charges of Communist subversion for the purposes of political, economic, and psychological profit." Don E. Carleton, "McCarthyism was more than McCarthy: Documenting the Red Scare at the State and Local Level," The Midwestern Archivist, 12 (1987): 13.
5. For example, Allen Zoll's National Council for American Education was targeted in Defense Bulletins 28, 35, 38, 39, 43, 46, 50, and 54. Similarly, General A. Amos Fries received comprehensive treatment in Defense Bulletins 2, 8, 9, 12, 14, 18, 28, 38, 52, 54, and 69.
Admiral Hyman G. Rickover on Education

Scholarly examinations of the Sputnik-era in American education history are hardly in short supply. Certainly by the 1980s, historians of American education found themselves confidently prepared to publish enlightened narratives about these years, taking full advantage of the deeper wisdom that reliably accompanies the passage of time. Even a cursory sampling of the more recent narratives about American education during the Cold War would very quickly reveal a rather familiar list of the key players who dominated the public arena during this period. Although some of the more extensive treatments would undoubtedly include such figures as Jerome Bruner, Charles Silberman, Max Rafferty, Paul Goodman, and Mortimer Smith, consensus attention is usually conferred on the big three of Arthur E. Bestor, James B. Conant, and Admiral Hyman G. Rickover, much better known as the father of the atomic submarine.

In the spirit of revisiting the conventional portrayals of key historical figures, it is the general purpose of this paper to provide a fresh and more exhaustive depiction of Admiral Rickover, unquestionably the most colorful personality among the big three. It is this paper's contention that Rickover's notoriously abrasive demeanor and contemptuous bearing have led some historians, perhaps understandably, to arrive at a rather superficial stereotype of his role in the Sputnik-era education reform movement. Consequently, extensive scrutiny of the entire body of Rickover's school reform writings is rarely attempted; the indelible memories of his frequently explosive personality have long since engulfed the public mind. Accordingly, the late admiral deserves a second hearing.

No one disputes that the Sputnik event of October 4, 1957 was an important moment in American educational history. Fairly or unfairly, public school officials were vociferously criticized by politicians and citizens alike for allegedly driving the country toward second-class status vis-a-vis the Soviet Union. The successful launching into orbit of the world's first artificial satellite proved, at least to some people, that communist education had indeed achieved a menacing superiority, especially in science and technology. It seemed to many that the public schools were partly to blame for this sudden crisis in national security, and that the Federal government had to do something.

President Eisenhower and the Congress immediately responded to the public uproar the very next year by cobbling together the National Defense Education Act. This new law gave Congress the authority to pour millions of tax dollars into public school budgets in order to relieve public anxiety and reassert American scientific supremacy. This rather desperate, face-saving response to what was actually a policy failure in Washington was transparently the "direct result" of the Soviet Union's Sputnik spectacular and could not possibly have generated any direct, short-term boost to the space program.

Nevertheless, from that point on into the early 1960s, the nation witnessed significant curricular changes in many public schools. "These changes sought to reshape on a national scale the total content of the curriculum and to introduce, at the same time, a new set of methodologies." These new approaches to learning soon became identified throughout the mass media by such shorthand labels as the "new math" and the "new science." The driving theme behind these new methodologies was that mastery of the thinking process itself was of greater importance than the factual content of each discipline.

Of course, harsh criticism of postwar public-school trends had already begun long before 1957. During these early postwar years, conservative advocates of traditional values and basic education, such as Russell Kirk and Arthur Bestor, had already emerged in print as passionate critics of public education. They were heavily engaged in a running battle with the dominant theories and practices of the day which they roundly condemned as ruinous to genuine scholastic excellence. Although some of these critics were more interested in restoring this standard of excellence only for an elite few, they all agreed that the sad historical decline of academic performance was directly traceable to what they insisted was the pernicious influence of John Dewey and his progressive education ideas.

Indeed, the very identity of progressive education had rapidly degenerated into a dirty word during the early Cold War years. In 1955, the progressive education movement's leading professional organization, the Progressive Education Association, was formally dissolved after thirty-six years of mostly triumphant advocacy.

At this point in mid-decade, Admiral Rickover's fame and photograph had been conspicuously disseminated throughout the American mass media and, indeed, throughout the Cold War world. Rickover's team of engineers in the...
Navy had taken the same atom that had incinerated Hiroshima and Nagasaki just ten years before and had harnessed it inside a nuclear reactor so compact that it could be fitted inside a submarine. At that time, Rickover’s nuclear-powered submarine had given the U.S. an enormous strategic advantage over the Soviet Union, or anyone else for that matter. Before nuclear power, conventionally-powered submarines were always vulnerable to certain destruction during sea warfare whenever they were forced to surface. Like whales, all submarines had to come up for air eventually. However, with nuclear power, a submarine could remain submerged for months at a time, making enemy detection from above virtually impossible. That is why Rickover’s achievement had made him the quintessential Cold War hero in America.

At this time in the mid-1950s, Rickover had not published any frontal criticisms about American public schools. What private concerns he had were largely indirect, being almost totally confined to his frustrations in recruiting a sufficiently large number of technicians qualified for the growing nuclear-powered Navy.9

It was from these humble personnel problems that Rickover was to elevate his sights to the more general problems facing the U.S. public schools. While making this leap into the domain of professional educators would appear to be a daunting task for any prudent nonprofessional, Rickover would have one big advantage over the professional educators: he was a famous national hero, and they were not.

Born to Jewish merchant parents in Russian-controlled Poland in 1900, Rickover emigrated with his mother and sister to the U.S. a few years later, eventually settling in Chicago. He graduated from a public high school in 1918 and four years later from the Naval Academy at Annapolis where he earned a reputation as a serious student with few social interests.10

Rickover’s record in the Navy during the next two decades was certainly honorable but hardly the sort that would have presaged his later fame in the 1950s. He spent World War II as a head engineer in the Navy’s Bureau of Ships, designing and building naval war vessels. He did not actually enter any war zone until he arrived at Okinawa on August 6, 1945, the same day of the Hiroshima atomic bombing which virtually ended WWII. By all accounts, his wartime performance at the Bureau was exemplary. However, his prospects for promotion were in jeopardy because of his notorious temper and disdain for military protocol.”

After the war, in 1946, Captain Rickover was assigned by the Bureau of Ships to study the Manhattan Project’s new nuclear reactor at Oak Ridge, Tennessee, as preparation for designing and building a nuclear-powered submarine. In short order, he succeeded in combining his new expertise in nuclear physics with his well-deserved reputation for ruthless bureaucratic in-fighting to carve out a new Navy career for himself as head of the atomic submarine program. On August 20, 1951, he ordered construction to begin on the world’s first nuclear-powered submarine, the U.S.S. Nautilus. With the Nautilus finally scheduled to be christened and launched on January 21, 1954, Time magazine published a flattering cover story on Rickover just ten days before the historic event, virtually creating a new American hero overnight. A full length biography of Rickover, written by a Time correspondent, hit the bookstores the same week. Perhaps most remarkable of all, he had by now risen to the rank of rear admiral with virtually no combat experience on his record.12

With Rickover’s place in American military history now firmly secure and additional atomic submarines being launched every year, the successful orbiting of Sputnik by the Soviet Union on October 4, 1957, posed yet another technological and political challenge to the U.S. government. Rickover, still annoyed by his continuing difficulties in recruiting qualified personnel for his nuclear Navy, seized the moment to demand that America’s schools must also improve their own performance in helping the nation meet this new challenge. So, he assigned himself to the task of leading America’s imperiled public schools away from Dewey’s misguided legacy and toward his own vision of an ever-expanding manpower pool for winning the Cold War. In January of 1958, just three months after Sputnik, he testified before Congress on the implications of Sputnik for drastic education reform. He suggested that, "Sputnik may well be the catalyst which brings about drastic and long overdue reforms in utilizing the Nation’s intellectual capacities." He thought "It may thus do in matters of the intellect what Pearl Harbor did in matters industrial and military."13

Rickover’s dramatic testimony before Congress surely added to the already considerable momentum that eventually led President Eisenhower to sign the National Defense Education Act later on that year. By this new law, millions of Federal dollars were appropriated to enhance the instruction of science, mathematics, and foreign languages in the public schools, despite a powerful national animus against Federal aid to education led by Republicans.14 Although Rickover could certainly not take sole credit for the passage of this historic legislation, his personal contribution was very influential. By the end of 1958, his credibility as both defender and savior had soared into the stratosphere with
the headline-grabbing news that the *Nautilus* had reached the North Pole, coupled with the ceremonial launching of the nation's first multiple-reactor submarine, the *U.S.S. Triton*.15

By 1959, with the twin issues of *Sputnik* and public school reform still enjoying the spotlight, Rickover's reputation as an unimpeachable expert on virtually any subject had reached a pinnacle. However, his stature as a serious participant in the school reform movement began to unravel soon after his return from a highly publicized thirteen-day trip to the Soviet Union and Poland with Vice President Nixon. Nixon was using the trip to solidify his credentials as the Republican Party's presidential candidate for 1960 while Rickover was brought along to symbolize America's leadership in nuclear-powered technology.16

Almost immediately upon his return from this trip in early August of 1959, Rickover committed the amateur's cardinal mistake of actually providing specific details, plans, and examples to support his school reform opinions. Up to that point, they had largely amounted to passionate diatribes in behalf of better science, mathematics, and engineering instruction, as provided for by the National Defense Education Act the previous year. But when he appeared before the House Appropriations Committee, he proceeded to read a rambling, eighty-page, single-spaced analysis of the Russian and American educational systems, most unflattering to the latter. The critique, simply called "Report on Russia," was based almost exclusively on observations gleaned from his recent whirlwind tour of Russia and Poland with Vice President Nixon. The report's opening statement perfectly set the tone for the argument about to unfold: "My visit to Russia and Poland confirmed my belief that the real race that we are in with communism is to see whose educational system best prepares you for the world of modern science and technology."17

Rickover forged ahead with his report, supplying the congressmen with his conclusion that Russia's ten-year ladder of basic education produced young adults who were "at least two years ahead" of the typical high school graduate from America's standard twelve-year ladder. Furthermore, Russia's ten-year ladder produced a "much larger talent pool" from which their society's professional leadership class would be drawn.18

Rickover then gave a detailed explanation of the Russian school system's national achievement examination covering seven academic subjects which all ten-year students had to pass to receive their diploma. The Admiral hardly had to point out that the U.S. had no mandatory national achievement tests to measure the learning levels of its high school graduates and that our various aptitude tests, like the S.A.T., were taken only by college-bound students on a volunteer basis, which he thought was much to our detriment.19

Rickover requested that a copy of these Russian national examinations be included in the Congressional Record. He also lauded the Russian school system as undeniably superior to our own and recommended that the U.S. immediately establish special advanced high schools for our most gifted students to ensure that we satisfied our professional manpower needs in the future. According to Rickover, "you cannot educate anyone properly if the class represents too large an intelligence spread."20

Rickover recommended that the Congress create a "commission or council" that would establish a set of national education standards or goals which local schools could decide to pursue or disregard as they saw fit. With such standards, "everyone could judge where exactly the local school stood."21

Just a few days after his startling Congressional testimony, Rickover fortified his case for radical school reform by giving an interview to the *New York Times* in which he alternated between fulsome praise for the Russian school system and scathing rebuke to American progressive educators. Under a headline reading, "Rickover Hails Reds' Education," he argued that "our really great race with the Soviet Union is in education," not military might, and that throughout his trip to Russia and Poland, he "could not find a single drum majorette."22

If all of the national publicity given to Rickover's educational views were not enough, 1959 was also the year that he published his first book of criticisms of American education entitled *Education and Freedom*. The book was basically a collection of previous speeches with such revealing titles as "Education Is Our First Line of Defense--Make It Strong."23 Needless to say, it attracted considerable attention in the news media and was heavily reviewed with mixed results, not that Rickover would have cared.24

Rickover's undoing as a vanguard spokesman for public school reform began near the end of 1959 with the publication of a competing book on educational reform, James B. Conant's *The American High School Today*. As a former president of Harvard and prolific author of numerous studies of American education, his book became an immediate best-seller, boosted no doubt by the enormous media blitz orchestrated by the book's sponsor, the Carnegie Corporation. Although
generally sympathetic to Rickover’s call for the greater care and feeding of the elite class of students, Conant rejected the Admiral’s key preference for special high schools for the elite and instead gave his seal of approval to the established pattern of the comprehensive public high school. Defenders of the status quo in public education rejoiced at Conant’s crucial support, and the public’s faith in its schools seemed to be restored. Rickover’s brief place as America’s most prominent spokesman on public education had suddenly been eclipsed by Conant.25

Rickover soon ran into other problems in his crusade to reform the public schools according to national security specifications. For one, members of Congress who hailed the Admiral’s testimony demanding more money for nuclear-powered naval vessels had difficulty in swallowing his insistence on the virtues of Soviet education. Congress members felt this implied that communism was, at least indirectly, superior to democracy. Perhaps this explains why the chairman of the House Appropriations Committee characterized Rickover’s detour into the field of education as only a "hobby."26

Rickover was undeterred. In 1962, he published his second book on education entitled Swiss Schools and Ours: Why Theirs are Better. The book was a bust in the marketplace. While railing against the usual litany of life-adjustment courses, child-centered progressive theory, and the absence of any national standards of achievement, the central message of this second book was now devoted to the alleged advantages of the Swiss school system.27

Rickover published his third and final book on education in 1963, calling it American Education, A National Failure. This book was the direct result of another repeat performance before the same House Appropriations Committee that had sat spellbound during the Admiral’s 1959 "Report on Russia," except this time the subject was the English school system and how it too was so obviously superior to the American system.28

During his testimony on English schools, Rickover returned to many of his favorite themes from the past, but he was especially incited to respond in print to his many detractors. There was a long list of charges that he wished to publicly refute, to wit: that he ignored the humanities; that he cared only for an "education for the elite"; that he was "out to destroy democracy"; and that he had a secret plan for America’s school children that would "educate the best and shoot the rest." He countered that all of these charges amounted to nothing more than name-calling by insecure educationists who refused to acknowledge "lay criticism."29

Admiral Rickover’s legacy to the history of American education is just as complicated to assess as the Admiral’s personality. Perhaps his biographers said it best by concluding that, contrary to popular belief, he was never really some sort of "wild eyed crypto-fascist." Rather, he was a man so intensely driven and so "narrowly focused" on those causes he championed that he was "innocent of the political consequences" of his actions and statements. He didn’t know when to shut up and rarely attempted to build a consensus. He unnecessarily antagonized those who might have been his allies. He believed devoutly in a society of hard work and meritocratic reward. Fools were not to be suffered gladly; they were a menace to the national security.30

But with respect to the field of education specifically, isn’t it remarkable that much of what Rickover proposed and criticized thirty years ago—and was resoundingly rejected at that time—has now re-emerged and has been accepted into the conventional wisdom of education. For example, how was Rickover’s unflattering comparisons of America’s schools with those in Russia, Switzerland, and England so different from our current preoccupation with the alleged superiority of Japanese schools?

For another example, how was Rickover’s proposal for the establishment of national standards of academic achievement so different from the Clinton Administration’s Goals 2000 plan, highlighted in the media by the controversial national standards for history? Even Rickover’s caveat that his national standards should be voluntary is duplicated in Goals 2000.

Furthermore, what about Rickover’s call for the establishment of special high schools for elite students? Many states over the last decade or so have founded special academies at taxpayer expense especially for those students gifted in mathematics and science. Rickover would certainly be nodding his approval if he were alive today.

All of these parallels, of course, bear the depressingly familiar stamp of compulsive school reformers from time immemorial: good intentions coupled with ulterior motives. Throughout American history, impassioned calls for education reform have usually become the convenient battle cry of political activists everywhere who have sought answers to the most vexing national problems by peering behind the schoolhouse door.

In 1989, David C. Berliner stated, "We are on the threshold of creating a truly scientific basis for the art of teaching that will be acceptable to the general public as a truly specialized knowledge." Today, we talk of a pedagogical science that has been built on research from developmental psychology, pediatrics, neuropsychology, and cognition. Its application is sifted through a constructivist philosophy that shifts the focus from the techniques of teaching to understanding our students' thought processes and helping them to build new concepts and thoughts based on that understanding.

In 1902, Ella Flagg Young wrote "Scientific Method in Education" and argued, "The teacher with the grasp of the subject-matter and a knowledge of the laws that underlie mental activity and growth has... this end in view: to keep track of the way in which different minds in the class act upon the stimuli presented. If the material presented does not lead to the new conceptual framework as assessed by the students' motor activity into the stream of consciousness, then the teacher knows that the stimuli are not stimulating, or that old presentations did not become a part of the capital of the children."

The obvious question then becomes, if progressivism had a constructivist scientific base for educational methodology in the first decade of the twentieth century, why has it taken the rest of the century to articulate and apply it? I believe part of the question can be answered by taking a look at what was happening in philosophy, psychology, and pedagogy at the University of Chicago when Dewey, Young, and Parker's Cook County Normal faculty were there.

In 1894, John Dewey was brought to the University of Chicago to direct the Department of Philosophy, Psychology, and Pedagogy. At the time Dewey was a relatively unknown figure in educational circles. He had graduated ten years earlier in psychology and philosophy from Johns Hopkins University and had just been appointed as Chair of the Department of Philosophy at the University of Michigan, when President Harper at Chicago offered him the position. His publication record was modest with only two articles related to teaching.

At the time of his arrival in Chicago, the city school system had just been indicted by muckraker Joseph Mayer Rice in one of a series of articles exposing the nation's schools as dreary, mechanical, and unscientific places to be. At the same time one of Rice's articles praised Chicago's Cook County Normal School, which was under the direction of Colonel Francis W. Parker. Rice described the school as the most exciting and scientific educational training center in the United States, embodying the scientific ideal of the "new education."

With little public school experience, Dewey was expected to develop the pedagogical side of his department. President Harper's grand design for the newly created university included a teachers' college and lab school that would bring Chicago's elementary teachers into university classes. Dewey struggled to develop these programs, relying heavily on the knowledge and experience of one of his graduate students, former assistant superintendent of Chicago schools, Mrs. Ella Flagg Young. Then, Harper acquired Parker and his million dollar endowment to found a teacher training institution in 1900. With all of this expertise in one place, the development of a strong scientific teacher training and lab school should have been a simple matter.

However, it was not. Politics engulfed the attempt, making a cooperative and collaborative approach impossible. When Ella Flagg Young decided to enter the University of Chicago in 1895 in hopes of completing a Ph.D., Dewey had completed his first year as department head. Although Young was thirteen years his senior, she and Dewey seemed to develop an immediate intellectual rapport. Dewey said of their relationship that he was constantly getting ideas from her: "More times than I could well say I didn't see the meaning or force of some favorite conception of my own till Mrs. Young had given it back to me." And "I would come to her with these abstract ideas of mine and she would tell me what they meant."

The president of the university, William Rainey Harper, was also eager to have Young, but for different reasons. He was opening a teachers' college and wanted Young to teach courses that would bring in the Chicago teachers, whom she knew so well. However, Harper was less concerned about Young's pursuit of her Ph.D., even though he had led her to believe that her normal school work could be evaluated as the equivalent of a bachelor's degree. After several communications between Harper and Young, and Dewey and Young, Dewey wrote to Harper that Mrs. Young was becoming restless, and that if the matter of a baccalaureate equivalent was not resolved quickly, he thought Young would...
terminate her university relationship. The matter was resolved. Young thanked Harper and continued to teach in the Teachers' College, while expressing her concern that the college would become a set of stair steps leading out of elementary education into secondary education and administration.

In the meantime, Dewey had opened a private elementary school in spite of inadequate funding from Harper and much controversy. Opened in 1896 with sixteen children of faculty in attendance, it was Dewey's attempt to make himself more familiar with educational matters now that he oversaw pedagogy. Dewey was not very clear about the purpose of the school. Sometimes he described it as a place where the best methods would be taught and other times he portrayed it as a laboratory where various methods would be tested. Thus, parents complained. George S. Goodspeed said of his son's experience, "One year at the University Preparatory Laboratory, otherwise known as the D____ School (supply the proper word, not on Sunday please!) nearly ruined him. We have to teach him how to study! He learned to 'observe' last year." After observing, another parent declared, "[M]y children are not going to that school."88

Ultimately, Young suggested the name Laboratory School and in 1899 she began to help Dewey with its design. The new organizational structure continued to promote education as growth in a community environment centered around occupational activity. However, the development of intellectual and academic skills related to language, math, and communication were also stressed. Staff and student enrollment grew in 1900 and 1901, but money continued to be tight. Harper had thought that he had made it clear to Dewey to make the school self-supporting. Dewey, however, continued to request money from the university.

University trustee Mrs. Anita McCormick Blaine had given Col. Parker one million dollars to endow him in his own training and practice school. Known as the Chicago Institute, Parker had taken his best normal faculty with him to this new school. Unfortunately, Parker had never been a good financial manager, and with the death of his wife, for whom he never quit grieving, the new institute was poorly managed. Blaine convinced Parker that it would be better served as the University of Chicago's School of Education, a prospect which delighted Harper. Parker was reluctant to give up his authority to a bureaucratic university structure but was convinced by his faculty, who were promised tenure under this new agreement.9

The preliminary agreement was signed in February 1901. The agreement stipulated that Parker would be Director of the Chicago Institute, which would be renamed the School of Education; his second in command at the institute, Wilbur S. Jackman, would be Dean. The departments of pedagogy and philosophy would remain with Dewey, as would secondary education in the form of an academy and a manual training school already controlled by the university. All elementary education, however, would be under Parker's School of Education. Dewey was very unhappy about this plan and felt that he was not adequately consulted. Harper offered him an additional thousand dollars, bringing his salary to six thousand dollars. Dewey demanded seven thousand and Harper acquiesced.10

In the meantime, Young and Dewey solicited letters from national educators, calling for the lab school to remain a separate entity under Dewey's direction. Parents of Dewey's school were also concerned that, under Parker, their children would be "practiced upon." Harper called a meeting with the parents to explain the merger of the lab and practice schools. Dewey could not be present and asked Young to speak on behalf of the lab school. Young carefully explained the difference between the work of the two and afterwards was given credit for saving the school from the merger.11

The parents followed up by meeting with President Harper to try to convince him that their school should remain separate. They said that they would raise twenty-five hundred to five thousand dollars to offset the deficit. Harper checked with Blaine and Parker. Katherine Stillwell, Parker's Latin teacher, recalled that Parker said, "Let him keep his little school; we can't have too many schools of this kind."12

Although Dewey could keep his school, he was still not happy. Parker's school was listed and advertised as the University Elementary School—the name that Dewey was officially using. He wrote Harper an angry letter, declaring that people requesting information about his school were receiving materials about Parker's school. Harper solved the problem by changing the letterhead to read, "The University Elementary School on the Blaine Foundation," and added Colonel Parker's name to it. Still not satisfied, Dewey turned his attacks on Dean Jackman, claiming that the new dean was not giving him enough money or space in the new building for his secondary school and calling Jackman's efforts "too absurd for serious attention."13

With little cooperation from Dewey, Jackman began working more closely with Harper, which only angered Dewey more. He wrote Harper again, stating that he did not want his secondary school housed in buildings that were controlled...
by another university unit. Harper wrote back out of frustration, wondering why this was coming up now since it had always been part of the agreement.  

Dewey's response is not recorded, but his next move was: he appointed his wife, Alice, as principal of his laboratory school at a salary of five hundred dollars. He did this without consulting Harper, who let it stand for a time. He questioned Dewey about the fact that his two children paid no tuition in a school that was constantly fighting deficit spending. Dewey replied that this was due to the fact that Mrs. Dewey was giving full time to the school. Yet their combined income of seventy-five hundred dollars a year (plus additional salary for Dewey's summer teaching at other institutions, such as Berkeley) allowed them to live very comfortably. They expanded into two adjoining apartments, employed two servants, a nurse and a part time laundress, and built a summer home in the Adirondacks. Yet, there is no indication that they ever contributed money to the laboratory school.  

Colonel Parker, who had left Chicago due to ill health, died on 2 March 1902. On 20 May 1902, Dewey was appointed to succeed Parker as the director of the Blaine elementary school. Jackman and the Parker faculty hoped that the previously strained relationship could now improve, but they were disappointed. Dewey did nothing to mollify the staff. Instead, he increased his wife's salary to $1,250 while reducing some Parker faculty salaries and giving the rest no raises. He attended no faculty meetings and finally admitted to Blaine that administrative work was not his line. He did not offer to step down, however.

During the fall of 1902 and spring of 1903, Dewey revisited the idea of merging the two elementary schools. He started by talking with the Parker principal, Zonia Baber and history department chair Emily Rice. He said that it would be more cost effective to remove some of the Parker faculty who were not "growing." He also stated that there would need to be salary cuts to save additional revenue.

Young visited the two women and tried to explain what she thought was Dewey's ulterior motive: to put Mrs. Dewey in as principal of the merged schools and to rid the school of faculty who were still loyal to Parker and his methods by cutting their salaries. They could not be fired because they tenure. Being somewhat naively accustomed to Parker's protection, they could not seem to comprehend this motivation. Young asked them if they thought Dewey could "sit in his office and do nothing but clerk work another year without having things done his way?" With salary cuts and with Alice Dewey as principal he would not have to assume the responsibility of "putting out the teachers." Young concluded that Mrs. Dewey was very adept at getting rid of teachers. When Blaine confronted Dewey with this, he was furious and accused Baber and Rice of being the manipulative ones by using him and misrepresenting Young's position.

By early May, Dewey had appointed his wife as principal over the merger at double her former salary. Blaine wrote to Harper, stating that "unless Mrs. Dewey fills the office of Grade Principal to everyone's satisfaction (which seems to us hardly possible under the circumstances) her occupation will be brief." Harper assured her that he would make this clear to Dewey.

Young got caught in another round of crossfire between Dewey and Harper regarding the editorial responsibilities of Parker's Elementary School Teacher. Mrs. Dewey was supposed to have done the editorial work, but Dewey advised her not to do it; Jackman wanted to do it but was waiting for Dewey to appoint him. Harper chastised Young for not doing it, even though Jackman had suggested she not do it. In a letter to Harper, Young stated that she had never been in an entanglement like this. Nonetheless, she agreed to be responsible for the conduct of the magazine from December until June, if the President so desired.

By the end of the 1903-1904 winter, Dewey's attempts to rid the school of Parker faculty had mostly failed. He had fired an art teacher, Miss Covington, who had been hired after the tenure agreement, and her supervisor, John Duncan, resigned in protest. He said that Covington was an excellent teacher, but Dewey had dismissed her to make room for one of his own teachers without Duncan's consultation. The rest of the Parker faculty remained even though Mrs. Dewey threatened to resign if they did. Apparently, she was not aware of Blaine's view of her employment, even though Harper had written to Dewey in February that "it was the distinct understanding of the trustees that the appointment of the present principal of the Elementary School was contrary to the best opinion of the Committee and the Trustees." He indicated that Mrs. Dewey was free to resign at the end of the year or sooner.

Jackman had been advised by Blaine and the School of Education's Board of Trustees to document any difficulties centering around Alice Dewey's administration. In a letter dated 23 April 1904, Jackman stated that her basic problem was in her critical attitude, "so critical that it becomes destructive... making it impossible for her to direct others... without
continual combat." He continued, "One patron, who withdrew her child was told that 'Christian Scientists' were not wanted"; others were told that "we should not have children who do not come from good homes." A letter from John Cook, Principal of the DeKalb State Normal School, described the humiliating treatment his visit received. He was told that his visit was inconvenient and he was not expected, even though his visit had been confirmed. Another party from Indiana was treated so rudely that they left in bitterness. Jackman continued to explain that a clerk had been hired under a year's contract, after having turned down a better paying job in favor of this one that would allow her to pursue her studies. When she was fired shortly thereafter without regard to the contract, Mrs. Dewey told her that there are no ethics in business, "that she was merely a cog in a huge machine." Finally, Jackman stated that her conduct in the Parents Association was one of "political ward maneuvers."22

During the early spring of 1904, Dewey went to Columbia University to give a series of lectures. According to a letter from Columbia's President Nicholas Murray Butler to Harper, it was during this visit that Dewey negotiated a position in their philosophy department. Upon his return, Harper wrote to Alice Dewey that the time for her resignation would soon be passed. Mrs. Dewey was surprised and said that Mr. Dewey had not told her about her expected resignation. Even though it had been conveyed in the February letter from Harper to Dewey, the latter said that he had not told his wife because he was not aware of it.22

Nevertheless, both Dr. and Mrs. Dewey tendered their resignations that spring, and by June they were off to a vacation in Europe. About that same time, Young resigned. Harper had made her a flattering offer, but she felt that she could not remain under the circumstances.23

What began as a great collaborative opportunity to lay the groundwork for a scientific pedagogy in professional teacher preparation ended impaled in politics. The School of Education followed the path that Young had feared: its focus became one of climbing up the ladder to secondary and normal preparation and administration, with the elementary coursework leading to what was regarded as an inferior bachelor of education degree instead of a B.A. or B.S.

Most of Young's writings, including "Scientific Method in Education," which explained the basis for a constructivist pedagogy, were buried in the plethora of other philosophic writings mostly by men who had little applied experience in teaching. In psychology as in other sciences, Young stated that the purely scientific study must be followed by the applied, which is generally termed educational psychology. Unfortunately, as the century progressed educational (and developmental) psychology was controlled by behaviorism. From Pavlov's conditioning we moved to Thorndike's laws of learning. Following in this tradition came John Watson and finally B. F. Skinner's operant conditioning. In the 1960s as behaviorism began to wane, the influence of Piaget's studies on conceptual development increased. Parallel to this study were the discoveries of cognitive science, an emerging field that includes research from neurosurgery, neuropsychology, cognition, and information or computer science. And so at the end of this century, we have come full circle in understanding how children learn. The difference, of course, is that we have the convergence of the research of the other fields listed above. But the speculative and conceptual framework of Young's scientific method has not changed. It is time that her work become recognized as part of our intellectual educational past. Furthermore, there is another lesson to be learned from the University of Chicago's situation: to be able to balance collaboration in the pursuit of professional excellence with political activities necessary to keep the education profession moving forward and not backward to a less professional time.

William Maclure, the Scottish-born geologist, traveler, reformer, and philanthropist, envisioned a world in which those who "labored by the sweat of their brows" would be economically and politically equal with the rich and powerful. To achieve this goal he devoted his time, talents, and considerable financial resources to a variety of educational reforms. In the course of his long life he sought to establish libraries and institutes for the working classes and Pestalozzi schools for children. He generously supported individual scientists and attempted to create agricultural schools in Spain and Mexico. He collaborated with Robert Owen in the communitarian experiment at New Harmony, Indiana, where he established Pestalozzi schools for the children of New Harmony. The purpose of this paper is to describe some of those reforms and evaluate their outcomes.

Born in Ayr, Scotland, on October 27, 1763, Maclure went to London in his early twenties to enter business. Little is known about the American firm of Miller, Hart, and Co. with which he was associated. Suffice it to say that the business and Maclure both prospered, so that when he retired from business altogether in 1797 at the age of 34, he was a wealthy young man.

He then came to the United States, settled in Philadelphia, became an American citizen, and took up the serious study of the geology of the United States. Again, how he obtained his working knowledge of both the theories and facts of geology—an infant science at the time—is unknown. Armed with his hammer and packet, however, he traveled throughout the eastern United States collecting specimens and writing up his findings. On January 20, 1809, he presented his paper entitled "Observations on the Geology of the United States, Explanatory of a Geological Map" to the American Philosophical Society in Philadelphia, of which he had been a member since 1798.

By 1818 when he had refined his observations and published them in a final form, he was one of the pre-eminent American scientists, known subsequently as the "Father of American geology." Memberships in scientific societies in America and abroad accompanied his wide-spread recognition as a scientist.

But while his scientific activities were in the forefront during the first years of the nineteenth century, his ideas about society and its ills had been taking shape as well. During his years in England, where he had been acquainted with the circle of radicals clustered around Joseph Johnson, the publisher, and his frequent visits to France, where he was witness to scenes of the Revolution, his sympathy with the exploited and disenfranchised had been reinforced. His ideas were congruent with many liberal notables of the day. He counted among his friends Thomas Jefferson; Count Francois Constantin Chasse-Boeuf Volney, an architect of the French Constitution; Joseph Priestley, the chemist and radical Dissenter; Joel Barlow, American wit and diplomat; and scores of other diplomats and political activists of the late eighteenth and very early nineteenth centuries.

There is a variety of primary sources from which to gain an understanding of Maclure's ideas. First, throughout his extensive European travels he kept journals which were edited by John S. Doskey and published as The European Journals of William Maclure by the American Philosophical Society in 1988. Second, the voluminous correspondence between Maclure and Marie Fretageot, the Pestalozzi teacher who was a devoted friend and manager of his affairs, has been edited in toto by Josephine Mirabella Elliott of New Harmony, Indiana, and published as Partnership for Posterity by the Indiana Historical Society in 1994. Finally, his frequent essays sent from Mexico after he left New Harmony and published in the New Harmony newspaper he founded, The Disseminator of Useful Knowledge, gave full scope to his wide-ranging ideas on education, politics, economics, foreign affairs, and society in general. These essays were compiled into a three-volume set entitled Opinions on Various Subjects.

Maclure expressed the core of his belief about education in a democratic society on September 21, 1829. He said that the neglect of the instruction of the millions is the greatest crime a free people can commit. It caused incalculable evils during the present age, and death and destruction to freedom in the next.¹

Maclure believed that ignorant men were duped and exploited by those who were richer, better-educated, and more powerful. Although the educated people did not produce goods for society, theys were free to pursue their own self-interest. While the "industrious producers," or, as he also referred to them, the "millions" were inhibited from doing so by laws, customs, and pressures created by the powerful non-producers and sustained by ignorance of their own rights.
Maclure was fully confident that, given knowledge, the millions were perfectly able to govern and could effect the equitable distribution of power and property. How to give them that knowledge was Maclure's continuing theme and the motivation for his philanthropic projects.

Maclure was scathing in his comments about the rich and powerful—the Church, the State, and the aristocracy. He was vehemently anti-clerical and railed against organized religion; he saw Church and State in league with each other in an unholy alliance.

For Maclure, Europe was old and corrupt. It was "enclosed in an impenetrable barrier of bayonets, and the field of political experiment is in possession of those who have an interest in retaining all subject to physical force, and limiting all moral improvement to the narrow bounds of their luxurious convenience." America was a more promising site for his dreams of social reform.

Maclure was at once a visionary, a sharp critic of society, and an intensely practical man. His remedy for the despotism and oppression in Europe was the equalization of knowledge. This required establishing a society on an equal division of useful knowledge, securing a proportionately equal division of property and power, and totally eradicating the power, as well as the temptation, of one class of society tyrannizing over another.

Maclure's Philanthropic Projects

Maclure attempted several projects that would give working people an "equal, universal, useful and liberal instruction." One model that had captured his interest during his European travels was the "mechanical institute." While in Scotland, Ireland, and England in 1824, Maclure visited, among others, the Belfast Natural History Society, the Mechanics Institute of Glasgow, and the London Mechanics Institute. According to G. D. H. Cole, these institutes had become very popular among the working class in the 1820s, offering lectures, practical training, and extensive libraries. They had both a self-improvement and a political aspect. Often run democratically in themselves, they "did much to stimulate discussion and kindle working-class interest, and they often supplied the stimulus for the organization of counter-activities by the working class bodies." They were, in short, the cradle of the labor union movement.

Maclure resolved to implement this idea. When he returned to America in 1825 after a journey of several years, his friends importuned him to join Robert Owen's communitarian experiment in New Harmony, Indiana. Infected with the enthusiasm of his friends and scientific colleagues and swayed by Owen's rhetoric about what was to transpire on the banks of the Wabash, Maclure agreed to head westward. However, his goal was not only to support Owen's utopian dreams, but to establish in the heartland a center for scientific research and publishing and institutions for the practical training of adults and children.

Most of his dreams for New Harmony came to naught, but the Working Men's Institute is Maclure's most lasting contribution to the welfare of the working classes.

According to George Lockwood, the first attempt to found the institute was made in 1828; Maclure called it the "Society for Mutual Instruction" and announced in The Disseminator that the new plan was to be like the mechanics' institutes in Europe and the United States. The object of the Society was to "communicate a general knowledge of the arts and sciences to those persons who have hitherto been excluded from a scientific or general education by the erroneous and narrow-minded policy of college and public schools, which have invariably endeavored to confine learning to the rich few, so that they might tyrannize over the uneducated many."

On the heels of the creation of the Society, Maclure left New Harmony for Mexico, never to return. Without his presence, the Society floundered. But in 1837, three years before his death, Maclure resuscitated the organization by giving it a permanent home and adding a library, thus establishing and incorporating the Working Men's Institute and Library in New Harmony. Thanks not only to its founder, but also to generous benefactors in the years that followed, it exists today as a library and research center.

Maclure had also been enthusiastic about the working men's libraries he had seen in Europe. Maintaining his interest in those who "labor with their hands and earn their living with the sweat of their brows" to the very end, he provided in his will that the sum of five hundred dollars be given to any group of working men who would add books to their already existing libraries of at least one hundred volumes.

After his death, this wished-for trust was declared void because it provided for funds to be distributed to organizations not yet in existence; and so Anna and Alexander Maclure, William's brother and sister who were living in New Harmony,
prospered for nearly three years, but in 1812 Neef moved the school to a different location.

Maclure supported Neef and his wife for three years while they learned English, planned the school, and began operations. In 1809 with an enrollment of 75 boys. The school was a way of improving the lot of the poorer classes. Maclure visited Pestalozzi himself at Yverdon on 3 October 1805, and continued those visits for many years. In his essay of 9 April 1828, he wrote that "he had traveled seven summers in Switzerland, and some months of each residing at Pestalozzi's school at Yverdon."

Maclure's thinking was largely congruent with that of the Swiss educator. In his belief in the child as active learner, who learned best when what was presented to him moved from the concrete to the abstract, from the immediate context to the more distant, from the simple to the complex, Pestalozzi practiced what is echoed in Maclure's writings. Maclure, the practical scientist, believed as did Pestalozzi that children learn through their senses and that what is presented to them must capture their interest and thus their attention. For that reason, the teacher must "find out the inclination of his pupils, and teach them any and all the useful lessons he may find they study with pleasure." For both men, it was more important to know how to think than what to think. This perspective was in sharp contrast to the customary teaching methods of the day.

Maclure set about to establish Pestalozzi schools, first in Paris and then in America. He tried to create an agricultural school along Pestalozzian principles in Alicante in Spain, but the land he acquired during a short-lived liberal regime was confiscated and returned to the Church. In spite of his continuing enthusiasm for forwarding the education of adults, Maclure often despaired of the efficacy of transforming grown persons. In one of his many letters to Marie Duclos Fretageot, Maclure wrote that for thirty years he had considered ignorance as the cause of all the miseries and errors of mankind. He added that his experience soon convinced him that it was impossible to give any real information to men and that the only possible means of giving useful knowledge to the world was by the education of children. The life experiences of far too many adults had either not educated them or had mis-educated them, and so, held Maclure, undoing the errors and faulty learning of a lifetime was too difficult. Since "men must be wise before they understand the real use of knowledge, and they must have knowledge before they can be wise," it was difficult to remediate "after their education had put them on the wrong road."

So Maclure turned to the education of children. He believed that his own classical education had ill prepared him for life and that the traditional methods of rote learning of meaningless information taught by authoritarian and ill-prepared teachers was no way to lift the working classes and prepare them for participation in democracy.

But from the moment, in 1805, that he saw the Pestalozzian method of teaching and learning in action, he knew that it would answer the need for a rational and useful education. Maclure's introduction to the Pestalozzi approach came about when he went to Joseph Neef's school in Paris in the hopes of meeting Napoleon who, with Tallyrand, was visiting the school that day. Although Napoleon stated that Pestalozzianism would not work in France, Maclure saw Neef's work as a way of improving the lot of the poorer classes.

Maclure visited Pestalozzi himself at Yverdon on 3 October 1805, and continued those visits for many years. In his essay of 9 April 1828, he wrote that "he had traveled seven summers in Switzerland, and some months of each residing at Pestalozzi's school at Yverdon."

Maclure's enthusiasm for Pestalozzi's educational and social philosophy led to an unswerving commitment to spread Pestalozzian education in as many settings as he could devise. He supported Pestalozzi teachers; he contributed money, books, and scientific equipment and specimens to Pestalozzian schools; and he recruited students. He loaned Pestalozzi the capital to continue his work at Yverdon when it seemed that the whole enterprise was crashing around the old teacher's head.

Maclure set about to establish Pestalozzi schools, first in Paris and then in America. He tried to create an agricultural school along Pestalozzian principles in Alicante in Spain, but the land he acquired during a short-lived liberal regime was confiscated and returned to the Church. Maclure's trusty manager, adviser, and confidante.

After Maclure met Joseph Neef in Paris, he persuaded him to come to Philadelphia to open a Pestalozzi school there. Maclure supported Neef and his wife for three years while they learned English, planned the school, and began operations. Neef's first American school opened at the Falls of the Schuylkill in 1809 with an enrollment of 75 boys. The school prospered for nearly three years, but in 1812 Neef moved the school to Village Green, also in Pennsylvania. Here there were
troubles, probably stemming from religious controversies. Although Neef was a deeply religious man, who opened his school to both Catholic and Protestant children, he believed in freedom of conscience and this tolerance did not suit the community. A discouraged Neef then moved to Kentucky where he opened yet another school, which also failed. It was there that Maclure found him as Maclure proceeded westward to New Harmony. Neef then opened his school for older students in New Harmony, where Maclure was in charge of the whole educational system.

The somewhat erratic and eccentric Phiquepal first taught with Neef at Village Green, where he gained his skill in the Pestalozzian approach. He returned to Paris after Neef left for Kentucky where, in 1820, he resumed his acquaintance with Maclure. Maclure offered him his private residence on the Rue des Brodeurs in Paris to establish a Pestalozzi school for boys. After a short time, however, the political climate in France following the restoration of the Bourbons made Phiquepal's teaching suspect, so he and four of his students, including Madame Fretageot's son Achilles, set sail for New York. Maclure intended Phiquepal to start another boys' school in Philadelphia, but no sooner were those plans underway than the whole project was terminated in order to transplant it to New Harmony.

Maclure met Marie Fretageot in Paris where she was first a parent, then a teacher, in Phiquepal's school. She had previously been connected with a school for girls in Philadelphia, so the return to Philadelphia in 1821 to start a boarding school for girls with Maclure's financial backing was an easy transition. The school prospered.

But once again everything changed. Robert Owen's plans for the brave new world in New Harmony lured Mme. Fretageot and many of Maclure's scientific colleagues. Upon his return from Europe, he could not resist the pleas of his friends and the opportunities he believed awaited him, where he could work with Owen and manage the educational system at New Harmony. So both Philadelphia Pestalozzi schools closed, and Phiquepal and some of his students and Mme. Fretageot and some of her students joined Maclure, Owen, and others of Philadelphia's most distinguished scientists on a trip down the Ohio River in a keelboat named The Philanthropist.

Affairs at New Harmony became more and more contentious. The ambiguity of the financial arrangements between Maclure and Owen caused each to sue the other. The organization of the community was in total disarray; Owen was frequently gone, as was Maclure. After their open break, Maclure was appalled to learn from Mme. Fretageot that Owen had instituted a totally new and competing educational organization in New Harmony. The three Pestalozzi teachers were at odds with each other and with the Philadelphia scientists. The situation deteriorated rapidly and in June of 1827, Owen left New Harmony for good and returned to Scotland. The utopian experiment ended a scant sixteen months after The Philanthropist had delivered its hopeful and high-spirited passengers to the banks of the Wabash. Maclure left a year or so later.

Conclusion

In many ways William Maclure's ideas and projects were sound and far-seeing. His belief in and support of scientific education was far ahead of his time, as was his vision of the child as an active and thinking learner. His efforts to raise the consciousness of the working class to an awareness of its opportunities and responsibilities for participation in a democratic society foreshadowed the rise of the labor union movement and, according to David Harris, the growth of socialist thought in America.12

He understood the power of the press and the frequent abuse of that power. His comments on various political issues--the sale of public lands, taxes, the equality of women, the shame of slavery, the manipulations of politicians, the importance of the small community, wars, even a world organization dedicated to peace, and above all, his call for free public education--were prophetic.

He was a one-man philanthropic foundation at a time in the United States when the drive for personal gain was the over-riding motive. Maclure had prestige and high visibility, contacts, resources, ideas, and vision. Yet so many of his projects either failed or never reached fruition. One must ask why. The reasons may be found both outside of and within William Maclure.

Political events in France and Spain, over which he certainly had no control, brought his plans for the agricultural school in Alicante, Spain, to a crashing and disappointing halt, while the restoration in France cast a shadow on his Pestalozzi schools there. His failing health dispelled hopes of an agricultural school in Mexico.

His vehement stance against organized religion was surely at cross purposes with the deeply-ingrained sectarianism that characterized early nineteenth-century America and that jeopardized Neef's schools in Philadelphia. His Pestalozzian views on the nature of teaching and learning ran counter to the prevailing educational ideas. Even the later work of Henry
Barnard (1811-1900) in the American Journal of Education, which popularized Pestalozzi, did not effect any long-term reforms of the traditional school.13

But one must look to the man himself. There was a certain political and administrative naivete about him. He was stubborn and probably too straightforward for his own good. In Samuel Morton's 1841 memoriam for Maclure, addressing the Academy of Natural Sciences of Philadelphia, Morton said of his friend, "Mr. Maclure's character habitually expressed itself without dissimulation or disguise," and "Mr. Maclure was very much isolated during the last thirty years of his life, partly owing to a naturally retiring disposition, partly to the peculiarity of some of his opinions, in respect to which, though unobtrusive, he was inflexible."14

He set his Pestalozii teachers up in business, then moved them about without regard to commitment or continuity. His frequent comings and goings must surely have affected the success, or lack of it, of his projects.

His loose arrangements with Robert Owen would certainly not characterize a practical man of business, and, much as he despised lawyers, his provision for the workingmen's libraries would have fared better had he been more attentive to the legalities and maintenance of his project.

Maclure operated unilaterally and was not a collaborator. His earlier geological expeditions were carried on either alone or with a small number of friends; he travelled alone; and he sponsored his projects alone. Perhaps that is why, when they failed, so little was left behind. Although the Working Men's Institute in New Harmony and his writings represent a significant legacy, one could wish that the efforts of so independent and unique a personality might have borne more fruit.

Religion, Culture, and Higher Education in the Writings of Christopher Dawson

Ronald Rutkowski
Marquette University

Christopher Henry Dawson was the second child and only son of Mary Louisa and Henry Philip Dawson born at Hay Castle in Wales on October 12, 1889. Mary Louisa’s father, William Bevan, was in a long line of ministers to the Anglican Church. In the course of his career he attained the office of Archdeacon of Bevan. Henry Philip followed the example of his forbears by choosing a career in the military. His choice was wise; he retired with the rank of colonel. The marriage of Mary Louisa and Henry Philip secured more than a middle-class existence. One notable benefit was an annuity that supplied their son with an income for study at Oxford and throughout his life. A large library signaled the value placed on learning. Christopher spent many happy hours in the library during his youth, and when he retired his library contained more than 2,000 volumes. The unwavering loyalty Mary Louisa and Henry Philip pledged to the Anglican Church was handed on to their children.

Christopher received his education from tutors and schools in England and Europe. He contracted bronchitis at the age of ten while attending Bilton Grange, a preparatory school. The illness was the first of many maladies including periods of apathy, depression, and insomnia that plagued his life. The condition of his health determined his scholastic performance. His poor health and frail physique permitted an exemption from military service during World War I and might have been the cause of his shyness.

Dawson received his Bachelor of Arts and Master of Arts degrees from Trinity College, Oxford. A scholarship and his income afforded a comfortable existence at Oxford, although he lacked some amenities enjoyed by other students. He studied under Ernest Barker whose specialty was ancient Greek political theory. Barker also encouraged him to develop his interest in the philosophy of history. Two events during his stay at Trinity College deeply influenced Dawson’s life as a scholar. He read the works of the historian Lord Acton, whose contention that religion was the key to understanding culture served as the background for Dawson’s investigations into the relationship between religion and culture. He also began to doubt his commitment to the Anglican church. In the writings of John Henry Cardinal Newman and other Catholics, Dawson found answers to his questions and converted to Catholicism in 1914. Dawson’s research would eventually be considered an example of the finest work from English Catholics.

In 1916 Dawson married Valery Mills, a member of a prosperous family. Her interest in history was the basis for their relationship. During her studies for a baccalaureate degree in art history, Valery acquired a thorough knowledge of the holdings in Europe’s finest museums. They had two daughters and one son.

After completing his studies, Dawson lectured on a part-time basis for twelve years at University College, Exeter, and for a short time at Liverpool University. Other universities requested lectures from him. He entered the main currents of British intellectual life through his lectures and published articles. Publication of his books during the 1930s established Dawson’s reputation as an historian and apologist for Catholicism. In 1940 he accepted the position as editor of the Dublin Review. For three years Dawson used the review as an arena for reflection by Christians on problems confronting Europe. Contributions from representatives of different Christian denominations quickly made the review the locus for ecumenical discussions between Catholics and Protestants. Reluctance on the part of the English Catholic hierarchy to support the discussions eventually caused Dawson to suspend ecumenical dialogue. The British Academy acknowledged the worth of Dawson’s scholarship in 1943 by electing him to be a fellow. Accepting the invitations of the University of Edinburgh, he presented the Gifford Lectures in 1947 and 1948. His lectures were the bases for his books Religion and Culture and Religion and the Rise of Western Culture.

Dawson demonstrated the contribution religion made to culture through his research. He also hoped to convince readers of the important choice confronting the West: a religious or secular understanding of culture and human existence. After leaving Oxford he prepared to write a history of culture, but the outbreak of World War I caused him to set aside his project in favor of aiding the British effort as a writer. Edward Ingram Watkin, Dawson’s friend since his studies at Oxford and another articulate voice for Catholicism in England, asserted that this cumulative history of culture would have been a most important venture.
The articles and twenty books that flowed from his pen were responses to questions about the relationship between religion and culture. His writings attracted a responsive audience. In his comment on Dawson's book, The Making of Europe, Aldous Huxley wrote: "The Dark Ages lose their darkness, take on form and significance. Thanks to Mr. Dawson's erudition and his gift of marshaling facts, we begin to have a notion of what it is all about." Many of Dawson's books were translated into German, Italian, Spanish, French, Japanese, Portuguese, and Polish.

During the years 1958-1962, Dawson taught at the Divinity School of Harvard University. Nathan M. Pusey, president of Harvard, believed a chair for a Catholic scholar would add prestige to the Divinity School and would acknowledge the presence of Catholic students at the university. He initiated negotiations between the faculty and the university's trustees to secure permission for a chair restricted to a Catholic scholar in 1952. Objections--some vigorous--came quickly, but Pusey persisted. An endowment for the chair was donated by the Stillman family, long known for generosity to the university and favorable to Pusey's idea because the family included converts to Catholicism. Pusey announced in 1958 the award of the Charles Chauncey Stillman Chair of Roman Catholic Studies to Christopher Dawson.

At Saint Bonaventure University in 1959, Dawson was the recipient of the Catholic Action Medal in recognition of significant achievement by a lay man or woman to the Catholic Church.

Dawson arrived at Cambridge eager to work. He completed five books and maintained a busy schedule for teaching. However, his relationships with students developed slowly. His shyness and habit of speaking very softly were obstacles. A few students withdrew from his seminars. Dawson and his students adjusted to each other as time passed. Students then found him to be congenial, always ready to discuss ideas, and helpful. His colleagues on the faculty enjoyed his presence. Despite being content with the weather at Cambridge, Dawson's health deteriorated. He returned to England in 1962. His departure ended the effort by the University of Notre Dame to appoint Dawson to its faculty.

A heart attack soon complicated by pneumonia and a coma led to Dawson's death at his home on the southern Devon coast on May 25, 1970. Except for a comment to Watkin about his dislike for the change of the language in Catholic liturgy from Latin to English, poor health prevented Dawson from writing more about the events taking place in the Catholic Church during Vatican Council II. Shortly after his death, admirers of Dawson's work began circulation of the Dawson Newsletter as a forum for reflection and commentary. The newsletter continues to be published.

The words religion, culture, and education had distinct meanings for Dawson. He understood culture to mean "any social way of life which possesses a permanent institutional or organized form." Culture was a living complex rooted in yet not determined by the external forces of biology or geography. Culture provided unity and coherence to a society. An important aspect of culture was its ability to adapt. "For a culture... is an open system--open not only to new knowledge and new ways of behavior but also to other cultures, if a bridge of communication can be established between them." Culture provided the common background for the lives of men and women and acted as the standard against which new ideas were assimilated.

Religion was "the word generally used to describe man's relationship to divine or super human powers and various organized systems of belief and worship in which these relations have been expressed." Research into the relationship between religion and culture brought him to the conclusion that religion was the basis of culture. Religion sanctioned a common view of life, common forms of behavior, and a common system of values. The relationship had been the normal condition of human existence from its earliest time. A culture that denied its religious foundation was an aberration. Religion made positive contributions to culture. His research underscored the point that "any religious movement which adopts a purely critical and negative attitude to culture is therefore a force of destruction and disintegration which mobilizes against it the healthiest and most constructive elements in society--elements which can by no means be dismissed as worthless from a religious point of view."

Christianity affirmed the goodness of life and the importance of time and history. "Christianity can never ignore history because the Christian revelation is essentially historical and the truths of faith are inseparably connected with historical events." The Middle Ages best exemplified the relationship between Christianity and culture, but one would be wrong to conclude that Dawson yearned for the return to the Middle Ages. Dawson understood history as moving forward. Christianity bore the responsibility of continually defining itself and its message within changing historical conditions. "And so when we talk of Christian culture, we ought not to think of some ideal pattern of social perfection. We should look first and above all at the historic reality of Christianity as a living force which has entered into the lives..."
of men and societies and changed them in proportion to their will and capacity."\(^{10}\)

Dawson wrote several articles during the 1950s about higher education. From the articles he issued an outline of his theory of higher education in his book *The Crisis of Western Education*. Emphasis is given to the word *outlined*. The book did not provide a detailed program for education. He was content to describe his program in broad terms leaving details to educators who wished to implement his theory.

Convinced the development of secularist thought turned education in the wrong direction, his book was a call to return education to its true mooring. Education was "the process by which the new members of a community are initiated into its way of life and thought from the simplest elements of behavior or manners up to the highest tradition of spiritual wisdom."\(^{11}\) He noted the similarity between his definition of education and what anthropologists called *enculturation*. The distinguishing mark of his theory of education when compared to much of contemporary education was breadth. Vocational and professional education were narrow forms of education, the result of the rise of secularist thought in Western culture.

In his book, Dawson argued that a secular theory of culture led from the Renaissance to the development of the modern totalitarian state. As secularism became the dominant motif in Western culture it coincided with the development of universal education. Dawson did not impugn universal education. He protested the linkage of secularist thought with universal education "that destroyed the hierarchy of divinity, humanity, and natural science that was the tradition of European higher education.\(^{12}\)

For much of its history, Western education was the product of the integration of the Christian religion and classical humanism. This was the background of the teachers who filled the universities. Christian education was the soil in which the idea of progress was nurtured. "It must be recognized that our faith in progress and the unique value of human experience rests on religious foundations, and that they cannot be severed from historical religion and used as a substitute for it, as man attempted to do during the last two centuries."\(^{13}\) Underlying universal education was the premise that either denied the existence of spiritual reality or considered religion to be merely a matter of choice without consequences for society.

To reverse the secularist trend, Dawson sought the restoration of Christianity to its proper place in higher education. Education must "open the mind to an appreciation of the spiritual as well as the scientific and humanistic inheritance of culture."\(^{14}\) Although he conceded that his position spoke for a minority of scholars and educators, he warned readers that unless the minority presented its argument forcefully, Christianity would not be able to regain its place in culture and education. "In the last resort every civilization depends not on its material resources and methods of production but on the spiritual vision of its greatest minds and on the way in which this experience is transmitted to the community of faith and tradition and education."\(^{15}\)

Dawson's program was a call for the study of Christian culture. "It was through the medium of culture that the Christian faith penetrates civilization and transforms the thought and ideology of modern society.\(^{16}\) The rise of secularism and its implications for education meant men and women could spend years being educated yet remain unaware of Christianity as a spiritual factor in the life of one's psyche or Western culture. His program focused on "the culture-process itself from its spiritual and theological roots, throughout its organic historical growth to its cultural fruits. It is the organic relation between theology, history, and culture which provides the integrative principle... and the only one capable of taking the place of the old classical humanism which is disappearing."\(^{17}\) Dawson cautioned readers that his educational program was not a kind of religious education, although the program could lead one to study Christian doctrine.\(^{18}\) His program sought to communicate one point: "Christian culture was essentially humanistic in as much as there is nothing which does not come within its sphere of influence and which does not in some way belong to it.\(^{19}\) He believed his program for education could establish curriculums for state, private, and religiously affiliated universities.

Dawson divided the development of Christian culture into six periods: primitive Christianity (New Testament to the 4th century), Patristic Christianity (4th to 6th centuries), the formation of Christendom (6th to 9th centuries), Medieval Christendom (11th to 15th centuries), divided Christendom (16th to 18th centuries), and secularized Christianity (18th century to the present). His program was neither a nostalgic review of the past nor an accumulation of Christian artifacts. It was an attempt to "study Christian culture as a social reality--its origins, development and achievements--for this would provide a background or framework that would integrate the liberal studies which are apt at present to disintegrate into unrelated specialization.\(^{20}\) The goal of the program was to show how Christian culture "is a dynamic process which does not belong to any single period, but is co-extensive with the history of Christianity and inseparable from it.\(^{21}\) His program
can be studied historically—Christendom as a historic reality and Christian culture—and as the spirit informing, preserving, and advancing Western culture.

His program for higher education attracted both praise and criticism. Proponents understood his theory of education as a means of reviving and restoring the importance of Christianity for higher education. Critics argued his program of education was bound to the medieval tradition and failed to take into account the factors influencing education in the United States. An analysis of the arguments criticizing or defending Dawson's theory of education is material for another paper. There are two aspects of his thought that have significance for contemporary Western culture and higher education in the United States.

Current statements by different groups of Christians are signs of Christianity searching for ways to address culture. Secularism for Catholicism is no longer the enemy of religion; it is the fact defining contemporary Western culture. However, recognition of the fact of secularism does not mean that secularism is beyond just criticism. Nor does Christianity remain absolved from answering questions raised by a secular culture. The historical implications of the way Christianity speaks to culture are worthy of investigation.

George M. Marsden concludes his book, The Soul of the American University, with an analysis of the current widespread disregard for Christianity in higher education, and he suggests reasons for the inclusion of the Christian perspective in academe. His comments are cogent and deserve an honest evaluation. Dawson uses a different methodology than Dr. Marsden by searching for points of convergence between religion and culture. Dr. Marsden investigates the intellectual currents within Protestant Christianity leading to the demise of Christianity in higher education. Yet Dawson's observations about higher education complement Dr. Marsden's book. By examining the implications of the convergence between Christianity and contemporary culture, historians of education can have a better method to evaluate the role of religion in higher education in the United States. Religion is a constant in culture and makes its presence felt in many ways. The historical analyses provided by Christopher Dawson and Dr. Marsden serve as reminders that religion in the life of a scholar and the academic community is of no little consequence.

Because he was a representative of Catholic thought inspired by the philosophy and theology of Thomas Aquinas, Dawson became virtually forgotten amid the sweeping changes in Catholic thinking fostered by Vatican Council II. In retrospect, Dawson asked questions and provided answers that are very much part of the discussion about the role of religion in culture and higher education. We would do well to read Dawson's words.

Endnotes

9. From Dawson's book Medieval Essays Edward Ingram Watkin quotes Dawson's evaluation of the Middle Ages: "I do not maintain that the general level of religious life was higher than at other times, still less that scandals were rarer or moral evils less obvious. What one can assert..."
is that in the Middle Ages, more than at other periods in the life of our civilization, the European culture and the Christian religion were in a state of communion: the highest expressions of mediaeval culture, whether in art, in literature or in philosophy, were religious and the greatest representatives of mediaeval religion were also the leaders of mediaeval culture.” Edward Ingram Watkin, "Reflections," 8.

A.S. Makarenko and New Dimensions in the Qualities of Teaching

Rose Edwards
Northeastern Illinois University

In the summer of 1928, Soviet educational authorities dismissed Anton Makarenko for using "un-Soviet" methods in a colony for juvenile delinquents that he had directed with great success since 1920. No sooner had he died (1939) than he was lionized as a Soviet cultural hero, his educational ideas officially recognized and his pedagogical model adopted as authoritative by the Soviet system. Such a paradox deserves our attention: who was Anton Makarenko, what really were his pedagogical ideas, and what was the historical context within which his ideas were rejected and then canonized in swift succession?

Makarenko worked as an educator of lawbreaking youth and juvenile delinquents within one of the most turbulent periods of Russian history, the years from 1917 to 1920 of the Russian Revolution, which Leon Trotsky described as "overturning the world." The Soviet historian Richard Pipes explained the revolution's intentions as "a complete redesign of state, society, economy, and culture all over the world for the ultimate purpose of creating a new human being." The Russian Revolution also prompted a revolution in education. The Bolsheviks were confronted with the necessity of completely restructuring the inherited tsarist educational system and with laying the foundation for a modern Soviet school plan. However, following the Bolshevik seizure of power in 1917, no one knew how to build a new school system that had a "Soviet" character. Anatoli Lunacharsky, appointed commissar for education and the arts after the Revolution, admitted, "No one knew, neither in detail nor in many other important matters," how to build a new educational system. During the first decade of communist rule, Lunacharsky and Nadezhda Konstantinova Krupskaya (Lenin's wife) struggled under uncommonly difficult conditions as the leading figures of Soviet education. Both had idealistic (if not utopian) goals for the new schools.

In discarding the old education system, Soviet leaders willingly opened their minds to the pedagogical ideas of Western Europe and the United States and borrowed liberally from such educators as Montessori, Dewey, Kerschensteiner, Kilpatrick, and Thorndike. Thus, many different pedagogical paths were tried and adopted simultaneously.

Dominant during the early period of Soviet education were the theories of "social education" and "pedology," (defined by educational authority A. P. Pinkevitch as a "science... which studies the biology and psychology of human growth"), essential aspects of a movement spearheaded by two of the most influential figures in early Soviet education, P. Blonsky and S. Shatsky. According to Soviet scholar Oskar Anweiler, they followed the premise that the "self-sufficient" aims in education were the child and the child's free development.

These liberal and child-centered principles were also applied to the social rehabilitation of lawbreaking youth, who, it was believed, should be educated "without force, punishment or scornful treatment." Such thinking was illustrated by Professor A. Zalkind, the leading authority in the field of re-education. He identified a labor colony for delinquent youth in Moscow as a model institution that, in Zalkind's words, had "not one ready-made rule, no directions from above; nothing should be forced upon the child, everything was to develop by itself in the course of time." Blonsky, who directed a "labor school" himself, deliberately put his students into an Urzustand (German for "primordial state of being") "to thus [spontaneously] awaken their drive for action, their urge for learning and their sense of community." Like Rousseau, early Soviet pedagogues believed the child would "naturally" develop into a new communist person.

Makarenko, in his work with lawbreaking and often dangerous youth, found that these theories of "free education" promoted by early Soviet pedagogues had to "stand helplessly" before the reality of his young charges, who, he quickly discovered, really needed an education "against their own nature." Makarenko had come to understand that lenient methods and gentle practices were hopelessly ineffective when working with delinquents. Spontaneous activities had to give way to disciplined approaches. The "progressive" assumptions of early Soviet pedagogues brought him into bitter conflict with his superiors and with leading Soviet pedagogues. Controversies erupted over his educational ideas and practices, and he encountered criticism and rejection of the principles he had so laboriously hammered out in the "rough air" of his colony. In the summer of 1928, the People's Commissariat for Education dismissed Makarenko from the directorship of the colony for using "un-Soviet" methods.

During the 1930s, the liberal approaches of early Soviet educators were replaced by stricter procedures intended to provide the nation with well-disciplined and highly trained cadres to meet Stalin's political goals. In this environment...
Makarenko's strict practices found official acceptance and after his death he was celebrated as the "father" of Soviet education. During his most active period as a teacher, the decades of the 1920s and 1930s, Makarenko came to be viewed as an outsider by Soviet authorities. He worked under disintegrated social, economic, and political conditions. His students were young war orphans and street urchins, often turned criminals, who challenged him far beyond normal parameters to take a fresh look at what is effective in education. To appreciate his insights and discoveries of what worked under such deprived circumstances, it is appropriate, first, to look briefly at Makarenko's life.

Born in the Ukraine, in 1888, Makarenko had been a schoolteacher for children of railroad workers for some 15 years before he took on the responsibility of educating homeless and delinquent children and youth. In 1920, amidst a raging civil war, Ukrainian authorities appointed him at the age of 32 to organize and direct a labor colony for "these homeless kids" who had appeared in unprecedented numbers. Makarenko faced the challenge of not only providing his uprooted pupils with the most rudimentary needs for daily living and education, but above all with mobilizing the cooperation of his defiant charges, whom he found alienated from society and ignorant of social norms. Makarenko viewed the situation pessimistically, writing as follows:

The lonely forest surrounding the colony, the empty shells of our buildings, our ten camp beds, . . . the five boys who were in frank opposition not only to our pedagogical system, but to the very principles of human culture itself, all this had . . . little to do with our conventional school practice.10

Overwhelmed by his new task, Makarenko admitted to a sense of profound helplessness. Searching for answers, he spent the first winter reading more books on education than he ever had before. He learned there was no existing theory that could guide him, and he would have to wrestle his own theories from real life encounters. He describes in his semi-autobiographical work, The Road to Life, how it dawned on him that theoretical formulations offered no answers. He wrote, "What I needed was immediate analysis of each situation, followed by immediate action."11

In The Road to Life, Makarenko described his successes and failures in resocializing vagrant youngsters and his efforts to help them reenter society as healthy, socially responsible people. He also described how, against a background of unusual conditions, he began to build his pedagogical principles.

Among Western educators, Makarenko is generally known for his use of "collective education," "student self-government," "productive labor," and "military exercises," but on closer examination of his writings, particularly the lectures he gave toward the end of his life, we find a far more differentiated picture of the true character of his teaching practice. Through daily interaction with his pupils, he had made some surprising observations and had gained insights as to what was truly important in education and in upbringing. Filled with these experiences and conclusions, he advised educators regarding these practices and conditions he had found to be effective.

As I will show in the following examples, Makarenko demonstrated that teaching is an art that involves far more than knowledge of subject matter, teaching methods, and theories of learning. He believed teaching to be a formative process that goes beyond classroom instruction to include forms of upbringing and that to be a competent teacher, one must acquire exemplary personal skills and habits in addition to traditional teacher training. Much of what Makarenko came to consider educationally effective most contemporary educators would not view as useful or important. Many of his teaching practices are difficult to define and resist evaluation, but they are nonetheless educationally consequential. For example, Makarenko discovered that teachers who paid conscious attention in the classroom to the many small practices of daily living engendered significant educational results. This conscious use of the seemingly insignificant details of life proved to be vital to his teaching success. The Russian novelist and dramatist, Maxim Gorky, after having observed Makarenko's work at the Gorky Colony, told Makarenko, "Your educational experiment with its outstanding results is . . . something of truly universal importance. . . . It is important, indeed imperative that you bring news of it to progressive teachers throughout the world. And the sooner, the better."12 It is on this dimension of educational practice that goes beyond traditional classroom instruction that I wish to focus. I will call this dimension Makarenko's "special features."

Makarenko was convinced that to become fully competent, teachers needed more training than was conventionally offered in teacher training colleges. To gain what he called pedagogical mastery, teachers had to acquire specific personal skills. He explained, "Children in our schools--as you know--assume a good posture with one teacher and a bad posture with another. This has nothing to do with the teachers' talents, but simply with one teacher being a master and the other one not."13 I will describe what Makarenko meant by pedagogical mastery and then look at several of the special features,
to which he gave such names as "style," "tone," "beauty," and "perspectives."

Makarenko explained that in daily practice he and other experienced teachers had found that many "little things" were decisive in their work. For instance, educators had to understand how to walk, how to joke, how to look happy or angry; "voice training, facial expression, the ability to stand up or sit down in the right manner, all that is very, very important for a pedagogue." He insisted that the acquisition of skills of just such a nature constituted pedagogical mastery. 14

Based on experiences in the colony that he eventually named Gorky Colony, Makarenko gained a clear idea of how an educator had to be trained. Teachers had to be "primed in the specific capabilities without which no single educator could work." 15 He believed a good educator had to know how to use his voice and how to speak to youngsters. Personal training was essential. Makarenko considered himself a master only after he had learned to say "come here" in 15 to 20 different shades or tones of expression. 16 He believed that such mastery was absolutely necessary when guiding young people's education and upbringing. He also believed teachers had to be trained to acquire such skills, for, as he explained, many parents and teachers did not know how to speak to a child. Makarenko gave this example:

The other day a father came to me and said:

"I am a . . . worker. I have a good son. He does not obey me. I tell him something but he does not obey me. I say it for the second time--he does not obey. I say it for the third time--he does not obey. What shall I do with him?"

I asked the father who had come to see me to sit down and began a conversation with him:

"Now show me how you talk to your son."

"Well, like this."

"Try it once this way."

"It does not work."

"Try again."

I spent half an hour with him, and then he had learned how to give an order. It was merely a matter of voice. 17

Makarenko advised his lecture audiences to employ an actor to school their voices, for "our voice is after all an instrument in our work that must be sharpened." 18 Another value for voice training, according to Makarenko, was that some parents and educators indulged in the luxury of allowing their own moods to be reflected in their voices. He thought this unacceptable; their voices, regardless of their moods, should be "normal," "good," and "firm." 19

In addition to training one's voice, Makarenko wanted educators to school their facial expressions, because he believed that an educator's countenance should be independent of his or her mood. He never permitted himself to wear a gloomy expression, even when he was worried. He explained that this demand was placed on all his staff and that he dismissed some educators because they grumped and pouted all the time. 20

Lastly, Makarenko drew attention to the educator's outer appearance, even down to such seemingly trivial matters as polishing one's boots every day or using a clean handkerchief, as this created a definite impression. In a lecture to educators he explained, "I must impress them [the children] aesthetically, and so I never once appeared before my pupils in an unbelted blouse or boots that needed a shine. I, too, had to shine to the best of my ability." 21

Makarenko summarized his ideas on pedagogical mastery in a description of how he had trained his teachers:

What constituted this training? Above all the tutor's character formation, the schooling of [his] behavior, and then transmitting such special knowledge and capacities without which no educator can be effective. If a tutor's voice is not trained, he will not know how to speak to students . . . . No one can be a good educator who cannot control his facial expression or who is unable to control his mood. The educator must know how to organize, how to walk, joke, and be happy or angry. The educator must behave in such a way that his every movement would be educative. He must always know exactly what he wants or does not want. If he does not know this, how can he educate others? 22

Makarenko frequently spoke of a special feature he called "style and tone," which he placed at the center of education, believing they had a critical part to play in children's upbringing. He expressed frequent regret that pedagogues had given style and tone little consideration. In his opinion, monographs should be written to deal with what he called "the problem of style." 23 According to him, the student's whole conduct and demeanor were shaped by the characteristics of the style prevalent in an educational community and by the tone of interaction between people. Style and tone were an expression of the predominant mood, the tenor of a social interaction. Makarenko called style a "perishable substance" that needed
"constant care and daily attention," requiring "as much tending as a bed of flowers." Makarenko admitted that style and tone had no functional value, but due to their observed beneficial effects on students they added important qualities to the life of an educational community. He strongly recommended that each educational community develop a definite style. Among the characteristics of a good style, Makarenko delineated a happy mood that, like a musical tone, sounded a major key: a sense of one's own dignity, which would find expression in the student's polite and friendly demeanor, an experience of inner security, wherein children could feel protected against force, arbitrariness, and humiliation; a sense of orientation that would enable students and teachers to be fully awake to what was going on around them, even discerning what was going on in another room; and feeling the "tone of life," the "tone of day." Makarenko noted that much too often such a sense was completely lacking in people, who seemed to experience only themselves. Makarenko conceded that style and tone could not be developed in an educational community overnight but he believed that slowly, over the course of years, it could grow out of the community's daily life.

Reflecting on what Makarenko perceived to be the characteristics of an appropriate style for a school or educational community, it becomes evident that he was not speaking merely of outer forms of style and tone, but rather of acquired capabilities and inner attitudes. It also becomes clear why Makarenko called style a "delicate and perishable substance" that needed "constant care" and "daily attention."

Makarenko told his lecture audiences that the importance of the aesthetic side of life in his colony could not be overstated. He observed that it was precisely the pedagogues who suffer from "a certain nihilism" in matters of aesthetics. In a written statement, he gave this direction:

Building upon beauty means to build securely. Beauty is a most powerful magnet, and it is not only a beautiful face or a beautiful shape of a human being that has an appealing effect, but also a beautiful deed, a beautiful concert... even a beautiful soldier cut out of paper.

On November 7, 1938, Moscow News published an article in which Makarenko described the life of his colony. He wrote:

We made their lives in the colony as... beautiful as we could. They [the colonists] had their own theatre, their orchestra, there was always an abundance of flowers and the young people were nicely dressed.

Makarenko felt it to be most important to beautify the colony in an outwardly visible way. He built a greenhouse at a time when the colony was poor and planted flowers that were tended by colonists and used to adorn the rooms, landings, and staircases.

Makarenko regarded cleanliness and personal hygiene to be aspects of beauty, contributing to the dignity of human life. Flowers, clothes, and cleanliness in all rooms needed constant attention. His demands for cleanliness were uncompromising. One of Makarenko's own accounts gives a flavor of the high standards he set:

There was, for example, the table. One can put a wax cloth over it, that is fine and hygienic. One can put all sorts of things on top of it, wipe over, and everything is clean again. No way! Only a white table cloth! Only a white table cloth can bring about the habit to eat mannerly; a wax cloth invites letting oneself go. During the first days, a white table cloth will inevitably be soiled and full of stains. After half a year it will remain clean. If there is no white table cloth on the table, it will be impossible to teach mannerly habits.

"Perspective" in the sense of having a joyful outlook, a happy anticipation of the coming day, and envisioning a hopeful future, was a central notion in Makarenko's work. "To educate man is to furnish him with a perspective leading to the morrow's joy. A whole book could be written about this most important work." Some educators attribute Makarenko's pedagogical success mainly to his having devoted much of his efforts to providing his colonists with joyful perspectives. Makarenko believed that man cannot live on earth without beholding something joyful. However, joyfulness had to be organized; it had to be called into being and treated as a reality.

Makarenko distinguished between near, middle, and distant perspectives. Essentially, the near perspectives gratify physical comforts and those things personally pleasant. In the colony's early days this meant food, shelter, warmth, cleanliness, and a sense of protection. Makarenko found that, typically, the near perspectives were most important to young children who needed instant satisfaction.

The middle perspectives might consist in planning a special event that was to take place in the near future. Gratification was delayed. Makarenko believed that older students were ready for more distant perspectives. Such special events should not occur too frequently—not more than two times a year—and should be anticipated with great joy. The
distant perspectives, which pertained to the most mature students, would include life goals and career aspirations.

As he developed these perspectives for the colonists, Makarenko discovered that entering colonists were used to other kinds of near perspectives, such as burglary, drinking, gambling, or terrifying weaker colonists. Consequently, he devoted his full attention to replacing primitive perspectives with worthier ones, such as visits to films, attendance at social gatherings, and trips and outings. Makarenko stressed that all perspectives had to be achievable, that primitive and egoistic joys had to be transformed into more selfless forms of gratification, and that ultimately total harmony between personal and societal perspectives could be achieved. He spoke of there being an "interesting line" of gratification, one that proceeds "from the primitive gratification provided by a piece of gingerbread to the satisfaction based upon the deepest sense of duty." He emphasized that perspectives had to be clearly understood. "The failure of many . . . homes was due to the weakness and ambiguity of [their] perspectives."

Since evaluation of educational methods during Makarenko's time rested almost entirely on observed results, we must rely on the accounts of those who observed or experienced his techniques. Several sources give evidence of Makarenko's success in the education and upbringing of delinquent youth. From Makarenko's own writings and the writings of his former charges, we know that many colonists became respected citizens, some of them successful teachers, others doctors, engineers, or factory workers, with families and children of their own. Reflecting on his former charges, Makarenko wrote in 1935:

Seven years have passed since then [since he left the Gorky Colony in 1928]: . . . My Gorkyites also grew up, and were scattered all over the Soviet Union. . . . There's no getting hold of engineer Zadorov, who has become absorbed by some vast Turkmenistan construction work; and neither Vershnev, Medical Officer to the Special Far Eastern Army, nor Burun, a doctor in Yaroslavl, can be called for an interview. Even Nisinov and Zoren, those kids, even they have flown away from me, rustling their wings, . . . [the] wings of Soviet airplanes. Shelaputin, too, made no mistake when he vowed he would become a pilot. And Shura Zhevely . . . has also become a pilot.

In addition to Makarenko's statements and the written testimony of a host of grateful pupils who attest to Makarenko's effective and imaginative ways of teaching and upbringing, we have an eyewitness report from Maxim Gorky, who wrote in his essay "Across the Soviet Union":

I had been carrying on a correspondence with the young people [at the Gorky Colony in Kuryazh] for four years keeping track of how gradually their spelling and grammar improved, how their social awareness grew and their knowledge of the world around them widened - in a word how young tramps, thieves, anarchists and prostitutes were turning into upright working men and women.

During a visit to the Ukraine in 1992, I met two of Makarenko's former pupils, now well into their seventies, who are now looking back at successful professional careers. Both gentlemen, still filled with admiration and love for Makarenko, confirmed his pedagogical talent.

My own appreciation of Makarenko's educational insights was drawn from personal experience as a teacher for handicapped and normal children in inner-city school environments. I recognized in Makarenko's work numerous perceptions and insights that corresponded to my experience of what elements in the total pedagogical process proved effective—many of them commonly overlooked in traditional classrooms. For example, paying attention to the many little things Makarenko mentions, such as posture, facial expression, tone of voice, beauty, cleanliness, and order and the mood in the classroom, as well as providing a joyful outlook toward the next lesson, seemed to have an encouraging effect on students as measured, at least in part, by their sincere efforts toward participating in activities inside and out of the classroom.

Based on my personal experience and those of others, I believe Makarenko's educational experiments merit the attention of teachers, and all those who bring up children and young people. Happily, implementing his "special features" would not require financial resources; they would neither appear on a budget nor could we measure their effectiveness with commonly used methods. Yet, they proved effective with even the toughest delinquents. The parallels between Makarenko's youngsters and those of today, particularly those in our inner-cities, are inescapable. I believe we have something to learn from this highly creative teacher. His ideas are as applicable today as they were then. I would urge teachers to try out for themselves some of the "little things," without which, according to Makarenko, no educator can be effective.

9. Makarenko's work has been widely read and widely acclaimed internationally by educators. To portray him as a communist ideologue, the Soviets have long falsified his writings and biography, thus misrepresenting his philosophy and work. These historical distortions are now largely being corrected. Since 1968, the Makarenko Department at the Philipps University in Marburg, Germany, has, through archival research and oral history, reconstructed Makarenko's writings and biography. We are now able to more accurately assess his contributions to education.

Struggle for the Soul of a Normal School

Jared Stallones
The University of Texas at Austin

Herbert Kliebard (1995) has described the ideological struggles surrounding the development of the school curriculum. The evolution of Alta Vista Agricultural College for Colored Youth into Prairie View Agricultural and Mechanical University is a case study of the ideological and political struggles that mold a school's curriculum and shape its identity. Competing interests attempted to define Prairie View's mission as one of training black students in the industrial trades and agriculture, or as a vehicle for character education. While Prairie View became a football for politicians, its core identity as a teacher education institution helped it weather adversity.

The Texas Constitution of 1876 was remarkably progressive in calling for the equal, if not integrated, education of all races. Article VII, Section 7, read, "Separate schools shall be provided for the white and colored children, and impartial provisions shall be made for both." Section 13 of the same Article VII established an Agricultural and Mechanical College as part of the University of Texas. Texas intended to take full advantage of newly-available Morrill Act monies in building this school. The Act required, though, that states accepting its funds make some provision for black education. If Texas did not act, the white land grant college, with its 180,000 acre endowment, would be at risk. So, on August 14, 1876, the 15th Legislature passed an enabling act which proposed, "to establish an Agricultural and Mechanical College of Texas, for the benefit of Colored Youths and to make appropriations therefor" (Gammel 1898). The college was to be a branch under the supervision of the nearby white A. and M. College.

The opening day of the new Alta Vista Agricultural College for Colored Youth, March 11, 1878, proved a disappointment. Principal L.W. Minor prepared for 20 students, but only eight enrolled. The next term, enrollment fell to six. Thomas S. Gathright, A. and M.'s President, attributed the low enrollment to "no demand for higher education among the blacks" (1878), but other factors may have accounted for the low turnout. Alta Vista was located far from the black population centers of east Texas, and on a former slave plantation at that. Possibly, black Texans aspired to more than a purely agricultural education already gained by so many through practical experience in the fields. Also, late 1878 saw higher wages paid for labor in the cotton fields, and the prospect of immediate cash may have proven too big a temptation for some students. Even though Alta Vista attracted more students than the white A. and M. college had, its Board declared the black school a failure and discontinued classes in late 1878.

The Texas Constitution and the Morrill Act both required the state to provide some form of higher education for black Texans. At that time, Texas suffered from an acute shortage of teachers for its black common schools. Orlando N. Hollingsworth, the Secretary of the Texas Board of Education, reported to the U.S. Commissioner of Education remarkable increases in black school attendance. According to these reports, the number of black children in the schools increased 600% during the 1870s (U.S. Commissioner of Education 1877). The private colleges of Texas could not keep up with the demand for black teachers. Governor Oran M. Roberts prompted the 16th Texas Legislature to recast Alta Vista as The Prairie View Normal Institute for blacks. Six thousand dollars a year was appropriated from the University Fund for the new school, to be matched by the Peabody Education Fund. Thus, on April 19, 1879, Prairie View became the first public institution for teacher education in Texas, while remaining a branch of the A. and M. College.

The term opened that fall with E.H. Anderson as principal. Sixteen students enrolled with assurances that simply remaining through the first year would earn them a certificate allowing them to teach in any black school statewide without further examination. The school was an instant success. By the end of the term, enrollment grew to sixty, and additional students were turned away for lack of space.

Prairie View rapidly established itself as a center for teacher education. It did this in several ways. First, the school supplied a large number of teachers to staff Texas' schools. A legislative subcommittee in 1917 found that 75% of all black teachers in Texas were Prairie View graduates (Tillotson 1917). Second, the school produced quality as well as quantity. Prairie View became the supplier of choice for the Austin public schools after its graduates bested those from other colleges in a three-day competitive examination (White 1938). By 1890, Prairie View students were taking education courses similar to those offered at Sam Houston Normal and the University of Texas, and using the same standard texts (Prairie View State Normal Institute 1889).

A third reason for Prairie View's dominance of black teacher education was the network established among its
graduates across the state. Prairie View graduates directed generations of their students and relatives to their alma mater, creating a chronic overcrowding problem. In his report for 1882, Principal Anderson claimed that Prairie View could serve three times the 51 students enrolled that year if only more space was available (Anderson 1882). The school strengthened its network by supporting organizations for teachers and providing services for their schools. In 1884, L.C. Anderson of the Prairie View faculty was instrumental in forming the Colored Teachers State Association, and the school began Summer Normals for teachers as early as 1910. Prairie View also ran the Texas Interscholastic League of Colored Schools, printing and distributing its rules, bulletins, and hosting its state meets.

Prairie View's prominence eventually invited meddling with its curriculum. This reflected a curriculum debate taking place in communities all over America. America was becoming an increasingly urban, industrial society as the nineteenth century drew to a close, and its education system struggled to meet changing demands. There was growing pressure on schools to train children for careers in industry. Industrialists such as Andrew Carnegie decried the traditional curriculum as a waste of to learn such languages as Greek and Latin, which are of no more practical use to them than Choctaw. Worse, Carnegie thought the traditional instruction imbued the students with false ideas and gave them a distaste for practical life (1902, 79). Many educators concurred. The Superintendent of the New Orleans schools told a National Education Association gathering, "We are living in a practical, money-making age... The big thing today is the reward, the dollar, and it is paid for practice and not for the theory and training behind the practice" (National Education Association 1914).

Some opposed industrial education for black students. This was a time of growing resentment toward blacks and attempts to draw strict color lines in political and economic life throughout the South. Blacks were often denied membership in labor unions, crowding them out of the industrial trades. At the same time, white workers were moving into such traditionally black domains as domestic service. Paul B. Barringer of the University of Virginia expressed the fears of some whites when he asked the Southern Educational Association meeting in Richmond, "Shall we, having by great effort gotten rid of the Negro as a political menace, deliberately proceed to equip the Negro of the future as an economic menace? Shall we, knowing his primitive racial needs, arm him and pit him against the poor whites of the South?" (Woolfolk 1962, 114). Some black leaders opposed it as well. They felt industrial education would consign young blacks to manual labor. They joined W.E.B. DuBois in calling for a classical-liberal curriculum for blacks equal to that in the best white schools.

Others favored an industrial curriculum for the black schools. Many in the black community saw that apprenticeships were increasingly difficult for young black men to find. Black leaders meeting at Waco in 1882 charged that some whites opposed industrial education for blacks because they feared the resulting competition for jobs. They petitioned Governor Roberts for a program of industrial education in their schools.

White Texans also found reasons to support industrial education for black students. To some it was a matter of conscience, "[I have] always felt that it was our duty, claiming to be the superior race, and having control of the government, to do all in our power that promised beneficial and practical results, to educate and elevate our colored citizens" (Peeler 1881). Others saw it as an economic necessity, "The people of Texas depend on Negroes and Mexicans for practically all agricultural and manufacturing labor. On account of the ignorance of the laborers they require constant supervision and in many cases lack the ability to obey orders. This great ignorance necessarily means an increase in the cost of production" (Platt 1917, 5).

The version that finally impacted Prairie View descended from the Russian educator Victor Della Vos. His blend of manual, literary, and moral education in both theoretical and practical instruction was adopted by General Samuel C. Armstrong at the Hampton Normal and Agricultural Institute in Virginia and by Booker T. Washington at Tuskegee Institute. It dovetailed neatly with the emphasis on character education described in the Prairie View literature, "Plainly a system is required which shall be at once constructive of mental and moral worth and destructive of the vices characteristic of the slave... His deficiencies of character are, I believe, worse for him and the world than his ignorance" (Prairie View Normal School 1883). Principal Anderson admired Washington, and had worked with him at Tuskegee. It was no surprise, then, that the industrial education at Prairie View would follow the Hampton/Tuskegee model, but flavored by the normal's pastoral setting and teacher education mission.

Industrial education was formally initiated at Prairie View in 1888, with the creation of an Agricultural and Mechanical Department. New faculty were hired to staff the fields and the shops. Professor Randolph, a Hampton Institute graduate, led instruction in woodworking, printing, and mechanics. In addition, a Ladies Industrial Department under the leadership
of Prairie View alumnus Sallie Ewell taught home economics subjects. The industrialists seemed to have won.

Yet, the critics of industrial education for blacks need not have worried about Prairie View becoming an industrial training center. The industrial course was not even listed in the college catalogue until 1893, and even then it was oriented toward producing teachers of industrial arts, not artisans. In fact, the industrial education curriculum was already being undermined by the ideas of the agricultural populists.

Agricultural education had been the original mission given Prairie View when it was still Alta Vista Agricultural College. The initial lack of student interest did not deter those who cast Prairie View as a training school for farmers from pressing to institute their vision. When Prairie View launched its Industrial Department, it started an Agricultural Department as well. A graduate of Tuskegee Institute was put in charge. The agricultural course of study blended classroom instruction in farming methods and general academic subjects with fieldwork. The agriculturalists gained momentum in the 1890s, and funding questions became a catalyst for curriculum change.

The second Morrill Act, passed in 1890, provided funds for Prairie View. An annual sum was granted to each land-grant college provided that a black college funded from state revenues receive a fair share of the money. Once again, adequate funding for Prairie View became a prerequisite for the continued funding of A. and M. At the same time, the Texas Grange lobbied Governors Roberts and Lawrence S. Ross to end instruction in the classical subjects at the land-grant schools in Texas. The Grange saw money spent on these as a violation of the intent of the Morrill Acts. Bowing to the pressure, Prairie View dropped Latin from the course of study, and a growing senior college program was discontinued. In a typically paternalistic statement, the A. and M. Board declared, "We believe that it is not higher education, but practical education that the Negro race needs for its development" (Prairie View Normal and Industrial College 1906).

Two influential reports added force to the argument for agricultural education. Thomas Jesse Jones directed an exhaustive survey of black education in the South for the U.S. Bureau of Education from 1910-1916. His study found that the curriculum at Prairie View was a blend of elementary and secondary subjects. He advised the school to relinquish its aspirations toward college-level work, and focus instead on normal and agricultural training. Jones wrote that, "While opportunities for the highly technical trades should be open to colored pupils, the primary need is emphatically for a knowledge of gardening, small farming, and the simple industries required in farming communities" (U.S. Department of the Interior 1917). The Texas Legislature concurred in its own study of Prairie View. Its report concluded that blacks lacked an appreciation of the value of education. It contended that large numbers of black students attended school with no idea of what they wanted to learn (Tillotson, 831).

In his insightful history of Prairie View, George R. Woolfolk (1962) sometimes casts the school's principals as innocents in a world of power politics beyond their grasp, but they should more properly be seen as shrewd politicians who understood the limitations of their influence, yet continually pressed for improved educational opportunities for black Texans. Throughout the clash between the proponents of agricultural and industrial curricula, the Prairie View principals played one against the other as they worked toward a classical-liberal course of study at the senior college level.

Despite the protestations of the agriculturalists, this curriculum was consistent with the intent of the Morrill Acts. Justin Morrill himself said, "The Act of 1862 proposed a system of broad education by colleges, not limited to a superficial and dwarfed training such as might be had at an industrial school... it was a liberal education that was proposed" (Woolfolk, 114). Prairie View adopted the air of offering a liberal education to blacks as its purpose in 1893.

As Principal from 1885-1895, L.C. Anderson presided during the early battles over industrial and agricultural education, but he had a broader vision for Prairie View's role in black education. He had supported Prairie View as the site for the creation of a four-year classical university for blacks, and repeatedly pressed the A. and M. Board to upgrade the school's curriculum.

The rapidly expanding curriculum in the lower schools continued to call attention to the need for a more sophisticated curriculum. By 1900, Texas had 19 black high schools (U.S. Commissioner of Education 1901), the most of any southern state. That number had nearly doubled by 1905 (U.S. Commissioner of Education 1905). The growth of high schools exerted pressure for more highly-educated teachers. The need for a black public university was apparent, but the issue was taken out of the hands of the educators by the politicians.

By 1890, the influence of black politicians was shrinking with the failing fortunes of the Republican Party. Many saw education issues as a means to stop this erosion, and the second Morrill Act offered the vehicle by which political power could be reasserted. Black Republicans, led by Norris Wright Cuney, lobbied the U.S. Interior Department to rescind
Morrill funds for A. and M. on the basis that Texas practiced systematic discrimination in its funding for black schools. There was some truth to the charge. Throughout this period of Democratic state administrations, there was considerable inequality between black and white schools in Texas in terms of teacher salaries, school buildings (Texas State Board of Education 1890), libraries (1900), length of the school term (1918), and spending per pupil (Tuskegee Institute 1917). Governor Ross responded to the accusation by arguing that Texas showed, "No distinction...on the basis of color in the distribution of the school fund, such distinction being forbidden both by the organic and statutory law, and as a matter of fact none has been made. . ." (Ross 1890). He claimed that Democratic administrations had spent far more on the black schools than had been received in revenues from black taxpayers. Despite the Republican lobbying efforts Ross' version held sway, and Secretary of the Interior John W. Noble consented to release the Morrill Act funds to Texas.

These bitterly partisan political battles culminated in the replacement of Principal Anderson with a Democrat, Edward L. Blackshear. More politically astute than his predecessors, Blackshear played on white fears of racial unrest to gain support for the school. He wrote, "there is probably no single agency in the state doing more than Prairie View Normal and Industrial College to bring about that proper understanding and relationship between the races" (Prairie View Normal and Industrial College 1902).

Typically, white leaders favored the gradual growth of a classical university at Prairie View. The Democrats, at their state convention in August 1896, claimed, "The Prairie View Normal School should be enlarged, making provision for industrial features and gradually converting it into a university for the colored people" (Winkler 1916, 388). The Prairie View directors concurred. They declared that, "The university for higher classical education of the colored youth of Texas will eventually be located at this school . . ." (Prairie View Agricultural and Mechanical College 1896). President M.H. Broyles of the Colored Teachers State Association also favored this gradual process.

Others, however, disagreed with the strategy of locating the black university at Prairie View. Some cities complained that making Prairie View the center for all black higher education, whether industrial, normal, agricultural, or classical, would dilute its ability to do any of those things well. In addition, the Republican Party made a separate university a rallying cry, calling in its platforms of 1884, 1892, 1894, and 1896 for "extending to our colored youths the opportunities of a university education" apart from Prairie View (Winkler, 427).

The time for a separate black university was not ripe in any case. A statement made by A. and M. Board Chairman W.R. Cavitt in 1884 typified the attitude of white educators. He echoed Texas A. and M. President Gathright's 1878 assertion that blacks were uninterested in higher education. Cavitt wrote, "It would be useless to equip a first class university, with all appliances for instruction, with none to enter" (Woolfolk, 96). Principal Blackshear assessed the resistance, and shelved his dream of a separate university. Instead, he turned his energies to gradually building Prairie View's curriculum. In 1896, the school was reorganized into academic departments. There were separate departments for Science, Math, Pedagogy, History and English, and Music, as well as a Mechanical Department, Agricultural Department, and Girls' Industrial Department. More classical elements were also added to the curriculum. A Department of Latin offering a two-year sequence was created, and in 1901, the Legislature appropriated money for the "...maintenance of a four-year college course of classical and scientific studies..." at Prairie View (Acts 1901). A Department of Greek was added, and the first A.B. degrees were granted in 1904. Although the proponents of agricultural education forced temporary setbacks in all of these programs, the foundations of liberal education at Prairie View had been laid.

Politics again led to the demise of a Prairie View principal. In the gubernatorial election of 1914, Blackshear had joined other black leaders in supporting Prohibitionist Thomas Ball against James Ferguson. Ferguson won and exacted political revenge. In supporting an appropriation for Prairie View, Ferguson told members of the A. and M. Board, "I want to serve notice on you right now that E.L. Blackshear at the head of the institution has got to go" (Woolfolk, 159). Blackshear was asked to resign in early 1915.

Despite nearly 40 years of meddling by politicians and curriculum ideologues, Prairie View survived the pressures exerted by agricultural populists, industrialists, and others all seeking to remake the school in their own images. Dedicated leaders shepherded the school through these trials, taking every opportunity to strengthen the teacher education curriculum. Their political skills, along with Prairie View's central role in black education helped fend off the worst of the attacks on its identity. But Prairie View is not unique. Institutions of teacher education have been buffeted by frequent assaults on their curriculum and identity. Investigating their stories will yield clues as to how teacher education institutions today can better manage the dynamic tension produced by the interests competing for their souls.

Is Outcome-Based Education Fair?

Erwin Goldenstein
L. James Walter
University of Nebraska-Lincoln

In an attempt to provide some insights with respect to a phenomenon that has polarized the country in the past decade, it is our purpose in this paper to examine Outcome-Based Education (OBE) objectively. Surely everyone expects some outcome from education. Otherwise, why would Americans spend so much money, publicly and privately, to provide schools and ancillary educational services? Why then should the mere mention of OBE elicit such extreme passion on the part of both its opponents and proponents? The question then becomes: what kind of outcomes should schools attempt to produce, and who should determine what those outcomes should be? This paper, however, reports the results of an examination of what a selected group of high school graduates over a period of three decades regards as the most important outcomes of their high school experience. It is the authors' belief that opinions of graduates regarding outcomes must be considered in the debate regarding OBE.

Bill Spady and Kit Marshall, as reported in *Educational Leadership*, attribute the genesis of OBE to Benjamin Bloom's essay, "Learning from Mastery." Spady and Marshall tout four principles that allegedly distinguish OBE from ordinary education. They are (a) clarity of focus, (b) expanded opportunity, (c) high expectations, and (d) design down (planning curriculum back from desired student outcomes). Others, however, attribute such principles to educational pioneers like Comenius, Rousseau, Pestalozzi, Froebel, and Herbart.

American philosophers and educators have largely built upon the foundations laid by these Europeans to bring U.S. education to fruition as we have come to know it in the late 20th century. For Ralph Waldo Emerson, the desired outcome of education was the moral and spiritual self-reliance of the individual. For Thomas Jefferson and Horace Mann, the desired outcome was the development of ethical and rational citizens capable of making democracy work. John Dewey rejected blind obedience and conformity in favor of originality, initiative, and responsibility.

Franklin Bobbitt was one of the first American educators to analyze the activities of adults as a defensible basis for curriculum planning. In his 1918 publication *The Curriculum*, he advocated an analysis of such activities as a basis for restating them in terms of behavioral objectives. In his 1924 *How to Make a Curriculum*, he explained in detail how this was to be done. Benjamin Bloom, however, is the researcher and theorist given special credit by Spady for the work that undergirds OBE. Bloom's *Taxonomy of Educational Objectives*, first published in 1956, examined educational outcomes from the perspectives of cognitive, affective, and psychomotor domains. Much of his genius lay in his ability to state objectives in measurable or observable terms by using action verbs to describe the behavior or outcome to be sought at various levels of development or sophistication within each of the domains. Bloom's work eventually gave way to a concept of mastery learning, and that, in turn, was succeeded by Outcome-Based Education.

The history of American education in the last century is replete with pronouncements by a variety of groups and individuals as to what the content, purposes, and outcomes of secondary education ought to be. By 1892 a debate raged as to whether the American high school should provide terminal education or preparation for college. The National Education Association in that year created a *Committee of Ten*, headed by President Charles W. Eliot of Harvard, in an attempt to resolve the issue. Interestingly, the resulting report took the position that terminal education was the main function of the high school, but it addressed primarily the need to reform college preparatory programs. Uncertainty regarding the purpose of high school education continued largely unabated. In 1918 the NEA's *Commission on the Reorganization of Secondary Education* developed a somewhat ambiguous statement in attempting to define what it called the seven cardinal principles of secondary education. In 1944 the Educational Policies Commission attacked the problem of defining secondary education by producing a statement of what it regarded as the imperative needs of youth. Responding to the often caustic criticisms of such writers as Arthur Bestor and Hymen Rickover, James B. Conant published in 1959 *The American High School Today*, a rather persuasive argument for a comprehensive high school that would provide appropriate options for both terminal education of a vocational nature and rigorous preparation for collegiate studies.

Conant was writing in an atmosphere of acrimonious criticism that had become highly politically charged. The launching of the Soviet Union's *Sputnik* in 1957 led much of the American media and many politicians to search for an explanation for the apparent superiority of Russian science. Almost immediately secondary schools became a scapegoat.
Suddenly federal support of education became much less distasteful than it had been through much of the country's history. As a result, Congress passed and President Eisenhower signed the National Defense Education Act (NDEA). National financial support for education, it seemed, could be tolerated if it were in the interest of fighting the Cold War. The NDEA emphasized such areas as science, mathematics, foreign languages, and vocational guidance. Almost overnight, collegiate scholars and secondary school teachers formed an alliance to design programs aimed at improving both terminal education and college preparation.

Emphasis on enhancing academic education and appropriate vocational guidance continued for nearly a decade. By the mid-1960s, however, new pronouncements critical of this emphasis began to emerge from John Holt, Jonathan Kozol, Herbert Kohl, and James Herndon. These "compassionate critics" and other opponents of the war in Vietnam began to call rather stridently for a curriculum that would emphasize human values and address the plight of poor and minority children in the nation's inner cities.

By the early 1980s, however, the advocates of rigorous standards for grading, promotion, and graduation had rediscovered their voices. Thus, in the midst of a new controversy, Terrence Bell, President Reagan's Secretary of Education, created a commission to examine secondary schools and to make recommendations for their improvement. The resultant report, A Nation at Risk, featured expressions such as "a rising tide of mediocrity" and "unilateral educational disarmament." Their recommendations featured an unambiguous academic program, tougher grading standards, enhanced college admission requirements, upgraded textbooks, and increased use of educational technology.

In view of the numerous educational pronouncements as to what outcomes should be expected of high school graduates, it is interesting to examine what some graduates from several time periods regard as the most important outcome of their high school experience. To investigate this matter, the authors conducted a telephone survey of 587 graduates of 16 Nebraska high schools for the years 1953, 1963, 1973, and 1983. The years selected were chosen because they were regarded as reflecting several distinct eras and the educational demands associated with those eras. Thus the 1953 graduates were considered representative of the pre-Sputnik era; the 1963 graduates of the Sputnik-Vietnam Era; the 1973 graduates of the Watergate Era; and the 1983 graduates of the New Federalism Era. Each of these eras was regarded from a point of view as responding to the demands and criticisms of the time as discussed earlier. The sample of schools was deliberately chosen to include a wide geographic representation of the state, as well as a considerable range in the size of graduating classes. The authors were interested in rural schools; hence high schools in metropolitan areas were excluded from the sample. Since large high schools in metropolitan areas are in a position to offer larger, more diverse curricula than smaller schools in rural areas, the authors believed that rural school curricula might respond more noticeably to changes demanded by educational critics. This, it was felt, might in turn effect the courses actually taken by the graduates and influence their decisions as to the most important outcomes.

School officials and alumni organizations provided the researchers with lists of graduating seniors for the years in question. From these lists students were randomly chosen to be interviewed. The subjects thus chosen were asked to identify the most important outcomes of their high school studies. Not surprisingly, responses varied greatly. They ranged from developing good human relations to escaping from the local community, from refining athletic skills to improving their thinking skills, and from having fun and recreation to acquiring a mature outlook on life.

It may be very disconcerting to educators and others who have prescribed desirable outcomes that the graduates interviewed regard the simple earning of their diploma as a very important outcome of their high school experience. One hundred nine (19%) of the sample of 587 students reported this as their single most important outcome. It should be pointed out, though, that the students were given no predetermined response choices in the telephone interviews.

The 19% who identified the diploma as being the most important outcome did so explicitly. The other telephone responses were classified in several different ways. First, they were grouped into 11 categories, namely diploma, further education, career education, human relations, philosophy/religion, self-confidence, general education, basic skills, communication skills, math/science, and music/art. Responses that did not readily fit any of these classifications were listed as miscellaneous. A considerable number of interviewees responded with a "don't know" or "none" answer. To gain an impression of overall trends, we further grouped the 11 categories of outcomes into three broad areas: affective development, career development, and general education.

Many of the responding students may have seen the diploma as an essential factor in their career development. Such responses as human relations, philosophy/religion, self-confidence, and discipline were placed in the affective development
category. Basic skills, communication skills, math/science, and similar responses were subsumed under the general education classification. Further education and career preparation were combined under the career development classification.

A few observations seem in order. Earning a diploma seemed to be most important to the 1973 graduates. Human relations nearly doubled in importance from 1953 to 1983. General education did double in importance according to our subjects during that time frame. Math/science, apparently never highly regarded by graduates, even declined during the period in question, despite the national emphasis that characterized the post-Sputnik crisis. The 1953 graduates were less clear as to what they considered the most important outcome of their high school experience than were their successors in the next three decades. This may be due in some measure to the time lapse between graduation and the date of the interview.

Male versus female comparisons yield some interesting data. On a number of important outcomes there is considerable difference of opinion between men and women graduates. Females in the sample placed a much higher value on career preparation than did the males by a margin of 14% to 6%. By a margin of 11% to 8% the females also valued general education more highly than the males. Gaining self-confidence, too, seemed more important to female subjects. In the categories of communication skills and math/science, however, the situation was reversed. Less than 1% of the women chose communication skills as the most important outcome, but 5% of the men did so. Similarly, only 1% of the females selected math/science as the most important outcome, compared to 4% of the males. Male subjects were far more likely than their female counterparts to choose a variety of outcomes classified under the miscellaneous heading; 11% of the males did so, but only 2% of the females did. Gender was, therefore, a factor in determining the selection of the importance of high school educational outcomes.

Responses as to the most important outcome of their high school experiences also depended, to some degree, on whether subjects had graduated from a public or a parochial school. These comparisons reveal several differences. Parochial school graduates were considerably more likely than public school graduates to select affective development as the most important outcome of their high school studies. Public school graduates, on the other hand, were more likely to select career development and general education. The most notable difference was found with respect to religion and philosophy of life. Fourteen percent of the parochial school graduates indicated this to be the most important outcome of their high school experience, but only 4% of the public school graduates did so. This difference was somewhat predictable in view of the fact that religion was a required course in the parochial schools. This requirement may also help to account for the phenomenon that fewer parochial than public school graduates gave a don't know/none response. Apparently, the reason for attending a parochial school is emphasized for its students. Somewhat surprising is the fact that 4% of the public school graduates chose communication skills, while only 1% of the parochial graduates did so, and that 3% of the public school graduates regarded music/art skills and appreciation as the most important outcome of their high school work, compared with 1% of the parochial school respondents.

As we reflect on our data for each decade, can we detect patterns in the graduates' statements which are indicative of the impact of national educational movements? For example, can we see evidence that the graduates of 1963 valued mathematics and science more because of the tremendous reaction to Sputnik? No. However, we did see some evidence that 1963 graduates valued career development more than graduates of other decades. Could that result be attributed to the National Defense Education Act of 1957, which stressed vocational and career development? Perhaps.

A higher percentage of graduates from the 1983 sample listed affective development outcomes than did graduates of other decades. Can that be attributed to the work of the "compassionate critics," as they urged schools to emphasize the attitudes and feelings of students? We could not discern a definite pattern from our data, and we sense a much larger national study would need to be accomplished to demonstrate changes such as these.

Educators, political leaders, scholarly organizations, and critics all have a remarkable capacity for overlooking the obvious fact that each high school student is an individual with his or her own peculiar educational outcomes in mind. Whether curricula can or should be devised that will lead all students to devote themselves assiduously to the pursuit of common outcomes prescribed by some self-selected segment of society is a question that has both practical and ethical implications. Those implications suggest the need for a broad based public discussion and further research.

During the Progressive Era in the United States, a group of successful clergymen, businessmen, and educators were selected to administer John D. Rockefeller's foundation, the General Education Board (GEB). Formed to fund Southern educational projects, it was a branch of the Conference for Education in the South and partner with the Southern Education Board.

These foundations confronted the many problems in Southern education, including illiteracy and public schools that were poorly funded. The Conference attempted to stimulate Southern public education by such methods as increasing taxation, lengthening school terms, consolidating smaller schools into larger ones, educating teachers, establishing high schools, and promoting industrial and agricultural education. The latter was a deliberate attempt to boost the economy of the South (and thus increase tax revenue for schools). One way to assure efficiency in production was to educate children to take on industrial and agricultural roles. This technique was efficiency itself: in business efficiency meant specialization, and in education efficiency meant education for particular jobs.

The General Education Board set about to hire people to further its cause and to see what it could do about Southern schools. This study begins by looking at the direction of GEB activity; it explores some of its members' publications and its beliefs about education; it continues by discussing specific programs that the GEB funded; finally it discusses the effects of the GEB programs. All areas featured a network of experts, who could be trusted to see that the purposes of the Board were carried out. None of the evidence indicates a formal plan to "keep people in their places," but rather it indicates experts trying to improve Southern education.

In a 1914 confidential report to the Board, Wallace Buttrick, Executive Secretary of the GEB, Abraham Flexner, Assistant Secretary, and Jerome Greene, member, summarized current programs and recommended new directions. They described their current programs as extensive and intensive. Extensive programs included Professors of Secondary Education and Rural School Supervisors, whose purpose was to begin educational programs. Intensive programs included experiments in the ideal rural school, in order to make education more responsive to needs.

They also recommended state surveys. For these the GEB would send a group of experts to study education within a state and make appropriate recommendations. They then planned for the states to emulate one another. The GEB would partially fund the first state, but other states would be expected to pay their own costs. The committee also advised setting up model county districts to publicize the ideal rural school and to encourage other counties to follow their example. The committee also called for publishing monographs on educational topics and contributing to certain teacher education institutions.

One way in which the General Education Board saw their ideas implemented was sponsoring conferences. They distributed their recommendations prior to the conferences, and then the agents who attended the conferences wrote conference reports which parroted the GEB's recommendations. Many recommendations centered on promoting industrial and agricultural education and making curriculum more appropriate for the children with whom they worked. Some recommendations were as follows: making sure that each principal was trained in agriculture and that each school had at least one teacher trained in domestic science; simplifying the curriculum by eliminating minor facts and secondary matters; and supplying more active libraries, laboratories, domestic science and farm mechanics, school gardens, demonstration plots, home building, farm life, and rural economy. Programs already in existence such as farm mechanics, cooking and sewing, woodworking, practical agriculture, and industrial work were praised, while questions such as "What Forms of Industrial Work Can Be Profitably Introduced into Country Schools?" were discussed.

Not only did the GEB predetermine topics and conference results, but the members attempted to insure that only their people would attend their conferences. In one situation, rural school supervisors planned to attend the annual meeting of the Conference for Education in the South. Upon learning of their decision to attend this conference, the GEB gave them permission to attend but informed them that the GEB would not provide the funds to do so. One rural school stated that the GEB officers were not inclined to favor outside participation in the planned meeting. As a result, the rural school agents did not attend the conference.
Several GEB members participated in what the GEB called occasional papers. Occasional papers were published and distributed in large numbers. Abraham Flexner often sent these out to selected GEB and non-GEB members for critique. Occasional Paper Number One was \textit{The Country School of Tomorrow}, by Frederick Gates, president of the board from 1907 to 1917. Gates blasted educational traditions; he believed schools should not teach students to be philosophers, men of science, lawyers, doctors, or politicians but should meet the lowly needs of rural life. To this end, he supported teaching every industry in the district, such as would be found in kitchen, barn, dairy, and shop. According to Gates, students should learn health, how to make clothing, how to cook, and what and how to eat, and they should learn in model kitchens and model homes. Further, he addressed the importance of scientific farming. He envisioned a community of young workers producing in agriculture, sewing, the kitchen, the dairy, the orchard, and the lawn. He scoffed at the three R's, suggesting that they be taught only within the realm of the child's experience.

Charles Eliot, former president of Harvard and member of the GEB upon his retirement, responded to Gates' paper. Agreeing with Gates' position, he told about a surgeon who had praised the value of classical languages for their ability to train the mind. Eliot wrote that the GEB's charge was to overcome this blind acceptance of tradition and instead produce men educated in modern ways. Flexner's return letter agreed with Eliot.

Charles Eliot wrote Occasional Paper Number Two, \textit{Changes Needed in Secondary Education}, in which he supported the need for practical courses, concrete experiences, and elimination of memory work. In another context he complained about the memory studies. Instead he wished to see manual and observation skills developed. The GEB issued a press release approving Eliot's paper, reiterating that the best knowledge came from observation of the senses. They recommended for poor children more hand, ear, and eye work, such as drawing, carpentry, music, sewing, cooking, and the sciences of observation (chemistry, physics, biology, and geology). For country schools they added agriculture and work in a school garden.  

Occasional Paper Number Three, \textit{A Modern School} by Abraham Flexner, also dealt with subject matter in schools. He supported the need for the rudiments of education but not for courses whose purpose it is to train the mind. Rather, he maintained that a "man educated in the modern sense . . . will be contentedly ignorant of things for learning which no better reason than tradition can be assigned." He preferred studies that served real purposes, which he divided into four fields: science, industry (including manual skills and industrial work), aesthetics, and civics. Although he recommended algebra and geometry for those who would later attend college, for those who would not need it, he recommended industry.

In addition to Occasional Papers, Flexner wrote some articles that appeared in a popular magazine. In one article he stated that mental discipline did not carry over to other subjects, except in particular categories. Virgil is just as valid as learning to bake a pumpkin pie, he declared: either task should only be performed for enjoyment or for a purpose. According to the article, if a student were not planning to attend college, he or she should not study Latin. He further maintained that only students who would need a command of formal grammar and arithmetic in their future jobs should study those subjects. Another article expressed his opinion that schools should replace Latin, math, ancient history, and bookish science and offer, instead, vocational and purposeful subjects.

These publications exemplify members' belief in efficiency. These members supported a simplified curriculum for rural or poor children, children not bound for college (or the professions). And what did they propose to do instead? Not to cram their minds with facts; not to challenge their thinking skills; but to prepare them for the life they would ultimately face. In the minds of the Board, one could not become too efficient. They were the experts, and their decisions were far superior to those of school personnel, parents, or students. Even the critics who responded to the occasional papers were disregarded unless they agreed with the Board's position.

The GEB sponsored three major programs. These were professors of secondary education, rural school supervisors, and surveys. The former began in 1905 and involved employing and paying travel expenses for an education professor from a state university to act as a field representative for the GEB. The professor's primary job was to establish high schools, including organizing the task, gaining public support, advising local leadership, and earning accreditation. In most cases establishing a high school meant adding two or three rooms, two or three grades, and two or three teachers to an elementary school.

The first professor selected was from Virginia. Eventually professors from Alabama, Arkansas, Florida, Georgia, Kentucky, Mississippi, North and South Carolina, Tennessee, and West Virginia were added. GEB members judged this program so successful that it was no longer needed, and they discontinued it in 1925. The board assured the professors...
that it would not dictate to them. The professors then wrote detailed reports to the board, describing conditions which they found and hardships which they faced.\(^9\)

The reports by the professors indicated that most existing schools offered highly academic programs, with such courses as agriculture, manual training, domestic science, school garden work, and bookkeeping, offered as electives. The professors praised these academic but diverse programs that they had found. However, as time progressed, the professors began to express urgency for vocational education, particularly agricultural and domestic.

The General Education Board records at the Rockefeller Archive Center contain the reports of a Professor of Secondary Education, Joseph S. Stewart of Georgia, which exemplify this change. He recommended a highly academic program in his reports until 1906. Following a visit to a private industrial school, he changed his views. In a later report in the same archives, he told of the work he had observed in the home, dairy, garden, barns, and woodworking shop. He then supported legislation to raise taxes to support schools and to build an agricultural high school for every congressional district. Stewart had been asked to help plan the curriculum for these schools: English, math, history, science plus agriculture, shop work, laboratories, and farm plots. Buttrick advised him to oversee these schools, to get the best men to run them, and to write him monthly reports.

Other examples from the archives show that another professor of secondary education, Charles G. Maphis of Virginia, wrote to a superintendent in 1912, accusing him of overly emphasizing academics and thus causing students to lose interest in school and to drop out. He then recommended parallel courses of study, equally emphasized: classical, business, agricultural, domestic arts, and so forth. He stated, "Your schedule administers practically the same diet to all alike, though their tasks may be different and their needs may vary." He urged the superintendent to require less homework, to strengthen the commercial courses, and to add manual training, domestic science, and homemaking.

As Gates, Flexner, and Eliot had rejected the idea that certain subjects were more worthwhile than others and wanted the curriculum to reflect what was needed for future occupations, these professors continued to promote the idea of efficiency. The Rockefeller Archives Center has examples in reports from L. L. Friend of West Virginia written in 1912. He complained that agriculture was not offered in his state as widely as it should be. Although few schools in his state offered domestic science and manual training, he stated that where they were offered, instruction was in closer contact with life. He also recommended practical application of chemistry, hygiene, geometry, and drawing. Furthermore, he reported that several high schools were offering commercial courses and practical English. Other professors reported similar results in vocational expansion. Some oversaw the building of agricultural high schools or the addition of industrial and household arts in more schools. They referred to any vocational additions as progress.

The GEB also promoted the efficiency of high schools. For example, Buttrick urged Stewart to oversee the new and much more efficient agricultural high schools. Maphis clearly maintained an air of superiority in remonstrating with his superintendent and recommending a more efficient curriculum. Friend and others were instrumental in seeing that high schools became more efficient, adding agriculture for future farmers, industry for future workers, and household arts for future wives and mothers.

A similar program, specifically for rural schools, took the place of the Peabody Fund when it dissolved in 1914. This program was called Rural School Supervisors. The agents were employed by the State Superintendent's office, and the GEB paid their salaries. Their purpose was to assist in consolidating small schools, facilitating local taxation, appointing local superintendents, improving facilities, and encouraging domestic science, student agricultural clubs, and demonstration work. Eventually twelve states participated in this program, and although most of them were Southern states, a few highly rural states from the rest of the country also participated.

Many of the rural school supervisors expressed the belief that it was the duty of public educators to assure the future of agriculture and domestic science. For example, in the records of the General Education Board are reports of school administrators officiating at fairs where children's agricultural and domestic products were displayed. The reports contain descriptions of county fairs that had competitions in physics, writing, maps, drawing, spelling, music, culinary arts, needle work, manual training, farm and garden work, and club work. From these records, it seems that, at one time or another, all the supervisors reported progress in expansion of agriculture, gardening, home economics and domestic science, and manual training.

Other progress involved a gift of $7,000 for a domestic science department in Charleston, South Carolina. The rural school supervisor from South Carolina later wrote Frederick Gates of the GEB, complimenting him on his Occasional Paper.
on rural schools. He cited some examples of domestic science and agriculture in schools of South Carolina, including one school in which the teachers taught on farms and in homes of the community. Furthermore, to dispense with "boring" curricula, this supervisor established a school in an old farmhouse, with a workshop for boys and a kitchen for girls. He did not teach academics but had the students grow vegetables and make wooden articles. Students learned from measuring gardens, dividing profits, and reading recipes and books about birds. GEB responded to him by asking him to participate in studying "interesting and significant experiments" in rural education. These rural school supervisors also acted as experts on education. Although they made great strides in education, by educating students for rural life only, they also limited their future choices.

A third program that the GEB sponsored was school surveys. Although they began at a state level in order to encourage emulation of good practices, they also spread to other locations. The first one took place in Maryland in 1915, at the state's request. Three-fourths of the cost was met by the GEB. "Shake-up Expected" read the headline that preceded the final report. The report reorganized the state system of education and was subsequently used as a teacher training textbook. Following the publication of the report, the recommendations, including vocational education for industrial areas of the state and agriculture for rural areas of the state, were enacted by the Maryland legislature. In 1918 the Delaware legislature invited the GEB to survey Delaware public schools and to revise state education laws. The recommendations, including increased funding for education, were accepted into law in 1919. North Carolina followed. However, the GEB found public resistance to its recommendations because they were associated with the GEB. Finally, although three other states had requested them, the GEB withdrew from conducting surveys; instead it assisted state legislatures in doing them. By removing its support, it hoped to influence more greatly educational policy-making.

The GEB also surveyed the famous schools of Gary, Indiana. Gary schools had been founded as an attempt to redefine education, including in the schools' role social services, recreation, adult education, and manual training. These schools traditionally prepared children to work in the mills of Gary. Believing that children had different abilities, interests, and employment opportunities that must be recognized, they also offered vocational courses. Boys regularly took courses in shop work, carpentry, electrical work, plumbing, and painting; while girls participated in domestic science, restaurant work, and secretarial skills. The survey was conducted in 1916, and reports came out in 1918. The GEB did not find that the program was deficient. Several clippings in the General Education Board records indicate that the administrators did not perform adequately. However, the evaluators praised the genuine life activities.

Another survey in 1919 took place in Tarrytown, North Tarrytown, and adjoining districts in New York. The GEB found that Tarrytown High School met college entrance requirements but did not "neglect the needs of students who desire to pursue the commercial course or to work in the area of industrial and household arts." It commended North Tarrytown Junior High for adding a vocational course, manual training, and cooking, as well as for making regular courses more practical. It recommended that both the junior high and the high school broaden opportunities in commercial work, household arts, and in industrial arts.

An inheritance of $1,650,000, left for educating the poor in Winchester, Virginia, prompted a request to the GEB for a survey. A news clipping of 1920, published by the Winchester Chamber of Commerce, explained the outcome of the GEB's study. They planned an athletic stadium, auditorium, art-history museum, dispensary and center of hygiene instruction, swimming pool, gymnasium and shower baths, domestic science and home economics laboratories, cafeteria lunch facilities, an open air classroom for anemic or convalescent children, vocational and pre-vocational shops for agriculture and industry, a library-study room, and an agricultural laboratory and experimental orchard.

A GEB survey in Indiana, 1921-1922, recommended agriculture for all boys and home economics for all girls, as part of their regular education program. In fact, a newspaper report stated that the study favored vocational education "beyond all other forms of education." The GEB then attempted to convince the public of the efficiency of county administration by setting up a model county demonstration in Indiana.

Certainly the surveys demonstrate how powerful the GEB had grown and how well-respected the experts were. That they were requested to perform the surveys and that their recommendations were enacted by the state legislatures would indicate public adulation of the expert. In these cases, as in many others during the Progressive Era, the idea of efficiency held sway, and school districts, counties, and states began rearranging their structure in order to address efficiency more adequately.
After examining the experts' methods, beliefs, and programs, the final topic that must be considered is the effect of the experts' actions upon school children. How efficient did the students and their parents want school to be? State high school inspector, B.L. Parkinson, reported in 1920-21 that 33% of South Carolina's white secondary pupils were in vocational courses. These courses took up 11.2% of the total teaching time in the state. Conversely, 67% of the white students were in such academics as modern languages, math, natural science, history, Latin, and English. This took up 88% of the teaching time. 17

By the 1916-1917 school year only commercial courses had a sizable enrollment increase. 18 Academics still held the largest enrollments. It would seem that parents and students regarded academics as a better route to future advancement than narrow job preparation. Viewed from the enrollment statistics alone, the experts' success in promoting efficiency was marginal.

Another concern to this study is why the GEB spent millions of dollars to fund these vocational programs. Abraham Flexner wrote that foundations did not act from self-interest. 19 It is important to keep the GEB's activities during 1905 to 1925 in the context of the Progressive Era. Changes were occurring on many fronts. Efficiency was being sought in many arenas, one being education.

Experts often believed in a special calling to shape a better society. Such is the case with GEB actions in Southern schools. Allan Nevins, well-known biographer of John D. Rockefeller, stated that Rockefeller built an "efficient industrial empire for what seemed to him the good not only of its heads but of the general public." Rockefeller and the first president of the GEB, Frederick Gates, believed that wealth was a God-given trust that should be stewarded by helping others. 20

It is true that the GEB put a great deal of emphasis on the efficiency of vocational education. It is also true that such an education may have limited children in seeking later options. However, one can also credit the Board for increasing numbers of schools, better funding and facilities, bus service, and teacher education, to name a few accomplishments. The experts took charge and did what they thought would best equip their clientele for their lives.

A Black High School Student’s Experience of Desegregation in Birmingham, Alabama

Anna Victoria Wilson
The University of Texas at Austin

On September 4, 1963, a 15 year old student walked up the steps of Ramsay High School in Birmingham, Alabama, accompanied by several attorneys for the NAACP and the SCLC and Federal Marshals. Richard Walker became the first Black student to desegregate Ramsay High School. State Troopers policed the building for the next two years. However, they supported the white protesters. Federal Marshals escorted Walker to and from Ramsay High School while he remained a student there.\(^1\)

In 1963, major structural changes were occurring in Birmingham, Alabama as responses to the values of both the Black society and the white society. Richard Walker’s schooling experiences help define the nature of the times through which he lived. Of equal importance to an account of his story are the perspectives of other participants in the desegregation of Ramsay High School.

This story focuses on ordinary people in their local setting who lived through some extraordinary events. Differences in viewpoints about the particular events continue to exist. Those multiple viewpoints offer both focus and dimensionality to this historical narrative.

In addition to Richard Walker, other participants in the desegregation narrative of Ramsay High School includes Odessa Woolfolk, Connie Pegues, and Tina Childs. Ms. Woolfolk, a Black woman, was born and reared in Birmingham, Alabama, and currently serves as president of the Birmingham Civil Rights Institute. During 1962-63, she taught U.S. Government at Ullman High School and knew Richard Walker prior to his attendance and enrollment at Ramsay High School.\(^2\) Mrs. Childs, a white woman and now retired, was a counselor and Assistant Principal at Ramsay High School during its desegregation years.\(^3\) Mrs. Pegues, a Black woman, taught English at Ullman High School, a Birmingham high school for Black students. Richard Walker was a student in her classes at Ullman before he decided to enroll at Ramsay. After Walker’s graduation, she was one of the first Black teachers to be transferred to Ramsay High School.\(^4\) Each recalls the events of 1963 differently from each other and from Richard Walker. This diversity enhances the thickness of Richard’s remembrance of the particulars of the summer and fall (1963) in Birmingham, Alabama.\(^5\)

During the 1960s, Birmingham’s Blacks experienced a rigidly segregated society based on race, black and white. Although most of the city’s Black citizens were poor, a minority constituted a small middle-class community, and a solid working-class community existed. Black families attempted to protect their children from thinking of themselves as being victimized. The adults talked among themselves about the evils of segregation, but seldom with their children. Black children were aware, through the NAACP youth groups, church groups and other organizations, that Birmingham’s segregated society applied an unfair and, even, un-American set of restrictions to their lives. In other communities, Blacks knew, they could shop and try on clothes, use public water fountains, ride buses, and have access to various parts of those communities. They could do no such things in Birmingham.

When Richard Walker was eight years old, he recognized separate black and white societies. As his grandmother took him shopping, she told him about things he could do and places to which he could not go. Walker remembered his experiences,

I could read and I would see the water fountains labeled *white* and *colored*. I would intentionally go over and drink out of the *white* fountain. My grandmother would get really upset and tell me the police would arrest me if I continued to do that.

As a young child, Walker was well aware of the differences between whites and blacks. Very early, he began to test the system.

The police would threaten me all the time ‘Boy, if you drink out of that fountain again I’m going to arrest you.’ But they never arrested me.

A recurring theme of Walker’s reflection about growing up in Birmingham referred to his friends’ being beaten or shot.
He did not want those events to happen to him. Early in his childhood, Walker decided to fight segregation in ways that were available to him.

Maybe some of the things I did weren't the smartest things to do, but I had some bravado attached to being young. I knew one-on-one, these people were basically cowards. They did not want to face you. But in a group, when they had the upper hand and they had a gun pointed at you, they were brave. Anyone can be a big man then. I tried to stay out of situations where they [the police or other whites] could accuse me of stealing or robbery - I didn't want to be in that situation. For example, one night I was stopped and this guy had a business card which he pretended to drop. I think he wanted me to run but I just stood there because I knew he would shoot me in the back. There was no sense in testing that type of situation.

Later, as a teenager, when he attended Ramsay High School, Walker remembered walking home with a friend when a police officer stopped them.

The officer wanted to know what we were doing. He wanted to know where I went to school and when he found out I went to Ramsay, he wanted to know if I had ever been in jail and I said 'no.' He said 'This is the night to bust your cherry--don't you think we should?' and I said 'no.' I was in the back seat of his car. He drove to this dark place [like an alley] continuing to threaten me. He wanted me to say 'no, sir,' and I wouldn't do it. The police in Birmingham did that all the time. I grew up knowing this type of behavior would happen.

During the Fall term [October, 1962] of Richard Walker's sophomore year at Ullman High School, U. S. District Chief Judge Seyboum H. Lynne heard final arguments about ending segregation in the schools of Birmingham, Alabama. Judge Lynne originally had been scheduled to hear a two-year-old segregation suit filed by James Armstrong, Sr., on behalf of his children Floyd, Dwight, Denise and James Armstrong, Jr., by Fred Shuttlesworth on behalf of Ruby Fredricka Shuttlesworth and F. L. Shuttlesworth, Jr., and by Vann English for his daughter Carolyn. Four months earlier, on June 17, 1962, a second lawsuit was filed by T. M. Nelson on behalf of his two children. Both lawsuits, filed as class actions on behalf of all Negroes, demanded desegregation of Birmingham schools and cessation of assigning teachers and other personnel to schools on the basis of race. "Arguments to Start on School Mix Here," Birmingham Post-Herald, 3 October, 1963.

For Blacks in Birmingham, 1963 was the culmination of their struggle which began, for many, in the 1950s. The state of Alabama outlawed the National Association for the Advancement Colored People (NAACP) in 1956. To pick up the work of the NAACP, the Reverend Fred Shuttlesworth formed the Southern Christian Leadership Conference (SCLC). This group invited Dr. Martin Luther King, Jr., to come to Birmingham to focus on desegregation of the schools. Dr. King brought a staff, visibility, and was a hero with a mission so the national news started targeting what was going on in Birmingham. He offered credibility to the desegregation movement in Birmingham.

Soon after King's arrival in Birmingham, Judge Lynne refused to order the Birmingham School Board to desegregate the all-white schools. He found that the plaintiffs had not exhausted the administrative remedy provided by the Alabama Placement Law. The NAACP and the SCLC recognized that Negro schools received less money, less support, less of everything during that period of time. Additionally, white students were given a wider array of courses from which to choose, and had better equipped laboratories than did Negro students. In response to the 1954 U. S. Supreme Court decision, the Birmingham Board of Education constructed three additional Black high schools, but none of these schools were equal to those attended by whites.

The NAACP and the SCLC organized marches to focus the attention of Birmingham, as well as the nation and the world, on the evils of segregation in Birmingham, Alabama. The organization recruited Black students were recruited from the local schools to participate in the marches. Despite increased pressure from the local Negro community, the Birmingham Board of Education held fast to its rules suspended or expelled these Negro student demonstrators. Subsequently, the Birmingham Board of Education expelled or suspended the 1,081 Negro pupils who were arrested for marching in support of desegregation. Fifth Circuit Court Judge Tuttle issued an injunction which ordered the Birmingham School Board to reinstate the students and prohibited Board's use of jail time to justify the permanent exclusion of the students from school.
During several of the marches in which the students participated in, Chief "Bull" Connor ordered the police force to use tanks, fire hoses, clubs, and dogs against the marchers. Black marchers, including the students, were peaceful; they never hurled stones at police. They only tried to escape the brutality of the police. Woolfolk remembered that when Bull Connor unleashed his dogs and fire hoses on the marchers, it made headlines around the world and finally caused the business leaders to say something. Even the Birmingham newspapers editorialized against the brutality. Certainly nobody in his right mind would condone the bombing of a church.

Depending on one's perspective, the conflicts in Birmingham during the summer and fall of 1963 were called either riots or demonstrations. Ms. Woolfolk and Richard Walker, for example, both believed that riots took place in the urban cities of the North, but that the demonstrations in Birmingham were provoked by police brutality. Thus, they differentiated between riots and demonstrations. In contrast, Mrs. Childs believed the press exaggerated the actual events which she called 'riots.' She believed that, the water hoses were taken out of context for the newspaper. I never knew what was going on. I hadn't seen anything. The papers played up the riots. Both local and outside papers.

Mrs. Pegues also was disturbed by the civil disobedience. She had been taught not to cause trouble and things would go well. The marches and demonstrations really troubled her. Mrs. Pegues also believed that desegregation would happen naturally. She did not believe the marches were necessary. When her students left her classes to march, she encouraged them to be careful.

The day students left to go march, I prayed they wouldn't get into trouble. I told them to be careful and not get into trouble.

Although many of Walker's friends participated in the marches, he did not think his temperament was suited to peaceful demonstrations, even though Martin Luther King was one of his heroes.

Nonviolent protest, especially when violence was being perpetrated against us, was not part of my makeup. I felt if I was going to do something, I could do it through education so that's why I agreed to integrate Ramsay. My integrating Ramsay was my way of contributing to the Civil Rights Movement.

About 85 Birmingham area residents, met on July 11, 1963, to discuss plans to keep Jefferson County schools open and to maintain the peace if desegregation were ordered. Each of these individuals was aware of the intense national focus on Birmingham as a city of violence. They were united in their desire to keep open the public schools and to keep the peace in expectation of a forthcoming court order for desegregation.

The day that the group of citizens met, the Fifth U. S. Circuit Court of Appeals gave the Birmingham Board of Education until August 19th [38 days from that date] to submit a school desegregation plan effective at the beginning of the Fall school term. If the Birmingham School Board failed to submit a plan by August 19th, a Federal judge likely would impose a plan. However the judges pointed out that they expected desegregation to be accomplished through application of the Alabama School Placement Law.

The Appeals Court order noted that the litigation had been pending for more than three years. Therefore, at the very minimum, the Board must make a good faith start toward the accommodation of the plaintiffs and the members of the class represented by them.

Because Judge Lynne refused to desegregate the schools, the NAACP and the SCLC contacted Richard Walker's parents and asked them if he would participate in the desegregation of Ramsay High School. Walker does not remember how the NAACP and the SCLC decided which students to contact.

The NAACP and the SCLC originally contacted me to go to Ramsay in May, 1963. I was a little anxious about it, but, at age 15, I was almost fearless of many things. There was some excitement about the integration plan, but I knew it had to be done and would be done. I focused on what would happen when I actually attended Ramsay High School. I would be the only Black person at that school and I wondered how that would be. I would have no friends there, but I'm a very innovative person. I thought about how would I fare as far as the other students were concerned.
Richard's willingness to participate in the desegregation process was also influenced by his decision to earn a medical degree.

I knew I would go to a predominately white school. I wanted to see how I would fare as far as other white students were concerned. I was always interested in medicine and I wanted to get a good science foundation. I had heard that the labs at Ramsay were superior to the labs at Ullman High School [the Negro school] including equipment and instruction. I knew it was a college preparatory school. You could take college level courses earning credit for them. But the main reason for my volunteering to integrate Ramsay was the competition with white students. I wanted to see how well I would do in an all white school.

Ms. Woolfolk, who knew Richard as a student at Ullman High School, described him as a quiet child. He was mannerable, quiet, studious, unflappable, likeable. He had a little group he ran around with. He always completed his homework—he grew up in public housing. We knew Richard was going to succeed in what ever he did because he had that internal strength. Kids liked him, but he was not a football hero. He was just a good, solid, hardworking student. One of the reasons Richard was chosen [to desegregate Ramsay] was because of these traits. You needed someone who would go into a hostile environment and not cave in. Richard had enough internal fortitude that he could take the slurs which he was surely to get and which he did get and still do his work. He would succeed academically no matter who was around him, what being said about him or if he was being ignored which actually happened most of the time. Those were the traits that it took to go into combat because that's what it really was and it took a special kind of Black student to go in Birmingham, Alabama, to a white high school such as Ramsay. It took a person who felt very good about himself and wasn't scared. That was the kind of person Richard was.

Mrs. Childs also described Richard as a very quiet, shy individual. However, her description differs from Walker's and Woolfolk's perception of him.

We [the faculty] never did understand why Richard wanted to let himself be put through this. 'He was very polite. He was a real fine young man and was scared to death the whole time he was there. We didn't blame him, because we never know when it was going to explode. Things were very calm as I remember them. Now he [Richard] may remember them differently. Mrs. Childs described Richard as an asset to Ramsay. Ramsay's faculty incorrectly believed that Walker was being paid by the NAACP to attend Ramsay. Otherwise, the reasoning went; no one would volunteer to put him/herself in such danger.

Federal Judge Clarence Allgood, on August 19, 1963, approved the Birmingham School Board’s plan to admit Negroes to Birmingham’s white schools September 4th. Birmingham would be the first public school desegregation in Alabama. The Board’s plan proposed that only the 12th grade accept Negroes that autumn, although it left open the door for other classes to desegregate. Under the Alabama Pupil Placement Act, several Negroes applied for transfers to white schools. Although the school board’s plan did not disclose the actual numbers, a limited number of grades, one or more, would accept Negroes for the 1964-65 term.¹⁰

Four hours before they were to be desegregated, Governor George C. Wallace announced that the Birmingham Board of Education agreed immediately to temporarily close the three schools. He noted that the Board also agreed to take legal action to attempt to stay the federal court order to integrate the three schools. The action was tied to an argument that integration would mean further racial violence.¹¹

Five Negro students planned to integrate three white schools on Thursday September 6, 1963. Two Negro brothers were to register and to attend Graymont High School which had an anticipated enrollment of 325; two Negro girls were to register and to attend West End High School which had an anticipated enrollment of 1,498. One Negro boy, Richard Walker, was scheduled to register and to attend Ramsay High School which had an anticipated enrollment of 900.

After obtaining a second court ordered injunction, Ramsay High School officials agreed to enroll Walker as a student. He remembers very vividly his first weeks there and how the State Troopers were not there to protect him but, if possible,
Especially in the beginning of integration at Ramsay, there would be lots of civilian crowds at the school. You would never know what the crowds would do. They would yell and vilify me as I entered school. On at least two occasions, they caught people trying to bomb the house where I lived. We had people in the neighborhood who actually stood guard for at least a couple of years to keep the bombers away. You have to understand the white people were ruthless. They did not want integration.

Mrs. Childs, who was the Assistant Principal at Ramsay, believed that Governor Wallace exacerbated the problems facing Ramsay High School. Unlike Walker, however, Mrs. Childs believed that the State Troopers were present to prevent riots and to protect Richard Walker.

At Ramsay, we had only one walkout by the white students [protesting desegregation]. As they started down the steps and I told them to think twice before they followed through. We never had a lot of the problems associated with the other schools. Many parents came to school complaining [about integration]. Some parents withdrew their children who did not want the school to be integrated. We didn’t have many but there were some.

Each morning Richard came to school, his ‘cheering squad’ waited for him at the front door. They said racial slurs and derogatory comments to him for the entire first year he attended Ramsay High School. The racial attacks, he recalled, did slow down after the first few months. But after John F. Kennedy was assassinated, they would say I was next and that sort of thing. They never changed the whole time I was there [two years]. Those students who were friendly to me were either kicked out of school or reprimanded in some way. I did not want that to happen but I had no control over it. I only stayed at school from 8:15 until 2:00, we had no recess per se. I always left school [Ramsay] early because the Federal Marshals would come and pick me up. I remember on one occasion, the Federal Marshals were not there but the State Police were outside surrounding the school. I went over and talked to one of them and he said, very sarcastically, ‘I figured you’d come out here.’ He was as bad as the students. I went back into the school and called on the telephone to find out where my ride was. That was true the whole time I attended Ramsay High School. I always had body guards (Federal Marshals) who escorted me to and from Ramsay High School.

Richard Walker always sat in the same seat in each class, at the same table in the cafeteria, and always ate lunch alone. At one point during the two years he was at Ramsay, some white students came to his table and sat down and tried to talk to him. Subsequently, he learned that they had been suspended from school for talking with him. Mrs. Childs remembered that the white students accepted Richard but that he had a difficult time with them. She recalled that he did not socialize with white students, but segregated himself.

He did not push himself on the other white students. They were nice to him. He would go to the lunch room and he would go to a table and sit by himself. He would not join a group. If they wanted to join him, that was fine.

Richard described very eloquently the assignment of seating in the classes at Ramsay High.

Once I sat in a seat in the class, that was my assigned seat throughout the semester. No one else would sit in that seat. What ever reason they gave is not the question. The seats were assigned by my sitting in the seat or by eating at the table in the cafeteria. I guess that was how the seats were assigned. Generally there was a space around me, seats on all sides of me would be empty. Sometimes the way the class was arranged, white students would have to sit beside me. If there was no way for the white student to avoid sitting in a seat near me, the student just wouldn’t come to class. Most of the time, the teachers would sanction these students but that was all. It was easier to blame me than hold them responsible. Some of them were just bad students and they were disruptive in class. Many of these students lived in the area and, as I told you before, I told them I would see them at Five Points and I would—they understood that. As long as they were in their little gangs that would scare me. I would go to the bathroom and about
10 of them would come in and stand around. I wasn’t worried about them trying to do anything. That’s what they would try to do, try to intimidate me. When I first attended Ramsay, white students would do unexpected things, like come up behind me as I am walking down the hall and knock my books out of my hands. When I got used to what they would do, I was prepared for that. Basically I think they were cowards because, without the group, they were totally different people. In fact many would say ‘It wasn’t me -- it was somebody else.’ I kind of got used to the constant harassment.

From Mrs. Child’s perspective, Walker was afraid of the white students.

He wasn’t treated differently although he asked to not use the boys’ restroom. He asked to go down stairs and use that one and he was allowed to do that. He was afraid, so it was a safe place for him. He did not push himself on anyone else. I don’t remember having to discipline any other [white] students because of Richard. I have not followed him after his graduation. I don’t know anything else about him, except he is a doctor here in Birmingham.

Years after the fact, Walker remembered some positive memories of his teachers at Ramsay High School. He thought that some of the teachers learned that he was a different kind of person and they befriended him.

In fact, most of the teachers were very respectful of me and appreciated my being there. Although some did not. There was not a lot of violence. Some of the students that I came in contact with were hostile, but we had this understanding that I would see them up at 5 Point South and they knew what that meant. I didn’t have much trouble overtly with people, but people did things behind my back.

Ms. Woolfolk supports Richard’s description of himself with teachers. She recalled:

He was able to get along with teachers very well. Teachers liked and respected him. He was hardworking and smart. There was a small group of smart kids of which Richard was a part who all worked together. Richard would go to school at Ramsay and would get out early, for his safety, and he would come to Ullman where his buddies were and they would ask what it was like to be at Ramsay. We all learned from Richard that those kids [white] were just like other kids [Black]. Black kids didn’t know what white kids were like, such as some were just plain dumb, others were disrespectful to teachers. Richard was an outstanding human being and very strong.

Walker gave school authorities no problems or concerns, as Mrs. Childs remembered. She described seeing him in the school office with an attorney from the NAACP [with the court order to enroll him].

He looked like a cowed little black boy. Scared to death -- I’d have been, too. We operated under a fear that something would happen. There was always a chance that something would erupt and cause problems.

Each person’s description of Birmingham’s desegregation process in the summer and fall of 1963 emerges from their particular point of view. These individual viewpoints add to the ‘thickness’ of how one young Black man traveled alone through the halls of an all-white school during the turbulent times of the civil right’s movement. He and the teachers were ordinary people who participated in extraordinary times.

The overarching story of the civil right’s movement includes episodes that feature Martin Luther King, Jr., Fred Shuttlesworth, Andrew Young, the NAACP, the SCLC, "Bull" Connor, dogs, water cannon, bombings, and marches. This story was captured in film, photographs, and print. Without the overarching story of the civil right’s movement, Richard Walker’s story might never have occurred. In the same way, without the Richard Walkers, the Odessa Woolfolks, the Connie Peguess, and the Tina Childs, the civil right’s story might never have occurred.

The varied and disparate voices in this narrative permit a glimpse of the multiplicity of interpretations of events which forever changed the lives of the participant, the city of Birmingham, and of the nation. Through this story, the participants’ voice their personal experiences of the time. An understanding of the story elevates the commitment and courage of a young Black man willing to risk his life for the right to an education denied him and others solely on the basis of their skin color. For this contribution, Richard Walker’s experiences must be acknowledged and not forgotten.
Endnotes

In 1982, Bill Clinton, Governor of Arkansas, proposed educational reform as the key to solving Arkansas' problems. Shortly thereafter, he appointed his wife, Hillary Clinton, to chair what came to be known as the Arkansas Education Standards Committee. The result of the committee's work was the Education Reform Act, passed in the fall of 1983 in a special session of the state legislature. A year later, the State Board of Education adopted a plan to implement the act entitled Standards for Accreditation (Standards). Hidden amidst a multitude of controversial changes was a requirement for a new high school social studies course which was to be called global studies.

Many Arkansas school administrators and teacher educators thought this global studies "thing" would disappear, or be overlooked, in the panic to meet the more dramatic reforms outlined in the Education Reform Act, e.g., smaller teacher-pupil ratios, new graduation requirements in fine arts and foreign languages, and elementary school counselors. Those leaders did not calculate the influence and support of Bill and Hillary Clinton. Nor did they anticipate the support of both statewide newspapers, the Danforth Foundation, and the John D. and Winthrop Rockefeller Foundations (WRF).

Curriculum initiatives do not occur in vacuums. To be successful, such efforts must have an element of grassroots support. If classroom teachers are not behind an idea, then it will not become effectively institutionalized. Secondly, although money does not solve problems, it certainly helps. New efforts, such as curriculum or educational reform, require financial, as well as legal, support from the state. Finally, any new endeavor in education such as global studies requires a spokesperson or group with a platform. This paper will provide a narrative history of the development of global studies in Arkansas, from conception to institutionalization. Along the way, readers should look for these key elements to curriculum reform.

A distinguished group of people was selected to represent the state on the Arkansas Education Standards Committee. It contained at least one person from every major professional educational organization in the state. Both the legislative and executive branches of the government were represented, and all of the agencies to be involved in educational reform had non-voting participants who provided information and internalized data as they heard individuals and groups testify before the committee. The success of the work of this committee was insured by the fact that all groups were "at the table" throughout the discussion. Hillary Clinton is to be commended for that.

In what was to prove significant, social studies was somewhat overrepresented. The president of the Arkansas Council for the Social Studies (ACSS) was a member. In addition, a past president of the organization was chosen to represent the National Education Association (NEA) affiliate. The representative of the administrators was certified in social studies. In addition, the vocational education person was also certified in social studies. Not to be overlooked, however, is the fact that both Clintons had keen interest in areas embraced by the social studies, i.e., geography, civics, and history. Both were active in numerous national organizations where education was a frequent topic, e.g., the National Governors' Association and the Children's Defense Fund. In addition, earlier in 1983, Governor Clinton had, at a news conference, announced the opening of the Arkansas International Center (AIC) and introduced its first director, Susan Wilkes, to the media. While they worked to bring international visitors to the state, the AIC became a critical component in the implementation of the new global studies course.1

Once the Standards Committee was formed, they, with Mrs. Clinton's leadership, established an agenda. They held hearings in which a multiplicity of people testified. Among those invited were representatives of the various subject area professional groups, e.g., the Arkansas Council of Teachers of English and the Arkansas Foreign Language Teachers Association.2 The ACSS was, perhaps, one of the weakest of these, organizationally speaking. Certainly it was one of the smallest numerically. However, it had a core of strong leaders.

Gene Manfridini lived and worked in Little Rock. He had regularly attended the annual meetings of the National Council for the Social Studies (NCSS). He put together a concise, realistic presentation for ACSS.3 Members of the Standards Committee when asked, "What do you remember about discussions concerning social studies, in general, and global studies, in particular, during the committee's work?" replied that what they remembered about social studies was the representatives of the ACSS "had[ing] their act together." They presented what they wanted, did not pontificate, and left with each member a clear summary of their presentation. There was, however, no mention of global studies.4
Unbeknownst to the ACSS leadership, Wilkes was also invited to address the committee. She discussed international education and the importance of recognizing the connections between Arkansas and the rest of the world. But, she did not make a concentrated push for any special course in the curriculum. At that time, she had not aligned herself with the ACSS, nor they with her. Although she had lived in Arkansas for some years, she had no affiliation with ACSS. She was affiliated with the University of Arkansas at Little Rock (UALR) because that is where the AIC was located.5

When the committee was finished with its work, it held public hearings around the state. The legislation was drafted and a special session of the General Assembly was called by Governor Clinton in the fall of 1983. At that time, the Education Reform Act was passed. Behind the scenes, Hillary had worked with key legislators to assure its smooth passage. Among other things, it was agreed, at least informally, that the legislature would not hold hearings on specific parts of the bill, but rather it would be considered in toto. Had the bill been dissected during a lengthy regular session of the legislature, or heard on specific sections of the bill, global studies, not to mention many other controversial issues (e.g., mandatory elementary counselors), would have been compromised. The bill, with its curriculum provisions, passed.

Social studies was to be tested on a new mandatory exam, called the Minimum Performance Test (MPT), at grades six and eight. Given the fact that elementary social studies was fragmented at best, having it tested provided an opportunity to focus. Students had to pass the MPT at grade eight, or they could not proceed to high school. And, all school districts had to have 85% of their students pass the MPT to avoid the possibility of a state takeover. Although this never occurred, it was a constant threat from 1987 through 1993.

Under the new requirements, every high school had to offer, at least once every other year, American history, world history, world cultures, civics or government, economics, world geography, contemporary American history, and global studies. After some argument, "offer" was interpreted to mean "teach." By the fall of 1987, every high school had to have someone on its staff certified and/or approved to teach each of those subjects. The Education Reform Act also increased the number of credits necessary for graduation. Beginning in 1987-1988, students had to have three credits in social studies to receive an academic diploma from an Arkansas high school.

In the fall of 1984, the Arkansas Department of Education (ADE), as a result of the requirements in the Education Reform Act, established its first full-time staff position for the field of social studies. They employed Cheryl Pagan. Pagan came with impeccable credentials, which gave her credibility with state officials, higher education, and the ACSS. Major responsibilities for her were to establish a working definition of global studies, to make national connections with those established in the field, and to explore the directions the ADE should go in instituting this new endeavor.6 The Standards required that a course content guide be written, but questions remained about just how someone should be approved to teach this course. While challenged and personally intrigued with what to do with this new course, Pagan was faced with a plethora of demands upon her time, all of which diverted her energies from the orderly development of a new course.

Under the Standards all courses were to have course content guides. They were the basis for the MPT. Within four months of her arrival in the state, Pagan had to put together a state-wide committee to write not only the global studies guide, but also all of the guides for grades nine through twelve social studies courses. That committee met in January of 1985. Along with this committee of 25 high school teachers, a number of college professors and staff people from the ADE also participated.7

Arkansas is a rural state. Even in 1995, there were still some 100 school districts with fewer than 200 students in grades kindergarten through twelve. Many districts had only one social studies teacher. Outside of the major cities, in 1985, teachers had little experience writing any kind of curriculum. The chore was ominous. The committee to write the guides for American history debated at length just what the scope and sequence would be. Other committees (e.g., geography and world history) had different problems. For example, how would world history, world cultures, world geography, and global studies be differentiated?

The global studies group wrestled with questions like: What is global studies? What are the appropriate goals and objectives? What is the content? Is there a scope and sequence? In the end, they chose very broad objectives, leaving the specifics to the teachers at the local level.8 The guide was not changed during a period of revision in 1990. As new course outcomes were identified in 1994, the global themes and objectives designed by the teachers on this committee in 1985 have come to permeate the entire social studies curriculum. When the 1985 document was finished, these teachers received an invitation to visit the governor. This was the first of many such gestures Bill Clinton would afford what came to be called the global studies community.
Arkansas is a textbook adoption state and the cycle for social studies began in 1985. Those who were to choose books for the state list and companies that wanted to bid their books for that process were in somewhat of a frenzy to discover just what global studies was going to be. Bids for the new adoption cycle had been made in December 1984. However, this was before there was any understanding among practitioners about just what global studies was.

When the state committee met in March of 1985 to select texts to be placed on the state list, the ink was hardly dry on the first drafts of the course content guides. Because of a quirk in the law, Pagan, as an ADE employee, was not allowed to serve on the committee or meet with it on a regular basis. Therefore, the committee was left in somewhat of a haze about what the content of the courses was to be. This was especially true of global studies and contemporary American history, since they were new courses. The committee's work was frustrating in that, under the law, they could not add to the state textbook list. They could only subtract. As teachers developed a better understanding of global studies, it became clear that what schools needed to provide in the way of curriculum materials for global studies did not exist on the state list. Even if state committee members knew of books that would be helpful, there was no way they could legally add anything to the list. It was, indeed, a conundrum.

The concept of global studies, a course that was to deal with broad themes, did not lend itself to being taught with a textbook. What teachers needed were reference materials, but they could not purchase reference materials. Consequently, the districts could not get the materials they needed to teach this legislated course because they did not have the spare funds to buy periodicals, resource materials, and other books that would be useful to teachers faced with teaching global studies.

Teacher preparation presented another dilemma. The ADE had decided that teachers who would be approved to teach this new course had to be certified in social studies. However, they also had to have six hours of college credit in teaching global studies.

Arkansas teachers had to be approved to teach this course by the fall of 1987. The directive from the ADE arrived in schools late in 1986. While the requirements seemed appropriate, not much thought was given to the fact that the people who would be teaching those courses at the college and university level, i.e., existing college professors, did not have such preparation themselves. College courses were well-established and are not easily, or quickly, altered. In a concession, the ADE agreed to sponsor two-day workshops around the state. Teachers who attended these could waive the requirement for a methods course, for three of the six hours. They did, however, have to take three hours somehow, somewhere.

In the fall of 1986, Pagan accepted a position with Heifer Project International. In February of 1987, I was employed to fill the specialist position and given the task of conducting the two-day workshops the ADE had promised. The first workshop was scheduled for March. No plans had been made, no locations announced, no materials developed or ordered, and there was no money to pay for consultants, materials, facilities, etc.

I had been on the course content committee and the state textbook adoption committee. Unlike Pagan, I was a native Arkansan, familiar with the schools, universities, and individuals within the profession. Having attended numerous workshops since 1984 about global studies, I felt that the emphasis needed to switch from the conceptual focus to an operational one. I visited with a number of teachers by telephone and simply asked: What do you need to know? What do you want to know? Whom do you want to hear? The responses were, overwhelmingly, practical. Give us materials. Let us know how colleagues are handling global studies. Let us work together to create lessons to use.

The agendas for the workshops focused on three matters: content, process, and production. The staff for each workshop included a professor, a classroom teacher, and the curriculum specialist. The professors dealt with the content. The classroom teachers demonstrated their lessons. The professors, teachers, and specialist worked together to assist the attendees in developing a unit of study. The workshops began in March, as promised. A total of nine were held, with the last one held in June of 1988. At that time, colleges and universities were to have courses in place and the job of teacher preparation moved from its center at the ADE into the hands of academia.

In May of 1986, interested professors from nine universities had joined a number of educational leaders from around the state, including staff from the ADE and AIC, at the Meadowcreek Project in Fox, Arkansas. This group had worked on developing a common understanding about what a global studies course would be. This meeting was funded by the Danforth Foundation. The Danforth grant funded three summer courses reimbursing teachers for travel, food, and lodging but not tuition. The state paid for consultants. Over 100 teachers took advantage of this opportunity.

Those who had been a part of the Danforth grant continued to meet occasionally. In addition, as a result of leadership training sessions held by the Center for Teaching International Relations, a group of teachers formed Global Insights for...
Today (GIFT). From this organization came a newsletter and student groups to further the cause of global studies. The most active student group evolved in Elaine, Arkansas, a town of 991, located deep in the Delta region of the state. These students organized special events that supported the social studies curriculum in Elaine, while broadening the global understanding of students and teachers alike. On a number of occasions, they had the opportunity to hear Governor Bill Clinton.

By 1988, there were a number of support groups in existence. In 1984, a Global Education Task Force had been established to help in the development of the new course on global studies. In addition, there was the support of the ADE and the AIC. The teachers who took the first course in global studies in 1985 from Gerald Hanson at UALR had been joined by hundreds of others. There were the professors who had met at Meadowcreek. There was a special interest group within the ACSS. Together these groups merged into one, entitled the Arkansas Council on Global Education (ACOGC). In subsequent years this group held regular conferences.

Because the staff development funds under the Education Reform Act failed to be appropriated by the legislature, teachers were faced with paying for college courses themselves. Most veteran teachers did not want to spend a summer session in school. In fact, some were so far away from a college or university, they were faced with moving into a dorm for five weeks. With the help of coordinator Patricia Roach, the AIC, the WRF, and later the Rockefeller Foundation in New York, teachers were assisted financially in taking the required courses. Those courses did then, and do today, vary tremendously.

Dr. Roach was commissioned to put together a guide to be distributed by the ADE to school districts. It was called Teaching for Global Perspective: A Resource Handbook. It became a "starter kit" for global studies teachers. While many veteran teachers found teaching global studies stimulating because they were allowed to develop their own lessons, many new teachers, as well as experienced ones who had always depended upon textbooks to order their class work, found planning from scratch exasperating. This book gave them models.

Aside from developing courses and offering them in convenient locations, several universities provided support for teachers of global studies. The goals of these institutions were multifaceted. For NCATE (National Council for the Accreditation of Teacher Education) purposes they all needed to exhibit a relationship with the members of the teaching profession in their respective communities. In some cases, funding was involved. More often, however, it was through the interest and dedication of particular faculty members that effective staff development experiences that could be mutually beneficial were planned and conducted.

The AIC was located on the campus of UALR. Through its programs, numerous professors were involved in conferences, institutes, and travel experiences for teachers. Over the period from 1985 to 1993, an estimated $1.3 million was obtained through grants and used to prepare Arkansas teachers to teach global studies. At least two full-time staff people, and numerous short-term or part-time employees devoted their time to the preparation of teachers, technical support to schools, programs for students, and the development of curriculum materials. The AIC aligned itself with the ACSS for the purpose of providing meaningful programs that centered on global studies. One example of the fruits that union bore was the global education emphasis at the annual fall meeting of ACSS in 1987. Governor Clinton was the guest speaker and a standing-room-only crowd signaled a "coming of age" moment for the ACSS.

With funds from the Rockefeller Foundation of New York, the AIC worked for a number of years with schools involved with school reform measures. Teachers were taken, as teams, to Guadalajara, Mexico, for example, to learn more about Mexican cultures, to study with Mexican teachers, and to prepare innovative curriculum for use in Arkansas schools. The AIC also sponsored similar trips to India and Australia. Teachers and administrators from the schools involved in the school reform programs sponsored by the AIC met in 1989 in Little Rock to discuss their progress.

From 1985 until 1992, AIC sponsored numerous conferences for Arkansas social studies teachers. They published the GIFT newsletter and sponsored annual meetings, as well as newsletters, for the ACOGE. When international visitors were in the state, the AIC would work through the network of global studies teachers to get those visitors into Arkansas schools. A share center was established where teachers could check out information, artifacts, and lesson plans that had been developed via the AIC by Arkansas teachers. Given that the state legislature failed to fund staff development efforts that would have helped to prepare social studies teachers to teach the new global studies course, Arkansas teachers would have been hard pressed to get started and remain committed to the new course, had it not been for the AIC.
It is important to note that the AIC operated from a perspective that it was supporting teachers in what they wanted, or needed, to succeed in teaching global studies. This was especially relevant to funds from the WRF. The WRF tends to support only events or requests that have a grassroots nature. The teachers in GIFT, for example, were able to receive funding from WRF to continue mailing their newsletter to one another.

Deep in the impoverished Delta region of Arkansas, the University of Arkansas at Monticello (UAM) is isolated in the southeast corner of the state. In the late eighties, it was decided that rather than adding a masters program in behavioral sciences, the school would seek grant support to assist social studies teachers in the area in acquiring effective staff development. With a planning grant of $2000 from the WRF, John Short, in 1988, convened a steering committee of local teachers to discuss just what the focus of such an endeavor might be. From that humble beginning, UAM launched a comprehensive program that has included local conferences, guest speakers, summer institutes, and trips abroad.¹⁰

An additional $2000 was contributed by the Arkansas Endowment for the Humanities (now known as the Arkansas Humanities Council [AHC]). Matching funds were sought, and awarded, from the National History Alliance. Short, and his fellow faculty members, have also obtained some $200,000 in three Fulbright-Hayes grants to take teachers to west Africa and the Middle East to study. In cooperation with the Middle East Policy Council and the National Council on U.S.-Arab Relations, the UAM has hosted annual conferences on relations between the United States and Arab nations. In 1994, the National Endowment for the Humanities awarded the university $176,000 to hold a summer institute for teachers on Islam and West Africa.

Combining efforts with the Winthrop Rockefeller Distinguished Lectures Series, an annual event on the UAM campus, teachers who participated in the summer institutes and/or travel abroad programs returned to the campus during the school year to hear speakers such as E. D. Hirsch, Stanley Katz, Maya Angelou, and Juan Williams. Most exciting is the fact that the professors involved in these programs have put forth a concentrated effort to be in all of the schools in the area, making themselves available to speak, to provide in-service programs, and to work with students and teachers on a plethora of projects. Through their personal efforts and through the opportunities that have been made available to the teachers in this very poor and isolated region of Arkansas, a global perspective on education in general, and social studies in particular, is thriving.

Governor and Mrs. Clinton succeeded in implementing numerous educational reforms largely because they had become intimately involved in the issues surrounding school reform. In interviewing the members of the Standards Committee, it was evident that they credited the integrity of the program they developed and its successful journey through the legislature to Hillary Clinton. When asked specifically about global studies, members of the committee referred to Hillary’s expertise and knowledge as the key to the creation of global studies. Her leadership, coupled with the strong social studies representation, together with the excellent presentation by Mr. Manfridini, secured the role of social studies in their reform movement. Global studies was destined to be a tool of change.

In August of 1950, the angry and defiant Georgia political boss Roy V. Harris took the floor at the state Democratic Convention in Macon and announced that Georgia's leaders "will go to jail before [they] will let Negroes and whites go to school together." While pledging to support equalization of school facilities, white Georgia Democrats vowed to oppose any form of racial integration. Within a month, Austin T. Walden, the state's only black civil rights attorney, had conferred with Thurgood Marshall, the National Association for the Advancement of Colored People (NAACP) litigation chief, and filed suit in federal court on behalf of 200 black children and their parents alleging that black children "can only secure the educational advantages, opportunities and facilities equal to those afforded white children in the public schools of Atlanta by being allowed to attend the elementary and secondary schools . . . which defendants are unlawfully and illegally maintaining and operating for white children." It was the first suit of its kind seeking desegregation of public schools filed in a major Southern city.*

The suit's filing prompted quite a furor. Well known newspaper editor Ralph McGill accused the plaintiffs of "alienating the support of a great many who worked continuously through the years for equal school opportunities." Governor Herman E. Talmadge offered the Atlanta School Board all the state's resources including the attorney generals' office and his own legal staff to fight the suit. In response to the suit, the powerful racist, Roy V. Harris, penned an inflammatory editorial suggesting that if the courts should ever order desegregation, then whites "ought to do away with the public school system and devise another to take its place." This marked the emergence of the idea of a "private school plan," which in early 1951 was formalized into legislation that required the state to cut off all funds to all public schools in the event of admission of one black to a white school. It also set in motion a paradoxical eleven year state policy that would force Georgians to both strengthen and threaten to abandon the public school system.

Ironically, the suit that sparked such controversy and political action lay dormant on the docket over the next several years. It was eventually dismissed in 1956 for lack of prosecution. It was, in essence, the dog that did not bark. This article, which is part of a larger study funded in part by the Spencer Foundation, examines the Aaron v. Cook case and its role in the school desegregation strategy of the NAACP in Georgia prior to Brown v. Board of Education. It explores the logic behind the decisions made by the New York based Legal and Education Defense Fund (LDF) and the Atlanta chapter of the NAACP. How did the LDF, which by 1950 had publicly announced it would end racial segregation, develop a litigation plan in a Deep Southern state whose state officials were committed to segregation? What events external and internal to Georgia accompanied any changes in tactics? Why did the LDF file Aaron v. Cook, a two-pronged suit in Federal District Court in 1950 that sought equalization and desegregation? Why was the suit never pursued by the LDF or by local black community leaders? This article examines Aaron v. Cook as it reflected and impacted on LDF strategy and the demise of de jure racial segregation in Georgia. The case and the strong reaction it evoked demonstrates the potency of race and schooling as political issues and illuminates the interplay of both in the formulation of public policy.

A top priority for Southern blacks has always been the provision of a formal education for their children. As James Anderson and others have argued, the belief in the power of education had been a cornerstone in African American culture dating back to the antebellum period. In the wake of the Civil War and for the first third of the 20th Century this belief was matched by black and philanthropic efforts to establish black common and high schools. Notably, there was a disingenuous public effort to provide funding for black schools in the South. The struggle nevertheless continued.

The movement for public support for black schooling in the South began in the 1930s and was largely a result of NAACP litigation. From its inception in 1909 until the Great Depression, the NAACP devoted its attention not to schooling but to the struggle against mob rule and lynching, disfranchisement, and residential segregation ordinances. In the 1930s the association began to focus its campaign for black equality on schooling. To carry out this campaign the association established a legal arm known as the Legal Defense and Education Fund (LDF) that devised a strategy that was twofold. One campaign sought to get qualified blacks into graduate and professional schools in the South where no provisions existed. The second campaign targeted facilities, expenditures, length of school term and teacher salaries, and sought to make progress toward equal education for blacks within the "separate but equal" doctrine that was established in Plessy v. Ferguson in 1896. Both educational campaigns experienced some early successes. In 1939 the U.S. Supreme
Court case, *Gaines v. Canada*, cracked open the door for the possibility for an end to the *Plessy* doctrine by ruling that equal protection of the laws required that the University of Missouri either provide a "separate but equal" law school for a black applicant or admit him to the white school. The equalization campaign was most successful in the area of teacher salaries. Yet by the end of the Second World War there was a sense among some LDF staff that a new approach was needed, a more calculated drive to end discrimination by allowing for integration as a remedy and leaving the "separate but equal" relief as a fall-back. As Thurgood Marshall put it in 1947 the idea was to be "constantly hitting on segregation" while allowing for equalization as one type of relief. It was a subtle, but critical strategic change. Ultimately it meant that the LDF would stop seeking enforcement of the "separate but equal" doctrine. To win support for this change, it would take all the political savvy Marshall could muster.

Even before the start of the campaign for educational equality a sharp tactical debate raged within the black community and the NAACP about whether to push for desegregated schools. As the debate ensued, tactical differences began to shape competing ideologies about the merits of race integration versus black self-pride. Two of the most prominent black intellectuals of the day, W.E.B. DuBois, a founding member of the NAACP, and E. Franklin Frazier, saw limitations and problems in desegregating the common schools. Early in his academic career DuBois had acknowledged that "segregation was a menace to democracy and bred misunderstanding and racial hatred." By 1934, however, while supporting the theory of integration, he called for policy that would improve and build institutions which would honor and respect black culture. At a now well-known conference at Howard University which marks his break with the NAACP, DuBois argued that the segregated black community was a fact of life, and all-black common schools, along with these other institutions, provided a means for the proper education of blacks. If blacks attended schools run by whites, they would be "miseducated and crucified" by the dominant white culture, DuBois reasoned.

As long as the LDF worked towards equalization, DuBois's position would not be at odds with the association's strategy. But any move to stop seeking the enforcement of the "separate but equal" doctrine could reignite conflict within the national office. Of particular importance was the fact that another major organizational objective was the building of local branch memberships by appealing to black school teachers, the largest group of black professionals in America. Teachers and principals, who swelled the ranks of the NAACP in the 1940s, actively supported the equalization campaign, particularly the drive for equal salaries, but integration was a different matter. First, it might be rejected by the courts and put equalization in jeopardy. Second, if it was successful, it might put black jobs in jeopardy. Understandably distrustful of white boards of education and other policy-makers, black teachers and principals feared desegregation would mean they would be replaced by white teachers. It was a great risk.

Building teacher membership and gaining organizational support for racial desegregation would not be easy for the NAACP. Adding to the difficulty was the success of the equalization campaign, which was narrowing the gap between white and black schools in the 1940s. After World War II the nation experienced a period of national and regional prosperity, and for the first time Southern blacks were able to gain significant public support for their schools. As *Plessy* required in the South, the gains would be made within the "separate but equal" philosophy. Between 1939 and 1949 the average term length for blacks in the South increased from 153 days to 173 days, only four days short of the white average. Black teacher salaries, which in 1939 were about half that of white teacher salaries ($962 versus $505 per year), increased by 152% to bring them within 90% of white salaries by 1951. During the same period black per-pupil expenditures jumped 43% to 70% of the white average.

It was against this backdrop that Thurgood Marshall began pushing the association and its branches toward an integration strategy. Between 1945 and 1950 Marshall was able to provide the leadership to unite his constituency behind a campaign, that while allowing for a dual strategy, put desegregation in the foreground and equalization in the background. By the summer of 1950 Marshall's plan had borne fruit in higher education. In Texas, Hermann Sweatt, who had been denied admission to the University of Texas Law School on the basis of race, was ordered admitted on the ground that the state failed to offer equal educational opportunity. On the same day in Oklahoma, 68-year-old George W. McLaurin, who had been admitted to that state's flagship institution for study toward a doctorate but was physically separated from his white classmates, won the right to "intellectually commingle" with his peers. In both decisions, the U.S. Supreme Court had clearly required equality, but had side-stepped the issues of segregation. The key holding in both cases was that if there was separation in education, equality "had to be real or the separation was constitutionally intolerable." While historians and legal scholars agree that Marshall's Legal Defense and Education Fund was successful with this
campaign at the national level, there is scant attention paid to modifications of this strategy at the state and local branches, particularly in the Deep South. What the record suggests, at least in the Georgia case, is that the new strategy was accepted in different degrees, used for different reasons, and consequently had different results. The record also suggests that Marshall was aware of these differences, but allowed local chapters substantial autonomy over their cases.

As had been the case since the Civil War, there were a variety of ways that black Georgians had sought to secure educational opportunities for their children. One strategy was to accommodate and be conciliatory with the white power structure in hopes that a pay off would result; it was a tactic associated with Booker T. Washington. The idea was to work within the existing social and economic mores, which for blacks in the South included accepting disfranchisement, political exclusion and separate public facilities. Within Georgia there were black educators who supported the Washington approach and argued for all-black schools at all levels. Dr. Joseph W. Holley, founder and president of Albany State College for Negroes, was the most outspoken black supporter of continued segregation in Georgia. Holley, an extreme accomodationist, disciple of Washington, and an avid supporter of and mouthpiece for both Talmadges, excoriated "northern agitators and radical elements that [sought] to cause trouble between the races in the South." Holley, who had written a book entitled You Can't Build a Chimney from the Top in 1948, referred to the attack on segregation as "the rape of his race by the northern press and other organizations."15 Holley, though not part of the mainstream black Georgian thought or leadership in the 1940s and 1950s, did represent the conservative position on the issue of segregation. His positions and statements were of course amplified by Southern whites who wished to maintain the status quo.

Notwithstanding Holley's utterances and the patronage he received from the neobourbon oligarchy, the preference for integration and political participation over the concept of black improvement through self-sufficiency and separateness assumed center stage in the NAACP and in the black middle-class thought during the post-war period.16 Thurgood Marshall and the Legal Defense and Education Fund, in pursuit of integration, received its strongest support in Georgia from William Boyd, State Chairman of the Georgia NAACP and Professor of Political Science at Atlanta University, and from Benjamin Mays, President of Morehouse College. In a speech in Atlanta shortly after Aaron v. Cook was filed, Mays explained that the suit attacks segregation not because the initiators of the suit want Negro children to go to school with white children. He asserted that mixed schools were not at the heart of the suit. He added the motive behind the Atlanta suit represents the growing conviction, rightly or wrongly, among Negroes everywhere that there can be no equality under segregation.17 Like Marshall, for Mays, integration meant power. Ostensibly, integration had the backing of Austin T. Walden, the key civil rights attorney in Georgia with ties to the Legal Defense and Education Fund.18

For a variety of complex reasons, however, not all of Georgia's black leaders could bring themselves to fully endorse Marshall's edict to pursue the integration prong. A core of black leaders in Atlanta including Walden and Atlanta Urban League head Grace Hamilton, and Charles L. Harper, head of the Georgia Teachers and Education Association (GTEA), though open to the idea of using desegregation as a distant rhetorical threat, privately cringed at the thought of mounting a local challenge to Plessy. They were well aware of the strong opposition to "racial mixing" in the Deep South in both its most ruthless forms such as lynching and Ku Klux Klanery and its more subtle manifestations. Moreover, there had been significant progress for blacks within the separate but equal restriction in the second half of the 1940s, particularly in Atlanta. Under Harper's leadership, the GTEA reorganized in 1941 and became a state-wide driving force for teacher-pay equalization, per-pupil spending equalization, abolition of one teacher schools and replacement with consolidated schools, and provision of black graduate and professional school opportunities.19 Hamilton's Urban League had been working with Walden and others to improve the conditions for Atlanta blacks. Since her appointment as executive secretary to the Urban League in 1943, Hamilton succeeded in getting $4 million of $9 million bond issue allocated to Atlanta's black schools and had helped narrow the gap between black and white teacher salaries. Letters between Hamilton and Marshall between 1944 and 1950 provide evidence that Hamilton worked tirelessly documenting and publicizing inequalities between black and white schools, and her efforts received the direct support of Marshall.20

For his part, Walden used his influence with the mayor of Atlanta to win concessions for Atlanta's black community. As one of the city's first black political strategists, Walden, starting in the 1920s, helped organize the black vote which in some municipal elections held a balance of power in city politics. In 1935, blacks were assured a larger school appropriation and supported a bond issue. The Atlanta Board of Education, however, after improving white schools, announced that revenue had run out for black schools. In 1938 and again in 1940 Walden and others helped organize the black vote and defeated both school bond issues. In the 1940s he was also able to get street lights installed in black neighborhoods.21 Like
a powerful ward boss in late 19th century New York City, Walden could not be ignored by city officials.

While not afraid to fight city hall, Walden had grown accustomed to working within the "separate-but-equal" system. Over the years "Colonel" Walden had developed a good relationship with the NAACP's national office, and had won Marshall's loyalty. Born in 1885, the son of former slaves, Walden began practicing in Macon, Georgia in 1911, and was the only black lawyer in Atlanta in 1919. Between 1911 and the 1950s he was one of only a handful of attorneys in Georgia with the credentials and the courage to litigate on the Negro's behalf. By 1949, however, there was some concern among Atlanta's younger black intelligentsia that the 64-year-old Walden was not up to the task of coordinating the legal campaign. William T. Boyd and Grace Hamilton wrote Marshall about this concern. "The stakes are high and [Governor Talmadge and his staff] will throw their big guns at us," wrote Boyd. "In light of the above I am requesting of you that you have Walden keep you informed of every move and that you lend us all possible aid." "Frankly, and off the record," Boyd continued, "the people here and throughout the state criticize us for using Walden on such an important case as this. I tell them that Walden has the backing of you and your staff. . . . Don't let Walden let the case drag unnecessarily." In May of 1949 the Aaron case was idle due to Walden's inactivity. Grace Hamilton, concerned that her latest survey of the inequities between black and white schools would become out-dated, also advised the New York office to push Walden.22

Walden took no action on Aaron, but continued to have the backing of Marshall and the LDF, his idleness notwithstanding. Perhaps it was Marshall's deep respect for his past performance as Atlanta's first black political boss, or perhaps it was his priority to attend to another case filed in rural South Carolina that had been moving its way through the courts. By the fall of 1950 Marshall was involved in pretrial hearing on Briggs v. Elliott, which would be consolidated into a class-action suit with cases from Delaware, Virginia and Kansas soon to be known as Brown v. Board of Education. The Briggs case had the advantage of being argued in front of Waties Waring, a disaffected federal judge from Charleston who had made unmistakable signs that he was willing to take on the legal doctrine of "separate-but-equal." With better courtroom chances in South Carolina, Marshall may have left those in Atlanta to their own devices in dueling Jim Crow. Perhaps Marshall thought it hazardous to jeopardize the Georgia connection, regardless of the LDF's new position on integration.

For whatever reasons, Marshall took a hands-off approach in Georgia, opting to maintain a cordial, if not brotherly relationship with Walden.23 This left Aaron v. Cook in the hands of Walden, who ultimately used it as a threat with the intent of forcing state and local school authorities to equalize existing dual systems. For six years the case sat around like a junk-yard dog—creating a credible threat of court enforced mixing. Aaron stared out at the white community and power structure and oversaw a massive eleven hour effort to equalize public schooling for blacks after 54 years of neglect. Four months after the case was filed, Governor Talmadge sheparded an unprecedented 3% sales tax through the legislature, which added an additional $10 million toward the equalization effort. Talmadge also worked with the legislature to launch a massive building campaign. Between 1951 and 1960, about 6,000 schools, nearly all of them dilapidated wood structures, were replaced with 1,720 new schools. For the first time in Georgia history, the construction of schools for blacks was a top priority. Another measure of this new sense of urgency is in black secondary enrollments. In the 1930s and 1940s one of the most glaring inequities was that high school opportunities for many Georgia blacks simply did not exist. By the end of the 1951-1952 school year black secondary school enrollment had increased 114%, in spite of a slight overall drop of school-age blacks as a percentage of the total population.24 By the early 1950s, with other dogs barking in the distance—in South Carolina, Kansas, Delaware, Virginia, and Washington D.C.—the Georgia bull-dog just stared out and watched the equalization effort unfold.

What are we to make of Aaron v. Cook from the perspective of Atlanta's black community power structure? Unlike Marshall's achievement of a consensus at the national office, these Georgians were never unified in launching a direct attack on Plessy in the five years that preceded the Brown decision. What developed in Georgia was a modification of the dual strategy that inverted the LDF's objectives; while Georgia's black political elite were ideologically opposed to segregation, they were able to support desegregation in only a passive way. Their local activities, then, were aimed at full equalization, while the desegregation prong of their position was used as a warning. The dual thrust nevertheless encouraged them to become fiercely active in pursuing the equalization strategy and it was here that public support for black schooling was finally realized.

The evidence suggests that Marshall and other LDF attorneys allowed for these differences in emphasis and corresponded often to maintain contact and to provide legal expertise, but put their best time and energy into the five
parallel cases in South Carolina, Kansas, Delaware, Virginia and Washington D.C.--cases that sought to dismantle Jim Crowism in public education altogether.

23. Marshall wrote Walden 11 October 1950 and expressed his willingness to support the case and sent a copy to William Boyd. Boyd kept Marshall abreast of developments in the case, explaining in a 24 October 1950 letter Talmadge's "blistering attack on the NAACP, implying it was communist. He attacked you and Walden." Boyd reported that Georgia would fight the case with all its resources, and would "fight the case in every court, from every city and county." Pointing out how the state officials were reacting to the case, he reminded Marshall that it was "imperative that Walden work closely with you and that you find out whether you should be in Macon on November 10 when the motion for dismissal will be heard. Please look into this at once." Marshall wrote Walden 25 October 1949 and offered to come down to the hearing on 10 November. "From what I read in the newspaper on Sunday, you came out best in the latest scrimmage with Talmadge concerning our school case. If Talmadge wants to make a big affair of this case, we will do the same and for that reason, I will be down to the hearing on November 10 if you believe it is worth my doing." Marshall sent copies to Spottswood Robinson and William Boyd. See Library of Congress, Manuscripts Collections, NAACP Files, Group II Series B Box 137, file: Schools, Georgia, Irwin County, 1949-50.

The second half of the eighteenth century brought major changes to the universities of the Habsburg domains (Maass 1961, 182-3). Curricular reform, the suppression of the Society of Jesus, the seizure and transfer of wealth from suppressed monasteries and convents, the establishment of normal schools, and the imposition of German as the language of instruction were among the most significant educational developments during this period (Goodwin 1938, 70-71; Havranek et al. 1986, 44). Paralleling structural and financial innovations at Habsburg universities was the arrival of the first significant numbers of Jewish students (Tomek 1849, 341). Although Joseph's successors abandoned many of his reforms, Jews were never again singled out for exclusion from Habsburg universities (O'Brien 1969, 54).

This paper will review the admittedly incomplete data about these students during the first forty years after non-Catholics were first allowed to seek degrees at the oldest of the Habsburg universities, the Charles University in Prague. Charles University was chosen both because of its preeminent place among educational institutions in the Kingdom of Bohemia, and because of the proximity of a sizable and vital Jewish community in Prague throughout the period under consideration. Jewish students had maintained contacts with the university since the fourteenth century (Kisch 1935). Charles University is also an appropriate institution in which to examine the impact of Joseph's reform policies because of the key role of the university in the development of a Czech national consciousness from the 1790s well into the nineteenth century. Charles University was a setting in which issues of national and ethnic identity were given increasing attention, both at the curricular level, and with regard to the actual makeup of the student body and teaching faculty (Havranek et al. 1986, 42-50). Much later, these issues would become irreconcilable tensions resulting in the creation of two universities—a Czech and a German—which would exist side by side until the arrival of Hitler.

Joseph II, Holy Roman Emperor, and hereditary ruler of the scattered dominions of the Habsburgs, initiated major changes in the status of his Jewish subjects (Bernard 1969). During his ten-year reign (1780-1790) he removed many of the civil disabilities that Jews had endured since the Middle Ages (Stein 1904, 91). For the first time Jews were allowed to serve in the Imperial Army, and a handful of Jews and Jewish converts even gained titles of nobility. Starting in 1782, Joseph also issued a series of decrees that made it possible for Jews to pursue degrees in law and medicine, as well as study in the philosophical faculties of universities within the Habsburg lands (Macartney 1969, 121; Shore 1995). The traditional fourth faculty of these universities, the theological faculty, was to remain off-limits to non-Catholics for many more decades to come (Hofdirekt 1797).

Research conducted on Jewish students at the University of Vienna shows that many Jews accepted the emperor's invitation and came to study at the university in the Habsburg capital. Similar—but by no means identical—patterns are found in the enrollment of Jewish students at Charles University during the forty years following Joseph's initial reforms. Yet the data available in the Studienkataloge, the enrollment books for courses offered at the University, must be evaluated in the context of both the social and cultural positions of Jews in eighteenth-century Central Europe and the nature of the Studienkataloge themselves (Sorkin 1987). Despite Joseph's attempts to do away with many of the legal and social boundaries between Jew and Gentile, there is abundant evidence that anti-Semitism was widespread throughout the Habsburg lands (Hausler 1990). The admission of Jews to the military produced a wave of vicious cartoons and verses denouncing the Jews as morally and intellectually unfit to serve. The appearance of Jewish aristocrats, wealthy merchants, and more humble Jews, all with the Germanic surnames that Joseph compelled Jews to take, did little to promote respect or acceptance among some segments of the population (Barzilay 1956). Indeed, the loosening of censorship begun by Joseph with the intent of promoting the diffusion of knowledge actually provided a new context for expression of anti-Semitism. Cheaply produced pamphlets and small books attacked Jews as unscrupulous, immoral, and incompetent. Jews undoubtedly made progress in the years and decades following Joseph's reforms, but only in the face of entrenched opposition to their admittance to positions long reserved for Gentiles. Thus circumstantial evidence suggests that some Jews sought to conceal their identity, while others underwent conversion in order to avoid the harshest aspects of anti-Semitism (Chiel 1974).
Viewed in this context, the value of the Studienkataloge, the single most important source of information regarding individual students of Charles University, becomes more ambiguous. The Studienkataloge, as records of student enrollment in each course at the University, were kept by professors, and frequently included information about the place of residence, the age, father's occupation, and religion of each student. However, as late as the 1790s, these records were kept unsystematically, and without any apparent supervision by university authorities. Some professors, for example, recorded a student's place of residence in a Latinate form, while others would use Germanic or even Czech or Magyar forms of the same place names. The same irregularity might extend to the spelling of students' names as well. The decrees that formally admitted non-Catholic students to the universities had not specified that any steps be taken to note how many non-Catholics actually enrolled, so each professor was free to be as assiduous or indifferent to this aspect of record keeping as he wished. The researcher can only speculate as to whether the professor who did not note the religion of a Jewish student did so from a sense of Enlightenment tolerance, or whether he was simply too busy or indifferent to bother. Records from the University of Vienna at the same time period show a wide range in the care with which professors filled out the Studienkataloge forms that were provided to them, with some instructors diligently completing all categories, and others recording almost no data. Later, when similar forms were introduced at Charles University, it appears that the same laxness in record keeping occurred.

The experience of discrimination and the lack of systematic record keeping cautions us to view the following data as incomplete and most probably artificially low in many categories. Nevertheless, these data are suggestive of the significant numbers of Jewish students who enrolled at Charles University during this forty-year period. In compiling these data, the author has included all students who are unambiguously identified as Jewish at least once in the Studienkataloge, as well as those whose name, father's name, place of residence, or combination of these factors strongly suggests Jewish ancestry. One indicator in the Studienkatalog of Jewish identity is the use of Roman numerals to indicate a residential address, a practice common throughout Bohemia (Iggers 1992, 169). Not included are the names of possibly Jewish students that occur in other university records such as discipline proceedings and petitions for the granting of diplomas.

* No records for 1805-1807
Total number of probably Jewish students 484

A brief review of enrollment of 484 Jewish students in the faculties of philosophy, law, and medicine from 1784 to 1822 reveals some patterns. First, the overwhelming preponderance of probably Jewish students in the Faculty of Philosophy reflects this faculty's significantly larger overall enrollment during most of the period under consideration. At the end of the nineteenth century, Charles University had the second largest student population of any Habsburg university (Szogi 1993, 391). In 1789 its Faculty of Philosophy enrolled 349 students, in comparison with 147 in the Faculty of Law and 73 in the Faculty of Medicine (Litsch 1989, 40). The Faculty of Philosophy at Charles University, as at most universities in German-speaking lands, was not only a self-contained academic program, but also the preparatory program...
for most advanced studies in the other faculties, thus explaining its high enrollment. Students in the Faculty of Philosophy sometimes enrolled when they were no older than fourteen or fifteen, and in many ways the curriculum resembled what came to be known in the nineteenth century as a secondary school program more than a university curriculum (Tomek 1849).

The larger number of probably Jewish students in the Faculty of Medicine is also noteworthy. Throughout the late eighteenth and early nineteenth centuries, medicine was the profession of choice for a significant number of Jewish university graduates. This was in part because medicine was still viewed as a relatively low-status occupation, one in which the highest levels of society seldom were involved. Indeed, it is rare to find a titled aristocrat enrolled in any course in the faculties of medicine at Charles University or the University of Vienna during the eighteenth century. Despite the innovations initiated at the Allgemeines Krankenhaus in Vienna, and the curricular improvements that continued at all Habsburg universities throughout the late eighteenth century and early nineteenth century, medicine remained too practical, too unsavory, and frequently too disastrously unsuccessful to be a fit calling for a gentleman. Medicine was also a choice for Jews because of their long association with that profession. From the High Middle Ages on Jewish herbal and surgical medicine had been sought out by Gentiles. Jewish women were frequently midwives in rural areas, and at Charles University a handful of Jews had managed to earn degrees as surgeons as early as 1771, or even earlier, although they were frequently enjoined by the authorities to practice their profession only on other Jews.

Among the probably or certainly Jewish students found in the Studienkataloge records of the Faculty of Medicine were a handful of female midwifery students. Midwifery was an important profession for women in the eighteenth century (Towler and Bramall 1986). The small number of these students precludes drawing sweeping conclusions about the experience of female students at Charles University, be they Jewish or Gentile, but the evidence is nonetheless suggestive. First, among those women unambiguously identified by their instructors as Jews are several who would otherwise have escaped detection. These include Maria Dux (enrolled in 1810), Marie Mauntner (enrolled 1815-1816), and Eva Klauber (enrolled in 1815). The given names of each of these students do not suggest Jewish origin, and raise the question as to how many other students whose given names appear to be Christian were in fact Jews or were at least perceived as Jews by their peers and professors. Such an instance is not isolated; in 1812 in Berlin, Jews were reported to have taken Christian names such as Johanna, Elizabeth, Johann, and Ludwig (Bering 1992, 70-71). The presence of women within the university system also raises questions. How was their education financed? Where did they live? Were they married, widowed, or single? It seems likely that many of these women had already been practicing midwives before coming to the university for formal training, but positive evidence is lacking. Of particular interest is the question of language of instruction and examination. By the 1810s when this handful of Jewish women appeared at the University, Latin had been replaced by German as the language of instruction, although Latin may have been used in some university record keeping. We must assume, therefore, that these women, most of whom presumably had received little or no formal education in the communities from which they came, received instruction and were examined in German, a language that may well not have been their native tongue. It is possible that for both male and female Jewish students, familiarity with Yiddish may have helped them deal with German in ways that gave them an advantage over their Czech-speaking counterparts. In the case of village midwives, more research into their educational and cultural backgrounds is needed to evaluate the experience of these women at Habsburg universities.

The majority of students enrolled at Charles University through most of its history have claimed Bohemia or Moravia as their home. This pattern appears to have been repeated in the surviving evidence regarding the place of origin of Jews enrolled at the University. In this respect Charles University differed from the University of Vienna, where Jews and Gentiles from all over Europe congregated to live and study in the Rezidenz und Hauptstadt of the Empire. By contrast, Charles University students identified as Jewish were heavily concentrated in Prague and in a few outlying Jewish communities in Bohemia.

Total of all reported places or origin 386

* A Circle or Kreis was an administrative unit roughly equivalent to a county.
Since well over half of the students identified as Jews reported places of origin, these data may be considered fairly representative. The predominance of Prague, with its large, wealthy, and ancient Jewish community is immediately apparent. Moravia, with a large Jewish community, is also represented, but to a much lesser degree. Noteworthy is the absence of large numbers of Jewish students from the eastern reaches of the Habsburg lands, in particular Galicia, which sent many Jewish students to the University of Vienna during this period. Also, the old and well-established Jewish communities of Hungary, including Buda and Obuda, are not in evidence here.

The earliest reliable statistics on the total number of Jews in what was later the Austrian Empire dates from twenty years after the terminus ante quem of this study, but are still useful in conveying the very uneven distribution of Jews in Central Europe. Almost all Jewish students had fathers who were business people.

Further, a dramatic preponderance of Jews came from the Polish province of Galicia. This points to another issue regarding the assimilation and acceptance of Jews into the universities and the professions. Many Galician Jews came from rural or small-town backgrounds, and were culturally and linguistically quite different from the co-religionists in cities such as Prague. Looked down upon by some urban Jews as culturally backward, and despised by anti-Semites as degenerate and "oriental" in their habits, these Jews might have had greater difficulties adjusting to the demands of urban university life, which may explain their underrepresentation at Charles during the period under consideration (Barzilay 1956).

The total number of Jews in Bohemia at the close of the eighteenth century cannot be estimated precisely, but vital statistics give us some picture of the size of Jewish communities in this kingdom. In 1798, 186, or .81% of the total marriages for Bohemia, were between Jews. In 1811, 1108 of the deaths, or .92% of the total recorded, were of Jews. Similar data for Moravia indicate a Jewish population approaching 1% of the total. In 1790, the total population of Bohemia was 2,882,106, and that of Moravia 1,594,558 (CS 1978, 138-140). Charles University had over 200 Jewish students, the majority of whom were from Bohemia, enrolled between the years 1817 and 1822 (see Table 1). Assuming that at any given time during this five-year period at least half this number were enrolled simultaneously, Charles University, with a total enrollment of less than 3,000, had a probable percentage of Jewish student enrollment several times higher than the overall percentage of the population of Bohemia identified as Jewish.

When standardized Studienkataloge forms were introduced at Charles University in 1808, a category was included for noting the occupation of the fathers of students. While as often as not professors did not bother to fill in this category, in the case of a large number of students identified as Jewish, this information is available. In some instances the occupation referred to has proven difficult to categorize or translate, but allowing for this difficulty, and the problem of legibility, a significant amount of data remains.

Total, all occupations: 224

Since this information was probably volunteered by the students themselves, we must view these data as a self-selected sample. It seems likely that those students whose fathers had highly respected occupations in the community would be more willing to report this information, yet only one rabbi appears on this list. The overwhelming number of reported occupations are associated with trade and commerce; interestingly, two occupations commonly reported in the popular literature of the day, innkeeper and moneylender, are scarcely present on this list. It is possible that the disrepute in which Jewish financiers were held resulted in that occupation simply being reported in the category of Handelsmann (Igers 1992).

No overall study has been done on the age characteristics of students at any Habsburg university during the period under consideration, so the following data cannot be subjected to any comparative analysis. However, these data on the reported ages of Jewish students at Charles University do help round out the picture of who these students were. The ages reported here are the ages of students when they first appeared in Studienkataloge records; therefore these students were at least several years older when they completed their studies. The date 1811 is taken as a starting point because data before this year are either fragmentary or nonexistent. Data are of course not comparable with previous data cited, owing to the inconsistencies in reporting patterns.

Students of probable Jewish ancestry ranged in reported age from 13 to 35, a range comparable to that of Gentile students. Presumably those students older than approximately 25 were entering the university after having worked for some years. In the instance of midwifery students, it seems likely that they had pursued this occupation previous to their enrollment.

Other scattered references to possibly Jewish students survive elsewhere in Charles University records. Three students whose names suggest Jewish ancestry—Elias Wiener, Elias Hirsch, and David Porges—requested on 1 August 1976, to be granted their D.M. degrees in a private ceremony (Sitzungsprotocoll 1796). Wolf Popper, who was not identified as a Jew, but whose surname was almost always associated with Jewish families, was awarded the D.M. degree on 15 August 1798 (Senat spisy 1798, c. 35). Also, Lorenz Franz Jonas, whose name and place of origin (Frankfurt am Main) point to possible Jewish ancestry, was reprimanded, along with another student, for his disruptive behavior on the streets of Prague (Senat spisy 1799). These accounts, taken with the record in the Matricula of twenty-four Faculty of Medicine students (including two women) whose names have not been located in the Studienkataloge, suggest that there were many more Jewish students than could be positively identified in this study (Matricula).

The arrival of Jewish students at Charles University was part of an ongoing transformation of the university from a relatively isolated institution dominated by Jesuit teachings, without textbooks, and with only limited contact with the outside world, into a major center of scholarly research and political ferment. Their ability to earn degrees and to establish a lasting presence at the university shows both that a university education was prized in Jewish communities and that prospective university students from these communities were able to acquire the necessary training to succeed in this academic environment. For the remainder of the nineteenth century, Jewish students would be a visible and influential presence at Charles University.

Major Developments in the Growth of Public Secondary Education in North Carolina

Ellis A. Joseph
University of Dayton

Stuart G. Noble suggests that colonial America had to wait until late in the eighteenth century before she came into the rich heritage of the seventeenth century achievement. Unfortunately, the planter class, who represented agriculture and the clergy, and who comprised the only large learned group, felt no great need for schools. As a result, they prevented the growth of secondary education in this period. The absence of a middle class can perhaps be labeled the greatest hindrance to the development of free secondary education, for it is usually with this class that free public schools originate.

Even without a middle class, educational interests were at least indirectly promoted through the work of the Society for the Propagation of the Gospel in Foreign Parts, an auxiliary of the Established Church. The purpose of education under the Society was "not only to fit the young for the business life, but to make them moral and religious beings." In 1715 the North Carolina Assembly passed a significant act which was concerned with the preservation of the Society's Dr. Brady library. The act encouraged and strengthened the charity schools, paving the way for further philanthropy in state education.

Examples of endowments for educational purposes were those of James Winwright and James Innes, whose funds promoted the emergence of some semblance of free secondary schooling. Politically, the early efforts of royal governor Gabriel Johnston and the Reverend James Reed led the way to public expenditure for a school in New Bern in 1766 and the Liberty Hall Academy in the western portion of the colony in 1775. The revenue for the New Bern school was obtained from an import duty on all rum and liquors brought into the nearby Neuse River. Coinciding with these early efforts was an increase in the public's yearning for culture, which was most glaringly exhibited by the growth of private libraries, the most notable being those of Samuel Johnston and Edward Moseley. Other evidences of increased interest in culture and education in the Old North State were the setting up of the first printing press in 1749, the organization of the North Carolina Gazette at New Bern in 1755, and the increase of private tutors in homes. Despite the early beginnings and the increased interest in education, the tint of charity remained on the surface of any educational effort which was the result of public expenditure, and this element of charity was to become a stubborn obstacle to future public secondary educational development.

The apprenticeship system, however, held many implied promises for the future of free secondary education. It was with the formation of this system that people felt the need for training so many in a useful art so that society as a whole could reap an all-round benefit. Among these promises were the notions of compulsory education and the State's increased concern about its obligations and functions in the field of education. While legislation on apprenticeship implied education in North Carolina as early as 1715, this seemingly weak and insignificant legislation is far removed from secondary education. However, the element of an awareness of the people for the need of some instruction is noteworthy.

The Latin grammar school, in which the classics were taught, reached its greatest development in New England and its least in the South. The second type of secondary school, the academy, began to appear around 1750 and rapidly developed throughout the South until the third type of secondary school, the public high school, began to gain importance after the Civil War.

Daniel Defoe's "Essay on Projects" influenced Benjamin Franklin considerably when he formed a plan of public education for the youth of Pennsylvania. It is widely known that Franklin's pamphlet, containing his plan for the academy, had an extensive circulation. There is record of much correspondence between North Carolinians and Franklin concerning the academy. Academies in North Carolina, which at first were religious in character, gradually became nonsectarian because of the obvious difficulties that multi-religious communities presented, and thus a lessened exclusivity and a greater democratic character began emerging at this early stage. The academies, however, were usually privately controlled, and fees were invariably charged, though in a few instances poor children were taught tuition free.

With the growth of a strong democratic spirit in the revolutionary period, the ideal of a liberal education for its own sake and for its value in promoting individual development became dominant. Zion Parnassus at Salisbury (1785), Tate's Academy in Wilmington (1760), and Liberty Hall Academy (1775) were some of the more outstanding early academies.
gaining prominence for maintaining high scholastic standings. An examination of the charter of an academy in Granville County (1779) reveals the felt need for education and the existence of both general and vague objectives to benefit all people. It is interesting to note, in connection with the "beneficial" purposes of the academy, that John Chavis, a Negro of Granville County, was sent to Princeton University to see if a Negro "would take a college education." He was not only successful at Princeton, but he also taught many distinguished whites after leaving the university. His knowledge and ability prompted Professor John Spencer Bassett to say, "This negro was received as an equal socially and asked to table by the most respectable people in the neighborhood."10

The curriculum, or course of study found in the academy, often showed a wide range of subjects, which afforded instruction in more subject matter than was offered in the old Latin grammar school of colonial times. Moreover, it was designed to satisfy the constantly increasing demand of those who did not seek a college training or admission into the learned professions.11 Therefore, the traditional Latin grammar school subjects of Latin, Greek, and mathematics were taken over by the academy. Since the academy existed not only for those preparing for college, courses in practical training, English literature, certain branches of the natural sciences, history, modern foreign languages, natural and moral philosophy, navigation, surveying, bookkeeping, embroidery, and needlework were also offered. Course offerings at the Raleigh Academy allowed students to pursue a range of studies for various fees.12

There were thirty-one academies in North Carolina by 1820, and they had considerable influence. The academy movement brought about a change in the courses of colleges, stimulated the training of teachers, encouraged the growth of higher education of women, and served as the nucleus from which numerous North Carolina colleges grew.13 Around 1850, the academy generally began to decline because of the development of a strong feeling in favor of public control and support of educational enterprises, both elementary and secondary. After the Civil War, when public education received a new meaning and an added impetus under the powerful influence of the Peabody Fund, the South and its public high school began to develop to the point of becoming the dominating institution of secondary education in North Carolina. Between 1860 and 1900, academies began to be replaced by public high schools. This period was largely an experimental period; getting the people to accept the idea that support of secondary education is properly a function of the State was one of the chief difficulties. However, with certain industrial and social changes, this idea became less and less a difficulty, for the populace gradually came to see the need for materially increasing the opportunities for high school education at public expense for the youth of the State.14

The North Carolina Experience

North Carolina's historical documents give ample evidence that during the period from 1750 to 1800 there was indeed a heroic and difficult battle being waged among an otherwise busy people for the establishment of some sort of public education. One appreciates the difficulty of this struggle after reading excerpts from S.F.B. Morse's description of North Carolinians during the period of the latter half of the eighteenth century: "They have very little of the bloom and freshness of the people in the northern states. The general topics of conversation among the men, when cards, the bottle, and occurrences of the day do not intervene, are negroes, the prices of indigo, rice, and tobacco. Many of the interludes are filled up with a boxing-match; and these matches frequently become memorable by feats of gouging."15 Despite Morse's unflattering description of North Carolinians, one contrastingly finds that the constitution of North Carolina of 1776 provides for "all men [to] have a natural and unalienable right to worship Almighty God according to the dictates of their conscience."16 The industrious few mentioned by Morse were moved to write about the lack of schools in the State; and Daniel Earl asked the Society for the Propagation of the Gospel in Foreign Parts to begin some sort of public education.17 It is significant to note that as early as 1758 the General Assembly of North Carolina also felt the urge to address His Majesty for the purpose of creating "regular and proper Schools and Seminaries of Learning," for the members of the Assembly "observed with unfeigned Concern, great Immorality and Profaneness in the Lives and Manners of many of your Subjects in the Province, as well as gross ignorance." It is also interesting to note that Governors William Tryon in 1770 and Alexander Martin in 1785 were among the most vociferous appealers to the Assembly for the cause of a birth of education which would correct the prevailing immorality and reach the people of the "back country."18

After the War for Independence, the idea that education is a governmental function and obligation gained immensely in strength, for now the people realized the need for able, intelligent, enthusiastic, and patriotic citizens in a democratic society. Thomas Jefferson, perhaps more than any other leader, aroused attention to this need by instituting reforms and by doing early work for public school education in Virginia, which was widely influential in North Carolina. North
Carolina was the first of the southern states to have a constitutional requirement for schools, but it was the last of the older southern states to enact a public school law. The state constitutional provision adopted in 1776 provided that a school or schools shall be established by the Legislature, for the convenient instruction of youth, in one or more universities, but it was not until 1825 and 1839 that legislation was enacted.

Archibald D. Murphey, head of a governmental committee recommending the establishment of a school fund, made a report concerning education in a democratic society which was so significant that it marked the dawn of a new educational era for North Carolina, and became the basis of the school system which was inaugurated in 1839. The proposed system was to include a literary fund and a state board of education to manage the fund and to have supervision over the schools. Murphey’s report led to his being known as the “father of public schools in North Carolina.”

Stuart G. Noble notes, “North Carolina found an intelligent leader in the person of Archibald D. Murphey, who proposed a plan of education similar to that which had been outlined by Jefferson. The state established a Literary Fund in 1825, but was unwilling to finance Murphey’s forward-looking program.” Briefly, Murphey’s history-making report recommended such things as the creation of a fund for Public Instruction, the constitution of a board to manage the fund and to carry into execution the plan of public instruction, the organization of schools, the courses of studies to be prescribed for each, and the modes of instruction. These recommendations, each containing many details, were undoubtedly the foundations for the establishment of a permanent public school endowment in 1825 and for the enactment of the first public school law in 1839, both milestones in the history of North Carolina education.

Despite Murphey’s recommendations and the endowment fund of 1825, it was not until Bartlett Yancey, a student of Murphey, presented a bill to the senate that a permanent public endowment for school support was established. The bill passed and became law with no division in either house of the legislature. The need for the education of the masses was so urgently felt that the surplus revenue distributed by act of Congress in 1836 amounted to $1,433,757.40, all of which was used by North Carolina for the cause of education. This increased the literary fund to two million dollars, and at this point steps were immediately taken to establish a system of public schools with the novelty of local taxation as a helping hand, a novelty of which no other southern state could boast.

Although the real educational revival began when North Carolina received its portion of the national surplus, shortly after the legislature instructed the Literary Board to submit a plan for public schools at the 1838-39 session. The Board, guided largely by Murphey’s report of 1817, recommended: the division of the state into 1,250 districts, estimating an average school population for each district of 108 children between the ages of eight and fifteen; the establishment of normal schools; the holding of an election in each county to vote on the issue of "schools" or "no schools." The law, as finally enacted, was a compromise measure, which carried out most of these recommendations, except those relative to normal schools and the election of a state superintendent, which were to come later.

The constitutional provision of 1776, the endowment fund of 1825, and the public school law of 1839 are the three major factors in the growth of public secondary education in North Carolina. After these three milestones, a setback was experienced in 1865, when the depreciation of securities and properties during and following the Civil War wrecked the banking system of the state, thus causing the state to lose most of its funds for education. It was not until 1917 that permanent public school funds of one kind or another were again reported. Numerous obstacles arose, and many years passed before the principle of free public secondary education for all children, by taxation on all the property of the state, was to be safely established.

One may think of the second quarter of the nineteenth century as a widespread reform movement that was felt throughout the entire state and South. In North Carolina the reforms undertaken for free public secondary education were not unlike the reforms undertaken by other states, and the plan of 1839 and the improvements made in 1852, which made possible a school system, advanced in support and control.

Although North Carolina was the first southern state to make constitutional provisions for schools, it was very tardy in its process of following up the early lead. With the exceptions of the literary fund in 1825 and the first public school law of 1839, no further public education legislation was enacted, but from 1840 to 1860 the state made such steady educational progress that the United States Commissioner of Education in his report of 1895-1896 was prompted to say that "it was able to place on the ground beyond dispute the best system of public instruction in the fourteen southern states east of the Mississippi previous to the outbreak of the Civil War.”

Such achievement was by no means easy, for despite the 1839 school law, many tutors and the people themselves were
jealous of the new system and felt that the fund was ample without taxation. Fortunately in 1841 legislative improvement was made for the administration of secondary schools, and counties which had failed to adopt the system of 1839 were in 1841 given the opportunity to vote on the issue again. Until 1853, when a state superintendent was appointed, the chief defect of the system was a lack of central supervision and control. Until that time the Literary Board was the executive head of the schools, and the system was left largely to county officials who were not qualified by training or experience to guide the work wisely. Other problems growing out of this fundamental defect were irregular returns of school statistics from the counties, no provision for special reports from the Literary Board, and the different habits developed by different counties in the control of school work. These problems certainly did not contribute to the formation of a coherent state system.

Finally, in 1852 Calvin H. Wiley was appointed to the position of state superintendent, a post in which he distinguished himself nationally until it was abolished in 1866. He was a man who labored with great zeal during the educational revival, and his constant reorganization and improvement of the various educational agencies of the state met with pronounced success. Wiley toured the state at his own expense to campaign and arouse interest in the cause for schools, a factor which he considered to be of paramount importance. Wiley's efforts were not always warmly appreciated, but, as is the case with so many successful persons, failure only prompted him to labor more intensely, and his name truly became synonymous with all North Carolina education from 1852 through 1866. At a time when obstacles hindering public secondary education were great, Wiley's efforts resulted in an increase in the number of teachers. In addition, teaching qualifications were elevated. Moreover, he encouraged women to become teachers, for he felt that their patience and other qualities were all conducive for the task of training youth. His urgings inspired library associations and a state teacher's association to be formed. One of Wiley's most significant and successful operations was that of giving an annual report of the schools, a report which so many times prompted innovations and reforms because it contained specific information about numbers of available teachers and willing pupils.

Wiley was widely recognized, and his services were greatly in demand in other states. Virginia, South Carolina, and Georgia sought to copy the educational example of North Carolina. Wiley was invited to appear before the legislature of Georgia for the purpose of aiding that state in improving its school system. By 1860 the scholastic population of the state numbered 221,000. There were 3,000 schools and more than 2,700 teachers licensed in that year, and $100,000 was collected in local school taxes. These are all facts which in some degree materially display the accomplishments of one man. Truly Wiley, Murphey, and Joseph Caldwell, who secured the passage of the first school law of the State in 1839, brought public education in North Carolina to the greatest development it reached prior to the Civil War.

The congressional plan (1867-1876) for the restoration of the South after the U.S. Civil War was not altogether effective, for under its terms native whites, Negro freemen, and men from the North--more familiarly known as radicals and scalawags, easily influenced Negroes, and carpetbaggers--were all jammed into the reconstruction conventions. The other plan for restoration, the presidential plan, which lasted from 1865 to 1867, unfortunately was not pursued long enough. The fact that there was much interest in the efforts to re-adjust secondary education in North Carolina after the war seemed to justify the continuance of the presidential plan, but such was not the case. Congressional reconstruction and the mixed-school question brought about many unintelligent debates and harsh feelings among members of the current so-called legislative bodies. Men in the legislature were not only calling each other "ordinary liars, but damned liars."

Despite the turmoil in 1869, the North Carolina State Senate passed a new school law which contained mandatory provisions for school support. Provision was made for a state board of education similar to the ante-bellum Literary Board mentioned earlier, but with more specific powers, and provision was made for county and township school officers with duties very much like the duties of similar officers before 1860. Township trustees were to establish and maintain, for at least four months in every year, a number of secondary schools at convenient points for the education of all children. They were also required to provide schoolhouses and equipment, employ and dismiss teachers, visit the schools, gather and report school statistics, and give attention to the details of local educational administration. Further, the portion of the state and county capitation taxes applied to public school support was seventy-five percent. In addition, a legislative appropriation was made to assist in maintaining the schools for four months. It is not difficult to see why this school law of 1869 became the basis of the present secondary school system in North Carolina.

A minister from Massachusetts named S.S. Ashley was elected the first superintendent of schools for North Carolina under the reconstruction plan. It has been said that his narrow and prejudiced views and incautious behavior far
overshadowed his abilities. He took an especial interest in mixed schools for the state, and it was this interest which served to make him very unpleasant to white North Carolinians. His initial report of 1868, the year before the new school legislation had been enacted, showed that almost nothing was being done for public schools and that the income for school purposes was very meager. Despite this, Ashley believed that some schools would be opened in the fall of 1869 and that by 1870 many communities would be supplied with better secondary school facilities. He perhaps expected aid from the school taxes and the outside agencies, which were aiding education in the state. Among these agencies were the Baltimore Association of Friends, the Soldiers' Memorial Society of Boston, the American Unitarian Association, and the Peabody Fund. The secondary education of the freedmen was receiving aid from the Freedmen's Bureau, the New England Freedman's Relief Association, the New York Freedmen's Relief Association, and other organizations.

Despite this help, conditions were far from satisfactory. In the fall of 1871 a new school law was enacted to take the place of that of 1869, with more liberal provisions for public secondary education. Among these provisions were property and special capitation taxes for school support. However, despite the fact that the principle of public taxation for school support was receiving wider acceptance, its application to the needs and conditions of the state was a more difficult task. Moreover, the fear of mixed schools and the agitation in Congress from the Civil Rights Bill added confusion and alarm. Between 1873 and 1875 only slight improvement appeared, and reconstruction was all but overthrown in the constitutional convention of 1875. The new constitution, which went into effect January 1, 1877, saw two significant educational acts passed by its first legislative meeting. One act established two normal schools—one for each race—and provided for their maintenance. The other gave authority to townships of a certain size to levy special taxes for public secondary schools. At this point conditions appeared more promising, and Dr. Sears of the Peabody Board observed that the tide of public opinion had been turned in favor of education and would thereafter be difficult to resist.

The Peabody Fund was a highly beneficial influence upon education in the South, and its primary object was to promote common school education. The fund was distributed on certain sound principles to the members of the confederacy and West Virginia. The fund's motto was "free schools for the whole people." North Carolina was among the first and largest beneficiaries of the fund, which served particularly to promote town and city school systems and advance educational interests generally.

North Carolina was one of the first states to participate in the distribution of the income from this endowment. On the advice of Calvin H. Wiley, former state superintendent of schools, Reverend Barnas Sears, president of Brown University and director of the fund, visited the larger cities of the State in 1868. Arrangements were made so that compliance with the conditions of the fund would be accomplished. After experiencing many setbacks, Sears, in cooperation with the state superintendent, continued to work to stimulate the growth of free public secondary education in North Carolina. Finally, with the return of so-called "home rule" in North Carolina in 1876, and with the adoption of a new constitution, conditions began to show some change for the better. The legislature of 1877 dispelled many of the fears and suspicions of the people by its enactations, prompting most of the outstanding educational leaders of the period to feel that free public secondary education would be an institution which would indeed be difficult to resist in the time to come.

It should be noted the first public secondary schools for Negroes appeared in North Carolina in 1918, but growth was slow until about 1921. In that year the Division of Negro Education was organized, with a full-time director, as an integral part of the State Department of Education. Shortly afterwards an inspector was appointed to devote full time to supervising secondary schools for Negroes. In 1922 the State High School Supervisor included data concerning secondary schools for Negroes in his annual report.

Editorial Policy: The Journal of the Midwest History of Education Society is devoted to the reflective examination of educational issues and problems from the perspective of diverse disciplines. With the Journal, the Midwest History of Education Society encourages communication among scholars of varied disciplines, nationalities, and cultures. Papers published in the Journal discuss comprehensive issues and problems confronting educators throughout the world.

The Journal has published authors from disciplines ranging from political science to philosophy to marketing to instructional technology to adult education. Its editorial board consists of a diverse group of professionals who referee articles according to their expertise. While the main criterion of acceptance consists in a well articulated argument concerning an educational issue, the editors prefer those papers that offer a historical analysis. Authors should contact the editor to receive a copy of the style sheet before writing the paper.

Articles published in the Journal do not necessarily represent the views of the editor, the editorial assistants, the members of the Society, or the University of Dayton. The authors of the articles are solely responsible for the accuracy and truthfulness of their work. The authors are solely responsible for ensuring that they do not infringe on copyright, violate any right of privacy, and do not use libelous or obscene language.

Articles appearing in this journal are abstracted and indexed in HISTORY ABSTRACTS and AMERICAN : HISTORY AND LIFE.
Several people made possible this issue of the *Journal of the Midwest History of Education Society*. The Dean of the School of Education at the University of Dayton, Dr. Patricia First, supported the project generously. The authors whose papers appear in these pages offered work of the highest quality. The editorial board and the associate editors worked diligently and carefully. Anna Victoria Wilson of the University of Texas at Austin set the format of the journal.

The *Journal* offers an important outlet for mature scholars and for students beginning professional careers. In these pages, as at the annual meeting of the Society, papers of all types appear together each reinforcing the other.

Announcing a New Book
Indiana and the National Defense Education Act of 1958

Sevan G. Terzian
Indiana University

Historians such as Norman C. Thomas have recognized the passage of the National Defense Education Act in 1958 as a watershed in bringing the federal government into the realm of public education. The federal government had repeatedly attempted to increase its limited control over educational matters since the Great Depression with very little success (Thomas 1975, 3-4; Smith 1982). However, the Soviet launching of Sputnik in October of 1957 ushered in a climate of apprehension and insecurity in the United States. This technological feat led many Americans to question the status of their own nation's human capital, and they placed the blame squarely on public schools. Thus, a federal aid to education program became more politically feasible, and within a year, the NDEA was signed into law by President Dwight Eisenhower. Despite the arguments that it would benefit national security, the multi-faceted nature of the bill indicates that, more importantly, the federal government had gained an opportunity to set a political precedent (Clowse 1981; Elliott and D'Orso 1992).

The federal battle had been won, but it would be another matter to secure the cooperation of all states. Education constituted a public arena significantly different from highways and farm subsidies, because it was indicative of deeply held cultural values in various places. This paper examines one aspect of the coming of the NDEA to illustrate the dynamics of public sentiment in the educational policy making process. The case of the State of Indiana and the NDEA marks a curious episode in itself. Local newspapers and the Congressional Record reveal that in the late stages of the bill's negotiation in Congress in August of 1958, Indiana appeared exempt thanks to an amendment by Indiana Republican senator, William E. Jenner. This amendment was the only one of its kind. For many years, Jenner had been vocal in opposing a strong federal government, and the pending education bill did not constitute an exception. Why is this example significant? Aside from its entertaining qualities, it also provides a novel vantage point for viewing the growing federal role in education and social policy.

In the months between Sputnik and the passage of the NDEA, Jenner and other public officials in the Hoosier State voiced their objections to the proposed federal-aid-to-education bill. Specifically, they employed a rhetoric of self-sufficiency and state pride to bolster local and state opposition to the measure, because they feared the consequences of losing their cherished control over curricular matters and funding. Such feelings of state independence were not new. Indeed, a strong tradition of self-help and local and state control had flourished for decades in the Hoosier State. By the late 1950s, however, it had become increasingly difficult to isolate oneself from national goals and federal initiatives. Americans, including Hoosiers, had to reconcile state and national identities. The growing presence of the federal government during the Cold War years pressured many Americans also to feel more pride about education as a nation. Therefore, the Jenner Amendment, in its call for regional exceptionalism, constituted a catalyst for shifting feelings of state pride to embarrassment, precisely because of this mounting federal pressure. Indianans abandoned their senator, and this constituted a fundamental shift in the history of Hoosier politics, as the people put a national allegiance before a state one.

In the decades preceding the NDEA, Indiana had voiced objections to some federal initiatives. According to historian James Madison, many Hoosiers subscribed to a tradition of self-help and home rule. Indiana had historically viewed high taxes and the federal government as the two biggest threats to its independent ethos. In 1947, the state general assembly passed a resolution which articulated this position:

Indiana needs no guardian and intends to have none . . . . We have decided that there is no such thing as 'federal' aid. We know that there is no wealth to tax that is not already within the boundaries of the 48 states. So we propose henceforward to tax ourselves and take care of ourselves. We are fed up with subsidies, doles, and paternalism. We are no one's stepchild. We have grown up. We serve notice that we will resist Washington, D.C. adopting us . . . we respectfully petition and urge Indiana's Congressmen and Senators to vote to fetch our county court house and city halls back from Pennsylvania Avenue. We want government to come home (Madison 1986, 313-314).

Although this statement had no legislative effect, it symbolized the predominant attitude among Indiana politicians.
At that time, Hoosiers felt confident enough to voice such invectives against the federal government, and the resolution continued by urging the other states to make similar proclamations. Indiana even had a history of refusing federal aid for education (Curti and Nash 1965, 244-246). In 1957, for example, Indiana was one of three states which did not participate in the modest six million dollar Library Services Act in which states were to match federal grants. This abstinence reflected the specific priorities of the state government, however, because according to "Books—But Not for Indiana" in The Gary Post-Tribune, 17 August 1958, the Hoosier State did not try to exempt itself from federal farm subsidies nor $93 million in federal money for highways. According to Madison, "Hoosiers, though strongly patriotic and nationalistic, were seldom very grateful" (Madison 1986, 313).

Shortly after the Soviets launched Sputnik in the fall of 1957, many segments of the American public blamed schools for the apparent technological inferiority of the United States. Calls for greater federal involvement in education manifested themselves in the NDEA bill to provide assistance in math and science instruction, but also for guidance counseling, foreign languages and even vocational education and financial aid for college. Hoosier state officials, however, were not so quick to condemn the condition of educational affairs. In the fall of 1957, Governor Harold Handley called on the Indiana Department of Public Instruction to create a fourteen-member commission to "scientifically" assess five areas: teacher qualifications, high school course offerings, pupil participation, student achievement and finally, "the need for scholarships for talented pupils." The ensuing report, often referred to as the Manion Survey (named after prominent Hoosier professor of education, Clarence Manion) and authored by State superintendent of public instruction Wilbur Young, was titled "Mathematics and Science Education in Indiana Schools" (Cong. Rec. 1958, 17279). It concluded that Indiana schools were doing just fine and did not need outside help or involvement. For instance, the Survey posited that only 53 students in the state needed financial aid for college. As a result, the Indiana State Chamber of Commerce, a powerful educational lobbying group, created a loan fund of $30,000 for the 53 students in the state it found worthy. But the methods used to determine those who deserved financial aid for college were dubios at best, and the committee operated under the assumption that one year of aid for college constituted sufficient educational opportunity. Nonetheless, the committee concluded "that Federal assistance on this program is neither necessary nor desirable" (Cong. Rec. 1958, 17279).

Editorials in Indianapolis newspapers applauded the findings of the Manion Survey. For example, "Uncle Sam, Schoolmaster," in The Indianapolis Times, 2 August 1958 and "Indiana Meets a 'Crisis'," in The Indianapolis Star, 7 August 1958 urged Hoosiers to resist the federal government's attempts to increase its influence in education at the expense of local and state control. They feared that the proposed federal programs would not be temporary and would create a permanent federal presence in education. Other articles like "Antidote to Federal Aid," in The Indianapolis News, 6 August 1958 and "Indiana Points the Way," in The Indianapolis Star, 7 August 1958 also praised the involvement of private interests, namely the Indiana State Chamber of Commerce. Such regional support for education, moreover, satisfied local needs, "something that would be impossible in any federal scholarship program operated by bureaucrats on the remote Potomac." Thus, other states needed to follow Indiana's example in opposing federal aid and creating alternative sources of school funding. Furthermore, two Congressional Representatives from Indiana, John V. Beamer and Charles B. Brownson also indicated their opposition to the NDEA and referred to the Manion Survey as evidence that states like Indiana could take care of their own. Above all, Brownson believed that matters of funding boiled down to the question of who was best fit to handle education. The answer certainly was not the debt-ridden federal government (Cong. Rec. 1958, 16695-16696). Both Representatives Beamer and Brownson appealed to the same sort of rhetoric of state pride in the House, and they anticipated some of the arguments Jenner would employ in the Senate. Thus, a number of prominent individuals and groups supported the optimistic conclusions of the Manion Survey. No one, however, proposed an amendment to exclude Indiana from all provisions.

In her account of the evolution of the NDEA, Barbara Barksdale Clowse notes that Indiana Senator William Jenner produced an amendment that exempted Indiana from all provisions of the proposed bill. Clowse adds that Indiana state officials were adamantly opposed to the issue of federal aid to education (Clowse 1981, 132). In light of the recent history and tradition of self-help, one can understand that many Hoosiers would have opposed the NDEA. However, opposition did not necessarily lead to a dramatic refusal to participate in the program. What led Jenner to present his amendment to the Senate? What was the legacy of the Jenner Amendment?
Jenner first served in the Senate briefly in 1944 and then for two six-year terms from 1947 to 1959. He was a "new isolationist" who believed that the United States had to minimize its international involvement and strengthen internally to meet the Soviet threat in war (Poder 1976, ii). He was used to voting in the minority during his Senatorial career (Poder 1976, 309 and 333). Jenner was also aggressively anti-communist, and from 1953 to 1955, he chaired the Senate Internal Security Subcommittee which investigated, among other things, the extent of communist infiltration into American education (Poder 1976, iii). Jenner objected to a strong federal government, favored balancing the budget, and advocated laissez-faire economics (Poder 1976, 22-23 and 107 and 277-279). His actions against the NDEA indicated his opposition to federal involvement in education. For him, educational policy belonged to the states, and he felt that post-Sputnik rhetoric was simply a veil for a federalist agenda (Poder 1976, 281-282). Impact aid, protecting civil rights, and national defense: these constituted the three realms appropriate for federal involvement (Poder 1976, 284). It becomes clear, then, that Jenner was remarkably consistent in his political ideology throughout his career. He was not particularly crafty or even influential, but he was candid and sometimes rabid in his attacks: "I charge that this country today is in the hands of a secret inner coterie which is directed by the Soviet Union" (Poder 1976, 90).

On August 13, 1958, the Senate version of the NDEA bill came up for a vote. The House had already passed its version on August 8. In the Senate, Jenner attacked the bill as a ploy to get the federal government involved in education: "It matters not how it is tried to dress the old gal; it may be called a defense program, but it is still a Federal-aid-to-education program" (Cong. Rec. 1958, 17275). Jenner also suspected that the provisions of the bill did not relate to national defense: "They were thrown together hastily, in an attempt to achieve under the influence of the spunktks, the same tired, old programs for federalization that Congress had withstood again and again" (Cong. Rec. 1958, 17281). The senator from Indiana objected to the proposed scholarship provision and that the bill did not require students to study math and science in college in order to qualify for financial assistance: "A person can take the money of the Federal Government as a pure gift and study tap dancing or the arrangement of flowers" (Cong. Rec. 1958, 17275). Perhaps Jenner exaggerated, but one scholar has demonstrated the piecemeal evolution of the NDEA bill in both the House and Senate and has shown the multiple purposes of this measure, one of which was to facilitate the entry of the federal government into the domain of public education (Clowse 1981). Furthermore, the major proponent of the bill in the House, Alabama Democrat Carl Elliott, writes in his memoirs that the bill was intended to establish a precedent for further federal aid to education: "Of course I couldn't admit it at the time..." (Elliott and D'Orso 1992, 169). Thus, Jenner accurately recognized one of the primary motivations behind the NDEA bill, and this guided his opposition.

For Jenner, states, local districts, and private corporations had to control education. In the Senate, he voiced the opinions of the Manion Survey (he had it published in the Congressional Record), the Indiana Chamber of Commerce, the State Commissioner of Public Instruction, Wilbur Young and Governor Harold Handley, all of whom feared the implications of a strong federal education bill. Jenner flatly rejected the NDEA: "The people of Indiana do not want it; my State does not want it. I shall try to find some way, if the bill becomes law, to prohibit $1 of the money from going to the State of Indiana" (Cong. Rec. 1958, 17275). The majority of Indiana newspaper accounts opposed the NDEA, and few voices appeared in the public press in favor of it. It is ironic that a state like Indiana, which expressed its patriotism and anti-communism so vehemently during the Cold War years, would oppose a measure meant in part to contribute to the fight. Some Hoosiers argued that greater centralization of power would resemble a Soviet-type system. Jenner communicated this sentiment when he spoke against federal incentives for students to pursue certain careers: "We want no uniform Federal examinations. This is the leftwing pressure for compulsory uniformity" (Cong. Rec. 1958, 17281). Senator Jenner and his powerful constituents employed the rhetoric of self-help and local/state control to try to cement their influence within the state. Instead, the rest of the United States needed to be more like Indiana and less like the Soviet Union: "That is the way we do business in Indiana, and some of the other states had better start copying it, or we shall all go down the drain together" (Cong. Rec. 1958, 17281). At the very least, the federal government needed to allow Indiana the freedom to maintain its educational prerogatives. This position led to conclusions that all was well with the existing curricula, funding,
methods, and student achievement. This promotion of home rule and state pride by the state government, Department of Public Instruction, the Chamber of Commerce and Senator Jenner also indicated a fear that regional cultural, social, and political priorities expressed in their school policies would be threatened by greater federal involvement.

In the Senate on August 13, 1958, Jenner proposed an amendment to the NDEA bill "[t]hat the State of Indiana be excluded from the provisions of this act" (Cong. Rec. 1958, 17320). Jenner made no provision to exempt Indiana residents from paying federal taxes to support the bill. The measure was approved by a voice vote and became part of the Senate version of the bill as the House and Senate versions went into conference to hammer out differences. According to "Indiana Omitted From Education Bill By Senate" in the Indianapolis Star, 14 August 1958, "The Senate floor and the crowded galleries rocked with laughter when Jenner introduced his amendment." The State of Indiana had voluntarily denied itself any of the program's potential measures, and Jenner confidently proclaimed, according to "Education Bill Excludes Indiana" in The Indianapolis News, 14 August 1958, that his amendment would remain in the bill as it went into conference. Jenner's opposition to the NDEA echoed the voices of many influential Hoosier politicians, educators, and others. It is not clear, however, whether any of these constituents anticipated the Jenner Amendment. Indeed, the ramifications of this development may have caused significant anger and embarrassment to Indianans. It was one thing to spout rhetoric in defense of principle; it was quite another to become the laughingstock of the nation. Jenner's Amendment alienated even those who opposed the NDEA.

How did people in Indiana react to the Jenner Amendment in the Senate? On the whole, two main groups of constituents in Indiana voiced their views about federal funding for education in the summer of 1958. On the one hand, Indiana state politicians, state education officials, the Chamber of Commerce, and a number of newspaper editors argued against federal aid to education, because they opposed federal influence in what had traditionally been their domain. These groups often appealed to sentiments of state sovereignty and regional pride in justifying and protecting their positions. On the other, some groups of Indiana teachers, principals, and administrators did not enjoy the existing state spending policies on education. They did not subscribe to feelings of state pride and regional exceptionalism. Some of these people favored the NDEA itself. Others may have opposed the idea of federal aid to education in principle, but found it ludicrous to stand alone. These people may have felt a degree of embarrassment from the whole affair.

The major Indianapolis newspapers generally applauded Jenner's amendment, at least symbolically, for it bolstered regional pride. Editorials such as "Indiana Stands Alone," in The Indianapolis Star, 15 August 1958 and "Nice Going, Bill," in The Indianapolis Times, 16 August 1958 celebrated the exceptionalism of Indiana and called the amendment "...a gesture that probably will be recalled in Capitol Hill cloakrooms for many a day." Others wrote that "[i]t sets the example that states do not have to tag meekly along while the Federal bureaucratic monster takes over all the functions of government." None of these articles mentioned that the Jenner Amendment did not exclude Hoosiers from having to contribute taxes for the NDEA if the bill became law. The next day, however, an article titled "No Work, No Pay," in The Indianapolis Star, 16 August 1958 expressed the realization that the Jenner Amendment might not be so rosy. "Since Indiana is to be excluded from the activities of the aid-to-education program, Indiana taxpayers should also be excluded from paying for it. We'd suggest a bill providing that a sum equal to Indiana taxpayers' share of the cost of this program be set aside and returned to the state, for use as Indiana taxpayers see fit." Indeed, the Jenner Amendment managed to create drama and elicit ridicule in Congress and to reinforce a feeling of pride back home, and although the Indianapolis newspapers praised the measure, they soon realized the pitfalls of this brand of exceptionalism.

Indeed, the proposed NDEA worked on an interstate level. For example, public schools in participating states would receive funding for various programs. But the proposed scholarship (and ultimate loan provision) involved students attending colleges in other states (Clowse 1981). Whether the loans would become available to the student or the institution, the Jenner Amendment was incongruent, because it could hurt out of state students who wanted to attend a University in Indiana, and it could deny out of state universities the chance to enroll a Hoosier student. Thus, the isolation sought by Jenner and many Hoosiers would not be feasible if the bill were to pass.

Meanwhile, editorials in the Gary Post-Tribune criticized the Jenner Amendment. "Jenner Takes From
Indiana," 15 August 1958 called the Senator's action “one of those idiotic things that responsible officials do not do. But Jenner, of recent years, has been chiefly a mountebank.” The article did not accept the argument that Jenner’s amendment constituted principled opposition to federal involvement in state and local affairs and saw it as absurd: “this is not a question of the values of the bill [NDEA] to the country but of whether Indianaans are to be made the goat by Jenner’s antics. Even if a majority of the people of the state do not favor the measure, and no one knows that they do or not, surely no Indiana taxpayer wants to help pay for education in 48 other states while getting no help from them.” According to this view, exceptionalism did not translate into regional pride, contrary to the rhetoric of Jenner and others, because Indiana was accepting federal money for some programs (for example, highways), but resisting aid for education. These contradictory policies indicate the highly charged arena of public education. These groups did not want their influence over schools to diminish.

While the nine Republican representatives from Indiana opposed the NDEA, not all of them applauded Jenner’s actions in the Senate. Republican Representatives William G. Bray and John V. Beamer did not like that Hoosiers would have to pay taxes and receive nothing in return. According to "Hoosier Solons Rap Jenner Amendment to Education Bill," in The Gary Post-Tribune, 14 August 1958, Beamer felt that most people would agree: “‘I don’t think people in Indiana would want an exclusion of this kind. If excluded from tax payments, they might be in favor of it.’” Ray J. Madden, a Democratic Representative from Gary, criticized both Jenner and the Governor: “‘Handley has been isolating Indiana from the rest of the nation. The taxpayers of Indiana have to pay terrific tribute to go along’” (Cong. Rec. 1958, 18549). In the House of Representatives on August 19, 1958, Madden objected to the Jenner Amendment while the conference was still negotiating the terms of the federal aid to education bill. He presented roughly 250 letters which he had received "... from groups of schoolteachers ... Principals ... Superintendents ... noonday clubs, from individuals extending all the way from the Ohio River to Lake Michigan; small towns and large towns ..." (Cong. Rec. 1958, 18549). For example, Mrs. Robert Hill, President of the West Vigo School Improvement Council wrote that "'[w]e represent several thousand citizens who urge you to work to reinstate Indiana and seek passage for the bill.'" (Cong. Rec. 1958, 18549). H.E. Roberson, Superintendent of Cambellsburg Schools, wrote, "Senator Jenner's action...[is]...childish. We want Federal aid for schools" (Cong. Rec. 1958, 18549). H.F. Schulte, superintendent of Jeffersonville City Schools, countered the conclusions of the Manion Survey: "... I assure you that the school officials do not concur with Senator Jenner's statement that Indiana will take care of the need" (Cong. Rec. 1958, 18550). Many letters employed similar wording in hoping that "Indiana be restored on the basis of other States" (Cong. Rec. 1958, 18549-18551). Indeed, those who actually worked in the classrooms and schools felt that federal aid to education would help where state efforts were not sufficient. This need overtook any sense of regional pride.

Thus, not all Hoosiers were happy with the Jenner Amendment, and some even favored the concept of federal aid to education. These views belonged primarily to teachers, principals, and school administrators. For instance, Robert H. Wyatt, executive secretary of the Indiana State Teachers' Association (ISTA) called for a reconsideration of social priorities: "The expenditures of the American people for automobiles, for highways, for cosmetics, for tobaccos and for a host of other items are so prodigious that the question of 'ability to afford' is trite" (Wyatt Jan. 1958, 205-206). He criticized the tendency of some Hoosiers who preached the virtues of home rule and also dismissed the claims of the state legislature that no teacher shortage existed and that only 53 students in the state needed scholarship aid to go to college. In addition, Dr. Edgar L. Morphet, who had helped to create Indiana's existing foundation program in 1949, pointed out that while Indiana ranked 15th nationally in its ability to pay for schools, it ranked only 37th in actual financing. This bolstered Wyatt's concerns that the priorities among state officials did not favor public schooling (Fraser Sept. 1958, 18-22; Wyatt Oct. 1958, 45-47). Thus, some Hoosier educators, namely members of the ISTA, were critical of existing state education policies and can explain why some teachers, principals, and administrators advocated federal aid to education and voiced their abhorrence at the Jenner Amendment.

A number of college students and other residents expressed their opposition to the Jenner Amendment. Referring to the laughter in the Senate galleries when Jenner presented his amendment, one student wrote in a letter titled "Aid Wanted" in the Muncie Evening Press, 21 August 1958, "[i]n my opinion, they should have laughed him
right out of Washington." He claimed to represent many others in their willingness to accept aid for educational opportunity. The student also criticized the Manion Survey: "I hope that the senator will be able to explain to the hundreds of students in Indiana who won't be able to attend college because they can't afford it..." Another student letter in the Indianapolis Star, 27 August 1958 favored federal aid, because the state had a poor history of funding higher education: "It is hard to imagine this state spending very much money on any scientific research project which is not designed to make corn grow better or to improve hunting and fishing." Thus, a number of Indiana students felt betrayed by state and Congressional action, and saw greater federal involvement as a viable alternative.

Between August 19 and 21, a Congressional conference committee met to resolve the differences between the Senate and House versions of the NDEA bill. One of the sponsors of the bill, Representative Carl Elliott of Alabama, informed Indiana Representative Winfield K. Denton that the conference had eliminated the Jenner Amendment as one of its first orders of business. This news pleased Denton, because he, too, had received numerous letters from Hoosiers indicating their disapproval of the Jenner Amendment. Denton also expressed his satisfaction that "Indiana is being treated the same as the other States of the Union" (Cong. Rec. 1958, 19608). Thus, the conference committee had brought Indiana back into the fold despite the contrary predictions of Senator Jenner, a move which pleased many of the Congressmen and people in the Hoosier State.

Ironically, Jenner was not present for the final Senate vote on August 22, 1958 which passed the conference measure by 66 to 15 with 15 abstaining. The House passed the conference version on August 23 by a vote of 212 to 85 with 131 abstaining. President Eisenhower then signed the bill into law on September 2, 1958 (Cong. Rec. 1958, 19087, 19618). The federal aid to education bill had become Public Law 864, and Indiana was very much a part of it (Clowse 1981, 140).

Irving Leibowitz writes that Senator William E. Jenner was "the symbol of Indiana" (Leibowitz 1964). But in fact, many Hoosiers were not happy with the Jenner Amendment and the state leadership and even advocated federal aid, because they had become dissatisfied with state funding policies. Jenner acted consistently with his political positions as a "new isolationist." This example also demonstrates how various groups can appeal to sentiments of state pride in order to mask their self-serving motives. Governor Harold Handley, the State Department of Instruction, the State Chamber of Commerce and some Congressional politicians called on Hoosiers to rely on themselves. These influential groups and individuals understood that education can be a powerful and contested terrain. If Indiana opposed federal aid, then state and local authority would remain intact over educational matters. And overseeing the state budget gave some the power to control schools through curricula and other means which would shape outlooks and aspirations of future youth in Indiana. In short, these groups lobbied Senator Jenner, because they did not want to lose the control they enjoyed, but even they may not have predicted his extraordinary initiative to make Indiana an exception.

Ultimately, this story has to do with the need to reconcile multiple allegiances, particularly state and national. Historians Rupert B. Vance and Howard W. Odum have shown that "...the region gains its significance only from its relation to a total structure. The relation that regionalism presumes to study is that of parts to wholes" (Vance 1957, 119). In other words, one's identity does not rest in a vacuum: many levels of identity coexist. Although individuals endure a number of contradictions in their lives, moments arise when such conflicts are brought to the fore and reconciliation becomes necessary. In the months immediately preceding the NDEA, many Hoosiers felt able to do this. Some argued that participation in such a federal program would abet a Soviet-type system. Therefore, non-participation would respect both state rule and patriotic goals. This constituted a very crafty and satisfying argument, indeed.

It was the Jenner Amendment, however, that forced the issue. By pushing Indiana into the national spotlight, Hoosiers found it very difficult to reconcile state and national identities, and a choice became necessary. Jenner had raised the stakes by making Indiana a public spectacle and at the expense of humility in the nation's capital. By rendering Indiana as an exception, Jenner led many Hoosiers to feel collective embarrassment instead of pride. Philosopher Arindam Chakrabarti observes that "[i]t is the widespread belief that the larger or more inclusive the group with which I identify myself in feeling collectively proud, the less morally objectionable is the pride" (Chakrabarti 1992, 35). This tendency was coupled with specific historical developments which prompted Hoosiers
to abandon their anti-federal stances and to urge participation in the NDEA. Indeed, Cold War rhetoric was difficult
to counter, and a national mood had emerged that states were seen as incapable of handling changing educational
demands. In addition, the interstate nature of the NDEA bill made it difficult for a state to isolate itself from it.

While the Jenner Amendment served as a catalyst to shift public feeling from pride to embarrassment, one
must recognize that the jump was a short one. Indeed, the quick move from taking pride in feeling distinct from the
rest of the nation to feeling pride as participants reveals the growing federal pressure to conform in the realm of
education and social policy. It illustrates the difference between 1947, when the Indiana General Assembly could
proclaim its vehemence against the federal government, and 1958, when much greater public pressure to conform
existed on the national level. The United States was on the brink of major federal programs such as Civil Rights and
the Great Society. Indiana had jabbed in the direction of the federal wall in 1947 and did not hit anything. But by
1958, the federal wall had moved closer and similar jabs, such as the Jenner Amendment, had resulted in a collision.
Thus, Hoosiers had to make a choice, and they decided to cooperate. Interestingly, in recent years, many states and
Congressmen have renounced federal programs in education and other public realms and tried to regain control.
Perhaps this marks the beginning of a reversal of the trends established in the 1950s. For the time being, however,
politicians like Jenner seemed suddenly quite out of date, even for many Indians.

The past fifty years of foreign language education in Austin high schools has been marked by a large and multi-faceted foreign language program. Austin's foreign language curriculum encompasses several languages taught at many levels and in a variety of ways. In general, foreign language education in Austin evolved from a strict grammar-translation approach in the prewar years to the audio-lingual method afterward. Subsequently, elements of both approaches, combined with further theoretical developments, led to the present focus on communicative competence, both written and spoken. Active exchange and club programs have augmented and strengthened the classroom curriculum.

Certainly, social and political upheaval, international crises, and continual growth of a multi-racial and multi-ethnic population influenced the development of the teaching of foreign languages in Austin high schools. In addition, methodological adjustments, increased access to foreign language courses, construction of new facilities, a growing tax base, and a larger native Spanish speaking population had a substantial impact on foreign language education. In the 1940s, Austin had two high schools, Stephen F. Austin and Lawrence Cecil Anderson High Schools. Today Austin boasts ten high schools. During the past fifty years, schools in the district routinely have offered Spanish, French, German, and Latin, but not necessarily every year at all high schools. Each high school has contributed uniquely to its students' experience with foreign languages by attracting notable teachers, developing innovative club programs, offering less commonly taught languages, organizing exchange programs, and designing advanced placement courses, foreign language symposia, and contests.

Prior to World War Two, the focus of most American foreign language education was on the development of reading skills in the classical languages of Latin and Greek for scholarly purposes (e.g., Kelly 1969, Long 1994, Met and Galloway 1992). With the coming of war and the evident need to communicate in both the written and spoken forms of modern foreign languages, second language acquisition theory experienced dynamic developments. In keeping with the strong behaviorist and structuralist traditions of the 1940s and 1950s, and in response to global sociopolitical developments, the predominant method of teaching foreign languages became known as the audio-lingual method. ALM, as it most often was called, relied heavily on drills, dialogues, and instant correction of errors. Technology (mainly audio tape recorders) could readily bring the second language into the classroom, and use of the first language (English) was strictly prohibited (Brown 1994). ALM was developed by the U.S. Army for intensive wartime training, but teachers quickly learned that high school learners wanted and needed more than drill after drill after drill; they wanted grammar explanations and activities which would enable them to use the second language more creatively (Brown 1994, Omaggio Hadley 1993).

The value of communication in foreign languages, certainly among friends, was important. But the need to understand and to communicate, even with communist adversaries, became critical to national defense. This "Red Scare" led to removal of books sympathetic to Communism from libraries, and to the demand that educators sympathetic to Communism be dismissed (e.g., Richardson, Anderson and Wallace 1993, Carleton 1985). On October 4, 1957, the Soviets launched the first manmade satellite, Sputnik. This event sparked a nationwide concern over an alleged "gap" between Soviet and American technology and schooling (Tindall 1988, Adey 1996, Mellenbruch 1996). Shortly thereafter, the federal government increased defense spending and created the National Aeronautics and Space Administration (NASA), and Congress passed the National Defense Education Act (NDEA). The NDEA of 1958 was an attempt to strengthen education in science, mathematics, technology, and modern foreign languages (Connell 1980). Through the NDEA the federal government provided substantial funding for research, purchase of equipment, teacher education, and various other teaching programs in these four curriculum areas (Hydak 1996).

In the 1950s, while ALM was touted as the best way to teach foreign languages, few districts were willing to fund the language laboratories and provide other necessary equipment such as listening carrels, tape recorders, headsets, and filmstrips. Nevertheless, three Austin teachers took matters into their own hands. Julia Mellenbruch,
a longtime Spanish teacher at Austin High School and the district's first foreign language coordinator, and two other teachers, Margarite Sledge of McCallum High School and Margaret Adey of Travis High School, decided to construct their own language laboratories (Adey 1996, Mellenbruch 1996). They enlisted the help of campus industrial arts (shop) teachers to make booths in their classrooms. Then they attached tape recorders to kitchen carts and wheeled them into the booths. Mellenbruch used her personal funds to purchase the tape recorder used in her classroom. Mellenbruch's cousin, a technician in the local telephone company, helped her to construct multiple listening stations so that two recordings could play simultaneously. With this system, she could better address the varying needs of her entire class, even some of whom were native speakers.

For Mellenbruch, as well as for many theorists of the time, speaking the foreign language needed increased emphasis. Some Austin teachers attended summer language institutes, developed in the wake of Sputnik and funded by NDEA and other programs. In addition, although they had only the old grammar-translation-based textbooks to use, Mellenbruch remembered that teachers had to be flexible: "We had to adapt the materials in the textbooks to get more speaking skills in the classroom" (1996). Technology was one way to bring spoken language in; increasing teachers' own speaking proficiency through workshops, symposia, and conferences was another.

Margaret Adey, Mellenbruch's colleague, taught Spanish at Travis and Crockett High Schools and, in 1981, was named Texas Foreign Language Teacher of Year (Hydak 1996). Adey (1996) remembered that, in the 1950s, foreign language enrollments dropped precipitously and that, for a while, foreign language teachers faced a "sink or swim" situation. Following Sputnik, however, she noted that general interest in languages increased. Also, she remembered a slight shift in emphasis regarding what language learning entailed. Speaking and listening skills subsequently received greater attention than did reading and writing, a reversal of previous teaching practice. In 1960, Travis High School acquired its first real language laboratory to enhance the development of these oral and aural skills. This "real" laboratory came about after Austin's Superintendent visited the makeshift laboratories that she and others had improvised. The Superintendent regarded these portable laboratories as "pitiful." At his insistence, and with the NDEA funds, the district installed laboratories in all of Austin's high schools. In addition, provisions for such laboratories were included in plans for all future high schools (Mellenbruch 1996). The Austin language laboratories included sophisticated audio-visual equipment such as tape recorders, filmstrip projectors, and record players. They enabled students to learn languages through the enhancement of their auditory skills, a major tenet of the audio-lingual method.

The audio-lingual method was based on a dominant theory in psychology, which throughout the 1940s and 1950s was behaviorism. Later, in the 1960s and 1970s, more and more emphasis was placed on inward behavior and, subsequently, meaning and understanding. The shift from a behaviorist approach to a more cognitive orientation had far-reaching effects on many related fields, including second language acquisition. In linguistics in the late 1960s, at roughly the same time that psychologists were thinking in terms of cognition, Noam Chomsky postulated a universal grammar underlying all languages which led to transformational linguistics (Brown 1994, Schultz 1991). Presently, communicative competence holds sway.

With increasing integration and growth in Austin in general, schools experienced changing needs for foreign language education while demand has increased for traditional Spanish classes, today there are also innovative classes such as Spanish for Native Speakers designed to meet the needs of students who may already speak some Spanish. Such classes reflect the present emphasis on communicative competence in foreign language education.

Austin teachers, such as Margaret Adey (1996), firmly believe in the necessity of students being able to use their Spanish skills in authentic communication situations. One of her common admonitions, one that former students have told her they recall vividly, is "Don't teach Spanish. No, use it in your chosen career." Of course, she did not intend to discourage future teachers, but wanted students to become aware that languages are useful in all walks of life, not just in school hallways. Adey developed and raised funds for an immersion program, the Spanish Workshop of Monterrey, a program that enabled students to have as much contact with Mexicans and their language and culture as possible. She believed that students' authentic contact with the Spanish language was critical to their success.

Adey remembered that as newer textbooks and other foreign language instructional materials became more self-contained, newer technology was made available, and second language acquisition theory changed, language
laboratories, once the hallmark of outstanding language programs, simply became obsolete. Their demise can be attributed to the extra materials, time, and preparation work that was required as well as to the vandalism of the equipment itself, which increased maintenance and repair costs (Adey 1996).

While few laboratories remain today, other district-wide developments have affected the nature of foreign language education in Austin. For example, in the 1980s, AISD created two magnet schools within existing high schools: the Liberal Arts Academy at Johnston High School and the Science Academy at Lyndon Baines Johnson High School. These controversial academies brought together highly-motivated, high achieving students and enabled them to pursue their studies, including foreign languages, at an accelerated pace. By bringing them together, however, the students inevitably are drawn away from other Austin high schools, creating a perception that the students remaining at the regular high schools are somehow less motivated and less able. Reflective of ongoing racial prejudice, too often Hispanic students are among those considered “less able”.

Yet Austin has had notably successful Hispanic students. Travis High School, in particular, serves a predominantly Hispanic part of Austin in which many native speakers of Spanish reside. Current and longtime Spanish teacher, Nereida Zimic (1996), has commented that “native is a strange category,” and that students may have Spanish names and come from Spanish-speaking cultures, but Spanish is not spoken at home. Families perceive the importance of English and encourage their children to adopt it as their first language. However, a more subtle and insidious problem exists, and that is an aura of “shamefulness” in speaking Spanish in this part of the country (Zimic 1996). Zimic tries to overcome this perception and to encourage pride in all students’ ethnic and cultural heritages by opening each new semester with the statement that “all of us are immigrants.” She assigns students to research their family ancestry to discover where in the world their families originated. She emphasizes that although English is a common language in the United States, people from all backgrounds have much to contribute to society as a whole, including their “old” languages. Her goal is to “help kids live with one another” (Zimic 1996). In fact, at Johnston High School and Keeling Junior High School, the foreign language departments offer separate classes of Spanish for native and non-native speakers and two different textbooks have been designed specifically to meet the needs of these different groups of students (Hydak 1996).

While changing demographics have had a marked impact on foreign language education, by and large, beneficial language learning situations have been in evidence in Austin high schools throughout the past fifty years. The need for, and the offering of foreign language courses has mirrored the changing times as theories have evolved, as political crises have arisen and passed (or lingered), and as the city has continued its relentless growth from 160,000 in 1953 (The Rebel Roundup 1978) to 540,000 in a metropolitan area that exceeds 1 million today (Lindell and South 1995).

On 7 December 1941, the mounting fear of armed involvement by the United States in a global war was realized. All sectors of society were called upon to do their part to aid the war effort. This included educators and school administrators who were committed to supporting democratic ideals as well as improving American Education (Field 1991, 210). In response to the challenge of those difficult times, teachers promoted a high morale for both school and community and the continuance of a national school reform movement (Cremin 1961, 273, Perrett 1973, 370). This paper describes the increased prominence of the fine arts curriculum during the war years and its relationships to the war effort.

The fine arts offerings in the schools suffered during the depression years due to a shortage of funds and perceived lack of utility. The latter was linked to the educational efficiency movement which increased pressure on schools to cut costs and reduce the "fads and frills" of the curriculum. The notion that education was to be preparation for a utilitarian life justified the elimination of some courses because they were too expensive (Callahan 1962, 6). Furthermore, rural one-room schools, still present in the 1930s, often employed teachers with little or no college education, thus limiting instruction in the fine arts. In addition, it is difficult to know how wide spread the fine arts curriculum was since very little has been written on this topic. For example, although I. L. Kandel (1948), a major educational historian of the period, provided in-depth information about schooling during World War II, the fine arts were not included. These curricular offerings within the public school curriculum have not researched.

Several questions initially guided this research. To what extent and in what ways did the war effect the fine arts offerings in American schools? Did wartime conditions attract increased enrollments? Did the fine arts offerings of curriculum—those most responsive to the emotions—reflect the isolation, fear and brutality of war events? Were the fine arts too elitist for the “practical” war effort or included even at great cost in the face of rationing and economic restrictions? These and other questions have remained largely unanswered because little research has focused on fine arts in the World War II curriculum. However, evidence of fine arts offerings was found in various sources including professional journals, teacher magazines, governmental reports, newsletters of interscholastic competitions, and meetings of specialized teaching associations. Also, valuable information came through and interviews of teachers working in classrooms during World War II.

The fine arts certainly appear in what Spaull has called "symbolic observances" and "practical patriotism" (Spaull 1990, 5). Symbolic observances gave rich meaning to the terms of freedom, citizenship, and historic lessons, promoting both morale and unity on the home front (Kandel 1948, 21). Practical patriotism offered a wealth of opportunities for fine arts involvement “to provide community service of both wartime and peace time nature”(Kandel 1948, 21). The fine arts in daily symbolic observances were found within the classroom, auditorium assemblies and in after-school programs (Nohavec 1943, 30). Social goals and artistic aims were met by flag ceremonies, school assemblies, patriotic plays and pageants, oratorical declamation, victory sings, art exhibits and other patriotic music. School assemblies provided an important outlet for fine arts instruction within the school day. For example, Dr. Nelson Patrick (1995), a former teacher in Donna High School (Texas) recounted in an interview that assembly programs which involved his 40-member band and 30-voice choir performed regularly to support wartime activities. This was not unusual as Cohen (1992) reported an increased emphasis on patriotic assemblies (30). The N.E.A. Research Bulletin (1943) reported a 25 -50% increase in all-school assemblies and special programs from the 1401 school systems responding to the questionnaire. University professors encouraged teachers to make provision for assemblies, debate, dramatizations, plays, pageants, music and art in order to vitalize our cultural heritage (Education for War and Peace 1942, 34).

Many publications for primary teachers—Instructor, Grade Teacher, Junior Arts and Activities, Progressive Education Journal and Plays—offered entire programs for use by the regular classroom teacher. Most were teacher written and were published with ample pictures, illustrations, and suggestions for production. Along with generous
amounts of teacher-made materials, publishers offered inexpensive booklets for quick production of professional-level material. One such volume, *Democracy and Patriotism*, included 80 pages outlining 13 separate pageants, five picture features, three choral recitations and four poster ideas. All of this could be purchased for 25 cents (*Instructor* 1942, 10). Fine arts materials with which to blend defense activities and instruction were plentiful and well distributed among primary and secondary teachers of the larger districts. For example, Bonnie Rigby recalled in an interview that while teaching in Abilene High School (Texas) during the war, that the district music supervisor distributed considerable free materials. One such package featured “Any Bonds Today?” a song written by Irving Berlin, a favorite with her students.

School reports reveal small steps taken to increase fine arts curriculum offerings. Districts from across the country reporting in the *Curriculum Journal*, from January, 1942 through December, 1942, reveal their plans to expand music, art and drama offerings. Clearly, certain facets are visible in tracing the development of fine arts instruction during the war years. They include the common use of assemblies, homeroom activity periods, and the use of more supplemental materials.

Symbolic observances, those actions or activities that foster a love for democracy and an appreciation of American heritage, stood as reminders of the dedication of the fighting soldiers. Symbolic observances include: patriotic oaths, murals, flag ceremonies, speech contests, oral declamations, victory sings, concerts of patriotic music, school assemblies for pageantry, plays on patriotic themes or historical drama. Practical patriotism was built on the mooring of pride in the American way of life. Many such activities directly supported the soldier on the front line. Fund raising, informing the community of war programs, sending materials to the war front, entertaining the armed forces and collecting scrap all gave direction for school activities. Schools saw a clear opportunity to combine high quality cultural opportunities with the practical experience of war support (Conn 1943, 17).

Music, art, drama and speech played a large part in these activities. Student activities and projects were filled with references to symbols of American greatness, a belief in democracy, American history and “justice for all.” The *Wartime Handbook for Education* offered guidelines for music and singing programs which advocated the “inclusive participation of the student body” (N.E.A. 1942, 25-26). Glee clubs were common in many schools. So numerous were the requests for public music performances, that the editors of the *Music Educators’ Journal* reported, “We are fairly overwhelmed with the wealth of contributions made by the school music organizations to the wartime program” (*Wartime Program in Action* 1943, 25). Ample supplemental materials were available to primary teachers along with how-to-do music instruction from other teaching professionals (Bryant 1943, 10). As the war raged on overseas, many teachers on the home front kept children singing and playing instruments to remind them of their American heritage and to increase their sense of hope as a symbol to the entire community. Clearly, high school choirs increased in public visibility during the war years. Such increased community events seem to signal a period rich in possibilities for vocal programs. Cooperation with other choruses, religious and educational, was commonplace. Music, instrumental, and vocal instructors in high schools and elementary schools enjoyed an increased rate of public performance (Boyle 1943, 15). High school bands and choruses provided music for such things as bon voyage concerts for the departure of men to military duty, Red Cross meetings and USO programs, and school assemblies (N.E.A. 1942, p. 25-27). Music also played a part in fund raising (Kirk 1994, 91). Occasionally the price of admission to school concerts was one war savings stamp. Whenever the need for war support, fine arts departments stood ready for service duty, fund raising, and entertainment.

Art in the classroom during World War II took many forms. Included were handicrafts, folk arts, posters, scale modeling, and classic art appreciation. Lacking in both preparation and adequate materials, teachers of art were often assigned to teach art with neither the background nor supplies. Still the “make-do” spirit was evident in arts activities. Due to rationing, class-produced art tended to resemble handicrafts (Todd 1943, 10). Teachers were encouraged to make their own finger paint and to use cleaning bags, butcher paper, scraps of fabric, pressed crayons, plaster of Paris, and cardboard to create family presents or gifts for servicemen (Todd 1943, 10). Popularized by the WPA Federal One Project, many state and federal buildings contained beautiful, expansive murals of historical tableaux (Cremin 1988, 460). The genre provided great opportunity to place art in the school hallways (Maples 1942, 8). Easily seen by the adult visitor, these murals used large brown paper often available from area merchants, and
provided a temporary canvas for secondary and elementary students alike (Todd 1944, 26). This practical use of art provided drawing and painting practice not only for individual students to expand artistic expression but also to encourage group cooperative work skills. Students produced millions of recreational articles for the armed forces (“Wartime Education” September, 1943, 4). Checkerboards, scrapbooks, picture holders, greeting cards and stationary were produced and mailed to soldiers by many of the high school art classes (“School Serves Wartime” 1942, 496).

School speech activities expanded through the World War II years on the local, state and national levels. Radio was a powerful force for the spoken word. Many radio technique projects were extensions of public speaking class (DeLay 1943, 10). Student forums offered a structured format for the presentation of current events, war information and student concerns. Declamation, was a favorite among classroom teachers. Any well-known classic in poetry, literature, or public speaking could be prepared for classroom, school assembly or parent night. A 15 cent newsstand magazine—Vital Speeches—provided easy access for students and teachers to enliven political studies. Another form of speech common to World War II years was choral speaking. Poems, prayers, pledges and creeds were favorite subjects for choral speaking at the elementary level. Most out-of-town speech competitions were curtailed by rationing of tires and gasoline (Hammock 1943, 3). Nevertheless, rationing did not stop in-school debates on topics of interest. Topics included “Lowering the Voting Age to 18 Years” and “The Formation of a World Police Force” (Leaguer October, 1944, 4). Extemporaneous speech topics include, “Employment of Discharged Army Vets”, “Public Work for Post-War Unemployed”, “Universal Military Training”, “National Radio Control”, “Equalization of Educational Opportunity”, and “The League of Nations” (Leaguer October, 1944, 4). Speech education throughout the war gave life and breath to famous words, uplifting thoughts, historic passions, classic literature and freedom of expression. A Victory Speakers' Bureau was a vital force in school-community relations. The high school supplied prepared speakers for the Community Chest, Red Cross, Sunday church messages and for Fire Department presentations (Livingston 1942, 1).

Theater instruction during the war years used pageantry and simple vignette to further wartime interest. Not an exercise in avant garde theater, simple situation comedy, patriotic themes and fund raising received most emphasis in wartime theater production (Rowe 1943, 1). Often the defense industry employment of older secondary students limited their involvement in after school drama activities (Miller 1988, 179). Play writing by students was encouraged. Plays magazine, a major source of low-cost dramatic material for elementary and junior high teachers, sponsored a play-writing contest in 1943. The topic was a biography of a famous American or an event in American history. Westinghouse Corporation provided the $100.00 war bond prizes and over 6000 one-act plays were submitted for consideration.

Large cast shows of historical vignette were given for several national conventions (Dore 1942, 10). Small performances were given in homerooms, at school club meetings, and assembly programs. Exchange programs with other schools and radio programs were also evident (Bravely 1942, 10). High school drama directors were admonished strictly to control the type of theater scripts being written. Satire was discouraged. “Simply written scripts of people doing the right thing and embodying the basic ideal of freedom are best choices for performances” (Rowe 1943, 3). School plays ended in hopeful terms with a post-war peace (Dore 1942, 3). A deeper sensitization of students to their heritage, common brotherhood and enriched social living were the goals of theater instruction in the wartime years.

The use of theater in practical patriotism was lavish and is well documented. The U.S. Office of Education, War boards, the U.S. Treasury department, the National Education Association and theater magazines made scripts available to schools. The scripts were written to encourage blood donations, sale of war savings stamps, sale of war bonds, the entertainment of servicemen, and for raising funds for war services (N.E.A. 1942, 1). Often these shows were used to raise funds. More often they were staged on or near military bases. The Army provided transportation, stage area and often refreshments for the troupe (Gorton 1942, 11). This emphasis on entertainment and not purely instruction led high school directors to consider shows for their entertainment value (Rowe 1942, 1).

The fine arts filled the need to stir hearts, soothe uncertainty and strengthen resolve. The essence of democracy, the energy of group planning and the creative expression of the individual, faceted the fine arts instruction
During the war years. Extant sources offer small bits of evidence, details that form pictures only after slow accumulation and study. These colored fragments seem to be supportive of a rich tapestry of school fine arts activities during wartime. The fine arts contributed considerably to the schools overall wartime activities. Even in the worst of conditions, people are capable of high-purposed conduct. The courage and resolve of American education was tested during World War II. The schools were “in this scrap” and provided students as artists, speakers, actors and musicians to strengthen the fiber of America’s appreciation of democracy and to provide the determination to see the war to a successful end. The fine arts programs were not excluded at the cost of practical war activities. Actually they blossomed in the war effort. Used as “vehicles” for self-expression, fund raising, reminders of American heritage and home front morale, the fine arts survived the pressure of war. Around the nation, school officials reported an increase in fine arts curricular offerings. Certainly more research will bring distinct clarity and additional detail to this picture.

The Carl Siembab Gallery, Boston: A Study of the First East Coast Photography Gallery

Keith Armstrong
Northern Illinois University

The Carl Siembab Gallery (1954-1983) was owned and operated by Carl Siembab, who sought the same artistic and humanitarian worth in his artists as he esteemed in himself (Armstrong, 1996). By these means he and his gallery were instrumental in unifying and fostering a new wave of photographic genius into a powerful photographic force. Carl Siembab's attentiveness for humanitarian and artistic worthiness helped him to select consistently exhibitors who continue to gain public recognition to this day.

Admittedly, there were factors which may have independently enhanced the importance of the Carl Siembab gallery and the reputation of the gallery's artists. First, the Siembab Gallery received some notoriety simply because it was the first mainstream gallery on the East Coast to dedicate space to photography. Second, there were fewer artists of photography in the 1950s through the 1970s than there are now, but they were willing to dedicate their life to this uncertain field of art, and they were unique individuals (Hooks 1995). It is these people and their motivation which this paper will investigate.

The Siembab Gallery showed only painting and sculpture in its first two years of operation. It differed from other mainstream galleries only when it opened a room just for photography. Unfortunately, the Carl Siembab Gallery soon discovered that few people valued photography as art in the 1950s and what did sell was sold at low prices. What kept this gallery and its artists going when neither economic gains nor the acceptance into the arts were readily forthcoming? It was due to Carl Siembab and the artist's sense of unity or an effective collective consciousness. "It is a sociological axiom that individuals as members of a community can endure great privation and difficulties" (Roberts 1971). Some writers about the 1950s gave this phenomenon the name Pour epater les bourgeois [i.e., to shock or "put on" the bourgeoisie] and a list of attributes including the ability to forego economic security. "Perhaps the two most influential pre-communist movements of recent times revolved around the 'beat generation' of the 1950s. . . . The conformity demanded by the larger American community was rejected by the beats' advocacy of artistic integrity, voluntary poverty, and social disengagement" (Roberts 1975).

Although only a small portion of the gallery's artists considered themselves as a formal part of the beat generation, its influence was everywhere evident; it became a means of sounding one's artistic authenticity. Even the gallery's more financially solvent photographers demonstrated these qualities. It is interesting to note that these older artists—those over thirty who had been given recognition by the Museum of Modern Art and The George Eastman House (the first two major American institutions to treat photography as art)—had an element of "shock" or appreciation for poverty or social disengagement about them. Berenice Abbott, Ansel Adams, Dorothea Lange, Brett Weston, and Imogen Cunningham are such examples. Maybe they were the photographic forerunners of the "beat generation" at the Siembab Gallery as they, to some extent, maintained these characteristics before the era existed. And they brought these qualities with them when they exhibited their photography and participated in the community spirit at the Siembab Gallery.

The book Imogen! contains an example of Imogen Cunningham's capacity to shock, which appeared early in her career. "In 1915, Imogen married the Paris-trained printmaker, Roi Partridge, and in the same year she made a series of nude studies of Roi on Mount Rainier. . . . Photographs of male muses were almost unheard of at the time; they are controversial even today. . . . She exhibited the prints once, but they created such a scandal of horror and disbelief that she hid the negatives for over fifty years" (Mann 1974).

Ansel Adams believed that the most photographic places were threatened by America's growth in the 1950s. He espoused that these lands be used by a select group of people, defending such exclusivity in the name of spirituality and writing, "There ought to be remote places accessible only to those willing to walk or ride horseback. There out under the stars people would find spiritual renewal" (Mann 1974).

Berenice Abbott was another colorful example of social disengagement whose work would inevitably show at the Siembab Gallery. She left America for Paris where she worked for Man Ray. There she met James Joyce, Jean...
Cocteau, Sylvia Beach, Andre Tardieu, Djuna Barnes, Alexander Berkman, Marie Laurencin and Andre-Gide (Forsee 1968). She spent most of her life advancing the French photographer Eugene Atget (O'Neal 1982). Abbott knew and understood the uncertainty and misunderstanding that was part and parcel of a photographer's life and she had learned it all from Atget. "It was from Atget that Abbott first learned she might have to walk alone... she wrote in her diary: 'It is not profitable to discuss whether or not photography is an art. Results will speak in due time'" (O'Neal 1982).

Since the Siembab Gallery represented the avant garde and the naturalist, the successful and those yet to be successful, the sacred and the profane, in time it became an effervescent place to exchange ideas and grow metaphysically. Some of the photographers formed common interests which grew into "movements" within the gallery.

Most of the "movement" oriented photographers at the Siembab Gallery were directly influenced by Minor White, MIT professor and "follower of the Russian mystic G.I. Gurdjieff" (Wise 1991). Although he seemed to lack polarity himself, he everywhere caused it. This fact is so evident that today it is difficult to get his closest friends to volunteer information about him. His friends are as protective of him today as they were when he was alive. Why? White’s unintentionally countercultural views were ever evolving—even more so as he got older—and his students experienced what no outsider has seemed to fully grasp: transcendence.

While teaching photography during the time of the Viet Nam and Civil Rights era, White’s use of photography as an educational tool scared people. The Boston Sunday Globe wrote of White: "With his conviction in 'the metamorphosing power of camera' and the pursuit of 'the other' that he believed a photograph could invoke or reveal, White laid a rigorous agenda on his students. Through the study of esoteric books, meditation, Oriental ritual and diet, mime and classical music, they were instructed to live and breathe photography." The article continued: "'Under his tutelage, they sought 'a heightened awareness'... after the mid-50's, he sought ways through photography to bring himself in contact with 'the Creator, either inwardly or outwardly... [and] White received his best local attention at Siembab's stalwart gallery on Newbury Street'" (Wise 1991).

The Museum of Modern Art, New York, presented Minor White's retrospective photographic opening in 1989. After the opening an exclusive, loft party was hosted primarily for White's closest friends. Through Carl Siembab's generosity, the author of this paper was invited and encouraged to meet many of the artists who were influenced by White. One of these was Jerry Uelsmann, who explained that writers have misquoted or misused White's statements and he had become cautious about responding.

In Bunnell's book titled Jerry N. Uelsmann, he credits White as one of Uelsman's godfathers (1973). Both White and Uelsmann see photography as a means of transformation. Bunnell puts it this way: "Let us not delude ourselves by the seemingly scientific nature of the darkroom ritual: it has been and always will be a form of alchemy. Our overly precious attitude toward that ritual has tended to conceal from us an innermost world of mystery, enigma, and insight."

Another group of White-influenced artists are also concerned with transcendence and joined under the historical banner of The Association of Heliographers. Although not perceived to be as radically countercultural as White, they were equally as abstract. The group billed themselves as follows: "The Association of Heliographers was organized early in 1963... The word Heliography was first used by J.N. Niepce in 1829 to name the astonishing process he discovered by means of which he was able to focus the sun's rays in a Camera Obscura upon a sensitized surface and obtain a lasting image of his vision." Their works show a clarity of vision that transcends the subject matter photographed and provides a manifestation of the envisioned experience (The Association of Heliographers 1970).

It was Paul Caponigro and Carl Chiarenza from The Association of Heliographers who played the initial role in the photography gallery. They are credited with having channeled Carl Siembab's interests away from painting and sculpture to the singular mediums of his original gallery, forging a way first to add photography to other mediums and then to make it the exclusive medium at the gallery.

Siembab, driven to share his new discovery—photography as a fine art—did not wait for photographers to seek him out, nor did he investigate the public's readiness and keenness for it. Nearly overnight he became dedicated to the dream of making photography speak as loudly as any other art in his gallery, but soon he realized that few listened.
He quickly learned that the public needed first to be educated about photography before they could appreciate it. Consequently, Siembab showed photographs that taught people to appreciate photography. In fact, Siembab often admits that photography was never available to the public as it was in his gallery.

In spite of Carl Siembab’s progressive notions, he refused to go the direction of the new photographic gallery movement that began in the 60s to grow in nearly every major U.S. city. With Siembab’s personal help and advice, galleries grew, but they responded competitively toward the market place. The wealthy galleries offered their already famous photographers a guaranteed income in exchange for the exclusive right to represent their work. Because Siembab had not done this and would not do it because of his personal dislike of the policy, he lost all of his renowned photographers, except Minor White. After losing the photographers, Siembab continued the gallery for ten more years with young, undiscovered photographers. In 1981 even this group of bright photographers ceased to show, and the Siembab Gallery closed.

Today Carl Siembab acts as a photographic consultant, yet he recalls how “in the 50s and the 60s and even in the 70s there was a kind of ferment; and out of the ferment came people with ideas and we had a whole string of young people with them in those days... They were coming up with ideas in ways to use the photographic medium to express artistic ideas in the hope of enriching the society” (Siembab 1992). In these ways the Siembab Gallery offered the American people an education.

Weldon Covington and School Music in Austin, Texas, 1931-1973

Henry Stanton Tuttle
The University of Texas at Austin

On Friday evening, September 13, 1996, more than 125 alumni of the Austin High School Maroon Band gathered for the first-ever reunion of members of the band during the "War Years," 1939-1945. Many of these graying alumni brought their high school yearbooks, copies of band concert programs, and letter sweaters. They hoped to rekindle the intensity of old acquaintances and to share fond memories of their accomplishments both during their school experience at Austin High and afterwards. Perhaps the most common comment overheard that evening was "You haven't changed a bit since 1944."

The primary purpose for the reunion was to pay tribute to their band director, Weldon Covington. "Mr. Cov," as he was and still is warmly known, humbly accepted a commemorative plaque from his former students. In his remarks to "you kids," as he affectionately called them, he reminisced how the band kids were always "classy." He also explained that the band's legacy was a standard of excellence and quality that still existed in the "classy kids" in the current Maroon Band. Earlier in the week, Covington directed the 1996-97 Maroon Band in a performance of Loyal Forever, the school song. For the reunion finale, he "directed" as that tape was played for the alumni.

Why would such a group of retirement-age, Social-Security eligible individuals travel from as far away as Colorado, Mississippi, and Michigan to gather for such an occasion? Many reasons exist, but honoring Mr. Cov was paramount for most alumni. Covington directed the Austin High School Maroon Band from 1931 until 1953. For more than a decade, he also served as supervisor of instrumental music for the Austin Independent School District (AISD 1960). He then continued in this supervisory post until his retirement in 1973. During his tenure, Covington influenced thousands of individuals, including students, parents, teachers, and administrators, with his unique talents and abilities. What were these unique talents and abilities? What did this teacher and supervisor do? Accounts of teachers' professional careers generally are uncommon. Especially rare are biographies of school supervisors (Glanz 1995). This essay not only portrays Covington's pivotal role as a music educator, but also contributes to an understanding of music supervision in a growing school district after World War II.

Weldon Covington's love for music is lifelong. He was born in Alvord, Texas, on March 5, 1908. He began his musical career as the pianist in his local church at the age of nine. Teased and bullied by another boy in the congregation for doing a "sissy" thing like playing the piano, young Covington began to lift weights. About the same time, he began to play the trumpet, transposing music written for the piano for the trumpet. After about two years of weightlifting, he invited the other lad to remain after church one Sunday for a one-on-one music appreciation session. Seeing Covington's improved physique probably convinced the other boy that the music sounded great and that it was OK to be a church musician. (Covington 1996).

Covington's love for music continued into his high school days. During his senior year (1924-25) at Alvord High, Covington begged the superintendent to become the band director when the incumbent resigned. The superintendent agreed. During the winter basketball season, Covington's situation became problematic. As a member of the district championship team, he played basketball during the first half of each game, directed the band during its halftime show, then returned to the floor and played the second half of the basketball game. His love for directing bands began in high school.

After high school graduation, Covington enrolled in a junior college, North Texas Agricultural College, now the University of Texas at Arlington. Covington quickly became assistant band director and cornet soloist in the band directed by Colonel Earl D. Irons, a renowned band director in Texas (Barrow 1982). While at North Texas Agricultural College, Colonel Irons encouraged young Covington to attend Ithaca Conservatory of Music in New York. There, he could study under the direction of Pat Conway, an associate of John Philip Sousa and the conservatory's world famous director. Mustering the funds, Covington left Texas for Ithaca, New York, to study music and to play the comet at Ithaca Conservatory. During that school year, 1926-27, the conservatory band included Les Brown, whose "Band of Renown" became a household name throughout the nation in later years.
Although he received a diploma from Ithaca, Covington did not earn a college degree. After returning home in 1927, he accepted a teaching position in the Marietta, Oklahoma schools.

Covington spent a year and a half from 1927 to 1929 in Marietta. He directed the high school band and the city's band. Furthermore, he directed his church's music program. Even though his life was consumed with music, he remained dissatisfied. He desperately wanted to receive his college degree, but "nobody had any money in the late '20s and '30s" (Covington 1996). Happily for Covington, happenstance intervened in his life.

In the spring of 1929, D.O. Wiley, director of the Cowboy Band at Simmons University, now called Hardin-Simmons University, in Abilene, Texas needed an assistant director and trumpet soloist for the band's scheduled three-month tour of Europe. Covington's younger brother, William, Jr., a member of the band, told Director Wiley about his older brother, his musical background, and his desire to complete the requirements for a college degree. Wiley offered both positions to Covington and also a scholarship that covered all university expenses. Covington promptly resigned his teaching post and "got in [his] car and went right straight out there" to Abilene (Covington 1996).

Covington received his Bachelor of Music degree from Simmons in June 1931. During his two years at the Abilene college, Covington's involvement in the university's program expanded. He played with the band in Europe, and gained valuable experience by directing the Simmons band at West Texas rodeos and fairs in the Abilene area. Director Wiley and Covington alternated band trips and concerts; Wiley directed the band at one event, and Covington led at another. By the time of his graduation, Covington possessed his coveted college degree and almost five years' experience as a band director and leader. In the midst of the Great Depression, he had accomplished much more than many other young twenty-three year old men. A telephone call was about to change Covington's life forever.

In August, 1931, with the school year about to begin, Austin High School still needed a band director and music teacher. Upon D.O. Wiley's recommendation, Austin, Texas school Superintendent A.N. McCallum telephoned Covington and asked him if he might be interested in the position. Covington drove to Austin the next day. Superintendent McCallum interviewed the young music teacher for about ten minutes and offered him a contract that would pay him $1350 for the nine-month school year. Covington immediately accepted the offer and became both the youngest and highest-paid teacher at Austin High School.

Covington moved to the Texas capital and began teaching at Austin High School on September 9, 1931. His predecessors had taken a 1920s award-winning band program (Burdett 1985, 44) and "ran it down to nothing." When Covington arrived on the scene, he met eight band members, six orchestra members, and about thirty choir members. He also taught a music theory class, and "since they thought I wasn't busy enough, they gave me a study hall, too" (Covington 1996).

One particular girl in the choir attracted Covington's attention. A good singer, Verna Young had the lead role in the school operetta that year. She wanted to be in the band, but school regulations excluded girls from the band in the 1930s. After Verna's graduation she and Weldon began to date. Married on August 24, 1933, the Covingtons recently celebrated their 63rd wedding anniversary.

By 1933-34 the band expanded in size and, in Covington's phrase, became "real good" (Covington 1996). During the following school year, the Maroon Band won the top award, first division, in a state-wide contest in Waco. However, Covington realized that to maintain such a high level of performance, the Austin High School band program needed to recruit students from the city's junior high schools. Accordingly, he undertook the development of such a system.

When Covington arrived in Austin, a small orchestra at Allan Junior High School constituted the entire instrumental music program available to the city's white students before they entered high school. In order to develop a junior high school instrumental music program, Covington volunteered to establish bands at Allan and the newly opened University Junior High School in 1933. As a trade-off, he relinquished his orchestra and choir responsibilities at Austin High. The Austin Public Schools' administration approved his suggestion and Covington established these feeder programs. He spent his mornings at Allan and University Junior Highs and his afternoons at Austin High School. He remembers that the program "boomed" after his establishment of the feeder system (Covington 1996).

In 1935, Covington took the bands from Allan Junior High, University Junior High, and Austin High to the state music contest. Each performed on the same day. Still, each band earned a first division ranking, the top award,
for their performances (Covington 1996). In only two years, the nascent feeder system was working.

In addition to his teaching and directing duties, Covington also composed music. In 1939, he wrote the musical score for the Austin High School song, *Loyal Forever*. The song was adopted as the school's *alma mater* by vote of the student council in January 1941. This song remains today as the school song, and the phrase "loyal forever" continues as the school's motto.

During this period of intense activity and success in the Austin schools, Covington received an offer to replace D.O. Wiley, his mentor, at his college alma mater (Sandefer 1934). Covington declined the offer and remained in Austin. Additional challenges, opportunities, and success were on his horizon.

As the 1930s drew to a close, Covington continued to direct the bands at the two junior high schools and the high school. However, the band at Austin High grew large and its program claimed increasing amounts of his time and energy. School administrators recognized the situation and altered Covington's assignment. He became supervisor of all band programs in 1940, including that at Anderson High School, Austin's high school for "colored" children.

As supervisor, Covington was involved in every aspect of the instrumental music programs in the Austin Public Schools. He approved both all musical selections for performance and all curricula and methods used by the directors. His supervisory techniques included hands-on demonstrations of rehearsal conducting. Covington recalls, "Instead of just telling them what to do, I just showed them. It worked. It worked for me, it could work for them" (Covington 1996). Still, as he worked with other band directors, he never lost his personal touch with students.

For instance, in the late 1940s, the University Junior High School band faced a stark reality. The father of its director, Frank Phillips, died and Phillips could not accompany his band to the state contest. Covington promptly stepped into the situation and took the band to the contest. He remembered, "The students didn't want to play for a sub, they wanted to play for Mr. Covington" (Covington 1996). He did not know the music the band was scheduled to play, so he sight-read it. At the same contest Verna Covington, his wife, directed the Fulmore Junior High School band "against him" in the same contest. Both of these Austin bands earned first division ratings.

Prior to 1940, Austin Public Schools' regulations excluded girls from membership in the Maroon Band. Girls were permitted to play in the orchestra, but the band was a territorial province of boys. In 1939, Charlotte June Stevenson moved with her family from New York state to Austin. Covington remembered her as a "great" flute player who had been in the marching band at her former school. At Austin High School, she wanted to march in the Maroon Band. Importantly, other girls at the school wanted to be in the band. Covington, significantly, also wanted other talented, qualified girl musicians in the band. Consequently, Covington decided to work to change the exclusionary policy. Covington remembers that he started "raising Cain" about the issue and he ultimately got the superintendent's attention.

To discuss the issue of girls' membership in the band, Superintendent McCallum called a meeting of the two junior high school principals, the Austin High principal, and Covington. McCallum "requested" their attendance, but no one understood the meeting as anything but a command appearance. McCallum presented his views obliquely, but others at the meeting knew that he did not want girls in the band. Subsequently, all the principals voted "no" to the proposal for a changed policy. Covington recalled, "I was real disheartened" (1996). The issue was not settled, however, because another McCallum entered the picture. She was the wife of the superintendent.

Mrs. Jane Legette Yelvington McCallum, who had been Texas' Secretary of State from 1927 to 1933, read an article entitled, "Problem of Girls in Band Is Still Undecided" in that evening's *Austin Statesman* (14 March 1940). Immediately, she went to work in support of the Austin High School girls, her sisters in the struggle for women's rights. Mrs. McCallum had been a leader in the women's suffrage movement earlier in the century, and her suffrage column, "Woman and Her Ways" appeared regularly in the Sunday newspaper for many years (Duncan 1996). She was unwilling to permit male school administrators, including her husband, to deny to girls this set of opportunities that boys enjoyed exclusively.

Because he was unaware that Mrs. McCallum had inserted herself into the situation, Covington was reluctant to attend a second meeting called by Superintendent McCallum for the same group the next day. Nevertheless, he attended. After voicing virtually the same remarks he presented the previous day, McCallum asked the principals for another vote. When the first principal voted "no," McCallum berated him, saying, "You're old fashioned" (Covington
1996). The votes reversed and the exclusionary policy died. Girls could join the band, but could not do "strenuous physical activities of marching and parading" without written parental permission (APS 1940). Obviously, Mrs. McCallum's influence carried the day. Covington could now use all available talent to showcase the Austin High Maroon Band.

During the war years of 1941-45, the Austin High School band flourished (Tuttle 1996). Overcoming wartime travel restrictions and rationing of all sorts, the Maroon Band continued to excel. It performed at War Bond rallies, in patriotic parades, and at the numerous local military bases. Throughout the period, Covington's reputation grew as well.

In 1943, Covington was offered the prestigious bandmaster position at Texas A&M College, now called Texas A & M University. Attracted by this visible position, Covington resigned his post in the Austin schools and moved with his wife and two young sons to College Station, about ninety miles northeast of Austin. Covington described his arrival in College Station as "no fun at all" (1996).

His offer actually was to serve as an assistant director of the band, with the promise of the director's position after the war. Once at the college, Covington had second thoughts about his decision, and subsequent events increased his uneasiness. When he inquired about the college's willingness to protect him from the military draft because of his children, college officials told him that they would not support his deferral if drafted. Covington immediately resigned from the college and he and his family returned to Austin.

He requested to resume his Austin positions and the district re-employed him. At the time of his "unresignation," T.N. Porter, business manager for Austin Public Schools, informed Covington that the school district would support his request for deferral because of his two young children and, primarily, because he was the only remaining male music teacher in the district. Although deferred from military service, Covington supported the war effort enthusiastically with his bands' many performances. By the end of the war, he had gained increased recognition from his peers.

Covington joined the Texas Band Teachers Association (now called the Texas Music Educators Association) in 1931. During the 1940s, he served TMEA in various leadership roles, including the chairmanship of the orchestra division of the association. In 1947, he was elected president of TMEA for the following school year (TMEA 1947). As president, Covington led the association in its selection of members of all-state bands, choirs, and orchestras. He also presided over the successful 1948 TMEA convention in Waco. This recognition from his peers was a harbinger of future accolades.

In March 1952, the American Bandmasters Association unanimously elected Covington to its membership (Bainum 1952). This special distinction placed Covington among the nation's elite band directors. Supporting his selection were Colonel Earl D. Irons, Covington's band director at North Texas Agricultural College in 1925 and the current ABA president, as well as D.O. Wiley, former director of the Simmons University band when Covington served as assistant director twenty-two years earlier. At the 1953 ABA convention in Deland, Florida, Covington served as guest conductor of the local high school band. He recalled that his performance before a national audience of his fellow band directors was a highlight of his career (Covington 1996).

1953 was a watershed year for Covington. Soon after his ABA performance and recognition, he conducted the Maroon Band in its final concert as Austin's only white high school band and for the last time as its director. Austin's population was soaring, and two new high schools would open in the fall of 1953. Furthermore, the expanding Austin schools needed a full-time supervisor for its instrumental music programs. The Austin school superintendent and Board of Trustees chose Covington. He was a "natural" for the new post.

Covington accepted the new position with very mixed feelings. He really enjoyed directing the Maroon Band. However, he decided that he must take the supervisory position, since he considered himself to be well qualified by his extended experience in the Austin Public Schools. He also thought that "pretty soon, somebody else would be my supervisor and I don't know whether I would have liked that or not, I don't think I would" (Covington 1996). So he moved from Austin High to the district central office and began his new job. After twenty-two years at Austin High School, he recognized new challenges and opportunities.

As supervisor of instrumental music, Covington quickly became immersed in facility planning, equipment
 purchase, and employment of music teachers for the instrumental music programs at the two new high schools, named A.N. McCallum and William B. Travis, that opened in 1953. He recommended employment of music teachers, approved curricula and expenditures for equipment, and worked to protect facilities like band and orchestra rehearsal halls and performance halls in the new schools that mushroomed throughout Austin in the decade of the 1950s.

For example, of the fifty-seven Austin schools in service in 1960, thirty-two were constructed during the 1950s (AISD 1960). Of these new facilities, four were high schools. The high school population ballooned from about 2,000 in 1938 to a projection of more than 6,500 in 1960 (APS 1950). To serve the increased number of high school students, the district had five high school campuses: Austin High, which was renamed Stephen F. Austin High School in 1953; A.N. McCallum High School, William B. Travis High School, and L.C. Anderson High School, which was for "colored" students but with a new campus, all opened in 1953; and Albert Sydney Johnston High School that opened in 1960. With these new schools and their feeder junior high schools, Covington stayed very involved with the district's music program.

As a supervisor, he spent as much time as possible in the band and orchestra halls of the schools. He observed rehearsals and offered suggestions and demonstrated techniques to individual directors. He found that his biggest challenge was the criticism of a director who was failing to perform to his high standards. Covington recalls that a few directors became angered by his comments and ignored him. Most, however, listened to and took his advice. Covington's biggest pleasure was to know that he could influence the improvement of both the directors and their bands and orchestras, and that they would recognize this improvement. Not all of his supervisory duties were pleasant, however.

Covington attended the regular weekly supervisors' meetings at the district central office. Most of the agenda items appeared to relate little or only marginally to the arts or instrumental music programs of the district. Covington felt that he could make better use of his time in a band hall or on a practice field. Other district supervisors likely shared his sentiments. Certainly, Covington made important contributions to these meetings and in his presentations to the district's Board of Trustees. He consistently advocated the best possible facilities and equipment for the district's music students and the hiring of the best qualified applicants as teachers and directors of instrumental music.

Covington remembered occasional opposition from district administrators about his employment recommendations. Once, for example, he wanted to hire Bob Foster, a recent college graduate, for an open position. Covington believed that Foster was very talented, but some district officials considered Foster too young and inexperienced for the position. Covington's recommendation prevailed, and Foster performed at a high level. Foster stayed with the district only a few years; today, he directs the very successful and highly regarded Longhorn Band. Originally employed to direct the Allan Junior High School band, Crider exhibited talent and ability. To fill the position of teacher and band director at Crockett High School in 1971, Covington selected Crider as the best qualified applicant. The district business manager did not want to employ her. According to Covington, the business manager believed that a woman could not perform the job. Covington insisted that Crider be hired because she was best qualified. Again, Covington's recommendation prevailed and Crider became the band director at Crockett High School. In 1995, The University of Texas at Austin named Paula Crider director of its highly prestigious and renowned Longhorn Band. Without a doubt, Weldon Covington was an influential contributor to her career.

Austin's population continued to increase. During the 1960s, the district opened four new high schools. They were the aforementioned Albert Sydney Johnston in 1960, John H. Reagan in 1964, Sydney Lanier in 1966, and David Crockett in 1968. Covington's many supervisory activities strongly influenced the music programs throughout the district. With instrumental music programs in place at eight high schools and eleven junior high schools, Covington continued to be very intensely involved in program development. He now believes that his greatest accomplishment was the establishment of an instrumental music program at Austin High School, then its expansion throughout the district.

Forced into mandatory retirement in 1973 at the age of 65, Covington did not cease his influence of the music scene in Austin's schools. For example, during the period 1974-1979, an average of forty-one all-state band and orchestra students were selected from AISD, more than from any other district in the state (AISD 1979). Truly,
Covington's influence could be felt, even if unknown, by each of these all-state musicians. Covington's influence continued to in other ways as well.

In retirement, Covington actively continued to support instrumental music. He served as a musical selection consultant for numerous contests. He continued to judge many contests as well. He assisted Verna Covington, his wife and band director at T.N. Porter Junior High School, until her retirement in 1977. Honors and awards increased.

During the centennial celebration of Austin High School in 1981, Covington was inducted into its Hall of Honor, a prestigious award given to only a very few special alumni and faculty. Both Weldon and Verna Covington were inducted into the TMEA Hall of Fame in 1991. The crowning moment of honor came in 1986, however, when AISD officially named a new junior high school in honor of both Weldon and Verna Covington. Now called, simply, Covington Middle School, this lasting, living tribute to the Covingtons continues to mean so much to them.

The Covingtons can be seen at their namesake school on a regular basis. They often eat lunch with the students and they attend pep rallies, PTA meetings, and sports events. Occasionally, Covington even guest-conducts the school's band.

The Covingtons also continue to attend most Austin High football games at House Park, scene of many days of glory for the Maroon Band under his direction. From time to time, Covington guest-conducts the band. Now in his late eighties, he remains physically fit by lifting weights, a routine he began early in his life.

When asked if he had any regrets over his life, Covington commented eagerly. Once, he thought he wanted to become a college band director, and had opportunities to move to Simmons and to Texas A&M. He expressed his pleasure that he remained in Austin.

Weldon Covington was Austin's music man. He was proficient technically and professionally. He composed, performed, and directed music as well as organized the logistics necessary to move his bands from their school to performance sites. He also possessed the ability and judgment to select strong individuals for important positions. As he remarked recently, "Good people equal good programs" (Covington, 1996). He also blended compassion with control and students saw him as "the leader" in any given situation. One band alumnus, for example, stated:

Discipline? No, not like the Navy Chief, but like a loving father who knows how to keep his kids in line and concentrate on the number one thing in [his] life. And what is that? Music, of course (Bible 1996).

All in all, Covington exhibited an uncommon mix of talent, ability, persistence, and hard work throughout his life. His legacy to Austin and to music education is a tradition of excellence. Another band alumnus phrased his feelings about Covington's influence:

I made many lasting friendships before moving on to college. We were a pretty rowdy bunch but when he picked up that baton and stepped up on that podium, we were all business. He wouldn't have settled for less. I've been through two wars, moved twenty-two times and traveled everywhere but my Maroon Band experience and Weldon Covington have always been among my fondest memories. I should note that I married one of the two majorettes of the band. We celebrated our 53rd anniversary this year. A lot of good things came from my band experience (Chambers 1996).

Weldon Covington was the catalyst for the growth of instrumental music in Austin's public schools. His influence and advocacy for more than forty-two years of service enabled a feeble program to become a model for emulation by other school districts. In both bright and bad times, Covington's influence encouraged students to achieve, and parents and school administrators to expect high levels of performance in instrumental music. Each time that a school band plays its school song, or that an orchestra earns an award at a state contest, the entire Austin community continues to reap the rewards of Covington's labors.

Historians have perpetuated a myth regarding William Rainey Harper's contributions to the junior college movement. One writer stated that the need for an extension of secondary education upward was the "contribution that is the glory of President Harper." Another historian postulated that the "father of the junior college movement is William Rainey Harper, first President of the University of Chicago." A recent publication updates and extends the myth with the view that "Harper founded the greatest democratic movement in the history of American higher education. Junior colleges would open college classrooms to millions who otherwise would have been denied a higher education" (Smith 1941, Colvert 1974, and Witt 1994).

Much of the myth is based on his alleged efforts to establish the nation's first public junior college at Joliet in 1902. The Harper Papers at the University of Chicago contain no evidence of Harper's efforts at Joliet. Sources do indicate his rather conservative political views were inspired by Social Darwinian ideas rather than Progressivism. Unlike Alexis Lange in California, Harper avoided leading a political movement to establish junior colleges and he never understood the junior college concept as it developed in California (Gallagher 1968).

Harper was the leading promoter and organizer among those educational leaders engaged in the business of university building. The University of Chicago, from its beginning, was intended to be an educational "trust." It served both theoretical and practical interests as a center for scientific and humanistic research. It was also a center for high level professional preparation in medicine, law, engineering, and business, and a site for the popular diffusion of knowledge. Harper hoped that the University of Chicago would become the model for a new kind of American educational enterprise. He desired that other "fit" universities would follow the Chicago pattern (Goodspeed 1916, 26).

Harper attempted to apply organizational ideas of industrial corporations to the University of Chicago. He noted succinctly that his proposed scheme "has more of the character of a railroad company or an insurance company than has heretofore characterized the organization of universities and colleges." Harper indicated his application of industrial principles through the establishment of university departments. He stated that their "work has been arranged on a business basis, with heads of departments, who are held responsible," and within the departments a ranking system was established. There were to be head professors, professors, associate professors, assistant professors, instructors, readers, lecturers, and docents. Departmentalization of the American university also involved the implementation of the concept of specialization. Specialists in history or biology were grouped according to function. Their interests were to be defined like industrial tasks (University of Chicago 1906).

Harper desired to make the University of Chicago the leading producer of scholarly monographs in the United States. This business required stressing research over teaching. Therefore, the basis of promotion in the departments was placed largely on production of tangible scholarship such as publishing books, monographs, and articles. As Harper stated, the "promotion of younger men in the departments will depend more largely upon the results of their work as investigators than upon the efficiency of their teaching" for "it is proposed to make the work of investigation primary, the work of giving instruction secondary." The graduate school constituted the apex of the university while the lower levels were considered preliminary to the work of the scholar or scientist. Though few students would ever become researchers, they would have still benefited from the university spirit which infused the whole institution (Gould 1961, 65).

The undergraduate work of the university was divided into an academic division and a university division. The academic division, covering the freshman and sophomore years, consisted of the colleges of arts, science, literature, and practical arts. The university division covering the junior and senior years contained the same "colleges." Why was the undergraduate work divided? Because, according to Harper,

"... the work of the first two years partakes largely of the academic character. The regulations must still be strict, the scope of election is limited. The character of the instruction is still the same as that of the instruction given in the academy (Harper 1892, 145)."
The end of the sophomore year, stated Harper, marks the beginning of a new period, for .

... the student begins to specialize and in many cases certainly to advantage may select subjects which will bear directly or indirectly upon the work of his chosen calling. Greater liberty is allowed in selection; greater freedom in methods of instruction. The student gradually changes from the college atmosphere to that of the university. Different motives incite him to work (Harper 1892, 145).

In 1896, the names for the separate divisions were changed to "junior college" and "senior college." Harper’s designation of the lower division of the university as "junior college" was probably the first use of the term in the United States. Actually, there were four junior colleges within the University of Chicago just as there were four senior colleges. Institutional unity was achieved by organizing the faculties of the junior colleges together under the authority of assistant deans reporting to the dean of the junior colleges. Organizational unity was also to be maintained through the junior college curriculums. No lines of division were permitted among the junior college students no matter what their curriculum—liberal arts, science, literature, or practical arts (University of Chicago 1903).

To help distinguish between the work of the junior and senior colleges, Harper initiated the awarding of the degree of associate upon students who successfully completed their junior college work. The associate degree was intended to encourage "fit" students to enter one of the senior colleges, while for the "unfit" the degree would be terminal, for "many students will find it convenient to give up college work at the end of the Sophomore year" (University of Chicago 1903).

Harper saw the junior colleges largely as aids in elevating the level of the professional schools, for the professional schools might raise their admission standards if junior colleges could guarantee that all preprofessional students would have a minimum of two years of "cultural instruction." The junior colleges could even help upgrade academies and high schools, for the secondary schools would be encouraged to undertake higher level work. Finally, the junior colleges might bring greater order out of American higher educational chaos. Specifically, four-year colleges which could not adequately provide upper division work might honorably drop their junior and senior years and become junior colleges (Harper pamphlet 1900, 4).

Harper took nearly every opportunity to inform other university presidents about the junior colleges within the University of Chicago. For example, late February, 1900, he met with other university leaders to discuss problems of common interest relating to graduate study. Institutions represented included Harvard, California, Chicago, Columbia, and Johns Hopkins. A major accomplishment of the discussions was to distinguish the universities from the colleges. During the discussions Harper presented his idea for awarding the associate degree to students successfully completing junior college work. He was pleasantly surprised to find that some members were already familiar with the Chicago plan. Presidents David S. Jordan of Stanford and Benjamin I. Wheeler of California were most enthusiastic about the associate degree (Harper to Ryerson 1900).

Perhaps Harper’s most significant influence in the development of the public junior college idea came from his comments upon the plight of the small liberal arts college in the United States. Harper was not the first educational leader to "attack" the pretensions of small colleges. Henry P. Tappan at Michigan had been an earlier critic. But Harper was the first critic to be taken seriously throughout the nation. The favorable reception of university presidents to his campaign was aided by the strong influence of Darwinian ideas on the American public. Colleges were in a struggle for existence in obtaining students, faculty, and funds. It seemed to some presidents that only the "fit" colleges would survive.

Harper commanded a relatively large audience among educators in discussing the problems and prospects of the small colleges. Pamphlets of his ideas were sent to university and college presidents throughout the nation. On July 10, 1900, he addressed delegates at the National Education Association on this topic. According to Harper, high schools posed a serious threat to many small liberal arts colleges. By small college he meant any institution graduating fewer than forty students each year. About one-third of American colleges were in this category. The threat to such colleges stemmed from the fact that much of the work formerly done in the colleges was now done in the high schools. Harper noted that the scientific equipment of the better high schools was often superior to that of colleges bestowing the degree of Bachelor of Science (Harper nd.).
The future of the small college seemed dismal to Harper, in large part, because of insufficient financial resources. Small colleges could not succeed in attracting able instructors, for the best young scholars would be looking for “greener pastures.” The small colleges could offer salaries only attractive to the “unfit.” An equally disturbing weakness of small colleges was their insufficient library and laboratory facilities. As Harper noted, “the number of institutions called colleges with an endowment of less than one hundred thousand dollars is appallingly large, and yet today the income of an endowment of one hundred thousand dollars may be reckoned at only 4 or 5 percent.” How much opportunity did this afford for furnishing instruction of a higher grade? (Harper 1900).

Harper noted several changes in the conditions of small colleges which were not only desirable, but inevitable. He considered these changes largely in Social Darwinian terms. The liberal arts colleges appeared to him to be in a “struggle for survival.” In this “struggle” the stronger colleges could be expected to survive while the weaker institutions would not. Those institutions which survived the struggle would be strengthened while others would become weaker, perhaps even closing their doors. According to Harper:

The laws of institutional life are very similar to those of individual life, and in the development of institutions we may confidently believe in “the survival of the fittest.” The severe tests, to which the [lives] of many institutions [are] subjected, serve to purify and to harden these lives. The institution which has survived the trials and tribulations of early years and which by this survival, has justified its existence, not only to its constituency, but to the world at large, deserves to live; and its subsequent life will be all the stronger and heartier because of the difficulties through which it has passed (Harper 1900).

Those colleges which could not preserve themselves in the struggle for finances, instructors, and students might survive by limiting their functions. Many weak four-year colleges might become strong academies or preparatory schools for the universities. Harper estimated that about 25 percent of the American colleges ought to concentrate on furnishing secondary work. He suggested that they become private “junior colleges.” As most of these weak colleges maintained preparatory departments, they could easily become strong secondary schools, and abandoning the junior and senior years from the colleges would save money, which could be used to strengthen the lower level work.

While Harper hoped that many colleges would drop two years of instruction, he desired that strong high schools would add two. Such institutions should evolve into high school-junior colleges. The high schools and weak colleges would then be instructing at about the same level – an extended six-year secondary level. Such a development, Harper ventured, would be consistent with the “laws of nature,” for “nature has marked out the great divisions of educational work, and the laws of nature may not be violated without entailing great waste.” Through the proper divisions of educational work Americans would finally have an “educational system” (Harper 1905, 84).

To demonstrate higher academic standards, Harper organized a loosely knit educational “trust” at the University of Chicago. This “trust” was formed through the University of Chicago policy of affiliation and cooperation with lower level institutions, including four-year colleges, junior colleges, academies, and high schools. Some of the institutions accepting affiliation included Stetson University in Florida, Kalamazoo and Alma Colleges in Michigan, and Oak Park School for Girls and the Kenwood Institute in Illinois. Though the University of Chicago was private, this did not stop Harper from attempting to make it the apex of an educational system. He considered the university, extending its influence in all directions, an integral part of public education.

Harper thought affiliation of the University of Chicago with private institutions and cooperation with public institutions would be mutually beneficial. The lower schools would be aided by the university in the acceptance of their graduates for higher work in Chicago. “The whole tone” of such schools would be “made over,” as the university inspected the instruction given in the classes of the lower school. Such schools would have their academic level raised. The University of Chicago would be aided through affiliation and cooperation by having growing sources of students. Both graduate and undergraduate students would be attracted to Chicago, and the chief aim for Harper was to get hold of the students.

Problems quickly developed in the relations between the university and the cooperating schools. A close connection with them was necessary, but the required visits of university personnel became too demanding. Besides visitations, cooperation included establishing relations with outstanding teachers at the high schools. Such teachers
were designated "university deputy examiners" and were delegated the authority to construct and administer admissions examinations.

Affiliation of the university with private colleges was often stormy. The officials of the colleges often disliked the paternalism of the university. "Affiliation" to some seemed like depriving a college of its independent existence. Some colleges rejected Harper's affiliation overture, for such a relationship seemed like a form of educational imperialism. To become an educational "colony" under the supervision of a "mother institution" was to lose independence.

Cooperation was important in the founding of the first public junior college in the nation. Joliet Junior College in Illinois was established in 1902, and Harper had influence in its creation. Harper's actual part in the establishment of the college cannot be clearly determined. His influence at Joliet came through his association with J. Stanley Brown, superintendent of schools. Harper and Brown met at Baptist Church conventions and educational conferences. Harper no doubt used some of these meetings to express his educational ideas to Brown. But more important in the establishment of the Joliet Junior College was the acceptance of its graduates at the University of Chicago. Harper drew upon the Michigan experience of a decade earlier of recognizing high school post-graduate work, but he took a more favorable attitude toward it than had President Angell at the University of Michigan. Angell had been skeptical about high schools being able to satisfactorily undertake such instruction and he had discouraged it in Saginaw and Bay City. He believed high schools should raise their graduation standards rather than attempt more advanced work. Harper, like Angell, was disappointed in high school standards, but he hoped that in time high schools would become stronger. Harper's attitude in encouraging rather than discouraging post-graduate work was an important step in the evolution of the public junior college idea (Gallagher 1974, 435-44).

The establishment of Joliet Junior College, as a department within Joliet High school, represented the implementation of an idea which had been developing for decades. The real inspiration for the founding came from a general desire of Superintendent J. Stanley Brown and others in Joliet to innovate. Harper and other University of Chicago officials encouraged Joliet by granting advanced credit to students transferring to the University. Advanced credits were earned by Joliet pupils upon recommendation of Joliet staff and the agreement of University officials.

Writers on Harper's role in the junior college movement have exaggerated his originality and influence. It has been customary to refer to him as "the father of the junior college," since his efforts indirectly led to the founding of the junior college at Joliet. His reorganization of the University of Chicago into "junior colleges" and "senior colleges" gave the junior college idea national attention. Harper was influential through the conferences held at the University of Chicago during 1902-1904 in which the junior college idea received considerable attention. Harper was also, probably the first person to use the phrase "junior college" to refer to grades thirteen and fourteen. And finally Harper was responsible for the granting of the associate degree at the University of Chicago (Smith 1941, 516).

In spite of William R. Harper's important contributions to the evolution of the public junior college idea, it would be easy to exaggerate his achievements. Harper's conception of the junior college was conditioned largely by the desire for organizational reform, and the organization of the University of Chicago shed little light on junior college functions. Though the university was divided into "senior colleges" and "junior colleges," the lines between the two were very indefinite. Junior college students took senior college courses, and upper division students enrolled in lower division courses. It was not even unusual for 10 percent or more of the students in the junior colleges to enroll in graduate courses. During one quarter 39 percent of the junior college students took advanced courses. Thus students were ignoring the "junior" and "senior" college designations (Storr 1966, 306).

While University of Chicago students largely ignored the distinctions between courses in the colleges, they nearly disregarded the associate degree altogether. To Harper the associate degree was intended to signify that students of lesser ability and desire ought to terminate their studies at the completion of the sophomore year. But this terminal function never worked, as few students took the associate degree and left. Students who could successfully complete two years were ready for two more. The junior colleges at Chicago were really segments of four-year programs. The University of Chicago functioned largely like other universities. Professor Storr stated that "the university did not differ greatly from older institutions in point of essential conformity to the tradition of the four-year college. The university observed a difference between the first and second halves of the undergraduate program, but
so did Yale.” (Storr 1966, 213).

The emphasis which Harper’s university placed upon research even hindered the effectiveness of the “junior colleges.” The research aim of the university took away status from the traditional teaching function. The junior colleges at Chicago were staffed largely by new recipients of the doctorate, and they were often inexperienced in teaching. Senior college faculty members had higher status. Junior college instructors desiring higher status concentrated on research also. The cult of research at the University of Chicago resulted in the neglect of undergraduate instruction—a major problem of American universities during the twentieth century. Though Harper had not intended that teaching would be neglected at the university, it resulted anyway.

It is ironic that junior college educators like David Starr Jordan and Alexis Lange would criticize the trend in American universities to neglect teaching. Poor lower division instruction in universities became an argument for establishing separate junior colleges. Harper’s university became the prototype for the institution neglecting undergraduate instruction, and this neglect became a justification for the establishment of junior colleges (Gallagher 1995, 1-12).

Harper’s interest in the junior college idea was largely related to his greater concern with the complete reorganization of American education, and within this concern for reorganization was the principal aim of founding a “graduate university.” Though he revealed an interest in popular education, his concern for the upward extension of the high school was conditioned largely by the desire to build an “empire” for the University of Chicago. Affiliation was a kind of educational “imperialism.” It was to assure the university of a steady flow of students more than to enhance educational opportunities for students in communities such as Joliet, Illinois, and Goshen, Indiana. The most important consideration in affiliation was to guarantee a supply of “thoroughly prepared” students who would be capable of “research and investigation.” His attacks on the “pretensions” of small colleges and his urgings that they drop the junior and senior years made him unpopular among liberal arts college educators. Harper favored decapitation of “weak” colleges, in part, because he hoped these academy-junior colleges might furnish students for the universities. While most of the early students at the University of Chicago were public high school graduates, he never felt comfortable with public secondary school university preparation.

Harper’s reorganization efforts at the University of Chicago and his encouragement of the founding of Joliet college was not the beginning of the junior college era as much as it was the last stage of university presidents urging the abolishing of the four-year baccalaureate college. The public junior colleges later founded in California and elsewhere were distinct products of the twentieth century. Harper never developed a conception of the public junior college related to its purposes and functions. They emerged, in large part, out of the spirit of California progressivism with Alexis Lange as the leading advocate and philosopher of two-year institutions. Under Lange’s leadership the junior college was to be an educational institution to provide two years of liberal arts instruction for students desiring to continue their studies at a university. It was to provide middle-level occupational instruction for students not planning to obtain a bachelor’s degree. The junior college was to emphasize the instruction of adults and attempt to provide community services consistent with local needs. Though each junior college would emphasize these functions in varying degrees, the seeds for the long-range development of the community junior college were present in Lange’s fertile mind. Unlike Lange, Harper was an elitist with little concern for expanding educational opportunities in local communities - the major thrust of community junior colleges in the twentieth century. William Rainey Harper was more “deadbeat dad” than “father” of the junior college (Gallagher 1974, 111-22).

The Strange Case of Joseph Baldwin

Jared Stallones
University of Texas at Austin

The American university tenure system has long been seen as necessary to the maintenance of academic freedom. On 2 September 1996, University of Texas Chancellor, William H. Cunningham, in the Austin American-Statesman, called tenure "an important safeguard for the protection of free inquiry, open intellectual and scientific debate, and unfettered criticism of the accepted body of knowledge." Yet across the country tenure is under fire for protecting incompetence, and education leaders are proposing reforms. Cunningham assures us that under his reform "the faculty member's rights of freedom of association, free speech and due process would be respected." But regents are political appointees subject to political pressures. It was for exercising his right to free speech and freedom of association that politically motivated University of Texas regents a century ago abruptly ended the distinguished career of Joseph Baldwin, their first Professor of Pedagogy.

Teacher education was slow in coming to Texas. In fact, nothing identifiable as a true system of schools existed there before the Civil War. Reconstruction era governments sought to provide public schools, but faced opposition from a disaffected and suspicious citizenry. Post-reconstruction governments battled reactionary and elitist forces uninterested in the general education of the masses. Yet to enter the modern era, Texas needed good schools.

Providing competent teachers in appropriate quantity was the immediate challenge. Governor Richard Coke outlined the crisis in 1874:

One of the greatest and most pressing wants which, more than any other, impedes the successful operation of our free school system is a sufficient number of educated and trained teachers. . . . I urgently recommend, in view of the urgent necessity, that your honorable bodies take measures looking to an early establishment, upon a liberal scale, of a normal school. (Moreland 1916)

Here was a call for the establishment of a state institution specifically for the education of teachers, but the legislature was not ready to act.

The question arose again in the Constitutional Convention of 1875. Progressives in that body laid the foundation for a comprehensive modern school system, but the conservatives scuttled it when the first legislature elected under the new Constitution adopted the School Law of 1876. This landmark legislation left the schools much as they had been before: a diverse array of public and private common schools, ungraded, for primary education; a few, mostly private, academies for teacher education and college preparation; and private colleges, mostly sectarian, for religious education. The quality and availability of education was uneven, to say the least. Any group could organize itself into an 'educational community' and apply for state funds to run a school. Teachers were certified by examinations overseen by "Three well educated citizens of the county." A certificate could mean anything or nothing.

By the 1870's, though, Texas was industrializing and its educational needs were changing. Brenham organized the first public high school in 1875, and other cities quickly followed. Secondary education demanded better prepared teachers, but Texas had no control over the supply or quality of teachers, because it had no public normal schools. Educators vowed to change that.

In 1876, Dr. Barnas Sears toured the state for the Peabody Education Fund with Dr. Rufus Burleson. He reported a growth in enthusiasm for education, but warned that,

Except with a few teachers educated in Normal Schools in the Northwestern states, and emigrants from Germany, there is a prevailing ignorance of the progress made in recent times in the process of education . . . Until Normal Schools shall be established, this kind of training in the cities [by the Superintendents], and teachers' institutes in all parts of the state, will be indispensable. Otherwise, the public schools will be but a farce. (Peabody Education Fund 1876)

Teachers realized the problem. An 1879 convention called for state supported teacher education. Governor Oran M. Roberts urged the creation of two normal schools, one for black teachers and one for white. The failed Alta Vista Agricultural College for Colored Youth became Prairie View State Normal Institute, and Sam Houston State Normal Institute opened in Huntsville in October 1879.
Sam Houston's reputation grew when it attracted Dr. Joseph Baldwin as its principal. Dr. Baldwin had already distinguished himself at normal schools in Pennsylvania, Indiana, and as 'the father of normal education' in Missouri. In 1881, he directed the new Summer Normal School at San Marcos. He impressed students with his scholarship. In a report to the State Board of Education, his students related that "at each rest he would advise that all have a good time and be sociable, that a band of teachers be as a band of brothers" (Texas Journal of Education 1881, 219). They concluded by commending the organizer of the Summer Normal for "procuring us a leader who, from his many years' experience in older States, was so fully able to arouse interest and give Texas the needed assistance" (Texas Journal). Finding itself in need of a principal for Sam Houston Normal Institute, the State Board, led by Governor Roberts, offered the position to Dr. Baldwin, and he accepted. The normally xenophobic Texas education establishment admitted that "while there were many excellent teachers in the State there were not six known to the public as answering the required need" (Texas Journal, 220).

The appointment was enthusiastically applauded. Percy V. Pennybacker invited fellow graduates of Sam Houston to write Dr. Baldwin for practical teaching tips. Pennybacker described him as "one of the most pleasant, agreeable and earnest gentlemen I have ever seen. He is thoroughly enthusiastic with his work."

Baldwin rapidly made himself a fixture in Texas education. The following summer, 1882, he was appointed traveling lecturer to the 18 planned summer normals. Baldwin waded into political issues when he felt it necessary. The October 1882 edition of the Texas Journal of Education contains his grand plan for a new school system for Texas, a plan which engendered vigorous debate. The same issue contains an editorial in which Baldwin called on educators to donate funds for the endowment of a chair of didactics at the future University of Texas.

Having successfully launched two normal schools, could contemplate its next step toward a comprehensive public education system, a state university. Many saw it as vital for supplying teachers and administrators for the public schools and teacher educators for the normals. A leading Austin newspaper, the Weekly Statesman of 28 November 1889, claimed, "The State University can be made the apex of a pyramid embracing the public schools at its base, and constituting a grand educational system in which every Texan can take pride." Ashbel Smith, a longtime Texas leader, wrote in 1881 of "great and most salutary effect of a well-grounded and well-managed State University in our State of Texas on the greater development and bettering of our Common Public Free Schools" (147-8).

Governor Roberts included in his arguments for establishing a university that Texas should not be dependent on other states for "statesmen, lawyers, judges, preachers, teachers."

The University's proponents carried the debate, and classes were first held on September 15, 1883. There was no chair of pedagogy among the original faculty, and no education classes offered. It was assumed that a university education by definition equipped one to teach. Pressure soon mounted, though, for the new University to initiate education courses at the earliest juncture. The common schools were increasingly staffed by graduates of the high schools and normal schools. The high schools looked to the normal schools and the colleges. But there was no higher institution in the State to provide the specially trained personnel needed for teacher education and administration.

At the same time, the University's faculty noticed that their students were ill prepared for higher academic work. Professor Mallet (Berry 1980) wrote, "These young Texans were characterized by a great lack of formal school training." Their solution was the Affiliated Schools Program, a system by which the University assessed and accredited high schools. The program did much to promote healthy relations between the University and the schools, but it had unintended consequences. As schools sought to meet the requirements of affiliation, it became clearer that Texas did not have enough teachers equal to the task of raising academic standards. It was equally clear that the smattering of private colleges and normal schools could supply neither the quantity nor quality of teachers Texas needed. Speaking at the first commencement exercises of the University in June 1884, Governor John Ireland asked, How and where are students to get their education to fit them for the University? There are but few high schools in Texas . . . I wish again to impress upon the immediate management of the University the absolute necessity of encouragement in some way to preparatory schools. (1884)

How, indeed, would the University help supply the burgeoning need for teachers? Upon his retirement as State Superintendent in August 1890, O.H. Cooper called for the establishment of a
Chair of Pedagogy at the University:

We should have some institution in the State which would prepare high school teachers and scholarly county and city superintendents. Such a chair well filled would attract many students of the highest character to our University. (1890)

By the 1890’s this was a commonplace at colleges and universities across the country. Cooper’s successor as State Superintendent, J.M. Carlisle (1891), reporting to the Legislature in 1894, quoted President A.S. Draper of the University of Illinois, “It [the state university] is to be a student of public school problems. It is to gather up the world’s experience and most advanced thought concerning the training of teachers.”

There has often been a reluctance on the part of the academic faculty to bring pedagogical studies onto university campuses. The University faculty, though, was unusually receptive to the establishment of a Chair of Pedagogy. One reason is found in the Faculty Report for 1890-91:

We have been this year, notwithstanding the great pressure on our time as teachers, to re-examine the previously affiliated schools ... the yearly inspection of these schools is only second in importance to the work done in the lecture rooms of the University itself.

Despite the importance of school visitation, it was clearly a burden.

Other Texas teachers weighed in on the issue as well. The 1890 convention of the Texas State Teachers Association passed a resolution calling on the legislature to establish a Chair of Pedagogy at the University. Jacob Bickler, a long time activist for this cause, was deputized to shepherd the resolution through the legislature. He faithfully executed his charge, and on August 25, 1891, upon a motion by E.J. Simkins, the University’s Board of Regents created the School of Pedagogy and hired Dr. Baldwin to fill its chair.

Baldwin had been lobbying for the position since he wrote former Governor Roberts in 1885 asking if he could "secure the Chair of Didactics for me?" (Baldwin). His letter of resignation from the principalship at Sam Houston, tendered to the State School Board on August 27, 1891, revealed his hopes for his new position. He wrote that it would, "relieve me of the care of a large school, and afford me an opportunity to do a work I much desire to do" (Texas State Board of Education 1891).

He had his work cut out for him. In 1890-91, the University subscribed to no education journals. But he threw himself into organizing the new School, beginning with a statement of purpose:

The object of this School is to prepare students for the profession of teaching. in our high schools, academies, city schools, and colleges to carry the highest college culture into the teaching profession. (University of Texas Faculty 1892) The first class in the School of Pedagogy assembled September 23, 1891. Juniors took courses entitled School Management, Applied Psychology, and the Art of Teaching. Seniors took History of Education, Science of Education, and the Art of Teaching. Graduates did seminar work. Those who completed the course of study had the title "Graduate of Pedagogy" printed on their diplomas.

In 1896, the School was recommended for upgrading to Department status, but the Board of Regents voted in favor of the following:

Resolved, that it is the sense of the Board of Regents that the School of Pedagogy heretofore established in the University of Texas should be discontinued from and after the termination of the present session of 1895-96. (Minutes)

The Board relieved Dr. Baldwin of his duties, granting him one year’s unpaid leave of absence.

Several explanations have been advanced for this sudden policy reversal. One author contends that the School was discontinued due to Professor Baldwin’s failing health (Anderson 1980). Baldwin passed away in 1899, but there is little to suggest any debilitating condition as early as 1896. Indeed, he was vital enough to serve as President of the Texas State Teachers Association in 1897.

Another explanation centers on financial issues. In defending the Regents' action at the time, Thomas D. Wooten, the President of the Board, explained to Jacob Bickler, "They [the Regents] believed that the fund thus expended can be more properly and [unintelligible] utilized along more direct lines of University work" (Wooten 1896). Texas suffered as much as any region from the severe recession of the early 1890's, and it is true that in the
the Regents were searching for sources of funding outside the University to support the School of Pedagogy, but this action is not consistent with others the Regents took in the same period. Throughout the early 1890's, the Regents expended large sums of money to build the Medical School at Galveston. In the same period, the School of Pedagogy requested no funds. The Board appropriated $200 in 1892 to establish a professional library, and no further expenditures beyond Baldwin's salary are reflected in Regents' records. A school that attracts students without requiring additional outlays would seem to benefit, not harm, a university's balance sheet.

Some in the educational establishment expressed doubt as to the stated reasons for the School's closing. J.M. Carlisle, State Superintendent of Public Instruction at the time, spoke for many when he wrote:

The school of pedagogy has been suspended for the current year, much to the regret of many friends of the University. Whatever may have been the causes that led to this action, and it is assumed that they were most urgent, it was a step apparently backward, and has had a depressing influence upon the good name of the State in educational circles abroad and among some of its best friends at home. (1896)

He went on to relate how the first year of the School of Pedagogy recorded the highest enrollment the University had yet seen, and that since the School was discontinued, enrollment had declined. In practical terms, Texas could not afford to close the school. Official records indicate that for the 1895-96 academic year only 15% of Texas' certified teachers had received their credentials as a result of formal professional instruction. Carlisle called it, a sad commentary on the professional standing of the teachers of the State, and when it is understood that our State normal schools and the State University and the Peabody Normal College, which furnishes a few teachers for Texas, cannot furnish more than one thousand trained teachers each year, the imperative necessity for enlarging the facilities for educating our teachers is apparent. (Texas State Teachers Association 1898)

So, if these explanations are problematic, what else could explain the Regents' actions? The 1890's saw a reassertion of 'Southern values' in Texas culture, and it was not uncommon for the Board or the legislature to investigate the political sympathies of faculty members. On March 4, 1893, The Legislature's Joint Committee on State Institutions of Learning reported,

Unfriendly criticism in circulation concerning the University have [sic] received attention from your committee . . . Some of the professors, it seems are from Northern States, one of them is perhaps a Republican in politics, and one of them is a pensioner of the United States for service rendered and wounds received in the Federal army during the great Civil War. (House Journal 1893)

In the summer of 1897, the issue heated up again. This time, the University Regents, President Winston, Political Science Professor D.F. Houston, and History Professor William Garrison were called before a legislative committee. The charges were:

there has been employed and included in said University those who are out of touch and not in sympathy with the traditions of the South, but hold our traditions and our institutions in contempt, and circulate and teach political heresies in place of the system of political economy that is cherished by our people . . . [the Regents should] exercise great care hereafter in selecting as members of the faculty only those who are known to be in sympathy with Southern political institutions, and further request them to cancel as soon as possible any existing contract with members of the faculty not so in sympathy. (House Journal 1897, 110)

Apparently, much of the furor surrounded Professor Houston's book, A Study of Nullification in South Carolina. "A casual reading would pronounce it to be unacceptable from a Southern standpoint as setting forth principles contrary to Southern teachings" (House Journal, 191-2). To their credit, the Regents answered the charges by saying that "there never has been any desire to employ professors or not to employ professors because of their coming from the Northern States. The sole test has been fitness for the position" (Benedict 1917, 408). The investigation proved to be more smoke than fire, as both Houston and Garrison kept their positions for many years. Still, the committee recommended regular legislative oversight of the University's political sentiments. The Regents further defended themselves:
There is not now, nor has there ever been, in the University of Texas, any instructor intended or calculated to hold in contempt the Southern people or ridicule their institutions. The Regents believe that all teachers, everywhere, to be successful, must be in sympathy with the people whom they teach, and, while the University of Texas is in no sense partisan, sectarian, or sectional, yet it is in sympathy with the life, character, and civilization of the Southern people. (Benedict 1917)

It was in this political climate that, in the summer of 1895, Dr. Baldwin journeyed north to Denver for the annual meeting at the National Education Association. On July 11, he delivered an address on the theme of the duty and opportunity of the schools in promoting patriotism and good citizenship. Baldwin's speech was entitled "The Study of American History as a Training for Good Citizenship", and it was certainly not intended to give offense, but in the course of his talk he managed to embarrass or offend many in the audience.

Baldwin intended to defend the South against charges of disloyalty when he said, "Nowhere in all our country do the fires of patriotism bum quite so brightly to-day as in our sunny Southland" (National Educational Association 1895, 141). Then to press the point home, he added that "all our Southern people, I think, without exception rejoice to-day that the Lost Cause is a lost cause... We love the South, and we love it because it is a part of our common country". No doubt, there were Texans who would disagree with him. In fact the Galveston Daily News considered Baldwin's comments on the Lost Cause were the only part of his speech worth relating. The newspaper mistakenly reported on 1 September 1896 that Baldwin's talk was titled "Patriotism of the Southland."

But Baldwin was not done. He went on to disingenuously claim that, we are giving the colored people of the South every advantage that we give to the white people. If we have a common school for the whites, we have a common school for the colored people. If we have a high school for the whites, on equal terms we have high schools for the colored people. If we have universities for the whites established by the state, we have colored universities, giving the highest education to the colored people. (N. E. A. 1891, 141)

These statements were demonstrably untrue.

Baldwin's most outrageous statements, though, came as he tried to defend the growing restrictions of the political rights of Southern blacks. He argued, Now, you blame us because we have made some restrictions. Before you all to-day I simply state what I believe to be a true position, that intelligence should govern. Senator Foster, a few years ago, at our State Teachers' Association, made a declaration that seems to me to be right: 'Universal education and limited suffrage.' Now, I do not defend many things that seem to have been found necessary, but the whole South is coming to this, to leave the colored man to vote as freely as the white man as fast as he becomes intelligent, able to read and write, able to understand his duties as a citizen. (N. E. A. 1895, 142)

Of course, the trend in suffrage for Southern blacks was moving in the opposite direction.

In the audience was O.M. Roberts, and he took such umbrage at Baldwin's remarks that he wrote Wooten about them. His letter was discussed by the full Board of Regents at its September 6 meeting. Some attempts were made at that meeting to defend Professor Baldwin. An explanation advanced for his indiscretion was that he was speaking extemporaneously in place of another scheduled speaker, but Regent William Prather claimed that Baldwin's remarks were "not entirely impromptu." Prather may have felt a personal animosity toward Dr. Baldwin. In a later note to Wooten, he mentions his discomfort with Baldwin's "overeagerness to please" (Prather 1896). Others had bristled at Baldwin's manner before. State School Board records show that he was repeatedly reprimanded for violating Board policies. At its September 11, 1882 meeting the Board passed a resolution that Baldwin, "be hereby again [emphasis theirs] instructed that under no circumstances shall he receive into said institute as State pupils any one who has at any time attended the Institute as a state pupil" (Texas State Board, 181). In the same meeting, the Board ordered that Baldwin, "be referred to resolutions adopted by the Board... and that the same be unqualifiedly adhered to and that the school be conducted in reference thereto." The tone of annoyance is unmistakable. In the end, the Regents voted their "concurrence" with Roberts' sentiments, adding that the speech reflected Baldwin's own feelings, not those of the Board.
Unfortunately, Roberts' letter outlining his specific objections to Baldwin's speech has been lost. But it is unlikely that Roberts objected simply to the statement about the Lost Cause. Although Roberts was a leading former Confederate, he advocated reconciliation. Speaking before a reunion of the Mountain Remnants, United Confederate Veterans, at Marble Falls on July 28, 1895, he said, "The object of these reunions is social, to see old friends together that suffered in the lost cause, but not in the spirit of keeping up the antagonisms between the sections of our common country" (Roberts). More likely, he was embarrassed for his beloved University at the generally impolitic nature of Baldwin's remarks.

The education establishment was full of old Confederates, though, and some of them may have been more troubled than Roberts at Baldwin's characterization of Southern feeling. Regents Wooten, Ball, and Prather served in the Confederate army, as did Professors Waggener, Gould, Mallet, Brown, and Proctor J.B. Clark. Professor Dabney had served as a staff officer to Stonewall Jackson, and was known to rail against the "defects of Yankee education and the follies of imitating them" (Dabney 1894). He emphasized the "importance of making it [U.T.] a thoroughly Southern institution for Southern youths." Baldwin had served in the Union army during the war. In fact, in 1863 he organized and led a company of his Kokomo Normal School students. Those less tolerant than Roberts may have objected to a former Union officer filling a chair at a Southern university.

Through indiscreet words, the career of a man termed a great "builder of the free school system in Texas" (Interscholastic Leaguer 1934) was over, and with it, a hopeful beginning for university level teacher education in Texas. There were no courses in Pedagogy offered during the 1896-97 school session, but the already acute teacher shortage ensured that the University could not ignore its duty to Texas schools for long. On June 16, 1897, President Winston appeared before the Board of Regents and requested the establishment of a Department of Pedagogy with a full professor and adjunct professor. He said,

The work of this school is of such importance, not only to a perfect system of University training, but also to the proper development of the public school system of the State, and to the general interests of the University. (Minutes)

Professor Baldwin's resignation was accepted, and he was named Professor Emeritus. William S. Sutton and Alexander Caswell Ellis were chosen to lead the new department.

Some might argue that, judging from the subsequent distinguished careers of both Sutton and Ellis, replacing Baldwin was a step forward for teacher education at the University of Texas. But there is no indication that Baldwin had done anything less than a superb job in his post. He was most likely relieved for purely political reasons. Tenure would have afforded Baldwin some measure of protection from spurious dismissal, and might have saved the promising new School of Pedagogy from needless disruption at a crucial time in its development.

Segregated Students at the University of Illinois, 1945 to 1955

Deirdre L. Cobb
University of Illinois at Urbana-Champaign

African American students at the University of Illinois Urbana-Champaign (UIUC) had to bear much of the burden their ancestors had endured. They were allowed to attend the University, however enrollment was on a limited basis, and they were not accepted as full and equal participants. The experiences of African American students at UIUC from the end of World War II to the Brown decision (1945 to 1955) were part of a history of overt and institutionalized discrimination dating back to the founding of the University.

African American students were constant victims of discrimination from the start of their enrollment at the University of Illinois. The determination of these students, with the assistance of Albert R. Lee, the unofficial dean of African American students, and the encouragement of African American elected officials, community individuals, the Interracial Committee, and individuals in nearby Chicago and St. Louis, enabled them to fight the discrimination emanating from varying levels.

The University of Illinois was incorporated on February 28, 1867, as the Illinois Industrial University and opened its doors to students on March 2, 1868. At the opening, it was clear the institution was intended for White men, despite its public land grant status. There was nothing in its charter which compelled discrimination against students because of race, sex, or class. Indeed, the U of I was chartered for all the children of the “industrial classes” of Illinois. Nonetheless, the University opened with fifty White males and maintained an all White male population until 1870 when it admitted its first female student, a White woman.

It was clear that women would no longer be excluded from admission to Illinois. The decision prompted by the fact that Illinois was a state school and taxpayers demanded their daughters as well as sons be educated. The Morrill Act established the land grant colleges especially for the sons and daughters of the common people. Although this was the case, it would be quite some time before White women matriculated at Illinois in any significant numbers. In 1887, the University admitted its first African American student, nearly two decades after the founding of the University. The population of African American students at the University remained at a minimum during the first half of the twentieth century, but there were relatively significant increases during the 1930's, 40's and 50's. From 1945-1955 approximately two thousand African American students matriculated at Illinois.

Housing problems that dated back to the founding of the University were exacerbated during the 1940's and 1950's for all students. Black students who faced the additional problem of racial discrimination found themselves in a difficult struggle to cope with living conditions on a Jim Crow campus. Typically, students lived in private housing around campus or if from the area with their parents in town. The first dormitory was erected in 1915. This dorm was for White women only, and was named Laura B. Evans Hall. This alleviated the problem of finding approved housing for many White women on campus, but the problem still existed for African American women. Over the next three decades the University continued to deny African American students the opportunity to live in campus dormitories. The year 1945 marked the first time African American women were allowed to live in the residence halls. The historical record is unclear as to when African American men were first allowed to reside in University dorms (Boarding 1930). It seems reasonable to assume that African American men were first admitted to the University residence halls soon after the admission of African American women in 1945.

African American students were only permitted to live in fraternity or sorority houses or in the African American community. The University housing authorities made virtually no effort to provide housing for Black students, who were expected to live off campus in restricted areas. Realtors used racial covenants to restrict various areas in and around town and thus African Americans were regulated to one corner of town based upon this particular situation. The covenants, although focused mainly on home ownership, also influenced renting to non-Caucasian individuals. The covenants clearly stated that “no part thereof will be sold or leased, either in whole or in part, or to be occupied as owner, or tenant by any person or persons not of the Caucasian race,” and this in turn set the stage for the limited choices African American students had for their living arrangements (Tiebout Papers). These covenants characterized the community into which the students were received.

Along with African American students being expected to live in restricted residential areas, housing for African Americans generally in the Champaign-Urbana area in the 1940's was despicable. A study conducted by the League of Women Voter's of Champaign County in 1946 indicated that housing for African Americans was a total disgrace (League of Women Voters). Many families lived in shacks with no indoor plumbing and had to use outdoor privies. In most cases these privies were very unsanitary and caused many people to contract communicable diseases, such as tuberculosis. Furthermore, these were previously used as coal bins (League of Women Voters 1946). In many instances the dwellings' people lived in were barely large enough for their families, not to mention students. It was in these conditions the Black residents of Champaign-Urbana had to live, as well as the African American university students that resided with them.

It is very important to note that many African Americans living in these conditions were able to afford better housing. Despite having the means to afford better, racial discrimination by the city Realtors and landlords prevented them from finding better housing (League of Women Voters 1946). It was clearly a situation where they were forced to live in a racially segregated and impoverished residential area, despite their economic capability to maintain a household in a more inhabitable environment. The condition of housing for African Americans in the community affected the majority of Black students, since most of them were compelled to live in the community. About the only exception were Black students who lived in fraternity and sorority housing.

Early on, the role of Black fraternities and sororities became quite evident in combating the housing needs for African American students. Most of these organizations were founded on the principle of community service, and functioned as a vehicle for African American students to come together under a common bond of struggle. Alpha Kappa Alpha Sorority Inc., (AKA) was one of the first organizations at UIUC to fight for housing near campus. This sorority was successful in securing housing in 1928, with the help of outside members, the Dean of Women, and various other African Americans and Whites.

After World War II the influx of African American students rose, due in significant part to the GI Bill. The impact of housing discrimination increased significantly as more African Americans entered the University. African American students were being admitted to the University at increasing rates. However no provisions were made for their room and board, and they were not allowed to eat, live, or interact socially on campus. If they were to attend the University it was an unspoken agreement on the University's part that they were to reside in the African American community. They were not to live on campus except in the rare instance of Black Greek houses located near campus.

The University prohibited students from living on campus through an unwritten policy that contradicted its written rules regarding equality of opportunity (League of Women Voters 1968). The unwritten policy was introduced in the form of a question on the housing application. All students were asked to designate “Race, and National Descent? (Willard Papers).” Individuals were curious as to why this question existed. University officials tried as best they could to explain, but the explanations were unsatisfactory. Lawyer and State Representative Charles J. Jenkins, from Chicago, was very concerned about the structure of the housing questionnaire and contacted the President of the University to inquire as to why these questions appeared on the form and what purpose they served. Consequently, President Willard had S. Earl Thompson, Director of Housing, conduct an investigation. In a letter to A.J. Janata, Assistant to the President, dated 6 August 1945 (Willard Papers), Thompson explained that these questions were of much importance in order to avoid any major errors in room assignments. However the most interesting part about his response is the meaning behind “major errors.” In this context major error meant unwittingly assigning students of different races and religions to the same double rooms. Willard forwarded the results of the investigation to Jenkins, omitting the statement issued by Thompson to Janata in the letter dated 6 August 1945 (Willard Papers). It read,

Almost 90% of our residence hall spaces are in double rooms. It seems essential to us that we have information which we requested if we are to avoid major errors in the assignment of roommates. I know of no University or College which does not request similar information for applications for assignment to residence halls.

In the history of the University, no African American had lived in the dorms, so in 1945 when the letter was written, no presumable "errors" had occurred. It was clear the President did not want any errors being made.
Jenkins began a campaign to ensure that African American females would have the opportunity to live on campus in the dormitories. He submitted several names to the President for consideration and awaited a response. In a letter to A.C. Willard dated 30 July 1945 (Willard Papers), Charles J. Jenkins was almost pleading with the president for consideration of his suggestions. In a letter to Thompson dated 11 August 1945 (Willard Papers), Jenkins provided letters of reference for various women, as well as giving his word that they would be qualified and respectable candidates. It was evident that African American women had to be hand picked for living in the dorms. There was no where on the housing application that indicated categories for respectable and qualified. Furthermore, it was inferred that a candidate might have the grades and still not be considered respectable by the University. In a letter to Charles J. Jenkins dated 2 August 1945 (Willard Papers), President Willard listed several reasons for the refusal of African American women being admitted to University housing. He commented that one woman was on academic probation and her grades were not satisfactory enough to live in the dorms. Of the housing documents surveyed never was it indicated that a particular grade point average had to be maintained for residents of the dorm.

A.C. Willard, realizing this campaign would not end until African American females were permitted to live in the dorms, offered a token measure. In a letter to Charles J. Jenkins dated 2 August 1945 (Willard Papers), Willard wrote ensuring him of his willingness to see African American women housed in the dorms, going so far as to reserve one room for African American females. This gesture was an assurance of the commitment to African American females. It was August 11, 1945, that two African American women were finally agreed upon, Quintella King and Ruthe Cash. These women were the first known African Americans to live in the dorms at UIUC.

In 1950, five years after the first African American females were admitted to the dorms, Vivian Adams experienced what may have been true for many African American female residents, racism. Apparently there had been several thefts in Busey hall, where Vivian resided, which were of great concern for the hall faculty as well as the women that lived there. In January of 1951 the dorm director called for an investigation indicating she had some information pertaining to the recent thefts. In a letter to University investigator R.S. Laymon dated 30 January 1951 (Women’s Card Files), security officer J.E. Ewers wrote that it had been brought to his attention by the dorm monitor and some of the women living in the dorms that they had observed Vivian Adams going from room to room suspiciously.

When Vivian was questioned she adamantly denied having anything to do with the thefts in Busey Hall. Furthermore she could not understand why she was being questioned on the matter. During questioning, her room was searched by dorm officials. In a report dated 2 February 1951 (Women’s Card Files), Florence B. Ingraham, Assistant Dean of Women, wrote to J.E. Ewers that the end of the search resulted in the finding of several reportedly missing items. Vivian still denied having anything to do with the thefts and refused to talk.

The matter was going to go before the student disciplinary committee, and until a decision was made Vivian was placed on probation. In the interim Vivian was questioned again, and eventually she felt comfortable enough to tell what had happened in regard to the thefts at Busey Hall. In a letter to J.E. Ewers dated 7 March 1951 (Women Card Files), Miriam Shelden, Dean of Women, wrote that Vivian admitted stealing the items from various students in the hall in an effort to hurt them as she had been hurt. She further stated she had not intended on keeping the articles or disposing of them. She merely wanted to cause pain to the women in the hall by taking things they valued highly, as this was her only recourse.

Prior to the thefts in Busey Hall, Vivian had engaged in conversation with some of the other female residents in the hall. These women were Jewish and they indicated how they had never cared for "Colored” people. Very much offended by this statement Vivian questioned them as to why.

In a letter to J.E. Ewers dated 7 March 1951 (Women Card Files), Miriam Shelden described the conversation that occurred between Vivian and the Jewish women, based on Vivian’s account. The Jewish women in the dorm described ways in which "negroes are so gullible.” Real estate operators seek African Americans to purchase property in an all white area. By purchasing property in these areas, African Americans are being set up to make White residents feel uncomfortable. As Whites began to move, real estate operators began to buy the homes at a reduced rate, and eventually resell the property in smaller units at a much higher price. The Jewish female students characterized the African American buyers as ignorant, implying that they were unwilling dupes of real estate
operators, and therefore very easy and willing prey. In the same letter dated 7 March 1951 (Women’s Card Files), Shelden reports Vivian as having said that African Americans were no different from other people who could also be victims of economic exploitation. The conversation ended in a violent argument, with the Jewish girls finally stating that Vivian and her sister were somehow different from the average "colored" person. This statement alone enraged Vivian, and she vowed to herself that she would repay them for their unkind words and thoughts about her race (Women Card Files). Vivian was very clear in her admission of guilt that she had not intended to keep or use the items. She intended on returning the items.

Vivian made an error in judgment when deciding to take items that did not belong to her. It was clear that she felt insulted, rejected and humiliated. Her actions, however inappropriate, constituted a vendetta against racism. Vivian’s stealing was her response to one issue of racial discrimination that was present in the lives of African American students. There were many other instances that would require a response as well.

The problem of housing still existed but it was further compounded by a lack of eating places available to African American students. African Americans were discriminated against in dining facilities on campus well until the 1960’s. African American students were not allowed to eat on campus or at any of the campus restaurants. Students were forced to carry meals or return to the North End for meals during school days. The trip back to where they resided could consist of an hour or so, allowing thirty minutes to walk home and another thirty minutes to walk back to campus. This did not include the time it would take for them to actually eat lunch. This created a hardship on the students and further demonstrated the University and White community’s commitment to making this group of students feel unwanted.

African American students suffered shame and humiliation from being denied the right to eat in public restaurants. Only African American students were refused service, making it known to all that they were uniquely despised and unwelcome in campus town. It was clear that restaurant owners did not want African Americans in their establishment, however they attempted to mask the racially motivated reasons in terms of potential business loss.

Restaurant owners claimed that they did not serve African Americans because of the harm it would do to business. Most restaurant owners claimed if they served "Negroes" their White customers would boycott them, and no longer patronize the establishment (Dean of Women Subject File, Box 4). However, no evidence exists that supports the claim of restaurant owners. While maintaining that they harbored no personal prejudices against African Americans, restaurant owners decided on their own initiative to disregard laws surrounding racial discrimination.

African American students at Illinois decided to take a legal approach to the discrimination they were receiving. The Student-Community Interracial Committee formed in 1946, including African American and White students, embarked on a letter campaign to the State’s Attorney and a method of testing campus area restaurants. In a letter to John J. Bresee, State’s Attorney, dated 14 May 1946 (Tiebout Papers), a student, Paul Burt, provided a list of restaurants that had openly discriminated against African American students. He also included the date of the discriminatory act, address of restaurant, people that were victims of discrimination, along with any witnesses that were present. It was his hope that Bresee would write these restaurants and call their attention to the violations of Illinois laws that protected citizens against discrimination based on race.

Besides writing to the State’s Attorney for assistance, students, as mentioned earlier, both African American and White, embarked upon a testing campaign, in which they documented discrimination found in the various campus restaurants. It appeared as if they went to campus town restaurants and documented what they either experienced or witnessed. In 1946 Eloise Ellison and Helen F. Wesley, both African American, had gone to Steak-N-Shake Drive Inn for a meal and were victims of discrimination. In their affidavits they wrote:

I seated myself in the Steak-N-Shake Drive Inn with a friend, also a Negro of dark skin. A waitress took our order and brought our food to us in a bag for us to take the food out. She replied that "Negroes can’t eat here on the inside of the restaurant. They can take it out or be served in a car.”

We asked to see the manager. The waitress stated, “Well the manager is my husband.” The manager repeated to us, “We serve Negroes when they are in cars but not in the restaurant.” We explained to him that we did not come in a car. Then he said, “Well, since you aren’t in a car you can eat here now, but don’t ask me to do it again (Tiebout Papers).”
Also dining in the restaurant were White students Verna Volz and Charles Shattuck. They witnessed the incident and reported:

While seated in Steak-N-Shake Drive Inn, I saw two Negro girls enter and sit down. I saw the waitress take their order and later bring it to them in a paper bag. I heard the Negro girls tell the waitress they did not want to take the food out but wanted to eat it there. The waitress said they would not serve colored people inside the restaurant. The Negroes asked to speak to the manager. I heard him say he would serve colored people in cars but not inside the restaurant. After some discussion, I heard the manager say that he would serve them that time but the Negroes should not ask him to do it again (Tiebout Papers).

Steak-N-Shake was not the only restaurant in Champaign-Urbana to discriminate against African Americans. Melvin Humphrey had a similar experience when he attempted to buy a beer at Bidwell's. The bartender indicated that Humphrey did not look old enough to purchase alcohol. Humphrey commented that he had served fifteen months overseas in the war, but would go home to retrieve his identification. Upon returning to the establishment he stated: I gave it to the bartender, manager, or owner, whatever his position was and asked him if he could read. After looking at the card, he then told me that he would sell me a bottle of beer but I would have to drink it in the kitchen. I immediately asked him why. He replied, “That’s my policy.” I then asked him if he had anything against me. He replied no. Then I asked him again why he was refusing me equal accommodation. He pointed to a sign that read “We reserve the right to seat our customers[“] I asked him didn’t he [know] that it was against the law to discriminate. He said he knew that or so what (Tiebout Papers).

Todd’s cafe was another establishment that refused equal service to African Americans. On May 5, 1946 a young African American woman stated she was refused service,

Because I am a Negro while at the same time and place that I was denied equal service other persons of the Caucasian or white race were being served without discrimination. Mr. Todd stated that it was not his policy to serve Negroes and if I wanted to be served I would have to eat in the back (Tiebout Papers).

Onlooker Smith Wisegarver was curious as to what was happening to the African American patron and inquired of the manager. The manager replied:

That he did not serve colored people because it would ruin his business. He said he would lose $50 a day if he served colored people and that no one would repay him the amount lost. Then I said to Mr. Todd that the Negroes there were obviously nice persons and as nice as anyone else in the restaurant. Mr. Todd expressed agreement with my statement but said that if he served them he would have to serve all kinds of undesirable people (Tiebout Papers).

In the cases investigated whites were not treated the same as African Americans. Students would then follow the guidelines set forth by CORE (Committee on Racial Equality). Based on the CORE guidelines, students addressed the issue of discrimination in an organized and non-violent manner. Students were instructed to do such things as plan campaign of testing; contact by letter, explain who we are, what we do, call attention to the incidents of discrimination in which we know about, recalling dates... Suggest we help them change policy without injury to their business—Ask for a personal conference with them, and have the Student-Community Human Relations Council committee go down without invitation if they do not offer one. These students were committed to addressing the issue of discrimination in an organized and non-violent manner. So, after each subsequent act of discrimination, African American students would file formal affidavits documenting their experiences. In these affidavits the students would provide a detailed explanation of their experience and have the document notarized to become a part of public record. White students and some faculty showed their support by filing affidavits as witnesses to the incidents.

The result from these tests of discrimination proved what most African Americans already knew, their second class citizenship. Although students were encouraged to exhaust all alternatives prior to legal action, often times the law was their only recourse. De Luxe restaurant continued to discriminate against African Americans in spite of approximately ten years of work by the Illinois Attorney General, States Attorney of Champaign County, the Student...
Community Interracial Committee, and particular African American students. Several civil suits were filed during this time. However, evidence only documents two cases appearing in court, and both times the court ruled in favor of the restaurant owner (Tiebout Papers).

African Americans in general and students in particular were discriminated against in all aspects of their lives. Attending college is often considered the best time of an individual’s life, and this should include African Americans as well. However, given the racial notions of the country, these students experienced a living hell, one that no one person or group should have experienced. These students attended school under extremely hostile and difficult living conditions.

The cohorts of University of Illinois African American students changed every four to five years. Throughout their difficulties, stability and continuity were provided by the ongoing presence of Albert R. Lee, African American elected officials, the Interracial committee, some University officials, and by the Champaign African American community. These individuals were the backbone to the growth and development of the students during the days of segregation and beyond.

Illinois represented an institution of higher learning situated in the “liberal” North, a place perceived as somehow different from the Jim Crow South. However what students encountered here was very much the same forms of segregation their Southern counterparts experienced. Despite time spent serving their country, and devoting time to studies so they could compete academically at the University, those things meant nothing. They lived by the Jim Crow laws of the North, a set of laws that boasted the inferiority of African Americans.

In essence African American students at the University of Illinois experienced varying forms of discrimination. As their enrollment trends increased so did the discriminatory acts they faced. These students attended school under very antagonistic conditions. Having to find a place to eat and live miles from campus, not being allowed to sit in adequate seats in theaters, or receive hair cuts, to name only a few instances of discrimination, were conditions that no student should have to live under. These various acts of discrimination had an impact on the educational and social environment of these students. Despite the less than pleasant or inviting instances, African American students were able to matriculate, persevere, and achieve.

Who is “Black” at the University of Illinois, 1965-1975

Joy Ann Williamson
University of Illinois at Urbana-Champaign

During the late 1950s and early 1960s, the proponents of the Civil Rights Movement encouraged African Americans to petition for the protection of their constitutional rights. Securing equality of social and educational opportunity was seen as a key to success and this was pursued through non-violent means. By the late 1960s, a new development, the Black Power Movement, advocated a more aggressive posture as some Blacks were becoming increasingly frustrated with the slow pace of change. Some African Americans opposed the non-violent strategy adopted by the National Association for the Advancement of Colored People (NAACP) and the more moderate Civil Rights leaders in favor of more confrontational methods. Blacks on university campuses across the United States gathered to discuss and plan ways they could more aggressively combat the inequalities Blacks experienced.

This paper describes the impact of the beliefs associated with Black Power at the University of Illinois at Urbana-Champaign (UIUC). I will draw on various student publications at UIUC in discussing Black UIUC students’ conceptions of “Black” and the ideology of “Blackness.” While I recognize that not all Black students participated in “Black Power” or agreed with its objectives and ideologies, evidence indicates that a majority of Black UIUC students were involved with the Black Power Movement.

Black UIUC students from 1965 to 1975 participated in the Black Power upsurge across the nation. When asked about their own definitions of Black Power, UIUC Congress of Racial Equality (CORE) chapter President Paul Brady and his friend Rodney Hammond stated in a 5 October 1966 article, “CORE Touches Racial Issues,” appearing in The Daily Illini, that Black Power was racial pride, Black consciousness, and the development of “political, economic self-determination in the Negro masses.” This sentiment was instrumental in organizing the Black Students Association. In 1967, within a month of its inception, BSA initiated a Black student newspaper, Drums. The following March the paper proclaimed that The Daily Illini, the general student newspaper, was the “voice of the White student on campus,” and that Black students needed an outlet to publish articles relevant to their experience. An editorial published in the October 1968 issue of Drums, “While Their Parents Waited...” revealed the activist nature of the paper. The editorial asserted that the older generation was apathetic, ignorant, and “white-washed.” Frustrated by their parents’ inaction, the Black students decided to take the reins, “it appears that the days when black students waited for their parents to take action against the racist school policies are over.” While their parents engaged in “habitual things” such as cooking, cleaning, reading the newspaper, and watching television their children were “organizing themselves to form a united front against the system to which their parents had become so well adjusted.” This view was harsh as many of these parents had fought for freedom and equality decades before the 1960s. Nonetheless, this view of a new generation seemed to be necessary in order to break with the mainstream Civil Rights Movement.

In harmony with their Black Power ideology, Black UIUC students followed the shift from racially integrated civil rights organizations to predominantly or all Black civil rights organizations and from non-confrontational or moderate methods to aggression. By the later 1960s, the NAACP and other integration-minded organizations still existed on campus but faced fierce competition for Black members from newly formed Black Power-minded organizations. As noted earlier, not all Black students joined this movement. However, Black Power-minded organizations gained momentum and claimed a significant part of the Black student population as adherents. By 1967, Black Power was the prevailing ideology among Black students on the UIUC campus.

This does not, however, mean that all Black students in the movement held identical beliefs with regard to tactics and solutions to Black America’s problems. One point of contention was “who is Black?” According to those in the Black Power Movement “Black” was more than pigmentation. “It is the soul, heart, mind, physical spirit,” stated John Lee Johnson, a Black Champaign community activist closely affiliated with BSA and who had a significant influence on Black students, in an interview published in the 7 December 1968 issue of The Daily Illini. Blackness became an ideology--a state of mind--and implied a degree of awareness, appreciation, and celebration of the African/African
American self BSA students, in their publications, often berated Black students whom they felt were not participating in Blackness. This resulted in a campus split among Black UIUC students. Those who did not follow BSA aims and policies were deemed not “Black” enough or committed to the struggle by the organization. Many BSA authored articles and publications were aimed at convincing the dissenters that their understanding of Black Power was the proper road toward Black liberation.

Like others in the Black Power Movement, Black UIUC students threw off the term “Negro” in favor of Black. While still being used in the general student newspaper, The Daily Illini, none of BSA’s newspapers used the word “Negro” as a descriptive racial term. Instead, they reinterpreted it, assigning a pejorative definition to the term. Negroes were those who had not embraced Black Power and Black Consciousness. As John Lee Johnson stated in a 17 February 1966 interview published in the 17 February 1968 edition of The Daily Illini, “I resent the word ‘Negro’, it means second class fool and one who does not want to be free. I am black and black means just the opposite.” This statement not only addressed the “Negro” versus “Black” dichotomy but revealed the tone of the Black Power-minded Champaign-Urbana community and Black UIUC students. While some used Negro and Black interchangeably to describe people of African descent (based on pigment), Black UIUC students used the terms to denote particular ideologies of liberation.

Students in BSA embraced this new interpretation of Blackness and adopted the mandate to promote Black consciousness and Black unity. The fundamental beliefs and mission of the BSA was clearly stated in “Goals Are Black Unity and Black Consciousness,” appearing in Drums (November 1967). Its goal included the establishment of a racially-based campus group mirrored after racially-based national groups. An example is that they supported SNCC when they expelled all Whites from the national organization in 1966. In addition, Black UIUC students declared that Blacks needed to “stick together” to protect their interests, “If it is logical that we as black students must stick together in order to promote and protect our own interests, it should be equally logical that we as a people must stick together to protect and promote the interests of our people.” Furthermore, the Black Power Movement’s push for more aggressive means and tactics for liberation was mirrored in BSA’s advocacy of direct confrontation “with any institution within or outside the University” and the use of “any tool necessary” in fighting against apathy and for liberation. Finally, Black students stated their connection to the larger Black Power Movement and the BSA took it upon itself to insure that all African Americans on the campus and in the Champaign-Urbana community were aware of the Black Power Movement.

Blackness was celebrated and promoted through the student organizations and activities such as Black Chorus, Black Mom’s Day, Black Weekend, and Black Homecoming. Using Blackness and Black culture as a basis for their organizations and activities demonstrated to the University that Black students valued their culture, heritage, and experiences. No longer would they participate in established organizations that did not cater to Black needs.

Poems and articles indicative of Black UIUC student conceptions of an ideology of Blackness were found in each of BSA’s publications. For example, in an effort to convince African Americans to “get serious” about Black liberation, including psychological liberation, former BSA Vice Chairman, Christine Cheatom, berated Black women who used hair straighteners in the December 1967 issue of Drums. She stated, “No one with straightened hair is an enlightened Black. You may be militant, you may be intelligent but if you can not see any beauty in the average black woman’s unstraightened hair, then you are still brainwashed.” This was a statement in favor of Blackness and against assimilation or Whiteness. The use of hair straighteners, “processes,” and skin bleaching creams was interpreted as a sign of weakness, desire to assimilate, and denigration of the African heritage. It was viewed as the internalization of standards of beauty consistent with the phenotypic traits of Whites. Students were told to break away from the long-held preference in the Black community for “good hair” and light skin, to stop mutilating their bodies for the sake of Whiteness, and to embrace their African/African American selves.

The October and November 1968 issues of Drums, carried “Know Your Black History” quizzes. The questions were designed to help Black students learn about African roots and the diasporic component involved in Blackness. Questions included, “[Name] three old kingdoms of Africa,” “[Name] the ‘Black Moses’ of the Underground Railroad,” and “[Name] the Black U. S. Senator from Mississippi during the Reconstruction.” Other questions focused on important Black leaders. These included Marcus Garvey, leader of the early 20th century “Back
to Africa” movement; W. E. B. DuBois, NAACP founder and Pan-Africanist; Imhotep, the 2nd century Egyptian “father of medicine”; and the Queen of Sheba. The goal was to educate and give a more prominent place to significant Black heroes and heroines.

A second BSA newspaper, Black Rap, appeared in 1969. Its pages referred to Black men and Black women as “brothers and sisters”, called for “Umoja”—unity within the Black community, declared themselves the “vanguard,” and demeaned Black men who dated White women. The paper proclaimed that true brothers would never date a White woman or voluntarily choose to socialize with Whites instead of Blacks. BSA member Paul Chandler published a poem calling for Black men to practice what they preached and criticized integrationist practices. Black unity and power were manifest in the relationships between Black men and Black women, not Black men and White women; the desire for Black liberation and the pursuit of a White woman could not co-exist in the heart of a real Black man.

Similar themes and sentiments regarding the ideology of Blackness continued in 1970 editions of The Black Rap. For example, in a poem indicative of the era and meant to chastise those who did not fully participate in the celebration of Blackness was published in a 21 October 1970 issue. Blackness was deeper than pigment; it was a commitment to Black liberation, celebration of the Black aesthetic, and immersion in Black culture. Total and full participation in Blackness was required. Having unstraightened hair did not necessarily mean “true Blackness;” one had to fully appreciate one’s Afro. This was part of the psychological criteria of true Blackness.

The 2 December 1971 issue of BSA’s third newspaper, Yombo, contained two poems, “Negro” and “Black”. The poems depicted the Negro as an “aged” person afraid to take a step forward and emasculated, “a Negro not a man . . . a Negro, boy, not a man.” I believe this characterized the feelings toward those in the Civil Rights Movement. Just as in an earlier edition of Drums, Black Power advocates continued to ridicule Civil Rights adherents for being of another generation with outdated methods for gaining Black liberation. Blacks, on the other hand, were no longer seeking an integration based on assimilation with Whites. Underscoring the point that Negroes and Blacks were fundamentally different kinds of people and redefining “integration,” Black students cited Don Lee, a Chicago poet and Black activist in the March 1968 issue of Drums, “I seek integration of negroes and black people.” This was the “correct” manner in which to gain liberation. “Black is like a treasure inside of a chest . . . beautiful, sweet, loving, and strong. . . . Black is where it’s at, it’s about time we should realize that.” Negroes outlived their usefulness; Blacks had to take the reins.

A poem in the 1972 Black student yearbook, Irepodun, described the transformation from Negro to Black. Black UIUC students were called to “experience the warmth of belonging to a race of Beautiful Black People.”

The birth of Blackness through becoming AWARE; The killing of the Negro, the birth of Blackness; The killing of Whitey in your soul and The birth of Blackness in your mind.

The Negro—the assimilated, complacent, timid, “white-washed,” and pre-Black Power advocate—part of the self had to be “killed” before the transformation could occur. One also had to annihilate White influence. The process was like death and rebirth, kill the Negro, kill the White indoctrination and Blackness was possible. The search for and attainment of true Blackness was a resurrection of the mind and soul which allowed for a new political and cultural awareness.

An important question was, who had the authority to determine who was “Black?” Answers varied depending on which person or which group was asked “who is Black.” The ingroup-outgroup dichotomy often was falsely (and hurtfully) drawn. BSA often wielded its “thou art Black enough” sword hastily and judgmentally. If a Black student did not fit all the criteria expected of a true “brother” or “sister”—both physical (wearing an Afro, having a Black girl/boyfriend) and psychological (appreciating the Afro, wanting to pull away from White influence and integration)—and fully participate in BSA events, s/he was called a Negro, sell-out, or Uncle Tom. This tactic often pushed away potential allies and alienated others.

Another problem in the Black UIUC student movement was that “Black” often meant Black man. “Black” was interpreted as Black men reclaiming their masculinity. Yes, Black women were a target audience (Black women were told to stop straightening their hair) and were critical to disseminating the new Black ideology, but never was
the sexism in the Black Power Movement or the emerging definition of Blackness discussed in the Black student publications. Perhaps sexism was discussed outside the publications, but as the primary source of information and the outlet for the Black student voice its omission was glaring. Gender issues, or issues of equity between the sexes, were ignored in discussions of Blackness though Black women played varied and critical roles in the UIUC Black Power Movement.

In Fall 1968, BSA delivered a list of 35 demands to the administration. The demands, published later in the 18 February 1969 edition of The Black Rap, included: establishing “a Black Cultural Center large enough to accommodate all Black people which will be run by the Black Students Association,” hiring 500 Black faculty within a four year period beginning with 150 by September 1969, and establishing an autonomous Black Studies Department with a major emphasis on Afro-American and African Studies. It was in this list of demands—and their implementation—that the redefinition of “Blackness” began to be tangibly manifest on the UIUC campus through Afro-American Studies and the Afro-American Cultural Program.

In early 1969, a student-faculty Commission on Afro-American Life and Culture moved to recommend the development of an Afro-American Studies Program and the possibility of pursuing minors in the field. Like many Black students at predominantly White institutions, some Black UIUC students voiced dissatisfaction with the development of the Afro-American Studies Program. In a 18 March 1969, Daily Illini article, BSA member Michael Wilson pointed to a class bias in the proposed program. In his article entitled “Class Bias,” he stated that the focus on teaching Black history, literature, and culture was only relevant to middle-class Blacks. He stated, “A Black Studies Program based on Black history and culture alone will not help the masses of Blacks who are preoccupied with the problems of jobs, housing, and education . . . More particularly, our Black Studies Program must provide the tools that will enable us to work with the people in our communities.” Classes on housing rights of the poor and consumer fraud in low income communities were proposed. This focus on the tangible benefits for a larger number of Blacks was a shift from the Civil Rights Movement of the early sixties, which was seen as a movement for and by middle-class Blacks.

Courses established in Spring 1971 were published in a flyer distributed to students. Some of the courses included Afro-American Lectures, Black Curriculum Methods in Early Childhood Education, Introduction to African Languages, Cultural and Political Revolution, and Police-Black Interaction.

One Black student demand, the establishment of a Black cultural center, was accepted and put to committee in March 1969. This center was called “the Afro-American Cultural Program (AACP)” and was established in the Fall semester of 1969. The AACP was not just a recreation center or meeting place for Black UIUC students and Black Champaign-Urbana residents. Workshops were held; speakers were invited; performances were sponsored. It served as the campus locus for the promotion of Black culture and Black pride. Demonstrating their deep respect for Malcolm X and his teachings, students named the AACP reading room the “El-Hajj Malik El-Shabazz Reading Room” in December 1969. By late 1970, AACP weekly activities included three dance workshops, a writers workshop, a drama workshop, and music classes and rehearsals.

Around 1975, Black Power waned. Possible factors in influencing this were that prominent Black Power figures strayed from the cause, the police actively and purposely helped disintegrate the Black Panther Party, and the government effectively declared war on Black Power. At UIUC Black student enrollment decreased which impacted the presence of Black Power on the campus. According to a report, “The Recruitment, Admission, Enrollment, and Retention of Minority Students at the University of Illinois” (University Office of School and College Relations 1985), Black UIUC enrollment rose from 330 in 1967 and peaked at 1,439 (4.2 percent of the UIUC population) in 1972. After 1972, the numbers dropped off. By 1984, the number of Black UIUC students had declined steadily to 1,160—equal to the number of Black UIUC students between 1969 and 1970. After 1975, most registered Black organizations focused on providing academic support. By the late 1970s all three BSA newspapers had folded.

Although I mark the end of the Black Power era in 1975, lasting benefits to Black students are evident. The Black students of the late sixties and early seventies forced the University to seriously commit itself to the recruitment and retention of Black students and faculty. Black residence hall councils, of which the first was formed in early 1969, remain active and chose Swahili names such as Ewezo, Eusa Nia, and Solongo. Black Mom’s Day
celebrations, which still include a Black Chorus concert and a fashion show, are still held the same weekend as the University Mom's Day celebrations. Black Homecoming activities, including the election of a Black Queen and King, continue to thrive. Black Chorus grew from four students to over one hundred members and now performs in churches and educational institutions around the state of Illinois. The African American Cultural Program continues to provide several different workshops and activities including Omninov (a dance group), Theatre 263 ("Theatre of the Black Experience"), the Griot (a newsletter), and WBML (alias "Where Black Music Lives," a radio station housed in the AACP and run by students). Students may now minor in Afro-American Studies and take a variety of courses on the African American experience in several disciplines. The first dinner to recognize Black graduating seniors was transformed into the Black Congratulatory Ceremony, a more personal event for Black graduating seniors, graduate, and professional students held in addition to the University graduation ceremonies.

A less tangible result of the Black UIUC students' labors was the fact that their struggle was taken up by other ethnic groups. Their push for an autonomous Afro-American Studies Program and more African American professors paved the way for other groups, especially Latino/a students, to follow in their footsteps. The ideas of psychological liberation, cultural nationalism, and self-determination were not unique to African Americans. Several ethnic groups experienced a resurgence of cultural pride and expression in the mid 1960s and early 1970s, but, African Americans led the way. Following in the path of African American UIUC students, Latino/a student groups began to demand courses relevant to their experience, increased Latino/a enrollment, more Latino/a faculty, and a cultural center for student support. Currently, there are University sanctioned efforts to establish a Latino/a Studies Program and an Asian American Studies Program. A Women's Studies Program was established some years after the Afro-American Studies and Research Program. The Black students created a climate conducive to the demands of other ethnic groups.

Whatever their limitations, the Black students' drive to implement programs and policies in line with their own conceptions of Blackness helped shape the UIUC campus. Although all of their demands were not met, Black Power era UIUC students accomplished a broader goal—they enriched the academic and social lives of Black UIUC students for years to come.

Devaluing Books and the Progressive Era

Mark McKenzie
Reynoldsburg, Ohio

From 1870 to 1920, during the 50-year period considered the heart of the progressive reform era, the popular valuation of both books and the activity of reading books drops dramatically. This devaluation of reading books as meaningful endeavor persists into the present with important consequences. If you believe that reading books is important to education, then the devaluation of book reading has made educational achievement, through formal or informal means, more difficult.

If the progressive reform era is the period when books and book reading become less important, then it is unlikely that the post 1940s development of the modern visual/mass media communications culture is solely to blame. Despite recent arguments (Kozel 1985, Keman 1990, Rigolot 1993), books and book reading lose their importance as social phenomena too early for media communications culture to act as cause. I do agree that the modern communications culture is continuing and reinforcing an already existing trend, but not that it is the cause of the trend.

So, if the media communications culture develops too late to act as social author, then who or what is the source of the stories that bring down the public valuation of books? What is in place at the critical time is the progressive reform movement. As part of that movement’s agenda is a two-prong attack on a curriculum used in schools (Kliebard 1987), stored in books, and learned and accessed through reading. Nothing in the progressive reform program seems to have intentionally worked toward the devaluation of all books and reading. Yet challenges by the progressives to the existing late nineteenth century curriculum appear to have generalized beyond their specific intent of curricular reform to undermine even the progressive’s own reformed curriculum.

Characterizing public beliefs, such as the valuation of books, even to the degree of an approximation is not easy (Abel 1980, Gates 1985, Marcus and Fischer 1986, Harding 1986, Lemert 1990). Still, there are techniques available to gain evidence usable in construction of a limited approximation of popular beliefs. For example, evidence may be gathered to support the assertion that books and book reading is given little value in today’s society through surveys and interviews.

Examining the responses to recent surveys, it seems enough of us confess to reading either regularly or frequently that of all households, 37.8% may be characterized as having at least one “avid” reader (SRDS 1996). A couple of other authors, however, cast some doubt upon this definition of an avid reader. Alvin Kernan (1990) reports that 60% of adult Americans have never read a book and the remaining 40% read only an average of one book per year. And according to a recent article in The Economist (1996), comparing the number of books sold, the time spent reading, and the general state of reading test scores, it seems we spend neither the time nor have the skills necessary to do more than browse the books we buy.

I suppose that it is possible that while all the books are bought with good intentions, many are just browsing so that the really important books may be carefully read. Unfortunately this is not so if Jeff Reid (1994) has properly characterized or identified a “trend” in reading habits. According to Reid, in a satirical article in the Utne Reader, it seems that even “literary” people, including authors, do not read the books judged by the people who judge such things as books worth reading.

Additional evidence comes from interviewing students in my classes during the last year I taught “The History of Modern Education.” During the first day’s class, we examined our expectations and preconceptions of our duties and roles as teachers and students. The topics covered during our cooperative self examinations included our reading habits and our valuation of books. For my sample of 140 students, less than 25% professed to either find reading a valuable use of their time or to routinely read books. Of the remaining 75% who did not value reading, half dismissed the required readings for all of their college classes (including their teaching methods classes) as having no value, meaning or impact even for their future teaching practice.

The popular belief in the valuelessness of reading books is, however, what Roland Barthes (1972) termed a social myth. Reading books is a valuable activity, and I am willing to contend, any time and any place, that books remain just as valuable to the educational process as they were before 1870. To what degree is it possible to become
significantly more partially educated without being a reader, and more specifically a reader of books? I do not mean to imply that education is impossible without reading books, but by the simple obstacle of the too limited period representing a human life span, the breath and depth of experiences possible is too small to allow for more than an extremely limited sense of education.

As John Dewey (1938) has said, the hallmark of “maturity of experience” is being able to get through the “dead places” of life. To possess “maturity of experience” is to have a repertoire of experiences that can arouse curiosity and strengthen initiative when life is difficult. And that repertoire of experience can be built through reading books. Whereas personal experiences of life are limited to the here and now, through reading we can interact with the environments of places we have never been or may never get to, with environments that have long since ceased to exist, and when reading literary fiction, with times and places that may never be.

While other modern media can also create environments, that is not to say that these environments are better than those experienced through books. Indeed, because of the more detailed continuity of book narratives, it would be easy to argue that books are the superior pathways to education.

The impracticality of surveys and interviews for investigation of the distant past requires an alternate approach. One approach is poststructural metaphor analysis, here applied to communicative visual metaphors existing before the development of a mass media culture (McKenzie 1995), but still consistent with the poststructural media work of Norman Denzin (1988, 1989, 1992a, 1992b) and the metaphoric examinations of modern narratives by Charlotte Linde (1987) and Naomi Quinn (1987).

An examination of books as visual metaphoric symbols in Medieval Christian religious art shows a connection, a coupling if you would, of capable, competent people and books. Here the book is the metaphoric source (Indurkhya 1993) signifying of the worth of the person. Even when the Medieval European belief system considered the words in books the words of God (Foucault 1972) and not the person (generally a monk, priest or Christ in the Christian iconography) holding the book, the presence of the book still signified that these were people deserving of the viewer’s esteem (Snyder 1989).

The archetype of the images of books metaphorically targeting (Indurkhya 1993) value upon the people holding them is actually pre-Christian. This archetype image is a representation of a male “proclaiming” or “delivering” with the right hand while holding a book of “law” in the left. Some of the earliest examples of this archetypal image are the Roman pre-Christian representations of the transference of law. For these images of the imperial traditio legis, the “book” representing or containing “law,” is clearly identified or marked as such, while the male figure is anonymous (Snyder 1989). The anonymity of the figure holding the book is a characteristic important for this analysis, for it is a characteristic that either disappears or becomes twisted after 1920.

The portrayal of a leader, secular or religious, holding a book (used as a symbol of power) in the left hand continued as a common public image for almost two thousand years (Ferguson 1954, Male 1956, Snyder 1989). This is the same image that is much venerated in Judaic-Christian religious visual representation, an image which, whether reinvented or adopted from Roman images, appears in the second century “AD” (Snyder 1989). By the beginning of the fourth century this image, now representing the Christian image of Christ proclaiming from and delivering the book or scroll of law to Peter, is both common and widespread.

As the structure of the Catholic church grows and institutions are founded that encompass books beyond the conventionally religious, this iconographic image is changed to account for differing communicative intent. At this later time, when Christ, Mary, and the apostles hold books in their left hands, the books remain metaphoric symbols of power. When the subject shown holding a book, however, is a saint, the book signifies the figure’s authority, usually as the head of an order, for the book shows that this is the writer of the order’s rules (Ferguson 1954, 305).

By the thirteenth century, when people associated with structured learning and universities believed that all the knowledge of the world was already known and the task for the scholar was to put that knowledge into better order (Thelin 1982), a new subject is added to the iconography. In the representation of philosophy, mistress of the seven arts, a female figure is shown with a book in her right hand and holding a staff (now the metaphoric symbol of power) in her left hand. This reversal of the image, switching the book to the right hand of an idealized image of a woman (mistress), represented people who were thinkers and creators, people who reordered the knowledge of the world into
their own works. This active task of ordering was given to the dextrous hand—the right hand (Van Treeck and Croft 1936).

Beyond this visual statement of the value of books held in a person's hand, there is evidence for the value of books even when not coupled with the human figure. Indeed, evidence exists indicating that books were respected and sacred objects carrying intrinsic value, almost having some slight degree of "humanity." This respect for books as more than mere objects, is exemplified by a Jewish tradition of ceremonially burying books that have aged beyond repair and that includes the name of God—collectively known as the "shemot" (Encyclopaedia Judaica, 1971, vol. 7).

As evidence suggestive of the value given to books, the details of the actual burial, including the site of the burial, the cemetery, and how the books are covered for the burial, by a simple cloth, is identical to the procedure for burying a person (Brooks 1995). While the practice, as it survives today, mainly deals with Bibles, volumes of the Talmud, and prayer books, historically, the contents of the "genizah" have also included works of philosophy, science, law and lore, and commentary (Richler 1990, 12).

I assert that the valuation of books evidenced through almost 2,000 years of Western North Atlantic (Carrithers 1992) history persisted in the lives of American citizens at least until the 1870s. While it is a wonderful idea, it is not necessary to go as far as to believe, as did Paul Anderson (1963), that every nineteenth century farm boy read books of literature and philosophy while they plowed the fields.

Less imaginative perhaps, but just as convincing is Karl Kaestle (1983), in Pillars of the Republic, retelling the story told by a Wisconsin historian of how nineteenth century Wisconsin school children came to school carrying the books brought by their parents, as part of the family's worldly goods, when the parents set forth into the wild frontiers. These books were not part of an official or set literary canon, for no two children in any class might each have access to the same book in their family library. The books the families owned ran the gamut from grammar books, to literature, to religious texts, none easily classified as having instrumental value to the lives of the settlers who carried them to a new place through great difficulties. Yet these books and the reading of them, as different in subject matter as they were and all inapplicable to the skills of making farms out of untamed land, were still considered the path to education (Tyack and Hansot 1982).

During the nineteenth century, especially on the frontiers, families had little free time, yet time was set aside for what was for them a ritual of reading. To read, whether you lived on the expansive frontiers or in an urban setting in an eastern city, was to be able to participate in the political life of the community (Postman 1985). In addition to the importance of reading in political life, particularly in those eastern cities, reading was a necessary part of business endeavors. This can be seen in how the advertising of products and services (even the most mundane) consisted entirely of textual expositions until the 1870s. Advertising slogans and pictures are both innovations first appearing during the progressive reform period (Presbrey 1929).

As evidence that the public visual metaphor of the potent power and value of books persists through much of the nineteenth century, there is the Statue of Liberty. Admittedly, the statue was not dedicated until 1886, but it still followed the form of our preprogressive era archetypal icon. The statue consists of an anonymous female figure with her right arm extended upright holding a torch, her left arm bent at the elbow, and left arm and hand holding a tablet (book) over the figure's heart. Upon the tablet held in the statue's left hand is inscribed the date of the Declaration of Independence. At her feet is a broken chain, representing the overthrow of tyranny. A tyranny broken by the power of the book.

I assert that it is the authors of the progressive movement who are the authors of the stories that soon were adopted by and communicated through the developing visual mediae that will undermine the popular valuation of books. Two strands of the progressive movement clearly, explicitly wished to reform school's curriculum, the books read. The reformers' success appears to have involved an odd and unintended social transaction in which there was an exchange of values. The unintended exchange in this transaction was the adoption of "right" and "proper" curriculum for a diminished belief in the intrinsic value of books and reading.

If we take the work of Charles Eliot as a limited exemplar of the humanist progressive reformer (Kliebard 1987), a primary function of public schooling was the development of a "taste for good reading" (Eliot 1961). By "good reading," Eliot meant the will and discipline to read only the works that experts judged worth reading. Eliot
believed that children and society could be harmed by reading the wrong books. We can see this in Eliot's calls for rewriting (or a "new writing") the imaginative literature for children, including fairy tales, Old Testament stories, and historical romances to reflect the proper moral values of society (Eliot 1961). Eliot's argument for reform of literary books (those books without instrumental value) is one important element in what will become an attack on all books.

The second prong of the progressives' attack upon books is exemplified by the "progressive" views of the social efficiency educators. The social efficiency reformers called for books containing applied knowledge of immediate and practical consequence. This group, including David Snedden and Ross Finney, argued that unless books directly helped prepare children for their places in adult society, those books were at best of no value and at worst potentially harmful to the survival of American society (Kliebard 1987). Add to these two stances on curriculum reform Joseph Mayer Rice's (1893) indictment of teachers and we have all the elements of Stephen Crane's 1898 short story, The Making of an Orator.

In this story, Crane criticized the curriculum, eighteenth century literature, the teaching technique, memorization and recitation, and the teacher, who must get her own book to prompt a student unable to recite from memory alone. Crane offered no alternatives for what school ought to be other than to say that schooling crushes the "natural" talent for oration a sensitive child brings to school. This is the earliest example I can find of the rewriting of progressive curriculum critiques into a story, intended for popular consumption, that assaults the idea of the intrinsic value of both books and teachers, whose work is closely associated with books.

These two strands of progressive thinking, each desiring a different curriculum reform, get combined and changed in the broader popular conversations to produce a popular belief that all books are meaningless. The only books to escape this indictment of valuelessness are how-to-books, and then they are of value only for the inept, the incapable, or as entertainment or folly for the intellectual.

The curricular arguments of the progressives become part of the popular culture and appear in the new visual media of the day, the moving picture. In particular, these arguments, although broadened and generalized become part of the stories routinely told through film.

In the opening sequence to a 1921 F. B. Warren production, directed and written by Lois Webber, titled The Blot, a college professor is shown in the pose of our archetype iconic image. Professor Griggs is standing on a platform seven steps above his class. With right hand held forward, away from his body, pointing toward the students, open book held in his left hand, he proclaims knowledge to the class. Here, however, unlike earlier versions of the image any markings or texts in the book are invisible, and the class does not listen to what the professor proclaims.

One student holds a notebook open and marks upon its pages, but in a closeup we are shown that he is drawing a disparaging caricature of the professor. Another student reads a newspaper while a third student sleeps and a fourth student plays a practical joke upon the sleeper.

The film, The Blot, was intended as an exposé about the low pay provided professors at endowed colleges and to religious ministers, so, in the film, the professor's friend is a minister who just happens to collect books. As the professor is leaving school, he meets the minister, who has just bought a book on the history of ancient civilizations. The pair enters the professor's home, a rented house furnished with threadbare rugs, chairs with split seat coverings and almost empty food cupboards, and begin to examine the book. The professor's wife, a thin, drawn looking woman (and a mother to a thin, frail looking daughter), upon seeing the object of their interest, comments that the minister's money would have been far better spent on a book explaining how to make shoes.

In the 1923 film featuring vaudeville comedian Charles "Chic" Sales as Professor Timmons, titled The New School Teacher, an early scene again shows Sales proclaiming to a class with a book held in his left hand. This time, however, the class is a group of small kittens sitting in a chair, and the book, while labeled on the outside cover as "The School Teachers Manual," is shown to be, in a close-up of the inside cover, "The Farmers' Almanac."

In a combining and generalization of the two progressive curriculum reform arguments, at least in the hands of the new schoolteacher, not even the applied knowledge in how-to-books can help Chic Sales' character, Professor Timmons. Because his teacher's manual states that proper schooling practice includes taking his students out into the country, the class goes on a camping trip. Professor Timmons knows nothing about the outdoor life. He does not
even know why getting his students into the country is a good thing, he only knows that his book tells him that it is. Professor Timmons, armed with how-to-books on outdoor activities, believes he is ready to lead his class in the great outdoors. Once in the countryside, after studying a book on learning to swim, Professor Timmons almost drowns. The children, however, can swim, and without ever having read a book on the activity. And even with a book on camping for reference Professor Timmons cannot start a fire, find food or make a proper camp. The children, however, although city raised, can quickly start a fire just by rubbing two sticks together.

Continuing the theme of the valuelessness of applied books, at least in the hands of the scholar, is Buster Keaton's 1927 film, College. Keaton's character, Ronald, is the star pupil of his high school. The young woman, Mary Haines, who Ronald loves, however, rejects him because he does not have a proper respect for athletic activities. So, when Ronald follows Mary to Clayton college, he takes with him several books on how to play sports. At college Ronald works to make money, studies his sporting books and practices his athletics. Ronald, however, fails miserably at every job and every sport he tries. On the baseball field, despite his scholarly studying of the game, Ronald does not even know the rules or the defensive team's positions.

Because of Ronald's preoccupation with sports, he fails at his academic studies. His academic failure results in a trip to see Dean Edwards, played by comedian Snitz Edwards. After listening to Ronald's tale of romantic woe, Dean Edwards sympathizes and tells Ronald of his own decision to pursue academic study instead of pursuing the woman he loved. Dean Edwards chose the life of scholarship but has regretted the decision ever since. After Ronald has left the Dean's office, Dean Edwards, surrounded by the symbols of scholarship and academic authority, breaks into uncontrollable sobbing. The scene fades out with tears running down Dean Edwards' face.

In the 1924 film, Braveheart, directed by Alan Hale and written by William Churchill De Mille, the story is told of the son of an Indian Chief, whose people live on the northwest coast of the United States, and the boy's journey to an eastern college to learn to succeed his father as his people's leader. When Braveheart arrives at the fictional Strathmore college, we are shown scenes of the campus. One scene shows a statue called "The Spirit of the Game." The statue is of two male figures. One figure, kneeling in a submissive position, appears to be reading an opened scroll that he holds in his hands. While what appears to be marks are visible on this scroll, the writing is so stylized as to be unreadable.

The statue's other male figure, standing with football held jauntily in his right hand upon his right hip, has his left hand resting upon the right shoulder of the kneeling figure. I believe that the statue tells an unsubtle story about the limited status of reading in relation to an active, physical life.

Before the progressive era, people valued books. The progressive era made the arguments for curricular reform urging the use of the new visual media communications. Thus, the actions of progressive era schooling reformers to develop a "superior" curriculum undermined the popular valuation of books. The value loss of books was tightly coupled to the progressives' arguments about the right and proper subject matter contained in the books worth reading.

If the progressive arguments are connected to the popular devaluing of books, then besides having an impact upon present education, there are consequences for any attempt to increase the popular valuation of books. Even if we could somehow stop the proliferation of stories of book valuelessness in the modern communications culture, within academic circles the arguments about proper curriculum content continue. And especially unfortunate, the arguments concerning the content of an appropriate curriculum not only continue, but continue using the same arguments (Casement 1996) that were already used to such educational detriment over 70 years ago.

This paper seeks to address the minimal attention which has been given to the role of teachers in Southern communities' desegregation plans by focusing on the plans in Big Springs, Goose Creek, and Austin, Texas. Understanding desegregation in Austin requires an understanding of two legal cases of Big Springs and Goose Creek, which graphically illustrate the struggle faced by most Texas communities in the 1950s and 1960s. These cases provide a glimpse of the at times very divisive struggle to meet the new legal standards implemented by the Brown decision, which eliminated the 'separate but equal' doctrine. These cases provide the contextual framework within which Austin's desegregation efforts transpired.

The first test in Texas of the Supreme Court's decision occurred in the west Texas ranching town of Big Springs. The local school board discussed the principles of a desegregation policy during the summer of 1955 and developed a written course of action that was to guide the formation of an official desegregation policy which it would then adopt. The official policy recommended the elementary schools be integrated on a voluntary basis during the forthcoming 1955-56 school year. The Board did not recommend desegregation of the white junior high and high schools because they were overcrowded and a new 'colored' secondary school building was scheduled for completion that fall. Thus, junior high and senior high school students were not affected by the Board's desegregation policy.

On August 9, 1955, the Big Spring ISD School District Board of Trustees ordered,

Without changing any of the boundary lines of the areas assigned to these Ward schools... grade school students living in these areas be permitted to attend grade school in the district where they reside, regardless of race... Individual students could apply to the superintendent of schools to attend the school of their choice. The applications would be considered on an individual basis and were subject to the long established authority of the superintendent to require the transfer of pupils between grade schools when classes were full in one school and space was available in another (Barbee, 1955, 62).

Reaction to this announcement was swift.

The Texas Citizens' Council immediately filed a lawsuit requesting an injunction against the School Board's implementation of its desegregation policy. Texas Governor Allen Shivers, as well as Attorney General John Ben Sheppard, supported the lawsuit. These officials argued that local school districts should proceed with caution because rushing into integration could cause great harm. They maintained that if Texas laws on segregation were eliminated, the state school laws would disintegrate.

The Texas High Court heard arguments in this lawsuit in September, 1955, and rendered its decision October 12, 1955.

[The Court ruled that] state funds could be spent for schools where Negro and white students were mingled... the U. S. Supreme's Court's desegregation ruling did apply to sections of the Texas Constitution and laws requiring segregation of white and Negro students in the public schools [and that] these offending portions were unconstitutional and void... [the Court found] that the school laws prohibiting the expenditure of public funds in integrated schools [were] not supported. [The Court declared] we find in the act no language which would deny the use of such funds to integrated schools... [while upholding the legality of voluntary integration, the Texas Court also said] the Supreme Court did not direct immediate and complete integration in all schools.

The Attorney General of Texas issued the statement that "the ruling settles the law in Texas on a statewide basis, but the time of integration will still be a district by district matter" (Barbee, 1955). Segregation had been the law in Texas, as in all other Southern states, since Reconstruction. This ruling changed the law but it did not solve the desegregation problems faced by the two thousand school districts across Texas. Attorney General Sheppard then urged Texas to begin immediately to map plans for a substitute to the state's present system of laws on segregation:
If we do not have a substitute ready when it is not needed, we may be forced by the courts to accept immediate integration. If we wait too long, our school legislation is going to be made by federal courts instead of our own legislature. Texas must take the initiative in solving the problem of desegregation or those nine men are going to solve it for us in a manner we may not like (Moorehead Papers, 1955).

McNair, a community just outside of Houston, Texas, was a part of the Goose Creek Independent School District. Shortly after the 1954 Brown decision, the Goose Creek school system closed its Negro schools and assigned Negro students to formerly all white facilities with the exception of the Negro Harlem Elementary School in the community of McNair, Texas. The history of Harlem Elementary School graphically illustrated the struggle between district officials and communities which resulted in a new education system.

Harlem Elementary, built in 1928, received its name in particular to designate it as a Negro school. McNair, the community which developed around the school, was a Negro community. Harlem Elementary School had three rooms with dirt floors and outside bathrooms (Roberts & Nichols, nd). In 1948, some twenty years later, these conditions were unchanged. The toilets remained outside, children served themselves in the cafeteria, and available classroom space remained limited. The school district board appeared to give little thought to the building plans of the school or to the education of the students at Harlem Elementary. Harlem’s teachers and students were made to feel like “second-class citizens” (Moorehead Papers 1987). As in other Negro schools, Harlem’s students were given secondhand books and supplies. However, the Negro faculty worked diligently to provide the best education possible to the students at Harlem Elementary.

In 1963, the Goose Creek Independent School District decided to build a Negro junior high school next to the Harlem Elementary School, despite the McNair community’s strong opposition. The community believed that only total integration would solve its educational problems. When the school board then decided to renovate Harlem Elementary School, the McNair community voiced strong opposition to this plan as well. The McNair parents were willing to have their children bused to all white schools within the district. The school board refused to consider their request. Instead the district renovated Harlem Elementary, built an auditorium, library, five classrooms, and an administration building at a cost of $67,000. In addition, the school district paid $23,000 for air conditioning and a stove on which to prepare the students’ lunches (Baytown, 1964: Pendergrass, 1964). Although the conditions at Harlem Elementary improved somewhat, it remained an all Negro school.

In 1965, to comply with the Civil Rights Act of 1964, the Goose Creek superintendent said that the district could no longer maintain segregated schools or faculties or the district would lose Federal funds (Baytown Sun, 1965). Shortly thereafter, a white teacher, Art Coltharp, volunteered to move to the Harlem Elementary School as principal, thereby becoming the first white teacher at Harlem Elementary. Coltharp immediately began to recruit white faculty to ‘cross-over’ from an all white school to Harlem Elementary School, an all Negro school. Apparently, the term “cross-over teachers” originated with these activities (Baytown Sun, 1966). Coltharp promised the white ‘cross-over’ teachers that they could leave Harlem Elementary at the end of the school year if they were displeased with their assignment. The community of McNair, although somewhat suspicious, supported the use of cross-over teachers.

In addition to ‘cross-over teachers,’ the Goose Creek ISD initiated a program designated “Freedom of Choice.” It was designed to recruit white students to attend Harlem Elementary School. The “Freedom of Choice” program allowed parents to choose any school within the district for their children to attend as long as overcrowding did not exist within the school or within the grade that the parents requested. If overcrowding occurred, students living closest to the school would have priority over those living further away. The school district did not provide transportation to schools outside of the neighborhood school. Not surprisingly, the “Freedom of Choice” program did not yield an integrated Harlem Elementary School. The Harlem Elementary School was in the midst of a Negro community, and white parents refused to transport their children across the district to an all black school for the same or an inferior education. For the next three years, only the faculty at Harlem Elementary School was integrated (Baytown Sun, 1965).

The desegregation plan which focused on ‘cross-over’ teachers and ‘freedom of choice’ did not meet the Department of Heath, Education, and Welfare’s criteria for legal desegregation. Because Harlem Elementary School
remained a Negro school in a Negro neighborhood, despite having white teachers employed, the Goose Creek School ISD was notified by HEW that it would lose federal funds. In 1969, the school district designated Harlem Elementary as a magnet school, which resulted in an enrollment of 59 white students and 289 black students. The Goose Creek School District met legal desegregation standards the following year.

Similar to the school systems of Big Springs and Goose Creek, the Austin Independent School District’s desegregation policy underwent several revisions. As with the Goose Creek School System, cross-over teaching was an integral component of Austin’s desegregation efforts.

Prior to the Brown decision, Negro students in Austin attended Anderson High School, Kealing Junior High School or Blackshear Elementary, Campbell Elementary, Oak Springs Elementary, Rosewood Elementary, St. Johns Elementary or Sims Elementary School, regardless of where they lived. No curriculum transfers were granted to Anderson High School students, although transfer funds were provided to Negro students in order for them to attend segregated schools. Anderson High School and Kealing Junior High School were open residential schools, is that no matter where a Negro student lived within the AISD boundaries, he/she was to attend Anderson High School or Kealing Junior High School (League of Women Voters, 1970). As a direct result of the Brown decision, the Austin Independent School District Board adopted a resolution on August 8, 1955, that desegregated the senior high schools in Austin. Thus, Negro students living outside the Anderson School residential zone could choose to attend either Anderson High School or the white high school for their residential zone. On September 6, 1955, 13 Negro students transferred from Anderson High School to the three formerly all white high schools. Only 2 of the 13 students actually lived in the residential zone of Anderson High School (Austin-American Statesman, 1955).

In the 1958-59 academic year, ninth grade Negro students were given a similar choice. They could attend either Kealing Junior High School or the all white junior high school in their residential zone. The Austin League of Women Voters (1970) reported that all the senior and junior high schools were now completely integrated in 1960. The League also reported that between 1960 and 1964, one elementary grade per year was integrated until the last four grades were integrated in 1964. In actuality, the Negro elementary schools of Brackenridge and Clarksville remained segregated until the 1965-1966 school year. Apparently Negro students were only given the option of attending the all Negro elementary school or transferring to an assigned white elementary school.

In 164, three Negro teachers were assigned to ‘cross-over’ to white schools, William Akins at Johnston High School and B. T. Snell and Miss Narvline Drennan at Allan Junior High School (Austin-American Statesman, 1964). Despite the reported desegregation of all schools and the cross-over teachers, in 1968, the Department of Health, Education, and Welfare found the Austin Independent School District to be out of compliance with federal desegregation guidelines.

In particular, HEW said that the Austin Independent School District’s plan had neither effectively eliminated the dual school structure nor had it provided an equal educational opportunity for minority students. Of the 22 reasons HEW listed as supporting its decision, the following six have particular importance for this study.

The first important reason was eight schools constituted visible vestiges of the dual structure in that they were established as traditionally Negro schools, and by 1968 still had enrollments that were totally Negro. The second reason was the only choices offered to elementary students in East Austin involve schools which were 100% Negro, 90% or more Mexican-American, or 90% or more minority. Student teachers from Huston-Tillotson, a Negro college, were assigned exclusively to all Negro schools, the third reason. That the Negro teachers assigned to white schools had more teaching experience than the white teachers assigned to Negro schools and minority schools was the fourth. Fifth, during the 1967-68 school year, only 31 Negroes were assigned as classroom teachers to 28 white schools where the enrollment was predominantly Anglo. Finally, out of a total of 2,393 teachers, only 41 Mexican-American teachers were employed in the 1967-68 academic year (League of Women Voters 1970).

At the beginning of the 1969 school year, the Austin School Board appealed for white students and teachers to ‘cross-over’ voluntarily. Only a few students and teachers responded to the board’s request. The board later abandoned its appeal to the community of students and teachers. HEW and AISD began negotiations which produced two plans, either of which would be acceptable to HEW. The two plans primarily focused on changing school boundaries. On January 10, 1969, the AISD Board rejected both plans offered by HEW and submitted its own plan.
The AISD Board's plan retained the Anderson High School residential area. Non-Negro students could not transfer to another school. The board moved the 9th grade from Kealing Junior High School to Anderson High School and 'freedom of choice' would be available to Kealing Junior High School students (Davis, 1974).

In 1970, the Austin School Board assigned 108 Negro teachers to fulfill the HEW requirements of racial balance in the white schools' faculties. White teachers would fill the vacancies in the Negro schools, again attempting to meet the HEW racial balance requirements in school faculties. However, in the same year the Justice Department filed a lawsuit against the Austin Independent School District on the grounds that it had failed to meet the federal guidelines for the desegregation of its schools. In particular, HEW examiner Leonard Ralton argued that the AISD fails and refuses to take prompt and effective action to eliminate its dual school structure and bring about an integrated unitary elementary and secondary school system. Every program and activity in said system is operated and administered directly in a discriminatory manner or is infected by a discriminatory environment (League of Women Voters, 1970).

Further, HEW stressed that Mexican-American students be included in any of AISD Boards desegregation plans. Despite the inclusion of Mexican-American students in previous desegregation discussions, they were never included in the actual desegregation plans. The AISD rejoined that Mexican-American students had never experienced segregated schools. Therefore, the Mexican-American students had not been discriminated against as had been the Negro students prior to 1954. The court still found the Austin Independent School District to be out of compliance and mandated in 1971 the submission of a desegregation plan to HEW as soon as was feasible.

The Austin School Board submitted, for HEW approval, numerous desegregation plans between 1971 and 1979. Not until the 1980-81 school year was the Austin Independent School District found to be in compliance with the federal desegregation guidelines. At this point, the court declared that the Austin Independent School District was finally legally desegregated. Cross-over teachers were a continual part of each desegregation plan submitted to HEW until the Austin Independent School District was found to be legally desegregated at the conclusion of the 1980-81 academic year.

Austin, Texas, Schools Go to War: 1917-1918

O. L. Davis, Jr.  
Federal Way (Washington) Public Schools

Realization of the new war broke slowly over Austin, the small capitol city of Texas. Quickly, however, Austinites joined with other Americans in efforts to mobilize the nation for its first total war. Austin's schools enlisted early, but the 1916-1917 school year was only six weeks from conclusion when the United States entered the war. By September 1917, the city's teachers and administrators were ready to participate as they could to foster the nation's war aims and to involve Austin's school children in learning about the war and contributing to the nation's war purposes. On the other hand, they recognized the importance of normal school operations and the continuance of pre-war plans.

This account of wartime Austin schools differs in details from other case studies of American schooling during the Great War (e.g., Brumberg 1990, Davis 1993, Nelson 1988, 124-126, Palmer 1966). Importantly, it lacks official reports of wartime school activities that are available for a few of the nation's school districts (e.g., Los Angeles City School District 1918, War Work of the St. Louis Public Schools 1919). Also, because this story has remained ignored since the end of the war, its construction rests, in the main, upon contemporary newspaper articles. The resultant account, sketchy and lacking robustness, nevertheless constitutes one of the few available case studies of the impact of World War I on an American city's schools and the only one to date from Texas.

World War I military operations, except for Atlantic submarine warfare, occurred at a great distance from the United States. Still, the nation's involvement in the new war did not assure support of war aims. Many Americans, not just recent immigrants, became reluctant patriots. Nevertheless, the majority of Americans accepted, even if they failed adequately to understand, proposals for national mobilization, even those initiatives that involved the nation's schools. Many of these wartime policies contributed to the long-term reshaping of American life and institutions (Schaffer 1991).

Not unlike their colleagues across the United States, teachers and school administrators in Austin swiftly launched a variety of symbolic and patriotic activities in support of the war. Only later did Austin teachers and administrators respond to war pressures on the curriculum. Significantly, these wartime activities did not disrupt major elements of ordinary schooling, even though wartime spawned a number of heretofore rare intrusions of federal influence on American local schools (Todd 1945, Davis 1994).

In fact, the war did not spoil the immediate pre-war successes of several Progressive era reforms. These developments rode out the war and, likely, became more robust during this national emergency.

Compulsory attendance legislation came late to Texas, but the state's 1916 law took effect in January, 1917, just three months before the outbreak of the war (Eby 1925, 230-231). In Austin, the schools' Board of Trustees and administrators recognized that enforcement of this new legislation would result in an increased student population. Their plans for the implementation of the new law included construction of three new elementary schools, including one specifically for Mexican-American children, and a junior high school. They also employed an attendance officer who was directed to give special attention to the city's Mexican-American children. Even with these developments, however, the Austin schools suffered some overcrowded classrooms during the war (Minutes 18 December 1916, AS 31 December 1916, 3 January 1917, 25 January 1917).

Several other progressive era educational reforms impacted the wartime Austin schools. They included compulsory vaccination of school children (AS 27 February 1917), provision of free textbooks to all pupils enrolled in the state's public schools (AS 9 September 1918), the development of a junior high school program and a free public kindergarten (AS 3 November 1916, AS 7 October 1917), and increased educational provision for Mexican-American children (AS 2 November 1916). Perhaps the most politically significant development, however, was the election of two women to Austin's Board of Trustees the day after Congress declared war (AA 8 April 1917).

These women, Mrs. A. C. Goeth and Mrs. J. B. Gay, were prominent leaders of the local Mothers' Clubs. Although such organizations were parent-teachers associations, they commonly were called Mothers' Clubs and they wielded considerable influence on school administrators in the pre-war years. Through their fund-raising activities,
the Mothers’ Clubs provided the city schools with a number of amenities, from trees and shrubs for landscapes and playgrounds to support of a “Penny Lunch” program for Mexican-American pupils at the West Avenue Ward School (e.g., AS 2 January 1917, AA 14 April 1918, 15 September 1918). Throughout the war, the new women members of Austin’s school board provided a vigorous voice “for mothers” in addition to their advocacy of improved school programs for children.

Maintenance of Austin’s schools amidst the war’s influences was important. Without question, the wartime teacher shortage did not jeopardize schooling in Austin, although it reached crisis proportions elsewhere in Texas (AA 26 May 1918). Nevertheless, like its impact across the nation (Evenden 1942), Austin’s teacher shortage continued throughout the war. Wartime continuance of Austin’s strong schools likely made possible the success of many symbolic and patriotic wartime activities conducted by Austin pupils and teachers.

The social climate during World War I not only encouraged public displays of loyalty, it expected them. National organizations as well as the federal and state governments promoted a great variety of programs designed to instill loyalty and to stamp out dissent (e.g., Breen 1984, Vaughn 1980). The schools, their teachers, administrators, and pupils, were not exempt from these pressures. School children could not win the war, but they could take home from school both information about and enthusiasm for the war effort; they could also influence their parents to better understand and to support the war.

As one of its first acts in response to the outbreak of war, the Austin school board required the reading of President Wilson’s War Message on a regular basis “until the children understood its meaning” (Minutes 14 May 1917, 332). Perhaps this criterion was reached quickly; no evidence remains about the duration of the requirement. Nevertheless, other speech events promoted the nation’s war aims at schools throughout the conflict. By January, 1918, for example, all school children received “ten minute speeches” about the war on a daily basis (AA 22 January 1918). Adults from the community often presented these speeches. Soon, however, children began preparing and presenting these near-ritual speeches, a practice which continued throughout the war. Guest speakers spoke at high school assemblies on a number of topics including their experiences in the army, the purposes and accomplishments of the Red Cross, the need to buy thrift stamps, and needed support of the war library fund (e.g., AS 3 January 1918, 15 November 1918). Also, adults spoke at elementary schools to encourage younger children to “do their bit” to help the nation win the war (e.g., AA 6 October 1918). Wartime interscholastic competitions in debate and declamation highlighted wartime concerns. High school graduation ceremonies especially highlighted patriotic themes. Student speeches focused, for example, on “Our War President” and “Our Present Duty” and audiences sang the national anthem and “America” (e.g., AA 9 June 1917, 2 December 1917).

Wartime brought special attention to the national flag. At least two Austin schools did not have flags at the beginning of the war, but they received flags before the end of April, 1917. Ritual pledges of allegiance became commonplace. Special school events prominently featured the U. S. flag (e.g., AA 22 April 1917).

School-wide patriotic ceremonies maintained pupils’ attention about the war. Pageants and a variety of assemblies featured the Red Cross and its activities, for example. In one elementary school ceremony, children marched in and out of their school building to the tune of the Liberty Loan March. The Austin community recognized that the schools’ “patriotic exercises” promoted sentiments of loyalty to the nation. Austin pupils’ wartime patriotism, even if it were serious, was not always unsmiling. On April 1, 1918, high school students came to school dressed in overalls, work shirts, and aprons. Their attire was an April Fool’s response to their teachers’ advocacy of the “simple ways” and “Hooverization,” a theme emphasized in preparation for the mid-term graduation ceremony (e.g., AS 1 April 1918, AA 13 October 1918).

Although ignored or commonly trivialized in many histories, pupil support of the war took a number of practical turns. These practical patriotic activities engaged school children in active work relating to the war as well as they encouraged the larger community to focus on the nation’s war aims. High among Austin schools’ priorities, like those in cities across the United States, were food conservation and production, thrift and purchase of war savings stamps, and Red Cross activities (e.g., AS 10 December 1917, 3 January 1918, AA 7 May 1918, 1 June 1918, 13 October 1918).

War gardening became an integral part of the day-to-day time tables in all of Austin’s schools. Individual
teachers and principals led this work. L. C. Anderson, principal of Austin's Negro high school, for example, personally supervised gardening efforts of students at that school. At least two of Austin's school gardens were cultivated by pupils under the supervision of teachers during regular school hours. At Palm School, the largest elementary school in the city, pupils cultivated a five-acre war garden. Produce raised in Pease School's war garden provided some of the food served in its lunch room. Administrators and public officials encouraged teachers to use war gardening, as well as other subjects, as opportunities to teach about the war and pupils' contributions to the war effort. Moreover, all the Austin schools enrolled in the U. S. School Garden Army, a movement sponsored by the federal Bureau of Education (e.g., AS 17 May 1918, AA 5 May 1918, 13 October 1918). Their participation in this intrusive federal program (Davis 1995), however, neither defined nor overwhelmed Austin schools' wartime gardening programs.

These gardening efforts received high praise locally. For example, city newspapers published honor roles of pupils for their home gardening efforts. Children who "performed especially well" received special military titles and a star for each month that they maintained a garden. Additionally, city elementary schools were awarded a "war garden decoration," designed to resemble the Congressional Medal of Honor. Several community organizations and businesses donated seeds, slips, and small plants to pupils as well as prizes for the best gardens and the best vegetables and flowers produced in those gardens (e.g., AS 25 May 1917, AA 14 March 1918, 3 April 1918, 7 April 1918).

Typical of the times in Austin and in many states, the gardening contests, exhibits, prizes, and publicity largely excluded Negro pupils and their schools. For example, Austin's first contest was advertised as one "for the children of the white public schools" (AA 10 April 1917). Even the city's business community largely ignored the gardening efforts of Negro school children. However, the Chamber of Commerce distributed 450 packets of seeds to Negro children just before the U. S. entered the war (AS 21 March 1917). Also, an individual citizen offered the use of some vacant land on which Negro children were assigned garden plots (AS 19 April 1917). The city newspapers published many fewer accounts of the gardening efforts of Negro children than they did about those of white pupils. Only two articles specifically praised the gardening accomplishments of Austin's Negro school children, but they did not mention any prizes awarded them for their work (AS 26 May 1917, 17 May 1918). Nonetheless, the Negro pupils also "did their bit".

Not only did Austin pupils grow food, they encouraged conservation. In February, 1918, for example, school children observed meatless and wheatless days in their school cafeterias (AA 12 February 1918). Primary grade pupils created food posters that depicted themes of conservation, gardening, and the dire agricultural situation in Europe (AA 1 June 1918). In addition, Home Economics departments in the junior and senior high schools developed canning centers to which pupils brought excess vegetables to be canned rather than wasted (AS 31 May 1918). Teachers and parent volunteers also gave canning and cooking demonstrations at school garden exhibits, at Mothers' Club meetings, and various other gatherings. Canning was a separate course offering in Austin High School's 1918 summer session (AA 20 June 1918) and, at Negro schools, pupils and adults canned and dried fruits and vegetables (AS 17 May 1918). Unlike schools in other parts of the nation, Austin schools did not encourage high school boys to leave school to work on farms. On the other hand, under the leadership of State Superintendent Dougty, several older Austin boys, including Dougty's son, worked on farms in Oklahoma during the summer of 1917 (AS 7 June 1917, AA 9 June 1918).

Wartime thrift, particularly that which emphasized the purchase of war savings stamps, developed only slowly in Austin. Like many other wartime school activities, pupils' interest and involvement in stamp and bond sales grew steadily as the war continued. In Austin, this participation did not gain prominent momentum until the third Liberty Loan drive in the Spring, 1918. At that time, all Austin schools organized thrift stamp sale contests and the community responded by offering incentives ranging from banana splits and cash prizes to a trip to San Antonio for winners. Pupils who sold ten subscriptions to war bonds earned bronze Liberty Loan medals. During this and subsequent war savings campaigns, Austin school children participated in great numbers (e.g., AA 16 January 1918, 8 May 1918, 6 June 1918, AS 27 April 1918). They also bought many thrift stamps. In October, 1918, eighty-five per cent of the white children in Austin forwent attendance at the circus in favor of spending the money on thrift
stamps. This decision apparently was not entirely that of the children. One school official earlier was reported to state, “There have been special methods devised to induce the pupils to buy” and “nearly every student in the [Woolridge] school is a stamp holder” (AS 4 October 1918, Minutes 17 September 1918, 372, AA 3 March 1918). Austin newspapers routinely reported the sales figures of stamps and bonds within individual schools and, also, recognized the special efforts of individual pupils.

Austin’s school teachers, despite their low salaries, were not immune to less than subtle coercion to buy war bonds. The school superintendent’s wife led the appointment of two teachers at each of the fourteen Austin schools to solicit subscriptions from the faculty members. To reduce or, at least, to eliminate objections to these purchases, the Austin schools announced that teachers would be paid as much as half of their salaries in advance in order that they could buy war bonds (AA 4 October 1918, 6 October 1918). Each school had its own war savings society and each was assigned sales quotas by the city war savings committee (AS 17 May 1918).

Pupils enrolled as members of special organizations made a number of practical patriotic contributions to the war effort. Notable among this group were troops of Boy Scouts and school chapters of the Red Cross. The Boy Scouts came to school in their military-style uniforms and became youthful leaders in community service related to the war effort. In parades and ceremonies, Boy Scouts carried the U. S. flag in parades and ceremonies. They actively sought subscriptions of Liberty Loan stamps and bonds. Scouts also maintained their own war gardens. In addition, they were the principal collectors of peach pits which were used in the manufacture of gas masks for soldiers. Scouts also distributed literature and hung posters about Red Cross fund drives (e.g., AS 27 April 1918, 20 November 1918, AA 24 November 1918).

Junior Red Cross chapters in each Austin school enrolled boys as well as girls. However, in Austin, unlike reports from many other cities, girls were much more involved in Red Cross activities than were boys. In their Red Cross activities, school children made bandages and sewed clothing, planned and conducted fundraising entertainment programs, and collected junk for resale with proceeds contributed to the national Red Cross. Such workers received pins that recognized their devotion to their country and the war effort. In these programs, Negro pupils were accorded the same recognition as that given to white school children (e.g., AS 3 January 1918, 29 January 1918, AA 27 January 1918, 22 March 1918, 13 October 1918).

The war impacted Austin’s schools in more fundamental ways than the symbolic and the practical patriotic activities undertaken by school children and teachers. It also affected the school curriculum. Of the war induced curriculum changes, the elimination of German from the American school program was near universal (Moore 1937). This profound change spread unevenly across the nation. Into the war’s first school year, no public opposition to the continuance of German in Austin’s school curriculum was voiced. Indeed, local schools offered the subject throughout that year (AS 9 August 1917). Thus, its precipitous loss was as rapid as it was unexpected.

A. N. McCallum, Austin’s superintendent of schools, supported the continued offering of German even as he recognized that schools across the nation dropped it from their programs of studies. He and other Texans had not reckoned with the power of the National Security League and the National Council of Defense and their state and local chapters. By the summer of 1918, their advocacy of the elimination of German instruction in schools began to yield dramatic results. In its 1918 session, however, the Texas legislature overwhelmingly rejected a proposal to eliminate the teaching of German (AS 8 March 1918). Nevertheless, the issue was only postponed, not resolved.

Individuals and local groups took independent action. In June, 1918, in the county surrounding Austin, Travis County officials closed two small rural schools taught mainly in German by German ministers (AS 12 June 1918). The pressure continued to mount. By September, the Travis County Council of Defense orchestrated an all-out campaign against the German language, not only in schools but in every aspect of public life. This group advocated the abolishment of all foreign language newspapers as well as the elimination of all foreign language (not only German) instruction in public and private schools. Cloaking his actions in patriotic rhetoric, its chairman insisted that everyone speak English and devote themselves to learning Anglo-Saxon ways and customs. Additionally, he used the word “traitor” to refer to anyone opposed to his group’s proposals (AA 8 September 1918). The Austin school board quickly capitulated to the local pressure and unanimously agreed to bar German from the high school and junior high school curriculum (Minutes 17 September 1918, AS 18 September 1918). Two days after its decision was made, and
much to its dismay, teachers discovered two German songs in the fifth grade music book. Superintendent McCallum, accordingly, ordered that these songs be eliminated from the book, but failed to specify how this purge would be accomplished (AS 20 September 1918). The loss of German from the wartime curriculum clearly presaged the dramatic post-war decline in enrollments in all foreign languages in the nation’s schools (Davis 1994).

Americanization programs were another wartime advocacy. Ironically, the Austin schools provided free Night School, primarily for immigrant adults (or other non-English speakers) until 1916, only shortly before World War I (Centennial Committee 1954, 91). The Austin school board decided to close this night school because of the impending expenses related to the recently enacted compulsory attendance law. Because of the continuing financial strain on its budget, the school board did not reopen its Night School until July, 1918. To help offset costs of operations, the board set a $2.50 tuition fee and the school emphasized instruction in English and civics. It also offered classes in bookkeeping, stenography, and mimeograph and multigraph operation (Minutes 10 June 1918, 368, AA 14 July 1918, AS 6 October 1918).

Another major curriculum change in Austin’s schools was the wartime offering of military training to high school boys. This development ran counter to the nationwide experience, although many schools embraced wartime military training (Ling 1918). At first, enrollment in Austin’s High School Cadet Corps was restricted to boys who were 18 years of age or older (AS 13 March 1917). The Corps quickly became popular. Within months, the school board required that all tenth and eleventh grade boys must enroll for military training. It also permitted large ninth grade boys to enroll (AA 28 September 1918). In the 1918-19 school year, most boys in Austin High School were members of the High School Cadet Corps (AS 6 October 1918). Military drills were conducted after school hours, initially, but, by 1918, this military training was inserted into the regular schedule of the high school (AS 5 February 1918).

On the day that war was declared, members of the Cadet Corps organized and led a rally at the high school in support of President Wilson and of the decision to enter the war “to obtain an enduring peace” (AS 6 April 1918). Throughout the war, members of the Corps were prominent high school leaders of patriotic events and causes. Cadets, for example, organized the Junior Home Guard gardening movement in Austin schools (AS 18 April 1917) and developed a minstrel show to raise money for war-related causes (AA, May 4, 1917).

Austin schools launched agriculture as a vocational offering during the war. However, its development was a function of the availability of federal funds made available by the Smith-Hughes Act of 1917 rather than a wartime advocacy. An agriculture teacher was employed in the summer, 1917, to offer courses at Austin High School and was charged also with the supervisory oversight of all school wartime gardening activities. This teacher began to offer courses in agriculture in February, 1918 (Minutes 14 January 1918, 355). Importantly, agriculture courses were not the first vocational courses offered in the Austin schools. A manual training program had operated at Austin High School for more than twenty years before the introduction of agriculture courses (Davis 1995).

Curriculum modifications occasioned by the war appear less in Austin schools than that known in some other cities’ schools. In no small measure, this observation likely reflects the evidence that has survived. For example, the school board minutes and local newspapers do not reveal any school use of special history and civics materials such as the National School Service designed and distributed by the Committee on Public Information. Elsewhere, these materials featured prominently in wartime instruction (Davis 1996). Nevertheless, wartime loss of German was a significant curriculum casualty. Also important were the addition of military training as a school offering and the introduction of agriculture as a new high school subject.

Without doubt, World War I affected the Austin, Texas, public schools. However, its impact was muted. Austin was a small city at the time and distant from both Europe and Washington, D. C. Thus, the conduct of the war, although of keen interest, remained for most Austinites a sentiment of national loyalty in search of expressions. In Austin schools, continuance of normal schooling even in abnormal months dominated the scene. Secondarily, symbolic and practical patriotic expressions found voice and platform. Austin pupils, teachers, and administrators locked arms in efforts to support national war aims and programs. All the while, they continued to engage in the fundamental activities of schooling.

Informal Learning in a U.S. Wartime Internment Camp, 1942-1946

Karen L. Riley
Auburn University at Montgomery

When Henry Adams penned his memoirs, which were privately printed in 1907, he intended that they would serve as a handbook for young men. However, his recollections of his travels throughout Europe and his own "higher learning" ultimately reached a far wider audience. According to his remembrances, much of his "real" education had taken place outside of official classroom doors. Official or state-organized education, such as the education system in Germany, insisted Adams, did little to broaden the horizons of intelligent men. Rather, it was rigid and ideologically driven (Samuels 1973).

Adams likely suspected that occasions for unintended learning were the incidents recalled with greater clarity later on in life--perhaps more useful also--than many formal classroom experiences. One profound example of such encounters consists of multiple learning opportunities experienced by former internees, both children and adults, in the United States Justice Department's family internment camp at Crystal City, Texas (Riley 1996). Opportunities for "higher learning," experienced by former internees, were often informal occurrences, or, if regulated, took place outside of formal classroom instruction.

As a result of the United States’ enemy alien internment program, developed by the Department of State and the Department of Justice, over 4,000 German, Italian, and Japanese enemy aliens and their children were interned at Crystal City, Texas, during World War II. Throughout internment, nearly all internee needs were taken care of by the Justice Department through its custodial agency, the Immigration and Naturalization Service (Official Historical Narrative 1945, Lunz 1995).

The men, women, and children interned at the United States internment camp at Crystal City during World War II were confined to the barbed wire enclosure of the compound (Official Historical Narrative 1945). There, within the view of guard towers, German, Italian, and Japanese internees were engaged in a variety of learning opportunities, although not necessarily associated with formal schooling. Some participated in purely accidental or unforseen learning occasions, others in extracurricular activities, and still others as a result of extended learning or extension programs.

Events which offered learning opportunities through extracurricular, and internee led activities included joint rallies and commemorations held by the German Youth Corps and Japanese Scouts, both of which were active organizations within the internment camp (Schmitz 1995, Tomita 1995). These ideologically charged rallies consisted of marching and drilling with ample opportunity to display the militaristic spirit of both Germany and Japan, while commemorations reinforced concepts such as bravery and honor with solemn demonstrations of loyalty and allegiance. Aside from these extracurricular activities and accidental or chance opportunities for learning, some students extended their classroom learning by dramatizing what they studied in school later at home. One such experiment involved a middle-grade student, Toni Tomita, who was motivated to replicate a frontier experience studied at school when she held a quilting bee in her internment-camp cottage with classmates (Takeuchi 1995). For Miye Takeuchi, whose hours of evening study with Dr. Mori, a respected Japanese scholar, eventually led to a national literary award from Japan, informal classes and study allowed her to become a writer and poet (Takeuchi 1995, Tomita 1995, Eto 1995).

These accounts of informal learning experiences incorporate oral history testimonies, archival documents, the private papers of one former teacher, and the memoirs of the internment camp’s Supervisor of Education. The interpretation of this evidence attempts to render an objective account of educational experiences that normally fall outside of the structure of formal schooling, which often relies on authorized reports for the substantiation of official school programs. The two reported occasions of informal learning which follow, based on oral and written recollections, are representative of others that likely occurred at the Crystal City Family internment camp.

One day, as eleven-year-old Art Jacobs walked through camp, he saw a huge kite flying in the distance. He immediately went over to get a closer look at this unusual kite. Art had made kites in the past, but only in the shape of triangles. He asked its owner, who looked to him to be about sixteen years old, "What is it?" The young
man replied, "It's a kite." "That ain't the way to make a kite!" Art answered emphatically. "That's the way we make 'em in Japan," the young Japanese fellow said. Eagerly, Art said, "Teach me how to make that."

Like most second generation German and Japanese children interned at Crystal City, these two conversed with each other in English, their mother tongue. So, Art learned how to make the new rectangular box kite, which he said "went higher than any other kite that he ever built." Kite making was Art's introduction to Japanese culture. From there, his new friend taught him how to make clog shoes, such as Japanese men wear to the bath house, and he even tried sushi (Jacobs 1995).

A similar account by a young Japanese girl, Kay Haga, suggests that the rate and degree of cultural interaction and informal learning occasions experienced by both children and adults during internment may well be higher than will ever be documented. Kay, for example, clearly recalled the times that she and her father walked over to the German section of the camp to attend informal German language classes held at the German School. Kay's command of German proved useful when she performed with the German orchestra and needed to take directions in German. As a pianist, she also accompanied German solists in camp concerts and played in a trio at the German section's recreation hall, Cafe Vaterland, where she remembered being paid for performances in cokes (Haga 1993).

The internment camp was divided into two sections, German and Japanese. In the Japanese section of the internment camp, most of the camp's continental Japanese American children walked the three to four blocks each day to either Federal Elementary School or Federal High School (Official Historical Narrative 1945). Latin American Japanese children also walked three or four blocks each day, along with Hawaiian-American Japanese children and a few continental Japanese American students, in order to reach their school, the Japanese School, which stood next door to Federal High School. On the other side of the camp, German American children and Latin American German children prepared for classes at the German School each day. Unlike continental Japanese American children, German Americans overwhelmingly attended the German School (Schmitz 1995, Jacobs 1995, Official Historical Narrative 1945).

After school, activities such as scouting formed part of the aggregate informal learning experience at the internment camp at Crystal City. As an extracurricular activity, scouting not only fostered discipline, it also provided opportunities for children to learn the ideals valued by traditional German and Japanese parents. In the German section of the camp, for example, the scouting program was known as the German Youth Corps, modeled after the Youth Corps in Germany; the Japanese scouting program was modeled after scouting programs in Japan (Schmitz 1995, Tomita 1995, Eto 1995, Sakarai 1995, Higashide 1993). In addition to the promotion of values, these programs fostered allegiance to German and Japanese educational aims, such as the development of good citizens, through adult/child participation. To those ends, participation in the Youth Corps and Japanese scouts added to the indoctrination process through rallies and pageants, all of which glorified Hitler and Hirohito and elevated Germany and Japan over the United States and her Allies.

One event, Hitler's birthday, serves to illustrate how adult led organizations such as the German Youth Corp facilitated the process of teaching German citizenship. During the week of April 20, 1944, German internees planned a huge celebration honoring their national leader. All patriotic organizations likely participated in the camp-wide festivities. John Schmitz, like other boys his age, prepared for this important event by dressing up in his white shirt and dark pants on the evening of the commemorations. John belonged to the German Youth Corps, as did many of his friends. On the evening of the celebration, excited about the opportunity to carry a small tin can filled with kerosene for the torches carried by marchers, John could hardly wait to participate in the big parade, and to witness the spectacle of dozens of lighted torches (Schmitz 1995). On occasions like the birthday celebrations of Hitler or Hirohito, which fell within nine days of each other, both German Youth Corps members and Japanese Scouts marched together.

John was delighted to be allowed to carry something as important as kerosene throughout the camp; besides, torchlight parades were the hallmarks of great Nazi political productions, and the German section, after all, functioned as a small part of Germany. John recalled that his participation in the Youth Corps made him feel important, as if he were part of something large and meaningful. At times like these, he was proud to be a
German. To young boys like John, the German Youth Corps reflected the pride and vigor of Germany, not to mention demonstrating its national values of power and might.

In looking at the forces within the camp that shaped the German Youth Corps, one event stood out: the Memorial celebration of 1944. A week before the celebration, the German section sponsored a registration for "boys from 7 to 10 years," for its Youth Corps (The Camp 1944, a). In less than two weeks, its new members paid tribute to Germany's fallen heroes, while proud German parents stood in the recreation hall watching as their children marched in to the rhythm of the drum and bugle corps (The Camp 1944, b). Not knowing what they were about to hear, or understanding, these new Youth Corps members, citizen children from the United States and Latin America, dutifully played the role of good German citizens.

Japanese students, like their German counterparts, were "expected to participate in military drills under the guise of belonging to either the Boy Scouts or Girls Scouts" (Uno 1993). Consequently, Japanese students regardless of which internment camp school they attended, enrolled in the Japanese scouting program. Mr. Kashihara organized the Japanese Scouts during the summer of 1943, although Mr. Tate, the camp's Supervisor of Education, was listed as its nominal head. The first registration drive enrolled 100 eager scouts, divided by age and height into five troops.

The Japanese Scouts met three times a week in the Japanese School yard. Its programs were not unlike the Boy Scouts or Girl Scouts of America, whose members learned helpful skills, such as lifesaving, outdoor safety, sewing, health care, handcrafts, and the art of tying rope knots. Japanese scouts also spent part of their time marching and drilling (Yamaguchi 1995, Kanegawa 1995). Several former Japanese Girl Scouts recalled a few educational experiences. Ruby Fukunaga remembered that in her troop, "We had lots of crafts." She also "studied science and learned about plants, bugs." Leaders concentrated on art and calligraphy in addition to science studies (Sakarai 1995). The Japanese scouting program helped to shape traditional Japanese gender roles by channeling girls' interests into areas such as homemaking or crafts, while boys learned such things as rope tying and camping. Japanese scout leaders also accomplished political objectives, such as fostering militarism, obedience, and loyalty to nation and Emperor.

Kazuko Shimahara, like dozens of young Nisei girls, joined the internment camp's Japanese Girl Scouts during one of its enrollment campaigns. "It was the first time I belonged to Girl Scouts and it was marching and drilling," she remembered. Several times a week after school, Nisei children scurried throughout the Japanese residential section of the internment camp in preparation for their scout classes. Part of their meetings were devoted to absorbing the Japanese value of strict discipline. Scoutmasters achieved this conditioning by requiring scouts to march and drill, and to stand at attention with eyes straight forward. Scouts who changed position or stooped to tie an unlaced shoe, for example, often suffered corporal punishment. Kay Uno well remembers the day that her scout master struck her for not understanding one of his commands.

Not all scout leaders used such severe techniques to instill discipline and pride; some employed methods such as rote memorization. In Kazuko's troop, scouts recited the following phrase: "I am a Japanese, I may be small [meaning young] but I am still a Japanese citizen." Although she repeated this motto each time, she felt confused by its meaning because she was aware of her American citizenship (Kanegawa 1995). Her confusion was exactly what the pro-Japanese Issei faction hoped to eliminate through aggressive enrollment drives for scouting and afternoon language classes at the Japanese school.

Adult education programs, in the Japanese section, for post-high school students and older adults, also offered opportunities for casual or informal learning, which attracted scores of internees and their wives. The adult education curriculum included interests of every description, such as flower arranging, judo, fencing, tea ceremony, literature, and world events (Spanish Legation Report 1943, Official Historical Narrative 1945, 170). Japanese teachers offered courses in Japanese language, pattern making, crafts, calligraphy, dressmaking, sewing, and cooking (Ibid). Many Japanese women took advantage of cooking classes and learned to make such exotic dishes as kuri manju. Reverend Yamashita, a homeroom teacher and language teacher at the Japanese school, even taught Zen classes in the evening (Yamashita 1995). These classes were held on school grounds after the regular school day.
In "Adult English Class," internees studied English through letter writing, speaking, reading, and translating English to Japanese and Japanese to English. For instructional materials, teachers used word lists, basic English readers, dictionaries, Learning the English Language, readers, and mimeographed lessons. One adult learner, Miye Takeuchi, was representative of other adult learners in the camp whose abundant free time enabled them to learn new skills or to seek creative outlets.

Takeuchi enrolled in pattern making, something her children said that she always wanted to learn. The Japanese section contained talented dress makers and tailors from Peru who offered classes in pattern making, dress making, and sewing. Through these adult education programs, she learned how to make dress patterns from a Peruvian tailor. She also studied literature and poetry with Dr. Mori (Takeuchi 1995). Under his tutelage, her gift of writing poetry blossomed into the mature style that won first prize in Japan's New Year's Imperial Poetry contest over a decade later when she expressed her joy at becoming an American citizen yet sorrow at relinquishing her birthright. Decades later, her son, Tak, referred to the internment camp at Crystal City as a "learning Mecca for the uninitiated" (Yakeuchi 1995).

Informal learning in the United States internment camp at Crystal City, Texas, took at least four distinct forms: accidental, school inspired home experiments, youth scouting, and adult education programs. Although not official academic programs, the learning outcomes that extend from these four informal categories were perhaps more profound—and in many cases, certainly better remembered—than formal classroom lessons. For example, Toni's school-inspired experiment with a quilting bee was recalled by her with greater clarity than her in-class lessons or other formal learning experiences she likely encountered, thereby supporting the idea that learning which is student generated is often more meaningful than teacher directed learning. Other significant forms of learning included both the German and Japanese scouting programs. Former students had little difficulty recalling specifics about their scouting experiences, even those who were of elementary-school age during internment recalled events such as marching, drilling, tying knots, studying insects, and numerous joint scouting rallies, as well as the color and style of their scout uniforms.

Adult education and post-high school informal classes, such as the one hosted by Dr. and Mrs. Mori, also offered numerous opportunities for casual learning. Women, whose homemaking chores prior to the war, engaged them full time, found new avenues of interest in the form of casual learning. From cooking to pattern making and literature, informal education enriched the lives of internee men and women. However, for adherents of informal learning as a meaningful endeavor, lessons taught and learned from accidental contacts may prove to be the most enduring. The examples of the German boy who learned how to make boxed kites, clog shoes, and eat sushi, and the Japanese girl whose German language lessons allowed her to play with the German orchestra, remain clear memories to these students, despite the distance of fifty years, when formal classroom events are but dim recollections.

Critical Thought in Social Education, Pre-World War II

Frances E. Monteverde
Hanover College

Critical Thought in Social Education, Pre-World War II

Uxtaposed to the backdrop of noble sacrifice and courageous patriotism, a cloak of negative images shrouds the concept of critical thinking in the World War II era. Fussell claimed the United States experienced a "general flight from complexity, irony, skepticism, and criticism" (1989, 179). Pells (1973, 1985) concurred: As the nation hurtled closer to war's edge after 1939, liberal writers and intellectuals retreated from reasoned social criticism toward emotional slogans, myths, and patriotic icons. Fear of a fascist victory replaced other concerns. Americans did not honestly confront the contradictions, irrationalities, and tragedies generated by the War.

Roeder's study of censored visual images (1995) concluded that official policies and practices fostered a simplistic understanding of the war and its repercussions on society. The "master narrative" described "sane" warfare. Rational contingency plans succeeded with minimal damage, loss, or pain. Cronbach advised teachers that a pupil can plan calmly for the future "when the pupil realizes that his [sic] government is protecting him from runaway inflation, that scientific progress is diminishing the deaths from battle injuries, that his fears about the terror of war are far beyond the realities of living" (1942, 303). Censors hid the errors in judgment, blunders, and war disabilities from public scrutiny. The media and official sources characterized friends and foes as either heroic or demonic, not ambiguous, blurred entities. Wartime mentality could not accommodate complex logic, nuances, or shadings (Fussell 1989). Stories that disrupted traditional values were quashed. The deliberate suppression and distortion of news hindered postwar efforts to improve minorities' socioeconomic status (Roeder 1995). For its lapse of critical mindedness, Fussell declared the United States paid dearly with an impoverishment in the arts, literature, and civic maturity.

In education, the critical research community argues that school systems reproduce the values, knowledge, and ideology of the cultures where they are located (Cherryholmes 1991). In the decade of political experimentation prior to the U.S. entry to World War II, the larger society engaged in intense social and economic questioning. Simultaneously, critical thinking occupied a central position in the educational rhetoric and curriculum projects of the 1930s (Monteverde 1996, Chapter 4). Kliebard commented briefly on curriculum of the war period:

Once the prospect of a world conflict loomed on the horizon, however, and criticism of American social conditions was no longer in vogue, social meliorism as a force for curriculum change gave way to curriculum thinking more in tune with the times. Those times were no longer right for social reconstructionism. With America's entry into World War Two imminent, criticism of American society slipped out of vogue in favor of a wave of patriotism occasioned by an external threat of aggression (1987, 207-208).

Did social studies educators who customarily focused on the human condition cease to engage students in inquiry and dialogue? To what extent did the official journal of the National Council for the Social Studies (NCSS) substantiate Kliebard's claim? Thus, did Social Education, 1937 to 1945, abandon critical thinking as an advocated instructional goal and as a tool for the construction of its discourse?

The term "critical thinking" exemplifies the postmodern idea that meanings of words are not fixed and immutable. They are floating, shifting, equivocal, dependent on the social situation and context where they are used (Cherryholmes 1991). Despite efforts to establish a common definition, a lack of consensus persisted for most of the twentieth century (Parker 1991; Armento 1986; Carroll 1981; and Taba 1942). An exhaustive review of recent literature on critical thinking concluded that writers generally believe it involves the comprehension of issues from various perspectives (Cassel and Congleton 1993, vii-viii). As such, the term implies questioning assumptions and assertions; the requirement of evidence and logic for truth claims; and a skeptical disposition. That abbreviated criteria was used to analyze the journal's discourse and pertinent archival materials. Did Social Education present controversial issues? If so, were the discussions simplistic and one-sided, or complex and multifaceted? Did the journal question social norms, beliefs, and practices?

Regarding some topics, the journal did follow patterns identified by Fussell, Pells, Roeder, and Kliebard...
(Monteverde 1996); however, the advocacy of critical thought continued as a rhetorical focus. Moreover, Editor Erling M. Hunt applied the principles of academic fair play to the treatment of crucial professional challenges and some social issues. This account relates a sequence of editorial decisions just prior the official U.S. entry in the War. Responding to conservative accusations of "treason in the textbooks," the journal published discourses from various primary sources, some contrary to the views of Hunt and the NCSS leadership.

Traced through the first five volumes of Social Education (1937-1941), the tale of critical thinking illustrates the influence of current events and social forces on educational discourse. After President Roosevelt's inauguration in 1933, "New Deal liberalism" became the dominant ideology in the United States. The public generally supported FDR's reforms although a minority of critics resisted the government's intervention in socioeconomic affairs. During the same period, American educators experimented with hybrids of progressive and traditional teaching practices (Cuban 1984). A major impetus for progressivism flowed from the faculty and graduates of Teachers College at Columbia University where Erling Hunt served as a professor (Cremin 1964). New Deal dominance waned at the end of the 1930s. In 1937 a coalition of Southern Democrats and Republicans waylaid FDR's legislative agenda and his strategy to name Supreme Court justices who agreed with his programs. The following year, liberal FDR supporters lost elections, and by 1939, the conservatives firmly controlled the U.S. Congress. The business community regained prestige lost in the early years of the Great Depression (Graham and Wander 1985; Kliebard 1986). The United States was locked in a "titanic struggle," with "the interests" pitted against the middle and working classes. Industry, business, and the media wanted minimal government intervention in economic life, while the lower classes sought income security and protection (Newlon 1939). Publications by the Educational Policies Commission decried partisan political interference in the schools and a growing incidence of censorship (Beard 1937; Stoddard 1938).

Into that sea of transition, the NCSS launched Social Education in January 1937. Editor Hunt vowed it would be a readable, practical publication focused on "man [sic], civilization, and society" (1:2). The journal embraced the spirit of intellectual freedom and inquiry. From the outset, it aired controversial topics in both education and the public arena. Contributors reviewed books and magazine articles, analyzed current world events, and reported teaching practices or research in the social sciences. School teachers, college professors, and specialist scholars wove an interesting tapestry of contrasting opinions, values, and beliefs. In short, Social Education provoked reflection and dialogue, the essence of critical thought (Monteverde 1996, Chapter 6).

Nevertheless, the journal slanted toward liberal causes. Kimmel (1937) argued for more teaching about government redistribution of wealth and power. In the aftermath of the President's failure to "pack" the Supreme Court, contributors denounced press hostility toward the New Deal (Bradley 1937; Brant 1938). Faulkner (1939) suggested collectivism to redress cyclical laissez faire economics of the 1920s. Articles informed teachers about government purposes and programs, e.g., public-welfare, the National Labor Relations Board, the Works Progress Administration, the National Resources Planning Board (NRPB), and the Federal Securities Commission (Koeler 1940; Social implications of the NLR Act 1940; Jensen 1940; and Stein 1941). NRPB consultant Charles Ascher said the nation "was approaching some sort of planned economy, whether we want to admit it or not." He reminded readers that government planning "was not a recent import from Moscow" (1940, 532-533).

Given the journal's advocacy of critical thinking and its penchant for liberal causes, NCSS reaction to conservative criticism came as no surprise. The Seventh NCSS Yearbook, Education Against Propaganda (Ellis 1937), railed against special interest groups that indoctrinated for consumerism and ultra nationalist ideologies. The Annual NCSS Conference featured a major address by liberal historian Charles A. Beard, "The High School Teacher and Academic Freedom" (News and Notes 1937). Advertisements in Social Education by the Institute for Propaganda Analysis (IPA) offered classroom materials to critique the radio broadcasts demagogue Father Coughlin (IPA 1939, iv). Almost half the states required loyalty oaths of teachers. Moon (1939) wrote that to discuss the U.S.S.R., communism, labor unions, government ownership, or socialism was "an occupational hazard for teachers." Van Til (1939) of The University High School at Ohio State described his students' use of IPA materials to study controversy and to think more critically. In November 1939, the journal reprinted an anti-censorship speech by U.S. Commissioner of Education John W. Studebaker.

A closer scrutiny of the journals yielded the surprising discovery of articles expressing conservative views. Erling Hunt's academic background pointed to a commitment to critical thinking, a philosophical imperative to balance viewpoints on crucial issues. His editorial policy and decisions regarding textbook criticisms reflected that stance. He demonstrated courage, intellectual integrity, and political shrewdness as an NCSS leader.

In December 1939, George Sokolsky sounded an ominous note in Liberty magazine, one that reverberated in Social Education. In his article, "Propaganda in Our Schoolbooks," the Hearst columnist asked, "Does the parent discover whether his child is being brought up in the tradition of America, or in the propaganda of Soviet Russia?" (Platt 1940, 227).

NCSS contributors responded swiftly to the contentious theme. Referring to articles in Forum and Reader's Digest, Ellis countered charges that consumer education was a "communistic attack on the American economic system." He retorted that "vested interests denounced [education in order to keep citizens ignorant so they can be exploited" (1940, 5). Brownlee (1940) reported tactics by the Chamber of Commerce, the American Federation of Advertiser, and Hearst's Good Housekeeping magazine to manipulate consumers and disparage social studies textbooks. In April 1940, Platt directly challenged Sokolsky's innuendo that schools and school books were overrun with "subversive Reds." Teachers defiantly described lessons and units on propaganda analysis and critical thinking (McNutt 1940; Cherry 1940).

Notably, Editor Hunt chose an article describing the American Legion's "Boy's State" program in New York State. The report began with an unsubstantiated charge: "At present there is unanimous agreement that citizenship education is not acceptably done in schools" (Marble 1940, 262). As alternatives, the writer described simulations of local and state government enacted at annual Boy's State conferences. Perhaps Hunt's selection was simply a shrewd move to mollify superpatriotic critics. Or, perhaps he chose to follow the principles of intellectual fair play that he learned early in his undergraduate career at Dartmouth College. In a later interview, April 1977, he decried the one-sided portrayal of Germany as "rank propaganda" in a government-required course during World War I (Hunt 1977, tape 1 side 1, hereafter cited as Hunt tape, OHEC). Whatever his motive, the article commended the work of an organization generally opposed to NCSS values.

In the wake of Hitler's 1940 Blitzkrieg victories in Western Europe, the October editorial pages reaffirmed the importance of critical thinking in classroom activities. NCSS President Howard R. Anderson and Editor Hunt (1940) hinted of future sacrifices to meet the wartime crisis, but they argued for the goals of open, rational inquiry and propaganda analysis. Despite claims that such instruction produced cynical youth, social topics such as unemployment, labor relations, general welfare, class hatreds, and bigotry, were standard fare in classroom dialogue. Loyalty to the nation should not be built on blind patriotism, they asserted.

In January 1941, Anderson took up the gauntlet Sokolsky had thrown down a year before. The battle now raged over O. K. Armstrong's "Treason in the Textbooks," published in the American Legion Magazine, September 1940 (cited in Anderson 1941). Armstrong charged that social studies education and its textbooks undermined loyalty to the nation, free enterprise, private ownership, American political traditions, and religious faith. To teach socio-economic problems and international topics would establish "socialistic control" in the United States. Offering a progressive, fusionist rationale for social studies education, Anderson refuted Armstrong point for point. By maligning the competence and patriotism of educators, as well as school programs, the Legion's attacks could ultimately destroy American public schools, Anderson argued. He admonished the NCSS to stand fast in its advocacy of critical thinking and "warm loyalties" for the democratic way of life.

The textbook controversy resurfaced the following month in a discussion between the National Association of Manufacturers (NAM) and professors at the Harvard Graduate School of Education. Hunt's direct quotations from primary sources and detailed explanations revealed his scholarly approach (Hunt 1941a; Manufacturers' Association Abstracts Textbooks 1941, hereafter cited as NAM abstracts). The following summarizes those reports.

In December 1940, the NAM proposed a review of some 800 social studies textbooks to be conducted by Dr. Ralph W. Robey, a professor of banking at Columbia University. The investigation would produce "abstracts" of direct citations to reveal the authors' beliefs about government and the free enterprise system. The Association intended to disseminate the abstracts to all its 8000 members, as well as school boards, teachers' colleges, libraries,
education associations, and the Congressional Library. The objective was to improve education and preserve the "democratic way of life" (NAM abstracts, 134). Educators and laymen would have a "factual basis upon which to judge . . . whether the attack on the books [were] warranted" (NAM abstracts, 138). Similar to the American Legion, the Manufacturers believed citizenship education had been neglected, and specifically, the free enterprise system, indispensable to the American way of life, had been misrepresented.

Robey's lack of specialization in education alarmed the Harvard professors. They objected to the destructive potential of the proposed abstracts, which, devoid of constructive criticism, could be misused. Would the tracts show whether books explored the advantages and disadvantages of the free enterprise system? Would the abstracts consider responsibilities as well as rights in a democracy? Would the quotations reveal whether the books addressed the social needs of the whole society? The professors harbored doubts about Robey's capacity for objectivity. In a rejoinder, the NAM alleged a "growing apprehension" over textbooks, but especially three or four authors. The Association reassured the Harvard committee that Robey's assistants would prepare "factual, unbiased accounts." Only quotations from the books, not opinions from the abstractors, would appear (NAM abstracts, 136-137).

Other elements of the article revealed Erling Hunt's sense of academic evenhandedness, or perhaps simply his political acumen. Citing the New York Times, he reported the Association's intention to mobilize its membership against "those prejudiced to our form of government, society, and system of free enterprise" (NAM abstracts, 139). Professor Robey, an outspoken critic of socialism and the New Deal, had been hired to provide academic credibility to the cause. NAM President H. W. Prentis, Jr. distinguished between democracy and republic: "Hope for the future of our republic and for the correction of its shortcomings does not lie in more democracy. It hinges on the resurgence of individual patriotism and religious faith" (cited in Hunt 1941a, 88). Significantly, the "News and Notes" column of March 1941 listed teaching aids—pamphlets, motion pictures, sound slide films, and posters—produced by the NAM for social studies classes. The author published the ordering addresses and the names of the authors, President H. W. Prentis, Jr., George Sokolsky, and the Robey's Research Assistants.

In April 1941, however, Hunt's evenhanded approach vanished, and with justification. Despite earlier assurances, Robey wrote sweeping, negative appraisals of texts and authors in the New York Times. Hunt pilloried Robey for his breach of trust. Newspapers in various parts of the country followed suit. Ultimately, the NAM disassociated itself from Robey and repudiated the accusations: "Subversiveness in textbooks had been immensely exaggerated" (cited in Hunt 1941b, 289). Belatedly, the American Historical Association denounced the NAM attack and argued that U. S. history must include controversial struggles for socioeconomic justice as well as heroic tales of glory. Teachers and scholars themselves were competent to evaluate schoolbooks for history instruction (reported in "Freedom of Textbooks" 1941).

By year's end, the textbook controversy subsided, but irreparable damage had occurred. Two battle fronts engaged the attention of social studies leadership in 1941. On one side, the tides of the European war rose menacingly to engulf the United States. Those events demanded reflective reassessment of educational priorities. On the domestic side, conservative organizations demanded unquestioned faith in free enterprise and the nation. Instead of unifying the society, the critics portrayed progressive educators as a cynical, subversive, unpatriotic fifth column. That open confrontation required immediate responses. The textbook episode was a prelude to the future debates over the adequacy of American history instruction in the nation's schools. An upshot of the textbook accusations was the swift removal of Harold Rugg's popular, socially critical texts from the nation's schools (Kliebard 1987, 207). Clearly, the conservative critics posed a formidable threat to individuals and organizations that fostered critical thought about social issues.

Although unnamed in the NAM replies in Social Education, Teachers College professor Harold Rugg was a major target of the attacks (Nelson 1982; Robinson 1983; Kliebard 1987). Rugg's best-selling series focused on current social, economic, and political problems. The American Legion, the Daughters of the American Revolution, and the publishing organizations of Hearst, Forbes, and Luce had campaigned to eliminate his materials, Man and His Changing Society. Nelson related the laborious steps Rugg took during 20 years to produce the controversial books. In That Men May Understand, Rugg stated his purpose: Youth needed the full story of their society if democracy were to survive (1941, 239-249). Rhetorically, he asked, "Which brand of the American Way are we to
hold and teach?" (Rugg 1941, 125). His answer: "Thinking ability [that] comes only from confronting problems and choosing between alternatives" (Rugg 1941, 126). Throughout this volume, Rugg argued for critical thought as the core for school curricula.

Mehaffy's taped interviews of Wilbur Murra and Erling Hunt in 1977 shed additional light on the drama of critical thinking in Social Education. Murra served as NCSS Executive Secretary and Assistant Editor of the journal from 1940 to 1943 (Murra 1977, hereafter cited as Murra tapes, OHEC).

Murra recalled that Rugg and his brother, Earl, favored a "fusionist approach" to social studies education. They, as well as Edgar B. Wesley and Murra, opposed the traditionalist views of Hunt and his mentor, Henry Johnson. The Johnson-Hunt faction at Teachers College advocated separate disciplines, whereas the fusionists sought direct application of the combined social sciences to the study of contemporary issues. The fusionists would have eliminated the study of ancient civilizations as irrelevant. The traditionalists believed students should learn history for its own sake, as a body of knowledge and a process of inquiry, but not as a useful subordinate to current social problems. (Murra tape 5 side 10; tape 2 side 4; tape 3 side 6, OHEC; Wesley 1968; Johnson 1915).

Mehaffy's interview with William Murra and Erling Hunt in 1977 shed additional light on the drama of critical thinking in Social Education. Murra served as NCSS Executive Secretary and Assistant Editor of the journal from 1940 to 1943 (Murra 1977, hereafter cited as Murra tapes, OHEC).

Murra recalled that Rugg and his brother, Earl, favored a "fusionist approach" to social studies education. They, as well as Edgar B. Wesley and Murra, opposed the traditionalist views of Hunt and his mentor, Henry Johnson. The Johnson-Hunt faction at Teachers College advocated separate disciplines, whereas the fusionists sought direct application of the combined social sciences to the study of contemporary issues. The fusionists would have eliminated the study of ancient civilizations as irrelevant. The traditionalists believed students should learn history for its own sake, as a body of knowledge and a process of inquiry, but not as a useful subordinate to current social problems. (Murra tape 5 side 10; tape 2 side 4; tape 3 side 6, OHEC; Wesley 1968; Johnson 1915).

Acknowledging his debt to Johnson, Hunt explained his pedagogy in terms similar to his mentor's 1915 text (Hunt tape 1 side 2; tape 3 sides 5 and 6; tape 2 side 4, OHEC). Students needed primary sources to augment textbook summaries. Instead of memorization, they should evaluate documents and artifacts, and draft well-written conclusions. Teachers needed competence in historical criticism and map work before teaching pupils to establish facts and to interpret events. Regardless of their abilities, students could develop higher order thought either through study of concrete narratives or the analysis of abstract ideas. He recommended the examination of various sources and critical book reviews. As with Rugg, critical thinking formed the heart of Hunt's educational philosophy. Rugg focused on present problems; Hunt on the lessons from the past.

Apart from their pedagogical differences, Erling Hunt admitted his personal dislike for the Ruggs, especially Harold whom he characterized as arrogant and self-promoting. "[They] took great credit for [founding the NCSS] and were involved until they couldn't get control. They didn't have much of a following." Hunt recalled that Earl served as Assistant Secretary from 1921 to 1922, but that Harold had never accepted an office. "If they couldn't run the show they'd be out" (Hunt tape 1 side 1; tape 2 side 3, OHEC). Murra claimed Hunt "detested" the Ruggs on pedagogical grounds, but also, he hinted, because they were of lower social origins. Other NCSS leaders reluctantly defended Rugg because he had not been active in the organization. Furthermore, open support for Rugg might have jeopardized the Council because of his radical stance against business (Murra tape 5 side 10, OHEC). Thus, for philosophical, personal, and organizational reasons, Erling Hunt might have withheld support for Harold Rugg during the textbook controversy.

Nevertheless, Hunt backed Rugg in various ways. The journal carried a favorable review of the 1937 edition of Man and His Changing Society (Cordier 1937). Publicly, Hunt defended the rights of teachers and textbook authors to work without interference from non-professionals. In 1977, he recalled a Town Hall debate with the New York City Chairman of the Board of Education and Professor Robey (Hunt tape 2 side 4, OHEC). Hunt opened the journal's pages to writers with whom he disagreed; Rugg was no exception. Three years before the NAM announced its veiled threat against Rugg, Hunt stated his editorial policy in a memorandum to the NCSS Executive Board. Dated 26 February 1938, it declared:

Social Education is not the organ of radicals or of those who have called themselves Progressives. It is not pro-Rugg; it is not anti-Rugg. It is open to all who have something of importance or interest to teachers. The social studies area is vast, it is controversial. . . . frankly experimental . . . . Thought and ideas are also important—they are the bases on which [teaching] devices are founded. Thus broadly interpreted, the articles [in the journal] are practical (Special Collections, Millbank Memorial Library).

In accordance with that stated policy, Harold Rugg addressed the question of censorship in March 1941 (176-181) with an excerpt from his book, That Men May Understand: "To keep issues out is to keep thought out." His self-appointed censors, a minority of six "liberal bakers," began a "witch hunt" in 1939. They condemned controversy and change in the schools. They deplored skepticism about American historical figures, negative comments about
American history, and discussions of contemporary social problems. The problem with censorship, Rugg reasoned, was that it withhold data needed to carry on cooperative, efficient social life. If the censors succeeded, he predicted fascism and prejudice would reign freely.

Rugg's self-defense failed to repel the conservative onslaught. The popularity of his texts diminished considerably by the end of 1941. The series was never revised (Kliebard 1987, 207). The scandal created fear, embarrassment, suspicions, and confusion for teachers and administrators (Hunt 1941c; Rugg 1941). Rugg had epitomized the liberal threat in U.S. education that conservative forces feared. The NAM had created an object lesson for teachers, curricularists, and textbook authors who advocated instruction about public controversies (Robinson 1983). Certainly, the postwar "life adjustment curriculum," which stressed conformity rather than questioning, impoverished the spirit of social criticism espoused a decade earlier (Jennings 1950).

To summarize from the inception of Social Education, Editor Erling Hunt permitted criticism of the powerful forces that re-emerged from the ideological right at the end of the 1930s. Journal articles tended to agree with New Deal socioeconomic changes. In the textbook controversy that began in 1939 and culminated in 1941, the journal predictably condemned censorship and the attacks on the loyalty of teachers and authors. At the same time, Hunt published information and viewpoints from the very same critics of social studies education and its textbooks. Significantly, he defended a major target of the textbook campaign, Harold Rugg, with whom he disagreed on personal, organizational, and pedagogical matters.

The conservative critics, who forced Rugg's best-selling books from the market, possessed the potential to destroy other thought-provoking institutions. Hunt's strategy to include conservative views perhaps contributed to the survival of the NCSS. By applying the principles of academic fair play to his editorial tasks, he gave the critics less justification to turn their sights on the Council and its outspoken journal. Social Education retained vestiges of critical thought, despite the trend toward simplistic thinking in the larger society. On the eve of the official U.S. entry to World War II, the journal not only exhorted its readers to teach critical thinking; it modeled the dialogue in its own pages.

During the 1950s and early 1960s, controversy about American education generally and the high school curriculum specifically generated more national attention than at any previous time in history. Many historians have provided accounts of this "great debate" (e.g. Cremin 1961; Rudy 1963; Krug 1972; Ravitch 1983; Spring 1976; Tozer, Violas, and Senese 1993; Urban and Wagoner 1996) and we do not wish repeat their work. However, we want to examine the question of the impact of this debate on the course taking patterns of high school students and thus to lay the groundwork for a more general challenge to the notion that the high school curriculum in America has gone through a series of "pendulum swings" between the poles of liberal expansiveness and back-to-basics conservatism. As a preliminary to this, we will take a brief look at the three main phases in this debate: Arthur Bestor's attack on life-adjustment education, Sputnik and the attack on the comprehensive high school by Hyman G. Rickover, and James B. Conant's affirmation of curricular differentiation as the solution to the problems of the high school.

No critic of American education in the 1950s carried the wealth of experience or knowledge of progressive education that Arthur E. Bestor, Jr. did. In 1953, when he published *Educational Wastelands*, Bestor was a professor of history at the University of Illinois. As a young man, he had attended the Lincoln School in New York City, a showcase progressive high school attached to Teachers College, and in the late 1930s, while completing his Ph.D., he taught history at Teachers College (Cremin 1961). Bestor did not criticize education as an uninformed outsider but as someone who had experienced the best of the progressive educational tradition and who recognized how far progressive education had fallen from its original ideals (Cremin 1988; Bestor 1953).

In *Educational Wastelands* Bestor forthrightly declared that "Genuine education... is intellectual training" (1953, 3) and that "schools exist to teach something, and that this something is the power to think" (10). He was adamant that teaching students to think meant that schools must concentrate on "the scientific and scholarly disciplines", areas of study that could be learned only in a sustained, systematic way (18). Bestor believed that teaching these disciplines was the aim of schooling and that classes in these subject areas were more important than any other educational aspect of schooling. Further, in contrast to the dominant professional view, Bestor maintained that virtually all the students in high schools should be following such a program. Bestor was thoroughly convinced that the vast majority of American students could master such an education and indeed that American democracy was predicated on this belief. Democracy, he argued, "implies the right of every citizen to develop his intellectual powers to the fullest extent possible. It also assumes that intellectual ability is independent of the accidents of wealth and social position" (25-26). Thoroughly rejecting the idea that the increasing democratization of high school enrollments meant that most of the new students were incapable of rigorous education, an idea that had become conventional wisdom among educationists, Bestor declared, "To assert that intellectual capacity decreases as one reaches down into lower economic levels of the population is to deny, point-blank, the basic assumptions of democratic equalitarianism" (36).

It was the failure of leading professional educators to take that idea seriously that provoked Bestor's scathing assessment of life-adjustment education. Although his description of the life-adjustment courses in Illinois was leavened with a good deal of humor and wit, beneath the discussion of units about "the problem of selecting a 'family dentist'" or "how the last war affected the dating pattern in our culture" was outrage at the general direction of secondary education in this country (86, 100). Life-adjustment, he argued, was education designed to teach the majority of high school students to recognize their modest place in society, "to keep it, and to be content with it" (82-83). In calling for a restoration of the academic ideal in American high schools, Bestor urged universities to abolish schools and colleges of education and return control of decisions over curricular content to more appropriate (and competent) groups and individuals within universities and communities.

*Educational Wastelands* quickly became a rallying point for people concerned about the condition of public education, and by the late 1950s, debates about the nature and quality of high school programs were raging in school...
systems across the country. While these were mostly sound and fury, after October 4, 1957, the day the Soviet Union launched Sputnik, Americans seriously considered whether the crisis in education had contributed to our failure to be first into space. Suddenly, questions about the quality of the high school curriculum became part of an urgent debate about national security.

Probably no individual involved in the debate about the high school curriculum leapt into the national spotlight more quickly than did Hyman G. Rickover. Writing at a time of crisis in national defense, his views about education received an enormous amount of attention due in large part to his position as a vice admiral of the U.S. Navy and the head of the navy's program to develop an atomic submarine. He claimed that his interest in education began in the late 1940s as he interviewed men for the submarine program. As a result of these interviews, he became gravely concerned about the quality of American education, particularly what he saw as the failure of schools to teach students "fundamental principles...[and] the ability to think independently" (1959, 23; see also Plath 1996). In the mid-1950s, Rickover began giving speeches on the woeful state of education in the United States, and as requests for such speeches increased dramatically after Sputnik, he was soon one of the leading figures in the great debate.

In many ways, the criticisms Rickover leveled at public schools paralleled those articulated by Bestor. Rickover denounced educational professionals as arrogant and narrow-minded, condemned the absurdities of life-adjustment education, and called for more rigorous, academic work in high schools. But in important ways, Rickover differed quite dramatically from Bestor. While he urged high schools to adopt higher academic standards generally, Rickover's primary focus was curricular and programmatic reform for elite students. As he put it, "Talented children are this nation's reservoir of brain power. We have neglected them too long" (1959, 208). Rickover seemed more concerned about how the deterioration of the high school curriculum had affected education for the talented rather than how it had affected schooling for the majority of students. In the 1950s, this emphasis on elite education was inspired by Rickover's fear that inadequate education for gifted students endangered national security. Whereas Bestor sought to insure the future of American democracy through a well-educated electorate, Rickover was mostly concerned with maintaining American military superiority over the Soviets, a position which in his view depended on a steady flow of brilliant, well-trained leaders in engineering and the sciences.

According to Rickover, the greatest obstacle to the education of such leaders was not so much arrogant educationists, bad curriculum, or even an ill-conceived philosophy of education but rather it was the commitment by educators to the comprehensive high school which undermined all efforts to train adequately the intellectual elite. In their haste to bring all the children of a community together in a single, common school, the founders of American education had failed to acknowledge "the incontrovertible fact that children are unequally endowed with intelligence and determination and that it is impossible to educate the slow, average, and fast learners together if by educating we mean the capacity to think, to understand, and to make wise decisions" (134). The policy implications of this idea were clear. If comprehensive public high schools were the problem, separate public high schools for elite students, what had always been called European-style education, were the solution.

Throughout the late 1950s and early 1960s, Rickover's dogged pursuit of this policy made him a major player in the debate about the nature and function of the American high school. However, his attack on the comprehensive high school, his adulation of European forms of high school organization, and his emphasis on education of the gifted and talented, played directly into the hands of educational leaders. In attacking the comprehensive high school, "democracy's high school", Rickover appeared to be challenging one of the finest achievements of American education. In the end, Rickover could easily be dismissed as an educational aristocrat who yearned for the traditional high school of the past, and in calling for greater attention to be paid to gifted and talented students, Rickover (unlike Bestor) endorsed the educationists' fundamental belief in differentiation and paved the way for a resolution of the great debate about American high schools. The person who would provide that resolution was James B. Conant.

In many ways, James B. Conant was perfectly suited for the role he would play in the great debate about the high school curriculum, a role that called for someone who could appeal to supporters of all the major positions in the controversy. As a distinguished scientist and past president of Harvard University, Conant had strong academic credentials. Having served from 1953 to 1957 first as the High Commissioner and then as Ambassador to West Germany, a nation on the front line of the Cold War, Conant could rival Rickover in firsthand knowledge of the Soviet
threat. Finally, Conant's service on the Educational Policies Commission in the 1940s had won him the respect and trust of leading educationists. This breadth of appeal is part of the reason that his report, *The American High School Today* (1959), essentially ended the raging debate about the high school curriculum in the 1950s and shaped how the institution would respond to the challenges of the 1960s and early 1970s (Hershberg 1993; Preskill 1984; Teicher 1977).

Released early in 1958, the Conant report was widely acclaimed. Major stories on the report quickly appeared in *Life, Look, Newsweek, Time, and U.S. News and World Report* (Preskill 1984, 280-81), all of them trumpeting Conant's key finding that "no radical alteration in the basic pattern of American education is necessary in order to improve our public high schools" (Conant 1959, 40). On one level, the Conant report reads like a direct response to Hyman Rickover. Conant focused his research exclusively on the comprehensive high school, the very institution that Rickover identified as the source of the educational crisis. Unlike Rickover, however, Conant gave the institution a ringing endorsement. In the opening section of the report, Conant declared, "I think it is safe to say that the comprehensive high school is characteristic of our society and further that it has come into being because of our economic history and our devotion to the ideals of equality of opportunity and equality of status" (8).

But Conant's rejection of a European-style structure for American secondary education masked his more fundamental agreement with Rickover on important educational policies. Like Rickover, Conant gave lip service to the need for higher standards for all high school students, but ultimately his main concern was the education of the gifted. The only difference between the two was where programs for these students should be housed. Conant believed that the structure of comprehensive high schools, based as they were on the principle of differentiated instruction for diverse ability groups, could easily handle upgraded programs for the gifted and talented while remaining true to the "democratic" mission of the institution.

Not surprisingly, therefore, Conant's recommendations for improving public secondary schools concentrated mainly on strengthening differentiation. Conant presented 21 specific recommendations for improving public high schools, almost two-thirds of which focused on fine-tuning the processes of differentiation and many of which focused on improving the quality of education for the gifted. Even some of Conant's recommendations designed to encourage common educational and social experiences for all students wound up strengthening differentiation. For example, Conant qualified his recommendation that schools require a body of core courses for all students by urging school leaders to divide the mandated courses in foreign language, math, and science into two tiers, one of which would "maintain high standards" for high ability students while the other would hold students of lesser ability to "another standard" (48).

In all, the Conant report was a masterful example of educational and political duplicity, hiding its elitist policies under a smoke screen of democratic and egalitarian rhetoric. At the same time that he was defending the "democratic" character of the comprehensive high school, Conant was specifically rejecting the idea proposed by critics such as Bestor that all students should receive an equally high quality education. Rather than boldly challenging the educational status quo, Conant embraced it. By making recommendations that barely diverged from conventional educational philosophy and practice, he helped restore the shaken confidence of school leaders and gave them a plan of attack that could effectively neutralize local critics. Conant arrived on the educational scene like a white knight who lifted the siege against the embattled public schools, and his report played a major role in ending the great debate about the nature and function of the American high school (Ravitch 1983).

By the mid-1960s the great debate was a fading memory. In the wake of the debate, however, many commentators and later many historians assumed that curricular offerings and patterns of student course taking had changed substantially. In order to assess the accuracy of those perceptions we will turn to a brief look at two of the most important subject areas in this controversy, mathematics and the sciences, to try to assess the impact these controversies had on curriculum and student course taking.

The U.S. Office of Education showed early interest in the condition of math and science education in the nation. In 1948, concurrent with its endorsement of the life-adjustment movement, the USOE carried out a small scale national survey of the teaching of science in public high schools. This was followed by a similar survey of mathematics teaching in 1952 and joint surveys of math and science in 1954, 1956, and 1958. In 1961, the office
calculated from its general study of course enrollments a selected survey of math and science offerings. In addition, tables on math and science enrollments continued to be published in the Digest of Educational Statistics until at least 1965.

Two different rationales provided the impetus for this series of studies. As the author of the 1956 report stated, "As our society depends increasingly on science and technology, it is important that all citizens have an understanding of the nature of science and mathematics. The continued security and growth of the United States in this age of technology require steady increases for many years to come in the Nation's supply of high quality engineers, scientists, and teachers of mathematics and the sciences" (United States Office of Education 1956b, ii). These two rationales, the need for greater scientific literacy for "all citizens" and the need for increasing the supply of "engineers, scientists, and teachers of mathematics and the sciences," were the themes that dominated the debate about science and mathematics in the 1950s. Bestor supported the former position, and Rickover and Conant supported the latter.

However, a careful reading of the reports from those years reveals that the USOE was itself far from neutral in this debate, demonstrating time and again that it was more concerned with training an elite corps of scientists and mathematicians than with improving scientific literacy throughout the general population. The office fully accepted Rickover and Conant's premise that algebra, geometry, trigonometry, and calculus were appropriate subjects for some students but inappropriate for most. Indeed, the USOE showed little genuine concern for the role of science and math in the general education of citizens. Rather than supporting the efforts of such critics as Bestor to bring more rigor into high school education for all, the tone of the reports was more critical of the critics than of the high schools.

Nothing revealed more clearly the USOE's deep commitment to the idea of the differentiated high school than its analysis of the transcripts of a national sample of the graduates of 1958 (Greer and Harbeck 1962). Carried out in the wake of the Sputnik scare and evidently prompted by the great debate, the study sought to learn what programs were being followed in the high schools by "pupils of various abilities." Throughout the study, groups of students were characterized as "academically able," "typical," or "less able," based solely on their IQ scores as reported on the transcripts and converted to percentile rankings. Because the "able" pupils were found to be enrolled in college preparatory curriculums at a higher rate, to rank higher in their graduating classes, to have accumulated slightly more high school credits, and to have taken more mathematics and science than their "less" able counterparts, the study affirmed that high schools generally were on the right track in terms of student course taking. The authors did, however, suggest that the student body was not as differentiated by program as it should have been. Observing that the middle 50 percent was divided roughly equally between academic and general programs and that the lower 25 percent was "only" about four times more likely to be in the general track than in an academic track, the authors concluded that "the differences in pupil programs between ability groups were not as great as the needs of the boys and girls would require" (p.121). Even the most ardent supporter of life-adjustment education would probably not have placed much faith in the power of a single intelligence test to determine the track placement of high school students. With that in mind, we can turn to the data that the USOE presented in its series of reports.

The data displayed in table one permit us to address questions about how increases in math and science course taking were distributed among different courses by focusing closely on enrollment changes within the two broad fields. The table lists the percentage of students in grades 9-12 enrolled in science and math courses between 1948 and 1963 and highlights the increases in these two subject areas that took place during these years.

At first, it appears that the great debate did indeed have an impact on student course taking. Overall, math enrollment rates rose from about 55 percent of students in grades 9-12 taking a math course in 1948 to about two-thirds of students in 1963. Nevertheless, these were extremely modest gains, given the passion of the great debate, and the gains in science were even more modest. Moreover, some subjects such as health and physical education which were not central to the great debate had far more dramatic enrollment increases during the same period. In fact, health and physical education enrollments rose from about 69 percent of students in grades 9-12 in 1948 to over 102 percent in 1960, over three times the increase of mathematics. High school enrollments generally were on the rise in this period generally. Consequently, there were large increases in the numbers of students and uneven increases in the rates of enrollment in such rigorous courses as algebra, geometry, trigonometry, biology, and chemistry. In all,
however, as table two shows, the share of math and science course taking remained virtually unchanged between 1948 and 1960.

A closer look at the data reveals that the most dramatic enrollment increases were not in the most rigorous courses but in the lower level "practical" courses. The author of the 1952 report was the first to acknowledge this trend stating that "enrollments in mathematics for general education have increased, but the enrollments in college-preparatory mathematics have not kept pace with the growth of the high schools" (Brown 1953, 40). The author of the 1961 report also found little change in that pattern despite the enormous amount of attention given to math and science in the great debate. The author noted, "Courses of a practical nature continued to proliferate [between 1948 and 1961]... In mathematics such courses as consumer mathematics, economic mathematics, mathematics for modern living, refresher mathematics, and terminal mathematics were reported. Science offered household biology, science for modern living, everyday physics, and consumer science among others" (Wright 1965, 19-20). In other words, the overall trends in math and science enrollments appeared unchanged by the great debate.

Furthermore, as shown in table two, the relative share of course taking represented by math and science was also mostly unchanged. Between 1948 and 1960, the relative share of mathematics rose by only one-tenth of one percent, and the science share actually fell by four-tenths. While the percentage of students enrolled in these two areas was rising slightly, enrollments rates in virtually all subjects were rising, as the average number of enrollments per students increased from 5.6 to 6.4. Despite the urgings of many of the critics of the 1950s to reemphasize the core academic subjects in high school, the academic share of course taking actually fell from 59 to 57 percent.

All of these data reinforce the notion that the dominant motif of curriculum change during the period of the great debate was movement toward what one commentator at the time called "split-level" education (Latimer 1958). The massive USOE and National Science Foundation curriculum projects of the 1960s provide an excellent case in point. Developed in the wake of the Sputnik scare, the NSF projects set out to develop new and more challenging curricula in the sciences, mathematics, foreign languages, and the social studies. Mainly taking the form of new teaching materials designed to replace traditional textbooks, these experimental approaches were adopted by many high schools in the early 1960s. Despite the substantial amounts of money spent on these projects and the considerable publicity they received, the NSF projects boosted enrollments only modestly at best and they appear to have had no lasting impact. At the same time that high schools showed modest increases in some of the more rigorous math courses such as calculus, they also continued to show increases at the other end of the difficulty spectrum, in the remedial and applied mathematics categories. Between 1960 and 1970 modest declines in chemistry and physics were offset by increases in lower level general science courses such as physical science and earth/space science. The high schools that adopted the NSF curricula targeted them for high performing, college bound students who probably would have taken all the advanced mathematics and science courses the schools offered regardless of the curricular revisions.

The most important factor shaping curriculum changes in the period of the great debate was the continued growth of high school enrollments to over 13 million by 1965. Educators responded to these new students, as they had in the past, by assuming that increased enrollments inevitably meant increasing numbers of low ability students. Believing that these students were incapable of mastering difficult course material, educators expanded the less demanding general courses. Whether one looks at the sciences or mathematics, the dominant trend was toward rising enrollments in less challenging classes.

Our data indicate that claims that high schools in the 1950s and early 1960s refocused on subject matter and intellectual discipline are quite wide of the mark. The math and science course taking trends demonstrate the persistence and indeed the strengthening of policies regarding differentiation, not a revitalization of rigorous academic course taking for high school students generally. If the great debate about the high school curriculum in the 1950s had any effect it was in the reaffirmation and revitalization of the policies of "split-level" education (Latimer 1957). From that perspective, James Conant did not just end the great debate; he won it.

Be Neither Radical nor Romantic: Researching a Culture Other Than Your Own

Bonnie Jean Adams
Loyola University—Chicago

The Houma Indians are the largest Indian Tribe in Louisiana. According to the 1990 census, there are 7,810 persons in the Houma Nation. They live along the bayous, south of the town of Houma, in Terrebonne Parish. The Indians work as farmers, trappers and fishermen still; some work at almost anything to make a living. They own no land and have no fishing rights as other tribes do. While Indian tribes in other parts of the United States made treaty agreements in exchange for government funded reservation land, schools, and health services, no treaties were ever made with the Houma Tribe and the United States government. The United Houma Nation is unrecognized by the federal government. According to common historical record, the Houma had ceased to exist by the beginning of the nineteenth century.

The first mention of the Houma was by Robert Cavelier de LaSalle, French explorer, when he noted in his diary the presence of the 'Oumas' village in March 1682, while traveling the Mississippi River. The first actual contact with the tribe by a Western observer was recorded by Chevalier de Tonti on his trip up the Mississippi in 1686. He wrote "...we discovered a Nation...the Oumas tribe, the bravest of all the savages. As soon as they saw us, they were struck with an astonishment mixed with respect..." (Bowman and Curry-Roper n.d.).

The Houma Nation was regarded as a distinct, sovereign people by the French, Spanish, and English colonial governments, who respected their rights to property. No colonial government took action to limit or define their tribal lands or tribal rights. Such harmonious co-existence would change as colonial powers clashed in competition over land acquisition. The signing of the Peace of Paris, in 1763, effected a major power transition in European-Indian relations. This agreement between France and Spain transferred all title to land west of the Mississippi River to Spain, while the English laid claim to all land east of the river. The Houma Indians found their hunting grounds to be within the direct control of the English and their villages under the dominion of the Spanish.

The English and Spanish agents competed to lure the tribe into their territory and to declare exclusive allegiance to one of the colonial powers. The Houma remained neutral. The tribe continued to move up and down both sides of the Mississippi River in pursuit of better hunting grounds, and to avoid conflict with other local tribes. Colonial census records indicate various locations as being headquarters of the Houma Nation. Conflicting census records concerning tribal location, lack of specific written treaties with colonial powers, or with the United States Federal government, and two reports led to the belief that the Houma Tribe were nearing extinction by the time of the Louisiana Purchase in 1803.

The first report was filed by Daniel Clark, landowner and politician. Clark wrote to Secretary of State, James Madison that the Houma tribe numbered fewer than 60 persons, who lived on the eastern bank of the Mississippi River and that there were no other Indians settled on the east bank in either West Florida or Louisiana. Historical record indicates that Clark was held in low esteem by many of his contemporaries for being untrustworthy, politically ambitious, and deceitful. He was known to have been involved in an earlier scheme to claim tribal land.

The second, more damaging, report was filed in 1806 by Dr. John Sibley, Louisiana Indian agent appointed by President Thomas Jefferson. Sibley was assigned to make a list of the territory's tribes. He reported there were 80 Houmas living on the east side of the Mississippi River. Sibley had personal reasons for avoiding fieldwork in the south. Unknown to the administration, he owned a plantation, and he feared that if such vested interest be known, his position as an unbiased government official would be threatened. Neither was he interested in going further into the swamp to count Indians. "Sibley's report on Louisiana's tribes, unfortunately, has been regarded as gospel by federal officials..." wrote historical researcher Earnest Downs in 1978 (Bowman and Curry-Roper n.d.). The Houma were said to have been struck with "...with an astonishment mixed with respect." LaSalle's report indicates that this astonishment was probably mutual. In little more than one hundred years, the explorer's romanticized version of the initial encounter with the Houma Nation was discounted by two reports.

History was being written by what Alan C. Purves defines as the scribal society; that is, those with the means
to write history decide what information to record. This then becomes what knowledge is remembered. In his book, *The Scribal Society*, Purves explains how in any society, the scribes decide what is integral to scribal culture and what is peripheral to it. The American Indian culture was transmitted by oral, not written means. Not until the late nineteenth century would the Indian begin to find a literate voice.

The United Houma Nation is recognized by the state of Louisiana. However, having no prior treaty or documentation of their rights, the Houma tribe remain 'unacknowledged' by the federal government. For American Indians, 'unacknowledged' is synonymous with being unrepresented in the legal system of the United States. The federal government is obliged to protect the tribal lands and resources of federally recognized tribes and to provide them with health care, education, and economic development assistance.

The tribal governments of 'acknowledged' tribes can negotiate with federal, state, and local governments. They can act on their own or join with other tribes in affecting federal legislation in regard to Indian concerns. They are afforded an opportunity to organize for their common welfare and to adopt written constitutions (formally approved by the Secretary of the Interior). The Tribal Council can administer justice through its own federally recognized court system. Federal acknowledgment is recognition of a tribe's identity, organization, and rights. The acknowledged tribe becomes a sovereign nation and political entity.

In 1978, Federal Acknowledgment Policy (FAP) was enacted enabling unacknowledged tribes, such as the Houma, to petition the federal government for a change in their legal status. Seven criteria have to be 'satisfied' in the petition for federal recognition. The attempt is a time-consuming, expensive, and politically charged process, rife with congressional politics and bureaucratic delay. Tribal government becomes overly concerned with the administration of its community and entangled in its own new bureaucracy. Tribal members begin to disagree. At the time of my first visit to them, the Houma people were working through the process of meeting the seven criteria to prove that the United Houma Nation was a legitimate American Indian tribe. It was their second attempt.

The Indian views land as central to his cultural identity, yet the Houma Tribe holds no land in common with which to build community. For the Houma, the benefits of tribal association reside in the heart. In the struggle for recognition, even that is divided. The Houma tribe is no longer united, but has divided into two separate factions, each submitting a petition for federal acknowledgment. Such intertribal competition may reduce the chance of success for either side.

In doing research about the American Indian, it is imperative that the Constitution, and the law, especially the history of specific laws regarding American Indians, including current issues, be studied. Even in casual conversation, those I was talking to were informed and concerned about federal and state issues particularly affecting them. It is also important to remember that aboriginal tribes never considered themselves 'Indians' in a racial sense, but as separate nations. While some information can be gleaned from diary entries and journals, many primary sources can be found in the archives kept by a particular tribe, which can sometimes be used by the historian who earns the trust and respect of the tribe. In this way the historian who is neither radical nor romantic can construct a record of a people.

References

Contrary to popular perceptions, the medieval universities were well ahead of their time regarding social functions and responsibilities. Specifically, the thesis of this research is the original universities were characteristically "modern" as suppliers of knowledge to society. I will further argue that the knowledge created, refined, and transmitted by the universities quickened the rise of early modern civilization in Europe, around 1500. All of this resulted from several major trends of the later Middle Ages: 1) revival of mercantilism; 2) growth of cities; 3) twelfth century intellectual renaissance; and, 4) Scholasticism.

While the burgeoning towns of the late Middle Ages provided the economic base of support for professors and students, their passion to learn was ignited by a stirring event. An intellectual awakening rivaling the Italian Renaissance took place in the early twelfth century. It is credited with producing the first universities and bringing a fresh, Aristotelian worldview to medieval culture. Westerners developed a terrific curiosity and thirst for the new knowledge brought from Moorish Spain, Norman Sicily, and Salerno, Italy, once Latin translations of the rich Islamic learning began to flow northward. Toledo was the principle center of translation by Jewish, Christian, and Moslem academicians (McNeill 1963, 549-550).

Although a small body of Latin manuscripts of Aristotle's writings and other classical works had survived in the Christian West since the early Middle Ages, the twelfth century influx of translations represented a virtual flood of new knowledge. Many philosophical and scientific works of Aristotle and Plato were recovered; these works had not only been preserved in the Islamic East for centuries, but were augmented with commentaries by Arab masters. Transmitted also were the writings of Euclid and Ptolemy, the Greek works on medicine, Arab mathematical treatises, and the major Roman law texts (Kagan, Ozment & Taylor 1979, 266). Highly advanced and useful Arab writings in the fields of medicine, astronomy, optics, philosophy, and encyclopedic collections on the natural and supernatural universe were of profound interest to Europeans (McNeill 1963, 550).

Henry Treece, in The Crusades (1964, 224-226), elucidated many of the treasures of Arab studies discovered by the Franks (Europeans) in the Levant during the twelfth and thirteenth centuries. Arab thinkers had improved classical Greek mathematics, evolved numerals from India, and created algebra. They built telescopes, studied physiology, practiced advanced surgery and used anesthetics. In chemistry they led the world, as they did in glass, leather, paper, and pottery production. Chemical analysis was also used in fertilizing the soil. They excelled in agricultural science and irrigation methods. Such was the craving of the Western world to learn from the Arabs, that Raymond Lull (1235-1314), a Spaniard, persuaded six European universities to establish programs in Oriental languages without delay. The Arabs responded by providing extensive scholarly materials on the Arabic language, which were mass-produced in Alexandria, Damascus, Cairo, and Baghdad.

During the twelfth century the first universities were born in a few urban centers (Bologna, Paris, and Oxford) as a more permanent organization form. A uniquely Western institution, the university possessed a structured curriculum leading to a specific degree (Cobban 1972, 227). The increasingly bureaucratic church, state, and municipal governments required highly educated administrators, theologians, and lawyers; in addition there were the secular professions of medicine, law and business. The monopoly of advanced knowledge passed from monasteries (and monastic schools) to the cathedral schools and then to the universities. While the early monasteries inherited a small fraction of the classical literary heritage, when the medieval universities were in full bloom they possessed an imposing, world-class base of knowledge. Thus the learned institutions ushered in early modern civilization.

Associated with the concept of a monopoly of advanced knowledge was the new class of academic men which emerged during the late Middle Ages. Salaried university masters or doctors (the terms were synonymous) tended to marry into the urban middle class. Consequently, they often became allied with the local ruling aristocracy of university towns (Cobban 1975, 203). The University of Paris' influential faculty of theology, besides analyzing controversial social issues of their time, also were concerned with defining and enlarging their own role in society, that of the new academic class (McLaughlin 1977, 132). As the Middle Ages drew to a close in France and other
societies, every estate, including academics, began to develop national consciences.

Thus, a further modernizing achievement of medieval higher education was the establishment of the intellectual class or intelligentsia in European society. The academics made learning respectable (in a previously barbaric environment) and an integral part of Western civilization.

The universities were charged with providing training in the liberal arts and the professions. Between 1200 and 1500 the university movement spread all over Europe, except to Russia. As society became more complex and bureaucratic, the universal church, secular governments, municipalities, and businesses required highly educated professionals and civil servants. Indeed, according to Cobban (1992, 228, 232), the academies appear to have succeeded in providing trained personnel for society. Here again it is evident that the universities, their doctors, and graduates ushered in the early modern epoch.

During the twelfth century the ever growing numbers of students and teachers of the cathedral schools desired an organized structure to protect their interests. They did not wish to be taken advantage of for food costs, lodging rates, and other necessities. Foreign students were most vulnerable to harsh laws and taxation. Groups of masters and students were a powerful and prestigious economic force in most cities. Once organized, their demands were usually met, for they could threaten to strike or to leave the city.

Generally in the northern European universities masters formed the guild membership, while students had little power. The opposite was generally true in southern Europe, where guilds of students, who were older and more financially independent, founded and controlled universities. There professors served more like tutors and had to obey strict rules for teaching and administering examinations set forth by the student guilds (Rudy 1984, 14-16).

Full-fledged universities were often called studia generalia and they had the right to grant the license of teaching everywhere in Europe through the issuance of the Master’s degree. They admitted students from all countries (Wieruszowski 1966, 81) and possessed one or more of the higher faculties, law (either civil or canon), medicine, or theology (Rashdall 1936, 3).

Following the twelfth century intellectual renaissance, and especially during the thirteenth century, Aristotelian logic and dialectic triumphed in prominence over the other liberal arts in the curriculum of the new universities. Scholasticism provided a system of organizing and interpreting the virtual flood of new knowledge entering the Christian West. Students used these tools to discipline knowledge and thought. They wrote commentaries on authoritative texts, but were not encouraged to be very critical or to search independently for undiscovered truths since the basic medieval assumption was that the truth was already known as revealed in the Bible (Kagan, Ozment & Taylor 1979, 269).

Scholars believed that they were harmonizing established truths, but as it turned out, they had actually prepared the way for new truths to be discovered. The infusion of Aristotelianism and critical thought into the Western tradition led to the slow and gradual breakdown of old ideas in the later Middle Ages. Peter Abelard (1079-1142) pioneered scholastic methods at the University of Paris and wrote Sic et Non. Scientific Scholasticism, beginning with Saint Thomas Aquinas’s Summa Theologica, in the thirteenth century launched the ideological attack of the Renaissance in the fourteenth through sixteenth centuries. The views of Abelard and Aquinas were not accepted by theologians like Saint Bernard, who placed greater emphasis on faith, emotion, and mysticism, and were suspicious of excessive inquiry and reasoning. Additionally, Aristotle, though highly intelligent, was nonetheless a pagan philosopher, and some of his notions were in direct conflict with Christian teachings.

Ultimately, the scientific method would triumph in the West, after numerous battles with church authorities through the later Middle Ages and Renaissance. Ironically, the Moslem scholastic methodology and intellectual fortunes, from which the West benefitted so much, began to decline by the thirteenth century when the Islamic East was devastated by Mongol forces, the Christian reconquest of Spain was progressing, and religious orthodoxy set in, putting pressure on academic pursuits (Stanton 1987, 19-20).

The medieval universities not only anticipated early modern civilization, but they contributed to its rise. By 1500 the Age of Discovery was underway and with it Western global expansion. In summary, the universities'
modernizing effects were: 1) near monopoly of advanced knowledge; 2) professional training for ecclesiastical and secular segments of society; 3) foundations of modern empirical science; 4) establishment of a new intellectual class; and, 5) upward social mobility.

References
In the fall of 1894, J. Allen Smith, a recent graduate from the University of Michigan with a Ph.D., arrived at the small southern Ohio city of Marietta as a professor of social sciences at Marietta College. Although Smith's tenure at the school was to be short, the next three years would be a time of great tumult as the educational beliefs, practices and mission of Marietta College would undergo rigorous challenge. In the spring of 1897 Smith was relieved of his duties by a vote of the college trustees.

The official reason offered for Smith's dismissal was the college's dire financial straits. In the previous three years the debt of the school had increased from $10,000 in 1894 to $30,000 in 1897 (Cayton and Riggs). However, financial exigency was likely not the reason for Smith's abrupt dismissal, as this paper will demonstrate.

A complex set of academic and cultural factors resulted in Smith's dismissal from Marietta College. These factors, as a group, worked to define Smith as a community outsider upon his arrival in Marietta, and over the next three years, conspired to isolate him from the mainstream culture of the school and local community. By 1897, Smith was isolated, culturally and academically, and his time at the small school had come to an end. Further, Smith's challenge to the culture of the southern Ohio school was unlike anything it had seen before, and it was easier and more efficient to dismiss him than to incorporate his practices into the community's culture.

In the final decade of the nineteenth century, the Ohio River city of Marietta was experiencing unprecedented social and economic changes. From 1890 to 1900, the city had grown from a population of 8,273 to 13,348, a nearly 40 percent increase. Likewise, the area of southeastern Ohio, with Marietta as its geographic center, was experiencing an economic boom (Cayton and Riggs). The local oil and natural gas industries were rapidly expanding during the decade, and population growth reflected the accompanying increase in workers. By the mid-1890s, "the price of oil launched the greatest oil boom the Marietta area was ever to witness." The impact of the oil industry is more completely understood by the fact that "by 1903, the dollars invested in the oil industry exceeded the appraised value of all the real estate in Marietta" (Cayton and Riggs 1991, 183). In the smaller and more intimate setting of Marietta, the many unprecedented social and economic changes occurring across the United States were at hand. Changes would also be taking place at Marietta College, and like those occurring in the city of Marietta, not all would be welcomed.

As early as 1829, efforts had begun to craft an historical record intended to create a specific historical perspective of the young Marietta. The community chose to project itself as an idealistic, New England oasis thriving in the Midwest due to the hard work, strong middle class values and pious beliefs of Marietta's early founders. In 1881 a published history claimed the Northwest Ordinance of 1787, being "New England in character" (History of Washington County 1881, 36), established the legal groundwork for those very New England values to become institutionalized in the Ohio country. This same history, in reference to the establishment of Marietta College, stated the college was to be "a genuine college of the New England type" (400). As Riggs notes, "For many, history was Marietta's ultimate claim to superiority for it naturally followed that because the founders of the town were extraordinary, so too were their descendants" (33).

The Marietta that existed, both town and college in the 1890's, was in reality two different worlds, the one community leaders chose to believe and the one that was real. The view community and college leaders held was one of a prosperous, dignified and unified Marietta built upon solid New England, Christian values of hard work, piety, and solidarity. In practice the town of Marietta had not lived the history that came to be written. As Cayton and Riggs note, this historical fiction created "a public image of harmony and homogeneity for their town which served to obscure" reality (158).

By the 1890's, Marietta had become a town of significant economic speculation, inhabited by a racially diverse population, and troubled with such persistent social problems as poverty, racism, prostitution and alcoholism. In short, Marietta shared problems with many other cities and towns of the era. However, armed with a mythical history, community leaders sought to preserve their storied New England past. Persistent social problems could be easily ignored because they existed in a world which these leaders were not a part of, either physically or
intellectually. Any challenge to the world inhabited by community leaders would be much more difficult with which to deal. It was into such a world that Professor J. Allen Smith entered in 1894.

The emergence of the social sciences at Marietta College may be directly traced to Smith. Introduced to the college as a revolution of methodology and academic inquiry, the social sciences shared much with the Social Gospel movement. The Social Gospel found support in an interpretation of biblical scripture which called for direct intervention into existing social problems. Believers in the Social Gospel held that current social problems were derivative of industrialization. The answer to these problems would be found in the universal application of the word of Jesus Christ to all aspects of society.

The Social Gospel was both a social and religious reform movement which originated in the latter half of the nineteenth century. Led primarily by Protestant clergymen, the Social Gospel movement emerged as a vociferous critic of the rising social disorder of late nineteenth-century America. These reformers were seeking to create a more Christian social order, yet maintain the existing capitalistic, economic and democratic political system (Ross 1991, Hofstadter 1944).

The social sciences, also oriented to the study of social problems, held no such religious legitimacy as to its existence. The social sciences existed, simply, to study society. Although still emerging as an accepted field of academic inquiry at the close of the nineteenth century, the social sciences were slowly but surely distancing themselves from the divinely inspired Social Gospel. As the social sciences gained shape and substance, the gulf between the social sciences and religious doctrines became evident. Marietta College was not yet prepared to surrender the Christian ideals of the Social Gospel movement to the squarely academic field of the social sciences.

Chartered in 1832 as The Marietta Collegiate Institute and Western Teacher's Seminary, the college was originally founded to provide to the struggling community a sense of economic and social stability and to alleviate its geographic isolation. The college intended, as did many religious orientated colleges of the then western frontier of the United States, to educate men to spread Christianity and Christian ideals to the developing frontier.

The 1894 Marietta College Annual Catalogue shows that the incoming class consisted of 29 freshmen, all male. With the local southeastern Ohio population accounting for the majority of students, Virginia and Massachusetts were the next most highly represented states (Matriculation Records, Pre-1900). Curriculum options were limited for students, with the majority enrolling in a Classical curriculum, including coursework in Greek, a modern foreign language, mathematics, philosophy, Christian religion, and the natural sciences (Catalogue of Marietta College, 32-33). All students attended religious services each morning at 8:45.

College president John W. Simpson, an ordained Congregational minister was appointed President of the school in 1893. Simpson was "in complete sympathy with the liberal trends in the social sciences" as well as "an active adherent of the Social Gospel movement" (McClintock 1959, 90). Under President Simpson, modernizing the curriculum was a high priority, particularly in the social sciences. Simpson increased the number of electives in political economy and added sociology. He taught many of these courses, as well as ones in religion and Christian ethics. Prior to Smith's arrival, the formal, academic study of society at Marietta was directed by ordained ministers. This religious orientation reconciled easily with the mission of the school, and all social investigations were therefore invested with religious legitimacy.

With Simpson at the college's helm, students at Marietta College became acquainted with three prominent leaders of the Social Gospel movement. These men were the Reverend Wilbur Fisk Crafts, the Reverend Dr. J. H. W. Stuckenber, and the Reverend Washington Gladden. Simpson invited Crafts to lecture on "Christian Socialism," Stuckenber to lecture on "The Social Problem," and Gladden to lecture on "Municipal Government" (Catalogue 1895-96, 10). Gladden also served as a trustee of the College from 1883 to 1898 and, as such, was able to provide the necessary political support to President Simpson as he went about reorganizing the school's curriculum.

J. Allen Smith came to Marietta in the fall of 1894 for his first teaching position. Prior to attending graduate school at Michigan, Smith had graduated from the University of Missouri with a bachelor of arts degree in 1882, then proceeded to earn a law degree from the same school and practiced for five years. Smith became bored by the "narrow limits" of the law, and with encouragement from his wife, decided to study for an advanced degree in the social sciences. He entered Michigan in 1892 because the reform-minded Henry Carter Adams was on its faculty...
While at Michigan, Smith became interested in the scholarly study of the currency question, that is, the viability and necessity of the gold standard. This issue was a popular political issue and would later play a central role in the 1896 presidential election and possibly in Smith's dismissal from Marietta College in 1897.

The "Multiple Money Standard" was the title of Smith's 1894 dissertation. This 60-page work was theoretical in character and was a refutation of many of the basic contentions of the gold standard advocates (Barclay 1931, 234). Regarding the currency issue, Professor Adams told Smith that "heretical sympathies would arouse opposition from members of the faculty who examined candidates of higher degrees" (Goldman 1944, 197). Although the dissertation was accepted, its approval was primarily due to the influence of Professor Adams, who overcame significant faculty opposition. Smith would be no stranger to issues of academic freedom throughout his professional career and often found himself at the center of academic controversy.

At Marietta Smith taught two courses in sociology and five in economics. The sociology courses were entitled "The Facts, Principles, and Methods of Sociology" and "Modern Social Problems." Smith also taught five different economics courses (Catalogue 1895-96, 40). Taken as a group, these courses reveal the progressive nature of Smith's social science philosophy. The descriptions found in the Marietta College catalogue show that Professor Smith strongly believed that government regulation offered the best hope for the improvement of all of society. These courses found their impetus in Smith's conception that an industrialized society was in need of a strong regulating government body to ensure freedom of opportunity and to prevent predatory business practices. The courses were entitled "Principles of Political Economy," "Taxation," "The Monopoly Problem," "The Theory of Money," and "The History of Economic Thought."

The study of local conditions in southeastern Ohio was an integral part of Smith's courses. Smith was holding up for public examination and study a world which local leaders had previously ignored. Undoubtedly, Smith's dispassionate, and public, examination of local conditions was disquieting for community leaders.

As long as President Simpson remained at the school, Smith was secure in his employment. In June 1896, President Simpson's resignation was requested by the trustees, and Smith knew his own time was limited.

In the spring of 1897, Professor Smith was dismissed from his position at Marietta. The reason for his dismissal, according to Hofstadter and Metzger, was "the bipartisan nature of intolerance" to academic ideas which challenged the prevailing status quo (423). Hofstadter and Metzger argued that Smith was dismissed because the trustees of the college were fundamentally opposed to the professor's ideas regarding monometallism. Likely a contributing factor to Smith's dismissal was his public support of William Jennings Bryan instead of Ohio-native William McKinley in the 1896 Presidential election (Goldman 1944).

Gladden served as a trustee of Marietta College from 1883 to 1898. In response to Professor Allen's dismissal, Gladden resigned from the board of trustees, albeit not until the close of the 1898 academic year. Gladden wrote to Smith on April 16, 1897, that his dismissal was "pitiful" but not to give up hope. Gladden would try to see if "possibly some changes may occur here next year." True to his reputation as a seeker of common ground, Reverend Gladden tried to resolve the issue of Smith's dismissal from Marietta.

Reverend Gladden, Reverend Stuckenber and Reverend Crafts were retained for the 1897-98 school year by the trustees to fill the gap created by Smith's departure (Marietta Trustees Record 1897, 108). Interestingly, Smith's salary was provided by an anonymous source during his three years at the school. This same source provided for the funding of the courses Smith was to have taught the next academic year. Therefore, money was to be made available to teach classes involving social investigations, but only if led by acceptable professors. The college trustees voted to replace Smith's position before the start of the next semester. Each of the three men hired to assume the vacant teaching load were ordained minister's with an academic interest in the study of social problems.

J. Allen Smith, as a trained professional, examined the local community as any social scientist would do. For Smith, social problems were to be presented for class study and discussion, analyzed and to have solutions proposed for them. The community of Marietta was more comfortable simply ignoring its own local shortcomings.

Smith came to view Marietta as the economic boom city that it was. However, community leaders maintained their self-image of Marietta as a New England oasis. To community leaders, the boom of the 1890's did not lead
to bust in the early 1900's, rather a return to the world in which they were most comfortable. The outsiders who rode the wave of economic growth and occupied the community went elsewhere for their fortunes. Further, intellectual outsiders like Smith were not a part of Marietta College as the new century dawned. In Marietta cooperation and social cohesion would be valued above academic freedom and emerging forms of academic inquiry.

Smith had specific, secular, social science beliefs and, regardless of the audience, did not modify them. As an outsider to the Marietta community, he was unable, or willing, to modify his pedagogy and professional beliefs to gain acceptance. He did survive quite well in higher education as he went on to a distinguished career at the University of Washington. Never losing his unwillingness to compromise his academic principles, Ross has labeled Smith as "the radical professor of political science" (Ross 1991, 458).

The oil boom of the 1890's was, like J. Allen Smith, a distant memory to the citizens of Marietta by the start of the 20th century. With outsiders, from academics to oil workers gone at nearly the same time, a comfortable retreat into the previous world of relative isolation and perceived common culture was possible. This retreat reconfirmed the notion that, either economically or academically, outsiders had little to offer Marietta.

Academic Freedom at the University of Dayton: 1963-1967

Amanda Pracek
University of Dayton

The purpose of this paper is to explore the national Free Speech Movement of the 1960's and 1970's as it manifested itself at the University of Dayton. Of specific interest is how a Catholic affiliated institution reacted to the tumultuous changes during the 1960's and the controversies surrounding academic freedom. A discussion of the University's history, as well as a discussion of academic freedom (and academic freedom in relation to the Catholic church) will in turn reflect the ways that the University of Dayton, as well as other Catholic universities, changed in response to societal changes.

The racial crisis, the Vietnam War, campus upheavals, and the growth of the counterculture made the 1960's an epoch of revolutionary change for all Americans. The radical changes and forces of the culture produced a whirlwind of debate in the American Catholic church (Gleason 1995). Academic freedom became the central theme in American higher education in the early 1960's. Vatican II had a profound impact on the Catholic university. The Council met in the early 1960's and by 1965 Catholics learned of Vatican II's religious views. Pope John XXIII had charged the Second Vatican Council "to seek fresh and timely ways to recover the essential spirit of the message and mission of Christ and to avoid incarceration in the institutional forms of the dead past" (Manier 1967). This new spirit of the church supported the growth of academic freedom in Catholic institutions of higher learning.

How did Catholic institutions react to new forms of thought? A review of events at the University of Dayton may help to answer this question. The Free Speech Movement initiated a decade of debate about the students' role in university governance on campuses throughout the United States. The University of Dayton participated in this debate (Unger 1964). Editorials in the student newspaper slowly shifted from issues such as homecoming, dances and parties to campus life and administration. In 1963, two committees were formed to study both a possible judicial system at UD and a student welfare system. These actions may have been the catalyst for other events (Kane 1974). The Student Council proposed a bill for the direct election of the President of the Council. The Council thought that if the students voted it would make the Council more responsive to their needs.

Although the students were beginning to realize that they might secure choices at UD, the church was still holding a strong traditionalist attitude. In spring of 1963, students were being called before the Chaplain to discuss their absence from retreats (Kane 1974). The Kennedy Union opened in 1964. With this opening, a new channel of communication between students and the administration was implemented. The first "Fireside Chat" was similar to a press conference with Fr. Raymond A Roesch, then president of the University of Dayton (Kane 1974). However, students were able to voice their opinions as well as ask questions.

In 1965 the subject of the Vietnam War was introduced to students. A rally in front of the student union and march was held supporting President Johnson's policy. Nonetheless, there were a few protest letters written in the Flyer News. The letters caused an abundance of criticism from other students who deemed it "un-American" to criticize Federal policy (Kane 1974).

By 1968, the first massive protest march occurred in the history of UD. The suspension of 12 students who had forged their advisors' signatures led to about 1000 students marching across campus to show their disapproval. The students argued that the punishment was out of proportion to the crime. Both a petition and a document calling for an approval of a Student Bill of Rights and a University Board of Appeals were presented to the administration. The students were beginning to join the Free Speech Movement in earnest.

On March 17, 1970, 150 UD students staged a sit-in in St. Mary's Hall over educational reform and student representation in university policy-making groups. After 24 hours the students left St. Mary's with the administration's promise that a meeting between the student body and the administration would be held the next day to discuss these issues. About 5000 students attended the session. In the aftermath of the St. Mary's sit-in, new programs were implemented, including interdisciplinary and black studies.

Another equally pervasive concern on the campus in the 1960's was academic freedom. In 1966, a professor...
of philosophy accused members of the philosophy department of teaching heresy and/or views contrary to the teaching of the church’s magisterium. This incident originated with an article reviewing Dr. Eulalio Baltazar’s book, Contraception and Holiness. Baltazar, a professor of philosophy, said that birth control was not a theological question. Dr. Dennis Bonnette charged several professors on campus, Dr. Baltazar included, of advocating doctrines contrary to the teaching magisterium of the church. This charge was made to Archbishop Karl Alter of Cincinnati, who informed university officials. As a result of the written explanations of their positions submitted by the accused, administrative officials ruled the four members innocent of the charges. The episode immediately plunged the university community into discord. Faculty and student groups held meetings, drew up manifestoes and issued reprimands.

At the Archbishop’s request, Fr. Roesch was instructed to create an ad hoc committee designed to establish clear directives for the pursuit of academic freedom (Shallenberger 1970). However, this was not the end of the controversy. Bonnette, along with seven other faculty members, said the university’s investigation was a “classic whitewash” and vowed to keep the matter alive.

Next, Archbishop Alter set up his own fact finding body composed of individuals not affiliated with the University. The Archbishop’s board did find some basis for charges, but declined to file accusations against any of the professors. Its report was not made public, and disagreement arose as to whether it had or had not cleared the accused professors of teaching heresy. Fr. Roesch turned again to the original ad hoc committee to specify the appropriate mode of paying respect to the magisterium (Gleason 1995). Its subsequent report asserted that although Catholics were obliged to respect the church’s teaching authority, that obligation rested upon them as individuals and did not apply to the university as an institution. Since the Catholic university’s relationship to magisterial authority was thus indirect, it could claim independence of all outside authority.

Never before had a faculty committee at a Catholic university flatly recommended secularization as the policy to follow. Fr. Roesch quickly addressed the faculty and public on the controversy and clarified the university’s position; he upheld the principle of academic freedom while asserting that “If the magisterium is not responsive to the new problems, it loses its role as a guide” (Shallenberger 1970). The University shared Vatican II’s spirit of inquiry and openness.

It is clear that the Vietnam War and Vatican II affected campus life at the University of Dayton in the 1960’s. Student and faculty concerns and administrative responses reveal how religious and intellectual life impacted campus life.

This article examines the founding of Lincoln, Cheyney, and Wilberforce Universities—three institutions of higher learning established to educate persons of African descent within the United States prior to the Civil War. The research provides scholars of American higher education with a missing link in the history and development of institutions of higher learning during the antebellum period. A discussion of the similarities and differences between the founding, organizational structure, and development of these institutions unveils the unique character of each school and helps to place them within the broader context of other institutions of higher learning founded prior to the Civil War.

Each of these institutions was founded to provide opportunities for higher education during a period when most African Americans were held in bondage. Yet, these three institutions provided the model for other African American institutions of today.

As a result of the expansion of foreign trade, America experienced a period of great progress prior to the Civil War. Gold flowed from California, railroad construction was at its height, there was rapid industrial growth in the North, and the cotton industry brought prosperity to the South (Brogan 1986, 305). During this period of rapid economic growth, there were also great challenges for freedom.

While controversy over the expansion of slavery in the territories moved America closer to a state of crisis, passage of legislation such as the Kansas-Nebraska Act, the Compromise of 1850, and the Fugitive Slave Act fostered resentment and tension between the North and South. These were very volatile times; America was headed for Civil War. As tensions mounted between North and South, increasing numbers of African Americans escaped slavery's bitter grasp and settled North. Nearly four hundred thousand African Americans escaped the institution of slavery by underground railroad (Galbreath 1925). Soon these newly freed African Americans mounted a systematic challenge to the root of the slave system.

While abolitionist and anti-slavery advocates lobbied against federal, state, and local pro-slavery laws and supported the underground railroad, colonizationists lobbied to educate Blacks for their return to Africa. Both groups rallied against the institution of slavery; however, neither group was wholly committed to social equality among the races. Peoples of African descent participated in both movements as well as political organizations such as the National Negro Convention Movement. Each of these movements played a significant role in the freedom struggle.

In reaction, supporters of slavery and many lower-class whites rioted, burning the homes and churches of African Americans. In addition, violent, physical attacks on persons of color led to a number of deaths. Because of the commonality of skin tone, there was little to no distinction made between African Americans who were free and those who were not. This attitude locked Blacks into a classification that allowed for little social or political diversity within the group when a number of African Americans had been free for two or three generations. In fact, attacks on Negroes were so violent and frequent that the government was forced to intercede in 1842.

Another example of the dilemma faced among freed blacks after passage of the Fugitive Slave Act is revealed in the case of Rachel Parker. On December 31, 1851, a professional slave-catcher crossed the Pennsylvania border, kidnaped seventeen-year-old Rachel Parker, a free-born Pennsylvanian, and took her to Baltimore, Maryland, a city where the African American had no rights. A campaign to return Ms. Parker to her home was initiated by Joseph C. Miller of East Nottingham Township from whose farm Ms. Parker was taken. East Nottingham Township is located four miles from Oxford, Pennsylvania, three miles from the Maryland state line, four miles from Lincoln University, twenty miles from the current location of Cheyney University, and some forty miles outside of Philadelphia.

Miller obtained a court order to detain Ms. Parker. After a three year political and legal battle, she was rescued and an attempt was made to bring her back from Baltimore (Bond 1976, 203). During their return, John Dickey, the founder of Ashmun Institute (later named Lincoln University), Joseph Miller and other sympathizers involved in the case, were met by mobs. In retaliation for his involvement in the case of Rachel Parker, Miller was given a dose of arsenic and met a very suspicious death. Rachel Parker, however, was returned safely.
demonstrated in the story of Ms. Rachel Parker, life among free blacks was quite precarious.

During the antebellum period, educational opportunities leading to the advancement for the descendants of Africa were very limited. By and large there was no provision for learning in the higher branches, and nearby schools would not grant admission to persons of color. Although a small number of individual African Americans attended schools such as Oberlin and Middlebury College, educational opportunities for the broader segment of freed African Americans had not been achieved. There were exceptions; for example, Alexander Lucius Twilight, the first Negro to obtain a college degree in the United States, graduated from Vermont's Middlebury College in 1823; and Mary Jane Patterson, the first female graduate of African descent, received her degree from Oberlin in 1862. The greater task, however, was the provision of education, particularly higher education, for African Americans on a much broader scale. Before the founding of Lincoln, Cheyney, and Wilberforce, this challenge had not been addressed.

Now that the historical context for the evolution of higher education for persons of African descent has been established, the paper will examine each of the targeted institutions. This discussion will include the founding, naming, significant preconditions, early curriculum, student life, and governance. We begin with Lincoln University.

Ashmun Institute, now Lincoln University, Pennsylvania, was founded by Reverend John M. Dickey, a colonizationist and leader in the Presbyterian Church. The son of Reverend Ebenezer Dickey, a Scotch-Irish immigrant into southeastern Pennsylvania, the elder Dickey was a cornerstone of the Presbytery and the Chester County community. Both Dickeys were well known for being actively involved in religious and civic activities of the period. John Dickey, Lincoln’s founder, was intimately involved in the case of Rachel Parker and was later influenced by the case of John Amos in deciding to establish an institution of higher learning for persons of African descent.

Ashmun Institute was founded in 1854 as a private, Presbyterian institution of higher learning in Hinsonville, Pennsylvania, a community of free African Americans in southeastern Pennsylvania. Several stops along the underground railroad remain on the campus until this day.

Lincoln was first named in honor of Jehudi Ashmun, a Congregationalist minister and supporter of the American Colonization Society. Ashmun did extraordinary work for Africans on both continents. He died in 1828; however, during his last mission to Africa, his efforts had helped to establish the colony of Liberia. In 1866, the school’s name was changed from Ashmun Institute to Lincoln University in honor of President Abraham Lincoln. The history of Lincoln University begins with the dream of one of its first graduates—James R. Amos.

Amos, a young freedman from Chester County, Pennsylvania had a dream to advance his education. While in his twenties, he had settled on small farm in Hinsonville, a small community of freed blacks in Southeastern Pennsylvania. Amos worked hard, only taking rest on Sunday to attend church. After a while, Amos felt the call to preach. He had already been ordained as a minister of the African Methodist Church, but wanted to further his training in the ministry. With this goal in mind, Amos sought the counsel of Reverend John M. Dickey and requested that Dickey help him to further his religious training (Murray 1973, 393, Thomson 1898, 392).

Dr. Dickey secured admission for Amos in a Philadelphia school that was connected with the Presbyterian Synod. After a short time, racial intolerance on the part of white students created a problem. Their narrow-mindedness demanded that Amos be made a porter. This was unacceptable. Amos refused this subordinate position, and subsequently was dismissed.

After repeated unsuccessful efforts to help Amos gain entrance to virtually every institution of higher education in the Union, Dickey himself, ended up tutoring Amos. A dedicated student, James R. Amos walked twenty-eight miles each a week to recite to Dr. Dickey. During the weekly visits, Amos would pray by a stone in a nearby secluded area of the field. That stone is said to have become a part of the foundation of the first building of Ashmun Institute.

After continuous rejection of Amos from institutions of higher education for which he was academically prepared, Dickey made plans to establish a school of Christian training for African American male youth. With the help of his wife, Sara Cresson, and many, many others, in 1854, Lincoln was chartered as a liberal arts institution for scientific, classical, and theological education. The expressed mission of Ashmun was to train males of African descent to teach others and to serve as missionaries in Africa. The first class of students was admitted in 1857, with the first class of graduates ordained and licensed by 1859.
Although Lincoln was established for the purpose of educating Colored male youth, it enrolled several white students as early as 1873. Baccalaureate degrees were conferred in 1868, with A.B. Degrees granted by 1870. Two Ph.D.'s were awarded, one in 1892 and the other in 1910. Women were admitted in the 1950s.

Following the Princeton model, the early curriculum of Ashmun Institute was rooted in the classics. Lincoln was among the earliest of institutions of higher education in Pennsylvania to include the science and the art of teaching in its liberal arts curriculum. Instruction was comprised of both college and seminary subjects. The early curriculum included the classics and theology, as well as some general courses or electives.

Student decorum was extremely important to the institution. Those enrolled were held to a rigorous academic program and were to exhibit and maintain the highest of moral standards. Faculty were largely responsible for monitoring the code of conduct and students could be dismissed for a number of reasons. Examples included: public drunkenness, visiting families in the neighborhood, misrepresentation of reasons for going into the town of Oxford, and for leaving campus without permission. Other offenses might include practical jokes, water fights, gambling, destruction of university property, possession of weapons, and the use of alcohol.

The first sign of organized student disorder came in 1890 when seniors refused to take part in an examination required by the faculty. As a result, the entire class was dismissed. Most of the students who were dismissed felt remorse for their actions and were subsequently re-admitted. A few graduated the next year and some transferred to other institutions. Of those who transferred, one returned later as president of the board of trustees. Another issue relating to governance is worthy of mention. In 1875, students began to question the racial makeup of their board of trustees and faculty. Ironically, Lincoln had a policy that prohibited African Americans from being part of the faculty or administration. For the students, this was unacceptable. Even after much debate and student opposition, this policy remained in effect; that is, the faculty and management remained white until 1931 when the board adopted a resolution to employ faculty regardless of color. The first African American president would be appointed in 1954, ninety-one years after Lincoln was chartered.

While the founding of Ashmun Institute marks a pivotal point in the evolution of educational opportunities for peoples of African descent, it was not the only institution chartered during this period. Another antebellum institution of higher learning, the Institute for Colored Youth, later known as Cheyney University was also founded during the antebellum. Like Lincoln, Cheyney was founded in Pennsylvania and was also chartered to serve the educational needs of people of African descent. The Institute for Colored Youth also holds a unique position in the evolution of American higher education.

The Institute for Colored Youth, now known as Cheyney University, was chartered in 1837, in Philadelphia, Pennsylvania to fulfill the dream of its distinguished Quaker benefactor, Mr. Richard Humphreys, who was born on one of the British Virgin Islands. His parents were members of The Religious Society of Friends. As with many of his associates, Richard gave freely to humane causes. The Institute for Colored Youth was one of them.

Richard Humphreys, a Philadelphia Friend, bequeathed $10,000 for the establishment of a training school for African American youth upon his death in 1832. Encouraged by the interest of African Americans, the Quaker Board of Managers bought land, erected a building, hired teachers, and set up a curriculum equal to that of other high schools in the city. In the midst of this country's great racial divide, Richard Humphreys offered another ray of hope.

First named The African Institute, the school was renamed at a meeting of the Association on April 19, 1837 to The Institute for Colored Youth. The institute would go through several name changes and today is called Cheyney University.

Philosophically, Quakers were hesitant about creating theological seminaries and the provision of classical education; therefore, the Institute for Colored Youth was established to provide training in various branches of the mechanical arts and trades in agriculture (Conyers 1990, 9). It was also designed to prepare students to serve as teachers. Because there was no provision for learning in the higher branches, the curriculum encompassed a number of different programs and fluctuated between manual and academic subjects. In time, the Institute for Colored Youth got on its feet and expanded the curriculum to include an apprentice program, a girls' and boys' preparatory school, boys' and girls' high school and an evening school, each being offered simultaneously. As the Civil War approached, the Institute offered six different programs simultaneously to both males and females of African descent.
Student life at the Institute was unique. Although the Institute was chartered in 1837, the first class of five students arrived on October 5, 1840. These eleven and twelve year old male students were admitted from The Shelter for Colored Orphans (Conyers 1990, 30). In that capacity, students were admitted from the shelter and bound to the Institute until they were twenty-one. Female students were admitted with the opening of the high school in 1852.

Conditions began to deteriorate two years after the admission of the first class. Students were progressing satisfactorily with their studies, however, literary education began to take second place to farm work. By summer of 1843, there was no teacher, and the daily school closed due to the pressure of farm work. A typical day went like this: rise at 6:00 a.m. with breakfast at 7:00 a.m. Academic instruction (when in session) began at 8:00 a.m. with manual instruction (farm work) at 10:00 a.m. Dinner was served at 12:00 with an afternoon school session beginning at 1:30 p.m. and ending at 5:00 p.m. Supper began at 5:30 p.m. and students were to retire after 7:00 p.m. The basic meal plan, which cost four cents, included fried mush and potatoes with bread and milk or molasses for breakfast. Dinner included soup and meat on alternate days with vegetables, rice, and flour pudding or plum pie. Supper consisted of bread and milk or mush and milk (Conyers 1990, 30).

Students were not happy with this arrangement. They felt that they were being treated as farmhands with no provision for classroom instruction, and soon, they began to run away. Other students were discharged because of rebellious behavior. At one point, the managers received word that a fire had occurred under suspicious circumstances near the outhouse. Less than a month later, another student, Elias Montgomery, ran away. The board would be called together on several occasions because of student disruption. Because these students were indentured, they were either returned to the school or their names were permanently stricken from the roster. Discontent among students ran so high that in 1846, only six years after the first students arrived, the Institute suspended operations. The Institute for Colored Youth continued in this struggle and produced students who went on to teach others of their race. The Institute rendered an important service by offering instruction to a number of African Americans who otherwise would not have had the opportunity for educational advancement.

Many years of hard work had gone into fulfilling the mission of the Institute, and on the eve of our nation's Civil War, it was achieving its mission as an institution of higher learning for African American youth. Even though certificates of accomplishment were presented after 1856, the first Bachelor of Arts degree was not conferred until 1932.

Like Lincoln and Cheyney, a third institution devoted to the educational needs of people of African descent is Wilberforce University in Xenia, Ohio. It was the outgrowth of a proposal that was made by the Cincinnati Conference of the Methodist Episcopal Church. Founded in 1856, the university was located at the Tawawa Spring Resort, along the borders of West Virginia and Kentucky. As with Lincoln University and the present location of Cheyney, the school is directly aligned with the underground railroad. In fact, there are two principal stations of the underground railroad on the campus.

In 1855, John Wright, a member of the Methodist Episcopal Church in coordination with the African Methodist Episcopal Church, set out to purchase the Tawawa Springs property. He was prepared to offer one-fourth of $10,000 as a down payment with the remainder due with interest in three installments. The offer was not accepted. That same year, another offer of $12,000 was refused. In March of 1856, another bid of $13,000 was presented and adopted and the Tawawa Springs Resort property was sold to the Methodist Episcopal Church (Payne 1873, Folder 2, Payne 1891, 423–424).

A few years later, in 1863, as a result of tensions between the North and South over slave territory, the school almost closed for good. Instead, through the work and vision of Bishop Daniel Payne, an African American member of the original governing body of Wilberforce, the charter was changed and ownership was transferred into the hands of the African American Methodist Episcopal Church. Without conferring with his colleagues of the general Methodist Church, Bishop Payne appeared on the day that Wilberforce was to be sold. Seconds before the grace period was up, Payne appeared and ran to the front of this distinguished group and exclaimed, "... In the presence of parties authorized to sell and with hands lifted to the heavens, in the name of God I purchase this property for the cause of Christian Education!" (Welch 1906, 12).

Although others placed bids on the property, Payne was able to purchase the land for $10,000 for the African
Methodist Episcopal Church. Thus, Bishop Payne saved Wilberforce University, making it the first institution in America to be owned and governed by people of African descent.

First named the Ohio African University, before issuing the original charter, the name was changed to reflect the life and work of William Wilberforce, the famous English philanthropist and abolitionist. William Wilberforce is remembered as a person who directed and enlightened public opinion against the British slave trade. A strong advocate for human rights and liberties, Wilberforce made eloquent and fearless speeches advocating on behalf of the disadvantaged and the oppressed.

The educational objective of Wilberforce was to provide men and women, particularly those of African descent, with a means of moral and social uplift. The posture of the Methodist Episcopal Church coincided with the desires of the African Methodist Episcopal Church where both were concerned with the intellectual and moral condition of thirty thousand people of color who were now residing in Ohio and the other free states. They both believed that African Americans in the West should also have opportunities for higher education. As with Lincoln University, Wilberforce was chartered and mandated to begin as a university, where the classics were at the heart of the academic curriculum. It was hoped that graduates would go on to teach and Christianize others. Operating with a normal school and with a preparatory department, students of Wilberforce enjoyed their rich surroundings.

When Wilberforce opened its doors to students in 1857, its popularity was evident as enrollment figures increased from a handful to more than two hundred. Not only did Wilberforce admit both male and female students, the population included a number of mulatto children. Significant to Wilberforce, these students were the sons and daughters of plantation owners (McGinnis 1962). Although it has been verified that some of the early students were from established families of Ohio and the Southern and Southwestern states, exact figures and names are not readily available. It is possible their identities were intentionally protected. Others were from the free states of Ohio, Pennsylvania, and California. A majority of these students excelled in their studies, going on to become teachers themselves.

As the academic program advanced, so did the agitation of the Civil War. Because a large number of supporters of the school were slave holders, when the war broke out, these gentlemen entered the rebel service and their children were withdrawn. In turn, the school’s income dropped and as the threat of Civil War advanced, the institution had to close. Approximately one year later, in 1863, with transfer of the property to the African American Methodist Episcopal Church, the institution was once again in operation.

Even with this advancement, the threat of violence loomed over the community. University personnel were afraid that fires would be set by those who opposed this advancement in educational opportunity. When it rained, they were happy. Although the majority of Xenians opposed slavery, there was considerable resistance on the issue of social equality and education. During the antebellum period, with the exception of Oberlin College, Wilberforce University was the predominant Western institution available to those people of color in Ohio and the West who sought higher education.

With the transfer of Wilberforce from the Methodist Episcopal Church to the African Methodist Episcopal Church, Wilberforce became the first African American university to be owned and governed by African Americans. Because of Wilberforce, educational opportunities for males and females of African descent were greatly improved. Wilberforce occupies a distinctive and unique place within American higher education.

Although research on this topic is much more in-depth and broader than could be presented in this work, three historical facts have now been presented. First, Lincoln University is the first university expressly intended for the higher education of African Americans. Second, Cheyney or the Institute for Colored Youth is the first institution to offer higher learning and third, Wilberforce University is the first institution of higher education to be owned and operated by African Americans.

It is evident that African Americans and their supporters were determined to have access to an organized system of higher learning. The fact that this goal was achieved during a period when the great masses of people of African descent were held in bondage lends even greater significance to the undertaking and its success.

Clearly, Lincoln, Cheyney, and Wilberforce Universities form the cornerstone of the advancement of opportunities in higher education for peoples of African descent. Part of their significance is derived from the fact...
that they were chartered during a period of crisis and debate regarding African American destiny and character. They are also distinctive in their missions to serve a population of newly freed persons for whom educational opportunities did not exist. The chartering of these three institutions offering a systematized approach to higher learning and higher education to African Americans during the antebellum period is a testament to the dedication and resolve of the newly freed Africans and their supporters to improve the quality of life for persons of African descent within the continental United States and abroad. The fact that they withstood and overcame the difficulties of the antebellum period and remain in existence today is a major accomplishment of which they can all be proud.

Teacher Preparation: From Common School Training to Professional Education

Courtney Vaughn  Joan K. Smith
University of Oklahoma

In the United States, the term “professional” was closely linked to the Progressive Era’s enchantment with scientific study. Scientific knowledge in any number of fields was abounding, and observers came to view a profession as an occupation that could claim a sophisticated theory base and practitioners who had the autonomy to apply this information in the service of “clients.” Although educators sought to meet and demonstrate these professional criteria, teaching remained a low status occupation. In part, this was because social convention viewed females, who came to dominate teaching during the late nineteenth century, as ideal due to their moral virtue and innate ability to nurture children. This paper will provide an overview of the process of raising the status of teaching through professionalization.

Throughout the decades of the nineteenth century, private normal schools existed solely to train teachers; however, by the early twentieth century, they began to decline as state and city normals became increasingly popular. In general these state normals were not able to provide the necessary numbers of teachers for the common school, so they trained high school teachers and public school administrators. The teachers for the common schools were prepared in county normal, city normal, and high school normal departments. From 1870 to 1900 the number of normal schools grew from sixty-nine to 289, with two teachers colleges, while the number of public school teachers increased from 201,000 to 423,000. By 1910 the normal school number had decreased to 247 while the number of teachers colleges increased to twelve of the 379 institutions preparing teachers. During this period public school enrollment increased from 6,792,000 elementary and 80,000 high school students in 1870 to 16,899,000 elementary and 915,000 high school students in 1910 (Folks 1982).

During the last half of the nineteenth century, as normal departments, the fledgling American high school became involved in teacher preparation. Teacher institutes were also a common form of teacher preparation. They had begun under Connecticut’s Henry Barnard in 1839 and had spread across the country in the next decades. They were often supported by fees and lasted from a couple of days to six weeks. They offered elementary subjects, teaching methods, and school management. This form of training continued into the twentieth century (Stinnet 1969, 392; Herbst 1989, 388).

As state universities opened their doors, almost immediately they established chairs of education or pedagogy: New York University in 1832; Brown and Indiana universities in 1852; Iowa in 1855, Wisconsin in 1856; Missouri in 1858; Kansas in 1876; North Dakota, Utah, and Wyoming in 1881; and the University of Chicago in the early 1890s. During the early decades of the twentieth century many of these universities expanded educational offerings and created comprehensive schools and colleges of education that offered both undergraduate teacher preparation and graduate education programs (Ryan 1975, 6-7). By 1900 it was estimated that 350 educational institutions offered teacher preparation. This estimate included normal schools and departments in high schools and academies. (United States Commissioner 1896-1900; Herbst 1989, 388).

Responsibility for certification also shifted from the local and county to the state level. In 1894 only three states issued all certificates, with thirty-five states utilizing a combination of state and county authorization. By 1919 there were twenty-six state systems in control of all teacher certification with only seventeen combining a state-county authority (Ryan 1975, 6-7).

Industrialization changed the nature of work for men, increasing their opportunities in both manual labor and the professions. Often, even non-skilled positions were higher paying than teaching, and, consequently, the percentages of male teachers to the total diminished throughout the nineteenth century. By 1880 only thirty-two percent of the nations educators were men. Forty years later that figure had decreased to less than sixteen percent, the lowest ever recorded in the history of teaching. (Although the aggregate numbers rose, from 73,335 in 1880 to 116,848 in 1920.) Those men who remained in the classroom or continued to teach did so for several reasons—doing God’s work, escaping manual labor, or entering a pathway to educational administration. As a result, males were
increasingly in charge of the schools. For example, the number of female elementary and secondary administrators declined from 1905 to 1920 (Tyack and Strober 1981, 140-141; Morain 1980, 161-170 Richardson and Hatcher 1983, 81-99; Rury 1986, 215-235; Farr (Vaughn) and Liles 1991, 234-248; Shakeshaft 1987, 16-55; United States Census 1883, 1893, 1904, 1914, 1923).

One prominent woman who gained respect as a "professional" in the male dominated area of school administration was Ella Flagg Young (1845-1918). She was one of the first graduates of the Normal Department of Chicago High School. Young completed the course in 1860 when she was sixteen years old. By 1909 when she became the first female superintendent of a major school system, and, later, when she earned a Ph.D. from the University of Chicago under the direction of progressive educator, John Dewey, most aspects of the educational enterprise in Chicago were gender segregated: elementary and secondary teacher; principal and district superintendent; and normal school principal were male.

While principal of the Chicago Normal School, Young made certain that the practice teaching experience of the normalites occurred in schools that reflected the growing cultural diversity of the city. Student teachers were supervised and evaluated by a normal school supervisor, a critic teacher, and the practice school principal. She also founded a journal, the Educational Bi-Monthly, for the purpose of not only enlisting the "work of the theorist but the practical teacher also" (Smith 1979, 117). By the time Young left the Normal for the superintendency of Chicago's Public Schools (1909-1915), her work was on solid scientific and pedagogical ground. Yet her national professional service had just begun. In 1910 she became the first elected female president of the NEA (Smith 1979).

Throughout Young's career, her thinking progressed toward a feminist insistence on the social equality of men and women. In fact her professional persona was implicated by what was classically considered a male ethic. Those who worked with her likened her service to that of a man. When she died of pneumonia from a bout with Spanish Influenza while touring the country to raise money from the sale of war bonds, Secretary of State William McAdoo said that she "died in the service of her country working like a soldier" (McAdoo, cited in Smith 1979, 230). In fact, the "Nineteenth Depot Company, Illinois Reserve Militia, accompanied the mourners to her grave so that a hint of a military funeral prevailed" (Smith 1979, 230). Furthermore, her successor at the Chicago Normal said, "had she been a man [she] would have directed a great corporation, managed a railroad, served as governor of a state, or commanded an army" (Cited in Smith 1979, 230-231).

While some women struggled to redefine themselves in alternative ways to the hegemonic Euro-American norms, the image of all women as nurturers and men as managers has encouraged teaching to be seen largely as a non-intellectual woman's field. Despite the label, significant strides to augment teachers' academic credentials continued. But these changes were influenced by social convention as evidenced by the greater emphasis on the professionalization of administration and secondary than on elementary teaching (Patrick, Griswold, and Vaughn-Roberson 1985, 139-157).

In 1920 no state required a bachelor's degree for elementary certification, but ten states required it for secondary certification. By 1970 forty-seven states required it for elementary certification and fifty-two for secondary certification. These state numbers include Washington D.C. and Puerto Rico (Monroe 1952, 303; Folks 1982). From 1920 to 1970 the insistence on more and more higher education to receive professional status encouraged the closing or transformation of normal schools into teachers colleges that: 1) required a high school diploma for an entrance requirement; and 2) expanded their mission and their curricular offerings into areas other than teacher preparation such as the liberal arts and sciences. As the ratio of normal schools to teachers' colleges shifted, the number of institutions preparing teachers increased from 839 in 1920 to 1,005 in 1950; by 1970 teachers colleges had been either closed or transformed once again into masters and doctoral granting comprehensive institutions on a par with universities (Folks 1982).

A look at teachers colleges and private universities gives an overview of the typical teacher education program in both elementary and secondary education. For example, in a B.S. program for elementary education from a 1961 teachers college about forty-nine percent of the total program was devoted to pedagogy, while fifty-one percent pertained to the liberal arts out of a total of 125 hours. However, in a large private university in 1960, seventy-four percent of the total program of 113 hours were education courses, while twenty-six percent were liberal arts.
again, was a B.S. in elementary education. In both cases the majors were elementary education. It is interesting to note that the teachers college required more total hours with a more even balance between subject content and pedagogy than did the large private university with a separate school of education.

Regarding secondary preparation for a B.S. in math education from a state teachers college in 1961, thirty-six percent of the total 122 hours was devoted to education, while sixty-four percent were liberal arts courses. Twenty hours or twenty-six percent of the liberal arts courses were in the mathematics major or about 16 percent of the total program. Comparing this to a B.S. in social studies education from a private university in 1961, twenty-three percent of the total program of 128 hours were education courses and seventy-seven percent were liberal arts with forty-six hours or about 46 percent of the liberal arts courses being in the social studies major; this is about 36 percent of the total program. In these two secondary cases, the private university provided more liberal arts work with more in the major than did the teachers college program. However, the practice teaching experiences represented a difference only of an hour and a half in both programs (Koemer 1963, 144-149).

In 1921 no state required college work for elementary certification. Thirty states had no stipulation for program preparation; fourteen required high school graduation; and four states defined some additional post high school requirements. By 1838-39 state teachers colleges and normal schools were under the control of state boards of education in seventeen states which constituted more than fifty percent of these institutions. This shift signaled the trend from certification by local examination of elementary school subjects to requiring some form of college preparation for both elementary and secondary teacher licensor. While all states required teachers to hold bachelors degrees, emergency and alternative certification procedures made this difficult to enforce (Stinnet 1969, 392-395).

The professional accrediting process began in 1907 when medicine developed the first accrediting body. This was followed by dentistry in 1909; architecture in 1914; business administration in 1916; law in 1921; engineering in 1934; optometry and veterinary medicine in 1941; and education in 1927 and again in 1951. The double dates for education reflect the shifts from normal schools and teacher colleges for teacher preparation into general purpose institutions of higher education. In 1927, the American Association of Teacher Colleges (AATC) attempted to initiate and employ national standards for teacher education institutions. However, due to the movement of teacher preparation to general purpose colleges and universities, AATC was never able to accredit more than about twenty-five percent (Stinnet 1969, 408).

By 1948 AATC merged with the National Association of Teacher Education Institutions in Metropolitan Areas, and the National Association of Colleges and Departments of Education to form the American Association of Colleges of Teacher Education in (AACTE). The AACTE continued the accrediting work of the AATC until 1954 when it delegated the authority to the National Council for the Accreditation of Teacher Education (NCATE). The make-up of this twenty-one member council was originally as follows: 1) six members of the legal state educational agencies (three from The National Council of Chief State School Officers—NCCSSO and three from the National Association of State Directors of Teacher Education Certification—NASDTEC); 2) six members from the National Commission on Teacher Education and Professional Standards broadly representing the professionals in the field; 3) six from AACTE with the its president as chair of NCATE; and 4) three from the National Schools Boards Association (NSBA) (Stinnet 1969, 410-414).

Over the years NCATE has revised its policies, but NCATE accreditation has always been voluntary. In the past several years NCATE has developed partnerships with state boards of education. Today there are thirty-nine such partnerships. With approximately twelve hundred teacher preparation programs, seven hundred are members of AACTE and of that number around five hundred are currently accredited by NCATE (Andrews and Palmer 1958, 222-229; Cogan 1958, 317-321).

In 1967 state departments became the legal authority for teacher education. They set requirements and controlled certification both initial and reissuing. More recently, teacher preparation commissions have assumed some of the authority for setting and evaluating standards for preparation programs. Competency or outcome based measures are also replacing semester hours for certification. However, most programs continue to require a general education component, a subject field block, and a professional educational sequence culminating in practice teaching or a practice teaching internship in five year programs.
Several studies done during the 1960s revealed that elementary programs required from about twenty to twenty-four hours or sixteen to twenty percent of the program to be in professional education. Another study of twenty-four institutions revealed that about 20 to 40 percent of the elementary programs were devoted to professional education. A similar study of 114 institutions showed that sixteen to twenty-one percent of the secondary programs were devoted to professional education. These percentages are far below those cited in earlier discussed examples from the 1960s. Thus, it would appear that, as liberal arts colleges and universities assumed the responsibility of teacher preparation, the percentage of the program devoted to professional education declined. The one caveat is that the hours of field-based experiences have increased the practice component of teacher education programs, because many states mandate at least one hundred clock hours prior to student teaching.

In the 1980s several reform efforts developed in an attempt to improve educational practices. These have included: 1) expanding teacher education to a fifth year and a masters degree; 2) working with K-12 schools to form professional development schools on the order of teaching hospitals; and 3) requiring increased field-based experiences plus a subject area block of courses for elementary majors (Andrews and Palmer 1958, 222-229; Cogan 1958, 317-321). But, in some respects, "professional" educators still faced an age-old dilemma. David Berliner hopefully writes:

We in education are haunted by the public's erroneous belief that someone can walk in off the street and deliver a curriculum to 30 or so children. Raising any number of children and having gone to school for a number of years does not make an expert teacher. I believe we are on the threshold of creating a scientific basis for the art of teaching that will be acceptable to the general public as truly specialized knowledge (Berliner 1989, 2-6).

Despite Berliner's reference to teaching as an art with a scientific base deserved of professional recognition, throughout all the many professionalization strides of the twentieth century, female educators (practitioners of and perhaps originators of the "art") have been devalued; while the modernization and professionalization of education have created high status, high paying administrative educational positions which women almost never hold. In 1905 women comprised 61.7 percent of the elementary administrators and 5.7 percent of the secondary administrators. By 1985 they were 16.9 and 3.9 percent respectively. Moreover, from 1870 to 1970 only six women were superintendents in the country's twenty-five largest cities. As recent as the early 1990s, only five percent of the nation's superintendents were female, and only nine of over fifty state school officers were women. Of the six national secretaries of education, only one has been a woman, Shirley Hufstedler; and she was an attorney. Historically, when women such as Chicago superintendent Ella Flagg Young have succeeded in such jobs, they have been perceived as behaving like men. Moreover, when males began making greater relative gains to females in teaching after 1920 it was in high school not elementary classrooms. In 1905, thirty-eight percent of the high school teachers were men, and by 1983 males comprised about fifty-one percent of the total; although, in the 1990s this percentage began to fall slightly (Shakeshaft 1987, 21; Cuban 1976; Chicago Tribune 1992, 5; Tabs 1990).

If indeed, nurturing is a trait that is not professionally valued, and society grants women less autonomy than men, then teaching may never achieve professional status. On the other hand, some educators are insisting on a new professional interpretation—in which an ideology of care is an essential component. Historically, it has provided the inspiration for teachers to dedicate themselves to serving others; demand autonomy; and increase their academic credentials. It is in society's best interests for educators to identify with and care for the communities (not "clients") they serve. Those citizens and patrons who do not now, could come to appreciate, rather than deprecate many educators' traditional commitment (Hargreaves 1994; Lieberman 1988; Spodek, Saracho, and Peters 1988).

Charles Dickens' Unrecognized Authority as an Educator

Educational historians do not typically turn to works of fiction for primary evidence of actual pedagogical practices. Even when such sources are considered within the broader context of the culture within which they were written, it can easily prove problematic in attempting to ascertain the author's own pedagogical creed within that culture, if indeed the author even has one. For instance, if the author portrays a fictional teacher favorably, does this indicate that the author approves of all aspects of the teacher's pedagogy? If the author portrays a fictional teacher unfavorably, how much truth is found in that negative portrayal, and what does that truth reveal about what the author deems education should be? Certainly one does not study Aristophanes' *The Clouds* to become conversant with the Socratic method of questioning as a means of seeking universal truth, but does *The Clouds* even speak to Aristophanes' beliefs about education? And if it does, on what basis is Aristophanes deemed an authority on education, as opposed to being an authority on Greek comedy?

Charles Dickens is a much more recent writer of fiction who has in fact been deemed an authority on education. For instance, about thirty years after the novelist's death, the Inspector of Toronto Schools, James L. Hughes, wrote *Dickens as an Educator*. Hughes' preface begins, "This book has two purposes: to prove that Dickens was the great apostle of the 'new education' of Friedrich Froebel... and to bring into connected form... the educational principles of one of the world's greatest educators..." (1902, ix). Yet, as Philip Collins noted over sixty years later in *Dickens and Education*, "There is no reason to believe that [Dickens] read or was otherwise influenced by Froebel, or any other important educational theorist," adding that Hughes did not "produce any good evidence... that, specifically, Dickens was the first and greatest disciple of Froebel" (1964, 17-18). Nonetheless, the larger issue remains that neither Hughes nor Collins' analysis of Dickens' fictional accounts of teachers in any way establishes that Dickens had any credentials as an educator, against which teachers in his novels might be judged.

It is not the intent of this paper to refute Hughes, Collins, or anyone else's assessment of Dickens as an educator, in the context of interpreting his novels. Rather, it is the intent of this paper to establish an accurate parameter regarding Charles Dickens' authority as an educator derived from his experience as a teacher of his own children. Curiously, a review of scholarship on this aspect of his life reveals that it was not until 1983, well over one hundred years after his death, that his experience teaching his own children was even acknowledged as a viable area of study.

Charles Dickens undertook what would today be termed home schooling, from 1846, when he had six children, to sometime before his death in 1870, when his youngest child was eighteen. Unlike some parents of today, however, Dickens was not dissatisfied with private and public school options. He was not even displeased with the Victorian middle class instructional approach of hiring a governess. On the contrary, with this one exception of Dickens' home schooling, Philip Collins (1964) reveals the wide variety of approaches to education which Dickens provided his nine children who survived infancy. For example, Charles, who was born in 1837, attended Mr. King's School from 1844 to 1849, Eton from 1850 to 1852, and Leipzig from 1853 to 1855. Francis, who was born in 1844, attended Gibson & Bewsher's School from 1853 to 1858 and Hamburg from 1858 to 1860. Two daughters were taught by governesses.

Dickens' approach to providing for the education of his children is consistent with the general findings of Edward E. Gordon and Elaine H. Gordon in *Centuries of Tutoring* (1990). In their chapter on "The Age of Domestic Education (1800-1900)," they write:

Domestic education and school attendance were often combined during a child's education. Children might be instructed at home during childhood, with many boys sent to a formal school at adolescence, and then some attending a university to complete their education. However, for most girls instruction at home lasted far longer, even up to age fifteen or sixteen... It was quite common for parents to give their son a combination of public and private education that mixed lessons from a tutor with school attendance. (193)
Writing specifically of England, they add:

For large numbers of English children, education became a domestic industry staffed in the first place
by the nanny in the nursery, governess in the schoolroom and supplemented by visiting tutors, or
later attendance (especially for boys) at a college preparatory school. . . . When the child left the
nursery and entered the schoolroom (age 7-8), girls and boys usually studied together. (210)

All that is missing from Collins' list, then, is the "nursery" education of Dickens' children, and this task the father
undertook himself:

In 1846, Dickens composed what he later described as an "easy account" of selections from the New
Testament, explaining in a letter written to his son Edward in 1868 that he did so "[b]ecause it is the best book that
ever was, or will be, known in the world; and because it teaches you the best lessons by which any human creature,
who tries to be truthful and faithful to duty, can possibly be guided" (Forster 1874, 446). Dickens, then, was intent
on making selections from the New Testament accessible and meaningful to his children at ages both earlier than when
schooling would occur under the direction of other teachers, tutors, or governesses, and earlier than the language of
the King James Bible could be expected to achieve.

In all, five references by Dickens to his manuscript survive. The earliest reference merely states that Dickens
completed his manuscript in 1846. The next reference, given above, occurs some twenty-two years later. What is
significant is not that Dickens may or may not have referred to the manuscript in the interim period in correspondence
which is now lost. Rather, at least three times during the last two years of his life, Dickens attested to the value of
the curriculum which he selected from the New Testament and taught at home to his children. In October 1868,
Dickens wrote to his son Henry:

As your brothers have gone away one by one, I have written to each of them what I am now going
to write to you. . . . I most strongly and affectionately impress upon you the priceless value of the
New Testament, and the study of that book as the one unfailing guide in life. . . . [R]emember that
I tried to render the New Testament intelligible to you and lovable by you when you were a mere
baby. (Hogarth, Dickens, and Hutton 1903, 305-306)

On June 8, 1870, the day before his death, Dickens answered a reader's letter in which the reader had claimed that
a passage in Dickens' latest novel was irreverent. Dickens replied to John Makeham as follows:

I have always striven in my writings to express veneration for the life and lessons of our Saviour;
because I feel it; and because I re-wrote that history for my children -- every one of whom knew it,
from having it repeated to them, long before they could read, and almost as soon as they could speak.
But I have never made proclamation of this from the house tops. (Hogarth, Dickens, and Hutton
1903, 361)

Dickens' assertion that he "repeated" the manuscript to all of his children "long before they could read" attests to his
using the manuscript orally and helps explain his aforementioned comment that he rendered it to Henry when he was
"a mere baby." Even though Dickens' eldest child, Charles, was nearly ten years old when his father wrote the
manuscript, nowhere in the remaining correspondence does Dickens state or hint that after a certain age, his children
were expected to read it on their own. Michael Piret, who worked extensively with the original manuscript for his
1992 annotation, describes "rather well-thumbed" leaves in concluding that "the piece seems to have been read in the
household quite a lot" (9), to which should now be added "by Dickens."

The final letter exists only as an excerpt in a book written by the Reverend David Macrae in 1871. Although
Macrae does not date this correspondence, he prefaces extracts from this letter as well as another:

In 1861, I unexpectedly received from Mr. Dickens a letter of thanks for a paper published at the
time in which I had endeavoured to point out the service his books had done to Christian morality.
This led to a correspondence . . . . (127)

The relevant passage reads as follows:

My reverence for the Divine Preacher of the Sermon on the Mount is not a feeling of to-day. I
married very young, and had a large family of children. All of them, from the first to the last, have
had a little version of the New Testament that I wrote for them, read to them long before they could
read, and no young people can have had an earlier knowledge of, or interest in, that book. It is an inseparable part of their earliest remembrances. (128)

Dickens never published his manuscript, and it was not until his last surviving child died that the text was published in 1934, under a title not attributed to Dickens, The Life of Our Lord. The first of two annotated editions was completed in 1983. The author, Madonna Egan, explained her goals in annotating the entire text:

Following the charting of each chapter and its sources is an analysis of the text which focuses on close reading, use of sources, Dickens's pedagogical techniques, relationship to other writings of Dickens, comments on language and style, and any insights provided by studying the chapter in its manuscript form. (54)

However, her specific commentary on pedagogical techniques is sparse and even disjointed. This results specifically from her attempt to analyze Dickens' text as static, written pedagogy instead of as interactive oral pedagogy.

For example, Egan encounters difficulty when she attempts to credit Dickens with "vocabulary adjustments to help the children's understanding . . ." (90) but then finds that words elsewhere have been changed "so that the children will not be misled by a too literal interpretation" (202) and that additional "vocabulary strikes us as cumbersome and inappropriate for small children . . ." (226). Such an approach is not what Egan variously labels in her first chapter of annotation good pedagogy, careful pedagogy, or good religious pedagogy. Rather, it is an attempt to limit Dickens' pedagogy to the word of the text instead of relating the written word to the context in which it was orally provided.

In 1992, Michael Piret, author of the second annotated edition, misinterpreted Dickens' oral pedagogy as well. To support his "view . . . that Dickens was rushing when he wrote the latter part" (180) of the text, he asserts:

For example: when we recall [Dickens'] careful explanation of what a camel is, in the second chapter, we may well ask why, in the eighth, he tells the children that the crowd in Jerusalem shouted "Hosanna!" to Christ; but does not pause to tell them what the word means. (181)

Piret is fruitlessly searching for consistency within a static written text. Whether Dickens wrote the latter part of his manuscript in haste or not is irrelevant to Dickens' implemented pedagogy. Presenting the text orally with his children during their nursery years allowed Dickens innumerable opportunities to answer any son's or daughter's question, "Papa, what does 'Hosanna' mean?" or to provide the requisite information, even if not asked.

For example, the full "camel" passage in Chapter the Second reads:

You never saw a locust, because they belong to that country near Jerusalem, which is a great way off. So do camels, but I think you have seen a camel? At all events they are brought over here, sometimes; and if you would like to see one, I will shew you one. (Dickens 1981, 23)

There is no reason to suppose that every time Dickens reached this passage, he read its question aloud, word for word, and then renewed his promise to take his children to the London Zoo to see a camel for the first time. His promise would have to remain unkept, in order for him to renew it at each teaching of the second chapter. Moreover, at some point each child could be expected to have sufficient knowledge of a camel to enable Dickens to preclude any further commentary.

Of course, in a curriculum of Jesus' life and teachings, the existence of camels and locusts has less significance than, say, Jesus' parables and miracles. Therefore, just as Dickens would edit his oral presentation on an as needed basis and just as Dickens would answer his children's questions during and after his oral presentation, surely Dickens would have interrupted the text on occasion to satisfy himself that a lesson had been learned.

Educational historians do have a basis for deeming Charles Dickens an authority on a particular aspect of education, and this basis is quite independent of knowledge and interpretation of Dickens as a novelist. Philip Collins was more insightful than he realized when he wrote in his concluding chapter that Dickens "seems . . . at his best as a writer . . . on the earlier years of childhood and on the simpler basic needs of education" (1964, 219). Charles Dickens personally provided some of those simpler basic needs of education to his own children.

A tiny college in Annapolis, Maryland, and its second campus in Santa Fe, New Mexico, offers one curriculum to every student for four years. During those four years each student reads, critiques, and reflects on the same one hundred books. Initiated at St. John's College in 1937 under the leadership of President Stringfellow Barr and Dean Scott Buchanan, the curriculum is called the Great Books Program (Barr 1967, 1). These books have been chosen on the basis of their influence on Western Civilization and span the humanities and sciences, including philosophy, history, logic, rhetoric, mathematics, physics, chemistry, astronomy, music, visual art, and literature. The faculty at St. John's College is responsible for additions or other changes to the reading list. The concept of the Great Books Program is not unique to St. John's; the classics of Western Civilization were taught in Europe's colleges from the thirteenth century. Furthermore, the first colleges in the colonies drew on the classics in order to pattern their colleges on the model of Oxford and Cambridge. The ultimate purpose of this curriculum has been and continues to be to develop individuals who think clearly, deeply, and independently, and thus are able to make good decisions for living.

According to the St. John's catalog, the Great Books Program is arranged in chronological order and is taught through seminars, preceptorials, tutorials, laboratories, and lectures. The seminar, which is the heart of the program, is conducted entirely as discussions of the assigned readings. All students are expected to participate. There are only two rules: 1. all opinions must be heard and explored regardless of any sharp clashes and 2. every opinion must be supported by argument. An unsupported opinion is discounted. Preceptorials, which are only for juniors and seniors, are similar to the seminars but the tutors guide the discussion. Each year tutorials are given in language, math, and music. Classes meet three or four times a week to analyze the given subject. Discussion is free but more focused on assigned tasks. Students meet in the laboratories to perform basic experiments from elementary physics and biology and to discuss and analyze them. Lectures are on Friday evenings and are followed by discussion. First year books are by Greek authors, second year books are from the Roman, Medieval, and Renaissance periods, third year the studies are from the Seventeenth and eighteenth centuries, and fourth year the nineteenth and twentieth century writers are studied. This order gives a historical perspective and a sense of what is permanent through all the shifts and changes in history (St. John's College Catalog 1994).

The Great Books Program is opposed by advocates of vocationalism on the grounds that it is not utilitarian. They ask how the study of ancient books can prepare one for earning a living. Yet the proper study of these books is eminently utilitarian.

This is supported by a survey conducted by St. John's which shows that an education in the classics provides a foundation for employment or further study. Forty percent of the alumni, over a period of fifty years, responded to this survey done in 1993 with the following disclosures: 20% are engaged in business; 18.5% are in teaching or educational administration, with over half of them in colleges and universities; 8% are in law; 6.5% are in writing and publishing; 6.4% are in health professions with 5% being physicians or psychiatrists; 5.5% are in social services; 4% are in government and politics; 3.8% in research; 3.6% in computer science; 3% in engineering; and 3% in visual and performing arts. This is evidence that this program prepares students for a life of continued learning and develops the cognitive skills, self-reflection, and independence.

Ignored by the vocationalists is the method of instruction which is as important as the books themselves. This method is dialectic (St. John's College Catalog 1994). That is, the students discuss the ideas found in the books and argue their opinions. No idea is accepted as automatically true; searching the books for truth and error is done by way of logic rather than from common assumptions.

Before the Great Books Program was established at St. John's College, Robert Maynard Hutchins and Mortimer J. Adler had started a Great Books Program at the University of Chicago. It was offered for two years to high school juniors and seniors. The program at St. John's was the full realization of what they had wanted for the University of Chicago. Hutchins and Adler argued that people would continue to repeat the errors of history by...
accepting, even inadvertently, the philosophies that created these errors. More than that, Hutchins and Adler believed many students were not getting an education that developed their character or their ability to think independently and make critical judgements. They thought a return to the classics would correct this situation. The classics contain the best and the worst that man has thought. They are referred to as classics because of their power and relevance to the urgent questions of every age. The focus of the Great Books is on those basic principles that are universal to all of humankind and not on those things we refer to as the individual differences (Hutchins 1936, 73, 75, 78).

In his book, The Conflict of Education (1953), Dr. Hutchins wrote that Americans in the late nineteenth and early twentieth centuries generally thought compulsory free education would be sufficient for dealing with the issues raised by freeing the slaves, giving everybody the vote, and developing industrialism. It was thought there would never be a barbarian conqueror because war now requires knowledge of the arts and sciences. An educated man could hardly be a barbarian. We now know that an educated conqueror is even more dangerous than his predecessors. Nor has free compulsory education solved the problems created by freed slaves, women voters, and industrialization.

Authors such as Allan Bloom (1987, 141-145), Leonard Peikoff, (1982), and Ayn Rand (1982, 1-11) write convincingly of how world events are a direct result of the teachings of philosophers. The professors of St. John's College are working to develop students who, because of their careful and critical study of the most influential minds in Western Civilization, are capable of seeing these effects and can sort out the complexities in our world.

The opportunity for an individual to analyze and reflect on the diversities afforded by the Great Books Program leads to introspection about his own character and intellect, thereby enabling him to achieve a basic vital intellectual ability: the ability to abandon his cherished beliefs in the face of evidence and reason. If we are to save the world it will be through education: education that does everything possible to develop individuals who are able to change their minds when reason demands it.

Most important, the focus in the Great Books Program is on principles. The St. John's catalog refers to the authors of the classics as the actual teachers whose "... example encourages us to strengthen our faculties for grasping principles among particulars and discerning the essential in the apparently haphazard."

A life of continued learning is almost guaranteed by the intellectual nature of the classics as the reader is constantly challenged to delve more deeply into what is meant. Adler claims that we fail to give our students an education that prepares them for citizenship or a life enriched by continued learning (Adler 1988, xxv). He tried to invent an educational system that prepares all students for citizenship and a life of continued learning before embarking on a career, whether the student will become a truck driver or a physician.

Probably the greatest hindrance to the spread of the Great Books program is the fact that Adler and Hutchins were advocates of both logic and faith (Hutchins 1936, Adler 1977) and neither saw this as an untenable position. Reason, they both believed, was the answer to the dilemma of their times. This put them on firm ground, but when they spoke in support of faith their arguments became unarguable.

Both drew on logic, but, because they held certain beliefs that were outside the laws of logic, they were unable to prove their points. In the areas where reason was abandoned, neither could use logical argument. Thus their arguments were not convincing.

Pragmatists are not the only ones who challenge the implementation of the Great Books program. Vocationalists are also skeptical of the value of this course of study. However, Hutchins thought the universities should teach the theories behind vocations. He saw the emphasis on the particulars found in educational vocationalism as highly expensive and counter productive because of its everchanging nature. A number of compromises have been made between those who believe the classics should be studied and those who promote vocationalism. Most often the compromise has been to have two years of a liberal education and two years of vocational studies. The results are inadequate on both counts; the liberal courses usually lack depth, and the vocational courses quickly become passe.

The emphasis on vocationalism became most widespread after the passage of the GI bill. This bill brought 88,000 veterans to college campuses by 1945. By 1949 seventy percent of all male college students were former GIs and therefore educational opportunity was no longer tied to income. The ex-GIs were more interested in job training than in their intellectual development (Miller 1988, 115-6). Pragmatism was the popular philosophy of the day. Its effect on the student was to make him ask why he should spend money developing his mind when the philosophers
were telling him his mind is incapable of knowing objective reality. Much better to gain training that will be put to immediate use (an objective reality he could not escape) making a living (Adler 1988). The market has continued to demand vocationalism.

Hutchins was certain that the classics would never be popular while pragmatism held sway. He writes quite extensively about this in his book, The Conflict in Education (1953). To this day it is commonly asserted on college campuses that "there is no right or wrong" and "what is right for me is not necessarily right for you". This pragmatic thinking makes intellectual pursuits seem useless.

The Great Books Program is similar to an old course taught at Oxford called Ancient and Modern Greats. It is similar to the education given in the colonial colleges to our Founding Fathers. No time in history has brought together a more august group of men—the most intelligent, logical, independent, and morally aware and concerned individuals the world has ever experienced. Their thinking and independence gave the world a form of government which has produced the freest and most productive nation on earth. Of the fifty-five signers of the Declaration of Independence, twenty-seven had graduated from a college or university. Twenty others had a less formal education or became self-educated to an equal or superior degree, such as Benjamin Franklin. These were men who had read the classics extensively.

Historian, James J. Walsh, searched the archives of the nine colonial colleges to learn what kind of education these founders had actually had. His findings were published in 1935 in The Education of the Founding Fathers: A History. These findings reveal many similarities between the colonial colleges and the Great Books Program. Grammar, logic, and rhetoric were the principal subjects for Freshmen and Sophomores. Cicero, Homer, Longinus, and Virgil (i.e. the classics) were also studied. Arithmetic, geometry, astronomy, and music were studied in the last two years, but the greatest emphasis was on the three philosophies: Natural, Mental and Moral; that is physics, metaphysics, and ethics respectively. All of these subjects are contained in the Great Books Program. In addition, disputations were held weekly throughout the school terms to help the students learn the rules of logic and develop the skills of debate (Walsh 1935, preface). These weekly disputations are similar to the seminars at St. John's. In both cases a deep understanding of the subject is developed. Rote memorization of the facts is not sufficient for debating issues that require reflection.

As part of the Commencement activities all candidates for the BA degree in the nine colonial colleges were required to formally debate a series of about one-hundred propositions. Printed copies of the propositions were passed out to learned members of the audience who wanted to take part in the public disputation that followed the formal debate. These propositions summarized the philosophical studies that were the principal occupation of the students during the last two years of their college course, and for a considerable portion of the first two years.

While it is true that the colonial colleges were established by puritans who wanted an educated clergy, classical education had such a liberalizing effect that puritanism was greatly diminished among the students. A study of their theses, many of which discussed Aristotelian ideas as well as theological issues, reveal this fact. Such a study also gives evidence of the scholarliness of the students and their understanding of the classics. A short list of representative titles demonstrates this: "There are no innate ideas," "Space is not a being," "Simple ideas are the foundation of every human cognition," "Two created spirits cannot occupy the same space at the same time," and "Ethics is equally capable of demonstration as mathematics." Evidence of the liberal trend at Harvard is this 1767 title: "No religion is rational without liberty of conscience." There were strictly physical and chemical theses such as "Earthquakes are caused by subteraneous heat" and "There is such a thing as the transmutation of metals." One title, "The diversity of sensation depends on the diversity of the nerves which carry it" pre-dates what is thought to be a nineteenth century discovery. "The knowledge of particulars is prior to that of universals" was presented and debated at Yale in 1770. In the same year we find, "Privations (negative qualities) have no true and real entity" (Walsh 1935, 14-24). Part of the difficulty in examining the theses is that they are all in Latin. Since the classics were written in Latin one could not enter a colonial college until he could use Latin readily. Today we have such good translations of the classics that St. John's students are not required to study Latin.

John Hancock, Samuel Adams, John Adams, Robert Paine, Elbridge Gerry, William Ellery, William Williams, and William Hooper are signers of the Declaration of Independence who graduated from Harvard. The
three most intellectual men of the time—Thomas Jefferson, John Marshall, and Henry Clay—had all studied with signer George Wythe. Thomas Jefferson became a William and Mary graduate. Benjamin Rush, referred to as the "Hippocrates of Pennsylvania", was a Princeton graduate. The list goes on as Dr. Walsh describes the education of each of the signers in the first chapter of his fascinating book.

Knowledge of the classics is evident in the writings of several of the signers. An eminent example is Mr. Jefferson's wording of the Declaration of Independence, for most of these words came from John Locke whose works are studied at the St. John's college.

Walsh said of each of the signers that they continued to study the classics all their lives. They saw that the reflections on human life made by these authors were pertinent for all times. Richard Henry Lee, Charles Carroll, and Mr. Jefferson have given abundant evidence in their writings of this continued love of learning. Macready, the well known British actor, wrote in his "Reminiscences" about meeting Mr. Jefferson: "In all my life's experiences I have never met a more finished gentleman. At his advanced age he kept up his acquaintance with the classics" (Walsh 1935, 355). Dr. Walsh goes on to speak of each of the founders with phrases like that applied to Thomas Nelson, Jr. of Virginia who was educated at Cambridge: "He acquired a taste for literature, which continued to occupy him for the rest of his life" (40). All of this suggests that Adler was correct in his idea that the classics keep drawing one back to delve more deeply into their meaning.

Mr. Jefferson gave much credit for his own development to Dr. William Small, a professor at William and Mary. Dr. Small taught mathematics, philosophy, ethics, rhetoric, and Belles Lettres. The two became daily companions. Mr. Jefferson expressed deep gratitude for his mentor who shared with him his way of looking at the meaning of life and the universe (Walsh 1935, 109-110).

From Dr. Small he learned to defend the proposition that authority for government derived from the governed. Study of the colonial theses reveals that this was the commonly held philosophy of the colleges (Walsh 1935, 111). Few men could afford to attend college but certainly these men knew how to reason and by means of reason to convince others of the rightness of their cause.

In a recent telephone conversation (13 Sept. 1996), the Dean of St. John's College, Eva Brann, said the greatest value the students received from their work at SJC was the ability to really listen to others and to speak their thoughts with clarity. The ability to speak with clarity, derived from clear thinking, applies equally well to the Founding Fathers who had the formidable job of convincing their constituents to risk their lives in order to free themselves of tyranny.

That the Founding Fathers were men of independence is an obvious and vital fact. They founded a country on that principle. Independence can only be experienced by individuals who are ruled by evidence and reason rather than by other men. Study of the classics gives men and women the opportunity to know this.

Just as independence was a result of the Enlightenment education of the Founding Fathers, so independence is a likely result of the Great Books Program. Thomas Jefferson penned a letter in 1800 to fellow signer, Dr. Benjamin Rush, "I have sworn upon the altar of God, eternal hostility against every form of tyranny over the mind of man" (1993, 511). Patrick Henry told his colleagues "Give me liberty or give me death". The world has never witnessed a greater demonstration of independence than is embodied in these words or in the pledge to risk their lives, fortunes, and sacred honor by signing the Declaration of Independence.

Our Founding Fathers have given us a nation that is conducive to real education for its citizens. We, the governed, need to understand the fundamental principles of freedom and how best to protect it. The Great Books Program gives us, in the words of Matthew Arnold, "knowledge of the best that has been said and thought in the world."

The history of higher education clearly demonstrates that radical changes can be established when thinking is altered. Many colleges, after World War II, dramatically changed from classical to utilitarian instruction when students were convinced that vocational training would give them what they wanted. We can just as dramatically convince them that studying the very best and the worst of human thought is the best foundation for achieving their goals. To accomplish this we must first recognize, as the Great Books Program does, that the development of man's cognitive skills is fundamental. Addressing the 1974 graduating class at West Point, philosopher Ayn Rand said,
"Nothing is given to man automatically, neither knowledge, nor self-confidence, nor inner serenity, nor the right way to use his mind. Every value he needs or wants has to be discovered, learned and acquired . . . . Philosophical training gives man the proper intellectual posture—a proud, disciplined control of his mind." It is for the achievement of this mental posture that the Great Books Program is eminently utilitarian.

The historiography of education of adults is complicated because it has no principal institution (Long 1988). It is, therefore, difficult to grasp the historical significance of education of adults as it is spread throughout numerous agencies, organizations and institutions identified with other historical problems. Despite the pluralistic (Long 1979) character of education for adults, historians generally have limited their attention to a few institutions such as the American Lyceum (Bode 1956). Because of the nature of early American society, education of adults was the result of participation in popular activities rather than participation in formal education institutions. The early history of education for adults in America may be better understood through study of what was known as self-culture.

A review of some important monographs on adult education reveals a general neglect of opportunities and/or provisions for education of adults in the South (Grattan 1955; Knowles 1977; Seybolt 1971a; Seybolt 1971b; and Stubblefield and Keane 1994). Regular and frequent treatment of education of adults in the South is scant. As a result, it is easy to conclude that the opportunities were of such paltry quantities as to deserve no consideration. Given the customary treatment of southern education opportunities for adults in the Colonial Period and Early National Period, it is obvious that the topic deserves our attention. Following the War of 1812 through the War Between the States American education for all ages became more institutionalized. Therefore, this inquiry is concerned with the question of what kinds of education opportunities for adults existed in Charleston, South Carolina following American independence.

Charleston, originally known as Charles Towne or Charles Town until 1783, was a cultural center attracting aristocrats and planters, who left their rural estates and plantations for communal life among the social elites of the city during the winter months. This group of planters, merchants, and professionals comprised an oligarchy, which influenced the character of Charleston. Although there existed a close relationship among the elite, leadership opportunities and intellectual intercourse were “open to all (whites) with talent and morals” (Zola 1994, a.). Thus, one way to gain access to this privileged group was through education. For the purposes of this article, education is used in a broad sense, including cultural societies, library subscriptions, apprenticeships, and the lyceum.

The South Carolina Gazette, first published in 1773, provides a glimpse of the development and character of this bustling city during its “golden era” (Rogers 1969). Some of the cultural societies founded during this time included the St. Andrews Society, formed in 1729 by Scots, was soon followed, in 1736, by the creation of the South Carolina Society to address varied charitable and social purposes. There is evidence that as early as 1736 Charlestonians frequented the theater (Molloy 1947). By the middle decade of the eighteenth century Charleston had become a center of wealth with an awakening interest in the arts. In 1761 the city population of about 8,000 was divided approximately equally between free whites and Black slaves (Rogers 1969).

The core group of Charleston society had the leisure to read, and the wealth and desire to build beautiful homes, to travel to other parts of the North America, Europe, and the Caribbean. The rich and cultivated life associated with the planters and merchants contributed to an ambience that impressed travelers for generations. According to Harris (1979/80) Duke La Rochefoucauld-Laincourt described the city as more sensitive to European manners than the inhabitants of northern states. His views were paralleled by those of Pope who, in 1792, also described the city as European. Henry Adams is reputed to have described Charleston as America’s most civilized city. Others have described it as being one of the most cosmopolitan cities in America during the Early National Period (Pease and Pease 1985). Certainly it was one of America’s wealthiest cities with much of the wealth evident in 1800 (Bridenbaugh 1952).

Charleston's popular education opportunities for self-culture compared favorably with other larger cities such as Boston and Philadelphia. For example, Charleston's library, dating from at least 1698, is among the earliest "public" libraries in the American colonies (Anania 1969/1970). In 1748 Charlestonian leaders formed a subscription
Education of Adults in Charleston, South Carolina in the Early National Period

Huey B. Long
University of Oklahoma

The historiography of education of adults is complicated because it has no principal institution (Long 1988). It is, therefore, difficult to grasp the historical significance of education of adults as it is spread throughout numerous agencies, organizations and institutions identified with other historical problems. Despite the pluralistic (Long 1979) character of education for adults, historians generally have limited their attention to a few institutions such as the American Lyceum (Bode 1956). Because of the nature of early American society, education of adults was the result of participation in popular activities rather than participation in formal education institutions. The early history of education for adults in America may be better understood through study of what was known as self-culture.

A review of some important monographs on adult education reveals a general neglect of opportunities and/or provisions for education of adults in the South (Grattan 1955; Knowles 1977; Seybolt 1971a; Seybolt 1971b; and Stubblefield and Keane 1994). Regular and frequent treatment of education of adults in the South is scant. As a result, it is easy to conclude that the opportunities were of such paltry quantities as to deserve no consideration. Given the customary treatment of southern education opportunities for adults in the Colonial Period and Early National Period, it is obvious that the topic deserves our attention. Following the War of 1812 through the War Between the States American education for all ages became more institutionalized. Therefore, this inquiry is concerned with the question of what kinds of education opportunities for adults existed in Charleston, South Carolina following American independence.

Charleston, originally known as Charles Towne or Charles Town until 1783, was a cultural center attracting aristocrats and planters, who left their rural estates and plantations for communal life among the social elites of the city during the winter months. This group of planters, merchants, and professionals comprised an oligarchy, which influenced the character of Charleston. Although there existed a close relationship among the elite, leadership opportunities and intellectual intercourse were “open to all (whites) with talent and morals” (Zola 1994, a.). Thus, one way to gain access to this privileged group was through education. For the purposes of this article, education is used in a broad sense, including cultural societies, library subscriptions, apprenticeships, and the lyceum.

The South Carolina Gazette, first published in 1773, provides a glimpse of the development and character of this bustling city during its “golden era” (Rogers 1969). Some of the cultural societies founded during this time included the St. Andrews Society, formed in 1729 by Scots, was soon followed, in 1736, by the creation of the South Carolina Society to address varied charitable and social purposes. There is evidence that as early as 1736 Charlestonians frequented the theater (Molloy 1947). By the middle decade of the eighteenth century Charleston had become a center of wealth with an awakening interest in the arts. In 1761 the city population of about 8,000 was divided approximately equally between free whites and Black slaves (Rogers 1969).

The core group of Charleston society had the leisure to read, and the wealth and desire to build beautiful homes, to travel to other parts of the North America, Europe, and the Caribbean. The rich and cultivated life associated with the planters and merchants contributed to an ambience that impressed travelers for generations. According to Harris (1979/80) Duke La Rochefoucauld-Laincourt described the city as more sensitive to European manners than the inhabitants of northern states. His views were paralleled by those of Pope who, in 1792, also described the city as European. Henry Adams is reputed to have described Charleston as America’s most civilized city. Others have described it as being one of the most cosmopolitan cities in America during the Early National Period (Pease and Pease 1985). Certainly it was one of America’s wealthiest cities with much of the wealth evident in 1800 (Bridenbaugh 1952).

Charleston’s popular education opportunities for self-culture compared favorably with other larger cities such as Boston and Philadelphia. For example, Charleston’s library, dating from at least 1698, is among the earliest "public" libraries in the American colonies (Anania 1969/1970). In 1748 Charlestonian leaders formed a subscription...
library under the auspices of the Charleston Library Society, also referred to as the Carolina Library Society by Bridenbaugh (1952). The Charleston Library Society was an active group, according to advertisements placed in the South Carolina and American General Gazette as cited by Long (1975b).

Different authors prefer to use dissimilar conceptual organizations for discussing the formal and informal opportunities for adults in varying historical periods. There is a degree of general agreement, however, on some basic points. First, education of adults is not always limited to the formal institutions of education such as colleges and schools. Second, numerous activities related to daily life objectives include education outcomes. Third, informal and formal agencies and institutions organized for purposes that are not explicitly identified as educational have educational consequences. Therefore, when education of adults is discussed, it is not unusual to include the mass media of the period under study; discussion of this period includes books, magazines, and newspapers. Hence, book sellers, libraries, and publishers are important education agents. Other activities with multiple outcomes such as the theater and social clubs often are identified as providing educational opportunities also. Finally, there were opportunities for learning associated with occupational organizations and societies. In order to appreciate the educational environment in Charleston during the period from about 1790 to 1810 it is imperative to examine a variety of sources of popular education opportunities in Charleston, they were namely, apprenticeships, clubs and societies, libraries, public meetings, religion, schools, and tutors. (Bridenhaugh 1955, Cremin 1970, Harris 1979/80).

South Carolina adopted its first apprenticeship law in 1740 (Cooper and McCord n.d)) According to the colonial act males were to be apprenticed until age 21 and females until age 18, although a mutually negotiated agreement could reduce the obligation to a younger age. This provision, however, did not apply to involuntarily indentured poor and orphaned apprentices. As in most colonies, a binding contract was entered into by both the apprentice and master. The apprenticeship law in South Carolina differed from those of other colonies as the apprentice was endowed with full contractual power when signing the indenture. A signature of a parent or guardian was not needed. Therefore, at least in South Carolina, there is legal justification for defining apprenticeships as an educational provision for adults. Unlike laws in Massachusetts and New York, South Carolina law did not require the master to provide instruction in reading and writing.

South Carolina modified the colonial laws in the Early National Period to, among other things, address issues of involuntary indenture of the poor and orphans as a means for addressing their educational needs. The policy was not limited to South Carolina, however, as it was clearly and directly based on English Poor Law of 1601 (Anania 1969/70, 139). In 1799 South Carolina added an educational clause concerning the poor and orphaned apprentices, so that they conformed more closely with those of the northern states. Harris (1979/80) identifies 176 young males apprenticed from the Charleston Orphan House between 1792 and 1812. Most of the orphaned male apprentices noted above were placed at age 14 or 13; 33 and 30, respectively.

Charlestonian society has been represented in secondary sources as being particularly interested in the "polite arts" (Bridenbaugh 1952). While it appears that this label is used in an invidious manner to imply that such interests are less desirable than other enlightenment concerns, it is obvious that the wealthy Charlestonian society was attracted to architecture, dance, and the theater. Bridenbaugh says "in truth, no other American community gave them (the polite arts) more wholehearted patronage" (1952, 108). Despite the relative youthfulness of the Carolina Society, it was most successful in encouraging music, the theater, capable painters, and a distinctive architecture. During most the Early National Period, Charleston was one of four major theatrical centers in America. Credit for the success of the stage in Charleston goes to the local stock company and a substantial amount of local dramatic writing (Zola 1994).

Given Charleston's demographics and economy as noted above, the involvement of well informed and intellectually curious adults in diverse endeavors is an easy assumption to hold. Most important for our purposes, it is not an assumption that is difficult to support as a wealth of historical information confirms such activity. The American Philosophical Society, which grew out of Benjamin Franklin's Junto, was ably represented in Charleston by Dr. Samuel Beach, John Deas, Dr. Alexander Garden, Henry Laurens, Charles C. Pinckney, and Thomas Pinckney. The society sponsored lectures which, at least, during 1809 and 1810 were open to the public and were reported as being well supported (Courier 18 May, 6 June, 5 July 1809, Times 29 Jan., 14 May 1810). Another
source of intellectual stimulation was the Philomatheon society. Zola (1994) credits the Philomathean Society, an elite forensic association, as being pivotal in Isaac Harby's formative years. This debating and discussion society was not greatly unlike earlier English discussion and debating societies. Topics included moral, medical, legal, and religious issues. The society was another means by which the Nobility associated with the Mobility.

Charleston accounts for several important firsts in adult education opportunities associated with social organizations. For example, The South Carolina Society for Promoting and Improving Agriculture and Other Rural Concerns, incorporated on August 24, 1785, is recognized as the first purely agricultural society in the United States (True 1969). The Botanic Society and Garden of South Carolina, the first botanical society in America, was formed in August of 1805 (Bates 1945). Charleston was among the very early American cities to form a mechanics society. Even though the general historical literature traces the Mechanics' Institute to England and identifies it in America from about 1820, Charleston established a Mechanics Society in 1794 with 74 members from mechanics, manufactures, and handicraftsmen. This date compares with a similar organization established in New York City in 1785 with 22 members. Perhaps it was the influence of these societies that contributed to what Bridenbaugh calls an astounding number of important achievements by the medical community (1952). The presence and activity of these societies, clubs, and associations suggests that the relatively small city of Charleston, separated by hundreds of miles from the larger American urban centers in the Early National Period provided many educational opportunities for adults.

The print medium is considered to be among the most inclusive educational media. Therefore, the balance of this paper examines the opportunities for education presented by the printed word in Charleston between 1790 and 1810. The print medium as an information and education source was more popular among early European-Americans than commonly recognized. Each city of any size had a book seller, and many had printers and newspapers. According to Krout and Fox (1944) most of the American publishing, before, 1820, was local. Most newspapers focused on topics of interest in the immediate vicinity. Printers also printed and distributed copies of sermons, public speeches, government documents, and a few favorite works of fiction, and broadsides. The majority of the publications were of an immediate or utilitarian nature designed to address religious, commercial, or political interests. Harris (1979/80) reports that more than nineteen imprints were released by the Charleston press annually during the twenty year period; an average of about one item every three weeks.

Publishers and others found additional ways to support themselves based on print media. The bulk of book publishing took place on the other side of the Atlantic and local printers often provided books from England and other European centers for sale. W. P. Young's lengthy career as a bookseller and printer illustrates the strength and viability of Charleston's book market in the Early National Period. He supplied Charleston's readers with books from his Broad Street book shop for more than twenty years, beginning in 1790. An indication of Young's inventory comes from local newspapers, the City Gazette, Times, and State Gazette which contained numerous advertisements, some listing as many as 100 titles, between 1790 and 1808 that extol Young's books. Other advertisement reveal the interest in French and Spanish languages among residents of Charleston. An advertisement in the Courier featured the works of more than thirty authors in French editions and several more in Spanish (Courier, 10 Nov. 1808). The City Gazette also advertised their own book stocks.

Perhaps the most famous of the traveling book-sellers to visit Charleston was Mason Locke Weems, better known to history as Parson Weems. Parson Weems is noted for his biography of George Washington. In 1806 he wrote to his publisher that he has sold $3,000 worth of books in Charleston in six weeks (Harris, 1979/80, 62). Used books were sold in a variety of ways from auctions to part-time book merchants including owners of coffeehouses who sometimes sold both new and used books (Courier, 28 April 1804). Despite a small population of about 7,000 white citizens, a relatively active book market existed.

Books and related print media were pervasive in Charleston during the first two decades of the Early American Period. Newspapers, however, were even more ubiquitous. By 1800, American newspapers had a relatively long history of influence on the European-American mind and action. The censorship suffered by the newspapers of Peter Zenger and James Franklin had illustrated the need for a free press in the new Republic. As a result, Charleston newspapers made much of the importance of informing the citizens of the new nation. The editors
of the State Gazette (23 January 1794) believed that ignorance was irreconcilable with republicanism; ignorance was
the "pedestal of despotism" while the twin "pillars of liberty" were comprised of "knowledge and political information
obtained from newspapers."

Newspaper editors often perceived their role as instructors of the people in numerous facets of life in addition
to politics. This position is reflected in the pages of the Courier (13 Jan. 1803) where it was stated that many
individuals obtained most, if not all, of their information from newspapers. Accordingly, the Courier's editor offered
to provide a range of materials calculated to have an affect on readers' minds and morals though information and
amusements. Examples include scientific essays, religious and literary topics, poetry, reviews of books and theater
productions, along with the standard political and news items.

Newspapers of the period easily might be called political journals as their reporting of political news was most
often interpreted though the editors' political screens. These missives were described by Isaiah Thomas (1810 cited
by Harris 1979/80) as "vehicles for carrying on political warfare." The newspaper constituted a political forum where
contributors often used Greek or Latin pseudonyms such as Americanus, Carolinianses, and Lucian. Vernon
Parrington (1930, 357) labeled this period as "The War of Belles Lettres," marked by slashing acrimonious attacks
by Federalists upon Democrats and vice-versa. While it is difficult to determine how enlightening these, usually well
reasoned, attacks or polemics were, it is less arduous to conclude that they were effective in rousing and encouraging
interest in local and national political issues.

Newspapers also made literary contributions as they provided interesting essays, poetry, and reproduced
excerpts from popular literature. Short stories from the Philadelphia magazine, The Port Folio, often found their way
into the pages of the Courier (1 Feb., 11 Feb. 1804). The Courier also published sixty three items dealing with
theater criticism by Stephen Cullen Carpenter in 1803 and 1804. Despite popular views that information in southern
newspapers was based on a one directional system of North to South, the Courier demonstrates otherwise. The
paper's weekly feature, titled the Weekly Monitor, provided a variety of moral and religious essays, was reprinted in
other American newspapers including the Philadelphia Democratic Press. A reader who used the pseudonym
Lucinda praised the editors for their wisdom in including the series (Courier, 7 May, 1804).

Despite the questions raised about the political biases of the various newspapers, they were recognized as
popular educational media. Dr. David Ramsay, of Charleston lauded the newspapers as a source of education for the
poorer people who had limited access to books. He said, from newspapers, they gained "a great proportion of what
they know respecting politics and government, the modern improvements in arts and sciences, and the present state
of the world" (Ramsay 1809, 212).

Magazines also provided a source of enlightenment among Charleston's readers. Many of the magazines were
available through agents and bookstores. Some titles were eagerly sought. The Gentleman's Magazine was so popular
that in 1792 the Charleston Library Society requested its London book agent to pack the magazine in their annual
shipment so that it could be unpacked first (Harris 1979, 1980).

Several attempts were made by Charleston residents to publish a local magazine that would compete and
compare favorably with those printed in London, Philadelphia and elsewhere. At least twelve magazines were published
in Charleston for short periods during the era, with most lasting less than one year. The problem of sustaining
magazine publication was not unique to Charleston as similar difficulties were encountered in much larger cities. The
effort to publish the magazine, however, suggests a creative talent for such an activity resided in Charleston.

Three types of conclusions are suggested by this inquiry: definitional and conceptual, historiographic or
procedural, and social. The definitional conceptual conclusions are as follows: lack of agreement concerning who
was an adult in 1790-1800 contributes to uncertainty about the clientele; similar problems or issues concerning the
educational character of popular media and programs of agencies and organizations contribute to difficulties in
assessing the educational opportunities of adults in Charleston during the period studied. Historiographic or
procedural conclusions are as follows: the effects of bias in both primary and secondary sources appear to influence
interpretation of the information available; secondly, it is not easy to document the effects of popular education.
Finally, the social conclusions are as follows: inquiry is needed to determine the involvement of adults in popular
education by social groups; the effects of the large slave population on popular education need to be examined; and
exploration of the balance between utilitarian knowledge and the belle lettres should prove to be informative.

Evaluating the life and practices of Nannie Helen Burroughs, it seems that she lived her life by the scripture, *Trust in the Lord with all thine heart and lean not unto thine own understanding. In all thy ways acknowledge Him and He shall direct thy path* (Proverbs 3:5-6). Nannie Helen Burroughs was born in Orange County, Virginia. She and her sister were the daughters of ex-slaves. Both her maternal and paternal grandparents began to acquire property after the Civil War. One grandfather owned a 'sizable' farm, while the other made a 'comfortable living' as a skilled carpenter. Occasionally, Burroughs makes mention of a male cousin who was continuously in trouble and eventually she disassociated herself from him. Nannie Helen Burroughs never talked much about herself or her family. Most of her discussions were about the National Training School for Women and Girls, God's school on the hill.

Burroughs completed her elementary and secondary education in Washington, D.C., graduating with honors from the academically renown M Street (later Dunbar) High School in 1896. Burroughs studied classical training, business education, and domestic science. She also had extensive study in the fields of literature, economics, and social science.

Upon graduation she was promised the position of assistant to the domestic science teacher in a D.C. public school. However, when she graduated, the position promised her was given to another woman. She was told that she was too young for the job. She was understandably upset when denied the appointment she had expected and for which she had prepared. Burroughs had planned to work for a few years in D.C. public schools in order to save money to attend law school in Boston. It was at this point that she decided that she would have her own school in D.C. someday. In her school, girls would receive a fair chance and assistance in overcoming their obstacles.

The school for which Nannie Helen Burroughs came to be known was the National Training School for Women and Girls, Incorporated. It would be hard to introduce this school without mentioning her roles in the National Baptist Convention. After all, it was at this Convention that she introduced her idea to begin the school and it was the Convention that she solicited for help. Eventually help would be among the least of things offered.

The National Baptist Convention was founded on November 24, 1880 and was largely controlled by men. In the beginning, a large group of concerned individuals came together to discuss forming such an organization. They were initially the Foreign Mission Convention of the United States of America. This new group sought to "extend our Christian influence and advance the Kingdom of Christ" (Jackson 1980, 34). The Convention was the key organization for Black Baptists.

Nannie Helen Burroughs was a strong believer in God, looking to Him for guidance in every step of her life. She believed that He had called her to open a school, and she knew where it was to be located. The only question was, "When would this vision of God's School come to pass?" In 1900, Ms. Burroughs attended the National Baptist Convention. She was the youngest and only single woman there. Her spirit dominated the meeting. Burroughs began her work at the Convention with the Women's Auxiliary, where she was elected Secretary. The Women's Auxiliary believed that she would make a good secretary and should be 'tolerated if not humored'. She worked her first year without pay and, after doing a fine job, she was paid $40.00 per month and travel expenses (Harrison 1956, 13).

The Women's Convention was accepted reluctantly by the National Baptist Convention whose members did not like the idea of an independent organization of women (Harrison 1956, 15). They preferred to have a Woman's Board governed by the men. In their struggle for control, the men in the National Baptist Convention eventually demanded that the women discontinue their support of Nannie Helen Burroughs and the National Training School for Women and Girls, Inc..

In 1901, petitioning to the National Baptist Convention for a training school began and continued for the next six years. It was not until 1906 that a committee to discuss the school decided on a location. As Burroughs stated, "The object of the school shall be to train women for mission work in this and other lands. Second, to prepare women as teachers of the word of God in our Sunday Schools. Third, to train them to give better domestic service" (Harrison...
1956, 17). Very few people had any hope that such a school would succeed.

When the Women's Auxiliary came up with the idea to open a school, they wanted all of the initial funds for the school to come from within the African-American community. Once open, the school did receive donations from white philanthropists. Many private schools for African-Americans during this time were supported, in large part, by whites. Considering her self-help philosophy, Burroughs thought it was important that African-Americans support their own institutions. In this vein, they could sit on the trustee board, decide on the curriculum which would be best for their people and, above all, have control over their own institutions. The National Trade and Professional School was founded by and for African-American women and girls, and supported by African-American people (Nannie H. Burroughs papers. n. d., Box 318).

The opening of this school did not come without controversy. A District of Columbia educator told Burroughs that the school would not be successful in Washington. The educator felt that a school in the District without large funding would not last in the United States capitol. Even Booker T. Washington disagreed with establishing this school in D.C. He thought, as did many others, that the South was the best place to begin a school to teach African-American girls. Washington also felt that Blacks in D.C. would not support the school.

Withstanding all criticism and lack of support, the title for the property was transferred on January 7, 1907. On October 19, 1909, the school was opened. By 1921, the six acres originally purchased had increased to eight. In addition, the one building had increased to eight substantial ones. The property value was worth more than $100,000, although the neighborhood in which the school was located was not one of the best residential districts in Washington. Burroughs did all in her power to ensure the success of this school. Outside of the money collected from tuition and that given by philanthropists (large or small), she raised funds through speaking tours. Much of the money that she gathered while traveling came from poor women and men, many of whom could only afford to give a dime and very few could give more than a dollar. In the first eleven years, the total amount raised for the school was $322,051.54. Of this sum, the Women's Convention had given only $4,375.94 (Pickens 1921, 9-10). When assistance did come from the National Convention, it was from the Women's Auxiliary and not the National Baptist Convention as a whole.

When the school opened, there was Nannie Helen Burroughs as president, five assistants, and eight students. The total enrollment for the first year was 31. The students ranged in age from fifteen to forty-three. From the outset, applications for admission constantly exceeded the accommodating space. Burroughs nicknamed the school The School of the Three B's. These B's represented the Bible, the bathtub, and the broom. Such were the school's standards for spiritual and physical cleanliness and industry. As stated by Fannie Cobb Carter, a teacher at the school, the National Trade and Professional School was "a school that offers such rare opportunities to both teachers and students to work together in the development of real Christian women. . . We make mistakes and have much to learn, but we have the desire to live righteously (Burroughs Papers n.d., Box 311).

Although, Burroughs was the primary source of support needed for the school the Baptist Convention wanted control of the school. Hence, a major problem was that the National Baptist Convention was not listed on the deed to the property. Burroughs did not claim the school as her own, but the Baptist Convention assumed this was her mission since it was not recognized in the official papers for the school. When the title for the property was signed however, members from the National Convention declined to show up for the signing which is why their names were not listed. Ultimately, the National Baptist Convention ordered the Women's Convention to withdraw its support of the school in 1938.

For many years, Burroughs stood virtually alone. She was cast from the graces of her denomination, the church in which she had invested many years of hard work. When she refused to give the deed over to the Convention, she was expelled; thereby losing her position as secretary of the Women's Auxiliary. The women did not turn away from her, however. Once she was dismissed from her duties by the men, the women wrote her a statement of confidence. The Women's Auxiliary "declares that it has absolute confidence in, and sincere appreciation for Miss Nannie H. Burroughs, . . . and pledge unstinted support to the Institution which she founded for the Women's Convention, to which she has given years of devoted service" (Burroughs Papers n.d., Box 310).

The National Baptist Convention was not satisfied with merely withdrawing support. Indeed, its main goal
was to seize ownership and operation of the school. However, upon attempting to seize the school, they realized that the Convention did not own it. A letter was written to Burroughs from the Convention requesting a meeting to resolve the matter of who really owned the institution. At this meeting, Burroughs informed the men that, in her opinion, the National Baptist Convention wanted to 'change a successful policy for an unsuccessful experiment' (Burroughs Papers n.d., Box 318).

The charter for the school was in the hands of the Trustees, where Burroughs felt that it should be. Before 1917, the school did not have problems with the Convention wanting ownership. Initially, they did not want the school at all. Then they waited for the school to fail. When it did not, they wanted the charter. With the charter controlled by the Trustees and not the National Baptist Convention, the school could receive money from all denominations, rather than just Baptist. If the school was entangled in the problems of the Convention with its extreme debts, most business people and philanthropists would not want to invest in the school (Burroughs Papers n.d., Box 318).

A major charge which Burroughs brought against the Convention was its practice of sexism. There were no women on the Board of Directors of the National Baptist Convention. Therefore, the Woman's Auxiliary had no voice or legal rights. They were controlled by the men. Hence, if the school was given over to be controlled by the Auxiliary, it would still be controlled by the men in the Convention. As Easter stated, "the issue was control and sexism. The Executive Board of the National Baptist Convention wanted compliance with their new charter, and they were being defied by Burroughs and the School's Board of Trustees, most of whom were women" (Easter 1992, 122).

This battle over ownership lasted for many long years. In the process, many in the Baptist Convention turned away from Burroughs and her school. When it was realized that, as stated in The St. Louis Argus, 5 August 1938, the Training school was "an incorporated body and that it was not amenable to the church" and that the trustees wanted it to remain that way, the Women's Auxiliary withdrew their support. Some support was wavering and even though many in the Convention left Burroughs, she refused to leave the Convention. "God was an everyday reality to Burroughs and the Baptist religion was the central core of her life" (Synott 1994, 71).

Burroughs' educational philosophies fell in line with her four main principles of life; love, learning, labor, and leisure. In her opinion, "They determine the destiny of every human soul. By them we walk steadily forward and upward, or we stumble blindly backward" (Burroughs Papers n.d., Box 46). These were her four 'lamps of life'. In Burroughs' view, the chief purpose of any institution was to tell where the oil could be found to fill the lamps and how they could be trimmed and kept burning. When students left her school, they were to be, in her words, the 'mental, moral, social, and spiritual lights of the world'. Learning becomes worthless when it is not passed on, she believed.

Love guides the daily path and allows an individual to touch other's lives. Pass on all that is learned to others, not allowing them to remain in ignorance. This is very consistent with the advice Jesus gave his disciples. It is constant labor which keeps the lamp from burning out. When putting forth the labor to learn, what is received in return is far greater that what was put out. The most important of the lights of life is leisure. Leisure is a time "for reflecting, for meditation, for recreation and restoration."

Burroughs' school did not accept "the delinquent or problem girl" under any circumstances. As she stated, we are in the "character-forming not the "reforming" business. They also did not accept, "The girl who drinks or smokes. The girl whose academic average is low" (Burroughs Papers n.d., Box 310). As stated by historian Evelyn Barnett, "Burroughs emphasized training for spiritual character, and thus the school operated along strict moral codes" (Barnett 1978, 99).

The National Training School for Women and Girls was extremely regimented. Anyone not in accordance with the rules was reprimanded. Students who were not residents of Washington were not allowed to board off campus. Students could have company only on Sunday afternoons for one hour. Visitation of any kind was forbidden at all other times. Even when visitation was allowed, only students over seventeen, with a satisfactory record of conduct and scholarship, were allowed guests. If the students were to have male guests, then the parent would have to write to the president with the names of the male callers in advance of the visit. Students were encouraged to write their parents weekly, but "continuous, useless" correspondence with other friends was not allowed.

Every student had to have her own Bible and songbook. Burroughs even specified what type of Bible the students must have. The Bible had to be "English No. 208, Minion Bible 18 mo cloth. American Bible Society, New
York." Short of illness, no student was excused from chapel. In Chapel, devotion was at 9:00 am every morning, a prayer meeting every Friday morning, Sunday School from 8-9 am and Vespers Service at 3:30 PM. on Sundays (Burroughs Papers n.d., Box 310). Attendance was mandatory at school conferences, which were held to keep high moral tone at the school. When the students entered the school, they had to agree to submit to discipline. Students were required to attend all religious services on campus as well as attend church services regularly.

Daily marks were given for how students kept their rooms. It was against the rule for students to borrow money or clothes. All students had to give one hour a day of service to the school. If a student wished to be relieved of her service duties, she could pay two dollars a month to the school. If students could not pay their bills, they were suspended from classes until they could do so. Yet, they were required to work to pay for boarding. Suspended students had to take exams for all of the work missed while suspended. During Christmas holidays students could go home, but they had to return a day before the vacation ended. For each day late they returned to school, they were made to pay one dollar (Burroughs Papers n.d., Box 312).

Burroughs made it clear that "This is a Christian institution. While it is non-sectarian, we do impress upon each student the importance of becoming a Christian, living a consistent Christian life and taking an active part in the religious work of her denomination and in the religious activities of the institution" (Burroughs Papers n.d., Box 310). She wanted her students to be able to do a special type of missionary work: to teach the Bible in local churches, to be able to raise a family or to go to foreign lands to teach, and represent Christ and the church. She proposed a program for Bible-Missionary Education and advanced religious education. In the Bible section, the women would learn the first five books of the Old Testament and the first four books of the New Testament. In Missionary education, they would learn the importance of missions in the Christian faith. They would also need to be well versed in Latin and English. The Missionary Training Department was only open to women over eighteen who felt God had called them to "engage in special Christian work." Some of their other mandatory courses were Old Testament interpretation, Biblical Theology, Methods of Bible Study, Exegesis of the Epistles, and Christian Evidence (Burroughs Papers n.d., Box 310).

One of the main reasons why the school was to be built in Washington was because of the opportunities for the women to be hired as domestic servants. This was one of the largest fields of opportunity at the school. Burroughs taught the young women who attended her school skills which would enable them to earn a living. One of the reasons some men in the National Baptist Convention gave for not supporting the school was that the young ladies were being trained to be "breadwinners" (Easter 1992, 121). They believed that this was the Christian duty of men only. Another criticism of the domestic training program was that Ms. Burroughs was training the young ladies to be servants. To counter this view, an editorial stated that "Nannie Burroughs does not prepare girls for servants, but for service... Nannie Burroughs secures a discipline and a morale which our public schools cannot begin to imitate or rival" (Burroughs Papers n.d., Box 318).

Soon, Ms. Burroughs changed the curriculum to meet the changing needs of the times and her international student body. The academic program expanded gradually to offer a junior high curriculum. Then, by 1929, junior college courses were mixed with those for trades and professions. The school was founded as the National Training School for Women and Girls. Its name was eventually changed to the National Trade and Professional School for Women and Girls, Incorporated. It seems that as the curriculum changed, so too did the name of the school. Burroughs stressed Black History and Black Pride. Hers was the only school to have a department of Black history and required every student to take a Black history course and to pass both oral and written exams on the subject (McCluskey 1989, 9).

There were extra curricula activities at the school such as basketball and interest clubs. These activities and clubs were formed to develop leadership skills. Another means for developing leadership skills was involvement in the Institute of Personal Development for students. In this institute, the girls and women were lectured on topics from the meaning of culture to poise and table manners to grooming and male-female relations. These lectures were held several times a month. Ms. Burroughs and her staff were serious about teaching the students to be ladies in good moral standing.

As well as receiving domestic and missionary training, the students were also receiving a classical education.
As stated previously, Burroughs believed in the educational philosophies of both Washington and DuBois. Her curriculum reflected that fact. Most of the curriculum information in the Nannie Helen Burroughs Paper collection reflected the courses required for the liberal arts section of the curriculum.

In looking at the curriculum, it seems that Burroughs was preparing the young women for much more than domestic work and missionary services. Her belief was that trades could not be taught without an academic background. The curriculum included classes such as English, Latin, psychology, and French, as well as U.S. history, science, typing, bookkeeping, business arithmetic, shorthand, sociology and world history, geography, and sewing (Burroughs Papers n.d., Box 311). As stated in the Washington Post, 24 May 1992, by Mattie Robinson, once head mistress at the current school, "Burroughs believed that academics and spirituality went hand in hand."

At the high school level, several subjects were required per year. The first year the students took English, speech, spelling, penmanship, and read a classic novel. The second year there was speech, composition and Rhetoric, spelling, and penmanship. Classes taken in the third year were composition and rhetoric, American literature, spelling, and penmanship. The fourth year's course load consisted of speech, English literature, spelling, and penmanship. In the third and fourth year classics classes, the students reviewed American and English literature as well as modern prose and poetry (Burroughs Papers n.d., Box 311). High school students also took algebra and word analysis. Teacher reports show that at the junior college level African-American history and finer womanhood were taught. The finer womanhood class covered topics such as homemaking, courtship, and marriage (Burroughs Papers n.d., Box 311).

Burroughs was a stern disciplinarian. When students violated rules they were brought before Burroughs and her staff to be rebuked. If the nature of the offense called for sterner actions, the student would be expelled from the school. When students were dismissed from the school, Ms. Burroughs would dismiss them with her well known farewell, "The arch is open, the trains are running, and God bless you." Teachers were not exempt from rules either. If they did not abstain from things such as drinking and smoking they were dismissed at the end of the school year. Burroughs sought "the highest development of Christian Womanhood" (Synott 1994, 126).

The school's code held teachers to a high standard of ethics. When dealing with students, teachers were always required to be impartial, professional, and just. The teachers were required to study, participate in educational associations, and subscribe to at least one educational journal. They were to never criticize a superior or fellow teacher when not in the presence of the accused. And even then, only constructive criticism was allowed. All such criticizing was kept confidential (Burroughs Papers n.d., Box 311). Burroughs did not want the school or its staff to develop a bad name over bickering.

Teachers were to come on time to meetings or not at all (Burroughs Papers n.d., Box 311). Each of these meetings was opened with prayer. Along with telling the teachers what not to do, she wrote a set of procedures telling them how to use good teaching methods. Teachers were to plan field trips, roundtable and panel discussions, various types of pupil reporting (such as oral presentations, two-way conversations, and dramatic expressions), and interviews as well as guest speakers (Burroughs Papers n.d., Box 311). All of the teachers were college graduates and highly respected. As Dr. Carter G. Woodson stated, "In Miss Burroughs school the instructors teach the students- actually educate them by bringing out into action the powers of the mind" (Burroughs Papers n.d., Box 318).

Believing very much in helping the less fortunate, Burroughs had a stem desire to help her needy students. If students could not afford the full cost of tuition, they were granted work study. In addition to the work study programs offered, Burroughs would allow parents to pay a portion of the school bill in vegetables, meat, lard, and eggs. Students who had no relatives were allowed to become a permanent part of the school family. Ms. Burroughs always demonstrated the skills she wanted her students to develop.

Burroughs aimed to promote an "atmosphere conducive to the development of real Christian Womanhood." If the student body had no pride, she believed, the school and buildings would suffer. All teachers and students were expected to attend social events held at the school (Burroughs Papers n.d., Box 311). It was absolutely necessary that all students living on campus kept "perfect rooms." If teachers wished to hold friendly conversations beyond the 30-minute dinner period, they were instructed to do so when it did not conflict with the school's schedule. Burroughs felt that "the theme of all educational programs is character building- - every true teacher's problem" (Burroughs Papers
Desks, floors, and walls had to be kept perfectly clean, remembering that "Cleanliness is next to Godliness." Time between classes was to be used as study time. Personal appearance had to be good at all times. Talking too much was frowned upon. When in the dining hall, the young ladies could only talk to those seated at their tables. They were not to lean on the tables. Only one person from a table could raise her hand for a waitress. Even in the dormitories, the students had to remain quiet and orderly. They were not allowed to move furniture around in their rooms and could not visit other rooms in their dorms or other dormitories without permission (Burroughs Papers n.d., Box 312).

She believed that four major things were needed to make the school work. These were faith, work, time, and money. Burroughs had great faith in God and was willing to work hard. Time was in God's hands. Money was in the people's hands. Nannie Burroughs, with her faith in God, her self-determination, and her willingness to work, plunged in to do the impossible (McCluskey 1989, 9). She let nothing stop her. In her mind, "It is not evidence of Christianity to have people mock you and spit on you and defeat the future of your children. It is a mark of cowardice" (Higginbotham 1993, 205).

Burroughs met many obstacles and overcame all of them. When there was not enough room for the students to sleep, she rehabilitated the barn to give them places to lay their heads. When classroom space was needed, she cleaned out other parts of the barn to make room. When the water pipes were broken and there was no money to get them fixed, Burroughs walked down to a well at the foot of the hill with tubs and buckets to get water. She filled them with water, carried them to the top of the hill, then to the third floor of one of the buildings, and filled up the water tank. She did the same when they needed heat one winter. The hill on which the school was located became too icy to drive up so the delivery man bringing the coal dumped it at the foot of the hill. Ms. Burroughs went to the foot of the hill and brought the coal up in buckets. Whenever anything was needed, Burroughs was willing to do what had to be done. Because of her contributions and those of her faithful supporters, her school had nine buildings, two brick and seven frame, all of which were debt free. The school, which was purchased for $6,000 and had one building, was worth more than one half million dollars by the time Burroughs' had completed her work (Harrison 1956, 13).

She expected the same diligence and hard work from her staff. "When I give people something to do, I let them do it, and when I find out they can't do it, I let them go." When she did not do this, the school "is hurt, damaged, destroyed, defeated by petty, selfish, weak, lazy teachers" (Burroughs Papers n.d., Box 46).

Graduates of this school were employed in nearly every state, and also in such places as Puerto Rico, Haiti, South America, and Africa. They were employed as teachers, principals, nurses, doctors, civil servants, church workers, entrepreneurs, administrators, and, of course, missionaries.

In her treatment of her teachers and students, Burroughs could be seen as controlling and almost as a tyrant. She definitely possessed perfectionists characteristics. The students had no choice but to graduate with high standing. The school climate was dogmatic and regimented. Many students were refused admission to the school because of unsatisfactory grades. Preference for admission was given to women who wanted training in Christian leadership (Burroughs Papers n.d., Box 163). Criticism of the school by teachers as well as others was viewed by Burroughs as unprofessional. In her own words, "it shows a lack- a woeful lack of standards, of principles, of ethics. . . . This [the school] is no place for anybody who is not mentally, morally, and socially fit" (Burroughs Papers n.d., Box 46).

Financial woes were a constant visitor to the school. Once the school had to be shut down for three years. During the Depression, the school only opened during the spring, summer, and fall months. Junior high, high school, and junior college students would spend three winter months at home. This helped to cut cost by fifty percent. A new department at the school, the children's department, remained open year round. Burroughs thought it was better to open the school in the spring and remain open than to open in the winter and be forced to shut down because of a lack of funds. A group known as "The National Training School Pageant Players" traveled the country to 're-sell' the school and its ideals. They began a nationwide campaign for new contributors, food, and coupons. They also published literary materials to arouse interest in the school (Burroughs Papers n.d., Box 46).

All an all, Nannie Helen Burroughs presided over her school with what she referred to as "twelve keys to God's Resources." These twelve keys were knowledge, faith, prayer, obedience, determination, faithfulness, hope,
patience, good works, golden rule, love, and joy (Burroughs Papers n.d., Box 46). Her knowledge provided her the ability to run the school effectively. Her faith allowed her to see her mission through even when she did not know how things would turn out. Her determination to provide a good school for African-American women and girls and her faithfulness to the mission played a part in the school's tremendous success. Her hope, patience, and good works brought about many supporters. She taught the Golden rule and she exhibited love and joy.

Throughout her life, Nannie Helen Burroughs held strongly to her faith in God and did what she could to help those who were less fortunate than she. She served as secretary of the Women's Convention Auxiliary for twenty years and then served as president of the Woman's Convention Auxiliary to the National Baptist Convention, Incorporated. Her most noteworthy contribution was her founding of the National Training School for Women and Girls, Inc. in Washington, D.C., where she served as president.

Ms. Nannie Helen Burroughs died of natural causes on May 20, 1961. In 1964 the school received its third name. The Board of Trustees, as a memorial tribute, re-named the school "The Nannie Helen Burroughs School, Incorporated."

Johann Heinrich Pestalozzi (1746-1827) was a Swiss educational reformer. Strongly influenced by Jean-Jacques Rousseau's philosophy of naturalism, Pestalozzi used concepts of Rousseau and modified them into a philosophy of education. He believed it best to teach the child by the nature of things themselves, not with words. The child should himself learn to see, hear, find, stumble or be mistaken. Nature teaches the child better than men.

In his numerous writings Pestalozzi explained his understanding of the concepts of God, nature and education. He defined man as a moral, intellectual, and physical being with innate potentialities. Education should draw out these inherent powers and develop abilities through activity. His method of natural education (development of head, heart, and body) is based on the principle of "Anschauung," translated as observation, sense perception, and sense impression. It is defined as face-to-face experience of the realities of the universe and can be summed up as "things before words," "concrete before abstract," or "concept formation."

Pestalozzi's philosophy is based on "Lebenskreise" (Spheres of Life), three exterior and one interior, rooted in a firm focal point, namely God. The spheres describe man's existence, going through several developmental stages, revealing the interrelationships of man within his world.

Pestalozzi begins with the concepts of Love and the Good. As did Rousseau, he claimed that human nature is good. Man is the work of nature that God had given as creator of the universe. Therefore, nature and everything that is natural is good. Driven by his needs man finds his way to this truth in the innermost of his nature (Pestalozzi 1927-77). Nature forms the child as an indivisible whole, as a vital organic unity with many-sided inherent moral, intellectual, and physical faculties. Where nature has influence on the child, she develops the child’s heart, intellect, and body into a harmonious unity.

Pestalozzi often drew an analogy between a child’s development and that of the natural growth of a plant or an animal. Pestalozzi saw the new-born child as a seed which already contained the essence of the child’s intelligence and personality. All faculties unfold during a child’s life time. The individual and separate organs of the child form gradually into unison, and build up humanity in the image of God. In line with this concept of the laws of nature, Pestalozzi defined education as the natural, progressive, and harmonious development of all the powers and faculties of humans. The child acquires knowledge if it is subjected to a certain order of succession. The unfolding of the child’s powers and their progress are kept parallel to his development.

Pestalozzi modified and extended Rousseau’s educational philosophy by urging the education of all children, regardless of their circumstances and abilities, he was a steadfast advocate of universal education. Pestalozzi’s contention was that poverty could be relieved and society reformed only by the intellectual and moral development of all people.

The three exterior spheres begin with the sphere of “Home and Family.” Pestalozzi was convinced that a child’s education starts at birth. From the beginning, every day in a child’s life and every source of influence play a part in forming character and personality. In the cradle the child hears its mother’s voice and enjoys an emotionally secure environment created by the mother as she speaks to the child while nursing, feeding and dressing him. The atmosphere of love creates a lasting impression on the child. Pestalozzi stressed the power of love in education. The child’s loving relationship with the mother provides a climate of emotional security. If a child is given love and care by his mother, it will grow into a person capable of giving and receiving love. Pestalozzi explained: “The new-born learns from the mother. She develops love and gratitude in the child. The domestic life is the climate of modeling virtues and moral values” (Pestalozzi n.d.).

In the home, equal development of all the human faculties can be directed and assured. Pestalozzi valued the home as a model of all education, the only place where a child can live a complete life, a microcosm of the larger social world outside. The family is the center of society, education starts in the home, and the mother is the child’s first teacher. Educational efforts must be conducted within the sphere of “Home and Family” and radiate to the needs...
and desires of the people in society. External human knowledge, power, and motive have to coincide with the internal essence of our nature.

Gertrude, the heroine of Pestalozzi’s novel *Leonardo and Gertrude*, is the ideal example of how to teach children by providing a secure and loving home environment. The children contributed to the family’s living by spinning and gardening. Education, however, does not imply working and making a living alone. Gertrude nurtured the powers of the children’s heart so that they could grow in independence and individuality. Pestalozzi’s idea and aim of elementary education were human salvation from evil. According to Pestalozzi, nature does not give birth to any evil. Everything that comes out of her is essentially good in the sense of innocence. Man leaves the state of contentment in which he achieved satisfaction of his desires without special effort and develops into a barbarian who asserts his will. The regeneration of the home and the family will have an impact on education, on society, and on a better world structure. Nature, the mother’s devotion, and the domestic surroundings are the components to incite and impel, direct and guide the child towards a natural and solid development. In the home, the foundation is laid upon which education in the school must be built.

The second sphere of “Vocation and Individual Self-Determination,” indicates individuality and inherent force of human character. The basis for education, according to Pestalozzi, is the individuality of man with his natural provided dispositions within his special condition. Unique by nature, man still can choose to mold his individuality. Pestalozzi declared: “You don’t live for yourself on this earth. Therefore nature educates you also for and by external circumstances” (Pestalozzi 1946-71). This educational process by external conditions or relations implies knowledge and experience within them and will radiate into the next conditions or spheres, already having experienced perseverance.

The starting point is to take the individuality of each single child and to cultivate it. The basis for natural development of all the needs lie in the faculties of the individual child that ought to be educated for a life within his sphere, as Pestalozzi pointed out: “View point of life, self-determination of man, you are the book of nature. In you lie strength and order of this wise leader. All education which is not built upon her foundation leads to error” (Pestalozzi n.d.).

Pestalozzi rejected a school system that focused on knowledge acquisition. He was disgusted by memorization and any one-sided method of instruction. Pestalozzi believed such schooling could never be natural because it is almost impossible for the teacher to meet the individual needs of the pupils. Pestalozzi called for a teaching method based on “Anschauung,” observation or sense-impression. The sphere of “Home and Family” expands and radiates into the sphere of “Vocation and Self-determination.” The individual child, while still being rooted in the sphere of “Home and Family,” can now participate in a larger sphere. The child develops his individuality. He grows in independence and takes responsibility within the society and becomes educated.

Pestalozzi always kept in mind the role of society as part of the individual’s environment. He felt strongly that education must support “Individualbestimmung,” individual self-determination. Gerd-Bodo summarized: “Vocational training should be subordinate to the goal of man’s character development. Each person possesses natural characteristics, unique to that person” (Gerd-Bodo 1984).

The principle of head, heart, and hands has priority over particular vocational education. With these ideas, Pestalozzi criticized society because schooling at that time did not respect individual education but was focused on discipline and memorization.

In the third exterior Sphere of “State and Nation” Pestalozzi expanded the parent-child relationship to the community, to the state and the nation, to society as a whole. His model combined domestic life and the world with God as the creator. Pestalozzi believed that a common faith as children of God would guarantee stabilization of the government. The blessings with which God endowed the sphere of the home influences not only the child’s education, but society in general. Pestalozzi declaimed: “Therefore, home, you are the basis for natural education. Home, you are the school of ethics and the school of the government” (Pestalozzi n.d.).

Pestalozzi called for a tolerant humanity. He believed in a social structure where the poor as well as the rich would enjoy respect, equal rights, and dignity. Every human ought to be treated with dignity. The ills of society ought to be remedied by educating each individual morally, intellectually, and physically.
Pestalozzi developed the character of squire Amer in *Leonard and Gertrude*. Amer, open-minded and helpful, having already become suspicious of the deceitful inn keeper and bailiff Hummel, listened to Gertrude’s complaint. With help of the pastor, Amer was able to remove the misery that Hummel and his complices spread over the village. He then established a new order in the village for social and moral improvement.

The interior sphere is described as “Inner Sense.” Pestalozzi called the inner sense of man “Seelengefuge,” the structure of the soul. Pestalozzi believed that the inner sense had a directing function. The inner sense is a safe guide for truth and duty.

Man must be educated to acquire an inner peace. This peace can be successfully found through the satisfaction of natural needs, drives, and prosperity. It leads to great joy. Inner peace is the way to truth by which man rightly operates (Spranger 1947).

Pestalozzi made a distinction between natural and artificial needs. Pestalozzi saw natural development in the process of the realization of truth. Inner peace is obtained by engaging in modest behavior and believing in and living with God, a goal to which man should aspire.

Pestalozzi’s focal point within the spheres of life is “God.” The closest relationship man possibly can have is with God who alone is able to understand the innermost part of a human being. The inner sense of man is able to seek and to find God’s very existence. Pestalozzi defined God as being the only one who is capable of handling any extraordinary life situation. God, then, becomes projected in every good person. The good exists in human nature. Pestalozzi with his humanistic concept equalized God and man in nature and identity. Man did not, according to Pestalozzi’s philosophy, inherit original sin but is essentially good.

Pestalozzi saw religion and faith in God as pre-suppositions for education (God - mother). The principle of a close relationship (mother - child) reappears in the personal and intimate climate between teacher and child. He emphasized body contact, communication, and personal encouragement. Pestalozzi was convinced that deeply rooted religious faith in a man’s heart was the basis of man’s very humanity. He took the Bible as a book of instruction with models to be imitated and followed.

The home and domestic life are the starting point of the “Lebenskreise,” the “Spheres of Life.” It radiates to the sphere of vocation, individual self-determination, and thirdly, flows into the sphere of society as a whole and then to the nation or the state. The nation or the state influences the home and family, vocation, and self-determination, and vice versa. There is a reciprocity between the spheres, an intermingling; the center, however, is the steadfast God who leads through the developmental stages. Without God or without faith, it is impossible to create an atmosphere of a loving home or to build and run a just and effective government. The intermingling of the spheres correlates to the ups and downs with times of inner peace or emotional turbulence in each persons life. Yet all the spheres are centered around God who is Love itself.

Pestalozzi’s spheres of life represented the framework of his philosophy. He stimulated educational theory and practice and his principles have been absorbed into modern elementary education in many countries.

Konnarock: A School Whose Spirit Lives On

James E. Gay
Robert Young
University of Dayton

Every year a number of people gather in Konnarock, a small village in a remote mountainous region of southwest Virginia, to attend a reunion of alumnae of a small private boarding school called Konnarock Training School. The school permanently closed its doors almost forty years ago. Modern highways made it possible for children of the area to attend the public schools.

The building that once housed Konnarock Training School is still standing, empty for years and in bad need of repair. It will probably never be used again, and someday will fall victim to the wrecking ball. But the spirit that characterizes the annual gathering of Konnarock alumnae is in no way similar to the state of the school's decaying physical plant. On the contrary, the loyalty, allegiance, and love for Konnarock Training School exist as strongly today among the alumnae, all now elderly, as they do for the most recent graduates of any school anywhere.

What makes this flame burn so brightly, years after the enterprise that fueled it ceased to exist? The answer to that question provides an insight into what people believe is important; how people are products of their environment; why "home" can be anywhere one finds or creates it, even in a school; and how profoundly a school can shape the lives, character, and personalities of its students.

Konnarock Training School (KTS) was founded in December 1924 by the Women's Missionary Society of the United Lutheran Church in America as a girls' elementary school. Its purpose, stated by its first principal, was "to minister to the spiritual, mental, and physical needs of the children of the Appalachian mountains" (Morehead 1925a). The school opened in a rented building with nine girls in Smyth County near Whetstop Mountain and Mount Rogers. North Carolina and Tennessee are only a few miles away. Marion, Virginia, is 25 miles north and Bristol, Virginia/Tennessee, is 48 miles west. These distances seem short today, but at the time these cities must have seemed light years away. One had to cross a mountain to enter or leave the region, on dirt roads difficult in summer and impassable in winter.

It was instantly obvious that the demand for this kind of school was overwhelming. Before the first class was held, there was a waiting list of 30 applicants. A decision was made to build a new building, and the year 1925 was one of furious activity. The president of the local lumber company donated 225 acres of land and personally supervised the construction of a building that was both school and living quarters for 35 boarding students. A 200 seat chapel, barn, garage, and chicken houses were also built that summer. Funding came from the sale of shares (Morehead 1925b), from the Inner Mission Board, the Women's Missionary Society and other church groups, and private donations (Morehead 1926).

One year after the first nine students enrolled, KTS opened its new building to students from five states: Virginia, North Carolina, Tennessee, West Virginia, and Kentucky. KTS also served as a public elementary day school for the Konnarock community, and thus came under the jurisdiction of the Virginia state board of education. The school focused on teaching the girls home economics -- cooking, cleaning, sewing, gardening, child care, and health -- along with academic subjects.

First enrollment figures in 1927 show that KTS had 30 resident students, all girls, ages 12 to 20, and 40 day students from the Konnarock community, both boys and girls. Twelve of the students attended high school in Konnarock (Cox 1927, 27-8). In January 1928, there were 35 boarding students, nine in high school, the rest in grammar school. There were also 60 day students -- 36 boys, 24 girls (Cox 1928, 24-5).

Prior to 1924, lumbering was the dominant industry in the region. Small farms dotted the area, most of which were capable only of growing food for the families. Because of its location and religious affiliation, the school was appropriately characterized as a "mountain mission school." Not surprisingly, religion was a part of the core curriculum for the boarding students. Many people in the area came from Baptist and fundamentalist backgrounds and were distrustful of "outside" religions. Thus, although KTS was founded and largely funded by Lutheran interests, the staff at Konnarock took great care in their religious work to not to offend the people of the region.
The poverty of the region served by KTS was so severe and widespread that the school founders soon waived most student financial requirements. Most of the continuing financial support came from the Women's Missionary Society, with additional support from the Smyth County School Board. Other income came from tuition (those few who could afford to pay), sales of clothing made by the girls, and gifts from various Lutheran organizations.

Poverty affected all aspects of everyday living. Housing was primitive, and a lack of sanitation facilities had predictable side effects: poor personal hygiene, dental and tonsil problems, colds and flu so chronic that they were thought of as normal, premature aging, and epidemics of typhoid and scarlet fever.

Many homes were little more than one or two room wood shacks with cracks in the floors, holes in the walls, leaks in the roofs, and doors that did not keep the heat in or the cold out. Water and sewer systems did not exist. Most homes had no electricity and were heated by the kitchen stove (Hatcher 1930,15-7).

The existing road system was built primarily to serve the lumber industry and only incidentally for the homes in the area. Many homes had no direct access to a road, and residents had to walk paths along creek banks, fields, and woods to reach a road. Many KTS day students walked several miles a day to school.

A secondary feature of the region was a general lack of education among the population. Most parents had a fourth or fifth grade education at best, and some had none at all. Children attended school not because of any perceived intrinsic value of education but rather because that was what children did. The few public schools in the region were small, offered only a partial school year of six months or less, and were staffed by uncertified and unqualified teachers. Many of them were one room schools in which all grades were taught.

Early marriages were another by-product of this environment. It was not unusual for a girl to marry in her early teens. These marriages reflected the pattern of their parents' marriages. Farming alone could not support a family, and men took jobs at local lumber companies and as truck drivers, miners, and general laborers. Many jobs required the men to be absent for long periods, creating a de facto single-parent family environment.

Birth control was either not available or practiced, and average family size was 7.3 children, often with a mother not yet turned thirty. With large families and absentee fathers, the mother did the domestic work of cooking, washing, sewing, ironing, and child care, and the outside work of working in the fields, milking cows, chopping wood, carrying water, maintaining a garden for food, and feeding the pigs and chickens. Children were expected to work, and older children took care of the younger ones.

With so many demands placed on them, mothers were hard put to give each child the individual attention that every child needs to develop assurance and self-esteem. Close observations of family life and chronicles describing the time and region reveal that mothers took little pride and often little interest in their children's school activities. Sometimes, mothers invited to KTS for recitals or convocations paid little attention to their children's presentations. Parent teacher meetings were met with indifference or simply a lack of understanding on the part of the parents. This was the general environment in which Konnarock Training School was founded (Hatcher 1930,18-20).

The contrasts of life at home and life at Konnarock Training School were many and all pervasive. The basic need of housing took on new dimensions for a student entering KTS. The main building was a solidly built three-story frame structure with large, well lighted rooms, indoor bathrooms, electricity, central heating, and a fire protection system. It housed dormitory rooms, classrooms, and two home economics laboratories, one for sewing and craft work, one for cooking. The school library contained about 1500 volumes and subscribed to magazines and a daily newspaper. The chapel boasted a pipe organ, two pianos, and a violin.

The highly productive school farm deserves special mention. Boys worked on the farm, and girls processed the farm produce. From the gardens came fresh fruits and vegetables in season, many of which were canned or preserved for winter consumption, and apples and potatoes for an entire year. Poultry was raised for both meat and eggs. Any surplus was marketed locally. Hay, oats, and soy beans were cultivated to support a small dairy herd that provided milk for the students and staff (Hatcher 1930,6).

The school served both as a private boarding school and a public elementary school. The latter had to meet the requirements of the state board of education, and teachers were paid by the county board of education. The faculty and staff were comprised of a staff of nine, plus a farm laborer. All were qualified for their positions, and certified where required. The principal had a bachelor's degree from the College of William and Mary, the home
The economics teacher was a graduate of Simmons College, and other classroom teachers held professional certificates. The school nurse was a Registered Nurse and a graduate of the Richmond School of Social Work and Public Health. The Supervisor of Farm Activities, although not a college graduate, practiced scientific farming methods.

When KTS girls reached high school age, they attended Konnarock High School in adjacent Washington County, along with boys from Iron Mountain School For Boys, another Lutheran sponsored boarding school. The two groups from the Lutheran schools made up approximately 50% of the total enrollment of this public high school (Virginia Final Annual High School Report 1939). Washington County charged $4 per month for every boarding school pupil. These fees came out of the Lutheran school budgets, and the school's principal addressed a plea for contributions for that purpose (Umbarger, 1929,504-6).

The teacher/student relationship at KTS was markedly different from other schools in that some of the staff lived with the girls in the main building, dormitory style. Although they had lived and had been educated elsewhere, four of the teachers from start to end of term became part of the isolated environment in which the girls had lived all their lives. The association was mutually beneficial; its closeness enhanced the homelike environment for the girls and helped the teachers see the world through the eyes of their students.

The four teachers from the local area were paid by the Smyth County Board of Education. These teachers found boarding accommodations locally, and thus were aware of how the local adult population viewed the school's attempts to teach the students. Additionally, when the local county authorities were not able to provide care for some children, they petitioned KTS to take them (Morehead 1926,73-4).

The school curriculum was general enough to provide a basic education, and specific enough to meet the community's particular needs. English, mathematics, science, history, and writing made up the academic part of the curriculum. The subject matter had both depth and thoroughness. English included sections in reading, spelling, composition, grammar, literature, dramatics, and debating. Science included geography and physiology, as well as general science. Mathematics included arithmetic to prepare students for high school algebra.

Religious education and character building went hand in hand with academics (Hatcher 1930,125-9). A daily chapel service and Sunday School were offered. Older girls taught Sunday School after they completed the necessary training. A more formal church service, "preaching," was held when itinerant ministers, mission workers, or students attending theological seminars were available. Special religious services were held at Easter, Thanksgiving, and Christmas. Vacation Bible Schools were held, often with the older pupils teaching the younger children. Two religious organizations were in place: the Light Brigade for younger pupils, and the Luther League for older ones (Umbarger 1930,305-10).

No pupil can engage in such activities without getting the feeling of doing something useful, with its attendant rewards. Small wonder that pupils at KTS developed strong emotional ties to the school. The school was a godsend to the impoverished region. If it did nothing more than what it had originally set out to do, it would have accomplished its purpose, but with the principles put into place, the character and identity of Konnarock Training School was shaped until it closed its doors in 1959 (Umbarger 1930,307-8).

What did Konnarock do for its students? For children from impoverished homes with bleak outlooks for a better future and with little understanding of the world outside their mountains, KTS provided them an opportunity to be somebody and an environment in which that could happen. It gave them a life.

How do KTS graduates feel about their school? Why do they return to Konnarock each year to rejoin their fellow students? What are their thoughts and their feelings? For answers to these questions, the authors consulted publications (Tannen 1995) and the alumnae themselves.

A student from 1934-1942 said, "Konnarock was not just a school for me. It was a community of girls and teachers who had fun, shared life experiences, and became friends and family. KTS in a very large way contributed to what I am doing today."

Another added, "I was at Konnarock for six years, and oh! it was the most wonderful place! A lot of girls got an education that they wouldn't have otherwise. We came from all over the mountains and none of us had much money. You can guess what a treat it was to have some comforts."

Konnarock Training School had a truly remarkable history. It represented an effort in which a religious
institution cooperated with two county boards of education to enable a significant number of children to obtain an education that would have been denied them otherwise. It provided faculty members, whose dedication to students is exemplified by their decision to live with the students during the school term. KTS provided religious services for the community twice a month, and presented religion in such a manner that members of other denominations worshipped together with their Lutheran brothers and sisters.

Although those in authority might have believed that the success of KTS resulted from the type of curriculum and the school organization, the authors believe that there is more to the picture of why the school was so successful as seen by its students. The students perceived that the institution nurtured them because the teachers cared for them and believed that every student had the potential to grow in the spiritual, physical, emotional and academic domains. Those who were in contact with the students were perceived as living examples of the second great commandment of Christianity as stated in the book of Matthew -- to love your neighbor as yourself.

Social Constructions that Influenced the Education of the Blind

Ronald Ferguson
Ball State University

The perceptions the general public has held about blindness and blind persons have gone a long way in constructing a mendacious view of their abilities and worth. Possibly the most oppressive burden of blindness is not blindness itself but, as Helen Keller wrote, “The attitude of the seeing to the blind is the hardest to bear” (Platt 1950, 57). The condescending attitudes she is referring to are largely formed from generations of myths and misconceptions about blindness. “Policy archaeology” (Scheurich 1994) maintains and this paper supports the belief that the sighted population’s attitudes toward the blind are socially constructed (Ferguson 1995, 34 - 43). The purpose of this paper is to apply the analytic methodology of policy archaeology to identify some of the significant forces and ideas of the past three millennia which have influenced educational policy related to the blind, specifically the establishment of residential schools for the blind in the nineteenth century. This paper will begin with a brief description of policy archaeology, followed by an historical overview of some of the beliefs that have shaped the public’s perception of the blind. The final section will illustrate how misconceptions of blindness influenced the school promoters in their establishment of residential schools.

A recent development in policy studies which provides a very useful framework for examining the history of the blind is "policy archaeology," which is a methodology for analyzing educational and social policy. In his article "Policy Archaeology: A New Policy Studies Methodology," James Scheurich argues that this methodology goes beyond traditional and postpositivist policy analysts' frameworks, which are restrictive because they "accept or presume a commitment to the larger liberal world view in which they exist" (Scheurich 1994, 299). In contrast, this new methodology provides "a radically different approach to policy studies in virtually all its aspects, including definitions of problems and problem groups, discussions of policies and policy alternatives, and presumptions about the function of policy studies within the larger social order" (299). Accordingly, policy archaeology is well suited to the investigation of the role of the marginalized voice of the organized blind.

For the purpose of analytical investigation, policy archaeology can be divided into four arenas. In arena I, the education/social problem arena, the focus is on the study of the social construction of specific education and social problems. The basic assumption that a certain social problem is an empirical given or is a natural consequence is questioned. Arena II identifies the network or grid of social regularities across education and social problem. These grids define the parameters from which acceptable policy choices are drawn. Arenas I and II are the focus of this paper. The next arena concentrates on the study of the social construction of the range of acceptable policy solutions. Consideration is given to how the grid of regularities sets the boundaries or context for policy solutions. The final arena, arena IV, is concerned with the study of the social functions of policy studies itself. This is done by examining the function of traditional and postpositivist policy studies within the larger social order.

On careful examination it becomes evident that many of the beliefs about the blind are misconceptions. Unfortunately, these misconceptions are reinforced in all types of literature and research related to the blind. Michael Monbeck, in a widely circulated book in the blindness field, The Meaning of Blindness (1973), wrote that “while the treatment of blind people has historically changed somewhat, beliefs about blindness and blind people have shown very little significant alteration over the last several thousand years” (Monbeck 1973, 24). Therefore, it is essential to give careful consideration to the study of the social construction of specific educational and social problems underpinning educational policies for the blind.

From ancient times some of the prevailing notions of the blind included perceptions that they were a useless burden to society, miserable due to their loss of sight, and worthy of disdain because it was believed that the blindness was the result of some punishment for a misdeed (Lowenfeld 1975, 22, 23). For example, Friedlander and Wissowa describe the daily existence of the blind in ancient Rome as miserable beggars often accompanied by a dog and existing on the discarded scraps from those who took pity on their plight. According to the writers, “Their refuge may have been an open shelter...[t]heir food may have been dog food, their only possession a staff, a cover or mat, and a knapsack, and their only deliverance death in a lonely corner” (22). Given this perception, some questioned the...
prudence of showing any benevolence to the blind since the "aim was to exterminate physically defective individuals, among them the blind . . . (23). In keeping with the thought of the time "[t]o give food and drink to such an unlucky person is a double evil. You lose what you give and only lengthen the misery of the receiver" (23). With this type of exhortation it is easy to see that "blindness was looked upon as the worst misfortune that could befall a man . . ." (23).

For over three thousand years sighted people's responses to the blind can be broadly identified by three categories—pity, sin, and myth. Each of these has influenced, in a pejorative way, the understanding of disability as it relates to the blind. One of the most insidious notions about the blind is that they are to be pitied because of their disability. The widespread feeling of sorrow for those who are perceived to be helpless and hopeless seems to be the consequence of a variety of misconceived ideas regarding the blind. One of these ideas is that the sighted have assumed they must provide custodial care for the blind because the blind are not capable of managing their own lives. Two common sources of this notion of pity came from religious beliefs and low expectations of the blind's capabilities.

Pity, inspired by religious sympathy, was a popular theme in the writings of Richard French, Michael Monbeck, and Barthold Lowenfeld, three influential figures in the blindness field. French highlighted the benevolent efforts of the early church to care for the blind. Monbeck explored how various religious writings have inspired feelings of pity. Monbeck drew on the Bible, Koran, Talmud and Midrash to support his "idea that blind people are particularly deserving of pity and sympathy" (Monbeck 1973, 26), because blindness was described as the "worst of infirmities" and "the greatest evil" (French 1932, 36). Thus, the afflicted are to be pitied because, "The blind man is as one dead" (Monbeck 1973, 28, 29).

Another perception of the blind is that they are blind for a reason, somehow deserving the tragedy that has visited them. Chevigny wrote in his autobiography My Eyes Have a Cold Nose, that: "With variations in circumstances and time . . . every man who suffers a calamity of the objectively tragic quality of blindness finds himself, like Job, surrounded by people who, in effect, debate with him on the nature of the evil which has befallen him" (48, 49). There are numerous passages in the Bible which could influence one to associate blindness with punishment for sin, giving rise to the belief that blindness is a punishment. The Pentateuch contains many instances of God warning the Hebrews through the prophet Moses that the guilty will not go unpunished. In giving the Ten Commandments Moses wrote that God "does not leave the guilty unpunished; he punishes the children and their children for the sin of the fathers to the third and fourth generation." Thus, blindness in children or grandchildren could be interpreted to be a punishment as a consequence for some sin of the fathers. A New Testament passage which deals directly with the issue of blindness as a consequence of sin is in St. John's Gospel. While walking with Jesus, his disciples noticed a blind beggar who was blind from birth. They asked Jesus, "Who sinned, this man or his parents, that he was born blind?" The response from Jesus was, "Neither this man nor his parents sinned but this happened so that the work of God might be displayed in his life." This passage is quite interesting because it goes on to describe a conflict that was occurring between Jesus and the Pharisees. They were upset over the healing of this blind man on a Sabbath. The Pharisees questioned the man who was healed and the formerly blind man turned the tables, in that he was instructing the Pharisees regarding religious teaching. This further upset the Pharisees. "To this they replied, 'You were steeped in sin at birth; how dare you lecture us!' And they threw him out." What is interesting is that while Jesus refuted the idea that blindness was a punishment, the Pharisees reinforced the notion.

Myth is a third category which has been a source of damaging notions about the blind. These myths powerfully influence the sighted to view blindness as a disability. Jessica Langworthy has researched the portrayal of the blind in works of fiction. She concluded, "No matter what the blind person's talents or lack of them are, all that he does, whether good or ill, is a result, in the minds of most people of his handicap" (Langworthy 1930, 270). Blindness is a very powerful identifying characteristic. Identity equals blindness much as identity equals gender. Some of the myths of blindness she discussed are that the blind are in darkness, they are miserable, helpless, useless, maladjusted, and compensated for their blindness.

The myth of blindness as darkness is a construction by the sighted population. The only relationship the sighted have with blindness is to close their eyes or stand in a darkened room. The sensation they experience is one
of darkness; therefore they impose their perception on the blind and assume all they experience is darkness. In reality, a totally blind person sees nothing—the absence of any sensory stimuli. Nevertheless, the perception that the blind live in darkness creates all types of unfortunate misconceptions due to the sighted person's fears of darkness and the negative connotations associated with the dark.

The sixteenth century Dutch painter Pieter Breughel (c.1520-1569) vividly communicated the message that the blind grope helplessly in darkness. One of his paintings titled "The Parable of the Blind Leading the Blind," depicts six blind men walking in a line, each with one hand resting on the shoulder of the man in front of him. The lead man falls at the edge of a creek with the second one falling on top of him and the others poised to fall like dominoes. Also of note is that the blind are painted without eyes, only empty sockets. The message of the picture summarizes the feelings of the sighted about the abilities of the blind.

Another powerful myth about blindness is that their disability causes them to be miserable. This theme has woven its way through literature, poetry and music for centuries. John Bunyan (1628-1688) described a blind child in Grace Abounding. He wrote, "Poor child, thought I, what sorrow art thou like to have for thy portion in this world! Thou must be beaten, must beg, suffer hunger, cold, nakedness, and a thousand calamities, though I cannot now endure that the wind should blow upon thee" (Merry 1933, 19). Best echoed this attitude, as he lamented their misfortune. He concluded, "In the mere absence of the sense of vision, there results to a human being a deprivation to which few if any other earthly ills are to be likened" (Best 1934, 289). This perception of misery is one of the central assumptions humanitarians, social reformers, policy analysts and organizations for the blind have about the blind.

Maybe the most grievous and detrimental myth about the blind is that they are perceived to be useless. Koestler wrote, "The belief that blindness equals uselessness has prevailed so long and so firmly in Western culture that its traces have yet to be fully erased" (Koestler 1976, 3). One conclusion that proceeds from the idea of the blind as useless is they must therefore be dependent on sighted people to survive. Basically the only thing a blind person can do is beg. The blind beggar is probably the most pungent picture of devastation of the disability of blindness that the sighted have constructed.

The notions of sin, pity, and myths contributed to the social construction of disability. Social reformers in the nineteenth century, influenced by this social regularity, established residential schools for blind students. Although this policy solution was not immediately endorsed by all citizens, the reasonableness of the solution did not take long to be accepted.

In the early 1830s three residential schools for the blind opened their doors to receive students--Perkins Institution and Massachusetts Asylum for the Blind, New York Institute for the Blind, and The Philadelphia Institution for the Instruction of the Blind. The directors of the first three residential schools were John. D. Russ at the New York School, Samuel G. Howe at Boston and Julius R. Friedlander in Philadelphia. Of the three Howe usually receives the most attention, possibly due to his active role in promoting residential schools in other states. The basic educational beliefs of Howe were similar to those of his friend and common school promoter Horace Mann.

Howe's educational ideas revolved around three assumptions:

Each blind child must be considered as an individual and be educated according to his interests and abilities; the curriculum of the residential school should conform as closely as possible to that of the public day schools, with added stress on music and crafts; blind students must be trained to take their places in the social and economic life of their communities (Roberts 1986, 3).

Howe valued the intellectual benefits stemming from education and believed blind students could achieve high goals. One of his biographers, Laura Richards, noted Howe's optimism about the potential of the blind. He believed that the blind should "assume and perform all the relations and duties attendant upon that age" (Richards 1935, 81). Howe went on to write, "In short, forgetting that he is blind, he should associate with his fellow-citizens, and labour with the most intelligent and virtuous of them for the promotion of the public weal" (81). It is interesting to note that French tried to temper Howe's high regard for the potential of the blind. French wrote, "Howe, in his enthusiasm, perhaps overstated the educational possibilities of the blind, drawing a rather rosy picture of their future as professors of music and teachers both of the blind and of the seeing, as well as craftsmen" (French 1932, 117, 118).
A particularly important idea of Howe's, and one that was used throughout the years to justify large expenditures to fund blind education, was that investing in the education of the blind would have economic benefits. Howe, in one of his early reports, wrote that "it should become a matter of state policy to educate the blind since nine out of ten of this class of persons if left to themselves would in some way burden the community with their support, while every one who is educated and thereby able to provide for himself is a citizen rescued from the almshouse and made a happy and useful member of society" (Gabriel 1950, 23). In his report of 1833 Howe stated that an objective of the institution was "to take from society so many deadweights and enable them to get their own livelihood: and society ought to consider any capital so invested as a sinking fund for the redemption of its charitable debt; as a provision for preventing the Blind from becoming taxes to the community" (French 1932, 117). This reflects the human capital theory which values persons provided they have an economic value to society.

Although the residential schools were to follow closely the common school curriculum, there was one significant addition to the blind schools which subtly reflected the attitude that even if blind children were given a similar education, they would still not be able to compete with the sighted when it came to employment. This feature of the residential schools was the establishment of vocational workshops which employed blind students who graduated from the school in the blind trades. All students, regardless of their academic or career goals "had to acquire skill in one craft and apprenticing in this craft was at least of equal importance with the academic learning offered" (Lowenfeld 1975, 92, 93).

With this background of the rise of residential schools, it is now important to examine how attitudes people had about blindness impacted the funding, establishment, and expectations of these schools. The first three schools for the blind in the United States were private institutions supported by individuals as well as with some state monies. A primary means of raising public support was to appeal to people's emotions. Best noted that, "[i]n the creation of the schools for the blind in America the chief appeal was to the heart. It was usually only necessary to invoke commiseration for their lot to secure the desired action" (Best 1934, 312). This is an example of the powerful influence the social regularity of disability had on the general public. Howe appealed to Americans' pride and humanitarian spirit as he conjured "the philanthropist and the patriot to assist in adding an Asylum for the Blind to the many charitable and humane establishments that ennoble and beautify our land." He went on to exhort in his first Annual Report, "Let our Hospitals, our Asylums, and our Infirmaries be cherished and venerated by us...Let these be the monuments by which our age and country shall be distinguished. They are the infallible evidence of an enlightened, refined and Christian community" (French 1932, 113).

Policy archaeology leads to a different conclusion, that this type of action was the evidence of the power of the social regularity of disability.

Prior to the incorporation of the school for the blind in Ohio, the General Assembly appointed Trustees to collect information regarding the opening of a school in Ohio. The trustees reported their findings to the Thirty-sixth General Assembly. The opening paragraph of the report stated:

It would be a waste of time, and would not be respectful to the good sense and benevolent feelings of the Legislature, to institute a process of reasoning, for the purpose of proving that it is truly a charity worthy of the philanthropist or of the enlightened legislator, to overcome, in every practicable degree, and to alleviate, by every proper means, the misfortune of those citizens who enjoy not the comfort and the profit of the glorious light of Heaven. If it is charity, heaven-born charity, to feed the hungry...it is surely charity to give light to those who are in darkness—to give the seeing eye to the blind, by furnishing those means and affording that instruction which may render feeling and hearing to admit a substitute for the seeing eye (Report. 3).

Note how the language used appealed to the emotions, and characterized the blind, although maybe unintentionally, as inferior persons.

The subtlety of these attitudes are evident in the early endeavors to educate blind children in residential schools. Howe, along with other school promoters, solicited support for residential schools by emphasizing the economic advantages it would have for society. Appealing to the ideas that we know today as the human capital theory, the promoters argued that the blind could be redeemed through training them to perform "blind jobs" (basket weaving, chair caning) and thus be able to recover much of the cost involved in their education plus eliminate the
economic burden they would become to society if they were not trained.

Like other marginalized groups the blind were viewed as less than human, and this justified the actions taken to assume control over them. Furthermore, because they were perceived to be defective their opinions were not sought.

Multiculturalism in Western Europe

Since multiculturalism has been a complex social theme, educators in the United States and Western Europe approached it differently. These differences may not be surprising in principle; however, they require attention because people seem to act as if multiculturalism exists as a universal ideological principle to guide social action. Unless these discrepancies are mediated, it is possible that multiculturalism will have the ironic effect of inhibiting social progress. This essay will present the historical underpinnings of multiculturalism in Western Europe in order to show the social problems that multiculturalism should address and the ideological framework best suited for the task.

One argument in multiculturalism stems from the field of history. Some educators assert that a substantial revision of the historical account of many countries has to be undertaken because textbooks portray an inaccurate picture of the roles that different groups played in the development of the nation. In the U.S., ideological camps are becoming well defined. Similarly, European educators ask about the historical construction of the European identity and wonder if it should be revised. They seek to establish the basic cultural traits of Western Europe and the characteristics of the Western European nation-state.

One salient aspect in the history of Western European nations has been the struggle to develop a Christian identity. The result of this long process is the reflection of one cultural and political view in such social institutions as schools and courts of law. One approach to empower minorities, practiced in the United States, is to show how they have historically contributed to the development of the country. Since many central European and Mediterranean countries have a long and important history of contact and co-existence with the Muslim and Jewish cultures, this could suggest that the transmission of European history should also undertake a similar revision.

The philosophy of enlightenment claimed to address the universal characteristics of human beings and build an institutional system that could accommodate differences among its inhabitants. This happened in the United States, a country of immigrants. Despite this historical bond, there have been many transformations in the contemporary organization of several Western European nation-states. For example, the separation between Church and State is not clear in some cases, or when it is nominally established there are still formal mechanisms of collaboration that influence many features of society.

The history of many European nation-states is characterized by the co-existence of regionally distinct religions such as Protestant and Catholic, linguistic groups such as Basque, Catalonian, and Galician in Spain, or national minority groups such as Gypsies. As a result, many countries have political organizations that recognize plurality within the nation-state. These include officially multilingual countries, or federal nation-states. Western European multiculturalism can use the cultural diversity that has existed within the nation-state as a building-block for a system that can include immigrants from non-European countries. It may require significant policy and ideological work to do so.

The basis of the current relations between Western European and non-European people can be understood by returning to the moment when Europe came into contact with the rest of the world. What was the nature of this relationship and what ideological concepts developed from it? The answers are found in colonialism and migration.

For many scholars, modern racism can be traced to eighteenth century Europe (Wieviorka 1993). Through the development of the nation-states, the colonies, and the "scientific-comparative" analysis of human groups, the hierarchical arrangement of the world's racial groups was established. Furthermore, some of the Europeans who received the benefits of the colonies viewed the exterior world as an exotic object of contemplation and consumption.

Europe has been heavily affected by migration for the last two hundred years, serving as both a departure and a destination point. After World War II, the economical development of North-Central European countries created a labor demand that could not be met by the indigenous population. Therefore, a policy framework to recruit labor from other countries was established from the 50's to the 70's (Eldering 1989). Initially, they came from Southern European countries, and later they came from Northern Africa and Turkey. First, this influx was understood as
temporary, but later they became permanent residents. This increasing number of immigrants from non-European countries is problematic. In general, there are four categories of non-European Union immigrants in European countries. First, with de-colonization many countries became hosts of large number of immigrants from their former colonies. The diverse ties that relate these migrants to their European hosts accounts for different and complex accommodation processes of each subgroup. Second, organized labor migration since the mid-sixties progressively included more North African and Turkish workers. This process lost its "original structure" in the late seventies and has evolved into generalized migration from developing countries into Europe. Third, the dissolution of the Soviet block and the economic and political problems that have developed produced a significant number of migrants and refugees into Western Europe (Carter, French, Salt 1995). Fourth, there are a number of political refugees in many European countries who have varied status and resources depending on the policies of each nation-state.

Two important questions remain: What is the situation of minority and immigrant students in Europe? What knowledge has developed in the last decades that can contribute to improve their situation? The most consistent demographical trend is urban immigration. It is crucial to contrast numbers at the national, regional and local level and in each age group to uncover the situation of target groups. While migrants in many countries may represent between 6% and 10% of the total population, in several urban areas, minorities tend to include up to one fourth of the population. Most of all, it is the current and future school-aged population that reflects the highest proportion of immigrants. For example, the total migrant population of the Netherlands is 7% while the total minority population of Amsterdam is 25%. Yet ethnic minorities probably constitute 70% of the youth population in this city (Fase 1994; Alkan 1996; Karsten 1995).

Any approach directed towards the socio-educational enhancement of minorities will have to be contextualized to the characteristics of the Western European urban settings. For the moment, European cities maintain a degree of socio-economical diversity and have a central political and social role. Although geographical stratification may exist, there is no clear picture in relation to an outer or inner city distribution of rich or poor people. In general, there have not been sufficiently large concentrations of single minority groups in specific communities to dominate the institutions of that area. Consequently, for many European researchers the urban underclass or the ethnic neighborhood are North American phenomena (Solomos and Wrench 1993).

Ethnicity is emerging as a variable in research as scholars refine the analytical tools of modern practice and break down some of the classic differences between the sociological and policy traditions of North America and Europe (Troyna 1993). Throughout the 1980s, many topics common in the United States found their way into the Western European educational arena. These include the problems of psychometric assessment for ethnic minorities, methodological concerns with second language instruction, and equality of educational opportunity in secondary education. Theoretical similarities can be explained by the academic traditions that are shared and by the great influence of North American research. Differences appear at the level of practice, which is constrained by the characteristics of the educational systems of each country. For example, some countries want to confront issues of equality of educational opportunity in secondary education and maintain the idea of different tracks, or they wish to concentrate minority students and resources in specific schools within a district.

The holistic answer to these issues is multiculturalism. In Western Europe this process involves three intertwined levels of discourse at the supra-national level, that there is a larger unit that needs to be defined. Within the nation-state, educators must acknowledge that there is historical diversity, and they must embrace the recent changes that have occurred in the composition of its society. In Europe in the early seventies, programs evolved from experimental pilot projects to the definition of topic areas to general socio-educational issues. This reflected the change in conceptualization mentioned earlier about workers becoming permanent residents.

Currently, developments in relation to ethnic minorities are at a stage where it is acknowledged that they are a part of Europe. Particularly relevant is the disappearance of internal borders, suggesting the need for a redefinition of the concept and rights of European Union citizens (Balibar 1988; Balibar 1991; King 1995). This is not simple. It requires harmonizing diverse views and combining different principles to which indigenous Europeans and first or second generation immigrants have different claims. This process has little historical precedent.

What should the principles of multiculturalism in Western Europe be? This is a complex question that deals
with many pragmatic constraints. First, there should be an ethical commitment, in what essentially is a new socio-historical reconstruction (Peters 1996). Second, social scientists have the challenge to suggest what problems should be addressed in Western Europe. Multiculturalism provides a powerful framework (Hamm 1992).

The Conflict Between Education Reformers and the Needs of Teachers

Robert J. Taggart
University of Delaware

For the last quarter-century, the most vocal and powerful educational reformers have been led by business interests in league with highly visible politicians. They have insisted that our public schools are not up to preparing American children for the future workforce to face international economic competition, and that our teachers are to blame for this. There have been repeated state initiatives to increase the accountability of teachers for student results as well as attempts to increase academic standards for students. Though there have been marginal gains in academic results, not much has really changed in the public schools. One reason for this is the lack of cooperation from the nation's teachers.

Why haven't the teachers been at the forefront of reform? There are two major reasons. First, many reformers insist that the teachers are as much the problem as the solution. For almost three decades, reformers have demanded that educators become accountable for results, implying that teachers know how to promote success in all of their students but are just too perverse to do so. Second, since legislators and many reformers believe educators are the problem, they see little reason to consult teachers as to solutions to perceived student problems. This demeans the teachers because they realize their knowledge is discounted, and angers them because they have little reason to believe reformers know much about student learning in a classroom situation. Reformers, particularly the business-led variety so prominent during the last 20 years, refuse to acknowledge the legitimacy of the teachers' culture: their ideals, needs, and motivation. The result is teachers tend to see reforms as ill-informed intrusions upon their territory by people who not only ignore their personal and professional needs, but also make their job harder and less rewarding (Biklen 1995).

The real problem is reformers and teachers do not communicate, which is caused by the reformers' failure either to understand or appreciate elementary teachers. It is ironic that reformers tend to attack current teachers, seeming to say that they are not as good as their predecessors. In fact, there is little reason to believe that noneducators have ever held elementary teachers in high esteem. This perception stems from the problems of the early teaching profession. When the public schools began their rapid growth in the 19th century, most children attended rural schools, as they did into the next century. As diaries, letters, and other written materials attest, conditions in these schools were grim. Pay was minimal, terms short, and equipment scarce. As a result, turnover was high because the only way most teachers could improve their lot was to move to another district (Fuller 1989). As late as the 1920s, rural teachers might have separate recitations for the many groups located among six or eight grades (Department of the Interior 1924). Under such conditions, relying entirely on readers or a few textbooks, teachers could do little more than drill students. As Barbara Finkelstein noted, less than one percent of the 1,000 teachers she reviewed attempted to explain the content to students or clarify ideas (Cuban 1984).

Elementary teachers have also had an unpleasant image as grim moralizers who uphold authority. As Cyrus Pierce, initial principal of Lexington Normal School, stated, the ideal teacher must have perfect self-control, mildness, a sense of moral responsibility, a “well” of obedience, and submission to her betters (Grumet 1988). The model teacher would serve as an antidote to the brutal competitive world of Victorian America by providing youth with a proper moral character, but by doing so, she lost her legitimacy as a role model in that individualistic culture. As Robert Lynd noted in Middletown in Transition sixty years ago, teachers were seen as “meager souls,” out of touch with the world, “the sort of people one can hire for the wages of a clerk in a retail store” since they “couldn’t make good in business” on their own (Lynd 1937).

The feminization of teaching extended the separation citizens saw between teachers and the more vital adult world outside the school. By 1900, women constituted three-quarters of all elementary teachers in the U.S. (Rury 1989). The late Victorians continued to think of female teachers of young children as self-sacrificing, submissive creatures whose virtues were those of the softer side of human nature. Women’s personal attributes fit them well for the nurturance of young children’s character development, but many men believed that such feminine virtues were dangerous to the growth of strong males able to fend for themselves in the rugged world of individual competition.
In the words of Sara Lightfoot, women elementary teachers were viewed as likely to produce in children characteristics “antithetical to the aggressive, instrumental roles needed in the world of men and work” (Lightfoot 1978).

The feminization of classrooms included the image of women elementary teachers as mothers, serving in a kind of home. The romanticization of the home justified the importance of woman as mother, but it also separated the mother role from the world outside the home. Though women might insist the home was equal to commercial and political activities in importance, there is little reason to believe men agreed with them. The school as a safe, stable, cooperative, and sensitive home environment remains at odds with the masculine world of physical effort, mobility, productivity, and individual striving. The school reforms of the 1950s and 1980s continued this dualism of the male authority of traditional disciplines and the attainment of clear standards over personal interpretation. Worst of all, schools are seen by most reformers as little more than producers of human capital, a ready workforce for the world for which there is no “soft” side (Grumet 1988). As long as elementary teachers are seen as models of the feminine part of humanity by the product-oriented male reformers who run our society, teachers will not be taken seriously by those reformers.

Another problem for teachers of young children is their lack of control over their professional world. They have had little say about standardized testing policies, grading policies, discipline codes, expenditure priorities, or what books to use. They do not control who their clients are or how many they have, the length of the day or period, or even the format of the report card (Shedd and Barcharach 1991). Their dependence on others extends to the community. As Hollingshead reminded us in the 1940s, one of the major objectives of the local board of education was to see that teachers conformed in the classoom and in their personal lives to the most conservative doctrines prevailing in the local culture (Hollingshead 1949). Elementary teachers’ lack of respect by the public is aggravated by educators’ vagueness about the definition of good teaching practice. Since virtually everyone has attended school a long time, he tends to believe he knows what “keeping school” is: giving lessons and maintaining control. Elementary teachers are generalists who are with young children every day, and are therefore viewed as more like surrogate parents than experts deserving respect for their expertise. The apparent lack of teacher power to control the important variables of teacher’s professional lives causes much of the public to wonder if teachers’ lack of power is deserved, especially when the goals of education seem ambiguous (Johnson 1990). Teachers also cannot stop the permeability of the school, though they certainly try by keeping parents at bay (McPherson 1972). Outsiders continually make new commitments for educators, while either telling them to change what they are doing or ignoring the complexity of the tasks that teachers do.

Many reforms fail because there is a fundamental clash of views between noneducators and elementary teachers as to what constitutes a professional teacher. Social scientists tend to use the models of physicians and attorneys as ideal examples. Ideally, professionals possess both acknowledged expertise, acquired in a long, rigorous academic training followed by an extended mentorship, and an authority unchallenged by nonexperts. Therefore they have significant deference from clients who pay them fees directly. They base their authority upon an objective appraisal of the facts. They also work full-time in a career with clear promotional ranks based on peer review (Biklen 1995). Social scientists argue that elementary teachers fail on all counts (Etzioni 1969). Teachers of young children have had four year college degrees only the last half-century, and few would argue their academic training is difficult. There has always been a vigorous debate about what expert knowledge teachers must possess about the “science” of education. Teachers are not accorded an unchallenged authority, since public education is, by definition, under public control. Teaching also lacks promotional ranks. The solution to these weaknesses in the profession is to gain the attributes social scientists list for them. We are then to believe that the public will give teachers status and the deference they desire, and children will then learn more from these true professionals who now have self-esteem and high standards.

There are at least two problems with this formulation. First, professionals in the U.S. are not held in the same esteem by nonprofessionals as they once were. Lawsuits against professionals frequently occur. In a democracy, Americans have always been ambivalent about those who insist they are superior and deserve deference. Second, elementary teachers believe they already are a profession. Their domain is the classroom, in which they believe they
are managers of learning, not technicians of instruction, and so do not need close supervision. As Shedd and Bacharach suggest, their classroom role is most like that of a civil engineer who must analyze and interpret data while constructing a structure that must be flexible yet strong (Shedd and Bacharach 1991). It is a complicated job, requiring anticipation, reflection, adaptation, and innovation guided by intuitive hunches (Schon 1983). To elementary teachers professionals do their energetic best with the students they are given. Being professional does not mean devoting 35 uninterrupted years of service, any more than being a mother, wife, and surrogate mother to her students denigrates the professional role. Each role enhances the others.

Teachers have their own reward system which is usually at odds with reformers’ ideas for improvement. Whether elementary teachers are traditional in their goals and methodology or not, they tend to look for the same intrinsic rewards. As Lortie (1975) stated, most educators believe that teaching is satisfying when positive things happen in the classroom to their students, and when they have reached students who have learned because of their efforts. In interviews, teachers say that they are most pleased when they receive positive comments from students, other teachers, parents, and principals, and get discouraged when positive feedback is absent.

Teachers also have several norms that have become ingrained in the profession. While not all teachers adhere to them, it is difficult for new teachers or nonteachers to break these down because they have served teachers well in their occupation. First, is noninterference, whereby teachers do not offer assistance to other teachers unless asked, and even then, offer as little as possible. Noninterference gives at least the illusion of protection to their control of the classroom, and it provides a legitimacy for that which teachers do control in each classroom, such as when students talk, where they sit, which tasks they do, with what tools, and with whom. A second norm is equalitarianism, in which no teacher considers herself superior to another as long as she tries to do the best she can. Teachers tend to focus on the process of instruction more than student results, in part as a defense mechanism to counter the lack of control over whom they have as clients. When nonteachers insist that treating all teachers the same in terms of salary raises regardless of student results makes it impossible to hold teachers accountable for student learning, most teachers would state that accountability is a dual responsibility in which both teachers and students must do their best. The accountability proponents of the Seventies and beyond have ignored this implied contract between teachers and students. As with physicians, good teachers diagnose each situation to the best of their ability and then prescribe a solution many times a day. Both depend upon the cooperation of the client to accept the diagnosis and to act on that basis.

Both merit pay and career ladder proposals are contradictory to equalitarianism. Teachers have often fought merit pay because it divides them in ways that presume some teachers are superior to others. Since teachers believe they have little control over who their students are, they also believe it is unfair to single out a few teachers who had good students chosen for them. Teachers dislike the implied competition inherent to merit pay because it destroys the equalitarian community that teachers believe they have (Murname and Cohen 1986).

Career ladders are rare in American school districts because they also contradict the teachers’ equalitarian ethic. Promoted by private organizations such as the Carnegie Forum on Education and the Economy and the Holmes Group, career ladders would presumably make teaching a true career with levels determined by promotions, resulting in differentiated functions (Johnson 1990). Career ladder advocates argue that the rigorous promotion regimen will impress the public so much that they will be glad to provide the tax funds for large promotional increments. In a few wealthy districts, this has occurred. But many districts are not able to fund current salary raises adequately, why would the public pay more so that some teachers will receive higher salaries for doing an excellent job? Shouldn’t all teachers be excellent? Besides taxpayers, most teachers are not excited about career ladders because they believe that all teachers deserve more pay and recognition, not a special few. Teachers have spent decades to attain equal rewards and status in nonhierarchical relations to one another, so they are not excited about differentiating pay or power within the profession (Tyack and Cuban 1995).

Teachers believe they have a momentous task. They must teach many subjects to students of different levels, with constant demands and interruptions made upon their time. Beyond that, elementary teachers would note the emotional cost of being with children 180 days a year in order to develop each child fully. There is only so much change a teacher can do. Few teachers believe they need more dissonance in their lives (Cuban 1984). However,
dissonance is exactly what the endless stream of efforts to reform American schools has brought upon teachers during the past century. Reformers have always argued that teachers are inadequate and so must be required to change, and when teachers resist or do not respond fully to the proposed change, they are attacked for their intransigence. Since reformers tend to see anything less than total change a failure by educators, teachers have learned to cope by pretending to change by mouthing the rhetoric while continuing to work as before because the methods they already use work for them (Biklen 1995). Progressive education provides a powerful example of such a reform.

Lawrence Cremin and Diane Ravitch have both claimed that progressive education transformed the educational aims of the school (Cremin 1961). If so, we would expect classrooms to be student-centered, with student interests the starting point for all learning. In fact, as Larry Cuban has found, few classrooms have ever operated this way (Cuban 1984). Most classrooms have been and remain teacher and subject-centered. Teachers continued to instruct the three R's in a disciplined, controlled manner. John Dewey remarked in the 1950s that progressive reform had been undermined because educators adopted the progressive rhetoric in schools and in teacher training colleges, but ignored substantive changes to instructional method (Zilversmit 1993). The rhetoric included individualized instruction, student initiated change, and democratic classroom management. The reality was lectures, individual seatwork, and short answer tests (Cuban 1984). The so-called science of education predominated in the schools, with its emphasis on testing, measurement, and efficient organization. This fit more closely into the teachers’ desire for control and regularity far better than noisy, unpredictable, democratic problem-solving through group projects. Most teachers and parents liked traditional patterns of education because they believed it served their needs and that of the children best in a competitive society. Most Americans believe social progress is best promoted by individual effort, not cooperative endeavors. Therefore, student-centered education will always be difficult for most Americans to accept unless the socio-economic system changes (Cuban 1984).

Later school reform efforts have also failed to transform classroom practice because they ignored the needs of teachers. The curriculum reform movement of the 1960s is a classic case. University professors of science and mathematics wrote new curricula without adequate knowledge of either classroom realities or children’s learning capabilities. Teachers were angered because the “teacher proof” curricula were difficult to use and the in-service training inadequate. As Charles Silberman stated, the “effort was doomed to failure” because “the classroom teacher is in an almost perfect position to sabotage a curriculum he finds offensive, and teachers are not likely to have a high regard for courses designed to bypass them” (Silberman 1970). Nor was the open education movement of the late 1960s and early 1970s so favored by Silberman any more successful. Patterned after practices in a minority of British primary schools and reminiscent of previous progressive practices, open education sought to destroy the boundaries between subjects, children, teachers, parents, and the community, while empowering students to make choices as to learning methods and goals. Whereas Cuban estimates that one-quarter of elementary teachers used some aspect of informal education, most ignored it for the same reasons they ignored progressive practices in earlier decades; it made their classroom life more difficult (Cuban 1984).

Performance contracting took place at the same time as the open education movement. Military and corporation organization experts attempted to attain higher student math and reading scores by teacher-proof curricula that students learned on machines. Education had become a matter of properly managed objectives using the science of behavioral engineering. Teachers became technicians, or “instructional managers,” who oversaw student drill on preplanned tasks. As with the curriculum reforms of a decade earlier, teachers were rarely consulted. Public enthusiasm diminished after outside evaluators found little or no significant difference between experimental and control groups. Federal funding ceased, and the movement was dead by 1975, just like open education (Gramlich and Koshel 1975).

By the 1980s, another wave of reforms burst forth as if nothing had occurred before. Spurred by the economic malaise of the Seventies and the Reagan administration, business-led reformers claimed that our public school students were performing at such a mediocre level as to put our nation at risk from international rivals. The excellence movement, as it was called, demanded more time in school for students completing academic tasks, with clear standards for all. By the 1990s, the Bush administration authorized the New American Schools Development Corporation “to achieve a quantum leap in learning.” It was to develop the best schools in the world by assuming
"that the schools we have inherited do not exist" (U.S. Department of Education 1991). As part of the Education 2000 program, the Corporation meant to transform the nation's schools. Once again, reformers ignored educators because they were the problem, not the solution. Corporation executives formed the original board of directors because they believed educators did not know how to produce good teaching. Ironically, reforms will have to be implemented by teachers—and who is listening to them?

States are now the foci as reformers press legislators to set higher academic standards. In Delaware, the legislature authorized funds to implement a "New Directions" program, with learning objectives students must "know and do" in science, math, English/language arts, and social studies (Delaware 1996). The main problem now, as with so many reforms, is assessment. The State Department of Education held an Interim Assessment Test two years ago that was a disaster. Students performed poorly on tests assessing information on which teachers had not instructed them. This angered teachers and parents to such an extent that the legislature canceled last year's follow-up test. Educators now are more anxious than ever about negative consequences to low test scores; many must wonder whether they have any reason to trust reformers or even cooperate with them (Miller 1996).

Restructuring is another current goal of reformers, that is, a total change in the organization engineered from the top, with extensive cuts and new functions assigned to employees, all in the name of efficiency and productivity. Unfortunately, it has been applied in the business world to achieve higher profits, a goal different and far clearer than school success. In Delaware, there are supposed to be restructured schools by 1997 with shared decision making among teachers, administrators, and parents. The major question is whether local boards or administrators will allow meaningful control over school functions by teachers and parents.

If teachers can make sense of change and retain control of the daily routine in their classroom, then they will accept at least some of that change. If reformers insist on systemic, complicated change, then those changes will fail. Effective educational change is best achieved school by school. There seems to be little historical evidence of system-wide changes in education that actually transform practice in a majority of classrooms. There have been no revolutions in education as far as teachers are concerned; just endless skirmishes which teachers attempt to fight on their own turf. They have learned to use what they can to help them achieve their classroom goals, and ignore the rest.

Differences Among Urban and Rural Teachers in Indiana (1820-1860)  
Kathleen Ann Murphey  
Indiana University-Purdue University, Fort Wayne

The literature on nineteenth century schooling and teaching generally falls into two categories: the history of urban school teaching (Tyack 1974) and the history of rural or country school teaching (Fuller 1982, Gulliford 1984). The portrait of teachers in each group is distinctly different. Other studies do not make an urban/rural or city/country distinction at all, such as some studies specifically on women teachers (Hoffman 1981, Kaufman 1984), making it difficult to overlay their results on the studies of urban and rural educators.

This study looks at teaching and teachers in mid-nineteenth century Allen County in northeast Indiana, and compares the developments in its largest city, Fort Wayne, with the developments in the surrounding, rural nineteen townships. It asks in what ways the rather sharp distinction between urban and country teachers was a true portrait of the reality in Allen County, and why it is important to understand the precise nature of the differences and likenesses in order to accurately assess the history of the educational labor force in the mid-nineteenth century.

This study begins with the founding of Allen County in 1824, soon after the founding of the state of Indiana in 1816, and moves through the birth of Indiana's public schools in the 1850s. The city of Fort Wayne had evolved during this period from a military outpost of the U.S. government and trading center, previously a stronghold and trading center of, respectively, the British, French, and various Native American groups, to a medium-size, industrializing urban area. In the 1830s, 1840s, and 1850s Fort Wayne attracted immigrants from many areas of Europe, but especially Germany, as its economy developed with the building of plank roads, canals, and railroads. The outlying townships around Fort Wayne in Allen County came into existence during the 1830s and 1840s as the farming population grew. While there was ethnic diversity among the settlers in the townships, settlers tended to be migrants of English and German background from Eastern and Southern states, as well as new immigrants to the U.S., largely from Germany (Brice 1868, Griswold 1917, Hawfield 1992, Poinsatte 1976).

Religious diversity in both Fort Wayne and the surrounding townships was great, and denominational rivalries spurred some of the earliest developments in education. In Fort Wayne between 1820 and 1860 Quakers, Baptists, Old and New School Presbyterians, American and German Methodists, French, German, and Irish Catholics, German and English Lutherans, Episcopalians, African Methodists (A.M.E.), Orthodox and Reform Jews, Swendenborgians, Christian Disciples, and Universalists formed religious congregations (Mather 1992). The religious diversity in the surrounding countryside was also great (Helm 1880).

Fort Wayne's economic development in the mid-nineteenth century came to be more industrial than the development in its neighboring townships. Educationally, however, Fort Wayne and the townships shared a common heritage. Indiana, which had evolved out of the old Northwest Territory, had inherited the legacy of district schools as spelled out by the Northwest Ordinance, i.e., the land or the proceeds from lease or sale of one section, the sixteenth, of each congressional township, was allocated for education. The spirit of this Ordinance was reproduced in the enabling legislation for Indiana statehood in 1816. This led to numerous small, one-room schools throughout Indiana. The funding was insufficient to support the schools, however, thus most district schools also charged a subscription rate, or tuition. Until states explicitly allowed cities, towns, and townships to establish schools, a change that came in Indiana with Common School legislation in 1852, the district schools had to suffice for city children as well. Thus, private venture, entrepreneurial, and denominational schools began to fill the void, especially in cities (Barnhart and Carmony 1954, vol. 1, vol. 2, Boone 1892, Cotton 1934, Newman 1926, 229-276, Madison 1886).

Common schools, or state overseen, public schools did not come about easily in Indiana. In 1848 a vote was taken statewide regarding the establishment of public schools. Fifty-six percent of the voters in Indiana supported the proposal (Boone 1892, 107-8), yet the state legislature passed no enabling legislation. In 1851 a new Indiana constitution set the ground work for legislation in 1852 that provided the administrative structure and funding to make public schools possible. Civil townships would be the new unit of administration. The former congressional township funds would go to the state to distribute according to student attendance in each township. Townships had new
powers to tax, as did cities and towns, which could form separate school corporations. Opposition arose, however, over the new method of distributing the former congressional funds beyond their local borders and over the new local taxing powers. Both measures were contested in court and eventually found unconstitutional. As cases came to court and new laws were written, Indiana's public schools, including those in Fort Wayne and the surrounding townships in Allen County, struggled to survive (Barnhart and Carmony, vol. 2, Boone 1892, Cotton 1934, Thombrough 1965, Herrling 1940, 3-14).

For Fort Wayne this meant the schools opened in 1853-54, closed, then re-opened in 1857, closed in the Fall of 1859, and re-opened in 1860. The openings and closings had to do with extended and withheld state funds, as well as local opposition to Common Schools. In the townships around Fort Wayne the opening of the first public schools varied, reflecting, like in Fort Wayne, the degree of local support for Common Schools, as well as the fluctuating success of Common School legislation at the state level (Kirby 1979, 13-25, 1980, 50-60, 1981, 1-10, 1983, 3-15, Murphey 1995).

In Fort Wayne, prior to the advent of Common Schools, a varied array of schools and teachers had emerged. The first school in the Fort in 1820 was run by a Baptist missionary, ostensibly for the children of the local Native American tribe, the Miami. It folded after two years (Hawfield 1992, 18-19, Mather 1992, 8-14, McCoy 1840, Steele 1973, 1-12).

From 1824 to the mid-1830s a county seminary opened in Fort Wayne, which ran on some public monies, but was largely a subscription school, taught by a series of male teachers for one or two years. Most men came from business careers and left to resume them, or they earned money as they studied law, or made contacts to pursue a life of public service. Some moved on into the ministry, or taught in addition to their clerical duties to earn money. In 1836 two women teachers, Susan Man and Alida Hubbell, were recruited from Catherine Beecher's Hartford Female Academy by a couple of the founding fathers of Fort Wayne to start a school. The women had barely arrived when they were convinced to work instead with a Lutheran minister, who taught a school in the basement of the Presbyterian church for children of all faiths. The minister died, the women teachers married, and the two men who continued the school, Alexander McJunkin and William W. Steevens, did so for only a short time before starting their own schools. Both men taught for many years, but later went on to careers in business and law (Cook 1926, Irwin, 1894, 252-272, Richards 1984, 3-15, Truitt 1971).

Lutherans opened a school in 1839; Presbyterians and Catholics opened schools in the mid-1840s; Methodists opened a college in 1846. While the Catholic and Lutheran schools maintained themselves and grew, the Presbyterians floundered but began again in 1853 and made their way until 1867 when they turned over their school to the public schools. Jewish and Episcopalian congregations also started schools in the 1850s (Cook 1926, Irwin 1894, 252-272, Mather 1992).

The denominational and subscription or private venture schools in Fort Wayne were taught by clergy and non-clergy, of the same faith as the students and founders or not, men and women, married and single. The schools each had only one or two teachers, thus the fate of the school and the fate of the teachers were synonymous. If the teacher left, the school usually closed; if the school closed, the teacher had to find other work. With a couple of notable exceptions, i.e., McJunkin and Steevens, most private venture schools were of very short duration; most denominational schools had high teacher turnover (Cook 1926, Irwin 1894, 252-272, Murphey 1995).

In Fort Wayne most subscription school teachers had no specific training for teaching, though most had received some advanced general education. Careers in education were, for the most part, short, as tradition led men and women, for different reasons, out of teaching. Men followed other careers, most single women married. In Fort Wayne, competition among schools further shortened brief careers. By 1853, the year the public schools began, there were many private venture and denominational schools in Fort Wayne (Ibid.).

In Allen County's nineteen townships surrounding Fort Wayne, the story of schooling and teachers was similar, though much reduced in scope, before the establishment of the first free schools in the mid-1850s. Adams Township, southeast of Fort Wayne, was typical. After the fall harvest residents began to consider "the idea of a winter school... and each subscribed a certain amount for the school fund of that year." Finding a teacher was difficult:
"Usually, a stranger made his appearance in the settlement, recommending himself as a teacher. He was engaged for the term, and sometimes the services of a good teacher were thus secured, and a course of instruction given which was of vast benefit to the scholars. At other times, the teacher proved to be of inferior attainments, and the winter school was scarcely more than a farce."

A log schoolhouse had been built in 1829 on the land of a local farmer. The first schoolteacher "was a man of fine acquirements, and conducted what was unanimously pronounced "a good school," but his services could not be secured for more than one term" (Helm 1880, 142).

This system of subscription schools in Adams Township continued until 1854. At that time three school trustees called an election to vote in a school tax. It aroused "violent opposition," as it had in Fort Wayne. The tax was defeated. The State Superintendent encouraged the trustees "to call another election for the same purpose, and to do so repeatedly, if necessary, assuring them that their cause would gain an increased number of votes each time." Each trustee then canvassed a portion of the township, and, "when they thought the question had been placed before the people in its proper light, another election was held, and the result was a victory for the free schools" (Ibid.). The first free school was then erected in 1854, and the school at New Haven, a town in the township, was converted into a free school.

In Aboit Township the first subscription school was taught in a cabin on a farm in 1837; the farmer "donated the stove and boarded the teacher." In Cedar Creek Township the first school house was also built in 1837, but it was inaccessible because of its location near a swamp and far from children. It was left to decay. Schooling did not begin until 1857 with the first public school. In Eel River Township the first school was built on a farm in 1837. In Jefferson Township a subscription school was erected in 1838 on a small corner of farm land donated for that purpose. It was abolished when the first free school was built in 1854. The first schoolhouse in Jackson Township was the public school in 1854. Lake Township reported no schools; Lafayette Township built a schoolhouse in 1850, and a Miss Eliza Ogden taught there (Ibid., 145, 147, 150, 154-6).

In Marion Township, in the 1837-38 school year and again in a subscription summer school, a Mrs. Parker taught in a log cabin. She had "enjoyed advantages of a fine education in her native state, New York, and opened, in the wilderness, a school far superior to the crude institutions by that name which characterized this county in the earlier years of its history." In the winter of 1840 Judge Nelson McLain opened a subscription school in the front room of his home to about a dozen students. It, too, was considered a superior school, but it brought little financial reward to the Judge: "It might well have been called a labor of love, as the emoluments derived from it would not have kept body and soul together, had he been compelled to buy his daily bread." The first schoolhouse was built in 1841 and run as a subscription school for four winters. In 1845, with congressional township funds supplemented by contributions from residents, a hewed-log schoolhouse was built on the property of Judge McLain. This arrangement lasted until 1853 when the new school law took effect (Ibid., 158).

In Monroe Township the first school in 1843 was a log cabin subscription school built on a farm; the first free school was initiated in 1854 (Ibid., 160-61). Although Monroeville, a town within this township, "had its share of wandering pedagogues, with the customary fluctuating standard of ability," the town perceived its major problem to be funding: "During the supremacy of the subscription-school system the important question was not 'Is the man able to conduct a good school?' but 'Can the town raise the necessary funds to maintain a school during the winter?'"

Madison Township tells a similar story. A hewed-log building first housed a subscription school in 1840. Teachers were of varying ability, for there were no standards, only the teacher's "own declaration of ability." This changed in 1854 (Ibid., 162, 164).

In Maumee Township the first school, taught in 1842 in a log house by Miss Eliza J. Curtis, was continued as a subscription school every winter until 1853 when the free school system began. In Milan Township the first school was taught by Miss Catharine Shell in 1845, and it, too, remained a subscription school until 1857 when the first free school was built on the same lot. Schools were soon built in all the other districts of the township (Ibid., 165-6).

In Perry Township, in 1835, "a lady who had acquired a good education in the East," taught in the first log cabin subscription school, which was "was greatly in advance of the subscription schools of that period ...." A
second school in the township was taught by a man in 1837. In 1856 three men incorporated a seminary and employed a professor to teach. Students came from all the surrounding counties to learn languages, higher mathematics, philosophy, and astronomy. It prospered until 1862 or 1863 when its professor resigned and many students left to enlist in the army (Ibid., 168, 173).

In St. Joseph Township outstanding teachers also dominate the record. James Daily started a subscription school in 1836. Another was started the following year by James A. Royce, who "brought into his work a rich fund of knowledge, gained in the schools of New York, as well as by years of practical experience." The next school, taught in 1839 by Ebenezer Ayers, also of New York, was, also, exceptional, because "after school hours, or during the long winter evenings, the teacher entertained his scholars with addresses on astronomy, geology, philosophy and other scientific subjects, in language which made it to them a lesson instead of a dry, incomprehensible lecture . . ." (Ibid., 173).

In Springfield Township two subscription schools, one started in 1840, taught by Sarah Bracey, and one in 1841, predated the common schools in 1854. In Scipio Township the first subscription school was taught in 1841 by Nancy Palmer (Ibid., 175, 177).

Washington Township dates its earliest subscription school from 1829 or 1830, a system that continued until the first free school in 1853. The first teacher, Alexander Waldron, is remembered for his failings. He did well with the young children, "but when the older scholars were called upon to recite their lessons in arithmetic, his deficiency was painfully apparent, and the young men took a mischievous delight in giving him problems which he was unable to solve" (Ibid., 178).

In the townships the diverse religious congregations did not start schools, as in Fort Wayne, though many did establish Sunday Schools, which had high attendance, sometimes far exceeding that of the established subscription school. Often a subscription school was held in a building built by a congregation for a Sunday School, or a Sunday School was held in a subscription school building (Helm 1880).

The educational labor force in Fort Wayne and the surrounding townships from roughly 1820 to 1860 was dependent on the willingness of the local patrons for financial support because public funding, i.e., money from the congressional township fund, was inadequate to cover the costs. Funding problems were particularly acute in the rural or country schools. In both places accommodations to meet the situation emerged. The accommodations in Fort Wayne were more varied, there were more of them, and new accommodations were continually being tried. Teachers and schools competed with one another for students; if the schools failed, new ones were established. Women teachers had been educated in academies or the new women's seminaries; most men teachers had been educated for, or were being educated for law, the clergy, or business. Many of the men are known to us today because they are visible in their other, or earlier, or later walks of life. Denominational schools competed with each other and with private subscription schools for students (Murphey 1995).

In the surrounding rural townships, this non-system of quasi-public, quasi-private alternatives operated on a much reduced scale. Teachers did not compete with one another; there usually was only one teacher, when the township was lucky. If anything, the rural township schools competed with Fort Wayne for its teachers. There were more children in Fort Wayne and more opportunities for teachers to set up a school, or work for one already in progress. Religious congregations were active in the townships, but they usually set up Sunday Schools only. Thus, schools run by religious congregations were a major player in the educational alternatives available in Fort Wayne; they were barely so in the countryside.

In the townships, as in the city of Fort Wayne, teachers included men and women, married and single, and people en route to or, in fact, in other careers, such as Judge McLain in Marion Township. The variety of teachers in both places defies the stereotype of Ichabods and Ralphs (Irving 1893, Eggleston [1871] 1984), i.e., of the itinerant single man.

Schools in the townships began later chronologically than those in Fort Wayne. This was due to slower population growth and lower population density in the rural areas. A very short school year reflected the demands of the agricultural seasons. Most communities were happy to be able to retain a teacher at all, and even happier yet if the teacher were educated and could teach. Good teachers were particularly difficult to retain.
Rather ironically, the historical record is more complete about the teaching, both effective and ineffective, of the rural school teachers, even though there were fewer of them, the school year was shorter and less predictable, and the turnover among teachers was higher. In Fort Wayne we know of many subscription schools and a lot of teacher turnover. Lore about discipline practices, particularly of some of the men teachers, like McJunkin, who taught a long time, survives, too. Letters of a couple of teachers shed some light on the teachers' lives (Richards 1984, 3-15; Truitt 1971, 12-17). The county histories, however, are rich in details and judgments about their pedagogues. Perhaps the scarcity of teachers made those who did teach, for better and for worse, all the more memorable, and the basis for the continuing historical visibility of rural school teachers.

Schooling changed in Fort Wayne and the surrounding county with the passage of the Common School laws. The new system, that began at various dates in the mid-1850s throughout Indiana, brought system, organization, funding, age-grading of students, and new requirements for teachers to schools, and all schools gradually moved in the direction of incorporating the changes (Helm 1880, Murphey 1995).

Irving's The Legend of Sleepy Hollow (1893) and Eggleston's The Hoosier Schoolmaster ([1871] 1984), show us only a slice of school life in the past. The record indicates that the history of schools and teachers before public schools in Indiana is much more varied than these accounts would allow us to imagine. The differences between urban and rural schools and teachers were more of degree than kind. There were more schools in the city, initiated by a greater variety of denominations and individuals, and propelled to some extent by the schools' competition with one another. The coming of the Common School, however, dramatically altered the framework of education in all geographic areas. The Common School greatly lessened the differences between urban and rural schools and teachers, as versions of the "one best system" came to dominate city, town, and township schools. The effect would be to build an economically stable system, with a more consistently trained work force of professional teachers that could serve the industrializing cities, as well as rural farming communities. The conceptual differences between the quasi-public, quasi-private schools of the 1820s-1860s and the new Common Schools were much more important for the future development of schooling, than the sometimes more visible differences between urban and rural or town and country schools.

African-American Teachers and Black History in the Curriculum
Before Desegregation

Anna Victoria Wilson
The University of Texas at Austin

This historical inquiry focuses, in general, on the concept of equal educational opportunity in a democracy and the maintenance of racial segregation in education. In particular, this inquiry focuses on how Black teachers confronted stereotypes as well as absence of attention to their race in their educational materials. Many of these textbooks portrayed negative ideas about African Americans specific to physical features, dress, mannerisms, living conditions, occupations, and abilities. Four African-American teachers describe their incorporation of Black history into the segregated curriculum.

Mrs. Clara Luper (1995), a retired Black teacher, described her childhood in a segregated society. It was like being put in a closet with the doors shut with a little hole where you could peek out to the real world. It was like looking up in the sky and you could see the sun but only like it was a shadow. Although African-Americans have played a significant role in history since the dawn of civilization, their contributions have been ignored by historians and their faces rarely appeared in history texts. Even Paul Revere's famous drawing of the Boston Massacre portrays a battle among whites, despite the fact that African-Americans were present and one leader, Crispus Attucks, was among the five American martyrs. Historian Benson J. Lossing had transformed Attucks into a "Nantucket Indian" (Katz, 1968).

Mrs. Luper commented:
You can't separate Black history from white history. Many of my white students have been unable to understand that. For example, let's just take a course in Black history—the Revolutionary Period. The first person to die for this country was a young black by the name of Crispus Attucks. You can't study about Crispus Attucks unless you study about all the white solders who were there with him. Therefore it has been an experience in both [Black history and white history]. If you study slavery, you have got to study the abolitionists. You study the civil rights period, you have got to study the blacks and whites, especially you have got to know about Lyndon Johnson.

In spite of the lack of general knowledge about African-Americans' many contributions to this nation, African-American teachers shared their knowledge and resources to give their students accurate portrayal of their history. Mrs. Iola Taylor (1996), an African-American social studies teacher, reflected on her need to portray accurately their history to her students in a segregated school system. She said,

I didn't go through college thinking I had the same rights as whites. I didn't grow up thinking I had the same rights. That was just simply unrealistic. So I never thought I had the same rights. But it is most interesting, however, despite the knowledge that there was difference and that it was not right to some. There are principles that catch you up in American history—I think will grab anybody regardless of where you are in the schema and I think those principles are important to me.

Because her classroom was not directly monitored, Mrs. Taylor was able to incorporate a 'sense of Black History' into her social studies curriculum. She believed most Black teachers approached Black History in similar fashion.

No one came to sit in my classroom when I first taught—my principal would listen and see how you were doing. But even there was a sort of an academic freedom as long as there was no disruption that got out of your classroom. Ideas could be discussed and so more Black teachers were sensitive to—not just teaching our young people—the textbook—but incorporating into the textbook a sense of Black History. Of who we were and what we were about. To some extent, the system forced you to do that—by virtue of the fact that you had to survive psychologically and your students had to survive psychologically too and so to accept totally that you were a 'no-no' would destroy your ability to survive and that totality was never accepted by any Black teacher.

For African-American students, a correct portrayal of the African-Americans' part in history served justice as well as truth. Amsterdam News columnist James L. Hicks recalled his days at Central High School, in Akron,
Ohio:
I was the only Negro in my history class, and the way my Beard and Beard history book presented
the Negro and the way my history teachers taught what little they did teach about the Negro was
more than enough to make me cut history classes and almost enough to make me cut out from school
altogether (Katz, 1968, 8).
African-American teachers, particularly those who taught history and government, were in a unique and
difficult position. Textbooks used in many Negro schools were discarded texts from the white schools. They were
seriously outdated, marked up by former students, and often had missing pages. Ms. Woolfolk (1994), a U. S.
Government teacher at Ullman High School (c.f. Wilson, 1996) in Birmingham in the 1960s, remembered:
American history was not correct. Historians have taken history and rewritten it. We know African-
Americans did more than just come over here as slaves. Many inventions which Blacks contributed
to America, whites were given credit for. White society did not want Blacks to read or write or be
educated. How then could we go back and correct our history for our students?
Incorporating Black History into the high school curriculum was important for these teachers. For example,
Mrs. Luper taught her students that
African-Americans explored the West with Lewis and Clark or Fremont, that an African-American
named Matt Henson (with the Peary polar expedition of 1909) was among the first men to stand atop
the world, that African Americans contributed a thousand patents to America’s industrial thrust just
a half century after Emancipation, that an African-American surgeon performed the first successful
operation on the human heart, and that an African-American, Mme. C. J. Walker, was the first
American woman to earn a million dollars.
African-American teachers were creative in finding ways to inform their students of the inaccuracy of the history as
presented in their textbooks. Mrs. Luper remembered:
Not only did I study history at Langston, I also studied it in high school and our parents taught us
about Black people who had made contributions such as Black writers. I was extremely interested
in Black history. In high school we would study Black history for a week around Lincoln’s
birthday. I was extremely interested in Black history and white history. I was never able to separate
one from the other.
In Mrs. Luper’s and Mrs. Taylor’s classes, Black students learned how
The Ninth and Tenth Calvary, composing a fifth of all the cavalry assigned to pacify the West, were
all-African American regiments. Despite discrimination they earned their share of Medals of Honor
and could boast the lowest desertion rate in the Army. Among their proud commanders was John
J. Pershing, who won his nickname of “Black Jack” leading a company of the Tenth against Indians
and bandits in Montana, against Spaniards in the charge at San Juan Hill and against Pancho Villa
in Mexico.
African-American teachers knew they were solely responsible for bringing their history into the curriculum.
Mrs. Vernice Smith (1996), the only African-American teacher at Austin High School, described her incorporation
of Black History into the English curriculum.
When I went to Austin High School, they had never heard of Black History. . . I wrote and made my
lesson plans and since I knew they had not dealt with it at Austin High with Black History or heard
of it, I sent my lesson plan to the principal’s office with a note that this was the plan that I had to
 teach Black History — at first it was just a week but finally it became a month. He said he was
 proud and appreciated that. I explained to them what Black History was all about and I let them
 choose different Black people to write about. And one group were to report on Malcolm X. Our
 librarian went crazy because — I think the Unitarian church — had given them that book. And this
girl knew they had given Austin High this book. She went to the library to check out Malcolm X and
 they did not have it on the shelf. And whatever this church was — had given a number of books —
they took back all the books when they found out that the librarian had not shelved Malcolm X. And
of course I went to the librarian and raised a little Cain — the librarian was too late — the kids went to the city library and got the books that they wanted! During this time, I was ill for several days and when I returned to school, my students were just angry. A young substitute teacher had decided to improve on my lesson plan and she told them “that Blacks ate salt pork and molasses for breakfast,” and Blacks fought with guns, Mexicans fought with knives and whites fought with bare hands. When I came back — my kids were so upset — apparently it had made her [the substitute] mad that my kids had done so well on their papers. She had even made notes on my lesson plans about Blacks — she was way back in slavery times!

Many teachers developed annotated bibliographies of the available materials which they shared with one another. In this way, resources were developed without regard to local availability and, in particular, the textbooks that were handed down from the white schools. Not surprisingly, African-American teachers taught from an integrated curriculum long before the concept of integrated history curricula became accepted.

Each teacher in this narrative attempted to teach the historical contributions of African-Americans to America. These African-American teachers tried to provide an enriching and empowering experience for their students, as their words so clearly reveal.

Training for Leadership: The General Education Board Fellowship Program, 1902-1954

Jayne R. Beilke
Ball State University

In 1902 John D. Rockefeller endowed the General Education Board (GEB) with $1,000,000 in order to "promote education in the United States of America without distinction of sex, race or creed" (Fosdick 1962, 8). The focus of the GEB quickly became Southern education and higher education in particular. From 1902 to 1924 the Board's main thrust was to increase the endowments of those institutions which best exemplified the Hampton-Tuskegee philosophy of curriculum. Other interests included the allocation of funds to supplement the salaries of Black college faculty and to support the development of college centers (to be located in Nashville, Tennessee; New Orleans, Louisiana; Washington, DC; and Atlanta, Georgia) by combining the services of what were determined to be the academically strongest, most financially solvent Black institutions. Over the course of the GEB's existence (1902-1954), over $122,000,000 was dedicated to education for Blacks in a variety of wide-ranging programs.

As early as 1902 the General Education Board (GEB) addressed the lack of trained leadership in the field of education by awarding fellowships or scholarships to southern white normal school teachers who needed scholarship aid to attend Teachers College, Columbia University, in order to complete their professional training (Fosdick 1962, 298). During the early 1900s, the South had few highly-regarded institutions of higher education for either whites or Blacks. In fact, Edwin R. Embree, who served as the president of the Rockefeller Foundation and later became president of the Rosenwald Fund was reported to have stated in an address delivered at Duke University in 1937 that there was not a first-class university in the South for white people, let alone Blacks (Thompson 1939, 135).

By 1905 a web of contacts had been established in the South who could recommend suitable candidates for fellowships. From 1905 to 1920 fellowship aid was distributed in several areas related to the development of leaders in public education. A more formal fellowship program was enacted in 1921-22, with the appropriation of $50,000 "for the purpose of awarding stipends for scholarships and fellowships to persons having definite opportunities of leadership in the field of education" (GEB Papers, McCuistion 1937, 7). In 1924 the GEB began to award fellowships to promising Black instructors in Southern institutions (Fosdick 1962, 300-301).

Fellowship programs had previously been a component of the various Rockefeller boards such as the Rockefeller Foundation, Laura Spelman Rockefeller Memorial and International Education Board. The GEB Fellowship Program began informally, patterned after that of the Rockefeller Foundation and influenced by the results of surveys of educational conditions in the South. The first survey—Negro Education: A Study of the Private and Higher Schools for Colored People in the United States—was compiled by Thomas Jesse Jones in 1917 and funded by the Phelps-Stokes Fund. This controversial evaluation concluded that only 33 of the 653 private and state schools for Blacks were teaching any collegiate subjects and that only three institutions—Fisk University, Howard University, and Meharry Medical College—"possessed the student body, teaching force, equipment, and income sufficient to warrant the characterization of 'college' " (Jones 1917, 17).

In 1928 Arthur J. Klein, chief of the Bureau of Education of the United States Department of the Interior, prepared a report of a survey of 79 Black colleges and universities. While the survey's recommendations stressed the interdependence of elementary, secondary and higher education and the need for higher standards at all levels, Klein viewed the effects of higher education on mass education as the solution to the following three problems: 1) it would ensure proper training of elementary and secondary teachers; 2) it would add to the economic stability of the race; and 3) it would provide a Black professional and technical leadership (Klein 1929, 2-3).

During 1924-25 the GEB began to administer a fellowship program which had two main thrusts: medical education and public education in the South. The latter was intended "for the purpose of cooperation with state and local authorities in obtaining advanced and special training for men and women occupying or about to enter important posts in the field of administration, supervision and teacher training" (GEB Papers 1925, 9)The Board awarded 36 fellowships for white educators and advanced training of Black leaders in education. Two specific fields were targeted;
administration and supervision (19 fellowships) and teacher training (17 fellowships). The trustees and officers of the GEB began to formalize the fellowship program in 1926 by examining the principles and methods of appointing fellows, administering the details of the fellowship, and evaluating the results.

From 1922 to 1933 the GEB targeted medical education in an attempt to relieve the teacher shortage in that area. The fellowships afforded a few Blacks the opportunity to study in Germany after graduation from American medical schools, but the real thrust of the program was the provision of qualified teachers for Meharry Medical College and the Howard University School of Medicine. The fellowship was intended more for remedial instruction than for the refinement of skills. Beginning in 1940 the GEB confined its activities entirely to the Southern schools, channeling fellowship money through Southern institutions and awarding scholarships to Black faculty members from Southern colleges and universities for graduate work.

From its inception, the fellowship program of the GEB displayed an instrumentalist bent, with money being awarded to the institution rather than the individual. The term "instrumentalism" in the philanthropic sense denotes, according to Bruce Sievers, "an orientation toward the use of the most efficient means to attain objectively measurable results" (Sievers 1995, 1). It was not unusual for the officers or trustees of philanthropic funds to debate the merits of instrumentalism versus the philosophy of making awards to persons of promise no matter what their field of interest, however. But there was far less ambiguity surrounding this issue for the GEB than for the Rosenwald Fund, which was the only other major philanthropic foundation to administer a comprehensive fellowship program. In the context of historical philanthropy, Sievers' definition of instrumentalism could be expanded to denote the preference toward an agenda which furthers the aims and objectives of the fund, rather than those of the individual. In other words, the GEB was clearly more interested in what the fellowship recipient could do to contribute to his/her institution than what the fellowship could contribute to the individual's professional goals. In the opinion of Board associate Frank P. Bachman, the objectives of the fellowships were as follows: 1) "to stimulate as many persons as possible to secure needed school training through their own efforts;" and 2) "to provide needed school training for persons working in fields wherein the Board is actively cooperating with state authorities." The fellowships were intended for "persons in key positions, such as teachers in normal schools and university schools of education, and to an occasional outstanding supervisor, high school principal, or superintendent" (GEB Papers 1924, 3). There is no mistaking the GEB's desire that fellows should return to the South after their fellowship year in the North had ended. In fact, the fellowship application forms specifically asked whether or not the candidate intended to return to the South upon completion of the study plan.

In 1932 Fred McCuistion, a field representative of the Southern Association of Colleges and Universities, pointed out that not a single state-supported institution in any segregated state was open to Blacks who desired graduate and professional training (McCuistion 1933, 5). In 1939, the first systematic study of the difficulties involved in the attainment of graduate education by Blacks was sponsored by the GEB and conducted by McCuistion. Defining graduate instruction as work beyond the bachelor's degree generally leading to a master of arts, McCuistion reported that no historically-Black college offered work beyond the master's level. At the time of the survey, Blacks were enrolled as graduate students in seven Black colleges in the South and eighty-two colleges outside the South (McCuistion 1939, 5-12).

Although the option to attend graduate school in the North was theoretically available, southern Blacks were often academically unprepared and financially unable to do so. The crux of the problem, then, was that Blacks who remained in the South for advanced schooling were unable to obtain a doctor of philosophy degree or even a master's degree of real substance, while Blacks who chose to attend schools in the North often faced a succession of summer school sessions and were not automatically free of discrimination. In occupations where Blacks had to work in close proximity with whites (e.g. medicine, social work, and teaching) northern schools often relegated Blacks to alternative experiences. Some northern medical schools advised Black students to take at least two years of their medical education in Black schools due to the difficulty of placing them into integrated clinical situations. This argument was also used to discourage Black education majors from practice teaching because "Negro teaching problems were different" and, by inference, not applicable to white schools (Frazier 1933, 330).

By 1934 the GEB began to grant the fellowships directly from its New York office instead of sending the
funds to sponsoring universities. Early fellowship recipients were selected in an informal manner, screened by college presidents and agency officials and then recommended to the officers of the GEB. As the program became more formalized, awards were divided into training fellowships and research fellowships. The presidents of the colleges had to "sponsor" candidates, who were then interviewed by officers of the GEB. Written references, as many as seven, had to be furnished, and medical reports and study plans submitted. It was important for candidates to be goal-oriented, acceptable to the institutional president, possess a "good personality", be majoring in a desirable field, and young enough to show promise. But of paramount importance was the candidate's ability to render service to the institution which employed them and to which, it was expected, that they would return.

One of the goals of the GEB, after all, was to provide personnel who could develop the national university centers by staffing new departments and teaching courses leading to the doctorate. But the difficulties of involving institutional presidents in the candidate selection process was noted by Charles S. Johnson, director of the noted Social Science department at Fisk University and a member of the Rosenwald Fund Fellowship Committee, who feared that "institutions may regard fellowships as awards for loyalty or meritorious service or financial need not primarily related to scholarship; or as a means of strengthening weak men in weak departments" (GEB Papers 1938, Johnson, 1).

The monthly stipends for whites receiving training fellowships and studying at northern universities was 100-$120, while white researchers received up to $150. Blacks received stipends of 75-$100 and up for training fellowships and up to $150 for research. Whites studying at southern universities received 90-$100, while Blacks received $40-60. There was also an allowance for dependents for whites of $50 for a wife and $10 per child. For Blacks, it was $25-50 for a wife and $10 per child, not to exceed $30 for each (GEB Papers 1934, Hill letter).

When examining the source of the recommendations, there is a discernible trend toward the granting of awards to whites on the part of sponsors affiliated with state departments of education. The recommendations for Blacks, however, rarely came from personnel at state departments and almost always emanated from institutional presidents or deans of Black colleges such as Tuskegee, Morehouse, Kentucky State, Fisk, Howard, and others. Most of the GEB fellowship awards granted under the Southern Program went to education candidates during the years 1922-1937. White researchers in education received 317 of 432 total awards; Black researchers in education received 166 of the 609 fellowships given to Blacks.

In 1951, a fellowship directory was published as a result of a confidential inquiry of fellows. The directory included 2000 fellows from 1922 to 1950, listing personal information along with professional information such as degrees held at time of the fellowship, institutions which granted them and dates. Data related to the fellowships included the institution with which the fellow was affiliated at the time of appointment, the major field of study, and location of institution. Occupational information including later degrees, field of study, present address, and current position. Selected examples of education majors include Francis L. Atkins, who, when awarded a fellowship in 1923-25, was a "teacher in a colored high school in Winston-Salem, North Carolina." He stated that he "also assist[ed] the principal of the State Normal School in certain lines of office work. " He is listed in the directory as president of Winston-Salem Teachers College (GEB Papers, Atkins file, n.d.). Florence O. Alexander was a supervisor of practice teaching at Langston University (perhaps Colored Agricultural and Normal University of Oklahoma). She became "assistant supervisor for Negro schools, state department of education and director of teacher placement for Jackson College, Mississippi " (GEB Papers, Alexander file, n.d.).

In fact, the directory is replete with evidence of upward mobility for education majors who received fellowships. But whether that mobility is directly attributable to the fellowship is not easily discerned. Fellowship programs yield few dramatic results, and their efficacy is difficult to measure over time. What is not difficult to discern is the extent to which the fellows heeded the admonition to return to the South. The directory reveals that 84.9 per cent of the fellows resided in the South in 1951 (Directory 1951, xvi).

In April, 1953, letters went out from the Board's officers stating as follows (GEB Papers, 1953):

"It has not been the purpose of the GEB to continue in perpetuity. Our assets have now been reduced to the point where we must think of an early termination of all activity and it has occurred both to the officers and to the trustees that it might well be useful and appropriate for the Board to provide
for a substantial continuation of fellowship and scholarship aid. This might still be of strategic value to southern colleges and universities in their efforts to provide training for their staffs and to recruit able young people for careers in teaching and research. In a sense, this might have been the final legacy of the Board at the termination of its own program.

By 1954, the resources of the GEB were diminished and the fellowship program was transferred to the Council of Southern Universities under the title Southern Fellowship Funds, where the goal was to promote graduate and professional education in the South. In retrospect, Fosdick wrote that "nothing threatened the outcome of this race more than the absence of trained leaders" and quoted Robert M. July, a GEB officer, as stating in reference to the fellowship program in 1953: "The philosophy for all fellowship programs is based on the very sound notion that any organization, from a total society to the smallest and most casual group, will be productive to the extent that it contains enlightened, educated individuals of sound judgment and intellectual curiosity, of emotional stability and unprejudiced minds, of mental discipline and broad social responsibility" (Fosdick 1962, 314).

While a great many of the talented individuals who took their places as department heads, deans and presidents of Black colleges and universities were the recipients of a GEB fellowship, the "value," or objective measurement, of fellowship programs is not easily quantifiable. While McCuistion stated that the fellowships "represented a sound and enduring investment," he also felt that their greatest impact had been in state departments of education, although "many colleges, schools of education, and other departments have been greatly strengthened through fellowship aid" (GEB Papers 1937, 4). In the collective opinion of the officers of the Board, "the results of the fellowships or scholarships granted to Negroes had been "somewhat disappointing" (Fosdick 1962, 313). But McCuistion admitted that "evaluations or comparisons of achievement through the various activities of the Board are difficult "(GEB Papers 1937, 4). It is tempting to speculate about the Board's satisfaction with the state departments of education, which largely represented white fellowship holders, and its admitted disappointment with Black fellows. For the purposes of this paper, however, it is sufficient to draw attention to the underdeveloped methods of evaluation. It is just as unproductive to compare the wide-ranging Board activities to each other, as McCuistion suggests, as it is to draw comparisons between the development of Southern state departments of education with that of Black colleges. In fact, the instrumental philosophy that was a hallmark of the Board contributed to the difficulty by insisting upon the separation of individual achievement from that of institutional progress. Evaluated within the context of the provision of Black higher education in the South, the fellowship awards undoubtedly contributed to the formation of a cadre of leadership whose influence persisted into the 1960s and 1970s.

It was the summer of 1951 and the Korean Conflict had greatly intensified Cold War tensions between the existing super powers and their respective allies. Still reacting to the earlier antagonisms and devastation that had been produced in Europe during World War II, a small group of influential Cincinnatians opened an international youth camp for a group of eleven year olds as a transcultural experiment for promoting global understanding and, hopefully, world peace. Under the auspices of the newly established Children's International Summer Villages organization (hereafter referred to as CISV), founded by psychologist Dr. Doris Allen of the University of Cincinnati (Green 1995), forty-nine children from seven European countries and Mexico were brought to Cincinnati in June to join six local children for a month long experiment in international living. Amongst them were differences of race, ethnicity, language, nationality, and religion—all exacerbated by the relatively recent experiences of World War II. Some of these children had fathers who had fought for opposing sides, others had direct, personal memories of the conflict, and a few were even considered war damaged children (Ruth Allen 1951, 29-5).

The purpose of this paper is to examine the outcomes of CISV's first ever summer village through the eyes of the social scientists who were assembled to do research. As a prototype for subsequent villages which have since served nearly 127,000 participants worldwide (Sally Stein 1997), the results from this first action research effort were instrumental in planning and promoting future summer villages.

The first CISV summer camp (the terms "camp" and "village" will be used interchangeably) consisted of fifty-five eleven year old children, plus seventeen adult delegates who served primarily as chaperons and translators. Nine different nations were represented, including Mexico and the United States and from Europe the following: England, France, West Germany, Austria, Sweden, Denmark, and Norway. Seven different languages were spoken by these children, which led to the researchers' first question: How would they communicate?

The camp program and schedule were very similar to a typical American summer camp of the 1950s (Allen and Shepard 1952, 5). Children began the day with breakfast and a cleanup of their living quarters. Then followed an hour of nature study and another of arts and crafts, ending the morning with free swimming and swim lessons. Swimming was very popular with the children and a relief from the hot and humid weather typical of summers in the Ohio Valley. Recreational swimming was an integral part of the camp. The camp staff viewed it as an ideal form of athletic activity in that it and the concomitant swim lessons could be promoted easily in a non-competitive manner unlike some other sports in which competition was unavoidable. They felt that competitive sports would have been detrimental to their efforts to bridge cultural differences. In fact, when the only competitive athletic event was held, the camp staff arranged for a local soccer team from a nearby school to play a combined squad of CISV children in a match. Apparently, this event helped to especially unify the Europeans and was noted most enthusiastically in camper Ingvild Schartum-Hansen's diary (Schartum-Hansen 1954, 80-83).

After lunch, the daily scheduled program continued with a rest period, in which the campers were encouraged to either write home or make entries in their camp diaries. The children's diaries were to provide data demonstrating changes in the children’s thinking respective to transcultural experiences. Unfortunately, very few children seriously kept diaries with the exception of the previously noted Schartum-Hansen of Norway, whose work was later published as Ingvild's Diary. By mid afternoon an hour of non-competitive sports was informally held, featuring typical playground games from the children's native countries, which they in turn would share with others. For example, British boys were seen teaching American lads the finer points of cricket, while at the same time being introduced to baseball. It was just these types of cross cultural experiences that the CISV leaders had in mind when they planned the camp. Late afternoons were usually scheduled with a return to the swimming pool plus free time for children to spend with the professional camp counselors, who were separate from the adult delegate chaperons who had accompanied the children to America. After supper, the children would entertain themselves with skits, songs, and dances from their native countries which would be shared with all. At least once during the month long camp, each national delegation was responsible for entertaining the entire village. Once again, transculturalism was being
Camp governance often involved input from the children not unlike what might have been advocated by Progressive educators of the time. This is not surprising considering that Ted Wuerfel, the camp director, was also headmaster of Lotspeich School, one of the most respected private schools in Cincinnati and long known regionally as a model for Progressive education. As a child centered educator, Wuerfel wisely scheduled enough free time, including most of each Sunday, for the children to partially make their own decisions regarding what to do and with whom. The subsequent interaction amongst these diverse children would provide grist for the researchers' mill.

Finally, the camp program and schedule furnished just enough special events to provide variety to the regular schedule. Besides the aforementioned big soccer match, other events included a professional Cincinnati Reds baseball game, a shopping trip to the downtown, an enthusiastically received exhibition of Native American dance and song, and a wonderful celebration of mid summers eve sponsored by the Scandinavian delegation but involving, in true cross cultural CISV fashion, everyone. Nevertheless, special activities, particularly away from the camp, were kept to a minimum, so that the actual experiences of living, working, and playing in the month long village could have its transcultural effect on the children - plus, provide an adequate laboratory for the research efforts of CISV's social scientists.

In addition, tourist type activities away from the camp site were also minimized, because Doris Allen and other CISV leaders did not want this first village to be seen as a propagandist attempt to promote the "American Way" of life (Allen and Shepard 1952, 5). This fear that CISV's first efforts might be used by someone in our government as a form of Cold War propaganda was heightened by concerns over the potential uses of a State Department film which was produced at the 1951 village. In fact, the actual film did not result in a propaganda piece, but rather was "very perceptive about the idea of Dr. Allen, and how it worked out in practice at the first Village" (Matthews 1991, 43).

Conspicuously absent from the camp program was any type of focus group activity, or any other technique, which would have required the children to consciously examine their differences and/or similarities. Here Doris Allen apparently borrowed from Gustave Carlson, an anthropologist from the sociology department of the University of Cincinnati. Speaking before the CISV adult delegates, Carlson suggested that to productively get a diverse group of people to come together one must do it "with reference to something removed from the differences that keep them apart" (Ruth Allen 1951, no page number). He noted that interracial dinners held to discuss race problems were often quite unproductive. Instead he recommended the following approach as a more productive model for the children's camp: "bring people together, but not on the problem that keeps them apart. Do not collect Jews and Gentiles into a group to discuss anti-semitism. Get them together on another problem. It is working on a common problem in which the differences are suppressed that counts" (Ruth Allen 1951, no page number). His approach to transculturalism would prove to be quite similar to that of the first CISV village.

To summarize, CISV's 1951 summer village was organizationally similar to so many typical U.S. summer camps, yet very different because of its unique mission of peace education within the context of a transcultural experience for pre-adolescent children. Remaining to be seen was whether it would work.

As conceived by CISV's founder Dr. Doris Allen, each summer village was to consist of three components. The first was the actual summer camp for children - a month long experiment in international living, previously described. As the second component, the adult delegates were organized into a separate Adult Institute. It was carefully planned that the adult delegates, who chaperoned the children from their native countries, would have very few responsibilities in the operation of the camp program, for which experienced camp counselors were hired. Other than sharing meals with the campers, the adult delegates mostly met on their own and were housed at a separate, but nearby camp site. For the most part, their meetings consisted of cross-cultural discussions, presentations from outside experts, and various activities as well as planning for future CISV villages. The final and third component of the initial summer village was an elaborately designed and conducted research project led by Dr. Allen. Cedary, she felt the research component was critical to the success of CISV as a peace education organization and as important as either of the two other components. In fact, Matthews suggested that Allen had first regarded the research as "even a raison d'etre for Villages" (Matthews 1991, 97). Not surprisingly, Allen believed, "There is no more urgent task
today than that of finding a way for human beings to live together without the recurrent mass destruction which we call war... Our object in presenting this paper is to interest thoughtful citizens and public officials in the possibilities of fostering research and action directed toward peace" (Allen and Shepard 1952, 1).

Designed with the object of promoting peace, Allen implemented an action research project based primarily on the social science disciplines of psychology and sociology. Assembling a local team of social scientists, she also enlisted the aid of a national advisory committee whose most well known members included Robert Angell, head of the Sociology Department at the University of Michigan, and noted ethnographer Margaret Mead. The research team met weekly in planning sessions for two months prior to the opening of the camp.

Allen's primary hypothesis was "that children of different nationalities, who have not yet had an opportunity to acquire strong national prejudices, will be able to cooperate better than adults" (Allen and Shepard 1952, 3). In a sense, the children of the village were the experimental group, while the control group was represented by the adult delegates. From the above hypothesis, other hypotheses followed, such as "international understanding has to be learned," "face to face contacts provide the best situation for learning social relations," "pre-adolescent children are more easily educated than older persons in whom prejudices are more firmly set," and "an informal camp experience for one month in a group of equally numbered child delegates from five to fifteen countries can foster international understanding in children under twelve years" (Allen and Shepard 1952, 4). As noted by William Matthews, a long time administrator for CISV, Allen's hypotheses were driven by such questions as how children from different languages would communicate, what would be the main obstacles to international understanding, and would a child's ability to transcend cultural barriers be more determined by their personality than their nationality (Matthews 1991,56)?

The setting for the study was St. Edmunds, a Presbyterian camp located in Glendale, Ohio - a northern suburb fifteen miles from downtown Cincinnati. It consisted of an excellent sixteen acre residential site, which included a main building with cafeteria, dormitory facilities, an arts and crafts workshop, an outdoor swimming pool, a chapel, and large open playing fields bordered by woods. The primary subjects of the research were fifty-five children, age eleven, from seven European countries plus the United States and Mexico. Nearly all of the national delegations were evenly divided between boys and girls.

Based upon her "Research Report - Part I," Allen's research methodologies centered primarily on group observations augmented by sociometry, a technique for measuring social relations in a group. Yet, in fact, as noted by William Matthews, Allen's research techniques included more than just group observations and sociometrics. In addition, there were individual interviews at the beginning and at the close of the camp to assess a child's personality as it related to their ability to deal with cultural diversity. From the interview reports, we learned that a certain Austrian boy was "apparently in a state of conflict around the acceptance or rejection of an introjected authoritarian ego ideal" and that he tried "to maintain `peace' between the warring components through strong intellectual control," and that another boy from England revealed "himself as a scared, physically weak person," who felt "castrated and physically inept" (Doris Allen Papers, Box 1, F - Research - 3 DAT 1951 - Analysis). Researchers concluded that the camp had been more beneficial to the first boy's development. In another file, a Mexican girl camper was noted for her high level of interaction with other children from outside her delegation. The researchers concluded her personality was the main factor explaining her ability to successfully deal with cultural diversity and not her nationality, since the other Mexican girls were unable and apparently much less willing to bridge these cultural differences (Doris Allen Papers, Box 1, F-W. Research 8 Reports, 1951). However, for the most part, it is somewhat difficult for an historian to now comprehend the value of some of these psychological reports as they related to the hypotheses of the research project. Interestingly enough, even Allen herself did not expend much space in her final research report on the specific results of the individual psychological reports.

Besides the psychological interviews, other less important research techniques included the audio taping of the children in camp meetings, filming of samples of camp activities, collecting of relevant data through the children's diaries, and finally projective testing of the child delegates, including the Rorschach and a specially designed three dimensional projective instrument developed by Dr. Allen. The latter measuring tool utilized abstract objects, which the children could handle before they told a story about them (Ruth Allen 1951, no page number). According to Allen,
Matthews, and Schartum-Hansen, the children eventually grew weary of the psychological interviews and the other testing. Indeed, Ingvild Schartum-Hansen suggested in her diary that maybe the adults should be the ones tested (Schartum-Hansen 1954, 108). Again, there is not much in Allen's final research report discussing the results of these lesser used techniques.

Based upon group observations, the researchers measured interpersonal relations along the following three variables: 1) the frequency of the contacts across and within national delegations, 2) the origins of the interpersonal contacts, were they initiated by the children or by the adult counselors or as a result of the camp program itself, and 3) "the feeling tone of interpersonal contacts," thus were they positive, negative, or neither (Allen and Shepard 1952, 7). Observations of various activities were done, including nature study, arts and crafts workshops, sports and games, and of course recreational swimming.

The basic findings noted a total of 4504 observed contacts among the children in the month long camp of which 64% were between children of different nationalities while 36% were within the national delegations, thus a two to one ratio favoring transcultural contacts. Interestingly, boys were observed accomplishing more interactions both within and outside their national delegations than girls - a result not been seen in more recent villages. As for the origins of these interpersonal contacts, it was determined that 72% were initiated by the children versus 28% by the adult counselors or the camp program itself, thus nearly a three to one ratio favoring child initiated contacts. In short, the children were not forced to interact with others from different cultures but chose on their own to do so. Of course, the central question remains - what would be the quality of the transcultural, interpersonal contacts? The results revealed that 62% of the child interactions were deemed positive in tone, while 33% were considered as undetermined in emotional tone, neither positive or negative. Most revealing and probably gratifying to Allen's researchers was the finding that "of the 4504 total observed child inter-actions, less than 5% - 4.8% - were scored as negative responses" (Allen and Shepard 1952, 9).

Beyond the aggregate data, further extensive analysis was done by nationality and gender, generating some rather detailed statistics. For example, the Austrian and Mexican delegations had a significantly higher number of negative tone interpersonal contacts as compared to other delegations. The English were noted as high in their total number of interactions with other delegations while the Danes were rated low.

Not to be lost among the data collected above were the results of the sociometric studies, in which one setting was utilized - the dining hall. The children were permitted to sit with whomever they wished without adult interference, either from the camp counselors or their adult chaperons. Observed were 3,334 child meals, each one "defined as one child eating one meal in the dining hall" (Allen and Shepard 1952, 28). As one might guess, reams of data were generated including numerous diagrams of cafeteria tables with their occupants. Although children sometimes ate with others outside of their nationality, they more often remained within their own delegation for meals as compared to other camp activities. It was speculated that after crossing cultural boundaries all day long in other activities that the children might have felt the need for the perceived comfort of eating within their own national delegations. Further research was deemed advisable.

Doris Allen and her research team concluded that "the 1951 United States Camp was a success" (Allen and Shepard 1952, 38). Children from different international backgrounds had been brought together successfully and had transcended their cultural differences with broader implications for peace education. They realistically noted the above results were not without some exceptions. William Matthews, in his work entitled Here in This Village, noted the following: "It was clear that there had been some fights between the children. Were they just personality clashes, or were they international fights? In a number of cases they had been the latter" (Matthews 1991, 87). Evidence of such fighting was also noted in the minutes of the meetings of the adult delegates (Ruth Allen 1951, 26-1), in which Austrian, Danish, Norwegian, and German boys were involved. However, researchers concluded that some level of fighting was to be expected within any group of children, but that the very small amount which had actually occurred in the first CISV village did not negate its overall transcultural success.

Interestingly, the media uncritically reported that the first CISV village was a total success. For example, Look magazine ran an article with the subtitle: "Forty-eight youngsters from eight foreign countries and U.S. show adults from all over the world that they can find nothing to be unfriendly about in Cincinnati." Later in the story, it
reported that "all international relations at the Children's International Summer Village were as good as chocolate ice cream" (Look August 28, 1995, 13). Similar accounts appeared in McCall's, General Motors Folks, The Christian Advocate, The Times Educational Supplement, New York Times Magazine, The Cincinnati Pictorial Enquirer, and Recreation magazine, whose conclusion echoed the other periodicals: "At the end of the month, all campers had lived and played harmoniously together" (Schroder 1952, 501).

Although it is evident that its contemporaries viewed the first CISV village as a great success, how might we view it today, from a more critical perspective, especially as a research project. Perhaps its greatest flaw is that the subjects, thus the children, were not really randomly selected from any larger population. To be sure, a rigorous selection process was employed, but part of its criteria unavoidably included a predisposition toward international experiences, and in fact a few of the children had even already had some exposure to such cultural diversity. One might even argue that CISV was preaching its transcultural message to the choir, but this would ignore the fact that there was still much that divided these children along cultural lines. It is a mark of CISV's first success that rather than develop larger cultural barriers when the children were brought together face to face, which could have happened, that in fact the opposite took place - a truly positive, transcultural experience.

Announcing a New Book

The editors of the *Journal of the Midwest History of Education Society* are proud to announce that Garland Press released *Politics, Race, and Schools: Racial Integration, 1954-1994* by Joseph Watras, a professor at the University of Dayton. As part of the series "Studies in Education/Politics" edited by Mark Ginsburg, this new book looks at racial integration in urban neighborhoods and in public, private, and church related schools.

Although there are many excellent studies of racial integration, *Politics, Race, and Schools* offers three unique features. First, it combines descriptions of how public, private, and church related schools underwent racial desegregation. Second, by focusing on a moderate sized city, Dayton, Ohio, the book shows how national trends influenced local schools, religious institutions, and technically unconnected aspects of city administration. Third, it shows how curriculum theorists responded to political changes.

Dayton serves as an excellent place to test ideas about racial integration in northern cities. The city is representative of other parts of the country. It has a mix of manufacturing, agricultural, and military activities, and the citizens lack the isolationist impulses found elsewhere. Further, since the city is not as large or complex as Chicago or New York, a scholar can explore such diverse activities as city planning, community activism, private philanthropy, and religious development. However, Watras does not let the Dayton case stand alone; he repeatedly compares and contrasts the experiences in Dayton with those found in previously published studies about other parts of the country.

Watras divides the book into three parts. In the first, he considers the national role played by federal courts and churches in school desegregation. Here, he offers a brief description of the NAACP campaign to integrate society and the response of politicians, educators, and church people. With the second section, Watras narrows the focus to Dayton, Ohio looking at the ways city administrators, neighborhood activists, and black separatists influenced racial integration. In this part, he describes the response of local private and Catholic educators. In the third section, he evaluates the ways that curriculum development influenced racial integration, the effects of compensatory education programs on racial integration, and the roles that schools play in social reform.

Watras relied on a variety of research sources. He interviewed almost two hundred people, collected documents from the schools, read the many affidavits NAACP lawyers submitted to federal district court, and searched local archives. As a result, the book is densely packed with information, however, the prose is clear and direct.

Editorial Policy: The Journal of the Midwest History of Education Society is devoted to the reflective examination of educational issues and problems from the perspective of diverse disciplines. With the Journal, the Midwest History of Education Society encourages communication among scholars of varied disciplines, nationalities, and cultures. Papers published in the Journal discuss comprehensive issues and problems confronting educators throughout the world.

The Journal has published authors from disciplines ranging from political science to philosophy to marketing to instructional technology to adult education. Its editorial board consists of a diverse group of professionals who referee articles according to their expertise. While the main criterion of acceptance consists in a well articulated argument concerning an educational issue, the editors ask that all papers offer a historical analysis. Authors should contact the editor to receive a copy of the style sheet before writing the paper.

Articles published in the Journal do not necessarily represent the views of the editor, the editorial assistants, the members of the Society, or the University of Dayton. The authors of the articles are solely responsible for the accuracy and truthfulness of their work. The authors are solely responsible for ensuring that they do not infringe on copyright, violate any right of privacy, and do not use libelous or obscene language.

Articles appearing in this journal are abstracted and indexed in Historical Abstracts and American History and Life.
From the Editor

Several people made possible this issue of the *Journal of the Midwest History of Education Society*. The Dean of the School of Education at the University of Dayton, Dr. Patricia First, supported the project generously. The authors whose papers appear in these pages offered work of the highest quality. The editorial board and the associate editors worked diligently and carefully. Anna Victoria Wilson of North Carolina State University set the format of the journal.

The *Journal* offers an important outlet for mature scholars and for students beginning professional careers. In these pages, as at the annual meeting of the Society, papers of all types appear together each reinforcing the other.

Influences of the 1957 School Desegregation Crisis on Little Rock

Michael J. Bercik
University of Pittsburgh

The purpose of this paper is to clarify how the community of Little Rock was influenced by the US Supreme Court’s school desegregation order in 1957. This paper will examine the response of the Little Rock community to the desegregation crisis from three distinct perspectives. First, the desegregation order’s influence upon the polarization of white and African American groups within Little Rock will be analyzed. Second, study of the anti-federalist reaction on the part of white Southerners to the intent of the 1954 Brown vs. the Board of Education decision will be explored. Finally, the roles which women undertook in the Little Rock community during the desegregation crisis will be brought into clearer historical focus.

The determination of the executive and judicial branches of the federal government to implement the legal intent of the 1954 Brown vs the Board of Education and the 1955 "With All Deliberate Speed" decisions would have a profound influence upon the attitudes and way of life within the Southern community of Little Rock. Until the Brown decision, legal school segregation existed in seventeen states. Arkansas was one of these states.

Virgil T. Blossom was chosen to be Little Rock’s superintendent of schools shortly after the announcement of the US Supreme Court’s May 17, 1954, Brown decision. Before coming to Little Rock, Blossom lead a successful desegregation effort in the school district of Fayetteville, which is located in Northwestern Arkansas (Nelson 1975). As early as the Summer of 1954, Blossom began to develop a plan of gradual racial desegregation for Little Rock’s school system, the Blossom Plan. The Blossom Plan would allow for a limit on desegregation for only two high schools in the fall of 1956. This would accompany desegregation for junior highs in 1957 and elementary schools in 1958.

Little Rock School Board members were in favor of an alternative approach to school desegregation, the Little Rock Phase Program (Williams 1987). This would limit school desegregation to only Central High School, and the timeframe for initiating desegregation at Central High School would be set for the Fall 1957. The Little Rock School Board minutes explain this time delay. "Since our school system has been segregated from its beginning until the present time, the time required in the process as outlined should not be construed as unnecessary delay, but that which is justly needed with respect to the size and complexity of the job at hand" (Minutes of the Board of Education of Little Rock School District, May 24, 1955).

The National Association for the Advancement of Colored People (Williams 1987). saw the compromise plan of the Little Rock school authorities as an instrument of delay tactics to appease white opposition segregationist groups like the Capital Citizen’s Council. Not until 1957 was the N.A.A.C.P. seriously listened to. However, there were moments in Fall of 1957 when not all African American organizations reacted in a unifying manner during of Little Rock’s desegregation crisis. The Little Rock chapter of the Urban League was one such African American organization.

During the early beginnings of the desegregation crisis in Little Rock, there was indication of African American solidarity within and outside Arkansas for the efforts of the N.A.A.C.P. in Little Rock. The Arkansas State Press, an African American publication, republished in its October 18, 1957, issue an editorial titled "Support The NAACP To Erase That Guilt". Essentially, the editorial was encouraging African Americans to support the N.A.A.C.P. with financial contributions and by becoming registered members.

Months before the September 1957 desegregation crisis, white citizens groups, who were not sympathetic to the court order for racial desegregation for Little Rock’s schools, made their influence felt. FBI Interview Report, #LR 44-341, written by FBI Special Agents Alfred J. Mobley and Richard T. Hradsky concerned a September 6, 1957, interview with Harold James Engstrom, a Little Rock School Board Member, at his place of employment, the Arkansas Foundry. Even though Engstrom was adamant in his denial of any knowledge concerning the existence of white supremacist groups, he did indicate that he was aware of the existence of a White Protective Association over the course of the past six months. Engstrom informed Mobley and Hradsky that he and fellow Little Rock School Board members had been discussing the existence of the Association. However, Engstrom and his fellow school board members believed the Association’s existence did not amount to much until the last two or three weeks before the opening of school in September 1957.

Underneath much of this growing tension between African American and white organizations was a reflection
of Southern attitudes. In an American Broadcasting Company series titled *Survival & Freedom*, broadcast journalist, Mike Wallace, interviewed James McBride Dabbs, a Southern scholar, during the height of the Little Rock crisis. In the initial phase of the interview Wallace reminded Dabbs how African Americans had been an influential force in the South since 1865 but that their plight had been often forcibly maneuvered out of sight in Southern society and politics. Dabbs suggested part of the problem between African Americans and whites in the South had to do with economics, when the African American was frequently denied opportunity or discriminated against in the market place.

Some outsiders to the crisis in Little Rock do not know of the influential role certain women fulfilled from the outset. This is also true for the long demanding legal and political battles occurring in the years following the intervention of U.S. Army troops. Section 7 of an FBI report written by Special Agent Eldon C. Williams on refers to an organization known as the Mothers League of Central High School. "This league was formed during August, 1957, and it has been said by some of the members of this organization that it was formed for the purpose of keeping Little Rock schools as they had been previously" (segregated). . .and to use peaceful and legal means to accomplish this purpose" (ASAC Williams 1957, Section 7). However, the League did not abide by its philosophy. Many members declared they had been working in an uncoordinated effort to encourage whites in Little Rock to gather on the grounds of Central High School on the morning of September 3, 1957 to demonstrate their opposition to school desegregation. This gathering was anything but peaceful.

Another group of white women established an organization titled the Women's Emergency Committee in September of 1958 to oppose attempts to close the public schools entirely (Murphy 1997). "The Women's Emergency Committee to Open Our Schools is dedicated to the principle of free public school education, and to law and order. We stand neither for integration nor for segregation, but for education" (Murphy 1997, p.101). Irene Samuel was one of the W.E.C. members who was capable exemplifying the mission of the W.E.C. when she spoke to a group of Alabamians in the town of Mobile in June 1963. Her speech carefully reviewed the problems and lessons resulting from the desegregation crisis in Little Rock. She stated, "Furthermore there was a total lack of communication between the white and Negro communities. This communication is essential. A good-working bi-racial committee, composed of white and Negro community leaders could have alleviated many of the difficulties we encountered" (W.E.C. Notes 1958-1963, p.16, Box 6, Folder 9).

This paper has attempted to provide a better understanding of how the U.S. Supreme Court's 1954 Brown vs. the Board of Education decision was responsible for influencing traditionally accepted communal educational and social practices between whites and African Americans from the summer of 1957 until June 1963. Hopefully, an improved historical understanding of how school desegregation genuinely influenced Little Rock has emerged.

Segregation In The North Through Redistricting: A Case Study

Brad Frey
Geneva College

In the northwest corner of Beaver County, a section of Pennsylvania just northwest of Pittsburgh, Beaver Falls High School had for years serviced not only the Beaver Falls School District (which included White Township and Eastvale Borough) but also provided grades 9-12 for Highland Suburban Jointure and Big Beaver Jointure. In November of 1963 the State Board of Education had adopted "Standards for School District Reorganization," which put counties on notice that plans to consolidate school systems were to be developed. Act 150 of the General Assembly in 1968, a supplemental bill, created two new districts in northwestern Beaver County (Reorganized School Districts 1970, 1-7). This formation of new districts caused racial tensions to erupt.

State Act 150 separated 14 municipalities in Beaver County into two school districts. Eleven of those municipalities had previously all attended Beaver Falls High School. Three of the municipalities, South Beaver, Darlington Township and Darlington Boro, had made up the Northwestern School Jointure. To understand the racial dimension of this split, Table 1 lists the total population and number of minorities in each municipality (U.S. Census 1970).

</table>
When the redistricting had been completed, the lines seemed to most racially gerrymandered. Four of the municipalities lay parallel to each other running one after the other along a long ridge. The newly formed Blackhawk District contained Patterson Heights, Patterson and West Mayfield. The Big Beaver Falls District maintained White Township. Both Patterson and West Mayfield had less than 1% minority population and Patterson Heights had 4%, while White Township had 20%, the largest minority population of any of the municipalities.

While median income data is not conclusive, five of the municipalities comprising the Blackhawk School District had a higher median income than any of the seven municipalities comprising the Big Beaver Falls School District. The Blackhawk School District represented those well off, while Big Beaver Falls represented those who were economically struggling. So severe was the split that the Big Beaver Falls superintendent hosted a breakfast for area realtors to try to convince them not to recommend clients to avoid the district, a longstanding practice.

The result of these actions was to create a segregated situation in the area schools which had never existed before. While much of the country was going through the trauma of desegregation, this area was able to reverse that trend and bring segregation where there had not been any educationally.

How was the plan that separated these two districts developed? The September 9, 1968, minutes of the Beaver Falls School Board contains some of the history supporting the desire to have one large unified district instead of two separate districts. The minutes note, "Every respected authority in the field of education who has studied the structure of the school systems of the northwest area of Beaver County, unbiased by local parochialism, local politics or local emotions, has recommended the combination of the four school systems (all 14 municipalities) into one administrative unit" (Beaver Falls Minutes 1968a).

Those same minutes reference two other important facts. On May 10, 1961, the then Superintendent of Public Instruction of the Commonwealth of Pennsylvania, Dr. Charles Boehm, recommended a combining of the four school systems of the northwest area of Beaver County (Beaver Falls Minutes 1968a). The following year, on May 25, 1962, a committee of experts given the task of reviewing a survey report done by the Northwest Beaver County Planning Committees (Dr. Earle Liggitt, Dr. Charles Saylor, and Dr. Howard Stewart) also recommended that the entire area be combined and organized into one administrative unit. They believed this would best meet efficiency concerns, quality concerns and community spirit concerns (Beaver Falls Minutes 1968a). Finally, in 1965 a Supplemental Order from the State Board of Education also suggested a total merger (Beaver Falls Minutes 1968a).

The rationale for dividing the area into two rather than one district was explained in two different interviews. Dr. S. Robert Marziano is currently the Director of the county's Intermediate Unit, what the county board of education evolved into. Dr. Marziano had recently been hired as a school psychologist by the county board when these events were unfolding. When asked what role politics may have played in developing a plan which changed course from earlier recommendations he said, "None." He said it was quite simply a matter of misjudging population growth. He said the formulas they were using to make their projections were just wrong (Marziano 1997).

A second perspective was advanced by Dr. Charles Groff. Dr. Groff was the Supervising Principal of the Highland Suburban Jointure (the largest piece of what would become the Blackhawk District) until 1970 when he became an Assistant County Superintendent. He said there had been a plan drawn up that would include all four districts in one but there was a sticking point. The high school was overcrowded and a new facility needed to be built. The people in the Highland Suburban Jointure insisted that the building be built outside of Beaver Falls because it would be too congested to have the school in town. From Dr. Groff's perspective this was totally unacceptable to the Beaver Falls Board because of their arrogant attitude. It was clear to Dr. Groff that if there could have been agreement on where to build a new high school, there would have been a single district (Groff 1997).

When the county announced its plan for separate districts, Beaver Falls School District and the Big Beaver Jointure prepared an appeal. Their appeal raised several significant issues. Most of the issues revolved around the belief that bigger is better. A bigger district would have more resources, allow more opportunity and have a wider blend of experiences. The appeal contended that "it is highly questionable whether any other of these systems (except combining all four) will meet the racial integration standards pronounced during this past year by the State Board of Education in conjunction with the Pennsylvania Human Relations Commission" (Beaver Falls Board 1968a).
Another issue was contained in the State's response to the appeal. In turning down the appeal the State said there was no racial imbalance proven and that topography favored the plan for two districts (Beaver Falls Board 1968b). This response is problematic. Regardless of what levels of integration the Human Relations Commission was looking for, it is difficult to accept that creating one district with 23% minority and another with less than 1% was what was intended. If this were not primarily a race issue and mainly an issue of population misprojection and school location, it is curious that in another part of the county where those same two issues, population and school location, were at stake (Ambridge, Baden, and Economy) that the county mandated the merger into one large district (Jute 1997). The main difference in that merger was that there was no issue of race.

Margaret Moss, longtime president of the Beaver Valley Branch of the NAACP, said that the legacy of the split will always be a factor in the community (Moss 1997). At a time when many parts of the country were trying to end segregation, Beaver County effectively started it.

This paper will examine President Dwight D. Eisenhower’s efforts to enact federal aid to education by analyzing his views on the major issues that emerged in the political battles over such aid during his eight years in office (1953-1961). I will identify and attempt to analyze any inconsistencies or contradictions between what he publicly stated and subsequent legislative or executive actions. I will also examine his political motivations for seeking such aid and will examine how the political times and events during his administration contributed to an emerging presidential role in the political struggles over the issues in federal aid to education.

Eisenhower often spoke glibly in generalities about the necessity for improved education so that all could become "better citizens," and he talked about "the best possible education for all our young people" (Public Papers of the Presidents of the United States 1955, 243). On the other hand, he did not refer to the injustice of the vast inequality of educational opportunities between the states and between local districts. This was tempered, however, by his statements in some of his recommendations that aid be based on need and that "the greatest help go to the states and localities with the least financial resources" (Public Papers 1956, 21). Although avoiding the issue of vast inequalities in education, Eisenhower’s legislative proposals were insistent that federal monies be used to help the poorest states (Public Paper 1956). However, Eisenhower was not so much concerned that the neediest states receive funds to reduce the inequality in education as he was concerned that "the firm conditions of federal aid must be proved by lack of local income" (Public Papers 1953, 32).

Eisenhower, even before becoming president, was emphatic that federal aid, especially federal aid for all states, meant federal control and expressed a deep concern about the possibility that federal control could result in a more centralized government, which he emphatically opposed (Congressional Record 1949, A3690). Yet in spite of his strong view on this issue, there were in fact elements of federal control in many of Eisenhower’s legislative proposals. For example, his 1955, 1956, and 1957 proposals all stipulated that all such aid requested must be spent for the construction of school buildings (Committee on Education and Labor 1960). Similarly, his 1958 National Defense Education Act (NDEA) proposals placed strict federal requirements upon local schools to spend federal monies on improving mathematics, science, and foreign language education. Furthermore the equalization formula, contained within many of Eisenhower’s education proposals, was also a form of federal control. Thus Eisenhower, who was incessant in his pronouncements against federal control, actually included strong federal regulations within his legislative proposals.

The issue of segregated schools was glaringly omitted from Eisenhower’s public speeches supporting legislative proposals for federal aid to education. For example, when questioned about an anti-segregation amendment to a 1956 school construction bill Eisenhower replied that although he believed in the principle of equality of opportunity for every citizen of the United States, he was bound by what the Supreme Court had recommended, i.e. "a gradual implementation" (Public Papers 1956, 187). The same controversy emerged again and was the main cause of the defeat of the 1956 school construction bill (H.R. 7535) (Public Papers 1956, 187).

Representative Adam Clayton Powell (Democrat-New York) in 1956 submitted an amendment to a bill prohibiting federal aid to states that failed to implement the 1954 Brown decision of the Supreme Court on the desegregation of schools. The amendment caused a curious realignment of votes. Some liberals, favorable to both civil rights causes and federal aid to education bills, voted against the Powell amendment, while 96 Republicans, who eventually voted against the bill, voted for the amendment. Both groups apparently reasoned that if the Powell amendment passed it would arouse sufficient opposition from a block of southern conservative Democrats and conservative Republican votes to defeat the bill. Although there was considerable debate over the principle of the Powell amendment, Eisenhower remained silent. Northern liberals opposed to the amendment pleaded with fellow liberals to join them and insisted that the issues of segregation and school aid should be kept separate less the school aid bill would go down to defeat when the bill came to vote. That is precisely what happened.

Just as Eisenhower avoided discussion of the Powell amendment, he avoided referring to the segregation of schools specifically in connection with federal aid to education. Not even during the Little Rock crisis did the President
speak out against the injustices of school segregation. Instead, he justified sending federal troops "solely for the purpose of preventing interference with the orders of the Court" (Congressional Quarterly Almanac, XIII 1957, 658).

In the post World War II years the long overdue political struggle over school segregation had begun to receive national attention mainly because the National Association for the Advancement of Colored People (NAACP) and other civil rights organizations mounted increased political pressure upon state governments, Congress, and the president to integrate the schools. Yet most public schools remained solidly segregated and an awareness of segregation in the nation's schools was literally forced upon Eisenhower because of the mounting criticism leveled against this entrenched discriminatory practice, especially after the Supreme Court's historic school desegregation decision of 1954. Nevertheless, as President, he avoided the issue whenever and wherever possible.

The main reason for his avoidance of the segregation controversy in his federal aid to education proposals was apparent; he knew full well that his speaking out on this issue would have only antagonized vested political interests, especially his political support in the south. Historically, however, the time was right to take political action. Indeed it was a sad commentary on Eisenhower’s moral leadership that he did not speak out loudly and clearly against the then vast injustices of the deep-seated segregation policies and practices in the nation's schools.

Eisenhower set up the White House Conference on Education in 1955 and appointed the Committee on Education Beyond the High School in 1956 (Committee for White House Conference on Education 1956). Composed of distinguished educational leaders and lay personnel, its task was to study and make recommendations in the field of higher education. The committee issued an interim report to the president in November, 1956 pointing out issues in higher education that needed careful scrutiny. In his January, 1957 Special Message on Education, Eisenhower referred to an important issue in the interim report: "It [Committee's Report] pointed out that much more planning is needed at the state level to meet current and future needs in education beyond the high school" (Public Papers 1957, 93).

In 1956 Congress had passed Public Law 813 authorizing federal aid to the states so that they could establish state committees on education beyond the high school. However, Congress failed to appropriate the necessary funds. Disappointed over its failure, Eisenhower recommended that "Congress now appropriate the full amount authorized under this legislation...I recommend that the Congress amend Public Law 813 so as to authorize grants to the States of 2.5 million dollars a year for three years for these purposes" (Public Papers 1957, 94). Even this meager request by Eisenhower met with unfavorable action by a Democratic controlled Congress.

It is apparent that the various surveys of the schools conducted during Eisenhower's two terms in office influenced his legislative proposals. For example, Eisenhower's school construction proposals were a direct result of the reports by the state conferences and the White House Conference on Education in 1955. Clearly the surveys conducted during Eisenhower's years in office served as an important basis for discovering what the schools' future needs were and formed the basis for justifying his requests for federal aid to education. Moreover, it appears to have provided a basic rationale for federal support of educational research and planning in the years to come.

Eisenhower offered limited educational legislation for two main reasons. First, he wanted to strengthen the nation economically and militarily. Second, he thought such support was important to his political career. Thus, Eisenhower wanted the federal government to support education even if it furthered the interests of the "military-industrial complex."

The historic launching in 1957 of the Soviet spacecraft Sputnik directly and profoundly increased Eisenhower's support of federal aid to education, especially federal aid for school construction and for the training of teachers of mathematics, science, and foreign language. Although Eisenhower consistently praised the nation's teachers and their importance in our society well before Sputnik, he consistently refused to make specific requests for federal aid to support teachers' salaries. His praise of teachers revealed an increasing contentment with what he considered to be their improved status. But this was contradicted by their continued low pay, poor working conditions, and their overall poor quality.

Eisenhower's contentment, however, was shattered with the Union of Soviet Socialist Republic's (U.S.S.R.) historic launching of the satellite Sputnik I into orbit in October 1957. In his Special Message to Congress on education
in 1958, he abruptly shifted from his pre-Sputnik position of no federal aid for teachers' salaries to requesting limited, special support for them. With the explicit intention of improving the subject matter knowledge of science, mathematics, and foreign language teachers, Eisenhower recommended federal funds specifically for teacher training institutes. For this purpose he recommended that Congress authorize federal grants to the states on a matching basis. These funds would be used according to the discretion of the States and the local school systems either to employ additional qualified science and mathematics teachers, to help purchase laboratory equipment and other materials, to supplement the salaries of qualified science and mathematics teachers, or for other related programs. By stating that federal funds for the support of teachers was to be used at the discretion of state and local school systems, the president seemed intent on preserving the integrity of his previous statements advocating local control. However, and even given the states discretionary power, the idea of supporting teachers with federal funds was indeed clearly contrary to Eisenhower's previous position. Congress' rapid and overwhelming support of Eisenhower's NDEA request was clearly a reflection of their desire (as well as Eisenhower's) to improve the nation's position in the space race between the United States and the U.S.S.R. Education became the principal vehicle in the nation's attempt to close the space gap caused by the Soviet's dramatic breakthrough in space exploration.

Although he began his first term of office requesting an extension and expansion of impacted aid, Eisenhower soon became reluctant in that support and eventually suggested that it be significantly reduced so that aid would be provided only where federal personnel both lived and worked on federal property. He believed it was unfair for the federal government to give aid to school districts that were benefitting in tax support from increased federal activities in their districts. To give federal subsidies to a district that was already benefitting from increased federal activity was tantamount to preferential treatment for those districts. Although Eisenhower's contention that this practice was unfair was quite accurate, his reluctance to support aid to impacted areas went well beyond his concern for the inequity of this type of aid to a much greater concern that impacted aid was becoming a permanent government fixture, and a very costly one at that. Becoming frustrated over the increasingly large amounts of aid for impacted areas, Eisenhower felt compelled to reduce, or at least slowdown, the flow of such funds (U.S. Congress, House Committee on Education and Labor 1963, 66). Clearly a reduction in federal expenditures for such aid was consistent with Eisenhower's conservative fiscal policies. Since impacted aid had been such a politically popular form of aid with most Congressmen and also with most of the American public, it appeared that Eisenhower was making a politically courageous move when he sought to curb such aid. What appeared on the surface to be an attempt by him to provide a more equitable distribution of funds to poorer states for education was, however, in reality an attempt by him to hold down and even to reduce total federal spending on education, or at least, to prevent future expansion of such spending.

Eisenhower entered the 1952 campaign with a strongly negative view toward federal aid to education. He held this view long before becoming president of the United States. For example, while president of Columbia University (1949-51), he spoke often and with great enthusiasm about "democratic citizenship" (Jacobs 1992, 455) while warning about the centralizing effect of federal aid to education, and how federal aid would result in federal control. Furthermore, his early reluctance to support federal aid to education was largely a result of his opposition to what he considered "reckless spending" (Childs 1958, 108). Despite this viewpoint, Eisenhower recognized in the campaign the grave national classroom and teacher shortages and called for some federal support to relieve these conditions. Indeed, and throughout the campaign, he vacillated between providing federal aid to education was largely a result of his opposition to what he considered "reckless spending" (Childs 1958, 108). Despite this viewpoint, Eisenhower recognized in the campaign the grave national classroom and teacher shortages and called for some federal support to relieve these conditions. Indeed, and throughout the campaign, he vacillated between providing federal aid to the critical condition of the nation's neediest schools and his conservative opposition to federal spending. Any support for federal aid that he did give was nearly always tempered by a cautious concern about excessive federal spending. But neither Eisenhower nor Stevenson (Stevenson 1952, 204) devoted much of their campaign rhetoric to the issue of federal aid, and this issue was of little if any consequence in the election of 1952.

Eisenhower's view on federal aid to education changed, however, by the time he accepted the nomination in 1956; by then he was more favorable. Similarly, the Republican platform of 1956 favored such aid in sharp contrast to their platform of 1952 (Porter 1966, 500). Throughout the 1956 campaign Eisenhower increasingly spoke in favor of federal aid to education while less often invoking the dangers of federal control and reckless federal spending. The
President campaigned mainly in support of federal aid to school construction and blamed the Democrats for the failure of his school construction program. At the same time, Stevenson, although not a strong advocate of federal aid to education, increasingly spoke about the poor condition of the nation's schools (Stevenson 1952, 9).

Although both presidential candidates, and especially Stevenson, gave more support to federal aid to education in their campaign speeches in 1956 than in 1952, and although the issue of federal aid became an issue in the campaign of 1956, it was overshadowed by other factors in the election and, consequently, had little effect on the outcome.

Although Eisenhower expressed concern about the shortage and the poor status of teachers, he also commented on what he considered to be their "steadily improving condition" (New York Times 1958, 4). Such a contradiction in regards to the teachers' plight could only serve to confuse the issue and the public. Until his legislative proposals in the NDEA, Eisenhower was unalterably opposed to the idea of federal aid to teachers' salaries. It took the threat of Soviet space superiority to convince him of the need to change his position. Sputnik even caused Eisenhower to talk about "national goals" and "national standards" for teachers, strange talk indeed for one who had on many occasions spoken publicly about the need to retain local control and avoid federal control of the schools.

In his final year in office (1960), Eisenhower predictably returned to his earlier opposition to federal support of teachers' salaries. When the President was asked about federal funds to support teachers' salaries he caustically replied:

"I do not believe the Federal Government ought to be in the business of paying a local official. If we're going to do that, we'll have to find out every councilman and every teacher and every other person that's a public official of any kind ... and try to figure out what his right salary is ... I can't imagine anything worse for the federal government to be into." (Congressional Quarterly Almanac, XVI 1960, 232).

It is apparent that Eisenhower did not believe in federal aid for teachers' salaries. His refusal to recommend it prior to the launching of Sputnik reflected his real attitude about such aid. Clearly the aid recommended in the NDEA proposals of 1958 in support of specific teacher training would not have occurred had he not been gravely concerned about the perceived national security problems caused by Sputnik.

Seldom in his early years as President did Eisenhower speak about the problems of higher education. Yet these problems continued to mount and in 1956 Eisenhower finally decided to make modest recommendations for higher education. However, Congress refused even to provide the very modest funds necessary to implement his basic recommendations. But with the launching of Sputnik, both the Congress and the President stampeded toward passage of legislation to aid higher education. Eisenhower strongly requested federal aid for scholarships and fellowships, and especially grants to improve the physical sciences. Congress then quickly approved the NDEA of 1958. It was clear that both Eisenhower and Congress were moved into action as a direct result of what they perceived to be a serious threat to national security. It was obvious that Eisenhower's lukewarm support of higher education was based on improving higher education in accordance with the nation's immediate security needs. And those proposals were designed primarily to provide only short-term emergency relief. He also knew that the kind of scientific advances needed at that time could best be provided by higher education institutions.

Eisenhower often opposed grants as a form of federal aid to education. He distinctly preferred the purchase of local school district bonds rather than federal grants. With the important exception of the NDEA, federal grants were the kind of federal aid least acceptable to him. Yet his requests to Congress for aid were usually a combination of federal bond purchases and some form of grants.

In 1958 Eisenhower abruptly shifted his requests from the purchase of bonds for local school districts to a request for federal grants. This was because his emphasis on federal aid to education had shifted from only school construction aid to aid for a variety of specialized programs. For Eisenhower, purchasing school bonds was more appropriate for school construction and federal grants were better suited for specialized programs. What enabled him to make this shift more easily was his on-going belief that the NDEA, like school construction aid, was a temporary kind of federal aid designed only to meet the "Sputnik crisis." In his 1959 and 1960 federal aid requests, Eisenhower...
Eisenhower and Politics of Federal Aid

Martin

did in fact return to a form of his earlier school construction aid, with the added change that requests were now based on a long-term plan of 30 to 35 years.

Speaking on the issue of school construction Eisenhower said, "If speedily and fully utilized, this Federal program — added to the increased basic efforts of States and communities — should overcome the nation's critical classroom shortage within five years. Once this shortage is overcome, the federal grant program can and must terminate" (Public Papers 1960, 66-67). In a later statement at a news conference, he said:

And I have come to the conclusion that because some of those difficulties were brought about by national emergencies, [Depression of the 1930's, World War II, and the Korean War] the National Government ought to help, — and I say help only — since is it beyond the power of the State to get those buildings built. Then we should turn the whole thing back to the States, and have nothing more to do with it (Public Papers 1960, 243).

Eisenhower's strong fiscal conservatism led him to oppose permanent, costly aid and caused him to go to great lengths to prevent it from occurring. And Eisenhower's requests to Congress for federal aid were often contradicted by his earlier political position.

Eisenhower reacted to the demands of the times, especially to the continuing poor condition of American education in the 1950's, and to the international political crisis caused by Sputnik. Eisenhower supported federal aid to education because he believed that such aid was primarily in our national interest. Moreover, he was well aware that Congress was more easily convinced of the need to support it on this basis.

Eisenhower's support of federal aid to education was more a result of the conditions of his time than they were a result of his own political convictions. Clearly his efforts were directly related to the school crisis at hand; teachers had left the profession in unprecedented numbers, mainly because of low salaries and poor working conditions, and many of the schools were overcrowded, in disrepair, and badly in need of financial help. The schools were facing a crisis of unprecedented proportions and Eisenhower had little choice but to seek some federal relief. Although Eisenhower had tried to avoid the usual political controversy that accompanies federal aid to education legislation, he could not prevent himself from being drawn into it. More than any factor, it was the controversies that emerged during the political struggles over federal aid that hindered Eisenhower's modest attempts at gaining aid for the schools.

Eisenhower's enormous national popularity enabled him to speak glowingly about the virtues of local control and his belief in the continued historic responsibility of financial support by local and state governments. Yet he knew full well that the schools remained overcrowded and underfinanced. Although Eisenhower was an unenthusiastic supporter of federal aid to education, his numerous political requests and actions on such aid revealed an increased concern about federal aid to education over that shown by any previous president. He set a precedent for such federal aid to become an important national issue, and presidents henceforth would have to contend with this issue.

In addition, and perhaps most important to future presidential administrations, were the many controversial political issues emphasized in the political discourse over federal aid to education that were included in Eisenhower's legislative proposals. Such issues as educational equality, flat or equalization grants, segregated schools, federal control, impacted areas aid or general aid, often formed the basis for subsequent national political debates over the nature and purpose of federal aid to education. Many of these same political issues confront Congress and especially the Office of the Presidency today. Indeed, the significantly increased political discourse and the partial resolution of such issues was a major turning point in the history of presidential support of federal aid to education. In the end the legacy of the Eisenhower years constitutes a watershed for federal aid to education policies — from a century and a half of minimal presidential support early on in our history to one of major political involvement by presidents for nearly the past half century.

Evangelicals and English Charity Schools in the Eighteenth Century

Ronald Ferguson
Ball State University

The religious awakening in eighteenth century England infused a sense of urgency and seriousness into the Evangelicals. This was a time of social and missionary zeal. These religious radicals were convinced that society needed a transfusion of morality into the spiritual veins of the people. Sin was like a dark cloud engulfing the nation, and peoples' souls were in danger. The purpose of this paper is to examine the influence the Evangelicals had on one aspect of reforming society, the charity schools. The Evangelicals' general perception of society will be discussed first in order to show how the conditions of society motivated them to action. Next, some basic doctrinal beliefs will be examined because they provide a foundation for their educational ideas. The remainder of the paper will explore the charity schools that were supported by Evangelicals, including the pedagogical methods and curricula used for moral instruction.

Evangelicals were very concerned with the moral health of eighteenth century English society. They pointed to John Locke's writings on the virtues of individual rights and freedoms as contributing to the disintegration and fragmentation of society. This emphasis on the recognition of individual rights for the common man was evident in the literary, political and economic works of this period (see Edwards 1943, 53). From an Evangelical perspective, an indulgence in the glorification of the individual could lead to the sin of pride and hedonism and they cited many examples as evidence that this was already happening.

Drinking and brutality were often identified as two great villains of moral virtue. Premature deaths and the rapid increase in crime and violence were linked by the Evangelicals to the consumption of alcohol. The manufacturing of distilled spirits is reported to have reached eleven million gallons by 1750. This was over twenty times more liquor than was produced in 1684 (Edwards 1943, 99). During the early part of the eighteenth century deaths exceeded births (Elliott-Binns 1953, 55). According to Elliott-Binns, "This was in part due to the excessive gin-drinking. . . . Many members of the upper class shortened their lives by hard drinking, and their indulgence in any case undermined their constitutions. . . ."(55). The Methodists' response to this problem was to avoid spirits and drams unless prescribed by a physician (Edwards 1943, 101).

The tentacles of brutality reached into all areas of society. Popular sports like hunting fox, boxing, baiting of bears and bulls, and cock fighting were characterized by cruelty and viciousness (Elliott-Binns 1953, 47, 48). The English also amused themselves by attending cheap forms of entertainment. These included, "The whipping of half-naked women at Bridewill, the stoning of unpopular pilloried prisoners, and public executions" (Miller 1965, 12). The English had a reputation for resorting to violence as a means for handling conflict or to protest. Miller notes that "No nation rioted more easily or more savagely--from 1774-1830 angry mobs, burning and looting, were as prevalent as disease, and as frequent in the countryside as in the towns" (14).

Evangelicals' educational ideas are grounded in their doctrinal beliefs. Therefore, some highlights of some prominent theological beliefs which relate to education will be discussed. A foundational conviction for all Evangelicals is that the Bible is inspired by God and therefore is the final authority for all matters of faith and practice. A central teaching of the Scriptures is that humankind has fallen from grace through the rebellion of Adam and Eve in the garden of Eden. The consequence of this first sin is that all people are tainted by sin from birth.

From an Evangelical's point of view, sin is a very serious problem because it separates the sinner from God. The only solution to this dilemma is to accept by faith the substitutionary sacrifice of Jesus as an atonement for sins. The Evangelicals stressed that this was a definite act at a particular moment in time (Elliott-Binns 1943, 387). Evangelicals were convinced that people needed to hear about the salvation that was possible through Jesus and they were motivated to get personally involved in all types of social and educational endeavors as a means of spreading the Gospel. Their backing of charity schools, and prison and hospital visitation "were in the vanguard of most social movements of the latter half of the eighteen century" (Sangster 1963, 20).

The Evangelicals' perception of God also had a profound influence on their lives. They portrayed God as a harsh judge, who vengefully poured out His wrath on sin in order to motivate children and adults to live a "God fearing life." This was in essence an attempt to "scare the hell" out of the person. Another method of trepidation was to use the
fear of death as an educational strategy (see Sangster 1963, 145). They would instill this fear through hymns, children’s literature, and sermons, often drawing on illustrations from everyday life. Rowland Hill, an influential Evangelical wrote in "Instruction for Children:"

Two sinners God’s just vengeance felt
For telling one presumptuous lie:
Dear children, learn to dread his wrath,
Lest you should also sin and die (134).

There were many contemporary object lessons from life that pastors, teachers, and parents could draw on to show that God inflicts His wrath on sinners. In one instance a boy who fed his rabbits on Sunday was punished by God. The boy’s rabbits died (Sangster 1963, 135). Basically, the Evangelicals believed that misfortune was God’s way of getting even for a previous sin and since He was no "responder of persons" He would inflict His wrath on adults as well as children. Conversely, if someone escaped harm or recovered from a serious illness they believed these were special dispensations of God’s benevolent favor (163). Therefore, self-examination was taught in order to “nip sin in the bud,” and thus keep God’s vengeance at bay.

A primary aim of Evangelical educators was to prepare children for heaven and, in so doing, they would also be fighting social evils and moral decay. John Wesley, probably the most influential Evangelical of the eighteenth century, established the theoretical framework for education among Evangelicals. Wesley outlined his educational philosophy in a sermon "On the Education of Children" and in a letter "A Thought on the Manner of Educating Children." The text for Wesley’s sermon was, "Train up a child in the way wherein he should go: And when he is old, he will not depart from it" (Proverbs 22:6). This task was to be a joint effort involving God and man. God’s role was that of the “physician of the soul.” As the Great Physician He treats spiritual diseases in order to restore spiritual health and uses men and women to be His earthly assistants in the treatment of these diseases (Wesley 1984, 7:87). Wesley described a number of "diseases" of human nature that could be cured by proper training. These included: atheism, self worship, pride, love of the world, anger, deviations from the truth, and acts contrary to justice (7:88, 89). His optimism with the role education could play was evident when he asked:

Now, if these are the general diseases of human nature, is it not the grand end of education to cure them? And is it not the part of all those to whom God has entrusted the education of children, to take all possible care, first, not to increase, not to feed, any of these diseases; (as the generality of parents constantly do;) and next, to use every possible means of healing them (7:90)?

In "A Thought on the Manner of Educating Children" Wesley reinforced some of the points he made in his sermon. He also took the opportunity to reflect on the educational philosophy of Rousseau. Wesley proclaimed that Emile was, "the most empty, silly, injudicious thing that ever a self-conceited infidel wrote" (Wesley 1984, 13:474). Wesley disagreed with Rousseau's view of childhood innocence and the need to follow nature. According to Wesley, the purpose of education was not to follow nature, but to "set it right. This, by the grace of God, was to turn the bias from self-well/[sic], pride, anger, revenge and the love of the world, to resignation, lowliness, meekness, and the love of God" (13:476). If possible, this was to be done gently; however, "if this does not get the desired results, then we must correct with kind severity" (13:477). He reminded the reader that this action was necessary and of the Scripture passages which declared, "he that spareth the rod, spoileth the child" and "For, 'whom the Lord loveth He chasteneth, and scourgeth every son whom He receiveth" (13:477). Wesley made one final plea in the last paragraph of his letter. He wrote:

In the name of God, then, and by the authority of His word, let all that have children, from the time they begin to speak or run alone, begin to train them up in the way wherein they should go; to counter work the corruption of their nature with all possible assiduity; to do everything in their power to cure their self-will, pride, and every other wrong temper. Then let them be delivered to instructors (if such can be found) that will tread in the same steps; that will watch over them as immortal spirits, who are shortly to appear before God, and who have nothing to do in this world but to prepare to meet Him in the clouds, seeing they will be eternally happy, if they are ready; if not, eternally miserable (13:476).
The Evangelicals took Wesley's advice seriously and fervently applied his educational principles in their homes and
charity schools.

Prior to the emergence of Methodism some serious minded Christians were already involved in educating the
poor. The Society for the Promoting of Christian Knowledge (S.P.C.K.) was a vanguard Christian society that was
started in 1698 and typified the climate of the eighteenth century which "was marked by a very real sense of pity and
responsibility for the children whose physical and spiritual interests were lamentably neglected..." (Jones 1964, 4). The
members of the society were disquieted, "by the atheism and indifference of the fashionable and intellectual world"
(36), and they responded by forming groups for prayer and to share spiritual experiences. In the process their attention
was drawn to the lower classes and they "were profoundly disturbed by the ignorance and indifference of the poor" (36).
The S.P.C.K. was able to arouse among the clergy and laymen a sense of responsibility to the under privileged--this
also included those "whose parents could not afford to send them to school" (36).

One solution to this problem was the establishment of charity schools as a cheap method for effecting reform.
It was inexpensive because they could use any unoccupied room and basic equipment was minimal--benches, slates and
pencils, and a few books (Jones 1964, 34). Some felt all this, plus an inexpensive uniform for boys and girls, could be
provided for about twenty pounds per year (31). These funds were raised through the solicitation of subscriptions,
which in the eighteenth century was a favorite form of benevolence by pious and philanthropic men and women (3).
Subscribers to charity schools signed a document acknowledging the need for these schools, along with their financial
pledge. The document stated, in part that:

it is evident to common observation that the growth of Vice and Debauchery is greatly owing to the
gross ignorance of the principles of the Christian Religion, especially among the poorer sort. And also
whereas Christian Vertue [sic] can grow from no other root than Christian Principles, we, whose
names are underwritten, being touched with zeal for the honour of God, the salvation of the souls of
our poor brethren, and the Promoting of Christian Knowledge among the poor...do hereby promise to
pay yearly during pleasure...towards the setting up of a school within this parish for the teaching poor
children...to read and write and repeat the Church Catechism (38).

The charity school was to give the student a basic education with an emphasis on Christian piety and
knowledge. The master of the school had to be at least twenty-five years old, a member of the Church of England, and
pass an exam on the principles of the Christian religion. In addition, he was to have an aptitude for teaching, be able
to write well and understand arithmetic (Edwards 1943, 120). The Methodists, as a society, did not organize nearly as
many schools as S.P.C.K. This was not because of their lack of individual enthusiasm or conviction for the need to
educate the poor, but, "The lack of organised effort in the establishment of schools for the children of the poor was due
in main to the concentration of reforming zeal upon the adult, in the belief that it was the quicker and more certain
method of national regeneration" (Jones 1964, 138). The enthusiasm for these charity schools "began to wane after the
middle of the century" (Curtis 1953, 195). It is reported that this decline was due, in part, to bad management. Probably
more critical was the lack of interest by the parents of the poor to sacrifice their child's earning power in order to send
them to school. Curtis notes that, "By 1780 the influence of the charity-school movement had practically ceased, and
the schools of industry, never very numerous, were declining in numbers" (197).

The schools of industry were an attempt to motivate parents to send their children to a school where they could
receive an elementary education, be trained for an industrial occupation, and make a small income in the process. A
very influential Evangelical in establishing schools of industry was Hannah More. Prompted by a visit from
Wilberforce, (1789) Hannah was challenged to abandon her plans of quiet retirement in order to help the poor in the
Mendip area, a group of villages south of Bristol (Miller 1965, 73). When Wilberforce visited Hannah they traveled
through the area and became acquainted with the poverty and decay. Later, in a letter, by Hannah indicated that there
was little chance for improvement, since "There were thirteen adjoining parishes without a resident curate" (Miller 1965,
76). In response to this glaring need, Hannah, along with her sister Martha, started a Sunday school and a school of
industry in the nearby village of Cheddar. Eventually other schools were opened in the surrounding villages (79).

These schools, like other schools of industry were supported through subscriptions (Lawson and Silver 1973,
Another similarity between More’s school and others like it was that they were an over-all failure (Jones 1964, 155). In Hannah’s case her initial intention was to teach "the children to spin yarn for the stocking-makers of Uxbridge [and this] would not only pay for itself but give them some small earnings" (Miller 1965, 79). This idea was thwarted because there was too much waste and the work was of poor quality. Thus, the focus of the school shifted from industry to a school that "concentrated almost entirely on training the children for domestic service" (79). Eventually the industrial schools were, "to be Superseded by the monitorial schools, which were seen to be able to handle more children, more cheaply" (Lawson and Silver 1973, 239).

Even though the schools for the poor started by S.P.C.K. and the schools of industry eventually gave way to other types of schools, they did serve a useful purpose and they filled the gap for education for the lower classes. However, the Evangelicals, in their efforts to take seriously the need for education for the poor, did come upon a system for providing cheap education. This innovation was the Sunday school.

The Sunday schools were the most successful form of charity schools undertaken by the Evangelicals. This movement "owed its astonishing success to the desire of the poor for learning, combined with the creation of a means which enabled them to obtain it without the diminution of the earnings, 'all little enough', which they received in six-day working week" (Jones 1964, 149, 150). In addition, the costs of running a Sunday school were minimal, especially since the Sunday schools eventually were able to be conducted with Volunteer teachers (Rice 1917, 17).

Robert Raikes (1736-1811) is credited with being the founder of the Sunday school movement in 1780 (Sangster 1963, 112). Raikes reflected the general beliefs of Evangelicals regarding their optimism in education as a means for the moral transformation of society. He proposed that, "The aim of the Sunday School is the reformation of Society... one only practicable by establishing notions of duty and discipline at an early stage" Jones 1964, 146). Hannah More in a tract "The Sunday School" stated that the Sunday school could improve society because it will prevent crime. She asks, "Will your property be secured so effectually by the stocks on the green, as by teaching the boys in the school, that for all these things, God will bring them into judgement" (Sangster 1963, 111)? The enthusiasm for the potential of the Sunday school was also shown by the chairman of the Sunday School Society, who in 1795 boldly proclaimed: "Sunday Schools will not fail, under Divine Blessing, to teach that 'fear of the Lord which is the beginning of wisdom', and steadily inculcate the duties of sobriety, industry, temperance, and Subordination, as well as a due regard to and observance for, the Christian Sabbath" (Miller 1965, 26).

If attendance is any indication of success, then the Sunday schools were undoubtedly successful. According to Sangster 250,000 had been enrolled in the Sunday school by 1787 (Sangster 1963, 112). By 1818 a parliamentary committee estimated that 500,000 pupils were attending Sunday Schools (Miller 1965, 24). Raikes stated that, "The children presented themselves in crowds on Sunday mornings at the schools. They came 'with great regularity'. Cold, dark, rainy mornings did not deter them" (Jones 1964, 147). Some of the Evangelical attributed the Success to the fact that, "God inspired it; Social conditions and the spirit of Christianity called for it" (Rice 1917, 11). One should not, however, lose sight of great financial benefits of the Sunday schools. They met only once a week and volunteers taught the classes. These factors certainly were a significant contribution to its success. Curtis offers yet another perspective for its success. He believed that, "The Sunday School movement of the eighteenth century owes its importance not so much to what it actually achieved, as to the idea towards which it strove, namely universal education" (Curtis 1953, 201).

According to Jones, "In broad outline the Sunday school movement was a replica of the early charity school movement" (Jones 1964, 152). Therefore the following discussion of the Sunday school will shed light on the whole charity schools movement. The basic outline for the Sunday school was modeled after Raikes' school at Gloucester. A typical day began at 9:00 A.M. and continued until 6:00 P.M. The only breaks during the day were for meals and attending church services at 12:30 and 3:00 P.M. (Sangster 1963, 114).

The curriculum may have varied somewhat, but the Bible, common prayer book, and a catechism served as the basic materials. During the school day children would recite prayers, sing hymns, answer Bible questions and learn to read (see Rice 1917, 17, 18). Obviously, the choice of curriculum was intended to provide basic moral instruction as the pupil learned his lessons. Catechisms were used to, "prepare the children both for a full knowledge.
of their Christian beliefs and—much more important—for their personal Salvation" (Sangster, 42). The format of instruction was primarily question and answer. One Evangelical catechism that was used contained this lesson on Hell.

Q. What sort of place is Hell?
A. A dark: and bottomless pit, full of fire and brimstone.

Q. How will the wicked be punished there?
A. Their bodies will be tormented by fire (Sangster 1963, 139).

Likewise, the stories of Mrs. Trimmer and Mrs. Sherwood are packed with moral lessons taken from events of everyday life. Elliott-Binns makes an interesting comment on the literature of the Evangelicals when he states that the value of the literature was not necessarily as literary pieces but "as 'documents' which reveal the thoughts and ideals which inspired their authors" (Elliott-Binns 1953, 396). Mrs. Sherwood's most Popular book, *The History of the Fairchild Family*, contains over two dozen stories for the purpose of moral instruction. In the chapter on the Sixth Commandment, Mr. Fairchild happened upon a fight between his three children, Lucy, Henry, and Emily. The altercation was interrupted by Mr. Fairchild, but before order could be restored there was one final volley of verbal attack with Emily crying out, "I hate You! I hate you with all my heart, you ill-natured girl!" Lucy retorted, "And I hate you too; that I do" (Sherwood 1977, 53)

Mr. Fairchild took immediate action. He disciplined all the offending parties and rebuked them by reciting the first two stanzas of the Isaac Watts hymn that appears above in this paper, "After which he made them stand in a corner of the room, without their breakfasts; neither did they get any thing to eat all the morning-, and what was worse, their papa and mamma looked very gravely at them" (Sherwood 1977, 53). At dinner time papa called them and asked if they were sorry for their grievous behavior. "'Oh! yes, Papa! yes, Papa! we are sorry,' they said" (53). Their father then proceeded to instruct them about the evils of hating others and being controlled by anger. He remind them of wicked Cain who in anger killed his brother and of the passage in the Bible that states, "Whosoever hateth his brother is a Murderer, and ye know that no murderer hath eternal life abiding in him" (55).

However, the lesson was not yet complete. Mr. Fairchild decided to use a real life object lesson to reinforce the seriousness of the consequences of hatred. He took them to an abandoned estate. They came to a broken down house with an overgrown garden. Just between a dilapidated garden wall and the nearby woods, "stood a gibbet, on which the body of a man hung in chains: it had not yet fallen to pieces, although it had hung there some years. . . the face of the corpse was so shocking, that the children could not look at it (Sherwood 1977, 57). Mr. Fairchild explained that: the man who hangs upon it is a murderer—one who first hated, and afterwards killed his brother! When people are found guilty of stealing, they are hanged upon a gallows, and taken down as soon as they are dead; but when a man commits a Murder, he is hanged in iron chains upon a gibbet, till his body falls to pieces, that all who pass by may take warning by the example (57).

Mr. Fairchild then recounted the story behind the hanging. He explained that there were two brothers who were spoiled and disobedient as children. They often quarreled with the servant and each other. "As they grew bigger, they became more and more wicked, proud, and Stubborn, sullen and undutiful " (58). The outcome was obvious, the one brother killed the other in anger. The lesson to be learned according to Mr. Fairchild is that by nature we are inclined to hate but we must rely an God to give us new hearts in order to love: "then I shall 'love my enemies, bless them that Curse me, do good to them that hate me, and pray for them that despitefully use me and persecute me'" (60). Upon hearing this Lucy asked Papa if they Could kneel down and pray for new hearts. Mr. Fairchild was agreeable, "So he knelt upon the grass, and his children round him- and afterwards they all went home" (60).

The moral instruction of this story is brought home though a graphic and fearful account of what could happen to children who grow up with anger in their hearts toward others. Many of the other stories are also designed to instill the "fear of the Lord" into the children who read or listened to Sherwood's stories.

The Sunday schools were funded through subscriptions, just as the other charity schools were. Wesley actively campaigned for Methodists to support the various charity school societies. He did this in part by exhorting people to consider the possessions of this world's goods as a trust from God (Jones 1964, 150). Christians were to meet
the basic needs of their families, "but beyond this he had no further defensible claim to use property for his own good" (150). Many Christians must have heeded Wesley's admonition because it was certainly an age of philanthropy.

Literacy in Eighteenth-Century Michigan:
The Marriage Register at Fort Michilimackinac

Andris Vinovskis
Ann Arbor, Michigan

Literacy -- the ability to read and write -- has frequently been studied by social historians, seeking to understand
the lives of our ancestors. The ebb and flow of literacy in North America has been a frequent topic of
investigation. Many studies have focused on the New England region and some have been directed at other areas
of English settlement. Recently the study of literacy has been expanded to include a few settlements of New France.
The findings of these investigations reveal a startling fact: literacy rates in these French settlements are significantly
lower than those of colonial New England. Indeed, they have some of the lowest rates of literacy in the western world
in the eighteenth century. This makes the study of literacy in pre-nineteenth-century Michigan especially timely and
interesting because the French settlements there represent some of the furthest westward expansion of French influence
while at the same time, they provided the basis for subsequent English colonization.

Studies of eighteenth-century literacy have not examined the northern Michigan settlements which were
occupied by the French until 1761 and then by the British until 1797. An examination of literacy in this far-flung
outpost of early European settlement will be useful for comparison to similar studies of the cities and rural regions of
eastern North America. Literacy data in the form of marriage register signatures from 1741-1821 are available in a
document now kept in St. Anne's Church on Mackinac Island. By examining the signatures in this register, it is possible
to estimate the rates of literacy at this French outpost during the second half of the eighteenth and the early nineteenth
centuries.

The limited number of written records left throughout the centuries are the only clues to patterns of literacy in
the past, and the interpretation of these sources is subject to much debate. Wills, deeds, marriage registers, and other
documents, to which people were asked to sign their names, if they could, are the only evidence of literacy skills
available for analysis when detailed school records and reliable census information do not exist for a particular area.
Historians use these sources to develop estimates of the levels of literacy in various parts of the world by examining
how many people could or could not sign such legal documents. If a person could not sign his name, this fact was often
noted on the document. An important inference drawn from these signatures is that if a person could sign his or her
name, he or she was also able to read -- at least to some extent. This assumption is based in part on the fact that in
the eighteenth century reading was generally taught before writing (Johansson 1981).

Although there was an overall rise in the proportion of people able to sign a document during the seventeenth-
nineteenth centuries, the rates of this growth in literacy varied from place to place (Lockridge 1974, 77-78). These
variations give historians the opportunity to see which societies and classes became literate and when. At the same time,
they also allow historians to see if educational developments in European countries had any effect in their New World
colonies. Trends in levels of literacy in North America were very likely related to some degree to ideas about education
that were transferred to the New World by the new settlers as well as the initial level of education the settlers had
acquired in the Old World.

In order to study past levels of literacy, historians have analyzed literacy by gender, class, and occupation. They
have also studied literacy trends in new locales such as New France and New England. The analysis of the marriage
register from Mackinac allows us to put these concepts to work in a study of literacy in Michigan during the eighteenth
century. This article will analyze the signing rates among the brides and grooms in the marriage register and will also
use entries in the baptismal record as another source of signatures for the brides and grooms who did not sign the
marriage register itself.

The register used in this study is from St. Anne's parish church on Mackinac Island. The church was established
at Fort Michilimackinac in the 1740's and was moved to Mackinac Island in 1780. The register was kept from about
1741 to 1821 and almost all of it is written in French. Each event is described in a short paragraph that follows a fairly
standard format and varies only slightly from one record to another. Usually each entry is followed by one or more
signatures. The person officiating signed and then participants and witnesses often also signed or marked the document.
Enteries in the register occur in a somewhat sporadic fashion and were made by priests, justices of the peace, and
commandants of the fort. Although the register is primarily a record of church ceremonies, a priest was not always present at the fort to conduct the rites.

Since information was missing from some of the entries, additional sources were used to try to fill in some of the gaps. The first and most useful source is the baptismal register which is located at the opposite end of the Mackinac register. The baptismal register contains signatures by many of the same people who were brides and grooms in the marriage register. Here they signed as parents or god-parents. The lack of a signature in the marriage register did not necessarily mean that a person could not sign. It is possible that they did not sign because the register was not always immediately accessible to them. By also including information from the baptismal register, a more complete record was compiled of who was able or unable to sign as well as who was employed.

In a few cases more than one occupation was listed for the person in question. In a diverse economy some people often had several different jobs. During the eighteenth and nineteenth centuries most people did not specialize in one trade as they often do in the twentieth century. These multiple occupations may also be due to the lack of permanent settlers in the Mackinac area. As it is likely that there were more jobs than there were able-bodied men to fill them, residents often had to take on more than one job. In addition, they may have taken more than one job to make full use of their diverse talents or to fill positions which opened up due to the sudden death or departure of someone from the Mackinac area. Finally the fluctuating circumstances of life in a frontier region may have made changing employment necessary.

A microfilm of the original document was used to make an assessment of the quality of the signatures. The photographic images of the actual signatures allows judgements about the quality of the signature to be made. The signatures were graded on three levels: good, fair, and poor.

The ability to sign the register can be correlated with other information included in the entries in the register as well as information supplied from other sources to provide an analysis of which sub-groups of the population were able to sign. These results are presented as signature rates for both men and women as well as for all occupations at the fort and for the native inhabitants. As discussed earlier literacy is inferred from signature data based on the assumption that those who could write could also read at least to some degree.

The data set consists of 174 subjects with equal numbers of men and women. The register contains 184 subjects but ten of them were married more than once. Most remarriages were of couples who reconfirmed their civil marriages with a religious ceremony. A single entry was created for those cases where the marriage was reconfirmed. Two remarriages involved individuals who married again after their first spouses died.

The interpretation of the results of this study becomes more interesting and useful by comparing its findings with those of similar analyses elsewhere. Two literacy studies of New France and one of New England are used for comparison with these results. The data for New England were taken from Kenneth Lockridge's 1974 work *Literacy in Colonial New England*; the two New France studies are: Christine Veilleux's 1981 master's thesis done at Université Laval in Quebec on the county of Portneuf (located about 30 miles west of Quebec City); and Michel Verrette's 1985 article in the *Journal of French American History* on literacy in eighteenth- and nineteenth-century Quebec City.

The samples used in these earlier studies are relatively large and are drawn from several sites within the main region of each investigation. In each of these other studies the quantity of data allowed researchers to subdivide their information by some time-periods, occupations, and sometimes geographic locale. That level of analysis was not possible for the data from Michilimackinac. So, in order to present the results of all these analyses in manner comparable to the results from Fort Michilimackinac, it was necessary to re-aggregate the rates of male literacy, female literacy, and overall literacy for two of the three studies to provide comparable information. Aggregate figures for these rates in Quebec City were already provided by Verrette in his article. The data for occupations in each study were aggregated into the total number of males known to have been employed. The data from New England covers the period 1650-1762; the data from Quebec City covers the period 1750-1850; and the data from Portneuf covers the period 1740-1819. While these time-periods are different in terms of chronological dates, they are similar in being the early phases of settlement by Europeans.

The results of this investigation are divided into several parts. First overall rates of literacy in the four regions
Literacy in Eighteenth-Century Michigan
Vinovskis

are discussed; then literacy of males and how religion and occupation influence these rates are considered. This is followed by an analysis of female literacy and the differences between male and female literacy. Finally the quality of signature is considered.

By looking at signatures throughout New England and New France, an interesting picture emerges of the patterns of literacy during the early stages of the settlement of the New World. For example, figures from the investigation of seventeenth and eighteenth-century New England by Lockridge show that overall about 71 percent of his subjects in Massachusetts, Connecticut, New Hampshire, and Maine were able to sign during the period between 1650 and 1762 (Lockridge 1974, 19,39). In the study of the county of Portneuf the overall literacy rate was 13.5 percent (Veilleux 1981, 143). And according to Michel Verrette's study of literacy in Québec City, about 40 percent of the population were literate (Verrette 1985, 63).

At Fort Michilimackinac about 41 percent of the subjects were able to sign their names. This is 30 percentage points lower than the rate found in Lockridge's study of New England at the time of its settlement. It is significantly higher than the figure for the county of Portneuf and is similar to the rate for Quebec City. The rates of literacy at the fort were 27 percentage points higher than those at Portneuf and just 1 point higher than those found at Quebec City.

What might explain these variations in literacy for these four locales? The rates of literacy of any given population are affected in part by the cultural influences and occupational opportunities in those communities. In each of these early communities the religious culture was dominated by either Catholicism or by Protestantism. Occupations varied from community to community. Proximity to a port, the extent of good farming land, or the size of the town might all affect the kinds occupations prevalent in an area. These influences, religious culture and occupation, are different for the people of each region depending on the mixture of the type of religion and the nature of the work performed. It is the interplay of these influences that in the end accounts for much of the variations in the levels of literacy observed at these sites.

Both the Catholic and Protestant churches exerted considerable influence on the inhabitants of New England and New France. The Protestant church in New England promoted literacy for everyone while the Catholic church in New France did not stress literacy for ordinary parishioners. As we will see, variations in religion seems to have had a direct effect on the rates of literacy observed for men and women at the various sites. An analysis of the rates of literacy by occupation, especially in New France, will also demonstrate how the rates of literacy at various places differed according to the types of jobs available. Overall, the Protestant church was the driving force behind the generally high literacy rates in New England while variations in the lower literacy rates in parts of New France were driven in large part by occupational considerations.

Without more detailed information about the religious experiences of each individual in these communities it is difficult to specify exactly how cultural influences impacted on their literacy. However, a look at the overall levels of literacy among males at the four sites (leaving aside for the moment occupational factors) confirms the overall patterns of literacy that would be expected for Protestant and Catholic communities. Protestant areas of North America had high rates of literacy for males while the rates for males in Catholic areas were significantly lower.

Of the rates of literacy for males at the four sites, males in the New England area show the highest rate of signature. The rate of signature for New England males was 74 percent (Lockridge 1974, 19). This high rate of literacy fits with the Protestant belief in the value of literacy for everyone. In the other three communities, chiefly Catholic, the rates of male literacy were much lower. In Québec City, the rate of signature for males was just over 48 percent (Verrette 1985, 63). For the county of Portneuf, the rate of signature for males was just over 13 percent (Veilleux 1981, 143). The rate of signature among males at the fort was 57 percent. This puts the New England rate 17 percentage points above Michilimackinac, about 26 points above Quebec City, and nearly 61 points above Portneuf. Clearly there is a lot of variation among the signing rates for all the sites. This probably reflects in part the additional influences exerted by occupation.

While there was a lack of knowledge about the nature or extent of religious influence among the individuals in all of these studies, there was quite a bit of information about their occupations. An examination of the of the rates of signing among the different professions shows that literacy was valued differently by each. Males in the more skilled
professions were more likely to be able to sign their names. For some occupations, such as trader, the ability to read and write was a great asset; for other occupations, such as day-laborer, the need for reading and writing was not as great.

The results for overall literacy among those whose occupation could be determined was just over 75 percent in New England and just over 64 percent at Michilimackinac (Lockridge 1974, 25). They are only eleven percentage points apart while the rate for Quebec City was 41 percent which is about 23 points lower than the rate at Michilimackinac (Verrette 1985, 74). The rate for Portneuf was just under 19 percent which is over 45 points lower than the rate for Michilimackinac and over 21 points lower than that for Quebec City (Veilleux 1981, 60).

A variety of factors may explain why different rates of literacy were found among populations of employed males in these studies. It's possible that the high rates of literacy observed at the fort reflect the fact that literacy skills were especially useful for commercial success in the wilderness. To understand the low rate observed at Portneuf, it is important to keep mind that much of the population analyzed by Veilleux was comprised of farmers and others who required little ability to write. Of the 1,921 farmers included in her study, 85 percent were illiterate (Veilleux 1981). For the numerous traders and voyagers at the fort, it was much more important to be able to write. They needed to be able to deal accurately with contracts and accounts and a knowledge of reading and writing helped them to do this. This difference in the composition of occupations may explain much of the 45 percentage point difference in rates of signature between the samples taken at Portneuf and Michilimackinac. The sample in Verrette's study of Quebec City also included a significant number of artisans and other occupations where writing ability was not necessarily a pre-requisite for employment. This preponderance of illiterate artisans and farmers skewed downward the overall literacy for males at both Quebec City and Portneuf.

The rates of literacy among men were probably influenced by both religion and occupation. Women on the other hand generally did not have jobs outside the home during this time-period. For the most part their tasks were taking care of the home, helping to raise their children, producing some home manufactures, and growing food and keeping animals for the family's consumption. Consequently, their rates of literacy were probably mainly affected by their religion. The rates of signature among females were higher in New England than in New France. According to Lockridge's numbers over 40 percent of New England women were able to sign (Lockridge 1974, 39). Most likely these women could both read and write. However, there was probably a fairly significant number of women in the New England region who could read but not write. So rates of reading literacy in New England are probably significantly underestimated by calculations of only those who could sign their names. Interestingly, several more recent studies of eighteenth-century New England literacy suggest that an even higher proportion of women could sign their names than indicated by Lockridge (Perlmann et al. 1997). This high rate of signing is probably due to the stress placed by Protestant culture on education in general.

In the studies of Catholic New France, rates of signature among females were lower than those found by Lockridge in New England. The signature rate for females in Québec City was about 32 percent (Verrette 1985, 63). In the county of Portneuf, the signing rate for females was just under 14 percent (Veilleux 1981, 143). At Michilimackinac about 24 percent of females were able to sign the register. Since the settlements of New France were under the influence of the Catholic church which may have proscribed women's literacy or at the very least did not encourage it, it is not surprising that the rates of signature at all of the New France settlements were lower than those for New England women.

The females of the fort have a rate of signature that is about eight points lower than the rate for females in Quebec City and ten points higher than the rate in Portneuf. While the rate for Quebec City is not unexpected for an urban area, the fort and Portneuf, both rural areas, might be expected to have similar rates of signature, but they do not. The explanation for this difference might lie in the nature of life at the fort. The females of the fort may have had to take the places of absent men, both in the home and workplace; and to do so they would have needed to be literate.

Another interesting comparison can be found in the differences between male and female literacy at each site. In New England the difference was 34 percent (Lockridge 1974, 39); in Michilimackinac 33 percent; in Quebec City seventeen percent (Verrette 1985, 63); and in Portneuf it is less than one percent (Veilleux 1981, 143). It is interesting
to note that at Portneuf, there was essentially no difference in the rates of literacy between males and females (0.7 percent). This can be accounted for by the very low literacy rates for both sexes: a low male rate due to the low literacy needs of farmers and a low female rate due to both the Catholic culture and the rural setting.

At Quebec City the difference in male and female literacy rates is moderate because male literacy was not very high due to the large number of fairly low-skilled workers while female literacy was not far behind perhaps because of the urbanization of the region -- and neither male nor female literacy was promoted by the Catholic culture. The differences for New England and Michilimackinac are quite close because male and female literacy rates at the fort are lower than the corresponding rates for New France by nearly equal amounts. As mentioned earlier the males rates differ by seventeen percent and the female rates differ by sixteen percent. It is possible that the differences in literacy rates between New England and Michilimackinac are reflecting mainly the influence of two different religious cultures.

The fairly wide gap between male and female literacy at these two sites is largely due to cultural and occupational influences. The differences in signing rates for men and women in New England was very likely due to the educational values of the time. Males received much more education in Protestant New England than females did. The difference in signing rates for men and women at Fort Michilimackinac may be due to the demands of the fur trade which required some degree of literacy for men.

Only two of the studies deal with the quality of signature, the data from Portneuf as well as the data from Fort Michilimackinac. Veilleux divided the signatures into four different categories of quality: poor, fair, good, and excellent. Although the bulk of her subjects did not sign, those who did sign were interpreted to have different levels of literacy. Subjects who had excellent signatures or who had good signatures were assumed to be able to both read and write. Subjects who had fair or poor signatures were assumed to be able to read only. Those who did not sign or who made a mark were considered illiterate in her study (Veilleux 1981, 60).

In the data taken from the register at Fort Michilimackinac, the signatures were divided into three categories: good, fair, and poor. Of the males who signed, 70 percent had good signatures, 28 percent had fair signatures, and two percent had poor signatures. Of the females who signed, 67 percent had good signatures, 25 percent had fair signatures, and eight percent had poor signatures. It is important to note that 69 percent of all who signed were classified as signing at the good level and this lends support to the theory that the signature might be a good measure of literacy. A good signature from a person means the skill was used regularly and suggests that the individual was probably engaged in other literate activities as well -- like reading.

Life at Fort Michilimackinac during the mid- to late-eighteenth and early nineteenth centuries was a strong test of the settler's ability to survive in a wilderness area. The fort was a bustling trade outpost on the frontier of New France. By examining the parish register, aspects of this life are revealed even though no detailed description of the day-to-day activities was included. The people recorded in the register are predominately of French origin with a significant minority of native peoples represented through inter-marriage with the French. There is some limited knowledge of the occupations of the people in the fort. The husband's activities encompass a wide variety of occupations including tavernkeepers and traders as well as skilled artisans. The majority, though, were involved in the fur trade.

An analysis of the signatures in the marriage register at Fort Michilimackinac suggests some tentative conclusions about the level of literacy in this population. The rates of literacy were generally higher than those found in other studies of New France. There was a high rate of literacy among males. This rate was higher than that found by Christine Veilleux and Michel Verrette in their studies of Portneuf and Quebec respectively, but not as high the rates found by Kenneth Lockridge in his study of literacy in eighteenth-century New England. A moderate rate of literacy was found among females at the fort. This was higher than in Portneuf but lower than in Quebec City and in New England.

The observed rates of literacy may have been related to the level of schooling people received during the eighteenth and early nineteenth centuries. Since the fort was a considerable distance from Montreal, it seems unlikely that teachers were frequent visitors to the Fort. No mention of any teacher is made in the register. Men were literate because their trades demanded it; women showed a higher rate of literacy than in the rural areas of eastern New France, but it is difficult to say why. It is possible that women needed to be able to run the household when the husband was
away. In addition, there is considerable debate as to whether schooling during the eighteenth century took place primarily in the home or in a school and just what was taught is not known.

Education in the eighteenth century was far from universal and tended to be available to males before females and to Europeans before natives. The educational needs of the fur trade also helped to shape the literacy patterns at the fort. These jobs required a significant level of education, which, in turn, helped to fill the area in and around the fort with a population of white males who were literate to some degree. Thus a combination of education and remoteness of the fort as well as job specifications and religion helped to shape the patterns of literacy at Fort Michilimackinac. The intriguing findings of this investigation suggest the need for more case studies of life in frontier French Canada--particularly in the Great Lakes Region.

School was different in New Braunfels on December 8, 1941. It was the first day after the Japanese bombed Pearl Harbor. It was the first day after the United States declared war on Japan and entered into WW II. As students arrived that somber day, they were directed to the auditorium for a special assembly organized by the school administration. The assembly began with the students reciting the Pledge of Allegiance and then singing the Star Spangled Banner. School officials and teachers proclaimed their patriotic support of the United States entry into WW II, and encouraged the students to do the same. This assembly was the first of many that would be called to support the war. These assemblies provided school and civic leaders the opportunity to speak and perhaps propagandize the importance of community and school involvement in the war. Assembly speakers and topics included: Superintendent Sahm's, "Our Part in World Affairs" and the "World Condition in General," and Mayor Walter Sippel's "Our Part in War." The curriculum was modified in order to demonstrate the school's patriotic loyalties. One example was removing German from the course offering and effectively terminating the German Summer School Program. This was a significant move since New Braunfels was a predominately German community. Nevertheless, they overtly demonstrated their support of the war.

Valuable insights into what teachers did in their classes to do their part in the war effort is gained from reading the New Braunfels Herald, one of the weekly papers. During 1944, the paper ran a series, "Know Your High School." The series featured New Braunfels High School (NBHS) teachers. On February 18, 1944, an interview with Edwin Harden, head of the English department appeared in the new featured section. The following passage illustrates his commitment. He stated:

In our democratic culture where freedom of speech and freedom of the press are cardinal principles, the ability to use the English language effectively in writing, speaking and in reading is a human necessity; it is likewise essential to intelligent social organization, and to the individuals personal development and success in any walk of life. For these very sound and obvious reasons the study of English is required throughout the entire High School course of study.

Since proficiency in English is a qualification of intelligent citizenship, since it is a necessity in many vocations, and certainly a decided asset in any career, and since it is a requirement for college entrance and the successful pursuance of a college career, we believe that scarcely too much emphasis can be placed upon the study of the subject, with the time devoted to curriculum, with the instruction and guidance of trained and experienced teachers, and with student and parent cooperation, we believe that the aims herein set forth can be, and are substantially achieved.

Mr. Harden exemplifies the idea of teaching civic responsibility in the English classroom. A close examination of his interview indicates that students who read and write will uphold certain democratic freedoms the United States provides for its citizens. If the students of NBHS are to be "true" citizens of the United States, meaning those that freely read and write, they must take advantage of the freedoms, liberties, responsibilities of being a United States citizen. He states further that they must be literate in oral presentation and in writing. As literacy is an asset to the United States. Mr. Harden inspired his students to achieve their full, patriotic literate potential.

Two months later the paper featured an interview with Miss Julie Lee Herring, who was in charge of the History and Sociology courses at NBHS. She provided the following insights on how her subjects could be used as a tool to aide the allies. She stated:

Sociology is the science of social relationships, and we study it that we may learn how to improve the social arrangements under which we live. In order to begin making a better society, we must first have a clear understanding of the human being-his feelings, ideas, and ideals what gives him the greatest satisfaction in work, play, family life, worship, and community membership. We study to find what produces the differences in individuals, and to what extent human strength and frailty are due to environment and how much to hereditary factors. . . What shall we need as citizens eager to play an active part in a democratic society, or make it more democratic and to insure continuance? History is to a country what a memory is to an individual. And, just as an adult's actions are understandable in
direct parentage and early environment, so are the trends of nations better understood by knowing through this knowledge will come increased devotion to the high ideals and purposes of those who so courageously chartered the new course of civilization. American history is not just an attempt to show the broad currents that have determined the course of American civilization, economic status, social achievements and how these currents are still at work producing problems and results that are typically American . . . . Geography—a frontier—what effect has a frontier had on the American mind—on crime—on depressions and panics. What peoples came to American and what effect has the blending of many cultures had on our achievements and attitudes? How can we best serve our country—all these things go to make-up American History as it studied today.

Miss Herring's philosophy of teaching history and sociology emphasizes the importance of understanding our global society. The students were encouraged to critically analyze, interpret, compare and contrast a variety of global societies with respect to their history and geographic location. The students were to understand how location, environment, and a country's social history affected its development as a nation. It was theorized that these courses offered an objective study of Japan and Germany during WW II. Furthermore, it was thought that students who studied United States history could better understand the role of the United States in WW II. Miss Herring encouraged students to examine their place in history and responsibility in relationship to the events of WW II. She believed that students could best serve their country by knowing United States history and taking an active role in its democratic development. Miss Herring believed that this knowledge was power and could be used to advance freedom and democracy.

Another article in the series, "Know Your High School," featured Mr. O.C. Rode, the department head of Civics and Social Studies. He believed that:

**Civics and Social Studies are one of the most important courses in High School. The value of these courses must be judged by the use to which the pupil puts the knowledge that he acquires. Boys and girls must be made aware of the problems that lie ahead; they must be equipped to deal with these problems, and they must acquire the interest, knowledge, and attitudes [in] these objectives It is necessary to give students experience in finding facts, and studying issues, in drawing conclusions, and in carrying out civic projects.**

Civics is a course which deals with the study of the national, state, country, and city government. . . . Since the course was taught in the 8th grade, the time when youngsters would their future, we have certain definite objectives: (1) the building of character, (2) the building of Americanism, (3) choosing a vocation, (4) helping the government, (5) destroying wishful thinking, and (6) how to take care of themselves under any and all conditions.

Mr. Rode connects the school and community through the study of Civics and Social Studies. Civics was instrumental in presenting the characteristics of government responsibilities which the students of NBHS understood and responded to during the war period. This course emphasized Americanism, helping the government, and being responsible citizens. These courses, as well as the others aided in involving the students to be active citizens within their school and community during WW II.

Teachers were instructing students to apply their school work and activities to their everyday life. To demonstrate their understanding of patriotism, civic responsibility, etc., students actively participated in War Bonds and Stamp sales. They gathered scrap metal, collected nylons and baked cookies. Evidence of student involvement was demonstrated by the active participation of the students in their club activities during and after school hours. The NBHS Yearbooks provide excellent documentation of the students involvement with the war effort. The Ramblers, a boys' club dedicated to practicing parliamentary procedure and coming together with persons with similar interests sold War Stamps. They helped collect the 920, 238 pounds of scrap metal during the 1942-43 school year. The Rangerettes and the black Widow Spiders, two girls' clubs at NBHS, also sold War Bonds and Stamps. They also helped to collect nylons by going door to door in the community. A war theme illustration divides each section of the Yearbook. The club section included a drawing illustrating a giant Uncle Sam holding a large spiked "club" ready to crush a small sized fleeing Japanese soldier. This Yearbook was one students produced document that was composed of drawings,
photographs, etc., that provided a special chronology of war related events that occurred during the 1941-1942 school year. Furthermore, the Yearbook of 1943, included the following statement:

"It is not our intention to go forth into the present War torn world with the assumption that the world was created for our enjoyment; on the contrary it is our sincere hope and endeavor, that through our actions we may do our part to insure a free America, and American gifted with the three essentials of a true democracy--liberty, equality, and domestic tranquillity."

Even though the students of NBHS and the community were immersed in support of the war, there were examples of life "being normal." This "normality" included attending school, going to the movies, and holding down a job. In 1943, the NBHS Unicorns won the district football championship. The NBHS band was a first Division winner at the marching Competition Festival for Region IV in San Antonio, Texas on December 12, 1944 (Yearbook 1944).

On January 7, 1942, the school board began involvement in the National Defense Program (NDP). This program had some interesting ramifications with respect to NBHS. The board supported closing schools on certain days in order for the faculty to attend NDP meetings held out of town. At the March 3, 1942 school board meeting, the board approved the purchase of $5,000 in United States War Defense Bonds. Contributions were also made to the Works Progress Administration (WPA). School typewriters were lent for defense work. The board also subsidized summer school, but not to the defunct German Summer School. Support was given to teachers who left to serve in the military. The school and community worked cooperatively throughout 1941-1945. The local Civil Defense Unit was given permission to hold practice drills on the NBHS football field.

Additional information demonstrating the community and school cooperating during this period was provided in the New Braunfels Herald. The once a week published English paper printed numerous accounts of war related articles, advertisements, etc., during WW II. The Herald also printed school-war related items. one example appeared in the Friday, February 24, 1944 edition titled, "Our High School and War Effort:"

In keeping with a nationwide movement our high school has organized a Victory Corps and is working with an effort to do something constructive to aid the progress of the war effort on Tuesday of each week (102) of the boys of the Senior High School boys fall out for 1 hour of military drill. The work is under the direction of Lt. Jim Schumann of the Home Defense Guard. The boys receive instructions in the fundamentals of military drill and in manual of arms. Boys who take this training are excused from Physical Education classes on that day. The student body as a whole are carrying on a systematic sales of bonds and stamps.... During the spring semester of 1943 stamp and bond sales averaged well above one hundred dollars per week. .... A course in home nursing is now in progress under the direction of Mrs. Effie Coenen and 22 girls of the Senior High School age have enrolled and are taking this course. Girls were not encouraged to take this course with the intentions of going on into military service, but for the purpose of training themselves in home nursing that they might be the means of being of service on the home front and by relieving someone else who might be interpreted in joining the nursing corps of the armed forces.

This project has provided an overview and understanding the impact WW II had on the curriculum and community of New Braunfels. The interviews and conversations held with a wide range of community members that went to school or taught during this time reveal a common thread of belief: that life was good, and the war really did not change lifestyles or one's moral character make-up. Yet, when one has the opportunity to review and reflect on the Friday editions of the New Braunfels Herald, the School Board minutes, the church minutes, the Yearbooks, the photographs, the Sophienburg Archives, and other documents, on the surface the schools responded to the war effort with little disruption, but with dedicated leadership that reinforced the responsibility of being a patriotic citizen. Life during 1941-1945 was affected by the war. Students not only participated in school functions but, extended their participation to include war related efforts, i.e. rationing, teachers and students leaving to participate in the war, students scrap metal drives, car pooling, creating victory gardens, slogan contests, baking cookies, knitting, collecting nylons, attending Civil Defense meetings, keeping an eye out for enemy war planes, and the cancellation of German language classes. Yet, on the surface, required educational goals and routine school activities were unaffected. Again,
most of the individuals interviewed remember the time in a glowing, positive way. They enjoyed school, the war was on, but so was the "normal" everyday aspect that one had.

Continuity, especially in the New Braunfels schools has provided the community a unique heritage. Depending upon events that occurred, school life has been the learning center for understanding and participation in the greater global picture. NBHS was but one artifact in understanding how the curriculum affected the children as well as the community's involvement in the war. WW II came and went, but the photographs, newspapers, etc., document how the war affected the lives of every student academically and left a definitive impact on most, if not all, high school curriculums, from 1941-1945.

New Braunfels High School Yearbook. 1941-1943 and 1945.
Groveton, Texas, established in 1850, deep in the piney woods 116 miles northeast of Houston, was incorporated as the county seat in 1882. Trinity County is steeped in the history of early Texas. John Wesley Hardin, the notorious outlaw turned lawyer, attended school there. The first permanent white settler was Jesse James. His name-sake nephew, Jesse, and Jesse's brother, Frank, lived there as well (Hensley 1986, 22).

The 1,200 citizens of Groveton nurture memories of family histories that shaped this fertile land of farms and forests. For decades, Groveton has served the educational, commercial and governmental needs of farming communities such as Friday, ten miles away, where in 1922, Mattie Thelma Rosser was born.

Thelma Rosser transferred from the Friday grammar school to Groveton High in the ninth grade while the WPA was constructing new buildings with locally quarried stone. Thelma graduated at sixteen and "enrolled in Sam Houston State Teachers College, [where] the tuition was $37.50 a semester, including textbooks." She vividly remembers December 7, 1941. That evening at a performance of Handel's Messiah, she stood for the Hallelujah chorus, tears streaming down her face, thinking about all the men who would be going off to war. From the first moment of conflict, Groveton citizens were involved.

In September, 1942, Thelma Rosser took a job at her alma mater and began her long career in education. The federal government was urging women to join the work force—"We're the Janes Who Make the Planes," was a popular song. That year tens of thousands of experienced teachers quit their jobs to join the armed services or take better-paying work in defense plants. By the end of the war, over 350,000 teachers nation-wide had left the field.

For generations, the citizens of this East Texas town and the outlying farmers, generously supported their educational institutions. Classes were often held in churches, such as Ellis Prairie, where Thelma's grandmother, Mattie Jones attended. Thelma has a receipt, dated 1860, in which her great-grand parents paid the teacher, not in dollars, but in potatoes.

Josserand, a mill town four miles from Groveton, by 1884, "had both white and colored schools" (Hensley 1986, 28). Glendale, twelve miles away, boasted the "first teachers' institute in the county," where "teachers met [yearly] to pool their experiences, develop better teaching techniques, and instruct new teachers" (Hensley 1986, 94).

The first one room school in Groveton was built in 1884. The population grew rapidly due to the timber industry and in 1898 a two-story frame school building was erected on land donated by the lumber company. It had "six large class rooms and a chapel that would seat 600 people, long porches, [and] a bell tower" (Bell 1980, 119).

By 1929, the old growth timber had been cut-over, the saw mills closed, and the trains stopped running through Groveton. The population remained stable during the Depression as did the commitment to education. During the next ten years the consolidation of smaller surrounding districts made the school building inadequate and in 1938 WPA crews began constructing the stone buildings that still house Groveton High.

When the bombs fell on Pearl Harbor, the WPA was putting the finishing touches on the new school and Henry M. Lively was director of Groveton's prize winning band, the most popular event in town. As Thelma describes the citizens of Trinity County, "Parents would do without, but their children rarely wanted for school supplies." The Groveton band played in parades and competitions throughout East Texas.

The local newspaper kept a close watch on Groveton High. Unfortunately, the office burned and with it, archives of past issues. Two large scrapbooks donated years ago to the Ex-Students' Association, contain hundreds of clippings from the 1930s and 1940s. One article titled, published in the January 25, 1940 edition of the newspaper, quotes a letter from Ruth Townsend, the English pen-pal of Dorothy James, a student at Groveton High, since war has broken out...there is the blackout...half an hour after sunset all lights have to be concealed. All windows are covered up and there is no lighting in the streets...The reason for the blackout is in case there should be an air raid. [The article concludes with this commentary] Ruth's letter should make us stop to think how lucky we are. Imagine harboring the fear of air raids...yet we argue over examinations in History! We should thank God that we're reading the book of wars, not making it!
Meanwhile, far from Groveton High, the events in Europe turned sinister. Hitler's decree of October, 1939, ordered widespread "mercy killing" of the sick and disabled. The Nazi euthanasia program to eliminate "unworthy life" at first focused on newborns and very young children with abnormalities. That January, the Groveton band held a "President's Birthday" in the gym. $72.25 was raised for "the infantile paralysis fund." While Groveton students worked to help disabled children, unknown to them, the Nazis were systematically disposing of them.

News of the war in Europe captured the attention of the citizens of Groveton and the build-up in the Houston shipyards drew on the labor force. That spring there was a talent show sponsored by the P.T.A., the basketball team had a winning season, and graduation was held May 31. That June, France surrendered to Germany.

During the fall of 1940, Mr. Lively taught the students such upbeat tunes as The Saint Louis Blues. In the opening day parade for the County Fair, the Groveton band won first prize, "five gallons of Gulf oil." On October 16 the Selective Service Training Act went into effect. Mr. I. Friedman, took his job on the draft board seriously. His numerous newspaper articles urged boys to sign up.

Mr. Friedman had reason to be alarmed about Hitler. German born, Isadore Friedman, of Jewish descent, came alone to New York in 1894 at the age of fourteen. Within four years, he had worked his way to Groveton, selling wares door to door from a hand drawn cart. Mr. Friedman soon established himself as a businessman and a patriotic American and was even elected Mayor in 1927. In 1939, he helped his sister and her family escape from Germany. Friedman served on the Selective Service Board from its inception. After the war he was awarded the Selective Service Medal, signed by Harry S. Truman.

That spring, the band participated in the Mardi Gras parade in Galveston, with 500,000 spectators. According to Thelma Rosser Terry, "crowd went wild when the band danced along the sea wall." Their rendition of In the Mood was a hit. Mr. Lively developed a repertoire of "swing music, [which] on trips, made the band so popular."

The summer of 1941 was hot and humid in east Texas, the cotton and the corn were growing in the fields. Cows ambled home in the evenings. Some folks spent time in honkey tonks and some at Sunday school. Meanwhile, navy ships were escorting lend-lease shipments across the Atlantic. Henry Lively recalls "looking at teacher applications" for the coming year. Mary Alice Keeton, was hired as the Business of Administration teacher. Several other teachers who had joined the war effort were also replaced. At the national level, responding to pressure from A. Philip Randolph, the Selective Service System agreed to draft black Americans in proportion to their presence in the population. African-Americans left Trinity County in large numbers to join the military and work in defense plants. In Groveton, the school year began with the romance of Henry M. Lively and Mary Alice Keeton. Their engagement party was held December 10, three days after the declaration of war.

Marcet Williams, a junior at Groveton High 1941-42, had "been with her sister at the Sunday matinee." When they arrived home, her parents told them that "the Japanese had attacked and we might all be killed." Mrs. Williams recalls a long string of substitute teachers, many of whom had not graduated.

The February 6, 1942, paper reported that "Mr. Lively went to take a physical examination. If he is drafted the students of Groveton will sincerely regret it." Mr. Lively returned to say good-bye to his new wife and his students before leaving for basic training.

Enlistment into the military continued to impact the Groveton schools. The loss of personnel was often noted in the newspaper. On March 19, 1942, an article written by Superintendent Frank E. White proudly stated, The teachers and pupils... are doing their part to help defeat the Axis powers. Last week the pupils bought $150.00 worth of stamps... The teachers have pledged to buy $165.50 each month. This brings the total to $765.50 per month. This shows what can be done through systematic planning... The American schools believe in American ideals and they expect to do their part to perpetuate them. We are engaged in a war to the finish; let's all buy more bonds and stamps to equip the boys on the battle fronts (Groveton High School Ex-Students' Association Scrapbook, n.d.).

On April 28, 1942, at a ceremony in the high school gym, Mr. Carl Andrew Brannen, Sr. was "awarded a purple heart for bravery in the first World War." Carl Jr., a 1941 graduate of Groveton High, is one of forty Groveton Indians who died in W.W. II and whose names are carved on large stone monuments by the flag pole in front of the
During the spring of 1942, the newspaper ran many stories about young men in the service. On May 23, Eugene Rushing, class of 1933, entered officers training school; John D. Collins, class of 1937, "enrolled in the Pre-Flight School;" Reed Dominy was "commissioned as second lieutenant in the Air Corps." Months later, an article states that Reed Dominy "was piloting a P-35 when shot down over the English Channel. His body was never recovered" (Hensley 1986, 312.)

Groveton Indians went marching proudly off to boot camp. It took a few years for the casualties to start mounting. Of those three young men who were first to volunteer at the courthouse ceremony where the G.H.S. band played in October 1940, one was Staff Sergeant Woodrow V. Thompson. He enlisted for "one year of training that turned out to be four years, seven months and three days" (Bell 1980, 109). He was in heavy fighting in Normandy, the day after D-Day, and at the Battle of the Bulge. He survived, worked in the Gulf of Mexico for many years and retired in Friday.

Forty other citizens of Groveton were not as lucky. One of those who did not make it home was David Stanley Hensley, class of 1940. In high school, he won prizes for playing the baritone. He became the tail gunner on a B-24, was shot down over France, bailed out, but his parachute failed to open. Clifton Scott, "class favorite" in 1940, never made it home, a nose gunner on a B-52, he had flown twenty-two missions when he was shot down over Italy; neither did Leon Wright, active in the F.F.A. in high school, who died when his ship was bombed; nor did Sam Thomas, Vice President of the Junior class of 1940, who died on Iwo Jima. In the early years of the war, when the Sylvester school consolidated with the Groveton school system, the teacher, Wilna Liles enlisted in the military service. She was killed in action. Her name is carved, along with thirty-nine other war heroes, on the G.H.S. memorial stones and into the memories of the citizens.

The people of Trinity County mobilized, raised money, collected scrap iron, grew victory gardens, sent their sons, daughters and husbands off to war. The 1941-42 school year ended in a patriotic flurry. On May 7 the Junior-Senior Reception was held in the new auditorium. The yearbook was dedicated to Mr. Lively, "Because of the splendid training of the band...[and] his service to his country." Twenty-three young men graduated from Groveton High that year.

No articles about African-American soldiers from Groveton appeared in the newspaper clippings pasted into the scrapbooks, though they volunteered to serve in the armed forces in as great or greater numbers as their white counterparts. Their mothers and sisters volunteered to work with the Red Cross.

The fall of 1942, Thelma Rosser Terry took Mrs. Lively's place as the Business teacher. Her brother, Felix Hoytt Rosser was a senior. She recalls "There was a scrap drive. And [students] were asked to bring in pieces of aluminum and iron." Thelma Rosser Terry remembers that the students "were somewhat insulated from the horrors of the war." In 1942, few people realized the toll that the war would exact on their lives. Not until the spring of 1943, when the government lifted restrictions off photographs of soldiers in combat, did "horror stories" appear in magazines and news reels, and these were mostly about devastation in the countries of Europe. Anxiety mounted for Thelma when her bother graduated from high school, was drafted and sent to the front.

Dan Dominey, who was an eighth grader in December 1941, remembers the excitement when older boys were signing up for duty. "At first [they] were eager. We were going to save the world." The "picture show" had long been one of the main attractions in town. Movies about soldiers were a popular theme. The handsome soldier vanquished enemies and returned home unscathed and married the beautiful woman, waiting faithfully for him. "They were never shown in fox holes and the good guys never died." But, by 1944-45, Mr. Dominey's junior year, some of the enthusiasm had worn thin, "As the war dragged on and boys were dying, it didn't seem quite as romantic after a while." The list of war casualties was growing. The drudgery of waiting for news, the photographs in the magazines, the telegrams from the War Department, were taking their toll.

The Trinity County War Price and Rationing Board was established in 1942. Mr. Dominey, explained, "Rationing didn't hurt this community. People could buy coffee regularly for the first time." Mr. Dominey recalls that
teacher attrition was high. "When teachers made just $100 a month and could go to Houston in the defense industry and make $200 or $300 a month," the lure was tremendous.

W. G. Rosser, who taught school at Friday before joining the Army, described the impact of the war on his community,

The boys went to the Army. Old folks couldn't farm with the boys gone, most of them moved to town. Those boys never did come back. . . [they] found a better life. They'd tried farming. If you had two pairs of overalls and a pair of shoes you were lucky [. . .] cotton was nickel a pound. We just existed. . . But [we] ate pretty good because we raised it and canned it. But the war ruined all the little communities like Friday. Pennington up here had a big school then, with about eleven teachers. . . it's nothing anymore, it's gone! [T]he communities never sprung back from the war (Personal Interview).

The population of Trinity County in 1910 was 12,768. The logging industry was in full swing and by 1920, the population was 13,623. It remained stable during the depression, but by 1950, the population was 10,040; it declined by almost a fourth during the war years. It continued to shrink and by 1960, was 7,539, half of its pre-war size.

Dan Dominey remembers trucks of soldiers, "A convoy might be so long it would take more than an hour to get through town." The citizens would come out and cheer. Marcet Williams recalls, "We'd wave and they'd throw addresses to us," in hopes of receiving letters.

Mary Ruth Rosser, Thelma's sister, began her freshman year just after her brother entered the service. The senior classes of 1943 and 44 did not publish a year book, paper was scarce. Football was suspended, there was no gas for trips, the band suffered the same fate. All able-bodied men were leaving for the service. In Groveton during the 1943-44 school year, extra-curricular activities were curtailed, and in Warsaw, 300,000 Jews were sent to death camps. That summer, Thelma returned to Sam Houston State to finish her degree. The college was full of soldiers training as "office workers." Late at night, "a soldier, who was a wonderful pianist,[would] play As Time Goes By on the baby grand in Old Main Building."

Mary Ruth Rosser's sophomore year lacked the usual excitement of competitive football games, and band trips. The books they used "were old," but "there wasn't a shortage because so many people had moved away." She "never had one day of science . . . Home Economics was counted as a science. They had all their equipment, and everything in the science lab, but no classes." She recalls some instructions from the Red Cross, "but basically it was just cooking and learning how to set a table and sewing."

"People made due," stated Mary Ruth Rosser, and except for the curtailment of "football and band," the students didn't object to a scaled down curriculum. The course offering during the war, added Mrs. Terry, "was just about as small as a curriculum could be. There wasn't anyone to teach the higher maths." She guessed that "students only had to have fifteen credits over a four year period to graduate."

In 1944, reports of Groveton graduates in the thick of battle, or in basic training dominated the newspaper. The Andersons had two other sons in France at the time. Claude Wilson received a Purple Heart for injuries sustained on Guam. Edwin Creasy, whose father was on the Groveton School Board, was wounded in action in Italy. He mailed his Oak Leaf Cluster and Purple Heart to his parents. "Staff Sgt. Marvin Atkinson," a 1927 graduate and the brother of the Home Economics teacher, was awarded a Silver Star "for gallantry in action in Normandy."

On August 25, 1944, Paris was liberated by the Americans. A week later, school began in Groveton. Mrs. Terry developed a reputation as a dedicated educator. She explained

With the boys, [I had] a particular motivation. I am quite sure that if you are a good typist, and if you know how to keep records, when you are drafted or enlist, they'll give you a typewriter instead of a gun. [In the kind, melodic tones of her East Teas accent, she commented] I just wish I had kept a count of the boys who came back and said, 'I can't tell you what an advantage being a good typist gave me in the services. They sent me to the personnel office [instead of] the infantry'. But, [she added] some of them had to be in the infantry. Your father was one of those. He would have been the last person to sit in an office and type. He wanted to be out there where the action was (Personal Interview).
And many Groveton Indians were indeed in the thick of battle. Missing in action, awards for combat bravery, promotions, transfers, obituaries, are crowded into the scrapbooks. Japp Lott, the former drum major, was "somewhere in the Philippines," and had "over 200 hours of combat flying to his credit" That year the senior class chose as their song: There'll Be a Hot Time in The Town of Berlin.

On December 16, 1944, in Ardennes, a wooded area in Belgium, American troops were surrounded by German forces. Three boys from Groveton were there, two in the Battle of the Bulge, and one in Patton's rescue mission. These country boys must have remembered the hospitality of their southern roots when the Belgian people brought white sheets to camouflage their equipment in the snow. The students of Groveton High were no longer just "reading the books of wars," as in the commentary added to the English pen-pal's letter, they were indeed "making" history.

Teachers in Groveton continued to be in transition--between January and March 1945, four teachers had to be replaced. The last school board meeting for that academic year was held on May 7, the day before VE-Day. In May of 1945, the school annual was again published. At long last, during the final weeks of the school year, as the hot and muggy east Texas summer was beginning, the war in Europe was over. Thelma remembers, "I have never in my life had such a thrill! Shills running up and down your spine. Our loved ones would be coming home." Arlisha Adams was "cooking and cleaning [in a lady's] kitchen and she come in and told me, 'This is VE-Day--no more fighting.' We just rejoiced! I had two brothers in the fighting."

At the August 8 school board meeting, the day before the Enola Gay dropped the bomb on Hiroshima, it was moved that the "salary of the Colored teachers be $1,200 per year." By the time school began a month later, the war ended in the Pacific. In September, the board appointed a committee to find a location for a football field and to use substitute teachers until teachers [can be found] to fill the vacancies.

Letters home from servicemen, published in the newspaper, fill the last few pages of one of the scrapbooks. James Reese wrote from Yokohama about being in an evacuation hospital "when in rushed a group of press men telling everyone that Tojo had tried to kill himself . . . they were bringing him in for treatment." On September 16, Standley Hudson wrote a letter to the Groveton News, "Thought you would be interested to know that Trinity County was represented in the first landing on Japan." Hudson described the ceremonies on September 8, at which General McArthur made a speech.

On September 27, the newspaper ran an article titled, "Ration Board to Close Oct. 30th." The next day three busses carried the football boys, the band and the pep squad to a game. On November 22, a Thanksgiving celebration at the courthouse, honored returned veterans. In Journey to Jubilee, on page 113, a book, Inside U.S.A., by John Gunther, published in 1947, is quoted, "Texas was the least isolationist state in the union . . . the real reason Congress passed the Selective Service was to get someone in the Army who was not a Texan." Soldiers from Groveton more than did their part. The ratio of war dead to the general population was 1 in 135; from Groveton forty citizens gave their lives, four times the national average.

The war was over. Many farm boys took advantage of the G. I. Bill. Most never returned, though they stayed in touch through class reunions and visiting the old folks at Christmas. Even fewer African-American soldiers returned.

Thelma Rosser Terry mentioned that during the war, "church . . . was the most important social activity of the week. [T]here was always prayer at school." Arlisha Adams remembers, "People lived close to God. They went to prayer meeting on Wednesday night, and prayed hard." She added, "During the war . . . we prayed for peace. Now days folks don't know what to pray for." Thelma explained, "It was a good time, but it was also frightening." It brought people together, the black community and the white community were both united in a common cause. The impact of the Second World War was felt not only "for the duration."

As Dan Dominey tells it, the "Groveton High band was a victim of the war. It never again achieved its former popularity in the community or among the student body." The football team rebounded, and has consistently won regional and state championships. "People support the football team and all the popular boys want to play. However," adds Mr. Dominey,
before the war, it was the band that was the center of Groveton's social life. Back then the big, good looking guys would rather be in band than football. Now it's reversed. The band never regained its pre-war status. The war killed it.

The Origins of K-12 Teacher Tenure Laws

Dorene J. Huvaere
Lewis University

The relationship between the permanent employment of K-12 public school teachers and the quality of education is frequently discussed among community representatives, school board members, educators, and teacher organizations. Some assert tenure is one of the fundamental challenges affecting the quality of education in the United States. Opponents contend it protects the mediocre, ineffective teacher and hampers the ability of administrators and school boards to remove incompetent teachers. Proponents argue it provides teachers with a safety net from arbitrary dismissal. Without taking a side, this paper will document the origins of tenure for K-12 public school teachers.

The concept of granting tenure to K-12 public school teachers dates back to the passage of the Pendleton Act in 1883. In 1880, under the leadership of Ohio Senator George H. Pendleton, the National Civil Service Reform League was established. The League worked to develop a law that would reform the methods used to secure and retain government jobs. Introduced to Congress on 6 December 1881, the Pendleton Bill was signed into law by President Chester Arthur, 16 January 1883 (Foulke 1974). Employment for civil service positions would now be based on competitive exams and promotion would be the result of merit and efficiency.

The effort to transform civil service employment affected public school teachers. Teachers received their salaries from local and state tax dollars. They were appointed to their positions by a local governmental agency, most commonly referred to as a board of education or boards of directors. Capitalizing on the role of the teacher as a civil service employee, teacher organizations began to advocate for the right of educators to receive the same protections afforded to other government employees.

The movement took root in 1885 when the National Education Association enacted a proposal to support tenure legislation for K-12 public school teachers. To develop a rationale for a tenure law and gain national support, the NEA created the Committee on Salaries, Tenure and Pensions (Swain 1920). Most of the early reform efforts of this committee centered more on the issue of teacher salary and pension than tenure. (Peterson 1921) In the 1920's under the leadership of Joseph Swain, the committee began to explore tenure as a separate topic. According to Swain, other civil service employees were guaranteed liberty and property interests concerning their jobs. However, teachers continued to work under the old "spoils" system of political patronage. The NEA believed that if teachers' property and liberty interests were protected, if they received proper training, and if a probationary period to further their proficiency were allowed, then the quality of those entering teaching would be elevated (Swain 1920).

The NEA appointed itself the role of providing direction to the various state organizations attempting to formulate tenure legislation. It formed a separate council, the Committee of One Hundred, in 1923. The Committee was charged with the task of gathering information supporting the case for tenure. It examined court cases regarding teacher dismissals and the rate of teacher turnover. It also investigated existing tenure legislation at the local and national level, as well as in foreign countries. Surveys of teachers and administrators were taken to obtain information regarding reasons for dismissal and the general attitude that existed among teachers and administrators toward tenure (Hunter 1924).

The results of the investigation were published in the pamphlet "The Problem of Teacher Tenure." It argued that public education in America was created, in part, to instruct young people in the values and goals of American society. Schools were expected to help "in [the] abolition of illiteracy" and "for Americanization of foreign elements" (Norton 1924). The growth of the profession, the heightened dependency on public education to instill the foundations of democracy, and the increasing momentum of the Progressive movement led the NEA to believe state legislatures, boards of education, and local communities were ready to examine the need for tenure.

Throughout the first quarter of the twentieth century, the Progressive movement gained momentum. Progressives believed individuals should expose the ills of society and then direct the government to design legislation that would correct the problems. This ideology complemented the goals of the NEA and provided the framework needed to promote tenure. The legislation would protect teachers from the unjust actions of school boards and improve the conditions of public education. It would, according to its supporters, provide the public with quality education,
competent professionals, and prevent arbitrary and capricious dismissal practices of school boards.

Further research into the issue of teacher turnover was conducted by A. G. Peterson, a graduate student at Columbia University's Teacher College. The information compiled by Peterson represented several studies done between the years 1910 and 1930. The research illustrated the percentage of turnover in communities of various sizes. It did not attempt to explain the reasons for the turnover, although it "emphasized the turnover problem as being constant with rural teachers" (Peterson 1930). Peterson included a summary of a study done by A. L. Crabbe regarding rural teachers in Kentucky. He noted, "the average consecutive tenure was 1.41 years." He also reported the study found "that 12.2 per cent of the teachers left at the end of the first year, thirty-three per cent left by the end of the second year and sixty-three per cent migrated at the end of the third year." Peterson also cited a 1922 study by William Ellsbree of teachers in the state of New York. The investigation revealed communities of less than 10,000 inhabitants exceeded an annual turnover rate of sixteen percent. Additional studies of rural teachers noted that in Vermont, "three out of four teachers are new to their positions every year" and in Wisconsin's rural communities "sixty-five to sixty-eight percent" of the teachers were new to their positions each year. Consistent with the other rural communities an Illinois School Survey disclosed that, "51.8 per cent of Illinois county teacher served two years or less, while 67.4 per cent served three years or less" (Badger 1930). The studies supported the NEA's ascertain that the high rate of teacher turnover, especially in rural communities, inevitably had a serious impact on school efficiency and the quality of education. Tenure legislation was needed to curb the frequent changes in personnel and bring stability to the American school system.

To determine the standards for re-election and delineate the grounds for dismissal, the NEA surveyed people directly involved in the operation of schools. The surveys were sent to university professors, superintendents, principals, classroom teachers, members of the Parent Teacher Associations and laymen interested in the operation of public schools. The questionnaire asked participants to indicate from a list of fifteen choices those they felt were grounds for dismissal. Although, sixteen percent of the total number surveyed represented groups other than those directly involved in the administration and organization of K-12 schools, the NEA did not incorporate their suggestions in the proposed recommendation. It believed educators would be more inclined to accept the direction of peers and work towards the fulfillment of these standards if they were established by colleagues. Therefore, the policy formulated included only the subsequent recommendations from superintendents, principals, and teachers.

1. A period of probation of one to three years.
2. Tenure during efficiency and good behavior.
3. Dismissal only upon proof of cause and after trial in at least two schools -- this to apply to any cause except proved immorality.
4. Right of hearing.

Recognized causes for dismissal.

1. Proved physical or mental incapacity for performing the duties of teaching.
2. Proved immorality.
3. Proved disobedience of State laws or reasonable rules prescribed for the management of schools.
4. Inability to maintain discipline or to secure and maintain the organization of the school or system in case respectively of teacher, principal, and superintendent (Peterson 1932).

An orderly selection process for teacher employment coupled with stipulated reasons for dismissal, the NEA argued, would attract qualified individuals to jobs in education and therefore, lead to better instruction for the children. To support its position, the NEA cited the academic successes of New Jersey and Massachusetts. Both had long-standing tenure laws and ranked, respectively, second and thirteenth in the United States for academic achievement (Hunter 1927).

The NEA also documented the achievements reported by foreign countries with existing tenure laws. A comparison of the literacy rate between nine European countries and the United States was undertaken. It showed the United States ranked tenth. The NEA argued, "Teachers in the educational systems of European countries, where a high degree of school development has taken place, are much more completely protected by tenure than are the teachers of
the United States. The advantage of a stable teaching force was evident in the low incidence of illiteracy in those countries granting tenure. In contrast, the United States had an illiteracy rate of 6.0%. This figure was more than one percent higher than any European country which granted teacher tenure. The NEA felt confident that if yearly contracts were abolished and if teachers were given permanent employment in schools, the literacy rate of the United States would improve (Norton 1924).

The NEA additionally advanced the assertion that tenure would be in the best interest of children. Of utmost importance was "the child's interest, not the teacher's" (Hunter 1927). The benefits for children would include quality instructors, long-range curriculum planning, and the healthy psychological development of the child. The absence of job security for teachers compromised curriculum planning. This difficulty was noted in its statement, "Such foresight in planning is nearly impossible where much time is consumed in bickering over hiring and firing of teachers. It is impossible to plan definite curriculum developments and programs unless there are stability and continuity within the teaching staff" (Oberndorfer 1941). Tenure would limit the time administrators spent on recruiting and training new personnel, and teachers would gain the time needed to develop lessons that benefited children instead of seeking new positions.

The benefits of a stable teaching force were also compared to the stability of a family. The NEA concluded the frequent turnover of teachers affected the psychological development of a child.

What kind of mental and moral growth would we expect from a child who changed his parents every year? Yet a change in parents annually would have somewhat the same effect as a constant change in a child's teachers (Elder 1920).

For a child to develop into a mature adult, they needed teachers who could provide guidance and advice over a period of years. A 1935 a Journal article written by Stella Goldberg, a Chicago public school teacher, highlighted the significance of teacher tenure on the development of the child. Ms. Goldberg stated the ability of a child to develop academically and socially depended on the quality of the educational system and "especially upon its most important administrator, the classroom teacher" (Goldberg 1935).

The NEA formulated twelve principles to be used by state tenure committees. The principles reflected the growth and maturity of the tenure movement. According to these guidelines, well-written tenure laws would improve the quality and efficiency of education and be designed in the best interest of children. To quell concerns regarding the professional growth of teachers, the NEA suggested tenure be given only after a probationary period in which the teacher demonstrated success and continued development. The decision to retain a teacher would remain the domain of the local school board. Superintendents would be required to demonstrate evidence of ineffective teaching practices and provide the individual with adequate notice of non-retention. The NEA also suggested that each state, according to its needs, establish a requirement for professional growth. This standard, they argued, should be rigorous and applicable to tenured teachers.

The arguments to provide tenure for public school teachers initially centered on increasing teacher salaries and improving the quality of people attracted to the field. The NEA felt teachers should receive competitive salaries and a retirement pension. A national movement to secure salary increases saw little success in the first two decades of the twentieth century. The NEA realized to achieve their goals they would need the support of the teachers and improved reasons for tenure. Applying the philosophies of the Progressive era, the NEA developed a rationale for granting teacher tenure. It postulated that tenure was needed to safeguard teachers from political patronage and other capricious actions of school boards. The NEA stressed the high rate of teacher turnover and its effect on the efficiency and quality of American education. Tenure would raise the standards of education by attracting high caliber individuals to the profession and result in more efficient school operations.

Discussion of the National Education Association Tenure Report. 1924. Fred M. Hunter, Chairman. Washington DC: National
Education Association Proceedings.
During the nineteenth-century urban school systems, such as Cleveland and Akron, Ohio, trained their own teachers in city normal schools operated by the cities' boards of education. This paper will document the pre-service training of teachers within these city normal schools, the progression of the city normal schools from its own teacher preparation programs to university affiliation, and the establishment of a university school of education and a teachers college.

The Cleveland city Normal School opened September 1874. Admission requirements were graduation from one of the Cleveland city high schools, or a certificate from the Cleveland Public Schools City Board of School Examiners, or a certificate from a County Board of School Examiners with not less than one school year's experience in teaching (Superintendent's Report Cleveland City Schools 1927/1928, 48). The Perkins Normal School of Akron had similar admission requirements. An applicant had to be a graduate of an Akron public high school and over the age of eighteen. They were to possess a teacher's certificate from the Akron City Board of School Examiners, or if they failed to have such a certificate they could be admitted into the normal school if they passed an entrance examination.

The course work of both city normal schools were two years in length and each school had a theory department and a practice department. The theory departments focused on preparation in professional studies which included educational history, educational psychology, and classroom management. Students also took courses in subjects they would be teaching as well as method classes (Manual Akron Board of Education 1900, 43; Superintendent's Report Cleveland City Schools 1887,48; 1891,46; 1901,49). Second year students took classes in the practice or training department. This department, in both city normal schools, established classrooms in various public schools as training classrooms. Students taught in these classrooms for ten weeks under the supervision of a teacher (Principal's Report Cleveland Normal School 1874, 104). Students also presented lessons to their fellow pupils in the practice departments, and as substitute teachers in the city elementary schools (Cleveland City Schools Course of Study 1894/1895; Manual Akron Board of Education 1900, 43).

In 1914 the Ohio legislature passed a series of laws that required increased preparation in the area of professional education and supervised practice teaching for state certification. Western Reserve University responded by establishing a joint training program with the Cleveland public schools in 1915 known as the Cleveland School of Education (Western Reserve University 1925, 3). The Cleveland School of Education, originally a summer term of six-weeks, was conducted jointly by the Cleveland Normal School and Western Reserve University. Under the terms of this partnership all the equipment and educational resources of the University were utilized to train Cleveland teachers and those in surrounding suburbs (Cleveland Board of Education 1915, 38). Course offerings for the school in its first summer of operation consisted of professional courses and academic studies for teacher review taught by faculty from the University and Normal School (Cleveland School of Education 1915; 1919).

In the fall of 1920 the Cleveland Board of Education and Western Reserve University expanded the work of the Cleveland School of Education to include the granting of the Bachelor of Education and the Master of Education degrees (Western Reserve University 1920). By the 1924-1925 school year the coursework offerings for prospective teachers were organized into the Junior Teachers College and the Senior Teachers College. The Junior Teachers College, also known as the Normal School Course, was a two-year teacher training course, extended in 1926 to a three-year teacher training course (Cleveland Board of Education 1926). Students who graduated from the Junior Teachers College were immediately offered positions in the Cleveland public schools. In addition, the graduates could enter the Senior Teachers College to work on their bachelor's degree (Cleveland School of Education 1921/1922, 6).

The Senior Teachers College of the Cleveland School of Education was created in the summer of 1920. The requirements for the four-year degree were 120 semester hours of study. Ninety hours the University would accept from the Cleveland School of Education with the University providing extension and summer courses to
complete the full degree requirements (Western Reserve University 1920). Four different units of credit were available to teachers through the Senior Teachers College of the Cleveland School of Education. One type of credit led to the Bachelor of Education degree, another to the Master of Arts in Education, another toward state certification, and the last was toward advancement on the salary schedule of the Cleveland Board of Education (Cleveland School of Education 1922/1923, 4-5).

By December of 1915 the University of Akron and the Akron school board formulated an agreement approved by the State School Commissioners for a combined course in normal training between the University and Perkins Normal School. Two training courses were devised, one a four-year combination course and the other a five-year combination course. The four-year combination course enabled the graduates to teach as elementary teachers in the Akron city schools but not as high school teachers. They were entitled to a provisional state high school certificate which gave them the legal right to teach in any high school in the state of Ohio. Students attended the University for three years, completed the required work (103 semester hours) and entered Perkins Normal School to complete the course there in one year. Upon completion of their work students received the Bachelor of Science in Education (Akron Board of Education 1915, 171-172). The five-year combination course was offered to those who desired to be high school teachers in the Akron school system. The student completed four years (128 semester credit hours) at the University, pursued a major in the subject he/she wished to teach as a high school teacher, received the college degree they were entitled to, and spent a fifth year at Perkins Normal School in observation and practice teaching (ibid.).

School of Education, Western Reserve University and Teachers College, Municipal University of Akron

As the professional educators within the urban cities worked to optimize the professional training of future teachers, a university school of education and teachers college were created. By late spring 1928 the Cleveland Board of Education and Western Reserve University combined resources to form the School of Education, Western Reserve University (Western Reserve University 1928). The work of the School of Education was conducted in three distinct sessions for teachers, supervisors, administrators, and students of education. One was designed for students who wished to complete a three-year diploma course in preparation for teaching in the kindergarten, primary or intermediate grades. A second session was a four-year degree course in preparation for teaching in K-12. A final session was available for part-time students in which teachers, principals, and others who possessed a Normal School diploma, or two or three years of undergraduate professional education could complete the requirements for the degree (Western Reserve University 1931/1932, 11).

In 1921 Perkins Normal School was merged into the Municipal University of Akron, becoming a part of the University known as the Teachers College (Buchtelite 1921). Initially the Teachers College offered six courses for training teachers. These were three and four year preparation programs in kindergarten-primary education and elementary education. Upon completion of their work students received either a state teachers certificate for completion of the three year program or a bachelor of education degree for work completed in the four year program (Municipal University of Akron 1922, 122-126).

In 1923 there were eight preparatory programs for teachers, by 1924 this had grown to thirteen courses of study. Courses leading to a master’s degree were established during the 1923-1924 school year. In 1926 new courses were offered to teachers in commercial and vocational education. In the 1928-1929 school year the course work again expanded to include industrial education (Municipal University of Akron 1923, 129-140; 1924, 120-127; 1926, 118-128; University of Akron 1928/1929, 139).

By the 1927-1928 school year the course work for high school teachers was slightly modified. Students were still required to complete five years of study, but now students had the option of completing their bachelor’s work in either the Teachers College or the College of Liberal Arts. If a bachelor’s degree in secondary education was obtained through the Teachers College a fifth year of study was spent in the Teachers College completing course work for a master’s degree. If the student received a bachelor’s degree from the College of Liberal Arts a fifth year of study in the Teachers College was required, and upon successful completion of this coursework received the bachelor of education degree (University of Akron 1927/1928, 130-140).
The economic depression of the 1930s was one of several reasons for the Akron school board to withdraw its financial support of the Teachers College. Another reason was that with five state supported teacher training institutions along with the normal school at Kent there was an adequate supply of teachers being prepared in Ohio and there was no need to continue the board’s support of the Teachers College. Furthermore, the chief function of the school system was to prepare students at the elementary and secondary levels and not teacher preparation. In January 1931 the Akron school board voted to officially terminate their financial support of the Teachers College by June 1, 1931 (Akron Board of Education 1931, 28; Akron Beacon Journal 1931).

The Cleveland school system, in January 1933, reduced their funding to the Cleveland School of Education by thirty percent in response to the economic crisis of the time (Cleveland Plain Dealer 1931). But, as in Akron, additional conflicts existed for the School of Education relative to its relationship with the other colleges on the university campus. From its inception the function and status of the School of Education was questioned by the other colleges who believed the School should only train elementary teachers. The dual administration of the School with the dean reporting to the superintendent of schools and the president of the university created indecision in policy making, and competition existed between the School and the other teacher training units on campus as each sought to acquire students. There were additional problems involving curriculum, number and distribution of scholarships, and the administration of the summer session (Western Reserve University 1935). The Cleveland school board officially terminated their support of the School of Education in June 1936.

The pre-service training of the nineteenth-century urban school teachers in Ohio progressed from entry by exam to awards of diplomas through city normal schools, to attendance at university teacher colleges or schools of education with the distinction of earning a bachelor or master’s degree in elementary or secondary education. These changes, initiated by state mandates in teacher certification laws, led to the creation of teacher preparatory programs administered by the respective city boards of education and their university affiliate. While budgetary constraints and other considerations regarding the function and purpose of the joint teacher training programs led to the city school boards decision in both cities to discontinue their financial support of their pre-service teacher training programs, the educational institutions in both cities assumed a shared responsibility for the professional preparation of their city school teachers.

Teachers and the American Success Ethic

Robert Taggart
University of Delaware

For the entire twentieth century, reformers have attacked the American public school for its presumed ineffectiveness. Most of the pressure has been on teachers to become more efficient. In any case, advocators of change have not consulted teachers as to the most desirable reforms in our schools. As a result, teachers have seen numerous reforms foisted upon them throughout this century, few of which changed the behavior of many teachers or increased student learning in a significant way (Cuban 1984).

Why the lack of real change in schools? Teachers have their own needs in their individual classrooms which are often ignored by outsiders. When that occurs, teachers either become defensive, which leads to new attacks by others, or they agree to accept the changes while in fact undermining them. Why do teachers do this? Because many of them recognize that what they represent is not considered valuable to society (Joseph and Burnaford 1994). The key to changing education is the classroom, where the schoolteacher tries her best to reign. Since reformers who demand more efficiency to produce better results dispute her hegemony, teachers resist as much as possible. The central question is why so many outsiders believe they know what the students need better than teachers who actually see the students perform every day. As Richard Hofstadter summarized: “The figure of the schoolteacher may well be taken as a central symbol in any modern society (from which by) observing how teachers are esteemed and rewarded they quickly sense how society looks upon the teacher’s role” (Hofstadter 1963, 309-310).

Never has there been a time in this nation when teachers of young children were esteemed. A primary reason is that teachers are not considered models of the American Dream. That dream has assumed for a long time that individual effort and risk-taking will produce success for all, proof of success being the attainment of power in society and the wealth that comes with success. Since teachers don’t seem to have attained success in a material sense, the public tends to question their authority, while ironically demanding that teachers exert more authority in schools. Since so few citizens believe teachers are a serious role model for their children, they denigrate both the profession of teaching and teachers’ lack of successful academic results with all students. Therefore, reforms have devolved into an attempt to force teachers to work harder toward clear standards and measurable results, since educators have not figured out how to accomplish success for all children or themselves.

Historically, the public has not been interested in teachers’ attainment of personal success. Under local control of schools, Americans have demanded a premium on economy. Teachers received low pay in most districts, which led to a series of young temporary teachers on the move searching for something better. As late as 1916, one-quarter of rural teachers left their position each year (Fuller 1989). Until recent decades, teacher’s salaries started low and rose little. Since there was little impetus to improve ones’ performance, the public then attacked teachers for their lack of effect (Johnson 1990). Besides salary, noneducators set all the specifics of the job: term length, curriculum, textbooks, supplies, building maintenance, and nonteaching duties (Fuller 1982). Later, teachers even lost control over evaluation and discipline procedures (Shedd and Bacharach 1991). Teachers had the difficult task of controlling students without the power to control anything else.

School boards usually got what they deserved. Kaestle describes rural schools in which students began each year repeating the same Reader they used the year before (Kaestle 1983). Rural teachers had to react to the lack of books and motivation by their students, while leading thirty recitations a day, planning endless lessons with few materials, and enduring numbing days ending with a supper at eight at night and going home to a chilly destitute room. They had no privacy, being closely watched for any moral or social impropriety (Fuller 1989). Since teachers’ wages showed a steady decline relative to other occupations after 1850, white males left elementary teaching to those who had few choices, women (Carter 1989). Without decent salaries, incentives were few for teachers to invest much into further education. By the 1910s, half the nation’s teachers still lacked professional or college preparation and the average length of service was just four years (Sedlak 1989, Coffman 1911).

A century ago, teachers of small children were women, approaching 98% of the elementary teachers in the United States (Tyack and Hansot 1982). Women took the jobs because they were as literate as men and had few options. School boards hired them because they were inexpensive, available, and of marginal status. Women fit the
popular ideal of elementary teachers: a well of patience, obedience, self-abnegation, and loving-kindness, and so able to serve society through her submissiveness to superiors. Such maternal ethos in Victorian society “denied the order and power of narrative to teachers,” as a feminist historian suggests (Grumet 1988, 89). Women are potential childrearers, as Catherine Beecher often reminded her listeners, who are then natural teachers of children. Unfortunately for women dedicated to subjective nurturance, male professional values have long held that a career includes objectivity, authority, deference from clients, independence, and in many cases the ability to set fees (Ehrenreich 1989). Neither Victorian women nor teachers of young children have ever been allowed such qualities without protest except in special circumstances. Women public elementary teachers are considered to be “servants” of others, sacrificing power and wealth in order to fulfill their feminine responsibilities.

The dominant male culture does not respect nurturance unless it is accompanied by successful results. There is much talk of “growth” in this country, but it is normally meant to be growth toward some measurable success. Whether it be a stock portfolio, a sports team, or a sales quota, success is the end product of the growth; growth itself is deemed to be pointless. Dewey’s maxim that the point of education is “growth and more growth” was meant to instill success, but one that included personal happiness and service to others as a full citizen in a community. The American success ethic has been individualistic, with limited expectations for service to others. A successful individual in the United States has power, wealth, and prestige; elementary teachers have none of these qualities in our society.

The American Dream is a powerful ethic in this country. It has propelled a belief system that suggests that if an individual uses all of his or her innate abilities, takes some risks in a competitive world full of opportunities, perseveres through all obstacles and uses one’s wits, then that person can expect to be a success in life. Conversely, if one lacks success, as measured by power, wealth and status, then that person is deemed to have not used one’s abilities in a creative and forceful manner. If one protests that he or she does not believe in such accountrements of success, then that person can expect to be dismissed as a weak eccentric. If one has apparently tried his or her best but lacks success, that person is accorded some sympathy, but is likely to be assumed to lack the ability. The society and belief system is not questioned under such assumptions (DeVitis and Rich 1996).

An important aspect of success is one’s willingness to take risks. As Richard Hofstadter relates, American conservatives have subscribed for more than a century to the ideal that a successful man is an entrepreneur, a “daring promoter” who asserts his individuality. Social Darwinists insisted that the “progress of the race” depended on such men being given the freedom to exert their prowess (Hofstadter 1944). The many Horatio Alger novels celebrated such freedom, cleverness, and opportunity, though without the brutishness assumed in Social Darwinism as the price of success for the winners. It is instructive that Alger books were not used in schools but bought by millions of Americans for depicting the true values of a growing nation. Students learned discipline, literacy, and morality in schools; real life was always more dynamic than school could ever be. Teachers were expected to keep youth under control, but they were not loved or respected for it. On the contrary, teachers were just another obstacle to individual success (Finkelstein 1989). Teachers did not take risks or allow risks to be taken in their classroom, and so they represented the antithesis of a powerful ethic held by most Americans as a primary explanation for one’s life success, and as such, were disrespected by the public.

Our American respect for the individual is as old as the nation, perhaps as old as the first colonist who refused to remain behind the stockade walls. Evangelists who insisted on the use of the King James Bible in every school believed that social evils were “an aggregation of individual sins” that could be overcome by self-improvement (Tyack and Hansot 1982). While such an ideal could be liberating if one overcame one’s evil tendencies, it also suggested that one owed nothing to anyone else. McGuffey Readers contained many references to charity toward others, but this may have been because there was insufficient evidence of such behavior. In the Protestant Ethic, one has a duty to be as strong an individual as possible to maximize one’s success in material ways. As Andrew Carnegie suggested, the individual is a moral agent whose initiative and superior judgment led to an improved society. He provided more than 4,000 public libraries so citizens could help themselves (Mills 1956).

John Dewey railed against American individualism as destructive to the American culture. During the Great Depression, he attacked an American economic system that was based on a “struggle for existence and survival of the
Teachers and American Success
Taggart

economically fit.” He disliked the most prized personal traits of this system, which included the “clear-sighted vision of personal advantage and resolute ambition to secure it at any human cost. Sentiment and sympathy would be at the lowest discount.” Dewey further attacked excessive individualism as the “source and justification of inequalities and oppressions” (Dewey 1929/1962, 18). He also insisted that individual acts were never really private, as all private acts are social in their consequences. More recently, John Goodlad insists that the public purpose of schooling has become subverted in favor of the private one (Goodlad 1997). The problem with Goodlad’s assumption is that a primary justification for public schools has always been the production of strong individuals as far as most citizens are concerned. Why else attend school for so long except for private advantage? Even when the National Governors’ Association slogenized “Better Schools Mean Better Jobs” with presumed benefits to the economy, parents believe that better schools will mean their children can make a living to improve their social mobility (1986). This is the American Dream, after all.

In the American Dream, wealth is the reward for hard work, perseverance, striving for personal advancement, and social mobility (DeVitis and Rich). From Weber’s Protestant Ethic to the Mind Power ethic of Norman Vincent Peale, wealth is the goal of personal happiness. American Victorians held this view in the 19th century, but as the McGuffey Readers emphasized, wealth was not only to be gained but to be given away to help the less fortunate have some chance of mobility in a fluid society. In the last two decades, much of that belief in charity has declined. One example of this is Newt Gingrich’s reform agenda in To Renew America (1995). As Robert Bellah insists, Gingrich and many other national leaders have eroded the moral understanding from primary relationships in our society in favor of market exchange. Business has little obligation to its employees or the larger society (Bellah 1997).

In this atmosphere, people such as teachers who lack power, wealth, or proven economic value have difficulty defending themselves. As a result, teachers’ salaries have not generally kept pace with other professionals in this nation the last quarter century. However, even when teacher unions fight for higher pay, the teacher culture is ambivalent about such material rewards. Teachers’ unwritten professional ethic includes the ideal of individual professional responsibility for one’s work, but also the ideal of one uninterested in financial rewards and oblivious to working conditions. A good teacher must carry on for the children’s sake, no matter the situation (Rousmaniere 1997). One of the worst things teachers can say about a colleague is that she is in it for the money as opposed to dedication to one’s work. In interviews, many retired teachers insisted that higher pay had a negative impact on teaching, and none mentioned higher pay as indicative of higher status within the profession (Green and Manke 1994). Teachers tend to be ambivalent about an increase in wealth; it is fine for oneself but not necessarily for other educators. If teachers disdain wealth, they are in discordance with the views of most members of society who equate success with wealth, and lack of wealth with failure.

In American society, wealth is also equated with power, another quality teachers have never enjoyed. John Dewey complained sixty years ago that workers of all kinds had no intellectual or emotional share in directing their work, and were treated as only hands without brains (1962/1929). While teachers may insist that they utilize both emotion and brains in their work, Dewey’s point is that even when workers do this, they are neither given credit for it nor are assumed to have the right to control their work. In a recent self-assessment by teachers, they agreed that two negative images included being pawns in a game that they did not always know was being played, and loyal soldiers doing administrator’s bidding without input into the educational process. The ideal collegial relationship with administrators was rarely attained (Efron and Joseph 1994).

Teachers have always been under great scrutiny. In the 19th century and most of the 20th century, teachers have been controlled both in the classroom and in the community. As President Hoover stated, teachers are public figures with public responsibilities whose lives must be an open book (Marsh 1928). As Beale, Elsbree, and Waller have documented, teachers have never been free (Beale, 1936; Elsbree, 1939; Waller, 1932). They have always been outsiders, kept at arm’s length from the dominant society of strivers. Much of this attitude stems from teachers’ character-building role, which places them outside the realm of ordinary sinners. It also means that they can never be fully trusted to be free. Women teachers became “vestal virgins” and male teachers were treated as ministers (Tyack and Hansot 1982). With such a lack of respect as individuals or as professionals, teachers remain marginalized by
administrators with the approval of school boards and their communities. Shared decision-making between teachers and administrators is rarely tolerated on the instructional program. True school restructuring remains an idea, not reality (Malen and Ogawa 1992). Faculty meetings are not famous for discussing important policy issues, and teachers' advisory councils find their suggestions ignored (Johnson 1990).

Much of the reason teachers are treated as people who should not have power is that teachers themselves tend to believe that their greatest rewards are psychic. They rely on positive comments from students, parents, and peers for reward (Johnson 1990). They state that they love to work with people and to see children learn and grow. Nineteenth century female teachers were exhorted even to save the children from sin, protect them from temptation, and steel them for life's challenges by serving as paragons of propriety. By the 1920s, the educational literature described model teachers as having good personality traits above all. They were to be generous, positive, selfless, self-controlled, enthusiastic, and moral (Rousmaniere 1997). Even in the film Blackboard Jungle, the heroic teacher is to save the students from themselves and be satisfied with intrinsic rewards (Ayers 1994). Good teachers, then, were not to be intellectual, ambitious, materialistic, or strive for power.

Teachers tend to focus on their own classroom. While this may be personally rewarding, it also means that teachers isolate themselves from one another and society, thereby decreasing their activity as citizens. Unlike other professionals, teachers do not see the necessity of entering into public debates about education. As a result, laws inimical to teacher's autonomy are passed and teachers lose more power. Teachers are expected to do even more than before, and find their job further eroded into a series of bureaucratic tasks that work to destroy whatever is left of their professional ethic.

Current reformers insist on system-wide reform. There is little that is new about this. As David Tyack has shown, the idea of scientific and efficient reforms affecting entire educational systems became the rage in the 1920s (Tyack 1974). By the 1960s, the academic community introduced the "new curriculum," such as Science--A Process Approach. A curriculum set in minute detail, the teacher was no longer the central figure in the instructional process, but an intermediary between the subject and student (Johnson 1989). Accountability schemes and performance contracts of the 1970s continued the trend, as did Madeleine Hunter’s Effective Teaching Model, a later attempt to turn pedagogy into science by using a drill system. Presumably, even the subjective elementary teacher could not destroy the process of student learning once it was laid out clearly in the objective technical manner that Hunter believed constituted learning. Sadly, these schemes not only attacked teacher's professional autonomy as well as the intrinsic rewards that provide much of a teacher's motivation, they did not even promote children's learning well (Gibboney 1994).

The most basic problem in educational reform is American society’s desire for quick results that can be proven through measurable results. Too often, this demand translates into goals listed by non-educators that are unrealistic for society, much less for schools. The National Goals 2000 is such an example. For instance, the goal of being first in the world in science and math test scores by the year 2000 is an impossible standard, and one that may not be related either to improved student learning or an improved national economy. Ironically, there is little evidence that the public believes these goals are attainable, or that teachers even know much about them (Goodlad 1997). If neither the public nor teachers believe in such goals, there can be little movement toward them. When the goals are not met, then reformers attack educators for their lack of will. We soon have another wave of reform (Darling-Hammond 1990).

Parents often look for quick fixes from education, just like business leaders, though their goals are different. Parents and their children are not so motivated by the intellectual growth implicated in good education as reformers would have us believe, but by grades that are surrogates for learning. However, the less academically inclined students are not even motivated by grades, but by graduation. A diploma becomes the entrance requirement for either an occupation or college; competency in the subject matter is less important than the fact of graduation (Steinberg 1996). There is little teachers can do to affect this student indifference unless parents support them.

Meanwhile, business-led reformers continue their own agenda with the standards movement, an extension of the excellence movement from the 1980s. Originally an attempt to set national standards, an idea attacked by both liberals and conservatives, reformers now are setting state standards for each major subject area for what students are to "know and be able to do." Like previous reforms, application of the standards assumes system-wide changes with
little input by classroom teachers. The goals are meant to represent the best knowledge our students need, with the assumptions that educators know how to get students to attain these myriad goals, that students can and want to attain them, and that the goals will lead to further education and jobs. With the goals set by experts, teachers are to get trained to help all students reach the goals. If students fail to gain such success, then teachers will be held accountable for results, punished or rewarded as the results dictate. In this process, then, teachers will find themselves held responsible for their failure to deliver what they do not control, but are assumed to control according to reformers.

These reforms are based on extrinsic sanctions that are irrelevant to teacher's goals and problems they face in their professional lives. In schools that have attempted accountability schemes based on goals set externally, teachers report the three A's: Anxiety about such programs, Anger when the rewards and punishments are meted out unfairly, and Alienation toward the schemes. Feeling maligned and misunderstood, teachers react with passive-aggressive behavior (Berliner and Biddle 1996). If we believe that good education is a process of learning by teachers and students, then teachers must be engaged in continuous planning with constant reflection on one's goals as well as means for attaining those goals. To promote effective reform in education, teachers must be in control of the curriculum and its goals, not an outside agency that believes teachers are the problem rather than the solution (Tanner 1997). If teachers are demeaned in this process, there will be no real improvement in student learning; just another statement of goals that neither students nor teachers can reach, followed by another round of recrimination against teachers. The solution is the setting of goals by educators in each building, with a system that gives teachers the time and resources to do a good job as well as the power to assist teachers needing help. Only then can we expect real improvement in our schools.

Affirmative Action at University of Illinois:
The 1968 Special Educational Opportunities Program

Joy Ann Williamson
University of Illinois at Urbana-Champaign

In the spirit of the Civil Rights Act of 1964 and the Higher Education Act of 1965, the University of Illinois at Urbana-Champaign (UIUC) initiated the Special Educational Opportunities Program (SEOP), a program to recruit more African American students to the UIUC campus. The SEOP will be the focus of this piece. The objectives are twofold. First, I will discuss the implementation and nature of SEOP including recruitment, admission requirements, initial academic achievement, and graduation rates. Next, I will illustrate the impact this first substantial number of Black students left on the UIUC campus both socially and academically. The first group of SEOP students will be the focus though later students will be discussed tangentially.

UIUC administrators and faculty began discussing the ground work for SEOP in late 1963. In an interim report issued by the Committee on Human Relations and Equal Opportunity (CHREO), a conscious effort to "expand substantially the enrollment of Negro and other disadvantaged youth" became a basic goal for UIUC (CHREO 1964, 1). In the Preamble of the report, the Committee cited the overwhelming under-representation of African Americans in "almost all of the status roles and favorable conditions of our relatively affluent and largely white dominated society" (CHREO 1964, 1). In an effort to compensate for "the grievous record of the past and present," both nationally and on the UIUC campus, UIUC was directed to reexamine its role in the perpetuation of oppression. The Committee highlighted the low number of African American students, faculty, and employees and pointed to the fact that "the 'public service' to the state to which we are dedicated [has not] been at all focused on the racial problems of the state and its citizens" (CHREO 1964, 2). The imbalance of minority student enrollment due to past discrimination had to be remedied, and the University decided to take an active role. As a directive, the Committee suggested UIUC remember and reclaim the historical role of the university as the birthplace for social, cultural, and economic revolutions. The recruitment and retention of more African American students was one means to this end. The Committee suggested expanding the enrollment of "innately able but educationally, socially and economically disadvantaged" students, encouraging those already enrolled to complete their education, and assisting those with the potential to go on to graduate school (CHREO 1964, 8). Out of this proposal came the seeds of the SEOP:

It is not sufficient simply to affirm the principle of non-discrimination in all aspects of the University's undertakings. Instead it is urgent to develop an affirmative action program to help overcome handicaps stemming from past inequality so that all shall have equal opportunity to develop their talents to their fullest capacity (CHREO 1964, 1).

A short time after UIUC expressed a desire to increase and promote diversity, two federal government pieces of legislation helped initiate many changes in higher education. In 1964, the Civil Rights Act became law. In response to Section 402, a study "concerning the lack of availability of equal educational opportunities for individuals by reason of race, color, religion, or national origin in public educational institutions" was conducted by the Office of Education under the auspices of the US Department of Health, Education, and Welfare (1965, iii). This report heightened awareness of discrimination in education and the value of a diverse campus environment as well as reminded institutions that federal money would be withheld from any institution in non-compliance with providing equal opportunity.

The next year the Higher Education Act of 1965, Title IV, Part A, was created with the mandate to "encourage and enable exceptionally needy high school graduates and college undergraduate students, who otherwise would be unable to continue their education, pursue their studies at institutions of higher education by providing them with educational opportunity grants [EOGs]" (US Department of Health, Education, and Welfare 1966, 9). Financial assistance was not limited to Black students, but they benefited most from the grants. The grants covered half the student's financial need. Part B enabled students to get low-interest loans from their respective institutions (US Department of Health, Education, and Welfare 1966, 11). Part C enabled students to take advantage of Work-Study programs in which they would work part-time to help defray college costs (US Department of Health, Education, and Welfare 1966, 13). These financial gifts enabled many low-income African Americans to attend institutions of higher education. Both the Civil Rights Act of 1964 and the Higher Education Act of 1965 acted as catalysts in opening the
doors of educational opportunity.

If the UIUC campus was just preparing to enroll African American students in significant numbers in the early 1960s, the 4 April 1968 assassination of Dr. Martin Luther King, Jr. accelerated the process. As a result of King’s death, segments of the campus and community, especially the Black Students Association (BSA), founded in October 1967, demanded that more African Americans be admitted in the Fall of 1968. In 1960, African Americans constituted 10.3 percent of the Illinois population and 5.1 percent of the Champaign county population (Bureau of the Census 1963, 15-202). By 1970, they represented 12.8 percent of the state population and 15.2 percent of the county (Bureau of the Census 1973, 15-89, 15-90, 15-252). On the UIUC campus in 1967, they constituted only 1.1 percent of the UIUC student population. The numbers are as follows: 330 Black UIUC students of 30,407 total students attended in the Fall of 1967; 223 undergraduates of 22,017 and 107 graduate/professional students of 8,390 (Wermers 1974, 17). Black students became determined to increase their numbers.

The University, in an attempt both to quell the rising tide of Black student resentment and increase diversity on campus, was in the process of implementing a program to allow a large number of Black high school seniors to enroll. When first conceptualized, SEOP included approximately 250 students. However, after King’s assassination and the BSA demands, expectations for the program changed. Instead of the original 250 students, over 500 were admitted. By admitting such a large number of students, SEOP became one of the largest programs initiated by a predominantly White university in attracting low-income Black high school students.

UIUC put forth five objectives in implementing SEOP: (1) to provide an educational opportunity to students who may not have had the opportunity to attend college; (2) to increase the number of minority students on the UIUC campus; (3) to develop educational programs and practices to aid the “disadvantaged” students in their academic careers; (4) to expose non-SEOP students to the cultural and social experiences necessary in understanding different cultures; (5) to develop information enabling in the ability to deal successfully with educational and sociological problems affecting students from disadvantaged backgrounds (The Special Educational Opportunities Program of the University of Illinois at Urbana-Champaign 1970, 2).

"Disadvantaged" students were those whose family income stationed them in the lower-class. David Johnson, Chief of the Educational Opportunities Grants Branch of the Office of Education, outlined the economic qualification in a Memorandum sent to Coordinators of student financial aid. In meeting the requirements for the program, each student had to qualify for a federal EOG or have an unmet need of at least $1,200 in UIUC expenses. If UIUC students were representative of all students receiving EOGs, only 13 percent came from families whose annual gross income exceeded $7,500 (Johnson 1968, 1-4). They were also students not exposed to college preparatory classes during high school or students ranking highly in their high school classes but with low college entrance test scores. In its first year of existence, SEOP accepted disadvantaged students from out-of-state and non-freshmen; but, in Fall 1969, the program was limited to Illinois residents and freshmen (The Special Educational Opportunities Program 1970, 1). Students received Illinois State Scholarship Commission Grants, federal government grants (such as EOG), and tuition waivers authorized by the University to offset the amount expected from family contributions (Warwick 1968).

To recruit students, the University solicited high school counselors to identify and encourage prospective students to apply to SEOP and arranged a series of Illinois regional conferences with counselors working in schools with large numbers of disadvantaged students. At the meetings, admission and financial aid applications were distributed, questions answered, and problems discussed. Chicago, down-state Illinois, and Champaign-Urbana were the target areas. BSA also was involved heavily in recruitment efforts and visited eleven predominantly Black high schools in Chicago to solicit potential students. Also, in Spring of 1968, BSA hosted a "get acquainted" weekend for Black high school seniors accepted for the Fall 1968 semester. Approximately 150 Black high school seniors from Chicago, East St. Louis, Illinois, and Holmes County, Mississippi, visited the UIUC campus and participated in tours, discussions, dances, and other activities. According to William Savage, BSA Recruitment and Retention Committee Chairman, BSA initiated the program because of the "lack of initiative of the University" (Savage 1968). In a Memorandum on their contact with high schools, university administrators praised the BSA effort: "We are highly encouraged by this evidence of interest on the part of a student organization and regard it as a most effective means of
Affirmative Action at University of Illinois

Williamson

recruitment. We shall continue to encourage their efforts and to cooperate in every way. The activities of this group will be an important aspect of the total program of identification and recruitment" (Memo of high school contact program of the Black Students Association 1968).

The University broadened its admissions policies in admitting the SEOP students. The requirements for admission included: students who met the high school subject pattern requirements for the college and curriculum to which they were applying and who ranked in the top half of their graduating class; students who met the subject requirements, ranked in the third quarter of their class, and had an American College Test (ACT) score of at least 19; and students who ranked in the fourth quarter of their graduating class and had a composite ACT score of at least 21. Students not meeting the above requirements could qualify for special admission (Shelley 1969a, A-3, 2). The students also had to have an unmet financial need. At the end of registration, approximately 1300 students applied to participate in SEOP; 768 were approved for admission (the University predicted that two-thirds of beginning freshmen actually register); 565 students registered. These included 502 freshmen and 63 transfer students (Peltason 1968, 1). A report compiled by Dr. Faite Royjier-Poncefonte Mack, UIUC Dean of Personnel, revealed that of the 502 SEOP freshmen, 478 students (95.2%), were Black. 287 students (57.2%), were women while 215 (42.8 %), were men. Most, 402 students (80.1 %), were Illinois residents. The rest of the students primarily were from Holmes County, Mississippi, and Philadelphia, Pennsylvania.

Academic programming was altered to fit the SEOP students. Financial, personal, and academic counseling were made available. Also, several courses, including Rhetoric, Mathematics, Chemistry, and Psychology, were restructured to emphasize "content appropriate to students with scholastic deficiencies" (The Special Educational Opportunities Program 1970, 2). A reading clinic, a writing laboratory, study skills workshops, and tutorials were initiated and coordinated by the Director of SEOP and several college departments. An additional day of freshmen orientation allowed for the students to attend the all-University orientation as well as a more personal SEOP orientation where students learned about the different services available (Shelley 1969b).

After their first semester on campus, the 1968 SEOP freshmen achieved a mean grade point average of 2.3 in the SEOP courses, 2.0 in regular courses, and a 2.1 overall (on a 4.0 scale). The mean grade point average after the second semester was 2.0 (The Special Educational Opportunities Program 1970, 3). In the College of Liberal Arts and Sciences (LAS) a Spring 1969 study comparing the grade point averages of the SEOP students in LAS and other students in LAS revealed a difference between groups after the first semester. While 76 percent of regularly enrolled LAS students were clustered between 2.5 and 3.49, 60 percent of the SEOP students were clustered between 1.5 and 2.99. Also, SEOP students were more represented across the grade point average range with 41 percent below a 2.0 grade point average versus 9 percent of regularly enrolled students and 59 percent above a 2.0 average versus 91 percent for regularly enrolled students (Schiamberg 1969). Explanations or justifications of the drop in grade point average varied. A report published by the University stated the drop "reflects fewer available special courses for the second semester" (The Special Educational Opportunities Program 1970, 3). A separate report to the president by the Committee on Human Relations and Equal Opportunity stated that few "disadvantaged" students were prepared for the competition and academic demands of the University. "For most of them, it has been a first exposure to the predominantly white world, and the first encounter with major failure. As these students have encountered academic difficulty, they have usually become frightened and begun to withdraw, attributing much of the blame to the practices and attitudes encountered in the 'white' world" (CHREO 1967, 4). In order to help the students, the Committee proposed an easing of drop and probation rules, increased financial aid, and more support services.

A study conducted by Dr. Jane Loeb, Coordinator of Research and Testing, revealed that the 502 SEOP freshmen of 1968 were on academic probation, dropped, or not enrolled at higher rates than regularly admitted freshmen although they out-performed pre-SEOP Black UIUC students (Loeb 1973, 1, 5). For instance, in 1966 and 1967, 50 percent and 53 percent of Black students, respectively, were on clear status after the completion of their first term. In 1968 and 1969, the first two years of SEOP, 64 percent and 67 percent, respectively, were on clear status (Loeb 1974, 9). Regularly admitted students also graduated at higher rates than SEOP students within an eight semester period. For the freshmen entering UIUC in 1968, 45.4 percent of the regularly admitted students and 16.7 percent (84 students)
of the SEOP students graduated by June 1972; by 1973, 60.7 percent of the regularly admitted and 32.1 percent of the
SEOP students graduated (Loeb 1973, 8). This was evidence that SEOP students who remained at UIUC, on average,
took an extra two semesters to complete college requirements and receive their degrees.

According to a separate study by Dr. Faite Mack, 44.4 percent of the Fall 1968 Freshmen SEOP students
completed eight consecutive semesters between Fall 1968 and Spring 1972. 8.6 percent terminated enrollment after
1968 but re-enrolled for continuous student status by the eighth semester. 47.0 percent terminated enrollment and did
not re-enroll. 69 (13.7%) students graduated in June 1972 (Mack 1972, 22). While a discrepancy in numbers exists
between the Loeb and Mack studies, the conclusions were similar. The SEOP students who remained at UIUC took
longer to attain a bachelor’s degree than regularly admitted students. Mack, however, came to another conclusion: those
students who left the University often enrolled in other institutions. 59 of the drop-outs attended another four-year (39
students) or two-year (20 students) institution after leaving UIUC (Mack 1972, 46).

The large infusion of Black students heavily influenced student and academic life on the UIUC campus. With
the SEOP students, the number of Black UIUC students more than doubled. The increase in numbers gave the Black
students confidence and support. They now constituted a crucial number of the UIUC population and, in accordance
with the BSA motto, no longer hoped for anything; instead they demanded everything. In this way, the University got
more than it bargained. It initiated SEOP to increase Black representation on campus--and it succeeded--but, as a
consequence, the late 1960s call for Black Power also was magnified on the campus.

Black UIUC students had begun a concerted effort to participate in the Black Power Movement across the
nation before the SEOP students arrived. Along with national sentiment, Black students reevaluated the goal of
integration and the tactic of gradualism advocated by Civil Rights advocates of the 1950s and early 1960s. Instead, they
initiated race-based student groups, such as BSA, for the purpose of celebrating and promoting "Black pride." Also,
they made several demands on the university to actively support and promote diversity. The arrival of the SEOP allowed
for a critical mass of Black students who then attempted to alter policies and programs on campus.

SEOP student demands altered campus academic life by initiating the development of courses with a decidedly
Black focus in the Spring semester of the 1968-1969 academic year. The first, History 199, was a visiting lecturer
series. Students enrolled for one credit hour and wrote a paper on one of the lectures or African American culture.
Reverend Channing Phillips, who placed fourth in the presidential balloting on the Democratic ticket in 1968, spoke
about "Being Black in America"; Val Gray, a Black dramatist, spoke about the "Concert Voice of the Black Writer";
Percival Borde, a scholar of Caribbean and African culture, gave a lecture entitled "The Talking Drums"; Alex Haley,
editor of The Autobiography of Malcolm X, spoke about his work-in-progress, Roots; Wardell Gaynor, an associate
producer of a television show, spoke about his program "Of Black America"; Reverend C. T. Vivian, Southern
Christian Leadership Conference member, gave a lecture entitled, "The Black Church in Transition"; A. B. Spellman,
author and participant in the television show, "Black Heritage," gave a lecture entitled "Toward a Saner Base for the
New Black Music." 275 students—and not just Black students—enrolled in the course (Jackson and Plater 1970).

By Fall 1970, African Americans constituted only 3.6 percent (1,252 students) of the total UIUC student
population (Wermers 1976, 12). However, their numbers did not deter the lecture series or the development of African
American-centered courses; in fact, the call for the initiation of a Black history class was made by the campus chapter
of the Congress of Racial Equality when less than 300 Black students attended UIUC in late 1966. The 1970-1971
lecturers included dancer and anthropologist Pearl Primus, Professor of English and Director of Afro-American Studies
at Iowa State University Charles Davis, Chicago reporter L. F. Palmer, Chicago reporter Burleigh Hines, Black
comedian and activist Dick Gregory, Chicago poet Don L. Lee, musician Tony Zamora, linguist Orlando Taylor, artist
Charles White, and former UIUC student and BSA president turned lawyer David Addison (Jackson and Plater 1970).
In 1970, LAS Deans projected that the average 1971 lecture attendance would be 875 students (Jackson and Plater
1970). Due to increased interest, the College of LAS proposed a follow-up course to LAS 199 in the Spring of the
1970-1971 academic year. LAS 291, "The Black World: Perspectives," was open to sophomores, juniors, and seniors
with prior relevant coursework (Cox 1970). College departments also developed African American oriented courses
in political science, psychology, sociology and English.
SEOP students altered campus social life by inaugurating separate activities based on race, a reflection of their connection to the Black Power Movement. Sponsorship of separate activities based on race could be interpreted as a repudiation of the university. However, Black students created parallel activities to those of the university signaling their desire to participate but at the same time feel comfortable. Black students created Black academic support organizations such as the Black Graduate Student Association and the Black Theater Students Association. Though the university sponsored events such as Mom’s Day and Homecoming, Black students initiated separate celebrations. Black Mom’s Day celebrations included a Black Chorus concert, a banquet, and a fashion show with African/African American styles of dress. Black Homecoming events included a dance and the election of a Black Homecoming King and Queen. Also, Black students published a yearbook, Irepodun. The university yearbook, The Illio, included a section on Black student activities, but Black students considered the treatment sparse and insulting. BSA goals, Black activities, Black social life, and Black student outreach programs to the Champaign-Urbana community were highlighted.

In early 1969, African Americans living in Illinois Street Residence Hall (ISR) moved to create their own residence hall government. Michael Wilson, in his article, "ISR", published in the 29 April 1969, Daily Illini, explained the reason for the racial split. He stated that the ISR government was racist and that in order for Black students to make the government more relevant to their needs they had to secede. Elaborating on the split, he declared, "more specifically, black students at ISR have been assessed fees which are then used to perpetuate white cultural activities, only. Secondly, they feel that the judicial mechanism of their dormitory is biased." As early as 1969, Clarence Shelley, SEOP Director, recognized that "the biggest complaint of SEOP students is that they do not feel welcome or comfortable in the [residence halls]" (Shelley 1969a, 10). This governmental split was the catalyst in the formation of the Black Student Unions that soon would be initiated in each residence hall on the UIUC campus.

With the initiation of the 1968 SEOP, UIUC maintained its position as the Midwest university with the most Black students enrolled. According to data compiled by the US Department of Health, Education, and Welfare Office of Civil Rights, UIUC continued to lead Big Ten institutions with 4.0 percent Black undergraduate enrollment in 1970 (Weinberg 1995, Table 45). In the years since, the number of Black undergraduates fluctuated. According to the Office of the Vice President for Academic Affairs report, "Underrepresented Groups at the University of Illinois: A Report on Participation and Success, December, 1995," as of 1994, UIUC fell to fifth in the Big Ten in Black undergraduate enrollment and placed third in degrees conferred (1995, 32, 88). Though UIUC dropped in Big Ten ratings, the university provided a model for recruitment efforts and later academic support programs offered through the Office of Minority Student Affairs.

The legacy of the first groups of SEOP students persists at UIUC both academically and socially. The university heeded Black student demands to reflect the heterogeneity of student experience by initiating an Afro-American Studies and Research Program and an Afro-American Cultural Program. Separate festivities and celebrations—to which all students are invited—continue to be held and now are sponsored by units within the university. Recently formed multicultural and cross-cultural courses, social groups, and academic associations promote interaction between groups. As a catalyst for such policies and programs, the initiation of SEOP helped enrich student life on campus by broadening the scope of the university’s duty to its diversifying student population.

In the report by the Office of the Vice Chancellor, the university described its goals for the future, "to lead all Big Ten Universities and to serve as a leader nationally in the enrollment of underrepresented minority students, to improve the retention rate of undergraduate minorities so it is the same as that of all students, [and] to lead all Big Ten Universities and to serve as a leader nationally in the granting of baccalaureate, graduate, and professional degrees to under-represented minorities" (Office of the Vice Chancellor for Academic Affairs 1995, 6, 26, 32). With attention focused on recruitment as well as retention and graduation rates the university continues to demonstrate commitment to a diverse student population. Conscious efforts still need to be made for the university to reach its goals, but it does have an established base on which to build for the 21st century.

Sources in History Instruction: Evidence in The History Teacher's Magazine
Chara Haeussler Bohan and O. L. Davis, Jr.
University of Texas at Austin

The use of source documents in students' study of history has been the subject of lively debate for nearly as long as separate history courses have been offered in American secondary schools, perhaps as early as 1870 (Johnson 1917, 127-132). This advocacy dates back prior to the work of the National Education Association's 1892 Committee of Ten. During the late 19th and early 20th century, as progressive era educators advanced the use of sources in historical instruction, the deliberation over the appropriate classroom use of sources in the classroom evolved. Throughout the 20th century this debate has waxed and waned. Recently, the national history standards and literature on historical thinking have called attention to the use of source documents in historical instruction. Current understanding can be helped by examining the discussion over the use of source documents that took place nearly a century ago in the pages of The History Teacher's Magazine.

Initially, the discussion focused directly on the efficacy of the use of source documents but later expanded to include the extent of their appropriate place in the curriculum. By 1916, when the Commission on the Reorganization of Secondary Education met, this rhetorical debate seemingly was settled with a consensus that source documents needed to play at least some role in history instruction. The use of source documents had become more accepted, at least in history education literature. Indeed, a plethora of source books, articles with suggestions for classroom use of sources, and related historical materials flooded the educator marketplace.

The first five years of The History Teacher's Magazine (1909-1914) well illustrates the change and growth of the early views on the use of source documents in history teaching in American schools. This journal, founded in September 1909 under the leadership of Managing Editor Albert W. McKinley, was, "devoted to the interests of teachers of History, Civics, and related subjects in the fields of Geography and Economics" and aimed "to bring to the teacher of these topics the latest news of his profession" (The History Teacher's Magazine 1, September, 1909, 1). Due to financial difficulties, in February 1912, the magazine came under the supervision of a committee of the American Historical Association (AHA). The History Teacher's Magazine was renamed Historical Outlook in 1918 and later The Social Studies in 1934 and for a brief period of time in the 1920's and 1930's was published under the aegis of AHA and the National Council for the Social Studies (Smith, Palmer and Correia 1995; Nelson 1995).

Fred Morrow Fling became the Source Methods of Teaching Editor of The History Teacher's Magazine in 1909, the first year of its publication. This journal's first volume featured a more lively debate over the use of sources in historical instruction than appeared in any of the contemporary, highly visible, national committees' final reports (e.g., National Education Association, Report of the Committee on Secondary Social Studies 1893; The Study of History in Schools: Report to the American Historical Association by The Committee of Seven 1899; The Study of History in Schools: Report to the American Historical Association by The Committee of Five 1911). Indeed, article authors who advocated the use of sources claimed that sources increased student interest, portrayed history more vividly, and added literary value to historical instruction. Additionally, several advocates of the use of source documents suggested a probable benefit to students' exercise of personal judgment.

Consistent with the times, advocates advanced a scientific argument in support of the use of sources. One particularly striking argument was presented by Editor Fling who compared historical methodology to scientific experimentation (1909). He noted that school boards would not hire a chemistry teacher who could not conduct chemical experiments with students. Consequently, he held that history teachers should be expected to know to engage in historical investigations. In "An Historical Laboratory," William MacDonald also compared history to science (MacDonald 1909). This appeal to science in support of history education was a clear attempt to gain legitimacy in an era when science was heralded as the most certain method for the acquisition of knowledge.

Throughout its first five volumes The History Teacher's Magazine published dozens of articles each year on how to implement sources in the classroom. The majority of articles lauded the use of source documents in history
instruction. Although a debate over the use of sources existed, most articles expressed the notion that progressive teachers at the forefront of their discipline utilized source documents in history instruction. For example, W.L. Westermann wrote:

There is no argument to be advanced against the statement that the teacher of history will be the better teacher the more complete is his acquaintance with the original sources of information in the field of his teaching. These are the real springs of inspiration. It is best to drink from them when one can (1913, 249).

Many articles included actual documents, reviews of source books and methodological suggestions for the study of historical topics such as: the French Revolution, Indian treaties with Colonial governments, the Mexican War, the Battle of Salamis, Constitutional documents, and the use of museums and libraries in historical study (Anon 1910, W. 1910, Fling 1909, Vieregg 1912, Anon 1911, Henderson 1912, Smith 1914, Nestor 1914, Page 1914, Beard 1909).

However, several articles in the first volume of The History Teacher's Magazine viewed negatively the classroom use of source documents. These dissenting perspectives contributed to the ongoing lively debate about history instruction in the first decades of this century. Several authors opposed outright or thought that the use of sources should be extremely limited in the secondary and elementary curriculum. For example, Henry Elson argued that some teachers who used source documents tended to emphasize historical method above the acquisition of information. The new method simply means that history should be taught largely if not chiefly through the sources; that is, by constantly taking a class back to the sources. The historian must go to the fountains, it is true, and college classes should be led to them frequently; but high school classes only occasionally (Elson 1910, 219).

Elson and others believed that the use of source documents retarded instructional progress and, in a given period of time, students would learn less history. Some opponents also questioned students' ability to exercise discriminating judgment in their appraisal of historical sources. They believed that students were immature and "undeveloped mentally" (Fay 1909, 67). Indeed, Elson even doubted most teachers' ability to evaluate sources. He cautioned: Let the teacher of the secondary school remember that a great majority of pupils will never get a higher education, that their time should be employed to the best possible advantage, and that one great historic truth of world-wide significance, properly impressed on their minds, is worth far more than all they can gain by months of plodding research among sources (1910, 219).

Certainly, opponents did not advocate the complete abandonment of sources in history teaching. They held that a few documents, such as the Declaration of Independence and Lincoln's Gettysburg Address, were sacred and should be read by all students (see Maier 1997). The opponents of the source method, however, believed that sources should be used in an extremely limited manner and not at the expense of routine classwork (Elson 1910, Fay 1909). In support of his approach, Fling wrote that the aim of the history teacher should not be to inculcate students with "the methodological search for the truth" but to introduce students to the domain of history (1909, 5). However, in opposing the source document method, Charles Fay explained that, 'the only place for the 'Sources' is in the hands of the teacher and not in those of the pupils. I do not believe in the so-called 'Source-Method' of history teaching in secondary schools; it is unsuited to the mental capacity of the pupils..." (1909, 68).

Middle of the road perspectives about the use of sources were also expressed in The History Teacher's Magazine. H. R. Tucker claimed that few teachers could carry out Editor Fling's theory of history instruction. Even so, he believed the entire 'source method' reform should not be dismissed casually. Furthermore, he believed that Fling had aroused teachers from their lethargy and the one-book method of teaching (Tucker 1910). Tucker further argued that history instruction should develop students' discriminating judgment as well as furnish information. Through the appropriate use of sources, Tucker believed, both goals could be obtained. In his article on reference work, Clarence Perkins acknowledged that the curriculum of the first two years of high school history was extensive, but that a teacher should still try to insist on students doing some collateral reading (1911, 123).

The nature of the debate about the use of sources in subsequent volumes of The History Teacher's Magazine changed. The number of articles that opposed the use of sources in history teaching declined, at the same time interest
in implementation of the use of sources increased. Although one author cautioned against assigning extensive collateral reading on all historical periods, since "many a high school student can hardly paraphrase accurately a few pages of simple prose," most articles on the subject accepted the legitimacy of the use of source documents (Perkins 1911, 123). Furthermore, they advanced various ways of accommodating sources into classroom instruction (Wolfson 1910, Thompson 1911, Hoover 1911, Westermann 1913, Hamilton 1914). In addition, earlier claims that students were mentally incapable to evaluate source documents almost entirely disappeared from later articles.

The first clear evidence of the expanded use of sources in actual history teaching was the increasing number of source books that were reviewed and advertised in The History Teacher's Magazine. In the 1890s, for example, Mary Sheldon Barnes asserted that locating and obtaining sources was a difficult challenge for teachers (1899). Within the next two decades, teachers welcomed the addition of new and obviously needed source books. When Managing Editor Albert McKinley reviewed H. W. Caldwell and C. E. Persinger's A Source History of the United States from Discovery (1492) to the End of Reconstruction (1877) he wrote, "It was but natural when the study of history came to be taken up seriously in colleges and schools, that teachers and scholars should desire to get away from insipid literary generalizations, and taste the freshness of original sources" (1910, 105).

By 1916, however, a plethora of source books were available. For example, the reviewer of William MacDonald's Documentary Source-Book of American History 1606-1898 wrote that "thanks to the work of Professor MacDonald himself, Professor Hart, and of many others, we are well supplied with source-books for several periods of American History" (Anon 1909, 18). Furthermore, by the fourth and fifth year of publication of The History Teacher's Magazine, the topics for source books became more specialized. Rather than a general source book for use in U.S. History, authors produced more focused source books, such as Allen Johnson's Readings in American Constitutional History 1776-1876, W.C. Ford's multi-volume The Writings of John Quincy Adams and The Proceedings of the Hartford Convention 1814 (Johnson 1913, Ford 1913, Directors of the Old South Work 1912). All of the aforementioned books were reviewed in The History Teacher's Magazine (Tucker 1914, Chase 1913b, Chase 1913a). In addition, these and dozens of other source books were advertised in this publication. In addition, several reviewers started indicating that the market for the compilation of sources was becoming flooded. For example, in his review of Arthur Innes' A Source Book of English History, Vol. 1, Lawrence Larson wrote, "Since Cheyney's Readings was published, there has been no great need for such a work. . ." (1913, 8).

Another dimension of the expanded use of sources was the increase in the variety and types of materials that were suggested for classroom instruction. If teachers could not bring authentic historical artifacts into the classroom, they could use illustrative materials. Each volume of The History Teacher's Magazine included several articles on the use of lantern slides, models, wall pictures, postcards, photographs, art, and, by 1914, even silent film. In addition, documents such as the newspaper and government proceedings and treaties also were suggested as source materials. Indeed, Lucy Maynard Salmon, a Vassar professor and member of the Committee of Seven, wrote two lengthy books on the historian's use of the newspaper as a source of information (1923a, 1923b). If teachers had access to local museums, students actually could see historical artifacts first-hand. Several articles explained how history teachers could use museums to increase student understanding of history (W. 1910, Page 1914, Sanford 1911).

A third dimension of the increased use of sources during the decade of the 1910's was the remarkably innovative work of the New England History Teachers Association (NEHTA). This organization had commissioned the 1902 report Historical Sources in the Schools, Report of a Select Committee and its work was recorded in The History Teacher's Magazine (New England History Teachers Association 1902). The NEHTA's Committee on Historical Materials organized a permanent exhibition of "Aids to the Visualization of History" in July, 1910, with the assistance of Professor Henry Johnson, who had created a similar exhibit at Teachers College (Andrews 1910). The NEHTA exhibited this display during that year's convention of the National Education Association. Later, the exhibit acquired a permanent home at The Fenwick in Boston. The exhibit portrayed various kinds of historical materials, such as maps, wall pictures, models and charts and provided a place for their study and comparison. Previously, no such facility was available to teachers. This exhibit's popularity was attested by its subsequent move from The Fenwick to the Boston Museum of Fine Arts (Cushing 1914). The idea of history museums which teachers could access, quickly spread across
the nation. In fact, the Northern Illinois State Normal School in Dekalb created its own historical museum for teacher use (Page 1914). In addition, professors at the Summer School of the South at The University of Tennessee in Knoxville, also assembled an historical exhibit (Bond 1914).

Two additional pieces of evidence reveal increased use of sources in historical instruction. In 1913, The History Teacher's Magazine published a nationwide index of illustrative materials for history classes. The editors arranged the index into two parts. The first listed dealers of historical materials in alphabetical order and the second comprised of a subject index of history courses and corresponding historical materials dealers. No such comprehensive list had been available previously (McKinley 1913). The subject index included access to materials for numerous periods and topics of historical study. They included, pre-historic, Greek, Roman, Christian, Medieval, European, English, French, German, Recent Events, American, Economic and Industrial, Architecture, and Art. Many subsequent articles in The History Teacher's Magazine referenced the list and materials that had been purchased through dealers on the list. In addition, some of the historical museums and exhibits that were established gathered materials through the dealers on the historical materials list (Bond 1914, 124; Hamilton 1914, 83).

Second, a new kind of source book appeared on the market. In Fred Morrow Fling's review of Frederic Duncalf and August C. Krey's Parallel Source Problems in Medieval History, he wrote:

It would be safe to predict that the volume entitled "Parallel Source Problems in Medieval History" edited by Professor Duncalf of The University of Texas, and Mr. Krey of the University of Illinois, will occupy a prominent place in the history of teaching history. It is not simply a source book: it is a new kind of source book... It is the first book of the kind that has been published in English, but it is not probable that it will be the last (1913, 112).

Duncalf and Krey's source book differed from its predecessors primarily because it presented several documents on the same topic, thereby making possible the critical study of problems in the use historical evidence. Previous source books had not offered such comparative collections. Rather, they tended to be comprised of chronological compilations of documents. E.D. Dow also acknowledged that the Duncalf and Krey book was a new type of source book because it organized materials around problems (Dow 1913, 85). The publication of this source book opened the way for similar problem-type source books to be developed in other fields of history.

Recent advocacy of the use of sources properly can not be heralded as a recent or new development in American history instruction (e.g. Barton 1997, Downey and Levstik 1991, Stahl et al. 1996, VanSledright and Brophy 1992, Wineburg 1991). Although this emphasis presently remains the subject of much recent literature on historical thinking, the use of sources in history instruction is nearly as old as is the inclusion of history in the secondary and lower school curriculum. The nature of the debate about the types of sources and their use in history instruction, however, has evolved over the past century. Most recently, arguments have been propounded that even elementary school children can use sources to enhance their historical understanding.

The first years of publication of The History Teacher's Magazine clearly revealed the evolution in the advocacy of implementing source documents in history instruction. During the early Progressive era, educators debated the value of such sources. By 1916, the use of source documents clearly was a fixture of history education literature and teaching. Although a few advocates of "the textbook method" remained, the debate was about the degree of use rather than the kind of use. Furthermore, the number of source books and the types of sources available increased. Finally, organizations and permanent exhibits were developed in order to facilitate the history teachers use of source material during instruction. Certainly, the use of source documents in school history courses has made the pageantry of history much more vivid for millions of American students.

Advocacy of Environment Education in Two Social Studies Journals between 1960 and 1980

Tsz Ngong Lee
University of Texas at Austin

In recent years, some advocates of environmental education have argued that besides science teachers, other teachers, especially social studies teachers, should promote environmental education (EE) in their curricula. But have social studies educators accepted this argument? What have they said about environmental education? This paper will address these questions by examining articles published in two social studies journals between 1960 and 1980. This paper will begin with articles found in Social Studies and then will continue with articles in The Journal of Geography.

A review of the articles published in Social Studies reveals that environmental education was not a significant topic. From 1960 to 1980, a total of 971 articles were published. Although articles on various aspects of EE increased toward the end of this twenty-year period, they are by no means abundant. These articles can be divided into several groups according to their main content. The first group discussed the status of social studies and/or advocated curriculum reform. These articles may mention environmental education as a minor point. The second group discussed the relationship between social studies and environmental education, with the latter featured prominently. The third group described specific environmental issues such as pollution and overpopulation. These articles usually recommended social studies educators put a stronger emphasis on teaching those issues. The fourth group included articles that were more philosophical or theoretical. For example, they discussed and debated the relationship between humans and nature, or the importance of values and attitudes in EE. Finally, a fifth group of articles dealt with instructional issues. These "how to" articles suggested methods of teaching environmental issues. Some articles included elements of more than one of the above categories. The main points discussed in these groups of articles, as well as some examples, are described below.

Of the five groups of articles, the first group is frequently found in the 1960s. Typically, these articles reviewed the contemporary situation of social studies education and provided recommendations for improvement (Monier 1960, Higgins 1964, Gall 1966, Bradley 1968). Some articles also surveyed the state laws that governed public school teaching or the opinion of social studies teachers on curriculum change (Moreland 1962, Lowe 1964). These articles’ recommendations varied, but many stressed the significance of the relationship between humans and society, the need to teach concepts, or the importance of incorporating current events in curriculum. However, in none of these articles was the introduction of environmental education or conservation mentioned as an important potential change for social studies. In only one article was "protecting and conserving human and natural resources" named as one of the ten social science "generalizations" which can be used to reorganize the social studies curriculum (Higgins 1964, 56).

Although articles that discussed general curricular issues neglected the possibility of introducing environmental education, the second group of articles did mention EE explicitly. Some articles continued to emphasize conservation (High 1968, Mings 1971), while another recommended the teaching of environmental history (Strong 1974). One article mentioned the possibility of "saving the earth" through cooperation between science and social studies educators (Hepburn and Simpson 1975). Another concentrated on improving teacher education (Rowley-Rotunno 1976).

Two topics clearly dominated the third group of articles on specific environmental issues. The first topic is population growth. The second topic is energy as a resource and an environmental issue. For the first topic, at least one article appeared every year from 1965 to 1968, with another one in 1976 (Dykstra 1965, Vent and Vent 1966, Brodbelt 1967, Johnson and Johnson 1968, Anderson 1968). These articles concentrated on the situation of world population growth and the potential for disaster, particularly in developing countries. Social studies teachers were urged to pay more attention to teaching about these potentials. However, the emphasis was clearly on overpopulation’s adverse impact on human societies, not on its environmental consequences. The articles which discussed energy as a resource were more focused on the environmental impact of increasing energy consumption (McCollum 1976, McCollum 1977, Joyner 1979, Fowler and Carey 1980). For instance, McCollum provided lesson plans on how to make students aware of the relationship between the environment and the use of electricity.

Compared with the first three groups, the fourth and fifth groups contain far fewer articles. Hemmer’s article on how values and attitudes influence environmental behavior, and how religion and education help shape future
generations, is unusual (1976). Most of the articles discussed a single aspect of teaching environmental issues.

In summarizing the findings for articles found in Social Studies, several points can be made. First, the total number of articles that have clear connection with environmental education is not great. Many articles discussed curricular matters, but most omitted EE. Second, the emerging environmental movement of the 1960s did not seem to have significant impact on social studies educators until the 1970s. Third, social studies educators appeared to be most interested in two environmental issues: Overpopulation in the 1960s and energy resources in the 1970s. Their interests clearly reflected the broader academic, economic, and social concerns of the two decades. Finally, not many articles were written on practical implementation of environmental education. Many more articles concerned what to teach than on instructional considerations how to teach.

Articles about EE in The Journal of Geography can be placed in the same five groups utilized for Social Studies. Articles in group one were relatively abundant during the 1960s. These articles covered a range of topics: describing new trends in geographic education for different levels of schools, analyzing the curriculum reform movement, and outlining objectives of geographic education (Whittemore 1960, Kennamer Jr. 1967, Scarfe 1968). Most of these articles did not mention environmental education explicitly. An exception is Casper, who argued that relationships between people, resources, and environment should constitute objectives for geographic education from grades four through twelve (1961). Besides Casper, several authors also mentioned outdoor education and conservation as important themes in geography. However, greater emphasis was usually paid to other objectives of geography education, such as promoting international understanding, and acquiring generalizations on human activities’ distribution throughout the globe (Hill 1960, Scarfe 1968).

In contrast to the first, the second group of articles directly examined the relationship between geography and environmental education. These articles can be found all through the twenty-year period, but those that were written in the 1960s tended to relate geography to conservation education or to the management of resources (Parson 1961, Hill 1962, Volk 1967). Volk argued that any course that dealt with resources and geography must not lose sight of the fundamental issue that the needs of man must be satisfied by using natural resources in order to sustain quality life. On the other hand, nearly all of the articles published in the 70s had the terms environmental education, ecosystem studies, or environmental studies in their titles (Renner 1970; Hill 1970; Mason and Kuhn 1971; Emery, Davey, and Milne 1974; Towler and Brenchley 1975). The authors either argued for more direct involvement in EE by geographers, or suggested incorporation of environmental issues in the teaching of geography.

For group three, a large number of articles on various environmental issues can be found (Barton 1960, Harper 1966, Visher 1966). Geographers did not restrict their attention to one or two big issues. These articles described conservation history, analyzed cultural factors behind environmental behavior, examined different conceptions of man-environment relationship in geography, and proposed alternative human-environment relationship.

All the above findings must be viewed with caution because this study is, strictly speaking, not a proper content analysis. The articles were selected and read by the author personally, and the factor of subjectivity must be remembered. There is also no attempt to indicate the relative abundance of articles in each group by computing their percentages. Nevertheless, the author believed that this simple exercise could still shed light on the issue of why social studies educators tend not to promote environmental education in their curricula. Simply put, social studies educators were not highly vocal on the issue of environmental education.

Recent efforts at school reform have prompted the re-emergence of a 100 year old debate regarding the contribution of the academic study of history towards the education of democratic citizens. For 75 years the field of social studies has reigned supreme in its educational and curricular role as the leader of citizenship education. However, the 1990s has seen increased momentum towards efforts to dismantle the field of social studies and reestablish history as the curriculum cornerstone of citizenship education. At the heart of this debate about school reform is the concept of citizenship, and the place of history education in contributing to the education of a democratic citizen.

For over 100 years American education has seen numerous models of citizenship education developed to serve both curricular and political needs. As schools have undergone periodic reforms, so too have changing conceptions of citizenship manifested themselves within schools and their missions. Initial efforts at standardizing school curricula focusing upon citizenship education occurred on a national level in the 1890s, and were led by the National Education Association. The number of released national reports, starting with the Committee of Ten’s "Conference on History, Civil Government and Political Economy" (hereafter Committee of Ten) in 1893 to the end of World War I was frantic as no less than five reports were issued. This period of frenzied reform activity has, however, been surpassed in the last 15 years. Starting with the 1983 release of the National Council for the Social Studies Task Force on Scope and Sequence, this most recent 15 year span has seen the release of no less than eight separate national curriculum reform reports directed to improving citizenship education in schools. In the 1990s a large number of individual state curriculum reports have also been developed with the intention to reform citizenship education.

The constant issuing of curriculum reform reports is a reality of education. Ignored shelves in libraries, often frequented only by curious graduate students, are filled with reform reports released with fanfare and promise which in short order were catalogued to gather dust next to the previous parade of reform reports. However, to summarily dismiss all past curriculum reports at citizenship reform as utopian, and ultimately unsuccessful, is at the peril for anyone seeking insight into the era, ideas and motivation of the developers of each past, and present, curriculum report.

Because the pace of present citizenship reform efforts continues unabated and shows no intent of letting up, it is to an historical review of these past curriculum reform efforts that one may look for insight into recent reports. Whether the curriculum report had history, geography, a social science, or social studies as its central curricular focus, each report held a view of citizenship which reflected commonly held beliefs by those issuing the respective report. This paper presents the thesis that there has been a return to the definition of citizenship forwarded by educational reformers of the 1890’s which characterizes much of the reform efforts of the 1990s.

The Committee of Ten formally established history as the primary vehicle for citizenship education in schools. The report declared itself to be "the most important educational document ever issued in the United States" (N.E.A. 1893, III).

Given the composition of the membership of the Committee of Ten, the almost 100 individual members of the nine committees were comprised entirely of white males, such that the report’s outcomes were not surprising. Each member was approaching the zenith of their respective educational careers, and a review of membership shows most were either professors in higher education, headmasters from select private schools, or principals from established urban high schools. At the time of the report’s release, less than three of the members lived west of the Mississippi River. It is little surprise then that the document reflected an eastern vision of an orderly, logical society, which could be taught to students through an historical examination of the institutions and events which culminated in present society. Simply, the report conceived of a good citizen as someone knowledgeable of the history of the institutions, values and beliefs of the dominant society of which the members themselves had risen to positions of power and respect.

The model of citizenship forwarded by this document was one of cultural transmission, including a fixed body of historical knowledge to be garnered from historical instruction. The report stated that "the minds of young children be stored with some of the elementary facts and principles of their subjects which the adult student will surely need" (N.E.A. 1893, 16) The document intended to serve as a device to ensure the extension of a common core of historical knowledge to be passed on to the next generation.
The report states that "History has long been commended as a part of the education of a good citizen." (N.E.A. 1893, 169). That vision of a good citizen was intended to include the history of America as the document states "we Americans know our country is great, better than we know why it is great" (N.E.A. 1893, 169). Therefore history was to serve to inculcate youth to accept the values of a common national vision, come to share those values and work to preserve them. It was hoped through a systematic study of history students would come to understand how and why this shared vision of nationalism came to be formed as well as understand it was for the betterment of all in society to both accept and support those values.

The centrality of historical knowledge to citizenship education was reaffirmed in the 1899 report of the Committee of Seven issued by the American Historical Association. The report stated that history was unique in its ability to provide students with "some sense of the duties of citizenship." Tinkering with the curriculum program forwarded by the Committee of Ten, the Committee of Seven argued that the past had unique insights to offer democratic citizens, and therefore history need not only have a present, immediate application to be of value to a democratic society. What these two committees had affirmed was that it was history, for all its unique insights and perspectives on the progress of human development, that would be of most value to a democratic citizen.

As the twentieth Century dawned, and moving along parallel, but not yet intersecting tracks, the social sciences were poised to challenge history's claim of uniqueness in the education of citizens. Social scientists held history, due to epistemological and methodological constraints, was unable to address the present problems facing society. To that end, the social scientists, led by the emerging fields of sociology and political science, "viewed the school curriculum as fertile ground" (Smith 1995, 394). With the social sciences gaining in legitimacy, citizenship education began to assume a greater place in the study of existing social problems. If history could contribute to that understanding, it was to be included. If history insisted on concentrating only in the past, it was to move aside for disciplines trained to address society's immediate needs.

The social sciences made only modest gains in the school curriculum for the first decade of the new century. It was not until the National Education Association convened the Commission for the Reorganization of Secondary Education (CRSE), in 1912, that the social sciences seriously challenged history as the central curriculum discipline to educate democratic citizens.

In 1912 Thomas Jesse Jones, a Columbia University Ph.D. in sociology, and an instructor in social studies at the Hampton Institute, was tapped to be the chair of the Committee on Social Science. It was likely Jones that changed the name from social science to social studies. It would be quickly evident that this committee was set to propose a radical new method of educating democratic citizens.

With Jones, and others that shared his vision of citizenship, leading the newly christened Committee on Social Studies, it is little wonder that present needs, and not historical perspective, became accepted as the primary focus of citizenship education. That is, with the social, political and economic challenges created by immigration and industrial development, educational leaders of this era felt compelled to address these problems immediately. History was still to have a place in citizenship education, but its role at the core of citizenship curriculum was forever altered (Correia 1994).

Social efficiency was the concept guiding the vision of democratic education forwarded by the CRSE. Education for a student to assume a personally rewarding, and socially responsible position in life was how the CRSE reformers understood social efficiency. The wants and needs of the individual were always to be weighed against the greater needs of society. The report of the CRSE resulted in the comprehensive high school which still dominates the nation's landscape today. In this instance, democratic citizenship was interpreted to mean a high school which was developed to serve the needs of all youth, and not exclusively in strictly academic terms.

Accompanying this acceptance of the social sciences, in the form of the social studies in the school curriculum, was a redefinition of democratic citizenship. These educational leaders of the CRSE held that individual needs were not universal, and were by definition, unique to each citizen. This notion was slowly supplanting the existing concept of a rigid standard of citizenship. Within the practice of citizenship education, the high schools soon assumed the mantle of the peoples college. Higher education, rightly or wrongly, came to be viewed as the purview of the elite, and the
comprehensive high school was developed to assume the education of democratic citizens.

The combination of changing social demographics in the United States and the rise of the social sciences in academia translated to both a conception and practice of democratic citizenship which was more fluid than those held in the past. Whereas in the past citizenship education was understood within a rigid conception of academic success and mastery of subject matter, those forwarded by the CRSE were intended to prepare students to function as contributing members of society.

The report issued by the CRSE in 1918, *Cardinal Principals of Education*, stated that a true Democratic education "should develop in each individual the knowledge, interests, ideals, habits, and powers" to benefit both the individual and the society in which they were to live (CRSE 1918, 9). Therefore, while academics would contribute to citizenship education, it would not be the ONLY vehicle to define a proper democratic education.

The composition of members of both the CRSE and its various subcommittees reflected a new age of educational thinker. The CRSE indeed was a reflection of the emerging, college educated professional of the 1910's. All of the members attended colleges east of the Mississippi River. In short, while not departing radically from the demographic composition of the Committee of Ten, intellectually this group represented a distinctive change in philosophical orientation from the earlier report. These members were educational professionals. They brought with them the recent educational and psychological findings to guide their thinking of how schools in general, and democratic citizenship in particular, should be developed and implemented in schools.

The social studies as a curricular field gained nation-wide acceptance due to the efforts of the CRSE. No longer would history have a special claim to democratic citizenship education. Just as nature studies become the organizing theme for the natural sciences, the social studies became the curriculum method to orient democratic citizenship education to the study of society.

Professional historians did not abandon the schools totally with the release of the CRSE report. However, given the rise of the professional educator, the field of social studies became the filter through which historians were relegated to pass in order to exert any noted influence upon schools. The social studies place of dominance in the academic preparation of democratic citizens was reaffirmed in the 1930s with the work of the Commission on the Social Studies. Representing the legitimacy of the social sciences, historians contributed, but did not dominate, this committee's work. The result of the Commissions' work was an extensive multi-volume set of publications culminating in the 1934 *Conclusions and Recommendations*. Affirming the centrality of the social studies, and not either the social sciences nor history, the view of democratic citizenship forwarded by this group's work was hardly surprising. Academic success as defined by rigid areas of discipline organization and a set body of knowledge, as defined by both the Committee of Ten and Committee of Seven, were absent.

The Commission wrote that the purpose of democratic citizenship education was to ensure that students had the "knowledge of realities and capacity to cooperate (which) are indispensable to the development and even perdurance of American society" (AHA 1934, 35). Explicitly the report cited as dangerous any "continued emphasis in education on the traditional ideas and values of economic individualism," which if left unchecked in schools would result in "conflicts, contradictions, maladjustment’s, and perils" (AHA 1934, 35). In short, traditional methods of curriculum organization, including the discipline of history, were not only unwise, they were downright dangerous.

Professional historians slow retreat from involvement in schools, which in reality began before the start of World War I, was abated briefly with the Commission's efforts. However, as Novick notes, "(H)istorians, on the whole, ignored" the report (Novick 1988, 190). With professional educators left free to fashion schools as they saw fit, the vision of democratic citizenship held by these leaders was unchecked in schools.

Occasional challenges to the social, non-academic definition of democratic citizenship did indeed occur. The cases of challenges to the textbooks of Harold Rugg, or the 1950s efforts of Arthur Bestor, did for a short time catch the attention of the public. However, as soon as the special interest groups dissipated, educationists once again found themselves responsible for the education of democratic citizens, and the social studies remained the curricular vehicle of choice.

"It is a matter of basic civil rights," National Education Association president Bob Chase stated in a 1997
article in The Christian Science Monitor regarding his support for academic standards. Yet another permutation of democratic citizenship has manifested itself with the 1990's debate over national academic standards. In the past democratic citizenship was, in the case of the use of history in schools, a mastery of subject-matter on which to rely for sound judgment. Social studies was born of the perceived need to educate students to function within present society and to contribute to the betterment of society. This new variety of democratic citizenship continues in the tradition of democratic citizenship by associating a sound academic background with a basic civil right.

For the last century the use of citizenship to legitimize academic reform has been a constant theme in our nation's schools. In the 1990's a new call for democratic citizenship education has emerged. Those advocating this position in a skillful use of higher academic standards as a necessary component of basic civil rights, have successfully melded the seemingly incompatible concepts of individual need with specific, prescribed, discipline-based instruction. In the past individual need meant schools were to provide courses to meet the wide variety of academic and vocational tracks a student was likely to follow later in life. In the 1990's these perceptions and interpretations of individual needs have narrowed, as was the case in the 1890's, to mean a stringent, narrow academic program that all are expected to master.

As historians rediscovered the nation's schools in the late 1980s the language of citizenship was resurrected to pave the way for public acceptance of discipline-based, academic reform. As has been the case in almost all educational reform movements, the impetus for change in citizenship education in general, and history-based instruction specifically, was from outside the classroom and not led by classroom teachers.

It was with the release of the 1987 Bradley Commission on History in the Schools report Building a History Curriculum that historians seriously challenged the then 60 year old notion that social studies was the most viable method to educate citizens. The report stated, in arguing that history deserved a central place in the curriculum, that "the knowledge and habits of mind to be gained from the study of history are indispensable to the education of citizens in a democracy" (Gagnon 1989, 7). Citizenship required a mastery of knowledge of United States History, and any compromise regarding subject-matter competence was to be at the peril of the individual and the society in which they were to function. Through history, a background of material could be considered prior to any decision-making. Leadership of the Bradley Commission was by those outside the mainstream of public school teachers. The demand that history be returned to its central place in the schools was predictable. As was the case nearly 100 years before, democratic citizenship in the late 1980's was being defined in a specific, academic sense of information necessary to be able to function as a citizen.

On the heels of the Bradley Commission's report, the National Endowment for the Humanities funded the National Center for History in the Schools (hereafter Center). It was the Center which spearheaded the development of the controversial National History Standards. No matter the result of this group's efforts, it was how these members of the Center defined citizenship, and the role of historical knowledge in that definition, that make its efforts distinctive. Reversing a 60 year trend is never an easy effort, and the intransigence to change in public schools is a tall order for any reform movement. As Tyack and Cuban note, "teachers tend to be allergic to utopian claims for reform", and "are often the people blamed when grandiose innovations fail" (Tyack 1995, 132). The Bradley Commission was sensitive to this fear and did state that the classroom teacher was to be a "equal partner" in the process of reform. In reality, both the Center and the Bradley Commission were special interest groups drawing their financial and intellectual support from sources other than teachers.

The debacle of the release of the two separate standards documents by the Center reveals just how little agreement among historians and the public actually exists relative to a common understanding of United States History. Whether naive or foolhardy, the Center's reform efforts have met with very mixed success. The Center chose to be specific in its curricular recommendations, and as such alienated significant, and politically powerful, portions of the citizenry. However, based upon its fixed notion of democratic citizenship, the report could hardly have issued anything different. That is, by choosing to make specific historical knowledge a prerequisite for competent, democratic citizenship, it was natural that not all of history, and not all of the special interest groups, could be included. By not including all of the history of the country, the group revealed a fatal flaw of the historian; namely choice.
The support the National Center for History in the Schools needed from classroom teachers to make its reforms work in the schools did not exist. Selected pockets of strong support for the Center's efforts surely existed, however, this was as much due to the extensive efforts of individual academics and professional historians as to a philosophical acceptance of its conception of democratic citizens. Operating by design outside the mainstream of professional educators, the Center was at the mercy of special interest groups. Grass-roots national support for the Center's efforts quickly disappeared, if it ever existed at all. Therefore, despite the Center's leadership claims of a merging of the interests of educators and the professional community of historians, in reality there had never been a true grass roots efforts to garner substantive support for history reform (Nash 1997, 113-114).

A distinguishing feature of education in the United States is the practice of local control. A fiercely protected tradition, it has served to allow local communities to fashion their schools to meet local needs and reflect local values. Any efforts at national educational reform to challenge such a deeply held notion has to pass the litmus test of whether the said reform challenges local control, and if so, is the result of said change to be a positive one for the local community. If the answer to any of these questions is negative, the implementation of any reform is likely to not find any lasting support in the local schools. Whether the issue is desegregation, textbook adoption, or curriculum revision, local districts have successfully kept "outsiders" from forcing their values upon local districts. It has only been in the case of a national consensus, and substantial financial commitment from the federal government, as in desegregation, that local mores and customs have been successfully altered.

No such ground swell of national consensus exists for changing the practice of democratic citizenship education. Despite claims of high academic standards being a basic civil right, national consensus has failed to gather the requisite national support. With teachers considered to be at the very least suspect, and often the cause of the problem of poor history instruction, teacher are not going to be the source for substantive curricular reform of citizenship education. If the National Center for History in the Schools hopes to implement their sweeping changes in schools, teachers must be included in the process. Currently the National Council for the Social Studies serves the interests of these citizenship teachers, and has done so for over 75 years. Upstart reform organizations, no matter what national figures lead them or how well funded, if seeking to radically alter educational practices, are likely to find schools unreceptive to proposals for substantive change.

What divides the advocates of history and social studies is how both fields conceive of citizenship education. The academic discipline of history represents a long tradition of professional historians striving to provide insight into the collective memory of human existence. Professional historians understand history to be a contributing factor to the education of a democratic citizen. Even claims of history providing to the student "habits of the mind" seem to hearken to the days of the psychological theories of mental faculties much less than current learning theories (Gagnon 1989, 25).

Frankly, for a discipline based on the understanding of the past, education reformers have proven themselves woefully ignorant of the limited success of previous educational reform efforts as well as the methods by which educators are prepared to teach in the 1990's. If this ignorance of modern teacher preparation is by design, these reformers are communicating loudly their contempt for teacher education. If this ignorance is by oversight, one must question the qualifications of these reformers to fashion any sort of change in an arena of which they have little understanding.

Social studies sees as its central purpose the education of democratic citizens. Whereas historians see their field as providing a convenient by-product of information for citizens in a democracy, social studies sees history, along with the social sciences, as contributing to the overall education of citizenry. The distinction is noteworthy. Given the erratic track record of professional historians in working with the teachers in the nation's schools, nearly a century of neglect exists. What the social studies has managed to do is serve the definition of democratic citizenship education by defining that broadly, including teachers in its efforts, and remaining dedicated to the education of democratic citizens.

Until advocates for a history based curriculum can build and maintain support networks for teachers, it is unlikely they will be successful in substantively altering the practice of teaching. The insistence of a rigid conception of democratic citizenship as has re-emerged in recent reform efforts, will both splinter and preclude a national consensus...
of support. Reform efforts which reflect a dynamic view of democratic citizenship and are inclusive are most likely to result in lasting, positive change in our nation's schools.

References
In the 1960s school administrators and teachers in Orange County, Florida implemented a new social studies program into the curriculum based upon Public Law (PL) 233.064 (1961) of the Florida State Statutes. Florida lawmakers entitled this new law, Americanism versus Communism: a required high school course. They mandated thirty hours of instruction for all high school students in the state of Florida as a requirement for graduation. Americanism versus Communism or AVC as both teachers and students commonly called the newly-mandated course, was based upon a seven-part law. Its statement of intent referred to Communism as a political ideology that was in conflict with the principles of Democracy. Additionally, the statute pointed to a growing global fear that student groups were especially susceptible to exploitation and manipulation. Therefore, reasoned lawmakers, free people everywhere were challenged to meet and defeat the dark forces of communism.

According to the law's formulators, the most expedient method of meeting this challenge was to provide students with "a thorough understanding of the entire communist movement, including its history, doctrines, objectives and techniques." Subsequently, teachers taught the tenets of Communism, while Americanism was supposed to be portrayed as the only reasonable political system of a free world. The title of the course, also mandated by law, implied a great political and economic contest between two rivals, although the word "Americanism" is neither a political nor economic system. According to the goals of the new curriculum, the course was designed as a bulwark against Communism, in that its primary purpose was to instill "in the minds of the students a greater appreciation of democratic processes, freedom under law, and the will to preserve that freedom." Other goals included student understandings of the American economic system as the one which "produces higher wages, higher standards of living, greater personal freedom and liberty than any other system of economics on earth" (Public Law (PL) 233.064, Florida Code 1961).

In advancing these ideas, the wording of the statute urged teachers to warn students about the misery of living under "godless" Communism, the political and economic system of the Soviet Union, the United States' greatest peacetime enemy. Accordingly, lawmakers charged teachers with placing "particular emphasis upon the dangers of communism, the ways to fight Communism, the evils of communism, the fallacies of Communism, and the false doctrines of Communism" (Florida Code, 1961). They went so far as to insist that the State Textbook Council and the State Department of Education use the official reports of the House committee on Un-American Activities and the Senate Internal Security subcommittee of the United States Congress as instructional guides. Moreover, none of the textual materials selected for Florida schools, or any teacher assigned to teach the Americanism versus Communism course, reminded lawmakers, were permitted to favor Communism or present it as preferable to the system of government of the United States. Florida legislators, either out of ignorance, or a certain superiority, even claimed that the free-enterprise system was indigenous to the United States.

Consequently, Florida lawmakers likely viewed students as natural candidates for exploitation and in need of defensive measures, such as the newly-mandated AVC social studies program. This inoculation approach to curriculum development and implementation seemingly guaranteed that Florida youth were armed with an appropriate quantity of knowledge about the dangers of Communism, and as such would be in a position to serve the state well as classroom soldiers and citizens. Escalating involvement in Vietnam may have been one reason lawmakers sought to keep the image of the Soviet Union as the, "Evil Empire," fresh in the minds of graduating seniors, whose civic responsibilities might later include military service. Viewed from that perspective, the AVC curriculum had the potential to contribute to both the recruitment of soldiers, and as a public relations endeavor which would make military involvement in Vietnam palatable.

A second theory, and one advanced by a teacher interviewed for this paper, involved influential South Florida businessmen and former Cuban citizens. According to this teacher, powerful Cuban businessmen from Miami feared the Castro government and persuaded South Florida lawmakers that the interest of the state would best be served by mandating an anti-Communist program for high school students (Ellis 1997a). However, none of the curriculum materials surveyed to date are anti-Castro; most focused exclusively on the following: 1) fear of the Soviet republics
Schooling and the Politics of Fear
Riley

as a threat to democratic forms of government; 2) Communist theory and doctrines; and, 3) infiltration techniques. The literature only mentioned other Communist countries in terms of the international nature of this odious political and economic system. One former teacher, John Sheehan, believed that Florida lawmakers "were aghast at the number of defections in Korea," which may offer some strength to the notion that the AVC program was, in part, a public relations endeavor (Sheehan 1997). However, one of the most plausible reasons behind the implementation of the AVC social studies program emanated from rumors and suppositions. Several former teachers believed that the one-time governor of Florida, Charlie Johns, along with his cronies, were behind the mandate.

It seems that Johns spearheaded a Communist "witch hunt" on the campus of the University of Florida during the 1950s, a decade marked by the highly profiled investigations of United States’ Senator, Joe McCarthy. The zeal with which McCarthy went after suspected "commies" and "pinkos" is legendary. According to informants, Johns or his minions, in true McCarthy style, held inquisitions in local motel rooms in Gainesville, Florida, where brutal allegations toward University of Florida faculty members were leveled (Riley 1997). These "star chamber" meetings often resulted in firings or resignations. Hence, the 1961 law which mandated the Americanism versus Communism program was likely an outgrowth of the fear and hysteria whipped up by Charlie Johns and his supporters. Thus, their thinking likely went, if Florida students were inoculated before enrolling in one of Florida’s institutions of higher learning, the teachings of communist professors not ferreted out by the Johns’ Commission would at least make them resistant to subversive teachings.

Regardless of the impetus behind Florida’s AVC program, several themes connect the recollections of former social studies teachers who were assigned to teach this controversial course, and who were interviewed for this paper: 1) refusal to accept the role of propagandist; 2) the desire to objectively present the course as either comparative economics or comparative governments; and, 3) an awareness that they as teachers were in charge of curriculum decisions in their respective classrooms. In most cases, these teachers accepted the instructional materials purchased by their school district, yet the approach they took was based largely on their personal and professional beliefs about teaching and learning. None of the teachers interviewed chose to teach AVC; most recalled the curriculum program as unpopular and disliked by both teachers and students, although some undoubtedly did not fit this profile.

As for former students who were interviewed for this paper, most recalled little of their AVC classroom days. Of those who were able to remember the course, most said that they knew it was propaganda, but that the propagandist nature of the course did not cause them to hold negative attitudes about the former Soviet Union. These recollections suggest that the efforts of former teachers to resist the strong indoctrination language of the state statutes by teaching the course as either the history of Russia, a comparison of capitalism to communism, or a comparison of democracy to communism, may account to some degree for this lack of overtly negative attitudes regarding the former Soviet Union. In any event, this paper is an initial look at Florida’s Americanism versus Communism social studies curriculum between 1961 and 1981, with emphasis on how teachers taught the course and how it was received.

Although Florida’s lawmakers mandated thirty hours of instruction for the mandated AVC course, schools in Orange County, Florida, implemented it as a full semester program of study. At Winter Park and Edgewater high schools, it was organized for large group instruction (Ellis 1997). Most schools in the county held this particular course in the auditorium, at least throughout the 1960s and 1970s. Sheehan, who began his teaching career in 1967, taught Russian language and culture at first. Later, in 1975, he taught the AVC course at Winter Park High School as one of three team teachers assigned to teach this large-group instruction class in the school’s auditorium. He recalled that his colleagues invited him to teach part of the content, rather than simply monitor the auditorium and assist students. He took his place on stage and presented slides of the Russian people and discussed Russian culture. After this experience, recalled Sheehan, his fellow team teachers refused to allow him back on stage. In fact, he stated that "the two never let me show slides again" (Sheehan 1997). By contrast, he taught one smaller section of 44 students on his own, to which he taught AVC as a comparative economic and political system. He especially focused on Russian history, a subject for which he was well prepared.

According to Sheehan (1997), his colleagues were convinced that he was a "Yankee subversive, who painted everything in shades of gray," while he in turn concluded that they taught the AVC course according to the spirit of the
state statutes, which is to say "right by the book." His impression is somewhat supported by another teacher, Jim Smith, a social studies teacher assigned to a rival school, who claimed that he had it on good account that teachers at Winter Park High School "white washed it [Americanism vs. Communism] by teaching that the Soviet Union was all bad and that we were all good" (Ibid). The supposed hard-line position taken by Sheehan's co-teachers may have stemmed, in part, from a certain degree of professional jealousy, rather than a blinded view of the United States as the "good country" and the Soviet Union as the "bad." Sheehan, a graduate of Indiana University with a Masters Degree in Slavic languages, and ten years teaching experience in the Russian language, likely overwhelmed them with his depth of knowledge on the subject of the Soviet Union. As a result, they retreated to the safety of the mandate, a place they probably believed the "Yankee subversive" would not follow, and stood firm on the use of the state adopted textbook written by J. Edgar Hoover, a book described by Sheehan as "awful" (Hoover 1958).

Jim Smith, a contemporary of Sheehan's, taught social studies at Edgewater High School, an early Orlando high school located less than five miles from neighboring Winter Park. Smith like Sheehan, used a comparative government approach and also taught the course with an emphasis on Russian history. Although most teachers interviewed claimed a distaste for the subject, Smith voiced an appreciation for the AVC course. However, both Smith and Sheehan experienced similar episodes of professional discrimination related to this controversial social studies program. For example, while Smith recollected that most of his social studies colleagues attempted to retain a measure of objectivity in their curriculum content and instructional strategies, some fellow teachers "didn't think much of the curriculum." Accordingly, at least one social studies teacher at Edgewater followed Hoover's book and its intent, according to Smith. Therefore, his claims of "We tried to show both sides," and "I went into the philosophy and theory and tried to show a comparison of the two" (Ibid), were often met with disapproval. He further recalled that he and fellow AVC teachers were "looked upon as Commies and Pinkos," despite the fact that the Orange County school board required all teachers to take a loyalty oath (Ibid). The name calling and disapproval, implied Smith, came from other faculty members who failed to understand the nature of the statutes or the course as he taught it (Smith 1997).

Danny Ellis, a colleague of Smith's at Edgewater, taught AVC as his first assigned course upon acceptance of a teaching position. He had been warned about the course by veteran teachers who believed that lawmakers had little business dictating to teachers how to teach a particular subject. Curriculum decision making, he inferred, was the domain of the professional teacher. Therefore, in his classroom, he approached the subject matter as a comparative study of modern governments. He, like others, emphasized Russian history, a topic students seemed to like. Some of these students were likely intrigued by the school's efforts to indoctrinate them, which may have piqued their curiosity about the so-called "Evil Empire." What ever the case, AVC as an indoctrination course became a widely-held belief among high school students (Ellis 1997).

Ellis, for all of his efforts at creating a critical perspective out of the highly prescriptive AVC statutes, withered under charges that he was a communist. He became hurt and puzzled over how his intentions to teach AVC as a comparative government course could be met with such hostility. A few of his course outlines, tucked in the back of one of his classroom file cabinets, attest to the veracity of his instructional approach. For example, one six-weeks' outline covered topics such as the "Introduction to Political Science and Modern Political Systems," and "Other Forms of Government: Britain and France," to "The Theory of Communism," "the Russian Revolution," "The Soviet System of Government," and the "American Federal Government" (Ellis 1997b). Despite the distance of more than six years--when the AVC course went off Florida's statutes book--Ellis remains defensive about his years teaching Americanism vs. Communism. Of this experience, he remarked, "I didn't like being called a communist." He defended his curriculum decisions by maintaining that he planned for AVC as he did for any other social studies course: he reviewed available instructional materials, and consulted the state and county standards. His goal was to create units of study according to what he believed was in the best interest of his students. As an example, he recalled that recently, after reflection, he decided to drop the "Cold War" as a topic, because for him, it was simply not relevant today (Ellis 1997a).

Eleanor Kenyon joined the faculty at William R. Boone high school in 1962. She recalled the students during the early 1960s as individuals who were superior in intellect to those she later taught in the 1970s, at least they were more inquisitive. Her own liberal arts education from Dennison College, she believes, prepared her to take a critical
view of history and a constructivist approach to teaching. Hence, her students conducted research and commented on
the research of others. As a teacher, she seemed more interested in a student's ability to discern what information was
left out, and why certain information was included, than in accumulating facts. Privately, she believed that the
Americanism vs. Communism course "was the most ridiculous course [she] could ever imagine." Publicly, however,
she taught AVC using the same instructional approach she used in other history courses, which meant a critical
approach, or, as she said, "I taught them to think!" Kenyon refused to allow her students to accept the state's version
of Communism, although she personally believed that the Communist system failed in a number of areas, such as
individual motivation (Kenyon 1997).

A native New Yorker, Kenyon saw Florida as a bastion of conservatism, and was concerned about its influence
on her students. According to her, "people down here don't think," and implied that Floridians possessed reactionary
tendencies. To Kenyon, New York state schools did a superior job of preparing students for the responsibilities of adult
life, one of which was to develop the ability to think independently. As a result, her background from Dennison College,
combined with her observations of Floridians, likely led her to take a constructivist approach in the classroom. Thus,
through critical examination, she stated that her students saw through the propaganda imbedded in the AVC program.
However, Kenyon's students were not the only ones to hold a distaste for their AVC course of study. Dislike of the
course was wide-spread, and according to Kenyon, was perpetuated through student rumors.

One of the most vocal opponents of the Americanism vs. Communism curriculum was Jessie Heasley, a former
curriculum supervisor and social studies teacher from Orange County, Florida. To her, the state-mandated curriculum
was nothing more than "propaganda." Heasley claimed that the course was a "reaction to McCarthyism and all that
garbage--the John Birch Society, etc." Moreover, she said, "It was all propaganda and I decided that I simply would
not be a propagandist." She expressed her concern that "those who didn't know," as she referred to the non-teaching
public, expected her to "send out a bunch of brain-washed individuals," which, according to her, was "not why I taught." Like other former AVC teachers, Heasley used the opportunity the course provided to teach the history of Russia: "We
knew so little about the Soviet Union, she said, that "it seemed to me to be a good time to teach Russian history."
Despite the fact that she taught AVC for only one summer semester in the 1970s, to students who wished to acquire
extra credits instead of the usual summer repeaters, she still holds strong opinions of the course and the state mandate
(Heasley 1997).

Like most of the other teachers interviewed, Heasley rejected the state of Florida's approach to the
Americanism vs. Communism course, not out of a lack of patriotism, but out of a sense of "rightness." All of these
teachers expressed a deep and abiding belief that the system of government in the United States was the best. However,
each stubbornly resisted what they perceived to be state intervention in the classroom for the purpose of indoctrination,
when as social studies teachers, most tried to encourage their students to develop the skills of critical thinking. Their
collective perception that the state's motive was a kind of "brain washing" endeavor, likely found expression in the
classroom, and may account for negative student attitudes toward the course. What tends to support this claim is that
while teachers know exactly why they opposed this state-mandated curriculum, former students interviewed for this
paper lack any understanding as to how they came to dislike their AVC course.

Like other "special interest" curricula, the AVC course, as these interviewed teachers recalled, was not
supported through in-service training. This lack of support for state-mandated educational programs, such as
Americanism vs. Communism, seems to be a common oversight by zealous congressmen who often sacrifice the
educational needs of teachers and students at the alter of the voting booth. However, this failure of vision is frequently
mitigated by the very individuals whose needs are neglected. While Florida lawmakers may have had the power to pass
education laws such as the Americanism versus Communism curriculum, Florida teachers, at least some of those in
Orange County, had the power to poison their legal well, once behind the closed door of the classroom.

In the early years of implementation, most social studies teachers, without benefit of in-service training, or, the
customary textbook, relied on the sensationalized treatment of Communism written by J. Edgar Hoover, entitled
Masters of Deceit: What the communist bosses are doing now to bring America to its knees. Hoover denied in his
opening remarks, however, that his was a sensationalized version of communism, yet he cautioned readers that the
Soviet system of government "would strip man of his belief in god, his heritage of freedom, his trust in love, justice, and mercy" (Hoover 1958). These strong words, used for the purpose of instilling fear, naturally overwhelmed his more cautionary rhetoric to Americans regarding the dangers of making false claims of sabotage, or exercising reasonable judgment if one found incriminating evidence.

Hoover's warning to America was contained in 352 pages under topics such as, "How communism Began," "The Communist Appeal in the United States," "The Communist Trojan Horse in Action," and "The Communist Underground." He sought to inform readers about the birth and growth of the communist movement and how the Soviets planned to take over the United States. One former student who attended a large-group instruction class in the mid-1960s at Winter Park High School, remembered the class as "boring," yet one which also gave her the feeling of "having to be alert," as though something were about to happen (Hardesty 1997). Another student recalled a movie entitled The Wave, which reminded her of the AVC course she took at Winter Park High (Ottinger 1997). However, the movie told the story of a real incident in Palo Alto, California, and concerned a classroom experiment on Nazism. Her analogy is likely based upon her impression of the AVC course as one of indoctrination, a dominant theme in the movie.

Initially, Hoover's book, Masters of Deceit, was the one readily available in 1961 when lawmakers passed the mandate. Later, in 1962, Hoover published a second book on communism; this one was a standard textbook entitled, A Study of Communism (Hoover 1962). Hoover stated that he was moved to write this textbook owing to such a large response from teachers across the nation following the publication of Masters of Deceit in 1958. In this newer version, he hoped to contrast the freedoms of the United States to the oppressive and restrictive government of the Soviet Union. Hoover began his comparative study with a series of question, one of which asked the following: "Why is our free society inherently superior to communism?"

Hoover's deliberate attempt to show the Soviet Union in the worst possible light, while glorifying the United States' system of government was equal only to his treatment of follow-up student activities. One question he posed for review asked the following: "Does the fact that so many different motives can be listed as part of the psychological attraction of communism tell you anything about the over-all nature of communism’s attraction?" The logic of that question defies pedagogical understanding. The remaining questions were nearly impossible for students to respond to without outside knowledge, as the text itself did not contain the necessary background information. However, unlike his earlier book, this new textbook contained sub-topics of manageable size for high schoolers, albeit without prior experience with subjects such as economics or philosophy, most students would find the text daunting. The density of the material was likely behind such responses by former high school students as, "The class was boring," or "I don’t remember a thing," the undesirability of an auditorium class notwithstanding.

The following year, 1963, a Miami University professor published his version of an AVC textbook entitled The Masks of Communism, whose front cover contained a photograph of an individual cropped so that only a pair of menacing narrowed eyes peer out from between black and red borders. In Hooverian style, Jacobs introduced his text as one that would demonstrate that the "United States is threatened by an enemy dedicated to its destruction," and, that the enemy is "Communism, whose leaders promise that in two generations or less they will ‘bury’ the American way of life and the system it represents." The text failed to take a different position from Hoover’s 1962 publication. Rather, it offered teachers or school districts a choice between a well-known’s version of communism or an un-known’s, both of which were virtually the same (Jacob 1963).

In the middle 1960s, some Florida teachers in Orange County taught AVC from a textbook entitled Democracy and Communism, Theory and Action. A far less impassioned treatment of the political and economic practices of the Soviet Union, its authors stated that the audience for which the book was written--the upper grades of senior high--were "well aware that the ideals and practices of democracy do not always coincide." However, they claimed, senior-high students were "equally aware that most Americans continue to strive to bring democratic practices ever closer to democratic ideals" (Allen, Bartlett & Colegrove 1967), an idea voiced loudly by Jessie Heasley, a former curriculum supervisor for Orange County, Florida.

Democracy and Communism, at this point in the study, appears to be the first state-adopted textbook purchased
Schooling and the Politics of Fear
Riley

for Florida's AVC program which took a more traditional political and economic studies approach. Out of some fifteen chapters, eleven dealt with the Soviet Union and its political, economic, and social systems. In addition, the authors examined its international strategy, including tactics of control. Of the four chapters which examined the system of government of the United States, three contained the word American: "Democracy: The American Ideal," "Free Enterprise: The American Way," and "Some Current American Domestic Concerns." Hence, the word American, seems to evoke a certain emotional feeling that is more difficult to replicate even with the term, United States. In any event, the fervor with which the Americanism versus Communism curriculum program was implemented, seemed to lose steam as the new decade dawned, and by the mid-1980s, teachers such as Barbara Slater Stern, Assistant Professor at Randolph Macon Woman's College in Virginia, and one-time social studies teacher in Central Florida, taught the course in a six-weeks' block within a World History curriculum, rather than as a full semester course. This latter treatment of the AVC course never stirred the emotions or incorporated the sense of "sturm und drang" that was so characteristic of the course in the early years of implementation. By 1991, when AVC faded from the law books, it was a thing of the past and all but forgotten.

In sum, what has been presented here is merely an initial look at this controversial social studies curriculum program. The speculation about its origins merits further investigation. Both teacher and student recollections are also in need of more detail and richness. These enrichments are already planned in a year-long study which begins in January 1998. What can be said about this social studies course is that it stirred certain protective feelings within teachers who rejected the role of propagandist out of concern for students, and possibly out of stubborn resistance. Some teachers, for example, simply refused to teach the AVC course with a prescribed "white hat" versus "black hat" approach. This reluctance became the source of much suspicion on the part of fellow teachers and some administrators, and eventually led to accusations such as "commie" or "pinko."

Despite the insults and distaste of the course, teachers planned for their units of instruction no differently than they did for any other. Most brought Russian history into the content, although some certainly followed the mandate to the letter of the law. While most teachers resisted the use of any material authored by J. Edgar Hoover, some, no doubt, found truth in its pages. As the war in Vietnam dragged on, and public sentiment turned against U.S. involvement, the fight against communism in the classroom seemed to lose its meaning, and by the time that the Gulf War loomed in our future, foe had turned to friend. Thus, the communist inoculation curriculum experiment, in which thousands of graduating high schoolers were taught how to identify communist infiltrators and threats, had been replaced by new "special interest" voices, all seeking their way into the social studies curriculum. The school house, in the decades since World War II, it seems, has been the object of ambitious politicians and misguided voters, whose strongest opponents, one might conclude, are those teachers who sometimes must employ subversive tactics of their own.

Ellis, Danny. 1997a. Personal Interview with Karen Riley
The purpose of this paper is to present the ethic of care, originally proposed by Carol Gilligan, as a framework that can contribute to understanding how teachers carry out their work (1977, 1982). Ethical considerations in teaching have usually been centered on the resolution of pre-established deontological or legal conflicts, not from a "caring" perspective, in which context and actual behavior are central, and where teacher-student interaction can be seen as a site in which participants construct ethical systems (Strike and Soltis 1992). From this standpoint of caring, an examination of teaching can contribute to an analysis of the ethical characteristics of different social roles, the relevance of distinctions such as "private-public," "personal-non-personal relations" and to clarify how teaching should be construed in relation to these dimensions (Bowden 1997, Blustein 1991).

Such a task stems from research discussions that have identified several ethical systems that should be taken into account when we seek to understand moral reasoning, but it also acknowledges that this attitude while valid for the researcher is difficult to sustain by the practicing teacher (Sastre, Moreno, and Fernández 1977; Gilligan 1988; Kohlberg 1992; Miller and Safer 1993). "Teaching is value-laden, interventionist work, and we have to answer the hard questions" (Cazden 1992, 10). An example of such a question is as follows: With which teacher-student ethical position do I identify myself, and with what results?

I will defend that the chosen answer in several contexts can be the ethic of care. This will be based on three lines of analysis. First, I will present a historical review of the changes in contemporary political philosophy that are at the basis of the "ethic of care" and of some of its applications to education. Second, I will discuss data from teacher interviews in which they show an ethical orientation based primarily on "caring." Finally, a response to the criticisms that have been made to this approach in relation to its gender and social implications will be proposed. The overall purpose is to further understand the ethical dimension of teacher's work, how it relates to other aspects of their activity and how it might be relevant to improve practice.

The ethic of care is part of a philosophical tradition that has emerged in the second half of this century. This evolution can be seen as progressing through three embedded domains: a conception of the person-self, from which a political and ethical system can be derived, and from which a particular approach ("caring") is built.

Starting with a rejection of universal and abstract principles as a guide to political organization a rather broad approach that may be defined as "communitarian" has emerged during the second half of this century (Mulhall and Swift 1992, 1995). Most relevant to this discussion is the proposition made by several of these authors that meaning and the values attached to them emerge from a community, that shares and transmits a set of social practices (Mulhall and Swift, 1995). While this idea has controversial implications for political theory that need clarification, it provides an alternative basis to understand moral development.

Carol Gilligan's work began as a critique of the studies on moral development of her colleague Lawrence Kohlberg (1976). The main issue that she contended was that Kohlberg's research, as well as other important works in psychology, were not sensitive to gender differences and failed to understand the principles and necessities that guided women's reasoning (Gilligan 1977, 1982). While this analysis was seen as a new direction for feminist thought it also provided an alternative framework, detached from the Kantian basis of Kohlberg's ideas, to understand moral reasoning in both men and women. This re-orientation is captured well in Gilligan's and Wiggins' conception of love, which is "tied to the activities of relationship and premised, like attachment, on the responsiveness of human connection, the ability of people to engage with one another in such a way that the needs and feelings of the other come to be experienced and taken as part of the self" (1988, 120).

U.S. educational policy has experienced several proposals based on different interpretations of "caring." One precedent is the educational theories developed in the 1960s based on constructs such as "cultural deprivation" or "at-risk." They suggested curriculum and instructional strategies sensitive to the specific needs and characteristics of particular social groups, such as lower-SES or racial minorities (Watras 1997a). These programs grew from a knowledge base with good intentions, but in retrospect were based on erroneous assumptions and failed to attribute any
"agency" to their recipients (Portes, 1996). In many cases efforts aimed at helping the disadvantaged only seemed to have justified policy and educational practices in which the professional educators simply exerted power over the students. Furthermore, these interpretations did not examine structural problems such as racial segregation (Watras 1997a, 318).

Since the last decade, as part of one version of the "women's movement," different proposals about education based on a "caring perspective" have been made. They claim to be important in solving a wide-range of problems by explicitly introducing aspects of what they construe as the "feminine approach." For example, they call for instruction based on dialogue and cooperation, a curriculum that builds nurturing capacities into the subject matter and changes in the organization of schools and teacher certification (Watras 1997b). However, some of these suggestions are problematic because they fail to take into consideration other aspects of the educational system and result in overall poor proposals (Watras 1997b). Furthermore, if one of the intended results is a social transformation that advances the position of women, these ideas put too much focus on intrapsychic change thus avoiding socio-structural issues and often do not consider any significant rearrangement of existing practices (Mednick 1989, 1120; Watras 1997b).

To put forward a contention that still defends that "caring" can have some pedagogical value requires responding to these shortcomings. An understanding of how teachers directly construe the ethical basis of their work is an important component in this process, especially if it emerges as a teacher-based response to educational problems that are structural in nature. Also, an ethic of care needs to be put in relation to criticisms inside feminist theory and to psychological research that can make contributions to further conceptualize its practical implications.

As part of two research projects, one focused on the overlap between family and school systems in several Chicago-area private and public schools and another focused on classroom discourse and literacy development in a Madrid public school, several teachers were interviewed in an open-ended fashion about their experiences, feelings, main concerns, problems, rewards and other general aspects of teaching (Quinan 1995, Poveda 1997). Therefore, the original purpose was not to study moral reasoning, but nevertheless, it became salient that they largely construed their work as an ethical activity sustained by the relationships that they chose to build with their students. A comparison of two particular teachers is especially interesting because this dimension seemed to rest on different modes of justification: while one directly interprets her everyday problems and work in terms of the emotional-relational ties with her students, the other teacher's is based on the failure of the principles of justice and equality that the system claims to uphold.

Concepcion is a Mexican-American teacher in a transitional-bilingual first grade classroom in an inner-city Chicago public school and has been working for more than twenty years with Hispanic students. In her feelings about teaching she states that, "I like children very much, I love them very much, that is why they sometimes make me very sad." She went on to give various examples she has encountered over the past two decades. When she talked about her role as a teacher in the lives of these children she put it in relation to the role of the family. This process is embedded in the difficult socio-economic situation of her students, which she believes is fostering detachment between the children and the community. She stated that:

[I]t seems that the family is not so united any more and has left the children more alone. . . . If they are not given the place they should have in the school, then they do not have much support in the home then you later see how their character changes. . . . Like Juana's mother, how can she help her if she doesn't know how to read or write and she is in a country where she doesn't know the language . . . for me this is a bit of work because I have to sit down with Juana. . . . The future of these children depends much on that the parents pay more attention, more warmth ("cariño"), that they do not leave them so alone, they are very alone!

While these examples do show a lacking inside the family in some areas, this is not turned into a general statement and she explicitly addresses the possibility of personal advancement, which is where she places the issue of structural change. Concepcion goes on to say that, "I think they see me in a very high position so I like to tell them that I also made mistakes in school but then learned, that my mother was also poor but that I was able to become a teacher, that I also sometimes don't have money to pay for things." She then adds that the children need to take pride in themselves even if it causes conflict with other groups. She states that, "I always tell them not to forget Spanish, it's
Paz is a first cycle teacher that has been working for more than fifteen years in public schools of the south of Madrid. This is an area mainly composed of a lower working-class population, it also contains most of the gypsy minorities of the region and recently has experienced an influx of immigrants from developing countries. This is what she expresses when she talks about the most gratifying aspect of her work: "the warmth (cariño) that the children give you in return, as long as you treat them well, love them a little and give them some attention, they will return it to you multiplied by fifty thousand."

When she describes her role in relation to other systems in which the child participates, she highlights her active place in confronting several problem areas. She states that "in these schools the children need much attention, they all have many needs and are lacking in many areas, some intellectual, others affective, others hygiene and behaviors. You want to work in all these areas as much as possible, in what they need but you just don’t have the capacity."

Nevertheless, when she contextualizes her work in the system it seems that her commitment stems from personal-affective reasons, without taking into account the assistance of other institutions. She notes that "for some people life is very hard, and from not any institution or government agency do I feel that we have support. All the theories in the books are very nice, but in practice you cook it the best you can. If you are concerned with the development of persons independently of their social condition, here you can do it, at least you can make that the time that they are here they feel happy and learn as much as they can."

Paz’s commitment to her students is put in relation to the failure of the application of the justice-deontological that are supposedly upheld by the educational system. Paz notes that "the situation of the schools in the south is a disaster, especially in the public schools, it’s a shame. They have taken care of breaking them down, with very subtle and Machiavellian strategies, but very clear... it’s an hypocrisy of society... everybody is schooled, all the population, and it’s reflected in the statistics that there aren’t any children out of school, but in what conditions?" This situation could be changed if the community and school, according to Paz, both took responsibility for the care of children.

These two teachers show how they have developed a view of their work, of their relationship with their students and the context in which this activity takes place that is largely represented in ethical terms that seem to have several components of a "communitarian" and "caring" approach. From one point of view, these teachers have very different life-histories and work in different countries. Although this "sample" by no means intends to reflect the whole scope of positions towards teaching, their convergence of ideas indicates a potential to generalize some proposals. From another point of view, they confront a series of problems that are common to many schools in Western urban contexts: socio-economic marginalization, cultural diversity, and insufficient resources to fully develop their work.

It can be claimed that it is these latter commonalities that help explain the emergence of a "caring" approach. Women, working in a "traditionally feminine" profession and in underprivileged contexts share some of the variables that would predict a predominance of the "different voice." Furthermore, one possible development of these implications could suggest that structural changes are not absolutely necessary. The proposal here is that structural changes are necessary but teachers cannot be considered empowered to execute this change. An ethic of care in this case can at least be considered as a teacher-based response to these problems but it probably can also be an important support to educational reform efforts. However, to be able to uphold this second assertion the implications of this ethic need to be further explored.

Carol Gilligan’s proposal that not only a different mode of moral reasoning exists and that it seems to be related to gender has been met with almost two decades of empirical and theoretical controversies (1977, 1982). During the past decade a number of studies began questioning the empirical reality of gender differences in moral reasoning (Walker 1984). Furthermore, ascertaining group differences became more complex as categories such as age, gender, ethnicity and social class were considered (Stack 1990). Gilligan and her colleagues, without discarding the idea of gender differences, replied that what was required was a "revision of the theoretical frame" (Gilligan and Wiggins 1988, 113). Other researchers as well as Gilligan have continued to explore and refine the meaning of "caring" as an ethical system (Blustein 1991; Bowden 1997). This paper is an effort to further this research by focusing on the ethical
problems of teachers. Another line of analysis has focused more on the political and social implications that certain interpretations of "caring" can have; especially within the "women's movement" and, by extension to other domains. This latter approach is interested in a critique of possible applications, like the examples in education discussed above, which is why it must be analyzed in further detail.

When the "ethic of care" is conceptualized with Essentialists-Naturalist connotations, it can be stated in terms of "someone cares-someone is taken care of" (Grimshaw 1993). In the case of gender relations "male cares-female is taken care of" or as this paper has discussed, "someone controlling the schools and deprived children being served" (Coole 1995, Sastre 1997, Watras 1997a). According to Coole, overcoming this reproduction of power relations requires us to "de-construct" critically the cultural assumptions underlying gender, or other social categories, and binary oppositions such as self-other, private-public, and logic-context (1995).

As a consequence, if the importance of "caring" wants to be maintained, a "re-constructive" analysis that understands morality as the result of interaction between people needs to be proposed. Selya Benhabib presents this through the possibility of distinguishing between a "concrete other" or a "general other" and the constraints that each imposes on ethical reasoning. The importance of defending a "concrete other" in interaction rests on two points: an epistemological difficulty in constituting a "general-universal other;" and an ethical relationship where communication and responsibility are central (Benhabib 1990, Grimshaw 1993, Bakhurst and Sypnowich 1995, Mulhall and Swift 1992).

Nevertheless, this argument is largely theoretical and although persuasive we still need evidence that shows that human behavior is more responsive when the "concrete other" is taken into account. In this sense, a strand of work developed in experimental social psychology during the 1960-70s under the topics "diffusion-assessment of responsibility" and "helping behavior" is relevant (Lerner and Simmons 1966). In a series of experiments developed by Darley and Latané in which they measured "diffusion of responsibility" and "inhibition of bystander intervention in emergencies" they reached the conclusion that non-helping behavior was higher when group size and sense of anonymity increased (1968a, 1968b). These results could also be interpreted as processes between "concrete others," where communication is prevalent and helping behavior high, or "general others," where the ambiguity of the social rules that should guide their behavior leads to non-action.

In a group of experiments conducted by Staub, he found developmental differences that he did not expect: children increased their helping behavior between pre-school and second grade, then decreased between second and sixth grade (1974). In seventh grade helping behavior was influenced by explicit behavior rules: permission, non-permission and no rule, and in adults he found gender differences in the interpretation of these rules. Given that these results were both surprising and "disturbing" in it's implications, Staub discussed possible implications for education and theories of social development:

Another important factor in the development of a tendency to act prosocially may be learning to assume responsibility for the welfare of others... Feelings of personal responsibility may also be characteristic of a person and affect his behavior in many situations. One way to develop or increase such feelings of responsibility might be to focus responsibility on children to engage in behavior that will enhance others welfare. Over a period of time this may lead to learning that others expect that one will help a person in need, that others regard it as one's obligation and it may even become an internalized standard. . . . By frequently or regularly assigning children responsibility to help others and having them actually exercise their responsibility, they may develop a feeling of personal responsibility for others' welfare (1974, 339).

Paz and Concepción have acknowledged this feeling of responsibility in their work. When viewed in such a way it seems that the fundamental purpose is to develop a sense of "agency" that incorporates the role of relationships with others as fundamental for development (Portes 1996). In this paper the focus has been on the ethical relationship between teachers and students but from a broader point of view this commitment equally underlays processes such as "cooperation and guided discovery" or "social scaffolding" (Brown and Campione 1994, Mehan et al. 1996). The challenge is to integrate them in a full interpretation of teaching.

There is a popular misconception that Catholic schools profited from the controversies to racially desegregate public schools. This is a misconception because Catholic acceptance of racial integration varied from diocese to diocese. That is, Catholic educators, students and parents responded in a variety of ways to the pressure to racially desegregate schools that swept the United States from 1954 until 1969. However, Catholics tended not to use theology to solve or to understand the problems of racial segregation. In this way, they were like the Protestant ministers in Little Rock, Arkansas in 1957 who could not use biblical language to support racial integration (Campbell and Pettigrew 1959). This can be seen through examples of racial integration of schools in New Orleans, Louisiana; Chicago, Illinois; and Dayton, Ohio.

New Orleans differs from other Southern cities in that within the city many African Americans are Catholics. In 1888, Francis Janssens became the fifth archbishop of New Orleans. A former native of the Netherlands, he gave black people in New Orleans a separate church hoping to foster more vocations for black priests. The experiment seemed to work because separate black Catholic Churches flourished in Louisiana (Kasteel 1993). Further, separate black schools became popular. In 1915, Xavier High School opened for black students. Ten years later, Xavier College began. This is the oldest continuing black Catholic college in the United States.

In New Orleans, as elsewhere, the Catholic parishes followed specific geographic boundaries. When Janssens set up the separate black church in 1889, black people did not have separate parishes. African Americans living in white parishes in New Orleans attended a black church within the parish boundaries. Segregation by geography came in the early 1960s as white people moved to suburban parishes of Jefferson and St. Bernard while middle class blacks moved into east New Orleans. The result was more churches in the city had entirely African American membership. However, at the same time, the designation of “Colored” disappeared from the National Catholic Directory (Niehaus 1993, 192-193).

In June 1949, the Seventh Synod of New Orleans forbade separating African Americans within a church while awaiting communion. It added that priests could encourage black parishioners to attend churches specially built for them. After the 1954 US Supreme Court decision, New Orleans Archbishop Joseph Rummel acknowledged the wisdom of the decision. However, he cautioned that immediate desegregation of schools would not be prudent. One reason for avoiding immediate change was that the state legislature threatened to withdraw all aid from any desegregated schools. As a result, desegregating Catholic schools may have ended the money for texts, transportation, lunch programs, and state approval. These cuts would have hurt the black Catholic schools (Kight 1994, 7-10).

In June 1955, Rummel appointed a committee of clergy and lay people to study racial segregation. The committee recommended a grade by grade introduction of integration beginning with first grade or kindergarten. In February 1956, Rummel issued a pastoral letter condemning segregation as sinful. Segregationists burned a cross near his home, picketed outside a local seminary, and turned in empty church support envelopes. They vowed to withhold contributions until assured there would be no school integration. Rummel canceled plans to desegregate the Catholic schools (Kight 1994, 10-12).

Rummel turned his attention to the national level helping to formulate a statement on race relations. Issued by the US Bishops in 1958, "Discrimination and the Christian Conscience" reaffirms the moral and religious nature of the race question. It said that racism was an affront to the rights of human beings and it denied the love God has for all people. Recognizing the differences that exist among groups of people, the statement called for the economic and educational opportunities enjoyed by other immigrant populations. Still, the bishops urged prudence in making any plans to change society.

On 14 November 1960, the New Orleans public schools began a process of token desegregation (Weider 1986). The legislature did not remove state funding from those public schools. Assured that the financial threat had passed, in 1962, New Orleans Catholic schools changed their enrollment policy to allow Catholic children to apply to any school in the New Orleans archdiocese. The schools desegregated peacefully as one hundred and fifty black children attended thirty formerly all white schools. When the White Citizens Council protested, the chancery mailed letters to...
six of the council's leaders threatening to excommunicate them if they persisted in their complaints. Four of these people stopped. Three continued and received letters of excommunication. One of these people retracted his racist position in 1968 and was absolved (Kight 1994, 19-22).

Conditions in Chicago paralleled those in New Orleans. In the 1880s, thirty black Catholic families in Chicago began worshiping in separate services in St. Mary's Church. About three percent of the city was black, and the black Catholics were a fragment of the thirty thousand black residents of the city. In 1889, a black priest educated in Rome came to minister the African American Catholics in Chicago. In 1912, the black parish, St. Monica's, began a Catholic school with 150 students (Sanders 1977, 205-206).

During the First World War, industries in Chicago needed laborers, and the black population in the city doubled as African Americans fled the poor conditions in the south. Black Catholics spread beyond St. Monica's entering other all white parishes. Seeking to answer what he saw as a color problem in 1917, Archbishop Mundelein designated St. Monica's as an all black parish. While African Americans could attend other parishes, they enjoyed full membership in St. Monica's. As a result, black children had no claim on any other Catholic school (Sanders 1977, 207).

In 1932, Mundelein tried to serve the black Catholics moving beyond the confines of St. Monica's. He designated as all black certain other churches in other parts of the city where black people lived. In 1939, when Mundelein, then Cardinal, died, there were six Catholic schools for black children with an enrollment of nearly 3,000 pupils. At first, his successor, Cardinal Stritch, maintained the racial segregation. He began to move against it by 1930 (Sanders 1977, 214-217).

Cardinal Stritch opened the Catholic schools in Chicago to all students in 1945. Unfortunately, local policies continued to retain segregation. Sometimes, the Cardinal interceded to force a white school to accept a black student. Unfortunately, when a parish acceded to the Cardinal's wishes, racial tipping resulted. For example, a formerly white Irish parish accepted its first black students in 1945, and by 1949 three fourths of the enrollment was black. A formerly German school opened its doors to black students in 1947. In two years, the school was entirely black. On the other hand, some formerly Irish churches and schools admitted a few black people but remained predominately white (Sanders 1977, 218-219).

The open enrollment policy in Chicago Catholic schools caused a related problem. African Americans saw the Catholic schools as superior to the public ones to which they would send their children otherwise. As the number of black people in Chicago grew, more black parents wanted to send their children to Catholic schools. As a result, by 1965, over 21,000 African American children enrolled in Chicago's parochial schools. One third of these were not Catholic. More important, there were few integrated schools. For example, 23 of the schools in the city had only black students. Another 23 schools had a few black students. The rest of the schools were in areas where the transition between white and black students promised to be swift (Sanders 1977, 219-220).

The situation was similar among the Catholic high schools. As the neighborhoods around the schools changed from white to black, white students left and not enough black students came into the school to compensate. Out of 96 high schools, by 1965, fifty-nine had some black students. Nine of these were more than ten percent black and of these nine, three had no white students at all. Only six had fewer than 90 percent of one race (Sanders 1977, 221-222).

As the white Catholics moved away from urban neighborhoods, the Catholic schools they left behind became racially desegregated. Unfortunately, resegregation followed this period of racial desegregation. At first, a few black students would enter a previously all white school. As the number of black students grew, the number of whites fell until the school became all black. Desegregation was the period between when the first black came until the last white left.

An example of this process of resegregation took place in the Academy of Our Lady, a school for young women on Chicago's southwest side. Founded in 1874 by the School Sisters of Notre Dame, the school accepted boarding students until the 1930s. It held continuous accreditation from North Central Association. Entrance requirements were high, standards were rigid, and almost all who entered went on to college. By 1967-68, enrollment rose to 1,800 young women with 70 faculty. However, the neighborhood around the school began to change. In 1960,
the area had a population that was 13 percent nonwhite. By the 1972-73 school year, the district around the school was almost 100 percent black. Black enrollment increased in the school (Moses 1978, 94).

In 1967, the Archdiocesan School Board of Chicago adopted an open enrollment policy. At first, this did not change the enrollment pattern of the Academy of Our Lady. As the neighborhood changed, the number of white applicants declined and black applications increased. From the 1968-69 to the 1972-73 school year, a total of 834 fewer pupils enrolled. This was a drop of 51 percent. More important, most of that decline was from white young women. Their numbers declined by 963 from 1968 to 1972. This was a drop of 71 percent. Black enrollment increased over the same period by 129 pupils or 49 percent. The increase in black enrollment did not rise dramatically in any one year; it was steady over the five years (Moses 1978, 95-96).

Thus, the pattern of enrollment in the Academy of Our Lady followed the pattern that happened in other urban Catholic schools around the country. The total enrollment declined because an enormous percentage of the white students left. While there was a significant increase in the number of black students, the decline in total enrollment made the black enrollment seem larger than it was. Unfortunately, when enrollment changed, the financial picture worsened. In 1968-69, the annual budget of the Academy of Our Lady had a surplus of $30,000. In 1972-73 the budget had a deficit of around $100,000. Consequently, racial desegregation raised questions about the survival of the school (Moses 1978, 97-99).

Trying to preserve the Academy of Our Lady, the alumnae board wrote a letter to the associate superintendent of the Chicago archdiocese. The board recommended limiting black enrollment below 50 percent to maintain an integrated student body. In June 1972, the principal and a delegation from the parents' association met with the archdiocesan school board to propose a plan to maintain integration at the Academy. First, they sought an exemption from the open enrollment policy to allow the use of a quota in admissions. Second, they asked for a recruitment program and busing to bring white young women into the Academy from other high schools. The school board appointed a committee to study these possibilities (Moses 1978, 100-104).

The quota committee met during the summer of 1972 seeking testimony from a variety of sources. Associations of pastors and principals in white areas supported the plan. Similar groups in black areas opposed it saying the plan was racist. One exception was a group of black parishes that supported the quota. The Provincial Chapter of the Sisters of Notre Dame declared opposition to the quota (Moses 1978, 104-106).

The committee sent questionnaires to the parents of the current and incoming first year students in the school. Parents of incoming and first year students returned 345 valid forms. Parents supported racial integration and approved of the quota to retain it. More black parents approved of integration and the racial quota on admission than did white parents. The higher the education of the parents the more likely they were to support the racial quota. Parents who planned to send their daughter to college approved the quota more than did other parents (Moses 1978, 169-173).

The quota committee showed that most people concerned with the school accepted the strategies for retaining racial integration at the Academy. Nonetheless, in October 1972, the Chicago Archdiocesan School Board rejected the Academy's proposal to impose racial quotas on admission. They said the strategies did not appear to appear viable (Moses 1978, 175-176, 244-245).

On 13 October, an editorial appeared in The New World congratulating the school board for refusing to exempt one school from the archdiocesan policy of open enrollment. The editorial criticized the quota as something that would simply exclude black students. The editorial said the school could organize its own resources better, aggressively recruit, and transport white students to the school. In a published letter to the editor, the principal of the Academy complained that the paper was advancing a double standard. In the same issue, the editors had complimented a high school for producing racial balance by accepting certain percentages from each parish (Moses 1978, 244-245).

The principal of the academy attributed the rejection of the quota plan to two main problems. First, school policy makers such as the members of the school board did not attend to the research to support their decisions. Instead, they shifted their consideration to vague public relations and social ethical ideas. Second, without any clear understanding of how desegregation could work, proposals such as the quota appeared racist (Moses 1978).

In September 1966, a brief but unsettling riot took place on the west side of Dayton in protest of segregated
conditions in the city. After the disturbance, Catholic parishioners asked their church leaders to help change the segregated conditions in their schools. In November 1967, the superintendent of Dayton’s Catholic schools formed a broadly representative committee consisting of eight lay people from five different parishes in the Dayton area and a priest. Called the De Facto Segregation Committee, it studied the segregated nature of the Catholic elementary schools and made recommendations.

The report of the De Facto Segregation Committee found that of Dayton’s 27 parochial elementary schools, three schools carried 90 percent of the total African American enrollment of 467 students and eighteen schools were all white. The De Facto Segregation Committee wrote that the Catholic school must face up to its moral Christian commitment to love its neighbor adding that segregated schools implied the inferiority of the minority children.

Interestingly, the report of the De Facto Desegregation Committee contained few references to theological ideas, nor did the report refer to any of several statements about racial discrimination that the United States Catholic Bishops had published by that time. Several members later said they had an antagonistic relationship with church administrators and did not attend to the works of the clerics (Dorenbusch 1990; Regulinski 1990; Vera 1990).

The De Facto Segregation Committee made two suggestions to racially integrate the Dayton area Catholic elementary schools. First, for the coming school year, 1969-1970, it recommended a program of open enrollment to begin desegregating the schools. Second, it called for consolidation of the Catholic elementary schools for the year 1970-1971. The committee did not recommend any changes in the attendance patterns of secondary schools because, the report added, those schools were integrated.

To consolidate the Catholic elementary schools, the De Facto Segregation Committee proposed a plan similar to those tried in places where short distances separated schools. The committee inscribed the Catholic elementary schools in the greater metropolitan area within a circle and cut it into six pie shaped sections. The committee suggested that children living within each section would attend one building for the primary grades, another building for intermediate grades and a third for junior high grades. To this plan, the committee added a magnet school for preprimary and primary levels of instruction in the then centrally located Emmanuel School. Since this plan would mix all children from each pie shaped section of Dayton, the committee hoped that children from the inner city would attend classes with those living in the surrounding suburbs.

On 8 May 1968, the chairperson of the De Facto Segregation Committee explained the report during a public meeting. Although he received strong support from several hundred parents and educators, a significant number complained. For example, when the chairperson asserted, "Segregated education and Catholic education are contradictory terms. Let's agree on that," a man retorted, "We don't agree on that" (Ball 1968).

Some criticism showed practical flaws in the plans. For example, one visitor pointed out that the committee's plan had placed 90 percent of all black children in Dayton Catholic schools in two of the six sectors. This meant the remaining ten percent of the black Catholic students would be distributed among the other four sections (Barmann 1968).

Catholic school teachers held mixed opinions. A reporter for the Cincinnati Archdiocesan newspaper, The Catholic Telegraph, surveyed the opinions of some teachers in the Dayton area Catholic elementary schools. On one hand, he found that some teachers vigorously supported the plan to end de facto segregation. On the other, he interviewed teachers who preferred open housing to advanced integration, not school consolidation (Barmann 1968).

The priests in Dayton were even more cautious. On 27 May 1968, the then dean of the Dayton Deanery, the organization of Dayton’s priests, and pastor of St. Helen's parish wrote a letter to Archbishop Alter asking how the plan was going to be carried out and how it would be financed (Kline 1968). Some people took the priests’ questions as serious criticism. One parishioner of St. Helen's Church wrote a letter on 21 May 1968 to the Dayton Daily News saying he was upset in the church bulletin that the De Facto Segregation Committee's recommendations were impractical. This parishioner thought it was practical to do everything possible to give children equal educations.

Religious women voiced their support for the desegregation of the schools in which they taught. On 30 May 1968 the Dayton Daily News carried a letter signed by thirty Sisters of Notre Dame, including the supervisor of Dayton area Catholic elementary schools. The letter quoted the Second Vatican Council’s “Declaration of Christian
Education” affirming that each person has a right to an appropriate education. The Sisters felt this justified supporting recommendations of the De Facto Segregation Committee.

The Archdiocesan Board of Education in Cincinnati discussed the report of the De Facto Segregation Committee on 11 June 1968. It approved the policy of open enrollment allowing black students to attend any Dayton area Catholic school with their parishes paying the tuition. The board would not extend this policy to new non-Catholic African American students. At the same meeting, the board approved a voluntary exchange program under which white students could attend predominantly African American schools in Dayton. The board did not answer the larger question of the reorganization of all Dayton area Catholic elementary schools. Nor did the members agree to start a magnet school in downtown Dayton. They asked the Dayton area Catholic schools to set up a task force to study these possibilities (Minutes 1968).

The archdiocesan school board commended the most radical aspects of the defacto plan to a task force for further study. Almost immediately, critics complained that the board of education designed the Task Force to defeat desegregation. The critics made two points to justify their distrust of the Task Force. First, the twenty-eight parish priests had criticized desegregation. Second, there was no stated intention to put educators on it (“Catholics OK” 1968).

The Task Force did not meet until September 1968, but concern for social justice continued among Catholics in Dayton as the date approached. Early in July 1968, members of half of the Dayton Deanery’s thirty-three parishes reflected on the success of Project Commitment, an archdiocesan program aimed at attacking racial discrimination through weekly lectures or workshop sessions. At the July meeting, the parishes noted plans for future activities asking for “a concerted effort to force improvement of housing conditions and for more person to person social contacts between whites and Negroes” (“Programs to Attack”1968). Some parishes invited minorities to join parish societies. Other parishes decided to contribute money to mission work in Dayton. Some parishes organized movements to advance open housing.

Other Catholic groups formed to push for desegregation of Dayton’s Catholic schools. Afraid the Task Force would defeat any movement toward desegregation, a twenty-three year old white teacher in Dayton’s historically black public high school, Dunbar, chaired the Ad Hoc De Facto Segregation Committee. Although they did not think they would succeed, they wanted to advance some proposals that were being considered. The Ad Hoc group made only one change in those proposals. They pressed for a pilot project of consolidation with three Catholic elementary schools. Originally, the De Facto Segregation Committee had recommended two distinct phases. First, it suggested a one year trial of voluntary exchange with open enrollment. Second, it suggested reorganizing all the Dayton area Catholic elementary schools into six consolidated districts in the next year.

As a counter offer, the Ad Hoc committee suggested that the first stage of open enrollment be dropped. Its members wanted the Dayton area Catholic schools to consolidate one district the first year to see how it worked (Nealon 1990). In June 1968, the Ad Hoc De Facto Segregation Committee had collected 8,000 signatures on petitions urging desegregation of Catholic elementary schools. But when the Committee submitted its plan for a pilot project to Archbishop Alter, he replied on 29 July 1968 that "all private suggestions or representations by self-appointed committees are being referred to the task force for evaluation." Alter (1968) added that the Task Force represents all legitimate interests both legal and canonical.

The summer of 1968 marked the beginning of the Open Enrollment and Voluntary Exchange that the Archdiocesan board had approved. On 17 July 1968, 168 people attended an organizational meeting at St. James where the chairperson of the De Facto Segregation Committee explained the idea. Other white speakers, such as Phil Donahue, then a local television personality, told how they were sending their children to predominantly black St. James school in Dayton.

For two years, several parents used their personal cars to transport the children. Some of these parents say they did this on the idea that the archdiocese would pick up the costs, but this never happened (Cochran 1990). As a result, during the 1968-69 and 69-70 school years, about 40 white children took advantage of voluntary exchange and attended St. James. They were almost the only white children in the building. However, their numbers declined by fifty percent each year until only five white children were involved in the 1973-74 school year. Black children were
more constant. From the 1968-69 school year until the 1973-74 school year, between forty and fifty black pupils from
St. James or Resurrection went to Catholic schools in the suburbs.

In 1970, half the white children in the voluntary exchange program withdrew. They did not do this easily. On 11 November 1970, a parent wrote a two-page single spaced typed letter to the assistant principal of St. James. She explained in plaintive terms the difficulties they had with travel and the expenses they incurred contributing to their own parish and to St. James. They gave to both churches because they did not want to ask the bishop to enforce the rule allowing families in the exchange program to pay only to one parish. She described her doubts about the worth of the venture. The last year of operation for the exchange was 1973-74 when one white child was involved.

The Task Force that was to consider the consolidation of Dayton's Catholic elementary schools met on 25 September 1968. There was considerable discussion about the absence of women religious on the Task Force. Actually, the Archdiocesan Board of Education had hoped that the Task Force would operate as a public school board with teachers and principals as resource persons. However, on 4 October 1968, the newly formed Southwestern Ohio Association of Laymen adopted a resolution to support the seating of Dayton parochial school principals on the Task Force. To underscore this appeal, sixty persons - men, women and children - from Dayton drove to Cincinnati and picketed St. Peter in Chains Church on 13 October 1968. The next day the pickets appeared in front of the Chancery building in Cincinnati carrying signs saying "Task Force Needs Nun Power" and "Halt Alter's Falter" ("New Proposals Offered in Dayton" 1968). The protest was successful because, in November 1968, women religious joined five of the six subcommittees making up the entire Task Force ("Dayton Area School Principals" 1968).

Archbishop Karl J. Alter added to the reaction against the Task Force while the group was meeting. On 12 November 1968, in a newspaper interview, Alter said dissident Catholics in Dayton who complained about inflexibility and pomposity in the church annoyed him. Alter estimated that there were 250 such dissidents that he called a fraction of one percent of the area's Catholics. Alter said they blamed him for decisions he did not make. For example, these dissidents criticized him for expensive building programs. He said local people initiated and conducted them. Besides, Alter asked, "Why should the government have lavish buildings and the church live in squalor?" As for Dayton schools, the Archbishop added that "the current open enrollment program fosters racial integration but the proposed consolidation of parish schools will hinder it and could threaten the very existence of Catholic schools." Further, Alter said of the Ad Hoc De Facto Segregation Committee that people from Dayton told him this was a conspiracy to destroy Catholic schools (Goodman 1968).

Archbishop Alter's remarks reached the Task Force in Dayton and led to the resignation of three of the four black members on the 76 member Task Force. Calling themselves Black Catholics in Action, Brother Joseph Davis, SM and two colleagues, resigned from the Task Force on 26 February 1969.

Despite its problems, on 27 March 1970, the Task Force produced its final report. It did not recommend consolidation because the specific plan would not provide adequate overall integration. Instead, the Task Force recommended beginning a nongraded, child-centered learning centers in various schools. Each would have a different theme. One school might concentrate on the humanities. Another school might focus on the fine arts. A third school could emphasize math and science. These centers would work as magnet schools encouraging integration within the existing parish schools.

A minority report from the executive committee disagreed with the development centers. Like consolidation, these would take the parish school away from the very parishioners who contributed to a building fund to construct the parish school. The minority report urged respect for this property right. Further, it quoted Pope Paul VI calling the parish a responsible body of necessary finality that takes care of everybody. In his view, the parish was an institution of high moral value.

In 1970, the Cincinnati Archdiocesan School Board approved the establishment of a development center as the Task Force recommended. However, the schools came to face a financial crisis accompanied by dwindling enrollments. When several schools in the Dayton area closed, the board dropped plans for the development center in Dayton ("School Teachers to be Trained" 1972).

Like other religious groups, most Catholics hoped that everyone would recognize the love that God has
for all people and stop prejudging other groups. Unfortunately, the faith in the rejuvenating power of religion seemed to excuse Catholics from making more positive acts to cause racial integration. Consequently, although the US Catholic Bishops criticized racism in several pastoral letters, they never called for racial integration. Church leaders may have seen segregation as a prudent course of action until religious awakenings in the community ended the split between races (Gleason 1961). Unfortunately, this course also made the religious groups appear unwilling to support racial desegregation.

Efforts to racially desegregate Catholic schools failed for a variety of reasons. First, the schools recruited students from specific geographic areas, and these neighborhoods were racially segregated. Although there were efforts to encourage pupil exchange, these were short-lived. Second, the Catholic leadership refused to make racial integration a goal for churches and schools. Third, few people could use gospel messages to reinforce the drive for racial integration. As a result, many Catholic leaders, educators, and parishioners created imaginative plans for racial desegregation but could not explain why schools should implement these plans.

At the end of May and the beginning of June, 1921, African Americans in Tulsa, Oklahoma, watched their homes and businesses deliberately destroyed by the Tulsa city police and the Ku Klux Klan. Through murder, looting and systematic arson, they destroyed the African American community, ending America's second largest race war and one of the nation's wealthiest Black communities. The eventual rebuilding of "Little Africa," as the African American neighborhood was called by Tulsa Euroamericans, and "Greenwood," or "Black Wall Street" as named by African Americans, was successful. However, its re-emergence was accomplished against the active opposition of the Tulsa city council, and the city's two most powerful newspapers, the World and the Tribune.

Seventy six years after the Tulsa Race Riot, investigation shows Oklahomans know little about the events of that period even though several historical interpretations have emerged. For example, Euroamerican histories have dealt with the social, political and economic impact of the race war. Those histories have been published in school textbooks and scholarly journals. On the other hand, African American histories have dealt with the personal catastrophes associated with individuals and family members. Because these accounts have been oral, few have been published, but most are recalled by the African American communities.

This paper suggests Tulsa's worst period has been identified by both African American and Euroamerican historians for different reasons. Therefore, a significant part of this paper is intended to review what is known about the Riot, identify the Euroamerican (written) history and compare it with the African American (oral) history. Conclusions will center on what happened that night and the next several days, and what Euroamerican and African American students learn that is common to both.

The events of the 1921 Tulsa Race Riot are sketchy. Many of the newspaper sources and oral accounts that relate to the Riot have either disappeared or are considered untrustworthy by African American or Euroamerican historians. Nonetheless, on May 31, 1921, Dick Rowland, a young African American, was charged with the attempted rape of Sarah Page, a white elevator operator in the Drexel Building, a multi-story building in Tulsa's business section. Dick Rowland was a drop out from the Black high school, Booker T. Washington, and worked across the street from the Drexel Building shining shoes. Rowland was arrested and incarcerated in the Tulsa County Courthouse's jail. That evening two angry mobs, one Black and the other white, met at the Courthouse. While Rowland was obviously the target of both races' interests, the issue dealt with violence. The whites wanted to lynch the alleged rapist and the Blacks wanted to rescue Rowland.

Gun fire solved the question of what the mobs should do next. By the next morning, June 1, 1921, the thirty six block Greenwood section of Tulsa was on fire. Black men, either armed or not, were arrested and imprisoned in three locations including the Fair Grounds several miles to the southeast of the Courthouse. The National Guard arrived in Tulsa from Oklahoma City during the morning after the gun play was finished. At this time, whites unanimously agreed they had won a major victory (Tribune 1921).

The result of the Riot was Greenwood was destroyed, uncounted numbers of Blacks and whites were killed (Ellsworth 1982, Impact 1971, World 1921), and Dick Rowland had been secretly whisked out of Tulsa by the sheriff before he was hurt. So ended the nation's second largest race war and focused the two Tulsa communities on explaining what happened.

Why did the Race Riot happen? During the post World War One period, Oklahoma was filled with change (Alexander 1965, 1976; Burbank 1976; Green 1978). Typical of small cities throughout the nation after the First World War, Tulsa was a magnet to those who lived on the farm. With a population of approximately 70,000, Tulsa offered new opportunities that few other cities in the state could boast. Although the city did not offer factory jobs, young men found the new oil industry appealing because most jobs did not require an education, yet offered high pay. Working in the oil fields surrounding the "Oil Capital of the World," roustabouts were employed by oil companies owned by Gilcrease, Getty, Rockefeller, Skelly and others. Obviously, Tulsa's attraction for these young workers was its ability
to entertain them with the new sounds emanating from Cain's Ballroom, and dancing to such bands as Bob Wills and
the Texas Playboys. Tulsa was a hot bed of talent for aspiring entertainers of both races.

Young women discovered they were able to find jobs beyond the kitchens and parlors of their parents' home.
For many young women, Tulsa represented a golden dream in which they could become responsible for their own lives.
Jobs, such as teaching and nursing, were in great demand. But, new and exciting to them, were office positions in which
they could become stenographers. This new position gave young women the thrill of responsibility. Many of them
learned to type on new Remingtons and mastered the mysteries of Gregg shorthand and the telephone. As much for the
men, women learned Tulsa was a cultural haven. New opportunities allowed them to meet many more men than if they
had remained on the farms or small towns.

In much the same fashion, Tulsa represented a world of change for African Americans (Franklin 1982, McGee
1956, Teal 1971). Prior to statehood, African Americans had strong attachments to Oklahoma. Many African
Americans at that time knew they lived in Oklahoma because their grandparents came as Cherokee slaves (Teal 1971).
Regardless of the mildness of Cherokee slavery, both Blacks and Native Americans were thankful for not living in the
harshness of Texas. Therefore, calling Tulsa the "Promised Land," large numbers of African Americans moved from
small Oklahoma communities, as well as other states, to Greenwood (Impact 1971). It is difficult to identify the number
or names of the small villages from which African Americans came. During that period, African American communities,
like Euroamerican, were scattered. The call for free land and the methods through which the state was settled allowed
for individual communities to be founded, populated and die within a matter of weeks or months.

Perhaps one of the best narratives of moving to the "Promised Land" is that of John Hope Franklin. He was
born in an all-Black village named Rentiesville in 1915. His father was the local postmaster, lawyer, justice of the peace
and president of the Rentiesville Trading Company (Franklin 1982). Franklin remembered his father was forced to leave
Rentiesville because he could not make a decent living for his family. Early in May, weeks prior to the Race Riot, his
father moved to Tulsa. His mother, a teacher, was to come at the end of the school year when his sister, now at a
boarding school in Tennessee, returned to Oklahoma. In fact, John, his sister and his mother would not move to Tulsa
until December 10, 1925, because his father's assets were totally destroyed in the Riot. Nonetheless, Tulsa beckoned
to young Franklin as the Promised Land. Years later, at the age of 67, Franklin reminisced,

Then it happened! Tulsa was burning! The news of the Tulsa riot reached the little village slowly and
piecemeal. In 1921 there were no radios or television sets, of course. And Rentiesville had no
telephones, or even a telegraph to connect it with the outside world. We had to depend on news of the
riot that was relayed from Tulsa to Muskogee, where it was printed in the Daily Phoenix, which was
dropped off at Rentiesville by the Katy Railroad mail and passenger train. Black Tulsa had been
destroyed, burned out, we learned. Many blacks had been killed . . . and we had no word from my
father (Franklin 1982, xv).

In short, Tulsa's cultural and social attractions were a significant bases upon which the races would clash. Each
race was willing to invest its cultural heritage on a future that would benefit it. Obviously, the Euroamericans felt
ownership of the community and the African Americans lived quietly hoping their improved life would not be too
cumbersome to those south of the railroad tracks.

However, there were other contributing reasons as well. The state was violent. Achieving statehood in 1907,
Oklahoma prided itself on the rugged individualism of the ranch hand and roustabout. Therefore, it had difficulty
establishing law and order. It was "Jim Crow territory." In 1890, the territorial government gloried in its modern
approach to race relations boasting to be the first in the union to segregate public telephone booths. In 1910, Black
Oklahomans lost the right to vote. Although Black Tulsans continued to cast ballots during the five years before the
legislation was struck down by the Supreme Court, Blacks remained second class citizens.

The oil fields also caused difficulty. Many of the workers wanted to unionize. The attempted organization of
the Mid-Continent oil field by the Industrial Workers of the World (IWW) was catastrophic. This tragedy was
especially felt by Black Tulsans because the IWW was interracial and supported Blacks' rights in conjunction with the
Oklahoma Socialist Party. The oil industry voiced its contempt through the city newspapers, the World and the Tribune.
This incident was only one of many in the state. For example, Drumright, a small oil town west of Tulsa, was typical of the state’s inability to solve social and economic problems peacefully (World 1997). In this community, local female telephone operators went on strike. To support the strikers, the oil field workers, many of them boyfriends of the striking telephone operators, took matters in their own hands by ransacking the phone company center, ripping out telephones in private residences (the girls helped too) and threatening to lynch the mayor. Order was restored with a small army of deputized citizens under the command of the local Undersheriff.

Tulsa, too, experienced racial violence. Prior to 1921, W. E. B. DuBois campaigned in the city for a chapter of the National Association for the Advancement of Colored People (NAACP). Chief Alfred Sam, a popular African American leader, advocated for Black Tulsans return to Africa. At the same time, Greenwood hosted numerous African American organizations including the militant African Blood Brothers (ABB). Perhaps the most violent organization in Tulsa was the Ku Klux Klan (KKK). Reorganized in Oklahoma in 1915, it was committed to white supremacy. The KKK was intolerant of both African Americans and Jews. The Tulsa chapter’s (Klan number 2) membership included 3,200 men and women (Alexander 1965).

It is important to understand the Klan’s extraordinary hatred of Black Tulsans. They feared the state’s image would be tarnished if its Black heritage was widely known. For example, during the thirty years prior to statehood, several national politicians flirted with the idea of Oklahoma becoming a Black state. The KKK was aware eastern Oklahoma had been created as Indian Territory by Congress in the previous century when Native Americans were force-marched from the southern states to Tallaquah. In fact, Tulsa had been first settled by Native Americans and their Black slaves from Alabama.

Most importantly, however, the organization acted as a disciplinary body in the city. Months prior to the Race Riot, the KKK was given informal permission by Tulsa County officials to keep the city peaceful (Ellsworth 1982). A favorite method employed by the KKK, was to secretly and swiftly wrench a person from his bed in the middle of the night. Held blindfolded and handcuffed during the rest of the night, the unlucky individual was tormented with thoughts of lynching. Newspapers variously reported that over a dozen individuals were publicly whipped (World 1921). Indeed, one month before the riot, an individual was lynched in West Tulsa. In this case the police were assigned crowd control duty. They also helped drivers park their cars.

Other than family letters or diaries, there was little written directly after the Riot by Black Oklahomans. However, marking the 50th anniversary of the Riot in the 1970s, several studies and oral histories were published. Except for an occasional Masters’ thesis, most were reported in the Black press. A news account in the Oklahoma Impact Magazine, a Black periodical, was written by Ed Wheeler, a Euroamerican reporter for a local radio station. Wheeler pieced together the events of the Riot from newspaper clippings, oral histories, court records, newly discovered photographs and church documents. As an investigative reporter, Wheeler described the hostility between Blacks and whites. Underlying the racial antagonism, he concluded, was the attitude displayed by young Black war veterans. They had just returned from Europe and believed they had risked their lives for those things denied them in Tulsa. Wheeler concluded that white youths had difficulty accepting the Black’s reasoning.

Wheeler best described the Riot in a series of newly discovered photographs. Most show young white youths smirking and strutting in mock military fashion as they carry their rifles or show off their pistols. Photographs of Blacks show dead men lying in the street or as prisoners with hands raised marching to internment camps. Other photographs show Black men, women, and children in Greenwood with burned homes, businesses, and churches in the background. More than 6,000 Blacks and white rioters were placed in internment camps and 25,000 white rioters were patrolling the streets in the morning after the Riot (Wheeler 1971). Wheeler reported the Euroamerican justification for their actions in the Riot was voiced by the Tulsa press which credited William Cherry, a brother of a Black policeman, Jim Cherry, as saying,

That fellow Dick Rowland should have been taken out to the edge of town and horsewhipped, tarred and feathered. He is one of the same bunch that started this awful thing (Wheeler 1971, 24).

Perhaps the best example of oral history describing the Riot and its context was conducted by the editors of the Oklahoma Impact Magazine (1971, 32-38) with Mr. W. D. Williams. A friend of John Hope Franklin’s father, Mr.
Williams was a teacher in the Tulsa Public School System from 1928 to 1970. He was born in Tulsa and graduated from Booker T. Washington High School in 1922 and was a classmate of Dick Rowland. The Williams family operated several of the more significant business enterprises on "Black Wall Street" including a garage, confectionery, and the Dreamland Theatre.

Mr. Williams or "Pops," as he was called, contextualized Greenwood’s success as being a city within a city. While large amounts of monies were being made in Euroamerican Tulsa, the same was happening in Greenwood, but because the races were separated, the economies did not assimilate. He says,

Tulsa took a segregated pattern mainly because the Frisco depot was right near Greenwood and that’s where many of the Blacks from the south headed... That’s not to say that if that had not been for this Tulsa would be an open city but at least Blacks would have been dispersed through the city (Impact 1971, 33).

He also described Tulsa’s mood as mirroring national hysteria about Bolshevism, anarchism, and the Ku Klux Klan. He describes Tulsa’s mood specifically as confused and paranoid.

The price of oil was down so [the] economy was having its problems here in Tulsa. So at that time Tulsa was in a state of confusion, if not, as I mentioned, down right paranoid, and that was Black people and white people. All it needed was a spark or an incident between the races (Impact 1971, 33).

Reflectively, Mr. Williams then described Black Wall Street. He talked about its sense of community and economic success.

Blacks then were of an independent spirit and had a special kind of pride in the Black community. They would not buy from White merchants... and the Black merchants didn’t take them for granted. He vote[d]... [and] the churches were well attended ... And that school (Booker T. Washington), is perhaps the last symbol of Black solidarity... The pioneering spirit, the sense of freedom could be felt in everything Blacks attempted to do (Impact 1971, 35).

There are two research camps which discuss the Tulsa Race Riot by Euroamerican historians. The first and most significant camp is the Eurocentered traditionalists. Beginning in 1921 and continuing until the mid 1980s, the traditionalists marginalized the Riot as an unimportant event in Tulsa’s history. These authors expressed the view the Riot was an historical footnote. As a consequence, that position is reflected in the state’s high school history textbooks.

To illustrate the traditionalist’s interpretation, the dean of Oklahoma history, Arrell M. Gibson, wrote the Riot was important only insofar as the National Guard was called out to establish order. While he recognized the importance of the KKK, he maintained the Riot and that organization’s hatred of Blacks were not connected. In his high school text, The History of Oklahoma (1986), Gibson painted a picture of post-war Oklahoma as a period of economic unrest. He focused on labor strikes and martial law in Henryetta, Coalgate, and McAlester as illustrations. In this complete recount of the Tulsa Race Riot, Gibson stated:

The theme of disorder and trouble continued in race relations. In Tulsa a black youth was arrested in the spring of 1921 on a charge of molesting a white girl. A mob of whites gathered at the jail, apparently to lynch the accused youth. Violence flared when another mob of blacks sought to protect the prisoner. The conflict spread to the black section of Tulsa where fire gutted two miles of homes and businesses. Seventy blacks and nine whites died in the rioting. Order was restored only by calling out the National Guard and imposing martial law (Gibson 1986, 142).

In the 1980s, Euroamerican revisionists developed different interpretations of the Race Riot. Some revisionists, such as Ellsworth, described the Riot as an embarrassment to whites because so many had participated in it. That is, most whites did not want to talk about that period because they were either embarrassed or feared if their actions were known they might be held accountable by friends, family, and the law. That explanation was voiced as early as 1921 in the Tulsa World.

Since Judge Biddison called the grand jury you can’t hardly find anybody who will admit they were in Tulsa when the rioting was on. Before the call was issued, there were a lot who boasted of the part they played (July 5, 1921).
Scott Ellsworth's *Death in a Promised Land: The Tulsa Race Riot of 1921* is undoubtedly the most scholarly of the revisionist camp. Its depth of original research is rewarding both in new discoveries and filling in historical voids. Ellsworth generally describes the events but questions several traditional Eurocentered positions. For example, he does not accept the *Tulsa Tribune* ’s explanation that Dick Rowland’s intent to rape Sarah Page in the Drexel Building was the spark that caused the Riot. Ellsworth also discusses the involvement of the Ku Klux Klan. His history credited the Ku Klux Klan as powerful in the state, and it controlled both Tulsa politics and its police department. Unlike the traditionalists, Ellsworth’s history also focused on post-riot events. He discussed the rebuilding of the Greenwood district as a promise made by the Tulsa city counsel to out-of-state newspapers. However, his research pointed out no city monies were used to rebuild Greenwood. He catalogued these and other happenings as efforts to suppress both communities’ memory of the Riot (Ellsworth 1982).

While Ellsworth’s book is credible, it is not used in public schools, although it is occasionally read in college contemporary Oklahoma history classes. Therefore, a better example of revisionist history can be found in Baird and Goble’s *The Story of Oklahoma*. In many ways, this is an extraordinary text. Published as a high school textbook in 1994, its theme was to explain Oklahoma’s history within a pluralistic framework thus countering a social myth of the state’s Euroamerican homogeneity. In fact, the text became so popular it was also sold as a tradebook.

The text reiterates and broadens Gibson’s sketch of the Tulsa Race Riot but is less willing to consider the encounter between Rowland and Page as an attempted rape. Unlike Gibson and other traditionalists, the text describes the violent destruction of Greenwood. The authors identify the cause for Rowland’s incarceration, describe the role of the media and recount the cost of the property damage. They increase the Riot’s death toll from twelve to "several hundred."

Yet, Baird and Goble are cautious in their revisionism. Believing they need to blame someone, but uncertain who, they follow the traditionalists headed by Gibson by reporting,

> Let that serve as our point. Those anonymous black Oklahomans endured and triumphed over momentous times. Like others--nameless roustabouts, oil millionaires, tired housewives, a famous newspaperwoman, even Tulsa’s white rioters--their lives were the stuff of which history was made, full of events to be preserved and remembered forever (Baird and Goble 1994, 386).

Obviously, Baird and Goble interpret the Tulsa Race Riot from a larger perspective. However, as they revise Tulsa history, they excuse the devastation of Greenwood as part of the historical romance of Tulsa. That is, in order to recognize the destruction of Black life and property as important, it was equally important to explain away the racial motives of the white rioters.

The lens through which the Tulsa Race Riot is viewed is dependent on race. Investigation indicates Black Oklahomans are interested in the specific tragedies that happened to their families in that fateful period. Therefore, Black oral literature describes and recounts the horror of the Riot and its aftermath. They voice their pride in the decades required to complete the rebuilding of Greenwood with Black money. The Riot may also be explained as an extended family event in which Tulsa Blacks share a common experience in much the same fashion as German Jews consider the holocaust.

Euroamericans view the Tulsa Riot from mixed perspectives. Traditionalists lead by Gibson considered the Riot a minor footnote in a violent history. Revisionists including Baird and Goble are more willing to describe the horrors of the event but also excuse it as part of Tulsa’s adolescent years. Ellsworth, on the other hand, recognizes the period as racist and explains the Riot within that context.

This paper concludes Tulsans view their history through different lens. African American students regard the Riot as part of the Black experience and study it within that context. For many African American students, the Riot and its aftermath is historical evidence they will remain separate and unequal from Euroamericans. On the other hand, Euroamerican students know little about the Riot. Oklahoma schools treat the Tulsa Riot as part of its null curriculum. Because textbooks reflect Euroamerican standards, white students interpret the Riot as a minor, or at best, an unfortunate event in an exciting and violent history. In short, the Tulsa Race Riot illustrates that Tulsans, both Black and white, live in the same segregated society their grandparents knew in 1921.

Robertson, Governor James B. A. Papers, Oklahoma State Archives

A significant body of research exists on the influence Black students attending historically Black colleges and universities had on their respective campuses, especially in the South; however, information regarding the influence Black students attending predominantly White campuses, especially in the Midwest, had on their respective campuses is lacking. As a case study of Black student influence on the University of Illinois at Urbana-Champaign campus (UIUC), this piece will help fill the information gap regarding the impact Black students had on helping to shape the nature of education at predominantly White institutions. Also, examining the Black Power era students and their influence on the UIUC campus provides a broader knowledge and appreciation for the full weight of the Black Power Movement on American higher education. The focus of this piece will be to examine the influence of the Special Educational Opportunities Program (SEOP) on the campus, the influence of a mass arrest on Black student life and thought, the evolving Black liberation ideology among Black students, and the perceived legacy of Black students of the late 1960s and early 1970s. The primary source for this project was oral interviews conducted by the author with persons involved in the Black student movement at UIUC from 1965 to 1975.

This research relies on the recollections of several interviewees who represent a range of opinions and positions on the UIUC campus. John Lee Johnson, a Champaign community resident, was involved heavily with Black UIUC students from 1965 to 1975 and still resides in Champaign. Clarence Shelley arrived at UIUC in 1968 as Director of SEOP, an affirmative action program initiated to increase Black student enrollment, and is now Vice Chancellor for Student Affairs. Edna Long-Green, Jeffrey Roberts, James Eggleston, Terry Cullers, Jacqueline Atkins, Terry Townsend, and Yolanda Williams were students at UIUC during the middle to late 1960s through the early 1970s. Each interviewee was able to offer a unique perspective on the sentiments and events occurring at UIUC in the late 1960s and early 1970s.

In the early to middle 1960s, integration remained the ascendant ideology regarding Black liberation. Blacks were encouraged to "fit in" and participate fully in the existing social structure. On the UIUC campus, African Americans and Whites practiced this philosophy in their student activities and organizations. For instance, they worked together in organizations such as the National Association for the Advancement of Colored People and the Student Nonviolent Coordinating Committee. Black and White students in the organizations helped draft a resolution to condemn the bombing of a Black church that killed four young Black girls in Birmingham, Alabama ("Senate Maps Bill," The Daily Illini 17 September 1963); traveled to Mississippi to register Blacks voters in upcoming elections and to teach in freedom schools ("UI Rights Workers Return from Mississippi Campaign," The Daily Illini 7 November 1964); and participated in civil rights demonstrations in Champaign ("SNCC to Stage Sit-In," The Daily Illini 19 May 1964).

As a reflection of the national sentiment on Black liberation, many Black students felt as Ms. Long-Green did about "getting along" on campus, "My whole focus was blending in. I didn't want to stand out" (1997). She engaged in social activities with both Black and White friends and related well with her White residence hall floormates. She described the interaction between Black and White students as natural not hostile, "We were so different from our roommates, the curiosity was a natural curiosity as opposed to a racial curiosity. Most of them had not known a Black person in a social situation. Most of us had not known any Whites either so there was a natural curiosity" (Long-Green 1997). Both Mr. Eggleston and Ms. Atkins recounted potentially hostile incidents with their White roommates. Initially encountering prejudice, both confronted their roommates and later got along with them or adapted to the situation. As Mr. Eggleston stated, "There was no animosity between Black and White students. You could go around and not be bothered" (1997).

This is not to say that Black students on campus in the early to middle 1960s were attempting to forfeit their Blackness in order to fit in, were disinterested in civil rights concerns, or that racial tension on campus was nonexistent. In fact, many interviewees indicated they were involved with Black attempts at liberation prior to coming to UIUC including participation in Dr. Martin Luther King Jr.'s open housing drive in Chicago, Illinois, a flirting affiliation with the Chicago chapter of the Black Panther Party, watching the bus boycotts and Freedom Riders on television, joining
sit-ins and marches in Chicago, initiating Black student activism at other campuses before enrolling at UIUC, membership in SCLC, CORE, the NAACP, and Operation Breadbasket, and modeling their beliefs after parental attitudes and actions. Students brought their experience to campus, but often focused on more immediate concerns such as graduating from the university.

However, Black Power politics and sentiment grew and were magnified on campus after the 4 April 1968 assassination of Dr. Martin Luther King, Jr. His murder stunned the campus, Champaign-Urbana, and the entire nation and seemed the last straw in a long line of disappointments and frustrations. Mr. Cullers described it as overwhelming, "There was a feeling in 1968 of, 'What in the world is happening? Is this country really going to hell in a handbasket?'" (1997). Students like Mr. Cullers examined such roadblocks to Black liberation as the assassinations of Medgar Evers, John Kennedy, Malcolm X, Robert Kennedy, the riots in Watts and Newark, the Vietnam War, and civil rights defeats in the South. King's assassination was the last insult they could endure. It bolstered their resolve and confirmed their belief that nonviolence was inappropriate, ineffectual, and useless. As Mr. Eggleston stated, "If somebody hits us, we hit them back. If you were really revolutionary, you would take up the gun to go for liberation" (1997).

At UIUC, King's murder directly influenced the number of students admitted through SEOP in Fall 1968. Initially conceptualized to include approximately 150 students, King's assassination, demands from the newly formed Black Students Association (BSA), and community pressure increased the numbers to over 500, more than doubling the Black undergraduate population. This sudden infusion of Black students invigorated the Black campus community and magnified Black Power on campus. It was in this context and climate that the SEOP students arrived on campus. Not only would they have to contend with the pressures of attending college and being away from home for the first time, they would enter an environment in which continuing Black students encouraged them to place themselves in opposition to the university and question the university's commitment to its Black students.

The interviewees agreed that a state of total confusion existed when the SEOP students arrived on campus. According to Mr. Shelley, "It was obvious early on that this community had never seen anything like this before. There was lots of tension because their presence was an anomaly" (1997). The Black students, primarily coming from predominantly Black environments, experienced culture shock; the administration poorly handled the shortage of housing and financial aid for the incoming students; the White students "began to look at you differently because they didn't know how radical you were" (Long-Green 1997). Adding to the tension on campus was the arrest of more than 250 Black students before the start of the 1968 Fall semester.

The first day of New Student Week, 9 September 1968, became a defining point for the Black UIUC student population, and by consequence, the entire University. While attending student orientation, held the week before New Student Week, the SEOP students were housed in the Illinois Street Residence Hall (ISR), a popular and relatively new residence hall. However, they found that they would be moved to older residence halls for the school year. Adding to their dismay, some had been placed in hall lounges until permanent rooms could be found and had been informed that the financial aid promised them by BSA recruiters was nonexistent. On that first day of New Student Week, the Black students, both continuing students and newly arrived SEOP students, decided that they would not tolerate the housing or financial aid situation and met in the Illini Union to discuss a plan of action. By the early morning hours of 10 September 1968, approximately 250 Black UIUC students, 221 of whom were in SEOP, were arrested on counts of mob action and inaugurated the UIUC campus as the scene of the first student "riot" of the 1968-1969 academic year.

News of the 9 September 1968 incident spread across the country as is evidenced in the Clipped Article File obtained from Mr. Shelley. In The New York Times, the headline read, "Classes to Begin at U. of Illinois: Tension Pervades Campus After Monday's Protest" (14 September 1968); in The Wall Street Journal, it read "Black Student Revolt: Colleges' Bid to Enroll 'Disadvantaged' Brings Problems and Protests; Feeling Strange at Illinois" (24 January 1969); in The Los Angeles Times, it read, "College Plan for Negroes Passes Test; But 'Project 500' at Illinois U. Meets Obstacle" (19 December 1968); in the St. Louis Globe Democrat, it read, "300 Negro Students Charged in U of I Row" (11 September 1968); in the St. Louis Post Dispatch, it read, "Illinois University Officials Meet Negro Group's Housing Demands" (11 September 1968); and in The Chicago Tribune, it read, "Negroes Riot at U of I" (10 September 1968). The articles chronicled the goals of SEOP, the students arrival on campus, the fact that Whites were ejected from
the 9 September 1968 meeting, the vandalism of the Illini Union, and the number of Black students arrested.

Accounts of why the Illini Union incident occurred and what actually happened varied. In the campus student newspaper, *The Daily Illini*, the headline on 10 September 1968 read, in bold letters, "Blacks Occupy Illini Union." The article stated that over 150 Black students occupied the South Lounge of the Illini Union to protest room assignments and financial aid arrangements. During the "occupation," furniture and glass were destroyed, and according to Carolann Rodriguez's article, "Blacks Urge Guns," Whites were barred from the South Lounge where the Black students met to discuss their grievances with the administration (*The Daily Illini* 11 January 1969). When the meeting continued past the Illini Union's official closing time and students became unruly, Champaign and University police were called in and "removed" the students.

BSA released a policy statement regarding the incident and placed blame squarely on the University. They also further explained BSA's role in the development and implementation of SEOP. They stated that in Spring of the 1967-1968 academic year they presented the administration with a list of demands. In an effort that would "legitimize" the university, they advocated an increase in the number of Black students. Recognizing that the recruited freshmen would need financial assistance and that finances were a major determinant in attending any university, the BSA Executive Council and the University administration agreed that no SEOP student would have to incur a loan exceeding $470.00. Also, no SEOP student would be required to work during his or her first year. However, when SEOP students arrived on campus, they were informed that some would have loans exceeding the agreed upon amount. Also, some were informed that they would have to work. Unlike *The Daily Illini*, BSA stated in an article entitled, "Misinformation," that housing was not the real issue in the events of 9 September 1968: "The Daily Illini reacted in true form with its publication on the morning after the incident by attempting to treat the housing problem as the issue. Of course they have attempted to exonerate themselves by praising the efforts of BSA in the last two weeks" (*Drums* September 1968.)

Some parents were furious their children involved themselves in such a protest. Mr. Shelley, then Director of SEOP, recounted an incident when a mother confronted her son, who had been arrested, in his office. According to Mr. Shelley, she yelled at her son, "I sent you down here to school, and you go to jail?" (1997). However, many parents supported their children, and defense of the arrested students came from many directions. A telegram obtained from Mr. Shelley’s Clipped Article File stated that Black UIUC alumni in Chicago, Illinois, formed "Concerned Alumni of Illinois" in an effort to support those Black students arrested at the Illini Union. Led by Chicago Alderman A. A. Rayner, the group requested a meeting with Mr. Shelley and Jack Peltason, Chancellor. The UIUC Graduate Student Association received a telegram from the National Students Organization decrying police conduct on the night of the arrest: "The National Students Association pledges legal assistance and advice to the students involved. . . . We are ready to continue the struggle against the use of such police tactics in the educational environment" (Shelley Clipped Article File). White UIUC students also rallied around the arrested Black students. According to the article, "Rally to Support Demonstrators," Peace and Freedom Party members circulated a petition during a rally to support the arrested Black students and collected approximately 700 signatures. Speakers at the rally included Black and White UIUC students, UIUC faculty, and church pastor, Reverend James Offutt. The culmination of the rally was the presentation of the petitions to the assistant Vice Chancellor, John Briscoe (*The Daily Illini* 25 September 1968).

All those arrested pleaded not guilty and were on bond. Administrators were split on how to handle the students' academic status. Some recommended expulsion; others recommended suspension; still others recommended more lenient procedures. The Black students, as well as various White student groups, demanded that the charges be dropped and the students retain full academic status. After a long period of deliberations, most SEOP freshmen were issued letters of reprimand for "conduct undesirable" to the University community. They were allowed to continue their UIUC academic careers without the reprimand appearing on their University transcripts.

The interviewees agreed that the situation began peacefully but continued to escalate until the students were arrested, that the situation escalated due to communication breakdown, and that the Black students did not anticipate the arrest or intend to be arrested. Mr. Shelley and Mr. Roberts recounted how the meeting began as a forum to discuss the housing and financial aid situation. Black students demanded the President and Chancellor come to the Union and address their concerns. When the administrators refused to come and the Union’s closing time neared, tension increased.
and the situation intensified. Mr. Roberts remembered that "ninety percent of the students arrested had no idea of what was going on that night." He believes the students were used as pawns by BSA and the administration: "The leadership of BSA felt they had been hung out to dry and they didn’t want to look bad in front of their constituents. The university wasn’t about to give on anything. You had these two forces come together and the students got caught in the middle" (Roberts 1997). Mr. Shelley agreed stating that, "Many of them were there because everyone else was there. Many of them were afraid to leave. Some of them were there because they didn’t want to be asked why they weren’t there" (1997).

With the 9 September crisis, the continuing students and new SEOP students became one cohesive group. According to Mr. Roberts, the Illini Union incident forced unity, perseverance, confidence, and persistence. Also, the arrests spurred many students to action. As Mr. Shelley stated, "A lot of kids who wouldn’t have been active spent all their time trying to get even for [the arrests]" (1997). Likewise, Mr. Roberts stated, "I think it turned a lot of people into activists. People who were sitting on the fence and didn’t know what to do got pushed into, ‘I need to participate’" (1997).

Though BSA existed before the SEOP students arrived, the interviewees agreed the arrests energized BSA. Before 9 September 1968, BSA was still "trying to define itself as a force" (Shelley 1997). At the 9 September rally BSA leadership attempted, as Mr. Shelley described, "to use this mass of students as a mobilizing entity. They were trying to politicize these kids" (1997). The arrests served as a confirmation of the need to become involved in BSA and Black issues on campus. With this newly energized and politicized group, Black UIUC students connected themselves to the Black Power Movement sweeping the nation in the late 1960s and carved a niche for themselves in it. In an article entitled, "Goals Are Black Unity and Black Consciousness," appearing in BSA’s newspaper, Drums (1967), the organization declared, "It is our responsibility to interpret to each student the changing attitude of the Black Movement [from the Civil Rights Movement to the Black Power Movement] nationally and locally and to reflect Black Consciousness."

Heavily influenced by national Black Power figures such as the Black Panther Party, Stokely Carmichael, H. Rap Brown, Malcolm X, Julius Lester, and Don L. Lee, and others, Black UIUC students began to formulate an ideology. They gleaned parts from their own experience in civil rights struggle and appropriated others from national discussions on Black Power and new tactics for Black liberation. Increasingly, they involved themselves in Black freedom struggles, and as Mr. Eggleston stated, "went with the Movement" (1997). They funneled their increased numbers and energy into creating change at the university. According to Ms. Long-Green, the SEOP students "wanted the university to catch up with the times and remove itself from the very protective collegiate ivy league world" (1997).

The shift in national sentiments, attitudes, tactics, and goals regarding Black liberation began to be manifest on the UIUC campus toward the middle to late 1960s. Students questioned the goals of the Civil Rights Movement, "The mood had really become not anti-integration or not integration at any price, but is integration really the goal?" (Cullers 1997). Black students pondered other objectives and followed the shift from racially integrated civil rights organizations to predominantly or all Black civil rights organizations, from non-confrontational or moderate methods to aggression. By the later 1960s, the NAACP and other integration-minded organizations still existed on campus but faced fierce competition for Black members from newly formed Black Power-minded organizations. It would be futile to argue that all Black students swayed toward Black Power. It is doubtless that many continued to fight for the equal opportunity to assimilate into the dominant White society and culture while others fought for an equal opportunity to participate in a pluralistic society. However, Black Power-minded organizations gained momentum with a significant part of the Black student population. By 1967, Black Power became the ascendant ideology on the UIUC campus.

The definition of "Black consciousness," according to the interviewees, varied between different individuals and groups. They were careful not to paint a monolithic picture of Black student ideology. As Mr. Roberts stated, "You had people who were Black nationalists, culturally oriented, academicians. We were spread all over" (1997). Mr. Shelley described parts of the group as Marxist, Pan-Africanists, or most concerned with Black Studies. "It was a very disparate group in terms of ideology" (1997). Regardless of their differences in ideology, all interviewees understood that the Black students were connected and bonded together. Though they subscribed to different beliefs, "we understood
we were banded together because of race" (Roberts 1997). Whatever the route the end was the same: Black liberation.

Reflecting on BSA's tangible goals, Mr. Eggleston remembered the increasing sophistication of objectives. At first, one of the primary goals of BSA was to integrate the campus. Not only did BSA view increasing the number of Black students a way in which to train future Black leaders but as psychologically satisfying as well. The low number of Black students deeply affected emotional well being and friendships. "Being there, it was so lonely. When people flunked out, it was devastating. Every year you had to make new friends. If you made three friends, two of them would leave." As their ideology became more developed and their goals more defined, "We got more sophisticated and wanted more Black professors. We got more sophisticated and wanted a Black student center. We got more sophisticated and wanted equal rights and good wages for Black auxiliary staff" (Eggleston 1997). BSA acted as an organized forum for students to discuss issues relevant to the Black community and as a reminder to individual Black students that they were not alone in their frustration and isolation on campus. BSA then took that energy, and as Ms. Atkins stated, "pushed the envelope for the university."

In their pursuit of liberation, African American UIUC students, consistent with national trends, formed all Black academic organizations, sponsored all Black events, and initiated all Black activities. According to Mr. Roberts, "There were attempts by the university to figure out how to bring Black students into the mix of things. But, many Black students didn't want to be a part of what was going on at the university. We weren't accepted into their social events, but nobody really wanted to be anyway" (1997). Instead of participating in established groups or activities Black students created a parallel existence in which Blackness was the center. All Black organizations such as the Black Law Students Association and the Black Engineers Association and activities such as Black Chorus and Black Homecoming served the academic and social needs of Black students attending a predominantly White institution, "you could go [there] and you didn't feel like you were being beat up on by the university. Every place else you went had such a negative situation. At least for that hour you felt like you were in a positive situation where people were reinforcing whatever needs you had" (Roberts 1997).

Why then, many Whites asked, would Black students attend UIUC instead of an historically Black college? If they felt more comfortable with separate activities and felt the university was not supportive, why not transfer? Answers among the interviewees varied, but none interpreted the perceived dissonance as debilitating. Some interviewees, especially those in SEOP, indicated that their financial packages kept them at UIUC. Others explained that there was an attitude among some Black UIUC students that their peers at historically Black institutions were not as academically capable. Though noting it was elitist, Ms. Atkins stated, "There was an attitude that we may have been a tad bit better" (1997). Many interviewees noted the prestige of UIUC. The academic reputation of the university and its high status among premier institutions was attractive and beneficial for future career pursuits. Mr. Cullers explained UIUC attendance as a right as taxpaying citizens in the state of Illinois. He stated, "Since we're paying taxes for this institution, we felt we should be able to take advantage of it" (1997). Discussions of the possible incongruence between Black Power ideology and attendance at a predominantly White institution existed but was not the primary concern of Black UIUC students. As Townsend stated, "We were more concerned with trying to pressure this university into being all it could be" (1997).

To be considered "truly Black" could be difficult and demanding. "Your academic success wasn't what you were measured by, it was your participation in relevant things" (Roberts 1997). Expectations for Black students included attending every BSA meeting. Mr. Shelley remembered that students took attendance, socialized with Blacks only, dated Blacks only, participated in all Black student sponsored events, and avoided White friendships. As Mr. Roberts described it, "if you ventured outside of that you were considered an outcast" (1997). Commenting on the pressures to conform Mr. Shelley stated, "Many of them were here trying to decide how Black they had to be while they were here. There was lots of pressure on students for them to behave a certain way. You could see the dissonance in how they were expected to act and how they really wanted to act" (1997).

Some interviewees noted a pressure to conform to certain ideas of Blackness. The degree of pressure felt by interviewees or exerted by interviewees varied. Mr. Eggleston acknowledged there was pressure but did not consider it a factor in relationships between Black students. Though it may not have influenced Black friendships, Mr. Cullers
explained how this pressure to be "truly Black" influenced friendships between Black and White students, "As the 1960s wore on, those relationships were not tended to. It was that period of being to ourselves and trying to work with ourselves solely" (1997). Also, Ms. Williams described the influence of the new ideology on the Black Greek fraternities and sororities, "We were pressured to get involved in BSA and not other things, especially Greek life. BSA would say to be Greek is to be White" (1997). Other interviewees who were also members of Greek letter organizations expressed similar sentiments. Whereas in decades earlier membership in a Greek letter organization brought prestige, in the later 1960s it became antithetical to the cause of Black liberation. Many interviewees indicated that the number of members in Black fraternities and sororities suffered during this period of "Black consciousness."

Regardless of the differences in ideology and the often stringent nature in which Black students could be considered "truly Black," all interviewees believed the Black students of the late 1960s left a positive legacy on the campus and that they benefitted from their involvement in the Black student movement as well. Remembering the personal for Black students, Ms. Long-Green stated, "I think a strength is that it produced tremendous leaders. They understood and appreciated the opportunity the university gave them and what the university meant for those who stayed. I think it was a character building and strength building process" (1997). Mr. Roberts attributes his current success to his years at UIUC and his involvement with the Black student movement, "Reflecting back, if I didn't do anything else at the U of I, I learned how to think for myself" (1997).

Also, interviewees believed the Black student movement of the late 1960s and early 1970s left an indelible mark on the UIUC campus, "I think Black students, especially the 1968 group, changed the direction of the university. They definitely turned the ship around" (Roberts 1997). Interviewees believed the legacy included forcing the administration to recognize the heterogeneous quality of its student population and its need to sponsor organizations and activities that reflect diversity, to understand the need for more Black faculty and staff, and to be adaptable and think and act strategically. They prodded the university to action and placed it and themselves at the forefront of Black student struggle across the nation.

Lasting tangible evidence of Black Power era student influence on campus includes the Afro-American Studies and Research Program, the Afro-American Cultural Program, courses in various disciplines on the Black experience, Black Chorus, Black Homecoming, Black academic associations, and the Black Congratulatory Ceremony. Today the university continues to provide funding and space for the above activities and associations in an effort to promote and maintain diversity on campus, a diversity fostered by the arrival of the SEOP students.

Most interviewees valued their experience as UIUC students despite the tension that existed on campus during the late 1960s and early 1970s, and would repeat the experience. As Ms. Long-Green stated, "For me, U of I was a good fit in spite of coming in the back door" (1997). They recognized deficits in the university structure, but agreed that their UIUC education was invaluable and helped them attain success in later life. Attempting to explain the fondness with which students of the late 1960s and early 1970s remember their experience at UIUC Mr. Shelley stated, "They look back on their days here with much more affection than students who left after them because they accomplished so much in such difficult times. They honor the experience more. It cost them more to get through it therefore they value it more" (1997).

The 1968 SEOP students left a tangible legacy on campus in the form of institutionalized programs and policies. Their insistence on separate activities based on race continues in the form of Black residence hall councils and academic associations. Their attempt to force the university to grapple with their demands as Black people subscribing to the philosophy of Black Power acted as the catalyst in the university's increasing commitment to its multicultural student population. As the interviewees mentioned, they prodded the university out of its protective shell and into the forefront of Black student struggle on predominantly White college campuses.

Shelley, Clarence. Clipped Article File.
In the fall of 1971, the Houston (Texas) Independent School District (HISD) opened the High School for the Performing and Visual Arts (HSPVA). Modeled on New York City’s High School for Performing Arts and High School for Music and Art, HISD Superintendent Dr. George Garver and the HISD Board of Education hoped that HSPVA would be Houston’s first positive demonstration of voluntary racial desegregation (Garver 1997, Oser 1997, Tinsley and Tinsley 1997).

The need for a positive demonstration of voluntary desegregation in Houston in 1971 could not have been more urgent. In August 1970, Federal District Judge Ben Connally ordered the immediate implementation of an unpopular, involuntary desegregation plan for HISD, the sixth largest school district in the United States (C of C 1970). On appeal, the Fifth Circuit Court developed a complex plan for HISD. Secondary students were assigned to their geographically closest school, an arrangement which changed the previous racially gerrymandered zoning, and the staff of each school was racially mixed to approximate black and white racial percentages in the district as a whole (History 1972, Houston plan 1972).

Historic school loyalties, perceptions of excellence, and racial prejudice encouraged many students and their parents to falsify home addresses or to rent apartments to remain within the districts of their preferred schools (Bull et al. 1997, Kronzer 1970). Private schools sprang up overnight to meet the demand of parents and students who decided to quit the public schools. Although HISD escaped court-ordered busing, public anger directed at HISD’s Board of Education and Superintendent Garver crossed all racial, ethnic, and socioeconomic lines (Garver 1972, Tinsley 1974).

Garver sought to restore the Houston public’s faith in schooling as a positive experience even though student bodies were racially desegregated (Garver 1997). This goal was shared by the Board of Education (Oser 1997, Tinsley and Tinsley 1997). In the search for such positive educational experiences, three new formats gained acceptance. The first, in 1971, was the creation of the Houston Community College, which held evening and weekend classes on high school campuses. The second was the establishment of HSPVA in 1971, and the third was the establishment of the High School for Health Professions in 1972 (Garver 1997, Oser 1997). The latter two programs were referred to as "alternative" or "special" high schools, as was Houston Technical Institute (HTI). These schools were planned to be fully desegregated and drew their student bodies from the entire district based on their educational focus (Whiteley 1997). Starting in late 1971, HISD officials began to refer to them as "magnet" schools (Houston plan 1972).

White Houston arts supporters had long looked to New York as the only model worthy of their attention in the development of their city’s as a national arts center. Since New York had high schools for artistically talented students, of course Houston needed one as well (McLanahan 1997). The HISD music and drama teachers simply wanted a school capable of challenging their most talented students. HISD Supervisor of Music Education Mildred Roach had begun to enlist support for such a school during the mid-1950s after she visited the New York High School of Music and Art (Red and Munson 1997). However, talk of such a school died after Sputnik’s launch in 1957; all discretionary funds were used for science laboratories in secondary schools (Clifton 1997, Red and Munson 1997). Plans for HSPVA in 1970 revived the dormant dream.

By January 1971, letters from Houston arts organizations arrived at the HISD Office of Board Services in support of the creation of HSPVA (Gockley 1971). Former drama teacher Ruth Denney assumed all responsibility for the school’s planning and implementation. Since 1966, she had directed HISD’s Coordinated Vocational and Academic Education (CVAE) program which featured a close tie between vocational and academic curriculum for students perceived as in danger of dropping out of high school (Whiteley 1997). This melding of the vocational and academic curriculums became a primary feature of HSPVA (Denney and Nipper 1997, Orlando 1997).

Superintendent Garver was not content with a vision of HSPVA as a vocational high school for the traditional fine arts. During the winter of 1971, he approached both Denney and Lamar High School’s CVAE teacher Jean Nipper about the possible inclusion of media as one of the HSPVA arts majors. Nipper had just finished raising funds from Houston businesses for a vocational media program at Lamar which would place interns at Houston’s radio and...
television stations as well as corporate audiovisual departments. By February 1971, the planned program had moved from Lamar to HSPVA (Denney 1971a, Denney and Nipper 1997).

Denney spoke of herself as the person who took the idea for HSPVA, one that had bounced around HISD for years, and made it go (Denney and Nipper 1997). Her first actions enlisted the aid of HISD's ninth grade counselors and arts teachers in the organization of the new school.

An exciting opportunity to participate in the planning of a High School of Performing Arts is being offered to all of us. Briefly, the purpose of such a school would be to more effectively and professionally train and educate those students with ability, potential and desire in any of the many fields of the performing and visual arts. The students would also have the opportunity to be trained in the arts of stage construction, costume design, scenic design, radio and television techniques, film and video taping, photography, instrument repair, lighting and sound design and operation, and the many other skilled occupations allied with the fine and performing arts (Denney 1971a).

This description emphasized the desirable efficiency of concentrating HISD's arts resources in one high school.

Denney also organized a creative planning workshop to which she invited HISD trustees and central office administrators, representatives of Houston arts organizations, arts professors from several Texas universities, HISD arts supervisors, and HISD high school arts teachers. Out of this workshop came HSPVA's official motto: "Education is an adventure in trust" (Denney 1971b). Students at the new school would be offered artistic and personal freedom coupled with adult trust in their responsible use of that freedom. A required student contract spoke to the issue.

The privilege of attending this school rests upon my own personal responsibility and dedication. I commit myself to good attendance, cooperation, respect for people and the school, and serious work in order that I may continue at the High School of the Performing and Visual Arts (Contract 1972).

The planning workshop also acted as a recruiting forum for HSPVA's future faculty, but recruiting was never necessary. By June 1971, "150 applications from through[ou]t the country for faculty positions" had been received (Lawes 1971). The number of faculty applications grew to 300 before the school opened in August (Weber 1971, 9). From these, Denney picked a tri-ethnic faculty of seven full-time academic teachers, twelve full-time arts teachers, and one counselor (Faculty 1971, Sinclair 1997). Part-time arts consultants were hired by each of the arts departments (Bonner 1997).

Despite Denney's careful involvement of HISD's arts teachers, she necessarily contended with their belief that HSPVA would "steal" their best students. A reassuring memorandum to all arts teachers followed the planning workshop.

In further explanation a High School of Performing Arts would not be a threat to any existing drama, music, or art department, nor to individual teachers and/or studios as it would be geared to take care of only those students who wished to pursue a professional career. . . . In my twenty years as a drama teacher I doubt that there were more than 5 students a year who would have taken advantage of such training. I do know there are too many boys and girls that we are missing who get 'turned off' by regular classes, who drop out and do not complete high school. These talented teenagers are the boys and girls--the talented, untrained, unsure, and poorly educated--that we must keep in school and better equip to become productive artists (Denney undated).

The music teachers were the most difficult to convince, but Westbury High School instrumental teacher Leslie Munson recalled that he lost only two students to HSPVA when it opened in the fall (Denney and Nipper, Garver 1997, Red and Munson 1997). Denney's memorandum highlighted her view that HSPVA would serve to decrease dropouts of artistically talented students.

Denney was offered her choice of three locations for HSPVA and she enlisted the help of architect Barry Moore to reach a decision. Two of the sites were former elementary schools with many classrooms, but only a multi-purpose cafeteria for performance and rehearsal space. Moore, like Denney, was inspired by the former Beth Israel's auditorium and attached Levy Memorial Hall and educational buildings at the corner of Holman and Austin streets. The
Talent Knows No Color
Gore

site lay east of Main Street within the attendance boundaries of traditionally black Jack Yates High School. With columns padded by mattresses, Lower Levy Hall became the dance studio; the auditorium of Upper Levy Hall became instrumental rehearsal space. The main auditorium of the former synagogue needed only a stage to become a theatre used full-time for drama classes as well as most performances. The courtyard provided space for an outdoor classroom and performance space (Moore 1997). The Beth Israel site was HSPVA's temporary home until bonds could be passed to create a permanent facility with adequate space for the projected capacity of 600 students (Garver 1997, HISD Chance 1972).

Denney presented the plans for HSPVA to the HISD Board of Education in May and, again, they responded with unanimous approval (HISD 1971, 17). Off the record, Garver and the Board gave Denney three years to demonstrate the school's viability as a Houston high school (Denney and Nipper 1997). HSPVA would open in fall 1971 with 200 sophomore students recruited exclusively from HISD's junior high schools. If juniors or seniors wished to be part of the school, they were to initiate their own involvement and spend afternoons only at HSPVA for their arts classes. Academic classes and graduation would take place at their home school (Denney and Nipper 1997; Proposal 1971). Forty upper-level students chose this option during the first year (HSPVA Progress 1972). The approved plan called for the addition of a sophomore class of 200 in fall 1972 and again in fall 1973 until the school reached its planned capacity (HISD Board 1971, 15).

The first hand-lettered recruiting flyer described HSPVA as "a program for professional training in the arts" (Flyer 1971). The arts were listed as instrumental music, vocal music, drama, technical theatre, photography-film-television, art, and dance. Correlation of academics and arts, student-centered curriculum, team teaching, and a daily three-hour arts time block were emphasized, along with the school's location near the "Houston fine arts district" (Flyer 1971). The only nod to desegregation was the description "student body representative of all areas of the city" (Flyer 1971). Given that HISD had been ordered to racially desegregate its schools by the 1970 court order, authors of the flyer must have believed unnecessary the mention of Garver's and the Board of Education's primary purpose for the school.

On June 13, the Houston Chronicle published the first feature article of what would become a media love affair with HSPVA. Fifteen-hundred interested students were reported to have auditioned for the 200 sophomore openings (Lawes 1971). Students remember hoping for entrance into the school for two primary reasons. They wanted either to get into a school with an artistic curriculum, or they wanted to get out of zoned high schools full of racial tension and student unrest. For those students who received HSPVA acceptances, their excitement and relief betrayed a mixture of both concerns (Bull et al. 1997).

In the auditions, Denney and the arts faculty looked for students with "creative potential, not artistic accomplishment" (Cunningham 1971, 30, 31). Talents of admitted students ranged from raw potential to polished artistry (Denney and Nipper 1997). Superintendent Garver, recognizing that HISD's tri-ethnic constituency should be evident at HSPVA, established racial goals for the school: 40 percent black, 40 percent white, and 20 percent brown, a rough approximation of Houston's racial demographics (Garver 1997). Although a representative of the local chapter of the National Association for the Advancement of Colored People requested racial quotas at a July Board of Education meeting (HISD 1971, 69), Garver's percentages remained only goals.

After HSPVA's opening on 26 August 1971, word of the "natural" racial integration spread to educators in other urban districts who were faced with busing orders and other involuntary means of racial desegregation (Denney and Nipper 1997). Visiting educators began to stream into the school, a development which necessitated a change in HSPVA's dress code by fall 1973. Whereas students previously were advised to "wear shoes because there's nails on the ground," the new directions were to "look neat and tidy" (Bull et al. 1997, Denney and Nipper 1997). HSPVA became a public relations success.

Although all the evidence pointed to HSPVA as a vocational high school, fine arts and academic teachers preferred to think of media as the only vocational component of the school (Whiteley 1997). Unknown to these teachers and fine arts students who often looked down on their media colleagues (Bull et al. 1997, Kobb 1972), the media department quickly brought both recognition and financial assistance to HSPVA. When heads of Houston's major
corporations visited the Industrial Media Technology (IMT) program they already funded, coordinator Jean Nipper made certain that they met Denney and toured the entire facility. Frequently, impressed with the caliber of both the media and arts programs, business leaders contributed additional funds to HSPVA (Denney and Nipper 1997). Only two years after the school opened, the U. S. Department of Health, Education, and Welfare Office of Education declared IMT "An Outstanding Program Deserving Special Recognition" (HEW 1973).

For the educators involved in HSPVA’s establishment, the school was not about racial desegregation. Rather, desegregation was a by-product of district-wide recruitment, auditions, and acceptance of artistically talented students of all colors. Denney was quoted as saying "we take students on the basis of talent, which knows no color lines" (Albright 1974, 25). She firmly believed that color was subordinate to talent in the arts' industry; HSPVA’s focus on talent, not color, simply reflected her belief (Denney and Nipper 1997).

What did HSPVA’s founding mean? For HISD, the school’s natural integration provided a ray of hope at the end of the long racial desegregation tunnel. Director Ruth Denney thought that it meant the success of a dream for artistically talented students bored by traditional high schools (Denney and Nipper 1997). To Assistant Superintendent Whiteley (1997), it was a vocational success story. HSPVA’s faculty believed that college acceptances and $118,815 in scholarship money meant that connecting the arts and academics provided success for the artistically talented (Albright 1974, 25). To HSPVA’s graduates, it meant an exhausting and exhilarating high school experience with other artistically talented students (Seriff 1974, 225).

During the nineteenth and twentieth centuries African American scholars and educators adhered to an educational philosophy that empowered oppressed people, challenged scientific myths which supported social injustices, and inspired citizens to transform society. Yet scholars have not, generally, acknowledged the work of African American educators in the field of educational philosophy (Dunn 1993, 25). This is especially true regarding the educational theory which came to be known as critical pedagogy. In brief, critical theorists work from the premises that the world is marked by asymmetries of power and privilege; that the individual's relationship with society is dialectical--one at once creates and is created by society; that schools, long operating as sites of domination, can be restructured to operate as sites of liberation; that any valid theory of schooling must be partisan, that is, committed to an agenda for justice and against oppression (McLaren 1994, 175-177). Although African American educators and scholars articulated an educational philosophy consistent with the major tenets of critical pedagogy, their contributions have been little recognized. To make the case that African American scholarship foreshadowed the development of critical pedagogy, this paper begins with the words and ideas of W.E.B. DuBois, the scholar Mary White Ovington distinguished as "the master builder, whose work will speak to men as long as there is an oppressed race on earth" (Lewis 1993, 496).

William Edward Burghardt DuBois came to see his own life as representative of African Americans' struggle for justice in the United States, and eventually of all Africans in the Diaspora. Eric J. Sundquist comments that DuBois' writing and his life's work as historian, sociologist, teacher, civil rights activist, editor, novelist, governmental envoy, Pan-Africanist, and political theorist underscored the intensity of DuBois' efforts to understand the biography of his race (DuBois 1996, 5). Called the "premier architect of the civil rights movement in the United States," DuBois exemplified the meaning of praxis that is central to the critical theorist's agenda (Lewis 1993, 4). Research on African American scholarship in the area of critical theory, certainly, cannot end with a study of DuBois alone; but, as James B. Stewart has argued, the magnitude of DuBois' intellectual and social contributions, together with the difficulty scholars have in comprehending DuBois' work with the use of traditional labels, justify an initial focus on DuBois (1984, 298).

Indeed, no single intellectual tradition has yet been able to capture the ideas of the man perhaps best described as a Black Radical Democrat (Sundquist 1996, 10; Marable 1986). In the course of ninety-five years DuBois moved from what could be described as a conservative intellectual-political position, to a liberal, and then radical, perspective. Throughout his life, however, DuBois remained constant to an ideal that characterizes critical pedagogy: belief that education can be used to generate economic and political power to overturn oppression. In this paper I argue that DuBois' scholarship foreshadowed the development of critical pedagogy by focusing on two themes in his writings on education: education as an essential element in the process of liberation; and, schools as significant sites of struggle. In his 1930 address, "Education and Work," DuBois articulated ideas that resonate in the work of critical theorists six decades later. Speaking to African American students in the days of Jim Crow, DuBois explained:

We are not going to share modern civilization just by deserving recognition. We are going to force ourselves in by organized far-seeing effort--by outthinking and outflanking the owners of the world today who are too drunk with their own arrogance and power successfully to oppose us, if we think and learn and do (DuBois 1973, 77).

Nearing the height of his leadership of African Americans in the United States, DuBois was beginning to outline a different strategy for outflanking oppression than that articulated by the young Harvard school earlier in his career. Forty years of education and economic productivity among African Americans had done little to loosen white America's grip of race hatred and discrimination. As DuBois turned to organization as a key element in the liberation of African Americans, he wielded the same "weapons" with which he began his life's work, "grand ideas propelled by uncompromising language" (Lewis 1993, 4; DuBois 1968, 192; Wright 1978, 85).

DuBois exposed the asymmetry of power that marked U.S. Society with clarity. His was a hegemonic society in which
the Negro is not free. In the backwoods of the Gulf states, for miles and miles, he may not leave the plantation of his birth; in well-nigh the whole rural South the black farmers are peons, bound by law and custom to an economic slavery, from which the only escape is death or the penitentiary. In the most cultured sections and cities of the South the Negroes are a segregated servile caste, with restricted rights and privileges. Before the courts, both in law and custom, they stand on a different and peculiar basis. Taxation without representation is the rule of their political life (DuBois 1901, 364).

This was the environment for which the young professor at Atlanta University argued for schools as sites of empowerment.

DuBois understood the consequence of using "knowledge as power" to overturn an unjust social system. In 1901 he wrote "for education among all kinds of men always has had, and always will have, an element of danger and revolution, of dissatisfaction and discontent" (DuBois 1901, 361). Five years later DuBois stood before an audience at Hampton Institute and, in an unforgettable speech that antedated Paulo Freire's concept of conscientizacao, traced repressive educational policy to a "Great Fear." DuBois explained that "when a human being becomes suddenly conscious of the tremendous powers lying latent within him...he rises to the powerful assertion of a self, conscious of its might, then there is loosed upon the world possibilities of good or evil that make men pause" (DuBois 1973, 8-9).

DuBois' references to the dissatisfaction and discontent stirred up by education, the awareness of the power within an individual to alter social structures, are forms of a critical consciousness that Freire described as conscientizacao: "learning to perceive social, political, and economic contradictions, and to take action against oppressive elements of reality" (Freire 1970, 19).

DuBois identified the "Great Fear" as the dominant group’s aversion to the empowerment of the oppressed; Freire wrote of a "fear of freedom" expressed by the oppressed--that critical consciousness would lead to disorder. Both the oppressors motivated by the "Great Fear" and the oppressed paralyzed by a "fear of freedom" hold that it would be better for victims of injustice not to recognize themselves as such (DuBois 1973, 8; Freire 1970, 19-20). Freire concluded that the oppressed remain resigned to the structure of domination, and to adapt to it, as long as they feel incapable of withstanding the risks associated with the fight for freedom. He believed that oppressed often found the security of conforming to a state of unfreedom preferable to the consequences of a pursuit for freedom. This was the type of response that DuBois called to question in his 1903 essay, "Of Mr. Booker T. Washington and Others." Crediting Washington for possessing incredible insight on the emerging economic conditions at the turn of the century, DuBois nevertheless charged that "Mr. Washington represents in Negro thought the old attitude of adjustment and submission" (DuBois 1990, 42; Freire 1970, 32). DuBois countered Washington’s accommodationist strategy by arguing for empowerment through suffrage, civil rights, and education. In doing so, DuBois attacked the notion that the oppressive reality of Jim Crow was unchangeable. The ability to perceive oppression as a situation capable of transformation, a fundamental principle in DuBois’ and Freire philosophies, was held as a necessary condition for liberation (DuBois 1990, 44; Freire 1970, 34). DuBois defined education as the drawing out, the fullest and roundest development of one’s powers as a human being. Aware that such a process would incite "Great Fear" in the oppressors, DuBois became a forceful and constant advocate of education designed to empower African Americans and transform society. Speaking from the platform at Hampton Institute in the summer of 1906, DuBois justified his philosophy with the warning, "unless we develop our full capabilities, we cannot survive" (1973, 9-10).

DuBois’ argument for a systematic method of education for empowerment sharpened focus with his 1903 essay, "The Training of Negroes for Social Power," in which he called for the "training of youth to thought, power, and knowledge in the school and college" (1903, 413). Four years later he underscored the important role the public school would play in the twentieth-century battle over the color line, writing that the "public school is the greatest single thing that is going to solve the race problem" (DuBois 1907, 174). The education which would insure survival in a hostile environment and enable African Americans to dismantle the color line could not be narrowly conceived. Writing in the Crisis in 1912 DuBois urged readers to "educate your children. Give them the broadest and highest education possible; train them to the limit of their ability" (1912, 76). DuBois championed education not only to build up knowledge and strength among African Americans, but also as a means to enlighten white oppressors who acted, DuBois concluded,
from a position of ignorance.

The idea that education was essential to the process of liberation emerged in DuBois' support of public schools. In "The Negro Common School," DuBois urged national support for common schools in the South on this basis: "Race antagonism can only be stopped by intelligence. It is dangerous to wait, it is foolish to hesitate" (Lewis 1993, 221).

Less than four years later, as editor of the Crisis, DuBois pointed to the need for organization along with intelligence in the fight for freedom. The training ground had been expanded to include the entire community, but education remained the essential element in the struggle.

the great blow---the freeing of ten million---and of other millions whom they pull down---that means power and organization on a tremendous scale. The men who fight in these ranks must be educated and The Crisis can train them... (Lewis 1993, 494).

Although DuBois never expected the color line to fall in the United States at just one blow, his faith that white America would learn to respect African Americans dimmed during his years in Atlanta. Following the Atlanta race riot of 1906, DuBois noted that ten years of living in the South had convinced him that no amount of desert on the part of African Americans would induce white citizens to grant them equal rights (1974, 244, 254). By 1916 DuBois was convinced that disfranchisement and separate, unequal schools would characterize U.S. Society for several more generations (Lewis 1993, 469, 521). His "overworked theory" collapsed under the weight of evidence, mounting with every lynching and riot, that accomplishment did not bring an end to prejudice and discrimination. Racism in the North was not far removed from conditions in the southern states, causing DuBois to write in 1934 that the solution to the race problem was farther away than he had dreamed in his youth (1986, 1240, 1256). By 1935 DuBois was calling for action in "A Negro Nation Within The Nation" (1996, 436).

DuBois was attentive to race and class dimensions of oppression throughout the twentieth century but conditions during the Great Depression pushed economic reconstruction to the forefront of his thought. In 1936 DuBois argued that political freedom and power were dependent on economic organization (1985, 112; Marable 1986, 61). DuBois' call for organization within the African American community was not an acceptance of racial subordination nor was it a retreat from the ideal of cultural pluralism. It was, simply, a means of preparing a direct assault on the forces which maintained a rigidly segregated society. DuBois' most cogent writing on the school as a significant site of struggle emerged during this period.

By 1933, DuBois acknowledged "in my own mind some change of thought and modification of method" regarding segregated schools (1986, 1012). As a young scholar DuBois held to the notion that the evils of segregation and other forms of discrimination would fall away once African Americans were afforded access to full human development through education and the dominant class was faced with clear evidence of the social impact of oppression. Lewis writes that it was the "bitterest of revelations" to DuBois that "scientific truth, repeatedly broadcast, was apparently impotent to ameliorate collective behavior" (1993, 225). When it was clear that reason and humanitarian appeals for justice were ineffective in altering the racist social structure of the United States, DuBois turned to a new strategy for outflanking oppression. DuBois maintained that as long as "overwhelming public opinion sanctions and justifies and defends color segregation," African Americans must use the segregated workplace, churches, and schools to think, plan, and condition themselves for the fight against segregation (1986, 1256-1259). DuBois held this position consistently across the last four decades of his life, always explaining that this was not an argument against desegregation (DuBois 1996, 28; Marable 1986, 134). DuBois wrote with great power and intensity against segregation, calling it wasteful and undemocratic, an indictment of the hatred and prejudice leveled against African Americans in the United States. It was an illogical, distinct slap in the face of civilization which emphasized that the organization he suggested along segregated lines was no reason for giving up the fight against equality. DuBois' new approach represented a change in desegregation strategy, mandated by the conditions of U.S. society in the third and fourth decades of the twentieth century, not an abandonment of the principles he expressed earlier in the Crisis.

DuBois offered a concise articulation of his stand on segregated schools in the conclusion to his 1935 article, "Does the Negro Need Separate Schools?" In theory, he explained, the African American needs "neither segregated
schools nor mixed schools. What he needs is Education" (DuBois 1935, 335). All things being equal, the mixed school was preferable for a number of reasons. But in 1935 all things were not equal, and it was better for African American children to attend segregated schools where teachers respected the students' abilities to learn. DuBois' conditional preference of segregated schools was based on the understanding that schools could serve as sites of domination or empowerment. Any system of schooling which abused and discouraged the children was to be avoided. DuBois believed that restructuring schools to serve as sites of empowerment for African American students was essential to the struggle against oppression.

In "The Field and Function of the Negro College" DuBois supported African-centered education for its proactive potential. He championed the idea of an African American university by contrasting it with the notion of a French university. DuBois explained, with persuasive logic, that an African American university founded on a knowledge of African American culture and language was as valid as a university founded in France, using the French language, assuming a knowledge of French history, and committed to a study of the current problems of the French people. One was no more universal than the other; the expectation for both was that, from a starting point grounded in the experience of the students, the university expands toward all knowledge. DuBois described the process as "a matter of beginnings and integrations of one group which sweep instinctive knowledge and inheritance and current reactions into a universal world of science, sociology, and art" (1973, 93-95). DuBois was ready with an answer to those of his day who categorized the program as working against national unity. Was it not a program of segregation? It is, and it is not by choice but by force; you do not get humanity by wishing it nor do you become American citizens simply because you want to. . . [The program] does not advocate segregation by race, it simply accepts the bald fact that we are segregated, apart, hammered into a separate unity by spiritual intolerance and legal sanction backed by mob law. . . (DuBois 1973, 99-100). DuBois developed his endorsement of segregated African-centered education out of the understanding that schools were significant sites of struggle. He hoped to find a place from which African-Americans could carefully shape a future which might insure physical survival, spiritual freedom, and social growth (DuBois 1973, 99-100).

Upon reflection, DuBois considered "The Field and Function of the Negro College" as the beginning of a new line of thought. In this speech DuBois sounded the call for organization within segregated institutions as a vehicle for empowerment. "Therefore, let us not beat futile wings in impotent frenzy, but carefully plan and guide our segregated life, organize in industry and politics to protect it and expand it, and above all to give it unhampered spiritual expression in art and literature" (DuBois 1973, 100-102).

DuBois continued the theme of education for empowerment in 1935. Such education required sympathetic touch between teacher and student; knowledge on the part of the teacher of the individual taught and of his or her surroundings, background, and history; and contact between teacher and student, and among students, on the basis of social equality (DuBois 1935, 328). He encouraged educators in African American schools to develop a curriculum and style of teaching that would help students claim their own power and ability. African American students ought to study, from their own point of view, African and African American history, particularly the history of the slave trade, slavery, emancipation, Reconstruction, and twentieth-century economic development. He called for curricular revision in the social sciences, the arts, and the sciences to counter the racist intellectual propaganda emanating from elite colleges and universities (1935, 332-334). The task DuBois laid out for scholars was not to replace white dominance in the academy with black dominance, or as he stated, "to parallel the history of white folk with similar boasting about black and brown folk" (1935, 334). His charge prompted scholars toward an honest evaluation of human effort and accomplishment, one stripped of white-supremacist notions. DuBois' educational paradigm indicated that a teacher should start with experiences and knowledge central to the students' culture, but to expand to encompass all knowledge. His ideas were echoed in Molefi Asante's definition of centricity: a perspective that involves locating students within the context of their own cultural references so that they can relate socially and psychologically to other cultural perspectives. . . . A person educated in a truly centric fashion comes to view all groups' contributions as significant and useful (1995, 339).

African-centered pedagogy in segregated schools represented the educational complement to DuBois' call for
economic organization along race lines in the 1930s. Both efforts required an exercise in what DuBois called race pride-teaching African Americans that they had established an historical record of which they should be proud, "that their history in Africa and the world is a history of effort, success and trial, comparable with that of any other people" (1996, 76).

For DuBois, critical thought was the vehicle through which the future was to be shaped. Criticism was at the center of DuBois' philosophy tying education to social democracy, just as it lies at the heart of critical pedagogy. The meaning of criticism that DuBois outlined in his 1903 challenge to Washington became the hallmark of his efforts against injustice (1990, 39).

But the hushing of the criticism of honest opponents is a dangerous thing. . . . Honest and earnest criticism from those whose interests are most nearly touched. . . . Is the soul of democracy and the safeguard of modern society.

At the age of 92 DuBois spoke before the twenty-fifth Conference of the Association of Black Social Science Teachers in Charlotte, North Carolina. He sketched a program of action leading to social equality in the United States, an existence unmarred by discrimination against African Americans and their cultural patterns. His long-held goals were to eliminate color discrimination completely and to preserve African history and culture in the process. DuBois called for children to be educated in African American history and culture, urging families and community organizations to carry the responsibility until public schools revised the curriculum. He called for widespread study of political economy and the media to shake loose the control of hegemonic structures.

DuBois held to the notion that education was essential to the process of liberation throughout his life. His recognition that schools were significant sites of struggle fueled his determination to make segregated schools centers of empowerment, even as he despised the principle of segregation itself. DuBois pointed to the danger of schooling children to submission decades before the NAACP battle against segregation was won in the courts and African American children faced this very situation in public schools.

Critical pedagogy is practiced by those who commit themselves to the fight against injustice and oppression. In this, admittedly partisan, endeavor, teachers and students can learn from the life and work of DuBois, one whose "greatest virtue was his committed empathy with all the oppressed and his divine dissatisfaction with all forms of injustice" (Martin Luther King, Jr, quoted in Marable 1986, 217).

Ivan Illich as Deschooler: A History of the Center for Intercultural Documentation

Pat Inman
Northern Illinois University

In 1970 Ivan Illich published his radical criticism of compulsory schooling, Deschooling Society. It is this work for which Illich is most well known. This series of essays was the result of a collaboration with Everett Reimer dating back to 1967 when Reimer and Illich met regularly at the Center for Intercultural Documentation (CIDOC) in Cuernavaca, Mexico. Their ideas were refined through Wednesday morning discussions during the spring and summer of 1970 along with Paulo Friere, Peter Berger, John Holt, and Paul Goodman.

While Illich had written of the dangers of dependence upon institutionalized values which "leads inevitably to physical pollution, social polarization, and psychological impotence..." it was at this time that he developed his thinking further regarding institutionalized knowledge production (Illich 1970, 1). He carried this idea one step further when he concluded that compulsory education was actually harmful in that social reality was shaped and reinforced through school's curriculum, which stressed dependence on expert knowledge and institutions. One example is that technocrats define poverty through their standards of consumption which they change at will. Defined in this manner, poverty refers to those "who have fallen behind an advertised ideal of consumption in some important respect" (Illich 1970, 4).

While the poor have always been socially powerless, Illich states that compulsory schooling increases their impotence as "increasing reliance on institutional care adds a new dimension to their helplessness" (Illich 1970, 4). Further, as formal education itself increasingly comes to be viewed as a necessary commodity, the gap between social classes widens as those who are able to afford it consume a greater number of years. The mere existence of school is viewed by Illich as disabling as the poor no longer take control of their own learning. But Illich's greatest concern with the hidden agenda of consumption within schools was the modernized poverty of spirit experienced by all classes in society. Illich feels that this spiritual poverty is the result of an educational system which creates false needs. Economic expansion deprives both rich and poor of their freedom and power to act autonomously; to live creatively. Illich believes that this confines humanity to survival through market relations. Even knowledge becomes a commodity that not all can afford. So what action must be taken if we are to restore dignity and autonomy to the learner? Illich states:

The current search for new educational funnels must be reversed into the search for their institutional inverse: educational webs which heighten the opportunity for each one to transform each moment of his living into one if learning, sharing, and caring (Illich 1970, v)

Such an educational system would have three purposes:

1. provide all who want to learn with access to available resources at any time in their lives.
2. to empower all whom want to share what they know to find those who want to learn from them.
3. to furnish all who want to present an issue to the public with the opportunity to make their challenge known (Illich 1970, 75)

The founding of the highly controversial Center for Intercultural Documentation in Cuernavaca, Mexico by Illich was the result of just such an unconventional educational approach. Established in 1961, CIDOC was part language school, part conference center, part free university, and part publishing house. An extension of a previous missionary training center in Puerto Rico, it was designed to keep all but the most progressive missionaries away. As it evolved, CIDOC became an oasis for the free exchange of knowledge and experience. This paper will trace the history of this educational endeavor which existed well ahead of its time, discuss the irony that such a progressive site of learning should emerge in a country which has produced one of the world's most reactionary brands of Catholicism, and review several of the criticisms which have been leveled of CIDOC. The use of Illich's publications, secondary sources, CIDOC documents and publications, interviews with CIDOC students and instructors, as well as tapes from the Canadian Broadcasting Corporation and Illich acquaintances provided the base of my research.

One cannot discuss the history of CIDOC without first looking into the background of its founder. Illich was born on September 4, 1926 in Vienna, Austria to Ivan Peter and Ellen (Regenstreif-Ortlieb) Illich. His father, a diplomat from an aristocratic family, was a Roman Catholic Croatian. His mother was from a Sephardic Jewish family that originated in Spain before settling near Heidelberg. Illich was an honor student at the Piaristen-gymnasium in Vienna.
from 1936 until 1941, when in accordance with anti-Semitic laws imposed by the Nazi occupiers the family left the

country. At that point the Illich family stayed mainly in Florence and Rome. In Florence, Illich enrolled in the university,
obtaining his degree in chemistry. After the war, he obtained a Ph.D. in history at the University of Salzburg and studied

philosophy and theology at the Gregorian University in Rome, where he prepared for the priesthood. It was here that

he met a man who was to become his mentor and friend, the French Catholic philosopher, Jacques Maritain who "laid
the Thomistic foundations of my entire perceptual mode" (Illich 1989, 3). This implied that rational thought was not
complete without spiritual grounding. St. Thomas affirmed the value of the individual in its subjective contribution. In
years to come Illich would echo this in his critic of societal institutions.

After his ordination in 1951, Illich's superiors in Rome groomed him for a career in canon law or the Vatican
diplomatic service. He attempted to escape the papal bureaucracy by working on a post-doctoral thesis in New York
City. On his first evening in the city, he overheard friends of his grandfather making disparaging remarks about the
influx of Puerto Ricans. Intrigued, Illich spent the next two days in the barrio beneath the tracks of New York Central,
where they had their market. His fascination with the Puerto Rican culture gave an entirely new direction to his life and
two days later Illich went to Cardinal Spellman's office and asked for an assignment to a Puerto Rican parish. Cardinal
Spellman, then Archbishop of New York, assigned him to assist the pastor of Incarnation Church in the Washington
Heights section of Manhattan. Formerly a parish consisting of Irish-Americans, Incarnation's character was rapidly
changing with the migration of Puerto Ricans. The older immigrant populations, the Irish, the Italians, and the Jews,
were reacting to the Puerto Ricans with the same prejudice which they had experienced.

Illich soon became aware that the American church ignored the Puerto Rican culture when considering its
policies and practices. He felt that by doing so one missed out on a great richness which would have enhanced
perspectives and, consequently, lives. Illich revolutionized the archdiocese's approach to the Puerto Rican "problem."
During his yearly vacations he steeped himself in the culture. He walked, rode horseback, and hitchhiked all across
Puerto Rico. After one such trip he wrote:

The first Mass I said at about six in the morning, after I had slept on the alter steps of the chapel. Then
I traveled on, by horseback, to the next chapel. I heard confessions, baptized, married, and off I went
to the third chapel, still on horseback, where I arrived after noon (Gray 1970, 44).

More importantly, Illich's philosophy of cultural humility provided a whole new perspective for missionaries
and ministering among minorities in the U.S. His intent was to convince the missionaries to relinquish their messianic
intentions and to replace them with "intercultural sensitivity." Illich explains:

Missionary Poverty is the core of missionary formation. The development of a missionary spirit will
have to start from an analysis of the concept of spiritual poverty of Ignatian indifference, or
detachment. Intellectual formation in the social sciences, or linguistic studies for the missioner must
be seen as an occasion and even as a means for development of a specific form of spiritual detachment
and freedom for contemplative love corresponding to his very personal vocation (Illich 1962).

Illich felt that an American priest working with a foreign population should cultivate a spirit of "total cultural
indifference, a beatitude of cultural poverty." In his unorthodox service to his parish, Illich cut through all formalities
in order to meet the needs of the communicants. His deep respect for the Puerto Rican culture resulted in a mutual
reverence of his parishioners.

In 1956, realizing Illich's insights and practice might be used to foster a bridge between America and Latin
America, Cardinal Spellman agreed to Illich's appointment as vice-rector of the Catholic University of Puerto Rico,
where he was to start a pioneering center for the training of American priests. While Illich and Spellman often disagreed
on central issues, over the years theirs was a relationship of deep respect. The training center's purpose was to steep
American priests in various aspects of Puerto Rican and Latin-American culture.

He made them (the future missionaries) live on the simplest of native diets, inspired them to travel to
the wildest mountain regions of Puerto Rico on foot and horseback, and grilled them with cross-
examinations worth of a Jesuit novice-master (Gray 1970, 44).

Throughout his stay in Puerto Rico Illich aroused local ecclesiastical resentment by insisting that Mainland-
born clergy and religious were imposing North American style of Catholicism on an Hispanic culture. After a particularly bitter dispute between the Most Rev. James McManus, the mainland-born Roman Catholic Bishop of Ponce, Illich was forced to end all of his work in Puerto Rico. He returned to New York determined to lessen cultural ignorance and increase professional competence of North American and European Roman Catholics intending to go to the aid of Latin America.

Under the initial sponsorship of Fordham University, Illich founded the Center of Intercultural Formation, from which sprang the center in Cuernavaca, Mexico soon to be known as the Center for Intercultural Documentation or CIDOC. Established in 1961, its opening coincided with the launching of the Alliance for progress as well as the call the Pope issued to the North American Church to send ten per cent of its personnel—or about twenty thousand priests and religious—to Latin America in order to alleviate the critical shortage of clergy in that region.

Illich saw an ominous conjunction between the two projects. Illich's CIDOC—part language school, part conference center, part free university, part publishing house—was designed not so much to train missionaries as to keep all but the most progressive of them away (Gray 1970, 46). For several weeks after his return to New York, Illich studied a map of Latin America, searching for "a valley with an excellent climate, with a town not more than an hour away from a great library and a good university, where housing and food would be cheap enough to accommodate many students" (Gray 1970, 46). He flew to Santiago, Chile, and proceeded to walk and hitchhike to Caracas, Venezuela—a distance of three thousand miles. South America provided no valley fitting Illich's specifications so he continued his search northward, settling in Cuernavaca, Mexico about fifty miles south of Mexico City. Illich also found support in the bishop of Cuernavaca, Bishop Mendez Arceo, who a year after Illich settled in Cuernavaca emerged as the leader of the Second Vatican Council's ultra-progressive ecumenical wing.

CIDOC became Illich's anti-school, which existed as a source of criticism for existing secular orthodoxies of development. Under the shadow of the Popocatepetl Volcano, a small permanent staff, a handful of visiting scholars, and a few hundred students a year. It seems ironic that such a center existed in one of the most powerful and reactionary theocracies in Latin America. The Mexican Church had long aligned itself with wealthy landowners and "sought alliances with numerous foreign powers that periodically invaded the country to combat its movements of liberation" (Gray 1970, 47).

Ms. Valentine Borremans directed the courses in all aspects of Latin American life. CIDOC had a 15,000-item research library which included unparalleled collections of religious history and the relationship between value systems and social change. Above all, the center was the locus of discussions among intellectuals of all political hues from all continents on subjects ranging from poverty to guerrilla insurrection. While discussions were open, Illich made it clear that CIDOC was not to be used as a base for insurrection. While Illich is viewed as a progressive, he insists that a priest must abstain from direct political action. Lee Hoinacki, a close friend of Illich's states:

The people who defined us a some sort of enemy usually knew nothing about what we were really doing. There were these illusions people had about what was going on there, and people seemed to operate in terms of those illusions in their estimation and in their actions against us (Hoinacki 1989, 6).

Accordingly, the papal bureaucracy viewed Illich's center as a threat and in June 1968 called Illich to Rome for an inquisition about his rumored subversive activities. Soon after, the Vatican declared CIDOC off limits to priests, nuns, and other religious. In response to these allegations and sanctions, Illich decided, in 1973, that it was time to dismantle CIDOC.

I had come to the conclusion that all that I wished to achieve and that could be done had been done. That because of the funny image created, the physical danger to my collaborators had become something which it was difficult to take responsibility for. You must think what Latin America was at that moment. And I also understood that the place would not be able to save itself from university-like institutionalization. Stanford, Cornell, and some other universities had groups of three or four professors each who wanted to take over that place, which would have meant that the 63 people who
under the leadership of Valentina Borremans actually ran and made the centre, none of whom had a
college degree, most of whom had not finished elementary school, would be replaced by a new bunch
of internationals (Illich 1989, 15).

Illich also perceived changes in the Mexican economy. The center had been run on the surplus generated by the well-
known language school and that depended on CIDOC's being able to charge American prices while paying Mexican
wages. The post-OPEC oil boom threatened this arrangement. Illich called together his staff of sixty-three and made
a proposal. He convinced the staff that for whatever time it took, the income expenditure would not be spent on the
purchase of new materials or airplane tickets for requested speakers, but instead would go into a fund. When the fund
had reached one and a half times the salary mass of a year, it would be divided into sixty-three equal parts and the
institution would be closed. This happened on CIDOC's tenth anniversary, April 1976, with a huge fiesta at which
hundreds of people from town were present.

Those involved with CIDOC dismantled the institution with a sense of acceptance. "The rapid changes in the
very fluid program are at once the great asset of this contemporary program as well as the source of much criticism"
(Yuasa 1967, 1). Beyond acceptance, Illich advises one to celebrate the mystery and surprise of perpetual renewal. Illich
related, "The Center is like a party. It is a group of people who have rather unusual competencies living here together
within a house with more rooms than we can use. So we invite guests" (Illich 1967, 11). CIDOC represented a
commons where inspired individuals united in the organic generation of knowledge. The joyful detachment from
permanence and limitations provided the strength for this example of institutional creativity.

Illich is an idealist. He views planning as a new species of the sin of presumption. For Illich social
transformation will result from the instinctive connection of self-actualized individuals within a commons rather than
planned or managed political action. This is where Illich departs from other more pragmatic social critics. It is
impertinent that we provide for this commons and that we accept on faith that if we use learning to find our authentic
selves, creative possibilities will be optimized in social transformation.

We must discard our cynicism which does nothing but limit our possibilities and we must restore our faith in
the spontaneous affiliation of inspired individuals. Education viewed in this manner becomes a search for self, and this
enriches a society in a constant state of renewal. Illich believes that dependence upon institutionalized knowledge
production not only limits human possibilities, but stupefies participants as they are convinced of their inadequacy and
need of professional educators. Michel Foucault refers to this institutional promotion as "pastoral power" (Foucault
1980).

Power for Illich resides in the acceptance of "radical powerlessness" as we exist in the present and its creative
possibilities. This flies in the face of today's teacher education so heavily weighted in technique and prescription. Illich
feels that as educators we must provide for the mystery and surprise which spontaneity provides. This describes the
foundation provided by the Center for Intercultural Documentation.

program structures of a recently established center in Latin America." Cuernavaca: CIDOC document.
Charles Spurgeon Johnson (1893-1956) was a sociologist, race relations expert, and the first African American president of Fisk University in Nashville, Tennessee. He founded the Fisk University Race Relations Institute.

This essay seeks to recognize his efforts as a pioneer in the struggle for social justice and to illustrate that African Americans did not have a monolithic view of how to deconstruct America’s discursive structural relations. While some African American leaders depended on educating and empowering individuals as a means of challenging the oppressive pillars that hindered African American progress, Johnson relied on utilizing social research to deconstruct structures that promoted the mental and cultural inferiority of African Americans.

Racial unrest was rampant in the United States during the 1940s. In 1943 alone, major race riots and revolts broke out in Mobile, Beaumont, Los Angeles, Detroit, and Harlem. This racially-based violence focused the country’s attention on race relations and showed that racial tensions were not confined to the south. Johnson was at the forefront of examining the decade's tensions.

Born on 24 July 1893 in Bristol, Virginia, Johnson was the eldest of 5 children born to a college educated Baptist minister and a homemaker. Upon completing the African American primary school in Bristol, Johnson went to Wayland Academy, the preparatory school of Virginia Union University in Richmond. He stayed on at Virginia Union for college and received his A.B. degree in 1917. Upon graduation Johnson went on to graduate school at the University of Chicago where he met his mentor Robert E. Park. Park put Johnson into contact with the Chicago Urban League.

At the Chicago Urban League Johnson began his career in race relations by "interpreting colored people to whites and white people to Negroes, Southerners to Northerners, rustics to city dwellers; analyzing people's problems so that they [could] understand themselves" (Embree 1944, 48).

Johnson's return to Chicago also coincided with the violent Chicago Race Riots of 1919. Aware of Johnson's work in race relations, Illinois Governor Frank O. Lowden appointed Johnson Associate Executive Secretary of the Governor's Commission on Race Relations. The commission, comprised of Johnson and an interracial group of researchers, investigated the social and economic reasons for the riots. Johnson served on this commission until 1921 and published the results of the study in 1922 in *The Negro in Chicago: A Study of Race Relations and a Race Riot*.

After such experiences, in 1921, Johnson moved to New York to become head of the National Urban League's research department. There he started the organization's monthly publication *Opportunity* which published issues of race relations and showcased the literary works of African Americans. In 1928 Johnson left the National Urban League to establish and head the Social Sciences Department at Fisk University. Johnson performed several jobs at Fisk. These included serving as professor of sociology, director of the Social Science Department, and head of the Social Science Institute that later to became the Race Relations Department. From 1930 and 1943, Johnson wrote 8 books, co-authored another, and published numerous articles.

Johnson continued to work in the field of race relations with well-known philanthropic organizations like the American Missionary Association of the Congregational Church (AMA), and the Julius Rosenwald Foundation. During the 1940s as racial conflicts became more violent and frequent, the AMA set its sights on entering more directly into race relations.

In 1942 the AMA set up a special department of Race Relations at Fisk University. In an article written around 1943 for the June *Herald*, Johnson wrote that the AMA's intent was to establish a "non-institutional ministries of reconciliation in communities of acute Negro-white tension in the United States" (American Missionary Association Papers, box 243, file "Other Records: ca 1943). Confident of Johnson's ability in the area of race relations, the AMA selected him to direct their endeavor. During the 1940s Johnson and his staff, known as "The Common Ground Workers", worked as advisors to authorities in Detroit, Chicago, San Francisco, Los Angeles, and other cities in the North and West that were experiencing racial tensions. He also conducted a month long race relations seminar for
Chicago city officials during February of 1943. The seminar had drawn over 150 city officials and about 400 citizens (American Missionary Association Papers, box 243, file "Other Records: ca 1943).

The Rosenwald Fund, established in 1917 by Julius Rosenwald, president of Sears, Roebuck and Company, was also interested in directly entering the field of race relations. The fund was incorporated in Illinois as a non-profit organization concerned with the well-being of mankind (Embree and Waxman 1949, 28). By 1948, when the Rosenwald fund ended, it had partially funded some 5,000 schools for African Americans (Embree and Waxman 1949, 42). From 1928-1948 the Rosenwald Fund had also donated $1,832,820 for 1,537 fellows of which 999 were African American (Embree and Waxman 1949, 28).

Johnson drew upon his affiliations with Fisk University, the AMA, and the Rosenwald Fund as he sought solutions to the racially tense times. Johnson was an adamant believer that "scientific" theories connecting race and intelligence negatively influenced American society. They contributed to the feelings of racial superiority and discriminatory myths reinforcing white beliefs that African Americans were mentally and culturally inferior. In a 1923 article, "Public Opinion and the Negro," Johnson argued that a long line of white scientists had based their conclusions about the African American's inferiority on faulty beliefs and research (Johnson 1923, 201-206). Johnson targeted this research at the Fisk University Race Relations Institute. He dedicated his "laboratory of social action" to training future social scientists, promoting research on minorities, and providing a place where research could be discussed and disseminated (American Missionary Association Papers, box 243, file "Other Records: ca 1943").

The 1942 prospectus for the Fisk University Race Relations Institute illustrates Johnson's basic premise that the training of social leaders had to take place in an environment of active research about race relations. Together, these were constructive social action methods (Charles S. Johnson Papers, Amistad, box 28, file 4). Although there was an increase in race and culture consciousness throughout the world, Johnson and the Institute's organizers contended that Americans lacked the social and moral unity to correct domestic injustices. This unity, they believed could only come through "intelligent direction by specialists trained in the social science of human relations" (Charles S. Johnson Papers, Amistad, box 28, file 4).

It is important to recall that Johnson believed pseudo scientific theories about the intellectual and cultural inferiority of African Americans contributed to the discriminatory practices and racial tensions. Thus, Johnson utilized social science researchers to gather and present accurate information on African Americans. He believed this evidence would, in turn, combat the negative scholarship of the day and thereby promote racial tolerance.

In the prospectus for the Institute, it's evident that Johnson organized the program to utilize social science research as a tool for alleviating racial tensions in a "laboratory of social action". The first section concentrated on training in the social sciences. Here, provisions were made to ensure that undergraduate and graduate students would be a part of the cooperative program. Doctoral students were encouraged to spend a year as research fellows at the Institute to gain research training and experience while working on dissertations. Master's students would receive Training Fellowships enabling them to conduct research on various minority group relationships that culminated in a Master's theses. Undergraduate students would be encouraged to enter the field through tuition waivers and honor's courses. This coordinated approach provided a body of knowledge and a group of trained personnel (Charles S. Johnson Papers, Amistad, box 28, file 4).

The second major operating section focused on research in the social sciences. Here, current research was exchanged and provided to participants of the Institute. The third major operating section of the Institute concerned social action. This covered methods and techniques in dealing with racial tensions, as well as community planning. The director of the Institute named representatives from each section to serve on an executive committee which were responsible for integrating the policy and work of the program (Charles S. Johnson Papers, Amistad, box 28, file 4).

The head of each section was a specialist with university faculty status. This was required so that the developing information would be related to Fisk's program.

Four basic areas were addressed in the research and social action areas of the Institute: (1) race and racial theories, (2) racial aspects of social problems, (3) methods, techniques and community planning, and (4) the role of
personal religion in human relations and democratic practices. The four areas were covered daily during eight hours of lectures, seminars, and discussion groups led by thirty-six resident lecturers and consultants. The program ran for 3 weeks on the Fisk campus to promote interracial contact and group exchange (Charles S. Johnson Papers, Amistad, box 28, file 4, 2).

A program announcing the Third Annual Institute advertised that the workshop was divided into 5 basic types of sessions called "methods of study": panel round-tables, seminars, cross-topical round-tables, consultations hours, and evening lectures. The evening lectures were a special feature of the program offered in the Fisk Chapel and open to local people who couldn't attend the entire Institute (Race Relations Department Papers, box 34, file 35).

Johnson asked leading scholars and specialists to come to share their findings at the Institute. Several news releases show that, on average, 90 lectures per workshop by invited scholars and specialists were given during the first few years of the Institute. Later programs averaged 40 lectures (Race Relations Department Papers, box 50, file 22; box 54, file 24; box 62, file 22).

Some luminaries were psychologist Gordon W. Allport of Harvard University, psychologist Kenneth Clark of Queens College New York City, Thurgood Marshall of the NAACP, and Hilda Taba of the University of Chicago (Race Relations Department Papers, box 38, file 10; box 50, file 22; box 54, file 24; box 62, file 22).

Although W.E.B. DuBois had been invited and did participate in another race relations project directed by Johnson's in the north, DuBois did not attend the Fisk program. Robbins notes that Johnson felt it too risky to invite W.E.B. DuBois and Adam Clayton Powell, Jr. to Fisk given the implacable hostility toward Fisk by the white power structure in Nashville. Martin Luther King, Jr. attended the 1956 Institute and spoke on the Montgomery bus boycott, which was going into its ninth month (Robbins 1996, 123).

The first Institute, held on 3 July through 21 July 1944, had 137 registered participants from nearly all the southern states, with whites outnumbering blacks about 8 to 5 (Robbins 1996, 122). The Eighth Annual Program Announcement shows that by 1951 over 800 participants from 200 communities in 36 states and 6 foreign countries had attended the Institute (Race Relations Department Papers, box 47, file 1). The initial program ended in 1969.

News release show that on average 125 participants attended the program each summer (Race Relations Department Papers, box 50, file 22; box 54, file 24; box 62, file 22). A program from the Third Annual Institute also shows that full participation in the 3 week workshop carried 3 semester hours of credit at Fisk and was priced at $61.75. Those participants who could not be in attendance for the full 3 weeks session could attend sessions at their convenience for an adjusted fee. Evening lectures were also offered for those who could not attend because of jobs. Participants lived in an integrated setting on campus in the residence halls and university houses (Race Relations Department Papers, box 36, file 1).

Evaluations from participants of the first Institute indicate that they were pleased with their experiences and welcomed the opportunity to gain information on racial issues. One participant believed that there were Americans who were "geniuiely [sic] interested in improving race relations but who [did] not have the time to search for the sources of information that would be necessary to improve their understanding of the problem." Others praised the program for using a scientific approach to deal with the issues of racial tensions and allowing them to explore one social field objectively (Race Relations Department Papers, box 34, file 35).

Several participants, however, expressed concern over the Institute being geared more towards the scholarly community, rather than the community at large. One student complained that the audiences were composed of "a very exclusive group" of "intellectuals." He wanted the program to involve a broader range of people. Another participant noted that the Institute's usefulness depended on reaching "a larger mass of people who [were] not professionals or who [did] not claim any scholastic standards" but had "tremendous influence in urban affairs." Thus they called for people from barber shops, churches, and school rooms (Race Relations Department Papers, box 34, file 35).

Although the Institute was the first of its kind in a Southern university setting, it was not the only organization where interested persons of all races could meet to discuss issues of social change. Highlander Folk School, established in Monteagle, Tennessee by Myles Horton in 1932, had turned its attention during the 1940s toward strengthening its education programs so that the area's poor -- African American and white -- could fight social oppression (Glenn 1988, 1315).
Seeking Racial Tolerance
Sanders

129-30; Payne 1995, 70).

The Institute differed from Highlander in many ways. Whereas the Institute's basic philosophy held that research could be used as a social action method, Highlander's philosophy held that common oppressed people could produce that change for themselves; or as John Egerton puts it, "that ordinary working people, no less privileged, could find within themselves and their neighbors the solutions to whatever problems they faced" (Egerton 1994, 161). Because of its faith in the oppressed, Highlander sought to bring in leaders like Rosa Parks and Martin Luther King, Jr. to share their experiences with participants (Payne 1995, 71).

The Institute also differed from Septima Clark's citizenship schools, which Highlander spread across the South. Although the citizenship schools used workshop formats, they concentrated on utilizing the culture of the oppressed to help them learn to read and write. For example, while the Institute held workshops on theories of race and race relations, the citizenship schools held workshops on teaching people to write money orders, or fill out voter registration forms, or use sewing machines. Again, like Highlander, the goal of the citizenship schools was to empower the oppressed so that they could in turn help themselves. As Payne points out the schools often discussed what he called the "big" ideas like "citizenship, democracy, and the powers of elected officials" (Payne 1995, 71).

The Fisk University Race Relations Institute relied upon scholars and the social sciences to build racial tolerance and change social policies by providing an arena where current research impacting race relations could be studied, presented, and discussed. Although some may criticize the Institute's theoretical approach, Johnson saw it as the best way to challenge and refute the "scientific" evidence that contributed directly to the oppressed status of African Americans and indirectly to racial tensions.

Realizing that improving race relations was a difficult task and finding definitive methods even more illusive, Johnson believed that there were at least principles that could be followed. In his eyes, the Institute provided those principles as it utilized trained researchers and specialists in a laboratory of human relations to disseminate factual information to community leaders.

References
Learning a second or foreign language is a long, complex, time-consuming, and, at times, frustrating experience. Many individuals share the experience that after having studied a language for several years they are unable to hold a conversation in a second language setting. Acquiring a second language for communicative purposes (Basic Interpersonal Communication Skills [BICS]) takes two to three years and for academic purposes (Cognitive Academic Language Proficiency [CALP]) six to seven years (Cummins, 1980). Researchers have constructed models and teaching methods for acquiring a second language with the intent of accelerating and optimizing this process and having better outcomes. One approach to enhance the acquisition of a second language has been through embedding strategy training into the curriculum, either as daily practice or in special sessions. The idea of strategy triggers the notion of better ways of solving problems to achieve goals.

Unfortunately, strategy has become one of those terms that everybody uses indiscriminately. Seliger clearly describes this situation:

> We have reached a point of semantic satiation with regard to the term 'strategy' and in many ways the term itself has become empty of any distinctive content. To call everything we observe in second language acquisition a strategy, divests the term of meaning. Everything to which the term is attached appears to have the same importance or psychological status in the hierarchy of events that lead to acquisition (1991 36).

Indeed, the meanings conveyed by this term vary in essence and reference. Strategy is used to convey more than thirty-five ideas such as an activity, a skill, a technique, or a process. In spite of this lack of agreement, the idea of using more effective and efficient ways to teach and to acquire a second language are still germane for investigators, teachers, and learners.

Individuals who need to master a second language frequently have time constraints, especially those who need to achieve superior proficiency levels, for example, learners acquiring the language to teach it, or learners who are studying content in the target language. These individuals, in many (if not most) instances, are still acquiring the language while they are already performing academic or professional tasks and competing with native speakers of the language. Teachers with inadequate proficiency levels may provide students with impaired input. Many second language learners acquire knowledge through a still developing language which translates into limitations to understand lectures or group discussions, or to take good lecture notes. In addition, they have difficulties in memorizing information, expressing or elaborating ideas appropriately, and writing smoothly and cohesively (Harrington and Sawyer 1992). They spend long hours in completing simple assignments. Hence, learners need mechanisms to help them compensate for their language and cultural limitations. Teachers need more effective methodologies to enhance learners' language development and to help learners surmount language limitations that interfere with communication, comprehension, and/or acquisition of knowledge. All these needs can be in part satisfied by employing strategies.

Strategies used in second language help handling breakdowns in communication and are useful means of maintaining interaction among second language learners, especially in situations where students run short of appropriate linguistic resources (Tarone 1983). In other words, strategies help compensate for the lack of language resources and obtain cognitive academic skills. These strategies can enlighten, inform, and guide teaching and learning across the curriculum. Learners may monitor their own learning if they are aware of their own cognitive processes, which helps them to learn better, more efficiently, and to become autonomous and critical learners sooner (Wenden 1987). Further, using strategies in learning and instruction promotes the achievement of one of the ultimate goals in education: produce independent, effective, and critical thinkers. If students monitor their knowledge and use it wisely and purposefully, they would deem learning as a much more interesting endeavor and, in turn, achieve higher levels of proficiency faster.

I wanted to explore the development of the numerous connotations that the term strategy/ies has had from 1960 to 1997 in second language teaching and learning. I thought that searching through these publications I would find a picture of what has happened to the meaning of this term since it was incorporated into second language literature.

The overwhelming number of publications on this topic made it difficult to analyze and categorize the various
Meanings of Strategy in Second Language
Cavour

meanings given to this term. From 1965 to 1997, the word strategy was part of the title or the focus of 65,698 articles stored on the Educational Resources Information Center (ERIC), out this number, 8,360 refer to second language strategies directly. This number would substantially increase if all the other publications (i.e., books, chapters in edited books, and dissertations) not recorded by ERIC were added. In the 1960's there was a handful of publications on this topic. In the 70's and 80's the number of publications increased exponentially. In the 90's, this trend did not slow down, as it can be inferred from two recent publications. Caverly and Orlando reviewed 114 experiments related to the use of four strategies, 31 publications exploring the effect of using the strategy "underlining"; 30 on "note taking"; 27 studies on "outlining and mapping," and 26 on "SQ3R" (1991). In the International Reading Association, Annual Summary of Investigations Related to Reading, 71 investigations out of 454 had either the term "strategy" or the term "strategies" in the title (1997).

Since a comprehensive and thorough review of the existing literature on strategy is an almost impossible task, I decided to review one hundred publications. I developed some criteria to select them to reflect the salient directions research has taken while defining, identifying, determining effectiveness, and teaching strategies. The criteria I used were as follows: I took the first ten published articles on strategy in second language literature. Then I selected fifteen publications for the 70s, 80s, and 90s that were written by widely cited authors. Finally, I randomly chose fifteen publications for the 70s, 80s, and 90s and looked for the influence of major researchers and to check for novel ideas or new trends.

In the first part of the twentieth century, there were scattered publications dealing with strategies in the field of education. These writings were concerned mainly with educational programs or administrative issues. In the 1940's and 1950's some new trends in theories of learning and linguistics started to evolve. Focus on the learners and on their covert cognitive processes became central to some models. Strategies were components of those models and discussed as such. In the 1960s, they became the focus of some studies, and consequently the first publications, authored by psychologists, on 'strategy' related to learning and instruction appeared. At this time, the meaning this term conveyed was that of an innovative way of doing something, e.g. using mnemonics to retain more words. In 1965, researchers embarked in the investigation of the use of strategies in second language teaching and learning.

In the 1960s strategy was not defined; it was brought into the classroom to mean effective classroom activities, techniques, and methods. Asher, a psychologist, and his colleagues used the term strategy in the title of a series of publications to refer to his method known as 'total physical response,' or TPR (1965, 1966). Records indicate that he was the first researcher who used this term on a second language publication. From the ten publications for this decade, 20% were related to second language teaching, i.e., classroom activities. Another 20% were related to second language vocabulary learning, 20% to language programs and policies, 30% to mental processes, and 10% to question the assigned meaning of this term in educational circles.

Throughout the 1960s, authors used the word "strategy" in different ways. For example, Atkinson and Shiffrin regarded strategies as memory processes (1968). Not mnemonics, but the processes that the brain engages in to store information in long term memory. Guszack in an analysis of teachers' questions to enhance comprehension, claims that: "Questioning strategies suggest carefully planned questioning tactics;" elsewhere, he states that there is no evidence that teachers engage in this careful planning and decides to call these teachers' behaviors "patterns rather than strategies" (1969, 111).

Although the number of publications on strategy in the sixties is small compared to the next 20 years, the field was already broadly using and discussing about this topic. Still rooted in the traditional military term, the term 'strategy' had three main connotations, (1) a sound teaching activity, technique, or method; (2) functions or brain information processes or behaviors; and (3) programs or policies.

In the 1970s, research on strategy in second language settings boomed. Over two thousand investigations and theoretical papers were published. Inquiries into the trends of the 1960's continued to occur, but a quite significant number of trends and meanings were added. The surge of new sciences, e.g., psycholinguistics, neurolinguistics, and artificial intelligence, highly contributed to this increase. For instance, the areas of 'error analysis' and 'interlanguage' opened the door to new meanings. Researchers focused on learners' errors as a way to explain the cognitive processes
involved in second language acquisition. For Burt and Dulay, strategies were behaviors and/or techniques learners use to deal with language difficulties (Burt 1975, Dulay and Burt 1972). Twenty-three percent of the publications for this decade indicated that strategy was a systematic technique employed by a speaker to express his/her meaning when faced with some difficulty. Difficulty in this definition is used to refer to the speaker's inadequate command of the language used in the interaction.

Selinker, one of the most influential writers on strategy, found himself unable to define strategy in spite of using it as a component of his interlanguage theory. Within the "latent language structure" component, he claims that strategies are fossilizable items, rules, subsystems which occur in interlanguage performance as a result of an identifiable approach by the learner to the material to be learned and to communication with native speakers of the target language. . . and that] this strategy of communication dictates to them [second language learners] internally as it were, that they know enough of the target language in order to communicate and they stop learning. . . the fossilizable error is due originally to a type of transfer of training and later to a particular strategy of second language communication" (1972, 18-19).

He also provides examples of strategies which include "acquired psycholinguistic constraints, poor behaviors, and acquiring a regional accent of the foreign language" (1972, 19). Twenty percent of the articles followed Selinker's notion of strategy.

New perspectives in cognition and language acquisition also contributed to the development of more understandings of this term. In the latter part of the sixties, Chomsky's Language Acquisition Device (LAD), Competence and Performance theories changed the stimulus-response views of language (1968). This change and other cognitive and psycholinguistic theories were not easily understandable. Therefore, research based on the new theories branched, thus creating disparate insights and trends in the meaning of strategy. For example, strategy/ies was/were the LAD, cognitive processes or functions, combinations of components (or steps) involved in a thinking task which constitute the first level of information processing (Rivers 1972, Hosenfeld 1977, Sternberg 1979). Thus, he states "strategies are sets of components that are always performed in combination for certain classes of thinking tasks" (Chomsky 1968, 212). Thirty-three percent of the articles, defined strategies on similar grounds. In spite of having the cognitive bond, these researchers regard this term quite differently. In other words, distinct functions, operations, connections, parts, and actions of the brain received the label strategy. Depending on the perspective taken by the scholar, the notion and definition of the term strategy was depicted.

Also, in the seventies, the first categorizations of strategies were published. Tarone, Cohen, and Dumas, after defining 'communication strategy' as a systematic attempt by the learner to express or decode meaning in the target language in situations where the appropriate systematic target language rules have not been formed, identified second language communication strategies (1976). Some examples include transfer from the native language; overgeneralization; pre-fabricated patterns; over-elaboration; epenthesis; avoidance; and getting around the language rules or forms which are not yet an established part of the learner's competence. Also, 6.67% of the articles offered some categorizations of strategies, but they did not offer working definitions. There are noticeable differences in the quantity and type of events included in these categories. The remaining 13.33% of the publications offered strategies such as classroom activities to improve reading comprehension and vocabulary.

Thus, in the 1970s, the meaning of strategy was much less clear than it was in the1960's. As the decade advanced, researchers came to relate strategies to thinking processes or mental functions. This preference also shows the change of direction of second language research and teaching. Learners' and teachers' roles changed as well as an interest in cognitive functioning. Finally, it is important to note that attempts to define this term were based on psycholinguistic issues.

In the 1980s, strategy obtained a central position in second language acquisition and teaching investigations. The number of publications on this topic reached alarming dimensions. Numerous aspects and kinds of strategy were studied. First, a significant number of definitions were proposed which clearly revealed a turbulent status of the meaning of this term. All sorts of concepts were insinuated in the definitions, from mental, abstract, and complex ideas to
Meanings of Strategy in Second Language
Cavour

specific, irrelevant, and minute actions. Some definitions are quite specific while others could be applied to a great number of events.

One of the most important definitions was constructed by Faerch and Kasper (Faerch 1980, Faerch and Kasper 1983). They claim that strategy is "a potentially conscious plan for solving what to an individual presents itself as a problem in reaching a particular goal" (Faerch and Kasper 1983, 59). Their comprehensive and thorough study on the essence and defining features of strategy differentiated it from other concepts such as process, plan, and behavior.

Other strategy experts for second language teaching and learning offered a great variety of definitions. Oxford, in her extensive work on learning strategies, defines this term as "all specific actions taken by the learner to make learning easier, faster, more enjoyable, more self directed, more effective and more transferable to new situations... learning strategies are steps taken by students to enhance their own learning" (1989, 1-8). For Weinstein and Mayer, strategies are "behaviors that a learner engages in during learning" (1985, 315). They also differentiate a teaching strategy from a learning strategy as the 'framework for analyzing the teaching-learning process' in the following words: "A teaching strategy is what the teacher does during teaching and a learning strategy is what the learner does during learning" (Weinstein and Mayer 1985, 316).

A second event in the 1980's is the extreme specialization of the studies of strategy and of course its meaning. For instance, many studies researched the effectiveness of one single 'strategy' (e.g. underlining); the strategies used in a segment of a task, e.g. pre-reading strategies. Thirty-three point thirty-three percent of the articles belong to this category, each one displaying a great array of meanings of strategy. Alternative words such as skill, procedure, process, action, rule, behavior, activity, technique, approach, method, and thinking process are used interchangeably with strategy. Since they were studying different items, their findings are considerably different. Some researchers found that the main difference between successful and nonsuccessful learners is that they used different strategies; whereas, others suggest that these students used the same strategies, but in different amounts or in different sequences.

Twenty-three point thirty-three of the publications were related to strategy instruction. Training is more effective when students learn why and when specific strategies are important, how to use them, and how to transfer them to new situations. Language teachers help students to gain self-awareness of how they learn and develop the means to maximize learning. This instruction should be direct and explicit. Opposing views argued that strategies should be embedded in daily practice, without raising awareness of the rationale for their use.

Thirteen point thirty-three percent dealt with the identification and classification of second language strategies. These organized lists of strategies are generally long and cover different areas of human behavior. That is, the variety and number of phenomena classified as strategy varies significantly among studies. Bacon and Finnemann, for example, listed the following phenomena as second language strategies:

being called on in class, finding new ways of using Spanish with others, hearing Spanish being used naturally, hearing Spanish being used in class and out of class, expressing oneself to others in small groups, listening to tapes, trying out what one has learned on someone else, repeating what I hear on tape, comparing Spanish with English, guessing at what may be going on, translating what I hear or read to English, writing the English words above the Spanish ones, keeping my dictionary close by, and rehearsing in my head before I speak (1990).

Certainly, some of these tasks would not be advisable for second language learning.

Twenty-six point sixty-seven percent regarded strategies as mental or cognitive functions, processes or operators. Detailed descriptions of mental models and thinking paths were their main foci. Delineating the content of these publications could be a publication in itself due to the detailed description of mental processes. Noticeable, as well, is the refinement and sophistication of these theories compared to the initial ones. Baron portrays this mental scheme of action, or strategy, as follows: a conscious, goal-directed episode consisting of a series of interdependent phases (1985). Essentially these phases are search processes in which the thinker seeks to define a goal or criterion for ending the thinking episode; tries to find various potential means for achieving that goal (possibilities); and then collects evidence for and against the alternative possibilities. Thus, thinking is a process in which evidence is used to choose among potential possibilities in order to satisfy a goal. The aim of the search process is to find the best solutions to
problems. However, there are costs associated with these processes in terms of their expected success and the time and effort required for their execution. In order to maximize the utility of these processes, the thinker should continue to search as long as the expected gains outweigh the costs. Ideal strategizing involves maximizing the utility of the search processes for any given task, as well as using the available evidence in such a way that all possibilities are fairly evaluated.

During the 1980s the most prolific second language scholars extensively investigated and published on this topic. Bialystok, Chi, Cohen, Faerch and Kasper, Flavell, Hosenfeld, Oxford, O'Malley and Chamot, Paris and his colleagues, Pressley and his colleagues, Rubin, Wenden are a relatively small sample of strategy experts who widely published on this topic. Thirty publications from this period are not enough to portray the events of this time. Certainly, thirty publications do not even represent one of these scholars' writings. Needless to mention that along with the thousands of publications during these ten years, the notion of strategy became more vague.

From 1990 to 1997, researchers investigated strategy from the perspective of the 1980's. But as they further specialized, the meaning of "strategy" became more blurred. This is the time when phases and components of a task became strategies, when techniques are no longer techniques but strategies, when processes no longer exist because they were substituted for strategies, and when skills became obsolete and sort of faded out to yield the road to strategies. Jargon and concepts in education such as programs, objectives, methods, policies, activities, lesson plans, classroom routines, aptitudes, attitudes, behaviors, coping behaviors, processes, procedures, heuristic, algorithms are all under an umbrella called "strategy/ies".

More researchers are discussing the meaning of this term and limiting its use to particular events. At least three events can clearly be noticed, a return to the initial works in the second language field; an importing-adapting strategy theories in other fields, e.g., military, games, sports, business; and a building of working definitions. Seliger, for example, brought back Chomsky's LAD concept as a strategy (Seliger 1991). Oxford includes features of the military field in her explanation of strategy (1989). A greater number of treatises on the essence of strategy have been published in the 1990's. However, this information has not been spread out yet; investigators keep giving it new meanings. Twenty-six point sixty-seven percent of the articles for this decade focused on the definition of strategies.

Another 26.67% of the papers offered a working definition and categorizations of strategies. The phenomena included in them substantially vary in quantity and quality, making these lists much longer. In actuality, three of these taxonomies are 3-4 pages long. There are strategies for every language skill and subskill, for every move an individual makes, for every feeling the learner feels, and for every circumstance surrounding the second language learning and teaching event. The most common superordinates in these categorizations are: affective, metacognitive, cognitive, emotional, environmental, circumstantial. Likewise, several strategy inventories have been developed to predict performance in language learning. The application of learning strategies inventories (13.33%) have yielded too many inconsistencies as predictors of grades on standard tests and of success in college.

During the 1990s, qualitative and quantitative investigations studying strategies from every imaginable angle proliferated. Factors repeatedly analyzed are degree of awareness, effectiveness, influence, effect, types of learners, surrounding circumstances, stage of learning, task requirements, teacher expectations, age, sex, nationality, ethnicity, learning style, personality traits, motivation level, and purpose for learning the language. Fifty percent of the publications reported findings of such studies, indicate in that researchers are testing theories and hypotheses formerly proposed. Most of them do not offer a working definition; they assume a common understanding. Sometimes, examples of strategies or alternative words help to infer its meaning.

Further, during the 1990s, 6.67% are reviews of strategy literature. Their main conclusion is a total lack of correlation in findings and object of study. It is not surprising whatsoever because these investigations are dealing with different phenomena. Sixteen point sixty-seven percent focused on the development of instructional designs to promote competent performance with an emphasis on assessing the value and effectiveness of strategy instruction in naturalistic settings. Actually, great emphasis is currently placed on the teaching of strategies at all levels of second language instruction. As a matter of fact, another 6.67% publications reported the implementation of strategy training programs at state levels. The last 6.67% for the 1990's were replicas of previously conducted investigations and did not define
Meanings of Strategy in Second Language

Cavour

strategy. Interestingly, their findings greatly differ from the original studies. When terms are not clearly defined, the chances of obtaining the same results are minimal. They may be studying other phenomena.

An interesting new trend arising in the 1990's was the study of strategic learners, rather than studying individual strategies. These investigations changed the focus of their study from the strategy itself to the learners as strategic performers or users, that is, as creators and users of appropriate strategies to respond to the uniqueness of the situation. This approach came from the field of psychology on studies related to reading (Paris 1993; Paris, Wixson, and Lipson 1994; Pressley et al. 1990, 1993).

Strategic reading is achieved with rational arguments since readers are involved with what they believe to be rational procedures. Indeed, they take pride in the rationality of strategic reading and thinking, in which they invest their knowledge competence. These scholars ascertain that strategic readers weigh carefully all the surrounding circumstances of the situation, evaluate carefully each factor and lead to reasonable decisions that are the basis for action. They will include a careful study of negative forces and a careful consideration of the means they have at their disposal for overcoming them. The way they decide to use their resources will form their plan of action.

In brief, trends born in the 1970's and 80's are further investigated in the 90's. In addition, new perspectives emerged such as strategic learners, strategy-based teaching methods, and philosophical studies on the meaning of this term.

Definitions and characteristics described in these studies on strategy were summarized as follows. A strategy is an intentional conscious scheme of action for doing, making, arranging, adapting and/or employing the most suitable techniques, moves, skills and resources--physical or mental, internal or external--for solving what is perceived as a problem by the individual to ensure the achievement of a goal most efficiently. In short, a strategy is a mental activity to envision what seems appropriate to overcome obstacles to achieve a goal when the usual skills and/or means fail or are insufficient.

Strategy, to happen, requires the following elements: (1) a problem which needs to be identified, mentally represented, and solved to be able to achieve a goal; (2) an individual with skills, weaknesses, background knowledge, and cognitive processing style; (3) a goal to achieve; (4) several possible paths to follow and decisions to make; and (5) time constraints (Paris, Lipson, and Wixson, 1994). Implied and/or stated in this definition of strategy are the following distinguishing characteristics: conscious, flexible, fallible, complex, individual, context-bound, effective, efficient, goal-bound, and problem-bound.

Clearly there was no single meaning for the term "strategy" that guided researchers. However, under this term an extremely broad spectrum of second language issues have been investigated. Many studies, conducted as studies of strategies, did not study strategies. It bears repeating, they investigated other aspects of the teaching and learning processes, but did not investigate strategies.

Furthermore, there is a worrisome lack of agreement on what this term denotes. Definitions abound. In general, most definitions of this term contain one or more of the defining features mentioned above. If investigations, based on these partial definitions, yielded positive effects on learning, merging all those powerful characteristics could get even better and consistent outcomes. Research findings continue to "prove" that strategies help learners take control of their learning and be more proficient in a second language. Also, teachers' experiences indicate that strategy is a very useful way of enhancing the language acquisition process. In addition, the number of investigations could mean both that this area is so important and complex that needs all this study. Or it could also mean that the situation is chaotic; thus, scholars think that it needs to be addressed. Therefore, having consensus on the meaning of this concept could have avoided much of the redundant research and writing.

Nonetheless, important contributions to the understanding and improvement of second language acquisition and instruction are the result of this extensive research activity. From 1960 to 1990 the second language field has advanced tremendously. Especially, the growing areas of theoretical and applied psycholinguistics, neurolinguistics, cognitive science and second language acquisition and instruction are leading theory to new areas.

Still, more thinking, discussion, and investigation are needed to delimit the uses of the term "strategy." When unlimited notions are included in the concept "strategy" the effort to find the way to optimize the second language
acquisition process declines. In spite of the considerable amount of investigations conducted on this topic, future research seems to still be needed to arrive first at a more focused understanding of what strategy is to identify strategies, to debate its characteristics and to develop methods to enhance learning under this understanding.

Maudelle Brown Bousfield was a pioneer Chicago educator from 1922-1950. She was able to succeed at a time when Chicago's education was becoming increasingly segregated. In 1928, Bousfield became Chicago's first Black principal during Chicago's de facto segregated school system. Her achievements paved the way for Black teachers and principals alike. Bousfield's accomplishments were not limited to her teaching and administrative advancements. Bousfield was a club woman who headed Alpha Kappa Alpha sorority; she was a youth advocate; and she was appointed special city and federal commissions.

Bousfield's background provides pertinent information as to her determination and advantages for success. Maudelle Brown Bousfield was born June 1, 1885 to St. Louis educators, Charles Hugh Brown and Arrena Isabella Tanner Brown. Bousfield's family could be considered middle class despite Bousfield believing otherwise. She considered her family to be poor, though not paupers (Chicago Defender, 8 May 1943, 15). However, compared to the masses of St. Louis Blacks, who either lived in dilapidated housing or poor city environments, the Brown's suburban housing was deemed middle class. Bousfield was privileged to learn about nature and partake in private piano lessons. As a result of being an accomplished pianist, Bousfield became the first African American to be admitted to the Charles Kunkel Conservatory of Music in St. Louis. She graduated from there in 1903.

Although Bousfield's teachers thought she a musical prodigy and recommended that she study for the concert stage, she excelled in her educational endeavors as well. She graduated from St. Louis' first Black high school, Charles Sumner in 1903, after only three and a half years. After graduating from high school, Bousfield chose college over a musical career. Bousfield became the first African American woman to attend and graduate from the University of Illinois, Urbana-Champaign. She continued to be the only African American female at the university for about two years. A 1943 Chicago Defender article states that because Bousfield was the only Black female at the university, "there was no discrimination against her. She participated in school activities and was generally accepted by the rest of the women students" (Defender, 8 May 1943, 15). While at the University of Illinois, Bousfield made money by tutoring in math, her major, and working in the cloakroom or playing the piano at sorority dances. In 1906, after only three years, Bousfield graduated with honors. The University's Phi Beta Kappa chapter was established in 1908, after Bousfield's graduation. But on January 14, 1965, Bousfield became an honorary initiate of the university's Gamma chapter.

Bousfield began her teaching career at East St. Louis' Lincoln High School. She taught there for one year, 1906-1907, before moving to Baltimore to teach math at the Baltimore colored high school. In 1914, she returned home to St. Louis and taught briefly at her old high school, Sumner. Maudelle Brown married Midian O. Bousfield on September 9, 1914, and gave birth to her only child, who took her name, Maudelle Brown. Soon after their marriage, the Bousfields migrated to Chicago. Bousfield took a seven year hiatus from her teaching career to raise her daughter. She furthered her interest in music by attending Chicago's Mendelssohn Conservatory of Music, where she graduated in 1920 (Cook 1996, 41).

Middle class and elite Blacks tended to marry among themselves. The Bousfields were no different. Midian Bousfield was born in 1885 in Tipton, Missouri to Willard Haymen, a barber, and Cornelia Catherine Bousfield. Dr. Midian Bousfield graduated from Kansas State University in 1907 and received his M. D. degree from Northwestern School of Medicine in 1909. After setting up medical practices in Kansas and Brazil, Dr. Bousfield and his wife settled in Chicago. Dr. Bousfield went on to hold a rather esteemed position in the Black community due to his involvement in several Black social and health organizations. From 1921, he was the co-founder, medical director, and president of Liberty Life Insurance Company. After a 1929 merger of his company and another, they were renamed Supreme Liberty and Life. Dr. Bousfield was director of the Negro Health Division of the Rosenwald Fund from 1933-1942. Starting in 1934, Dr. Bousfield served a one year term as president of the National Medical Association, an organization of Black physicians. From 1935-1939, he served as the Chicago Urban League president and as a member of the executive committee of the National Urban League. During World War II, Dr. Bousfield was the commanding officer of an all Black hospital he organized at Fort Huachuca, Arizona. He retired in 1945 after becoming the first African
American colonel in the Army Medical Corps. Dr. Bousfield died of a heart attack on February 16, 1948 (Salzman, Smith, and West 1945, 410).

During Maudelle Bousfield’s teaching hiatus, she tutored students having difficulty in school. In 1921, Bousfield decided to go back to teach high school. She took a teaching examination, as was required along with two years teaching experience in Chicago’s elementary schools or at an outside high school, and a college degree. After passing the examination, Bousfield was placed at Wendell Phillips High School in January 1922 to teach math. Permanent teaching jobs did not come easy for Black teachers. Many had to remain on substitute lists for a number of years before being placed permanently. African Americans remained on the list longer than whites primarily because the substitute bureau purposely identified Black teachers so that they could be placed at majority Black schools (Herrick 1931, 34-35).

In 1916, the Defender’s editorials criticized the practice of placing "race" teachers at predominately Black schools. While forced segregation was the norm in the South, the Defender recognized that in the North, teachers had the opportunity (though limited) to teach at predominately white schools. Furthermore, more opportunities were available to Black teachers in a non-segregated school system as opposed to a segregated one. The editorial also suggested that racial contact in mixed schools aided in breaking down prejudice.

It is ironic that what was argued in 1916 is still being debated today. In 1984, Michael W. Homel in Down From Equality: Black Chicagoans and the Public School 1920-45 chronicles the move of Chicago public schools from "integrated" schools to de jure segregation 1863-1865 then from desegregated to de facto segregation from 1920. The segregated status of Chicago’s schools took its toll on potential African American teachers and students. Teachers had to battle white principals and a racist school board in order to be hired permanently. The placement of teachers was dependent on a particular principal’s acceptance of them. Principals often rejected Black teachers due to their belief that Blacks were inferior; principals feared the response of communities where the school was located; and the school’s prestige may have been lowered due to the common practice of assigning Black teachers to low status schools. Some Black teachers resorted to using their political connections to speed up their assignments to permanent positions (Gosnell 1935, 32-33).

Bousfield’s quick placement was rare for African American teachers. It did not take long for Bousfield to be recognized by Wendell Phillips’ administrative staff. Principal Albert Evans offered her the position of dean of girls. Bousfield agreed to take the position, however, the board of education insisted that Bousfield take an examination before she could become dean. In an interview with Harold F. Gosnell, Bousfield stated, "At that time the dean was selected by the principal, or rather the candidates for the position were selected, for we all had to take an examination, the only one in fact that has been given for this position" (Gosnell 1935, 295).

The board required teachers have a least five years teaching experience before they could take the examination. Bousfield only had four years experience. Ironically, the principal’s examination only required four years. Bousfield ingeniously asked the board if she would be eligible for any position if she took and passed the principal examination. The board replied yes, but as Bousfield recalled, "They laughed in my face when I told them I’d take that exam" (1969). The board obviously believed that they had cleverly placed an obstacle in Bousfield’s path. The board reasoned that since only eight African Americans had taken the exam by 1927, but none made competitive scores, Bousfield would also be unsuccessful. Bousfield scored among the top twenty out of the more than 600 individuals who took the exam. The board’s discrimination tactic eventually was a boost to Bousfield’s career. Bousfield became Chicago first African American dean in 1926, and remained so until 1927.

On December 20, 1927, Bousfield became the first Black principal during Chicago’s defacto segregation. Her appointment to Keith Elementary School made national headlines, particularly in the Black press. Despite the celebration, rumors persisted. Many believed that Bousfield used the political connections of her husband to get appointed. Cary B. Lewis of the Pittsburgh Courier claimed, "It is no secret that the appointment of Mrs. Bousfield to the principalship of the Keith School had the o.k. of Mr. DePriest [Oscar DePriest, Chicago’s first Black city alderman]" (Lewis 1928).

Bousfield vehemently denied allegations of politics in her appointment. She proclaimed that "If there has been
any politics in the school, I haven’t come into contact with it“ (Gosnell 1935, 295). Bousfield’s comments indicated both her confidence in her qualification and her ability to be a formidable opponent to any school board antics. Bousfield and her husband were known locally and nationally and knew that they could muster support for protest. She appeared to be unwilling to accommodate blatant discrimination, while at the same time recognizing her importance.

Mary J. Herrick, who studied Negro employees of the Chicago school board, came to Bousfield’s defense (Herrick 1931). Not only did she recognize Bousfield’s qualifications, but she acknowledged that Bousfield had been assigned a school that was "the smallest, oldest, and most poorly equipped in the city." Keith Elementary was indeed an inferior school. The building had been built since 1883 and was one of the two oldest schools built that contained a sizable Black student population by 1920. Keith had no gymnasium. It also had one of the largest Black student populations at a time when Chicago’s schools were becoming more and more segregated (Chicago Commission on Race Relations 1922, 242-243; Homel 1984, 6).

Bousfield stated that Keith was the kind of school that new principals were assigned. An estimated 400-500 students attended what Bousfield describes as a horrible school in a horrible location. "It was run down like I don’t know what." The building was ancient, Bousfield said, "with rickety stairs. The toilets were in the basement, and somebody was needed down there to prevent tramps from coming into the school and getting girls when they went to the toilets" (1969). Keith was located in a low income neighborhood in the Black Belt (where most of Chicago’s Black population was crammed). Bousfield’s 1931 masters thesis from the University of Chicago entitled, "A Study of the Intelligence and School Achievement of Negro Children," which interviewed Keith students from fifth to eighth grade, revealed the high level of poverty among the families of the pupils she studied. Bousfield’s appointment to Keith, while celebrated, was the very least the school board would assign her.

Bousfield was soon promoted to principal of Stephan A. Douglas Elementary School in 1931. Support from the Colored Women’s Republican Clubs of Illinois, Inc., headed by Irene McCoy Gaines helped to secure Bousfield’s promotion. In a letter to Gaines dated September 24, 1931, Bousfield wrote to the ladies on the Board of Directors of the Second Ward Republican expressing her appreciation of their interest in her coming to the Douglas school. On October 14 Gaines replied, the members of the Colored Women’s Republican Clubs of Illinois, Inc. were happy to participate in the reception given in her honor. This correspondence revealed Bousfield’s political connections.

Commenting on her promotion, Bousfield stated, "Most persons think that the Douglas assignment was a move up but it really wasn’t for there was no increase in salary at all, only more work" (Gosnell 1935, 295). Douglas was viewed as a promotion primarily because it had 2000 pupils, more than four times the size of Keith. Moreover, Douglas was located in a better neighborhood of the Black Belt than Keith. While at Douglas, Bousfield faced white teacher opposition, extreme overcrowding, and depression era cutbacks which left her like other principals temporarily demoted to teacher in 1934. Bousfield had one insubordinate teacher transferred from Douglas. Several others transferred out as well, ending teacher resistance (Bousfield 1969).

The overcrowding situation at Douglas was handled with "double shift" school assignments. During Bousfield’s entire tenure at Douglas, she had to operate with double shift assignments. Double shift meant that students were in school either three or four hours daily, as opposed to five hours. So many students were in school for less time than was necessary to compete with other children in the city. Overcrowding had plagued white schools as well. However, their overcrowding was rectified by the construction of more schools (Homel 1984, 76-80).

Bousfield endured at Douglas and was promoted to principal of Phillips High School in September 1939. She became the first African American principal at a Chicago high school and the first African American to head a multi-racial high school, although Phillips was overwhelmingly Black. While at Phillips, Bousfield worked to upgrade the reputation of that school. Bousfield recalled, "Phillips had a low-down name when I took it" (1969). Phillips was located in an area with a lot of negative activities. There was prostitution, gambling, illegal drug dealing, and a liquor store selling alcohol to under-aged Phillips’ students. Bousfield had the liquor store owner arrested and took him to court to have the store shut down. Five judges refused to take the case against Mike Feldman. One judge claimed, "I’ve been on the bench too long to take such a chance. There has been too much pressure brought to bear already. I don’t want to be put on the spot. Let somebody else handle it!" Eventually Mike Feldman was fined and the liquor store was put
Bousfield's victory helped to boost Phillips' reputation.

Bousfield ended her career in 1950 due to forced retirement. She had spent twenty-eight years in the Chicago school system and had been a trailblazer. One of the themes of her career was that she was a fighter be it for herself or her students. Bousfield threatened to fight the school board if she had not been promoted to a principal position. Fortunately, there was no need for a fight. She got the opportunity to head Keith, although she was probably passed over for schools with larger white populations. After all, the school board did not even think Bousfield possessed the intelligence to pass the principal examination. Why would they then have given Bousfield an opportunity to head a "reputable" school in a "reputable" area?

Bousfield got the white Douglas teachers in order. She demanded the respect of her subordinates and made sure that she received it. As she gained the respect of her subordinates, her superiors recognized and promoted her. Bousfield tried her best to fight for her students. The liquor store shut down was a situation in which Bousfield passionately fought against outsiders for her students. She was both persistent and determined to close the store down. When judge after judge refused to take the case, she kept pushing until a decision was rendered. Bousfield was by no means afraid to use her political connections to benefit her and her students. Thus, Bousfield did not appear to be an accommodationist. She made the best of any situation and fought when the need arose.

Bousfield's publications expressed her deep concerns for the mis-education of Black people and the inappropriate use of intelligence tests. In her article, "The Intelligence and School Achievement of Negro Children," which appeared in the first Journal of Negro Education in 1932, Bousfield concluded that the test available in the 1920s and 1930s were insufficient measures of intelligence. Her evidence revealed that three tests she gave to Keith Elementary students yielded vastly different results. Bousfield had hoped that the results of her study would be a valuable aid for northern teachers and school officials supervising Black students to "interpret pupil performance intelligently" (Bousfield 1932, 395).

Bousfield's second article, "Redirection of the Education of Negroes in Terms of Social Needs," also appearing in the Journal of Negro Education in 1936, argued that African Americans were not being served either in kind or degree by the type of education they received at any level. Bousfield suggested several ideas to combat the miseducation of Black people. She added that health and Black history be added to the curriculum. She recommended adult classes, special education for exceptional children, and physical and vocational education. Above all, she called for well-trained teachers (Bousfield 1936, 412-419).

Commitment and dedication to organizational activities is one of the things Bousfield is remembered for. Bousfield was initiated into Alpha Kappa Alpha, the nation's first Black sorority on a college campus in 1921. By 1927, she move through the ranks of the sorority to become national vice president. From 1929-1931, Bousfield was the sorority's national president. During her administration, she led a drive to recruit inactive members, initiated a project to print a sorority handbook, and developed a bond purchasing program for the sorority. Bousfield also headed a committee from her chapter that worked towards purchasing and maintaining a sorority house on the campus of the University of Illinois, Urbana-Champaign (Parker 1990, 52-64). Bousfield and her husband frequently went to Champaign for football games. Her trips to Champaign enabled her to keep an eye on the sorority house and serve as an advisor to the women there (Evans 1997).

Serving in numerous organizations, Bousfield kept busy throughout her life. Her organizational affiliations were mostly based on her educational and musical interests. She belonged to the National Educational Association, National Association of Deans of Women, Chicago Teacher's Federation, Central Association of Science and Mathematics Teachers, Chicago's Principal's Club, National Negro Music Association, and the National Negro Business League. She also served as vice president of the Board of Trustees of Provident Hospital. Bousfield chaired the Board of Saint Edmund's Episcopal Parochial School which she helped organize. During World War II, she was the only African American appointed to the Women's Advisory Committee on the War Manpower Commission as the representative of the 6th region. Bousfield was also appointed to Mayor Richard M. Daley's Commission on Juvenile Delinquency.

Maudelle Evans recalled that her mother contributed to every committee that she was a part of (1997). Despite
being the only Black person on War Manpower Commission, Evans said her mother spoke up on that committee. Evans called her mother a genius and said that she took every task seriously.

Maudelle Bousfield opened so many doors for African American women and African Americans in general. She was the first Black to attend the Charles Kunkel Conservatory of Music in St. Louis, the first Black woman to attend and graduate from the University of Illinois, the first Black dean in Chicago, the first Black principal in Chicago, and the first Black principal of an integrated high school. Bousfield’s contributions need to be further studied and analyzed. Her role in Chicago’s educational history is too important to continue to go unrecognized.

Evans, Maudelle. 1996. interview by Dionne Danns. November 11.
During the early nineteenth century, Indian education in Oklahoma developed in the communities of the five tribal nations. Prior to this, the original homeland for Choctaws was Mississippi where there had been some successful attempts to proselytize them by missionaries. These tribal groups were forced to vacate their land due to the desires of whites to develop Mississippi. Thus, as a result of the 1820 Treaty of Doak's Stand, the tribal communities agreed to leave the Mississippi tract and to move to new lands in a territory bordered by the Red, Arkansas, and Canadian Rivers in what is now the southern half of Oklahoma and the southwestern portion of Arkansas. The Original treaty called for a gradual resettlement process, but this was circumvented by a new agreement, the treaty of Dancing Rabbit Creek, which called for quicker removals so that whites could occupy the land sooner. The purpose of this study is to: 1) describe the development of the Oklahoma Choctaw society; 2) chronicle the events that ended the Choctaw republic; and 3) discuss the contributions of three generations of Wrights in both the anglo and Choctaw societies.

The 350 mile journey from Mississippi to their new lands was made under extremely harsh conditions. One particularly tragic misfortune was a cholera epidemic that killed many. President Andrew Jackson and other politicians were unsympathetic to the difficulties the Choctaws encountered even though they were responsible for evicting them from their homeland. Nevertheless, those who endured the trek established several small towns with post offices, hotels, blacksmith shops, stores, and produce markets. These communities were located at intersections where travelers emigrating to Texas and California would pass (Wright Interview 1997).

Shortly after arrival, the Choctaws began to build a school system with help from missionaries of the American Board of Commissioners for Foreign Missions. Several of these missionaries, including the physician, Dr. Alfred Wright actually helped with the relocation and joined the Indians in the new territory. By December of 1832 Wright had organized Wheelock Presbyterian Church originally under the trees. By 1836 there were eleven schools in the new nation with a total of 228 Choctaw children enrolled. That same year five log school buildings were also constructed with funds from the Treaty of Dancing Rabbit Creek. In addition to these, one school was established in each of the three districts named after the 1824 Choctaw delegation: the Mushulatubbee, Pushmataha, and Apukshunnubbee districts. Each had a district chief and an administrative council (Debo, 1967).

In addition to district councils, there was a national council, headed by a chief, that was responsible for administering the entire Choctaw society. In 1842 this council began making provisions for a comprehensive school system including boarding arrangements. In 1844 Spencer Academy and Fort Coffee were opened. Two years later Armstrong and New Hope Academies were opened, and by 1848 the nation was supporting nine boarding schools including four that had been founded by the American Board. The council usually made arrangements with mission boards to conduct the actual business of managing the schools and hiring the teachers. At about the same time, the council also began the practice of sending some of their best graduates of these academies to college. During the 1840s and 1850s as the population increased, the original districts were subdivided into counties, and more day schools were opened and ultimately funded by public appropriations. By the eve of the Civil War in 1860 the nation reported that five hundred children were enrolled in day schools along with four hundred others attending the boarding schools. Thus, a total of nine hundred students were being schooled in English and Choctaw. The American Board missionaries including Alfred Wright translated and published Choctaw versions of the New Testament and portions of the Old Testament along with hymn books, moral lectures and sermons, and hagiographies of pious Indians.

Adults were also provided for educationally, through Sunday schools conducted by missionaries with help from the council. They met on Saturdays and Sundays and often instructed the whole family in arithmetic and the fundamentals of reading and writing in Choctaw. Although Moshulatubbee had resented the Christianizing of the Choctaws, their work continued after his death and by the Civil War the Choctaw nation was considered Christian. Sunday Christian observances were common in the society which was between twenty and twenty-five percent Protestant--mainly Baptist, Methodist, and Presbyterian; and council meetings began and ended with prayers (Debo 1967).
By the late 1850s Choctaw society was well established in the new territory. Economically, the settlers were agricultural. Those who farmed along the Red River developed cotton plantations and held slaves. Those along the Arkansas and Canadian Rivers planted corn and fruit orchards and raised cattle, hogs, and ponies. In addition, to the school system, they created a fourth district for new arrivals including the Chickasaws, and increased the number of council members to reflect this growth in population. In 1843 they changed the constitution so that the governing body would be bicameral: a Senate with four members from each of the four districts who would hold office for two years; and a House of Representatives who would be elected annually and who would be apportioned according to the total population which was about fifteen thousand. Polygamy was made illegal in 1849, and marriage ceremonies were also modified so that they became custom. In addition, property laws made the wife equal to her husband. During the Civil War the Choctaw nation sided with the South, because their economy and their customs had been influenced by their stay in Mississippi, as evidenced by their practice of slavery. Furthermore, they had been concerned with some of the policies that the Republican Party had advocated, especially the proposed policy to seize the Oklahoma lands for white settlement. In response to this proposal, the Choctaws petitioned Congress to adopt an article that would allow for Indian representation in the House of Representatives. They hoped that this would be a way of protecting their land from being confiscated. They elected a delegation to be sent to Fort Smith to negotiate a preliminary treaty with the North. A prominent member of the Choctaw party was Allen Wright.

Allen graduated from Union College in 1853 and immediately enrolled in Union Seminary in New York City graduating from that institution in 1855. He returned to the Choctaw Nation and served as its general Secretary and as Superintendent of Education. In 1866, after the Civil War, he was appointed to the treaty commission that was necessary to make peace with the U.S. government due to the Choctaw Nation’s alliance with the confederacy. Principal features of the treaty negotiated stated that the Choctaw Nation was compelled to surrender the western extension of its territory and that it was forced to accept freed slaves as citizens of their nation with full rights and privileges.

Allen was elected Principal chief of the Choctaws that same year and served two terms in that office. He believed in tribal modernization and consolidation of tribal affairs. In today’s terms, he might have been considered a constitutional constructionist as he believed in the primacy of law over what has been called "reactionism," or the act of policy-making for contingency. He emphasized that laws should be created that are reasonable and that establish standards and guidelines for society. The traditional "blood covenant" or an "eye for an eye" attitude was not considered by him to be an appropriate response to murder, for example.

He is also credited with establishing the manner in which the U.S. government and other American Indian nations arrived at the point at which territorial status would be granted. Allen is credited with many firsts, one of which was the establishment of the first masonic lodge in the state. He probably was the first head of an American Indian nation to hold a university and seminary degree. He authored a Choctaw dictionary for the purpose of standardizing a language.

During this period Allen Wright had married a woman who was a direct descendent of the Mayflower Pilgrim, the Elder William Brewster. Their first born was a son whom he named Eliphalet Nott Wright after the President of Union College (1802-1866). Both Dr. and Mrs. Nott had taken a special interest in Allen during his years of study there. Eliphalet was born in Boggy Depot, in what is now Southeastern Oklahoma, on 3 April 1858. He grew up during the Civil War and Reconstruction periods and started his educational career at the local school under the tutelage of Miss Clara Eddy, a graduate of Emma Willard's Seminary in Troy, New York. His next schooling experiences included a year in the preparatory department of Westminster College in Fulton Missouri and three years at the Spencer Academy in the Choctaw Nation.

In the fall of 1878, E. N. Wright entered Union College, his father's Alma Mater, along with his brother Frank. They became members of his father's fraternity, Delta Phi and friends with sons of nationally and internationally prominent families. Unfortunately, his father could not afford to continue E. N.'s education, because he had four other children away at boarding schools and colleges. Thus, in order to help out the others E.N. left Union in his junior year and entered Albany Medical College for one year. In 1883 he returned to Boggy Depot to set up a much needed but temporary practice—temporary because he intended to return to Albany to complete his medical studies. By collecting
on his IOU notes, he was able to complete his medical course, and he graduated in the spring of 1884. His father, Allen, died the following year in 1885 (Wright Collection, Box 4).

Despite encouragement to practice in New York, the young doctor returned to the region where he knew the Choctaws needed him. He became chief surgeon and physician for the Missouri-Pacific Coal Mines. In 1888 he married Miss Ida Belle Richards, a teacher in Atoka who was a graduate of Lindenwood College in Missouri and whose ancestors were from the New England lineage of Bassett, Stone, and Sprague. In 1889, a daughter, Muriel was born to Dr. and Mrs. Wright (Wright Collection, Box 1).

In addition to his heavy medical practice, Wright took up the work of the Medical Board and the Choctaw Oil and Refining Company. He also was in charge of recording and reporting the amounts of coal mined and sold during Choctaw Chief, Thompson McKinney's administration (1886-88). In 1890, under Chief and Governor, Wilson Jones, Dr. Wright was appointed as supervisor of all stone, coal and timber contracts and inspections. Throughout his life he tried to organize a Choctaw run company that would have oversight of their mineral interests worth about seventy-five million dollars at the time. However, with the merger of the Indian and white societies and the establishment of the state of Oklahoma, such an organization never materialized. By the end of his life the proceeds from mineral sales had been poorly managed and yielded only a small percentage of its original value.

In 1894 Wright was appointed to a delegation that was to meet with the Dawes Commission—a special committee appointed to treat with the five tribes in order to dissolve the Indian governments and allot the lands in severalty among the citizens of the nations. However, by 1896 the Dawes Commission had changed the provision so that the Choctaw and Chickasaw nations would convey in trust all interest of their lands to the United States. Dr. Wright was the only tribal delegate to refuse to sign the paper, indicating the trust as his main reason for not signing. The document was never signed by the federal government. Instead, the Dawes Commission met with another Choctaw delegation at Atoka in 1897; Dr. Wright was informed that his services were no longer needed. Known as the Atoka Agreement, it deeded to the United States all tribal lands to be divided equally among its citizens and to remain inalienable and non-taxable for twenty-five years with one exception: there could be periodic sales of certain portions of lands. The tribal governments were to continue for an eight-year period at which time the Indian portion of the territory would become a state. By 1905 the white people living in the nations were eager to create a government and not willing to wait the eight-year period. Consequently, Congress passed the Enabling Act in 1906 and the new state joining the Indian Territory with the rest of Oklahoma was admitted in 1907 (Debo, 1967).

During this eight-year period Dr. Wright continued to work for better conditions and solutions to the Choctaw Nation's Problems. In 1900 he ran for Principal Chief on the platform of improving the inadequate Atoka Agreement conditions. However, he was defeated. He also realized that dissolution of the tribal government would not be an easy task under the inadequate Atoka provisions. In 1908 Choctaw Governor Green McCurtain sent Wright to Washington as the representative of the Choctaws. Wright hired an attorney to secure a better settlement under the treaty's provisions. Unfortunately, McCurtain died in 1910 and Wright's position was abolished. As he had predicted, the tribal government never really came to an end, although it lost power and authority (Wright, 1935).

Wright continued to promote Choctaw interests in Oklahoma. Along with his brother James Brooks, he founded and developed the town of Olney as a major station of the Rock Island Railroad. This was near the family farm. He contributed to the establishment of the Presbyterian Church and the Ash Flat Valley Bank in Olney. He also saw to it that public schools were established in the town.

Wright continued to be politically active on behalf of the Indian nations. He worked to alleviate poor economic and educational conditions. He ultimately realized that the only way Indians would be treated fairly would be to elect their own people to public office. This was to be without regard to party affiliations. He also continued his medical practice and was instrumental in merging the Indian Territory Medical Association with the Oklahoma Territory Association as the Oklahoma State Medical Association in 1906.

His place in American and Choctaw society was one of continued prominence. However, such was not the case for most of his Choctaw brothers. The bright civilization that had known such distinctiveness in its governmental, social, and educational institutions continued but without the strong support it had once known. Wright died in 1932 leaving
his legacy to one of his two daughters, Muriel, who would make her own unique contribution to Choctaw and American societies.

The eldest of the two daughters, Muriel grew up in Lehigh near Atoka during the years of the allotment struggles with the Dawes Commission. While many of the governments ceased to function effectively, Muriel would later recall that the Choctaws were tenacious enough to keep a form of their government and educational institutions running. She started her formal education in the Choctaw and missionary schools. Muriel recalled later that even though she received good marks and got along well with the children, the atmosphere in these schools was "terrible." Consequently, she was "delighted" when in 1902 her father moved them to a farm ten miles southwest of Lehigh--later to become the site of the town of Olney. This meant that she was to be taught by her mother at home, because there was no school in close proximity to the farm (Wright Collection, Box 1).

After teaching Muriel what she could, Mrs. Wright made a survey of girls' schools in the East, and Muriel chose Wheaton Seminary in Norton, Massachusetts. In January of 1906, Dr. Wright took his daughter to Norton, via Washington, D. C., and New York. At the age of sixteen she bid good-bye to her father and found herself alone for the first time in her life.

Being shy and in a panic at the thought of trying to academically compete at this institution she was afraid that she would not make good grades. She later recalled: "the fact that she was a 'Choctaw Indian' was no asset; and from the Indian Territory and southern in some ways caused a flurry in the school" (Wright Collection, Box 1). The teachers and President Cole were able to manage the situation, and Muriel overcame her "blank panic" in about a month. She ended up receiving A's in history, Latin, and geometry. She attributed her academic acuity to her mother's teaching. Her teachers—all women—were from the best institutions: Radcliffe, Wellesley, Holyoke, Oxford, and Paris. Muriel went out for sports, and excelled as a wing in field hockey.

After graduating from Wheaton, Muriel returned to Oklahoma in 1911 and she matriculated as a senior at the newly opened East Central Normal School in 1912. She described her teachers as very "forward-looking" admonishing all future teachers to get acquainted with the parents of their students by making home visits. After graduation in 1912, she spent the next four years as a teacher and then a principal in elementary and high schools in Wapanucka and Tishomingo, Oklahoma.

In the fall of 1916, Muriel had an opportunity to enter Barnard College in New York City. Her uncle by marriage to her father's sister was from an old prominent New York family and sat on the Board of Regents of Columbia University's School of Mines. She spent the year there, and became close friends with John Dewey's younger daughter, Lucy and Ellen Borden of the Borden Milk Products. While in New York she became fascinated with the Roman classics, especially the folklore of Virgil's Aeneid.

With war developments, Muriel returned to Olney without her master's degree. She began teaching again, and soon became the principal of the Hardwood School District. She also began writing historical articles about Indian experiences in Oklahoma. She became active in the Choctaw Tribal Council, first as Secretary from 1922-1928 and then as a member of the Choctaw Advisory Council from 1934-1944. These organizations carried on continued business matters of the tribe (Wright Collection, Boxes 1-2).

From 1943-1973 she became editor of the Chronicles of Oklahoma. She continued writing including a prominent book, A Guide to the Indian Tribes of Oklahoma. It is an encyclopedic coverage of sixty-seven tribes that made Oklahoma their homeland. Her other publications include The Story of Oklahoma, Our Oklahoma, The Oklahoma History, Oklahoma: A History of the State and Its People with Dr. Joseph B. Thoburn, and Civil War Sites in Oklahoma with Dr. LeRoy H. Fischer.

Throughout her life she maintained an active involvement with Choctaw society as well as with friends in the East. This is evidenced by her nomination and acceptance into the Daughters of the American Revolution. Her awards include: Oklahoma Hall of Fame, 1940; Distinguished Service Citation, the University of Oklahoma's highest award, 1948; State Women of the Year, 1950; The White House Award for distinguished service in preservation of American heritage, 1971; and the National American Indian Women's Association Award for historical writing and civic contributions, 1971.
She died in 1975, and part of the dedication recalled what historian and co-author LeRoy Fischer had said about her:

Leadership, courage, dedication, ability, efficiency, enthusiasm, preserverence, [sic] service, insight, creativity—all are words that aptly describe Miss Muriel Hazel Wright. Filled with enough viable research and writing ideas in her work in Oklahoma history to last two or three lifetimes, she is spurred on by her desire to continue her notable contributions to Oklahoma's heritage and culture (Wright Collection, Box 1).

By the time that Allen Wright was an adult, the Choctaw society was developing into a sturdy socioeconomic society with political and educational institutions that would perpetuate a bicultural tradition. The Choctaws seemed eager to incorporate some of the legal, political, religious and educational customs of their white neighbors. However, they did maintain their system of common ownership in land control. Thus, any Choctaw citizen could develop a piece of land as long as it did not infringe upon the developments of another citizen. This system allowed some Choctaws to become the upper class members who enjoyed vast holdings and large rambling southern-type mansions. Some even had a slave-based plantation. On the other hand, the majority of the Choctaw citizens satisfied themselves with small portions of land and the rudiments of a basic education in both languages. During the mid-nineteenth century, the Choctaw society experienced majority status with protection of their new lands. In the aftermath of the Civil War this cultural status changed. Original treaties were no longer being honored, and the Union was eager to allot the lands in severalty, instead of honoring the community property notion. As Muriel noted conditions in the tribal schools and in towns such as Atoka were quite dismal. Choctaw culture no longer dominated Oklahoma society, and they reverted to a minority status.

Individual leaders, such as Allen Wright, had achieved political and educational standing in both Choctaw and American societies as evidenced by his administrative position and his educational experiences. His adoption by the Alfred Wright family allowed him to pursue a very prestigious educational course of study and develop elitist New England friendships. Hence, he ended up marrying into Massachusetts's mainline society. As Principal Chief and diplomat and as a large landowner in Oklahoma, we can see that Allen Wright held high status in both societies and identified with the most powerful group in the Choctaw society and a relatively powerful group in American society.

In applying these constructs to Dr. E. N. Wright, a similar picture emerges. Even though the status of the Choctaw society was diminishing, Dr. Wright maintained his professional, social and economic standing as Oklahoma became a state. He also continued to work on behalf of Choctaw society by maintaining his medical practice, and founding and developing the town of Olney. He was able to pass this standing on to his daughter, Muriel, who as a woman, receives her status from her father or her husband. Her eastern educational opportunities and her DAR membership attested to the mainline WASP reference group with which she was able to identify, while her work in Oklahoma as a prominent Choctaw historian made her an important member of the Choctaw society.

The American Baptist Home Mission Society and
the Development of Historically Black Colleges

Stephanie R. Sims
Baltimore, Maryland

Following the Civil War, Northern benevolent societies invaded the South in an attempt to aid ex-slaves in the
transition from slavery to freedom. Many of these missionary and philanthropic organizations established and
helped sustain Black schools. The American Baptist Home Mission Society (ABHMS) was one such
organization. Beginning its work during the Civil War period, the ABHMS aided in the building of elementary schools
as well as in the establishment of institutions of higher education for African Americans.

The American Baptist Home Mission Society was not the largest philanthropic organization in the South, but
it was one of the most important. ABHMS leaders such as Thomas Morgan, Henry L. Morehouse, and Malcolm
MacVicar were outspoken advocates of Black education. Using their periodical the Baptist Home Mission Monthly as
well as their agents and teachers in the South, members of the ABHMS set out to spread both the social and religious
gospel as well as its philosophy on higher education for African Americans. In addition to advocating higher education
for Blacks through their journal and missionary activities, the ABHMS provided the financial backing to establish
Black colleges throughout the South. Some of the colleges it was instrumental in helping to establish were: Benedict
College in South Carolina; Bishop College in Texas; Leland College in Louisiana; Atlanta Baptist College (later
Morehouse) in Georgia; Spelman Seminary in Georgia; Virginia Union in Richmond; Jackson College in Mississippi;
Shaw University in North Carolina; and Alabama Baptist (later Selma University).

Despite the importance of the American Baptist Home Mission Society as a philanthropic organization, a
thorough critique of its activities, philosophy, and role in Black education has yet to be written. A study of this
missionary society could contribute to several areas of history and education. Three areas in particular are: the history
of religion and education; the history of philanthropy and higher education; and the history of African American
philanthropy and self determination.

In its own writings, the ABHMS implied that it was simply waiting for an opportunity to help freedmen and
that this opportunity presented itself with the onset of the Civil War. However, evidence does not support this claim.
Its history in regards to abolitionism indicates that the debate over when and how involved to become in the lives of
enslaved Blacks (many of whom were Baptist) was a complicated one within this Baptist organization. Blacks in the
slave states were particularly attracted to the evangelism of the Baptists as many evangelical Baptists allowed
Blacks to practice a form of religion which enabled them to combine slave culture with White religion (Washington
1986, 7). Although the American Baptist denomination maintained the largest number of followers among both the slave
and ex-slave Black population, it lacked a commitment to Black liberation prior to the Civil War. Black Northern based
Baptist associations formed during the antebellum period had abolitionism as one of their primary interests. However,
few White Baptists could assert the same. While the American Baptist Home Mission Society was the largest, oldest,
and richest of the Northern Baptist groups, it was not the most committed to Black life and education prior to the Civil
War (Washington 1986, 28,54). The Society started out its mission to educate Blacks as a fairly conservative
organization. The persistent thread of conservatism and paternalism within the Society is one that would not disappear
despite the new commitment of the ABHMS to Black education.

The primary questions in the study of the history of the American Baptist Home Mission Society in relation
to Black colleges are: what motivated this group, who refused to make a strong commitment to the abolitionist
movement, to become supporters of Black education in the South; was the ABHMS able to live up to the ideals which
it espoused to its followers; and was its involvement with Black education beneficial to African Americans? In order
to address those questions, this paper focuses primarily on two issues: ABHMS policy on Black education and issues
of power and control between the Society and African Americans.

American Baptist Home Mission Society involvement in Black education began near the beginning of the Civil
War. In 1862 two men who had led the fight to expel slaveholders from the Baptist mission societies in the 1840s also
took the lead in establishing a freedmen's department within the Home Mission Society (McPherson 1975, 154). In the
same year the Society set out with a goal to evangelize and educate ex-slaves. From the beginning of its involvement
in Black education, the American Baptist Home Mission Society was committed to providing African Americans with an opportunity to receive a higher education. The ABHMS believed that African Americans needed to be educated if the South was to be won for Christianity. It hoped to make a "homogeneous Christian people" out of the heterogeneous population of the United States (Home Mission Monthly 9 1887, 40). According to James McPherson, Northern missionaries saw providing schools as a way of atoning for White sins against Blacks. White Northern missionaries as well as some African Americans hoped to incorporate Anglo-American ideals of citizenship, religion, and family into Black culture. In their view, the only valid American culture was the Northern Anglo-Protestant culture. H.L. Morehouse, Executive Secretary of the ABHMS defined the goal of missionary education as "America in the Negro" (McPherson 1975, 184). Education was perceived as a way to control the assimilation of the African American population into Anglo-America.

The goals of the Society were deeply rooted in its beliefs about African Americans and in the importance of religion in the members' lives. Thomas J. Morgan, editor of the Society's Baptist Home Mission Monthly and a former leader of Black troops during the Civil War wrote several articles on African Americans which were published in the journal. Morgan's writings reflect the ways in which the thinking of Society members both differed from and was similar to general Euro-American modes of thought during the late nineteenth and early twentieth centuries. Morgan and other Northern missionaries believed that slavery had a severely negative effect on African American morality and spirituality, prompting the belief that African Americans were hedonistic, child-like, and in need of white leadership. In "Africans in America," Morgan argued that slavery left no place for the recognition of manhood and womanhood; "it made no provision for the cultivation of self-respect, industry, thrift, intelligence, enterprise, [nor] independence" (Morgan 1897, 395).

The crux of ABHMS commitment to Black education lies in the final passage of Morgan's essay "Africans in America." In it he wrote:

Without any doubt one of the great questions that will insist upon solution during this century [the twentieth] will be that of the proper relation of the Africans in America with their white fellow citizens. The Negroes... are here to stay. They will remain an integral part of our national life. They will exert a tremendous influence, for good or for evil. There is every reason that they should be educated and Christianized. If the white people do not lift the black people up, the black people will pull the white people down. It is manifestly to the interest of the white people themselves to do everything possible to foster education and Christianity among the Negroes, and to prepare the rising generation not only to become self supporting, but to become efficient factors in promoting the common welfare of the nation (Morgan 1897, 403).

Morgan believed that as human beings African Americans were equal to European Americans, but without the influence of Whites in the new century, the effects of slavery would lead them astray. This, Morgan believed, could be the downfall of both White and Black Americans.

While Morgan's description of Black personality is clearly stereotypical, it differs significantly from the ways in which Southern Whites were describing the people who they claimed to know and understand as no White Northerner ever could. By the 1890s when Morgan provided his assessment of Black personality, White Southerners had begun to characterize Blacks as dangerous, subversive criminals in need of strict codes of control. Morgan embraced stereotypical images of African Americans as dependent and docile as part of his justification for their education.

While the ABHMS claimed that it was trying to prepare Blacks for independence and gave some control (primarily over churches and grammar schools) to Southern Blacks, some of its other actions call into question whether or not it always acted in the best interests of the people for whom it claimed to serve. For example, Charles Becker, a White Home Mission Society selected president of Benedict Institute in South Carolina, had repeated disagreements with a leading Black minister, Edward Brawley. Brawley advocated for more Black teachers and a local Black board of trustees. Becker responded to Brawley's demands by writing to Secretary Morehouse at the ABHMS that Brawley's idea of a local board of trustees was absurd, stating that "There is not a single man [among the black preachers] aside from Brawley who can speak two consecutive sentences correctly. . . . If I see a little more of the ignorance and
degradation of these people. . . I think I shall give up work in sheer despair" (McPherson 1975, 285-87).

A case in Georgia illustrates yet another thwarted effort of African Americans to gain more influence in the running of Black schools. In the 1890s, Black Baptists were demanding an increased leadership role in Atlanta Baptist College and Spelman Seminary. One of the leaders of the Black Baptists and advocate for Black controlled education was E. K. Love. Mr. Love had several reasons for the need for an increase of Black power and leadership at Black colleges. He argued that White teachers did not have a genuine belief in racial equality and therefore could not stimulate Black pride in their students. He also asserted that White control deprived Blacks of responsibility and hindered them from developing self reliance (Range 1951, 110). In 1899 Love, upset that the re-organization of the Board of Atlanta Baptist College did not give Blacks more representation, founded a Black run college in Macon, Georgia (Brawley 1970, 171).

For its part, the American Baptist Home Mission Society attempted to deflect Black calls for control. Morgan expressed the reluctance of his organization to turn over control of colleges in a number of editorials and letters to Black Baptist conventions. He believed that those Northern missionaries who had aided in founding Black schools should be rewarded with leadership positions. They had, according to Morgan, helped Blacks at a time when they could not help themselves. He argued that while "the Negroes have made great progress . . . the white race . . . have made far greater progress" (Morgan 1897, 338). Morgan went on to argue that Blacks had not reached the same stage in civilization as whites. Moreover, Morgan wrote, the Home Mission Society had made every effort during its tenure in the South to cooperate with Blacks and give them every opportunity to gain experience for the purpose of assuming responsibility. He noted that over half of the Black schools aided by the ABHMS were under the exclusive control of Blacks. Furthermore, Morgan asserted that the greatest unkindness that could be done to Negroes at their present stage of advancement would be to turn over to them absolutely all of the schools that have been established and maintained for their benefit; they are not yet prepared fully, financially, or otherwise, for this responsibility (Morgan 1897, 339. Emphasis mine).

Morgan and other White philanthropists felt that as long as the schools were reliant upon money from the ABHMS, the Society should retain chief control over the management of the schools.

Morgan made a number of statements which deserve attention. If one ignores Morgan's ignorance of African civilization and slave culture which was the norm for his day, his editorial still contains several objectionable assertions. First, the history of the ABHMS does not support his claim that they made every effort to cooperate with southern blacks in gaining responsibility for their education. In fact, the ABHMS seemed to perceive Black efforts at independence as an affront and threat to its Southern work. It seemed absurd to the ABHMS that it channel its money through Black organizations, although it wanted Black groups to channel money through the ABHMS (Washington 1986, 79-80).

While Northern White missionaries were indeed important to the founding of Black schools, at no time did it appear that African Americans depended completely upon Whites to build their schools, provide teachers, nor for financial assistance. In fact, the Home Mission Monthly reports and editorials often made special reference to Black contributions to the establishment and maintenance of ABHMS schools. Black schools could not have been established or sustained without African American support (Anderson 1988). Understandably, many Blacks sought to have a significant say in the administration of schools teaching people of color. It seemed impossible to many Black Americans that they would ever be able to assert their personhood if they were not even able to run the affairs of Black institutions. Furthermore, the paternalistic attitude of many of the White missionaries led Black leaders such as T. Thomas Fortune to wonder if "the black man had any manhood left after the missionaries and religious enthusiasts had done picturing. . . his debased moral and mental condition" (McPherson 1975, 187).

The Home Mission Society was not able to ignore the continuous pressure put upon them by members of the Black community, students, and in a few cases, faculty to increase Black autonomy. Regardless of whether or not Blacks gained complete control over faculty appointments and/or boards, the conflicts between Blacks and the Society did result in change. Through negotiations, concessions were made and Southern Blacks continued their involvement
in and influence on Black schools.

The ABHMS was not always able to live up to its ideals. It was often reluctant to share power with African Americans and used stereotypes to justify its reluctance. At times its actions seemed to undermine Black efforts at self determination and autonomy. The curricula established at the institutions were Eurocentric, except for a class on Negro life taught at Spelman, Atlanta Baptist, and Atlanta University on Negro Life in the early 1900s. The colleges, and the society that helped establish them, focused on education and left unanswered questions of political, economic, and social oppression of Blacks. A reason for this is that it was assumed that if African Americans received an education they would become accepted and equal partners in American life. This of course, did not turn out to be the case.

The Home Mission Society attempted to provide African Americans with the best possible education by Northern standards. For the most part, Northern missionary sponsored schools were the only places where African Americans could receive a post-secondary education. The Home Mission Society believed that a select group of African Americans should be given as great an opportunity for learning as White students at Harvard and Yale. African American religious organizations did operate a small number of their own schools enrolling less than fifteen percent of Black college students (Anderson 1988, 240). Colleges established by the state governments in the South also existed but most of these schools lacked college-level courses and although managed by Black administrators and teachers, were strictly controlled by state legislatures (McPherson 1975, 269). Thus, schools established by Northern missionary societies such as the ABHMS offered a unique curriculum in terms of the type of education available to African Americans during the late nineteenth and early twentieth century.

The history of the American Baptist Home Missionary Society opens up a number of avenues for further study. The writings of the Society's leaders leave an impression of an organization with a complex and sometimes paradoxical racial ideology. In 1984 George Orwell described a concept he called "double think." Double think, according to Orwell, is the power of holding two contradictory beliefs in one's mind simultaneously and accepting both of them. The ABHMS seemed to accept notions of both Black equality and inferiority. Articles within one issue of the Home Mission Monthly might refer to African Americans as pickaninnies in one paragraph and ladies and gentlemen in another. Though the Society attributed Black inferiority to culture and the impact of slavery, they were never quite able to separate the concepts of environment, race, and culture. The relationship between the Society and Black community leaders and early Black college presidents also reveal their "double think" in action. At times the Society encouraged independence among Black men, yet seemed reluctant to relinquish control to them. An examination of the Women's American Baptist Home Missionary Society, a branch of the ABHMS, could reveal much about gender issues. Comparisons of Morehouse and Spelman offer opportunities to examine the impact of race and gender on the development of two Black institutions. Finally, the history of the ABHMS reveals the complexity of race, gender, and class ideologies during the late nineteenth and early twentieth centuries.

In recent years, observers of publicly-supported schooling have come increasingly to view such education from the perspective of its role in individual and societal development. Nowhere is such a viewpoint more illuminating than in the case of American common school formation in the first half of the nineteenth century. As historians like Lawrence Cremin, Carl Kaestle, and David Tyack have repeatedly pointed out, one of the major results of the foundation and development of such institutions was the socialization of immigrants into American life and culture (Cremin 1980; Kaestle 1983; Tyack 1967, 1974).

The unique character of America as an immigrant society throughout the nineteenth century made this task especially critical. Between 1830 and 1840, nearly half a million immigrants, mainly from Britain and Western Europe, came to the United States. By the end of the century, the intake of immigrants was around 500,000 annually, and the migration pattern had shifted first to Central, Southern and Eastern Europe, then the Mediterranean and East Asia (Bureau of the Census 1976, 106-08). Only with the passage of the restrictive Johnson Acts in the 1920s did the flow decrease significantly.

Israel in late twentieth century, like America in the mid- and late nineteenth, is demonstrably a society of immigrants. While immigration to Palestine was relatively limited until after the First World War, it expanded dramatically in subsequent years, so that nearly half a million people arrived between 1919 and the eve of statehood in 1948 (Central Bureau of Statistics 1969, 112-13). This, however, was only the beginning. In the following two and a half years, 687,000 immigrants, the majority of them having European origins, entered the new state. Over the next four decades, these were joined by another 1.6 million, coming initially from the Arabic-speaking countries of North Africa and the Middle East, and more recently, from Ethiopia and the former Soviet Union (Central Bureau of Statistics 1994, 176-77).

While both nineteenth century America and twentieth century Israel have been immigrant societies, the roles of formal schooling in immigrant socialization have been significantly different. In the United States, a form of state-supported and controlled universal education, the common school, took on primary responsibility for the assimilation of newcomers into the society. Israel, in contrast, chose not to develop a single comprehensive system of schools. Instead, it opted for state support of multiple educational arrangements with significantly different characters and cultures. At the primary level, the majority of children have attended "state Hebrew schools" that are roughly analogous to public schools in the United States. Some families, however, elect to send their youngsters to "state Hebrew religious schools" that emphasize the fusion of the Hebrew-Zionist ideology with Orthodox religious tradition and observance. Others choose to support "independent schools" that are affiliated with non- (and occasionally, anti-) Zionist Orthodox groups, and offer an intensely conservative religious education in gender-segregated classes. Finally, both Arab and Druze Israelis have their own schools in which the medium of instruction is Arabic and the curriculum is geared to the culture and needs of these communities (Facts About Israel 1992, 158-59). These latter even operate on a different calendar than the Jewish schools, making any sort of common activity virtually impossible.

Secondary education is similarly heterogeneous. While most young Israelis attend general academic schools, more specialized institutions have been founded to offer agricultural instruction, as well as train future career soldiers and military technical specialists. Secondary-level yeshivot, the majority of which serve a population of male boarders, have provided intensive religious instruction along with a more secular curriculum (Facts About Israel 1992, 160).

This institutional diversity has created a markedly different educational ecology than that of the United States. Although the Ministry of Education has always exerted significant control over large segments of the curriculum, the cultures of different categories of schools have been widely divergent. Although a Hebrew common denominator of basic culture and some elements of unique Israeli social behavior have developed, such a diffuse educational sector has not (and probably, could not) exert the powerful social influence of more standardized American K-12 education.

To assert that Israel lacks a culturally coherent school system, however, is not to say that there is no analog within the society to the American common school and its mission of assimilation and nation building. In Israel, this
The Israel Defense Forces has, since its inception, been the most universal social institution to be found in Israel. For men, there is near universal conscription after completion of secondary school for three years of service. Only some yeshiva students are exempted, although the period of service for certain special groups (e.g., immigrant inductees over the age of 26) serve for shorter periods of time. About 85 percent of the males in any given annual cohort are inducted, with about 3.5 percent of those remaining rejected because of severe illiteracy (Gal 1994a; Schiff 1986, 104–105). It is noteworthy that many with medical conditions that would be grounds for automatic rejection in most military establishments routinely serve in non-combat roles in the IDF, an indication of the degree to which participation in this comprehensive socializing institution is promoted (Gal 1994b, 21). Annual reserve service for men (about 30 days annually) continues until their early fifties: one result of this is that many develop some of their closest friendships with other members of their military units (Facts About Israel 1992, 73).

Jewish women, too, are subject to conscription, but exemption categories are broader, and include marriage or formal engagement, or less than a primary school education. The largest category of those exempted consists of women who declare that their "religiosity prevents them from serving in the military." Around 60 percent of the women in any age cohort actually are inducted. However, half of those exempted choose to volunteer for one to two years of national service (Gal 1994b, 21).

It is small wonder that the IDF is a major social influence within the Jewish state. The overwhelming majority of Israeli citizens have been shaped by its culture. Lack of discharge papers makes employment, education, or advancement difficult, and civil society frequently evaluates individuals on the basis of rank achieved or the prestige of units in which they served (Schiff 1986, 104).

All of these factors are indicators of the extent to which the Israel Defense Forces functions as both cognitive and cultural educator within Israeli society. Accounts of army life make it clear that both its formal and informal cultures exert a powerful influence in socializing the young and recent immigrants into the national culture, as well as providing them with wide exposure to the nation’s heterogenous population. Emphasis on loyalty to the group, a strong motivator on the battlefield, as well as the informal relations between officers and enlisted personnel, and the expectation of a high level of institutionalized concern for individual welfare are all examples of attempts to utilize the military culture to inculcate important civic virtues (Gal 1994a; Pa’l 1994; Wolf 1989).

Within the army, a significant part of this task historically has been the responsibility of the Education and Youth Corps (formerly, Education Department). Utilizing an organizational table unlike that of many military services, the IDF has separated training and education into two distinct units. To the former belong the classic military tasks of providing instruction in areas having direct military applications. The Education and Youth Corps has been more concerned with the sorts of general education that characterize civilian schooling. The result has been what amounts to an almost totally unique entity among modern military forces, a formal agency that concerns itself with the development of highly motivated soldiers who will become, as a result of their term of service, even more productive members of the nation. In the words of one recent Chief Education Officer, one purpose of the Army in general and the Education Department in particular was to "maximize the potential of its members" (Perlmutter 1969, 69-79; El 1994).

Here, our concern will be with the history of this corps’ formation and development from the establishment of the Israel Defense Forces in 1949 until 1967. Responding to particular social and cultural needs created by the rapid growth of the State of Israel and wider socio-political forces operative during these years, it established itself as a major agency of cultural formation and transmission within Israeli society. Thus, it established itself as the Jewish state’s "common school," taking on the task of assimilating immigrants and socializing children to the national culture with at least as much intentionality as did the American common school.

The roots of the IDF’s Education and Youth Corps are to be found in the pre-state underground military units: Haganah, Palmach and Irgun. Each of these had political officers whose role was one of morale building and the creation of a political consciousness, especially within the officer corps (Rothman 1972, 158–59). In many ways, the model was that of the political commissar in the Red Army.

With the creation of the State of Israel on 14 May 1948, a military establishment sprang into existence to meet
the threat of imminent invasion from Israel's Arab neighbors. Pressing personnel shortages demanded the immediate recruitment of recent immigrants, sometimes literally taken from the boat and sent to the front with only a few hours training in weaponry and rudimentary Hebrew. The critical nature of the latter was shown in the accidental killing of an American volunteer, Col. David Marcus, by a nervous recent immigrant unable to understand Marcus's reply to his challenge (Luttwak and Horowitz 1983, 52). Under Yosef Krakovi, the fledgling army established a "cultural services" unit that operated at the brigade and battalion level, to provide basic language instruction and activities geared toward morale building (Bar-On 1992).

Regional geopolitics made it clear that Israel would have to maintain a standing army. National security concerns, local and international politics, and the positive experience of Chief of Staff Yigal Yadin, an archaeologist by training, with the Swiss model all moved Israel in the direction of a "people's army" consisting of a core of professional careerists and a very large standing reserve (Bar-On 1994).

With the passage of the Defense Service Bill in August, 1949, by the first Knesset, the framework of an army in service to society was set. Prime Minister David Ben-Gurion proposed that it should act as a citizen-maker and assimilator of immigrants, as well as serve as a model of fraternity and collaborate with the national youth movement (Perlmutter, 1968). One month later, in September, 1949, Ben-Gurion met with Minister of Education Zalman Shazar, Army Chief of Staff Ya'acov Dori, and the children's poet Aaron Ze'ev to create army educational structures (Dagan 1992).

The initial structures of both the army and its Education Department were grounded in the socialist origins of the state. Bitter experiences with oppressive military structures in Eastern Europe, coupled with fear of the threat that a military caste might pose to the fledgling democracy, led Ben-Gurion and the other founders to assure that the military would always remain firmly under civilian control (Ben-Meir 1995). Besides formal legislation designed to serve this purpose, Zahal structures themselves were designed to diminish the army's political power within the society. Overt political activity by active duty soldiers was forbidden. A system of rapid promotion that would have most officers achieve significant rank and retire by their mid-40s helped to thwart the development of a Junker-style officer caste.

Besides such checks put on the IDF's potential for control of civil society, the army was also given the positive role of taking on tasks that civilian institutions were unwilling or unable to fulfill (El 1997). This was a natural role for the IDF, given the central role of military defense in the national life and, as a result, the intimate relationship between the military and the rest of Israeli society. Immigrant assimilation, for example, was a fundamentally civilian issue but one with profound military implications. So, it was logical that the military would involve itself with this issue.

At the same time, the ideology of a "people's army" inherited from the pre-state Haganah and Palmach encouraged the IDF's understanding of itself as being in service to society rather than standing apart from it. As Chief of Staff Yigal Yadin forcefully argued at the time, the issue was whether to create an army from 600,000 selected Jews who resided in the country before the war of independence and treat the others as garbage or to conceive of the problem of the IDF as part of the problem of a state that is absorbing immigrants with all the attendant difficulties and dangers (Schiff 1974, 54).

All of these factors, political and ideological, helped to create an army linked to society in a fairly unusual fashion. It was in the context of this vision that Ze'ev, Ben-Gurion, and Dori designed the Education Department. Ben-Gurion, especially, was insistent that the whole army be intertwined with the wider society like Nahal, the movement that combined army service with the establishment of new kibbutzim on the frontier. Fundamentally, the army was to be a social as well as defense agency (Bar-On 1994).

The unusual choice of Aaron Ze'ev to head the Education Department indicates how unique this new army's educational establishment was to be. A charismatic children's poet who, as one contemporary has commented, "walked through the world with a magic wand" (Tzvion 1994), Ze'ev served as Chief Education Officer from 1949 to 1963. Although criticized by some as an uncompromising socialist, he brought to the department a visionary perspective that sustained it through its early years. His personality also was a major factor assisting him in recruiting highly talented officers into his unit, and obtaining the resources necessary to create programs.
The Education Department's greatest task in its early years was the remedial education and assimilation of immigrants. Hebrew language instruction became the centerpiece of these educational efforts. This was due, in large part, to the almost unique situation in the twentieth century in which the overwhelming majority of the citizens were not native speakers of the national language. The problem was compounded by dramatic increases in Jewish immigration from the Arab world, with over 120,000 new arrivals from these countries in the single year of 1951 (Central Bureau of Statistics 1994, 176).

Between 1948 and 1950 alone, 4830 soldiers received such Hebrew instruction under IDF auspices (Roumani 1978, 52). Over time, these efforts would blossom into highly specialized diagnostic testing as well as sophisticated intensive instruction in both written and spoken Hebrew (Wolf 1989, 67-68).

This Hebrew instructional program also served an indirect but very intentional socializing purpose. Exploding Jewish immigration from the Muslim world made both government and army concerned about integrating Sephardic Jews with their Arab-influenced culture into the overwhelmingly European Israeli culture created by the Ashkenazim who had dominated the society since its creation. Texts used to teach basic Hebrew did so via stories emphasizing desirable cultural values. In one, a soldier rushes to visit a comrade in the hospital only to find his entry delayed by visiting hour regulations. The friend, replying to his puzzlement, comments:

You get it [regimentation] everywhere. Isn't there regimentation in civilian life, too? You get up at a fixed hour and you go to work and at work there is regimentation again. You go home and there is regimentation at home too, and the same is true in restaurants and on public transport. It exists everywhere. Even though it is a little inconvenient, life is impossible without it (Koresh, 1955, 88).

Other stories in the same series promote cleanliness, awareness of Jewish and Zionist history, and the importance of seeing oneself as an Israeli rather than in terms of national origin or background (Koresh 1955, 20-21, 74, 78-9). Here, the tone and purpose of the texts greatly resemble those utilized by common schooling in late nineteenth America for similar purposes (Tyack 1967, 128-77; Elson 1964).

Addressing the cultural disjuncture and social tensions resulting from the massive Sephardic immigration also became part of the army's mission. Sephardic youth were rapidly becoming an underclass. In academic year 1964-65, for example, only about sixty-three percent of these teenagers entered secondary school and, of those who did, only about sixteen percent passed the university matriculation examination. More generally, around eighty-three percent of those in substandard or slum housing were Sephardim (Sachar 1996, 539-40).

At the level of individual units and commanders, special attention began to be paid to the particular needs of Sephardic immigrants, especially those whose families lived in poverty. It became fairly common, for example, for units to give soldiers from such families four to five weeks of leave at a time so that they could return home and take a temporary job to generate income for their families (Arad 1994). Officers were expected to visit the homes of their soldiers and provide whatever assistance was available. A commander of the officers' school, situated in a location where many of the residents were Sephardic immigrants, required that his largely Ashkenazic officer candidates spend some of their weekend leaves with Sephardic families to promote friendship and understanding on both sides (Pa'il 1994). In short, there was a general expectation that units at the grassroots level would actively try to promote understanding and interaction between the groups.

Several of the structures of the Education Department formalized these values as well. The initial language program at Camp Marcus became the seed of an extensive elementary educational program serving a largely Sephardic population. By the late 1960s, a General Order had established the requirement that every soldier complete elementary school by the end of national service, and that those coming from abroad complete the Israeli portion of the curriculum. Study of Bible, national geography, History of Israel, World History and civics in a program that consisted of 500 hours of class and seventy-five hours of extra-curriculars was designed to inculcate immigrant soldiers with Israeli cultural values as well as an appreciation of modern democratic society and the role of active participants in it (Roumani 1978, 54-56).

By 1954, the program had expanded to include an evening secondary education program designed for those whose education had been interrupted by World War II, the 1948 War, and the lack of educational resources in the
state's early years. Although participation in the secondary program obligated soldiers to an additional four months of service, those who sought promotion to NCO or officer status found the opportunity especially attractive. In 1965 the program was expanded to include a secondary correspondence division. By the end of the 1960s, students were even matriculated in a program designed to prepare them to sit for the university matriculation examination (bagrut). One requirement for eligibility is that the soldier come from a North African or Middle Eastern background, clear indication that, like the other programs, this one was aimed at enhancing the life chances of those young Israelis for whom educational advantages were least available (Roumani 1978, 56-62).

Along with such programs to serve disadvantaged youth, the Education Department concerned itself with other sorts of education that also reflected broader societal needs. On 29 October 1956, forty-three farm workers, unaware that a curfew had been changed from 7:00 to 5:00 PM, were massacred by the paramilitary Border Police at Kfar Kassem, an Israeli Arab village on the Jordanian border. Despite a defense that soldiers were simply following orders, several including the major commanding the unit received prison sentences at the court martial that followed. The military court established the precedent that a soldier not only was obliged not to follow an illegal order but had a positive duty to interfere with its execution (Luttwak and Horowitz 1983, 207-08).

It became the responsibility of the Education Department to develop materials and a curriculum to support the IDF battlefield ethic of "purity of arms." Initially introduced at the Officer School, such ethical study became a mandatory part of military education throughout the army, and every soldier was given a copy of the court's decision on the Kfar Kassem case upon his or her induction (Pa'il 1975, 1994; Bar-On 1992; Gal 1986).

This and similar projects occurred during the tenure of Mordechai Bar-On as Chief Education Officer from 1962 to 1968. Bar-On, a Columbia University-educated intellectual, sought to standardize the charismatic Ze'ev's programs, as well as develop new ones rooted in social research. For him, "Freud as well as Marx is important" (Bar-On 1992).

More broadly, the army undertook leadership training, especially for officers, utilizing current research in organizational psychology. An important part of IDF culture became the belief that the individual soldier needed a high level of understanding of his situation personally and as a citizen of the Jewish State in order to maintain the motivation necessary to fight as well as the personal autonomy required to make necessary decisions in battlefield situations (Rothman 1972, 161; Shalev 1994).

During this period, too, the Education Department began extensive involvement in what might be termed cultural education. Galei Zahal, the army radio station, had begun broadcasting during the War of Independence (Brosh 1992). Now, it underwent expansion to include music programming spanning the range of classical, modern and folk idioms. Fine arts activities undertaken both by Army Radio and the Education Department directly included the establishment of small theater groups and even an IDF string quartet, which had the additional benefit of allowing talented young musicians to spend their military service improving their musical skills (Bar-On 1992).

A unique activity instituted during this period was "Sunday Morning Culture." Soldiers returning from weekend leave, rather than being left to their own devices at staging areas to await buses to transport them back to camp, were instead taken to different venues for lectures, plays, concerts, and movies. For many, especially those from backgrounds of poverty, this was frequently the first experience of such cultural activities (Bar-On 1994; Novack 1994, 77-78).

The IDF also became a literary publisher during this period, sponsoring the publication of works by fifty classical authors (e.g., Dostoyevsky) in editions of 10,000. The army's weekly magazine, Bamachane (In the Camp) became a forum for a wide range of social and political viewpoints, publishing over 5000 pieces a year (Bar-On 1994; Roumani 1978, 44).

Reflecting the IDF belief that the primary educator within the army is the small unit commander, structures were created that placed Education Officers in brigades not so much to provide educational services as to be resources and catalysts for education by junior combat officers. These activities included discussions of Bible, ancient, and modern history done in conjunction with sites visited while on training exercises, as well as bi-monthly group discussions with soldiers on politics, culture, and international affairs (Pa'il 1994; Roumani 1978, 44). The goal, as always, was to inculcate national ideals and values as well as encourage young soldiers to be reflective about the society.
and world in which they lived.

Thus, the IDF's education structures were formalized and expanded during these years. So successfully were its activities viewed within the society that in 1965 the Education Department was awarded the annual Israel Prize for Education (Rothman 1972, 171).

From its inception during the War of Independence through the Six Day War, the Israel Defense Forces Education Department took on a function analogous to that of the American common school. While much of its activity was directed toward instruction in traditional curricular areas like language and history, its most important function has been to serve explicitly in a role that the IDF implicitly takes on as a whole. This is to function as the Israeli "common school," the one universal national institution with the task of socializing the young and recent immigrants into the culture and values of both the army and the wider society.

Like the common school, much of the effectiveness of the IDF and its Education Department lies in linkages with broader Israeli life and culture. Just as Mann, Barnard, Lewis and the other common school pioneers intentionally created an institution that would engage in such socialization, so did Ben-Gurion, Dori, and Ze'ev under the auspices of the newly-established IDF.

The Education Department, in a manner similar to the public school, has been both shaped by the fledgling nation that created it, and has served as both creator and articulator of that nation's culture and values. Thus, over time it has taken on specific tasks that have arisen as a result of civil and military exigencies. From the assimilation of immigrants to the propagation of key societal values, it has attempted to grapple with major national concerns, in the process helping to articulate and shape the country's culture.

It has been aided in this task by the unique role that the Israel Defense Forces has played in the Jewish State's life. Unlike the situation of the American military, but closely resembling the common school, the IDF has been since its creation a highly regarded institution in which the vast majority of the citizenry has participated. As a result, it has close linkages with the broader society that allow and encourage it to take on a major formational role within the nation. If Israelis have been willing to delegate such responsibility to the IDF and especially, its Education Department, it is because they, like American participants in public education, have experienced it in an overwhelmingly positive manner.

None of this is to say that problems are nonexistent. It can be argued that, in the 1950s and 1960s, the Education Department has engaged to a significant degree in a form of "cultural imperialism" in which Ashkenazic culture was trumpeted to the detriment of Sephardic interests (Bar-On 1992, 1994). In that, it mirrored Israeli society as a whole.

Within the Israel Defense Forces, the Education Department sometimes appears to have had questionable status. Most of its unit-level officers have historically been women, a serious issue in a highly male-dominated society. While one commentator has argued that the presence of such a large female contingent has benefited the Corps by making it so unique as to remove it from the usual status "pecking order" (Fisher 1997), it may also be the case that the gender imbalance has marked it as a comparatively low-status unit.

After the Ze'ev era, the Education Department traditionally has drawn its commanding officer from another branch of service, with the second in command usually being an education professional. The rationale appears to be that a commander from outside would have a wider view of the needs of the IDF and the role that the Corps might serve. Negatively, it might be argued that this has created a situation of "management by amateurs" with resulting instability, especially when the rapid turnover of Chief Education Officers is taken into account. What is especially interesting, though, is the further career paths of these commanders. Although not trained as educators, former commanders and senior officers have served in two cases as Director of Yad V'Shem, the Holocaust Memorial, as well as in the roles of Member of Knesset, founding Dean of Students of the Hebrew University, Director of the Jerusalem Theatre, and senior staff member of the United Jewish Appeal. What this suggests is that the sort of officer likely to command this Corps also has been likely to have both temperament and skills that lead to additional careers in educational activities.

The configuration of the army and its relation to the wider society present what is arguably the greatest future challenge. With genuine peace a foreseeable possibility for the first time in the nation's history, the question has been raised once again about the utility of universal conscription into a "people's army" rather than defense by a smaller cadre...
of permanent professionals. Were universal conscription to end, the army inevitably would cease to function as "common school." While the argument has been made that all ought to be inducted but for a shorter term of service, there is significant question about whether service of a year or one and a half years would be enough to allow for appropriate training to meet national security needs (Gal 1994a). Alternative national service provides an attractive option, but it is unclear that the heterogeneous experiences of those in the military and those in civilian occupations would foster the socialization into a common culture that has made the IDF such a potent force in Israeli life.

How any of these issues eventually will be resolved is unclear. What is obvious, however, is the degree to which the Israel Defense Forces, especially operating through its Education and Youth Corps, has served as the "common school" of a nation as young, volatile, and dynamic as was the United States during the era of common school formation. In this sense, it offers a unique opportunity for comparison and contrast with its civilian counterpart that can serve only to illuminate and sharpen the common elements of both, as well as the unique perspectives of each.

Endnotes

1Zahal is an acronym for Zva Ha-Haganah Le-Israel (Israel Defense Forces).

2Avraham Tzvion, one of these young disciples, named Ze'ev, along with Ben-Gurion and Martin Buber as one of the three most significant influences on his life. Tzvion eventually became commander of Camp Marcus, the IDF’s principal compensatory education facility, near Haifa.

3In Israeli military parlance, this is sometimes called the "great head" doctrine (as distinct from the "small head" centralized command approach of most modern armies).

4It is worth noting that, with the exception of Ze'ev's fourteen year stint, no Chief Education Officer has served more than five years, and three years is the mean average tenure.

5Yitzak "Tolka" Arad (1968-72) and Avner Shalev (1977-79) have directed Yad V'Shem, Bar-On (1963-68) has been a member of Knesset and political activist, Tzvion was the first Dean of Students at the Hebrew University, Gross (1988-91) directed the Jerusalem Theatre, and Dagan (1985-88) works for UJA.
In Rome, on the right bank of the Tiber just inside the Aurelian Wall, the Villa Farnesina stands as a remarkable remnant from the High Renaissance. Externally the villa remains quite modest in appearance, as intended by the architect Baldassare Peruzzi, even though it was built at the beginning of the 16th-century for one of the richest persons in Europe, certainly the richest man in Rome, Agostino Chigi. In this case, the modesty was programmatic and conveyed imperial aspirations. Because of his Christian name, Agostino identified with the Emperor Augustus who, according to Suetonius, lived in a modest house with an exterior not of marble but of peperino, the same material used on the façade of the Villa Farnesina (Divus Augustus, 72). But within, the decorations of the villa are, if not sumptuous, spectacular in their artistic refinement and elegance, a fitting testimony to the power of Chigi’s patronage and his standing with Pope Julius II, whose election to the papacy he may well have financed and whose patronage of Raphael he shared (Gilbert 1980, 75-76).

One of the villa’s rooms, the Sala di Galatea (named after Raphael’s fresco portraying this mythical subject) is particularly useful for understanding how ambitious families in the Renaissance went about manipulating or explaining the destiny of their children. The frescos on the upper walls and ceiling of this room use mythological subjects to describe the heavens on a particular day in the year 1466, the year in which Chigi was born. Using mythological subjects, Baldassarre Peruzzi, who in addition to designing the villa painted these frescos, placed the seven known planets of the Ptolemaic sky into signs of the zodiac to describe a sky that could have only presented itself on November 29 or 30, 1466. But the signs of the zodiac are supplemented with the symbolic representation of other constellations in the northern and southern sky. These add further precision to the horoscope cast on the upper part of this room, so that the sky portrayed is that which would have been seen in Siena, Chigi’s birth place, the evening of November 29, 1466, in the three hours between 9:20 PM and 1:00 AM. In fact, it is possible to discover even more precision in the ceiling so that the indicated time is narrowed to 10:25 PM and 11:00 PM (Quinlan-McGrath 1984, 91-105).

Whatever the artistic merits of these frescos, they are intriguing because of the way they use myth and astrology to precisely fix a moment in time. Was that moment in fact the time of Chigi’s birth? Verification seems to be possible in that from the time of the Black Death until the eighteenth century all Sienese infants were baptized underneath the Duomo in the Baptistery of San Giovanni and the baptismal ledgers still exist. In one of these, Mariano Chigi, Agostino’s father, has written in his own hand a notice which can be translated as follows:

Agostino Andrea son of Mariano Chigi was baptized on the thirtieth day of November 1466 and was born on the twenty-ninth day of said month at the hour twenty-one and one-half [i.e. 9:30 PM] and Giovanni Salvani was godfather (Rowland 1984, 192-193).

The written record and the celestial arrangement painted on the ceiling have a general correspondence, but the most precise reading of the ceiling places the birth of Chigi at least an hour later than what is recorded in the baptismal record. Why should there be even this small discrepancy given the precision of both the ceiling and the birth record?

Various explanations are possible: after the passage of forty-five years a failure to remember in Rome an event that took place in Siena; or perhaps the event was remembered but in a general way and not with the precision of the written record; or perhaps the astrologer who worked out the time of birth made a mistake or used unreliable timepieces. A more plausible explanation, though, comes from the confident belief among people of that time in the influence of stars on destiny. In the case of Chigi, although he was born at 9:30 PM under the waning influence of the constellation Leo, the influence of Virgo whose rising would not begin for another fifty-five minutes better explained the facts of his life. The ceiling would then have recorded both the exact time of Chigi’s birth as well as the more appropriate time for his birth. That is to say, the time of Chigi’s birth would have been rectified to place it under the right stars, namely those which best explain the course of his life; the virgin elbows aside the lion (Quinlan-McGrath 1984, 100-101).

This marvelous ceiling and the rectified time of birth it presents should not be considered the quirky affectation of an eccentric rich person who arrogantly wishes to reorder the cosmos. Mary Quinlan-McGrath who decoded the ceiling’s astrological message notes that “such rectifications were extremely common because the facts of the native’s
life were considered primary evidence in determining the correct birth date" (Quinlan-McGrath 1984, 100, n. 52). In Chigi’s case, the adjustment was less than a couple of hours, but adjustments of even several months were sometimes made. In fact, an argument can be made that the primary duty of an astrologer in the Renaissance when dealing with a birth date was to find a date proximate enough to the real date of birth, if in fact that was known, which would generate a horoscope corresponding as perfectly as possible with the client’s actual life. Happily, in some cases this could be done without cheating. But one can point to the examples of Luther and Pope Julius III, where the search for an appropriate date of birth had to range over a year or more. One historian of natural science dryly notes: "The only thing that astonishes us today is that such a procedure, which could not possibly escape attention, in no way impaired the trust the contemporaries placed in astrology" (Hartner 1967, 227).

Since the rectification of Chigi’s birth portrayed on this ceiling is modest, the ceiling may in fact be better regarded as exemplifying the Renaissance practice of providing two rising signs for a human subject, that occurring at birth but also that occurring at conception. Given that birthing is not instantaneous, determining the precise moment of birth is a troublesome question. Infinitesimally small differences in time allow for slight shifts in the heavens, which in turn produce different planetary influences. Hence whether birth occurs with the appearance of the baby’s head or the emergence of the feet is a matter of some consequence. One way around this problem used by Renaissance astrologers was to focus on the moment of conception, using the rising sign at the instant of conception to accurately fix the moment of birth. Some would even have argued the influence of the stars was more important at the moment of conception than at birth. Ancient wisdom from the astronomer Ptolemy could be called upon to support this position:

> "Since the chronological starting-point of human nativities is naturally the very time of conception, but potentially and accidentally the moment of birth, in cases in which the very time of conception is known either by chance or by observation, it is more fitting that we should follow it in determining the special nature of body and soul, examining the effective power of the configuration of the stars at that time (Tetrabiblos, 105)."

Needless to say, fixing the moment of conception is no mean trick. Folk wisdom offered some suggestions on how to do this, such as looking for light cramps after coitus. The most careful approach, of course, used by those especially intent on bequeathing the right stars to their offspring was to abstain for a month in advance of the propitious moment and then see whether the hoped for incarnation had taken place (Quinlan-McGrath 1984, 101, n. 57).

But for those not so careful or so restrained, the astrologers offered the possibility of precise mathematical calculations. In a wonderfully circular piece of reasoning, the approximate time of birth was used to fix the exact moment of conception and from that to work forward and determine an exact moment of birth. Not only did this fix the influence of the stars, but it also produced two rising signs that could be used to explain destiny, one for birth and the other for conception, or in Chigi’s case, Leo for his birth and Venus for his conception (Quinlan-McGrath 1984, 102-103).

We no longer live under a Ptolemaic sky, nor do we conceive the heavens as the perfect handiwork of God within which can be found the ideal model towards which human behavior should aspire (Hutchison 1987, 100-101). No longer are the planets endowed with human characteristics so that they are seen to be temperamental, crossing paths, or confronting one another. And although many contemporaries are entertained by astrology and know their birth sign if not the sign of their conception, generally speaking the influence of the stars is not used to explain human destiny, pace Nancy Reagan. But nonetheless, the thinking which tries to order the cosmos by getting the right moment of birth, even if ex post facto, features assumptions that are not strange to contemporary thought. The content has indeed changed, but the framework of belief that encourages attempts to order the cosmos for the benefit of personal destiny endures.

First, there is the belief that the determinants of destiny are external to the individual person. The stars and the planets fix the details of an individual’s biography. Astrology thus was regarded as the applied branch of astronomy (Smoller 1994, 15). In fact, the influence of the stars was believed to be so pervasive that a knowledge of astrology was a fundamental component of professional expertise in the late Middle Ages. Each sign of the zodiac, for example, ruled a different part of the body, which meant that a physician before administering treatment had to read the heavens
Not only did the universe have a marvelous unity binding the heavens and earth, but the heavens as the perfect handiwork of God were primary in determining destiny.

Second, this confidence in the efficacy of the stars provided, oddly enough, space for human initiative. Destiny could be manipulated by getting the right stars, either through good family planning in advance or after a blessed event through the efforts of a skilled astrologer. Since the stars were the ultimate cause of human events, if the stars could be touched as it were, human destiny could be manipulated. Moving the time of birth to the propitious moment had life consequences. Once the right stars are selected, the rest is star-destined.

Third, the system could not be proved wrong. The complexities of astrology were such that for every discrepancy between prediction and fact, the prediction could be corrected by noting factors that had not been sufficiently considered or had been overlooked. In this way the system of astrology was endlessly corrigeable and impervious to devastating challenge. For this reason, the actual events of life were conclusive in pointing to a particular moment of birth, no matter what may have in fact happened. If the noted and known time of birth did not produce a horoscope that explained the life as lived, the time of birth was changed. The order of the cosmos was maintained by simply altering a biographical detail.

Even though we have largely left behind the effort to alter or explain destiny by laying claim to the right stars, the interest in arranging beneficial life chances for ourselves or our children remains a strong motivation in our culture for deliberate action. But rather than ordering the cosmos by selecting a time of birth to get the right stars, the modern, apparently more rational approach, is to select a place of residence to get the right schools.

In 1993 the Chicago Tribune ran a series called "Moving Out" which examined the relocation of Chicago residents from within the city boundaries to the outlining suburbs (Chicago Tribune 1993a). The Tribune reported that approximately 60,000 Chicagoans left the city limits in 1992 with two of every three households relocating to the suburbs in the Chicago metropolitan area. Hence two-thirds of those who moved out really did leave Chicago the city, but not Chicago the metropolitan area. In preparing their story, reporters from The Tribune surveyed 3,000 people from the 16,000 households who migrated out of Chicago between April and October, 1992. While only thirty-one percent of the survey participants had children under the age of 19, four of every five of these families specified better education and safety as the main reasons for their move.

In the second part of the series, the Tribune printed personal statements from those who had relocated. Four responses in particular demonstrate the modern approach to determining destiny (Chicago Tribune 1993b):

- Time for my daughter to go to kindergarten. No Chicago public schools for us, thank you.
- The Chicago Public School System chased me out of Chicago. I could not see paying all that school tax and not feel safe sending my child to a Chicago public school.
- The birth of our son caused us to leave. If we hadn't had a child, I don't think we would have moved out. We had a lot of reservations about city life. The biggest thing was the schools. It sort of seems like everything in the Chicago public school system is headed in the wrong direction. If we had moved in Chicago, I felt we were going to have to move five years later when Grant came of school age.
- Factor in two kids in private school at $7,500 per kid per year, and you’ve more than justified the economics of moving to the burbs.

These comments do not seem strange nor would the sentiments expressed be regarded as peculiar to the inhabitants of Chicago. In fact, an item of consensus among economists who examine contemporary relocation patterns is the important influence the quality of public services, such as the local public schools, has in shaping the family decision to move (Varady 1986, 20). In twentieth century America, changing residential location to gain access to the right school is an understandable motivation and an acceptable explanation for severing ties with a familiar neighborhood and beginning life in one that is strange. In some cultures, deeply cherished values such as being rooted in a place or living out family traditions precludes the instrumental approach to residence which permits choosing a place to live based on the availability of schools of a certain type. In fact, the concern for getting the right schools for one's children, starting with kindergarten and working up, can be commended in contemporary America as taking the...
responsibility of parenthood seriously by enhancing the life chances of one's children. The ability to relocate for access to the right school is an identifying characteristic of those who fully participate in the American dream, the advantaged; likewise, not being able to relocate at all marks the disadvantaged. And for the truly advantaged, the Holy Grail sought through the pursuit of the right elementary and secondary school is admission to the right undergraduate college. With that accomplished, the cosmos has been properly ordered and the influence now not of Mars and Venus but of New Trier and Princeton can be counted on to produce a happy and prosperous life.

How rational is this approach to ordering the cosmos? Or, to make this question more particular to the present discussion, is this approach to shaping destiny more rational than selecting the right stars?

Of course, this question in a fundamental way defies answering since all depends on the destiny which is desired and that will vary with the individual person. In this sense, destiny is like pleasure which Aristotle says "is regarded differently by different persons, and varies according to the habit of individuals" (Politics, VIII, 3). So at this point, we need to proceed on the basis of a major, even if quite reasonable assumption, that the destiny to which getting the right schools is instrumental is economic well being. Given that, how rational is it to pursue economic well being through getting the right schools?

There is certainly a substratum of rationality to this approach in that more schooling, i.e. staying in school, at least up to a point increases the chances for economic well being. And it cannot be denied that some secondary schools send more students on to college than do others. But as Christopher Jencks pointed out many years ago, this may have less to do with the quality of the school than with the high standards and aspirations of the families of the students enrolled. The culture of the middle class perpetuates the assumption that one must stay in school to be successful. Jencks noted, contrary to popular belief, that "living in the right school district seems to make relatively little difference to an individual's educational attainment" (Jencks 1972, 148).

But what about those who do graduate from college? Are their life chances improved? The economist Andrew Hacker has recently pointed out that "having a college degree yields a man aged thirty-five to forty-four an average income of $57,196, compared with the $32,689 for men who only finish high school" (Hacker 1997, 217). An average difference in income due to different amounts of schooling of almost $25,000 is not insubstantial. But differences between income averages leaves considerable room for variations among subsets and individuals. For example, in the study used by Hacker, twenty percent of those who have only high school diplomas were making over $40,000, while almost thirty percent of those with graduate degrees were earning less than that amount (Hacker 1997, 217). Getting the right amount of schooling for some leads to upward mobility, but for others the result is mobility in the opposite direction.

But beyond getting the right amount of schooling, how does getting the right schools affect destiny, again construed in terms of economic well being? Let us assume that the effort to get the right school eventually aims at admission to one of the most selective undergraduate colleges, namely those institutions of higher education in a position to select for admission the best high school graduates in the country. A standard list would include Amherst, Brown, Columbia, Cornell, Dartmouth, Duke, Princeton, Stanford, Williams, Yale, and the University of Pennsylvania. Since these are the most selective schools and are in a privileged position of admitting the most highly talented high school students and would figure prominently as the college of choice for graduates of the nation's best high schools, the graduates of these institutions should be, as the good souls in the after world described by Plato in The Republic (Book X), in the best position to capture the best destiny. But as Andrew Hacker notes, "When we look at the graduates of selective colleges, say, thirty years later, the results are disappointing" (Hacker 1997, 209). In justifying this claim, Hacker examines leadership in the corporate world. Of the one hundred largest corporations and financial firms, in only eleven cases were their chief executives Ivy League undergraduates, and of these eleven, three had studied engineering at Cornell (Hacker 1997, 209). Interestingly, Amherst, Brown, Columbia, Duke, Stanford, and Williams produced not one of these one-hundred CEOs. Eleven state universities were able to claim two each. As Hacker notes, "campuses in Kansas, Idaho, and Iowa surpassed most of the highly selective schools" (Hacker 1997, 209). If, then, getting the right schools means eventually to get into one of the Ivies, and if destiny is associated with economic well-being, even with economic prowess, then the logic of this approach is shaky at best. Hacker provides a stark summary: "Thus, if
we take as our pool all male Ivy graduates who are now in the age range of current CEOs, it emerges that less than one-tenth of one percent of them have reached the summit of the corporate world" (Hacker 1997, 209). If we changed the content of destiny to, say, excellence as a philosopher or a poet is there reason to expect that the results would offer more assurance that the right schools guarantee destiny?

The attempt to order the cosmos through getting the right schools is supported by the same belief structure that led individuals during the Renaissance to seek the right stars. First, consider the belief that determinants of destiny lay outside the individual person. Schooling rather than stars is now seen to determine fate. In either case, destiny is shaped by external elements external to the individual. In the contemporary scene, destiny depends on schooling, on teachers and instructional resources that have been the maturing individual’s environment. Particularly important have been those teachers and school staff who participated in the final campaign for admission to a select college. Whether the empyrean is filled with stars or schools, the universe remains harmonious. In the one case, God’s design was writ large in the heavens so that earthly events satisfy an eternal plan; in the other success is regarded as the expected and even just result of good schooling. In the latter case, getting the right schools is socially and ethically a far more appropriate way to success than, say, winning the lottery.

Second, confidence in the external determinants of destiny leaves space for human initiative. In the case of the schools, the initiative can be quite determined. The act of physically moving from city to suburb is no small event. Geographic location is only the first step which subsequently must be supplemented by the cursus honorum of appropriate activities and experiences so that when the time comes to apply for a select college, the student’s career will seem both well-rounded and interestingly diverse, even exotic, to capture the attention of the admissions committee.

Third, the system could not be proved wrong. The straining to get into the right schools produces results that are often quite ordinary. Hacker observes that "anyone who has attended reunions of Ivy League graduates cannot help but be struck by how many of these alumni end up with middling middle-class incomes and quite commonplace careers" (Hacker 1997, 217). Nothing wrong with that, of course, except that the aspirations were much more grand. On the other hand, exceptional careers come to some who went to unexceptional schools. This is to be expected in a society which allows and preaches social mobility. Getting into the right schools is hardly more effective in attaining a sought after destiny than changing ones date of birth. But that does not challenge the efficacy of the belief that schools are connected to destiny. When that connection breaks down in an individual’s biography, the results can be easily explained: poor effort, bad luck, loss of interest. The belief is preserved because the individual or chance events are at fault.

The practice four hundred years ago of altering one’s birth date to get the right stars may seem odd or silly to the contemporary, post-Enlightenment observer. But what about four hundred years into the future, will the practice of uprooting family and migrating from the cultural centers of our civilization to the banality of suburban sprawl in order to get the right schools seem equally odd and silly to that future observer? Perhaps, but silliness is not our common bond with the Renaissance. Rather a common, enduring characteristic of our culture is the belief that somehow the cosmos can be ordered for an individual’s benefit.

Editorial Policy: The Journal of the Midwest History of Education Society is devoted to the reflective examination of educational issues and problems from the perspective of diverse disciplines. With the Journal, the Midwest History of Education Society encourages communication among scholars of varied disciplines, nationalities, and cultures. Papers published in the Journal discuss comprehensive issues and problems confronting educators throughout the world.

The Journal has published authors from disciplines ranging from political science to philosophy to marketing to instructional technology to adult education. Its editorial board consists of a diverse group of professionals who referee articles according to their expertise. While the main criterion of acceptance consists in a well articulated argument concerning an educational issue, the editors ask that all papers offer a historical analysis. Authors should contact the editor to receive a copy of the style sheet before writing the paper.

Articles published in the Journal do not necessarily represent the views of the editor, the editorial assistants, the members of the Society, or the University of Dayton. The authors of the articles are solely responsible for the accuracy and truthfulness of their work. The authors are solely responsible for ensuring that they do not infringe on copyright, violate any right of privacy, and do not use libelous or obscene language.

Articles appearing in this journal are abstracted and indexed in
Historical Abstracts and American: History and Life.
Several people made possible this issue of the *Journal of the Midwest History of Education Society*. The Provost of North Carolina State University, Dr. Kermit Hall, supported the project generously. The authors whose papers appear in these pages offered work of the highest quality. The editorial board and the associate editors worked diligently and carefully.

The *Journal* offers an important outlet for mature scholars and for students beginning professional careers. In these pages, as at the annual meeting of the Society, papers of all types appear together each reinforcing the other.

In studying the Little Rock school desegregation crisis, it is important first to analyze the relationship of the US Federal Government to Arkansas' state and local governing bodies. Without clarifying each's defined roles and powers, one cannot fully appreciate the complexity of the crisis.

President Dwight D. Eisenhower's Attorney General Herbert Brownell states it was the guidelines in Brown II (May 31, 1955), "With All Deliberate Speed", which gave authority to the Executive Branch, the Department of Justice, and other branches of the federal government to become involved with the crisis. However, Brownell carefully states (Brownell 1993) that those analyzing 1950's school desegregation cases must remember that the federal government was powerless to initiate any action unless the local school district first submitted a desegregation plan to their respective federal district court.

Brown II mandated school desegregation but, wanting to grant school districts a certain amount of freedom in implementing the new policy, it provided the districts with some flexibility in developing plans to submit for federal district court approval. A school district might, for example, attempt a sincere effort at desegregation — but if it met strong community opposition, the federal government would be powerless to aid the district if it did not first have in place a court-approved desegregation plan. Brown II divided the responsibilities of the development and approval of desegregation plans equally between the local governments (i.e. school boards) and the federal government.

Brownell (1993) illustrates the complexity of this dilemma by citing the 1956 Mansfield, Texas desegregation case in which Texas Governor Allan Shivers used Texas Rangers to keep African American children from attending an all-white Mansfield public school. As events turned out, the African American students didn't even try to enter the school (Bartley 1969), and, after this episode, district school authorities sent the students back to segregated schools. Brownell describes the legal complexity of the Mansfield situation:

We were powerless to intervene, however: in the federal court that might have led to circumstances in which the Justice Department could be called in to enforce the federal court's decision...Commentators often miss the distinction between the Mansfield situation and the later episode in Little Rock" (Brownell, p.204,1993).

Had the Mansfield School Board followed the legal guidelines of Brown II, there would have been grounds for federal intervention. As it turned out, however, this Texas community learned that Eisenhower or the Justice Department could not simply command a school district to desegregate. With 1956 a Presidential election year, Eisenhower no doubt was relieved by the School Board's oversight.

Many school boards in the South gained an opportunity to learn even more about the legal complexities of school desegregation from the Hoxie, Arkansas case. Anderson (1964) describes the effects of the 1955 desegregation incident as it reverberated through this Eastern Arkansas town and the US Department of Justice. Segregationists in Hoxie initiated a campaign of harassment and student boycott that was so effective, that at one point officials closed the schools for lack of students. The Hoxie School Board countered the segregationists' strategy by filing for a federal injunction against interference in the desegregation process, and the schools, in turn, re-opened. This action by the elected school board allowed twenty-five black students to join the thousand whites in the local high school, thus ending the awkward and expensive practice of shipping the students to a neighboring district with a black high school. The mayor of Hoxie explained why the town's leaders had reached their decision: "It's the law of the land, it's inevitable, it's God's will, and it's cheaper" (Ashmore, p.113, 1994).

The Hoxie case began to incite even more a traditional white supremacist mentality, especially in this eastern, Mississippi Delta region of the state.

Orval Faubus, who at this time was serving his first two-year term as governor in Arkansas and was facing an election in the Fall of 1956, recognized this as a hotbed of political controversy in which he didn't want to get involved. Consequently, he took only the smallest steps, desegregating the state's Democratic Party and some Arkansas universities, and increasing salaries for African American school teachers. Faubus went on to win his second term as
governor in the heated but easily won 1956 election against James D. Johnson (Ashmore 1997), a fervent segregationist. Faubus neither attacked nor supported the renewed extreme segregationist spirit some Arkansans felt after the 1955 Hoxie incident.

Faubus would not offer encouragement even to Arkansas' state's rights supporters in the state's legislature (an organization known as the "State Sovereignty Commission"), a group that advocated the philosophy of "interposition." Adopted to challenge federal attempts to segregate their schools, interposition was the "constitutional" device of choice of the legislatures in Alabama, Georgia, Louisiana, Mississippi, and South Carolina. Wrapping themselves in the banner of states' rights, southern governments sought to interpose the Tenth Amendment between the federal courts and their segregated schools (Mann, p.160, 1996).

To insure success with the 1956 electorate, Faubus "endorsed segregation, as did all other Arkansas politicians" (Murphy, p.37, 1997). Because of his moderate stance on segregation, Faubus enjoyed the support of the state's liberal Democrats and the Arkansas Gazette for both his 1954 and 1956 gubernatorial campaigns.

Faubus' decisive 1956 election victory should not overshadow the racially charged rhetoric of that year's campaign, as voiced by his opponent Johnson. During the 1955 Hoxie desegregation controversy, Johnson exhibited his racism publicly since he knew media coverage would be so influential in this specific desegregation case (Murphy 1997). One can only speculate as to why Johnson did this considering that, up until the time of the Little Rock crisis, Arkansas had traditionally been a moderately segregationist state. Perhaps anticipating the need for name recognition in the 1956 gubernatorial election, Johnson pushed his extremist views so as to receive name recognition among the candidates. To further assist himself in his bid for governor, Johnson founded, at about the time of the Hoxie case, the White Citizens Council of Arkansas (which would later be questioned in FBI documents dealing with Ku Klux Klan involvement in the crisis).

In the heat of battle, as he tried to disrupt the Hoxie desegregation process, Johnson took it upon himself to cite racist data from a similar White Citizens Council in Mississippi (Murphy 1997). This external interference is evidenced by segregationist agitators from outside Arkansas making their way to Hoxie to work with native Arkansans making their way to Hoxie to work with native Arkansans like Johnson. Outside support exerted its influence in Arkansas during the Hoxie case and later in the Little Rock crisis.

In examining the Hoxie situation, one notes how supportive fellow segregationists in other Southern states were for like-minded Arkansans. "The State of Georgia entered the case as amicus curiae [i.e., "friend of the court," Webster's New World Dictionary, p.44,1970], in support of them (Arkansan Segregationists)" (Anderson, p.128,1964). This legal alliance between the Arkansas segregationists and the State of Georgia did not receive overwhelming publicity in 1955, but was indicative of an emerging groundswell of support from fellow Southern states for any of their brethren states who were being legally compelled to abide by the intentions of the Brown decision. South Carolina Senator Strom Thurmond typified this spirit of defiance when, in early 1956, he "proposed that southern congressmen issue a formal statement articulating their objections to the Supreme Court's Brown decisions" (Mann, p.161,1996).

This document became nationally recognized on March 12, 1956 when Georgia Senator Walter George read a statement in the Senate titled the "Southern Manifesto" (originally "Declaration of Constitutional Principles") which one hundred and one Southern US Representatives and Senators signed. Those notable Southern leaders who refused to sign were Tennessee Senators Albert Gore Sr. and Estes Kefauver, and the Senate Majority from Texas, Lyndon B. Johnson (who wasn't asked to sign). Of the Southern US Representatives in the South, House Speaker of Texas, Sam Rayburn — like Johnson — wasn't asked to sign. The remaining US Representatives who didn't sign were from Tennessee and Florida. All House Representatives and Senators from the state of Arkansas put their signatures to the document (Brownell, p.363, 1993). These signatures of endorsement included very religious and well-educated leaders such as Representative Brooks Hays and Senator William Fulbright, who was internationally recognized for his foreign exchange student program, the Fulbright Act.

It is interesting to study how Georgia and it's political leaders such as Senator George figure into the mounting popular resistance to desegregation. It should be noted that Georgia is considered one of the Deep Southern States by scholarly works of Howard W. Odum Southern Regions Of The United States (1936) and Gunnar Myrdal An American Dilemma:The Negro Problem and Modern Democracy (1962). These same Deep Southern states were supporters of
then South Carolina Governor Strom Thurmond, who ran for President against the incumbent Harry S. Truman in 1948. Thurmond's presidential bid was part of his self-initiated effort to lead the Dixiecrat Rebellion, which attempted to derail Truman's modest Civil Rights proposals. Later, during the early stages of the Little Rock crisis in August 1957, this spirit of Deep Southern support from the state of Georgia would be more publicized and dramatic. This allied effort was evidenced by the state's Governor, Marvin Griffin, who arrived in Little Rock to attend a rally held by the local White Citizens' Council, which opposed the upcoming desegregation of Little Rock's Central High School. Griffin, the state's governor, he declared, unlike Arkansas's, was prepared to turn out his State Highway Patrol and National Guard to bar any black child from attending any white public school, and he would enlist in their support every right-thinking, red-blooded white Georgian (Ashmore, p. 126, 1997).

This spirit of anti-federalist rebellion by Southern Congressional leaders reemerged once again in July 1956 while Brownell was working on a Civil Rights bill with congressional leaders. This renewed Southern defiance became tangible with publication of a new Manifesto which specifically attacked the upcoming Civil Rights legislation as violating states' rights. The new Manifesto also asserted that the pending Civil Rights legislation "effected further concentration of federal power, gave the Attorney General unprecedented authority, and increased racial discord" (Anderson, p. 82, 1964). These legislative attempts by Southern Congressional leaders to subvert the Brown decisions highlighted the need for increased power by the federal government to intervene in school desegregation struggles.

The Hoxie desegregation situation proved to be the first test of federal resolve in enforcing the legal intent of the Brown decisions. In particular, the power of Brown II, "With All Deliberate Speed", provided the US Department of Justice with the necessary tools of law enforcement to deal with local and state government in relation to school desegregation. Unlike the dramatic, confrontational situation in Clinton, Tennessee where governor Frank G. Clement ordered out the National Guard to insure compliance in this community's school desegregation case, the Hoxie situation brought "greater meaning to the political issue as the federal government encountered it" (Anderson, p. 128, 1964). As stated earlier in the chapter, Georgia legally allied itself with the segregationists in Hoxie by means of amicus curiae. With newly received enforcement powers in school desegregation situations, "the United States Department of Justice came forward as amicus in support of the School Board, the first time that the federal government had ever appeared in court to ask for implementation of desegregation decisions" (Anderson, p. 128, 1964). Fortunately, the Circuit Court of Appeals upheld the federal injunction, ruling that "a federal judge has the authority to protect a local board in carrying out his orders" (Anderson, p. 128, 1964). This long overdue victory for the federal government in Civil Rights enforcement was much welcomed, but despite being a decisive influence, it won little notice for the US Department of Justice's role in the Hoxie case.

The Little Rock desegregation crisis of 1957 would require similar intervention by the US Department of Justice, but as events developed in that crisis, there would be a demand for action by other branches of the federal government as well.

Courtesy of Brownell's influence, members of the federal government became involved in Civil Rights enforcement by pushing for controversial legislation. On January 1st, 1957, Eisenhower and Republican Congressional leaders proposed to the Congress a comprehensive Civil Rights package. Although the 1957 Civil Rights act fell short of some of its proponents' hopes, it did set in motion the machinery of the federal government in becoming more involved in an emerging social controversy.

The draft of the act thus empowered the attorney general, without further congressional action, to enforce the constitutional promise of equal protection for all citizens when such violations occurred. Its scope was broad enough to give the attorney general the power to enforce not only voting rights but also any federal district court decree that approved a local plan to desegregate the public schools (Brownell, p. 202, 1993).

The Congressional Quarterly Almanac provides a summation of the proposed legislation. In essence, the Eisenhower Administration and Republican Congressional leaders wanted to create a bipartisan commission that would (1) investigate Civil Rights violations and make appropriate recommendations, (2) establish a Civil Rights division -- to
be headed by an assistant Attorney General — within the Department of Justice, (3) enact laws to enforce voting rights, and (4) amend laws that would allow the federal government to obtain preventive relief in Civil Rights cases. Though Southern Congressional leaders had signed the Southern Manifesto a year earlier, now, as might be expected, many criticized the proposed legislation.

The version of the bill that Eisenhower signed into law to create the Commission on Civil Rights permitted the President to appoint an assistant Attorney General to head up a new Civil Rights division in the Department of Justice, and empowered the Attorney General to try for an injunction when someone was deprived of the right to vote. Regarding judicial matters, the bill "allowed the judge to decide whether a defendant in such cases should be tried with or without a jury." (Congressional Quarterly Almanac, p. 553, 1957). White Southern Congressional leaders realized that white juries would be sympathetic to acquitting fellow white Southerners who were guilty of Civil Rights violations even in murder cases like Emmett Till in 1955 and Medgar Evers in 1963.

The final version of the 1957 Civil Rights legislation contained no provisions for federal enforcement in school desegregation cases. To curb the power of the executive branch in school desegregation situations, the Senate "repealed a statute of 1866 empowering the President to employ troops to enforce or to prevent violation of civil rights legislation" (Congressional Quarterly Almanac, p. 564, 1957). My original purpose in researching the 1957 Civil Rights act was to suggest that it influenced the 1957 Little Rock school desegregation crisis. I was disappointed to discover that Southern Congressional leaders made it their specific strategy to eliminate the provision that allowed increased federal involvement in school desegregation. In this particular political strategy, they were successful. Despite the Southern Congressional leaders' victory in depriving the 1957 Civil Rights act of enforcement powers in school desegregation, it was, as Brownell suggests, "the first civil rights act of the twentieth century" (Brownell, p. 226, 1993), and proved to be a portent of the end to legal segregation in the South.

Truman and the Issue of Federal Aid to Education in the Election of 1948

Don T. Martin
University of Pittsburgh

If President Truman’s renomination in 1948 had depended upon his previous federal aid to education legislative proposals and their enactment, that nomination would not have occurred; however, federal aid to education had not yet become an issue of importance and had little influence on Truman’s presidential nomination by the Democratic party. And even though Truman stated that he would not seek his party’s nomination if Eisenhower declared his candidacy for the Democratic ticket in 1948, there were few Democrats who could challenge Truman’s bid for his party’s nomination. The Democrats re-nominated Truman in spite of his lack of success with much of his first term domestic program, including federal aid to education, and in spite of the President’s sharp decline in popularity (Abels 1959, 1).

James Forrestal, Truman’s Secretary of Defense, recorded in his diary that in late 1947 Truman looked forward with deep misgivings to another four years in the White House and that if he had not believed it his duty to run again because of world conditions he would have stepped aside. Yet at this time Truman was considered to be certain of renomination by his party and a Gallup Poll taken at the end of 1947 showed that he would have then defeated the two leading Republicans, Senator Taft or Governor Dewey, by wide margins. However, due to his stand on civil rights, the Palestine issue, and a series of other complicated events, Truman’s popularity went into a tailspin and within four months a new Gallup Poll revealed a reversal and showed him far behind leading Republicans (Abels 1959, 13).

By the spring of 1948 few persons believed that Truman had the slightest chance of winning the election; one exception was Truman himself. Truman was not only having trouble with the extreme left (supporters of Henry Wallace) and the southern conservatives (the Dixiecrats) of the Democratic Party; he was also having difficulty in gaining support from the political center. For the first time since 1930, both houses of the 80th Congress were Republican, and it seemed as though the mood of the American voter was moving toward a Republican president. Fearing Truman’s unpopularity many dissident Democrats tried in vain to draft Eisenhower, but Truman remained calm since he knew that former presidents in power, seeking renomination, had traditionally controlled the nominating conventions (Abels 1959, 14).

Meanwhile, Truman’s decline in popularity caused a surge of optimism within the Republican party. Opening on June 21 in Philadelphia, the Republican convention four days later nominated Governor Dewey on the third ballot over Governor Stassen and Senator Taft.

NEA Convention Controversy

Shortly after Dewey’s nomination and before Truman’s re-nomination an important development, specifically involving federal aid to education, occurred at the 27th Annual Convention of the National Education Association. The NEA convention, being held in Cleveland July 5-9, 1948, showed special interest in gaining federal support for the nation’s schools and therefore called upon President Truman to reconvene the 80th Congress to pass Senate Bill 472 providing for 300 million dollars in federal aid to education. This section, not scheduled for the conference agenda, broke unexpectedly after heated discussion by delegate members (National Education Association: Addresses and Proceedings 1948, 39).

Glenn E. Snow, then president of the NEA, disclosed to the convention delegates that he had sent telegrams to both Governor Dewey and President Truman asking them to state their position on federal aid to education. Moreover, NEA leaders announced that they would ask all teachers to canvass state and federal candidates for their stand on federal aid to education. It is understandable that the NEA would ask Dewey for his stand on federal aid since it was far from clear where he stood on this issue, but to request Truman’s stand seemed unnecessary since his favorable position on federal aid was well-known to Snow and to other NEA leaders. It appears that the request was designed to force Dewey to publicly state his position on federal aid to education in order that the two positions could be juxtaposed. If Dewey came out strongly for federal aid to education (which was unlikely), then the NEA would have strong promises from both presidential candidates for support of education. But if Dewey did not support federal aid, it would give the NEA members a legitimate reason to support Truman. Either way the NEA’s cause in favor of federal aid to education would benefit their cause (National Education Association Journal 1948, 335-336).

What stirred the delegates at the NEA convention most had been an article in Drew Pearson’s nationally
syndicated column, “Merry-Go-Round”, published on June 21, the same day that the Republican Convention opened. Pearson claimed that Governor Dewey, at the Governor’s Conference held earlier in June at Portsmouth, New Hampshire, had tried unsuccessfully to get other governors to support an “anti-teachers publicity campaign (New York Times 1948, 25). Pearson also said that Dewey denounced the call of the teacher’s lobby (NEA) for higher teacher pay and that he called the teachers’ propaganda the “biggest lie since Adolph Hitler” (New York Times 1948, 25). Pearson said that the debate in which the other governors rejected Dewey’s suggestions was held in an executive session, and the press was barred because of Dewey’s insistence. James Haggerty, Dewey’s Press Secretary, immediately sent word to the NEA convention denying Pearson’s claim. Haggerty’s statement was read to the convention delegates but not until after the resolution had already been passed to get Truman to reconvene Congress (New York Times 1948, 25).

On July 8 Dewey did send a message to the NEA convention clarifying his position on state aid to education, but did not directly reply to the NEA’s request for his position on federal aid to education. In sharp contrast, and on the same day, was Truman’s message to the convention promising his vigorous support in the association’s campaign for federal aid to education (New York Times 1948, 10). Moreover, Dewey’s refusal to commit himself on federal aid to education caused more controversy at the convention. In an effort to tone down the controversy, the issue was referred to a nine-person committee; but a resolution was passed two-to-one by the delegates to mimeograph and distribute Pearson’s charges against Dewey—together with a telegram from Pearson asserting that his report was accurate. The resolution commended the other governors for rejecting Dewey’s alleged statement.

There was speculation that Dewey would clarify his position on federal aid to education shortly after the NEA Convention adjourned. On July 13 Dewey and Senator Taft met to discuss the campaign and other political matters, and it was thought that the topic of federal aid to education would arise since Taft was a strong advocate of federal aid. But no public mention was made about the NEA controversy nor did any public statement concerning federal aid to education come from this meeting. The controversy over Dewey’s alleged attack on the “teachers’ lobby” was deliberately kept alive by the Democrats until the closing days of the campaign. In a speech in Springfield, Massachusetts, Truman provided testimony that supported Pearson’s charge against Dewey. He said that Governor Lane of Maryland and Governor Maw of Utah had sent him telegrams saying that Dewey had viciously attacked the nation’s schoolteachers at the Governor’s Conference (Public Papers 1948, 876-877).

Regardless of whether the allegations against Dewey were true or not, these charges, backed with such reputable testimony in such a convincing manner and within a week of the election, could not but have had considerable impact upon certain voters who wanted to vote for Dewey but who could not do so because of his failure to support federal aid to education in the campaign. One way that Dewey could have rid himself of these “anti-teacher” charges, or at least have mitigated their effect, would have been to come out strongly in favor of federal aid to education. But throughout the campaign his views on federal aid to education were not clearly revealed. Since Dewey had often strongly criticized increasing centralization of government, it would have been difficult for voters who were strong advocates of federal aid to have supported him.

Special Congressional Session

The Democratic Party nominated Truman on the first ballot at their convention in Philadelphia on July 14. On the same day Truman made his acceptance speech at Convention Hall in an optimistic and self-assured manner. This was in sharp contrast to the gloom of the leaders of his party. Truman’s acceptance speech was perhaps his most politically astute of the 1948 campaign for within it he called Congress into a special session to give the Republican-dominated Congress a chance, as Truman claimed, to enact the moderately progressive legislation they had called for in their platform three weeks earlier. Included within this acceptance speech was his promise to ask the Republicans to “act upon vitally needed measures such as aid to education....” (Public Papers 1948, 409).

From the beginning Republican party leaders, particularly Dewey and Taft, were opposed to the special session, and after it convened on July 27, they worked for its early (August 7) adjournment. Clearly, Truman had the Republicans in a bind. Whether the Republican-dominated Congress passed the extensive new domestic legislation Truman called for in the special session or, on the other hand, were they to fail to pass such legislation, Truman stood only to gain politically.
Although both parties included federal aid to education in their platforms, the Democratic platform was much clearer and more positive in its support of such aid. Truman was especially proud of its inclusion of a specific request of 300 million dollars for federal aid to education and was disdainful of the generalized statement on this issue by the opposing party’s platform. Truman’s earlier contention that the Republicans did not mean what they said in their platform gained credence by the fact that very little of the promised Republican legislation was enacted. This rather fruitless special session, which was part of the legislative record of the 80th Congress, gave Truman his most effective political weapon. Now he had the opportunity to condemn the Republican-controlled Congress, a "do-nothing" Congress as he incessantly called it throughout the campaign (Public Papers 1948, 409). An important part of Truman’s condemnation was based on his concern over the distressful condition of American education and the Republicans’ failure to support federal efforts to alleviate the Nation’s educational ills. As early in the campaign as the acceptance speech at Philadelphia, Truman expressed concern that the schools were overcrowded, that teachers were underpaid, and that there was a teacher shortage. Truman could not have been more succinct and penetrating in conveying his views on the need for federal aid to education to the American people (Public Papers 1948, 408).

The Campaign Speeches

Beginning with an address before the Greater Los Angeles Press Club in June and continuing through October, Truman made the nation’s shortage of teachers, their inadequate pay, and the shortage of classrooms an important issue in at least fourteen of his campaign speeches, and he included brief statements on federal aid to education in many others. Campaigning throughout the nation with great vigor, Truman frequently expressed his favorable views toward federal aid, while Dewey conducted a more relaxed, overly confident campaign in which he ignored this issue.

In many of his speeches, Truman hammered away at the distressful condition of American education and the Republicans’ failure to support federal efforts to alleviate the nation’s educational ills. His criticism of the Republicans became more severe as the campaign progressed; however, only a few times did he directly and specifically criticize Dewey’s position on education. At a news conference early in the campaign, Truman referred to the failure of the special session to pass Education Bill §472, but deliberately avoided direct criticism of Dewey. Nevertheless, it was clear that Truman linked his opponent to the record of the Republican 80th Congress (Truman 1956, 210-211).

Truman’s extensive, whirlwind speaking tour of the nation came to be known as the “whistle-stop” campaign. Campaigning throughout the nation with great vigor, he frequently expressed his favorable views toward federal aid to education, while Dewey conducted a more relaxed campaign which fell far short of his opponent’s concern for federal aid to education. An example of his concern about teachers was perhaps best expressed in his statement that “There are teachers who are teaching as many as 55 to 75 pupils when 20 to 30 is about as many as any one teacher can handle; and they are the poorest paid people in the country” (Public Papers 1948, 469).

Truman’s criticism of the Republicans in general terms became more severe as the campaign progressed; for example, at a news conference early in the campaign, he referred to the failure of the special session to pass the Educational Bill §472. Truman’s campaign speeches consistently revealed his special interest in the plight of the teaching profession. He was perceptive of the teachers’ severe problems and revealed an understanding of their frustrations over low pay and poor conditions in the schools. Calling for salary increases, he even went so far as to say that “if school teachers want to organize for better pay—l am all for them” (Schnapper 1949, 210). At the same time, he was sharply critical of the Republicans’ failure to support the nation’s teachers.

Federal Aid to Education Compared to Federal Aid to Highways

In addition to calling for partisan support for federal aid to education, Truman, in a number of his campaign speeches, considered the passage of federal aid to education as legitimate as the federal government’s aid to states for building highways:

Time and time again I urged the Republican 80th Congress to pass legislation, to extend Federal Assistance and aid to the States for the school systems, just like the Federal Government helps the States build highways. You’d think everybody would agree that school children are at least as important as the highways over which the school buses carry them to school. The Republicans didn’t think so (Public Papers 1948, 726).
An even stronger statement was made at Madison Square Garden on October 28:

I think it’s much more important to see that the Children that ride in the buses over these roads get the proper kind of schooling and the proper sort Of teachers than it is to build the roads, myself (Public Papers 1948, 912).

**Anti-communism and Federal Aid**

Truman’s campaign maneuver to make federal aid to education a partisan issue, and his equating the need for such aid to that of the need for federal aid to highways, did not seem as surprising a tactic as his efforts to tie the need for federal aid to education to the anti-communism cause. By 1948 Truman’s policy of containment was very much in effect, and the cold war intensified because of the Berlin crisis. Anti-Communist sentiment was becoming more widespread among Americans and as a result both candidates included this theme in their campaign rhetoric (Public Papers 1951, 94).

Dewey made anti-communism one of his major campaign themes, but he did not relate it to the issue of federal aid to education as his opponent did. By contrast, in a campaign speech in Schenectady, New York, Truman told his audience that providing ample educational opportunities for all Americans was “the best safeguard there is against communism. When you have an educated people, communism hasn’t a chance in the world” (Public Papers 1948, 716).

**The Election—and Conclusion**

Truman appealed to the voters to vote out the Republican 80th Congress and replace it with a Democratic 81st in order that the promises in the Democratic platform could be enacted. In his final message to the American voters, (a radio address from Independence, Missouri on election eve) he stated that he had done his best to discuss the issues and to explain the meaning of the Democratic platform during the campaign and told them, “I intend to carry it out if they give me a Democratic Congress to help” (Public Papers 1948, 939). The nation’s voters settled in their living rooms that evening to await the returns.

As the lights burned late throughout the night all over the nation it became increasingly evident that the election was not going to be the easy victory for Dewey that the polls had predicted; in fact, to nearly everyone’s surprise, the election was unfolding into one of the greatest political upsets in American history.

Dewey conceded defeat shortly before noon the next day after Ohio fell into Truman’s column. That day The New York Times was flooded with a record 25,000 telephone calls seeking confirmation of the election results. Groucho Marx quipped, “The only way a Republican will get into the White House is to marry Margaret Truman” (Abels 1959, 270).

When the final results were in, Truman had received 24,105,695 popular and 304 electoral votes to Dewey’s 21,969,170 popular and 189 electoral votes. However, these figures were deceptive and the election was closer than the figures suggest. A couple of the bigger states could have “swung” the election to Dewey (Abels 1959, 289-290).

It is impossible to identify and isolate any one issue and confidently say that it contributed most to Truman’s astonishing victory. Truman, himself, attributed it to labor’s support, but most political analysts said the farm vote made the difference. Yet, as in most elections, there were a number of factors that converged to produce the final result. The issue of federal aid to education alone, just as any other one issue--save the issues of agriculture and labor, could not have reversed the election results.

But the issue over federal aid to education contributed to Truman’s victory. American education had reached one of its lowest levels and was a national disgrace. Although most American voters still viewed education as a local affair, many were becoming impatient with local inaction, and many looked to the federal government for help. Clearly their candidate in the 1948 election was Truman.

In an attempt to analyze the reason for Truman’s defeat of Dewey, Democratic women at party headquarters in Washington D.C., on the day after the election, said that an important factor in the outcome of the election was Dewey’s attack on the teachers’ lobby and that Dewey’s failure to back federal aid to education caused many mothers and teachers to vote for Truman (New York Times 1948, 12). Considering Truman’s victory a “mandate from the people” the director of the legislative and federal relations division of the National Education Association wrote: President Truman’s victory in the election is regarded by many as a strong promise of the enactment of federal aid to education legislation in the 81st Congress. The President has a clear mandate from
the American people to fight for legislative objectives which he clearly defined during the course of
the campaign. One of these objectives is federal aid, without federal control, to help equalize
educational opportunity for youth throughout the nation. The President is sincere and courageous.
No one who knows him believes he will be deflected from the program he charted during his
campaign (Marston, 1948, 571).
It is not possible to determine precisely how many voters were influenced to vote for Truman because of his
support of federal aid to education or because of Dewey’s failure to do so, but with the nation’s educational system
in such poor condition and with the candidates differing so clearly on this issue, I would argue that large numbers of
concerned teachers and parents cast their votes for Truman because of this and other related issues.
What is more significant, however, is the fact that Truman’s endorsement of federal aid to education, as
reflected in his public statements and his actions, especially his support of teachers, exceeded any previous
presidential candidates’ concern and support for aid to education. Indeed, it was a milestone in expressed presidential
concern for educational problems. His campaign set a precedent for later presidential aspirants to speak out on
education as a matter of great importance to our nation’s well-being.

New Metaphors for the Interpretation of Oral History: Detective Fiction as a Narrative Genre

Brad Frey
Geneva College

In this paper I will explore the possibility of using a fictional genre', detective fiction, for investigating local aspects of civil rights history. In particular, I will show how detective fiction can inform the doing of oral history in this setting. Research on how three areas of Beaver County (western Pennsylvania) used school redistricting to segregate African-American students will be used as the example of how this might be done.

Historians have long been detective-like in their research. As they examined the data they concentrated on solving the puzzle of the research problem by logically deducing from the data what had happened. The rational process of discovering who, how and why were foremost. However, civil rights history, especially at the local level, necessitates a different kind of research (Rogers, 1994). Much of the story has never been recorded, there is great controversy over what happened and how it should be interpreted, and there is little relevant record keeping to clear up discrepancies. The oral historian is left with the dilemma of either shrugging and acknowledging the inaccessibility of the data or turning to other means to acquire it.

The other means to acquire the information may well come from the genre of detective fiction. Approaching the problem with the mind set of a detective hero at work, "Ma'am, there is one other question," (Columbo).

The Detective Fiction Genre

There is precedent for using the genre' of detective fiction in serious essays. Literary critic Henry Louis Gates in a chapter titled, "Canon Confidential: A Sam Slade Caper," uses detective fiction as a means of investigating the legitimacy of the western canon as it is traditionally configured (Gates, 1992). However, while he is making a serious point about a crucial area of higher education, he uses detective fiction more as a foil, a humorous way to make his point. What I am suggesting goes further. I am contending that the genre' of narrative fiction can enhance our understanding of this historical investigation.

Popular culture scholar John Nelson suggests the elements of the genre'. In a section titled, "Detective Fiction: Declining Hope for the Future," Nelson suggests these elements (Nelson, 1976): 1. The intellect still guides investigation but impacted by the investigator's guilt and the moral ambiguity of the situation; 2. The detective makes mistakes by overvaluing his/her own analysis and underestimating the perversity of the foe; 3. Tenacity and luck always prevail; 4. The context is depicted as corruption, cheating, duplicity, violence and perversion while much that seems normal is built on suspicion and greed (This is usually depicted as "urban"); 5. Finally, while the detective is certainly a skilled survivor, his/her significance is not found in his/her wealth and power but in the doing of justice and righteousness.

These five characteristics frame what I refer to as the detective fiction genre'. When used in conjunction with the tools for doing oral history they provide a guiding narrative. I am not suggesting that a researcher simply pretends to be a fantasy detective but that this genre' be used in conjunction with oral history. Piantanida and Garmen contend that many approach the multifaceted terrain of research looking for "the" qualitative method to substitute for "the" quantitative method when in fact multiple possibilities exist for understanding research material (Piantanida and Garmen, 1997). If, as these authors contend, knowledge is socially constructed through discourse in interpretive communities (Piantanida and Garmen, 1997), then multiple ways of getting at that knowledge to obtain "thick" data seems appropriate.

The Use of Metaphor

The view of historian as detective fiction hero needs to be seen metaphorically to be useful. Lakoff and Johnson (1980) argue that the entire nature of our discourse is predicated on the functioning of metaphor. In particular, the conceptual systems of cultures and religions are metaphorical in nature (Lakoff and Johnson, 1980). Simply put, there is no area of investigation that is understood apart from metaphor. It is useful metaphors which typically open up new areas of learning to us and these new metaphors can also guide our research. This is how a fictional genre' can be useful to a serious researcher. By being able to refer beyond the typical researcher's posture to the allusions opened up by a metaphor one can get information otherwise unavailable.
The argument thus far: civil rights history is difficult to uncover at the local level through conventional means; qualitative research acknowledges various ways of obtaining information on any given problem; metaphors are structurally necessary for meaning making in language; using detective fiction metaphorically in oral history research opens new possibilities.

Oral History and Detective Fiction in Use

I am researching the school redistricting which was done in Beaver County in the mid 1960's. Beaver County is of Pittsburgh, Pennsylvania containing both small industrial (steel mill) towns and large rural sections. During the mid 1960's school districts were mandated to merge and form larger, more efficient districts. In Beaver County the outcome was interesting.

There were only three areas in the county that had African-American populations. As a result of the “School District Reorganization Act of 1961," new districts were formed which had the effect of isolating the African-American children in three districts all in small mill towns. Before redistricting, surrounding townships attended the high schools located in those towns. After redistricting (which was intended to create larger districts for efficiency sake) districts were reconfigured which isolated the African-American children in three newly created districts, and, three additional districts were created for children from the surrounding rural townships.

There were two ironies. First, at a time when efficiency ruled, they avoided creating the large districts which the state had mandated (The state had set as a target number 4000 or more students which none of the newly created districts even approached). Second, while the rest of the nation, particularly the south and urban areas, went through the struggles of school desegregation, Beaver County found a way to bring a new level of segregation to its schools.

What made this obviously perverse was what happened in a fourth district. In this instance the same situation existed. There was an old mill town surrounded by rural townships. What was different was that there was no significant African-American population in this town. In this instance the county school board pressured these districts to merge even though it had configured the others not to merge. This became the only large district in the county which conformed to the state mandate to form larger more efficient district.

Many people in the area contend that this is a clear instance racial discrimination. Minorities especially believe this to be the case. But what evidence is there? In cases such as this, there is little if any documentation. Many say that race was no factor in the redistricting. Oral histories are available but if key figures had acted in a bigoted way they would not be likely to admit it (Thompson, 1988, p.3). This is the time for oral history in the detective fiction genre. The person on the street readily admitted that race was a factor in the formation of the districts and that has historical value (Thompson, 1988, p. 15). But people in key positions denied it leading to ambiguity.

The fourth element of Nelson's (1976) detective genre is to understand the context characterized by corruption, cheating, duplicity, violence, perversion and even the normal built on suspicion and greed. While this may sound like a cynical view of society, at the time when structures are being changed coercively to segregate, this description seems accurate (Rogers, 1994, p. 32). In one of the districts hearings were held about the redistricting plan and those hearings were broadcast over live radio. “I couldn’t believe how ignorant people were. They would scream into the microphone, ‘my kids will never go to school with those kind of people.’” said one interviewee (Veon). As the time approached for two of the districts to separate, a full scale race riot broke out in the school on the last day of school necessitating that state police had to be called in to aid local police in restoring order (Potter). The detective genre adequately portrayed the meanness of the context.

The second element of Nelson’s detective genre contends the detective will overvalue his/her own analysis while underestimating the perversity of the foe. As I listened to the people describe the situation I assumed that I had come across a clash of cultures. That people in the sixties just weren’t ready for integration. I told myself this wasn’t a conspiracy. But I kept hearing the name George Campbell come up as a key person. I asked one school administrator of the time (from one of the newly formed all white districts) if George Campbell played any role. He said, “absolutely not, he wasn’t even an elected official. What would an oral surgeon have to do with the schools?” (Groff). However, I noticed an obscure newspaper reference noting that Dr. David Kurtzman, the State Superintendent of Education, was in the county and had met unofficially with Campbell (News Tribune, 3-4-'68).
In a related interview with a member of the same district I was given perspective. "How would I describe George Campbell? Well, I guess in today's terms we would call him a white supremacist. He ran the county from the country club." But I protested that I had asked Dr. Groff and he had denied Campbell had any role. "Campbell had Groff wrapped around his finger. Groff did whatever Campbell wanted" (Lieberman). According to Thompson (1988, p. 8) oral history is both creative and co-operative. Both aspects came into play as I pieced together what seemed to be an orchestrated attempt to segregate.

But I was confused. Dr. Groff had seemed very relaxed as we spoke and seemed to honestly believe that the division of the two school districts was based on a dispute over where the new high school was to be located (Groff). Examination of newspaper accounts from 1962-64 showed that there was a dispute about a potential new school (Beaver County Times). Both Nelson and Thompson explained. History must take account of the complexities of a situation (Thompson 1988, p. 20), and, while the intellect still guides our investigation, Nelson's first characteristic of detective fiction is that it is comprised by moral ambiguity (Nelson 1976, p. 163).

One key interview I had was with a current county school administrator who had been part of the county office when these decisions were made. He told me, "there were no politics involved at all in these decisions. We had made certain population projections which turned out to be wrong" (Marziano). What he said next proved that detective fiction genre was holding true because certainly luck had prevailed (Nelson's third quality of detective fiction). Unable to let it go with such an incredulous statement he continued, "we didn't really have time to worry about those districts, we had enough trouble overseeing the Ambridge merger" (Marziano). I had never thought much about Ambridge or realized it had a troublesome merger. Since it didn't have an African-American community of any size at the time, I hadn't even studied it. As a result of my conversation I thought it merited at least a quick investigation. The result was a surprise. It was the same situation as the other three districts I was studying. There was a small mill town surrounded by several rural communities which had traditionally gone to the same high school. The state, through the county school board, was demanding they merge even though the rural townships objected. But in this case there was no race issue and the county insisted and prevailed. In the other three cases where race was a factor the county acquiesced to community demands to construct alternative districts so they wouldn't have to go to school with "those kind of people." A chance comment meant to justify a position was the piece of luck I needed to complete the picture.

Alice Harris critiques the kind of official history that I encountered as, "pre-censored and prepared for special purposes, history which is devoid of the real lives of the vast number of poor and working people," (Harris 1991, p. 1). The official history I was told by a county official radically diverged from what people on the street believed. Is this a place a survey would help? Probably not. It was the in-depth perspective presented by the average person that seemed more reliable and historically believable (Hoopes 1979, p. 42).

The last piece of the detective genre that I drew on was the result of what Thompson describes as the result of calling witnesses from the underclass (1988, p. 6). If you don't listen to the voices on the street you risk just re-enacting the community myth with your history (1988, p. 20). Nelson says detective fiction is never resolved for wealth and power but for justice and righteousness. In typical research we would not be so triumphalistic as to describe the outcome of our research as justice and righteousness. However, in cases where the inequities of civil rights denied are exposed, such a claim seems appropriate.

While the above findings could have unfolded without framing them in a fictional genre, the genre provides both a style for a narrative and an alternative voice for the historian. A voice which is biased and passionate for justice, lucky and determined in research, and, appreciative of the perspective never heard in formal settings.

Veon, Robert. Personal interview. 11 April 1997.
Mankind, like no other creature, has been singularly blessed with a unique and significantly different way to communicate—that is with words. Words are able to articulate dreams, stir the heart and mind, and offer vision. It is the persuasive power of words whether spoken or written that have long been recorded, researched, and catalogued. But what ignites a thought, a word, a language? Consider the following excerpt:

He stood six feet four inches tall, and wore a silk hat. At first glance he seemed no taller than anyone else. Most thought he was homely. He often seemed sad and gloomy. But when he began to speak, his expressions changed. The dull, listless features dropped like a mask. His changeable features, his tones, gesture, and expressions, seemed to defy description. His eyes began to sparkle, his mouth to smile, the whole countenance was wreathed in animation, and then Lincoln spoke.

This passage sets the stage. The above description is a visual image of Lincoln, one of an awkward fellow, comely and nothing to be desired. As his mind began to summons the words to portray his thoughts, his demeanor changes. The onlookers described him as angular and solemn but as he began to speak he grew in statue. His outer visage became secondary, his inner thoughts primary.

Consider the nature of the spoken word and the mechanics involved. William Sweat, 19th Century Professor of Etymology asserts that the speech of man is influenced by physical laws. When someone speaks, their words are carried on air and quickly dissipate. Words spoken into a microphone and converted to radio or television signals, extends endlessly into space. Hence, utterances delivered fifty years ago are fifty light years from earth and still traveling. A sobering thought that perhaps the well-known children’s proverb, “Sticks and Stones” may need to be rewritten. Stick and stones may break our bones, but words go on forever.

In geometry there are laws which state that there must be at least three straight lines to enclose a space. There are laws in chemistry suggesting two hydrogen atoms and one oxygen atom are needed to create one molecule of water. There are also laws governing language. The laws of syntax declare there must be three words to construct a simple sentence. These three words are named by grammarians. There must be a spoken subject, a predicate, and connecting verb to make a simple sentence. When the laws of syntax are legitimately broken, figurative language emerges.

The purpose of this essay is twofold. First, to rediscover the nature and character, knowledge and use of figurative language by examining the works of historians and rhetoricians across several centuries. Second, we desire to encourage all writers to expand their repertoire by emboldening their writing style through application of figures of speech and thereby consider figurative language as a point upon which to test a whole literature.

But upon what point can one judge the merit of composition of speech? Are there any scientific tools or criteria that stands as a template upon which to test an entire literature? According to John Walker Vilant MacBeth, When our subject is finished. Whatever decision may be come to, as to the way in which we have done our work, the idea itself with which we started is worthy of a lifetime; very singular that no student of books or language ever suggested it before, to test a whole literature by the light of figurative speech. Nobody will readily believe that, after the most inventive minds have been treating of literature for twenty-two centuries, an entirely new and exceeding comprehensive and searching mode of treatment can possibly remain to be discovered; yet such is the case, remarkable is the fact.

Let us now take pen to paper, or figuratively, take a microscope to writing and narrow our focus to figures of speech. We shall begin by boldly stating that figurative language sets forth the power, beauty, wealth, and wit of language. MacBeth remarks, “Writers generally, even the ablest, are wholly in the dark as to the precise distinction between a trope and metonymy and very few even literary men have so much as ever heard of implication or hypocatastasis.”

The springboard for our research began with E.W. Bullinger, early 19th century teacher, historian, and scholar. It was his text alone that peaked our interest in this field of study. Bullinger categorizes 217 separate figures possessing thirty to forty varieties and subdivisions with over 800 illustrations. Many figures listed have duplicate names which bring up the total number to over 500. Bullinger’s classifications includes the Latin and Greek nomenclature with
accompanying English equivalent. Another remarkable attribute is the extent to which he illuminates the historical, political, and spiritual significance of figures. Clearly, we were overwhelmed by Bullinger's specificity, classification, and the sheer number of these figures.

Questions immediately emerged. Where did all these figures originate? For what purpose do these sheer number of figures exist? How did Bullinger arrive at his classifications and divisions? Were the researchers that he referenced as sophisticated and detailed in their classification? Lastly, was there a level of agreement as to the nature and character of figurative language? Before reviewing the researchers on Bullinger's time line, establishing a clear definition of figures of speech is imperative.

After arduously researching many definitions, Bullinger's was the most decisive and clear. Regarding figures, Bullinger concludes,

All language is governed by law, but, in order to increase the power of a word, or the force of an expression, these laws are designedly departed from, and words and sentences are thrown into, and used in new forms or figures. So, a figure is a departure from the natural and fixed laws of grammar or syntax; but it is a departure not arising from ignorance or accident. Figures are not mere mistakes of grammar, on the contrary they are legitimate departures from law for a special purpose. They are permitted variation with a particular object. Therefore, they are limited as to their number, and can be ascertained, named, and described. No one is at liberty to exercise any arbitrary power in their use. All that art can do is to ascertain the laws to which nature has subjected them. There is no room for private opinion, neither can speculation concerning them have any authority. It is not open to anyone to say of this or that word or sentence, 'this is a figure according to his own fancy, or to suit his own purpose. We are dealing with a science whose laws and their working are known.'

Figures unequivocally go beyond science. MacBeth argues that figures are far more than what some view as natural and decorative. They are the necessity of argument, truth, and reason. Figures are where the intellect and the emotion are unavoidably mingled to unearth a greater truth. We use such expressions as iron firmness, melting affections, or piercing judgment. These are not factual statements but ties and associations between one object to another. Many figures illuminate by comparison. When Sydney Smith spoke and described his dear friend, Daniel Webster, he said, "He struck me as much like a steam engine in trousers." This simile cannot be factual, but mighty is the comparison. Therefore, they call upon a speaker as well as a listener to think more critically, thus illuminating a greater truth.

A smile can convey a historical criticism on the style of Edward Gibbons, author of History of the Decline and Fall of the Roman Empire. The eminent Greek scholar, Professor Porson states, "Gibbons style is to uniform; he writes in the same flowery and pompous style on every subject. He is like Christie the auctioneer who says as much in praise of a ribbon as of a Raphael." A 1941 Harvard Law Review article uses simile to describe a judge. "The position of a judge has been likened to that of an oyster--anchored in one place, unable to take the initiative, unable to go out after things, restricted to working on and digesting what the fortuitous eddies and currents of litigation may wash his way.'

Whether one is traveling in art circles, government, law; or spending hours on a tractor tilling ground for future harvest; whatever journey one is upon, the knowledge and use of figures become apparent. Figures delicately weave fibers of truth through all walks of life and are common in every state of society. Bullinger reminds his readers that, "A figure may not be true, or so true, to the literal meaning of the words, but is more true to their sense, and truer to truth.'

Because Bullinger cites many authors and references their works, we felt with great assurance that the path was clear and open to locate several of these resources. Bullinger first references Solomon Glassius (1593-1656). Glassius distinguished scholar and theologian, in 1625, wrote Philologia Sacra. His original manuscript in Latin was translated in English in 1855. Upon examination, we found his work and style of writing detailed and thorough. Written in grandiloquent manner, much like Shakespearean rhetoric of the 16th century, Bullinger remarks that his work is by far the fullest account of Biblical figures ever published.

A student of Glassius, Benjamin Keach, is second on Bullinger's reference time line. In 1682 he completed
the prized and voluminous classic entitled *Troposchemalogia*, an intensive study of metaphoric language. Keach does not hesitate to avail himself largely to his mentor Glassius. In fact, he acknowledges *Philologia Sacra* as the cornerstone upon which his research was built.

Keach understood the power of language, in particular the use of metaphors. The weight of his research focused on Biblical literature and the wealth of his illustrations truly clarified the compelling parallels of this figure of speech. "While smile gently states that one thing is like or resembles another, metaphor boldly and warmly declares that one thing 'is' the other." While metaphors encompass the bulk of his thesis, Keach includes eight other figures of speech illuminating their nature and character.

Our search for *Troposchemalogia* took us to the University of Michigan Graduate Library. We had success in locating his major works on microfilm, but were unable to read and duplicate due to the deterioration of the facsimile. Remarkably Kregal Publications has reprinted Keach's original volumes including a commentary from Herbert Lockyer, a scholar who acknowledges the importance of figurative language. Lockyer elaborates on the unique beauty and eloquent style of Keach. In acknowledgment of his contributions Lockyer concedes, "I am not ashamed to confess how deeply in debt I am to the most substantial studies of this renowned expositor."

Johann Albrecht Bengel, German philosopher and academic scholar stands without question as one of the most original and creative writers of the 18th century. Bengel is credited with many essays, but his synthesis of ideas had a profound influence over the next two centuries. His major work that permeates academic thought is called the *Gnomon*. The text *Gnomon*, meaning index, was published in 1742 and is a five volume masterwork. In his opening remark, the editor of this remarkable text affirms what could be a very coetaneous comment. He writes, "Ever since the year in which it was first published, A.D. 1742, up to the present time, it has been growing in estimation and has been more and more widely circulated among the scholars of all countries."

We were able to obtain an original copy of the *Gnomon* in its entirety. It is read with much difficulty in that Latin and Greek text appears throughout. Several of his colleagues have been critical as to his usage of technical terms, but all agree that his work is unrivaled. Bengel's editor, Andrew Fausset admits that the text is "Terse, weighty, suggestive, and often as a modern writer observes, condenses more matter into a line, than can be extracted from pages of other writers."

The one-hundred and fifty year span between Glassius, Keach, and Bengel reveals an active involvement in figurative language. Bullinger states that the research on figures following this period of time is scarce. However, he does continue to brief his readers on others who have addressed figures of speech. He mentions Drs. MacGill and Blair without mentioning their first names nor citing any of their contributions. We have concluded that Bullinger assumes his readers are keenly aware of the status and expertise of these two scholars.

Hugh Blair, Professor of Rhetoric, lectured at the University of Edinburg for twenty-four years. Upon examination we realized that his work is voluminous and easily accessible. In 1829, he published his famous two volume text, *Lectures on Rhetoric and Belles Lettres* (Polite Literature). His text includes chapters on the techniques of historical composition, the origin and nature of figurative language, and sublimity in writing.

Referred to by many as a "Public Professor", Blair believed that "it was incumbent on him to convey to his pupils all the knowledge that could improve them; to deliver to them what was new, and what might be useful from whatever quarter it came." He believed that writing and discourse are objects entitled to the highest attention. He also understood the strength and value of figurative language is its ability to dress language in a rich tapestry; to ignite and to artfully frame one's thoughts. He succinctly claims that figures must arise naturally from the speaker and cannot be artificially forged.

Stevenson MacGill, in his *Lectures of Rhetoric and Criticism* at Glasgow College, devotes one chapter to the subject of figurative language and describes sixteen figures. Although only attributing one chapter to figures, MacGill's unaffected simplicity characterized his manner and style of writing is a joy to read and embrace.

MacGill initiates the recurrence of a provocative question—the origin, nature, and progress of language. Studying figures of speech will always take you back to the question, "Where did figures originate, and for what purpose?" This topic has engendered great contention. Our position is not to resolve this antiquated question: origin
of language; but rather have it known that it is the culminating question to the study of language and one that each of our above authors have visited.

Bullinger cited other significant authors from the eighteenth and early nineteenth centuries. Each author illuminated different facets of figurative language. Our attention was called to a gentleman by the name of John Walker Vilant MacBeth. This man is an enigma. Professor of History from 1874-1877 at the University of West Virginia, he wrote, The Might and Mirth of Literature: A Treatise on Figurative Language. We found that only several libraries carried his text. A most interesting note is that his book was published simultaneously in London, but the edition had to be sent back to New York due to no demand.

To assemble any biographical information, we contacted various organizations and institutions of higher learning in West Virginia. Archives from West Virginia University Special Collections Department verified that he was both a historian and department chair in history, a post he resigned to assume responsibilities as vice-president of the University. Dates of birth and death or any other information was unobtainable. MacBeth dedicated his text to George Mott, minister of the Presbyterian Church, Flemington, New Jersey. A call to the church historian only confirmed that Mott was the minister of that church during that time. Obtaining data on MacBeth from church archives and the community historical society also proved unsuccessful.

Words fall short in praise and admiration as to the depth and breadth of his scholarship. Ingeniously, he opens his text and concisely communicates the immensity of this discipline. MacBeth begins by stating that many writers are discouraged, critical, and overwhelmed by the study of figurative forms of expression. The first difficulty is in their nomenclature. All of the names of the figures are either in Greek or Latin. This difficulty can be to a great extent cleared away by a simple explanation and by substituting an English equivalent which Bullinger accomplished. The second difficulty lies in the sheer number of figures. Prior to Bullinger, a clearly ordered system of classification of figures was absent. If the Greeks did this work, no record of it seems to have been unearthed or discovered. Bullinger created an ordered system of classification which assists in the critical retrieval of this science. The third difficulty lies in the criticism that abounds from skeptics concerning the use of figurative language. Many perceive figures as frivolous and decorative, mere rhetoric applicable only to poetry. Today, figurative language is ignorantly spoken of as though it made less of a meaning and deprived the words of their power and force. Figures are met with a cry, "Oh, that only figurative—implying that its meaning is weakened or that it has quite a different meaning, or that it has no meaning at all. But the very opposite is the case.

As the course of language moves smoothly along according to the laws which govern it, there is little that attracts our attention. It may be likened to traveling by railway. When the tracks are clear and smooth, we notice nothing. We read or sleep and occasionally peer out the window. But if the train slows down or is interrupted by a sudden stop, we immediately hear the question, “What’s wrong? Why are we stopping?” Attention is aroused and interests peaked. Such is the case with our speaking and reading. Figures provide that interruption. They cause our mind to stop and consider what is being said. Discourse takes on a different level of meaning and the instruction of ideas can be conveyed with more vividness and power. It could be said that Venice is a city half land and half water but in Geoffrey Crayon’s “Tales of a Traveler”, puts it thus: “Venice, that mermaid of a city”.

For scholars who desire to explore figurative language, MacBeth highlights six points which he sees as critical elements. When studying figures writers must, (1) seek not to disparage the claims of the Greek and Latin classics, in order to clear the way for the fuller study of English. Much can be learned from their foundation, (2) discover that cadence is an important criterion in composition and is not limited to poetry and prose, (3) utilize three references: the Bible, Shakespeare, and Paradise Lost, (4) comprehend the simplicity of one-syllable words and construct a list of at least a hundred of such terms, (5) be aroused and attuned to the fact that figures aid in the invention of impressive ways of speech, (6) embrace the suggestion that the study of figures has an emphatic bearing on Biblical scripture.14

We believe that MacBeth stands at a pivotal point and his treatise is unequivocally unparalleled to this date. His work systematically unveils the premise that writers who acclaim figurative language as a standard upon which to test any composition will fashion themselves as seekers of the truth, passionate thinkers, and pure artists. MacBeth offers an alternative to academia’s objective morality. His literary masterpiece encourages those in all disciplines to
experience free and unconstrained subjectivity. To employ a word with a figurative force is as good as to add a new term to the language.

As we read and recorded data from these historical essays, themes immediately emerged. We were amazed at the level of agreement regarding definition, nature and character, and purpose of figures. Our research efforts focused on a period of four hundred years dating back to 1550. Certainly figures can be traced back to the early Greeks and Romans. They carried this science forward but a specialized system of classification seemed to pass away with the decline of learning in the Middle Ages.

The authors that fell within our research time line were in full agreement that figures are a science governed by strict laws. They are not translucent and without substance and form. They are calculated departures from natural and fixed laws of grammar. Just as biology defines and organizes life forms the same is true for figures. Figures are named, numbered, described, and are hierarchical.

An interesting and intriguing commonality was our authors’ insistence that figures can only emanate from within and cannot be superimposed or artificially created. How is a writer to interpret this, an intangible characteristic defining this science? The best figures are uttered by those who are thinking least about them. If you make yourself very familiar with them, you are able to put all manner of weapons rhetorical or written into the hand of your passion—just as an accomplished skater moves over the ice artificially.

Arthur Quinn, University of California at Berkeley scholar, insists that figures of speech are not like chemical engineering, they cannot be learned in the same way as the periodic table. “For figures are struck out, not by whim at the prompting of rhetoricians, but at the bidding of the soul. Perhaps we have entered on the sublime domain of psychology, or the strength and beauty of the soul. Mark this axiom carefully. All genuine study of language carries you into the study of the mind; and is an affinity with the Deathless, the Immutable, the Divine.”

As our provocative study continued, the most significant consequential conclusions began to come forth. A significant question continued to be generated. How does spoken and written communications impact the mind, or for that matter, a society? This has been pondered throughout many ages. The three elements of thought, speech, and the written language are inexorably interdependent and are the keys to a thinking society.

A thought is quick. They fire off in our brain with lightening speed. With or without wisdom man speaks about as quickly as he thinks. But it is the written language that exacts more time. The most highly advanced nations are those who actively teach and value skills of oratory, critical thinking, and composition.

The role of figurative language, whether speaking, reading, or writing is virtually inseparable from the development of a higher order and reasoning ability. The use of figures causes one to stop, think, rethink, and respond in a more calculating and analytical manner. One of the most frequently cited factors of American education is the inability of American students to read and think critically. The National Commission on Excellence in Education alarmingly reported that many seventeen year olds do not possess higher order intellectual skills. Nation at Risk report concluded that students today cannot draw inferences or write a persuasive essay. Echoing a theme common to most analysis on the need for critical thinking, they question how any of us can find what we need to know, make sense of the expanding pool of knowledge, or put knowledge to work solving human problems.

In today’s tumultuous intellectual environment we need to teach students to manage the working of their own minds. Figurative language moves readers and writers into complex skills such as generating and explaining comparisons (similes and metaphors), exchanging one idea for another associated idea (synecdoche), interrogation and implication (erotesis), and repetition (mesarchia; medodiplossis, mesoteleuton, and polyptoton) which is profoundly used by the human mind to recall, coach, and review.

We as a nation no longer learn the rhythms of public utterance from Shakespeare and the Bible. Yet, when young Lincoln was sprawled in front of the fireplace reading this passage from Julius Caesar, “The abuse of greatness is, when it disjoins the remorse from power”. He was unconsciously learning to be a poet. You say, “that was Lincoln, not the common man.” But the common man was flocking to the docks to get the latest installment of Dickens’s off the ship from England.

To conclude, mankind, like no other creature is in receivership of a very precious tool—language. Men, not
having the right word, or not knowing how aright to use the words they have, are piteously at a loss. The commencement of our research began with E.W. Bullinger. We are greatly indebted to this scholarly masterwork written well over one hundred years ago. He dedicated his life to the rebirth and revitalization of the science of figurative language. He did his homework well and reconstructed with clarity and simplicity what perhaps the Ancients knew, but were somehow lost.

To be a great writer, the above authors have taught us to gather facts—facts obtained direct from nature not from books, then similitudes will come at their own sweet will. To be a profound speaker, our field of vision must change. We must be honest, be downright earnest, then you will be great in speaking and writing. Truth is the necessity for every good metaphor in that it must be born of some real glow of soul, not from false fervor artificially wrought up.

We have become convinced that the study of figurative language on sound principles must form one of the most important departments of criticism. They bring us into connections with the grandeur and versatility of language and of mind. Trench in his admirable work on the “Parables” states, “Language is the amber in which a thousand precious thoughts have been safely embedded and preserved.” How simple, how truthful.

References
3. E.W. Bullinger, *Figures of Speech Used in the Bible*, (Baker Books, Grand Rapids, Michigan, 1968, p.1). The text was originally published in 1898 in London. By far, this work is unprecedented. It represents the fullest accounting of figures ever published. Each figure is carefully defined and categorized with many illustrations. Bullinger gives proper order and sequence to each figure along with the historical and contextual usage. The introduction gives a history of figurative language with a timeline of key researchers.
4. John Walker Vilant MacBeth, *The Might and Mirth of Literature*, (Harper & Brothers, New New York, 1898) p. xxxviii. His treatise on figurative language is an exceptional literary reference. MacBeth’s volume sets forth the power, beauty, wealth and with of language. He carefully surveys both American and English writers and advocates figurative language as the mode to accurately judge compositions. He deals with 220 figures with definitions and illustrations.
5. Ibid, MacBeth, p. xxxviii.
7. Ibid, MacBeth.
8. Ibid, Bullinger, p. xi.
9. Hugh Blair, *Lectures on Rhetoric and Belles Lettres*, (Cadell and Davies, London, 1798, p. 6). This three-set volume was considered a classic in the study of rhetoric. He devotes one full chapter to figurative language.
The nineteenth-century, visionary reform efforts of Brigham Young were nothing less than grandiose. During his thirty-year tenure as "Kingdom Builder" of the intermountain West, the second president and prophet of the controversial Mormon Church initiated several attempts to revolutionize the community life of his beloved Latter-day Saints. While the faithful say his motives were divinely inspired, cynics claim that Young was driven by a desire to amass personal wealth. Regardless of intent, the fact remains that Brigham Young managed to subjugate a hostile frontier and create a thriving settlement in a land of scarce natural resources. These efforts included almost complete economic independence through the development of home industry and self-sustaining agriculture, "retrenchment" of "frivolous conversation" and dress, and his most infamous reform venture, the widely condemned experiment in nontraditional family arrangements—polygamy.

Another dauntless effort of radical reform attempted by the controversial Mormon leader, though largely unknown, was his attempt to develop and implement a written language system exclusive only to the faithful. This controversial and unparalleled innovation to adopt a separate set of written symbols was known as the Deseret Alphabet. The word "deseret" comes from the Book of Mormon (Ether 2:3), and means "honeybee." The honeybee was a symbol of industry for the Mormon pioneers, and "deseret" was the name they christened their new home in the Great Basin region. The Mormon's endeavor at linguistic autonomy was the first of its kind in American history.1 There were several significant reasons for developing and implementing a separate language. An article in the 19 August 1868 issue of The Deseret News, the foremost source of news for Mormons at that time, claimed that a primary reason for the alphabet was "the weeding out of objectionable literature."12 Another reason stemmed from the growing diversity among church members as a consequence of successful overseas proselytizing efforts. In 1850, only thirty-nine percent of church members were located in the United States. As the decade progressed, thousands of non-English speaking Mormons from foreign missions began to migrate to the new Mormon kingdom west of the Mississippi.3 Church officials firmly believed that the new alphabet could help unify the diverse group of Mormon colonists, as well as provide distinct educational benefits. It must also be remembered that the Mormons of Utah were isolated from mainstream American society, both geographically and ideologically. It was an isolation they chose deliberately, and a distinct language would help ensure their insularity.

Of all the features that distinguished the nineteenth-century Mormons of Utah, two features directly influenced both the development and demise of the Deseret Alphabet. The Mormons were unwavering in their faith, and practical in their daily habits of living. The tension between faith and utility proved to be a delicate dilemma that, on occasion, could not be effectively fused into Mormon social or political policy. The religious principles of their nontraditional faith distinguished them as a people, but the colonization of the Great Basin Region required tremendous utility as a means of surviving in the undeveloped wilderness of the intermountain West.

To understand the driving forces that motivated the Mormon's revolutionary attempt at linguistic reform, it is essential to understand both the commitment to their faith, and the exigency to be practical. As such, it is necessary to examine the historical context and religious principles that characterized the early Mormon Church. Mormonism has been an enigma since its inception. It has been characterized as paradoxical in its tendency to represent both American mainstream culture, and counter-culture. In 1957, historian Thomas O'Dea observed that:

...in its origin, Mormonism was to be both typical of the larger American setting in which it existed and at the same time peculiarly itself, with its own special idiosyncratic emphasis and interpretations. Even when most at odds with its fellow Americans, it was to be typically American, and it was always to feel and express this combination and peculiarity.4

The history of the Mormon Church is a narrative in Americana. While many historians focus on the "myth of the Trans-Mississippi West, that is, the well-known image that associates Mormons with cowboys and Indians, gold miners, mountain men, and other heroic figures of the great, open, arid West,"5 the first chapter of the Mormon saga correctly begins in upstate New York during the early nineteenth century. The origins of Mormonism are rooted in the
life of its first prophet, Joseph Smith, Jr., born to Joseph and Lucy Mack Smith on 23 December 1805.

Mormonism was first revealed to Joseph Smith in 1823 by an angel who appeared to him in a clearing in the woods in upstate New York. The angel told Smith about the existence of gold plates upon which the true gospel of Jesus Christ had been recorded by an ancient prophet named Mormon. Smith, a “treasure-digger” by occupation, was a young man of questionable character who was charged with fraud on more than one occasion. He claimed that Mormonism was to be a religious restoration of the first church established by Jesus Christ and his twelve apostles. By March of 1830, Smith had translated the mysterious plates and published the Book of Mormon. The Church was officially established 6 April 1830 as the Church of Christ and espoused many radical religious concepts.

Mormons believed that God was knowable, plural, and material. They practiced baptism for the dead, theocentric democracy, and until the transcontinental railroad was completed at Promontory, Utah in 1869, they enjoyed deliberate social and economic isolation. But of all the distinctive features that characterized Mormonism during the nineteenth century, no single practice marked it more dramatically, nor wreaked more havoc for the fledgling religion than that of polygamy. Plural marriage, also known as “spiritual wifery” was not publicly acknowledged by the Church until 1852, but had been practiced in secret by a small, elite group of Mormon leaders as early as 1841. Polygamy derived from the Mormon belief that no marriages would be performed in the afterlife. Only marriages that had been created on earth would endure in heaven.

Polygamy, which was based on the practices of the Hebrew patriarchs, would enable the patriarchal leaders of the Mormons to have the largest families, and thereby gain the most status and power, both on earth and in heaven. Using this elaborate family ideology, the Mormons eventually would successfully colonize much of the intermountain West, providing concrete evidence of their loyalty to their community and to God.

Radical religious tenets, and non-traditional family arrangements challenged the cultural composite of American society. It was a challenge met by mounting malice and pervasive conflict. Experiencing the overt hostility of a non-Mormon world, the Mormons struggled to survive as a people and a faith. In June of 1844, Joseph Smith and his brother Hyrum were imprisoned in Carthage, Illinois on charges of destroying the press of a newspaper that had opposed Smith’s leadership in the Church. On June 27, both Smith and his brother were murdered in their cell by an angry mob of non-Mormons.

In the aftermath of the assassinations, Brigham Young was installed as the second prophet and president of the Mormon Church. In 1847, under Young’s leadership, 147 weak and weary Mormons embarked on the 1,300 mile pilgrimage to the Great Salt Lake Valley where they would begin to build a new society. Unspeakable persecution had forced them to resettle time and again in Ohio, Missouri and Illinois, losing most of their property, and often losing their lives. The geographic isolation of the intermountain West would provide them with a buffer of space and time to prosper materially, and to firmly establish social and religious practices that would, among other things, inspire church leaders to create a written language exclusive to the faithful.

Despite securing their geographic distance from mainstream society, the Mormons of Utah continued to experience severe persecution from an openly hostile Gentile world. The hostility they suffered is revealed in several scathing invectives that admonished the nontraditional Church. A lecture delivered at Chautauqua, New York in August of 1880 entitled "Utah and the Mormons" was reprinted in The Chatauquuan with the name of the lecturer withheld by request. An excerpt from the speech poignantly indicated general mistrust that many Americans had of the Mormons.

They are an aggressive, a growing people, and utterly alien and foreign to us, to our government and institutions, customs and traditions. They are as much foreign population as if we should take 150,000 of the Russians, with the emperor of Russia at their head, and place them in the centre of this country. They owe no allegiance whatever to the government at Washington, nor to our flag.

A year later, in an article published in the Utah Review by Reverend Theophelus Hilton, Mormonism was depicted in the following terms:

Mormonism is made up of twenty parts. Take eight parts diabolism, three parts of animalism from the Mohammedan system, one part bigotry from old Judaism, four parts cunning and treachery from
Jesuitism, two parts Thugism from India, and two parts Arnoldism [from Matthew Arnold], and then shake the mixture over the fires of animal passion and throw in the forms and ceremonies of the Christian religion and you will have the system in its true component elements.\(^9\)

The Mormon’s subsequent removal to the shores of the Great Salt Lake was regarded as a necessary means of self-preservation given the many violent encounters with surrounding communities. The early architects of the Deseret Alphabet sought to use the exclusive language as a means of strengthening their community, and ensuring Mormon insularity. Mormonism was a nontraditional religion committed to establishing the Kingdom of God on earth. The faithful believed that linguistic autonomy was a strategic weapon that could provide the Church with a powerful defense mechanism to help protect against external Gentile influences.

During the last two decades of the nineteenth century the most lethal blow to strike down Mormon cultural practices and social policies was the successful passage of several pieces of anti-Mormon legislation, most of which addressed the controversial practice of polygamy. In September of 1890, Church President, Wilford Woodruff declared that the practice of polygamy would no longer be recognized. His declaration, known as the “Polygamy Manifesto,” marked the beginning of “an era of concession and compromise leading to Utah statehood in 1896.”\(^10\) The Mormon’s forced surrender to mainstream society would ultimately include the demise of the Deseret Alphabet.

The influx of Gentiles brought about by the gold rush to California in 1849, and the completion of the transcontinental railroad in 1869, caused the gradual secularization of the public schools in Utah. One means of staving off non-Mormon interference was the establishment of Mormon Academies in 1875. Between 1875 and 1922, the Church established twenty-two academies. Formal education served as a powerful tool for building the Kingdom of God on earth once the Mormons reached their new home in the Great Salt Lake Valley. For Brigham Young to bring his visionary dream to fruition, his approach to education needed to be consistent with his approach to all social, political, and economic matters - pragmatic. His daughter claimed that Young believed “there should be no broken links between the school door and the shop, farm or kitchen.”\(^11\) The Mormons believed that formal education had a very defined role, and their school curriculum was designed to achieve a perfect blend of spiritual principles and secular skills. The nineteenth-century Mormon leaders firmly believed that schools would serve as a primary catalyst for propelling the Deseret Alphabet into the larger Mormon community.

The Deseret Alphabet was regarded as another means of thwarting Gentile influence. In 1853, an editorial was published in the Deseret News:

One thing seems quite certain in regard to language - especially the language of this people; it ought to be adapted to the emergency of these particular times. The focal point where the diverse languages of the people of all nations must be brought to harmonize into one common standard of speech renders the selection of a language for this purpose worthy of devout consideration . . . should we look for the wisdom and power of God to be displayed in forming a simple, easily acquired language, in which barbarians and Christians, bondsmen and freemen, of every grade of intelligence, out of every tribe, caste, language and country, can, in a short time, interchange their sentiments and praise God unitedly in spirit and understanding? If such a language is ever demanded at all, it seems to be required without delay, even now. It is not for a future generation, but for the present. Now the people are gathering, and the varied and general influx of the diverse tribes, nations, kindreds and tongues, is even at our doors. Provisions must be made for this forthcoming crisis and event.\(^12\)

The regents of the University of Deseret (later to become the University of Utah), along with the territorial Superintendent of Education, formally introduced the idea of establishing a separate Mormon alphabet in the early 1850s. They did so, however, on the strong recommendation by Brigham Young, who had privately, yet consistently voiced his interest in the new alphabet, and offered his full support to its implementation in all the territorial schools. (Utah was a “territory” until 1896, when it finally achieved statehood.) The seeds of this idea were actually rooted earlier in Mormon history, however. In 1845, while still in Nauvoo, Illinois, the English convert George D. Watt who had, "developed some skill in phonography" and "became interested in shorthand writing" . . . "serving as the official church reporter for many years"\(^13\) first suggested phonetic reform as a means of eliminating the incongruities of English
In October of 1853, George Watt, Parley Pratt, and Heber C. Kimball were appointed by the Regents of the University of Deseret to prepare a school book in the new alphabet in which the spelling and pronunciation of the English language would be more uniform, and easier for foreign converts to acquire. Perhaps the one institution that would become most critical to the development and implementation of the new alphabet, was the University of Deseret, the oldest state university west of the Missouri River. This institution, first established in 1850, became the University of Utah in 1894, and served as an umbrella organization supervising all educational efforts throughout the Territory of Utah. In November of 1850, the University opened the "parent school" which was designed to coordinate subject matter and pedagogical methodology in all the common schools of the region, as well as prepare teachers to instruct in those schools. During its first decade, a primary task assigned to the University’s Board of Regents was the overseeing of the creation and implementation of the Deseret Alphabet.

While the protective confines of the intermountain West ensured, to some degree, social and religious purity, isolation also created several problems. For education in general, and the Deseret Alphabet specifically, one serious dilemma created by social insulation was the inability to provide an adequate supply of qualified educators who could teach the new language. Radical linguistic reform was often met with resistance - even by faithful educators. Initially, the Deseret Alphabet was considered to be a superior symbol system by Mormon leaders because of its simplicity, and was considered relatively easy to learn. It consisted of thirty-eight letters which represented the number of sounds heard in speaking the English language. There were eleven "vocal" sounds, six long, with corresponding short sounds, four double, and one aspirate, as well as twenty-one "articulate" sounds. Although Church leaders believed it would be relatively simple to teach the alphabet to young children whose minds were more predisposed to new language forms, teachers showed little interest in teaching it. Given that few textbooks were printed in the new symbols, their objections were understandable. Additionally, the actual structure of the characters did not lend themselves to handwriting in cursive.

Although George Watt and his colleagues would be significant catalysts for the creation and adoption of the Deseret Alphabet, it was Brigham Young who provided the spiritual and political leadership to push forward with its development despite many formidable obstacles. In an address he delivered in 1854, Brigham Young commented:

"It is moreover an opportune time to introduce the New Alphabet, in forming which, the regency have performed a difficult and laborious task. I recommend that it be thoroughly and extensively taught in all the schools combining, as it eminently does, a basis of instruction for the attainment of the English language, far surpassing in simplicity and ease any known to exist."

Mormon scholars generally agree that Brigham Young’s personal history had a direct impact on his impassioned attitude toward the Deseret Alphabet. Not only did he appreciate its potential for protecting the faithful from objectionable literature saturated by Gentile influence, Young also believed there were many inconsistencies in the English language. He believed that all existing languages had deteriorated from a once perfect language. His fervent religious belief that the Mormons were a chosen people of God who were charged with the overwhelming task of establishing the Kingdom of God on earth, compelled him to establish a universal language that could unite the faithful. Young’s personal history also included several difficulties he suffered with respect to his own formal education. He spent no more than eleven days in a formal school setting, a school that by even the standards of his day would be considered "backwoods." Brigham Young also mistrusted intellectuals, and once commented to one of his counselors that he felt “the classics had been used by the learned to keep the unlearned in subjugation and ignorance.” He rejected novels. Shortly before his death he told one of his sons, “novel reading appears to me to be very much the same as swallowing poisonous herbs.” He urged his children to focus their reading on historical, scientific, and religious works. He urged them to study the new alphabet. It was hardly difficult for Brigham Young to reject the traditional language of an educational system he had mistrusted for most of his life.

Brigham Young believed that first and foremost, education should promote the faith. As mentioned earlier, he also believed that education should lend to the development of practical skills. In 1877, when he provided land for Brigham Young College, he stipulated that in addition to a liberal education, young male students should also focus
on trades such as blacksmithing, carpentry, and masonry. He requested that young female students learn to spin, weave, and sew, as well as develop skills in dairying, poultry raising, and flower gardening. The schools of nineteenth-century Utah were designed to develop practical, economic competencies, and emphasize learning that was utilitarian to daily life.

The Mormon's effort to create and implement their own language was laudable. In 1859 the Mormons began preparing a dictionary in the new alphabet. By 1868, two primers had been published in the new characters, but Church leaders continued their efforts to secure the publishing of "all of educational books for the schools and the general reading of the people" in the new characters of the Deseret Alphabet.\(^{18}\) This was a monumental undertaking, not to mention an extremely expensive enterprise. In little more than the two decades that Church leaders actively pursued the widespread implementation of the new alphabet, the Board of Regents at the University of Deseret (with the unyielding support of the Church), had approved more than $20,000 in expenditures for this eventually futile project.\(^{19}\) By nineteenth-century standards, this was an extremely substantial amount of money. Their efforts to promote the new language were not limited to the schools, however. In 1856, the Deseret News, using the locally made type, advertised "Deseret Alphabet (Latest Revisions) printed on cards ... Price 10 cents per card."\(^{20}\) Brigham Young instructed that the manuscript history of the church be written in the Deseret Alphabet. He also insisted that his personal journals be recorded in the new system. And after many "trial runs," in 1869, the entire Book of Mormon was finally printed in the Deseret Alphabet. Wide circulation of materials printed in the new language met with dismal failure, however. Aside from the formidable task of changing the "mind-set" of the faithful, there was the practical difficulty of actually securing print-type for the oddly shaped characters.

As another means of disseminating the new language, lectures were given in classes specially designed to instruct Mormons on the form and function of the alphabet, and several cultural organizations were utilized to educate the faithful about the new written symbols. The "Deseret Typological Association" was formed, and in 1855, the Association asked George Watt to provide educational instruction to Mormon's who wanted to better understand the practical application of the alphabet. Instruction throughout the common schools and Mormon academies was also used in "establishing the Deseret Alphabet as the accepted pattern of spelling, writing, and reading among the people."\(^{21}\)

Although the Mormon's effort to adopt the Deseret Alphabet was embraced by a large portion of Church members, it was an effort at social reform that was destined to fail. Because great time and labor had been necessary to colonize the Great Basin region, the pioneers of Utah had been inculcated with a strong sense of utility. As such, educational systems were intentionally designed to be less ornamental than the classical systems in the East, and more practical in their function. To require that a separate language be incorporated into the formal system of education meant that basic school curriculum could not be effectively administered. The overwhelming majority of textbooks addressing standard subjects that were essential to a practical education (reading, science, math, etc.), were printed in standard English. The Deseret Alphabet was simply antithetical to Mormon utilitarianism.

Additionally, as the boundaries of the intermountain West began to diminish with advances in transportation and communication, the expansion of the railroads, and the lure of gold in the fields of California, implementing a language that isolated the Saints from the larger national population would hinder the Mormon's efforts to achieve a prosperous economy. Such efforts at isolation also served to fuel long-standing anti-Mormon sentiment. Gentiles had always resented Mormon practices that segregated them from the mainstream culture. Such practices were met with suspicion and treated with hostility.

By the turn of the century, the Deseret Alphabet was little more than a memory. Its demise can be likened in many ways, to the demise of polygamy. Both efforts attempted to radically reform traditional systems. Both efforts were grounded in religious principles. Polygamy asserted that exaltation in the afterlife was predicated on marriage and progeny. The concept of a uniform language was predicated on the religious belief that a universal language would unite a multi-national faith that bound together the chosen people of God. Both systems, in the ideal, were regarded as having practical value. Over time, however, both systems would prove to fail in that regard.

Despite allegations by critics who charged the practice of polygamy as a effort on the part of Mormons to justify an immoral lifestyle, the historical record would bear out that plural marriage was based on the religious belief
that increased progeny enhanced one's ability to know exaltation in the afterlife with their God. It is somewhat ironic (if not mildly amusing), that Brigham Young, while sealed to approximately fifty-five wives, essentially did not like women. In fact he once commented that "probably but a few men in the world care about the private society of women less than I do." When asked by a British journalist what he thought of women in general, Young responded, "They will be more easily saved than men ... they haven't sense enough to go far wrong." Like most leaders of the Church however, Young truly believed that taking responsibility for a number of wives and producing extensive progeny would ensure a place for him in the afterlife. Additionally, he strongly believed in the form and function of a communal household in which labor and economic costs could be shared by a number of individuals. At a social level, Polygamy was a dismal failure, largely as a consequence of the Gentile belief it was a pagan practice that threatened the American way of life. At a personal level, it was a deep disappointment for Brigham Young. By the end of his life, Young painfully admitted that having multiple wives under one roof produced far more grief than benefits. In 1928, one of Young's daughter's recounted a comment made by her father.

... he told me at the close of his life that he had made a mistake. If he had to do it over, he said he would deed each wife with her own home and let her pay her own tithing and have her own belongings around her.

The institution of polygamy could not successfully merge the Mormon's commitment to faith, and their need for systems that were practical. Their failure at linguistic reform suffered a similar inability to reconcile faith and utility. Although its justification in religious principle was religiously grounded in the Mormon's belief that an exclusive language would unite a multi-national faith, the practical reality was that the proposed new language necessarily limited the Mormon's ability to access great stores of information. As such, if the Mormon people held firm to the utilization of a separate language system, they necessarily would remain insulated from all the innovations and information emanating from mainstream society. To this end, the alphabet failed. That it received such tremendous effort and financial support is testament to the Mormon's deep desire for securing an isolated and protected existence, free from the influences of a dominant culture. Despite their valiant efforts to maintain autonomy, the Mormons of Utah would ultimately be conjoined to the larger American society. It was a union that allowed them achieve impressive social and economic prosperity, a prosperity that continues to thrive. It is well worth noting that the Mormon Church is "by far the most numerically successful creed born on American soil and one of the fastest growing anywhere." Current Church assets are in excess of $30 billion. History teaches us that the efforts of religions to co-exist as members of a broader society, while seeking to remain distinct from it, often resulted in spiritual compromise or secular catastrophe. In the tension between faith and utility, it appears obvious that the pragmatic leaders of the Mormon Church, in the final analysis, discriminated in favor of utility.

I can still hear her coming down the hall, she wore those lace-up Oxfords with a good sturdy heel. She was tall, her bearing was regal and she conducted herself in a very businesslike manner as though she was going to make a difference," reminisced Martha Williams, (1998) Executive Secretary-Treasurer of the Alabama Women's Hall of Fame. "Dr. Vickery was a good role model for women like me, who were struggling to get our education. When those hard times would come, when you would think, 'I might not be able to finish,' she would be very encouraging and help you find the strength to go on."

Katherine Vickery lived her 80 years with a single-minded dedication to education and support of women's rights. She was born May 5, 1898, in Dahlonegh, Georgia, on the eve of the twentieth century. For the remainder of her life, she continued to be ahead of her times. She taught psychology at Alabama College, for 46 years, served on national boards of professional organizations, wrote numerous journal articles and a book, and traveled the world. Such accomplishments were not a part of the lives of most of her peers. In addition to those professional achievements, Dr. Vickery maintained close relationships with many of her former students and often offered the hospitality of her home to visiting alumni.

In 1919, at the age of 22, Vickery completed her master's degree at George Peabody College for Teachers, Nashville, Tennessee. This achievement was all the more extraordinary given that most women of the period did not complete high school, nor college. The following year, 1920, American women won the right to vote. Undoubtedly, Vickery's witness of the struggle for and the success of Women's Suffrage helped her to formulate her commitment to furthering women's career options. For example, she used her position as a charter member of the Alabama chapter of the American Association of University Women, to advocate for the rights of professional women. Later, in 1950, as the chairperson of the Education Sub-Committee of the Alabama Governor's Commission on the Status of Women, she was instrumental in organizing a two day conference that focused on "Women in the Home, Women in Business, and Women in the Professions." "The conference was the first of its kind in Alabama, attracted outstanding speakers and professional women from all over the nation and represented a milestone in the history of the Women's Rights Movement in our state and region." (Resume, 1998)

Alabama College employed Vickery in 1922 to teach psychology. Seven years later, she earned her Ph.D. degree from George Peabody College for Teachers. That same Fall, in 1929, the stock market crashed and plunged the United States of America into the worst economic depression of its history. At a time when millions of Americans were without a job, Dr. Vickery's career at Alabama College was ascending to heights unknown to most women and very few men of the time. She was promoted to Assistant Professor in 1930 and to Professor in 1935. In addition to teaching, she traveled to Mexico, England and France as part of the Comparative Education Society. In 1939, she became the president of the Montevello branch of the AAUW and, in 1942, she began her 22 year tenure on the Executive Council of Kappa Delta Pi, international honor society in education.

1947 was an important year for Dr. Vickery. Alabama College awarded her an honorary doctorate, and appointed her to head the Psychology Department. The AAUW also recommended her for the presidency of Alabama College.

For many women, their 50's and 60's are times to begin taking life at a slower pace or to look forward to their retirement. For Dr. Vickery, those years became even busier than before. She was at the peak of her career and professional development. During this twenty year period, she participated in a variety of unique experiences. While continuing her duties as a professor and department chair, she found time to make two tours with the Comparative Education Society, one to Northern Europe and one to Russia. The Cold War was intense when Dr. Vickery went to Russia in 1958 to study the Russian education system. After her trip, she wrote an article, "Contrasts and Trends in Russian Education" (1959) and contributed to a book edited by George Z. Bereday and Gerald Reed, The Changing Soviet School (1960).

Dr. Vickery continued her close affiliation with Kappa Delta Pi. She served as its national president from 1953-1958, as well as continuing her position on the Executive Council for another 6 years following her tenure as...
president. As well as her Kappa Delta Pi responsibilities, she served as President of the Alabama Psychological Association and served on an AAUW National Committee on Standards and Recognitions of Colleges and Universities.

In the 1960s Dr. Vickery assumed a prominent role in the Alabama mental health community. She served as a Board member of the Alabama Mental Health Association. She was an American Psychological Association Fellow, in addition to being an American Association for the Advancement of Science Fellow. She received two awards for her work. One cited her for outstanding service to the Alabama Association for Mental Health; the other recognized her distinguished service to the Alabama Psychological Association.

Throughout her career, Vickery devoted a great deal of her time and attention to the AAUW. She served on the AAUW Board of Directors from 1963 until 1967. Dr. Vickery did not hesitate to hold this organization to high expectations. For example, in November 1963, the national AAUW distributed a press release in support of the Fifteenth Anniversary of the Adoption of the Universal Declaration of Human Rights by the United Nations General Assembly. The release included the statement, "Human rights know no national boundaries. . . . This is true whether one considers Buddhists in South Vietnam, Jews in Nazi Germany, missionaries in the Congo, or Negroes in Birmingham." (italics added). Dr. Vickery was incensed by the "Negroes in Birmingham," phrase. She fired off a telegram to protest "uncalled for wording of Schmerts release on Human Rights Day. Why all reference to nations except in United States where Negroes are persecuted only in Birmingham. It shouldn't be publicized here only if newspapers would accept it as it only breeds more hatred. Should AAUW join in making Birmingham the nation's scape-goat. Statement should be retracted." (Vickery and Griffith, 1963)

Amazingly, in retrospect, seven days after the assassination of President John F. Kennedy, while most of the nation was in the deepest mourning, Dr. Vickery called the AAUW to task for what she believed to be a slight for Alabama. Nevertheless, and perhaps as amazingly, Pauline Tompkins, General Director of the AAUW, apologized to Dr. Vickery (Tomplins, 1963).

In 1969, the year after Dr. Vickery retired, the name of the college was changed to the University of Montevallo. True to the pattern of her working days, when Dr. Vickery retired, she continued to engage in important work. Significantly, she wrote a 518 page, titled, A History of Mental Health in Alabama (Vickery, 1972). On November 9, 1972, she was honored at a reception given by the Alabama Mental Health Association in Montgomery, Alabama. She was 74 years old.

Dr. Vickery lived 6 more years and died in August, 1978. Funeral services were held at St. Andrew's Episcopal Church. She was buried in the Montevallo Cemetery, not far from the university that she had served so many years. On October 17, 1985, she was posthumously inducted into the Alabama Women's Hall of Fame. At the induction ceremony, she was eulogized as being one of the "great ladies of this century in Alabama history. She is already enshrined in the memories and lives she touched." (J. Vickery, 1985)

The 20th century witnessed many changes in the status of women and Dr. Katherine Vickery was in the forefront of many of those changes. As an educator, counselor, organizer, writer and advocate for women, her example and her work built a foundation on which women who followed might stand. As Martha Williams said of Dr. Vickery, "She was a triumph!"
Thomas Cooke McCracken was born on January 5th, 1876 near Bellefontaine, Ohio, and began his teaching career at the young age of eighteen. He taught in rural Ohio schools, including those in his home town, between 1894 and 1901, and attended Monmouth College in Illinois from which he graduated in 1904 with his Bachelor’s degree. As an undergraduate, he was an assistant in the Mathematics Department and member of the Ecritean Society. Later as Head of the Preparatory Department of Monmouth College, he taught Latin. For three years, he was principal of Monmouth High School, and in 1909, he began work on his masters degree at Harvard University, graduating in 1911 and continuing with intermittent doctoral study. He received his Ph. D. in 1918 with his dissertation entitled, “The State Board of Education.” While at Harvard, he served as a South End House Fellow and was also awarded as an Austin Scholar at Radcliff.

Between 1913-1914, McCracken accepted the position of Assistant Professor of Education at the University of Utah for one year, then left to become Dean of the Graduate School at Colorado State Teachers’ College, fondly called “Greeley”, now the University of North Colorado. He served there eight years, teaching various courses in the education department and aiding the process of beginning graduate programs. Graduate work was offered for the first time in the summer of 1913, and the school conferred sixteen master’s degrees in 1917 during his tenure as Dean of the Graduate School.

Progressing in his career, McCracken returned to Ohio in 1922 to become Dean of the College of Education at Ohio University in Athens, and in 1936, he became that University’s Provost. While in Ohio, he taught courses in Research, School Administration, Current Educational Thought, and Vocational Guidance.

Altogether, McCracken spent forty-five years in the teaching profession, thirty-two of which he served as college dean. He did a great many services in Ohio, including seven years as a member of the General Advisory Committee of the Ohio Department of Education (1927-34), and serving as president of the Ohio Association of Presidents and Deans (1938). Also in Ohio he was president of the Ohio College Association (1926-27), and the Ohio State Teacher Association’s Teacher-Training Section (1925-26). He began the Bureau of Appointments, The Extension Division, and the Service Bureau at Ohio University. A series of lectures entitled The McCracken Lectures were arranged under sponsorship of that University. In other areas, he served as visiting professor at Washington University for two summer sessions, five years on the Committee on Standards of the American Association of Teachers Colleges (1930-35), and two years as a member of the Board of Control for Child Welfare in Colorado. For eight years he was a member of the National Committee on Education for the Camp Fire Girls movement, and was a member of the Harvard chapter of Phi Delta Kappa as well as President of the Harvard Graduate School of Education Alumni. In more personal circles, Dean McCracken was a charter member of his local Rotary Club and served as its president in 1929, later being elected to its honorary membership. He was a long time member of Athens’ First Presbyterian Church and president of its board of trustees in 1923.

Regarding McCracken’s writings, he wrote several articles and practical books on education. As Professor of Education at Colorado Teachers College, he wrote an article in support of the community co-op plan which offered college students the opportunity to earn course credit by serving in various areas of leadership in their town. Students could participate by teaching Sunday School, leading boys’ and girls’ clubs, and aiding other community services that involved teaching. The plan was quite successful and helped the college and community benefit from one another.

McCracken authored two very practical books concerning vocational exploration and training for children, one entitled Handbook of Opportunities for Vocational Training in Boston and a second called Occupational Information in the Elementary School. Both books served to provide youth and parents with a list of vocations from which adolescents could choose. His goal was to help youth constructively contribute to society, and avoid the waste of resources that occurs when job selection is erratic. In Handbook of Opportunities, he gave information about various types of employment, from needle arts to wood guilding, and listed professional schools, their courses, and admission procedures. Also described in this book are commercial and industrial schools, schools for training in “household arts”, and opportunities for the physically handicapped.

In Occupational Information in the Elementary School, Thomas McCracken and Helen Lamb sought to
provide elementary school teachers with information about various lines of work available for their students. They selected stories, readings, and songs related to different types of employment. McCracken believed that occupational guidance should begin in kindergarten, and that curriculum in the lower grades should develop foundations for basing decisions regarding work. McCracken wrote, "The youth can make wise selection of a life work only when he knows and understands the world of (employment) in which he must find his place when he is ready to leave school and join the ranks of wage-earners." McCracken's desire for appropriate work selection by children reveals real compassion and concern for America's youth, desiring that no talent be wasted. The goal of guiding students into appropriate work fields was one McCracken felt that the school could so greatly help accomplish, along with the help of the "live, earnest, competent teacher." Through these publications, one finds that quality teaching and provision of practical, useful tools for teachers were principle goals of this man's leadership. Such verve for emphasizing quality may have been the key element behind his long involvement with Kappa Delta Pi. This Society was first to locate on a teacher's college campus, and T. C. McCracken was its chief organizer. Serving from 1924-1948, McCracken was Kappa Delta Pi's fourth national president.

Through his long incumbency, McCracken was able to contribute to education by steering the Society through the dark times of the 1930's Depression and the second World War, heartening many in the teaching field as he inspired not only Society members, but others in the teaching profession. Constant encouragement was a hallmark of his Presidency and of great importance through the Depression-- his knack for thriftiness and keen business sense, ideal for steering Kappa Delta Pi through this time. During World War II, McCracken continued to inspire teachers, writing, "It will be a heavy task to maintain high professional standards in teaching when the government and general public do not consider their maintenance as an emergency in these war years...(But) we must stem the tide which seems to surge against professionalization and adequate preparation of teachers." In bold support, McCracken spurred on the chapters of Kappa Delta Pi as they entered the college year of 1943 which promised many difficulties. He admonished that "...Kappa Delta Pi should (aid) every effort to create in society an eagerness to support education," and he praised chapters' efforts to stoke student interest at a time when many noble causes vied for attention. He empathized with the daily problems educators faced such as "lack of transportation facilities, a limited gasoline supply, and cars too aged to stand ...traveling to meetings." He felt later that despite the hardships, the activities of the chapters had moved forward in "a very satisfactory manner," and that they "(had come) through the emergency years with few, if any, chapter casualties." This survival was largely due to McCracken's constant encouragement and relentless pursuit of his vision for education.

While President, Kappa Delta Pi established its annual Lecture Series which became available to others as it was printed, and the Kappa Delta Pi publications The Kadelpian Review and The Educational Forum were also made available to aid those in the teaching field. McCracken highlighted the scholarly and research nature of Kappa Delta Pi but stressed even more the need for the professionalism of teaching. Bringing about such professionalization became McCracken's key pursuit, working through his leadership of Kappa Delta Pi to urge all in the teaching field towards this goal. McCracken wrote, "It is the purpose of the Society to encourage high professional, intellectual, and personal standards in teaching and to recognize outstanding contributions to education." He felt he could not stress strongly enough that the ideals set forth in Kappa Delta Pi helped foster the highest standards for education, writing: "(These ideals) are bulwarks against attitudes so frequently expressed by the non-professional general public...(and) are needed in education if we are to educate citizens with enough stamina to preserve the earlier sturdy American way of life." McCracken wrote numerous articles stressing the responsibility of Kadelpians to strive for teacher education beyond the high school diploma and two years of college. In 1926, with over fifty percent of United States teachers having less than two years of training beyond high school, and many teaching with only a high school diploma, he claimed that "it (was) almost impossible to have a real profession." In later years, he stated that he believed the main purpose of Kappa Delta Pi, though unmentioned in its Constitution, should be to "work for the greater professionalization of teaching."

"Let us agree," he wrote, "that one of the greatest influences of Kappa Delta Pi will be to widen the horizons of teachers and broaden their human understanding of peoples and their different cultures with the expected result of better educated teachers. We will contribute to a higher quality of citizen leadership when higher ideals for teacher
preparation bring about better teaching.' He believed that Kappa Delta Pi members should use their knowledge, sense of duty, and power to bring about professionalism, knowing that educators alone could elevate the career of teaching.

Thomas McCracken longed for members of the Society to foster not only the aforementioned intellectual and professional standards, but personal ones as well. Dean McCracken saw no congruency between teaching professionalism and personal slovenliness, writing to the Society, "(those) whose lives are consecrated to teaching should as far as possible eliminate that which is offensive, and encourage that which is refined. It matters little whether this is in action, dress, thought, or speech. For the coarse act, refinement should be substituted; for the unbecoming dress, that which is neat and becoming; for careless thinking, straight, clean, vigorous thinking; and instead of thoughtless, unchaste speech, utterance of that which no teacher of youth should be ashamed. Courtesy should be an unyielding characteristic of every Kadelpian and of every chapter. I submit to you the proposition that all (Society) activities should encourage in human living that which is beautiful and refined," and indeed the Society's President was exemplary of such conduct.

Upon his retirement from Ohio University in 1946, McCracken became Dean Emeritus. In 1963, the University's College of Education building was renamed McCracken Hall in his honor, and in 1964, his widow and daughter, Alice, presented an oil portrait of Dr. McCracken to the University. He died at the age of 85 in Athens, Ohio on March 9th, 1961 after an illness of several months, and is buried in the West Union Street Cemetery.

Dr. McCracken was a man who was pragmatic in teaching, zealous in pursuit of educational professionalism, and ethical in conduct, all three standing as qualities greatly needed today. He contributed to education through his professional teaching career and personal demeanor, but through his presidency of Kappa Delta Pi, he stood most strongly as a leader. As the Society's President, he wrote countless letters and visited many chapters, always regretting his inability to visit more. He grew the number of chapters from twenty-six to 154, thus increasing the opportunities for more to strive for professionalism. Kappa Delta Pi and the field of education are indebted to him for his notable service to the cause of teacher preparation, and American youth are in debt to him for his compassion, concern, and continual investment in their welfare. As he parted in one of his articles, "It is the hope of your Executive President...to accomplish many things for Kappa Delta Pi and the profession of teaching," we see that he well accomplished his goal. He possessed rare talent for surviving storms, continued zeal in encouraging efforts, and a great heart for fostering friendships, thus greatly advancing the profession of teaching and the educational cause, and standing as an inspiration for us as a man of pragmatism, professionalism, and propriety.

From the “Yellow Peril” to the “Model Minority”: Asian American Stereotypes from the 19th Century to Today

John D. Palmer
University of Iowa

Since the late 19th Century, Asian-Americans have struggled in their attempts to settle into a strange new world. Coming to the U.S. in search of a better life than their native countries could offer, the majority of Asian immigrants worked the undesirable positions as gold miners, railroad laborers, factory workers, laundry cleaners, and as seasonal laborers in the canneries (Takaki 1989, 1993). As the Asian population increased throughout the U.S., Whites became apprehensive about losing their jobs and “their” country to this “non-assimilative” race (Takaki 1993; McClatchy 1997; Wollenberg 1995; Wong 1998).

Early discrimination against Asian-Americans was originated due to the fear of the Yellow Peril. Thereby, the U.S. government began passing laws that restricted Asian immigration: the 1882 Chinese Exclusionary Act and the 1924 Asiatic Exclusion Act were aimed at the reducing the number of Asians in America (Hirschman and Wong 1988; Takaki 1989). Other laws were passed to forbid citizenship and land ownership to non-White immigrants. These early laws established a general apprehension towards Asian-Americans, which eventually led to the internment of over Japanese-Americans during the U.S. involvement in World War II (Hosokawa 1997).

After the 1965 Immigration Act, an amendment that lifted the ban on Asian immigration, the Asian-American population soared from 890,000 in 1960 to 7.3 million in 1990 (Bureau of the Census, 1980, 1990; Pang 1995). This new wave of Asian immigrants was highly touted by the popular media and leading politicians as the model minority, primarily due their perceived economic and educational achievements.

This paper will attempt to provide a brief evolution of Asian-American stereotypes from the 19th Century to the present date and how little has changed for Asian-Americans since the early 19th Century. The first part will provide a historical account of Asians in America and the early discrimination they encountered. The second part will introduce the problems associated with the image of the model minority and attempt to demystify this stereotype through the existing literature. The third part will reveal evidence of how this stereotype has negatively affected Asian-Americans through lack of government and community support. The conclusion will make a connection between the stereotypes of the 19th Century with those of today. Furthermore, I will offer suggestions to educators to assist them in educating one of the fastest growing populations in the U.S.

History of Asian-Americans

In the 1840s, in search of a better life, the majority of Chinese immigrated to the U.S. as a form of cheap and unskilled labor. They were responsible for laying large portions of the railroads, expanding the agricultural industries in California and the Deep South (during the Reconstruction years), thus, contributing to the settlement of the United States (Takaki 1989, 1993; Yee 1992).

Stereotypes of the Asian immigrant at this time were contradictory in a number of ways. For the most part, Chinese laborers were considered coolies; “unfree laborers who had been kidnapped or pressed into service by coercion and shipped to a foreign country” (Takaki 1993, p. 193). However, the majority of Chinese laborers in the U.S. came upon their own free will and paid their own travel expenses (Takaki 1993). Furthermore, Asians were considered to be diligent and frugal laborers that could be used as a model for others minorities, such as Blacks and Irish (Takaki 1993). However, this stereotype antagonized White laborers. They believed that the Asian laborer accepted minimal pay without resistance, intentionally broke-up their labor strikes, which consequently led to the loss of their jobs. The White laborers animosity was based on the fact that Chinese laborers made up nearly 90 percent of the Central Pacific Railroad work force in 1867, nearly half of San Francisco’s four key industries in the 1870s, and 86 percent of agricultural labor in Sacramento County, California, in 1880.

Due to this seemingly take over of labor, Chinese-Americans were conceptualized as a non-White race that could possibly gain both political and economic control of California and the western states. White leaders such as former President Rutherford B. Hayes (1877-1881) warned “Americans about the ‘Chinese Problem” (Takaki 1993, p. 206). These fears lead the U.S. government to prohibit Chinese immigrants from entering this sacred land in 1882 and denied citizenship to those already residing in the U.S.

Japanese immigrants began replenishing the need for cheap labor from 1890-1924 (Daniels 1988; Takaki 1989). Their journey to the new world was a different experience than that of the Chinese. Under severe restrictions
from the Japanese government, the Japanese population in the U.S. grew slowly in the beginning; from 148 in 1880 to about 2,000 in 1890 (Wollenberg 1995). However, following their victory in the 1904-1905 Russo-Japanese War, the Japanese government allowed more of her citizens to migrate to the U.S. Accordingly, from 1890 to 1910, the Japanese American population grew to more than 72,000 (Wollenberg 1995). The Japanese, nonetheless, faced widespread discrimination in the U.S. and Hawaii. Based on the fear of the Yellow Peril, the xenophobic attitude which feared an Asian take over of the western part of the U.S., the U.S. government slowly moved towards the complete barring of Japanese immigrants and restriction on their rights to own land.

In the 1908 Gentlemen’s Agreement, Japanese laborers were prohibited to immigrate; however, Japanese women were allowed to enter the U.S. as family members (Takaki 1993). The rise in the number of picture brides to the U.S. at this time contrasted the Chinese experience. Chinese men, who for the most part left their wives and families in China, dreamed of one day returning to their home with riches from the West. Therefore, the Chinese population remained stagnant while the Japanese population continued to grow mostly due to the rapidly rising Nisei (second generation Japanese) population. Accordingly, the Japanese came to Hawaii and the U.S. in the hopes of building a permanent residence.

The increase of Japanese population affirms to the belief that the Japanese were in the U.S. to stay. In California alone, the Japanese population surged from 41,000 to over 71,000 between 1910 and 1920, in spite of the laws restricting their immigrations. It is also interesting to note that of the 71,000 Japanese residents in California in 1920, nearly half were below the age of seventeen (Wollenberg 1995). The Nisei represented a strong growth in economic and education gain as they were considered citizens of the U.S. yet were refused the same rights as that of Whites.

Feasibly the most affected by discrimination in the U.S. were the second and third Asian-American generations. Having only seen the U.S., these children called the U.S. their home, yet rarely were allowed to reap the riches of America. In spite of their success in school and in institutes of higher education, Japanese-American and the few Chinese-American second generation were denied, for the most part, jobs in the White man’s world. Therefore, they were restricted to the Japanese-town and China-towns as bookkeeper, small shop owners, and provided services to the first generation that had limited English speaking abilities (Takaki 1993). These children were educated in the public schools on the “founding” of the U.S. and the belief in democracy and the rights to the pursuit of happiness. However, they recognized that by being non-white, their position in the U.S., as second class citizens, was never likely to improve.

Further discrimination against Asians, especially towards the Japanese, California passed the 1913 Land Ownership Law and the 1920 Alien Land Law in an attempt to restrict the expansion of property ownership among Japanese immigrants. However the Nisei, as U.S. citizens, were able to purchase land for themselves, their parents, and any other first generation Japanese who desired land ownership. Therefore, the fear of the take over of California and other west in combination with a quandary in diplomatic relations between the U.S and Japan following World War I, led to the Asiatic Exclusion Act of 1924, which restricted further immigration from Japan (Hirschman and Wong 1988; Takaki 1989).

The stereotypes of Japanese laborers were much the same as the Chinese who preceded them. Look upon as a form of cheap labor and portrayed as acquiescent and subservient, white owners held little fear of uprising and strikes among the workers. However, when the Japanese did show signs of resistance to the unfair labor conditions, the white owners began importing other Asian laborers from the Philippines and Korea to break up the workers camaraderie. This method of “divide and control” pitted the laborers against one another based on their ethnic heritage, thus the laborers’ efforts and animosity were directed towards each other rather than towards the suppressor (Takaki 1993).

Throughout their history in the U.S., Asian-Americans have encountered severe discrimination and acts of violence from the White population (Daniels 1988; Takaki 1989). Restricted from further immigration and denied the right to citizenship, Asian-Americans became an isolated group in the U.S. Some returned to their homeland, while others persevered in spite of their subordinate position in the U.S. society.

Probably the most recognized act of discrimination against Asian-Americans in history was President Franklin Delano Roosevelt’s Executive Order 9066, which detained nearly 110,000 Japanese-Americans in remote internment
camps after the declaration of war on Japan, due to fear of espionage tactics and distrust of loyalty to America. Therefore, the Japanese attack on Pearl Harbor on December 7, 1941 validated the fear of the Yellow Peril among the majority of U.S. citizens. The U.S. government deemed it necessary to imprison nearly all Japanese-Americans, albeit nearly two-thirds were U.S. citizens. The suspicion was partially based upon the notion that the Japanese government considered all of her people Japanese citizens no matter where they were born or resided (McClatchy 1997). Nevertheless, young Japanese-American men volunteered their military services and lost their lives in Europe to prove their loyalty to the U.S., while their families suffered in the remote camps (Bell 1997; Takaki 1989; Yee 1992). In spite of their loyal service and the highly recognized and honored 442nd, their parents were still denied citizenship, the rights of free people, and equality in the U.S.

Discrimination against the Japanese during World War II exemplified the racist attitudes towards all immigrants from Asia. The Japanese were able to improve their position in the U.S. through hard work and determination to assimilate into the American way of life (Kanzaki 1995). However, the Japanese attack on a U.S. naval harbor, provided the U.S. government enough of a reason to desolate the progress of the Japanese-American by stealing millions of dollars worth of property and convicting them on charges of espionage and fifth-columnism without due process (cite). The next section will examine the post 1965 immigration surge from Asia and how the stereotypes of the past took a slightly altered appearance from those of the past, yet, discrimination continued to plague the Asian-American experience.

Post 1965 Immigration

The racism encountered by the early Asian settlers was no less serious than that encountered by other oppressed groups in the U.S. before the turn of the 20th Century up to the present day. The banning of immigration and the internment camps during World War II clearly elucidated Americans discriminatory disposition against Asian-Americans. However, as the Civil Rights Movement began to establish the need for equality in the U.S., the 1965 Immigration Act was passed. This edict eventually allowed for a massive increase in the Asian-American population, which has grown from 890,000 in 1960 to approximately 7,300,000 in 1990 (Bureau of the Census 1980 and 1990), making it the fastest growing population in the U.S.

The first immigrants, after the 1965 Immigration Act, from China, Korea, Japan, and the Philippines migrated to the U.S. mainly with middle class values and educated backgrounds (Bernstein 1988; Daniels 1988; Takaki 1989). This wave of educated immigrants also included Indo-Chinese refugees fleeing war torn Vietnam in search of freedom from persecutions in their home countries and a better life for their children. The majority of these refugees were involved with the U.S. military, the upper levels of the socio-economic class, and the “Westernized elite” (Thompson 1986).

However, following this wave of immigration from Asia, a second group of Asian refugees from war-torn countries, the isolated countryside, and urban ghettos found refuge in the U.S. With little or no education and very few economic resources these émigrés are experiencing a much more difficult time in the U.S. than those that preceded them (Suzuki 1989; Thompson 1986; Walker-Moffat 1995). Thompson (1986) notes that it was these refugees fleeing Vietnam, Laos and Cambodia who came to the U.S. with few resources and limited exposure to the Western world who lack a strong social and economic foundation. For these reasons, this wave notably endures more hardships in finding economic and educational success in the U.S.; far from achieving the level that many believe all Asian-Americans are reaching. Often overlooked for social support services, due to the reports that praise the achievements of Asian immigrants, is a great disservice to the later who came with practically nothing. As a result, it is imperative to realize the diversity of Asian-Americans in order to lend assistance to the groups that are in need.

Success or Failure – Discrimination against Asian-Americans

In 1980s and 1990s reports portrayed and praised the Asian-American success story. However, the majority of these reports glossed over the truth behind the high income rates and college percentages and failed to mention the struggle of those Asian-Americans who were not succeeding. This section will attempt to demystify the model minority stereotype by revealing information often overlooked by the general public and popular media. Asian-Americans migrate to the U.S. in search of an improved life find themselves and their families are only qualified for menial labor in the service sector far below the levels of their abilities. As middle class, white-collar workers in their home country, some first generation Asian-Americans discover that it is nearly impossible to gain
employment that is suitable to their educated backgrounds and training. (Page 1989; Takaki 1989; Woo 1989). Others who seek self-employment work from early morning until late at night hoping to save enough money to move their families into better housing conditions and provide a better education for their children. Many of these small private businesses do not have enough capital to hire outside employees, and as a result, their children are forced to work long hours for little or no pay (Louie 1996). In addition, 1.5 generation and U.S. born Asian-Americans are encountering discrimination in the work force, the “glass ceiling,” as there are few management and upper-level positions made available to them (Constable 1995; Suzuki 1989; Woo 1989).

Furthermore, reports show that Asian-American family median income was higher than the national median and Whites. However, the reports failed to include the Bureau of the Census data in 1990 that also exposes the other side of the story. Both Korean-Americans and Chinese-Americans are shown to have higher family median incomes than Whites, yet, these groups’ poverty rates are higher than the 10% national average; 13.7% and 14%, respectively. Similarly, the poverty rates for Southeast Asian groups are well above the national average with Hmong, Cambodians, and Laotians at 63.6%, 42.6%, and 34.7%, respectively. 

One explanation for the discrepancy between these findings may be attributed to family composition. The Bureau of the Census (1990) found that the percentage of Asian-American families with three or more workers contributing to the median income exceeded that of the total U.S. population. Thereby, in an Asian-American family three or more workers contributed to the household income while in the typical U.S. household only one or two family members contributed. Furthermore, Asian-Americans primarily live in larger cities where the cost of living is higher than in the smaller communities, thus their higher income is misleading.

Reports also praised the high academic achievement of Asian-Americans, giving the impression that all Asian students were on a higher level than the rest of the U.S. (Bell 1997; Butterfield 1986 and 1997; Graubard 1988; Kasindorf et al. 1982; Page 1989; Ramirez 1986). The media heralded Asian-Americans in such headlines as: “Success Story: Outwitting the Whites” (Newsweek June 21, 1971; “Why Asians Are Going to the Head of the Class” (The New York Times August 3, 1986); “America’s Super Minority” (Fortune November 24, 1986); and “Those Asian-American Whiz Kids” (Cover of Time Magazine August 31, 1987). Several scholars sought to determine the reasons behind the success of the Asian-American student. Butterfield (1986) reported the findings of Dr. T. Berry Brazelton of Harvard University “suggests that Chinese and Japanese babies are more alert and sensitive at birth, making them faster learners” (A2). In addition, Butterfield (1986) found that Harold W. Stevenson of the University of Michigan, Sanford M. Dornbusch of Stanford University, Julian Stanley of The Johns Hopkins University and Thomas Sowell of the Hoover Institution at Stanford hold that family values and hard work ethics contribute to the success of Asian-Americans. Yao (1985) believes that Asian-American parents tend “to maintain more control over their children than Anglo parents [and] play a major role in their children’s education and career choice” and that children who are “high achievers could not have reached the academic excellence without parental push and assistance” (pp. 203-204, 206).

However, while some Asian-American students are high achievers, as a whole they are not. For example, high school-drop out rates for Asian-Americans are increasing, while the national levels are decreasing (U.S. Educational Report). In San Diego, California and St. Paul, Minnesota, Southeast Asian drop out rates are as high as 60% (Sengupta 1997). Furthermore, while Asian-American college graduate levels are higher than the 20% national average, Southeast Asians are far below the national average e.g., Hmong 3%, Laotians 6% and Cambodians 6% (Bureau of the Census 1990).

From these reports, it is apparent that all sub-groups within the Asian-American category are not reaching the same levels of those depicted as the succeeding minority. The new immigrants coming from backgrounds of little or no education and limited financial security are finding it very difficult to succeed in the U.S. From these statistics researchers are now disputing the overall belief that Asian-Americans are succeeding in spite of racial discrimination. Furthermore, as will be discussed in the next section, the model minority stereotype has been a impediment for some Asian-Americans.

**Harmful Effects of the “Model Minority” Stereotype**

Although some Americans tend to believe that Asian-Americans do not encounter discrimination, due in part to their perceived success, Asian-Americans’ needs are given little consideration by government officials, school
From the "Yellow Peril" to the "Model Minority"

Palmer

administrators, and the general public. Furthermore, tension between Asian-Americans and other oppressed groups came as a result of the media and leading officials’ praise of their success and the promotion of the idea that failure is the fault of the individual not because of institutional and cultural racism in the U.S. This section will elucidate on particular struggles Asian-American encounter with other oppressed groups, the government, and the education system.

In theory, those in leadership and policy-making positions would rather see the minority and oppressed echelons of society pitted against one another than to have them join forces to challenge the existing order. For example, in the late 1800s and early 1900s, Asian-Americans were used as strike breakers against one another and against Irish union workers (Takaki 1989). In my opinion, the philosophy of “divide and rule” continues to be the hidden agenda of some of the leaders in politics, economics and education.

The development of the model minority stereotype has caused problems both within and outside the Asian-American community. Concerning the latter, this myth has been used by policy-makers as an example for other oppressed groups that they too are able to overcome their hardships and succeed in the U.S. (Kamen 1992), thus, proclaiming that meritocracy exists for all in the U.S. Therefore, constant praise of the Asian-American success story began causing friction and rivalry between Asian-Americans and other oppressed groups in the U.S. Testimonies to this were: 1) the boycotting of Korean markets in New York City and Los Angeles between 1985 and 1990 by African-Americans; 2) the destruction of Koreatown during the Los Angeles Riot in 1992, resulting in over $400 million in damages; and 3) other acts of violence between the Asian-Americans and other ethnic minority groups (Dugger 1992; Mydans 1993).

Furthermore, Asian-Americans encountered racial violence from the White working class who felt that the new immigrants and their native countries were the cause of their loss of jobs and decline in wages. The most prominent case occurred in 1982, when Vincent Chin, a Chinese-American, was brutally murdered by two Whites in Detroit, Michigan, with baseball bats after losing their jobs at the automobile factory. The convicted murders received no jail time and fined less than $4000 “because the court acknowledged that Japanese auto imports had indeed caused great stress” and the two on trial had no prior records (Saigo 1989, p. 8). Similar cases of racial violence are levitated by a variety of recent attitudes towards Asian-Americans: 1) a feeling in U.S. society that Japan’s economic power is surpassing America’s position on the world’s economic level (Lee 1990); 2) post Vietnam War hate; 3) jealousy over the Asian-American economic and educational success; 4) the fear of the “Asian invasion,” the rapid Asian-American population increase. (Lovely 1993; McBee et al. 1984; Toy 1996).

In addition to intra-minority problems and hate crimes, Asian-Americans who do not achieve in schools and society receive less support from community social services due to the existing stereotype of overall academic and economic success (Bernstein 1988; Lee 1990; Thompson 1986; Yao 1987). In the areas where Southeast Asians and rural Chinese immigrants are migrating to, there are few social workers and qualified educators to handle the vast differences in culture and language within the Asian groups (Chin 1997; Suzuki 1989; Walker-Moffat 1995). The initial reaction to the mass migration of different Asian groups throughout the U.S. has been positive, yet as time passes the enthusiasm wanes and the children are given less support. In most instances, bilingual education is not offered due to the vast differences in the languages spoken by Asian groups and the lack of qualified individuals working inside the school (Walker-Moffat 1995). This may be one of the reasons why some Asian-American groups are showing higher drop out and severely lower college graduation rates.

Furthermore, stereotyped as the high achiever and the need to fulfill the pressure of upholding the family honor, Asian-American students are displaying great signs of psychological stress in their schools with little or no assistance from their teachers and counselors. Some students are unable to handle the pressure of receiving grades below an A because they along with their parents have bought into believing in the model minority stereotype and as a result is one of the contributing factors to an increase in Asian-American teenage suicides (Kamen 1992).

Others who are unable to achieve due to lack of English speaking abilities or learning disabilities are ignored by teachers who automatically assume that their Asian students’ silence equals understanding (Bernstein 1988; Griffin 1986; Howard 1988; Hubler 1988; Kamen 1992; Lee 1990; Yee 1992). In addition, teacher expectations of Asian-American students add to the dilemma of those who are failing at school.

Lee (1994) found that there is a rising group of Asian-American students in high schools who intentionally
decide not to fit into the stereotypical mold and tend to break away from those who they consider nerds, fresh off the boats (fobs), and overachievers. Therefore, academic achievement is not a part of their self-identity. Consequently, the majority of these students fail in school. Furthermore, she found that their teachers marked Asian-American students who act in the same manner as the average U.S. student as trouble makers since they do not fit into the stereotype of the quiet and respectful student.

**Assimilation**

Dhooper (1991) believes that since Asians are neither White nor Black, they are treated as “aliens” and made to feel as though they are foreigners even if their family line dates back to the 1800s. The media continues to portray Asians and Asian-Americans as a people with a strange and exotic culture that rivals and contrasts that of the U.S. dominant group. Therefore, Asian-American youth encounter additional pressure to feel accepted in the U.S. and as a result some surrender their ethnic identities, as they are unable to identify with the stereotypical Asian. This not only causes some to lose interest in school but also causes some to distance themselves from the culture of their parents. It has been found that some Asian-American children adapt so quickly to the American system and language that they do not have a strong understanding of the language of their parents (Thompson 1986). This has lead some to view their parents as “second class citizens,” due to their parents’ lack of understanding English and more importantly American culture. Therefore, in some instances, the child’s role in the family becomes one of manager of the daily life encounters that can only be solved by an English speaker and one who understands the American way of life i.e., dealing with bankers, loan officers, insurance companies, and teachers. In addition, when social problems arise for these children, they are unable to express their true concern to their parents because of barriers in communicating in two languages, where the child is not completely proficient in his/her ethnic tongue and the parents do not fully understand English (Thompson 1986). Thompson believes that “Americanization means a waning of parental authority, which in turn is linked to slipping education performance” (p. 46).

Assimilation into White middle class culture strips the majority of Asian-Americans of their ethnic identity. Nearly everything around them influences some to believe that being of Asian descent is strange and exotic and therefore do not take pride in their ethnic heritages. Consequently, Asian-American children are unable to identify with these stereotypical portrayals and thus identify more with the dominant culture. However, as Chin (1971) writes, “...many Orientals who in their quest for acceptance have rejected their Oriental identity and heritage. It is indeed a heavy price to pay for admission to a group that one must reject one’s own background since this is a form of self-hatred. ... Even if an Oriental should go to the extreme of changing his name from Wong to Wright, and have surgery performed to make his eyes more oval ... there will always be some Caucasian who will remind him that ‘all Orientals look alike’” (p. 183).

Furthermore, Barbara Schneider, professor of education at Northwestern University, discovered that those Asian-Americans who were more assimilated into the American mainstream tended to lose interest in school leading her to conclude that the high curve set by Asians will eventually level off. Furthermore, Dombusch believes that “the more English that was spoken in the students’ [Asian-American] homes, the less well they tended to do in school. ‘To put it bluntly, America may be a melting pot with low standards’” (Butterfield 1986, A3).

**Higher education institutions and the Asian-American challenge**

The longer a family line has been in the U.S., the more of an understanding of the role of “second class citizen” is realized. It has been the later Asian-American generations that have come to the forefront to challenge the discrimination that have hindered their progress of gaining full privilege and rights of citizenship. One example of Asian-American resistance to discrimination occurred during the 1980s.

In the late-1980s, the elite universities began reporting disproportionately high percentages of enrollment compared to the overall Asian-American population, which accounted for 2.9% of the total U.S. population (Bureau of the Census 1990). For example, in 1986 Harvard’s freshman class was 11% Asian-Americans and overall enrollment was 8%, Massachusetts Institute of Technology (MIT) freshman class was 21% and overall enrollment was 19% (Butterfield 1986). Similarly, in 1989-1990 Asian-Americans represented 27% of University of California-Berkeley’s student body (Wang 1995; Yee 1992). Therefore, when these institutes began cutting back on the number of Asian-American admitted, they were accused of placing quotas on the number of accepted students (Biemiller 1986; Hsia and Hiirano-Nakanishi 1989; Molotsky 1988; Nakanishi 1989; Wei 1993).
community leaders challenged these universities freshmen acceptance criteria, which changed their policy to include extracurricular activities rather than on high school G.P.A., SAT math and verbal scores and academic tests (Biemiller 1986; Nakanishi 1989). In rebuttal, administrators stated that they were attempting to build a diverse campus and that the majority of Asian-American applicants were in the fields of pre-med. studies, engineering, and the natural and physical sciences (Escueta and O'Brien 1991; Nakanishi 1989). Therefore, they argued that if Asian-Americans were diversified along other studies, their acceptance rates would be higher (Nakanishi 1989). Although Asian-Americans lost the overall battle against illegal quotas on entering freshmen, their voices were finally heard and at least a small proportion of the general public came to realize the force of their actions (Hsia and Hiirano-Nakanishi 1989; Nakanishi 1989).

The popular media is one of the main reinforcing factors behind the stereotypes that depict Asian-Americans as non-English speaking foreigners with exotic cultures, yet due to their perseverance, hard work, and natural intelligence they have been able to claim economic and educational success in the U.S. Thus, the model minority stereotype has spread throughout the U.S. as a proclamation for the belief in meritocracy. As a consequence, a 1991 poll conducted by the Wall Street Journal and NBC News found that the majority of voting citizens believe that Asian-Americans do not suffer from discrimination but rather receive too many special advantages (Dugger 1992; Polner 1993). However, often overlooked are the truths behind the so called “success story.”

The U.S. Commission on Civil Rights found that the majority of native born Asian-American men were earning considerably less than similarly qualified White men (Suzuki 1989). Furthermore, the percentage of Asian-American children living in poverty are higher than Whites, hate crimes against Asian-Americans are increasing, and school drop out rates, juvenile delinquency and gang related activities continue to rise (Lee 1990).

The media and leading politicians overlooked these facts to display a story of one minority group overcoming their difficulties, and therefore some reached the conclusion that discrimination in the U.S. does not exist. However, the U.S. Commission on Civil Rights also found inequities in the public schools in which Asian-Americans suffer considerably.

The educational system has not been eager to meet the diverse needs of Asian-American students. Bilingual education programs are among the most pressing of educational needs for Asian-American students. However, Yao (1987) believes that many schools offer no bilingual education programs and that English as a Second Language (ESL) program do not adequately meet the needs of the students. Thomas and Collier (1997) address the need for more bilingual education in our schools to assist non-English speaking students to develop their English abilities as well as receiving education in all other areas. However, current ESL and bilingual programs do not provide the necessary groundwork the new immigrants from Asia need.

In addition, qualified school counselors need to be recruited to assist students who are having trouble adjusting to the western world from their isolated societies (Lee 1996; Walker-Moffat 1995). These counselors must also assist teachers and principals in understanding the differences between the Asian groups and their cultures. Therefore, principals need to assist teachers in building a multicultural education program to inform students and the community of the vast differences of Asian cultures and display positive accounts of Asian-Americans outside of the academic realm.

A constant theme throughout this paper is the sanctioning to understand the diversity of Asian-Americans. This group needs to be divided into at least four separate groups. I suggest that these four groups should be categorized along geographical lines; 1) Far East Asia; 2) South Asia (Asian Indian); 3) Southeast Asia and 4) Pacific Islanders.10

The last suggestion for change deals with the recruitment of leaders in education and politics to spearhead the changes above. More Asian-American teachers, counselors and administrators are needed in the elementary, middle school, secondary and higher education to promote a stronger image of Asian-Americans among the students. Furthermore, Asian-Americans need to have their voices heard in local, state and national legislatures to promote equality for the new and rapidly rising immigrant group in the U.S.

Young Asian-Americans are finally taking a stand to fight back against the stereotypes that have haunted Asians since their arrival in the 1800s. This paper attempted to dispute only one of the stereotypes that continues to hinder the growth of Asian-American individuals. By placing all groups under one category, those Asians who come
to the U.S. with little resources need government and community support services to assisted in the adjustment period. However, depicted by the popular media and leading politicians as money hungry and overachievers, little support has been offered to assist the immigrants from across the Pacific.

Conclusion

Throughout history Asian-Americans have struggled in their fight to gain equality in the U.S. However, little has changed since the first immigrants from China came to the west as gold miners in the 1840s. The connections I will make from the past to the present are encompassed in the stereotypes that were disclosed throughout this historiography.

The first stereotype of the Asian immigrant was one of being a coolie, an uneducated laborer, and/or a worker that will except the lower wages because a U.S. salary was much higher in proportion their native countries could offer them. This compares to the present day Asian immigrant working in the factories, in the service sectors, and in the undesirable vocations since they are unable to obtain other employment.

In the past, Asians were looked upon as heathens, strange and exotic, and as a non-assimilative race. This stigmatism has lasted throughout the century. Today, Asian-Americans are still looked upon as a foreigner with strange cultural values and the inability to speak English. This could possibly be attributed to the low numbers of Asian-Americans represented throughout the U.S. Since there has been little exposure of their culture to the general public, these stereotypes remain stagnant. However, with the Asian-American sudden population surge, it is possible that these typical representations may eventually cease to exist.

Previously, Americans feared the eventual take over of the western states when Asian-Americans began dominating the workforce in the late 1800s through the early 1900s; the fear of the Yellow Peril. This hysteria continues to exist in the present era. As the Japanese began to threaten and compete with the economic welfare of the U.S., the media summoned Americans to "Buy American" to counterattack this threat. Furthermore, the current term for the rapid rise of Asians in America is the "Asian Invasion."

In last, the Asian laborer was termed diligent, respectful, hardworking, non-assertive, and a model for other minorities to follow. Today, Asian-Americans, for the most part, are viewed in this perspective. The model minority stereotype of the present attest that ineffectual changes have taken place since the turn of the 20th Century. Thus, the depiction of Asian culture has remained, for the most part, static in the minds of the majority of Americans.

I argue throughout this paper for the modifications of viewing Asian-Americans as not only diverse but also possess a constantly changing culture in the U.S. The existing stereotypes need to be reexamined in the schools, by government officials and policy makers, and by the popular media, which as a result will enable Asian-Americans to be liberated from the stigmas behind each and every stereotype that leads to further discrimination in the world.

References

1 I recognize that there are other stereotypes that demean the existence of Asians in America; such as Asian women are represented as passive, exotic, mysterious, male pleasers, evil and Asian men as martial arts experts, foolish, and evil. However, I will not address these issues in this paper since the focus will be on discrimination in labor and education.

2 During the negotiations for the Portsmouth Treaty, which brought a close to the Russo-Japanese War, then Secretary of War William Howard Taft signed a secret treaty with the Japanese government which allowed the Japanese to colonize Korea in return for their promise to recognize U.S. control over the Philippines. This negotiation must be considered when thinking of Japanese immigration to the U.S. Both former Presidents Theodore Roosevelt (1901-1909) and Taft (1909-1913) "interfered with political processes in California to prevent the legislature from passing anti-Japanese bills which would upset the diplomatic balance" (Wollenberg 1995, 21). See Carter Eckert et al. 1990. Korea old and new: A history. Seoul: Ilchokak, Publishers for further information on the Taft-Katsura 1905 agreement.

In 1988, President Ronald Reagan would finally offer the U.S. apologies for their atrocious and racist acts and remit $20,000 to each relocated survivor (Yee 1992).

A few of the second wave immigrants from poor social foundation have found success in spite of their hardships before arriving in the U.S.

In world population percentages, Asians make up 60% of the population with 30 plus nationalities (Suzuki 1989).

This may be attributed to their lack of English speaking abilities and a general attitude that Asian higher educational systems are below the academic standards of western institutions. In addition, this ethnocentric attitude could be one of the reasons Asian parents want their children to have a western education.

These impressive numbers lead some to comment that the initials UCLA and MIT actually stands for “United Caucasians Lost Among Asians” and “Made in Taiwan,” respectively (Yee 1992). For further data on the Asian-American students in higher education see Section IV of Don T. Nakanishi and Tina Yamano Nishida (eds.) (1995). The Asian American educational experience: A sourcebook for teachers and students. New York: Routledge.

However, within the Asian-American category, two distinct groups tend to be absent; Western Asia (generally thought of as the Middle East) and Russia (which tends to be a category all its own).

Bureau of the Census. 1980 __________. 1990

Though *Brown I* mandated the desegregation of schools, *Brown II*’s “with all deliberate speed” prolonged the actual implementation of desegregation. After the Warren’s court unanimous decision in *Brown I*, the separate but equal policy was not easily unsanctioned, and still remained strong in many areas, particularly rural schools in spite of the Brown decision. Whites and Blacks since the decision have had to deal with these issues collectively and individually as many held similar views of what was right, or how to correct wrong interpretations of the new federal mandate.

This article looks at issues that surface through a class project that was designed to not only review the history of Hopewell School, a rural segregated school in Texas, but also to assist others doing similar historical research. The last part of this article focuses on the issue of desegregation, and brief discussion on the recent move toward resegregation.

In validating many of the interpretations of the present, reflection on the past may be appropriate. Issues such as maltreatment of ethnic groups and discriminatory treatment of minority are issues historians of education examine. It is the concern with the past that led five graduate students enrolled in a graduate seminar called *From Desegregation to Resegregation* to look at a segregated Black school in Round Rock, Texas. Three of the researchers were white (2 females and 1 male), and two were Black (1 female, and 1 male). The particular school was chosen after the professor who directed the class had read about the Hopewell school, and contacted one of its students.

Historical research requires becoming “aware of your own values, beliefs and interest concerning the topic that you are investigating.” Hopewell had been ‘forced to close its doors.’ Why had it been forced to close its doors? Looking for the answer to that question made the researchers more aware of their own values, beliefs and interest. Reflecting on the past became the challenge for the five graduate students to conduct their final project in a graduate seminar as they discovered what actually happened at a local school that had been closed for 32 years. The school was the Hopewell School, located in a small rural farming community about 20 miles north of the state capital. It closed its doors in 1966, following the city’s’ decision to integrate all public schools.

The School: A brief History.

Hopewell was a segregated school for Blacks that opened in 1922. Its closure in 1966 came about when segregationists finally realized they had to comply with the Brown decision or lose federal funding. But the school’s history dates as far back as 1874.

*Good Hope Missionary Baptist Church*, established in 1874, was the first Black church in Round Rock. It is speculated that from this segregated congregation came a need for a school for Black children. In 1909 the Colored School District Trustees of Round Rock bought 1.1 acres of land from Black farmer Mitchell Mays to build a Black school on the 1.1 acres. For reasons not known the school was not built at that time. In 1913 a Black school, which was held in a church at the time, perhaps the Good Hope Baptist Church, came under the jurisdiction of the Round Rock school district. In 1921 the Black school applied for funds “to build a new school” to the Julius Rosenwald Foundation. This fund had been established in 1917 to fund worthy causes throughout the country, and hundreds of Black schools across the country were constructed through matching grants from this foundation. In 1922 Hopewell officially opened with only grades one through nine. At its opening there were approximately 50 students enrolled.

The school term was six months long, running from October to April. This increased the school term by one month from the previous year. Prior to 1922, the school term for Black students had been only five months long. In 1926 Hopewell opened a vocational training program for both youngsters and adults. A separate building was erected on campus for this purpose. The participants of this program entered competitions in which they could exhibit their skills. DiGesualdo and Thompson report that the school term was extended from six to seven months with the establishment of this program.

The school survived the depression. During the 1932-33 school year teachers of the district were asked to teach for one to two weeks without pay due to the financial difficulties brought on by the Depression. In 1936 an additional 2.4 acres of land was purchased for Hopewell. In 1937, the school year was extended to eight months long and stayed as such at least until 1949.

During the 1940s several significant things happened. The school term had already been extended to eight...
months. Sometime during the 1940s, monitoring of Hopewell’s educational quality began. At some point during the 1940s, as enrollment at Hopewell continued to grow a decision was made to hire only degree teachers.21 Also around this time, Hopewell began admitting students who lived in the rural area North of Austin, not just Round Rock.

The increase in enrollment at Hopewell caused by students from rural areas north of Austin attending under the separate but equal system of education, necessitated additional transportation beyond students being transported by their parents or walking to school. By 1954, Hopewell had obtained a school bus to transport the students to and from school.22

Brown I and II were gradually inching their way west, and in 1963 the Round Rock district adopted the Freedom of Choice policy, which allowed students to attend any school in the district.23 There seems to be some dispute about the year that this policy was adopted. Di Gesualdo and Thompson24 report that it was not adopted until 1965, and that it was a response to the 1964 Civil Rights legislation. Albeit, expansion continued at Hopewell as 1964 saw an annex being added to Hopewell.25 This four-room building became the site of the high school classes. Barracks that contained a cafeteria and band hall, as well as some classrooms, were connected to this annex. According to his own recollections, Anthony Mays,26 the first Black student to take advantage of the Freedom of Choice policy, left Hopewell and enrolled at the previously all-white Round Rock High School in the fall of 1964. This calls into question Di Gesualdo and Thompson’s27 claim that the policy was not adopted until 1965. However, several sources report that Mays did not begin attending Round Rock High School until 1965.28

Rather than attempt to maintain a separate but equal school, Round Rock High School was integrated and Hopewell finally closed at the end of the 1965-66 school year. The annex became Southside Elementary school—a school for all third graders in the district, “establishing a unilateral system. This arrangement was used only for the 1966-67 school year as the students eventually were transferred to the newly enlarged Central Elementary School.”29 All the other students from Hopewell were transferred to Round Rock High School.30

The Project: Strategy & Syllabus:

An important part of capturing the history of the school relied on the actual strategy the researchers would use. Many of the parameters were identified in the course syllabus, but the actual plan, and implementation of that plan, and how the final project would look was still novel, and still unclear.

Shortly after the research into Hopewell began, it became apparent that records were not well kept for the school. Uncovering history of this school where little was documented presented a paradigmatic problem for current and future research. The researchers relied on a strategy borrowed from the Organizational Effectiveness School, Fort Ord, California, called APIE, (Assessment, Planning, Implementation and Evaluation).31

In assessing the researchers’ tasks, the researchers wrestled with conceptualizing what the final project would look like,32 as well as what resources were available to conduct the research. This deliberate assessment aided them in determining the project’s outcome. Once the outcome was determined, the how to orchestrate such a project became clearer. The class syllabus provided gave specific guidance on how long the paper (the outcome) should be. In class, the professor proposed suggestions on how to collect data. Each researcher had to conduct at least one oral interview. Additionally, the syllabus required that each researcher presents the oral history in class of the person they interviewed, and also each researcher accepted a specific role on the team. These roles on the research team included: Research Director: responsible for reviewing research methodology; Editor: responsible for proper format in finished written paper; Interview coordinator: responsible for submission of Human Subjects Release forms; and School board archivist: responsible for collecting data from School Board Minutes.

Planning centered on how the research would be conducted, and how to organize the final paper. The researchers realized they needed to look at school records and school district archives, as well as conduct oral interviews of former students and teachers. As the students planned, they realized that not all the sources to be used could be entirely determined in advance.33 The five ethnographers methods of ‘constructing reality’34 concerning the history of this school emerged as the researchers used a hermeneutic approach. The research team’s approach resembled Elaine Atkins’s approach35 where the researchers examined and interpreted each part of the project as it related to the class. The implementation and evaluation portions of the design were interwoven. There was concern about consistency of information, so a list of standardized questions were developed and shared. As interviews were conducted, and available resources examined, researchers periodically met to assess what was remained to be done.
These group sessions were used to further evaluate the project, discuss the validity of the information collected, and strategized how best to proceed to complete the project.

The actual research project called *Hopewell: A School Without a History*, became a paper divided into three major parts and an appendix. The *first* part, the methodology, discussed how the project originated and why this particular school was chosen. The methodology part also examined how the research was conducted. The *second* major part of the paper consisted of two major sections: autobiographies and life histories. The autobiographies focused on the background of the researchers who performed the interviews. The *life histories* centered on the experiences of the former Hopewell students and teachers and evolved from interviews the researchers conducted. The *third* part of the *Hopewell* of the paper synthesized historical information and reflected on lessons learned, recommendations for future research. The last part of the paper, the appendix, included pictures, lists of contacts as well as the letter used to establish the contacts, and actual questions used during interviews.

Each researcher was cautioned by the professor, and reminded by each other to go into each interview with an open mind. Since the basic purpose of this research was to construct and record the history of the school. Though the research project was supposed to record Hopewell’s history, the reason for Hopewell’s closure was also part of its history.

In developing the model for the project, the researchers felt strongly that the belief, values, and even the ethnicity of interviewer could have an effect on how some details might be viewed. During a group strategy session, it was therefore agreed a brief autobiography of each of the researchers become an essential part of the project. The autobiographies were done to give the reader a more accurate picture of who conducted the interview, and how the interviewer’s history might effect their ‘construct’ of ‘reality’. The team of researchers discussed the feasibility, and possible ‘comfort zone’ of the Hopewell students being interviewed by white students. But for the parameters of the class, in a different situation, the two Black students might have assumed the entire role as interviewers.

The ‘Lost’ Hopewells:

In giving a brief overview of the Hopewell project, it is hoped that the paradigm discussed might be used and adapted in other areas throughout the country by local communities researching the history of their schools. This is particularly important where the school’s history has not previously been well documented. The experience gained during the research efforts included in this article provides parameters that can serve as a guide for researchers to design and implement their own plan.

Hopewell’s doors were closed in 1966 as a result of the implementation of the *Brown I & II* decisions, along with many other Black schools. Although segregated schools were declared illegal in 1954, 12 years passed before this policy was widely implemented in Central Texas. One of the researchers recalled that the school he had attended also closed in 1965, in Tennessee, probably due to the same belated rush toward integration.

Education was important in many rural communities. Education for many in the rural areas began at church. Many rural segregated Black schools like Hopewell started in the church. These schools survived the depression even though the funding for these schools was limited because of the value placed on education. The education of their children was the driving force to many rural communities. Many members of the rural Black community felt that the only way to get ahead and compete with the ‘white man’ was to get an education, so the Black schools, in many cases, were seen as the backbone of the Black rural community.

Education was important in many rural communities. Education for many in the rural areas began at church. Many rural segregated Black schools like Hopewell started in the church. These schools survived the depression even though the funding for these schools was limited because of the value placed on education. The education of their children was the driving force to many rural communities. Many members of the rural Black community felt that the only way to get ahead and compete with the ‘white man’ was to get an education, so the Black schools, in many cases, were seen as the backbone of the Black rural community.

There are not many school histories written about small cotton-farming communities in rural Texas, or elsewhere. But because these schools’ histories are wrapped up in the communities, their histories can be reconstructed and documented. Speculation about the commonalities might be true of other rural communities, specifically Black segregated schools throughout the United States. Recovering and documenting these views adds a new look at educational history from before, during, and after *Brown*.

Mistakes, Assumptions, Lessons Learned:

The researchers made several assumptions that proved incorrect during the project. First, they assumed school records of enrollment, teachers’ daily reports, and so forth would be available. Second they assumed that former students and teachers at Hopewell would all consent to be interviewed. Neither of these proved to be the case.

Of the records that were available, most were sanitized or generic accounts about the school. The accounts generally covered things like the actual purchase of land, and the construction of the school building, but actual
records that documented various curriculum changes in school board minutes and local newspapers, or feelings about the school closing were very difficult to find or substantiate.

Because one of Hopewell's former students wanted this history to be documented, the researchers felt other students and teachers would also be as interested. This was not the case. Several former students declined outright to be interviewed. Additionally, it was also assumed that those who agreed to be interviewed would be willing to conduct "on the record" interviews, and be totally candid. Again, this was not the case. As one researcher reported, on several occasions, one of the interviewees asked that the audiotape be turned off. Even though it would have provided a fuller picture concerning the issue of segregation, the richness of "off the record" information could not be included. This gives rise to the idea that some information used in the final report was incomplete and may have been selectively interpreted as Burstyn discussed.

The interviews were conducted over a three-month period. Synthesizing the data and writing up the report was also done during this time. Inconsistencies surfaced as the data was synthesized among the group and the project's work further evaluated. "Internal criticism involves evaluating the accuracy and worth of the statements" collected. The researchers discussed these inconsistencies to determine their accuracy. These inconsistencies were only noted in the project's appendices, as a lesson learned, not the specificity of the inconsistency. The research group decided had there been more time, the researchers would have either called and scheduled subsequent interviews, ideally a group interview, at which time the internal criticism of the information researched and collected could be improved and clarified.

Listed here are other issues and possible resolutions the researchers felt needed to be addressed: A. Collective interviews would resolve many of the issues concerning the vagueness or inconsistency of some of the information. These interviews would have to be coordinated several weeks in advance, at a mutually convenient place, and the interviewers need to have a clear understanding of the information requiring clarification. B. Reliance principally on interviews for detailed documentation created many inconsistencies that were unresolved. The researchers felt that a more detailed search within the local school archives, or developing ties with the local media might aid in resolving this dilemma. C. The choice of former students to be interviewed hampered some of the data corroboration. Seeking funding to use monetary incentive to interviews, or finding someone within the community who would encourage the surviving members to be interviewed might resolve this dilemma.

The researchers realized that the complete history of Hopewell will never be recorded because too much has been lost. There are no school records. Many of the people connected to the school have either died or wish not to be interviewed. Still, this project began a process of uncovering existing information, which can also be done in other communities. Though factual inconsistencies and gaps are still present, the project provides an outline of Hopewell's history where none was known before. The fact interviewees primarily recounted positive portrayals of the past, including segregation, may reinforce the 'comfort zone' issue mentioned earlier. At least being aware of this offers it for consideration in planning other research.

Segregation Revisited:

As we look at present situations like resegregation, looking at the past and issues of segregation through the eyes of those who experienced it validates perspectives about present conditions, trends, practices and educational issues. Resegregation is on the rise. Orfield's demographic studies of school enrollment demonstrate that segregation is increasing. Wells and Crane argue that there has been a gradual undoing of desegregation and an increased concentration of urban minority students in high poverty schools. Within-school integration is an issue Willis discusses as minority students are tracked and grouped based on performances on standardized test within individual schools and classrooms. Lindseth calls this achievement gap legalized segregation. This recent research sheds a dismal view of the progress since Brown v. Board of Education. This article attempts to shed light on aspects of what in many cases still has yet to be documented concerning the impact of the Brown decision in rural communities.

In doing historical research, one becomes aware of one's own values, beliefs, and interests concerning the topic being investigated because one sees certain aspects of past events and not others. This awareness precludes exaggerated and biased reports. The Hopewell project provides a base on which to focus questions about past events. By focusing on them, answers to questions previously unconsidered can be revealed.
Though it's been more than fifty years since the Brown vs. the Board of Education decision, segregation is still an important issue for researchers. In *Deepening Segregation in American Public Schools*, Orfield and colleagues report that a generation of progress is coming undone as segregation trends are changing not only in southern and border states, but also across the nation. The 5-4 Supreme Court ruling in the Missouri v. *Jenkins* case essentially gave the “courts license to return school districts to local control” to affect whatever remedies they felt needed to resolve discriminatory practices. Orfield contends that decisions such as *Jenkins* will increase trends toward racial and economic segregation of Latino and African American students.

White, in “*Brown Revisited,*” talked about how traditional histories largely ignored the back room, southern planning session to forestall desegregation. It is through projects that examine schools like Hopewell that researchers can more fully understand the realities of the events that occurred during the aftermath of the Brown I and II decisions, and reveal a more vivid picture of this process.

Teaching History in Texas Schools During World War I

O. L. Davis, Jr.
The University of Texas at Austin

For Walter Prescott Webb, a history teacher at Main High School in San Antonio, the central issue for Texas history teachers was not whether they would attend in their teaching to the raging Great War in Europe. Rather, he observed, they had to decide how much attention they would devote to the war (Webb 1918, 8). Simply, according to Webb, a future president of the American Historical Association, “The war has indirectly influenced the content of every history course, and also the method... Every course is mined with comparisons, rich with analogies, or filled with contrasts” (9).

As a matter of fact, Texas schoolteachers and students had responded rapidly to the United States’ entry into Europe’s Great War in April, 1917 (e.g., Davis and Long 1997). They, like their counterparts across the nation, recognized that home front support was critical to the national mobilization underway. Fewer than two months remained in the school year and their initial wartime school activities were little more than symbolic.

By the time the 1917-18 school year commenced, however, schools in Texas and across the nation routinely began to encourage wartime activities and to incorporate war emphases into regular instruction. Many of these activities, to be sure, were symbolic or practically patriotic. For example, teachers and students in small rural schools as well as in city schools participated in Liberty Loan drives, Red Cross work, war relief fund drives, and patriotic assemblies and parades (e.g., Davis 1995a; Davis 1995b). Of the curricular modifications, none probably were as prominent as those in history instruction. These changes apparently continued until after the November, 1918, Armistice.

Wartime symbolic and practical patriotic activities in schools, perhaps not surprisingly, retain their prominence in official memory. Simply, they have received historical attention. The impact of the war on the regular school curriculum, however, remains obscured. Even for history instruction, most renderings report rhetorical advocacies and impressionistic estimates to the neglect of actual school practice (e. g., Mehaffy 1987; Shermis 1989). This portrayal, on the other hand, adds specificity to the record with its focus on the wartime teaching of history in Texas schools.

Special Materials about the War For Use in History Courses

In order that American teachers effectively teach about the nation’s involvement in the war, several federal agencies and individual scholars readied articles, books, and pamphlets for early use in the 1917-18 school year. The federal government’s emergency Committee on Public Information sponsored and distributed the bulk of these special materials. Known informally as the Creel Committee for its activist chairman, George Creel, its publication program included an array of pamphlets, books, and bulletins, most of them available to the public free of charge and many used in American schools. The U. S. Bureau of Education issued only one special text-type material for school use. Its Lessons in Community and National Life (1917), commonly used in elementary grades, sometimes fit into some Texas high school courses (Kean 1918). It also published a series of leaflets, the first of which highlighted opportunities to teach about the war by history teachers. In addition, it promoted the study of the war in its twice monthly published National School Service that was mailed to all schools in the nation (Davis 1996). Wartime issues of the nationally distributed The History Teachers Magazine also featured teaching about the war. Its value to Texas teachers, however, remains unknown.

On the other hand, Texas history teachers did receive copies of The Texas History Teachers’ Bulletin. Published three times each year by the University of Texas department of history, issues of the wartime Bulletin not only advocated teaching about the war, it also featured reports of local school teaching practices. For example, in its first issue following U. S. entry into the war, editor Milton R. Gutsch (1917b) called teachers’ attention to a number of available sources for classroom use in teaching about the war. That same issue, however, highlighted routine aspects of at least two popularly offered history courses in the state. One focused on source readings in medieval history (Gutsch 1917a) and the other emphasized source readings in Texas history (Barker 1917).

A year into the war, The Texas History Teachers’ Bulletin devoted an entire issue to the publication of UT Professor Frederic Duncalf’s “A War Textbook for Texas Schools” (1918). Duncalf wrote in its Preface: A heavy responsibility rests upon all history teachers in our present crisis, for their instruction will have great influence upon the opinions of their pupils. Amid the bitterness and hatred that war
develops, it becomes increasingly necessary for as many people as possible to keep clearly in mind the main issues of this conflict. Disloyalty and intrigue are abroad, and Americans should one and all so understand our part in this war that no doubt or faintheartedness can turn us aside from what we have undertaken to do. (84)

He also suggested to Texas teachers that they use historian Samuel B. Harding’s *Topical Outline of the War* (1917) as well as the *War Cyclopedia* (Paxson, Corwin, and Harding, 1917), both Creel Committee publications, and other published sources in their instruction.

Availability of special war-related materials, however, did not guarantee their use by teachers. American teachers, likely many more than evidence attests, actually used these materials in their teaching. On the other hand, Texas teachers used these special materials less than advocacy admits. Texas high school teachers in Austin, Dallas, and Port Arthur, all among the large school systems of the state, included some attention to these special materials in their courses. Information about their use in smaller, including rural schools remains sketchy at best.

### Teaching History and Teaching About the War: Reports From Texas Classroom Teachers

Wartime history teaching in Texas emphasized the standard fare of pre-war syllabi. Corsicana High School teacher Laura M. Moore (1918) was more emphatic, “The regular history work is not neglected for war history” (30). Study of war topics in history courses, indeed, increased the amount of work required of the students, according to teacher Mary Crutchfield of Sherman High School (1918, 22). In this attention to the practical, teachers developed both opportunities and rationalizations for the incorporation of war topics into their regular courses, from ancient history to civics. These war topics entered ordinary coursework through two channels: as contemporary examples of parallels and contrasts and as attention to current history.

Evidence of these wartime teaching practices in Texas schools comes from reports of teachers that were published in *The Texas History Teachers’ Bulletin*. On April 8, 1918, Editor Gutsch, in a letter to a number of the state’s high school history teachers, asked for reports about the teaching of history in wartime Texas. He requested specific information about how history teachers were teaching about the war in their regular courses. From the responses, Gutsch (1918) estimated that Texas history teachers were allotting almost one-sixth of their instructional time in history to study about the causes, events, and objectives of the war. He also selected accounts of eight teachers across the state to publish in the *Bulletin*’s November 1918 issue. Paradoxically, this issue likely was not distributed until after the November Armistice and, thus, its implicit purpose to encourage other Texas teachers to use some of the reported classroom practices likely was in vain. These reports, nevertheless, constitute the best extant accounts of wartime history teaching.

Some revision of history courses began as early as the Great War commenced in 1914, according to Sherman High School’s Crutchfield (1918, 22). With American entry into the war, she reported that the demands for changes continued. San Antonio teacher Webb appropriately noted that he taught about the war both directly and indirectly (1918, 8). He and other Texas teachers led class discussions about current events. In this teaching, they departed, of course, from their textbooks, and a few (e.g., Crutchfield (1918) in Sherman), used daily newspapers in their classes. Most teachers reported that students used class sets of magazines, specifically *The Literary Digest*, *The Outlook*, *Collier’s Weekly*, as well as single copies of magazines such as *The American Review of Reviews*, for their preparation for discussions and individual reports (e.g., Whittaker 1918). Typically, as Webb (1918) noted, these current events lessons occurred about one day each week. At Galveston’s Ball High School, the history department secured on additional class period in the weekly timetable for current history (Hill 1918, 32).

Teachers and students also maintained bulletin boards and war maps. Daily or as appropriate, they posted newly published accounts and photographs. They also marked shifting battlefronts on the classroom map, as best they could, with pins or lines.

On occasion, teachers organized and presented special lectures about the war. These lectures apparently were uncommon because of the teachers’ insistence that their classes encounter the standard course outline and materials.

The Texas teachers’ reports of their indirect reference to the war should neither be minimized nor exaggerated. They wrote about their year’s work in the closing weeks of the 1917-1918 academic year. Consequently, they wrote only some of what they remembered doing. The also may have written about their own thoughts which they did not incorporate into their teaching. Their reports nevertheless, reflect these teachers’ mindful associations to and
interpretations of the war in their standard history courses.

For example, Beaumont teacher Ora B. Riggs (1918) noted the parallels of the feebleness of Hellenism "to the lethargy of some of the modern nations" (14), the American unpreparedness of 1812 and 1917 (15), and "the Confederate cruiser warfare and the submarine campaign" (15-16). Sherman's Crutchfield (1918) stressed the contemporary alignment of countries with that of the Napoleonic Wars (24). Webb (1918) of San Antonio mentioned the analogies of Germany and Sparta and of England and the Athenian empire and of the French Revolution to the Russian revolution (7).

All the Texas teachers commented upon the war's influence on their students' increased knowledge of place geography. For example, Port Arthur teacher Anne Hughes Kean (1918) assigned one class to make maps that showed the territorial changes of Prussia, Russia, and Poland over time. Sherman's Crutchfield (1918) remarked about her students' increased awareness of the importance of the Black Sea to Russia as well as the number and locations of wheat fields and industrial outputs. In Ballinger High School, teacher Kathryn Barnett (1918) insisted that her students locate cities and nations, particularly in Europe, and sites in the war zone. Laura M. Moore (1918) of Corsicana High School also recognized the extent to which her students had learned about and continued to be interested in locations, populations, resources, and forms of government (28).

Particularly significant were teachers' estimates of students' increased learning and interest in history. For example, Webb reported comments of his San Antonio students about what they had learned from their study of the war. These remarks included "I did not know there was such a place as Belgium," "I did not know the European countries were so small. I never thought Germany was smaller than Texas," "I did not know the nationalities of Europe were so distinct, but thought French and German blended, and Germans and Russians, etc.," "I was under the impression that the Italians were common, a sort of dog nation, but they are our allies now," "I did not know England was so dependent on her fleet," and "The United States must feed the allies as well as herself" (Webb 1918). He also noted that history enrollment in San Antonio's two high schools almost doubled for the 1917-1918 academic year (Webb 1918, 7). Galveston's Hill commented, "There was a time when "Belgium," "Poland," "Roumania," "aristocracy," democracy, " may have been meaningless, but that time has passed" (1918, 32). All the teachers commented that the war itself and teachers' classroom responses to it had impacted the state's history courses for the better.

Plans for a Longer War and the Sudden Armistice

At least some of these teachers expected the war to last longer than it did. Teacher Kean (1918, 21) of Port Arthur admitted, "With the year's experience as a guide, the Port Arthur High School is taking on a permanent organization for the handling of all this government material. The history department will feel less responsibility for the whole of it, and will consequently be able to do its allotted share of the work more systematically and efficiently". In all likelihood, she and her colleagues abandoned these plans after the Armistice. As well, the post-war teachers probably ignored Riker's (1918) excellent bibliography that accompanied the teachers' reports. Teacher Webb, after writing his enthusiastic report, resigned his teaching position and gave away most of his books after a bitter dispute with San Antonio's superintendent of schools (Webb, 1969; Furman 1976). The war was over and teachers in Texas and across the nation reemphasized their interrupted course of study.

Gutsch, Milton R., “The War and High School History Teaching,” The Texas History Teachers' Bulletin 7 (November 15, 1918): 5-6. (a)

Character education in the United States has always been a mainstay of children’s schooling. Widely debated in purpose, definition, and in implementation over the years, it has seen upswings and downturns of popularity and media attention. Public schools have long been charged with educating young pupils to be good citizens. Researchers have studied the effectiveness of character education programs, most notably in the 1920’s and 1930’s by Hartshorne and May (1930) and in contemporary times by Lickona (1991), Leming (1997), Kirschenbaum (1992), Field (1996) and Wynne (1997). Many parents, policy makers, and politicians are calling for a commitment to the character education goals of the past. An introspective survey of the reported successes and failings of past programs designed to cultivate the formation of good, moral character in children may inform the debate today. Perhaps the character education reform movement of the 1920’s and 1930’s, one unprecedented in American educational history, best parallels such contemporary calls to action.

According to the New York state study, authored by J. Cayce Morrison in 1931, much was being done across the nation in the name of character education, as evidenced by one school district as it developed its own character education plan. “...[we] analyzed the provisions for character education in the syllabuses or statutes of 41 states and of 57 cities of the United States, together with an account of several organized, privately financed efforts toward character education and a considerable correspondence with prominent leaders interested in character education or child guidance” (21).

This study is a descriptive analysis of three state (Pennsylvania, Iowa, and New York) and three city (Washington, D.C., Denver, and Birmingham) character education reports. It provides details about those reported definitions of and rationales for character education in public schools during the 1920’s and 1930’s, what schools’ reported purposes of implementation were, who participated, and how teachers were prepared.

Origins and Purposes of Reports

Each of the six plans was written for the purpose of describing, prescribing, or reporting the progress of character education programs for public schools. Of the three state programs, the Iowa Plan was the most broad in purpose. Following the 1916 Morality Codes Competition, for which a $5000 prize was awarded to William J. Hutchins in 1917 for his contribution of ten “laws of right living”, a second competition took place. In this latter competition, the same anonymous donor offered a $20,000 prize – the largest ever offered in an educational competition in the U.S. The award was to go to a state collaborative “research” effort that resulted in a plan for the best methods for teaching character. The Iowa Plan, completed in 1922, was the winner and was distributed nationwide. Thus, this plan was not one designed solely for Iowa, but rather for use across the country. It was written by a collaborative composed of two succeeding state superintendents, two university Presidents (the State University of Iowa and Upper Iowa University), an attorney, six professors at various Iowa institutions, and two local district superintendents. It addressed character education at all grade levels.

Foundations for Character Education, the Pennsylvania plan, while indicating that character education was required by law, was not a mandate in itself. Rather, it was a treatise on the rationale for character education and how it could effectively be delivered. Based on a collection of articles by Miss Helen Purcell, State Director of Elementary and Kindergarten Education, the compilation was eventually published by the Pennsylvania Department of Public Instruction in 1931. While primarily focusing on the early grades, a few examples from upper grades are present as well.

The New York State document, Character Building in New York Public Schools (1931), was termed, “An analysis of practices reported by teachers and supervisory officers for the school year, 1928-29.” In fact, in the report, one may read voices from all over the state of New York as they described various initiatives to incorporate character education into school life. It appears that no state mandate for character education existed when this report was filed. However, it does indicate that state supervision of rural districts had character education as its first priority for a time. Further, it implied that there was a socially accepted expectation that schools would attend to character building: “To teach all that is generally accepted [in terms of character], to refer children back to the home and the church for further information as to debatable questions, and to build happy contacts with home and church based upon mutual trust and good will – this is the opportunity of the school.” Related state requirements were made clear in the following: “In
New York [the responsibility to provide instruction in citizenship] is expressed in the state syllabus" (1931, 6).

Among the three local school district initiatives, that from Washington, D.C., a Preliminary Report on Character Education was also published in 1931. It implied no current or future mandate, but was written to serve as character education guidelines for recommendation to the Board of Education. There was no evidence whether the Board subsequently passed or rejected the plan, but its inclusion in the archives at Columbia Teacher's College would imply that it held at least a degree of significance.

The Birmingham program was presented by Charles A. Brown, Associate Superintendent of the Birmingham Public Schools, and appeared in the Proceedings of the Sixty-seventh Annual Meeting of the National Education Association (1929). NEA's conference was held in Atlanta in the summer of 1929. The character education report described the program in Birmingham that had been in place for six years and was deemed effective enough to continue in future years.

The Denver monograph, Character Education in the Public Schools, was printed in 1929. It described an initial, "tentative" report of what public schools were doing in response to a district policy "to organize and direct a broad and varied program, curricular and extracurricular, the natural consequence of which is the learning of social as opposed to antisocial behavior."

Rationales for Character Education

As one might assume, each report began with a rationale for character education. These illuminated common educational concerns of the time period relating to the young and their needs. They also provided a glimpse into how schools viewed their roles with regard to these issues and the degree to which they held themselves responsible for training the young in character and civic responsibility. In each case, the documents revealed a pervasive attitude that schools bore, in fact, heavy responsibility in this domain, with a number mentioning the failure of homes to effectively teach desirable character traits and values. The award-winning Iowa Plan charged that schools were neglecting character education in favor of academics. The Washington, D.C., report indicated that this was "an important educational problem" and that it was the schools' job to avoid a "laissez-faire" attitude toward character building. Blaming the home for neglect in this area, the Pennsylvania report maintained that the purpose of character education is to form "the Ideal American Personality" in young children. The Birmingham assistant superintendent claimed the existence of a "universal argument that ethical character is one of the most desirable results to be obtained [from education]."

Perhaps the Denver superintendent, A.L. Threlkeld, provided the greatest caution in terms of the schools' role and ability to deeply affect the nation's character. "...We are safe in saying that no institution comes ahead of the home in its immediate influence upon character. While much of the program of socialized activities basic to character once given in the home is now, under changed social conditions, necessarily delegated to schools and other institutions, no surer sign of weakness on the part of any home...can be observed than [the] tendency...to place too much of its own responsibility upon other institutions" (1929, 6-7).

Overall, it seems quite clear that each reporting institution recognized and was intent upon addressing a renewed interest among society at large in character education. There were hints that longer school days and proportionally more children in attendance gave rise to concerns that since the state held more control over children's lives, schools must assume greater responsibility for what had formerly been left to the home. In none of these reports were there charges that young people suddenly were behaving unusually irresponsibly or in any way posing a threat to the social fabric; rather, there appeared to be at the root of these efforts merely a heightened sense of duty.

Teacher Training

The Iowa Plan, Character Education Methods, addressed teacher training most directly. Of course, it should be remembered that this plan was intended for a national audience.

"It must be acknowledged that the effort spent among institutions for the preparation of teachers, in inculcating skills and in clarifying the thought about the mechanics of culture is quite out of proportion to the ingenuity exercised in matters bearing directly and indirectly upon the humanizing and moralizing of boys and girls...Character training hardly appears in the schedule of courses. Let none defend this situation on the ground that everything in the curriculum when rightly taught is food for moral education...It is to be hoped that training-schools for teachers will give first place to
courses in character education” (42).

While the Washington, D.C. report briefly concurred with this need, no other document speaks to the need for pre-service training. Rather, they implied that teachers should acquire the skills, techniques, and dispositions needed for character education by working among themselves and those in leadership roles within the school milieu.

The Denver monograph acknowledged the enormous influence of the teacher in character building and described the ideal traits for this task:

“Like that of the parents, [the teacher’s] influence is exerted in three ways: by the words he uses in precept and in explanations, by the example he sets, and by the things children do under his direction. He must not only be thoroughly conversant with the subjects he teaches but he must be a master of child psychology and of approved teaching method. He must be a companion on the adventure of learning, the guide because of longer experience with life. To be a leader without imposing tasks, to be an inspiration to immature minds, to keep ideals intact, to be ever on the alert for moral values but to be always unobtrusive, to set an impeccable example of behavior, to prepare varied situations in which to stage the learning process, to keep each child working joyfully at the height of his best efforts, to measure progress, to be a progressive student of pedagogy, to keep abreast of the times in politics, history, and science, and still to have time for repose and contact with rare minds past and present, these and similar duties make teaching the most exacting of professions” (1929, 27).

The New York report provided insights into various districts’ efforts to develop their character education programs. In most, teachers contributed to the district report by sharing their personal efforts in the classroom to engage students in character-centered learning. Each document indicated a great respect for teachers and their ability to assume the duty of character training effectively through self-improvement and a desire to do what was best for children and society.

Examining Traits of Good Character in Six Locales, 1923-1931

One of the more illuminating components of our examination of these early documents was the analysis of specific “character traits” that each recommended for incorporation into character training. Our first question was whether the lists of character traits appeared to follow those outlined in Hutchins’ award-winning Children’s Morality Code which offers ten general traits of desirable character for teaching in schools. These included self-control, good health, kindness, sportsmanship, self-reliance, duty, reliability, truth, good workmanship, and teamwork.

Considering the Iowa plan first, since it followed on the heels of the Hutchins award and was honored by the same agency, we found surprising variance from the earlier code. While the report focused on methods for teaching character education and did not purportedly attempt to address what morals should be taught, nonetheless, in an attempt to show potential relationships to the ongoing curriculum, it suggested nine “moral objectives.” These include Health and Happiness, Initiative, Life in the Group, Reverence, Leisure Time, Civic Relations, Economic Relations, Vocation, and Family Relations. In a section that suggested ways to measure character for the purpose of reporting to parents, yet other lists appear, varying by grade level. In this section, the report recommended that students beginning in the primary grades complete a self-measurement scale on these traits. The upper elementary scale offered a prompt and six behavior descriptions from which to choose. For example, at grades 5-8, the trait called “Work at School,” provided descriptions ranging from “Lazy, gets out of work when possible” to “Finds work whether assigned or not”. For the category “Eating,” response options ranged from “Careless, eats too much and too often” to “Eats only good food, never too much rich food or sweets.” For the category “Truthfulness,” options ranged from “Tells lies, can’t be depended on at all” to “Tells the truth even when it hurts.”

At the primary level, a list of 21 questions had children check off various behaviors daily. Figure 1 is an attempt to align these questions with the Hutchins categories. While not always well-matched, it is interesting to note that “self-control” was implied by at least 11 questions, “good health” appeared in at least 7, while teamwork and sportsmanship were only implied once each and truth and good workmanship did not appear at all. Of course, it could be said that the entire test requires truth in order to achieve its aims, but no item specifically asked students to self-examine their honesty. It should be noted that “thrift” was included as an additional category that appeared regularly in other documents, but which did not appear among those offered by Hutchins.

(Insert Figure 1 about here)
The analysis of the Iowa Plan followed by a perusal of the others indicate that the Hutchins model appeared to have had little, if any, influence. No reference to his Children’s Morality Code appeared in any save the Iowa Plan, and there it only received attention in the foreword as having been an earlier awardee. None of the character trait lists in other documents used Hutchins’ order or specific language. While there were many traits that appeared in two or more documents, no patterns in language or order were apparent.

A second question yielded more results. Could a pattern be discerned among the character traits used for guiding school instruction in the 1920s and 30s that would 1) be useful to today’s educators seeking to distinguish characteristics of the current movement from its earlier counterpart, and 2) that might, therefore, inform current efforts for better results?

In analyzing the character traits advocated in these earlier documents, an informative pattern did emerge. This pattern had to do with the nature and purpose of the various traits listed. Upon first reading, one of the more curious aspects of these lists is the obvious importance placed upon social efficacy. Today, most of us do not think of washing our hands or having a savings account as a matter of character. But these were found among these lists as well as many others that seem beyond the realm of character as we think of it today.

Further analysis and comparison of the character traits grounding the six documents indicates three major categories: Personal, social, and civic character. To begin to understand these categories, one might ask, “Who should most benefit from someone exhibiting this trait? To whom was it directed? Was it for the good of the individual and his/her family, or for the good of one’s immediate social group (e.g. classmates), or was it for the good of the community, nation, or world?”

For purposes here, we define “Personal character” as the choices, decisions, and behaviors that are grounded in personal values, religious beliefs, or moral constructs such as those underlying the current Pro-Life vs. Pro-Choice debates. Personal character also, by our definition, has self- and family interests and expectations at heart. The individual and his/her immediate family would be the beneficiaries of these traits.

“Social character,” on the other hand, involves those values, ideals, and behaviors that place individuals in good stead with peers and others with whom they come in contact. Making certain one’s clothes are clean before going to school would indicate social character. Schoolmates, teachers, friends, and others beyond the family would benefit most from these traits.

“Civic character” is comprised of values and actions that serve the common good, even at the expense of self-protection, personal desires, or social pressures. Choosing to serve in the Peace Corps instead of accepting a job that promises to be lucrative and an important career move may well indicate strong civic character.

Looking again at the Iowa document, we see these categories, and how they sometimes overlap, emerge. (See Fig. 2)

The Pennsylvania document listed “qualities of the ideal American personality,” which the author explains as having been gathered from “the advice of many people.” These were grouped into two parts: “Characteristics that civilized peoples, in general, accept as eminently desirable” which included honesty, self-respect, fairness, truthfulness, courtesy, kindliness, reliability, charity, thrift, courage, self-control, persistence, giving credit where credit is due, sense of duty, strong family feelings, self-protecting recreational assets, and being a faithful worker. The “Characteristics specifically essential to the highly effective American citizen,” included those of being conscious of one’s responsibility as a member of a universal governing class, appreciative of the attainments and possibilities of the nation, a defender of the right, considerate of the greatest good in political judgements, insistent that law and order operate, solicitous of knowledge of current problems affecting the nation and the world, an active seeker of the truth, forward looking, able to meet new conditions and needs logically and intelligently, capable of successful teamwork, and intensely interested in constructive and protective health measures.

The New York study involved the examination of all reports sent to the committee by different districts statewide to identify character traits most often listed as goals. While the original lists were long and often quite tedious, we found the compilation created by the authors of the twenty traits most often listed to be most helpful. This list included responsibility, initiative, cooperation, courtesy, honesty, sportsmanship, school spirit, healthfulness, leadership, fair play, neatness, loyalty, patriotism, punctuality, appreciation, unselfishness, morality, respect for authority, self-control, and service to society.
Short of recommending a list of character goals, authors of the Denver Public Schools, in examining current practice in district schools, listed those traits mentioned on report cards at grades 1 and 2, and at grades 3-6. These appear in Figure 3.

(The committee that authored the District of Columbia report took on the arduous task of outlining in great detail the traits and related behaviors that should serve as “outcomes” of character education if effectively applied. These were further broken down into outcomes for elementary schools and secondary schools. Each trait was followed by a listing of how schools and teachers could best set the stage for achievement of that outcome, as well as detailed descriptions of how children would demonstrate embodiment of the trait. For example, following the trait “ambition and enthusiasm for work,” schools were admonished, among other things, to offer plenty of worthwhile materials and activities, teachers were to model ambition and enthusiasm for their work, and children would demonstrate possessing the trait by being “satisfied only with [their] best.” For purposes here, only the character traits were included but these were divided by school level as shown in the report.

**District of Columbia Outcomes in character education for elementary grades:** Are our boys and girls growing in ambition and enthusiasm in their work; learning to cooperate with each other in a courteous, reliable, and self-controlled way; developing ideals of honesty, fairness, and justice; are these ideals becoming a part of their conduct; growing in judgment and foresight? Are they acquiring habits of self-criticism; acquiring habits of good workmanship; acquiring wholesome attitudes toward health and cleanliness; growing in initiative and leadership; growing in attitudes and habits of kindness; acquiring habits of thrift; learning wholesome ways of using leisure time; growing in respect and reverence?

**District of Columbia Outcomes in character education for secondary grades:** Is our school program meeting the intellectual needs of our boys and girls; are our boys and girls getting some understanding of the major fields of occupations and professions, together with an appreciation of their opportunities and requirements; are our boys and girls intelligent and responsive to the requirements of health; are our pupils growing in understanding of the principles upon which our Nation is founded – freedom, equality, implications of democracy, meaning of patriotism? Are these principles vital in the life of our school; is the school preparing its pupils to use leisure time worthily; are our boys and girls forming satisfactory standards of social relationships – toward their own contemporaries, both of their own and of the opposite sex? Toward the “elders” of their environment – parents, teachers, civic leaders, etc.? Toward the handicapped of society? (Social virtues mentioned include sociability, courtesy, sympathy, kindliness, appreciation, and tolerance); are our pupils acquiring ethical habits of conduct – playing fair, owning up, being honest in work, learning to respect the rights and property of others? Are they learning to regulate conduct in terms of consequences to themselves and to others? Are the more thoughtful and mature learning to regulate their conduct in terms of accepted principles; are our boys and girls acquiring a sense of personal debt to others for their part in building up a civilization for us – debt to the institutions of family, school, church, community, Government, past civilizations, etc.? Do the more mature feel an obligation to improve and to pass on this civilization; are our children becoming sensitive and responsive to the needs of others – need for friendly companionship on the part of new pupils; need for friendliness and toleration of the part of those who are “different” in dress, in speech, in nationality, in temperament, etc.; need for helpfulness on the part of those who are strange or have fallen behind in their work; do our boys and girls show proper reverence for ideals of beauty, chivalry, patriotism, and religion? Do they show respect for fineness of character and conduct both in themselves and in others? Are they becoming sensitive to nice (sic) distinctions between right and wrong? (1931, 21).

The Birmingham presentation provided a list of seven vehicles for teaching character which also served as goals of instruction. Sub-characteristics were provided for only one, but the general categories are illuminating – “Development of Character Through Health,” “...Sportsmanship,” “...Work,” “...Love of the Beautiful,” “...Thrift,” “...Courtesy,” and “...the Study and Love of Nature.” One category, “Development of Character through Sportsmanship” was amplified and noted the objectives for a good sportsman:

1) Is Courteous: On the field he does not jeer at errors; he does not cheer at opponents’ penalty; he treats them as guests, not as enemies. In life he is respectful to elders and superiors in authority; he treats the other fellow as he would be treated.
Character Education Reforms
Nickell and Field

2) Is Modest: On the field he works for the good of the team rather than for individual honor; he will even sacrifice his own prestige for his team; he is gracious as a winner. In school he does not become conceited over his success, neither does he feel himself superior to his classmates. In life he does not "blow" about what he is going to do; he does not boast about what he has done.

3) Is Generous: On the field he applauds a good play of his opponents; he gives the other fellow the benefit of the doubt. In school he does not "knock" other schools or individuals; he appreciates another's merit. In life he does not ridicule the man who is "down," but encourages him; he is not afraid to think for himself and to voice his opinions straight-forwardly and clearly.

4) Is Game: On the field he plays hard to win; he fights though he may already be defeated; he accepts adverse decisions; he is a good loser. In school he does his work, he keeps on working in the face of almost certain failure. He has "the vim to think straight, the pluck to act straight." In life he does his part, however hard it may be; he accepts reverses with a smile and tries again.

5) Is Obedient: On the field he observes the rules of the game. In school he observes all the regulations. In life he respects the civic laws and the demands of the community.

6) Is Fair: On the field he competes in a clean, hard-fought but friendly way; he helps an injured opponent; he has no alibis. At school he does not waste his time nor that of the faculty; he does not copy his classmate's work; he does not receive aid from any source on examinations. In life he tries to see both sides of a question; he uses no underhanded methods; he is not influenced by money; he is not partial in administering justice (Brown 1929, 629-630).

Concluding Remarks

Any of the character education reports analyzed in this study might seem imminently peculiar to a particular district or state; that is, taken individually, the stance portrayed about character education might indicate autonomous decision-making about and implementation of curriculum and instruction on the topic. Taken as a whole, however, the reports provide overwhelming evidence, corroborated by teachers, principals, and administrators that character education was an important, much-discussed goal of public school systems across the nation in the 1920's and 1930's. Each report seems to have a common core purpose and an underlying theoretical perspective. No matter how we might disagree with those purposes today, their preeminence in schooling of the times is certain. Additional research regarding the success or outcomes of these and other character education programs during the Progressive Era is needed to gain a more complete understanding of what happened in schools during this time.

Limelight or Edge of a Precipice: An Exemplary School’s Multiple Purposes

Elaine Clift Gore
Connecticut College

1993 political cartoon depicted the entrance to Houston, Texas’s High School for the Performing and Visual Arts with the American flag flying bravely amidst dark storm clouds. The label “SCHOOL CLOSINGS” was superimposed on the clouds in white letters (School Closings 1993, 2). This cartoon represented neither the first nor the last time the community would worry about the school’s continuance (Denney & Nipper 1997; Hurst 1987, 1). Founded in 1971, the school was the first of its type in the southwestern United States. As the Houston Independent School District’s high school with the highest academic standardized test scores and largest number of national artistic honors, how could continuance of this exemplary school ever be seriously called into question?

The “limelight” enjoyed by the school informally known as HSPVA was recognized both nationally, in large numbers of honorable mentions, finalists, and Presidential Scholars in the prestigious Arts Recognition and Talent Search, and locally, in the media attention and applause which greeted outstanding HSPVA academic and artistic performances (Cox 1990, 1; Magnet schools 1985, 2; Moore, D. 1997; Morgan 1997; NFAA 1988; NFAA 1998). Despite the presence of the school in this limelight, an undercurrent of tension persisted over what some people called a “private school” funded by public dollars (Garver 1997). This tension suggested that the school teetered on the edge of a precipice. Document and oral history research of HSPVA’s twenty-five year history, from 1971 through 1997, uncovered lingering questions about the multiple purposes conceived for HSPVA in its early years, and their individual effects on HISD policy decisions. In their multiplicity and individual maturation lay the potential for discontinuance of the school.

Dropout Prevention for the Artistically Talented

Founding director Ruth Denney’s original purpose for HSPVA was dropout prevention for the artistically talented, a purpose which was verbally reaffirmed by the succeeding three principals (Adams, A. 1997, 1, 4; Cox & Daniel 1983, 5; Stanton, 1991, F1, F7). Their reaffirmation appeared to be hollow, however, in light of “the catch” revealed in this excerpt from a 1991 interview with the school’s third principal, Annette Watson:

We find that some students who were marginal or at risk in the past come into an environment [at HSPVA] that builds their self-esteem. We’ve seen some real turnarounds as a result (Stanton 1991, F1).

The catch came in these words:

Students have to be organized and able to budget their time, prioritize and be self-disciplined (Stanton 1991, F1).

Such an ideal seems problematic certainly, or maybe just unrealistic. Marginal or at-risk students likely have not learned the time-management and self-discipline skills Watson described as necessary to survive at HSPVA. Additionally, potential dropouts, even if they had a favorable artistic audition, improbably could qualify for the highly competitive school which HSPVA had become. On-grade-level academic status was a criterion for admission for twenty of the school’s twenty-five years, including those lead by Watson (Karpicke 1997; Merrill 1997; Moore, D. 1997). The purpose of dropout prevention may have remained an ideal, but, as the school matured and became more popular, the ideal became less reachable and reaffirmation of the purpose became an empty slogan. Dropout prevention, however, had never been the official HISD purpose of the school.

Natural Racial Desegregation

HISD General Superintendents Garver and Reagan, as well as the Boards of Education during their tenures from 1971 through 1986, hoped HSPVA would become a naturally racially desegregated (Garver 1997) or integrated (Reagan 1997) school because of its educational focus on performing and visual arts. Both superintendents believed that this goal was met when HSPVA enrolled a tri-ethnic student body (Garver 1997; Reagan 1997). However, some Black members of the HISD community questioned whether or not the school had true desegregation value (Anderson 1997). Its reputation from the 1980s through 1997 as HISD’s only majority-White high school helped fuel the controversy (Markley 1992, 1E). HISD official insistence on more aggressive minority recruitment from 1986 through 1995 (Merrill 1997; Moore, D. 1997) eventually increased minority enrollment in the school’s student body. The White student percentage, however, never fell below 51.5 percent, although the district’s White high school population
dwindled to 12.3 percent (Fall 1994 & 1996). Other aspects of HSPVA’s history may have affected this outcome, but their significance remains unanalyzed. These aspects include the school’s history of a color-blind philosophy, all White principals, and a predominantly White faculty. The question of whether HSPVA’s ethnic diversity should have been or should be reflective of HISD’s ethnic diversity has never been publicly addressed by HISD officials (Blank, Levine & Steel 1996, 167).

The school’s fourth principal, Herbert Karpicke, instituted a mentoring program in 1997 which focused not on minority under representation in his student body, but on schools which rarely sent graduates to HSPVA. He hoped to prepare talented students for audition at the school who would look forward to attending (Karpicke 1997). This sidestepping of the natural racial desegregation goal is characteristic of the HSPVA community which liked to believe the school’s primary purpose was artistic meritocracy. The larger educational issue of meritocracy versus equity remains problematic within Houston as well as in the educational, scholarly, and political communities of the United States (Blank 1989, 15; Doyle & Levine 1983, 11; Klauke 1988, 2-3; Tannebaum 1995, 485).

Artistic Meritocracy

HSPVA’s meritocracy was rooted for the entire twenty-five years in the artistic standards of the school’s pre-professional arts preparation. Those standards were evident in rigorous auditions and graduates who immediately obtained lucrative post-secondary jobs and arts scholarships. For example, in May, 1985, 22 graduating art majors topped all previous HSPVA records by becoming the “million-dollar class,” after art teachers worked to promote their talented students and bring them to the attention of scholarship providers (Feigelson 1985, 11; HSPVA’s Million 1985, 3). On the other hand, it is impossible to ignore the fact that no HSPVA graduates have become artistic “household names.” Evidence suggests that only 40 percent of graduates continue as adults to pursue their arts area professionally (Thomas 1997, 1D). HSPVA jazz studies director Bob Morgan offered one possible explanation for why more graduates from his program have not pursued jazz full-time:

It’s a very hard career to pursue these days. I think that only a very few should have any business actually pursuing it, so I actually tell my students that. Basically, I try to talk to the upper level kids, juniors and seniors, at least once a year, and basically try to talk them out of doing this for a living. I know officially our school is career preparatory, and the way I figure it, if I can talk a kid out of doing it, he shouldn’t be doing it....If they just can’t imagine doing anything else, then, okay, they may have a chance (Morgan 1997).

Talking students out of making a living with their art may also have occurred in other arts areas (Schulman 1985, 550). HSPVA’s clear intention across its history was to develop each student as a whole person, not just as an artist. If the faculty and administration had emphasized solely career preparation in the arts, and if their goal had been preparing national standouts in every arts area, question exists as to whether they would have been able to recruit 600 students at all times to fill the student body.

Academic Excellence

Student academic excellence was consistently the goal of HSPVA’s academic faculty members. Originally intended to provide strong fallback possibilities for students who chose not to pursue the arts professionally as adults, many of HSPVA’s arts faculty supported this purpose throughout the school’s history (Morgan 1997). Strong academic achievement was evident in the high standardized test scores of the student body, often the highest in the district (Cox 1990, 1; Denney & Nipper 1997; Gray, T. 1991, 9; Magnet schools 1985, 2; Richards 1993; Sanchez 1994; TEA 1997; Top-notch 1995).

Academic strength likely was an attribute of admitted applicants rather than skill fostered by HSPVA academic teaching, although most interviewed participants failed to acknowledge this possibility (Barrow 1987, 294). This understanding of causality seems particularly probable during second principal Norma Lowder’s tenure, when admission required both high academic standards and artistic talent demonstrated in an audition. Whether the net effect of her emphasis on strong student academic backgrounds was positive for both students and HSPVA, or negative, destroying the school’s original mission and eliminating the very students who needed the school’s help, remains a matter of opinion. Unresolved conflict over this issue was evident in most of the oral history interviews conducted with
adult members of the HSPVA and HISD communities. The power elite of Houston, however, revealed no such conflict.

Promoting Houston’s Greatness

For Houston’s White arts community and wealth/power elite, HSPVA’s purpose was to promote the city’s greatness. Civic leaders long had understood that great cities must have excellent arts organizations (Carleton 1985, 8; Houston/Harris 1993, 3, 4; Lanier 1992). To that end, they were happy to support financially HSPVA’s visibility, through activities such as international Sister Cities’ tours (Morgan 1997), and to intervene with HISD officials when they believed necessary, as they did in 1980 when they convinced Superintendent Reagan to build the school’s new physical plant in the city’s arts corridor (McLanahan 1997).

All four principals worked to strengthen the school’s connection with the Houston power elite in order to foster support and to fund HSPVA’s continuance within HISD (Anspoon 1992, 16; Moore, D. 1997; Morgan 1997; School and community 1985; Watson 1997). In actuality, each new HISD Board of Education trustee, HISD general superintendent, City of Houston mayor, and Greater Houston Partnership member personally determined how important it was for HSPVA to represent HISD, Houston, and the Houston area to the world. They did so with their public recognition or lack of recognition of the school as exemplary (Cunningham 1987, 8C; Five 1987, 1; 150 1986, 18). One nagging question remains today. If HSPVA became a majority non-White school, would it continue to enjoy the support of Houston’s White power elite?

The Confusion of Multiple Purposes

From its beginning in 1971, HSPVA has stood both in the limelight and on the edge of a precipice. In part, this awkward situation seems to have persisted because stakeholders have never agreed on a unified mission for the school. Also, policy makers and administrators never seriously considered HSPVA’s ability to meet simultaneously all its avowed purposes of dropout prevention, desegregation, professional artist preparation, academic excellence, and exemplary representation of HISD, Houston, and the greater Houston area. The risks of never making a decision, or of shifting purposes over time, may continue to mean that HSPVA never is fully illuminated by the limelight.

On the other hand, the multiplicity of purposes conceived for the school may, in reality, have been responsible for its continuance and exemplary status both within the local and national educational communities. With HISD’s 1997 adoption of a magnet admissions policy which ignores race and ethnicity (HISD Board 1997, November 20), HSPVA is now free to flourish as the artistic meritocracy its participants wish it to be. The school community’s 25-year espousement of a color-blind philosophy outlasted the political need for racial desegregation. As the purpose of natural racial desegregation expired, artistic meritocracy gained the necessary prominence to perpetuate the school’s exemplary status. The same adjustment of purpose may have occurred in the 1980s when academic excellence replaced both natural racial desegregation and artistic meritocracy as most significant. Although at some points the impression was one of political peril for HSPVA, the school’s continuance was assured.

Perhaps most neglected from the start has been the issue of which of the multiple purposes best serves the HSPVA students. Although continuity and dedication of faculty members sustained the academic and arts programs for a quarter century, no guarantees exist for the future. A unified mission based on student needs might help ensure the school’s continuance, excellence, legitimacy as an HISD high school, and exemplary status within the performing and visual arts magnet high school genre.

The preparation of elementary school teachers in the mid and late nineteenth century were increasingly trained by city normal training schools (Herbst 1989, 4). The city school board of Akron, Ohio reflected this trend and established their own normal training school in 1898. This paper will document the pre-service training of teachers within the city training school, the progression of the city normal school from its own teacher preparation program to university affiliation, the establishment of a teachers college, and the merging of the teacher college with Akron University.

The Akron schools attempted to train their own teachers before the establishment of their normal school. One type of training was the Specimen School or Spectator School held each Saturday morning throughout the school year. A teacher was selected to work with students in an observation class. Instruction lasted approximately one and half-hours then students were dismissed. The ensuing discussion revolved around classroom methodology and pedagogy. Attendance by teachers was mandatory, but the sessions were open and attended by board members and interested members of the public (Hatton 1955, 28). Samuel Findley, superintendent of Akron schools 1868-1882, established a normal school for teacher training. Spicer School, an elementary school in Akron, was converted to a normal school where young lady high school graduates were given small salaries to teach for one year under the supervision of experienced teachers (Hatton 1955).

Despite these efforts to better train Akron teachers, city school officials were not satisfied with the quality of their teachers. Findley previously recommended to the school board the requirement of prospective teachers to have had one year in the study of pedagogy, review of the common branches with special reference to teaching them, and to have observation and practice training experience. During the 1881/1882 school year Findley recommended the establishment of a Saturday Normal School which would utilize the more experienced teachers to attain the desired ends for qualified and effective teachers (Thirty-fourth Annual Report Akron Board of Education 1882, 50).

In June 1896 the Akron board of education received a report from the Normal Training committee which outlined the establishment of a city normal school. The report was adopted, its recommendations integrated into the Akron schools, and Akron had its normal school (Minutes of the Akron School Board 1896, 158-160).

Admission into the normal school was open to any resident graduate of the high school over eighteen years of age and under the age of twenty-one. This individual was to have a teacher’s certificate from the Akron City Board of Examiners. If they failed to secure such a certificate, depending upon satisfactory reasons for this failure, were admitted into the normal school if they passed an entrance examination held by the superintendent and principal of the normal school (Ibid.).

Residents of Akron who were graduates of the high school or had successfully completed the entrance examination, which covered coursework taught in the elementary schools, were admitted free into the normal school. The admission of non-residents was dependent upon their being of like age and possessing the same satisfactory qualifications as the residents of Akron. The tuition charge at the normal school was the same amount charged for attendance at one of Akron’s high schools. After admittance, upon consent of the superintendent, the normal school student could pursue the course of instruction in more time than required. Pupils chosen as teachers in the Akron public schools were selected on the basis of their excellent work in the normal school (Ibid.).

By 1919 admission requirements had changed substantially. The rules now stipulated that all applicants must be acceptable to the principal of the normal school in scholarship, personality, health, and musical ability. Applicants could be requested to withdraw at any time. Members of the senior class were expected to give assistance in teaching when called upon by the superintendent-without pay- in addition to their regular substitute teaching for which they were paid. Applicants were expected to teach two years in the Akron city schools if appointed to such a position (Minutes of the Akron Board of Education 1897, 184; 1919, 213).

Diplomas were awarded upon satisfactory completion of work in the two departments of the normal school. Students were to average seventy-five percent between the two departments and not receive marks below seventy percent in either department. This diploma, issued by the city Board of Examiners, served as a certificate to teach in the Akron public schools as determined by the Board of Education (Minutes of the Akron Board of Education 1896,
The normal school course was two years in length and consisted of a theory department and practice department. The students' first year of training was in the theory department where they received instruction in the elementary branches, general culture studies, nature work, form study, drawing, history, literature, methods, and psychology. Second year students were in the practice department. There students prepared lessons and taught under the direction of the critic teacher and principal (Manual of the Board of Education 1900, 43).

By 1905 the Normal School course had been modified to cover four lines of work. These were educational psychology, history of education, general methods of teaching, theories of school management, and methods classes for primary, intermediate, and grammar school (Ibid.). A course of study was added which allowed college graduates to enter the second year of the normal school, complete their work, and graduate in one year (Rules and Regulations of the Board of Education 1900, 43-44).

By December of 1915 the Municipal University of Akron and the Akron school board formulated an agreement approved by the State School Commissioners for a combined course in normal training between the University and Perkins Normal School. This partnership was needed by the University to comply with new state mandates passed in 1914 by the legislature that required increased preparation in the area of professional education and supervised practice teaching for state certification. Two training courses were devised a four-year and five-year combination course. The four-year combination course enabled the graduates to teach as elementary teachers in the Akron city schools but not as high school teachers, however, they were entitled to a provisional state high school certificate which gave them the legal right to teach in any high school in the state of Ohio. Students attended the University for three years, completed the required work (103 semester hours) and entered Perkins Normal School to complete the practice training course. Students then received the Bachelor of Science in Education (Minutes of the Akron Board of Education 1915, 171-172).

The five-year combination course was offered to those who desired to be high school teachers in the Akron school system. The course candidate completed four years (128 semester hours) at the University, pursued a major in the subject he/she wished to teach, received their bachelor's degree, and spent a fifth year at Perkins Normal School in observation and practice teaching (Ibid.). In 1921 Perkins Normal School was merged into the Municipal University of Akron becoming a part of the University known as the Teachers College (Buchtelite 1921).

The work of the Teachers College was organized for the preparation and training of teachers for the Akron public school system, the professional improvement of teachers already engaged in the public school system, and the study of educational problems. Sessions of the Teachers College were held during the day, evening, and through the summer. The administration of the Teachers College was under the management of the President of the University and Superintendent of Schools (Trustee Minutes of the Municipal University of Akron 1923).

The teaching staff was college faculty who taught pre-service and public school teachers the various professional programs of the Teachers College. The Akron school board paid the salaries of all teachers of the College and the salaries of teachers in the summer session. The university furnished all required classroom and office space, equipment, light, heat, stenographic service printing, and bore the cost of instruction on purely collegiate, non-professional subjects (Ibid.).

Admission into the Teachers College was determined by examination, high school certificate, honorable dismissal from other colleges of universities, or if over twenty-one years of age as special students not in candidacy for a degree. Unconditional admittance was granted to students with fifteen units of high school work (University of Akron 1922, 121-122).

Summer session programs were initiated June 1922. Offered were professional coursework and opportunities for practice teaching (Report of Sarah Stimmel University of Akron 1921/1922, 6-7). The observation and training experience of prospective teachers generally took place in the last year or two of the student's pre-service program. Schools were designated for observation and training work through out the system.

The training experience of the cadet teacher was completed in the public schools in regular schoolrooms under the supervision of critic teachers. Each elementary critic teacher supervised four student teachers. Each high school critic teacher supervised but one student teacher (The University of Akron 1922, 121-122).

Initially the Teachers College offered six courses for training teachers. These were three and four year
Midwest History of Education Journal  
Volume 26 Number 1 1999

preparation programs in kindergarten-primary education and elementary. Upon completion of their work students received either a state teachers certificate for completion of the three year program or a bachelor of education degree for work completed in the four year program (Municipal University of Akron 1922, 122-126).

In 1923 there were eight preparatory programs for teachers, by 1924 this had grown to thirteen courses of study. Courses leading to a master’s degree were established during the 1923-1924 school year. In 1926 new courses were offered to teachers on commercial and vocational education. In the 1928-1929 school year the course work again expanded to include industrial education (Municipal University of Akron 1923, 129-140; 1924, 120-127; 1926, 118-128; University of Akron 1928/1929, 139).

By the 1927/1928 school year the coursework for high school teachers was slightly modified. Students were still required to complete five years of study, but now students had the option of completing their bachelor’s work in either the Teacher’s College or the College of Liberal Arts. If a bachelor’s degree in secondary education was obtained through the Teachers College a fifth year of study was spent in the Teachers College completing coursework for a master’s degree. If the student received a bachelor’s degree from the College of Liberal Arts a fifth year of study in the Teachers College was required, and upon successful completion of this coursework received the bachelor of education degree (University of Akron 1927/1928, 130-140).

In order to gain a broader perspective of the Teachers College, three former students of the College were asked to recall their training at the College and their professional experience thereafter. Mrs. Margaret Brewster, a 1925 graduate of the Teachers College and a former kindergarten teacher had the distinction of serving as an observation teacher. Brewster recalled that students attended her class in pairs or small groups to observe her classroom techniques and participate in classroom activities under her supervision. Sadly enough when Brewster was pressed to offer her opinions on her work as an observation teacher, she stated she did not know why she was selected or why she was in the observation school. Brewster’s teaching career spanned a few years ending when she married and had children. A second alumnus of the college was enrolled in the graduate program in art education. This teacher remembered she had not received any training in pedagogy or educational methods until she completed student teaching experience and observation work required by the College.

The third alumnus interviewed was Mrs. Helen Coup, a 1928 graduate of the Teachers College and a thirty-five year veteran of the Akron public schools. Coup’s comments reflected the observations of the other College alumni, that the most important aspect of her training experience was the time spent in observation work and student teaching. Another observation by Coup was too much time was spent on academic matter and not enough time given to methods work. Interestingly enough educators still debate this issue of the why of knowledge over the how.

By June 1929 the Akron school board was considering a decision to withdraw their support from the Teachers College (Minutes Akron Board of Education 1929, 113-114; Minutes Trustees University of Akron 1929). The reasons for this were varied, but the economic depression of the 1930’s was one factor. Other reasons considered by school board members were that with five state supported teacher-training institutions along with the normal school at Kent there was an adequate supply of teachers being prepared in Ohio and no need for the Akron Teachers College. Furthermore, the chief function of the school system was to prepare students at the elementary and secondary levels not at the level of teacher preparation. In January 1931 the Akron school board voted to officially terminate their financial support of the Teachers College by June 1,1931 (Akron Board of Education 1931, 28; Akron Beacon Journal 1931).

The pre-service training of nineteenth-century schoolteachers in Akron, Ohio progressed from teachers being awarded a diploma to receiving a university degree. Akron teachers first earned diplomas through the city normal school then progressed to attendance at the university Teachers College earning a bachelor’s or master’s degree in elementary or secondary education. These changes initiated by state mandates in teacher certification laws, led to the creation of teacher preparatory programs administered by the city board of education and their university affiliate. Eventually the dual administration of the teachers college by the city school board and the university was dissolved, with the university assuming control over the teacher preparation program.

The racial tensions of the first half of the twentieth century were not confined to the deep South. The onset of World War II ignited smoldering frictions and antagonism that reverberated throughout the United States as African Americans and European Americans who migrated to northern and industrial cities in hopes of securing war-related employment, improved housing, and equal education, found themselves competing for resources. As social institutions were called upon to respond to the eruptions, this paper focuses on intercultural education, the school's response to calming those racial and ethnic tensions. Specifically, the approaches teachers in Carbondale, Illinois; Cleveland, Ohio; and Detroit, Michigan utilized in their classrooms to promote racial tolerance and democracy will be reviewed.

Intercultural Education

There is no doubt at all that the schools of America can make a great contribution in this direction [improved race relations]. School is often the place where such discrimination, including persecution and physical attack directed against children belonging to a minority group, will do its most lasting damage. It may breed arrogance and superciliousness, and brutal disregard for others, among children who belong to the dominant group, and it may reed lifelong bitterness and blind resentment among the children in the minority group.²

Intercultural education developed in response to the mass immigration of some 13 million southern and eastern Europeans into the United States during the early 1900s. Americans feared that this group of new comers, believed to be intellectually inferior to immigrants who arrived from mostly northern and western European countries prior to the 1880s, would weaken American society.³ Ethnic group leaders who sought positive group relations and supported the notion of cultural integration first used the term “intercultural education” to reflect “the study of the history and cultural contributions of ethnic groups to American society.” They viewed intercultural education as a way to promote positive group images and assimilation while “raising minority self-esteem, building attitudes of mutual appreciation among groups and promoting inter-group harmony, and stimulating a ‘renaissance’ of American culture.”⁴

Although The Service Bureau for Intercultural Education was established in 1933 as a clearinghouse for workshops and information on intergroup relations, it wasn’t until the 1940s that intercultural education received significant attention as communities around the country sought to calm the violent racial eruptions of the decade.⁵ In the 1943 work Intercultural Education in American Schools, published by the Bureau, William E. Vickery and Stewart G. Cole noted that the objectives of intercultural education were “the breaking down of the barriers tending to disrupt our national unity and the establishment of firm bases for mutual understanding and cooperation of the various racial and nationality groups present in our population.”⁶

Intercultural education activities could be broadly classified as either “contributions” or “American Dilemma” approaches. “Contribution” activities highlighted popular individuals within a group and group contributions in certain areas. Although most intercultural activities fell into this category, reliance on these techniques had the potential of perpetuating false ideas about a group or maintaining associations that the groups wanted severed. The “American Dilemma” approaches considered that students were mature enough to study the contradictions in America’s democratic philosophy and actual practices as long as the presented material didn’t undermine respect for law and order.⁷ We shift now to the intercultural education approaches Midwestern teachers utilized in their classrooms to break down racial barriers and promote racial tolerance.

Carbondale, Illinois

In 1946 several teachers from the Midwest met in Nashville, Tennessee to attend Charles S. Johnson’s Fisk University Race Relations Institute. The Institute, which began in 1944, was a non-profit social science workshop that brought together social scientists, educators, labor and industry leaders, ministers, civil rights leaders, and lay persons interested in achieving racial tolerance. Among the teachers, who served as members on an intercultural education panel at the Institute, was Carbondale, Illinois educator Amanda Murdock. Since Illinois experienced several violent riots...
during the twentieth century -- the Springfield race riot of 1908, the East St. Louis riot of 1917, and the Chicago Riot of 1919 -- many teachers like Murdock took an interest in promoting positive race relations. Murdock shared with Institute participants that she found her students at the Attucks School, an all African American school, "knew little about their own race." Taking this as an opportunity to educate not only her African American students, but also European Americans in the area, Murdock introduced a unit on the study of African Americans. After writing letters to different sections of the country for materials, Murdock's students received "nearly 500 pieces of invaluable material" which they placed on exhibit with material obtained from the Council Against Intolerance in America (New York). The exhibit was open to the public for 3 nights a week for 2 weeks. The city's daily newspaper lent support to the effort by running articles on "some phase of the Negro." 8

Although Murdock conceded that she had no way of measuring how much her students learned, she felt interest was aroused in the community and school as numerous visitors, European American and African American, perused the exhibit. Comments on the endeavor were "very favorable", and the school's library "continued to add material on the Negro to their information book." Murdock also noted that after the students' exhibit, the demand for material on African Americans at the public library prompted the librarian to purchase several books which focused on African Americans. The Southern Illinois Normal University also invited Murdock to lecture on African Americans in music and art which in turn prompted invitations to African American artists to the campus the following year. 9

Cleveland Public Schools

Like Illinois, Ohio had also experience racial tensions during the first half of the twentieth century as mob violence erupted in Springfield, Ohio in 1906. To facilitate positive race relations, Cleveland public schools utilized a comprehensive intercultural approach. Feeling that teaching an isolated semester on any one minority group was essentially "'Jim Crowism' in the curriculum", Cleveland's schools integrated the study of African Americans into their already existing curriculum. Allen Y. King shares that Cleveland did this because

[i]t [was] an indication of subconscious race prejudice to treat the Negro "problem: as separate and distinct from other minority problems. Such separation may be considered "Jim-Crowism" in the curriculum. Each minority problem may have complications peculiar to its specific case but all these problems are related and tend to form parts of a more general pattern. The study of great Negro leaders or of the Negroes as a group is best done in its natural setting in regular courses and units dealing with the life of our nation and community. 10

Cleveland's concern with incorporating information on African American with its existing curriculum reflected a larger debate among those proponents of intercultural education who wanted efforts to be systematic and consistent instead of brief attempts like studying a certain book. 11 Thus, Cleveland teachers utilized direct and indirect approaches. Direct approaches included utilizing biographies "related to the Negro" like those of "Abraham Lincoln, William Lloyd Garrison, Booker T. Washington, George Washington Carver, Crispus Attucks, Paul Lawrence Dunbar, Paul Roberson" in fifth, sixth, eighth, and eleventh grade American history. Teachers' discretion and the availability of "satisfactory supplementary reading materials" determined the amount of attention given. 12

Although a few schools organized special units on "Negro history" in their American history courses, most "made conscious efforts to distribute attention to Negro history throughout the American history courses." For example, in covering the topics of slavery and the Civil War, eighth and eleventh grade American history students explored the "evils of slavery, the problems of reconstruction after the Civil War, the progress and difficulties of the Negro since the days of slavery, the too frequent appeals to prejudice in political life, and to such organizations as the Ku Klux Klan." Again, King notes that

Considerable emphasis is placed upon the progress which the Negroes as individuals and as a group have made in improving their own conditions and upon the progress—gradual, even though too slow— which the United States has made in extending economic, cultural, and political opportunity and rights to Negroes. This emphasis upon progress is given so the Negro pupils may gain a reasonable sense of pride in the achievements of their own group; that they may enjoy a sense of psychological security; that all pupils may gain an appreciation of the achievements of their fellow Americans; and that all
Teaching Democracy
Sanders

may be challenged by the hope that further needed progress is possible in spite of obstacles.

Besides concentrating on individual groups, in 1941 Cleveland’s curriculum also began focusing on the concept of democracy. Students in the fourth, fifth, and sixth grades were introduced to the idea that democracy and liberty were concepts that required “that we exercise these liberties in such a way as not to deny equal opportunities to others and that it is un-American to promote racial or religious prejudice.” For example, in American history courses, equal opportunity for all citizens were stressed when students studied the Declaration of Independence and the Bill of Rights.

One of Cleveland’s indirect intercultural education approaches was encouraging students from different racial and national backgrounds to work together on projects so that they could “forget” their minor differences and come to recognize “individual merit”. Proponents of the activity hoped that students would recognize that “in all groups there are some who are crude, discourteous, dishonest, careless, shiftless, or lacking in ability” and that “both the desirable and undesirable qualities are individual traits rather than group characteristics.”

Through its efforts the Cleveland Public Schools found the following things about intercultural education:
1) ...it is an area in which excessive zeal, especially if misdirected, may be more detrimental than indifference.
2) care must be exercised in teaching about different groups that superficial differences do not receive undue emphasis; that misconceptions about special endowments of various racial or national groups are not reenforced or induced. Since people of various groups are more alike than different, the similarities must be stressed constantly.

Detroit Public Schools

Detroit experienced one of the most violent racial eruptions during the first half of the twentieth century. The third and largest riot to occur during the war years, Detroit’s June 1943 riot left 34 people dead. Hulda Fine, another intercultural education panelist at the 1946 Fisk University Race Relations Institute, shared examples of Detroit’s public schools efforts to address racial tensions. In order to establish a framework of intercultural education, proponents drew up an intercultural code and submitted it to the Detroit Board of Education, which passed it. According to the code, Detroit schools were responsible for rendering services to all students “without regard to race, creed, color, or national origin.” An administrative committee was also appointed to act in an advisory capacity to the Superintendent of Education. The committee stressed 1) teacher education and 2) individual school committees on intercultural education. The individual committees were formed on a voluntary manner. 180 out of 220 schools formed such committees. Of the 180, though, many of the committees were in name only, while others which were active were asked to submit reports of their activities. Wayne University, a local college, was also active in promoting racial tolerance as it offered 2 elective courses in intercultural education—one in its School of Social Work, and the other in its College of Education.

Collins J. Reynolds shares that one of Detroit’s project involved a interschool program between a predominately European American Jefferson School and a predominately African American The Garfield School. Although the schools were located on opposite sides of the town the students shared similar economic conditions. Most of their parents migrated to Detroit from the south because of war-related opportunities, but found themselves competing for the resources. These similarities aside, the students had little opportunity to share experiences and participate in integrated activities. Intercultural committee members from both schools suggested activities for the students. One activity was an essay contest, “One World”, based on a selected reading list. Winners were selected from both schools. Another activity involved field trips to institutions within each groups community. The intercultural education experiences between Garfield and Jefferson provided opportunities to 1) combat stereotypes; 2) “demonstrate the possibilities of cooperation; 3) “learn techniques of cooperation and for the development of new ones”, and 4) possibly lay the “foundation for growing intergroup friendship.”

Summary

This paper offered a brief look at some of the intercultural activities utilized by teachers to promote racial tolerance and democracy in three Midwestern cities. Although not an exhaustive review or analysis, this paper shows that some school districts and teachers were taking active measures to build positive race relations during the 1940s.
As the intercultural education movement gained momentum during the late 1940s and early 1950s, more approaches appeared involving reading activities, oral teaching, writing activities, and “non-verbal” techniques. As we continue to deal with differing racial and ethnic groups in the United States and issues of racial intolerance, these intercultural activities and techniques utilized during the World War II era warrant further research to see if there were any measurable differences in student attitudes after being presented with information.

After the battle of Chaeronea (August 338 BCE), Philip II of Macedon (382-336 BCE) had established hegemony over the various Greek cities. With the support of the Hellenic League, Philip planned a crusade to the East—a crusade against Persia. However, in the summer of 336 BCE, Philip was assassinated while attending his daughter's wedding. His son, Alexander III (356-323 BCE), succeeded him to the Macedonian throne and executed his father's plans. As a result, Alexander invaded Asia Minor and conquered Persia. He then went on to conquer Egypt, Phocis, Mesopotamia, central and eastern Iran, Afghanistan, Baluchistan, and the Indus Valley. On his return home, Alexander mysteriously fell ill and died in Babylon (323 BCE). The "Great" son of Philip II had truly conquered much of the oikoumene or "the known inhabited world". Through his marriage of Greek culture with the indigenous cultures of Asia Minor and the Levant, Alexander basically instituted a wide spread Hellenization process. The resulting cosmopolitan culture—referred to as Hellenistic—acted as a common link between diverse peoples with differing customs. It also laid the foundation for what we know consider to be Western culture.

Thanks to historians such as Plutarch (late 1st century CE), and Arrian (2nd century CE), we know quite a bit about Alexander's life, his accomplishments, and even his education. Philip employed several tutors early on to educate his son, Alexander, and each served to teach him about a particular sphere of arete or "excellence" (sometimes translated as virtue). This pursuit of arete is characteristic of the Homeric tradition and becomes the basis for Athenian paideia or education. In the Iliad, Achilles' tutor, Phoenix, reflected back to Achilles' youth: "...a mere child, knowing naught as yet of evil war, neither of gatherings wherein men wax pre-eminent. For this cause sent he [Peleus] me to instruct thee in all these things, to be both a speaker of words and a doer of deeds." This passage clearly identifies the two basic ideals associated with the Homeric hero—to be both orator and warrior—serving his king both in the court and on the battlefield. These ideals were the essence of arete, and eventually became the nucleus for traditional Athenian paideia or "education". As a one might expect, Philip surely wanted his son, Alexander, to become the embodiment of the Homeric hero—to be like Achilles. Consequently, Alexander's first tutor was the stern disciplinarian, Leonidas, who trained him physically and taught him the arts of warfare; while his second tutor was Lysimachus of Acarnania, who taught him music, along with reading and writing. Both Leonidas and Lysimachus fulfilled the basic tenets of traditional Athenian paideia. In his Republic, Plato described this earlier form of Athenian education as being gymnastike for the body and mousike for the soul. As a result, gymnastike was basically any physical training of the body, while mousike referred to the endeavors personified by the divine Muses (music, dance, poetry, and literature). Alexander's early education was obviously modeled after this traditional Athenian paideia.

In 343/2 BCE, Philip invited Aristotle of Stagira (384-322 BCE) to the capitol of Pella, so that he could tutor his thirteen-year old son Alexander. Along with his formal education under Aristotle, Alexander seems to have had an informal relationship with the Greek rhetorician, Isocrates (436-338 BCE), while also showing an interest in Cynic philosophy and the teaching of Diogenes of Sinope (c. 400- c. 325 BCE). Peter Green, the renowned historian of Alexander the Great, has remarked: "History tells us something of Alexander's teachers, but remains almost silent as to what they taught him." It is from this statement that I begin my inquiry. By examining the teachings of Aristotle, Isocrates, and Diogenes, this paper will attempt to reconstruct some of the possible educational tenets taught to Alexander by comparing his actions and policies to some of the lessons—both formal and informal—that he may have learned from his teachers.

Aristotle

One of the more famous examples of the student-teacher relationship in all of history is that of Alexander the Great and Aristotle. To foster this relationship, Philip even set up an educational retreat for both teacher and student in the secluded Precinct of the Nymphs at Mieza. Several other young princes accompanied Alexander on his retreat. They included Hephaestion (his close friend), Cassander (son of Antipater), Ptolemy (son of Lagus), and Marsyas of Pella. In fact, it was Marsyas who supposedly wrote the now-lost work, The Education of Alexander.

At Mieza, Aristotle not only continued Alexander's paideia, but he specifically gave Alexander an education in science, philosophy, and politics. Throughout his conquests, Alexander is said to have corresponded with his teacher.
on a variety of issues—particularly the sciences. Alexander even developed a scientific corps, led by his historian Callisthenes (nephew of Aristotle).\textsuperscript{14} This scientific corps of zoologists, botanists, and surveyors must have provided Aristotle with much of the necessary information to compose treatises such as \textit{Historia Animalium} and many of his other scientific works.\textsuperscript{15}

There is an epistolary tradition associated with Alexander. In the fictional romances associated with his conquests, Alexander is depicted to have written many letters to his adversaries (e.g. Darius and Porus) and to his family and friends (e.g. Olympias and Aristotle).\textsuperscript{16} However, the letters serve more as a narrative than historical documents. When he set out on his crusade, Alexander was simply leading the Greeks against the Persians. However, it seems that somewhere along the way he became enamoured with the idea of uniting the \textit{oikoumene}.\textsuperscript{17} In a somewhat controversial letter, Alexander's teacher, Aristotle may have even instructed him with the very philosophy to accomplish his task. This letter has been preserved in ancient Arabic, and here is a translated portion of that letter:

"I \[Aristotle\] know that if mankind in general is destined to reach true felicity within the duration of this world, there will come about that concord and order which I shall describe. Happy is he who sees the resplendence of that day when men will agree to constitute one rule and one kingdom. They will cease from wars and strife, and devote themselves to that which promotes their welfare and the welfare of their cities and countries. They will all enjoy safety and quiet, dividing their day into parts, part for rest and welfare of the body, part for education and attention to the noble pursuit, philosophy—studying what has been achieved and seeking what has not yet has been attained. I would love to remain alive and see that age—if not all, at least part of it."

Aristotle did see most of the \textit{oikoumene} united, but he never saw his pupil again. If the letter is authentic, then it makes a truly amazing connection between teacher and student. This letter could be a direct representation of an Aristotelian lesson being learned by Alexander. When did the Macedonian plan to conquer Persia evolve into conquering the \textit{oikoumene}? Did Alexander receive encouragement such as this to unite the \textit{oikoumene}? Regardless, Alexander did briefly establish the single polity described above. Although, it would be great if the development of Alexander's ecumenical side could be credited to his teacher.

In addition, Aristotle's syllabus surely included lessons about governance and just rule; and many of these lessons must have made their way into his own \textit{Politics}. To support the above letter's authenticity, there is also a passage in the \textit{Politics} that relates a similar sentiment of achieving a single polity:

"The nations inhabiting the cold places and those of Europe are full of spirit but somewhat deficient in intelligence and skill, so that they continue comparatively free, but lacking in political organization and capacity to rule their neighbors. The peoples of Asia on the other hand are intelligent and skilful in temperament, but lack spirit, so that they are in continuous subjection and slavery. But the Greek race participates in both characters, just as it occupies the middle position geographically, for it is both spirited and intelligent; hence it continues to be free and to have very good political institutions, and to be capable of ruling all mankind if it attains constitutional unity."

This elitist justification for Greek rule over the \textit{oikoumene} may give some explanation as to why the Macedonians chose to import Greek culture into their own. Since Philip understood the value of Hellenic culture and wanted to make it his own, it is not hard to imagine why he chose Aristotle to be his son's tutor.

Plutarch supports the unification theory put forth by Aristotle in his own description of Alexander's cosmopolitan intentions for the \textit{oikoumene}:

"But, as he \[Alexander\] believed that he came as a heaven sent governor to all, and as a mediator for the whole world, those whom he could not persuade to unite with him, he conquered by force of arms, and he brought together into one body all men everywhere, uniting and mixing in one great loving-cup, as it were, men's lives, their characters, their marriages, their very habits of life. He bade them all to consider as their fatherland the whole inhabited earth (\textit{oikoumene}), as their stronghold and protection his camp, as akin to them all good men, and as foreigners only the wicked; they should not distinguish between Grecian and foreigner by Grecian cloak and targe, or scimitar and jacket; but the distinguishing mark should be seen in virtue, and that of the foreigner in inequity..."

This passage basically outlines Alexander's ecumenical reasons for Hellenization, but it also clearly establishes virtue
as the defining quality of being Greek. Eventually, Alexander himself would become the "mediator for the whole world".

With respect to virtue, Aristotle surely taught his pupil that virtue was the most desirable quality to have, whether it is applied to a ruler or to those being ruled. In fact, Aristotle spends a good deal of time in his Politics explaining the importance of virtue. Aristotle described virtue in the following manner:

"...it was proved that the virtue of a man and that of a citizen in the best state must of necessity be the same, it is evident that a man becomes good in the same way and by the same means as one might establish an aristocratically or monarchically governed state, so that it will be almost the same education and habits that make a man good and that make him capable as a citizen or a king."21

This lesson from the Politics truly encapsulates Alexander's successful conquest and Hellenization of the oikoumene. The last clause is the most important; because it states that people must have similar education and habits to be either good citizens or good rulers.22 This passage reinforces the belief that Greek paideia was in fact the primary mechanism for the Hellenization process. As a result, paideia is also the medium for the establishment of a cosmopolitan society throughout the Mediterranean. Plutarch described the conquests of Alexander in the following terms:

"Those who were vanquished by Alexander are happier than those who escaped his hand; for these had no one to put an end to the wretchedness of their existence, while the victor compelled those others to lead a happy life."23

Throughout history, Alexander has been identified as a civilizing force for the "uncivilized" regions of the world. This idealistic and one-sided sentiment is not far removed from the aspirations of the British colonialists or even the twentieth century American psyche.

Isocrates

However, Alexander's education was not limited to the teachings of Aristotle. In fact, one argument in this paper is that Alexander was also influenced by the teachings of Isocrates. Like Aristotle, Isocrates also corresponded with Alexander about his education. This is best exemplified in his letter to a young Alexander on the study of rhetoric. Isocrates praised Alexander's choice of rhetoric:

"...you choose rather the training which rhetoric gives, which is of use in the practical affairs of everyday life and aids when we deliberate concerning public affairs. By means of this study, you will come to know how at the present time to form reasonably sound opinions about the future, how not ineptly to instruct your subject peoples what each should do, how to form correct judgements about the right and the just and their opposites and, besides, to reward and chastise each class it deserves. You act wisely, therefore, in devoting yourself to these studies; for you give hope to your father and to all the world that if, as you grow older, you hold fast to this course, you will surpass your fellow-men in wisdom as your father has surpassed all mankind."24

From this letter, Isocrates clearly identified rhetorical study as the means of acquiring wisdom. Thereby, for Isocrates and Alexander, it is through rhetoric that the tenets of philosophy and just rule can be learned and practiced in everyday life.25 This pragmatic lesson was truly invaluable for the young conqueror and also for the development of modern education. Throughout Western history, rhetoric has always remained the queen of the liberal arts.

Interestingly enough, Isocrates was the one who had also encouraged Philip and later Alexander to wage war against the Persians and bring peace to all.26 In addition, Isocrates clearly established that paideia was the cultural link between differing peoples:

"And so far has our city [Athens] has distanced the rest of mankind in thought and in speech that her pupils have become the teachers of the rest of the world; and she has brought it about that the name 'Hellenes' suggests no longer a race but an intelligence, and that the title 'Hellenes' is applied rather to those who share our culture (paideia) than to those who share a common blood."27

This basic humanism was one of Isocrates most significant contribution to Greek society and to Alexander himself. He believed that the Athenian culture defined the school of Hellas. In fact, wherever the Greeks settled, one of the first things that they did was to set up their gymnasiuums and schools.28 During the period after Alexander's death, even the Greek language changed to help facilitate language learning in traditionally non-Greek regions of the oikoumene.
This new form of Greek was called koine or "common" Greek. It is the Isocratean view of paideia that finds its way into the Hellenistic world through Alexander's conquests. This Hellenistic notion of paideia established the educational foundations for the Roman Empire and eventually the Western world. Because of his universal notion of paideia, the best ancient model we have for modern educators is not Plato or even Socrates, but rather Isocrates himself.

Cynics

Also, the notion of Alexander being an unofficial follower of Cynic cosmopolitanism can be alluded to from the historical evidence. In fact, it was the Cynics who first developed the notion of cosmopolitanism. Because the Cynics rejected all social conventions, they received the nickname kion or "dog" which is the root of kunikoi or the Cynics. Antisthenes of Athens (445-360 BCE) was probably the founder of the cynic sect; but it was his disciple, Diogenes of Sinope (c. 400-325 BCE), who in fact coined the term. When asked from what city he was from, Diogenes responded, "I am a cosmolites, a citizen of the world." As a cynic, Diogenes was really rebelling against the notion of belonging to an elitist Greek polis or city/state. However, Diogenes' notion of cosmopolitanism was received without the characteristically cynical overtone by his Hellenistic followers.

Crates (365-285 BCE), a disciple of Diogenes, put forth a more proactive definition of cosmopolitanism in one of his tragedies:

"Not one tower hath my country nor one roof,  
But wide as the whole earth its citadel  
And home prepared for us to dwell therein."

The cynic view of cosmopolitanism seems simple in that it views people as being individual citizens of the world order. Like Diogenes before him, Crates spent his life wandering around in poverty preaching his gospel and converting people to Cynicism. John L. Moles characterized cynic cosmopolitanism in his conclusion:

"The Cynic proclaims his allegiance to the cosmos. He can live a virtuous live anywhere: the whole earth serves as his home. He maintains a positive attitude toward the natural world and toward the animal world. He is himself godlike. He recognizes his actual kinship with other sages and his potential kinship with human beings in general, whom he seeks to convert. He is a mediator between men and gods, and this mediation is an important part of his pedagogic activity."

This summation of cynic cosmopolitanism reveals that the Cynes were more than the literal cosmopolites. There was a religious component of the Cynic being "a mediator between men and gods". The notion of human unity was prevalent throughout the early Greek intellectual history; but it was the Cynic who went beyond the borders of the Greek polis and viewed the world as his/her metaphysical stomping ground. This sounds a lot like Alexander.

Before Alexander set off to conquer and unite the oikoumene, many statesmen and philosophers visited Alexander—all except Diogenes. Alexander sought out Diogenes and found him sunning himself. Alexander asked if the philosopher needed anything, and Diogenes made his famous reply, " stand aside, you're blocking the sun." Alexander was so struck by Diogenes' disdain that with a chuckle he replied, "But verily, if I were not Alexander, I would be Diogenes." It is interesting to note that the famed teacher and popularizer of the Classics, Gilbert Highet, wrote an essay based on this very scene:

"He [Alexander] was what Diogenes called himself, cosmopolites, "citizen of the world". Like Diogenes, he admired the heroic figure of Hercules, the mighty conqueror who labors to help mankind while all others toil and sweat for themselves. He knew that of all men alive in the world only Alexander the conqueror and Diogenes the beggar were truly free."

In many respects, Alexander and Diogenes were very much alike, because each man in his own way represents the essence of cosmopolitanism. Alexander becomes a symbol for cosmopolitan society, while Diogenes exemplifies the necessary individualism within such a society.

In addition, Alexander brought a Cynic named Onescritus of Astypalaea along with him. Onescritus was a seaman and is mentioned to have been with Alexander in India. Onescritus steered Alexander's ship down the Jhelum River and was a lieutenant of Nearchus. Also, Onescritus is known to have written a pseudo-historical account of Alexander's journeys. This book would be similar to Xenophon's Cyropaedia. In it, Alexander was depicted as a Cynic hero and apostle of Greek culture or paedeia. Whether there is a connection or not, this romantic vision of
Alexander seems to hold a bit of truth in the history. Alexander did not generally view the people he vanquished as mere barbarians, but rather strove to establish a certain amount of respect and equality between conqueror and conquered. In fact, Alexander embraced the customs of the so-called barbarians. He wore longer hair and "effeminate" dress, and acquired some very eastern mannerisms. These internal changes were also of great concern to Alexander's men. Arrian reported that Alexander at a banquet in Opis called the Persians his kinsmen. He also described Alexander's sentiment in the following passage:

"And Alexander prayed for all sorts of blessings, and especially for harmony and fellowship in the empire between Macedonians and Persians."

Likewise, after Alexander conquered the Indus Valley, he asked his adversary, Porus, how he would like to be treated. Porus answered that he would like to be treated as a king. Alexander agreed and restored his sovereignty in India. However, it should be noted that the acculturation aftermath was not entirely one-sided. The Roman historian, Livy (late 1st century BCE), alluded to the reciprocal relationship that formed on account of Hellenization:

"The Macedonians who hold Alexandria in Egypt, who hold Seleucia and Babylonia and other colonies scattered throughout the world, have degenerated into Syrians, Parthians, and Egyptians."

Livy was a bit condescending in his analysis, but his words ring true with respect to the evident cultural sharing. Eventually, the difference between Greek and non-Greek becomes a semantic debate. Under the umbrella of Hellenization, cosmopolitanism had become a reality in the Hellenistic world.

This cosmopolitan reality is best exemplified by the foundation of Alexandria in Egypt. Alexander himself founded this Alexandria, along with many others, as he marched towards India. Consequently, Alexandria became a cosmopolitan center—the cultural Mecca of the Mediterranean world. Ptolemy I, who was one of Alexander's generals and heir to the Egyptian throne, moved the capital of Egypt to Alexandria. However, it was his successors who made the city into a center of learning, commerce, and industry. Strabo (1st century BCE), a historian and geographer, remarked on the importance of Alexandria as a trading capital:

"Among the happy advantages of the city, the greatest is the fact that this is the only place in all of Aegypt which is by nature well situated with reference to both things—both to commerce by sea, on account of the good harbours, and to commerce by land, because the river easily conveys and brings together everything in a place so situated—the greatest emporium in the inhabited world (oikoumene)."

Its importance as a commercial center is really no different than that of New York, London, Hong Kong, or Dubai. At its height, Alexandria had a strong multicultural population that could be divided into being originally Greek or non-Greek. The non-Greek population was by far the majority and was composed of Egyptians, Jews, Syrians, and many other ethnic groups. Even though the Greeks governed the indigenous people, they were really the immigrants in Alexandria and other eastern cities. Throughout the Hellenistic Age and into the Roman Empire, Alexandria remained the cosmopolitan center of the oikoumene. This ideological movement away from the polis or city-state evolved after Alexander the Great had conquered much of the Mediterranean world. The polis was no longer the center of civilized life. As a result, cosmopolitanism took the place of nationalism in the Hellenistic world. This change in sentiment was an outward affirmation of the individualism that became characteristic of the Hellenistic Age—an individualism that evolved from the reign of Alexander the Great to the advent of the Roman Empire. Basically, this cosmopolitan individualism is symbolic of an emerging global consciousness within the multicultural world of the Mediterranean. It was also the most important lesson learned by Alexander.

Conclusion

Interestingly enough, the lessons learned by Alexander have great implications on the development of the globalized world of today. Aristotle obviously had a profound impact on his young protégé. As a result, Alexander implemented fairly sound policies of government throughout the oikoumene. Isocrates enhanced Alexander's education through his encouragement and revolutionary notions of paideia. Alexander himself became the embodiment and vehicle for understanding and transmitting Cynic cosmopolitanism throughout the Mediterranean world. In his monumental work, Paideia: the Ideals of Greek Culture, Werner Jaeger rightly asserts:

"And it was ultimately in the form of paideia, 'culture' that the Greeks bequeathed the whole achievement of the Hellenic mind to the other nations of antiquity. Augustus envisaged the task of
the Roman empire in terms of Greek culture. Without Greek cultural ideals, Greco-Roman civilization would not have been a historical unity, and the culture of the western world would never exist.\textsuperscript{44}

Alexander's education was defined by these ideals. Hopefully, this brief discussion concerning the educational biography associated with Alexander the Great will reaffirm the importance of ideals such as paideia and cosmopolitanism from both Alexander's world to ours.

Establishment of the Finlandssvensk Folk High Schools: Political and Philosophical Underpinnings

Katherine Brown
Loyola University of Chicago

In response to German cultural influence and democratic awakening in Denmark, Bishop N.F.S. Grundtvig began writing in the mid-nineteenth century about the prospect of an educational institution organized around the German romantic idea of enlightenment education for the peasantry. These rural folk high schools were to preserve and protect the Danish language and culture from the cosmopolitan tendencies of the cities and their intelligentsia. The schools were loosely structured and adaptable, which aided in their viability as they spread across Scandinavia and Finland. This essay will address the events and ideas which served as precursors and catalysts for the folk high school movement and subsequently for the development of folk high schools by the Swedish-speaking minority population of Finland (Finlandssvensk).

Social and political developments within Finland during the course of the nineteenth century contributed to the increase in Romantic, nationalistic thought among both the Finnish and the Swedish speaking populations. The environment of external philosophical influence coupled with political and social transition led to the founding of the first folk high schools in Finland at the end of the nineteenth century by both the Finnish-speaking majority and the Finlandssvensk. Finland was unique in the sense that two separate groups within the country utilized nationalistic folk high schools for cross-purposes; whereas, a contrasting example, Denmark, established the schools to ward off an external threat and unite the nation as one ethnic community.

Grundtvig, the Folk Highschool Movement and German Romanticism

Bishop N.F.S. Grundtvig, the father of the folk high school, was nothing less than a radical and rebel within Danish culture and the Danish Lutheran Church of his time. He was an amazingly prolific writer throughout his long lifetime, delivering his final sermon the day before his death in 1872 at eighty-nine years of age. His drive throughout was the enlightenment of the Danish people in their true essence and spirit so that the nation could live on in independence, strength and prosperity and rise to the task of being Christian in a deep, meaningful, Danish way.

Grundtvig was born in Udby, about 40 miles from Copenhagen on 8 September 1783. His father was a pietistic minister and his mother a member of a prominent Danish family that had produced teachers, scientists, ministers, and public officials. At nine years of age he went north to Tyregodlund to spend six years in a minister’s home to prepare for the Latin School. There he developed a love for the peasantry and their myths and songs of the North (Kenworthy 1944, 4). This interest was to carry through his adult years and find resonance in the writings of the German Romantics. In 1800, at seventeen, he entered the University of Copenhagen and was introduced to such German thinkers as Goethe, Schiller, and Fichte. Between 1805 and 1810 he steeped himself in Herder, Schelling, Fichte, and Schlegel (Fain 1971, 76).

Among individual harbingers of German Romanticism, Vico, Shaftesbury, Moser, Klopstock, Lessing, and Moser stand out, but the writer who exercised the most profound influence on the German Romantics was Johann Gottfried Herder, (Reiss 1955, 2) a man Grundtvig referred to as a “poem” (Knudsen 1955). The movement in which he was pivotal was much more than simply excising French and restoring the German language among the elites of Germany. For Herder, the mother tongue was the manifestation of the Volks spirit and the medium of man’s connection to God. This special spirit of a people was held to be impaired if there was too much contact with foreign influences and foreign languages.

This national spirit was precious for, throughout the history of the world, God had created diverse national groups, and through these groups, God’s plan was realized. Diversity should be respected, and therefore each Volks needs to be protected and preserved; intermixing of the diverse groups was seen as a very negative consequence of the more “cosmopolitan age.” Herder and subsequently Grundtvig held in theory that the spirit of one nation was as valid as the spirit of another – each nation created by God (Fain 1971, 83).

If a nationality forsakes its Volks spirit and language, it is considered by the Romantics an unnatural society, having destroyed its “self.” The Volks must protect the natural divisions of the human race and preserve its language as its most distinctive and sacred possession (Herder XIII, 384-5; XVII, 155; XVIII, 247-8; 59, 70-1, 100-101). It was thus the goal of Herder, among others, to overcome the artificiality of his age and bring the people back to life grounded in the mother tongue and love for their fatherland: this was the natural order of the world.
In order for the society to regain its previous natural state, the Volk must be developed through education, Bildung, in a broad sense. Herder believed that people can achieve self-development as long as an initial stimulus comes from outside. Perfection, therefore, was both an individual and a social process and any social and political framework which neglects the development of its members or directs it into the wrong channels was deemed by Herder to have lost its raison d'être (Herder XIII, 147; XXX, 517; XXXII, 518; 79).

Education to Herder was not only the preservation of the traditions of the Volk but also the means by which a society progressed. The synthesis and reconciliation of the Hegelian dialectic of “new” and “old”, tradition and progress, though superceding the two original opposites, absorbed and enriched them (Herder XVI, 571; XXIII, 9; 130). One avenue of transformation which Herder greatly anticipated was that of a move away from hereditary rule to a system of aristocratic democracy (Barnard 1965, 75, 82, 87). Herder did not favor full democracy; he believed, as many others, that the centuries of neglect had left the Volk educationally and politically unfit for government. “For the time being, all we could wish for was not that the Volk should rule, but that it should undergo education (Bildung).” (Herder XVII, 96; 81)

Ironically, it was the German Romantic belief in the inherent value and utmost necessity of educating the Volk as to their history and identity that led Grundtvig to encourage the Danish people to support the Danish Folk spirit as opposed to adopting the German culture and language. Grundtvig was bothered not only by the Danish lack of ethnic self-esteem but the negative light in which many Germans held Danish culture. He stated in 1838, his “whole quarrel with Germany is really concerned with the fact that they are determined either to make me a German or to regard me as a fool...Instead I assert that Denmark is no more the tail of Germany than the Norse spirit is a sprite serving the Imperial German reason.” (Grundtvig 1984, 100)

Grundtvig saw the Norse spirit as the “venerable father” of all people of the North – which included the English. His hope was to see the day when through the use of the Danish mother tongue, the heroic Norse spirit would be able to rise and be recognized by the rest of the world. To this end he dedicated great amounts of time to the compilation and interpretation of Norse Mythology. Regardless of the reaction of others, the work was to instill pride in the Danish people and would come to serve as a central component to his ideal nationalistic curriculum. Preservation of the Danish language was central; it was believed by Grundtvig to be the key to the understanding of God and men. Grundtvig’s conception of the “living word” (Grundtvig 1984, 120) is basic to his ideas on religion, history and education. He believed that everything should originate in Danish or be translated into Danish for the students (Grundtvig 1991, 37). Grundtvig proposed that Danish should be utilized in the classroom by bard-like instructors who ground education in the students’ current life experiences and communicate via discussion and storytelling rather than through books and lectures.

“Just as the invisible world becomes alive and strong only in the mother tongue, our living relation to our past and our future depends on our sense of continuity with our ancestors and our descendents... it is necessary for a word of the people (a folk word) in the mother tongue to turn the hearts of the children to their parents and the hearts of the parents to their children.” (Grundtvig 1976, 43)

During Grundtvig’s three summer trips to England from 1829 to 1831, he had been impressed with the universities of London and Cambridge and the active life of the English people (Mortensen 1983, 123). Being abroad greatly sharpened his sense of Danish ethnicity. He could only admit that Denmark had somehow fallen behind England in a fundamental way, that Denmark had not yet evoked the proper fighting spirit and that the reason for this was that the English, by using their mother tongue, had been able to unleash their unique spiritual essence (Fain 1971, 77).

“For where the mother tongue in its natural simplicity is ousted from official usage and the cultural circles it is so to speak thrown on the dunghill. For it is there that it gradually loses, together with its refinement and its cultivation, all its higher forms of expression and thereby all it spiritual character and its power to move us; the learned and the cultured circles endeavor to assert a way of thought which is foreign to the people and cannot therefore be given living expression in the language of the people, and the people themselves cannot say what they think and feel.” (Grundtvig 1984, 116)

It was a combination of his visits to England while continuing his work on Nordic mythology, together with
a Romantic perspective of the rapidly changing political and social scene in Denmark (Borish 1991) that all coalesced for Grundtvig to produce in the 1830s a series of writings and lectures in which the idea of the Danish folk high school was born (Grundtvig 1991). He came to be known as the father of the folk high school and some go as far as to declare him the "father of Western adult education" (Grundtvig 1991).

At an historic meeting on 4 July 1844 on Skamlingsbanken Grundtvig addressed some 12,000 people and, with the background of encroaching Germanism, called for an awareness of what it meant to be a free people with self-determination, a culture and a language of its own; and he challenged people to build a school where the emphasis rested not on academic systems, alien cultures and foreign tongues, but on the mother tongue and the Spirit of the North. A few months later, Redding Højskole in North Slesvig opened its doors and the folk school movement was on the way (Mortensen 1983, 123).

Interestingly, Grundtvig never established nor ran a folk high school himself. He was characterized as a scholar who rarely left his desk, which explains that huge amount of writing he produced in his lifetime. He was an advocate for the peasantry and rural population in general but tended to remain in Copenhagen as one of the intelligentsia he so disparaged in his writings.

Warren (1989, 217-8) has culled eight distinct features of the folk high school as articulated by Grundtvig from 1832 to 1855:

1) subject matter would not be significant in and of itself; the curriculum is up for discussion at the beginning of each course with the teacher acting as a bard who's excitement about the topic and personal experience establishes their facilitator role.
2) dialog should be the tool of instructional communication, that grows out of the students' personal experience and found not only in class but also in out-of-class interaction, discussion meetings, student council meetings, and assemblies.
3) no test, grades, or degrees would be imposed. Competition within the group is seen as disruptive and inappropriate.
4) duration of stay would be limited (a single 3-4 month term).
5) students must live at the school.
6) students and staff would work together in some form of physical enterprise.
7) each term's educational community would be self-governing.
8) the teachers would live at the folk high school with the students.

A note to make of this list is the absence of specific religious instruction within the school. This is key because even though he firmly linked Danishness to Christianity, Grundtvig believed that religious awakening would occur naturally once the students were enlightened as to their ethnic identity and prior to that point should be dealt with within the family and the church (Grundtvig 1991, 70). Grundtvig's Christianity did not subsume history and poetry, but operated on an equal level. The goal of the pursuits of religion, history and poetry was enlightenment of life (Warren 1989, 215). Nevertheless, many folk high school leaders who followed Grundtvig's ideals, most notably Christen Kold, (Kulich 1991, 451) missed the subtlety with which he regarded this subject and placed Christian awakening at the center of their schools at the expense of enlightenment of the Folk. This split led to two very different types of folk high schools. Kold created what was considered for a long time the dominant model of the Danish folk high school, a revivalist school focused on Christian awakening rather than civic enlightenment, which admitted students as young as 14. Grundtvig, himself, paid tribute to him on several occasions, but it is unclear whether he knew to what extent Kold was deviating from his ideal curriculum of the folk high school (Kulich 1997). Despite this difference in interpretation, the seeds sown by Grundtvig in Denmark grew into a system of folk high schools which influenced the country's development at a crucial juncture in its history. By 1870 there were 50 folk high schools in Denmark, by 1880, 64 had been established, and in 1900, 74 folk high schools existed (Kulich 1984, 11). Grundtvig had a huge output - his collected prose works were published in a 10 volume edition, which joined nine volumes of poetry, five volumes of songs, and a huge manuscript collection at the Royal Library in Copenhagen (Fain 1971, 80). Many of his hymns were published and he was granted the title of Bishop in 1861. When he died in 1872, his coffin was accompanied through the streets of Copenhagen by thousands of people singing his hymns. His ideas and their import have been variously compared to Dewey, Marx, Illich and Freire by
Establishment of the Finlandssvensk Folk High Schools

Brown

Scandinavian authors, even though he is little-known outside that area of the world. As the folk highschool movement spread to different countries, the centrality of grounding the school in the experiences of the common people and organizing it democratically aided in its adaptability. This was the case as the schools moved into the rest of Scandinavia and Finland. Much like Denmark at the time, Finland was going through a great period of change in the nineteenth century. The social and political shifts elaborated upon below led to the awakening not only of Finnish national identity but of Finlandssvensk (Swedish-speaking Finnish minority) identity as well. German Romantic influence became evident in Finland as had been the case in Denmark, with the folk highschool serving as one of its primary conduits.

Finlandssvensk Folk Highschools and Nationalism in Finland

As opposed to Grundtvig’s desire to preserve and promote a threatened Folk culture, the Finlandssvensk (Swedish-speaking minority in Finland) found themselves firmly in the elitist position, similar to the German-speaking or, at times, part-German Danish elite of Grundtvig’s day. The Finnish folk highschools mirror quite closely the Danish institutions, while the Finlandssvensk were able to use the same institutions for cross-purposes.

During 550 years of Swedish rule, Finland, by 1700, had grown into a cohesive entity made up of a Finnish-speaking peasant class and Swedish-speaking elite class. At the turn of the nineteenth century, Finland had educational institutions, including a university in Åbo. Swedish, though spoken by the minority, was the language of all government and educational institutions of the time and Finnish books and newspapers were virtually nonexistent. But it was at this time that the first cultural about-face for the Finns occurred when Sweden lost the area of Finland to Russia as a result of the Napoleonic Wars. Finland was officially made an Autonomous Grand Duchy of Russia in 1809 under the Treaty of Fredrikshamn (Hamina). This was the beginning of a recognized Finnish state. Czar Alexander I took a lenient tact and in order to win support from the new Grand Duchy, he supported the growing desire among Finnish-speakers to find their own culture and use their own language. He hoped to encourage Finns to break emotional ties with Sweden.

The first influence of Romanticism could be observed in Finland with the development of the Finnish Literature Society in the 1840s and 1850s. This group of university students drew on Herderian and Hegelian philosophy to advocate the creation of a national unity and a national culture based on folk culture and use of the Finnish language. The greatest accomplishment of the society was the publication of Elias Lönnrot’s compilation of the Finnish folk epic, The Kalevala.

Members of the politicized faction of this Society were known as Fennomen; a group of young academics who held that the Finnish nation ought to be founded on linguistic unity and called for the Swedish-speaking educated class to acknowledge, at least in theory, Finnish as their “real” mother tongue. This line of reasoning culminated in the writings beginning in the 1840s of Johan Wilhelm Snellman, a follower of Hegel. He held that use of Finnish was the natural means of expression of the spiritual unity of the nation and that the existence of two languages in a nation was contrary to the very conception and nature of the nation and thus in itself an absurdity (Snellman 1842; Myhrman 1939, 9). Snellman went on to become the eminent spokesman for Finnish language and history. His followers radicalized the movement further and under the leadership of his former student, Yrjö Koskinen, came to be known as the Young Fennomen.

One of the main responses to the Fennomen was found in their contemporary, Axel Olof Freudenthal, whose Hegelian/Herderian interpretation of Romanticism won over many followers. Freudenthal’s patriotic instincts were directed toward the totality of Sweden and Finland, the entity which had existed as a political reality for 600 years before 1809. At the time when he expressed his ideas (ca. 1860), he was among those who regarded Finland’s reunion with Sweden as a real and highly desirable possibility. In principle the Finnish-speaking population in Finland was a “foreign nation” to him and he called on all Finlandssvensk to support politically, economically, and spiritually their own “nation” within Finland. He stated specifically to the students it was their “duty to work against assimilation by raising the cultural level of this rural Finlandssvensk population and by making it conscious of the fact, that, though politically united with the Finns, it was nevertheless in nationality a branch of the Scandinavians, between whom and the Finns it was to make a connecting link in the future” (Mørne 1927, 54-5).

The attempt to counter Finnish nationalism with a mobilization of the entire Finlandssvensk population, elite and rural, led to the creation of a variety of ethnic-movement organizations. Initially, the Finlandssvensk nationalism
movement had been focused only on the upper, educated classes. The leaders were in the power position and did not have to reach out to the masses to bolster their support and standing.

The Freudenthalian group, the Scandinavians, was more and more comprised of not the aristocratic and upper class families, but of Finlandssvensk university students from the small town bourgeoisie and even some peasantry (Mörne 1927, 225). Like-minded members of the upper classes were not circumvented for long however, as their interest in the university students’ publications on the geography, history and ethnography of the Swedish-speaking countryside was peaked. With the support of the aristocracy and well-to-do, the university students were able to publish many albums, calendars and pamphlets on the Finlandssvensk culture (Nationalitet och Bildning 1887; Magnusson 1893, Om Folkhöskolan 1891). In addition, popular lectures were held and public libraries were opened throughout the rural areas.

To understand the import of university student activism in Finland, the political structure of the student nation must be clarified. From 1640 until the beginning of the twentieth century, Finland had only one university, Åbo Akademi, which was moved to the new capital, Helsinki, and renamed the Imperial Alexander University in 1828, after a fire destroyed nearly all of the city of Åbo (Klinge 1989). Because of its singularity the university was the hotbed for all political movements and parties within Finland, whether they were Fennomanist or Freudenthalian. The student nation at the University of Helsinki was extremely powerful and the alliances established there continued into the formal political life of the country. University students from each province had their own group, from which representatives were elected to serve in the central Student Nation. The groups were segregated according to language and generally dominated by one of the political sentiments of the time (Klinge 1978). The Finlandssvensk provincial nations fostered folk education and a nationalistic agenda rooted in the concepts of mother tongue and fatherland. The students volunteered their time to provide classes and lectures on Finlandssvensk heritage and history, folk music, dance, and crafts, as well as raised money for public libraries, and eventually folk highschools, in their home provinces.

The first mention of Finnish folk highschools was made by Yrjö Koskinen in the Aftonbladet article entitled “Om Bondehögskolor” (On Rural Highschools), but it was in 1868 in the newspaper Folkvännan that Wilhelm Greber wrote a more detailed five-article series on the possibility of folk highschools in Finland (Selén 1989, 9). During the 1870s and 1880s writings appeared periodically in Finnish newspapers and periodicals debating the merits of the schools after the opening of the first folk highschool in Sweden in 1868 (Helsingfors Dagbladet, 19 October 1888; Helsingfors Dagbladet, 26 October 1888; Hufvudstadsbladet, 31 August 1889). The first Finnish folk highschool was established in the Grundtvigian tradition at Kangasola by Sofia Hagman in 1889. In reaction to the Finnish rural population becoming politicized through folk education and to increasingly oppressive measures from Russia, the Finlandssvensk intensified their efforts to uphold the Swedish language and culture. Though politically and economically powerful, the Finlandssvensk urban intelligentsia realized that even more must be done within the rural population to solidify their political base and preserve the integrity of their ethnic / linguistic group.

The Finlandssvensk university students from the province of Nyland held lotteries, secured funds, and served as the initial leadership for one of the first Finlandssvensk folk highschools, Finns Folk Highschool (initially called Mellersta Nylands Folk Highschool), established in 1891 (Fallen 1985, 11-13). One day after Finns’ establishment, Kronoby Folk Highschool was opened as a result of the work of university students from the province of Vasa, the “Young Vikings,” and the local Östrobotnian Youth Movement.

The first Finlandssvensk folk highschool, Borga, was established in 1889 by J.E. Strömberg. He had been dedicated for years to the formation of Swedish-speaking folk schools for children and other projects such as public libraries. He assembled eleven men from the town who had worked with him on other projects and formed the Board of Directors of the school; these individuals also provided the initial funding (Selén 1989,11-14). The aim of the folk highschools was to advance Finlandssvensk culture and civic education in rural areas and to create a desire in the students to be Swedish in mind and language. They sought to prevent language shift to Finnish, increase ethnic awareness among the rural population, and provide a base for political participation and activism. The schools achieved this through courses on Finlandssvensk culture and history, Swedish language and literature, and participatory political systems. Just as important, if not more so, were the out-of-class experiences.
such as discussion meetings on political and social issues, student council meetings, folk choirs and dance groups. Robert Rostedt, the first headmaster of Finns Folk Highschool, outlined goals for Finnish folk highschools in a speech at a folk benefit for Finns in 1891. He stated that young people at the schools should first learn their mother tongue, so that it, in thought and feeling, is natural and through which a connection develops among them. This connection then forms the essence of the community. On the same note, they learn to speak and write clearly about what they think and know, as well as become familiar with the wisdom available to them through their folk heritage (Rostedt 1891). The initial mission statements for Kronoby and Borgå Folk Highschools in part state that the purpose of those schools was to promote a higher peasant education and work toward, through appropriate instruction, refinement of feelings and reason as well as retain useful, practical knowledge and skill (Program för Folkhögskolan i Kronoby 1892, Program för Folkhögskolan i Borgå 1894).

In many respects the early Finlandssvensk folk highschools appear similar to the Danish and Finnish schools of their day, but it would be wrong to equate them in every aspect. Most importantly, the Finlandssvensk were not attempting to establish the respectability of their culture and language; in fact, their superiority was seldom questioned among the intelligentsia. Though threatened by certain political elements within the country and without, they were acting from a position of power and prestige, unlike their Finnish-speaking cousins and Danish neighbors. Had it not been for the growth of the Finnish nationalistic movement, there is doubt as to whether the Finlandssvensk would have been compelled by Romantic ideals alone to reach out to their rural population.

How the Finlandssvensk folk highschools evolved through the turn of the century and after Finnish independence may very well shed further light on their distinguishing characteristics which set them apart from the Finnish schools. An in-depth study of the Finlandssvensk folk highschools after the establishment of a Finnish state, based on the knowledge gleaned from this examination of their historical development, could lead to important insights on the viability of ethnic, nationalistic adult education over time.

Endnotes

1 Throughout this essay folkhögskola will be translated as folk highschool in order to distinguish its meaning from the "high school" for adolescents. Some authors utilize the translation "folk college" but this is misleading in that the schools are not colleges in the American sense.

2 In the macrocosmic sense: "A Volck is a natural division of the human race, a community sui generis, endowed with its own language by means of which it became aware not only of its own existence but also of that which differentiated it from the rest of humanity. It is the most natural and organic basis for political association. A Volck's language was not something detachable, for Herder saw it as the embodiment of a Volck's inner being, its inner Kraft, without which it ceased to exist." (Barnard 1965, 57, 118, 142)
In the microcosmic sense: "The Volk are associated with the Bürger, whose occupations figure predominately in folksong: the farmer, fisherman, craftsman and artisan, small trader; all those who Herder feels are least affected by the influence of
“civilization” and, accordingly, embody most truly the original *Volk* characteristics of the nation: spontaneity, ‘earthiness,’ and Naturverbundenheit, a kind of naturalness and simplicity found in children.” (Ibid., 74)

3 *Bildung*, a main function of the State, has no real equivalent in English. In the sense Herder uses it, it is best rendered as conscious human development. It is a process of education in the widest sense in which the individual becomes aware of his relationship to his environment and of what he can receive from, or add to, the cultural heritage that is transmitted to him. (Barnard 1965, 78, 131)

4 The aristocracy was to be made up of scholars and professional educators who were “of the people” but not “from the people,” who would willingly relinquish power when they were no longer necessary. At that point, Herder foresaw a situation of Humanität, a world of “organic” nation-states, in which political government was replaced by centrally uncoordinated autonomous *ad hoc* institutions.

5 Grundtvig’s main essays on his educational ideas were the “Danish Four Leaf Clover” (1836), the “School for Life and the Academy at Soro” (1838) – especially Part One, “The School for Life”, and the “Introduction to Nordic Mythology” (1832), which contains a chapter on Universal Historical Learning which may be described as Grundtvig’s manifesto on culture and education. His series of 51 lectures at Copenhagen University in 1838, “Within Living Memory,” each drew from 300 to 600 people, and spoke to his view of current history as well as education. These were not published until after his death.

6 A traditional folk highschool assembly is the *morgensamling*, a morning gathering at which students and faculty sing songs from the folk highschool songbook (many by Grundtvig), hear a brief motivational presentation (usually by a student), and discuss the day’s schedule and cooperative tasks.

7 Grundtvig’s ideas have been compared to those of Dewey in both Opstein’s and Pitkin’s chapters in *Grundtvig’s Ideas in North America* (1983). He is also compared to Marx, Illich and Freire in various chapters of *Grundtvig och Folkupplysningen* (Grundtvig and Folk Enlightenment) (1978).

8 *The Kalevala* (1835) helped establish standardized, modern Finnish. Lönnrot traveled the countryside as a rural physician and collected folk stories, from which he constructed a new and ordered mythology to record the ancient history of the Finns. *The Kalevala* was pivotal because it established the Finnish people along with the Finnish language as something that had a long, glorious past: a past which could be used to bolster support for an independent state. *The Kalevala* empowered the Finns by allowing them to read about their own heroes in their native tongue. (DuBois 1995; Collinder 1964)

9 All folk highschools in Finland, both Finnish and Swedish-language, were of the Grundtvigian type until 1907, when the first revivalist Christian folk highschool was established. These were slow to spread in Finland, only two were founded in the following ten years. (Larson 1970, 140)

10 The Youth Organizations were made up of the young people within a province or smaller area who were younger than university age or not necessarily attending the University (although some leadership within the Student Nations and Youth Organizations overlapped.) The first *Finlandssvensk* organizations were established in 1888, one in Östrobotnia and the other in Åboland. The numbers grew provincially until a national organization was formed, the *Finlands Svenska Ungdomsförbund* (Finland Swede Youth Organization.) The societies sponsored lectures, discussions, amateur theater, concerts, choirs, folk dancing, and sporting events, as well as supported local historical and ethnographic studies, local museums, and folk highschools. (*Ungdomsrörelsen i Svenska Nyland 1889-1914* 1915, *Ungdomsrörelsen i Svenska Österbotten: 75 År 1963, and Finlands Svenska Ungdomsförbund Historik och Statistik 1912*)
Historical Portraiture: The Artistic and Spiritual Legacies of Kathe Kollwitz and Evelyn Underhill

Rita E. Guare
Fordham University

I am the woman dancing the world alive:
Can you not see the roundness of me:
Curve of the earth
Maternal arms of the sea
Encircling you wetly as you swim?
I am the birthing woman
Kneeling by the river
Heaving, pushing forth a sacred body
Not mud, not stone: flesh and blood
I am a God of a thousand names:
Why cannot one of them be
Woman Singing?
— Catherine De Vinck

Historically, women have probed the fabric of their lives searching for spiritual meaning. With persistence, compassion, and the intuitive sense that the search itself is worthwhile, many women have traveled the routes to interior landscapes, the unseen borderland of their souls. Often such journeys begin deep in the drama of ordinary life, the familiar terrain of women’s lives. There, amidst the cultural, social, and political forces distinctive of each historical period, women have witnessed with extraordinary power and beauty to the music of Wisdom sounding through the ages.

The poet Catherine De Vinck celebrates this Wisdom in “The Womanly Song of God.” With feminine imagery, she describes this wisdom “dancing the world alive,” a fluid and embracing reality that seeks expression in birthing women “heaving, pushing forth” sacred lives of flesh and blood. Through the generous acts of their love and their work, women have enlarged our sense of the spiritual as that underground source of all cultures and as a generative force in history. All too often, however, this steady stream of Wisdom is shadowed and silenced. To uncover the hidden life, the sacred recesses beneath the surface of things, and to catch a glimpse of the paradoxes and the promises that dwell in the depths of Mystery, we need to explore the full adventure of women’s lives. This paper is an historical portraiture of two women’s full engagement with the mystery of life.

First, let me suggest the critical lens through which my eyes tried to capture the historical portraits of Kathe Kollwitz and Evelyn Underhill. In The Great School Legend: A Revisionist Interpretation of American Public Education, Colin Green described historiography from “E.P. Cubberly to Lawrence Cremin, from 1900-1965” as “filiopietist, parochial and narrowly institutional” (Greer 1972, 38). He challenged the history of education to uncover the conservatism of schooling hidden in the promises of the American dream. In dismantling the myths of the one best system, Greer called for a revisionist telling of the history of education. Such an historical account would be faithful in describing the actual practices of schooling and not the rhetoric of its advocates. Greer called for a more inclusive telling of the history of education, one that heard the voices and recognized the visions of all those that the school failed to honor. Building on Greer’s argument, and challenging the “narrowly institutional” focus of the history of education, I want to honor the voices and visions of two women, Kathe Kollwitz and Evelyn Underhill, who worked outside the boundaries of traditional schooling but who contributed in deeds to the full enterprise of education.

In developing the unique angles of these portraits, I am mindful of Bernard Bailyn’s analysis that women’s history has not been drawn into the general history as a full partner (Bailyn 1994). Rather, it still remains parochial and polemic emerging as an argument and not as a natural part of the wider story. According to Gerder Lerner, however, women have always been in the majority and need their own history (Lerner, 1975). What can historians do then to change history as it is written? First, historians must overcome the traditional neglect of male historians in documenting women’s history and appreciate women as cultural and spiritual forces acting throughout history.
According to Lerner, the freedom to chronicle women's history depends on breaking the traditional links to women as only child-hearing and child-rearing. In order to write history anew, we need to recognize that women's culturally determined roles and psychologically patterned responses seem to be what makes women's historical experiences different from that of men (Lerner 1978).

Today, historians are developing a more heightened awareness of gender differences (Anderson and Zinsser 1988; Lerner 1975, 1986). They acknowledge that the interpreted record of the past is only a partial record. Omissions and distortions in telling the story from the male perspective, as the one best viewpoint, have rendered the record incomplete. Those committed to a more generous telling of the story with multiple meanings and perspectives, and those dedicated to a broader vision of what constitutes the history of education are giving rise to a new consciousness. This new consciousness celebrates women's place in educating communities in schools and beyond the borders of traditional schooling.

When I was preparing the canvas and deciding upon the background colors for the portraits, the work of Bonnie Anderson and Judith Zinsser informed my vision. In the introduction to A History of Their Own: Women in Europe from Prehistory to the Present, Anderson and Zinsser describe a method of organization that looks at "place" and "function" in order to write a history that includes women and their interests by definition (Anderson and Zinsser 1988, XV). Like Lerner, these authors question the forcing of women's lives into male categories and experiences which usually result in their disappearance from history altogether. To redeem the invisibility of Kollwitz and Underhill from the historical record and "to counter the subtly denigrating myth that women either 'have no history' or have achieved little worthy of inclusion in the historical record", I attempt to make visible through portraiture the artistic and spiritual lives of these two women (Anderson and Zinsser 1988, XI).

At one of the darkest times in history, Kollwitz and Underhill educated human communities in the root sense of "leading out" those artistic and spiritual impulses in the human soul. To tell their stories is to place their visions and their voices at the center of the canvas and make sense of their experiences. It is telling the stories as "if it were seen through the eyes of women and ordered by values they define" (Lerner 1979, 168). It is reconceptualizing history (Greer 1972).

Portraiture is a powerful way to witness to Kathe Kollwitz and Evelyn Underhill, birthing women heaving, pushing forth life, laboring at the borderland of their souls. In selecting portraiture as the process of inquiry for this historical project, Sara Lawrence-Lightfoot and Jessica Davis became my mentors informing my perspective and guiding my hand (1997). When I was first drawn into the lives of Kathe Kollwitz and Evelyn Underhill, I knew that portraiture was a way to illuminate their lives and "capture the richness, complexity, and dimensionality of their human experience in social and cultural contexts (1997, 3). I was eager to combine in my research efforts "systematic, empirical descriptions with aesthetic expression, blending art and science, humanistic sensibilities and scientific rigor " (Lawrence-Lightfoot and Davis 1997, 3).

In order to begin this work, I had to see myself as a portraitist who would be dialoguing with her subjects as they negotiated the boundaries of their worlds. I had to understand that I would be participating with each woman in drawing the image of her life. And, finally, with great surprise, I had to discover that the portraits were not simply mirror images of Kathe Kollwitz and Evelyn Underhill. Rather, I came to appreciate that I was involved in and with a process of rendering visible some essence unique to each woman.

Kathe Kollwitz (1867-1945), the German painter, sculptor and printmaker, dared to tell the truth about her life. That truth unconcealed through the legacy of her art has created clearings and open spaces for the wounds of war to be seen an, in some cases, healed. Tears and grief are no strangers to those who are familiar with her work and find in her art burning outrage and penetrating forgiveness. An outspoken critic of violence and war, Kollwitz so threatened the Third Reich that much of her work was burned. Yet, enough of Kollwitz's work remains to offer us one woman's courageous vision of protest, a prophet's resistance, against the dominant imperial culture of her world.

A dominant culture is one that refuses to see the pain and to hear the cries of the dispossessed and uses religion as an opiate so that no one discerns the misery alive in the heart of the Creator (Brueggimann 1978). To form a new consciousness, the social political imagination of the prophet must be at work cutting through the numbness and self-deception of people immersed in privileged and oppressive structures. Embodied in Kathe Kollwitz's art is the radical work of a prophet dismantling the dominant culture of pre-war Germany. To accomplish this work of
unsettling a world that feeds on the suffering of others, Kollwitz offered symbols of poverty, conspiracy and death that spoke to the horror that was evoking numbness and denial. Kollwitz sketched poor working women, showed women as revolutionaries in her series on the Peasant’s War, and used forceful images of mothers and children to embody her pacifist spirit. “Black Anna” in the fifth drawing of her series on the Peasant’s War is the embodiment of outrage (Kollwitz 1969, 19). One can imagine that Anna holds in her strong clenched fists the untold story of women during the war.

In her work, Kollwitz reactivates symbols for redemptive honesty. This, too, is the work of the prophet. Her charcoal representation of “The Visitation” comes to mind as a profoundly simple yet powerful encounter of two women daring to break the silence of mystery in a culture that would never understand a woman’s protective custody of seed, of life in its greatest possibility (Kollwitz 1969, 51). More typically, however, Kollwitz offers children as symbols hungering for a world without war. “Seed Corn Must Not Be Ground” is the haunting image of one mother’s painful effort to shelter the children from the horrifying shells of mortar (Kollwitz 1969, 64).

Dismantling a dominant culture involves bringing to public expression those very fears and terrors that have been denied so long that we have forgotten they are there. Kollwitz’s drawings of war-torn lives graphically open us to the needless violence of “man’s” inhumanity. The most moving indictment against war is the statue of the “Grieving Parents” at the German military cemetery in Vladslo (Kollwitz 1992, 182). Through these images, we participate in the passion of God, the divine pathos, and through it, we meet the mourning of God poured out in human faces and huddled figures.

Kollwitz is concrete about the real deathliness that hovered over her life and her world. As an artist and prophet, she invites us to experience what was all around her—poverty, violence, and death. A thread of suffering and anguish runs through all his work. Perhaps, however, the most poignant of her prints is “Woman Welcoming Death” (Kollwitz 1969, 67). What we see here is an utterly tender and gentle reminder of that experience which touches all our lives. It is a prophet’s picture, one inviting us, as all her work so powerfully does, to relationship. Yes, even our relationship with death. It is this uncanny quality of intimate and profound relationships that makes her art so compelling. As I dialogued with Kathe Kollwitz through this portraiture and participated with her in creating an image, I am aware that it was her own deeply-lined face, her self-portrait that drew me into her life (Kollwitz 1969, 40). It was as though her charcoal pencil found and uncovered a bond of communion with me. For this alone, I the portraitist, am in her debt.

Across the continent, working in a quieter but no less prophetic way was a contemporary of Kathe Kollwitz. Evelyn Underhill (1875–1941) was born in England and knew from a very early age that she wanted to be an author. In 1902, The Grey World was published. We find in this novel not only autobiographical hints but the theme that would possess her life, the quest for the Infinite. Willie, the main character of the novel, is a reincarnated English boy who struggles to live between two worlds, at the same time, that he searches for what is real. That search for authenticity resonates truth only when he discovers beauty. “It is after all the visual side of goodness” (Underhill 1902, 332). The connection between beauty and transcendence is made all the more clear to him when the woman he meets in the woods tells him: “You must love everything, don’t you see, because every thing in the whole world is being offered to you as a symbol of an adorable idea that is beyond” (Underhill 1902, 336).

What Willie discovered in The Grey World, Evelyn would learn throughout her entire life, namely that, everything in the world is lovable and holy. In essence, everything is a sacrament of the infinite and the entire landscape of life brims with that deeper Reality.

Evelyn Underhill spent her life living in that “landscape so rich and great that no one person can explore, apprehend, still less live in all of it” (Underhill 1927, 195). Evelyn’s access to that world came through the poets who she believed, see right to the marrow of the bone and through the mystics who see beyond the shadows of our lives to a more loving Reality. Like the poets and the mystics, her vocation in life was to make visible our deep connection to the sacred. Such work involved her in mediating "a range of reality and beauty to which the common eye is blind" and in offering us "an inkling of... other reaches of reality and beauty" (Underhill, 1925, 224).

While her early work was informed by the great mystics who always searched beyond this world for their true homeland, Evelyn’s later work was penetrated by the awareness that in the ordinary affairs of one’s life the ways of the spirit can be learned. Listen as she speaks about her own experience:
The first thing I found out was exalted and indescribable beauty in the most squalid places. I still remember walking down Notting Hill main road and observing the (extremely sordid) landscape with joy and astonishment. Even, the movement of the traffic had something universal and sublime in it. Of course, that does not last! But the after flavour of it does and now and then one catches it again (Underhill).

Preparing to Serve: Educational Development at the National Training School, 1920-1950

The National Training School for Women and Girls, Incorporated was founded in Washington, DC in 1909. Its founder, Dr. Nannie Helen Burroughs, is most known for her oratorical skills and her sixty-one years of work with the National Baptist Convention. However, her most profound contribution to American history was her dedication and contributions to the education of African American women and girls.

This paper seeks to examine how the women and girls at the National Training School were educated. In doing so, the school’s curriculum as well as student and teacher expectations will be discussed. A history of the National Training School (often referred to as “God’s School on the Hill”) naturally focuses on Burroughs. After all, she founded the school and served as president for fifty-two years. Yet, there were other important lives on the hill that have been virtually omitted in studies of the school. These individuals shared Burroughs’ strong belief in God, worked hard, raised money for the school and helped the school to earn and maintain a good reputation. Even with a phenomenal leader such as Burroughs, the institution did not grow to be successful without good teachers and students. Although little is known about Burroughs, considerably less is known about the lives of the teachers and students. However, there is enough information to develop a sketch of what the lives of the teachers and students were like as they taught and matriculated at the school on the hill.

On October 19, 1909, Dr. Nannie Helen Burroughs opened the National Training School for Women and Girls, Incorporated in Washington, DC. The school opened with Nannie Helen Burroughs as President, five assistants and eight students. In order to attend the school, young ladies had to be at least fifteen years old and have completed the sixth grade. Its object was to "establish and maintain institutions of learning for women and girls, in which special attention is to be given to formation of industrial habits and Christian character" (Burroughs Papers, Box 310). Burroughs decided on a trade school "Because specialized training meets the definite requirements in the world of today. It gives the graduate special advantage over those who have only a general education. It is less difficult for her to secure employment and make advancement in her field. It develops job security" (Burroughs Papers, Box 310). The school would open the first Wednesday in October and close the first Friday in June.

It was important to Burroughs that African American girls were cared for and properly trained. She did not believe that they should be left unattended. Yet, she did understand that some mothers had to work all day and had no other option but to leave their daughters at home. Still, Burroughs pleaded with parents not to leave their girls alone while working. She felt that "Our race will be morally bankrupt if parents do not put first things first in the care and protection of their daughters" (Burroughs Papers, Box 310). She went on to remark that parents should send their daughters to "the best Christian boarding schools" for their protection and the training that they needed for productive futures.

It was Burroughs' belief that the majority of African American women made their living in the area of service. It was her opinion that the specific need was in the area of domestics for well-trained "servants." The young ladies in her domestic science program received practical experience along with book knowledge. They served in some of the most affluent white homes in the Washington area. She wanted "to professionalize domestic science and to redefine the work identities of Black women as skilled workers rather than incompetent menials" (Higginbotham 1993, 204). In her words, "Since we must serve, let us serve well, and retain the places we have long held in the best homes in the land" (Burroughs Papers, Box 303).

The women who entered the domestic science program learned far more than just how to clean a home and provide other needed services for their employers. In a general sense, Burroughs training African American women in domestics and other industrial areas was keeping in line with current trends. However, the difference was that Burroughs also stressed educating the head along with the hand. The women graduating from her school were highly trained and qualified to take any job in their field. A woman in the domestic science program was also introduced to higher level math, history, a foreign language, and many other subjects that may not have been considered "needed" for domestics.

Burroughs taught the young women who attended her school skills that would enable them to earn a living. One of the reasons some men (specifically those in religious circles) gave for not supporting the school was that the
Preparing to Serve
Taylor

young ladies were being trained to be “breadwinners” (Easter 1992, 121). Traditionally, and not just in the African American community, this is the man’s role. Another criticism of the domestic training program was that Dr. Burroughs was training the young ladies to be servants. It was stated in an editorial that “Nannie Burroughs does not prepare girls for servants, but for service. . . Nannie Burroughs secures a discipline and a morale which our public schools cannot begin to imitate or rival” (Burroughs Papers, Box 318). The women and girls who attended this school were trained to do the ‘essential’ things in life.

While many criticized Burroughs saying that she only trained girls to be servants, a closer look at the school reflects something totally different. Burroughs and her teachers trained their pupils to be self sufficient and productive members of their communities. The students were trained to effectively work in the school, in the home, in the church, in business, and in their communities among other places. Although Burroughs was considered the female Booker T. Washington, she blended industrial education with classical training to develop well-educated and well-rounded students. Even the young ladies who were in the trades (plain sewing, dressmaking and tailoring, millinery, printing, beauty culture, gardening and laundering) had to successfully pass the classical component of the curriculum. In Burroughs words, "We are looking for girls of the finest character. This is a select school. There is such a great need for young women of talent and leadership ability, who really want to let their lights shine in this 'confused' world, that we have highly resolved to find and train leaders" (Burroughs Papers, Box 310).

The school’s academic program expanded gradually to offer junior high courses initially, then by 1929, junior college courses mixed with those for trades and professions. At the junior college level, such courses as leadership of girls’ activities, Philosophy I, the History of Education, Expression II, English, English grammar, and English composition were offered (Burroughs Papers, Box 310). There were extra curricula activities at the school such as basketball and interest clubs. Such activities and clubs were formed to develop leadership skills. It was Burroughs' opinion that she developed the school curriculum in conjunction with the needs of her people. As Burroughs stated in one of her informational circulars, "We keep in close touch with the masses, study their condition and needs, and shape our curriculum to meet the actual needs of the race" (Burroughs Papers, Box 310).

Burroughs' teachers were college graduates who were upstanding, hard working, Christian citizens. She sought only the best for her school. "Teachers were selected on the basis of Christian character- professional fitness-definite interest in the growth and development of the students, fineness of spirit and excellence in good social behavior” (Burroughs Papers, Box 310). The teachers seemed to agree with Burroughs’ tactics and did their job in upholding school rules and keeping the students in line. Their mission was to develop fine Christian women and send them out into the world to be of service in their communities. Burroughs wanted her teachers to have the same zeal for the development of character and zest for the training of Christian workers that she possessed. As she once told her teachers, "I have put much into this CAUSE and I haven’t put it in for Nannie H. Burroughs, but for my Lord and Savior who wants womanhood glorified and as Christian women, I want you to catch the spirit of this thing. Put your heart in it. Understand everything about it" (Burroughs Papers, Box 46).

Carter G. Woodson was a friend to Burroughs and supported her efforts both in word and deed. He felt that morality was taught at the National Training School. Both Woodson and Burroughs had their own ideas of what it was to be “morally estute.” For Burroughs, morality was based both on her own personal principals of and ideas about morality and on her Christian beliefs and assumptions. It seems that many students weren’t necessarily immoral, but lacked qualities which may have been considered highly immoral by Burroughs’ or Woodson’s standards. To them, anyone who was a smoker, drinker, user of foul language, or exhibited any type of deviant behavior was immoral. This went for students and teachers alike.

It was important that Burroughs teachers were also of the highest moral standing because many working parents sent their daughters to the National Training School for refined training, growth and protection. Some of the parents worked all day and had no one to look after their daughters and a boarding school met their needs.

These students come from the homes of the hard-working people- from that of the widow or widower with a daughter requiring protection while the breadwinner is away at work, from that of the parent who is seriously concerned about the development of character in the child, from that of the religious person who wants to see his child taught the principles of Christianity by the examples of the teachers who do not spend their leisure smoking, drinking, petting, or playing poker (Burroughs Papers, Box
Burroughs aimed to promote an "atmosphere conducive to the development of real Christian Womanhood."

Interwoven in the standards Burroughs held for students and teachers were the moral and ethical standards, which she forced them to conform to. She dealt, directly and indirectly, with issues of respectability. She told them, both teachers and students, how they should present themselves. Burroughs was very serious about image and ethics. African American women in general, and African American religious women specifically held themselves up to very high standards. For them, it was important to be a lady at all times and not to carry ones self in any way that would allow others to think otherwise. African American teachers, churchwomen and clubwomen epitomized this true womanhood.

African American women had a great deal to stand up against when it came to issues of feminine nature and womanhood. Many (specifically whites) refused to look at them or any one in their race as human so it would be almost impossible for people holding such views to see African American females as women. "... black women were not perceived as women in the same sense as women in the larger (i.e., white) society. The emphasis upon women's purity, submissiveness and natural fragility was the antithesis of the reality of most black women's lives during slavery and for many years thereafter" (Perkins 1983, 18). This is all the more reason to stress finer womanhood. Not just at Burroughs school, but in the African American community and beyond. Black women were able to develop their own standards of womanhood and hold each other to them. Burroughs instilled this in her students.

A large part of Burroughs' curriculum revolved around religious education. Two examples of this in the curriculum are Bible-Missionary Education and advanced religious education. "Any young woman with a good English education, sound health and strength enough for the labor and strain of her calling, can take up this work....Each applicant will be expected to be recommended by her pastor, or some other reliable Christian worker or organization known to the faculty" (Burroughs Papers, Box 310).

In the Bible section, the women would learn the first five books of the Old Testament and the first four books of the New Testament. In Missionary education, they would learn the importance of missions in the Christian faith. They would also need to be well versed in Latin and English. The Missionary Training Department was only open to women over eighteen who felt God had called them to "engage in special Christian work." Some of their other mandatory courses were Old Testament interpretation, Biblical Theology, Methods of Bible Study, Exegesis of the Epistles, and Christian Evidence (Burroughs Papers, Box 310).

In the Missionary Training and Social Science Department, there were three years of training for church, city, home and foreign missions. This program prepared the participants for positions as pastor's assistants and as settlement workers. Those in missionary training had to take elementary nursing to prepare them for emergency cases and to enable them to be helpful to the poor. Applicants for this program, as with others had to be recommended by their pastor or "some other reliable Christian worker or organization known to the faculty" (Burroughs Papers, Box 310).

As well as receiving domestic and missionary training, the students were also receiving a liberal arts education. Burroughs stressed Black history, culture, and Black pride. Her school had a department of Black history and required every student to take a Black history course and to pass both oral and written exams on the subject (McCluskey 1989, 9). In many instances, Burroughs' ideas sound very much like the thoughts of her colleague, Carter G. Woodson. Woodson criticized institutions for not teaching African American history. Burroughs did what Woodson felt African American institutions should be doing. As Woodson states, "In our schools, and especially in schools of religion, attention should be given to the study of the Negro as he developed during the ante-bellum period by showing to what extent that remote culture was determined by ideas which the Negro brought with him from Africa (Woodson 1990, 147).

Nannie Burroughs was a lifetime member of the Association for the Study of Negro Life and History (ASNLH), now called the Association for the Study of African American Life and History. This dimension of her curriculum was consistent with the work and ideas of ASNLH. In Burroughs' opinion, it was important for the attendees to know and be proficient in their own history. Knowledge of self was critical. The students came to look forward to the oral exams. They used this as a time to show everyone what they had learned about their own history and culture. Racial pride was evident at the National Trade and Professional School for Women and Girls,
Burroughs was named the "Female Booker T. Washington," however, she believed in the educational philosophies of both Washington and DuBois. Her curriculum reflected that philosophy. In looking at the curriculum, it seems that Burroughs was preparing the young women for much more than domestic work and missionary services. Her belief was that trades could not be taught without an academic background. Burroughs stated, "This is a trade school, but we can't teach a trade without giving an academic background. . . therefore, for that purpose only, do we offer the literary subjects that we have in order to round out the necessary qualifications for useful citizenship" (Burroughs Papers, Box 310). The curriculum included classes such as English, Latin, psychology, and French, as well as U.S. history, science, typing, bookkeeping, business arithmetic, shorthand, sociology and world history, geography, and sewing (Burroughs Papers, Box 311). As stated by Mattie Robinson, once the head mistress at the current school, "Burroughs believed that academics and spirituality went hand in hand" (Washington Post 1992, B-1). The students at the National Training School were taught to love knowledge, themselves and their race, and above all, God.

At the high school level, several subjects were required per year. A total of thirty-four units were required. The first year the students took English, speech, spelling, penmanship, and read a classic novel. The second year there was speech, composition and Rhetoric, spelling, and penmanship. Classes taken in the third year were composition and rhetoric, American literature, spelling, and penmanship. The fourth year's course load consisted of speech, English literature, spelling, and penmanship. In the third and fourth year classics classes, the students reviewed American and English literature as well as modern prose and poetry (Burroughs Papers, Box 310). High school students also took word analysis and algebra along with other higher level math and sciences. At the junior college level African-American history and Finer Womanhood were taught. In the Finer Womanhood class, topics such as homemaking, courtship, and marriage were discussed (Burroughs Papers, Box 311).

There was also a foreign language component to the curriculum. Four years of both Latin and French were offered. These subjects were taken as part of the general or academic, commercial, home economic, and trade course requirements. Three units of foreign language were required, but a student would be allowed to take up to six. Both the Latin and French teachers had A.B. degrees. One had also gone to graduate school. These teachers were certainly skilled enough to have their positions. Each of them had studied two to three languages other than English. Another one of the languages studied by them (including French and Latin) was Greek (Burroughs Papers, Box 311).

The school held an institute for personal development for the students. Different teachers conducted the workshops, speaking on topics that they found important. The workshops were: "The Nature and Meaning of Culture; Courtesies of Everyday Life; Poised Personality—What is it? How to develop it; Poise and Graciousness at the Table; The Art of Studying; Friends—How to Make and Keep Them; A Living Religion; The Art of Gracious Grooming; Standard to Live By; and Boy and Girl Relations" (Burroughs Papers, Box 311). The workshops were to help the students with their everyday living, both as students and after graduation.

To successfully complete each course, students had to pass written exams. In some cases, exams were oral. Oral reports started as early as the seventh grade and continued on through junior college. In most cases, written exams were in essay format. Teachers did not administer "fill in the blank" and multiple choice exams. Students had to prove their understanding of the material covered, and in some instances, be able to defend their positions.

The intense training received at the school worked to the benefit of the students. They graduated and went on to be successful in many different arenas. In his travel, Woodson came across ladies trained at Burroughs school and found them well fit for their jobs. He came in contact with a waitress in a diner, a secretary with a handicap who worked in one of the largest African American owned businesses, and a woman who ran a large "up to date" print shop "very efficiently." Burroughs tried to find jobs for students who earned diplomas. It was her desire that they hold jobs suitable for their training.

Graduates were asked to fill out a "Former Student Questionnaire." This questionnaire requested current mailing information, occupation, a request to join the alumnae association, and recommendations for officers for the Association, students who the graduate kept in touch with, as well as a request for the graduate to recommend a new student to the school. The Questionnaires reflect that graduates of the National Training School for Women and Girls, Incorporated had various occupations. Some of the occupations were: stenographer, departmental secretary, domestic,
Most African American women did not have the luxury of deciding whether or not they would work. Yet, many of them did not have specific training for employment. Between 1895-1925, most African American females were not college or training school graduates. The majority of African American women in the labor force had "menial, unskilled, low paying jobs deemed suitable for women only" (Neverdon-Morton 1989, 68). It was not Burroughs' desire that her graduates had to take certain jobs. She trained them so that they could hold the job of their choice. Even if it was not a traditional female occupation the graduate wanted.

Graduates of this school were employed in nearly every state, and also in such places as Puerto Rico, Haiti, South America, and Africa. These ladies were trained to work, and they left the school and did just that. Some other occupations were, principals, nurses, doctors, civil servants, entrepreneurs, and administrators. Some other graduates were private secretaries, dressmakers, beauty specialists, social workers, insurance agents, cateresses, and milliners (Burroughs Papers, Box 309).

Some students kept in touch after leaving the school. Some wrote about their current experiences or how they had grown as a result of their experience(s) at the school. One of the students, Annie French from West Virginia, replied to a teacher five years after leaving National Training School: "Had I known how green I was 5 years ago, I would have been ashamed to come to any body's school. But thanks to something, I didn't know that I didn't know" (Burroughs Papers, Box 309). It was felt that "A normal girl cannot live in this atmosphere without improving" (Burroughs Papers, Box 309). Della Harris from the Missionary Training Department spent four to five years in Africa and was engaged in church work. Susie Green from Alabama and Christine Jean Francois from Haiti tended a garden while at the school that was very plentiful. Christine returned to Haiti, but kept in touch with the school. Her friend, Susie Green owned a print shop in DC and was an assistant at the YWCA summer camp. Before beginning the National Training School, Green was attending school in Montgomery but could not afford to continue nor could she afford train fair to DC. Burroughs "discovered" her and made a way for her to come to DC. Because she had a "mechanical mind" she was asked about taking printing and did (Burroughs Papers, Box 309).

Nannie Helen Burroughs worked hard and went above and beyond the call of duty to insure that the young ladies who came to her DC school were highly respected, trained to hold good jobs, be productive members of society, and assist their churches and communities however possible.

History and Ideology: Conflicts Between Angie Debo and Muriel Wright

Courtney Vaughn
and
Joan K. Smith
The University of Oklahoma

Well into the twentieth century, professional opportunities for women were severely limited. The history profession was no exception. Although, early in the century graduate schools in various universities across the country, namely Stanford and the University of Chicago, were offering women the Ph.D., it was very difficult if not impossible for graduates to secure faculty positions in university history departments at coeducational and, of course, all-male schools. Even women's colleges and their practice of hiring female faculty members were waning, and with it was the opportunity, some historians have noted, to bond with other women both socially and professionally (Palmieri 1995). Thus, a turn-of-the-century female historian usually was faced with finding alternative employment—conducting research and writing when she could.

During the first half of the twentieth century, Angie Debo and Muriel Wright were two of the only notable female historians in Oklahoma. Both were: born late in the nineteenth century; reared primarily in Oklahoma; committed to Protestantism; and dedicated to the field of history. Moreover, despite Wright's elitist family background, each struggled during her life to make a living in a male dominated profession. Neither married nor bore children, but both left a rich legacy of numerous books, articles, and other writings, primarily in the area of Native studies and the American West. Despite all that Debo and Wright had in common, they were not friends; in fact, they were frequently at odds. Essentially, their social and political ideologies were antithetical, never to be reconciled through the example of their own lives.

Wright was a product of Choctaw and United States history, providing the background for her later academic battle with Debo. Muriel's grandfather, Kililhote, was born in Mississippi in 1826 and came to Indian territory with his parents, when the federal government "removed" all of the Five Tribes (Cherokee, Chickasaw, Creek, Seminole, and Choctaw) from the southeastern United States to Indian Territory, now Oklahoma. Although a full blood Choctaw, Kililhote was orphaned as a child and went to live in the home of Cyrus Kingsbury, a prominent white missionary. Subsequently, he was imbued with Euro-American culture, symbolized by a name change and his conversion to Christianity by well-known Presbyterian Indian Territory missionaries. As Muriel later explained:

Through the influence and preaching of Rev. Gleason, my grandfather, Rev. "Allen Wright," joined the church and was christened with his English name—"Allen Wright," at Wheelock Mission Church soon after its completion in 1846 in the presence of the old missionaries, Cyrus Kingsbury, Cyrus Byington, Alfred Wright C.C. Copeland, and] Ebenezer Hotshkink (Wright 1952).

Allen grew to manhood and graduated from Union College in 1853 and from Union Seminary in New York City two years later. He returned home to Civil War in Indian Territory as the Choctaw Nation sided with the Confederacy. In fact, Boggy Depot, a town Allen helped found, was a headquarters for Southern troops. After the war, in 1866, he served on a Choctaw commission which was forced to accept freed slaves as citizens of their nation with full rights and privileges and a concession of some Choctaw western lands. But, in absentia, he was elected Principal Chief of the Choctaws and would hold two consecutive terms (Wright, 1952).

Allen married white elitism, Harriet Mitchell, a direct descendent of the Mayflower Pilgrim, the Elder William Brewster. The couple's firstborn son and Muriel's father, Eliphalet Nott Wright (1858-1932) graduated from Albany Medical College in New York in 1884. He returned to Boggy Depot and became a surgeon and physician for the Missouri-Pacific Coal Mines. In 1888, E. N., as he was called, also married a white woman, Ida Belle Richards, an Atoka teacher who could trace her New England lineage to families such as: Bassett, Stone, and Sprague (Smith et al. 1998; Wright undated).

In 1894, E. N. was appointed to a delegation that met with the Dawes Commission to dissolve the Indian governments and allot the lands in severalty among the Choctaw citizens. Wright was the only tribal delegate to reject the edict, but another delegation later signed the Atoka Agreement of 1897 which deeded to the United States all tribal lands to be divided equally among its citizens. In 1900 and again in 1930, E. N. vied but did not secure the position
of Principal Chief (Smith et al. 1998). Apparently, he was well thought of by many of the Choctaws, including full
bloods who "...look to Doctor Wright as the one man, among their people, who has the knowledge and the ability, and
the sympathy, too, to help them in their problems" (Thoburn, 1929).

Politically, the Wrights were progressive Republicans, and they were progressives within the Choctaw Nation.
But in the latter case, this political ideology advocated pride in the Choctaw heritage but also assimilation into the
Euro-American power structure in Indian Territory. The Twin Territories became one in 1907; and for decades
Oklahoma was dominated by a political machine that centered in what was called "Little Dixie," a portion of
southeastern Oklahoma (formerly Indian Territory). Ironically, for the Wrights, this machine was dominated by
Democrats (Debo 1961; Roll of Delegates and Alternates to the First National Progressive Convention 1912;

Also a dedicated Republican, Muriel, the eldest of the two daughters, was born in 1889 and grew up in and
outside of Lehigh, near Atoka. It seems that Muriel's childhood was happy, and that she was well loved. When Muriel
was fourteen, her maternal grandfather, Reverend Thomas Marshall penned, "I love [you] so much. I wish the time
was shorter when I am to see you again.... I hope and pray that your life may be long, happy and useful in the pleasant
service of the Master" (Marshall, 1903).

As a young child, Muriel attended "awful" schools, so when the family moved outside of town, Ida tutored her
daughter at home. In 1906, Muriel enrolled at Wheaton Seminary in Norton, Massachusetts. She enjoyed her time
there but was taken back by the liberal attitudes, especially toward African American equality. "The one point that
stood out was... the whole school and teachers were pro Negro," she later recalled (Wright 1973). Muriel graduated
and then came home to complete a teacher education course in 1912 at Talequah's East Central Normal School. While
a student she appeared in a play that in some respects imitated her family heritage. She was an Indian girl, reared by
whites. As a young girl her biological father kidnapped but returned her to the Euro-American world to which she
belonged. A certified Oklahoma teacher, for four years Muriel taught and was a principal in the state's schools (Smith
et al. 1998; Wright, Scrapbooks).

Although East Central had not been a bachelors degree granting institution, in the fall of 1916, Muriel had an
opportunity to enter Barnard College in New York City as a special graduate student but returned to Oklahoma a year
later. She resumed teaching and administering, became serious about publishing historical research, and was a candidate
for principal chief of the Choctaws during the early 1920's (Wright, Scrapbooks). From 1934 to 1943 she became
assistant editor of the Chronicles of Oklahoma, the state historical society's publication, and after the latter year she
held the editor's position until 1973. Moreover, she remained active in her tribe's political and social activities (Wright
1973; Smith et al. 1998).

In a sense Debo and her family represented many of the people whose financially desperate situation had been
part of the dispossessed's persistent interest in Indian Territorial land. In 1890, the year Angie was born, the American
frontier officially closed, and land hungry whites helped government officials reduce Indian Territory to its eastern half
and create Oklahoma Territory out of the western portion. Hoping for a more prosperous life, the Debos (tenant farmers
in Beatie, Kansas) migrated to Oklahoma Territory and settled near Marshall in 1899 ("Indians Outlaws and Angie

Hungry for learning, Debo loved school. She was disappointed that after completing the eighth grade there was
no high school for her to attend.

That was one of the most miserable times of my life. I wanted to accomplish something. Well, I wasn't
even graduating from high school. And then when I was sixteen I started teaching in the rural schools
around Marshall, and from that time on I was very content" (Debo 1989).

When Angie was able to attend high school most of her teachers had only two years of college, but they tried very hard
and as a result "walked in grandeur among us" (Debo 1984). Debo graduated from high school when she was
twenty-three, and after teaching for two more years, enrolled in the University of Oklahoma and received a bachelors

One of Debo's professors, Everett Edward Dale, who had studied at the University of Chicago under the
esteemed Frederick Jackson Turner, encouraged her to attend the University of Chicago where she received her master's degree in 1924. While at Chicago, it was very disconcerting for Debo to learn that although her master's thesis would be published, "the history field was closed and barred to women. There wasn't anything a woman could do to enter it" (Debo 1989). Curious why the Chicago history faculty did employ one woman, Angie sought her out and discovered that she had received her position during war time, as an emergency hire, and it seemed very unlikely that any more women were forthcoming. Debo did manage to secure a position at West Texas State Teachers College in Canyon, Texas and then pursued a doctorate at the University of Oklahoma with Dale (Debo 1984).

Knowing little about Natives, but having majored in international studies at Chicago, as a dissertation topic, Debo proposed to investigate the Choctaw nation's history, before and after white encroachment. She completed her Ph.D., and, in 1934, her dissertation was published as The Rise and Fall of the Choctaw Republic. After her ten year stint at Canyon State College in Texas, she quit to make a living as a writer and moved home to work. From 1947 to 1955, Angie resided in Stillwater, serving as maps librarian at Oklahoma A. & M. College (Debo 1961, 1984; "Indians Outlaws and Angie Debo," 1989; Loughlin 1998).

Common Ground

Hardship was a common denominator in Debo's and Wright's life. As tenant farmers in Kansas and later as small farmers in pioneer Indian Territory and then Depression-era Oklahoma, Debo's family had struggled to make a living. At one time or another, she, her parents, and her brother had worked the fields, and after Debo became an educator, she contributed sporadically to her parents' and brother's financial support (Debo 1984, "Indians, Outlaws and Angie Debo," 1989). Angie's familial loyalty is evident in The Rise and Fall's dedication to her brother who had died young (Debo 1961).

After Debo resigned from Canyon, probably because she had been denied promotion, she wrote And Still the Waters Run (1940). A very controversial work, it charged prominent Oklahoma politicians and others with cheating the Indians out of their land. After completing a chapter Angie would read it to her mother who feared, "no one will ever publish that book" (Debo 1989). Although The University of Oklahoma press initially offered Debo a contract, officials were concerned about potential law suits and eventually declined to honor it. Princeton University Press published the work in 1940, after having removed a few overt references to certain individuals in the text. Debo was then fifty years old (Debo 1984; "Indians Outlaws and Angie Debo," 1989). Forever grateful to her mother for her continued support, Debo (1951) wrote, "Most of all I want to express appreciation to my mother, who remained at home alone at an age when she might have been expected to require the attendance of her only daughter" (iii).

Wright also was adamantly loyal to her family who held a prominent place in Indian Territory and Oklahoma history. By no means inestimably wealthy, her grandparents were able to educate their children well, although not without financial sacrifice. Muriel's father had to leave Union College, because his parents had other children to support. E. N. and Ida did send Muriel to Wheaton and Barnard College, but World War I ended her stay at the latter institution after only one year. By the 1920's, the family's resources were not plentiful. Muriel made a living teaching in and administering Oklahoma public schools and selling her written works. When her father could not co-author a textual history of Oklahoma with local historian, Joseph Thoburn, he suggested Muriel for the job (Smith et al. 1998). Muriel did receive temporary research work at the Oklahoma Historical Society for which she was praised, sometimes in a deliriously racist way. She sardonically penned to her parents that in the presence of Mr. Adair, a Cherokee and a signer for the Historical Society Bill, Judge Baxter Taylor:

was complimentary of my work,...especially remarking upon my ability as a worker. Mr. Adair looked pleasant and jovial during the conversation, then said, 'Well, when you find an Indian that will work, he sure does work! Now ain't that so, Miss Wright' (Wright 1931)?

Muriel's father died in 1932 about the time his daughter lost the Historical Society job (Dwight 1932; McCurtain 1931; Miller 1932). Muriel and her mother moved in with Gertrude, the younger sister, and her family who then lived in Oklahoma City. By 1934 Wright was appointed assistant editor of the Chronicles, but then around the time of her mother's death in 1941 she was again faced with the prospect of unemployment (Application for Employment, 1940; Wilson 1941). Although she had graduated from a normal school and attended Barnard College,
she never received a higher education degree, and by the early 1940's this proved a hardship in receiving good teaching and other professional positions related to her field. In the 1940's she attempted without success to convince what was then Northeastern State College to grant her a degree based on her normal school and Barnard College course work augmented by her numerous publications (Faust 1941; Linscheid 1942). Then in her early fifties, Wright contemplated enrolling in the University of Oklahoma to complete her degree, but in 1944 she was appointed the Chronicles editor (Gittinger 1941; Smith et al. 1998; Wright 1955).

However, academic credentials remained important to her as evidenced in later interviews in which she explained that if she had completed her work at Barnard she would have received both bachelors and master's degrees; when in 1968 Oklahoma City University granted her an honorary doctorate she sometimes used the title Dr. Wright (McRill, 1973; Wright 1985).

Controversy: Familial History and Professional Turf

Debo's book *The Rise and Fall* began the two historians' lifelong conflict. Although not yet personally acquainted with Angie, Debo's work pierced the core of Wright's being. *The Rise and Fall* noted that Allen, Muriel's grandfather, had taken a bribe during the 1866 Washington DC treaty negotiations (Debo 1961). Muriel was incensed. In a scathing critique published in the *Chronicles* (1935), she lightly acknowledged the work's contribution and went on for several pages to delineate errors, such as misinterpretations of key Choctaw words, crucial when speculating about the ancient Choctaw's religious and cultural perceptions. Further, Wright denied that any money her grandfather received for his services to the Choctaw people was a bribe. Angie later commented concerning the review and Muriel's obvious hurt feelings:

> Miss Wright would never have known how shocked and distressed I was when I found out [about her grandfather, but]...I don't know of anyone except Miss Wright and her relations, but perhaps there might have been other Indians like her, who were extremely successful leaders of the white men's society... (Debo, cited in Loughlin 1998, 14).

The *Chronicles* did not review Angie's next work, *And Still the Waters Run*, although major historical journals, such as *The Journal of Southern History* did. Possibly, Wright's editorial decision was influenced by Robert Williams, a former federal judge and head of the Oklahoma Historical Society. His name had appeared in Debo's book as a participant in the fraudulent acts perpetrated against Oklahoma Indians (Debo 1940; Loughlin 1998).

A brief interlude of overt cordiality between the two historians did occur in the 1950s when Angie wrote to Muriel asking if Debo might write a "Necrology" sketch for the *Chronicles* on A. H. Ellis, a member of the state constitutional convention who had recently died (Debo 1950). Muriel responded favorably (Wright 1950). In addition, as a member of the program committee, in November of that year, Debo asked Wright to present a paper concerning the history of higher education in Oklahoma (Debo 1950). Wright responded favorably (Wright 1950).

Yet, in 1951 another *Chronicles* publication delivered caustic remarks concerning Debo's monograph, *The Five civilized Tribes of Oklahoma: Report on Social and Economic Conditions* (1951), a piece of commissioned research for the Indian Rights Association to assess the economic success of Five Tribes Indians. Although the author reported lethargy as she saw it, she also portrayed the economically poor Oklahoma Indians whom she visited as taking pride in their homes, being clean, and taking care of their surroundings. Yet to Muriel and her uncle, James Brooks Wright (J. B.), formerly a government Indian agent, the report focused on the unsuccessful, thereby fueling the all too common image that Indians were depraved and incapable of assimilation into the white world. J. B. (1957) penned:

> It seems that Miss Debo is unfortunate in her use of English words and expressions and this conveys the wrong impressions, in many cases, to the casual reader and these are in the majority. She is also inclined to generalities. A reader might be led to believe that all Indians are placed in the same category (244).

Debo objected to J. B. rather than Muriel writing the critique and countered with a response, later explaining:

> In all my career as a writer I have never replied to a review of one of my books. A reviewer is supposed to be a scholar in his own right, and his judgment is entitled to respect. If he makes a mistake, it is his own reputation that suffers. Thus, if Miss Wright had reviewed my report...
unfavorably, I should have made no objection, because she is a distinguished historical writer who has earned the right to criticize. But this is different. It is simply a letter from an individual correspondent (Debo, cited in Loughlin 1998, 13).

Muriel may not have solicited her uncle's written remarks, but receiving them just as an edition of the Chronicles was being type set, she eagerly squired it into print (Wright 1951). In addition, Muriel and her family had always, at least privately, been critical of "elitist" Oklahoma historians. For instance, Gertrude's son, John Allen Reid, wrote to Muriel, praising the value of her historical writing for the "good" people and not just by [and for] the ivory-tower professors" (Reid, unknown date).

Considering the recent fray, Angie's 1952 review of what was one of Muriel's most significant works, A Guide To Indian Tribes of Oklahoma, published by the University of Oklahoma press, was somewhat charitable, but Debo did restate what was becoming a familiar response. Writing for the New York Times Book Review, Angie wrote:

This is the most useful reference book on Indians that has appeared for many years. Its compass is much more extensive than its title would indicate; for Oklahoma was once an 'Indian Territory' and Indians from all the eastern half of the United States were concentrated there.... Except for some mention of the plight of the Cherokees, however, the book almost ignores the poverty in which many unassimilated Indians live.... This should not obscure the fact that many Oklahomans are successful farmers by any man's standards, but it should have been presented as an essential part of the picture (10).

A final, rather public (at least in historical circles) debate between Wright and Debo evidenced what an outsider might view as the ridiculous ends to which rival historians sometimes go. Each supported by local authorities, Debo and Wright debated the location of the first Civil War Battle in Indian Territory, Round Mountain, beginning on "November 19, 1861 between the Union Creeks and Confederate troops, including a Creek regiment, Choctaw-Chickasaw and Creek-Seminole regiments, and a detachment of Texas cavalry" (Loughlin 1998, 5). Again, Wright considered the Civil War, particularly in Indian Territory, her expertise, while by the early 1960's, when Debo wrote an article defending the Yale site, she was thought of as a noted national frontier historian. The squabble resulted in a stalemate, but the two continued to spar at academic conferences during the 1970s (Loughlin 1998).

Religion and Race

Religious beliefs and race augmented the familial history and professional turf issues explicit in the Wright-Debo feud. Both of Muriel's grandfathers had been ministers, and in a sense, her parents were missionaries. Their and Muriel's goal was to retain pride in the Choctaw heritage while emulating the dominant society's ideals. During the 1920s William Dunn, one of Muriel's Native friends articulated this ethos, in a series of letters, penning:

We have forgiven, but we never can forget [the forced removal to Indian Territory, but]...the grand missionaries who were among the class of 'good White people'...certainly deserve revered recognition in the History of the Indian "...Your grandmother, and others, you know of...did so much to enlighten and elevate the Standard of morality and Christianization of our Choctaw people (Dunn 1927, 1928).

Another Native friend, reiterated the hope that "we may be some enlightenment to our race as well as to ourselves" (Roberson 1928). An active Presbyterian, in 1932 Muriel revealed her own views on Choctaw Christianization, writing to P. D. Miller, Educational Secretary for the Presbyterian Executive Committee of Home Missions:

Doctor Morrison had told me of his work in preparing a book for the study of Indian missions in the Presbyterian Church and I have been looking forward to seeing it in completed form. You asked that Doctor Morrison might have the data in my story on the Choctaws to use in the preparation of his manuscript. This story, to which Mr. Scatargood referred, was written with the idea of interesting the general reader in one of the most tragic chapters in Choctaw history, the circumstances of which, paradoxical though it may be, finally led to some beneficent results for that people.

Debo's religious beliefs manifested themselves socially in a somewhat different direction. She served as a Methodist pastor during World War II in her home town of Marshall, and apparently her convictions were a linchpin of Debo's commitment to civil rights. Her choice to give voice to Indians without social and political power spoke for itself. Debo's stance with regard to African Americans was similar. As Wright, herself, wrote, Angie was:
very religious and critical of anything that has to do with the Confederate history in the Civil War. She is a devout Methodist and served as the *Minister* in the pulpit of her home town (Marshall) during World War II. She 'bends over backward' in favor of Negro racial problems, and evidently follows in the train (I think) of Elinor [sic] Roosevelt (Wright 1952).

A member of the United Daughter’s of the Confederacy, Muriel had problems dealing with racial equality between African Americans and others. Although dated, from a modern perspective, in 1945 she wrote to J. Bartley Milam, Principal Chief of the Cherokee Nation:

Now as Southerners, you know and I know that there are some good, old darkies who do know local lore and some stories about former days whose reminiscences do have a place in history, but recording their accounts, the investigator has to take into consideration the reliability of the individuals giving the information.

A few years later, the state branch of the Oklahoma Pen Women's Association, of which Wright was a prominent member, invited Debo to join. Angie declined because of the association’s exclusion of black writers. As she explained to Wright in 1949, "I object to racial bars in cultural and intellectual organizations."

**Reflections**

Both Muriel and Angie lived long and productive lives; Wright died in 1975 and Debo in 1988. Although each was a dedicated historian, the ideological outcomes of each person’s work contradicted the other. Thus, rather than forming a bond based on feminist and professional interests, they found themselves constantly at odds. Each one’s publications seemed to annihilate the important statements made by the other, jettisoning both into at least one of the significant battles of her life. It is truly a tragedy that given the female centered environment of an institution such as Wellesley, these two historians may have come to recognize the power of their commonalities rather than their differences (Palmieri 1995).

Throughout the nineteenth century, coeducation could mean segregated education for both sexes, segregated education of the sexes in the same college (although the curriculum was not the same), and education of the sexes together. Some of the opposition to the admission of women in state universities could have stemmed from the “Cult of True Womanhood”, where education of women in the early nineteenth century focused on developing homemaker skills for the female role of wife and mother. Included in women’s education was reading of the Bible and other religious materials; which was intended to provide upper and middle-class white women the skills necessary to train their children. These subjects assisted in perpetuating the ideal of true womanhood for a select group of females destined to become the wives of the leaders of the community.

The Civil War era forced women to cross over to traditionally male roles. Women were allowed access to careers during the war because their skills, such as nursing, were in demand. Some became property owners due to the death of their spouse or never married due to the shortage of marriageable men after the Civil War. These women, forced to support themselves because of the social upheaval of the War, became prime candidates for higher education.

Early alternatives to coeducation, such as women’s colleges offered the opportunity to prepare for a career as a teacher, originally the only career available for women besides the role of a missionary’s wife. Over time other career choices for women also emerged in these institutions. Women’s colleges provided a unique experience for their students as they could enjoy and participate socially in ways traditional institutions would not allow. For example, women could hold elective office and participate in theatrical productions and graduation ceremonies.

Coeducational institutions did exist in the early nineteenth century. One of the most notable was Oberlin College which admitted its first female students in 1837. Oberlin offered traditional courses and a special “Ladies’ Course” which offered a diploma upon completion. Most women received their diploma from the Ladies’ Course. In fact, in the first 34 years of coeducation at Oberlin, 395 diplomas from the Ladies’ Course had been granted, while only 84 graduated with a traditional Bachelor’s degree during the same time period (Woody 1966).

Other institutions were also coeducational. Antioch College, under the direction of Horace Mann in 1852, was developed as a coeducational institution different from Oberlin in that it allowed women the opportunity to participate in the same courses as men. Both men and women recited their lessons in the same classrooms, fulfilling Mann’s idea “to secure for the female sex equal opportunities in the same studies, and classes, and by the same instructors, after the manner of many academic institutions in different parts of the country” (Woody 1966). State universities created additional opportunities for coeducation, such as Iowa, which was coeducational from its opening in 1856. In general, however, Western State Universities were the influential leaders of the coeducation movement, though not much importance was attached to it until after 1870, with the admission of women to the University of Michigan.

The debate of women’s education has been described as becoming “what the abolitionist debate was before it and what the suffrage debate would become after it—a large-scale movement, amorphous, with different intellectual strands, involving the energies of many middle-class women and men” (Palmieri 1989). Arguments against coeducation stated that it would reduce a woman’s chance of marriage and result in physical and psychological damage. These arguments were designed to intimidate women by suggesting that attending college threatened their ability to fulfill their role as a “true woman,” which was limited to the roles of wife and mother.

One of the most prominent anti-coeducation theories espoused during the post Civil War era was published by Dr. Edward Clarke of Harvard University, in his 1873 book Sex in Education: A Fair Chance for the Girls. He claimed that the female anatomy could not withstand the rigors of higher education and the result of women’s education would be damage to the female reproductive organs. Proponents of coeducation suspected his book had been inspired by the reluctance of Harvard University to open its doors to women (McGuigan 1970). The doors of coeducation were firmly locked at prominent institutions such as Yale and Harvard for much of the nineteenth century. The University of Michigan became a Western icon for coeducation, but it took over twelve years from the first inquiry before the door was opened.
The first inquiry for female admission to the University of Michigan was presented to the Board of Regents on March 25, 1858. The Board of Regents documented the inquiry as follows: “A communication was received from Miss Sarah E. Burger, stating that a class of twelve young ladies would present themselves for admission as students in the University, in June next. Laid on the table” (University of Michigan 1863). After no reply was received from her initial request, in June of 1858 Miss Burger and two other women, Miss Harriet Patton and Miss Augusta Chapin, sought admission to the University. The following minutes were recorded on June 24, 1858: “A report was received from Regent Parsons, Chairman of the Committee, on the admission of Miss Burger and other ladies to the University. On motion of Regent Bishop the report was accepted and the Committee discharged” (University of Michigan 1863).

On September 29, 1858 the issue was revisited as Regent McIntyre read his fourteen-page report, “On the Admission of Females.” The report stated that the University had the right to refuse admission to persons “whose presence would detract from the character of the Institution, or prevent it from attaining to the proper rank of a University” (University of Michigan 1863). On the motion of Regent McIntyre, the following resolution was passed:

Resolved, that to adapt the University to the education of both sexes would require such a revolution in the management and conduct of the institution, that we think it wiser, under all the circumstances, both in respect to the interests of the University and the interests of the young ladies, that their application should not be granted, and that at present it is inexpedient to introduce this change into the institution (University of Michigan 1863).

Less than a year later, 1,476 signatures were accepted on petitions, supporting the admission of women to the University; along with the applications of Sarah Burger and three other women for admission to the Literary Department. Again, a resolution was passed on June 30 1859, by the motion of Regent Brown that stated “Resolved, that the Board sees no reason to change the action already had upon the subject of the admission of females to the University” (University of Michigan 1863). The door was officially slammed.

What happened to these women? Harriet A. Patton, who applied in 1858, eventually in 1872, graduated as the second woman to receive a law degree from the University of Michigan. Augusta Chapin of Lansing went to Olivet College and earned a Master of Arts degree in 1884. She was the first woman in the United States to earn a Doctor of Divinity degree from Lombard College (McGuigan 1970). Sarah Burger of Ann Arbor, attended Ypsilanti State Normal School. In 1863 she married and with her husband pursued the attainment of women’s rights. Sarah Burger Stearns served as president of the Minnesota Woman’s Suffrage Association and other active leadership roles.

The admission of women at the University of Michigan took almost two decades from the first inquiry. Although the original charter of the University called for a female department, no money had been appropriated and the Regents firmly opposed every admission inquiry presented. Officially, women were barred from the classrooms. Unofficially, at least one woman did attend classes.

James Robinson Boise, a professor at the University, is credited with allowing the first women into a Michigan classroom. His daughter, Alice Boise (Wood) attended Latin classes in her father’s classroom with the traditional male students. Some of the faculty, including his assistant, approved of Dr. Boise’s daughter in the classroom, and allowed Alice into their classrooms. She continued to attend classes from September 1866 to December 1867. Rising opposition to a female student in the classroom provoked the resignation of Dr. Boise in December of that year.

Official documentation did not describe women pursuing admission to the University of Michigan again until 1867. During the period 1859 to 1867, feminists, politicians, and the media discussed the subject of women’s education in the state of Michigan. The Michigan Legislature passed a resolution stating that “the high objects for which the University of Michigan was organized will never be fully attained, until women are admitted to all its rights and privileges” (University of Michigan 1870). The Board of Regents, in response to legislative pressure, agreed to revisit the subject of the admission of women.

A high school teacher, Lucinda Stone supplied the initial force that led to the admission of Madelon Stockwell as the first female student of the University. She and her husband, who was Principal at the University of Michigan’s Branch College at Kalamazoo, got a copy of the organic laws governing the University. They could not find any laws prohibiting the matriculation of women from the College to the University. With the power of the University’s own laws in hand, they sought out the Rev. George Willard, a member of the Board of Regents, and persuaded him to back
their case before the Board.

It took two new members on the Board of Regents, intense lobbying by politicians, and nine months for a final vote on the subject. Finally, in January of 1870 the historic resolution was officially recorded: “Resolved, That the Board of Regents recognize the right of every resident of Michigan to the enjoyment of the privileges afforded by the University, and that no rule exists in any of the University statutes for the exclusion of any person from the University, who possesses the requisite literary and moral qualifications” (Centennial of Admission of Women Committee, Senate Concurrent Resolution #247 1970). Within days, acting President Frieze granted Madelon Stockwell permission to take the University’s entrance examinations.

Immediately a faculty bloc was formed to fight the motion of the Board. The Medical Department, backed by the Clergy, submitted a memorandum on female medical education in March of 1870. It stated that while the medical faculty had no prejudice against the medical education of women, in their judgment, “the medical coeducation of the sexes is at best an experiment of doubtful utility, and one not calculated to increase the dignity of man, nor the modesty of woman... it must be obvious, even to the casual observer, that a large portion of medical instruction cannot be given in the presence of mixed classes without offending the sense of delicacy, and refinement, which should be scrupulously maintained between the sexes” (Centennial of Admission of Women Committee, Memorial on Female Education 1870). Although the Medical Department sought to prohibit the admission of women, they succeeded in segregation of the departmental classes only, with faculty receiving an additional five hundred dollars for the “burden” of teaching the female students.

Miss Stockwell was subjected to rigid entrance examinations, and as reported by Mrs. Stone they were “much more severe than that given to the men students” (Sagendorph 1948). Not only did she pass the examinations; she had enough credits to be admitted to the sophomore class and became the first woman to gain admission to the University. During the year 1870 – 1871, she was the lone female student in the University of Michigan. The following year, 34 additional women entered the University in the following departments: 14 in Literary, 18 in Medical, and 2 in Law. Although many private institutions were open to women, admission to the largest, tax-supported institution was an important victory for women’s rights. Coeducation had officially become public policy.

Miss Stockwell graduated in 1872 from the Literary Department and married her classmate Charles Turner, who graduated from the Law Department in 1873. She remained socially active through serving as President of the Ladies Library Association and ran for positions on her local school board. She also continued her education after graduating by learning several languages and was awarded an honorary degree from the University in 1912.

As published in the University Newsletter, #62, in the first decade of the admission of women to the University of Michigan, the number of female students enrolled grew from 1 to 138. The percentage of women students grew from .08% to a total enrollment of 9.67%. By the turn of the century, 714 women were enrolled, which accounted for 21.61% of the enrollment at the University. The proportion of women to men grew substantially in the Literary Department, where Madelon Stockwell represented .21% of the departmental enrollment in 1870, however, by 1880 women represented 18.07% of the enrollment and by 1900, they represented 47.20% of the overall enrollment in the department.

Women were officially admitted, yet there is a difference between admittance and acceptance. The doors of admission may have been flung open; but the pioneers of the first decade did not always have the welcome mat rolled out for them. The signs of acceptance were evident in the reactions of the students, professors, and the community at large.

Women who aspired to attend college took the initiative to enroll themselves, as their families were not likely to encourage continued education for their daughters. The dangers of sending a daughter to an institution that traditionally fought their presence at all costs, coupled with the limited funds for education (usually reserved for the sons of a family), caused many families to hesitate sending their daughters at all. Daughters were also viewed as having more family obligations than sons, especially in large families, where older daughters were responsible for the care of younger siblings and aged relatives.

For example, Alice Freeman (’76) had to promise that she would not marry until she had paid her younger brother’s way through medical school (McGuigan 1970). Upon arrival on campus in June of 1872 with her father, she failed the strenuous entrance examinations. Unwilling to give up, Alice and her father spoke directly with
President Angell imploring him for admittance. She did not let President Angell down. Alice Freeman exemplified the early woman scholar and has been named repeatedly as one of the outstanding students of her time. To live in Ann Arbor, she took interim jobs during vacations to support her living expenses during the term. Described by a classmate, Lucy Andrews (’76) as “a silver tongued orator and genius” (University of Michigan Alumni Association 1924) Alice Freeman was recommended by President Angell to Wellesley College, where she became the second President in 1882. The University of Michigan, in 1912, conferred upon her the honorary degree of Doctor of Philosophy for her accomplishments as a pioneer for women’s education.

Convincing family members and enduring the difficult entrance examinations were just the beginning of the journey for women students. The University did not accommodate the female students. For example, women students were not allowed to place their coats in the coatrooms and had to wear their coats and hats in class, causing many to become ill from wearing their wet clothing. The community of Ann Arbor regarded women students with discourtesy and at times, open hostility. Two students, Lucy Maynard Salmon (’76) and Louise Hall (’76) walked the streets of Ann Arbor for three days trying to find a landlady willing to rent them a room (Walker, 1896). Ostracized by society and denied fellowship in most churches, the pioneers of the first decade demonstrated resilience to the coldness that surrounded them. One woman student purchased and occupied a pew in a prominent church for an entire year and was never spoken to except by the treasurer (who collected the pew fees) and the minister who openly expressed his disapproval of the “unwomanly position of college girls” (Walker 1896).

Professors, who were charged with publicly accepting female students in their classrooms, did not deny themselves the opportunity to openly resist the new students. Upon the arrival of Madelon Stockwell, the professors who administered the entrance examination required her to recite the following for admission: (Dick 1988)

It behooves us in the first place, to consider this, that we are by nature women, so not able to contend with men; and in the next place, since we are governed by those stronger than we, it behooves us to submit to these things and those still more grievous.

Other professors addressed female students as “Mr.” instead of “Miss” and addressed the class as “gentlemen” instead of “ladies and gentlemen”. As recounted in the University Chronicle soon after Madelon Stockwell’s arrival, one professor even openly ridiculed the admission of women (McGuigan 1970):

A dog had wandered into a classroom, and a couple of students rose to remove it. The professor stopped them. “That dog,” he said, “is a resident of Michigan. Don’t you know we now recognize the right of every resident of the state to enjoy the privileges afforded by the University?”

Not all professors were openly hostile towards their female students. Even Madelon Stockwell had fond memories of Professor Olney, who commented on the artistic touches she added to her trigonometry notes when he said, “Who can say now that mathematics is not one of the fine arts?” (Stockwell 1919). His comment may not have been made in earnest, for it was this same professor who avoided calling on the only female in one of his classes for an entire semester. At the end of the semester he apologized, saying he knew she was prepared and it was her male classmates who actually needed the drill. It is difficult to judge the temerity of his actions, were they the result of sincerity or sarcasm?

The early women students did not always silently endure the prejudice of their professors. Lucinda Goodrich (’77) wrote of the following experience (University of Michigan Alumni Association 1924):

We were studying Plautus and Terence as sophomore Latin, and if my memory registers correctly, the selection at the time was “the Andean Woman”. Very properly our textbook was a dramatized edition with asterisks to indicate omissions. Ours not to reason why the assignment – ours but to get our lessons and behave in a most lady like manner, lest the experiment of co-education receive an impetus in the wrong direction. Our instructor was what was then denominated a woman hater and violently opposed to the admission of women to Michigan University. To make it unpleasant for the girls, he persisted in supplying the omissions. We bore it for some time, lowering our faces over the desks, and then held indignation meetings in the dressing room in the old university hall building. Finally after a very embarrassing experience, a member of the class, Octavia Williams Bates, who knew the rights of properly behaved students said “Girls, if he ever does that again, I shall leave the class and I wish you would follow me.” We didn’t have long to wait. The offense was repeated. Miss
Bates rose to her full height and she was tall and stately and left the room and we went trooping after her. He never did it again. We had tactly taught him his lesson.

The community and faculty reactions to women students provided an atmosphere of rejection most often demonstrated by the reaction of the male students in the classrooms. Madelon Stockwell was initially treated with cold indifference by her male counterparts. The feeling seemed to be that if they ignored her existence, she would simply return home. When she didn’t they went on the offensive, lining the streets as she walked down them, trying to stare her down as she passed. Miss Stockwell stared straight ahead and with forced determination ignored their silent threats.

Other students recalled similar treatment by male students in the classrooms. In chapel for example, the women students were placed in between the freshman and sophomore male students. The students proceeded to throw hymnbooks, and apple cores at each other, through the crowd of women students. Mary Marston, in a letter to her mother described her reaction in this way: “I felt as though I wanted something to happen to make them sorry. Of course, I didn’t want to shake them myself, because it would tire me and wouldn’t be lady-like, but I would willingly have held a lamp or something of that sort while somebody else did it” (Marston 1874). Some male students even offered women students money to forego graduation exercises, so they wouldn’t have to graduate with them. When women did attend their graduation exercises, like Amanda Sanford (’71) the first female graduate of the Medical Department, they were cheered with vulgar obscenities from the audience.

Not all students had the resilience of the early pioneers. In the first decade two students committed suicide on campus. Mary Marston described one of the students in a letter to her mother (Marston 1874):

A very sad thing happened here last Sunday. A Miss Sykes, who entered college two years ago, and was out last year, came back to complete her course. But she was seized with a fit of monomania to which she has long been subject and shot herself through the head. She is still alive, but there is little hope of her recovery. President Angell this morning in chapel gave a brief statement of the facts, speaking of her as a girl of “excellent character and excellent mind”.

We are left to wonder how her experience at the University affected her decision to take her life.

The women of the first generation at the University of Michigan knew that their success or failure influenced the future for women who would knock on the University’s door in subsequent years. The reaction of the community, faculty, and students within the University was the preamble to the reaction the culture at large would have to women who were educated at the University.

The women of Michigan’s early admission years, 1870 – 1880, were provided with unique experiences at the University. Those that wondered why a woman would want to attend college in the first place began to wonder what effect the experience of higher education would have on early female scholars. President Angell reported that none of the perils envisioned upon the admittance of women had been realized either intellectually or physically, no embarrassment had arisen from the presence of women and the academic scholarship of the institution did not falter.

If the influence of women on the University had not been as negative as was predicted, what was the influence of the University on the women who were admitted?

In 1924, the Michigan Alumni Association distributed a survey to complete the record of women graduates and former students. The respondents included 69 women who attended the University during the admission era, 1870 -1880. Of those responses, 50 cases were reviewed for this report. Findings from a review of these cases confirm that 72% of the respondents graduated from the University of Michigan or another institution of higher education such as Radcliffe, Northwestern, Bryn Mawr, Oberlin, Chicago University, Smith, Stanford, the Sorbonne in Paris, and the Polytechnic in Zurich. Contrary to the popular beliefs of the time, 50% of the respondents married after graduation and an additional 4% were married and then divorced. Of those women 30% had children, effectively defeating Dr. Clarke’s argument against coeducation.

An overwhelming majority (82%) of the women who responded to the survey worked outside the home. While most became teachers or physicians, other occupations of these women included Librarian, Writer, “Farmerette”, Preceptress, Chair of a Normal School, and Director of a Settlement House. Some of the women earned national recognition for their achievements, including Sarah Banks (’73) who was the second woman physician in the city of Detroit; Eliza Mosher (’75) who became the University’s first Dean of Women in 1896; Annie Peck (’78)
was the first person to climb Mt. Huascaran in Peru (elev. 21,812 feet); and Lucy Salmon (’76) an accomplished author who published 5 books during her career.

The women who blazed the trail in the first decade of women’s admission to the University became role models for future students. Every woman of the admission era, graduate or not, could be considered outstanding for their sheer determination to cross the threshold of the once all male institution. The findings of the 1924 Alumni Association survey concurred with President Angell’s opinion that most of the fears of admitting women to the University of Michigan were unfounded. Male students continued to enroll despite the inclusion of women, and attendance by women did not result in spinsterhood or prevent women from having children. In spite of the cold treatment they received on campus, a majority of them did graduate with a diploma or degree from a college or university. Most of these pioneers continued to blaze trails for women by entering occupations outside the home, some practicing their craft for over 50 years, receiving national and international honors for their achievements.

Today, the doors of admission at the University of Michigan are open for any that wish to apply. The women of the admission era defied the culture of their day by attending college in the first place. It is hard to imagine the depth of commitment any of the women who attended the University in the 1870’s must have possessed in order to return each day and endure the ridicule, condemnation, and indifference with which they were treated by the community, faculty and students around them.

Despite the fears propagated at the time by the adversaries of coeducation at Harvard and Yale, Western Universities became the icon for the coeducation movement in the nineteenth century. The admission of women to the University of Michigan was important due to the size of the institution and the fact the University was a state supported institution. As a powerful force in the administration of the University, the Board of Regents refused to admit women and it took almost two decades before the will of the people of the state of Michigan forced the Board to rescind its earlier resolutions barring women from the University doors.

Madelon Stockwell is lauded as the first female student to attend classes at the University. We cannot forget other pioneers such as Alice Boise who attended classes even though women were not allowed in the classroom and Sarah Burger who was turned down three times before she sought access to education elsewhere. These students along with scores of politicians, feminists, and the people of the state secured a place for any woman wishing to go to college, thereby creating a “wedge in the door” for all women at the University of Michigan.

Reflections: Student Life on the African American Campus During the Nineteenth Century

Wanda M. Davis  
SUNY—Buffalo State College

During the antebellum era, educational opportunities for the descendants of Africa were virtually non-existent. By and large there was no provision for learning in the higher branches and with little exception, historically white colleges denied admission to persons of color. Christopher Lucas, in his work *American Higher Education: A History* reminds us that no more than twenty-nine black graduates are listed on college rosters prior to the Emancipation Proclamation. A few of the distinguished are: Alexander Lucius Twilight, the first Negro to obtain a college degree in the United States, graduated from Vermont's Middlebury College in 1823. Edward Jones and John Russwurm graduated respectively from Amherst and Bowdoin, in 1826. Mary Jane Patterson is recognized as the first female graduate of African descent. She received her degree from Oberlin in 1862. Despite these exceptions, during the pre-civil war period, educational opportunities for the greater population had not been achieved nor had the greater task of providing higher education for African Americans on a broader scale been addressed.

Golden Beginnings: a Comparison of Pre-civil War Institutions

**Ashmun Institute**, now Lincoln University was founded in 1854 as a private Presbyterian institution of higher learning for males of African descent. Reverend John M. Dickey, a colonizationist and leader in the Presbyterian Church, established the school. Located in Hinsonville, Pennsylvania, adjoining the tri-state areas of Delaware and Maryland, the campus rested in a community of “free” African Americans. One case, the story of James R. Amos, the university’s first student, is extremely important to the history of Lincoln.

**A Dream Deferred: An Abbreviated Story.** James R. Amos, a young “free” man, had a dream to advance his education. Then in his twenties, James settled on a farm in a small area in southeastern Pennsylvania. Hinsonville was a community of five African American settlements. Amos was a hard worker, only taking rest on Sunday to attend church. Already an ordained minister in the African Methodist Church, he felt the call to preach. He wanted an advanced degree. With this goal in mind, Amos sought the counsel of Reverend John M. Dickey (Murray 1973, 393; Thomson 1898, 392).

Dr. Dickey found Amos to be academically qualified and sought to secure admission for him at a school connected with the Presbyterian Church in Philadelphia. Unfortunately, white students reacted negatively. They demanded that Amos be made a porter rather than to engage with them in scholarly activity. When James refused to take this subordinate position, he was dismissed.

Determined, Dr. John Dickey sought admission for Amos to virtually every institution of higher education in the Union. Although academically prepared, to no avail, Amos faced continual rejection. In the interim, Dickey instructed James. A dedicated student, Amos walked twenty-eight miles once a week to recite personally to Dr. Dickey. Frustrated with standing admissions practices, Dickey laid plans to establish a school of Christian training for African American male youth. With the financial assistance of his wife, Sara Cresson, and many, many others, in 1854 Ashmun Institute was chartered as a liberal arts university for scientific, classical, and theological education. The expressed mission of Ashmun Institute was to train males of African descent to teach others and to serve as missionaries in Africa.

**The Early Curriculum.** Following the Princeton model, the early curriculum of Ashmun Institute was rooted in the classics. It was among the earliest of institutions in Pennsylvania to include the science and the art of teaching in its curriculum. Academic instruction was largely comprised of college and seminary subjects with a sprinkling of general courses. As with other schools of the period, religion was at the core of the curriculum.

**Student Life.** The first class of students was admitted in 1857. Although the university was established for the purpose of educating colored male youth, as early as 1873, Lincoln enrolled several white male students, some of who graduated in the first class.

At Lincoln, student decorum was extremely important. A rigorous academic program complemented high behavioral and moral standards. If anyone was found in violation of any code of conduct, they were dismissed. Misbehavior included public drunkenness, misrepresentation of reasons for visiting families in the village or in the town of Oxford, and for leaving campus without permission. Other offenses might include practical jokes, water fights, gambling, and destruction of university property, possession of weapons, and the use of alcohol. Two instances
of student protest of particular interest occurred in 1875 and 1890.

In 1875, students questioned the racial make up of their board of trustees and the faculty. Ironically, Lincoln had a policy that prohibited African Americans from being part of the faculty or administration. For students, this was unacceptable. After much debate and student opposition fifteen years later the policy was changed to employ faculty regardless of color. In 1954, (91 years after Lincoln was chartered), Horace M. Bond became the first African American president.

Another sign of organized student unrest came in 1890 when seniors refused to take part in a required examination. As a result, the entire class was dismissed. Most students felt remorse for their actions and were subsequently readmitted. A few graduated the next year. Some transferred to other institutions. Of those who transferred, Dr. Eugene Percy Roberts later returned as president of the board of trustees. (Bond 1976, 357)

These early students were full of fun. A traditional prank at Halloween was to take the presidential buggy out of its shed and to leave it at some distant point. On one occasion, Dr. Rendall, a graduate of Princeton and then president of the university, hid in the buggy. After the students had taken the buggy several miles toward the town of Oxford, to their astonishment, the president rose up from the buggy and made a strong suggestion that they take the buggy back to the campus (Bond 1976, 287). So the prank was foiled.

Dr. Rendall expected his students to succeed academically and often arranged for them to display their mastery of the King's English as a promotional tool. The book loan record of the library indicates that the earliest of students read widely and in quantity. For example, William D. Robeson, 1873-1876, father of the noted artist Paul Robeson was very well read. Another student George Cleveland Hall class of 1886, a most voracious reader, became a famous surgeon and civic leader in Chicago. Other students went on to become heroes in the Civil War.

The founding of Ashmun Institute marks a pivotal point in the evolution of educational opportunities for peoples of African descent. Like Lincoln, Cheyney University was founded in Pennsylvania during the early nineteenth century.

The Institute for Colored Youth, now known as Cheyney University was chartered in 1837 in Philadelphia, Pennsylvania to fulfill the dream of its distinguished Quaker benefactor, Mr. Richard Humphreys. A Philadelphia Friend, Humphreys was a member of The Religious Society of Friends. As with many of his associates, Richard gave freely to humane causes. The Institute for Colored Youth was one of them.

Upon his death in 1832, Humphreys bequeathed $10,000 for the establishment of a training school for African American youth. In accordance, the Quaker Board of Managers bought land, erected a building, hired teachers, and set up a curriculum equal to that of other high schools of the period.

Curriculum. Quakers were hesitant about creating theological seminaries and the provision of classical education, therefore, the Institute for Colored Youth was established to provide instruction in literature science, agriculture, and the mechanic arts (Conyers 1990, 9). An integral part of the mission included preparing students to serve as teachers.

The diversified curriculum covered an array of programs in both vocational and academic subjects. As the Civil War approached, the Institute offered six different levels of academic program for males and females of African descent. Later, based upon the insistence of students, Black mechanics in Philadelphia, and a Committee of Colored men, the curriculum would be expanded to include the liberal arts.

Student Life. The first class of five students arrived on October 5, 1840. Admitted from The Shelter for Colored Orphans (Conyers 1990, 30) the male students were of eleven and twelve years of age. They could read, write, and spell. The also had some knowledge of geography. Ms. Ann Jones, wife of the principal, Isaac, enforced the rules and regulations. In that capacity, students admitted from the shelter were bound to the Institute until the age of twenty-one. After four years of service, starting with garden and farm work, they were to advance to some instruction and cultivation of good habits. The presence of female students became evident after 1852.

Two years after the admission of the first class, conditions began to deteriorate. The needs of the farm placed literary education as a second priority. As a result, between 1840-1844, students became restless. They rebelled and it caused such hardship that the farm had to close. It seems that students wanted intellectual stimulation and this conflicted with the needs of manual farm labor. As a result, they ran away or caused destruction to property (Conyers 1990, 8). Elias Montgomery was the first of a number of students to run away. Others would leave to take on
apprenticeships with masters in the city. A typical day went like this: rise at 6:00 a.m. to a breakfast of fried mush and potatoes with bread and milk or molasses at 7:00 a.m. Academic or manual instruction began at 8:00 a.m. These youngsters would then work the farm until noon when dinner would be served. Dinner included soup and meat on alternate days with vegetables, rice, and flour pudding or plum pie. It was back to the fields from 1:30-5:00. Supper, which consisted of bread or milk and mush, began at 5:30 p.m., and students were to retire at 7:00. This basic meal plan cost four cents (Conyers 1990, 30).

Needless to say, students were not happy with this arrangement. They felt that they were being treated as farmhands. Their discontent surfaced in a variety of ways. Not only did students take permanent leave from the campus, in one instance, late one night, the managers received word that a fire had occurred under suspicious circumstances near the outhouse. Dissatisfaction among students ran so high that by 1846, only six years after the first students arrived, the Institute suspended operations. The school reopened and continued. Two of the early graduates of the institute went on to Oberlin College. Another graduate went to Edinburgh, Scotland to pursue a scientific and classical course of study. His desire was to teach.

Substantial changes in institutional and student culture would occur under the tutelage of Ms. Fanny Jackson in the 1870s. The presidencies of Fanny Jackson Coppin and Hugh Browne and later, Leslie Pinckney Hill deserve individual study and attention that will not be provided here. (Conyers 1990, 62).

Many years of hard work had gone into fulfilling the mission of the Institute, and on the eve of our nation's Civil War, it was achieving its mission. Instruction was now being offered to a number of African Americans who would not have had the opportunity for educational advancement. Our third institution is Wilberforce University in Xenia, Ohio.

Wilberforce University is the outgrowth of a proposal that was made by the Cincinnati Conference of the Methodist Episcopal Church (M.E.). Founded in 1856 and located at the Tawawa Spring Resort, the campus rests along the West Virginia and Kentucky borders. At least two principal stations of the Underground Railroad lie on the campus.

Resulting from tensions between the North and South over slave territory, the school almost closed. Fortunately, in 1863, through the hard work and extraordinary vision of Bishop Daniel Payne, an African American member of the original governing board of Wilberforce, the charter was changed and ownership was transferred to the African Methodist Episcopal Church (A.M.E.).

Curriculum. The educational objective of Wilberforce was to provide men and women of with intellectual, moral and social development. The M.E. and the A.M.E. Church felt that it was important for the West to have a university to accommodate the intellectual and moral condition of thirty thousand people of color who were now migrating and residing in Ohio. As with Lincoln, Wilberforce was chartered and mandated to begin as a university. As such, the classics and religion remained central to the curriculum. Operating as a normal school with a preparatory department, students of Wilberforce enjoyed their rich surroundings. They graduated and went on to teach and Christianize others.

Student Life. When Wilberforce opened its doors in 1857, nineteen students were enrolled. Between 1857 and 1860, enrollment increased to include more than two hundred and seven male and female students. These early students represented a wide range of ability and attainment. They came from over twenty states. Approximately one half of them were from twelve southern states. Wilberforce also admitted a number of children of mixed blood. They were sons and daughters of plantation owners (McGinnis 1962) and some were from established families of Ohio and the Southern and Southwestern states therefore exact figures and names are not readily available. As much as possible identities were intentionally protected. Not only did the students of Wilberforce represent the integration of various races, student representation grew to include an international segment. They came from Mexico, the British West Indies, Bermuda, Canada, South America, Haiti, and almost every part of South Africa. As with Lincoln, an international connection was apparent. The majority of Wilberforce students graduated, excelled, and went on as teachers.

During the formative years the faculty controlled the extracurriculum and it consisted of study hall and activities that centered on the religious program of the college. A literary society, the Giddings Lyceum was formed to facilitate debate and literary culture. Women students proclaimed their compositions every two weeks with male
students promoting their views on alternate weeks. Fredrick McGinnis (1941) suggests that sometimes students would get so involved with the religious fervor that classes would need to be canceled. He goes on to explain that the university sanctioned theatricals and elocutionary contests because it was felt that they would encourage literary activity among the young scholars.

Overall student life was restricted and rather routine. Roommates shared responsibility for keeping their quarters orderly. After making their beds, they carried in coal and water. General duties related to hygienic living were also necessary. Little to no frivolous behavior was permitted. Life was organized and serious. The chief event was the monthly social hour when at designated times, older students could mix sexes. Mixing meant that they were allowed to march up and down the corridor of the hall, arm in arm to the tunes of martial music. Generally, however, students were expected to attend chapel services twice daily, at 7:45 a.m. and at 4 p.m. Alcohol, tobacco, firearms, games of chance, profanity, obscenity, and immoral books or papers was forbidden. A student caught visiting with another student during study hours or a student found absent from campus faced dismissal.

Common among students of the period, pranks were in order. As with other institutions Halloween was an excuse for this behavior. So, aside from playful activities such as pillow fights and wrestling matches, students would sometimes involve themselves in activities against an individual faculty member or the president. In 1887, when the president was doused with water, the faculty resolved itself into a court and called before it twenty suspects. Some were suspended from school. The university chapel was also targeted. In fact, once a year, a cow, pig, or horse needed to be rescued from the chapel tower. Most of this happened at 12 midnight on the eve of Halloween. If students were not in class or church, they were supposed to be studying. If they were found in violation of any of the codes, they received a black mark. Three such marks resulted in a separation from the school. This represents the first sign of an organized system of discipline. Over time, these rules and regulations were softened and modified. In fact sometimes they would bypass the faculty and go straight to the board of trustees to get what they wanted (McGinnis 1941, 253).

During the antebellum period, with the exception of Oberlin College, Wilberforce was the predominant institution of higher education available to people of color in Ohio and the West. Not only did the school produce teachers and preachers, by the end of the nineteenth century Wilberforce began to produce doctors and lawyers (McGinnis 1941, 282).

Conclusion

In comparison, each institution had theology or religious study as a core element of their curriculum. In each case it was hoped that students would go on to teach and Christianize others. Lincoln University had an international mission, Cheyney geared its focus on youth of the Colored race in Philadelphia, and Wilberforce University had a national focus that addressed the educational needs of those of African descent, the mulatto descendants of Southern planters, and African Americans in the Western region.

Similar to other institutions of the period, students were held to a very tight schedule that included daily prayer. Lincoln students were being trained to serve with the Presbytery in Liberia, Cheyney’s students were being trained as teachers and were provided the practical skills of the mechanical arts, and Wilberforce was training teachers. Both Lincoln and Wilberforce were founded as liberal arts universities.

On occasion, each school faced student discontent. In some cases students were suspended; in others, the campus was shut down. At each campus, students took the initiative to form extra-curricular activities. In most cases they took responsibility to meet their own intellectual or social needs even in the face of dismissal. When they were the campuses remained relatively quiet. If the environment was not compatible with student needs and expectations, they responded, sometimes with violence. By the end of the Civil War, a number of students had completed their studies and received their degrees or certificates. Clearly, students influenced Lincoln, Cheyney, and Wilberforce Universities. Each, although distinct in their mission, withstood and overcame the difficulties of the period. The African American University/College and their students occupy a distinctive and unique place within American higher education.

Gerald Howard Read has served as America’s education ambassador to the world. His contributions in the field of comparative education are unparalleled and numerous. At Kent State University (KSU) from 1943-1976, he was the Endowed Professor of Comparative Education. Twice an Ohio State Scholar at The Ohio State University during his years as a graduate student, Read went on to a career that included academic leadership as national president of Kappa Delta Pi, founder and Secretary-Treasurer of the Comparative and International Education Society, Associate Editor of the Comparative Education Review, Fulbright Scholar, Chairman of the Selection Committee of Fulbright Scholars, and Honorary Chairman of The World Council of Comparative Education Societies. Read has also authored many articles and co-authored two books, *The Changing Soviet School* (1960) and *Russian Education: Tradition and Transition* (1995), and has received prestigious honors such as the President’s Medal for Outstanding Service to Education (KSU), Outstanding Alumni of Kent State University, and Charter Fellow, College of Preceptors, United Kingdom. In addition to these noteworthy accomplishments, Gerald Read has been a remarkably altruistic individual who has made significant monetary donations to several educational organizations. Read’s most notable abilities, however, lay in his organizational and interpersonal skills. He directed field studies and seminars for many organizations throughout the world for over forty years. Thousands of educators were able to learn about and to visit educational systems in countries around the globe because of Read’s leadership. Significantly, Read negotiated the first academic exchange agreements between the United States and the Soviet Union, 1957; Rumania, 1958; Hungary and Czechoslovakia, 1960; Poland and East Germany, 1961; and the People’s Republic of China, 1973 (Read 1998a). Clearly, Read was an educational pioneer in an age when the airplane enabled people of the world to come into closer contact with one another.

Born in Akron, Ohio, on June 28, 1913, Gerald Read’s family was of modest means. He graduated from high school in the midst of the depression, but was able to attend nearby Kent State University on a football scholarship (Read 1995). Although an injury sidelined Read and left him on crutches for almost five years, Read earned a Bachelor of Arts and Bachelor of Science degrees, *magna cum laude*, from Kent State in 1936 (Ohles 1986). During his senior year at Kent, Read organized his first trip abroad to study Cuba’s rural education program undertaken by the national President, Fulgencio Batista. Read’s interest in Cuba stemmed from his youth. His childhood home was filled with Spanish American War memorabilia that his father, a U.S. Army veteran, had collected. During his first trip to Cuba, Read and several of his fellow Kent State University students were guests of the director of the “Escuela Normal José Martí” which trained “sergeant-teachers.” As a result of this experience, Read’s interest in Cuban education expanded, and he formed lifelong professional friendships with Cuban educators (Read 1998d). Subsequently, Read attended The Ohio State University, at which he wrote his master’s thesis, “History of Cuban Education” and earned his A.M. degree in 1938. Thereafter, Read began his professional career in education as a junior high school principal in Tallmadge, Ohio. In 1941, he married Victoria C. Taros. Desiring a position in a high school, Read taught Spanish and history in Perrysburg, Ohio during the 1941-42 academic year (Ohles 1986; Read 1995). The following year he returned to The Ohio State University, again as an Ohio State Scholar, and began work toward a Doctor of Philosophy degree. Continuing his work on Cuban education, he wrote his doctoral dissertation on “Las Escuelas Rurales Civico-Militares Movimiento,” but did not complete his degree until 1950.

Read returned to Kent State in 1943 as supervising teacher of social studies and professor of secondary education. He resumed his activity in the local campus chapter of Kappa Delta Pi, the national honor society in education. As an undergraduate, he had been initiated into the society in 1936. Upon his return to Kent State as a professor, he assisted with the organization and became the chapter counselor in 1948 (Read 1995). Since its founding in 1911, Kappa Delta Pi had been run by “essentialist” educators such as William C. Bagley, Dean T. C. McCracken, and E. I. F. Williams (Read 1986, 70). He quickly gained notice from the society leaders at the national level, and in 1954, he became national Vice-President. Subsequently, he was reelected to this office five times and served until 1964. Believing that the times demanded changes in the authoritarian power structure that he sensed had dominated
Kappa Delta Pi since its inception, he used his presidency (1964-1966) to democratize the society and bring it into "the 21st century of progressive reforms," an accomplishment about which Read remains extremely proud (Read 1998b). One change was that long tenures of Executive Council leaders ended, and a democratic method of electing Kappa Delta Pi officials was instituted. Read also helped to amend the constitution of the society to create the office of President-Elect. Continuity in leadership was established by the election of a member to serve two years as President-Elect, two years as President, and, then, followed by two years as Advisory Counselor. Furthermore, tenure of President was limited to one biennium, except when an unexpired term of President was served by the President-Elect (Read 1986).

At Kent State University, Read taught numerous courses related to his interest in comparative education. At the undergraduate level, he taught "School and Society" along with other professors who were part of the Foundations of Education department. In addition, Read taught several graduate level courses. These courses included: "Teaching Moral and Spiritual Values in the Public Schools," "Teaching About Religion in the Public Schools," "Education Reforms in Developed Countries," "Persisting Problems in Education Throughout the World," and "Communism, The Soviet Union, and Socialist Education" (Read 1998c). Because Read increasingly engaged in directing educational seminars abroad during his years at Kent State, courses were either team taught with other members of the department or conducted in short, intensive four-week seminars in order to facilitate his extensive travel.

Despite an incredibly busy schedule, Read developed strong relations with many colleagues and students, particularly his doctoral candidates. Read's former Ph.D. students, such as Abdul Al-Rubaiy, Peter Hackett, Mary Ellen Hynes, Xiaolu Hu, and Sherry Cable, eventually spread out across the country to numerous institutions including the University of Akron, the University of Virginia, Central Florida State University, San Jose State University, and the University of Tennessee. Dr. Abdul Al-Rubaiy conveyed fond memories of Gerald Read stating that he was "a man who provided rare opportunities for American teachers and professors to see how the other side of the world lived, educated, and provided for their young. His main idea was not to argue the benefits of democracy and capitalism, but to show others that it is one of the better options available for governing and providing for people" (Al-Rubaiy 1993, 40). Colleagues, such as J. Arch Phillips, a professor at Kent State University for twenty-six years and the director of the Center for International and Intercultural Education, conveyed similar complementary sentiments. He wrote, "Dr. Read is one of a kind among professionals and I think he has no peer in the field of Comparative Education... It was Dr. Read's contention that teachers (of social studies in particular) needed to observe and experience socialist government and education practices first-hand if indeed they were to teach about democracy and its critical advantages in a civilized society" (Phillips 1998).

During the 1950s and 1960s, Read engaged in several academic endeavors which enhanced his interest in comparative education. He directed the work of the Commission on Teaching Moral and Spiritual Values in Public Schools, of the National Conference of Christians and Jews. He also attended conferences of the Society for College Professors of Education, at which individual scholars interested in comparative education formed a special interest group. At these meetings, Read formed a life-long friendship with William W. Brickman, a New York University professor and editor of School and Society, who became instrumental to Read's future travels (Bereday, Brickman, and Read 1960; Read 1995). Brickman had been a student of Isaac Kandel, at Teachers College, Columbia University, an individual prominent in the field of comparative education studies. In the 1950s, Brickman organized several conferences on comparative education. Soon thereafter, interest arose in planning visits and seminars with professors in European universities. Brickman and Read became directors of the first European seminar which occurred in 1956 (Read 1998d, 1). Forty-four U.S. professors of education began this first trip on a Pan American jetliner that had to be refueled twice before landing in London. After a challenging session of seminars led by the director of the Institute of Education of the University of London and several visits to surrounding schools, the professors continued their program in France, Switzerland, Germany, the Netherlands, Denmark, and Scotland (Ohles 1986, 54). The trip was a tremendous success.

As a result of the European Seminar, Read and others organized the Comparative Education Society, as a section of the Society for College Professors of Education. Read was elected the group's Secretary-Treasurer. Shortly thereafter, the organization began a scholarly journal, The Comparative Education Review, and Read became its Associate Editor, with George Bereday, Professor of Comparative Education at Columbia University, as Editor.
Demand for seminars in other countries followed. In 1957, at the request of the Japanese Ministry of Education, Read organized a delegation of U.S. professors to visit Tokyo and to attend a conference sponsored by UNESCO on moral education (Read 1998d, 2).

In that same year, Read and Brickman, at the meeting of the Comparative Education Society, were asked to explore the possibility of an exchange with professors in the Soviet Union. This exploration launched Read’s interest in Russia that continues to this day. Of course, 1957 was the height of the Cold War. In that year, the Soviets launched the “Sputnik” satellite which caused tremendous fear in the United States that the Soviets were scientifically superior to the U.S. (Tindall 1988, 1340). Books such as What Ivan Knows and Johnny Doesn’t heightened the demand for an improvement of American education (Read 1998d, 2). In the midst of such a tense atmosphere, the American Ambassador to the Soviet Union, Llewelyn Thompson, pressured the U.S. State Department to encourage educational and cultural relations between the two powers. Thompson prevailed upon Moscow State University’s preeminent psychology professor, Dr. Alexi N. Leontiev, to extend an invitation to Read and Brickman to make an exploratory visit. Read’s wife, Vicky, who spoke Russian, accompanied the men, although the Russians were unaware of her fluency (Read 1995). On the way to Moscow, they stopped for a briefing from Stockholm University’s Professor Torsten Husen who later was to become the founder of the international testing movement. Individuals at Stockholm University had established close contacts with Soviet educators. Read and Husen eventually became the first foreigners to be elected as Academicians by the Russian Academy of Education because of their work. In January, 1958, a U.S.-U.S.S.R. agreement was reached to exchange a delegation of educators that was approved by American Ambassador to the Soviet Union, Llewelyn Thompson (Ohles 1986; Read 1998d, 3).

When Read and Brickman returned to New York, they received word from the U.S. State Department that a number of national organizations were opposed to the exchange agreement. The opposition included leaders of the U.S. Chamber of Commerce, the American Federation of Labor, and the National Education Association. Read and Brickman produced Ambassador Thompson’s initials on the official agreement, and after lengthy discussions the agreement remained in effect (Read 1995).

Despite this controversy, Read and Brickman conducted the first seminar in August and September, 1958, and this initial visit paved the way for many that followed. Not only did the American group visit the Soviet Union, but the seminars eventually expanded to nearly every region of the world. Members of the first seminar, which included seventy educators from across the United States, spent time in Moscow, Leningrad, Kiev and Tashkent. They met with Russian educators and visited local schools. The group, which was sponsored by the Fund for the Advancement of Education of the Ford Foundation, were guests of the Soviet Trade Union of Educational, Cultural, and Research Workers (Bereday, Brickman, and Read 1960, xiii). As a result of the exchange, a final report, The Changing Soviet School (1960), was published. Although authored by George Bereday, William Brickman and Gerald Read, many of the seminar members contributed to the book, which described Russian education’s historical antecedents, organization, and other selected issues. Another result of the exchange was that Read received invitations to visit other Eastern European countries soon thereafter, and he negotiated the first Academic Exchange Agreements between the U.S. and Rumania, Hungary, Czechoslovakia, Poland, East Germany, and China.

Read’s travels extended not only east and west, but also north and south. Indeed, he has directed educational travel programs that have covered almost the entire globe and included almost one hundred countries. In 1962, Read organized a tour of several African countries, including Liberia, Ghana, and South Africa. Because of South Africa’s policy of apartheid, that nation typically denied visas to non-white foreigners. However, Read’s group included Mrs. Fleming, an African-American educator from Canton, Ohio. While visiting Johannesburg, the group attended a reception hosted by the mayor, a Mr. Fleming, who told the American party that he had been born of South African parents in Pennsylvania, and wanted to meet Mrs. Fleming to find out if perhaps they were related. Mrs. Fleming assured the mayor that they were not related. During the visit, no South African officials made an issue of her race. When Mrs. Fleming returned home, she told people how she had broken through South Africa’s racial barrier and met a possible relative, the honorable mayor of Johannesburg (Read 1998e, 2).

In 1972, while lecturing at Haile Selassi University in Ethiopia, Read was asked to serve as advisor of group travel to the Ethiopian Airlines. Earlier, the Ethiopian government’s national airline had been granted the rights to fly to China. Because of his expertise, Read flew with the Ethiopian royal family to China in February, 1973. During
his trip, Read met with the Premier of the People’s Republic of China, Chou En Lai, and Chinese educators, and arranged for a delegation of American educators to visit China. In return, the Chinese officials requested that Read gain admissions and financial support for Chinese professors to pursue graduate study in American universities. In 1974, amidst the Cultural Revolution, Read directed the first group of American educators to visit China, which was sponsored by Phi Delta Kappa (Ohles 1986, 56; Read 1998d, 6). Interestingly, one of the conditions was that the Americans travel to China by way of Ethiopia, and spend time touring that developing country. In a recent interview, Read reported that this visit to such a primitive country as Ethiopia was quite an experience for the American group, which included college presidents. In Ethiopia, the people were appallingly poor, children often had flies over their bodies, hotel facilities were meager at best, and education was generally rudimentary (Read 1995). On a personal level, the trip to China also was tremendously rewarding for Read. Kongit Haile Meriam, the niece of the Director of Sales of Ethiopian airlines whose father had died and left nine children, befriended the Reads. At the end of the visit to China, the Reads accepted her as their daughter. She later graduated from Kent State University and earned a master’s degree (Read 1998d, 6).

Read’s work in comparative education enabled many students and visiting scholars, particularly from Eastern European countries and China, to come to the United States to teach and learn. For example, his efforts led to bringing two scholars, Dr. Yany Zig-Ling and Dr. Lin Bing, from Beijing Normal University to Kent State University. These two Chinese individuals were the first to earn doctorates in any field at an American University since the Cultural Revolution (Phillips 1998). Read also arranged for numerous visiting professors from around the globe to teach specially designed courses at Kent State University. Hailing from prominent world wide educational institutions, a few of these professors were Nigel Grant of Edinburgh University, Michael Debeauvais of the University of Paris, Elzo Velema of Amsterdam University, Brian Holmes of the University of London, and Buhn Thin, Thailand’s Minister of Education (Read 1998c).

Not only was Read instrumental in developing relationships and enhancing understanding among educators around the globe, often times between the United States and countries where tensions were deep, but he also has been generous in supporting future generations of educators through endowments and scholarships. A modest man, Read has given intellectually and financially without seeking recognition. Indeed, his generous philanthropy is quite astounding. When Read began directing the seminars and travel programs, Kent State’s College of Education set up an International Travel Fund to administer and disperse payments and charges. Because Read fulfilled his teaching assignments by team teaching, the college did not have to draw upon the fund as originally planned. The fund, which helped to establish the Endowed Gerald H. Read Chair in International and Comparative Education, was turned over to the Kent State Foundation upon Read’s retirement, and at present has grown to more than one million dollars (Phillips 1998; Read 1998c). In addition, Read and his wife “donated a major pavilion to the Porthouse Theater grounds, the summer home of Kent State’s theater department which is located in conjunction with the Blossom Centerk, the summer home of the Cleveland Orchestra” (Phillips 1998).

Read’s philanthropy has not been limited to Kent State University. Because Read also directed seminars and tours for Phi Delta Kappa (PDK), upon his retirement he was able to turn over the surplus fund of more than $200,000 dollars to the PDK Foundation. Today, this fund has grown to over $700,000 and it is the source of PDK scholarships (Read 1998c). Furthermore, Gerald Read is not the only generous member of the Read household. Read’s wife, Vicky, who owned vast property in Ohio, funded the “Adopt a Scholar” program of PDK and also gave her hometown its first public library (Phillips 1998). Recently, both Read and his wife gave a challenge grant of $100,000 dollars to Kappa Delta Pi (KDP) in recognition of the contribution the society made to Read’s professional development as a counselor and officer of the society. Clearly, the Reads’ generosity is quite extensive has and will continue to benefit education for many years.

Read retired from Kent State University in 1976, but continued to direct tours until 1986. From 1987-1994, together with Professor Brian Holmes of the Institute of Education, University of London, and Professor Natalya Voskresenskaya of the Russian Academy of Education, Read updated the original Ford Foundation project that sponsored his first educational tours to Russia. The result was the publication of Russian Education: Tradition and Transition (Holmes, Read, and Voskresenskaya 1995). Clearly, Read has remained active in retirement. On the occasion of his eightieth birthday, a group of professors wrote and distributed a Festschrift, a pamphlet with almost
a dozen articles, to honor Gerald Read. Fittingly, Read's admirers who contributed to the Festschrift hailed from around the globe. One former student noted that Read was a father figure to a large number of foreign and domestic students, but that he was also now a grandfather, who has educated his grandson to “see the difference in people, but also to look for the commonality among human beings” (Al-Rubaiy 1993, 41).

With such remarkable accomplishments, altruism and praise, one is left wondering whether Gerald Read has any flaws. Surely, Read is mortal. He seems to have been a fairly opinionated person with whom to work. In fact, one former student reported that Read had a “rough exterior” “demanding manner, and forceful personality,” but that these traits belied his willingness to provide and support people (Al-Rubaiy 1993, 40). Undoubtedly, Read’s powerful demeanor enabled him to make contacts and negotiate important agreements. Moreover, Read’s success was in large part due to high expectations he held for himself and others. With the present emphasis on multicultural education, Read’s work stands as groundbreaking. He worked to increase understanding of other cultures by bringing educators from around the globe into contact with one another. Read’s work deserves critical acclaim, and his generous philanthropy assures that future generations of educators will also benefit from his efforts.

Among histories of immigrant education in America, emphasis on Mexican American schooling has long languished. However, a Harvard Educational Review symposium on Mexican American educational history in April 1998, highlights growing interest in this area. A recently published article in the pages of that journal constitutes the most thorough chapter yet in the history of Mexican American education.

However, little is known of individual schools where children of Mexican heritage in this country have been or continue to be educated. Particularly missing are accounts of schooling opportunities beyond the blighted experiences reported by Manuel, Carter, San Miguel, and others. This form of "problematizing" the subject - exploring the complexities of the lived experiences of students - only recently has been a source of inquiry in African American educational history. Not until more numerous, and more complex, studies of individual schools have been written can meaningful comparisons between various schooling experiences be investigated. This paper attempts to fill part of the void in educational history by describing one specific school for children of Mexican descent.

Zavala Elementary School was established as a public school in Austin, Texas, in 1936 specifically to educate children of Mexican heritage. The school was named for Lorenzo De Zavala, Interim Vice President of the Republic of Texas one hundred years before and former governor of Yucatan in southern Mexico. The Mexican origin population in Austin during the 1930s, as today, consisted of both recent immigrants and people whose families had lived in the United States for generations. From its founding until 1969, classes were taught in English only at Zavala. Even though the Austin school board wanted specifically to address the needs of Spanish-speaking students, English-only laws forbade instruction in any other language in Texas public schools.

Zavala represents a commitment to education during a time in Texas when both people of Mexican heritage and Whites were less educated than their counterparts in other Southwestern states. Zavala also demonstrates considerable differences to the stereotypical pattern of poor schooling conditions for children of Mexican heritage in the United States during the early years of this century. From the beginning, it has been an urban school with an excellent physical plant. The standard curriculum for Austin Independent School District has always been taught, rather than the sparse curriculum often described for schools serving Mexican origin students prior to 1970. It has always offered a full nine-month scholastic calendar in contrast to rural schools for agricultural workers that were only open five or six months per year in some areas. Even though the neighborhood was primarily low-income and minority, many families were settled urban dwellers rather than migratory farm workers. Nonetheless, it is often a story of political compromise cloaked in good intentions during periods of segregation, court-ordered desegregation, and modern resegregation.

Information for this study was collected through interviews and document examination as part of a dissertation for one researcher and a graduate class project for the others. Even though this study is still incomplete, it fills in some of the spots left blank by previous fragmentary reports of Mexican American educational history.

White School Dominance: Zavala’s First 30 Years, 1936-1968

During a school board meeting in Austin, Texas, in the summer of 1935, the superintendent rose to enumerate the most pressing needs of the city’s schools. Among the priorities he specified was the construction of a new school specifically for students of Mexican ancestry. According to the school board, it had been the desire of that group for many years to provide for the “large group of Spanish-speaking citizens of Austin a suitable, well-equipped school building... as near the center of population as possible... It is proposed to construct and equip a conveniently located 12-room brick building including an auditorium.”

Two months later Austin Mayor Tom Miller signed the grant application to the Federal Emergency Administration for Public Works to build the new school in the middle of the deepening Depression. Thanks to the influence of then Senator Lyndon B. Johnson, federally subsidized construction projects for public housing and school renovation and expansion were underway in Central Texas. The new school was to be built directly across the street from a new housing project for low-income Mexican families, in a neighborhood that was primarily of Mexican heritage.
Two schools existed in Austin exclusively for Spanish-speaking children prior to 1936, the West Avenue School and Comal Elementary. Four blocks away from the Zavala location, children of Mexican origin had attended Metz Elementary School together with Whites since 1916. But with the hardening of segregation during the Depression, another separate school for Hispanic children was seen as a political necessity.13

Zavala Elementary School opened specifically to educate children of Mexican heritage in September, 1936, at a cost of $52,153.00, which was $12,000 under budget. The new brick building included 11 classrooms, manual training rooms, homemaking rooms, a lunchroom, a bookroom, and something that gave great pride to the school, an auditorium. The building represented the best physical plant available for students during this era. This was a dramatic difference from the poor facilities in which many Mexican origin children in Texas, especially in rural areas, were compelled to study.14

Four years later a south wing was added that included 3 classrooms and a library. In 1949, a second auditorium was built, as well as showers and bathroom facilities. Finally in 1955, a large recreation center was built adjacent to the school. Clearly the school board was following through on their desire to provide an outstanding educational facility to this neighborhood.15

From its opening in 1936 until court-ordered desegregation began in 1981, Zavala’s school enrollment was approximately 98% children of Mexican origin. As was commonly known at the time, and still expressed in the neighborhood today, Zavala was built especially to educate Mexican children in a segregated school. In the 1930s, citizenship classes were held at Zavala in an effort to “Americanize” immigrants from Mexico.16 After Zavala was built, the perception in the neighborhood became that Metz Elementary four blocks away was only for White children, and Mexican children should attend Zavala. In actual fact, not all Mexican origin children who had attended Metz prior to 1936 changed schools. Metz remained at least 10% Mexican origin from 1936 to 1940, even though Zavala offered a brand new building as well as community solidarity.17

One woman who did switch schools recalled her childhood during the Depression. She attended Metz for first through third grades, and transferred to Zavala for grades four through six. When she finished sixth grade in 1939, she had to quit school to help support her family. “I cried and cried for days when I had to quit school,” she said. “That was my sacrifice for my family.” She says all the children in the family had to work to get enough to eat during those years. Even the youngest ones shelled pecans to earn money. The family also made Mexican candy and sold watermelons to make ends meet. “Everybody pitched in,” she recalls.18

During the first 30 years or so of its existence, the school struggled to educate an annual influx of migrant students, who followed their parents to work in the fields from Texas to Michigan six months out of the year. No provision was made in the school calendar to accommodate the needs of these children, however; consequently, many fell behind the typical pattern of grade progression.

The overall school enrollment at Zavala reached 665 in 1954, the sixth highest in the city. Meanwhile Zavala’s sister school, Metz, hit a peak of 880 students, topping all other elementary schools in Austin that year.19 Clearly this part of town was continuing to grow. In 1958, the school district installed one of the city’s first Mexican American principals at Zavala, a Mr. Hernandez. More research is needed about this phase of Zavala’s history in order to address adequately the impact this made on the school, the neighborhood, and the city.

By 1961, Zavala had another White principal, Don Schmidt. When he became the school administrator, a particularly strong mandate from the central administration office spurred Schmidt to improve daily attendance rates. He successfully raised daily attendance from 85% in 1961 to 92% when he retired seven years later. An attendance investigator was assigned by the central office to meet weekly with the principal. Truancy cases were filed in city courts against several parents who failed to comply with the district’s compulsory attendance laws. As Principal Schmidt recalled 30 years after his tenure, “attendance was vital to student progress.”20

Similar to reports from many other schools serving children of Mexican heritage in Texas in the early half of this century, staff demographics failed to mirror students’ faces. For example, Mr. Schmidt remembered only 3 Mexican American teachers at Zavala while he was there in the 1960s. One of these was Edemira Saenz, however, who had taught continuously at the school since 1945.21

The Rise of Mexican Culture in Education: Zavala as a Model Bilingual School, 1968-1980

A major shift in school culture occurred when Hermelinda Rodriguez became the second Mexican American
principal at Zavala Elementary in 1968. A woman of intelligence and zeal, she grasped the opportunity for change during that era of social reform. She instituted the first bilingual education program in Austin in 1969, years before federal mandates, with the help of three other Zavala teachers. Ms. Rodriguez wrote a letter to the school board outlining her plans to teach Spanish-speaking children in both Spanish and English. There was no response to this letter whatsoever by the school board. “So, I took that as agreement,” she said, “and just did it.”

Former Zavala teacher Edermira Saenz recalls that people came from all over the United States and several foreign countries to observe the Zavala program. Many people considered the program a success, she said, “because [of] the results ... in teaching these young people.”[23] But “to become a bilingual teacher, I had to struggle,” said Ms. Saenz. “We had to, not knowing what bilingual education was when we first started.” She describes how the program began:

Not much happened until Ms. Rodriguez entered the picture...[then] we did our own thing of what we thought bilingual education was. I had never seen a class of bilingual education, but what was in [Ms. Rodriguez’s] mind, what was in Ana [Galindo’s] mind, what was in my mind, we sat together and figured out that this is what bilingual education is.

In summer 1969, Ms. Saenz and others took a nine-week course taught by Dr. Theodora Anderson for bilingual education teachers. The course was partially funded by the federal government. The following year, Zavala began receiving Title VII money for bilingual education. Ms. Saenz related:

At the time, we started the program to help our children: our Mexican American, native Mexican American children, born here in the United States, learn English. It was a new concept. We didn’t have any books. We were reading out of books from Puerto Rico. And you know that the way that you express certain things, that you say it, we don’t say. Then we would have to explain [to the children] what the things were and how come they were said that way.

Ms. Saenz taught at Zavala since graduating from the University of Texas at Austin in 1945. She taught solely in English for 23 years, before the bilingual program began under Ms. Rodriguez.

“It suddenly, I was given permission to speak in Spanish,” she recalled. So I started in Spanish, and then all of a sudden I can hear myself, I have reverted to English. Because I was used to teaching in English and it was the harder thing for me to stay in Spanish, it is even now. To become a bilingual teacher, I had to struggle. We had to, not knowing what bilingual education was when we first started. It was a good program. And [then] it was...just dropped like a hot potato! Federal money was running out and Austin was not ready to pick it up. Those are the exasperating times!

It was not until Fall 1974 that bilingual education was initiated in other elementary schools in Austin Independent School District. Bilingual education was implemented in kindergarten through third grade. Schools could continue bilingual education past the third grade on a volunteer basis. Not everyone in the community favored bilingual education during this period. For example, a Mexican American woman addressed the school board in August, 1970, commenting that the only reason bilingual education was necessary was because Mexican American children were often segregated from English-speaking White children.

The late 1960s and 1970s in Austin saw much debate over school integration. The school district was sued three times in federal court to end segregation of Black and Hispanic children. In 1968 the district was found to be in noncompliance with the 1964 Civil Rights Act because their modified neighborhood school desegregation plan was too restrictive. In 1977 the 5th Circuit Court of Appeals ruled that Austin had intentionally segregated minority children in schools. The Supreme Court refused to hear the case in 1979, setting the stage for massive busing to achieve racial balance in schools.

Forced Desegregation: A Period of Unrest, 1981-1987

When two-way busing went into effect in Austin in 1981, Zavala was paired with Casis Elementary School, which served a mostly White, upper middle class population on the other side of town. The plan called for kindergarten students to attend their neighborhood schools, but first through third grade students would be bused across town. Zavala students would then attend fourth through sixth grades back at their neighborhood school, along with additional students from Casis.

In Fall 1981, the mixed first through third grades at Casis included 26 Black children, 243 Mexican American
children, and 207 White children, for a total of 476 students. Bilingual teachers from Zavala also went to Casis to teach the young Spanish-speaking children. Zavala educated kindergartners from the Zavala neighborhood, and fourth through sixth grade children from the areas around both Casis and Zavala. This gave the school an unusual mix of very young children, and children in the intermediate grades.

Some Casis parents were anxious about their children attending Zavala, which had an obviously Hispanic culture, according to one Zavala teacher. For example, a local artist had painted a huge mural around the front door at Zavala. The Zavala teachers, students, and neighbors loved it. But when the Casis parents saw it, they demanded that it be removed. Some Zavala teachers reported that major repairs to the school were not done until the partnering with Casis was imminent. Some saw this as preferential treatment by the district for the White, upper middle class newcomers to the school.

The desegregation plan created problems for many people with school-age children in Austin. For example, many Zavala parents did not own cars, and Casis was a 45-minute bus ride away. This made it almost impossible for Zavala parents to attend school meetings or pick up students if they got sick at school. Some Zavala parents escorted their children on the school bus everyday, however, rather than let the youngsters ride that far alone. Busing was traumatic for children who had to leave their neighborhoods and go to a strange school. Many young Zavala children, and even some parents, had never been outside their own neighborhood before. On the other hand, some teachers at Casis were intimidated by the thought of having to work with Spanish-speaking or limited English-speaking parents, as well as children. Teachers also reported that students from both neighborhoods interacted during the school day, but did not become friends and play together after school. Because of these and other barriers, unclear perceptions about the other often remained in both White and Hispanic groups.

Many Zavala parents were monolingual Spanish speakers. They sometimes felt overwhelmed by the influential White parents from Casis. The Casis parents were used to being very involved in school activities, especially the Parent Teacher Association (PTA). Even though the Zavala school benefited from their experience in some ways, some neighborhood residents feel that the White parents took over the PTA and, in effect, kept Zavala parents away. For example, the wife of then Texas governor Mark White, regularly attended Zavala PTA meetings and class parties since her two children were among those bused from Casis.

Casis parents wanted the bilingual teachers at Zavala to teach their children Spanish. That was not feasible, however, since the teachers’ job was to support monolingual Spanish-speakers in learning English, not the other way around. The parents raised enough money to pay a Spanish teacher’s salary, however, thus implementing a two-way bilingual program during those years at Zavala. Several teachers from both schools switched places during this time, creating a more integrated faculty as well as student population.

One White teacher from Zavala remembers that fifth and sixth grade students were separated into “gifted” and “non-gifted” at Zavala for language arts. During the language arts class period, students identified as gifted were sent to a special classroom, and taught by the special “gifted” teacher, with additional assistance from their homeroom teacher. Those students were mostly White, the teacher recalls. Remaining students not labeled gifted, were mostly Hispanic. These students did not get the same enriched language arts experience as the others. Since busing ended in 1987, special programs have been put into place at Zavala to prepare students for honors classes and challenging academic work.

Resegregation: The Current Conundrum

Today, busing continues for Zavala students entering middle school. They are bused across town for almost an hour to Murchison Middle School, located in an affluent, mostly White neighborhood. Zavala teachers sometimes hold special after school tutoring sessions for middle school children, to help them make the transition to the expectations of the new school. Parental involvement has been steadily increasing at the elementary level since Zavala returned to a neighborhood enrollment policy in 1988. The school today is more than 90% Mexican American, and the center of community pride. A new wing will be added soon to replace portable buildings necessitated by increased enrollment.

Conclusions

Zavala has survived as one of the primary elementary schools serving children of Mexican heritage in Austin for over 60 years. It has weathered changes in the academic climate to offer a quality educational opportunity for
Mexican School
Black et al.

children. Even though the hardships of poverty continue to trouble many students, the school was recently nominated as a Blue Ribbon School for educational excellence. The story of Zavala demonstrates variety in the educational experiences of Mexican American students. It represents an urban school especially created to offer the best available public education to children of Mexican heritage, even during periods of educational neglect in many parts of the country. It also represents a compromise, however, between full equality and perceptions of political necessity during eras of both restraint and expansion. It is only by looking at individual school histories that we begin fully to understand the implications of policy decisions on individual institutions and people.

The purpose of this study is to chronicle and analyze the rise of postsecondary military academies in the antebellum North. This study develops an understanding of how military institutions developed in northern states and the larger historical trends that created a climate conducive to their development. Northern states are defined as those that comprised the Union during the Civil War. Northern states were the focus of this study because of the more rapid development of military education in the north and differences in the development of military education between the north and south.

Scholarship on the history of military education in America has tended to focus on events following the Civil War or the origins of West Point. There is ample history on West Point, but little examination of the history of military education beyond that institution. For example, Frederick Rudolph’s *The American College and University* and *Curriculum* goes no further than West Point. In a sum, this indicates a sizeable gap in the literature on military education in the United States, as well as the history of higher education. Existing literature concludes that military education developed largely as a response to national crisis brought about by war (Sack 1963, 499).

The postsecondary military institutions in the United States can be divided, for the most part, into three types. The first type of institution is that controlled by the federal government for the purpose of preparing men and women to be directly commissioned officers in one of the branches of the armed forces (Reeves 1914, 158). Examples of such institutions include West Point, Annapolis and the Air Force Academy. Postsecondary graduate institutions include the Naval War College. The second type of institution is controlled by the state governments (Reeves 1914, 158). Examples of state controlled military institutions are The Citadel or Virginia Military Institute. The third type of institution is privately controlled. For the purpose of this study, the focus will be on privately controlled postsecondary military institutions.

Implying causality is always a difficult issue when working in a historical context. Rather than imply causality, this study is influenced by the notion that economic, political and societal conditions create a climate favorable for change to occur, rather than causing the change themselves. This recognizes that factors favorable for change may already exist, and that larger economic, political and societal conditions act as the catalyst to allow change to take place.

A problematic issue when addressing the origins of military education, is what criteria to use to determine when a college or institution 'exists.' We can formulate a number of possible definitions to establish when an institution exists. It can exist at the point when boards of trustees come together with a common purpose; when an institution is named; when a mission statement is written and agreed to; when it owns property or assets; when it is recognized or accredited by the state; when the first student is enrolled. The problem of existence is evident in the Annual Reports of the United States Commissioner of Education when accounting for the number and condition of colleges in Pennsylvania.

Collegiate privileges have been granted by the legislature of Pennsylvania to between forty and fifty institutions of learning. Over thirty of these are believed to be still in existence, but a number of them are in such a condition of constitutional weakness or premature decay that they would scarcely seem for themselves the rank of a college. Apart from these dilapidated institutions we have some twelve or fifteen live colleges (Report of the Commissioner of Education for the Year 1869-1870 1870, 271).

For the purpose of this study, an institution will be recognized when it has been recognized as an educational institution by state or federal agencies, such as in annual reports by the Commissioner of Education.

Citizen-Soldier Principle

An underlying factor important to this inquiry is the influence of the citizen-soldier principle in early United States history. The central elements of this principle are the subordination of military authority to civilian control and a historical apprehension about a standing, professional military.

The citizen-soldier principle was a legacy of Colonial occupation by Britain. In the twenty years before the Revolution, Britain’s dispatch of thousands of troops to the Colonies placed the civilian population in an uncomfortable position. British troop needs with respect to supplies, impressment and quartering fostered a sense of mistrust toward
The History of Antebellum Military Academies
Duemer

The military (Rogers 1974, 37, 75). As early as the French and Indian War, it was a common and popular Colonial sentiment to assert that a Colonial militia of irregulars was more trustworthy, brave and effective in battle than professional British troops (Rogers 1974, 9-10). The value emphasis on the citizen based militia is articulated in the Second Amendment to the Bill of Rights: "A well regulated Militia, being necessary to the security of a free State, the right of the people to keep and bear Arms, shall not be infringed" (United States Constitution, Second Amendment 1791).

The preference for citizen-soldiers was partly responsible for George Washington’s appointment as Commander-in-Chief of the Continental Army. Those who recommended his appointment did so not because of his previous military service, but based on his experience as a legislator in the Virginia House of Burgesses and in Congress, and his character (Letters of Delegates to Congress Vol. 1 1976, 499-500). Philip Schuyler, the only other general appointed by Congress in 1755 to command a field army, also served in Congress (Rogers 1974, 146). In spite of their high regard and personal respect for Washington, there continued a high degree of suspicion toward the Army. John Adams, though a strong supporter of Washington, advised that the military should be closely monitored (Letters of Delegates to Congress Vol. 1 1976, 667-668).

Preference for a national defense policy based on a militia was evident in the educational philosophy of Captain Alden Partridge. In 1813 Partridge was appointed Professor of Mathematics at West Point. From 1813 to 1816 he served as Professor of Engineering and in 1815 was appointed Superintendent.

Partridge advocated military training as part of higher education. He was opposed to the idea of a large standing army, and was of the opinion that the nation would better benefit from citizenry properly trained in military tactics. Partridge believed that practical and scientific military instruction as part of higher education would produce a nation of physically fit citizen soldiers who could be called upon to defend the nation without the need for a standing army (Nash 1934).

Such concerns were usual for the early nineteenth century. Throughout the early half of the century, West Point was the target of repeated attacks on its existence and mission. The House Committee on Militia submitted a 17 January 1817 report which included the committee’s concerns about and recommendations on military education. The report was as much an endorsement of military education as it was a warning. That the committee preferred a citizen based militia is clearly articulated in their report.

The safety of a republic depends as much upon the equality in the use of arms amongst its citizens, as the equality of rights. Nothing can be more dangerous in such a government than to have a knowledge of the military art confined to a part of the people; for sooner or later that part will govern (Debates and Proceedings of the Congress of the United State 1848, 571).

The committee based much of their criticism on concerns about the power a professional military structure would command. They compared America to ancient Rome which transferred military education from the masses to professional soldiers who in turn, took arms against their own country (Debates and Proceedings of the Congress of the United State 1848, 571). The only logical solution according to the House Committee on Militia was to diffuse military education among the masses through public education (Debates and Proceedings of the Congress of the United State 1848, 573).

Following his departure from West Point and court-martial on orders from President James Monroe, Partridge embarked on a path of revenge against the institution. On 2 March 1820, Partridge presented a memorial to Congress which attacked West Point and complained about the threat of a growing military aristocracy (Journal of the House of Representatives 1855, 333). Partridge’s complaint soon found sympathy, on 10 March 1820 Representative Newton Cannon of Tennessee submitted a resolution in the House Appropriations Committee which recommended the elimination of West Point. It was taken up the same day and rejected by a vote of 12 to six. The committee reported the vote to the full House and no further action was taken (Journal of the House of Representatives 1855, 1632).

Another attempt to abolish the academy was made on 17 May 1834 by Representative Richard M. Johnson of Kentucky. In a meeting of the Committee on Military Affairs he cited formal resolutions from the Tennessee and Ohio legislatures that recommended closing West Point. The committee decided not to recommend closure to the full House (Committee Reports of the House of Representatives 1855, 466.) On 7 January 1836 Representative Albert
Hawes of Kentucky introduced a proposal asking that the House to appoint a select committee to investigate whether West Point should be closed. His proposal was rejected (Congressional Globe 1836, 83).

In 1838 Partridge submitted another memorial to Congress, petitioning for the elimination of West Point. Partridge's second memorial was a change from his first when he only recommended a change in the form and organization of military education (Executive Documents of the House of Representatives 1839, Document 140). Partridge's request was followed in 1842 by similar petitions from Maine and Connecticut (Senate Documents 1842, 85, 363).

1803-1817

Early Private Military Education

Before the American Revolution few opportunities existed for American colonists to obtain instruction in military education. The most likely option was to study military science on one's own. Washington's military education is typical for army officers of the 18th century. He obtained his education through the tutorial method. Much the same as many physicians and lawyers prepared for their careers. The tutorial method involved discussions with battle veterans, readings, observation and practice (Higginbotham 1985, 15).

Americans had to wait until 1788 when General Henry Knox, Washington's Chief of Artillery, opened a conventional military academy in Pluckemin, New Jersey. Knox lectured untrained officers on tactics and gunnery. However, his commitments to active duty soon forced him to abandon and close the academy (Callahan 1958, 155).

The earliest examples of military education were found at small, private schools that included military education into an otherwise typical curriculum for the time. Such schools cannot rightly be considered "military institutions" or "military academies" because the character of the schools was not primarily military. Though they did engage in military education, it was a supplementary component of their curriculum. One of the earliest examples of such an institution was that established by Mrrs. G. and F. Blackburn in Philadelphia in 1800. Their curriculum included classics, English, mathematics and "Military mathematics . . . similar to that of Woolwich, to which will be added a short system of Tactics" (Mulhem 1933, 272-273).

West Point Reforms

A series of reforms for West Point were initiated by Congress in 1812. A 29 April 1812 Act of Congress reorganized West Point and set a tone for the institution which would last into the twentieth century (Reeves 1914, 40). The act increased the number and qualifications for faculty, and increased the number of cadets to 250, considerably more than 156 since 1808 (Debates and Proceedings of the Congress of the United States 1852, 2849-2852). Admission requirements for cadets were formalized, the academy was granted permission to confer degrees, and cadets were required to serve five years in the Army following graduation (Debates and Proceedings of the Congress of the United States 1852, 2282-2284).

A second set of reforms were initiated in 1816 under the authority of Secretary of War George W. Crawford. Crawford's reforms included the appointment of a board of visitors to oversee the academy, description of the proscribed curriculum for cadets, the requirement for yearly examinations of cadets with graduation based solely on performance, and a required four year course of study for all cadets (Lovell 1979, 21).

The reforms were necessary considering the state of disorganization at West Point before 1816. The reforms of 1812 were largely ignored; cadets continued to be admitted without consideration of age or academic qualifications. Consequently, the student body suffered from a high attrition rate, and the institution suffered from a general lack of military discipline on the student level and on the administrative level evident by the continued neglect of the 1812 reforms.

1817-1861

West Point Reforms

In 1817, Sylvanus Thayer was appointed Superintendent and initiated another series of reforms. He immediately organized the cadets into military units; a battalion composed of two companies. A Colonel of Cadets with supporting staff was appointed to supervise discipline and order.

More significant, however, were academic reforms to the academy. Cadets were organized into four classes
and movement upward was based on successful academic performance. Weekly reports on classroom performance
were required for all cadets and a unified system of grading was implemented. Admissions were further defined in 1818
by the Secretary of War to include an entrance examination to be administered to all applicants.

In 1819, as the result of a decision by Attorney General William Wirt, it was determined that the cadets at West
Point were subject to military law, including courts martial. Wirt's decision eliminated any lingering ambiguities about
the interpretation of the 3 March 1815 act of Congress which detailed the military peace establishment of the United
States and specified that the corps at West Point was part of the military establishment. Consequently, the cadets were
subject to all the rules of war and military law.

**Increased Sophistication of Private Military Institutions**

In 1819 the American Literary, Scientific and Military Academy (later Norwich University) was founded in
Norwich, Vermont by Partridge. The curriculum for Partridge's academy was a combination of military science, liberal
arts and scientific study. Partridge's plan was a subtle but significant departure from previous military education in
the United States. Before this point, private institutions that offered military education offered it as a distinct
component from the rest of their curriculum. Partridge developed an institution that combined military instruction with
the liberal arts and scientific education. Still, Partridge was clear to caution observers that his intent was to produce
young men who were as capable of defending their nation, as they were aware of their civil obligations in a democracy.

"I beg not to be understood as recommending a system of education for our youth purely military.

Being far from this: I mean nothing more than that the military should constitute an appendage to their
civil education..." (Partridge 1820).

Partridge's vision of military education was partly shaped by his resistance to a standing military. The intent
of institutions patterned after his model was to provide all the military expertise sufficient for the national defense
establishment. In his framework for military education, there would have been no need for West Point, private military
institutions would have supplied all the necessary personnel for the officer corps.

Partridge's academy experienced rapid success. By 1825 when it had only been operational for five years,
enrollment exceeded 200 students, making it one of the largest postsecondary institutions in the United States. Partridge
founded another military academy in 1826 in Frederick City, Maryland (Laws made and Passed by the General
Assembly of the State of Maryland 1826, Resolution 10). In 1829 the New York Legislature approved the
incorporation of the Harlem Literary and Scientific Academy. The Harlem academy was founded by Partridge and
based on the same plan as the American Literary, Scientific and Military Academy (Laws of the State of New York
1829, 81-82). Other institutions founded on Partridge's plan were the Scientific and Military Academy at
Whitesborough, New York in 1826; Collegiate and Commercial Institute in New Haven, Connecticut in 1836; and Duff
Military Academy in Cooperstown, New York in 1838.

Certainly Partridge's imprint was on the Pikesville Literary, Scientific and Military Academy founded in 1828
in Maryland. The institution's curriculum included the liberal arts, science, civil engineering and military education
(Laws made and Passed by the General Assembly of the State of Maryland 1826, 51). His influence is also apparent
in the 1829 founding of the Western Literary and Scientific Academy in Buffalo, New York. Other institutions that
reflect his educational philosophy include the Military, Scientific and Collegiate Institute in Briston, Pennsylvania and
the Gymnasium and Military Collegiate Institute at Pembroke, New Hampshire.

Following the success of Partridge's academies, Christian denominational bodies began to found military
academies of their own. The Episcopal Church was responsible for the establishment of several military academies in
the Northern states. Among them were Burlington Military College in Burlington, New Jersey in 1846 (Report of the
Commissioner of Education for the Year 1883-1884 1884, 595). The first Presbyterian military institute was Clinton
Military Academy founded in 1816 in Clinton, New York. This was, however, relatively primitive in the historical
evolution of military education as drill composed the bulk of the military component (Report of the Commissioner of
Education for the Year 1874 1874, 582). The Presbyterian Church later founded Alexander Military Institute in 1844
(Report of the Commissioner of Education for the Year 1872 1872, 732) and Yonkers Military Institute in 1852, both
The influence of military and scientific education spread to change the character of existing institutions. Pennsylvania Military Academy was not originally a military school when it was founded in 1821 as a boarding school for young men. A military component was introduced in 1858 and became so popular it defined the institution completely. The curriculum included practical military instruction such as drill, but also theoretical instruction including engineering (Reeves 1914, 180).

Analysis and Conclusions

Early private military institutions consisted of small schools with military instruction defined in a narrow, unsophisticated manner. In the early nineteenth century, military education was often defined as nothing more than drill and military tactics, as was evident in the curriculum at Clinton Military Academy, founded in 1816. Military education consisted mainly of instruction in military subjects isolated from scientific or liberal arts material.

The findings of this study indicate that the most likely explanation for military education development was grounded in a desire to disperse military knowledge across the population. There is ample evidence from the writings of Partridge and debates in Congress that many were concerned about the creation of a military aristocracy as a result of the establishment of West Point. The idea of distributing military knowledge throughout the masses was nothing new to the American people. The earliest settlers existed in a wilderness with a native population that alternated between periods of peaceful coexistence and open warfare. The diffusion of military knowledge was encouraged as a means of survival. One of the earliest examples of legislation encouraging private military education originated with the Virginia House of Burgesses in 1640. A law concerning military education required the male head of each household to oversee the military education of each male family member who was physically capable of bearing arms (Transcripts of General Court Records 1640, 174).

The decade spanning the 1820s represents a turning point in the history of military education in America. With the exception of West Point, until the 1820s, most military academies were focused primarily on military education defined by drill, tactics and military history. The founding of the American Literary, Scientific and Military Academy and the efforts of Alden Partridge redefined the form of military education in America.

Alden Partridge’s influence was central to the qualitative improvement in private military education in the United States. Partridge’s philosophy of military education was far more comprehensive and sophisticated than was previously evident. His proposed curriculum was a combination of military science, liberal arts and scientific study. Military education was a component of a more comprehensive curriculum, not the entire course of study. Partridge’s proposed curriculum revealed a higher degree of liberal arts influence than at West Point, where the curriculum remained more technically based.

Certainly, Partridge was motivated by a degree of lingering hostility toward West Point and the Army. Following his resignation from the superintendency and court-martial for disobedience of orders in 1817 and resignation from the Army in 1818, he began a series of attacks against West Point and national defense policy. However, accusations that hostility toward West Point and the Army were his primary drives can be dispelled by his efforts at developing a unique vision of military education for America. His success at building institutions patterned after his own vision far overshadowed his attempts to destroy West Point.

Partridge’s model reveals an awareness of the modernization trend in American during the early nineteenth century and the need for the infusion of science and technology in higher education. Modernization had a considerable impact on higher education, pressuring it to respond to the increasing needs for men educated in a scientific curriculum. Like competition in business, commerce would force a system of education covering the professions and trades (Reeves 1914, 180). One of the goals of the industrial movement was to apply the findings of science to the changing business order and keep education in touch with the affairs of the world (Ross 1942). With the increasing application of science in the development of industry, and the broadened social and educational vision of leaders in American higher education, “Educational reform and extension were inevitable phases of (this) general movement” (Ross 1942).

The findings of this study also indicate that the growth of military academies was related to the reforms instituted at West Point during the Thayer administration. The reforms helped set a standard for military education in America. That West Point was essentially a military installation with a military focus, justified the inclusion of military
subject matter across the curriculum, rather than as an isolated component. The reforms at West Point raised the level of instruction and student expectations from secondary to postsecondary level. The broader result was to enhance the image of military education and justify its existence in spite of repeated challenges from the public and Congress. Within 20 years, military institutions existed in nearly every northern state. Changes in northern military institutions paralleled some of the reforms instituted at West Point. Engineering and scientific instruction was improved at many institutions, and the quality of instruction overall improved. Additional studies will be necessary to better chronicle the development of private military institutions in the United States. The development of private military institutions in the south will be necessary to provide a comparative perspective of antebellum military education in American history.

Partridge, Alden. To the Public. March 1820. Manuscript in Norwich University Library.

On April 17, 1947, John W. Studebaker, Commissioner of Education, whose office was in the Federal Security Agency (FSA), wrote to Senator William F. Knowland (R-California), chair of the Senate Appropriations Committee:

"I am sure you will be appreciative of the full significance of what I listed as the No. II priority on the list I gave you this morning, namely the educational program on Democracy vs. Communism...If that program can be set up I hope very much that you can be a member of the committee to work with our Office in setting up the objectives and policies for the program and in guiding its operation throughout."

Included with the letter was a four page outline of the proposed program entitled Education to Implant the Ideals and Benefits of Democracy and to Reveal the Evil Character and Tactics of Communism. Studebaker, like so many in the post-war world, believed that Soviet communism was a direct threat to American democracy, and sought to enlist American educators in developing a civic education program that would warn America’s youth away from totalitarian forms of government. As part of his program proposal, Studebaker also recommended the Office of Education (OE) develop a film series that would address aspects of democracy and totalitarianism. Studebaker divided the series into two parts. The first, Our Freedoms, would present the student with information that focused on the ideals and mechanics of American democracy, such as the Bill of Rights and the various freedoms American citizens enjoyed. The second part of the series, Ways of Dictatorship, would be devoted to describing how totalitarian forms of government sought to restrict the people they governed.

Zeal for American Democracy was part of an over-all plan within the OE in support of strengthening national security, and an expression of the rise of anti-communism. What made it unique as a civic education program was its dual nature as it compared and contrasted American democracy with Soviet communism. The fact that the House and Senate Appropriations Committee agreed to fund such a program without much discussion was indicative of the growing consensus within government in regard to the threat posed by Soviet Russia. When the program was first brought to the Senate Appropriations Committee on April 7, 1947, Senator Pat McCarran (D-Nevada) responded that he was glad Studebaker had proposed the program and saw the schools as a logical place to fight against communism on the home front. Although Studebaker's request for $235,678 to develop ZAD, was pared down to $121,213, the Congress had given the program its support and the OE proceeded with confidence.

The basic goals of education for citizenship in the post-war world were ideas that had been discussed during the 1930s. With the advent of the Great Depression, educators used the crisis to promote the discussion of contemporary issues, in order to give the youth of America the practical knowledge needed to be a good American citizen. The world-wide depression also forced Americans to acknowledge their dependence on the well being of other nations, and as the specter of fascism cast its shadow across Europe, educators expanded the notion of citizenship to one that encompassed the world. The conflict between the United States and the U.S.S.R. gave educational policymakers a reason to pursue education for democratic citizenship with a missionary zeal.

Another concern for American educators was the need to facilitate the development of critical thought within the mature student. Encouraging discussion of contemporary issues and problems, especially those of a controversial nature, was necessary in the development of a thoughtful citizen. Throughout the Twentieth Century, progressives in every field of endeavor agreed that the ideal citizen was an engaged and active person who understood the issues affecting her society whether it was on a national, state or local level. For the progressive generation, meaningful reform began at a community level and gradually made an impact on the larger world scheme. This was Studebaker's vision of how Zeal for American Democracy should work, and he sought to assist in shaping an American citizen who would be well equipped to fight communism because she was fully schooled in its tactics and strategies, which could only be achieved through thoughtful consideration. Studebaker strongly believed in the American democratic faith, and that "the inculcation of the faith itself must be a controlling purpose in the conduct of this country's educational enterprise." The basis of that faith was expressed in the American Creed developed after World War I. The creed was
a reaffirmation and commitment to the American ideals of freedom, equality and justice. By the end of World War II it also included notions of the public welfare and the right of all Americans to a high quality of life, regardless of racial or religious differences. In emphasizing these principles, ZAD reaffirmed the framework of civic education that progressive educators of the 1930s had agreed upon, which was fostering within the youth of America the kind of activism that would seek positive solutions to contemporary problems.

In February, 1948, the OE published a special edition of its monthly publication *School Life*. The issue was entitled "Zeal for American Democracy: Education to Meet the Challenge of Totalitarianism," and over the next six months the OE would distribute 35,000 copies to educators, business, and community leaders across the country. The issue opened with a reprint of a keynote address John W. Studebaker had given before the annual convention of the National Council for the Social Studies(NCSS) held in St. Louis the previous November. The speech, entitled "Communism's Challenge to American Education," introduced educators to the Zeal for American Democracy program, and reiterated the idea that education's basic and fundamental task was to help to strengthen democracy.

The OE also used the special issue to promote programs directly targeted for student involvement. One was an annual contest, "Voice of Democracy," sponsored by the National Association of Broadcasters and the Radio Manufacturers. It was a way of encouraging students throughout the U.S. to think and present their ideas about American democracy. Those who won were given the opportunity to record their thoughts, which were then broadcast over the radio. Although the content of this special issue of *School Life* promoted a harsh view of totalitarianism, it also focused on the positive aspects of democracy and encouraged educators to present a balanced view.

A major criticism about the special issue was the lack of concrete curricular material for use in the classroom; however, the OE had been working intensely on a series of booklets and pamphlets which would provide educators with the materials that they called for. The ZAD program was under the daily direction of Edwin H. Miner, Associate Commissioner of Education, and he had assembled a general council made up of personnel from various divisions of the OE. The task before them was to make concrete some of the more idealistic notions of the program. The general council broke up into smaller working conference groups in order to address the curricular needs of the program more efficiently. By February 17, 1948, these groups had completed forty-two outlines for various pamphlets. The first twenty-three projects developed were resource materials to be used by educators on all levels, and subjects ranged from "Developing and Sustaining Loyalty to Democracy," to the "Strategy and Tactics of Communist and Fascist Infiltration of American Institutions." Along with these general projects, there were also those developed specifically for the various educational levels. These focused on suggested activities that students might engage in for a positive "hands on" experience of democracy.

Zeal for American Democracy emerged at the end of a period of transition within the American government. Congress had moved toward a more conservative political outlook and at the beginning of the 80th Congress, Republicans were in the majority in both the House and Senate. At the same time, Truman replaced the New Deal cabinet with one that was more moderate and conservative. It is well known that Truman was never able to achieve a consensus with Congress on his domestic agenda, but foreign policy was another matter entirely, and in the fight against communism the president and Congress cooperated with one another.

Truman moved to make the Executive departments of his government more reflective of his agenda, and to that end he appointed Oscar R. Ewing as the new head of the FSA. As often happens in transitional periods, new leadership can cause tensions and confusion within institutional structures, and the FSA was no exception. The greatest public display of conflict within the FSA occurred between Oscar R. Ewing and John W. Studebaker, and it would eventually affect Zeal for American Democracy, particularly as it concerned the anti-communist component of the program. Given the fact that 1948 was a Presidential Election year, and the OE was part of the Executive division of the government, it was not surprising that its parent agency, the FSA, would try and control the rhetoric of the ZAD program. Oscar R. Ewing became administrative head of the FSA on August 27, 1947. Prior to his appointment, he had spent his political life in New York State, and by 1944 he held the Vice-Chairmanship of the Democratic National Committee. With Truman's approval, Ewing implemented plans that would centralize the FSA to a greater extent, and bring the various constituent units under a stronger administrative control.
John Ward Studebaker, a New Dealer, had served as Commissioner of Education for fourteen years, the second longest tenure in the OE’s history. As a progressive educator, Studebaker’s management style made the OE a strong example of democracy in education, and there is enough evidence to suggest that the conflict between Ewing and Studebaker was a clash between bureaucratic styles and philosophies.

By February 1948, Ewing began putting feelers out for a new Commissioner of Education. Studebaker had built up many enduring relationships within the educational community and one of these was with the publishers of Senior Scholastic Magazine. The publication was aimed at the high school student and created for use in the classroom in conjunction with both the English and history curriculums. On June 21, 1948, Studebaker sent his letter of resignation to the President of the United States. Citing financial reasons as the main consideration, Studebaker was slated to leave his post on July 15, 1948, to become Senior Executive and Chairman of the Editorial Boards of Scholastic Magazines, a post he would hold for the next twenty years.

On July 30, 1948, Studebaker wrote a rather lengthy letter to Ewing stating the actual reasons for his departure. A copy of the letter was also sent to the Chairmen of the House and Senate Subcommittees on Appropriations, Representative Frank B. Keefe (R-Wisconsin) and Senator William F. Knowland (R-California). The tone of the letter was so accusatory that hearings were scheduled in August and September 1948, in order to investigate the situation.

The timing of Studebaker’s letter is interesting because of other events that were capturing the nation’s attention. Twelve leaders of the American Communist Party had just been indicted under the Smith Act, the Soviets were blockading Berlin, the State Department was moving swiftly ahead with the European Recovery Program, the House on UnAmerican Activities Committee had just begun hearings, concerning communist activity within the Federal Government, and the Presidential Election was only three months away.

The letter, which was read into the Congressional Record by both Knowland and Keefe, focused on several issues: Ewing’s reorganization of certain aspects of the FSA and how that reorganization directly affected the OE; how the resources allocated for the ZAD program were being utilized; and the policy of censorship as it related to the language used by the OE in written form describing the totalitarian threat of communism. There was also a disagreement over the primary focus of Zeal for American Democracy. The House Subcommittee of the Committee on Appropriations conducted its hearing on August 4, 1948, and the Senate Subcommittee on Expenditures in the Executive Departments hearing took place on September 27-28, 1948.

The single most important issue that was considered during the hearings was the FSA’s policy of censorship. Under Ewing’s direction, the FSA administrative staff insisted on seeing everything the OE presented in written form concerning the ZAD program; this included press releases, speeches and magazines, anything which might be quoted and attributed directly to the OE. Studebaker noted that in its eighty-one year existence the OE had functioned without such policing except, understandably during times of armed conflict.

One of the most sensitive issues facing the Truman Administration had to do with the rhetoric used to describe the Cold War and the government of the Soviet Union. In order to create an impression of strength and unity, the Truman administration wanted its foreign policy rhetoric centralized. Initially the State Department took responsibility for policy statements but there is evidence that suggests, because of the impending Presidential Election, the control of the rhetoric would shift to the White House. Presidential Advisor, Clark Clifford, recommended that the President, rather than the Secretary of State, make foreign policy announcements, and create the perception that he was a strong, determined and forceful leader. Regardless of where the rhetoric was coming from, government officials within the Executive departments were very cautious about any appearance of overstepping their authority in this area. No one wanted another Madison Square Garden speech, where, in September 1946, the then Secretary of Commerce, Henry A. Wallace, had called for a more conciliatory approach to the Soviet Union in direct contradiction of State Department policy. The speech was delivered while acting Secretary of State James Byrnes was in negotiations with Europe’s foreign ministers, and Wallace’s speech created the perception that there was a division within the Truman Administration’s foreign policy efforts. Byrnes was so angry that he threatened to resign, and rather then lose him Truman fired Wallace.

A little over a year later the Secretary of State, George C. Marshall, noted publicly that at a recent meeting of
the U.N. General Assembly there had been criticism of the United States in regard to its verbal hostility toward the Soviet Union. Marshall acknowledged that much of what had been said by way of criticism was probably for propaganda purposes but he stated that some restraint ought to be exercised when discussing international issues.  

The strongest example of censorship that Studebaker discussed in his letter to Ewing concerned a speech to be delivered by Earl Hutchinson, Field Representative for Secondary Education, and a member of the ZAD group. This incident seemed to become the focal point in both the House and the Senate, and it demonstrates, rather clearly, the attitudes of the sides involved, the timbre of the hearings and how Cold War rhetoric was used to solidify positions of authority at the Federal level.

The circumstances began simply enough when Earl Hutchinson sent a memo to Edwin H. Miner, and asked for a review of a speech he was scheduled to deliver at a conference in April, 1948. Hutchinson was concerned that the tone of the speech might be considered too sensational, and wouldn't make it past FSA officials. Miner passed the speech through to Zilpha C. Franklin, Director of Publications and Reports for the FSA. She in turn gave it to John L. Thurston, Assistant Administrator for Program, who did not approve certain passages within the speech. Thurston thought that the OE was suggesting that the nation's schools teach students the ways and means of ferreting out communists and fellow travelers, and in effect turn them into a police force. The sentence that had prompted such a response read:

"Light must be shed on the insidious methods and strategies of hostile forces, so that every citizen, young or old, can clearly discern these threats and recognize them for what they are, barriers across the path of a forward marching American Democracy."

Under Ewing's direction, the staff of the FSA wanted to minimize the emphasis the ZAD program placed on the evils of communism. They wanted a program that would address American ideals and civic responsibility with an emphasis on the greatness of American democracy. But Hutchinson's speech was not a diatribe against totalitarianism and he stated that the ZAD program should not be considered as "...witch hunting on a national scale...this is not a hate program to effect a curtailment of thinking..." The speech continued to explore what American educators could do to strengthen the qualities of citizenship and respect for democracy. If Hutchinson had called on the youth of America to respond to communism much the same way that the Nazi Youth operated in Hitler's Germany, it wasn't in the body of the speech that was presented before the Subcommittees.

The fact that the inflammatory language Thurston had found unacceptable was missing created a great deal of confusion surrounding the speech. Thurston implied several times, before both Subcommittees, that he thought that there was another draft of the speech. When asked directly during the Senate Subcommittee hearing if he was accusing Hutchinson of lying, Thurston backed down.

The Senate tried to determine if the FSA had a written policy of censorship. The response to that probe was negative as Ewing and his staff insisted that they were only implementing an oversight policy that had existed since the creation of the FSA in 1939. The Subcommittee held the response as suspect because of the similarity of action that had taken place in regard to other speeches, and press releases that had come out prior to Hutchinson's speech. During the Senate Subcommittee testimony Edwin H. Miner was asked what the OE personnel thought about the fact that they had to get clearance on the materials for the ZAD program and not for any other. Miner replied that they couldn't make sense of it because there was no clear statement of policy in regard to the matter, and the lack of a stated policy was effecting the productivity of the program in general. There is some evidence which suggests that Zeal for American Democracy had, because of Studebaker's accusations and criticisms, become part of the campaign process, and there could be some damage to Truman's re-election if members of his administration were seen to be soft on communism. Dr. Rall I. Grigsby, Acting Commissioner of Education, said during his testimony that he thought the political implications of communism, particularly as they effected public relations, justified Ewing's actions in regard to censorship. Asked by Senator Homer Ferguson(R-Michigan) if he thought, "...that the political head of your department should review it and see whether or not it is good public relations?" Grigsby answered in the affirmative, and said that it was particularly true when educational matters focused directly on national concerns, such as teaching about communism in the classroom. Ferguson asked "...then as I understand it very little will be done against
communism until after election, as far as this program is concerned, because it is a political issue?" Grigsby, as acting head of the OE, concurred.

Internally, the OE continued to pursue the ZAD program even though the House and Senate had not appropriated any funds for the coming fiscal year 1949. Civic education projects were better developed within educational circles outside the government. Between 1947-1954, there were several brought to fruition, such as the Detroit Citizenship Study, and Columbia University Citizen's Education Project, but the ZAD program was the only one of its kind to compare two ideological systems of government in such a forthright manner. The demise of the ZAD program on a national level was part of the trend, within American society, to try and suppress intelligent discourse on the subject of communism. Although educators thought the subject warranted attention, the national security agenda meant that there had to be some control over the perception of the Soviet Union so that public opinion would support United States' military expansion and foreign aid.

Zeal for American Democracy sought to serve national security in its comparative approach, but the educational philosophy behind it encouraged the development of critical thinking, and exploration of controversial issues. This paradox of wanting an informed citizenry that would champion freedom, equality and justice over tyranny and oppression, conflicted with the government's compulsion to control how much freedom, equality and justice were to be meted out to make the world both at home and abroad safe for democracy. If America's youth were going to be inculcated with anti-communism it would not be through the agency of the public schools.

I met Ivan Illich in one of the first graduate courses I took as part of the doctoral program at Northern Illinois University. Having become concerned about the increasing isolation of individuals in society and the decreasing sense of community, I was particularly attracted to his discussion of the medieval commons as a metaphor for those areas of traditional living that are vital to our individual and collective well-being. These are the areas which provide for human connection and contact with the natural environment. From his works I understood that industrialization and the resulting corporate domination had commodified such spaces making them scarce, I understood that learning was about living as one discovers and develops self in the context of connection and Spirit, and I learned to question ideologies; a process which my education had schooled from me. Over the next several years I read Illich’s extensive publications in an attempt to discover the scope of his work. Originally intrigued with his thoughts, I became increasingly attracted to the vibrant soul that is Illich.

Ivan Illich is a Roman Catholic priest who emerged as an uncomfortably powerful voice not only within the Church, but throughout societal discussions in the 1950s. Serving first as a priest in a Puerto Rican parish and later serving as vice-rector or the Catholic University of Puerto Rico he became interested in the problems facing Latin American missionaries. Developing a highly anti-imperialistic stance, Illich started the Institute of Intercultural Communications (later emerging as the Center for Intercultural Documentation in Cuernavaca, Mexico) as an intensive language school for missionaries. Concerned that North Americans were diminishing Latin American culture in their attempt to bring development to the many countries they served, Illich tried to dissuade all but the most qualified from serving in such a role and alienated many within the Church’s hierarchy with this revolutionary stance which asked all to question institutional ideologies. Moving from the institutional agendas of the Church to the hidden agendas of educational institutions, he is most well known for his admonition to eliminate compulsory education. Illich’s orthodox message that we must allow the diversity of actualized selves to surface rather than succumb to an institutionally managed truth was carried in unorthodox rhetoric. His books became highly controversial within and outside the Church.

From 1969-1973 most professors of education in the United States knew the name of Ivan Illich. Today academic educationists, if they recognize the name at all think of him as the distant relic of “deschooling”. While Illich has published steadily since the 70’s, his books are rarely noticed in academic circles even though his message is even more relevant to today’s version of institutionalized diminishment.

Illich’s main theme has always been consistent—humanity’s hubris in assuming that one can plan life. “Classical man was aware that he could defy fate-nature-environment, but only at his own risk. . . . Contemporary man goes further: he attempts to create a world in his own image, to build a totally man-made environment, and then discovers that he can do so only on the condition of constantly remaking himself to fit it.” (Illich, 1971, 154).

While Illich’s message is clear it is not always easy to accept. Our only focus of control in life is the ability to change our perspective. We are in Illich’s words, “radically powerless” and in that acceptance lies our “power”. Power is actually the relinquishment of control. Our only power is choice. For many years Illich’s idealistic message of convivial but austere living was too painful for a population who seeks to defy limitation and thrives on manipulation. We are a people who are only comfortable with outcomes we have planned and managed rather than anticipating whatever surprise or mystery awaits. We strive for safety, prosperity, comfort, long life and dullness. A people of faith we are not. Our economic focus based on scarcity leads us to view each other as needy rather than gifted as we diagnose deficits rather than celebrate uniqueness. No wonder we look to the future with great cynicism, rather than savoring the present. We don’t live; we exist, and considering the manner that we have managed, even that is in doubt. It is for this reason that we must revisit Illich’s thought.

I spent the next two years reading as many of Illich’s works as I could find, which was not always easy. He is much more extensively published in Europe than in the United States. More importantly, I met with Illich in Bremen, Germany at which time we discussed how his thought had evolved in the field of education over the course of three decades. Our discussion centered around the seven points that Illich felt were topics that had emerged over the years.
as a result of changing societal conditions. From the beginning of his work on education, Illich had perceived institutionalized education as limiting. His new conceptions of education found it to be increasingly devastating. These included the concept of humanity as needing education—*homo educandus*, the concept of education as prison, the disembedding of life spheres, the separation of learning and doing, the concept of content-sensitive help programs—technology which prevents us from thinking, the loss of sensory experience in learning, the removal of physical manipulation from the development of technological tools used in learning, and the importance of an ethos of friendship as the basis for learning.

Arriving home, I delved further into Illich's works and looked for the evolution of the seven points we had discussed in Bremen. Upon reflection I realized the basically Ivan's thinking had not changed, but rather had deepened and after lengthy deliberation decided that these seven points actually fell into three groups of thought. The concept of “humanity needing education” related to “education as prison” in its discussion of the critical issues in the generation of knowledge. The disembedding of life spheres (particularly the educational sphere), the separation of learning and doing, content-sensitive help programs, loss of sensory experience, and the removal of physical manipulation from the development of tools for learning all spoke to the connection of knowledge to selves and nature. Finally, the importance of an ethos of friendship as the foundation of learning was probably the most radical and foundational.

In rereading many of Illich's seminal works, as well as the newer pieces which were so graciously provided me in the course of our meeting, I realized that these groups reflected Illich's thinking in a chronological sense as well. The first group of publications relating to institutional generation of knowledge emerge in his earliest thought. The second, which reflected a need for an understanding of the connection of knowledge to our sense of self and place represented Illich's thought during the 1980's. The third theme, suggesting that all learning must be guided by friendship is found in his most current work.

Illich's writing, while addressing specific issues, incorporates his all-encompassing focus on the relationship between God and humanity as the central organizer. “As you see, I engage philosophy as *ancilla*, not just to avoid blunders on the path to the good life, but to avoid perverting the Gospel” (Illich, 1996, 4). While Illich's thoughts do progress over the years, a common thread emerges throughout and so a discussion of genesis of thought does not follow strict divisions of publications or time. Nonetheless, it is easier to speak of change in terms of decades: 1968-1978, 1978-1988, and 1988-1998.

1968-1978

During his first decade Illich identified those qualities of education which he felt dilute specialness and in fact imprison one in an economic web of modernized poverty. Defined as needy both in an educational and economic sense, we become dependent upon institutional solutions. Imprisoned through stupefying educational systems we lose our sense of possibility.

Illich introduced the theme of neediness in *Deschooling of Society* with great intensity. In his publication, Illich sees school as an institution which perpetuates the myth of unending consumption (someone produces something and then produces the demand for it). We become addicted to education and must expand schools to feed this addiction.

Since *Deschooling* Illich has carried this concept even further. He historically traces the emergence of *homo educandus* to the time of John Amos Comenius (1592-1670). Comenius was a Czech educator and bishop who pressed for more schools and universities in his promotion of a broad general education which he considered necessary for living. “Education, as the term is now used, means learning under the assumption that this learning is a prerequisite of all human activities, while at the same time, the opportunities for this learning are by their very nature in scarce supply. Thus understood, learning is an aspect of life which can be adequately distinguished from other aspects. Learning precedes, if not temporally at least logically, the competent execution of a socially expected task” (Illich, 1992, p. 115). In other words, through the Comenius construct, learning became disembedded from living.

In a more dramatic analysis, Illich uses the metaphor of prison to explain the current function of schooling. Illich believes that prisons celebrate the ritual of losing the freedom of choice. These institutions are useless, damaging and very costly. In Toward a History of Needs Illich delineates three factors involved in education which enslave individuals: enslavement of consumption, enslavement to industrial tools, and the enslavement of impoverishing wealth.
Illich describes schooling as an epoch-specific phenomenon recently invented as a more convenient way of dumbing down individuals to take their appropriate places in a modern consumer society—we can’t imagine life without it. Illich implores us to develop research on education rather than in education. He asks us to question the philosophical foundation upon which the assumption of schooling rests rather than finding ways to make it more efficient. If this were done, comparative education would become one of the rare fields that attempts to clarify one of the least recognized and most characteristics of our age: “the survival, even at the heart of highly developed societies, of fantasies, behavioral rules and patterns of action that have successfully resisted colonization by the regime of scarcity.” (Illich, 1992, 118) Illich stated at this time that we have become prisoners to the professionals who create our educational addiction and then charge dearly for detoxification.

1978-1988

During the next decade Illich perceived a change in the way we live. Ever more distanced from the natural world, technology allows one to learn through images. Our sense of self has been distorted. Learning based on what humanity had created rather than Divine creation causes us to view ourselves as a reflection of the machines and constructed images with which we work. Life as system becomes easier to manage, but remote and minimal.

The Thomist lens which Illich uses to view the world asserts that all knowledge, including the spiritual, takes its starting point (and so always remains dependent upon) sense perception. Further, humanity consists of the unity of body and soul. The body belongs to the essence of an individual. The body is not the ultimate bearer of knowledge, but rather humanity, composed of body and soul. Therefore, knowledge is approached through the intellect, but has no meaning until one applies it to the task of self-discovery. While the Divine exists in each of us, we discover this self through sensual experience and our groundedness within this experience. Learning takes place within a specific physical presence. From 1978 to 1988 Illich became increasingly concerned with technology which distanced us from such sensory and grounded experience associated with the natural or the creatura of the Creator.

Prior to the industrialization revolution life centered around the home. Working, learning, living were an integrated whole. There was an integrity to life as learning and doing were one and the same. Experience was not fragmented. With work moving into factories and workplaces outside the home and education moving into separate facilities, life spheres became disembodied. One worked at a certain location, learned in another, all the while living elsewhere. It became difficult, if not impossible to apply knowledge to a sense of an integrated self.

As disturbing, the advent of the computer disembodied learning. One learned from images rather than natural phenomena. One now viewed oneself as a system rather than a life. We had moved ourselves further and further from the real. Illich’s second decade of writing reflected his growing concern with the fragmentation of life experience and disembodiment of learning. Unable to know what is real, individuals apply distorted knowledge to artificially concocted selves.

Computer technology also fostered the destructive trend toward “content-sensitive help”. We are encouraged to be passive receptors of information rather than active learners who facilitate connection of knowledge. In the Mirror of the Past speaks of the memory of the past which differs from person to person. This is the memory of culture. Illich defines culture as those practices which seek to preserve the commons and its vernacular elements, “What else is culture but the frame within which the shadows come back and are enfleshed? . . . Different ages have used different devices to conjure up what has been. Greeks the lyre, Aztecs the flute, Bushmen the drum, to make the whole body of mnemosyne resonate to the rhythms of the past.” (Illich, 1992, 186)

In accepting the premise of life as duration of time and the accumulation of experience, one can only learn through the memory of experience and can only make choices through the imagination of possibilities. Creative evolution depends upon the inventiveness of life and mind. Lacking sensual experience and memory, we are unable to imagine. The theme of this catastrophic change was made evident in H2O and the Waters of Forgetfulness, published in 1985. In this book Illich wrote about the “historicity of stuff”, and reflected on how the natural stuffs of our world were losing their imaginative associations and metaphors. This book resulted in a request for Illich to speak to a group in Dallas, Texas who were planning on constructing a lake, fountains, and waterfalls from recycled sewage water. Illich felt that the industrial solvent Dallas hoped to use in its beautification program might chemically be H2O, but it had
lost its ability to mirror the water of dreams.

I do believe that in this world into which I see the young generation now moving, it is not only their voice they are losing by imagining themselves along the model of the computer, it is also that they are emerging as a generation rid of stuff. . . I am saying the deadness which sets in when people have lost the sense to imagine the substance of water, not in its external appearances, but the substance of water, that deadness might be worse for those who live on than the diseases that set in, the AIDS analogues which will set in because there are too many organic phosphate residues . . . I'm speaking of the deadening of the imagination. (Illich, 1992, 27)

We have so deadened our ways of feeling and doing that we no longer have the ability to create. Moving from an active oral tradition of learning, text had caused us to fatally describe experience. The current concept of life as system, mind as computer, left no space for imagination. Technology has successfully blocked connection.

Just as importantly, the death of imagination precedes the extinction of understanding of other so critical to the celebration of diverse beings. It is only by imagining what you as other feel or experience can one hope to find common ground for community. Within his writing Illich takes us from the need to detach for critical generation of knowledge, to the need to integrate and embody human experience, finally reaching the need to respect the individual embodied experience of others through imagination. The more diverse and embodied the experiences the greater the ability to imagine how others feel or know. The desire to empathize with others is whetted in friendship, and it is through friendship that we arrive to wisdom. During the next decade, friendship would become an extremely important context for knowledge in his writings.

1988-1998

Illich's life continues to be instructive, following those precepts he so ardently espouses. He lives as an independent scholar, with no permanent attachment to any contemporary institution, earning no regular salary. While I visited with Illich in Bremen, he worked closely with small groups of students. Providing the ultimate open door policy, students and friends visited and discussed, came and went, always being greeted with the greatest respect.

Illich currently spends part of his year as visiting professor in the science, technology, and society program at Pennsylvania State University, part of his year in a similar role at the University of Bremen, and part of his year writing in Cuernavaca, Mexico. While Illich possesses a passport from the United States, he does not claim a country. He has a group of friends to whom he is infinitely loyal and they to his. True to his most foundational thoughts, friendship forms the structure of his life.

If technology has successfully separated us from nature, learning becomes disconnected as our senses wither from disuse. According to Illich, the answer to this cataclysmic loss lies in the renewal of friendship as the basis for living and learning, which for Illich are one and the same. Friendship provides the basis for the exchange of Divine gifts as well as for the natural limitation of tools. Always placing the needs of others first we share what is most valuable in our lives (our talents) and defer in our needs to those with whom we live. Both physical space and time must be provided for this exchange. Friendship must be the basis for all learning both as a process and as focus as we re-engage the real and authentic.

In the study of theology, ecclesiology was my preferred subject; and, within this discipline, liturgy. Liturgy, like ecclesiology, is concerned with sociogenesis. It inquires into the continued embodiment of the Word through rituals. Necessarily, these rituals often center on objects like tables, tombs, and chalices. So, my interest in these so-called sacral led me to the theory of instrumentally used objects. I pursued the nature of the artifact in the belief that understanding would deepen my insight into virtue in our epoch, especially the virtue of charity. Therefore, the love of friendship philia, as practicable under the social and symbolic conditions engendered by modern artifacts, has been the constant subject of my teaching. For me, philosophy is the ancillamicitiae. (Illich, 1973, 7)

Illich discusses friendship throughout his writings, but in his earliest works the importance of austerity in friendship most frequently emerges. In Tools for Conviviality, Illich began such a discourse. This volume contains a historical study of tools and tool use. Illich came to the conclusion that the character of tools today has a direct
relationship on personal and social possibilities. Illich sees energy and education as such tools. With the first we are moved and the other we are taught. “Because of the way these tools are designed and operate, privilege, power, and prestige necessarily cluster around a few persons. The many—you and I, the individuals we know—are reduced, to stupefication. And there is no way to remedy this situation short of draconian re-structuring of society’s tools. (Illich, 1973, 7)

In this case friendship suggests the limitations one should put on the production of tools and their use. One must self-limit out of concern for other. Further, we must unite in a political inversion: “If within the very near future man cannot set limits to the interference of his tools and the environment and practice effective birth control, the next generations will experience the gruesome apocalypse predicted by many ecologists. Faced with these impending disasters, society can stand in wait of survival within limits set and enforced by bureaucratic dictatorship. Or it can engage in a political process by the use of legal and political procedures.” (Illich, 1973, 100)

Illich comes to a much more connected and relational concept of friendship in his later works. As I read In the Vineyard of the Text, a 1994 publication, I was most impressed with Illich’s complete identification with Hugh of St. Victor. Hugh was a Parisian monk who wrote the first book on the reading of text. In this work he attempts to reconcile technology and philosophy. Hugh writes on friendship as wisdom:

To my dear Brother Ranulf from Hugh, a sinner . . . . Charity never ends. When I first heard this, I knew it was true. But now, Dearest Brother, I have the personal experience of fully knowing that charity never ends. For I was a foreigner and met you in a strange land. But the land was not really strange for I found friends there. I don’t know whether I first made friends or was made one. But I found charity there and I loved it; and could not tire of it, for it was sweet to me, and I filled my heart with it, and was sad that my heart could hold so little. I could not take it all there was—but I took as much as I could, and weighed down with this precious gift, I did not feel any burden, because my full heart sustained me. And now, having made the long journey, I find my heart still warmed, and none of the gift has been lost: for charity never ends. (Illich, 1994, 27)

In this passage Hugh reflects the metaphor of seeking wisdom as journey; wisdom residing in a place in one’s heart. Friendship assists us in this pilgrimage. Illich reflects the need for friendship in learning throughout the decades, but the emphasis on connection and support becomes especially clear in his latest works: “But my conviction has only deepened: The time of qualification by curricular attendance, the time of schooling which grew out of the idea of seminary and the ratio studiorum, is over. Even now, higher learning depends crucially on hospitality and friendship and lifelong personal emulation in those virtues which establish the independent stance of heart and mind on which studium . . . . depends.” (Illich, 1998, 2)

While allowing for connection in political community has always been an important focus for Illich, I believe that in his later years friendship provided an even greater model for an ethos in learning. Illich had always defined life in terms of the ability to maintain relationship. Now he sees friendship as a guide to wisdom. Friendship provides the human face of truth through which one finds multiple perceptions; fuller perceptions of reality through relationship to others. The world we know cannot speak back to us. We come into a community of mutual knowing through friendships both past and present.

Each of us can remember his own past. But the older I get the more I treasure the discrepancies between what is uniquely mine in the past and what others can share with me. The past that appears in this interstice is the past that can surprise me. For even when we have grown up together and later on recall the same moment that we lived together, my substance that is recalled is frequently not yours. And, further, the chords which the past strikes when it comes to me might jar those that respond in your heart. Only years later I suddenly grasped that when those bells tolled for the wedding, for you they meant death. This is the one reason why I like to reminisce with others: the shoddy evening that made me cringe when I thought of it has put on a festive dress since you told me about it. (Illich, 1992, 182)

Conclusion

In the course of the past three decades Ivan Illich has moved from a discussion of the dangers of institutionally
generated knowledge, to understanding the connection of knowledge to our sense of self, to the necessity of placing learning in a context of friendship. While all learning was always viewed Thomastically as a means of discovering self, Illich proceeded from a discussion on knowledge, to understanding, to wisdom.

I believe that what Illich abhors in today’s compulsory education is the fact that coerced institutional education is planned and packaged for standardized groups. We remove individuals from the ability to be surprised. Educators rarely allow one to find themselves and develop unique talents, but instead ask each to fit into standardized diminished selves—one size fits all.

The Christian truth which Illich advocates is universal but not objective in the sense that it is “out there”. Parker Palmer describes such: “Instead, truth is personal, and all truth is known in personal relationships. Jesus is a paradigm, a model of this personal truth. In him, once understood as abstract, principled, propositional, suddenly takes on a human face and human frame . . . . Indeed, if truth is personal, then creeds and institutions are only objectified shells of the truth-seeking life that pulses in every human heart. We will find truth not in the fine points of our theologies or in the organizational alliances, but in the quality of our relationships—with each other and the whole created world.” (Parker, 1992, 73) This personal truth of Christianity is not just an epistemology, but rather a way of living. For Illich knowing is based upon intentional living and learning from relational experience to both Spirit and friends.

Community Schools in Texas: A Failed 19th Century Experiment in School Choice

Alan W. Garrett
Eastern New Mexico University

Community schools were established in post-Reconstruction Texas as a response to a despised, centralized school system created following the Civil War. They were organized in a way unique to Texas. More than a mere historical oddity, community schools exhibited several characteristics that correspond to school choice plans discussed today. Thus, an understanding of the background, organization, problems, and ultimate demise of community schools can inform contemporary school choice debates.

Prior to Reconstruction, public schooling was virtually nonexistent in Texas. Several factors led to this situation. First, the costs of providing public education were too great for a relatively new state. Debt and a general absence of money were constant conditions from the state’s earliest settlement, through the Texas Revolution, years of the Republic of Texas, early statehood, and Civil War. Compounding the problem of the unavailability of funding was the fact that the relatively small population tended to settle diffusely in order to pursue agricultural interests. Even had finances not been a problem, the citizenry by and large was not yet prepared to support public education. Most early settlers came from existing Southern states where, unlike in New England and the Midwest, there existed neither traditions of nor expectations for public education. Attitudes in Texas at that time, as well as in other Southern states, regarding public education transcended benign neglect. Many, if not most, citizens regarded state funded and mandated schooling as incompatible with liberty, a form of charity and coercion inappropriate for a free people (Eby 1925).

Substantive efforts to establish public schools did not begin until after the Civil War. Several school laws were passed between 1866 and 1869, but their impact was negligible (White 1969, 170 – 173). A new state constitution written in 1869 addressed education explicitly and provided for free schools for all children between the ages of 6 and 18 years and for compulsory attendance for a minimum of four months each year. The 1869 constitution also created the office of superintendent of public instruction and mandated that counties be divided into school districts with local boards of managers (Eby 1925, 158). Legislation passed in 1870 to implement the constitutional provisions regarding education was largely ignored (Albright 1940, 40).

Incensed, leaders in the Reconstruction government then authored and passed the School Law of 1871. According to Frederick Eby (1925), this law was the most imperial system of education known to any American state. It was organized along military lines and assumed absolute authority over the training of children. (159)

Authority for policy and curriculum making was vested in a three member state board of education consisting of the superintendent of public instruction, governor, and attorney general. The responsibilities of this board were:
- To adopt all necessary rules and regulations for the establishment and promotion of public schools.
- To provide for the examination and appointment of all teachers.
- To fix the salaries of all teachers.
- To define the state course of study.
- To select textbooks and apparatus for the schools.
- To prescribe the duties of the boards of directors of the several school districts. (159)

The superintendent of public instruction also was responsible for the collection and dissemination of statistical and other information related to the schools, oversight and distribution of fiscal resources from the school funds, and approval of various appointments, accounts, and contracts. For each of the state’s 35 judicial districts, the superintendent of public instruction appointed a district supervisor. Finally, should local boards of directors fail to provide adequate school facilities, the superintendent was authorized “to rent rooms or buildings for school purposes anywhere in the state . . .” (160). Immense discretionary powers were given to the three men who constituted the state school board. They controlled practically every aspect of the newly formed school system.

The 35 district supervisors appointed by the superintendent of public instruction divided each of their regions “into convenient school districts” and appointed a five-member board of directors for each district. As agents of the state board of education, these supervisors were responsible for enforcement of state board directives as well as reporting to the superintendent of public instruction and state board those students who did not abide by the state’s compulsory attendance laws. They also examined teachers and prospective teachers who might be appointed by the
state school board to teach in local schools (Eby 1925, 160).

Finally, each of the local districts created under the School Law of 1871 was overseen by an appointed local board of directors. These directors had only two real powers. First, they were to decide whether to have integrated or segregated schools, essentially a nonissue in 1870s Texas. Second, they were allowed to select the locations for school buildings. In addition to these two decision making opportunities, the local boards were delegated the enforcement of the two most hated provisions of the 1871 law. They were to levy and collect a tax to fund the school buildings within their districts and to enforce state compulsory attendance laws (Eby 1925, 161).

To describe the educational system established under the School Law of 1871 as unpopular with Texans would be an understatement. Commonly known as “the radical school system” due to its creation during that phase of Reconstruction in Texas, it also was referred to as “the infamous school system” by those familiar with it (Eby 1925, 162). Although no compulsory education system imposed by the Reconstruction state government, and perhaps no compulsory system at all, likely would have found favor with Texans during those years, three characteristics of the radical system were especially unpopular. A one per cent property tax for the building and support of schools was the most hated aspect of the radical school system (Eby 1925, 162 – 163; White 1969, 203 – 204). Compulsory attendance, too, proved highly distasteful to the citizenry (Eby 1925, 164; White 1969, 205). This first attempt in the state to impose compulsory attendance, especially by a government viewed by most as illegitimate and alien was bound to meet vigorous opposition. Such government intrusion into what many people viewed as a personal responsibility violated their long-held traditions and mores. Finally, the appointment of teachers by the distant state board of education without consultation of those people in the localities involved as opposed to appointment by the local boards not only resulted in anger, but also invited speculation and accusations of “graft and favoritism” (Eby 1925, 162 – 166).

Despite widespread intrastate dissatisfaction with the radical school system, its benefits must not be overlooked. This was Texas’s first significant attempt at public education, and it was begun on a statewide basis. In 1870, on the eve of this great experiment, there were no public schools in the state (Albright 1940, 39). The School Law of 1871 provided free schools for both races, assured that teachers in schools were, on the whole, more competent than either their few predecessors or immediate followers, and offered a degree of efficiency through its highly centralized operation. Worthy of note is that the radical school system tended to be viewed favorably by people who lived outside of the state, especially those from regions that had a tradition of compulsory public schooling (Eby 1925, 167).

Texans, however, were not impressed with the educational benefits afforded by the radical school system and sought to dismantle it as soon as possible. They had that opportunity only four years after the system was established, in September of 1875, when a new state constitution was written following the end of Reconstruction in Texas (Eby 1925, 169 – 170). The School Law of 1876 that enacted the educational provisions of the new constitution provided for a state board of education with “general oversight” authority only and an appointed secretary to the board who merely collected and disseminated information (171). Unlike his predecessor, the superintendent of public instruction, the secretary held no supervisory powers. Alienated by the almost military hierarchy of the radical school system, Texans sought to establish an educational system that afforded maximum local control and gave parents a wide latitude of choice when making educational decisions for their children. Community schools were the outcome of those desires.

Community schools were organized on an annual basis by interested parents, and state funding was provided based on the number of students that parents forming the community school asserted would attend for that academic year. Frederick Eby (1925) best described the community school system and how it worked:

[T]he parents and guardians were permitted to unite and organize themselves into school communities, embracing such population as might agree to take advantage of the benefits of the available school fund. The parents submitted to the county judge, who was ex officio county superintendent, a list of the children whom they wished to send to the school. This officer was required to appoint three trustees to act for the term in which the school was to be in operation. These trustees were charged with the employment of the teacher, and the general oversight of the school. This entire process had to be repeated yearly. There were no definite boundaries for the
school communities, and the patronage of schools shifted from year to year. Any group of children, however few there might be, could form a school. The "community" was a purely voluntary district in the exact sense of the term, having a legal existence for one year only. (172)

Thus was formed on a statewide basis a public school system exhibiting characteristics very much like some educational choice plans discussed today. Before pursuing these similarities in greater detail, an understanding of the decline and ultimate demise of community schools is helpful.

Community schools offered a Reconstruction-weary populace several perceived advantages over the radical school system. Parental discretion was maximized and state regulation minimized. With no lower limit on the number of students required to form a school community, access to state educational funding for all students, even those who lived in sparsely populated areas, became readily available (Eby 1925, 172). Schools could be located near students and not confined to fixed locations in permanent districts, a definite advantage for a mobile population always seeking better opportunities. Unfortunately, community schools’ disadvantages far outweighed their advantages.

With no provision for the local collection of taxes, schools depended solely on the state for their support. Localities could not have used local tax efforts to improve the educational opportunities for their students, had they desired to do so, and remained within the state’s public school system. School communities could not construct permanent buildings nor could they amass from one year to the next collections of instructional materials due to their statutory life of one year. This lack of continuity compounded by ever-changing trustees and school locations adversely impacted public support for local schools (Eby 1925, 173; Hodnett 1935, 20). Without the state oversight and regulation of the radical school system, community schools tended to employ less qualified teachers (Hodnett 1935, 32), perhaps engaging in more “favoritism” than had existed under “the infamous school system.” Finally, the community plan not only promoted the creation of many small school districts each year that squandered public funds in inefficient attempts at schooling, but, more importantly, it was organized in such a way that the “graft” associated with the radical school system could be practiced on a statewide basis. Parents could affiliate with any school community, no matter how distant. Given the limitations of transportation at that time, students legally could become members of communities that they had neither the ability nor the intention to attend. Nevertheless, state funding for such students would follow their purported enrollments (Eby 1925, 173). The problems precipitated by the community school system in the names of parental autonomy and local school control were great.

In fact, by June of 1879, just three years after the creation of community schools in 1876, the legislature undertook its first tentative steps toward the reform of this unsustainable system. Among the potential improvements suggested were the hiring of better qualified teachers, increasing state and local supervision of schools, the formation of permanent school districts, and the development of more stable sources of funding (Eby 1925, 176). Unfortunately, remembrance of the hated radical school system remained too great, and, ultimately, the legislature only could reduce school appropriations and require that each community school maintain an attendance rate of at least 75% if its teacher was to be paid (175). Reducing appropriations indicated the degree of dissatisfaction with the ways in which state funds were being expended, a recognition of the ineffectiveness of the system. Establishing a mandatory minimum attendance requirement demonstrated that many students, in fact, joined school communities without serious intentions of attending school and, either inadvertently or with forethought, caused state education funds to be expended for other than their benefit.

Eight years after the establishment of community schools and five years after the state’s first attempt to reform them, the legislature began to dismantle the community school system. The Peabody Commission’s work for the improvement of education in Texas as well as adequate temporal distance from the radical school system allowed the legislature to pass the School Law of 1884. This law contained five significant provisions to reform and improve public education:

1. A state superintendent was to be elected to have general supervision over all the schools of the common school system.
2. All counties except fifty-three which were especially exempted were to divided into school districts. The fifty-three exempted were mainly in east Texas and in the Rio Grande Valley. They were to retain the old form of annual reorganization of schools, now known as the community plan.
3. District or local taxation was authorized up to 20 cents on the $100 valuation, provided two thirds of the property owners who paid taxes voted in favor of such a tax.

4. A state tax up to 20 cents on the $100 valuation was to be collected on all property or as much as was necessary with other sources of income to maintain the schools for a term of six months each year.

5. The school fund was to be invested in county or other bonds, thus enlarging the means of steady investment of the permanent fund. (Eby 1925, 195)

Forty-eight years after independence and 39 years after statehood, Texans realized the importance of a stable, adequately funded system of public education and began to establish one. Community schools, however, persisted. Their numbers in the counties in which they were allowed varied from year to year, as was their very nature, but, by 1893, community schools began a constant numerical decline as many counties exempted from the permanent districts called for in the School Law of 1884 recognized the superiority of such districts and accepted the provisions of that law. By 1909, the legislature mandated that the 12 counties then still using the community system abandon it and form permanent districts (211).

Thus ended a chapter of educational history written only in Texas. Community schools and their problems, however, should not be relegated to the forgotten memories of the irrelevant past. Their parallels with contemporary school choice plans offer insights unavailable elsewhere.

Although late 19th century Texans did not employ vouchers in their community school system, the funding mechanism employed was surprisingly similar. Peter Cookson (1994) defined a voucher as “any system of certificates or cash payments by the government that enables public school students to attend schools of their choice, public or private” (16). Two differences emerge. First, payments under the community system were made to the school’s trustees, not directly to parents. Second, all community schools, by definition, were public. Features inherent in the organization of community schools, however, provided parents a great deal of educational choice, at public expense, as that term is understood today. Since community schools had a legal existence of only one year, parents were not merely able to make decisions about the school of their children’s attendance each year; they were forced to do so. Parents annually determined the nature of the school their children would attend when they voluntarily formed their school communities. In all probability, the petition process could have been used not only to include certain students but also to exclude others. School choice under the community school model also transcended limited selection between established alternatives. Parents actually “created” their own schools to their own likings.

Affording parents this degree of latitude in educational decision making was a primary intent of the School Law of 1876. Shifting power and responsibility away from a handful of individuals perceived as remote must have seemed to be an improvement to post-Reconstruction Texans. No longer would educational decisions be made by “outsiders” who often viewed the world far differently than most parents. This line of reasoning is very much akin to the “community-power rationale” for educational choice that asserts, among other tenets, that schools are useful for “reinforcing and transmitting local values” (Henig 1995, 17).

Today’s most commonly asserted rationale for school choice is that of the market. Parents, free to choose from among competing alternatives, presumably will make informed, studied decisions, in effect “buying” the best educational “product” for their children. John E. Chubb and Terry E. Moe (1990) are two of the most prominent apostles of this viewpoint. They proffer that choice, in fact, is the long sought educational “panacea” (217), claiming that market control will lead to academically superior schools (190).

Chubb and Moe, along with numerous other educational choice advocates, view the market as the ultimate determinant of good and bad, of right and wrong. This simplistic view is reminiscent of another “panacea” foisted upon educators and the public during the early years of the 20th century. Franklin Bobbitt (1918), too, believed that there existed “certain general principles of management and supervision that have universal applicability” (8). To improve schools, Bobbitt contended, educators should emulate successful manufacturers and businesses. In a sense, Chubb and Moe’s work merely is an extension of Bobbitt’s earlier efforts. Bobbitt sought to impose on individual schools and school districts the models of individual plants or companies. Chubb and Moe seek to reform the entire system of American education through the application of a general economic principle.

The appeal of the market rationale is strong, but that alone does not account for its current prominence. One reason for its regular assertion is the perception that it cannot be contested, at least not without great difficulty (Davis
Many people will not argue against a basic tenet of much of the American economic system. Yet, while the market rationale is invoked often, its use tends to obscure the primary reasons for which many, if not most, educational choice advocates assumed their positions.

Cookson (1994) noted the philosophical diversity of those individuals who support educational choice, noting that often they have “little in common except deep contempt for public education as we know it” (6). The market rationale becomes a convenient banner for such a group to rally around, although it is not one that always defines members accurately. Cookson also observed that a common characteristic of choice advocates is their “loss of faith in public institutions and democracy” (5), a situation not unlike the one that led to the creation of community schools following Reconstruction. Thus, behind the façade of the free market, may be attitudes and beliefs about schools not so very much unlike those held by most Texans immediately following Reconstruction.

The Carnegie Foundation’s objective 1992 report, School Choice, pointed out that many school choice decisions are made for “nonacademic reasons” (12). This fact calls into question the appropriateness of the market rationale and the validity of Chubb and Moe’s (1990) claim that market control, of necessity, leads to academically superior schools. In fact, the Carnegie Foundation (1992) determined that “the educational impact of school choice is ambiguous at best” (20). Ernest Boyer observed in the foreword of School Choice that “little effort has been made to report, in a systematic way, on the problems as well as the progress in the ‘choice’ programs now in place” (xv). To that can be added “or the choice programs of the past.”

While community schools do not offer precise parallels to modern educational choice issues, no present situation ever perfectly duplicates its historical precedents. Community schools do offer a good approximation of a modern educational issue of significant importance, and they merit further study. Records of community schools, their teachers’ papers and remembrances, and their students’ recollections could provide valuable insights into this largely forgotten chapter in educational history. Unfortunately, no such documentary evidence, if it has been preserved, has been located to date.

Lacking such primary source material, this work relied heavily on Frederick Eby’s 1925 The Development of Education in Texas, as have most others that have addressed community schools since that date. Any reading of Eby should take into account Bailyn’s (1960) warning, “Implicit in all of these writings is the professional purpose they were meant to serve” (56). As Tyack (1970) clarified a decade later, “educational historians often wrote to unite and inspire their co-workers in the schools” (22). Any complete reading of Eby’s history of education in Texas makes clear that, intended or not, he was influenced by this bias.

Nevertheless, these facts remain clear. First, the educational system established in Texas during Reconstruction, although despised within the state, offered the promise of free education to all children and was among the most comprehensive and efficient of its era. Second, at the first available opportunity, citizens dismantled that system and instituted in its place one that gave parents choice, the right and obligation to determine on an annual basis which schools their children would attend at public expense. They took this action based on political and philosophical beliefs that superseded their support for quality education. Third, problems with the community school model became apparent almost immediately after its implementation. The education offered students did not improve. Finally, a third of a century elapsed before community schools could be eliminated entirely. In the case of community schools, the “cure” was at least as bad, if not worse, than the problem they were intended to solve. This lesson is worthy of recall whenever any peddler of educational reforms offers a panacea.

Hanna and Stanford: Saving the University by Throwing it to the Wolves

Jared Stallones
The University of Texas at Austin

The Great Depression posed a challenge to the academic and financial integrity of many private colleges and universities. Hard times imposed financial strictures that forced administrators to rethink their fundamental philosophy of academic independence. From the vantage point of today's academy and its relentless quest for grants, the hand-ringing of university presidents and trustees sixty years ago seems quaint. Nevertheless, theirs was an honest dilemma over how to preserve the unique identities of their institutions. Into this milieu stepped a new breed of academic, skilled in both scholarship and entrepreneurship. Stanford education professor Paul Hanna exemplified the new, indispensable academic entrepreneur. As much as anyone, he helped move the University from an attitude of distrust of big government and an unwillingness to receive its help to that of open-armed acceptance of and active search for government grants and contracts. In the process, he helped obscure the distinction between public and private institutions.

Hanna's entrepreneurial qualities surfaced early in his life. By the time he arrived at Stanford University as an assistant professor of education in 1935, he held a patent on an arithmetic calculating machine for children, he had begun successful textbook projects with both the Scott-Foresman and Houghton-Mifflin companies, he had developed and launched the Building America series of issue-based curriculum supplements, and he had cultivated a truly amazing network of collegial contacts. At the same time, Stanford was in desperate need of new approaches to funding its growing academic and research programs. Perhaps no story better illustrates Hanna's drive, his ambition, and his ability to marshal resources for a productive end than does the tale of Frank Lloyd Wright's Hanna-Honeycomb House.

Paul and Jean Hanna had first become acquainted with the work of Frank Lloyd Wright while they were still in New York. Columbia University contemplated employing Wright to design married faculty housing. The Hannas were enthusiastic about purchasing one of the units. They had studied Wright's philosophy on home design in the volume Modern Architecture. Wright's ideas resonated with the Hannas and they decided that, "There could be no other architect for us" (Hanna n.d., 1). Columbia eventually shelved its plan, but the Hannas did not.

Upon coming to Stanford, with the relative financial security of promising textbook projects in the works, the Hannas announced their intention to ask Frank Lloyd Wright to design their home. The idea of a junior faculty member contracting with the world's most famous architect for his private residence was audacious. The plan was alternately referred to as 'Hanna's Folly' and "A dream castle come true" (Stanford Daily, 10 February 1938).

The Hannas' first hurdle was to select a location for their house. They hoped to lease a plot from Stanford University in a previously undeveloped tract known as Frenchman hills. The Stanford Daily called the site "Stanford's most romantic spot." Wright enthusiastically approved it, but Paul Hanna was told by the university's comptroller that Stanford planned to keep that tract as open space for all time. Hanna and his colleague, Grayson Kefauver, then embarked on a strategy designed to weaken the administration's resolve. Each week, one of the men would meet with the comptroller and the other would meet with President Ray Lyman Wilbur and make a particular case for leasing them the sites. The next week, they would switch and each would meet with the opposite official. After several months, Wilbur decided to grant the two their request. Hanna was indeed persistent, but the proposition of the first Frank Lloyd Wright house on the west coast being built on Stanford land certainly helped sway President Wilbur.

Stanford's Crisis

Stanford University in 1935 had a mixed reputation. Its nickname was "the Harvard of the West," but the appellation was not entirely complimentary. In addition to academic excellence, the name connoted social elitism. The Depression accelerated the narrowing of the student demographics. The university served an increasingly homogeneous conservative, Protestant, Anglo-Saxon student body drawn from middle and upper socio-economic backgrounds. The student tuitions imposed in 1920 to support university expansion had become a necessary funding source that limited the diversity of the campus population. Stanford's academic reputation suffered a blow in 1934 when the Academic Council decided that students unable to maintain an adequate level of scholarship would not be dismissed, but the university would rely instead on their common sense to know when to withdraw themselves. Critics suggested that this change in policy demonstrated that tuition was more important than scholarship.

The relaxing of academic standards added to the mild climate and beautiful setting of the Stanford campus,
gained the school a reputation as California's 'country club university.' This image was carried to the nation in a 1931 article in *Time* magazine touting Stanford as "predominantly a rich man's college." The article emphasized the upscale facilities of the university, including "one of the finest Pacific Coast golf courses, two lakes, a polo field . . ." Regarding the student body, the article claimed that "more than half own automobiles. Some fly their own planes" (*Time*, 8 June 1931, 40). A national survey ranked Stanford twelfth academically, while it put the University of California at Berkeley, Stanford's arch-rival, at fourth in the country. Adding to this humiliation was a note accompanying Stanford's rating, "When we are considering scholarly eminence of universities, the country club aspects of undergraduate life are not relevant" (Embree 1935, 652).

Despite the impression that all Stanford students were well-heeled swells, the decade of the Great Depression showed how vulnerable the school had become to the vicissitudes of the market cycle. By the middle of the decade, Stanford students were receiving support from the California State Emergency Relief Administration and about 12 percent of the student body were enrolled in federal work relief programs (*Report of the President of Stanford University*, 1934).

Some private institutions in similar straits sought direct federal aid, but others found federal support for private higher education unpalatable and suspect. It seemed to blur the traditional distinction between public and private education and threaten the independence of the private university. For Stanford, though, the issue was more visceral. Both President Wilbur and trustee Herbert Hoover intensely disliked and distrusted President Franklin Roosevelt. They looked with disdain on his New Deal initiatives, and especially on those that threatened to bring private colleges into the orbit of the federal government. They were intent on heeding James Conant's admonition that, "[I]f and when private institutions pass under government control, [it will be ] because they were forced there as a result of their begging policy for money" (Conant 1937). Instead of begging for government handouts, Stanford sought funds elsewhere.

**The Search for Private Funding**

A promising source of private funds was the licensing of technological innovations to industry. Although some at Stanford saw peril in becoming too closely allied with industry, others welcomed the opportunity. Notably, Robert Swain, chairman of the chemistry department, and Frederick Terman, Chairman of electrical engineering, actively courted industrial support. The result was mixed. Stanford signed an agreement with the Sperry Gyroscope Company concerning a navigational device developed by Stanford scientists, but the arrangement fell apart. Although potentially profitable for all parties, the contract did not address questions of faculty autonomy, control of university research facilities, and university promotion policies.

Paul Hanna entered the search for private funding early in his tenure at Stanford. In 1936, Paul H. Davis, a 1923 graduate of Stanford and newly-named General Secretary of the University, prevailed on Paul and Jean Hanna to join the Stanford Associates in their fund-raising efforts. The Hannas were asked to cultivate two wealthy sisters, Margaret Jacks and Mary Jacks Thomas. They developed close friendships with both women, serving as their escorts to Stanford events, visiting in each others' homes, and even traveling together. In 1958, Margaret Jacks willed her estate to Stanford. At $10 million valuation, it was the largest gift to the University since the original Stanford family endowment. Other personal friendships developed by the Hannas resulted in substantial gifts to various departments and units of the University.

Few stones were left unturned in the search for private support for Stanford. A 1944 memo from Hanna to University President Donald Tressider describes Hanna's strategies for getting financial help from the Ford Foundation. Hanna detailed a scheme to induce Edsel Ford's son, William, to enroll at Stanford in advance of approaching the Foundation. Hanna recommended that, "... we get former Hotchkiss boys who are at Stanford, or who have gone to Stanford, to work on this possibility. Also, the Hoover boys appear to be rather close to the Ford boys and might be of assistance" (Hanna 1944). Although these schemes helped prop up Stanford's balance sheet, neither support from industry nor from private sources provided the steady income stream Stanford needed. By the end of the 1930's, the University was again in severe financial straits.

**A Crack in the Wall**

By this time, though, a new model of government support had evolved. Instead of distributing funds through
grants to private institutions, the National Advisory Committee on Aeronautics had pioneered the use of contracts with individual researchers. Contracts gave the illusion that agreements between the government and universities were arm's length transaction for the mutual benefit of each. Moreover, the generous provisions for the university's overhead expenses in these contracts smacked of 'profit' for Stanford.

World War II marked the philosophical watershed for Stanford, as it did for many private institutions. The growing conviction that war might be unavoidable made alliances with the government seem a patriotic duty. Indeed, many in the Stanford community were frustrated by President Wilbur's reluctance to aggressively seek out government research contracts in the days before Pearl Harbor. Hanna and nearly twenty other faculty members took out a full page advertisement in the local paper arguing that Stanford should prepare to take part in the war against National Socialism. As he recalled, "This was serious, this was survival- we knew we had to defeat the Germans." In response, Hanna received a "most devastating letter from [Herbert] Hoover, as a member of the Board of Trustees, telling me to shut up" (Hanna 1974) Hoover's violent opposition to any alliance between Stanford and the Roosevelt administration helps explain President Wilbur's reticence on the issue, but Hanna was adamant about the need to gear up for war. As a member of the National Resources Planning Board from 1937-39, he had come to believe that U.S. involvement in the war was inevitable. Hanna met with President Wilbur and recalled Wilbur telling him, "I just don't want anything to do with this, but I wouldn't restrict you" (ibid). Hanna took him at his word and met with Donald Tressider, president of Stanford's Board of Trustees. As a result of their meeting, Tressider appointed Hanna chairman of the Committee on University Services to investigate further opportunities for the University to contribute to wartime research.

Tressider was a businessman rather than an academic. He did not share the view that Stanford must maintain a pristine separation from government, and saw qualities in Hanna that he recognized from the business world.

In the days before the U.S. declaration of war, the National Defense Research Council and the Office of Scientific Research and Development were organized to coordinate federal government contracts for war-related research and training. The NDRC panel that let contracts was a clubby group of academicians, and personal and professional contacts were as important as merit in their decisions. The primary recipients of NDRC-OSRD contracts included M.I.T. and Harvard, both of which had officers serving on the NDRC-OSRD review board. Stanford officials felt some urgency to get in the game, especially since their west coast rivals Caltech and the University of California were also key recipients of NDRC-OSRD contracts. Demonstrating that they understood the politics involved, when President Wilbur's retirement approached, the Stanford trustees offered the University presidency to the head of the NDRC-OSRD Board, Vannevar Bush. Unfortunately, the offer was made on December 5, 1941. Events of the following days rendered Bush's consideration of the offer impossible.

The U.S. declaration of war posed other setbacks for Stanford, as well. Students left the university to enlist in the armed services, once more cutting into revenue from tuitions. This despite President Wilbur's advice to, "Be reluctant to drop out of the University. The government will pull you out if it wants you. An engineering student who can get a new idea that will make an airplane go twenty miles faster per hour is worth a hundred thousand men in uniform" (Stanford Daily, 10 December 1941). Just as ominous for the long-term health of the University was the defection of professors to schools with more prestigious, better funded war research contracts. Frederick Terman left to head up the Radio Research Laboratory at Harvard. By January 1942, Stanford had lost forty professors to war work at other sites. With the defection of top faculty members and fewer opportunities for research, Stanford's graduate programs also threatened to fold. Whatever scruples Stanford officials still held about federal funding of private universities was overwhelmed by the winds of war.

Hanna Goes to War

Hanna's University Services Committee geared up quickly. It recommended that the University send representatives to Washington, D.C. to offer Stanford facilities for war-related research. This smacked of begging the federal government for financial assistance to President Wilbur, and he was reluctant to commit precious funds to the effort, but the committee argued that success in Washington could enhance the university's prestige, stem the flight of faculty and graduate students, and provide needed revenue. The fact that it could be seen as a patriotic act made it philosophically acceptable even to trustee Herbert Hoover. Hanna and Paul Davis left for Washington in late 1942.
Once there, the two realized that their task would be more complex than they had anticipated. They were in competition with dozens of other institutions. Davis minimized the intensity of the competition in a letter in which he assured Wilbur that he and Hanna were not like the "desperate university presidents [who]...sat on every doorstep and with trembling voices pleaded for a handout" (Davis 1943). Hanna and Davis realized that a permanent office in Washington was needed to cultivate the personal contacts upon which the enterprise depended, and set up shop in the American Council Building on Lafayette Square.

Hanna was in his element. His tremendous energy and his entrepreneurial skills formed a powerful combination on Stanford's behalf. His schedule was grueling. He typically spent two weeks in Washington and two weeks in California. In Washington, he approached government officials through high level contacts, like those made through his membership in the exclusive Cosmos Club. He recalled, "Most of the leaders of the war effort would gather for lunch. I would listen and ask questions and find out where research or training needs...were...And then I would come back and write up a proposition and take it back [to the appropriate officials]" (Hanna 1986). He and Davis even hosted a luncheon for Stanford alumni holding high government positions to gain information and plan strategies for approaching various government agencies. In addition, the two asked Hoover and Terman for introductions to important officials. Terman was especially helpful. Hanna recalled that his name was "an open sesame to all the scientific research groups" (ibid).

Aggressively courting the Washington bureaucrats paid off for the University. By the end of the war, Stanford had inked twenty-five contracts with the NDRC-OSRD, worth over $500,000. In addition, the Office of Strategic Services enlisted Stanford to study German food production and distribution capabilities. Hanna and Davis were directly responsible for these contracts. A 1943, Time magazine article labeled Hanna, "Stanford's ambassador to the U.S. Government" (November 15, 1943)

As Director of University Services, Hanna also oversaw training programs for military personnel at Stanford. These included the Army Specialized Training Program, programs run by the Signal Corps, the Women's Army Corps, language and cultural training, training in military government, and others. The war with Japan caused new departments to be created as Stanford exploited its traditional role as a center for research in the natural and socio-cultural environments of the Pacific Basin. Stanford ultimately ranked second among American universities in the total number of military personnel on campus. Its enrollment numbers reached an all-time high. Donald Tressider attributed Stanford's strong financial position at the end of the war to the work of Hanna and University Services. Interestingly, Hanna quantified his contribution by claiming, "The overhead payments to Stanford amounted to more than two million dollars" (Hanna 1982).

Stanford's location also provided Paul Hanna the unique wartime role of influencing the curriculum for schools in the War Relocation Authority's internment camps for issei and nisei. In July 1942, twenty-five graduate students in Hanna's summer session Education 299b course, "Curriculum Development", undertook the study of educational problems at the Relocation Centers to ensure that the Japanese-American children and youth, "continue their growth toward American ideals during the war." The study began with a review of background materials concerning "the problem of cultural absorption of an alien minority group" (Hanna et al 1942). Officials from the Western Regional Office of the Relocation Authority met with students on the Stanford campus, and together they decided to focus on the Tulelake Center in northern California as representative of the educational challenges throughout the system of camps. Seventeen members of the class then visited the Center for a two-day period. In a series of subsequent meetings and conferences with W.R.A. officials, Hanna's class sketched out a sample curriculum for camp schools. The model developed by Hanna's class was adopted for the Center schools in the Western Region of the W.R.A.

His experience with government work during the war, "...broadened my horizons tremendously," Hanna recalled (Hanna 1974). A key event in the broadening of his view was his war-related travel on behalf of the Coordinator for Inter-American Affairs. The CIAA was established under the authority of the Council on National Defense to coordinate the cultural and economic activities of U.S. Government agencies in Latin America. By 1940, growing U.S. concern over Nazi infiltration of Latin American economies brought the Coordinator under the direct purview of the President. On August 16, 1940, Franklin Roosevelt appointed Nelson Rockefeller head of CIAA. Rockefeller, in turn,
called on Otis Caldwell to help him in Washington.

In late 1940, Paul Hanna met Caldwell at a dinner party for the Commissioner of Indian Affairs. During the course of the evening, Hanna described his upcoming trip to Peru to visit Inca sites. The CIAA had been collecting first-hand information on Nazi incursions into South American culture, politics, and economies, so Caldwell asked Hanna to keep his eyes open and report on his impressions when he returned. Hanna's trip became one of at least nine fact-finding missions authorized by the CIAA that year.

Hanna enjoyed the cloak and dagger mission. He characterized himself and his mission as "a first counter-espionage agent to find out what in hell Germany was doing and how they had captured the drug market-well, the whole thing, transportation, communication, etc" (Hanna 1974). Upon his return, he made a full report of German influences in the schools in the countries he had visited. Partly as a result of the report, the thrust of CIAA efforts in Latin America shifted from parrying Nazi propaganda to aiding economic development in the region, with education as a significant component. Hanna followed this trip with another in 1941-42, from which Stanford benefited by landing a small contract to update the Latin American edition of Who's Who.

Hanna Goes Global

Out of his travels Hanna developed the conviction that the wider world should be included in his conception of expanding communities and that education played a pivotal role in national and international development. Hanna's growing interest in international education coincided with the growing realization among policymakers and average Americans alike that the postwar world would not be one in which the United States could isolate itself. International cooperation would be the commonplace. Hanna took steps to position Stanford as a leader in international education studies. Even before the war ended, Hanna planned a conference bringing together at Stanford top figures from universities, corporations, foundations, and government to discuss programs of training, research, and service for the Pacific, Asia, and Latin American regions. The conference never took place due to lack of funds, but its planning laid the foundation for future developments.

In May 1945, Hanna proposed forming a "Stanford Pacific Institute." Its five-fold purpose included, "teaching and training personnel for duties in Far Eastern countries; [research to make] relations with the Orient more effective and productive; collection of materials on the Far East; dissemination of information; and promotion of international cultural relations." The effect of his wartime activities on Hanna's thinking about education is seen in the proposal's text. Part of the value in such an Institute, Hanna wrote, would be, "An effective impact of American educational ideals and methods with their emphasis on democracy and equality of opportunity." He felt that these ideals, "can prove one of the great molding forces in the future of the Pacific" (ibid). Hanna's pursuit of this goal continued to benefit the University through government contracts and private fund-raising in the following decades.

The major vehicle for Hanna's postwar entrepreneurial work on behalf of Stanford was a series of contracts among the University, the United States Government, and the Republic of the Philippines. Under the aegis of the Agency for International Development, Hanna administered multimillion dollar contracts using Stanford resources to help develop Philippine universities and schools. From 1951-1966, the overhead payments amounted to over two million dollars.

Hanna's interest in international development also resulted in the creation of the Stanford International Development Education Center. He served as the Center's Director from 1952-1967. It trained hundreds of leaders from many countries and brought the University U.S. Office of Education and UNESCO grants.

Hanna's Personal Philanthropy

The Hannas' private fund-raising continued, as well. Paul Hanna's prestige grew in the postwar period, and this opened more doors for him to approach individuals and corporations. In addition to the substantial donations by the Jacks family, the Hannas' personal touch resulted in a nearly $400,000 gift from Mrs. Myrna B. Martindale-Freeman. The Hannas were music lovers, and in 1967 they hosted a series of musical evenings at the Hanna-Honeycomb House to raise funds for a new organ for Stanford's Memorial Church. One guest eventually donated $500,000 for the project. Another $500,000 was given to Stanford in 1977 by the Nissan Motor Company for the maintenance of Hanna-Honeycomb House.
Paul Hanna recalled fondly the dedication soon after his arrival at Stanford of the Cubberly School of Education Building. Elwood P. Cubberly had retired as Dean of the School of Education in 1933. During his long career, he had published a number of professional books that sold well. He invested the royalties shrewdly, and was able to donate funds enough for Stanford to build the new education building and create a library fund, as well. Hanna took this act as his model, and eventually donated to various units of the University over $1.8 million, including deeding the Hanna-Honeycomb House to Stanford in 1974. Over their long association with Stanford, the Hennas were responsible for an estimated $18 million in gifts of various kinds.

Lessons for Today

A stroll across the modern university campus illustrates the changed relationship between academia and business and government. At the University of Texas at Austin, the buildings in the center of campus are named for revered professors and university presidents. Few of these gave the school great sums of money. Instead, they are honored as great teachers and scholars. The Board of Regents of the Texas University System once had a policy that University buildings could not be named for living individuals. In the sections of the Austin campus developed since that policy was changed, visitors find the McCombs Softball Stadium, named for one of the biggest car dealers in Central Texas, the Moffett Cellular and Molecular Biology Building, named for the Chairman of Freeport-McMoran Corporation, or the Jamail Swim Center, named for one of Texas' original million-dollar lawyers. The list could go on. Not coincidentally, each of these individuals is a major contributor to the University. None has much to do with what goes on in the building that bears his name.

Perhaps Stanford's leaders of the 1930's were right to be cautious about protecting the independence of their institution. The university, government, and the corporation form a triad of power centers in society, each with its own unique ethic and purpose. The university's traditional role is to develop knowledge which business and government use. Vital to this function is intellectual independence, but partnerships between these institutions can threaten that independence. When the force of money and prestige from business and government enter the decision-making processes of the university, it alters how scholarship is rewarded, research facilities are used, and knowledge is disseminated. In his recent book, The University in Ruins, Bill Readings suggests that universities have become corporate training camps and research arms of government and business. Too close an association between the developers of knowledge and its consumers may affect the nature of that knowledge. Perhaps the members of the triad function best when they remain distinct from one another. Academic entrepreneurs, those who move easily among universities, government, and business, serve to blur the separation between the institutions. They are not to blame, for the modern university is a costly proposition, but evaluating things in academia with the same measure used in government and business can warp the institution. David Harvey of Johns Hopkins University complains that, "the traditional university culture, with its odd sense of community, has been penetrated, disputed, and reconfigured by raw money power" (1998, 112). Academic entrepreneurship brings the university needed revenue and prestige, but in the process its unique identity and its important role in society becomes a bit more obscured.

—. 1944. Letter to Donald Tressider. Hanna Collection, Hoover Institution Library, Stanford, CA.
Special education occupies a large and growing part of public education. This prominence is due to the work of advocacy groups that borrowed the rationale and imitated the strategies used by such organizations as the NAACP to advance the racial desegregation of schools. However, there was an important difference. Resistance to the civil rights movement blunted the effort to racially desegregate schools. On the other hand, when supporters of federal legislation for disabled citizens met resistance, the resulting controversies advanced federal regulation and increased the number of programs.

Special education grew rapidly in a short period. In 1965, there were five to seven million children needing special education services, but only 25 percent of them attended appropriate private or public school programs staffed by a total of about 71,000 teachers (Senate, 1965). In 1977, the number of public school students classified as disabled increased to 3.7 million and by 1990 that number increased to 4.6 million. Interestingly, from 1977 to 1990, public school enrollments declined by three million students. Consequently, the percentage of all public school students classified as disabled grew from 8.5 percent in 1977 to 11.4 percent in 1990. The number of special education teachers grew even faster rising by more than 50 percent between 1978 and 1990 (Hanushek et al. 1994, 35). Most important, this growth took place after advocates for special education imitated the more adversarial style of the NAACP.

Until the late 1960s, organizations to advance the care and education of disabled persons tried to advance their positions in a cooperative manner. For example, in 1962, the U. S. President’s Commission on Mental Retardation called attention to the needs of handicapped children. However, in its message, the panel cautioned against using legal means to force a community to provide adequate care for the mentally retarded. Legal means, such as the courts and the legislature, the report went on, should be a last resort (149). Instead, the panel called for such federal agencies as the U.S. Department of Health, Education, and Welfare (HEW) to exercise national leadership in developing educational services for retarded children. These agencies of the federal government, the panel added, could act in partnership with state agencies, local governments, and voluntary organizations (178-180).

Not long after the special education advocates made this call for cooperation with and among governmental agencies, the NAACP and the Southern Christian Leadership Council (SCLC) proved to other advocacy groups that they could pressure the federal government to make changes in local school policies. In 1963, tired of the slow pace of the racial desegregation of schools, the SCLC coordinated a demonstration in Birmingham, Alabama. Headed by Martin Luther King, Jr., the SCLC called for a march on Washington, D.C. that led to the 1964 U.S. Civil Rights Act (King, 1964). Under the authority of this law, from 1964 until 1970, the U.S. Office of Civil Rights (OCR) moved more than 600 school districts toward racial desegregation (Salomone 1986, 65).

Imitating the civil rights movement, advocates for handicapped people linked their campaigns with the then current drive for human rights for the underprivileged. For example, in 1968 the International League of Societies for the Mentally Handicapped adopted A Declaration of General and Specific Rights of the Mentally Retarded asserting that mentally retarded people have the rights accorded to more fortunate people. In addition, it added, each mentally retarded child had a right to proper medical care and “to such education as will enable him to develop his ability and potential to the fullest possible extent” (Lippman and Goldberg 1973, 7). Other groups soon adopted similar statements.

When advocacy groups for special education adopted the language and the strategies of the civil rights movement, they grew rapidly. For example, the Council of Exceptional Children (CEC) grew from 5,000 members in 1950 to 70,000 by 1980. Similarly, in 1950, the National Association of Retarded Citizens (NARC) had 23 member organizations, by 1960, NARC had 681 state and local chapters and 62,000 members. In 1975, NARC grew to 1,700 state and local chapters and 218,000 members (Levine and Wexler 1981, 15-16).

Once the national advocacy groups had recruited teachers and parents to form local organizations and state coalitions, these groups pressured school districts to change. Claiming that local officials violated the rights of the handicapped, coalitions of advocates for special education asked the federal government to make changes in local or state affairs. However, professional elites led these apparently popular uprisings. Vermont offers an example of such state level pressure from special educators.
Special Education Advocates at the State Level

In 1970, Vermont State Senator John Alden submitted S.98, a bill modeled on an Illinois education for handicapped law reputed to be the best in the nation. Jean Garvin, the state director of special education and pupil personnel services; Sister Janice Ryan, from Trinity College; and, Hugh McKenzie, head of special education at the University of Vermont, began raising support for the bill from members of such interest groups as the Vermont chapter of Association of Retarded Children and the Vermont Association for Children with Learning Disabilities (Riley 1976, 312-313).

Trinity College sponsored a Political Action Day in September 1971 with representatives from such national organizations as Council of Exceptional Children. Participants at this meeting formed the Vermont Committee for the Handicapped (VCH). Employees of the University of Vermont special education area began developing county organizations and asked everyone to contact members of the Education and Appropriations Committees in the state legislature. On 4 November 1971, the VCH organized a demonstration of more that 250 people at a meeting of the state senate education committee. At Garvin's urging, the state board of education voted during November 1971 to lend its support to S.98. And, in January 1972, county groups of parents and special educators who had formed to pass Alden's bill began publishing a newsletter to circulate among themselves (Riley 1976, 315-317).

The strongest opposition came from the Governor of Vermont, Deane Davis, who, on 5 January 1972, complained that the special education legislation would be too expensive and incite unnecessary litigation. When Vermont's senate education committee reviewed an amended version of Alden's S. 98 in January 1972, Garvin, Ryan, and McKenzie testified that the Governor's objections were unfounded. Although the VCH members asked the senate not to compromise, the committee approved a mild version of S.98 (Riley 1976, 317).

Fortunately, for the special education advocates, in 1973, the House appropriations committee discovered more than $400,000 the governor had placed in an unused budget account. With the public aware of the existence of this money, the legislature could use it to fund the special education bill (Riley 1976, 320).

Other interest groups began to support the special education legislation including the American Civil Liberties union, the Vermont Diocesan Council, the Vermont Superintendent's Association and the National Association of Social Workers. When committee deliberations threatened to kill the bill, a newspaper reporter wrote an article accusing the governor of holding S.98 ransom to obtain approval for legislation concerning campaign expenses. Suffering public criticism, the committees released the bill, and it came to the house for a vote just before the Easter holidays. In one morning, Vermont's house and the senate approved the legislation (Riley 1976, 318-322).

Lobbying the Federal Government

The case of Vermont described above illustrates how special educators worked at local and state levels. At the same time, national organizations lobbied the U.S. Congress calling for legislation to help states in educating the handicapped. As early as 1958, the CEC and the NARC had joined to support enactment of Public law 85-926, Expansion of Teaching in the Education of the Mentally Retarded. Further, the CEC cooperated with the National Education Association to promote passage of Public Law 89-10, Elementary and Secondary Education Act, (ESEA) (Colachio 1985, 51-52). Federal funds supporting education rose from $890,685,000 to $2,408,209,000 (Bailey and Mosher, 1968, pp. vii-viii). However, special educators did not benefit as they might have. Although Title I of ESEA could have directed money to handicapped children, the staff in the U.S. Office of Education decided to use it only for low income children (Salomone 1986, 143-144).

When the U.S. Congress had to renew ESEA in 1966, the CEC took the lead and lobbied such people as Wayne Morse chair of the Senate Committee on Labor and Welfare. Within a short period an extensive array of interest groups such as the American Psychological Association, the National Association of Mental Health, and the Association for children with Learning Disabilities joined to ask for three things. First, they called for federal funds for the states to educate the handicapped children. Second, they wanted an explicit bureau within the Office of Education to administer programs for the handicapped. Third, they claimed each child should have a free,
appropriate public education (Levine and Wexler 1981, 20-28)

With surprisingly little debate about the special education sections, the U.S. Congress approved and President Johnson signed in 1966 a bill that became Public Law 89-750. While this renewed ESEA, it contained a new Title VI that authorized $50 billion for 1967 and $150 million for 1968 to help in the education of the handicapped. Most important, Title VI created the Bureau of Education for the Handicapped (BEH) in the Office of Education. It also mandated formation of the National Advisory Committee to act as a consultative body to the BEH and to Congress. As a result, advocates for the many different types of handicaps had a single position from which to exert combined influence. Not surprisingly, in 1970, the U.S. Congress replaced Title VI with the Education of the Handicapped Act, added a category of special or learning disabled to the list of handicaps, and authorized $630 million to be spent for the education of the handicapped (Levine and Wexler 1981, 29-41). The U.S. Congress also added to ESEA the opportunity to provide services to gifted and talented children (La Vor 1976).

Litigation to Influence Policy

In order to make its appeals to Congress appear reasonable, the organizations for special education pointed to federal court decisions that seemed to establish a right to education for handicapped children. At first, the legal cases came from extensions racial desegregation suits. For example, *Hobsen v. Hansen* concerned the use of tracking systems to promote racial segregation (267 F. Supp. 401).

The first case demanding access to public schools for retarded children began on 7 January 1971 when the Pennsylvania Association for Retard Citizens (PARC), a state affiliate of NARC, filed a case in U.S. District Court. The American Association of Mental Deficiency, the Council of Exceptional Children, and the National Association for Retarded Children joined as friends of the court. This case began in 1969 when members of PARC complained during an annual meeting about conditions at the Pennhurst State School and Hospital that was one of the nine residence facilities for mentally retarded people under the supervision of the Pennsylvania State Department of Public Welfare. At that time, the facility had 3,013 residents and a bed capacity of 2,126. Although newspapers had published reports of overcrowding and inhumane treatment, the state legislature had not acted. Parents and members of PARC called upon the organization to stimulate reform. As a result, PARC resolved to retain counsel and file any necessary legal action against the Department of Public Welfare to close or improve Pennhurst. At the same convention, the PARC members adopted a Bill of Rights for Pennsylvania’s Retarded Citizens that was similar to the one adopted a year earlier by the International League of Societies for the Mentally Handicapped (Lippman and Goldberg 1973, 16-22).

PARC’s bill of rights had no legal bearing on the case. Instead, imitating *Brown v. Board of Education*, the PARC case rested on the claim that Pennsylvania statutes violated the Fourteenth Amendment of the U.S. Constitution. Represented by Thomas K. Gilhool, an attorney who had previously worked in civil rights cases, PARC contended retarded children did not have equal access to an education. Official exclusions, postponements, waiting lists, and excuses kept retarded children out of public schools (Lippman and Goldberg 1973, 22-24).

There was no contest. After testimony by four witnesses for the plaintiffs, the officials of the Commonwealth of Pennsylvania consented to enroll the mentally retarded children in publicly supported educational programs. These were to be as similar as possible to that available in most public schools and supervised by state department of education personnel (Lippman and Goldberg 1973, 31-32).

In the consent agreement, the state of Pennsylvania agreed to search out and find all children requiring special education. As part of this effort, agencies such as county mental health and program offices notified parents through public news releases, messages to professional groups, and civic and neighborhood organizations of the services available to the children. Radio and television spot announcements broadcast these messages through the state. State senators and representatives included notices in their letters to constituents. Even the Liquor Control Board enclosed announcements of the search for retarded children in consumer packages. At the same time, the Pennsylvania Department of Education began to plan ways to educate the expected increase of 53,000 disabled children. In these actions, the state department of education worked under the supervision of a court master just as
school districts did when ordered to racially desegregate pupils and faculty (Lippman and Goldberg 1973, 37-44).

In 1972, advocates of special education won a second major victory in *Mills v. Board of Education of the District of Columbia* (348 F. Supp. 866). A year earlier, the board of education of the District of Columbia Public Schools admitted that it had an affirmative duty to provide an appropriate education to several children who suffered from behavioral problems, hyperactivity, emotional disturbances, or mental retardation. When the board failed to comply, the plaintiffs filed again in January. In his decision, U.S. District Court Justice Joseph Waddy quoted several cases that concerned racial segregation. He argued these showed that a child has a right to an education on equal terms with the education a state provides to other children. Waddy forbade the public schools of Washington, D.C. to exclude a child unless the board of education provided adequate alternative education, a prior hearing, and a periodic review of the child's progress.

In *Mills* case, Paul R. Dimond was a lawyer for the plaintiffs. As in the PARC case where Mr. Gilhool, lawyer for the plaintiffs, had worked in civil rights law, Mr. Dimond had worked with Nathaniel Jones and the NAACP Legal Defense Fund to racially desegregate schools and public housing in Dayton and Columbus, Ohio; Detroit, Michigan; and Wilmington, Delaware. In 1973, he summarized the ways that civil rights law and previous decisions enhanced the education of the handicapped.

For Dimond, such litigation as *Larry P. v. Riles* (343 F. Supp. 1306) that contested the incorrect assignment of minority children to classes for the educable mentally retarded did not point out the disadvantage minority children have taking the verbal portion of the I.Q. test. He felt the cases called for a complete reform of placement procedures because they implied that school authorities excluded the children from public education by arbitrary and capricious processes (1973, 1091-1108).

Since justices could not decide what education is appropriate, Dimond thought the court cases should seek a fair procedure for assigning children to various educational programs. Looking at other cases where decisions could impose a stigma on the person, Dimond found several steps outlined in these decisions. The child must have an opportunity for a hearing. There must be a timely evaluation and public notification of the opportunity for special education. There had to be full expert evaluation of the child's needs and development of a specific educational plan. Finally, the officials had to give the plan to the family and notify them of their right to appeal the decision to a hearing officer. If requested, school officials would call the meeting promptly and prove the appropriateness of the proposed placement. The hearing officer had to be independent of the school and all records made available to the parents. In this way, Dimond argued, if school officials chose not serve the best interests of the child, parents could follow the proper avenues of appeal resulting in a decision that helped everyone (1973, 1108-1127).

What is important is the steps for deciding the appropriate education that Dimond noted appeared in the Education for All Handicapped Children Act, Public Law 94-142 of 1975. These included such points as the requirement from the PARC case that school districts advise all parents of special opportunities and the right to a prior hearing and periodic review from the *Mills* case.

**Resistance and Results**

Although P.L. 94-142 allowed the federal government to define the way special educators could plan lessons for children, this engendered less resistance than when the HEW began monitoring racial desegregation of schools. This is odd because the central arguments against racial desegregation concerned federal intrusion into local affairs (Freyer 1984).

A simple way to measure the lack of resistance that advocates for disabled children met is to compare the number of cases concerning special education that traveled to the U.S. Supreme Court compared to the number of cases concerning racial desegregation that went to this highest level of appeal. By 1994, the U.S. Supreme Court heard only seven cases involving special education (Thomas and Russo 1995, 50). However, between 1954 and 1994, the U.S. Supreme Court rendered decisions in more than three dozen cases involving racial desegregation of public schools (Russo 1994). While such a measure does not compare how many cases could have started on this journey, many of the cases that set the precedents for the treatment of handicapped children ended with accord
made at U.S. District Courts. As a result, it is safe to say that special education cases were not as controversial as were racial desegregation cases.

More important, the public reactions about special education legislation seemed to take opposite directions to the public reactions about racial desegregation. For example, in 1965, the U.S. Department of Health Education and Welfare (HEW) promulgated guidelines for Title VI of the 1964 U.S. Civil Rights Act. HEW warned that school districts had to show progress toward racial desegregation to receive federal funds. By 1968, HEW forced more than 200 rural southern school districts to racially integrate. However, when the HEW officials tried to enforce these guidelines on Chicago schools, the outcry was so great that HEW backed down immediately (Orfield 1969, 157-206).

On the other hand, the public reaction about special education legislation was to seek the enforcement of federal guidelines. For example, following the Mills decision, U.S. Representative Charles Vanik and U.S. Senator Hubert Humphrey introduced an amendment to a bill that became the Rehabilitation Act of 1973. Modeled after Title VI of the 1964 U.S. Civil Rights Act, their amendment became section 504 that prohibited discrimination against handicapped individuals in any program that received federal funds. This brief amendment passed with little discussion, but the adoption of regulations enforcing it was two years and eight months in the making. In May 1976, the U.S. Department of Health, Education and Welfare (HEW) invited comments. After receiving hundreds, HEW officials wrote a draft of the final rules. HEW Secretary, David Mathews refused to sign them. A U.S. District judge ordered him to do so; however, Mathews left the rules for Jimmy Carter's appointee, Joseph Califano, to sign in January. When Califano called for more study of the proposed regulations, handicapped people gathered in his offices to protest. In April 1977, Califano approved the regulations for Section 504 (Levine and Wexler 1981, 110-112; Salomone 1986, 140-142).

Furthermore, public protests about special education seemed to run counter to the perceived political moods of the times. In 1983, then Secretary of Education, Terrel Bell, announced his intention to narrow the restrictive regulations found in P.L. 94-142. He suggested such changes as reducing the reporting the federal agencies required from states to every three years instead of annually, and releasing school districts from the requirement of reevaluating children every three years. Although such changes were in keeping with the generally popular Reagan ideal of allowing school districts local autonomy, Bell dropped this proposal and retained the original restrictions when more than 23,000 parents and special education advocates protested (Salomone 1986, 164-165).

Reactions Among Recipients

While the public reaction to federal support for special education differed from the public reaction to federal support for racial desegregation, the groups that would be served reacted similarly. That is, they wanted to control their own affairs but asked the federal government to aid them in that effort.

In the case of racial integration, some African Americans protested against federal pressure for cross district busing. However, they sought federal support for community control of the schools. While the civil rights movement seemed unwilling to tolerate racial segregation, by 1967, the black power movement sought community control of schools to help black children develop pride in their culture and to tailor compensatory of education to the children's needs. At least two authors argued that such community control was necessary because professional educators proved insensitive to Black children (Carmichael and Hamilton 1967, 166-167).

To some extent, the federal government aided this form of community control through the Demonstration Cities and Metropolitan Development Act. Through this act, the U.S. Department of Housing and Urban Development offered citizens in as many as seventy-five cities the opportunity to submit proposals to receive millions of dollars for comprehensive plans to transform blighted areas into useful ones. In Dayton, Ohio, the Model Cities program that came from that federal development act served as a focus of black resistance to racial integration from 1966 until it ended in 1975. Some of the members of Dayton's Model Cities planning council joined a largely white conservative political party that controlled the school board and enacted anti busing policies. These black separatists, as they were then called, complained that busing for racial balance would disturb the compensatory programs they had initiated (Watras 1997).
Similar controversies existed among special education advocates. For example, in the middle 1980s, the National Federation of the Blind, an organization of blind people wrote model legislation requiring that Braille be taught to blind children. They encountered considerable opposition from groups of sighted people who were responsible for the education of blind people; they countered that new technology made Braille unnecessary and the requirement was onerous to special education teachers. Even teachers at residential schools opposed it. However, this opposition did not stop the regulations because by 1995 twenty-five states had passed such bills (Ferguson 1995).

Resistance at the Federal Level

In general, special education advocates agreed that federal control was necessary to...
Interestingly, researchers disagree if the increase in special education services accounts for increased school expenditures. One group of researchers asserted that special education was roughly twice as expensive as that of regular children. From this estimate, they concluded that the increase of special education students and teachers from 1980 to 1988 must have cost $3 billion out of an aggregate of $54 billion for all school expenditures (Hanushek et al. 1994, 36). However, researchers from the Economic Policy Institute estimated the cost to be much higher. In a detailed study of nine typical U.S. school districts, they collected data on total spending for special education and calculated its share of the total spending for K-12 programs. From this analysis, they concluded that the biggest share of new funds coming into school budgets went to special education. They wrote, “Special education growth consumed 38% of net new funds in 1991” (Rothstein and Miles 1995, 49).

Conclusion

The trend is away from racial desegregation. Resegregation took place so rapidly that the proportion of black students in schools with more than half minority students rose from 1986 to 1991 to the level that had existed before 1971 (Orfield 1996, 54).

While pleas to increase racial integration sound out of date, special education advocates remind parents that federal requirements serve them. For example, in You your child, and “special” education, Barbara Coyne Cutler warned parents that school officials would ignore the needs of a special child if the superintendent wanted to reduce educational costs. Thus, she urged parents to learn about the obligations federal laws placed on school districts and become a parent advocate to make sure the districts fulfilled these requirements. She said, as Dimond concluded in 1973, “The full implementation of the law depends on parents” (1993, 2).

The point is simple. Until researchers understand why similar rationales, strategies, and policies have different effects in special education than in racial integration, the hopes for developing public policies to encourage racial mixing in schools and neighborhoods are slim.

The purpose of this study is to investigate the implications of foundational and transformative approaches to teaching the history of education. This explores the strengths and weaknesses of each approach and how they can each be best used to teach the history of education. The purpose of this inquiry is not to engage in an examination of the overall limitations or deficits of foundational and transformative approaches to teaching history of education or issues surrounding pedagogy. The literature is already abundant with attacks and counterattacks. Too often, such scholarship on this and related issues is couched in terms of one side amassing evidence to support its case while ignoring benefits other perspectives bring to the discussion. Often, the debate has consisted of each side building a case for its position (or against the other) and presenting the findings to a sympathetic forum where the information presented will not likely be seriously scrutinized (Banks 1993, 4). Though the debate over the traditional Western curriculum and multiculturalism has generated considerable scholarship, in many cases little good has come out of it (Banks 1993, 4). This study is not intended to comprehensively detail every strength and limitation of the foundational and transformative perspectives. The purpose of this paper is to examine the appropriateness and implications of foundational and transformative approaches while acknowledging strengths and limitations of each perspective in with respect to the teaching of educational history in hope of moving the discussion toward application and away from polemics. Existing scholarship is drawn together to form a larger, more comprehensive and comparative examination of the foundational and transformative approaches and their implications for teaching history of education.

Foundational and transformative epistemologies represent different perspectives about the nature of knowledge, how knowledge is constructed, and the purpose of knowledge (Banks 1996). Transformative is better suited to this study than the term multicultural. There is less agreement to the aims, boundaries and specifics of multicultural education. There is a looseness in the core concept of “culture” which can refer to anything concerning a group (Zorn 1995). Multiculturalism tends to understate the degree to which values, knowledge and lifestyles are shared among cultures who live in the same geographic area (Zorn 1995). Furthermore, it does not take into account differences within a group, and is open to the criticism that it overgenerizes group characteristics (Zorn 1995). Some scholars interpret it as a means to understand non-White groups, while others focus on issues of class or gender, a broader interpretation refers to any group that has been historically under represented or unacknowledged (Banks 1996). For purposes of clarity, and to keep this inquiry centered on the epistemological level, foundational and transformative epistemologies are used as the focus of this study.

For the purpose of this study, the focus will be on a comparison between the foundational and transformative perspectives on teaching history. Epistemology refers to the study of knowledge, including its structure, validity and creation of knowledge (Samuelson and Markowitz 1987, 178). For the purpose of this inquiry, epistemology is more narrowly defined as the implications of knowledge manifested through the teaching/learning process.

Certainly, there is a wide body of interpretation over what constitutes foundational knowledge for any discipline or profession (Alexander, Murphy and Woods 1997). The foundational knowledge approach is designed to develop an understanding in students of the essential knowledge of history of education. The goal of this approach is to provide students with a core of essential knowledge, and the thinking skills to be able to apply that knowledge to investigate areas of educational history on their own. One of the criticisms of contemporary higher education is that it fails to provide students with a body of foundational knowledge that prepares students to be lifelong learners or to communicate within a profession or field of study (Bennett 1992; Bloom 1987). Advocates of foundational knowledge support a curriculum that emphasizes a common culture and history through the study of seminal literature (Rorty 1979). Often, advocates of foundational knowledge are defenders of the Western canon who advocate a curriculum based on the continued dominance and cultural superiority of Western civilization (Banks 1993, 4). The foundational knowledge perspective addresses the issue of cultural relevance by relying on the cultural superiority of Western civilization. Because the contributions of Western civilization in areas of art, literature, science, government, etc., transcend cultural boundaries, there is no need for historical perspectives which emphasize or isolate particular groups. Western
traditionalists claim that the Western canon is indispensable and must be preserved because it represents the most advanced state of human development and is essential to maintaining our cultural, historical and national identity. The goals of scholarship in traditional knowledge are accuracy, analysis and objectivity in reconstruction of the past. However, even supporters of the traditional knowledge approach acknowledge how historical interpretations are misshaped by individual prejudices or preconceptions (Schlesinger 1992, 45-46).

A different perspective supports the idea that education has historically marginalized the intellectual, social and cultural history of non-White racial groups (Alexander, Murphy and Woods 1997). Transformative knowledge is defined as: “concepts, paradigms, themes, and explanations that challenge mainstream academic knowledge and that expand the historical and literary canon” (Banks 1996). The transformative agenda understands knowledge in terms of how it is constructed and how it reflects the social context in which it was created (Banks 1996, 22). For transformative knowledge to be effective at its mission to include representation of excluded groups, it must be framed in a manner that identifies the weaknesses of the traditional curriculum (Minnich 1990, 12).

Transformative academic knowledge refers to ideas or ways of thinking that challenge traditional views. The purpose of transformative knowledge is to add to the body of knowledge that composes the curricular cannon. Transformative and foundational knowledge are based on two different frameworks about the nature of knowledge and its purpose (Banks 1993, 9). Transformative scholars take the position that no knowledge is objective and value free, but is subject to the power of human interests and changing values (Minnich 1990). One of the goals of transformative knowledge is to teach students how knowledge is constructed (Banks 1993, 11).

Advocates of the transformative approach to teaching the history of education claim the traditional Western curriculum maminalizes the accomplishments of women and non-Whites (Banks 1993, 4). Transformative education seeks curricular change as a means of achieving equitable representation of the accomplishments that developed our culture and nation. The transformative approach seeks to develop an understanding of the ways in which American education has responded to race and gender and the diverse experiences of various racial and ethnic groups from the perspectives of dominant and minority groups.

Implications for Teaching
Understanding of Foundational Knowledge

One of the goals of the foundational knowledge approach to teaching history is to impart on students a set of objective truths that cannot be mutated by human biases (Kaplan 1964). The historical knowledge that composes a foundational knowledge base is intended to be part of a curriculum which all students should be exposed. While the majority of the information contained in the traditional curriculum reflects Western civilization, it is considered to be relevant across cultural boundaries because of its centrality to the human experience.

The foundational knowledge approach enables one to make meaningful and useful interpretations about historical events and trends (Bauer 1988). Foundational knowledge is intended to give structure to what we know, so that instead of merely knowing, we can interpret and add meaning to facts (Bauer 1988). One difficulty with this approach is that historical interpretation, even as it pertains to foundational knowledge, is guided by the prevailing societal standards (Bauer, 1988). In light of this criticism, it is important to note that foundational knowledge is not static, but in a constant state of change and renewal. Past ideas have been reinvestigated to be revealed as false or inaccurate. Some of these have been historical representations of 19th century slaves as essentially content with their lot, or that the history of America has been of continually improving progress toward democracy and participation (Banks 1993, 9).

A foundational knowledge base is vital for the educator or educational practitioner to engage themselves in their profession. A 1997 study by Alexander, Murphy and Woods surveyed foundational knowledge of undergraduate and graduate students in education. The purpose of the study was to gauge what preservice teachers and practicing professionals knew about “particular individuals, movements, writings, and terms associated with their root disciplines” (Alexander, Murphy and Woods 1997, 172). Their findings indicated the foundational knowledge of respondents was low, and suggested a greater emphasis on the foundations of education and the basic elements of education. Their findings cast doubt on whether educational programs support the development of foundational knowledge among
students. A deficiency in foundational knowledge has implications with respect to one's command of expert knowledge, private language and the ability to develop coherent and organized learning experiences (Alexander, Murphy and Woods 1997, 185). Studies fitting into this pattern also stressed the importance of foundational knowledge in engaging in dialogue with people in or out of the educational/historical field, and its value in developing a clear understanding of the nature of educational/historical phenomenon.

Experiences of Diverse Groups

While the foundational knowledge emphasis has been found to increase understanding of the underpinnings of education, such as history of education, the foundational knowledge focus has not adequately represented the experiences of diverse groups in educational history. If it does, it seems to do so in a manner that can be compared to "social lag" in terms of curricular change. Flexner addresses the issue of social influence using the term "social lag" to describe how institutions or curricula change in such a way that they lag behind society (Flexner 1968). While he felt that curriculum should reflect social need, he and Kliebard cautioned that curriculum should not be a weather vane, responsive to every variation of the public whim, and must at times give society not what society wants but what it needs (Flexner 1968; Kliebard 1986).

Traditional knowledge, like transformative knowledge, is fluid and in a state of continual change. The criticism that traditional knowledge represents a static body impervious and resistant to change or inclusion is a misrepresentation of reality. The canon and paradigms that constitute traditional knowledge are in a continual state of challenge and revision from internal and external scholarship. Challenges to old knowledge and the inclusion of new knowledge result in new paradigms and interpretations (Kuhn 1970).

Consistent with a transformative perspective, Clifton Conrad argues that since education is largely a function of society, and is paid for by society, it only stands to reason that the focus of higher education ought to be based on societal problems (Conrad 1978). In The Undergraduate Curriculum: A Guide to Innovation and Reform, he argues that a curriculum using this approach would be characterized by a problem orientation and concern for social responsibility. Out of this orientation comes an emphasis on the present and future rather than the past. Consequently, this type of curriculum is likely to be more flexible than a foundationally based curriculum (Conrad 1978).

Rather than being static, curriculum is not fixed in an unchangeable form, but is rather a dynamic form of knowledge that is always under change and construction (Gumport 1988; Short 1993). Because knowledge is continually evolving, legitimacy is relative and contingent on the historical context (Gumport 1988). Curricula, therefore, are in a constant state of fluctuation in response to social demands. It is one of the strengths of curriculum that it has the ability to reflect the interest of groups in society (Kliebard 1992).

Schlesinger compares history to a nation as memory to an individual (Schlesinger 1992, 45). As a type of collective memory, the understanding of cultural or ethnic history is invaluable for a group if they are to understand themselves and situate themselves in the larger world history (Schlesinger 1992, 48). Certainly, history has been used in the past to justify actions of the ruling class (Schlesinger 1992, 48). History was often used as a means for stabilizing or minimizing class conflict. Schlesinger readily admits the failures of the traditional history curriculum. He admits that women and non-Whites were deliberately excluded and considers the Anglo centric control of history to have been an undeniable fact (Schlesinger 1992, 53).

Spring finds that for many generations minority groups looked toward education for hope to improve their condition. He also concludes that some majority groups looked toward education as a means to control or restrict the advancement of minority groups (Spring 1986, x). The study of educational history is inseparable from issues of diversity and representation in American history through the history of restricted access to education of excluded groups. To understand how educational history has meant different things to different people at the same point in history, we must examine it from the standpoint of minorities (Fass 1989, 4).

Intermittent Focus on Educational History

A recurrent criticism of transformative education has been its narrow, intermittent focus on educational history. Such criticism is grounded in the idea that a race or gender based approach has little sense of connection to demonstrate
an identifiable pattern of educational change over time. A weakness inherent in a race or gender focus is that it defines educational history in a manner that marginalizes many of the essential elements necessary for a broad based understanding. Scholarly efforts to document the history of education have left the majority of educational history largely unwritten (Davis and Mehaffey 1989). Rather than seeking to expand the knowledge base in a manner relevant across gender and racial lines, the transformative perspective seeks to develop new knowledge relevant only to certain segments of society. The result is an educational history which focuses on experiences of diverse groups, rather than larger social/political/economic factors that impacted all groups.

One of the criticisms of the recent inclusion of race in historical curricula has been the political nature of its use. Schlesinger refers to the use of history to boost the self esteem or position of “underdog” groups as compensatory history (Schlesinger 1992, 49). Educational history framed in transformative knowledge has declared its purpose to be to educate specific groups by exposing them to a curricula which appeals to their ascribed group membership. Compensatory history accomplished its aim by inspiring a sense of pride in the targeted group, or uniting the group through the development of a shared sense of anger directed at an outside group (Schlesinger 1992, 55). In doing so, the transformative perspective has opened itself to the same criticism it has leveled at the foundational canon for its political role in preserving the status quo.

Efforts to boost group self esteem increase the likelihood of excluding events or episodes that reflect poorly on group identity. Such omissions result in a historical review that pretermits negative events but emphasize positive or even neutral events (Zorn 1995). An example of this is found in Empowerment Through Multicultural Education (Christine Sleeter, editor), in an article by Kathleen Bennett. Bennett writes:

Appalachian people share a rich cultural heritage which includes a strong sense of kinship, a love of the land, a rich oral tradition, and a commitment to personal freedom and self reliance (p. 27).

As Zorn (1995) points out, Bennett’s remarks are framed in such an ambiguous manner that a variety of interpretations can be attached to them. “Rich oral tradition” could refer to widespread illiteracy among the population; “self reliance” could refer to a lifestyle based around subsistence farming and chronic poverty; “strong sense of kinship” could mean that the population is distrustful of non-family to the point of xenophobia; and “commitment to personal freedom” could refer to anything from a general lack of regard for personal responsibility to total anarchy (Zorn 1995).

The transformative approach to teaching informs us that the experiences of ethnic groups are intertwined with each other (Webster 1997, 54). If this is indeed true, then a race or gender based examination of educational history raises some problematic questions if the goal is to provide students with a foundational knowledge base. Because the histories of different ethnic groups share common connections, how do we go about presenting an ethnicity based focus on educational history? Two equally problematic responses to that question come to mind. We can present a historically isolated representation of a particular group. However, this opens us to the same criticism that transformative advocates have directed toward foundational history, that we intentionally and systematically exclude the contributions and histories of other related groups. In addition, such an approach would present students with an understanding of educational history which would be intermittent and unconnected to historical trends and their impact on the larger population.

Conclusions

To understand the contradictory implications manifest in foundational and transformative perspectives, one need only comprehend the current criticisms directed toward contemporary education. Critics who find fault with the “pitifully meager results in the intellectual and cultural training of our children” are often the same who suggest the remedy to the problem is that students need to study an objective body of knowledge relevant to Western civilization (Dobay 1988, vii).

When we engage in a debate over the implications of foundational and transformative approaches to teaching history of education we are really discussing the meaning of knowledge. Much about what educational historians of the foundational and transformative approaches disagree about focuses directly on meaning. Historians may be in agreement over dates and events, such as when Harvard College was founded. However, they may forcefully disagree over the meaning of its founding. Was it to educate clergy for the Puritan society that was essentially theocratic? Or,
was it to perpetuate economically based social stratification and gender supremacy by ensuring that the sons of wealthy families could benefit from higher education that would lead them into positions of social control and influence? The answer depends on who you ask and the epistemological framework they apply to answer the question.

One of the findings of this study is that both the foundational and transformative perspectives have something of value to offer the way in which we teach the history of education. If we frame foundational and transformative perspectives in terms of “generalized” and “specialized” knowledge, each can be fixed in a specific role in teaching history. A foundational approach is best suited to convey important subject matter that all students should apprehend (Hirsch 1996). Such generalized knowledge serves as the fundament for later challenges or interrogation of foundational knowledge. Students can hardly be expected to question the legitimacy or relevance of the foundational knowledge base if they have not first been exposed to it. The contrast between generalized and specialized knowledge is based on the understanding that in order to learn critical thinking skills central to transformative scholarship, students must principally learn subject area content.

Transformative knowledge is unsuitable for imparting on students a foundational knowledge of the history of education. The wide body of interpretations and perceived applications of transformative knowledge limits its ability to provide students a foundational base of knowledge. Definitions about the purpose of transformative knowledge have included understanding the social realities of racism, sexism and poverty; giving voice to historically excluded groups; empowering the oppressed; and the eradication of educational inequalities and inequities (Webster 1997, 14).

Transformative knowledge plays an important role in fostering critical thinking and knowledge development skills of scholars. While the goal of foundational knowledge is that everybody is exposed to the same knowledge base, the goal of transformative knowledge is to question how that knowledge base was developed. In specialized educational history courses, students are more often required to examine conflicting explanations for historical trends. Such intellectual exercises serve several purposes. Academic exercises that encourage students to question how knowledge was created lay the foundation for knowledge development skills.

Because of the long lag time it takes for new knowledge to be included in the foundational perspective on history, the transformative route for the inclusion of knowledge is most appealing for many scholars. This is particularly important for historical perspectives based on gender or ethnicity. The transformative perspective of educational history is essential to the inclusion of issues of diversity and representation in educational history. To understand how educational history has meant different things to different people at the same point in history, we must examine it from the perspectives of those it represents (Fass 1989, 4).

To bridge the gap between foundational and transformative epistemologies scholars must conceive the two in relative terms. Assertions that a crystallized Western canon exists are inaccurate and misleading. The foundational knowledge base indeed changes with the inclusion of new knowledge, though admittedly too slowly for the satisfaction of many transformative scholars. Furthermore, the foundational perspective advocates the learning of a common body of knowledge, though few foundationalists would suggest reliance on rote memorization and verbatim regurgitation, or claim that an understanding of core knowledge is itself sufficient to develop higher level thinking skills (Hirsch 1996).

Further inquiries into the implications of foundational and transformative epistemologies will be necessary to better gauge their application in providing students with an understanding of the history of education. Many contemporary educational initiatives have origins that reach back to the previous century. Alexander and Knight remind us that education has been handicapped in its ability to influence meaningful change because of the profession’s lack of understanding about its own history (Alexander and Knight 1993). The detailed study of our past is vital if we expect to be productive in the future (Cuban 1990).

References

The study of national history is an important part of the curriculum. What we teach young people about their country's history tells a story not only of our collective past but also of our present; our values, ideals and our sense of history. The history of both the United States and Australia has involved the displacement and mistreatment of the native populations. The encounters between the Native Americans and Aborigines and European settlers includes all of the possible reactions when two very different cultures meet: segregation, accommodation, assimilation and annihilation. The history of relations between these two groups often contained a mixture of more than one reaction through any historical period of time.

Unlike other European colonists the English came to America in great numbers with the intent on permanent settlement. They had a great interest in owning and occupying the land. As their numbers grew, so did the need for land, which directly affected their encounters with the Indians. The English crown had given land rights and trading prerogatives to individuals and groups in the form of charters. Each of these settlements could and would deal differently with the natives they encountered. Each colony in time developed its own rules and procedures. "There would be great changes in the twentieth century..."

The Constitution of 1789 excluded the Indians from taxation and representation, by implication denying them citizenship. Indians were regarded as a foreign nation, with whom Congress could regulate commerce. The Congress attempted to do just that by passing laws to regulate trade with the Indians and setting a Proclamation Line in 1796 which marked Indian Territory under federal jurisdiction. Such a line was difficult to enforce and as settlers pressed westward and occupied Indian lands. The tribes fought back in numerous Indian uprisings and wars which opposed white encroachment on Indian territories.

With the Louisiana Purchase in 1893, Thomas Jefferson attempted to negotiate treaties to move the tribes west of the Mississippi but would not force them to leave. He had hoped that Indians would take up agriculture since, as he stated, "household manufacture...will enable them to live on much smaller portions of land." But the Indians fought to maintain their own way of life. The period of 1816-1860 was marked by the forcible westward movement of these tribes. The Indian Removal Act of 1830 removed tribes to land west of the Mississippi. It rejected, in principal, the conditions of earlier treaties, which had recognized the rights of the Indian tribes to their land and in fact, nullified the legal understanding that the Indians were independent nations. In the cases of *Cherokee Nation v. Georgia* and *Worcest v. Georgia*, the Supreme Court ruled that the Indians were a "domestic, dependent nation" subject to federal not state authority. As such, they should have been protected by the federal government and their rights could not be disregarded by the states. President Andrew Jackson, however, refused to enforce the ruling.

Jackson instead pressured Indian leaders to sign new treaties, most of which were signed under intimidation, threats or bribery. Indians could remain on their land only if they gave up allegiance to their tribe and accepted that of the state. In reality, few Indian land claims were accepted by whites. Eventually their lands were taken over by whites, and these Indians were landless and poor. The tribes who accepted the treaties were moved westward.

The period of the American Civil War (1861-65) saw an increase of open conflict between the white settlers and the Native Americans. Having abandoned military forts in the west, settlers and natives fought each other in bitter battles, with atrocities on both sides. Settlers wanted protection, new lands opened up for settlements and Indian tribes forced onto reservations. Indians, confined to reservations, on land that was unsuitable for farming, could not survive. Some hunting parties left the reservations and did not return. When the government annuities were delayed, their very existence was threatened.
The bloodshed on the frontier during the Civil War period did alert the federal government to the failure and a much needed reevaluation of Indian policy. A Congressional report issued in 1867 blamed the whites for the violence on the frontier, much of which was attributed to the depletion of the buffalo herds. With the destruction of the buffalo and their livelihood, Indian life was severely threatened. The report recommended that for their survival, the Indians should all be placed on reservations and be protected by the federal government. The reservation system became the accepted policy to satisfactorily meet the problem of violence between the two cultures.3

No longer a military threat, in 1869 the Department of the Interior instead of the War Department was given control of the Bureau of Indian Affairs. The Board of Indian Commissioners recommended a threefold policy: that the Indians be considered wards of the government, that the tribal practice of communal landownership be ended and lastly that the Indians be "civilized" to western culture. The implementation of such policy was begun. By 1885, the Major Crimes Act gave the federal government jurisdiction over Indians. Indians, however were not considered members of the individual states. A Supreme Court decision, Elk v. Wilkins denied Native Americans citizenship under the Fourteenth Amendment, which had recognized former slaves as citizens of the United States.

It had become apparent that the Indians were not being assimilated into the Anglo-American culture quickly enough. "The alternatives were cruel and undesirable, either death or parasitical existence upon reservations."4 The Allotment Act of 1887, also known as the Dawes Act, attempted to bring Indians into the mainstream of American culture by making them individual landowners. The act authorized the president to break up reservations into individual parcels of land. Any Indian who left the reservation and became a landowner would automatically become a citizen. With the closing of the frontier, the destruction of the buffalo herds, whites believed that it was time for the "Indians to settle down and live on farms like other Americans."5

The Dawes Act was a failure. As noted, historian D'Arcy McNickle explained, "It would not have occurred to any of the debaters to inquire of the Indians what ideas they had of home, family, and of property. It would have assumed, in any case, that the ideas, whatever, they were without merit since they were Indian."6 The Act had, in essence, attempted to exterminate Indian culture. Opponents of the act had warned that to destroy Indian culture in the name of humanity was far worse than destruction in the name of greed.7 Treated as individuals, rather than as tribal entities, groups lost their independence and became subject to state and territorial laws. The Indians lost most of the land that had been theirs under treaties. Land ownership by Indian tribes was reduced from 138 million acres to a mere 48 million acres.8 Most of the Indians had little interest in farming.

By the beginning of the twentieth century Indian tribal culture had been all but wiped out by the provisions of federal policy and laws. Tribal affiliation was dealt a further blow when Indians were enrolled in public schools in the 1920s. Reformers believed that public education would further detach Indians from their native culture. Truant officers made sure Indian children attended public schools or were forced to go to boarding schools away from their homes. Poor, often ridiculed at school, discriminated against by others, few Indians remained in school.

The reform move to provide education also brought to light the problems of poor health care, nutrition and living conditions of the Indians. Awarding citizenship in 1924 did nothing to improve living conditions of Indians. The Meriam Report did bring about changes in Indian policy. It emphasized the need to improve Indian welfare by involving Indians themselves in finding solutions to the problems they faced. It brought about an end to allotment and saw freedom of choice as essential in the development of Indian policy.

Among the poorest during the Great Depression were the American Indian tribes. By 1933, President Roosevelt had "accepted the radical thesis that the Indian race was not headed for extinction. The population trend had already begun an up-swing, and a growing body of ethnological studies offered evidence that cultural survival of the Indians was indeed extensive."9

The Bureau of Indian Affairs, under the New Deal, was headed by John Collier. Collier respected Indian culture and was dedicated to improving their treatment. Many of his goals were realized in the passage of the Indian Reorganization Act of 1934. The Act repealed the allotment of the Dawes Act, extended the trust system for land and provided an annual budget of two million dollars to buy up additional land for Indians and established a rehabilitation program. It also granted tribes limited self-government and power over its members.10 The act, however, did not
Indigenous Peoples in National History

preserve or revitalize Indian culture, or establish special courts for Indian concerns, or return allotted lands to tribal control.

At the conclusion of the World War II, Indian servicemen returned home. Many better equipped to earn a living, left the reservation. Providing special services for Indians, as different from other citizens, came under attack. Congressmen from the western states began endorsing a policy of "terminating" Indian tribes and reservations from federal responsibility. The many Indian claims against the federal government were given financial settlements (totally more than eight hundred million dollars). Congress absolved itself from further economic and legal responsibility for the Indians, arguing that they were now financially able to take care of themselves.

Federal programs to aid minorities, the war on poverty program, and the civil rights movement brought larger funding to Indian reservations in the areas of health, education, and welfare. The American Indian Civil Rights Act, returned control of Indian affairs to the tribes. Protests at Alcatraz, the Trail of Broken Treaties Protest in Washington, D.C. in 1972 and the widely publicized protest at Wounded Knee heightened public and government awareness to the mistreatment of Indians throughout the course of U.S. history.

In 1970, the government "enshrined the concept of tribal sovereignty at the center of its policy toward the nation's more than three hundred tribes." Renouncing the policy of termination, returning of sacred lands, and administering programs of education and health by the tribes were some of its primary concerns. Political autonomy provided many legal victories for Indian rights. The U.S. Supreme Court and Congress upheld Indian claims of treaty violations and the unlawful succession of land in many states. Indians received damages, land claims and significant rights in the areas of water and fishing. Indians have won some mastery over the land and resources which were once entirely in their domain. While they have won rights to their reservation land, there are many economic problems of supporting themselves on this land.

Though the land and settlement of Australia was very different from the colonization of the Atlantic seaboard, the same prejudices towards indigenous peoples played an important role in the treatment of Aborigines. Undisturbed and "undiscovered," the early Aborigines survived in the harsh environment. Linked by common spiritual beliefs, a variety of Aboriginal languages arose from their tight social structure of family groupings. An estimated five hundred different groups existed before the European arrival. Though they had no concept of private property, leaders or councils, they were intensely territorial, linked to the ancestral area by hunting customs and totemism.

European exploration changed the continent and the life of the Aborigines forever. Captain James Cook, who landed at Botany Bay (later renamed Sydney) in 1770 brought back glowing reports of the land. The First Fleet sailed into Botany Bay in 1788 with 776 convicts who would become the first settlers of the new colony. The settlers, however, did not find the rich soil of their expectations. Instead, the harsh, barren land was difficult to farm, and supplies were short.

Life was difficult in the small colony. When a prisoner's sentence expired, however, few returned to the unemployment and poverty they had known in England. At the end of their sentences, these emancipists, outfitted with provisions and clothing for eighteen months, set off on their own and attempted to farm the vast expanses of land.

Governor Philip estimated that there were only about fifteen hundred Aborigines in the area of first settlement. This sparse population of three per square mile presented no threat to early settlement. His instructions from England had been to "live in harmony with the natives and to punish anyone who harmed them."

The British soldiers and prisoners, however, carried with them the attitudes and prejudices of the early explorers descriptions of the native Aborigines. Based on the former derogatory descriptions, stone-age stereotypes, the absence of agriculture and political organization, as well as the low population density of the natives, the British government declared its new colony Australia, *terra nullius*, empty land. This meant that the land was uninhabited and, therefore,
the property of the crown.

Captain Philip had little difficulty in getting along with the natives. His journal reveals that "the 'Indians' showed no signs of aggression and their primitive lifestyles made them the objects of curiosity and sometimes amusement." The early colony often relied on the Aborigines knowledge of the bush for their survival. Problems arose, however, as settlement continued outside the small confines of the Sydney colony.

The root cause of conflict between the settlers and the Aborigines was one of land and the right of Aborigines to exist as a people. The early pioneers "regarded the aboriginal people as vermin to be exterminated or as potential serfs to be exploited." While the British government issued proclamations of equality before the law and threatened punishment of settlers who mistreated the natives, very little could be done to stop white aggression.

Finding passage through the Blue Mountains west of Sydney in 1813 led to the settlement of the interior. Sheep and cattlemen were an invasion that killed the necessary game and restricted Aboriginal movements across the land. The Aborigines, whose very existence depended on the land and water, fought back. Greedy for land, the whites started the 'dispersal' a bland euphemism for massacre. In 1828, martial law was proclaimed against the Aborigines in Van Dimens Land (Tasmania) and in 1830 a full-scaled, yet unsuccessful campaign, sometimes called the "Black Drive" was organized to round up the Aborigines.

The massacres of the Aborigines became the subject of British Parliamentary debate. 1837 began a new government policy, which was to remain in force for a hundred years, that of 'protection.' With the help of missionaries, Aborigines were to be assigned to safe reserves. Despite the protection of the British government, hostilities continued. The great expanse of colonial territory made the British enforcement of the protection policy often irrelevant.

The discovery of gold in 1851 changed and intensified the course of settlement. Miners confined to their diggings and small settlements had little contact with the Aborigines but ranching also continued to increase. Needing great expanses of land for grazing sheep and cattle, ranching presented a greater threat to the Aboriginal lifestyle. Law enforcement in remote parts was non-existent, and whites often took the law into their own hands. The Aborigines, simply fled into the bush, the unsettled interior.

Violence continued. The Protection policy failed to eliminate conflicts and while reserves separated the Aborigines from the pastoralists, it did not accommodate the Aboriginal lifestyle of hunting and gatherings." It did, however, usher in a period of attempted assimilation. Missionaries tried to teach Aborigines to live like the white settlers. The Aborigines Protection Act legislated in 1869 in Victoria and subsequent acts excluded Aboriginal peoples from all aspects of modern Australian life. Those who remained religiously and culturally Aboriginal were not allowed to live or work off the reserves.

There would be great changes in the twentieth century. In 1901 the new nation of Australia, independent of Britain, began to establish its own policies. Migration to Australia increased though the government directed its efforts to preserve "White Australia" through its immigration restrictions. The Constitution gave the Commonwealth the power to make laws for only Aborigines who lived in federal territories. Each state could decide government policy towards its native Aboriginal population. In no state were Aborigines given voting rights or counted in the census.

With the 1911 Aborigines Ordinance Act, an attempt was being made to preserve the records and the culture of what most taught was a dying race. This law was followed by individual states issuing similar acts to determine Aboriginal status, rights of protection and settlement on reserves and employment. Assimilation was an anticipated end of the Aboriginal issue.

Among the Aboriginal community, there was a continued resistance to assimilation. The Aboriginal Manifesto of 1938 signaled an awareness of Aboriginal identity that would have to be recognized in a new Australia. By this time in was becoming apparent that the Aborigines were not dying out as anticipated, in fact, there was a growing population of Australians who were Aboriginal or part-Aboriginal who were becoming increasingly active, particularly in the area of political and economic rights. Aboriginal organizations began to appear throughout the 1940s to promote cultural awareness and champion civil rights. The official government policy of both the states and federal government, however, continued to be one of assimilation. In a joint statement in 1961 this policy was explained that all Aborigines
and part-Aborigines are expected eventually "to live as members of a single Australian community."

Aborigines, long excluded from the political life of the nation, continued their struggle for rights and opportunities. In 1962, they were finally given the right to vote. Economic as well as social concerns were being brought to public attention. Poverty, poor health conditions and the isolation of Aborigines as fringe-dwellers in modern society had made it obvious that assimilation had not been successful. At the same time, census figures began to show a growth in native population. The national debate on how best to achieve equal rights for Aboriginal peoples led to the 1967 referendum which amended the constitution to give the Commonwealth government the power to make special laws for Aboriginal people. While political rights were ensured by the national referendum, land rights became the pivotal and still unresolved issue. In the case of *Murrupum and Others v. Nabalco Pty Ltd and the Commonwealth of Australia* the decision found against the plaintiffs, who claimed that under native title the Arnhem land belonged to them and not to the mining company which was developing it.

The unfavorable ruling helped end a policy of assimilation and began an era which would be marked by movement towards the self-determination of Aboriginal people. Indigenous peoples established the Aboriginal Tent Embassy on the lawns in front of the Parliament House in Canberra. Aboriginal protests against government continued. A majority of Australians saw the Aboriginal cause as legitimate; the government was toppled.

The new Labor government emphasized the rights of the Aborigines to be "a distinctive people with a special attachment to the land." The last twenty-five years have seen greater attention paid to Aboriginal concerns and certainly increased legislation on their behalf. With the Aboriginal Land Rights Act (1976) the government established land councils to act as custodians of the land granted to Aboriginal peoples. It also incorporated town councils to administer the land. Such claims were further protected by the Aboriginal and Torres Strait Islander Bill (1984).

Strides were made in overturning the protection of past legislation. Freed from any legislative review by British authority the way was cleared to nullify the historical claim of the British crown to all the land of Australia. The implications for Aboriginal Rights were monumental. The 1992 *Mabo v Queensland* 2 was the most important legal decision in the area of Aboriginal Land Rights. The decision nullified the historical *terra nullius* claim on which the Crown had colonized Australia. The argument of the plaintiffs in the case, which was accepted by the court was that the indigenous people did, in fact, have an organized social group and a system of laws. The land, therefore, was not empty when it was colonized. The concept of *terra nullius* was found to seriously offend our modern concepts of civil rights and justice. This decision opened the courts for a plethora of suits regarding native title to lands which will undoubtedly fill the courts for years to come.

It is evident from this brief history that the relationship between indigenous people and European settlers has gone through many turbulent times and great changes in both the United States and Australia. Most significantly it has been a history of survival. The early curiosity each group had about the other was replaced by open hostility with competition for land and resources. The larger numbers and organization of Native Americans assured their recognition by the Europeans. This was not true of the Aborigines in Australia who disappeared into the bush and survived in the outback.

Both groups were belatedly "protected" on land reserves set aside for them and administered by the government or missionaries. Assimilation and the dismantlement of native culture was the official government policy in both the United States and Australia. While some indigenous peoples were assimilated, many attempted to preserve their culture and way of life. It was not until recent history, as a result of civil rights and protests, that indigenous peoples have been recognized as citizens and ensured self-determination. This recent policy has made it possible for native peoples to take charge of their own lands and revitalize their culture. Assimilation has finally been replaced by a policy which recognizes the cultural diversity. An attempt is being made to understand the culture of the people who were once considered of little consequence. It also recognizes that Native Americans and Aborigines are an important part of the history and culture of their respective countries.

The future, it seems, will depend upon how much we can learn about these indigenous people and how well their culture can be preserved and appreciated in their national histories. As John Gunther, Australian commentator, notes modern society needs a more comfortable give and take "between Western cultures and the cultures that we
perhaps quite wrongly call primitive."22

Clean Shirts and Creased Trousers: The Summer Teaching Institute of 1915 and the Influence of Booker T. Washington on Negro Teacher Education in Alabama

Karen L. Riley, Auburn University at Montgomery

The faces of black and white men and women stare back from the sepia-colored pages of the past. These images, set between the pages of a tattered black photograph album, are a record of a bygone era. Men and women, blacks and whites, all gathered together to record their experiences of the summer of 1915: the setting, rural Alabama, the participants, Negro teachers, white supervisors, and a special category of educators known as Jeanes Teachers, named after the philanthropic fund which supported their activities. The story of the summer of 1915 is one of learning, dedication, and achievement. It represents a piece of Negro history in Alabama which has all but been forgotten—Negro self-help, white involvement in Negro education, and the nature of black rural communities. The Civil Rights rhetoric and highly-profiled achievements of Blacks during the 1950s and 1960s has likely eclipsed the story of the slow-but-steady progress made by a handful of Negro leaders and scores of Negro followers, especially in the rural South, decades earlier. This paper, then, seeks to illuminate a small piece of their struggles and successes.

However, in order to understand the “Summer of 1915” and its meaning to Negro teacher education as well as rural Negro education, one must first understand the education path rural southern Negroes followed, that of industrial education. The course of southern Negro education was set when Booker T. Washington graduated from the Hampton Institute in 1875 (Bond, 1934). Washington, born into slavery, came under the influence of General Samuel Chapman Armstrong, founder of the Hampton Institute, and former military commander during the Civil War (Bullock, 1967, 76). Washington, who, decades after his work on behalf of rural Negro education, has been much maligned by both whites and blacks for not seeking an intellectual vision for Black Americans, but rather confining his vision to that of industry and labor. However, his vision for black Americans had less to do with either blue or white-collar economics and everything to do with a moral vision. After all, at the Hampton Institute, Washington studied moral philosophy, not vocational education. Accordingly, one of Washington’s biographers (Bond, 1934) wrote that Washington’s “first duty at Tuskegee was not to erect a formidable catalogue of technical ‘courses’: [rather] on his first school day, he noted every missing student, every dirty collar, every filthy shirt or uncreased trouser. [Thus,] his first assignment was to request that these defects be repaired by the next day” (p. 119).

The Great Vision and the Great Fear

Likely, more than a few Tuskegee graduates who heard Washington’s messages of cleanliness and attention to duty, were captured on film, and are represented in the photographs contained in the black tattered album. These images give sharp testimony to the scores of Negro teachers and students, who embraced Washington’s approach to the uplifting of the Negro race—pride in self, and pride in work. His directives of cleanliness, orderliness, and personal hygiene are evidenced in every photograph (Alabama State Archives, Jeanes Teachers, SPP28). Yet, as dynamic as Washington was, his ability to generate funds within the Black community for Black education was limited. However, his great vision for Tuskegee, some 30 miles east of Montgomery, Alabama, the state capitol, came at a time when northern philanthropy was at its peak. Thus, individuals such as Julius Rosenwald, one of the principals of Sears Roebuck, Anna T. Janes, a wealthy Quaker, George Peabody, and John F. Slater, from the Slater textile family, played a pivotal role in southern rural Negro education, albeit their work was often viewed with skepticism by those who feared that they would unduly influence southern Negroes (Bond, 1934). To be sure, white fear often focused on the Negro’s assertion of individual rights, along with the perceived attempt by some that Negroes might place themselves, through education, on the same plane as southern whites.

In 1906, W.E.B. DuBois delivered a speech at the Hampton Institute in which he eloquently outlined the ideas behind this white fear. On the one hand heeded DuBois, the voices which comprise the “Great Fear,” as he called it, experienced saner moments in which Negroes were accepted to some extent as human brothers. On the other, the voices cautioned that Negroes must be dealt with in a careful manner. One way to accomplish this “carefulness” was to emphasize duty and minimize the rhetoric of rights. As DuBois succinctly stated, “take the eyes of these millions off the stars and fasten them in the soil; and if their young men will dream dreams, let them be dreams of cornbread and molasses” (Aptheker, editor, 1973, 9). Thus, the industrial training schools promoted by DuBois’ counterpoint, Booker T. Washington, and then later by the philanthropists who supported Washington’s ideas, seemed to quell the Great Fear and perhaps redirected the gaze of some from the stars to the soil. In any event, Washington’s industrial
The idea that the South needed many hands to help it rise from its failed attempt at nationhood contributed to the energy and vitality which Washington and others brought to the educational endeavor of building up industrial programs. More to the point, as a former slave Washington himself had witnessed the brief ascent of his people during the Reconstruction period when the “Yankee occupiers” thrust scores of former slaves or northern Negroes into political offices in the South, only to be turned out once Reconstruction ended. Thus, Negro aspirations were confronted, at the close of Reconstruction, with growing resentment by southern whites. This resentment resulted not only in acts of violence, but also in institutional endorsements of white racial superiority. In one revisionist account of Reconstruction (Stampp, 1965, 198), the author outlines southern white sentiment:

To prevent the ‘Africanization’ of the South, they demanded: ‘A white man in a white man’s place. A black man in a black man’s place. Each according to the eternal fitness of things.’ [Additionally,] an appeal of South Carolina Democrats on behalf of ‘the proud Caucasian race, whose sovereignty on earth God has ordained’ protested against the ‘subversion of the great social law, whereby an ignorant and depraved race is placed in power and influence above the virtuous, the educated and the refined’ (Ibid).

In the face of such extreme opposition, Washington’s conciliatory approach to education and the Negro acted as a salve upon an inflammation. Yet, the intellectual dream refused to die. The irony is that Washington did not advocate industry without intellect nor did DuBois advocate intellect without industry. These two endeavors according to both men were not mutually exclusive. However, at the turn of the century, it likely seemed that both approaches to Negro education were locked in a winner-take-all combat. In 1895, while United States Commissioner of Education, William T. Harris, continued his advocacy of a classical-style education for Negroes before audiences at Atlanta University, Washington campaigned at the Atlanta Exposition that same year for Negroes to abandon the lofty ideals of the classics and cast down their buckets where they were (Bullock, 1967, 87). At the Exposition meeting Washington put the following before his audience: ‘Ignorant and inexperienced, it is not strange that in the first years of our new life we began at the top instead of the bottom; that a seat in Congress or the state legislature was more sought than real estate or industrial skill; that the political convention or stump speaking had more attractions than starting a dairy farm or being a truck driver’ (Ibid). He went on to admonish his fellow Negroes to ‘cast down in agriculture, mechanics, commerce, domestic service, and in the professions’ (Ibid). Thus, his response to Harris and others who were like-minded, was immediate and profound; it resounded around the nation and the world.

With enthusiasm, white northern philanthropists lined up behind Washington and his Tuskegee experiment, a program whose core was comprised of moral teachings and industrial know-how. However, rather than simply handing over sums of money for Negro education, the approach taken by some northern philanthropists, like Julius Rosenwald, included an insistence on the participation from both the white and black community. For example, the terms of the Rosenwald school building program involved contributions by both white and black communities. By 1932, some 5,300 Rosenwald schools had been erected in fifteen southern states (Embree and Waxman, 1949), with Alabama serving as the birthplace of the Rosenwald schools. The vision of both Washington and Rosenwald regarding the school building program was to offer community grants of one-third the cost of construction with the other monies emanating from the local black community, public support, and the local white community. According to one writer and critic, however, the reality failed to meet the vision—“the attitudes of southern whites were little changed by Rosenwald grants and few whites were induced to contribute to the building fund” (Rosenwald School Building Fund, Alabama Historical Commission, 1997). Yet, the enduring stories of community successes refuse to slip into obscurity. For example,

In Mississippi, John H. Culkin, superintendent of Warren County, having learned of the Rosenwald buildings in other states, became disturbed because there were not decent schools for blacks in his county. He became determined to erect a new building in each of the twenty-five black communities in Warren County. Disliked by the local Ku Klux Klan because he was Catholic and because two of his board members were Jews, Culkin ordered that the entire program be begun in each community and in the utmost secrecy. Complete bills of material and specifications of all the schools were given to large lumber mills with orders to deliver the goods on a specific day in Vicksburg. White citizens
not only gave money, but provided mule teams and wagons to carry the materials to the sites. Workmen had already laid the foundations and women and children organized by Jeanes teachers, cleaned and graded play areas and walkways and the women served hot lunches to the laborers. Within a week all twenty-five schools were enclosed and roofed and within a month, all had been completed, painted and equipped. By the time the Klan had convinced the courts to issue an injunction to stop the building, the superintendent had completed his plan (Embree and Waxman, 45-46).

Despite the massive amount of funding Rosenwald administrators poured into the rural school building program—$4,071,463 for school house construction alone—the philanthropic effort was later viewed as a crutch rather than a stimulus (Rosenwald Building Fund, Alabama Historical Commission). Both Washington and Rosenwald had envisioned a “public-private partnership, believing that a shift in southern white attitudes toward blacks could be achieved by retaining the goodwill of southern whites and working with the South’s social system” (Werner, 1939, 366). However, far from being a failure, other money funneled into programs like Negro teacher education by philanthropies such as the Jeanes Foundation, was largely considered a success.

In 1907, Miss Anna T. Jeanes initiated a fund of one-million dollars, consisting of income-bearing securities for ‘the furthering and fostering of rudimentary education in small Negro rural schools’ (Rosenwald School Building Fund, Alabama Historical Commission, sec.E, p. 16). By 1915, the Jeanes Fund had placed supervisors in 134 counties with the majority of these counties accepting responsibility for some percentage of their salaries. The largest recipient of Jeanes teachers was the state of Alabama. Jeanes Teachers seem to defy definition. Their own motto was “the next needed thing” (video tape of Jeanes Supervisors, Alabama Historical Society). By their own accounts, they would go into communities and “do what ever needed doing.” In Alabama, at the turn-of-the-century, 40% of the state’s population was Negro, and 90% of that figure lived in rural communities throughout the state. Thus, the role of the Jeanes Teachers, often referred to as Jeanes Supervisors, was pivotal in organizing schools for Negro children in rural Alabama. In 1917, the state’s Rural School Agent, James L. Sibley, published his report on the work of the Jeanes Supervisors. In it, he wrote “the South is dependent upon agriculture for a great deal of its prosperity and upon the [N]egro farmer and laborer for a large part of its industrial development. There should be some method to train [N]egro children while attending rural schools to become intelligent, thrifty, and skillful workers” (Sibley, 1917, 4-6).

According to Sibley, Jeanes teachers “visit the [N]egro rural schools, teach the industrial work in the classes, supervise the schools under the direction of the county superintendent, and hold patrons’ meetings for the improvement of schools. During the winter months, their time is largely devoted to actual work in connection with the schools. In the summer they devote their time to club work and community affairs” (Ibid). His strong and approving words are testimony of the extent to which not only the communities valued the services of the Jeanes Teachers, but also white superintendents and the Rural State Agent himself, Sibley. His report is filled with their accomplishments such as agents of the then popular “HOMEMAKERS' Clubs,” (443 clubs in 541 communities in 1916), and their work with community folk in planting home gardens, growing their own supplies, saving and storing food for winter months, and improving their homes.

Other duties filled by these Jeanes supervisors included, meeting with trustees, organizing improvement clubs, and sponsoring fund-raising rallies. Some even personally raised money for school building programs. One Jeanes supervisor, Mary Sanifer, serves as an example of the type of individual who exhibited the level of perseverance Jeanes Teachers were noted for.

One day while reading a copy of the Christian Index, I noticed a headline “Better Rural Schools.” With much interest I read the notice that Mr. Julius Rosenwald was deeply interested in better Negro school buildings and would give dollar for dollar in the erection of modern Negro school buildings. I wrote to him immediately for further information. He referred me to Mr. C.J. Calloway, Rosenwald’s Agent, Tuskegee Institute, Alabama. From him I received all needed information. Filled with encouragement I began to advertise my project. It seemed impossible to make the people believe a man would give dollar for dollar to erect a school building. I tried to organize a school improvement association. I succeeded with three men and four women. The men were afraid to venture, so I had to assume all the responsibility. I bought two acres of land at a cost of $50.00.
With my school improvement association we planned a school rally and raised $62.00. This paid for the land, which was encouraging. I began then to raise money and subscriptions for money to qualify. When I covered the amount in subscriptions, I suggested that we borrow the money paying as much as possible in labor. The three men secured subscriptions and immediately afterwards during my absence, had their signature abolished from security. When I found it out, I did not know what to do. Trusting God, I continued. I went to the man who was lending us the money and offered my name as security. Seeing my anxiety for the building he accepted me alone. I deposited the money and the county superintendent sent in the application. It was accepted and the work began. The community was convinced that the work would be done. I employed a contractor and the community joined in. As a result we succeeded with a beautiful two-teacher Rosenwald building (Rosenwald School Building Fund, Alabama Historical Commission, p45-46).

Sanifer’s story is one of many. Her work in raising money for Washington’s industrial school model was echoed throughout the South as Negro leaders and parents sought to educate their children “up from slavery,” toward self-determination, despite protests by some leaders and citizens who argued against the education of Negroes. However, by the summer of 1915, Jeanes Teachers were familiar faces and a welcome presence in many rural black communities.

The Summer Teaching Institute of 1915

The participant record by county for the Summer Institute of 1915 for rural black teachers and Jeanes Supervisors stretches from Mobile County in the far south of the state of Alabama to Calhoun County in the far eastern part of the state and Tuscaloosa County to the north. More than 1,600 educators were enrolled in the institute, which ran from July 12 to September 29, owing to the fact that the school term for most Negroes began in October after the harvest. The reports which accompany the photographs were written by the in-service institute’s “Conductor,” and generally contained the following information: enrollment figures; a note on the character of attendance; work stressed by the conductor; role of the Assistant; list of visitors; spirit of work, and distinctive features (Alabama State Archives, Jeanes Teachers, SPP28). Although not richly detailed, these brief reports offer us, in synopsis form, a glimpse at this turn-of-the-century teacher in-service institute.

Booker T. Washington, his wife, and James Sibley, the State of Alabama Rural Agent Among were among those present at the opening week of the institute, held in Tuscumbia, Decatur, and Huntsville, located in the northernmost part of Alabama. The goals stressed by the Conductors ranged from arithmetic in grammar grades to the removal of illiteracy. Of seemingly high interest during the entire summer institute was a model of a sanitary toilet, as it was mentioned in nearly every Conductor’s report. The role of the Assistant at Huntsville, for example, was to discuss work in the Primary grades, demonstrate games and the use of a sand table, plus a discussion of the vocational work of girls. The Huntsville institute was visited by the Honorable E.B. Almon, Congressman, who spoke on the “Advantages of present over past system of Schools” (Alabama State Archives, Jeanes Teachers, SPP28).

The Superintendent, S.R. Butler also spoke to attendees on the importance of the institute, while Sibley addressed the group on Agriculture and Sanitation. Superintendent A.A. Persons discussed the “Proper Use of Fertilizers,” while Dr. L.B. Moore, Dean of Howard University, spoke on “the Need of Correlation and continued preparation.” P.C. Parks discussed Colored school farms, while Miss Nixon lectured on Primary Hand work and Mrs. Gordon demonstrated how to prepare a “wholesome meal on the farm (Alabama State Archives, Jeanes Teachers, SPP28). The “spirit of work” described by the Conductor included his assessment that “teachers showed a determination to be of service to their communities.” The distinctive features of the Huntsville institute included a demonstration on how to make a fireless cooker, the evening social and Dr. Moore’s address.

The County Superintendent wrote a brief report about the institute’s Conductor, H.C. Binford, in which he described his work “as being beyond the average for negro instructors. He is willing and seems to have a fair knowledge of what the negro needs.” Likely, the county superintendent would not in any way consider his remarks about Binford to be biased or negative, yet they underscore the then current attitude prevalent among many whites, that the level at which Negroes function is inferior to that of whites. A more telling remark from a white superintendent about Negro educators came from the Clarke County superintendent who described his Conductor as
"a typical African: a smart man and a most excellent institute conductor. Can't be beat for his place." Other such remarks emanated from the county superintendent of Morgan County, Decatur, Alabama, when he wrote that the Conductor of his institute, G.W. Trenholm, was "a capable Negro."

At the Decatur institute, the conductor stressed community clubs and industrial work. Like the Huntsville meeting, the fired-cooker demonstration received special mention, and stamping out illiteracy was a collective goal. In Tuscumbia County, the conductor reported that the "spirit of work" was excellent and that "teachers worked over time each day, once till dark on making the sanitary toilet." These demonstrations and "hands on" projects were indicative of the type of work and curriculum developed for the 1915 summer teachers' institute. The distinctive features outlined by the Tuscumbia Conductor included an Illiteracy parade with about 50 placards, flags, and pennants, "mending for men," "chair caning," sanitation, and the fired-cooker, while the county superintendent reported the distinctive features as "construction work in the way of manual training and domestic art." Although the enrollment for Tuscumbia was 56, the country superintendent believed that it was light owing to the early date of the institute.

While the institutes organized in most counties resembled one another, each offered a unique curriculum, although the universal attendance of James Sibley and A.A. Persons seemed to provide continuity. For example, when the institute moved from the northern part of the state to the central, the week of July 26, Conductors and Superintendents focused on the scholarship of teachers; however, they also stressed the industrial model which included a dose of Washington's moral philosophy through lectures on punctuality and sanitation. In Tuscaloosa, attendees heard lectures on issues such as agriculture, improvement of teachers, school improvement, health and cooperation with patrons. The usual demonstrations of canning and lessons on whitewashing were part of the curriculum. The county superintendent's assessment of the spirit of the institute included the following: "Those in attendance, I feel satisfied were greatly benefitted as I have never attended a negro institute where a more marked spirit of determination has been shown to do better work among their people than was evinced at the closing hour of this institute" (Alabama State Archives, Jeanes Teachers, SPP28). In Pickens County, the attendees were so proud of the sanitary toilet they built during the institute, that they placed it "in the middle of the court house square for inspection" (Ibid).

In Dallas County, Selma, Alabama, during the week of August 2, community uplift and gardens were topics on the agenda. The Assistant emphasized primary methods, sewing, domestic science, and the need for good teachers. Guest speakers spoke on topics such as sanitation, personal cleanliness, care of babies, and training of head, hand, and heart, while the attendees in Hale County listened to lectures on "Better Rural Schools," "Making Farm Life Happy," and "Correlating Rural School and Country Life." One "distinctive feature" of interest was how to study "geography in local grocery and dry goods stores" (Ibid).

Clarke County's program was slightly different. It stressed academic subjects and content such as English and Arithmetic and methods of teaching in the "advanced grades." The Conductor spoke on the need to organize reading circles and school improvement leagues. Interestingly enough, these leagues were gender distinctive: one for men and one for women. At the Clarke County meeting, the Conductor reported that a number of local white people attended the sessions and "large crowds of colored." In fact, the Conductor stated that there was "hearty cooperation on the part of the teachers in attendance and the people of the community both white and colored" (Alabama State Archives, Jeanes Teachers, SPP28).

In South Alabama, in the town of Brewton, which is located in one of the most rural sections of the state, teachers went into neighboring homes and gave domestic science lessons to residents. Other notable demonstrations included pine needle baskets and "shuck work." Only an hour away in Monroeville, home of two of America's most well-known writers, Truman Capote, In Cold Blood, and Harper Lee, To Kill a Mockingbird, the Conductor stressed "kindness to children," "teachers living in the community," and "clean-up day," among other topics. The County Superintendent was enthusiastic when he remarked that "I consider the institute a success in that it evoked the approbation and commendation of the best people of the town" (Ibid). Lee County's Superintendent also made positive remarks about his institute when he said, "the negroes of Lee county are loyal and cooperate in progressive measures" (Ibid). One interesting feature of the Barbour County institute was the use of a former slave in teaching craft work. According to the Conductor's report, "an old negro basket weaver who had learned his trade in slavery..."
days was employed to give the teachers lessons in basket making, bottoming chairs and shuck work” (Ibid).

Conclusion:

While an examination of each county’s report on the success or lack of success of the 1915 summer institute is a worthwhile endeavor, this analysis and summary of events demonstrates several unique aspects of Alabama’s Summer Teaching Institute for rural Negro teachers at the turn-of-the-century. One, the curriculum clearly embraced Washington’s industrial model of practical crafts such as sewing, cooking, canning, and other domestic arts and sciences. Two, the curriculum also focused on agricultural science, including planting and raising livestock. However, one of the most distinctive features of Washington’s educational plan was what Bond (1934) referred to as moral philosophy. Throughout the 1915 summer institute, for example, one can find references to punctuality, sanitation, cleanliness, and health. These personal qualities were as important to Washington as learning a trade because to him they spoke of character building. He had learned well from his mentor, General Armstrong, at the Hampton Institute, who once remarked that his desire for Colored Americans was to ‘go out and teach their people, first by example, by getting land and homes; to give them not a dollar that they can earn for themselves; to teach respect for labor; to replace stupid drudgery with skilled hands and to these ends to build up an industrial system for the sake of characters’ (Rosenwald School Building Fund, Alabama Historical Commission, sed. E, p. 12).

However, what can be said in retrospect about Washington’s influence on the Summer Teaching Institute of 1915? To begin with, the scores of Negroes who followed the agricultural and industrial dream quickly realized that in the areas of agriculture and industry, southern Negroes failed to fit White expectations. The scientific approach to farming was based upon the concept of land ownership and directly competed with White notions of Negro farming: Negroes as tenants not competing land owners. In industry, skilled Negro labor rapidly deteriorated. As both avenues narrowed, their followers sought relief in the professions. Some turned from farming to farm agent; others turned from farming or industry to teaching, while females trained in domestic sciences looked to teaching as an equalizing force for many black Americans, which assured them the prestige within their community that agriculture, industry, or domestic science had promised, but not delivered. As William E. Hutchins so succinctly posed the question nearly a century ago when he argued for a liberal education for Negroes instead of industrial education, “what can you teach colored women about washing clothes?”

Cultural Archeology and School Leadership: The Eternal City and the Educational Present

Robert E. Roemer and Janis B. Fine
Loyola University at Chicago

The 1990 Carnegie Foundation report, Scholarship Reconsidered (Boyer), called for a broader view of scholarship that included the scholarships of integration and application in addition to that which has been usually expected of faculty in higher education, the scholarship of discovery. This paper falls under the scholarship of integration, in this instance between cultural history, especially as this can be exemplified in the ruins and cultural artifacts found in Rome, and the need of principals in Chicago Public Schools to make informed policy decisions. In this case, the urgency of present educational crises and issues motivates a digging into their cultural past.

Beginning with an explanation of the scholarship of integration and application, this paper then argues for the importance of providing educational leaders with a deep understanding of the cultural history that surrounds present crises and issues faced in operating a school. The paper then presents a methodology employed to make cultural history relevant and understandable to educational leaders so that the educational historian enters into the dialog of educational decision making. Finally, the paper shows how this methodology can be used in a particular historical setting, in this case the city of Rome.

Scholarship of integration and application

The concept of an “applied academic discipline” refers to a discipline that has, through its content and methodology, the ability to explain related aspects of the larger culture. The use of “applied” means that these disciplines can be focused to examine the institution of education both as a cultural agency and as a process. Having general explanatory powers, these disciplines illuminate education within the cultural context in a particular way. When used in an interdisciplinary approach, they provide an integrated perspective on education which is highly useful for educational leaders who are involved in administrative decision-making. Since educational structures exist to serve students in particular socio-cultural situations within the broader cultural context, these applied academic disciplines are foundational to the analysis of these educational settings. Thus, the scholarship of integration has as its purpose the identification and analysis of the elements of continuity and change in the institutions of education within a general cultural context. For educational leaders who are to act as agents of change, these perspectives on both continuity and change provide needed professional competencies.

The scholarship of application is manifest in a professional development workshop developed for Chicago school principals that involved a week-long stay in Rome with daily visits to important historical sites and discussion of contemporary educational issues and controversies. Commentary at the sites in Rome displayed the central components of Western civilization which in turn provided a basis for more deeply understanding what is fundamentally at stake in the decisions a leader of a Chicago Public School is called upon to make. The same applied academic disciplines that examined the broad cultural or macro context were also used to examine particular educational settings (schools and classrooms) in a micro and/or phenomenological context.

Basis for decision making and school reform

This practical application of historical resources to the professional development of those who run our urban schools has long been needed. David Tyack (1967) in his book, Turning Points in American History, observed that perhaps no institution in our society is more constricted by unexamined tradition and unconscious ritual than the school. He argued that in order to either attack or defend tradition intelligently, one first needs to understand it. One reason, says Tyack, that education is subject to monotonous cycles of reform and reaction is that few recognize that “today’s headache is the result of last night’s binge”(p.xii). Our educational institutions have been most responsive to community and societal needs. No longer rulers of small kingdoms, urban principals are called upon to be responsive to teachers, parent groups, locally controlled school advisory boards, and a tightly controlled central governing agency. What effect has this responsiveness or vulnerability had at different times in our history?

The issue of reform is complex. It is especially complex when we examine and interpret the message behind such terms as restructuring, and site-based management. These terms have become, for some, the panacea for finding quick-fixes and short-term solutions for complex issues that paradoxically transcend the boundaries of the school but are also inherent to the school’s structure. For others, these terms have become the mantra to connote the phenomenon Sarason (1990) describes in the book, The Predictable Failure of Educational Reform.
Golarz and Golarz (1995) in *The Power of Participation: Improving Schools in a Democratic Society*, indicate that historically schools have been a reflection of the larger society of which they are part. As such, schools reflect and experience turmoil and stress which places unprecedented demands and challenges on the role of the principal. Like the intersection of society to school, the causes of these demands and challenges often reside outside the purview of the principal, the superintendent, and even the board of education at the local level. According to Murphy (1993) in *Preparing Tomorrow's School Leaders: Alternative Designs*, training programs for school administrators must change to meet the evolving demands placed on educational leaders, the context of the principaship must be changed, and traditional leadership programs must be transformed. As Tyack notes, by examining our educational history, the individual and group decisions, the social conditions that restricted or expanded choices, educators may become aware of actual opportunities and the necessity for wise decisions in the present. Otherwise, he warned, we may be perpetuating an unexamined relation of schools and society by default or in utopian daydreaming. According to Tyack, "History as embodied in institutions and attitudes has a momentum which deflects naive attempts at reform, but history perceptively grasped can assist needed innovation and conservations" (1967 p.xiii).

**Fundamental Principle**

The basic principle underlying this program of integrative scholarship is that sound decision making in schools depends on getting beyond the particular details of an educational crisis to its underlying cultural configuration. Present educational crises and issues are not random events. The decisions an educational leader needs to make have in a very real sense been pre-selected by history and by the particular ideologies shaped in the previous experience of Western civilization. The events in schools that call for policy decisions are constituted in a significant way by the distinctive cultural configuration within which the school exists, and as such the essential elements that challenge educational leaders have long been argued, pondered, and deliberated, although perhaps with different words and different details. The reflective educational leader who wishes to leverage, rather than be shoved about by, today's educational issues and crises to attain excellence needs to understand the cultural tradition which has brought this event to the present. In short, the present needs to be contextualized by the past.

**The Chicago Context**

During the last decade, a series of reform measures have combined to present principals in Chicago Public Schools with a drastic imperative: perform or be replaced. The implementation of the Illinois School Reform Act of 1988 shifted responsibility for governance of individual schools from a centralized board of education to Local School Councils for each of the city's 550 schools with authority to hire the school principal. By 1995, however, citing insignificant academic improvement, the Illinois Legislature enacted the Amendatory Reform Act which abolished the existing Chicago Board of Education, and created a Chicago School Reform Board of Trustees with Paul Vallas as CEO.

Under the Amendatory Reform Act, while the Local School Councils maintained authority to hire principals, outside interventions of various levels of aggressiveness were put in place to limit or replace the authority of the Local School Councils and school principals: state watch list, remediation, and finally probation. For a school placed on probation, a team appointed by the central office assesses the school's academic plan and institutes curricular and educational change. All probationary schools are assigned a probation manager by the school board who imposes a "corrective action plan" for the school. Failing significant academic improvement, the probationary team may move to dissolve school councils, and make top-to-bottom personnel changes including firing principals and teachers, and calling for new local school council elections. While probation is an extreme measure, in practice it is not extraordinary; last year Vallas placed 71 elementary and 38 high schools on probation.

Clearly, the probationary act is a take-over by the school board which removes educational leadership from the principal. The consequences, then, for a principal who fails to produce education excellence in a Chicago school are drastic: loss of authority to the school board or eventual firing by the local school council. Looking for new ways to help sitting principals meet the leadership imperative, the officers of the Chicago Principals and Administrators Association asked the authors to develop an innovative and intensive program of professional development that would help principals acquire a deep understanding of the educational issues they faced. The intent was to explore educational issues and current crises beyond their present urgency and thereby to lessen the temptation for principals to respond to daily challenges with the latest quick-fix panaceas. The professional development program was planned,
then, to examine the complexities of the current socio-cultural crises impacting educational achievement in Chicago Public Schools as events deeply rooted in the central characteristics of Western Civilization, thereby developing a reflective principal who understands what is fundamentally at stake in educational decisions regarding purposes of schooling and appropriate programs to meet those purposes.

This road leads to Rome

In the years 1895-1900, Sigmund Freud worked with the questions that were resolved in his *The Interpretation of Dreams* (1955). During that period Rome came to occupy a crucial place in his life. In fact, Freud found an analogy between depth psychology and archaeology, and these came together in Rome (Schorske, 36). A similar, albeit completely non-Freudian, use is made of Rome in the workshop developed for Chicago school principals. In many ways, Rome enjoys a privileged position as a repository of our culture. Located on a peninsula jutting into the Mediterranean, Rome absorbed an combined the cultural forces that shaped the western tradition: the literature and philosophy of Greece, the spiritual traditions of the Jews and other near-eastern peoples, the mysteries and monuments of Egypt, the economic forces of North Africa. As these traditions were crystallized and moved through the transformations of the Middle Ages, the Renaissance, and the Enlightenment, they were expressed in the buildings and art that endure as part of the Eternal City. Rome, arguably the central city of Western Civilization as it was for Freud, stands today as a magnificent repository of the past ages out of which our present world emerges and within which educational leaders work our education destinies.

In the workshop that was developed, the sites of Rome became a means to discover the cultural components of what has come to be called Western civilization and through them to interpret the fundamental issues at stake in the current operation of Chicago Public Schools. In Rome, the cultural past that gave rise to the educational present is visible and palpable, to be seen and touched. Witnessing our cultural memorialized, as it were, in the sites of Rome provides an educational leader with the basis of reflecting on why the current educational events that consume time and energy in Chicago represent long standing issues deeply embedded in our culture and for that reason are to be expected.

Using Rome

How, though, practically speaking does one use the cultural riches of Rome to enlighten educational decisions made in a contemporary urban school? The protocol developed for this workshop featured five separate phases:

1. Visits to important locations in Rome which display the way in which Western civilization conceives of the world and the role of human beings within it.
2. Reflection on current educational crises to understand them as part of the fabric of Western civilization.
3. Pro-con debates about these issues.
4. Examination of Chicago Public Schools in general and one’s own school in particular in terms of how the issues raised are manifested in the school’s explicit, implicit and null curricula.
5. Determination of implications for educational change, enlightened by knowledge of the cultural heritage of an issue and its current manifestation.

Using this five-phase approach moves the examination of current educational crises beyond their present urgency by displaying their roots deeply embedded in the Western tradition. This in turn lessens the temptation felt by principals who are on the firing line to get past a present problem by adopting a quick-fix solution using the latest panacea. Rome, with its monuments and artifacts, is the text for demonstrating that the current moment of educational crisis is in many ways to be expected because it reflects the culture within which we live and work. A particular aspect of our cultural past is first examined, then a related educational crisis is examined, and only after that is there a movement toward decision-making within the context of a particular school.

Example: The Roman Forum

The Roman Forum, where human habitation has been recorded for almost 3,000 years, the center of the Roman Republic, and venerated deep into the Empire as central to Rome’s permanence, today remains as a magnificent visual aid displaying cultural elements central to the Western tradition. Kieran Egan writes that our tradition of educational thought has only three basic educational ideas: that we must shape the young to the current norms and conventions of adult society, that we must teach them the knowledge that will ensure their thinking conforms with what is real and true about the world, and that we must encourage the development of each student’s
individual potential (Egan, 3). Each of these can be easily demonstrated in the Roman Forum:

- **Norms and conventions:** through the institutionalization of censorship, every five years the more public citizens were humiliated in front of their fellows when not only their economic status but their morality was written up for all to see by the censors. These notices were displayed in the comitium area of the forum.

- **Development of potential:** when the Romans began to conquer the Hellenized part of the Mediterranean, they in turn were conquered by Greek culture: Graecia capta ferum victorem cepit et artes intulit agresti Latio... [Captive Greece captured the victor and brought the arts to rustic Latium.] (Horace *Epodes* 2.1.156). This new cultural influx was almost flamboyant in its celebration of personal excellence, something foreign to the frugality and restraint of the ancient Romans. This cultural conflict and enrichment is reflected in new architectural forms brought from Greece as evident in the forum’s Basilica Aemelia.

- **Reality and truth of the world:** at least in terms of brick and mortar and concrete the Roman knew the way the world worked. Their engineering competence shows that at least in this realm their thinking conformed with reality. The magnificent remains of the Basilica Maxentius, with its still-standing cavernous vaults, vividly demonstrates that the Romans knew well the way the world worked.

After these themes are explored as part of our cultural heritage, various school issues easily emerge, now not as topical crises but rather as enduring tensions within our cultural heritage. Some of these are:

- Should the curriculum be standardized for all or should there be either explicit or implicit tracks in the curriculum?

- How are the diverse goals to be met of teaching social norms, developing individual potential, and imparting understanding of how to get things done?

- To what extent do students have to prepared to live in different cultural frameworks, the cultural of mainstream capitalism and the culture of one’s personal identity?

The final moment in dealing with these issues is to generate policy statements, in the form “A does X whenever C to achieve P” (an agent does some action whenever particular conditions prevail to achieve some purpose) that concretely specify courses of action. But this is only done after exploratory debate in which opposing sides of an issue are displayed. The debate attempts to lay out as completely as possible how a particular position can be supported. Then, assuming that the argument is sound, the general principle of action recommended in the debate is converted to a statement of action. The action specified is now put forward in its cultural context so that it is more than a way to get rid of a problem but is instead an attempt to cope with part of our cultural heritage.

**Rome and diversity**

One benefit of seeking to understand present educational crises in terms of their cultural past is that by understanding our culture we understand the boundaries of diversity. Rome provides a particularly important entry into this understanding. By an ancient tradition, the world was given a tri-partite division: Europe, Asia, and Africa. The Romans accepted this division and made it a permanent feature of what later became the unified culture of Europe. Rome, then, stands as a witness to the definition of citizen and barbarian, to the declaration of who is one’s fellow and who is Other. This ancient determination of difference remains in our cultural present and still gives rise to life-and-death struggles.

Rome provides another approach to diversity. By understanding our cultural tradition, we particularize it and delineate its limitations. In understanding what it is to be members of the Western tradition, we also come to understand what we are not and therefore where diversity begins. “Know thyself” is also a command to know who is other. The more the components of western civilization become understood, the more clearly the boundaries of this cultural complex are discerned. Only when the limits of the cultural universe are recognized does it become possible to recognize other universes. An educational leader who thoroughly understands the characteristics of the western way of thinking is able to appreciate its particularity and to render it less absolute. This, then, is the basis for genuine rather than merely polite encounter with diversity.

**Sound decision-making**

The education reform movement of the 1980s and 1990s has produced disappointing results. Policy makers
who have labored over federal, state, and local reform initiatives blame these results on the reluctance or incompetence of school leaders. It is important to provide principals with a sense of continuity that integrates our cultural past with the present. Too often, leadership training, in its enthusiasm for change, yields too quickly to an overeager presentism. Often, novelty is confused with significance. Principals who are prepared for the profession in strictly presentist manner lack the needed insight to examine the present in view of the past. As Chicago’s principals engage in sound decision-making they will, through this workshop, link present day problems with an historical treatment of our cultural past.

Clementine Anna Skinner: Tapestry of an African American Educator

H. Michele Soria
The University of Texas at Austin

Clementine Skinner’s womanhood and ethnicity are facts that shaped the course of events in her life. She was born at a time when it was not beneficial to be Black. Her birthday occurred just before the United States entered World War I. She grew up amidst the rapidly changing nature of a dual American scenery: a time of immense prosperity (the Roaring and indulgent Twenties) and a time of great hardship (Depression). Later, Clementine would remember participating in both the Second World War as an enlisted soldier and the Civil Rights Movement as an activist.

How did this woman maneuver through the turbulent Twentieth Century and still manage to make a positive impact in the lives of so many throughout her life? Somehow, against this backdrop, a woman had to forge a place for herself. As an African American woman growing up during watershed moments in United States history, Dr. Clementine Skinner’s experiences are unique.

Childhood in the Roaring Twenties

Clementine was born on February 9th, 1916 in Birmingham, Alabama. She was the oldest of seven children (two children died in infancy). Her mother’s parents were both born into and raised under the mantle of slavery. Freed by a benevolent master before slavery ended, Clementine’s grandmother was the first real generation of “freedmen”. Thus, the McConico family (Clementine’s parents) were direct descendants from slave stock. Clementine’s grandfather, John Burnett, had even enlisted in the Army and served during the Civil War from 1863 till 1865 (Skinner 1998, Summer). Later, he met, wooed, and married Annie and together they had five children, of which Clementine’s mother, Alice, was one. Clementine’s father’s past is much more ambiguous. He was an orphan raised by an elderly couple who died when John McConico was only twelve years old. He refused to ever talk about his past with his family. When she was just eighteen months old, the family made the trek to the large, industrial, northern city of Chicago. Clementine’s siblings were all born in Chicago and all were raised in the south side area of the city (Skinner 1998, Summer).

Clementine John McConico was a strict disciplinarian. He demanded a great deal from his children: obedience, respect, industriousness, and reliability. The family was the strongest unit and was together at all times. The children were restricted to playing among themselves. Clementine remembers that she and her siblings could not participate in after-school activities in either elementary or high school years. The McConico children had few playmates as a consequence. When the family went out on the town or to a picnic in the park, friends and neighbors saw the family together at all times. John McConico’s control seemed absolute.

The family was not staunchly religious. Father was Christian but not a member of any organized church; mother rarely went to church because of young ones to tend to at home. Even so, the children were duly enrolled in the Olivet Baptist Church Children’s Sunday school program. And father made sure that everyone gathered together every morning to recite the Lord’s Prayer. The children also read and memorized Bible verses and sang religious songs before starting the day. Everyone had to participate for father McConico would brook no excuses.

As a result of the tight reign of control the parents wielded over their children, Clementine’s earliest role models were her own parents. There were no close friends and the only other role models were schoolteachers, of course, and live theater shows and film. Clementine remembers that during the late Twenties through the Great Depression, she frequently ran errands at her mother’s direction in downtown Chicago. Clementine’s errands took several hours every day because she had to stop in each theater and take in the show and vaudeville act before she returned home (Skinner1998, October 31). Clementine remembers this time with laughter. Her tardiness was infamous.

The Working Girl in the Great Depression

Clementine remembers how her father, John Federick Anthony McConico, had a difficult time providing the daily necessities for his family during the Great Depression. He was a good provider, nevertheless. He managed to keep his children fed, clothed, and sheltered—without resorting to welfare or handouts. Clementine’s mother, Alice Burnett McConico worked in the family bookstore where her father housed rare books including books about African Americans and their history. Her father was too proud to ask for or accept help from anyone, even relatives. His fierce independence made an important impression on young Clementine.
Education was very important and something they had to do. Father McConico expected his children to do well in school. Consequently, all of the McConico children were good students. They did what was expected of them and received good grades. This was true even though the children often had to wait to get school supplies at the beginning of school since the family did not have the money. By high school, Clementine had learned thrifty shortcuts. To extend the life of her shoes for instance, she would hit the dime store and purchase cement-on-soles. She also visited the Salvation Army to buy clothing. A testament to their parents and children’s hard work was that every child graduated from high school. Clementine was the only one to go on to college later in her life.

1934 was the first year of employment. Her burning desire was to work for a bank or utility company. Yet, the answer was always the same. There were no jobs for Negroes except as cafeteria workers. Instead, Clementine worked as a temporary fountain helper for six months at Walgreen Drug Company. Her duties included peeling potatoes and washing dishes. She also had to travel all over Chicago to work in those stores that needed help. Clementine found it highly ironic that as fountain help, she could not serve customers although she prepared the food and most of the clients were African American.

Times were changing, slowly to be sure, but they were changing. As a result of the Negro Labor League’s work for better employment opportunity of the Black community, Clementine was the third person of color hired at the Woolworth Company as a salesclerk six months after her temporary work (Skinner 1998, May 12). She remained with the company for almost ten years leaving Woolworth’s in 1943 to work for M.S. Stotland (owner of a clothing and furniture store) as a bookkeeper.

Clementine was never allowed to forget her race or gender by the way people reacted to her. She remembers when she and other Blacks had to watch how differently white store managers treated them. One day, while Chicago suffered through a terribly harsh winter, Clementine and other Black women arrived for work (work hours were often from nine till ten or eleven each night). The lack of customers prompted one manager to advise that all of the colored girls return home for four hours. After four hours, the women could work an eight or nine hour shift. The women did not know what to do. None of the Black women lived anywhere close to the store; there was nowhere to go. Clementine noticed that the White salesgirls were not asked to leave for those same four hours. Clementine then made a bold decision (as she was to make many over her lifetime). She approached her superior and announced that she would stay and work until six. The manager thought that was a better idea, so he informed all of the women, both Black and White, that they were all working till six! He had neatly solved the problem of cutting work hours and all because of one bold suggestion made by a young Black lady (Skinner 1998, Fall).

The young White salesgirls were given first choice and advanced quickly through the stages of employment, even though a Negro woman may have had seniority. Clementine remembers another incident vividly. An opening occurred for a higher position within the Woolworth Company store and Clementine’s co-worker, another Black woman, had seniority. Logically, she should have been advanced. Instead, one of the new hires, who just happened to be Caucasian, received the promotion. Clementine watched disappointed. It was a situation that really bothered her. She bided her time till her turn came to be promoted. Again, management wanted to pass her over and advance a White person with less experience and time on the same job. Clementine was not going to allow them to take away her hard-earned promotion. She confronted her immediate superior and told him in no uncertain terms that she should get the job. Management offered her the position; even so, Clementine was not through yet. She wrote a letter to Company officers complaining of unjust treatment. The result was that officials came into the store and took management to task. Positive changes began to occur. When Clementine Skinner left her job as the first Negro Floor Manager and Buyer at her store, she was proud to hand over the store keys to another woman of color. In her own take-charge way, Clementine had assured equal opportunity for other Negro saleswomen who would follow in her footsteps. Thus began Clementine’s life long work for Civil Rights.

A Soldier during World War II

In July of 1943, in the midst of World War Two, Clementine enlisted in the Women Army Auxiliary Corps which later in September of that same year became the Women’s Army Corps (WAC). Clementine was assigned to the First WAC Training Center in Des Moines, Iowa. After basic training, she was assigned to an all Negro band (WAC band #2). She thought she was going to learn accounting. Instead, she, along with other women of color from all over the United States, played the trumpet/French horn for Bond Drives and Recruiting Drives to aid the war effort
by raising funds and attracting volunteers.

Clementine was forced to acknowledge rigid race relations while in the army. Besides the all-Black band, the WAC already had an all-White band commissioned the 400th. This White band was recognized as the official military band while no recognition was given to the Black counterpart. Eventually, through a secret petition drive to stave off being disbanded, the Black band was given the respect and recognition it deserved as the 402nd Band (Chicago Tribune 1985, August 25). Meanwhile, Clementine remembers the positive interaction between White and Black band members. At a time when most of the African-American women could not play any instrument, many of the White women from the 400th worked to train and drill the Black band. Despite general army disapproval and interference to keep the bands of women apart, the ladies continued a very successful and rewarding interchange (Skinner 1994, May 26).

Clementine finished her duty in August 1945 and was honorably discharged from Sheridan, Illinois. She went home with a Good Conduct Medal for her service as a tech/Cpl (Chicago Tribune 1985, August 25). Why volunteer in the first place? Said Clementine Skinner, “There were those of us who felt that if you’re going to demand things of your country, then you must give too” (Skinner 1998, 12 May). Clementine’s strict upbringing and sense of responsibility as instilled by parents and teachers never faulted her. She gives all the credit to her teachers who made her believe she could and would do everything.

In 1941, something of great significance for Blacks happened. In order to stave off the planned 1941 March on Washington, President Roosevelt signed Executive Order #8802, The Fair Employment Practices Act, which required all businesses that had a contract with the Federal Government to hire Negroes. When Clementine returned home, she found new doors were opened where they had once been firmly closed. She successfully passed a number of Civil Service examinations and went to work for various federal and state administrations. Clementine’s last official federal job, as Library Clerk at Manley Vocational High School in 1950, was her entry into the field of education.

Belated Education

It was not part of her plan to become an educator. She had always envisioned herself as a player on the business stage. During the Great Depression, Clementine took commercial courses with aspirations of becoming a secretary or accountant. She would not enter the educational sphere till some twenty-five years after her graduation from Wendell Phillips High School in 1933.

Clementine’s achievements have come later in her life. She married in 1947 and gave birth to the first of two sons a year later at the age of thirty-two. Beginning with her latent social development as a teenager because of a very closed family life, Clementine has taken her time about accomplishing some of the most memorable moments in her life. This is especially true when it comes to education.

Around the time that son Kenneth was ready to start school, his mother enrolled in college. She earned an Associate in Arts degree at what is now Kennedy-King College. She then enrolled in Chicago Teachers College where she earned a Bachelor’s of Education with a minor in library science in 1961. Reading was more than an interest stemming from childhood or a job. Reading was the hobby of her lifetime.

Clementine Skinner continued with her education by receiving a Masters of Education degree in librarianship and was the first library science major to receive the honor key in 1963. For the next nine years, Clementine completed more than fifty hours of graduate study at Chicago Teachers College, University of Chicago, and Loyola University. She received her doctorate in education from Nova University (Ft. Lauderdale, Florida) in 1976 at the age of sixty (Skinner resume). She was truly a lifelong learner.

Civil Rights and Diminishing Returns

Clementine actively participated in the movement of Civil Rights as a marcher, an organizer, a financial supporter, and NAACP member. Though she marched with Mr. A. Philip Randolph to Washington in 1963, she was content with working behind the scenes more often than not. She had always sought equality even in employment, but she advocated for rights not just by picketing or marching but through petition, letter, and conversations with managers and superintendents. In her own words:

There is a time to protest, march, et cetera, but, there comes a time when such activities result in diminishing returns...All of my life, I have worked for equal rights for all people, regardless of race,
Clementine Anna Skinner

Clementine would add that integration was more of a reality before desegregation in Chicago public schools. She does remember that many Black teachers were displaced by desegregation in the South and were invited to teach in Chicago schools by the superintendent at that time, Dr. Benjamin Willis. Though many of the problems within schools remain essentially the same from the Sixties and Seventies such as crowded, oversized classes, limited budgets, and student mobility, Dr. Skinner does see increasing challenges within education in the Nineties. For example, students come more mentally and physically unprepared. There are many children with disabilities. There is also a predominant amount of "babies making babies" resulting in limited parental knowledge and participation. In today's world, race seems to be a growing problem (Skinner 1998, Fall).

Educator Extraordinaire

Clementine earned her degrees while working full time as a mother, a wife, and an employee in the Chicago school district. While she worked on her first college degree, she was invited to become part of the Kappa Delta Pi Society. She was elected into Theta Rho Chapter in 1958 from the Dean’s List. Her involvement in Society functions led her to earn prominence in this prestigious educational institution. She served two terms as Alumni Counselor and was then nominated for president-elect in the early seventies. She later became President in 1976. Her term as Society President lasted from 1976-78. Clementine Skinner is honored by the fact that her appointment as Kappa Delta Pi President makes her the first African American and the fourth woman to ever serve as President in the history of the Society (Skinner 1994, March 26).

Dr. Skinner’s memories with the Society are warm and positive. Her presidency marked some more “firsts” for a woman who was known for many “firsts”. But her most personal and gratifying work was done with children at the public school level. Clementine became involved in various aspects of the school community. She held positions as librarian, teacher, assistant principal, dean of students, and curriculum coordinator. She loved to design and implement programs that would help children. She initiated a photography program which achieved national acclaim, introduced and coordinated the “Living Witness” Program of the Chicago Task Force on Youth Motivation, and assisted in the development of reading laboratories and reading programs. Clementine Skinner never stopped transferring her love for reading to those around her. As a librarian, she revamped the system and added many more books, particularly books about and by African Americans, to the shelves. She began a literacy program at her school and became a curriculum specialist where she developed the first Closed Circuit Television System in any Chicago Public School and implemented a prize-winning Photography Program. Clementine remained involved with young children’s literacy efforts all her life. Even today, as of May 1998, Clementine Skinner continues to be involved with two schools as a consultant (Skinner 1998, October 31). Her calling still leads her to work with Chicago’s children. Clementine also developed a keen interest in teacher education. She conducted workshops in the Race Desegregation Training Institute at Northeastern University from 1979-1981. She taught “Discipline Techniques and Desegregation” and “Equitable Discipline Policies in the High School”. One of her speeches details her belief in the educator’s responsibility to provide quality education. Indeed, the most important requisite for the quality education is the teacher first and foremost. She makes strong statements in her speech about the teacher’s role in the educational life of every child:

A school may be small in size, possess limited facilities, finances, and resources, and still provide quality education. The teachers make the difference. A school may be large, possess elaborate facilities, have countless resources, and unlimited finances, and provide quality education. The teachers make the difference. Teachers who settle for mediocrity are not the kind of teachers who make that difference. Quality teachers do not settle for mediocrity (Skinner 1973).

She then spells out ten strategies for the quality teacher. Clementine both admonished and praised teachers in holding them accountable for quality education for all children. Her involvement in every phase of education (from librarian to teacher to administrator to national and international appointments) proves her dedication and interests went much farther than the classroom.

An Honored Woman

Clementine Skinner has been the recipient of many awards over her lifetime. Too numerous to list here, Clementine remembers her most cherished honors. She is most proud of her induction into the City of Chicago’s Senior Citizens Hall of Fame in 1983. Following that would have to be her election to her high school’s (Wendell Phillips) Hall of Fame. In 1982, Dr. Skinner received a letter from Jane M. Byrne, Chicago Mayor, to accept an appointment to the Chicago Committee on Urban Opportunity. Recently, Dr. Skinner was named the AARP’s Retired Educator of the Year, and she was surprised and pleased by the tribute. Every award, certificate, plaque, and ceremony to honor her has been deeply appreciated (Phelps 1998-99, 10:1368). The high-esteem fellow Chicago citizens have for this remarkable African American woman is well documented.

Unfinished Chapter

Eight years ago, Clementine found an unfamiliar lump in her breast. She reported the condition to her physician, and, after testing, she was diagnosed with breast cancer at the ripe age of seventy-four. Instead of panicking or feeling depressed, Clementine reacted predictably by facing every challenge and obstacle with calm courage. She gave an account of her ordeal in her 1990 holiday letters that she sent out that same year. She was featured by an article in the Chicago Defender by Ada Phillips on the 26th of December, “Skinner tells how she underwent a major three and a half hour surgery in January, yet about two hours later, she chewed down 1,800 calories. Then during her six months of treatments afterwards, she still keeps on eating. And most importantly, after surgery she never had to take any medication for pain!” What could surely have been a personal tragedy turned into a heart-warming tale of triumph over cancer. Clementine is the first to admit that she is “funny like that”. Her verve, her vitality, and her boundless energy are part and parcel of the woman named Clementine.

Clementine Anna Skinner’s life is woven throughout the fabric of American moments. Her travels have taken her from prosperous times in American history to perilous times. She has witnessed segregation, desegregation, and resegregation. She has watched curriculum and classrooms change over the years. She is amazed by the advances and worried by the increasing challenges. Through all of the periodic stages, Dr. Clementine Skinner has remained optimistic and active through her roles as an involved, reform-minded educator, a devoted mother, a faithful and loving wife, a model Chicago citizen who worked actively in and out of educational circles in the hopes of making that difference. When asked the question: What do you want people to remember about your life and your accomplishments? Clementine never hesitated. “I hope that I have made a little bit of difference in those lives I’ve touched...I’ve always been available. I try to deliver. I try to give back something that was given to me. I hope somebody remembers I passed this way one time” (Skinner1998, May 12).

Editorial Policy: The American Educational History Journal is devoted to the reflective examination of educational issues and problems from the perspective of diverse disciplines. With the Journal, the Midwest History of Education Society encourages communication among scholars of varied disciplines, nationalities, and cultures. Papers published in the Journal discuss comprehensive issues and problems confronting educators throughout the world.

The Journal has published authors from disciplines ranging from political science to philosophy to marketing to instructional technology to adult education. Its editorial board consists of a diverse group of professionals who referee articles according to their expertise. While the main criterion of acceptance consists in a well articulated argument concerning an educational issue, the editors ask that all papers offer a historical analysis. Authors should contact the editor to receive a copy of the style sheet before writing the paper.

Articles published in the Journal do not necessarily represent the views of the editor, the editorial assistants, the members of the Society, or the University of Dayton. The authors of the articles are solely responsible for the accuracy and truthfulness of their work. The authors are solely responsible for ensuring that they do not infringe on copyright, violate any right of privacy, and do not use libelous or obscene language.

Articles appearing in this journal are abstracted and indexed in Historical Abstracts and American History and Life.
This is the first issue of the journal of the Midwest History of Education society under a new name, which the society believes more appropriately represents the breadth and depth of articles. Several people made possible this issue of the *American Educational History Journal*. The Provost of North Carolina State University, Dr. Kermit Hall, supported the project generously. The authors whose papers appear in these pages offered work of the highest quality. The editorial board and the associate editors worked diligently and carefully.

The *Journal* offers an important outlet for mature scholars and for students beginning professional careers. In these pages, as at the annual meeting of the Society, papers of all types appear together each reinforcing the other.

In the Spring of 1969 African American students blockaded the doors of DePaul University's largest building, the newly constructed Schmidt Academic Center. They took this action after issuing a series of demands for changes in the university's curriculum, the faculty, and its relationship to the immediate neighborhood. Like similar building seizures at other institutions, this action prompted a series of events which revealed a great deal about the institution and the tenor of the times (Williamson, 1998). It also brought about many changes. And it highlighted issues which DePaul and other institutions of higher learning continue to wrestle with at present.

DePaul is a Roman Catholic institution, controlled historically by members of the Congregation of the Mission (popularly known as "Vincentians"). There is a peculiar history of African American students at DePaul, like other Catholic schools, a story which culminated in the Black student strike in the Spring of 1969. DePaul is also an urban institution, with a student body comprised historically of commuters from Chicago's white ethnic neighborhoods, enrolled at campuses in downtown Chicago and near Lincoln Park on the city's near north side. The DePaul experience, in that case, is somewhat distinctive, and differed from other institutions that underwent disruptions of this sort at the time. (Brisbane, 1974; Sitkoff, 1981) It provides a telling case study of institutional change in response to student activism in the era of the civil rights revolution.

DePaul has long been known as a school for first generation college students. Through much of its history, DePaul's students were the descendants of immigrants, most of them Catholic but significant numbers of others as well, particularly Jewish students. By and large, students from these groups did not question the university's authority in matters of the curriculum or on social issues. It was not until after the Second World War that African Americans began appearing in various branches of the university. The numbers of Black students was relatively low, however, until the 1960's, when more full time African American students began to enroll in the College of Arts and Sciences at Lincoln Park. And that is when things began to change.

The sixties, of course, was also a time of ferment on the nation's campuses, particularly in the wake of the Civil Rights Movement. As at other campuses, Black students at DePaul came to resent subtle signs of exclusion from the social and intellectual life of the university. And in the Spring of 1968 these feelings of discontent burst into the open, when Black students staged the first and only "strike" in the history of the university. As it turns out, this was a decisive turning point in the development of the institution.

**Black Students at DePaul: A Brief History**

Like other major urban Catholic universities, DePaul enrolled very few Black students before the Second World War. In the composition of its faculty and student body was a largely white ethnic institution. Virtually no African Americans were pictured in university yearbooks prior to that time, and former students interviewed from this period do not recall seeing any Blacks at the university. There is evidence of a few Black students enrolled in the Downtown College of Arts and Sciences in the 1930's, a division of the university which primarily served teachers seeking extra courses. There also were small numbers of students from other non-white groups: students from China, the Philippines and the Caribbean. But aside from these students, DePaul was an institution which mainly served Chicago's principal European ethnic groups prior to the 1940's. (Rury 1997, 1998)

DePaul was not unusual in this regard. Notre Dame historian Philip Gleason has noted that relatively few Black students attended Catholic universities before the war; indeed, enrollment of African American students was low or non existent at other private institutions of higher education at the time. (Gleason, 1995; Levine, 1986) Furthermore, other historians have documented the existence of tensions existing between Catholics and African Americans in Chicago, long before the violent clashes over housing integration and school bussing of the 1960's. There is even evidence of admissions policies at DePaul in the 1930's intended to discourage Blacks from attending. (McMahon, 1995; Elerlebacher, 1998) It is hardly surprising, in that case, that there is little evidence of Black enrollment at DePaul prior to the 1940s.

This began to change after the Second World War. There was a shift in public attitudes regarding race relations in the years following the war, partly fueled by popular revulsion at Nazi theories of racial superiority and the horror of their genocidal policies. President Truman sponsored the very first civil rights legislation in this period, including bans on racially restricted housing sales, and signed an executive order ending segregation in the armed
forces. There was a feeling of new opportunities in the air for African Americans, particularly in the North. And larger numbers of Black students began appearing on college campuses. (Franklin, 1985; Lucas, 1995)

A part of the change in race relations was due to recognition of African American contributions to the war. Nearly a million Black men and women served in the armed forces during World War Two, and were subsequently eligible for GI benefits in the years which followed. One of the most important programs to serve veterans under the GI Bill was government subsidies for college tuition. This was a boon to colleges, but it also allowed many African American veterans to acquire a higher education. (Franklin, 1985; Olson, 1974)

DePaul was one of many colleges and universities that experienced a rapid increase in enrollments, including African Americans, following World War Two. In the Fall of 1949 the university conducted a survey of the various schools and colleges to determine the number of Black students. The largest numbers, well over 100, were located in the evening graduate school (which mainly served teachers) and College of Commerce. These schools were located in the Loop, and enrolled several thousand students, many of them veterans. In the College of Arts and Sciences at Lincoln Park, which primarily served younger students, there were just 28 African Americans, out of a total enrollment that approached a thousand. (DePaul University, 1948)

Black students were a small minority at DePaul, in that case, and most of them were adult veterans enrolled at the university's Lake Street campus. Still, their numbers were increasing. Three years later, the university reported counting nearly three hundred African American students, all but 34 located in the Loop. Again, the bulk of these students were adult veterans, most of them men, attending class in the evening. (DePaul, 1951)

Like other commuter universities at the time, DePaul provided relatively few services for students, and there is no record of any special support given to Black students. Frank Owens, who headed the university's office of Veteran Affairs, was the university's only Black administrator. And there were no African Americans on the full time faculty during the 1950's. (DePaulian, 1959) But because of the GI Bill and DePaul's success in attracting veterans, and perhaps because of Owens' efforts, Black enrollment increased for a time.

Eventually, however, the number of veterans declined at DePaul, as they did at other institutions, and the Black enrollment fell also. In the Fall of 1955 the university counted almost two hundred Black students, most of them at the Loop campus. Less than ten percent were veterans, and over forty percent were female. Four years later the number had dropped by about twenty five percent, as fewer Blacks enrolled in the university's downtown evening programs. (DePaul University, 1955, 1959)

While the bulk of DePaul's Black students enrolled in the Loop colleges, a small number enrolled at the university's uptown campus. All throughout the decade of the fifties, however, there was little increase in Black enrollment among the university's full time students at Lincoln Park. Although there was over a thousand students on the uptown campus for much of the decade, Black students never exceeded forty. An analysis of names in the university's 1955 yearbook indicates that most liberal arts students represented the city's major Catholic ethnic groups: Irish, Italians, Germans and Poles. While there were many student clubs, and an active fraternity and sorority life, relatively few Black students participated in such activities. And most of those who did were enrolled at the Loop campus. (Rury, 1998) Like many other institutions of higher learning in this period, DePaul had only started to address the difficult question of racial integration.

In September of 1960 a university administrator wrote to university President Comeford O'Malley, declaring that because there "is no accurate way of tabulating these numbers," the university would not collect statistics on Black students in the future. "The figures we now have," he added, "might well embarrass DePaul in its endeavor to serve all students equally." (Richardson, 1960) As the age of civil rights protest dawned in the United States, the university began to be self conscious about serving Black students. It was a concern which would grow in the years ahead.

A Changing Student Body and Social Protest

The decade of the sixties brought a new generation of students to DePaul and other colleges and universities. It was a time of social activism and protest over a variety of issues, particularly racial injustice. It was also a time when more traditional Black students were enrolling in institutions of higher learning. And this was the case at DePaul as well.

Because the university stopped collecting statistics on the numbers of Black students, it is difficult to document the growth of African American enrollment after 1960. In the Fall of 1969, following student protests, the
university did conduct a census of Black students, and counted nearly five hundred. This, of course, was considerably more than the number reported ten years earlier—more than a three hundred percent increase. Although the report did not provide a breakdown by college, much of this growth probably occurred at Lincoln Park, where a majority of the university's full time students attended. If the numbers of Black students in the College of Arts and Sciences increased at about the same rate as the rest of the Black student population, African American students at the uptown campus probably numbered about 150. Because overall enrollments in the college grew slowly over this period, an increase of this magnitude pushed the proportion of Black students to roughly one in ten. (DePaul University, 1969; Rury 1998) This alone was a big change.

On the national scene and in the city of Chicago, of course, the decade of the sixties was also characterized by growing tensions over racial issues. The city's black population had expanded dramatically since the Second World War, to more than half a million. (Kleppner, 1985) This was a period marked by increased Black concern over educational equality, with large scale protests over school segregation and access to higher education. In Chicago there were massive protests in the early 1960's over the segregationist policies of public school superintendent Benjamin Willis. There also was a continuing controversy over racial discrimination in housing, and in 1966 Dr. Martin Luther King launched a campaign in Chicago which resulted in violent opposition from largely White Catholic neighborhoods. There were active chapters of the NAACP, CORE, the Urban League and other civil rights organizations in the city. And more militant organizations such as the Black Panther Party were also active in Chicago. (Anderson and Pickering, 1986) The generation of Black students that came to DePaul in the 1960's was acutely aware of the major issues of the day. And when they arrived at the university they discovered a number of issues to raise questions about.

Late in the decade, a survey of DePaul's African American students revealed a good deal of dissatisfaction with their experiences at DePaul. Respondents complained about feeling isolated from other Black and minority students, about the lack of attention to Black history in the curriculum, and about the way certain faculty members treated Black students. "There are constant reminders of minorities not being on the same level as whites," wrote one Black student, "so they must put forth extra effort." A number complained about there being too little for Black and other minority students to do outside of classes, and the vast majority said they would welcome the opportunity to meet more minority students. (DePaul University, 1969)

It is difficult to say exactly when DePaul's Black students began to organize, but in the years following 1965 there was a new level of concern about questions of social justice on the campus. There is little question that DePaul's student activists were influenced by the Civil Rights movement and events on other campuses. During the 1967-68 academic year, there were growing signs of activism on the Lincoln Park campus, around issues ranging from the Vietnam War to equal rights. In 1967 DePaul's African American students established the university's first student organization dedicated to representing Black concerns on campus: the Black Student Union. (DePaul, 1967; Salounis, 1996) This was a critical step, and mirrored the formation of similar groups on other campuses across the country. Chief among the issues they were interested in was the university itself, and the way it treated students from minority group backgrounds—particularly African Americans, but other groups as well.

The Situation in 1968

In the Spring of 1968 a series of events began to unfold which eventually pulled DePaul into the growing national controversy over equal rights and racial discrimination. The university's Black student activists, dissatisfied with many aspects of the university, organized diligently to draw attention to their cause. And this marked a new era in the history of student life at DePaul.

There was a new atmosphere on DePaul's Lincoln Park campus in the latter sixties. Students were interested in a variety of issues, and the campus newspaper, The DePaulia, urged greater activism and debate in the student body. Forums on race relations and the Vietnam war in the opening months of 1968 were well attended and sparked discussion of national affairs. DePaul's first anti-war demonstrations were inspired by the Presidential "peace" candidacy of Eugene McCarthy in March, and in April McCarthy won a campus poll of student preferences among leading candidates, defeating Robert Kennedy and Richard Nixon. (DePaulia, 1968a, 1968b, 1968c, 1968d; Burciaga, 1996)) DePaul's students were closely attuned to events on the national stage, and some of them sought ways to bring these debates to the campus.
On May 1, 1968, Liberal Arts and Sciences Dean Edward Schillinger met with a delegation of "about twenty" Black students, led by James Hammonds, with a demand that representatives from the Black Student Union be appointed to university committees making policy recommendations regarding students and faculty. Not accustomed to being confronted by students, Schillinger was somewhat taken aback by the term "demand," but several days later expressed interest in finding a way for the BSU to be represented on student committees. (DePaul, 1969) It is not clear how this response was communicated to the Black students, but it marked the beginning of a long dialogue between the BSU and the university administration.

The events of early May 1968 were altogether unprecedented in the history of DePaul. The very idea of students issuing demands to the administration was unthinkable to earlier generations of DePaul students. But these were unusual times, and some of these students had new ideas. The most significant factor, however, was the presence of a large cadre of Black students who were determined to make the university a better place for all students, and particularly racial and ethnic minorities. It was emblematic of DePaul's Vincentian heritage that its leading administrators recognized the significance of this. Unlike the responses of many other institutions to student protests such as these, DePaul's reaction was conciliatory. The university reached out to the BSU to establish a dialogue. Of particular importance were student concerns about curricular inequities: the lack of attention to African American history and other subjects reflecting the experiences and contributions of Blacks and other minorities, and the absence of Black faculty members and administrators. These were problems that DePaul's administration moved to correct, although many students did not feel that progress occurred fast enough.

Even if Black students expressed frustration with DePaul's administrators, there is considerable evidence that key university officials sympathized with many of the ideas the BSU represented. Early on, university President John Cortelyou recognized the need for changes in DePaul's curriculum. In a memo addressed to Vice President John Richardson dated May 1, the same day the BSU issued its first set of demands, Cortelyou put the matter in characteristically blunt terms. "Could it be that our whole liberal education is whitey oriented," he asked, "and that the Negroes will be really liberally educated if they get the message? Or should our liberal education have those ingredients that will let whitey know that the Negroes are people too, and that the lives and action of Negroes have been involved in the development of human history?" The answer to these questions was obvious to Father Cortelyou. "It seems to me," he declared, "that we have a real opportunity to have our Negro students be more intimately and more substantially incorporated in the mainstream of DePaul, and to have educational programs that will more fully liberate the mind of whitey." (Cortelyou, 1968)

To respond to the BSU demands, and any others that may have arisen, the university established a Committee on Human Relations (CHR). Chaired by Dean Schillinger and including representation from the BSU and other minority student groups, this body was supposed to look into the various issues raised by the BSU and other students and to make recommendations to the President. Meeting over the summer months and into the following school year, the CHR focused on curricular reform and improving conditions for minority students. By July the committee could point to special curriculum committees in the departments of history, psychology and sociology to develop and approve new courses reflecting the interests of minority students. In September the CHR issued a report listing a series of courses, old and new, which had been developed to address these concerns. The committee also noted efforts in the various departments to recruit Black and other minority faculty members, although it suggested that finding eligible candidates was difficult. In addition to this, the CHR investigated charges that Black and Hispanic students experienced discrimination when seeking housing in neighborhoods adjacent to the university. And it looked into ways of offering more extra-curricular activities for minority students. (DePaul, 1968)

It was a time of radical calls for change, and for the first time in its history DePaul was considering significant changes to its curriculum and policies to address the interests of a particular group of students. When the CHR issued subsequent reports they often appeared with bibliographies on African American history, urban sociology, studies of racial and ethnic discrimination and related topics. Like the rest of the academic world, the DePaul community was learning about these issues, and making their integration into the institutional culture a priority. All of this reflected a realization that such changes were long overdue, and that the university had been an unwitting contributor to a measure of social injustice.
In February 1969 Father Cortelyou wrote to Iowa Congressman William Scherle, who had requested information about student protests at colleges and universities across the country. "Like any other university," Cortelyou declared, "we recognize that we are sitting on a powder keg." But he quickly added that DePaul was working with the BSU and recognized their demands as "reasonable." For Cortelyou and other administrators and faculty members at DePaul, student concerns were more than a problem to be resolved with punitive federal legislation. They were a source of critical insights, an impetus to reform which would keep the institution evolving in a time of social upheaval. Cortelyou recognized that it was the university's ability to communicate with its students, and especially with African American and other minority students, which would determine much of its success in the years to come. (Cortelyou, 1969) And it was this perspective which ultimately guided the university's response to the challenges of the sixties.

Of course, the pace of change was uneven, and not everyone was satisfied with the university's response. Members of the BSU complained about resistance to change encountered among certain faculty members and in various departments. The BSU--along with others in the university community--also protested DePaul's lack of communication with community groups concerned about the university's expansion. This had become a heated issue with the demolition of housing for building the Schmidt Academic Center in 1967. (DePaul, 1969) Even though the university had opened a dialogue with its students, the potential for misunderstanding remained significant.

The Crisis of May 1969

In the opening months of 1969 members of the BSU were becoming frustrated. After working closely with the CHR, little seemed to be happening. The BSU also had not been assigned office space by the university, like other student groups. In the 1968 and 1969 DePaulian yearbooks, the BSU had been not listed as an official student organization. (Salounis, 1996) Many wondered whether most faculty, administrators and students at DePaul even cared about the issues the BSU had raised.

On Wednesday, May 7 members of the BSU staged a small rally in the SAC pit--at high noon--to read a new list of "demands" of the university. This time the list was much longer, and touched on many of the issues then become points of controversy among students across the country. The BSU declared itself against the Viet Nam War, and against military training on campus, particularly the ROTC. The other points concerned the university's policies regarding the neighborhood and minority students, especially Blacks and Puerto Ricans. The group demanded that the university "halt immediately" its program of expansion, calling it "a racist conspiracy" to force minority families out of Lincoln Park--a largely Hispanic and Black area at the time. It called for major curricular changes, to make the university "relevant to Black students needs," and the creation of several new programs to serve low income minority youth in the city. It also demanded "abolishment" of a lecture series on Municipal Government named after Mayor Richard J. Daley, whom they considered an anathema to the city's Black community. Finally the BSU also declared its vehement opposition to "institutionalized and individual racism at DePaul University and elsewhere. When Dean Schillinger received these demands he agreed to respond to them by noon the following day. (DePaul, 1969; DePau1110, 1969a)

The atmosphere on campus had become highly charged in the wake of these events, and the university's administration did not delay in answering the charges and demands issued by the BSU. On May 8 the BSU received a response, and again held a meeting in the SAC pit to discuss it. To begin, the university denied participation in any "racist conspiracy," calling such charges "gratuitous and libelous and... not substantiated with evidence." The university expressed willingness to "accept a program" to educate minority students, but noted that such programs faced great difficulties. It was pointed out that efforts to revise the curriculum had been hampered by lack of BSU cooperation, but added that the university "continues to invite positive recommendations by the students to assist the faculty and the administration in the improvement of its programs." In particular, it was noted that if Black students wished to contribute to this process, "their assistance will be appreciated." While the university maintained that ending the Daley lecture series (a one year program administered by the Political Science Department) would be an infringement of academic freedom, most of the other demands received positive responses. (DePaul, 1969)

At this point the crisis escalated quickly. Later in the afternoon of May 8, members of the BSU went to Dean
Schillinger's office and asked to see university president John Cortelyou, C.M.. A meeting was scheduled for 6:30 on the fifth floor of SAC, but Father Cortelyou did not appear. At 8:30 that evening members of the BSU and students supporting them "secured" the fifth floor of the building, and after classes had finished they took possession of the rest of the building, blocking or barricading doors so that students and university personnel could not enter. Within a span of barely two days of seeing the new demands issued by the BSU, DePaul had joined the growing list of institutions during this period experiencing student unrest. (DePaul, 1969; DePaulia, 1969a)

The immediate confrontation precipitated by the take-over of SAC did not last long. Although there was a tense stand-off with White students attempting to gain access to the building on the morning of May 9, and university officials threatened to seek an injunction to open the building by force, the BSU abandoned the takeover shortly after noon that day and held another rally. There was great interest across the campus in the issues raised by the BSU, and hundreds of students came to find out what was going on. Representatives from the Black Panthers and Young Lords, concerned about the university's impact on the neighborhood, also attended and spoke. If the goal of the takeover was to draw attention to the BSU's position, it had clearly succeeded. (DePaulia, 1969a; Salounis, 1996)

Student opinion was divided regarding the BSU's demands and actions, but most students appear to have supported the call for greater curricular focus on problems of discrimination and inequality. On the following Tuesday the Student Activity Council, the principal student governance body at the time, voted to support the BSU demands for curricular changes and establishing special programs for minority youth. For its part, the Committee on Human Relations resumed its dialogue with the BSU, and determined to look into inequities in the curriculum and school policies. (DePaul, 1969; DePaulia, 1969a) Even though there had been some heated moments, it appeared that a resolution to the conflict was at hand.

Just when the situation seemed to be stabilized, however, a new crisis erupted. Late in the afternoon of May 14, a week after the BSU had publicly issued its demands, arsonists struck the old Lyceum Building (the former library), which contained the university bookstore and the BSU offices. Although no one was harmed and it was never determined who set the fire, the BSU declared it a racist attack, and at a rally two days later the BSU and other student groups called for a general student strike across the university. (DePaulia, 1969b)

For two days a minority of students at the Lincoln Park campus did not attend classes, and pickets circled the entrances to SAC and other university buildings. Even if most students did not observe the strike, however, many went to workshops on institutional racism conducted by the BSU the following Monday, and a rally held at noon. Many students were supportive of the quest to improve conditions for Black and other minority students at the university. And a resolution signed by several dozen faculty members also expressed support. (DePaul, 1969; DePaulia, 1969b) There can be little doubt that the arsonist attack on university property, and particularly the BSU office, helped to build sympathy for Black students and contributed to broad endorsement of the BSU position. In the space of a little more than two weeks, DePaul's Black students had mobilized a significant portion of the university community behind their concerns.

As short as it was, the BSU building seizure and strike of 1969 had a major impact on DePaul. It opened lines of communication between the university and minority students, and established the BSU as a major element of campus life. Shortly after the events of May 1969, the BSU reported a membership of nearly one hundred, about one in five Black students at DePaul, making it one of the largest student organizations. More radical Black students split away from the BSU to form another organization which was even more militant in its demands. (DePaul, 1969) And other groups of students brought new proposals to the table, including from calls for additional special programs to serve the disadvantaged. Students also continued to exhibit interest in the Vietnam war, and a chapter of Students for a Democratic Society (SDS) was formed at DePaul. (DePaulian, 1969) It was a time of rising social consciousness, and at DePaul's Lincoln Park campus students confronted the issues that defined the period. Even if DePaul was not a major center of student protest at this time, it certainly was not isolated from it. And the institution could no longer maintain that students did not have a say in the curriculum—and other areas of university policy-making—as had been the case in the past.

The Legacy of 1969: Students, Diversity and the University

The student protest era lasted only a short time, but its impact was significant. The Black Student Union remained active for several years, but by the early seventies it numbered only a handful of active members and was
no longer a major force on the campus. The Vietnam war was an issue for some students, and there were lively demonstrations in the Spring of 1970 (at the time of the Kent State shootings) and later (around the bombing of Cambodia). (DePaulia, 1970) But these were rather isolated episodes and had little long term effect on the institution. Rather, the legacy of the period springs directly from the events of 1968 and 1969: students--at DePaul and elsewhere--demanded a voice in campus affairs. And because they had something valuable to say, the institution stood ready to listen.

DePaul has changed a great deal in the years since 1969. It has grown, and a new generation of students has arrived with each succeeding decade. African American students have continued to be an integral part of DePaul’s student body, and in recent years the number of Hispanic students has increased significantly. (Meister, 1998) The university has not experienced demonstrations as dramatic as the BSU seizure of SAC in the intervening years. But the principle of the administration and faculty listening to what students have to say about the curriculum, and about university policies that affect their lives, is alive and well at DePaul today. So too are departmental curriculum committees, and courses featuring African American history and other fields of research which examine the experiences and contributions of Blacks and other minority groups. This is another tangible legacy of the events in 1968 and 69.

This is not to say that problems do not continue to exist. In the Spring of 1995 controversy erupted once again over campus police treatment of African American students, and a number of other issues quite similar to those raised almost three decades earlier. And the DePaul tradition of conflict resolution through dialogue--first employed in 1969--helped to resolve the immediate crisis in this instance as well. (DePaulia, 1995) These conflicts and the dialogue which follow them mark the on-going process of education that diversity entails, a point first recognised some thirty years ago. It is a process which has proven essential to sustaining an institutional culture which makes diversity a critical value. And through this the university continues to serve the interests of all its students, and it provides an atmosphere conducive to learning--for students, faculty and the administration alike. This is what DePaul’s Black students demanded in 1969, after all, and what Father Cortelyou and other university leaders recognized as necessary. The lessons of their confrontation and subsequent dialogue continue to resonate today.

Salounis, F (1969) Interview with Author.

A town was born July 24, 1880 when the families of Fergus Kyle and David E. Moore, along with Miss M. E. Moore, deeded two hundred acres of land to the International and Great Northern Railroad Company (Strom, 1981, 30). This prairie town named Kyle is nestled along the southern tip of the Texas blackland prairies where the dark soil is especially adaptable to the producing of small grain crops. Farming has been a main industry of the town, while the school has been a principle employer of Kyle citizens (Miller, 1950, 4).

From its inception, the people of Kyle attempted to operate free public schools, though classes were often dismissed for a two- to three-month period so that operating costs could be obtained. The most successful operation of all was the Independence Hall School, originally located between Mountain City and Kyle and moved to Kyle’s lot thirteen in 1883. In 1890, a new building was built on lot thirteen which stood until 1910 when it was dismantled to make room for a larger, more modern school (Strom, 134). On April 1, 1913, Kyle became an independent school district with many other districts joining from Fairview, Hemphill, Wiegand, Goforth, and Blanco Star(135). Later, Uhland high school transferred to Kyle(136). In 1897, a $25,000 addition to Kyle Independent School District was made which included a home economics cottage and a gymnasium with seating for five hundred. The buildings were constructed of central Texas limestone and were projects of the Works Progress Administration (Miller, 59). By 1950, the town had grown to a population of 892 and had a school faculty of twelve members, nine of whom held a Master of Arts degree(Miller 3, 60).

In 1945, Mr. James Childs presided as superintendent of schools. At the onset of World War II, Kyle had an approximate enrollment of two hundred students(Sstrom, 136).

Minnie Jo Bagley was born on April 19, 1914 near Bishop, Texas and attended Martindale Schools through tenth grade and San Marcos schools for the eleventh grade. At age sixteen, she began college at Southwest Texas State Normal College, just ahead of the Depression. Due to lack of funds, she did not return for college the second year but returned home to help her father on the farm. When an uncle heard of this, he loaned her seventy-five dollars and told her to get back to school; she did, and received her teaching certificate at age eighteen. During her early teaching years, separate schools existed for whites, Hispanics, and African-American students. Minnie Jo’s first job was in the “Mexican School” in Martindale where she taught for $365 a year. With this income, she purchased her first automobile—“a tan and brown four-door something-or-other!”(Minnie Jo Schmeltekopf, 1999).

After two years in the Mexican School, Minnie Jo decided it was time for something new and accepted a position in a two-teacher school just outside of Lockhart; later she taught in Uhland for $95 a month where she stayed for four years, all the while continuing with her education. It was in her third year of teaching in Uhland that Minnie Jo met Walter Schmeltekopf at his girlfriend’s house. “That was the end of the girlfriend. We went to a Valentine’s party, and married the following December.” She completed her fourth year at Uhland, then resigned to start a family (Minnie Jo Schmeltekopf, 1999).

Family didn’t come, however, and Mrs. Schmeltekopf continued pursuing her schooling, earning a Bachelor of Arts in English in 1939. The standard at this time opposed the hiring of married instructors, but the outbreak of World War II altered this practice. The current teacher of the Mexican School at that time notified the trustees on a Thursday that she was leaving Friday to take a job with the government in a Japanese Internment Camp. In a pickle, the school called married lady Minnie Jo to begin work that Monday; she completed that school year and was moved to teach in the white school the following September. “I studied, ohhh, I studied, because the superintendent came to me and said, ‘You have one more credit of science than I have, so you’ll teach the science.’” The next year, she was asked to teach English since three of the previous English teachers had become pregnant over the past year; the superintendent said, “I’ve GOT to have an English teacher that’s not going to get pregnant!” Teaching English sent Minnie Jo back to Southwest to take one more course, certifying her to teach high school (Minnie Jo, 1999).

At this time, there were about fifty students in high school. Members of the faculty consisted of the superintendent, principal, boys’ coach, home economics teacher, and Minnie Jo. Minnie Jo assisted as the girls’ volleyball coach, taught physical education, led the senior play, pep squad, and choir, and oversaw the students’ weekly submissions to the local newspaper. During wartime, there was such a shortage of gasoline that the students would get together and “come up with a place to go; and they ALWAYS had a place to go. They’d go to the superintendent and ask(to use the school bus for transportation).” Though the superintendent approved these outings,
neither he nor the principal wanted to supervise the students, so Minnie Jo and Walt would chaperone the escapades into Austin for plays and other events. Minnie Jo taught English for five years and finally became pregnant with her first child. When she told the superintendent, "he went home and rolled; he just couldn't get over it!" (Minnie Jo, 1999).

War remembrances are that there were shortages of many things, including farm equipment. "Things would break and just have to be left alone; not everything could be replaced." She did not recall curriculum changes during the war, nor much disruption or great worry due to the war. They did have a curriculum guide that listed required items to be studied, "so many Shakespeare plays, and so on." During her teaching, teachers were allowed to make one reproduction of a paper per day, and the curriculum required more intensive writing than at present: examinations consisted of written answers as opposed to multiple choice or fill-in-the-blank responses. A much wider variety of courses are offered now than were mid-century. During her teaching years, the students spent one semester studying grammar and the second on literature with one year focusing on English literature and a second upon American literature (Minnie Jo, 1999).

While at the Mexican School, Minnie Jo said, "I sort of remember we improvised a whole lot," and she pulled from her prior years of lessons for teaching. She and one other teacher taught at the Mexican School, Minnie Jo teaching the younger group and the second teacher leading the older students. Minnie Jo does not recall teaching children much older than twelve since the older children often left to work in the fields. The two teachers focused upon teaching English, writing, spelling, and simple math; she recalls no science curriculum. The children sat in rows of desks and brought their own pencils, paper, scissors, and other simple supplies. At recess, she can recall that they loved to play baseball! No school, white or Mexican, supplied lunch for the children before or during the war; the Mexican children "brought their tortillas." (Minnie Jo, 1999).

After the war, the morning service at a local church was changed from German to English. The evening service, however, continued to be led in German. A last item of interest is that Minnie Jo attended high school with Lyndon B. Johnson’s brother, Sam, and knew his sister, Lucy, well (Minnie Jo Schmeltekopf, 1999).

Kathryn Ann Rogers was born on July 23, 1910 and raised in Lockhart. At age ten, her father moved the family to Buda where he tried to grow cotton but had little luck. The family then relocated to Kyle where Kathryn has now lived for forty-seven years. When moving, she skipped the fourth grade, making a high school graduate of her at age fifteen. "This was a problem," (to begin college at fifteen) "because, you know, students have other things on their minds, at fifteen...!" She began college at Southwest Texas State Teachers College, taking her bachelor’s and master’s degrees from the school. She planned to pursue a doctorate, but became too popular as a piano teacher to have the time (Kathryn Ann Rogers, 1999).

Kathryn spent forty-two years in the teaching field: one in Fentress, two in London, outside of Corpus Christi, and the remaining years between Kyle and Buda schools. In all her years of teaching, she never filled out an application, held an interview, or developed a resume. In Fentress she taught third grade in the morning and high school English in the afternoon. In London, she also taught high school English, then returned to Kyle where she took a job with the government for a time. Later in Kyle, she began teaching music in the schools. To handle some unruly seventh graders, she was asked to move to junior high for a time, and finally she taught in the elementary grades where she spent the majority of her career. She had about thirty students in her class. It was during the Second World War that Kathryn was teaching English and music. She does not recall much alteration in her teaching during the war years. One vivid memory she has is of the one (and only) time she received a slight reprimand from a principal. The story is that a class of students was eating lunch out in the hall, and that Kathryn poked her "beautiful, gold-handled umbrella" at one of the students in jest as she passed by; all the children laughed. Their teacher—also the principal’s wife—did not find the disruption amusing and "blessed out" Kathryn for disturbing her class. Kathryn responded by saying that she was taught that "meals were to be a happy time." The next day, the principal announced that no class would any longer be allowed to eat lunch in the hall. When the schools first began offering meals, the first food provided was cornbread and beans, with chili following soon after (Rogers, 1999).

Kathryn can recall being very nervous about the counselors coming to observe her teaching, though none corrected any of her methods. She drilled her students in multiplication facts and other areas. "I don’t think I could go back to teaching (now) if I had a chance, because I was too engrossed in seeing that they learned these things. And
we stressed writing back then.” Kathryn’s mother, Mrs. Willy Allen, had also been a teacher, and Kathryn’s father “thought she was it...so, I had no choice but to be a teacher. But I’m glad!” Kathryn’s mother taught in Caldwell county. The unruly umbrella mentioned earlier originally belonged to Mrs. Allen (Rogers, 1999).

Our next neighbor was a Kyle high school student during World War II. She remembers the Kyle school building being made of brick with classrooms with hardwood floors; hallways and restrooms had floors of smooth, waxed, red cement and she recalls thinking that the school was pretty and clean smelling. Apparently there was a problem with the boiler room since every time a good rain came, the room flooded, resulting in the cancellation of school—“(I was) elated every time!” Students had very little special equipment—pencils, paper, and blackboards consisted of most of the materials used. She does not remember a reduction in the use of paper, but “we were always economical with everything we had.” She recalls little disruption in school activities as a result of the war. The boys played six-man football and basketball, but there was no basketball for the girls because it was considered too rough. Several banquets were held each year: the junior-senior banquet, the sweetheart banquet, and others. These were fancy affairs for which the students spent long hours getting their gowns together and decorating the banquet area. She recalls that “we dressed up more then, it seems; we really wanted to look special for these events.” (Neighbor, 1999).

Small classes of nine or ten students composed most rooms. During the war, it was difficult to get teachers; one friend’s mother came to teach after having been out of the field for many years. She recalls having no male teachers for two years and that some science and math courses were left out for a year or more due to lack of instructors. Upon her entrance to college, she struggled terribly with her science and would have failed were it not for her roommate’s tutoring, for the high school science teacher Kyle managed to obtain was not competent to teach in that field. In English class, students began writing fiction stories about spies after war was declared on Germany. She recalls that some of her classmates had very good mysteries! A new emphasis upon physical fitness was begun and a set of warm-up exercises came from “some Washington D.C. department”; she remembers executing “butterfly wing” arm exercises. Home economics was available, but no agricultural or “shop” courses were offered; with many students still helping on farms, however, the concept of studying “ag” in school seemed unnecessary. (Neighbor, 1999).

“I remember that we did not like conscientious objectors at all. We also had open-heated discussions about the enemy—/I hated Hitler and the Japanese. We all loved President Roosevelt, and I cried when he died. But I can remember later when I found out that he had a mistress, I just couldn’t believe it. That broke my heart that he would do that, because to us—he was everything.” Great reverence was shown to those killed in action and lists of former students lost in the war were posted in school (Neighbor, 1999).

Outside of school, this student moved in with her sister to keep her two children while the sister worked. The student fed and bathed them, helped them with their homework, and put them to bed each night. She can remember the poster of Uncle Sam at the post office whose eyes caught you from every angle, declaring, “I want you!”, and the trains moving through town, loaded with scrap metal. Overall, “life moved slower in those days—getting a hamburger was a treat”, and she and her friends spent time riding bikes and going for ice-cream. Once a month, one of her friends went to San Antonio for orthodontist appointments; she and another girlfriend were allowed out of school to go along: “we wore our best clothes on those excursions into the city.” (Neighbor, 1999).

“I was also involved in some volunteer group where we were to knit for the military. I was issued thread and four steel needles to knit a cap—don’t think I ever finished it! It was knit, pearl—I didn’t gain much skill.” Her sister handled the sugar rationing by concocting a cake sweetened with syrup. Family members lent tires to one another for trips. She did not lose any close family members to the war, but for several months, they failed to hear from her brother-in-law; “we suffered constant agony for fear that he had been killed, and a great cloud hung over the house.” The man had not been killed, but was injured (Neighbor, 1999).

Juliann Schmeltekopf Magdalena was the only child of five who didn’t have to pick cotton! Her sisters helped in their father’s fields due to shortages of labor, and her oldest brother, Lawrence Schmeltekopf, was permitted to remain home to help with the farm. Juliann remembers “big rations” on sugar, tires, and other things. Though much remained the same, a significant alteration due to the war was that “you just had to do without.” Due to the use of silk in parachutes, women’s hosiery became scarce to nonexistent. Juliann recalls a thick make-up product for “painting” legs so that it appeared that one were wearing hose, “and then we’d draw a line up the back of our legs to
look like the seam.” Just how the ladies prevented this invention from smearing, she could not recall!(Magdalena, 1999).

School memories are that she took no general science in high school because all the male teachers went to war. Black curtains were required to be hung from the windows for black-outs, for which they practiced by turning out lights and pulling the shades. She was a senior in 1947 and recalls the senior trip which they funded by collecting newspaper and scrap iron, and saving gas stamps. Her father was the bus driver, and the class traveled to Carlsbad Caverns in the school bus. On the trip, they drove to White’s City and went across to Mexico where they had some “wonderful lemonade!” She remembers that in one of the restaurants, the tables were just covered in dust from the Texas storms. The second day they toured the Caverns and then returned home after a second night. Upon Juliann’s entrance to Southwest Texas State Teachers College, she remembers that there “were few boys in college.”(Magdalena, 1999).

Nancy Kercheville Elliott’s father managed a Pontiac agency in San Marcos, Texas, but when the war put an end to the production of cars and tires, he closed shop for a time and managed his brother’s Red and White store while the brother went off to war. At fourteen years of age, Nancy went to work at the store counting ration stamps and meat tokens. She remembers several items being rationed including cokes, mayonnaise, shortening, and canned fruits. She does not recall people fearing losing the war, but she did fear her uncles not returning--four left to fight. Many of the male teachers left the schools for the war, and one Kyle elementary teacher was killed at Pearl Harbor(Elliott, 1999).

A highlight of high school days was the boys’ basketball team. Occasionally, friends would go to a movie, “we could walk everywhere in Kyle. I remember learning to jitterbug by juke box at the Arrowhead Cafe by the railroad tracks; now that was fun!”(Elliott, 1999).

Ethel Louise Dupree Simon was born in Elgin, Texas and moved to Kyle with her folks in 1935. Graduating from high school in 1944, her story is more grim than the aforementioned. As a senior, they had no sports and no class trip. One night, the football coach was drafted, leaving the school with no athletics; the agricultural teacher was also drafted and later killed in action. At her English teacher’s recommendation, Louise left school in February to work for the San Marcos Army Air Force as a clerk typist. Possessing strong grades, Louise was still allowed to graduate that May of 1944(Simon, 1999).

“We had to cut back so much. There were rations on sugar, coffee, tires, gasoline. My grandparents had chickens and we wore clothes sewn from the feedsack that my mother made. If you washed them enough times, they would get soft. Later, I learned to sew in home economics--to sew, knit, and cook-- and I made my own clothes.” Kyle also had a cannery where townspeople could preserve items to have on hand(Simon, 1999).

A cherished memory Louise has of that time is the music of the big bands: “Now, that’s the best music anybody could ever listen to--I suppose you like today’s music--but Glen Miller, Tommy Dorsey, Harry James; wonderfull!” She and her husband, Red, splurged to see Me and My Gal for a first date. Red graduated in 1942 and served in the army but never left to fight. They married in 1948 and purchased Louise’s childhood home in Kyle for their own in 1950 where they live today. Though the war years dampened many facets of school life for her and others, courageous optimism refuted self-pity. “It didn’t hurt us--in my feedsack clothes. It didn’t hurt us.”(Simon, 1999).

Evelyn Bristow Schmeltekopf recalls a number of changes due to the war. Wooden wheels replaced steel on her rollerskates, and band woodwind players had difficulty finding reeds. Specific coupon allotments were required for buying certain items, and for a time, Evelyn wore a right shoe attached to its sole by tape; her mother tried to disguise the tape with polish, but Evelyn was still mortified! Finally sufficient coupons were collected for her family to purchase a new pair(Evelyn Schmeltekopf, 1999).

News was censored and weather reports ceased; Evelyn’s mother searched high and low for white nylon stockings as part of her required nursing uniform. Oleo margarine was marketed as a butter substitute and Evelyn and her siblings battled over whose turn it was to “color” the spread with the packet of yellow powder! Finally the family bought “a beautiful Jersey cow named Blondie--no more Oleo for us!”(Evelyn Schmeltekopf, 1999).

Each Friday at school, Evelyn purchased ten-cent savings stamps to paste into her book, and as a member of a Girl Scout troop, Evelyn distributed cookies and cupcakes to troops who stopped in town. If the train went
through non-stop, citizens lined the walk to wave flags. Memories of the post office include posters of Uncle Sam admonishing that “Loose lips can sink ships” while holding up the “V” sign for victory, and another of Adolph Hitler with an oversized ear, gathering information from “loose lips”. “I don’t remember ever thinking that the United States could lose the war. There would be setbacks and we would have special prayers for the troops, but the ultimate outcome was never doubted in our house. My father, who had served in the navy during World War I, said we would win and that settled it for me (Evelyn, 1999).

“I remember a neighbor who hung a picture of her son in the window after he was killed in action. The war took on new meaning for me after that; I guess for the first time I realized that war was not just an exciting adventure, that people I knew were dying.”(Evelyn, 1999).

Neighbor Two attended the black school in Kyle during the war. A ready-learner, she acquired reading skills before entering school from watching her mother teach her older sister. Thus, Neighbor Two began school at age six but was immediately advanced to the third grade:

“All couldn’t carry all my books!” Children purchased their own pencils and paper. The principal and teachers were “colored” and there were, as she recalls, two rooms to the schoolhouse with grades first through seventh offered. “It was rough; we had very little. The principal would try to get the things for us from the other schools—we had to take leavin’s. We don’t really like to talk about it—it was their idea. It’s a sore subject. But we just were thankful we got this far, because there was not a thing we could do. It was rough. But we made it!”(Neighbor Two, 1999).

Beatrice Ortiz attended the Mexican School in Kyle during the war. Born in 1939, she and her parents were raised in Kyle. Beatrice says that the school had no running water or indoor plumbing. Beatrice and her siblings walked at least two miles to school each day and “we didn’t miss much—rain or cold, we went.” Hours of school were eight o’clock A.M. to three o’clock P.M. and children were provided with texts; lunches were offered but were too costly for most of the students who instead brought lunch from home. The Mexican School held grades first through third only; at the fourth grade level, Hispanics were integrated with whites. When asked if she felt ostracized or ridiculed at the white school, Beatrice replied that she “didn’t remember that too much, because I was more paying attention to my work.” There was one Hispanic teacher, Sarah Ortonio, at the Mexican campus at that time, and the other personnel were white. “All the teachers were real nice and very friendly to me,” Beatrice said. Teachers stressed teaching English since all the children came to school speaking only Spanish. “Mrs. Ortonio said I was a good reader—that’s because I would read my sister’s books. She wanted to move me up to second grade, but I wanted to finish first grade. We had lots of homework and I read at home a lot. History and English were very hard for me, but I really liked spelling and math. I would win contests in spelling. My parents couldn’t help us with our work because they didn’t know English, plus they were working—so they weren’t very involved in school much. That’s why I told my kids, ‘Don’t think I don’t care (about your school), but I had to do it on my own,’ and I expected them to do it on their own, too.”(Ortiz, 1999).

Beatrice’s father passed away at the age of 36 and the five Ortiz children went to work in the fields. “If I had to live life again, I’d go to school more. But I got married too young (age 14, sixth grade); they wouldn’t let us go to school after we got married, I guess because it was a bad influence (on others).”(Ortiz, 1999).

In 1945, Beatrice was six years old. “I remember my mom had these stamps, but I didn’t know what for! We only had one pair of shoes for the whole year, and now—?!?!” Perhaps war times weren’t so very different for her family than peace time. In regard to the proposed Y2K problem, she added, “They’re saying all this stuff about how we’re not gonna have electricity, no water—I told my husband, ‘I remember when we didn’t have water or light.’ When it rained, we saved the water to bathe and to wash. So, to me it’s not gonna be different (than old times)!”(Ortiz, 1999).

Regarding rural schools of that era, the Charter of Education for Rural Children recommended that local areas of administration be large enough to provide modern educational systems and to guarantee an American standard of educational opportunity. Such educational opportunities were said to include access to education in “modern school buildings” for nine months per year, complete with health services, vocational guidance, library facilities, recreational activities, transportation, and school lunches where necessary(Kandel, 1957, 64). Nationwide, the evaluation of teaching material and methodology was encouraged in terms of its contribution to winning the war(Stanford
Workshop on Education for War and Peace, 1942, 33). “In all activities, emphasis should be placed on the conservation of all resources, human and material, and on the efficient utilization of these resources at all times in the productive war effort.” (Kandel, 1948, 27). More specifically, questions asked at the Sixth Annual Conference of Reading were: “What can we do to meet the wartime need for efficient readers?” and “How shall we make effective use of maps and globes?” (Gray, 1943, 274). World War II heightened concern over reading since many drafted men could not meet the standard of functional literacy which should have been attained after four years of education (Kandel, 1957, 120). A subject area enhanced by the war was social studies; price control and rationing were suggested as topics of study for every grade level (Field, 1994, 448). Social Studies teachers were also urged to regularly instruct pupils about the proper care of supplies and play equipment to prevent unnecessary damage (Field, 451). Geography studies escalated with the war with Allied nations more frequently discussed than others (Field, 456). History and citizenship education were heightened, and children learned the marching songs to all four branches of the armed services (Tuttle, 1993, 119). School mathematics found a sure foundation at the close of the war (Davis, 1993, 121). Increased emphases were made upon physical and vocational education, and students received academic credit for parades, scrap drives, and calisthenics (Davis, 114). At the secondary level, occupational guidance was emphasized to encourage boys and girls in preinduction training and occupational training; “every young person must be regarded as a reservist in preparation for the armed forces and the war industries.” (Kandel, 1948, 21).

School children were made to feel that their service, sacrifice, and dedication were important to the war effort; older rural school children within two miles of school were requested to walk in order to save bus use (Cyr, 1943, 48). To be certain, children’s school activities were also used as means of stimulating adults to action (Cyr, 11, 12). Some responsibilities of the schools were set forth as being to “guarantee children adequate protection... (and) intellectual participation,” protection referring to frequent air raid drills and the provision of gas masks and identification tags, and “participation” materializing as intensely propagandistic efforts reflecting an ideological certainty about what the United States was to be in the minds of all its citizens (Tuttle, 115). Government bodies, educational associations, and magazine articles lauded wartime aims of the school (Tuttle, 116). School-age children shared not only a sense of unity and invincibility but also one of moral and military superiority (130). Certainly the curriculum changes of wartime extended beyond classroom doors to improve civilian morale and work towards unifying national purpose (Davis, 116).

The "New Education" in Photographs and Words: Four Superb Booklets, But a Failed Publishing Dream

O. L. Davis, Jr.
The University of Texas at Austin

The eighteen photographs published in the January 1900 issue of The Ladies Home Journal claimed instant national attention. Each portrayed Washington, DC, schoolchildren and teachers engaged in a pedagogic activity. One, for example, depicted Kindergarteners tending their school garden. Several depicted schoolchildren on field studies at places such as a vegetable market, a museum, a quarry, and the zoo. Others showed children measuring spaces, engaged in physical fitness drills, cooking food, and observing science objects. With their captions, these photographs brought pictorial specificity to the abstractions of the New Education slogan in American schooling. They signaled, in addition, another achievement by Frances Benjamin Johnston, the nation's foremost female photographer. They were only a small number from a special collection of photographs that she had taken in the Washington, DC, schools. All 350 photographs in that collection would constitute the centerpiece of the Washington, DC, schools' exhibit at the international exposition in Paris during the summer of 1900 ("The New Ideas in Teaching Children," 1900; Daniel and Smock, 1974; Davis, 1999).

When Richmond (VA) publisher B. F. Johnson saw the published images, he quickly wrote to the photographer. After a short exchange of letters, Johnson visited Miss Johnston at her DC studio and looked at the entire collection of her photographs taken in the DC schools. Miss Johnston apparently suggested that he publish the photographs in book form. Having seen the stunning images, Publisher Johnson's entrepreneurial imagination immediately blossomed (BFJ to FBJ, 25 January 1900, 19 February 1900, 28 February 1900). Johnson recognized that no set of school photographs equaled the images that he saw - neither in quality nor in number. Moreover, to fulfill their original purpose, these images depicted white and African-American children in both elementary and secondary schools and in all branches of the curriculum. Johnson sketched out an ambitious publication project with photographer Johnston. Subsequently, he and Miss Johnston agreed to a contract whereby Johnson would purchase prints for use in the series of booklets at a price of $3.00 each and would pay Miss Johnston a 3% royalty on the wholesale price of all books sold (Contract, 5 April 1900). Although Johnson projected his eventual purchase of at least 256 photographic prints, he paid Miss Johnston on receipt of the prints. This financial commitment likely was a substantial investment for Johnson's publishing firm.

Publisher Johnson's plan called for the production of a 16-booklet series to carry the title, "The New Education Illustrated." Each of the 34-page booklets would include a preface, facing pages of text and photograph, and a bibliography. The projected books included the following titles: Primary Education, Arithmetic, Geography, History, Institutional Life, Nature Study, Physical Culture, School Games, Sewing, Cooking, Manual Training, Drawing and Clay Modeling, Laboratory Work in the High School (I and II), High School Athletics, and Normal School Work. Of these titles, only five would deal at all with secondary education (Manual Training, Drawing, Laboratory Work in the High School (I and II) and High School Athletics (Westcott, 1900)). Conspicuously missing from the titles and, also, from Johnston's entire collection of photographs is explicit attention to high profile school subjects like reading, composition, and speaking (in elementary schools) and mathematics and both English and foreign/classical languages and literature (in secondary schools). To be sure, some attention to reading and composition at the primary level was apparent, but almost no attention at higher grades. This absence likely constituted an Achilles heel to both the advocacy and practices of the New Education. Also, it may have detracted from sales of the booklets.

Johnson set to the task of production. He knew that Miss Johnson would deliver promptly the photographs that he needed. He also claimed the financial support of his firm's directors. He established, however, what became an unreasonably short production schedule. He especially wanted the booklets available for purchase at the meeting of the National Education Association, the nation's largest meeting of educators, to be held in Charleston (SC) in July 1900 (George J. Ramsey to FBJ, 9 June 1900). Johnson proceeded deliberately to sign an individual to write the booklets' narratives. He followed Johnston's advice and contacted Edith C. Westcott, principal of DC's Western High School. In short order, she agreed to write the needed texts (BFJ to Edith C. Westcott, 13 March 1900). Westcott was a sound choice for authorship. She knew the DC schools well, enthusiastically accepted their philosophy, and strongly advocated their practices ("The Founding of Western," c.1940). As a busy principal, she could work on the books' manuscripts only after school
American Educational History Journal  
Volume 27 Number 1 2000  

hours and weekends. By late May 1900, nevertheless, she had sent manuscripts for five booklets to Richmond (Edith C. Westcott to FBJ, 27 May 1900). She may have completed her authorship of the text for all sixteen booklets in the series a month later (BFJ to FBJ, 30 June 1900).

Clearly, a variety of circumstances had converged to make possible this major publishing prospect. B. F. Johnson and his firm enthusiastically provided the production facilities and financing for the high quality publication of marketable products. Also, he perceived that nationwide public interest in the New Education would embrace, and buy, Johnston’s superb photographs. Westcott’s substantial practical experience with New Education practices in the schools of the nation’s capitol city added credibility to the entire undertaking.

The New Education, to be sure, was a slogan more than it was a description. Nevertheless, it called attention to the late-nineteenth century transformation of the nation’s small, mainly rural, common schools into increasingly centralized county and city graded school systems. Also, the New Education sought for pupils their own personal inquiries rather than their acceptance only of memorized set exercises, their development of personal, experiential meanings rather than verbalisms only, and their expression of meanings in art, drama, and music as well as in writing, reading, and speaking. Object teaching and field studies – from the schoolyard to creek beds to museums – found comfortable homes under the New Education umbrella, even as these innovative practices occurred in the period’s conventional boxy classrooms with pupil desks affixed to the floor in rows. Underlying some of the New Education’s most popular dimensions were teaching practices traced directly to philosophic positions asserted by Pestalozzi, Froebel, and Herbart. Francis Wayland Parker led the movement and Washington, DC’s Superintendent William B. Powell became its leading practitioner advocate. By the late 1890’s, the DC School Board president loftily noted that this method of learning “begins as nature begins, first with the senses, with things, before the symbols of things. . .It must have the living teacher. . .to lead the child. . .not as by the old methods, by vainly solving his tasks for him, but by leading him to new truth, to new outlooks, and to new insights.” New Education practices found purchase in the classrooms of the District’s elementary and secondary schools both for white and African American students (e.g., Gilbert, 1895; Campbell, 1967; Whelpley, 1899; Haycock, 1949).

Proud of the DC schools’ position as a leader in the nation’s educational enterprise, Superintendent Powell decided to display the New Education’s virtues to the entire world. The perfect platform presented itself. The occasion was the 1900 International Exposition in Paris, France. The DC schools would be but one of about fifty American public school systems to exhibit works of their students and teachers in the Education displays in the magnificent U. S. pavilion. Superintendents of most exhibiting school systems chose to exhibit pupils’ written exercises and drawings and some photographs of school buildings. Superintendent Powell took a bold extra step (Rogers, 1901; Taylor, 1901).

Powell contracted with Frances Benjamin Johnston, nationally visible as the first official White House photographer, to take a series of photographs that would illustrate New Education practice in DC’s schools. He sensed that these photographs would prompt visitors to the Exposition to pause and to consider the multiple meanings behind the simple depictions. His vision constituted a masterstroke. Miss Johnston’s 350 photographs, taken in late Spring 1899, captured the attention of numerous visitors to the Education exhibits at the summer exhibition. Viewers praised the photographs. For example, one Spanish education official wrote after seeing these photographs, “The Americans defeated us [Spanish-American War], not only because they are rich, but also because they are better educated” (Blanco, 1900).

Unfortunately, “The New Education Illustrated” project back in Richmond did not proceed apace with the world exhibit in Paris. Members of the National Education Association who came to its Charleston convention saw none of the booklets. Unexplained production delays, in fact, prevented issuance of the first booklet of the series, Primary Education, until August. Not until December were the next two booklets, Arithmetic and Geography, issued. In mid-January 1901, Johnson released Manual Training, the fourth title, and announced a revised projection of dates during the spring and summer for the publication of the final twelve volumes in the series. Production was seriously behind schedule. Still, one additional title likely was published. Johnson claimed to have mailed Miss Johnston a copy of Physical Culture, in late January 1901 (BFJ to FBJ, 4 February 1901). However, no copy of that title is extant and it only appears as a bibliographic ghost.

The completed booklets were handsomely produced. Printed on high quality paper, the booklets presented
crisp and bright reproductions of Johnston’s photographs and the Wolcott texts complemented the excellent images. Each book, as part of the series’ description on the inside front cover, carried the sentence, “The books are not only fascinating from an artistic point of view, but they are brimful of new ideas which every teacher will want to put into practice.” Discounting this advertising puffery, these books reasonably represent some of the most authoritative contemporary verbal and pictorial descriptions of New Education practices available. Issued in a convenient and attractive 12” x 9” page size, each booklet’s listed price seems excessive: 35 cents per copy, three copies for one dollar, or a complete set of copies (16 volumes) for $5.00, postpaid (Westcott, 1900). However physically and professionally attractive, the booklets likely were too expensive for most school administrators and interested citizens to purchase.

Publisher Johnson never revealed publicly any sales figures of the four booklets. However, he wrote to Miss Johnston that the series “is not having a sale such as I hoped and expected it to have. I am quite a good deal disappointed in that respect” (BFJ to FBJ, 22 Jan. 1901). This admission glossed a more grim reality. Two weeks later, Johnson reported, “I am very sorry to say that the series as a whole does not seem to be moving very well. Prominent educators endorse the idea . . . but when it comes to subscribing for a thing that costs as much as $5.00 there are not many of them that are willing to do it.” He had publicized the books to many daily newspapers and to the nation’s educational journals. He even mailed two or three copies of the first booklets to many city superintendents and, to as many as a thousand others, he offered “favorable terms” on purchases (BFJ to FBJ, 4 Feb. 1901). Failure to generate sales marked the certain demise of the series.

In fact, Johnson’s firm published none of the remaining and projected eleven or twelve titles. Either Johnson or the investor directors of his firm apparently cancelled the project in order to staunch further hemorrhaging of resources. Pricing and an inadequate marketing plan were the most obvious culprits in this failed enterprise (BFJ to FBJ, 22 January 1901).

The failure of this publishing venture clearly must have disappointed its principal figures. It constituted a blemish, however minor, on Johnston’s triumphs at the Paris Exposition. Not only did Exposition jurors award her photographs of DC elementary schools a gold medal and of the District’s secondary schools a silver medal, they recognized her brilliant photographs in other competitions as well. In the photographic portraiture competition, judges awarded her a gold medal. In addition, jurors presented a Grand Prix award to W.E.B. DuBois’ exhibit about the American Negro, a display that included her significant photographs taken at Hampton Institute (Rogers, 1901; Report..., 1901; “Learning by Doing’ at Hampton,” 1900; The Hampton Album, 1966; Peterson, 1980). Photographer Johnston suffered major financial loss from her aborted expectations. Despite paying her for an unknown number of photographic prints, Publisher Johnson apparently paid her no royalties. As well, she lost the income from the anticipated sales of the remaining prints, perhaps as many as half of the 256 planned for the entire series. About Edith Westcott’s probable losses, however, nothing is known. She may well have gained no remuneration from this venture. For publisher Johnson, the consequences of this business failure likely were particularly grim. Within three years, he had lost his company and began to work for another publishing firm in Washington, DC (BFJ to FBJ, 5 March 1904).

Two additional costs of this failed project are easy to identify. These costs may be calculated from the near disappearance of even the four known published titles from bibliographic and historic attention. Indeed, only one copy of each of these titles presently is known to exist. They were Johnston’s personal copies and currently are housed in the Frances Benjamin Johnston collection of the Prints and Photographs Division, Library of Congress. However, they languish uncatalogued and only obliquely identified in the Library’s extensive catalogue system.

The failed national distribution of even the four known published titles frustrated the development of reasonably important meanings. The nation’s educators and concerned citizens at the turn of the century knew less about the actual practices of the New Education, an obvious predecessor of progressive education, than they would have had the series achieved widespread distribution and sales. A special irony of this failed venture is that DC’s Superintendent Powell resigned his position in the summer of 1900 on the heels of a particularly vicious and divisive six-month campaign to change the governance of the District’s schools. In typical fashion, the objective of governance change remained obscure in the campaign. Rather, the near-daily target was the pedagogic practices and philosophy of the District’s schools, essentially those related to Superintendent Powell’s advocacy and support of the

A second impressive cost, particularly of the bibliographic disappearance of the New Education Illustrated booklets, has been the failure of historians to consult both Johnston’s photographs and Westcott’s informative narratives in order to develop a more robust understanding of the period’s educational practices. Similarly, Johnston’s school photographs have remained largely unknown. Not since the 1900 Paris Exposition and the subsequent 1901 display of the American educational exhibits in Manchester, England, have Johnston’s magnificent school photographs been exhibited together. Only on a very few occasions have individual photographs from her DC schools collection been displayed. However, at its November 1999 convocation in Baltimore, Kappa Delta Pi hosted an exhibit of more than forty prints from this collection. Within the past quarter-century, moreover, a few educational historians have begun to use these photographs (e.g., Davis, 1976a, 1976b; Cuban, 1984; Tyack and Hansot, 1992).

This failed publishing dream left a thin, but heretofore unrecognized residue of evidence about actual practices of the New Education in an American school system. However, in both photographs and words, these contemporary descriptions of American classroom realities at the turn of the century remain impressively valuable.

Oral History Applications for Recovering Policy Implementation
Lee S. Duemer
Texas Tech University

Understanding policy implementation in a historical context is difficult enough when sufficient documentation exists to reassemble events into a coherent picture. The problem becomes more complex when informal lines have been utilized to communicate or transfer information (White 1990). Informal lines of communication are often used rather than formal lines for facility. Why write a memorandum when less effort is expended through a telephone call? Informal interactions such as telephone calls or direct encounters leave little or no archival data for the historian to reconstruct events. The issue of insufficient documentation is equally problematic in contemporary times with electronic mail as messages are routinely deleted after an interval of time. In his study of policy implementation, White uncovered frequent use of informal lines of communication. Formal lines of communication were available but were often not used to transfer information or make implementation decisions.

The purpose of the study reported herein was to identify themes in the theoretical literature on policy implementation that provide a framework for the educational historian about how oral history can be used to recover policy implementation. This study draws from existing scholarship to bridge the gap between policy studies and oral history to explore innovative ways for scholars to expand our understanding of policy implementation. This study does not imply that any theoretical framework is more or less valid for the educational historian in terms of understanding policy implementation. It is also not intended to engage in an exhaustive analysis and interpretation of organizational theory as it applies to oral history. Rather, the purpose is to explore some of the theoretical literature as a means of provoking scholars to think about ways in which organizational theory informs oral history.

A large body of scholarship exists using oral history methods as a means of emphasizing the personal element or preserving heritage through the recollections of ordinary people (Manning 1990). The application of oral history methods points toward the usefulness of oral history in reconstructing policy implementation; however, the existing scholarship on oral history does not directly develop a linkage with policy studies. March and Olsen (1976) inform us that organizational scholarship must pay particular attention to the human factors that influence decision making. March and Olsen indicate that decisions are often influenced by personal values and agendas that are not on the surface evident to an investigator. Such personal factors do not fit into a rational decision making framework but can be accounted for by a focus on the human element.

This study examines the theoretical literature on policy implementation in terms of understanding how policy is mutated through implementation, and in terms of understanding the role of the individual in implementation. Implementation is defined as the means in which policy is carried into effect. Implementation can refer to a one-time effort at enacting a policy, or a continuous process such as strategic planning. In any event, implementation involves the process of moving from decision to operation (Williams 1976, 3). In complex organizations like educational institutions, the implementation process may involve many different people and levels of hierarchy that change the nature of policy from decision to implementation.

Oral history methods have been used to collect the experiences of a diverse range of people's lives, from world leaders to common people and their work as in Working (1975) by Studs Terkel. Transcripts do not necessarily have to be collected by the investigating historian, but may be found in an already existing collection waiting to be reinterpreted or searched for new meaning. Oral history has been applied as a research methodology to convey history (Grim, 1995) and increase awareness of and interest in history (Blount 1992). The use of the personal element and the narrative format provide a better sense of context (Blount 1992) through preserving the experiences of those who were involved in policy implementation (Manning 1990). The idea of historical preservation is largely derived from the fact that oral histories are collected from direct participants, rather than distant nonparticipants.

Once a policy is set by an individual or policy-making body, there is no guarantee that it will be implemented in the same way as it was originally intended. The difference between institutions and individuals is central to understanding how policy can change from inception to implementation. In order for an institution to accomplish anything, it must rely on individuals. Individuals have interests of their own and reflect larger societal interests, which may conflict with those of the institution. Policy can be changed or revised by institutional officials from inception to
implementation in a manner that more closely meets their interests rather than the interests of the organization (Elster 1989, 157).

Even when individuals claim to support a policy or initiative, they can surreptitiously undermine it or at least decline to actively work toward its implementation (Duemer 1998; Pressman and Wildavsky 1984, 135). Individuals may also attempt to mutate policy through implementation into a shape that more closely meets their conception of what is in their or the institution’s best interests. Understanding efforts to disjoin policy development from policy implementation is essential to an understanding of how policy may fail or change, through implementation, from its original form. Mutation is more likely when policy is developed in a climate that views implementation to be merely a technical detail (Pressman and Wildavsky 1984, 143). When a governing board directs an institution’s officers to implement a new policy, but do not define any operational limitations or delimitations, there is no way to know how implementation will occur or in what manner. Under such conditions, it is inevitable that implementation will be influenced by individual perceptions (Duemer 1998). If individuals behaved in the same predictable sense as chemical reactions or genetic programming, there would be little need to explore policy mutation. Human reactions would be testable according to proscribed and predictable formulas. Human beings do not behave; instead, they act (Sergiovanni 1984). The salient characteristic is that thoughts are filtered through values, preferences, prejudices, motives, and the like, to produce actions. Actions vary for different individuals even if the initiating factor remains unchanged (Sergiovanni 1984).

Policy mutation is also caused by administrative labor divisions. Some positions enjoy more freedom or autonomy than others through division of labor (Sergiovanni 1984, 152). Autonomy provides individuals with various degrees of freedom to impose their own interpretations on the manner in which policy is implemented. Labor division and specialization encourage individuals to identify and congregate into smaller units that share similar goals. Individuals’ vested interests and breakdowns in communication increase the likelihood of policy mutation (Petrow 1973). The idea that institutions are rational bureaucratic organizations where decisions are regulated by a structure of rules and sanctions is rejected by the recognition of individual influence. Institutions have been compared to facades that are intentionally designed to mislead observers from the reality that within are individuals who behave as they want (Greenfield 1984, 160). The efficiency of bureaucratic organizations is compromised by the interpretations individuals make in policy implementation as the result of their own interests (March 1984, 20).

The use of oral history methods reflects the idea that institutions are composed of individuals and that individuals can be the focal point of inquiry. Investigations that focus on individuals seek to understand their relationships with those inside the institution as well as with those outside the institution. The use of oral history methods is consistent with theory that recognizes institutions to be composed of human will. Consequently, oral history methods reject the idea of institutions as a group mind or social reality that is above or beyond human control (Greenfield 1984, 152).

Theoretical perspectives about how organizations function are useful to the educational historian as a way of stimulating new avenues of thought about how to understand how policy is implemented. Such perspectives provide the educational historian with a rationale for using oral history to explore the role of the individual in institutions. The use of oral history methods to document policy implementation allows the researcher to understand rationales behind decisions and how those decisions impacted individuals.

Understanding the human element in policy is a central aspect of oral history as the human element is the basic unit of social life (Elster 1989, 13). Such a perspective recognizes institutions as social constructs designed to hold society together (Elster 1989, 13). Institutions are themselves held together and maintained by individuals who share, to varying degrees, a similar interest or goal. Elster (1989, 13) reminds us that in order to understand policy implementation, it is essential to understand the actions and interactions of individuals. A human-centered focus, versus an institution-centered focus, avoids the pitfall of understanding institutions in terms of key leadership positions. The study of leadership is limited to a very narrow spectrum of all the individuals in an institution (Greenfield 1984, 160). Such a limited focus encourages us to remove the personal element and focus on the generic administrator devoid of personal identity or interests. Leadership and institutional investigations present a delusive image of educational
administrators and do not adequately account for the diversity of individuals and their organizational roles.

Investigations that focus on the role of individuals reject the idea that an institution can embody any value, or
that any one individual can embody the values of an institution. Such individual focused investigations reflect a
perspective that recognizes the power of individuals to impact policy implementation and establishes a framework where
competing values are uncovered and examined to develop an understanding of policy. To further understand the human
role, we can frame an individual’s relationship to policy implementation in terms of Orientation, Degree, Resources,
Activity, Autonomy and Rationale.

Orientation. Was the individual supportive, oppositional, or neutral toward the policy in question?

Degree. To what degree did the individual support or oppose the policy? If one opposed the policy in question,
to what degree did that person attempt to stop, obstruct, or mutate implementation?

Resources. What resources were available to the individual that could be used to help or hinder implementation?
What types of resources did the individual expend on this policy?

Activity. What actions did the individual take to support or obstruct policy? How much activity did the
individual expend to support or obstruct policy?

Autonomy. What level of autonomy did that person have in his or her position? A high degree of support or
opposition will not have had much impact on expense of energy and resources if the individual had little autonomy to
exert influence on policy.

Rationale. What explanation does the individual provide for his or her orientation toward the policy? Does
the individual have superseding interests, loyalties or values that conflict with the policy?

The preceding questions establish a framework that informs us about individual perspectives toward policy and
policy implementation. These criteria establish a relationship to policy implementation in individual terms and are
consistent with the individual reality central to oral history. This framework also takes into account societal and
institutional contexts that influence individuals and that individuals change through their actions and decisions. Such
a framework recognizes that the relationship between the individual and society is reciprocal rather than unidirectional.

Individuals are inclined to receive information through filters that alter the way that information is perceived compared
to other people. Such filters can be defined in terms of interests, values, or any number of intervening factors (Bess
1988, 160) and are represented in the preceding framework.

The individual emphasis of the preceding framework is also consistent with the work of Bess (1988), which
recognizes that continual and unresolvable differences exist among institutional participants. The framework also
accounts for divisions of labor and labor specialization which encourage individuals to identify and congregate into
smaller units that share similar goals. Individual interests and breakdowns in communication increase the likelihood
of irrational behavior and conflict (Perrow 1973, 2-15).

Conclusions

We displace the locus of responsibility when we think in terms of how institutions implement policy. An
emphasis on institutions compels us to assign blame or praise on constructs rather than the individuals who make and
implement decisions. The individual emphasis encourages us to better understand the collective role of individuals
throughout the institutional hierarchy in implementing policy and the influence they have in determining its final form.
An individual emphasis also helps develop an understanding of how policy is changed and affected as it progresses
through the institution. Such an approach recognizes that individuals are not machines, and cannot be programmed to
consistently perform in a mechanistic and rational manner. The result is a multi-dimensional understanding of how
policy is affected by individuals.

This study recognizes educational institutions to be complex social structures with multiple agendas, rather than
rational-bureaucratic structures that exist in a vacuum (Dollar 1994). As a social process that sometimes involves the
use of informal, rather than formal bureaucratic protocol, policy implementation is an interconnected part of the social
structure. Informal processes include, but are not limited to, conversations, disposable communications such as
electronic mail and reliance on unspoken understandings such as tradition. The use informal bureaucratic processes
enables a rapid and flexible response to difficult and controversial issues. Informal communication processes enable
policy to be implemented efficiently and effectively; however, they also eliminate written records of decisions and interactions. Informal patterns of communication leave few alternatives for the educational historian but to rely on oral history methods to recover policy implementation. Even when written records exist, oral history findings add depth and context to the study in question. Such context-focused information is sometimes not available from archival sources such as memoranda or minutes of meetings which lack such details for purposes of brevity (Duemer 1998).

References

The years immediately preceding World War II were difficult ones for American mathematics educators. Ironically, the most significant challenge they faced was due in large part to the unprecedented success of public schools in attracting and retaining students, especially at the secondary level. Studying mathematics long had been an integral part of the American school experience, an expression of national identity through the curriculum (Reid 1998). School mathematics constituted an explicit and accepted portion of what all students in the United States studied. Clearly, the position of mathematics in the curriculum also had been bolstered by the tenets of mental discipline, a theory that collapsed under the weight of experimental evidence presented in the late 19th and early 20th centuries (Stanic 1987). The legitimating strength of curriculum as an expression of national identity was insufficient to sustain school mathematics with the failure of mental discipline and, especially, with the growth in student enrollment and the changing characteristics and aspirations of the students who attended school during the first half of the 20th century.

Urbanization and prosperity afforded an increasing number of young people during the early years of the 20th century the opportunity to attend school for longer periods of time. By the 1930s, economic depression eliminated employment opportunities for many students who almost by default chose to remain in school and continue their educations. Enrollments grew ever more rapidly as alternatives to school disappeared (Newman 1998, 178). A significant number of the students who remained in school were unlike previous generations of students. They possessed few or no ambitions for further education and their immediate post high school employment prospects were bleak. In previous years, they would have been working and probably would not even have considered seriously attending or completing high school. For educators, these students presented a vexing problem as well as an opportunity. Clearly, they could not be turned away during an era of diminished resources, for they represented much needed funding for the schools. Unfortunately, these students often demonstrated little interest in the traditional curriculum and commonly were viewed by educators as having little chance for success with it (Tyack, Lowe, and Hansot 1984, 149). For mathematics educators, the question of what to do with these “new” students presented two alternatives, either the mathematics curriculum had to be changed or school mathematics reduced or eliminated. Both courses of action were followed.

The percentage of students enrolled in the traditional sequential mathematics courses, algebra, geometry, and trigonometry, declined during the years from 1890 to 1948. A new course, general mathematics, was added to the curricula of many schools. Offered as a practical alternative to the sequential mathematics courses, general mathematics was intended to insure that most students possessed at least some degree of mathematical competence. Unfortunately, the perception of general mathematics as “ill-defined and often poorly, or at least unwillingly taught” appears to have had a firm basis in reality in many cases (Jones and Coxford 1970, 53-54).

Advocates of general mathematics courses regularly asserted the practical, as opposed to formal, nature of such general courses. For most students, traditional school mathematics failed the test of social efficiency, for they were unlikely to apply often or directly most of the mathematics they learned. During these years of efficiency and specialized curricula in the larger schools, this perceived lack of immediate, practical utility for most students contributed to the decline of school mathematics, and especially the sequential courses, in the curriculum (Osborne and Crosswhite 1970, 197). Also during the interwar years, some child centered progressive educators, such as William Heard Kilpatrick (1926, 111-112), questioned the need for formal mathematics study at all.

Fortunately, by the close of the 1930s, concern over the breadth and quality of mathematics education reached such a level that thoughtful educators began seeking ways to improve significantly the teaching and learning of mathematics in schools. These efforts resulted in two major reports released in 1940, the Committee on the Function of Mathematics in General Education of the Progressive Education Association’s Commission of the Secondary School Curriculum’s (1940) Mathematics in General Education and The Place of Mathematics in Secondary Education prepared by the Joint Commission to Study the Place of Mathematics in Secondary Schools of the National Council of Teachers of Mathematics and the Mathematics Association of America (1940). Both reports reached startlingly similar conclusions. First, all students should learn mathematics. Second, for many students, this had been
a neglected curriculum area. Third, a revitalized mathematics curriculum that addressed mathematics as an essential form of understanding related to virtually all human endeavors should be developed. The seeming consensus between progressive educators, mathematics educators, and mathematicians concerning the place and importance of mathematics in the curriculum for all students might have proven to be a firm beginning for robust reform. Unfortunately, World War II intervened and diverted attention from these reports. Other imperatives for school mathematics loomed too large and familiar legitimations proved too alluring.

As Americans prepared for inevitable involvement in the Second World War, mathematics educators foresaw a renewed emphasis on school mathematics as the subject came to be understood as a prerequisite for success in modern, technological warfare. This attention, however, tended to reinforce the perception that the importance of learning mathematics lay in the ways in which it could be applied directly to solve immediate, practical problems. In other words, mathematics was a useful tool and nothing more. Casting aside the spirit and conclusions of *Mathematics in General Education* and *The Place of Mathematics in Secondary Education*, mathematics educators returned to the comfortable legitimations offered by social efficiency arguments. As the nation prepared for and engaged in war, more people undoubtedly would be required to apply more mathematics than ever before. The war thus offered a compelling if ultimately short-lived rationale for requiring more students to study more mathematics.

The argument that mathematics was a practical wartime tool received prominent attention in Marston Morse and William L. Hart’s article, “Mathematics in the Defense Program,” published in the May 1941 issues of both the *Mathematics Teacher* and the *American Mathematical Monthly*. Morse and Hart provided a detailed list of the mathematical “needs” of both officers and enlisted personnel in the various military branches as well as of industrial workers. They also emphasized the critical role of effective guidance in helping students to design appropriate mathematics programs of study. Such guidance was important, since, for the most part, Morse and Hart proposed reliance on traditional, sequential mathematics courses. However, they also recognized that many of the students who would be called upon first to support the war effort through either military service or industrial work lacked adequate mathematical backgrounds as well as the time to complete the sequential courses. Thus, they proposed “abbreviated” courses, to be taught regularly, that addressed logarithms, plane trigonometry, intuitive solid geometry, and introductory solid geometry. Such “refresher” or, probably more accurately, “pre-induction” courses were destined to offer a much discussed solution to the perceived inadequacies of prewar mathematics education. Morse and Hart concluded their article with a direct appeal to the social efficiency argument:

*Mathematical content with military uses* is the most socialized variety of mathematics to which they [high school students, especially males] can be exposed at present. (Morse and Hart 1941, 201)

Advocates of improved mathematics education regularly sought to enhance the status and role of school mathematics in the curriculum using arguments based on widely anticipated wartime manpower needs.

Harl R. Douglass (1940) presented the common viewpoint that the war presented an unprecedented opportunity not only to recover lost ground, but to establish the importance of our field in a realistic way that cannot be denied, thus relieving us of the constant necessity of apologizing for our failure to educate for the mathematical needs of the great mass of American men and women. (24)

Invoking a military metaphor, one North Carolina high school mathematics teacher observed, “Today, perhaps as never before, mathematics is demanding a place in the front lines of high-school teaching” (Watkins 1943, 108). Such military allusions offered an important and publicly popular legitimation for school mathematics as well as provided a potentially significant means of improving student motivation in mathematics classrooms. The expected relationship between school mathematics and ultimate military success was made clear early and prominently by the man who soon would become the nation’s foremost naval officer.

Admiral Chester W. Nimitz, then Chief of the United States Navy’s Bureau of Navigation, spoke at the University of Michigan during October of 1941. At the request of an individual in attendance at that presentation, Nimitz briefly summarized his remarks in what became known as the “Nimitz letter” that appeared both in the *Mathematics Teacher* and the *American Mathematical Monthly*. Nimitz bluntly recounted failure rates exceeding 60 percent on the mathematics tests required for entry into the Naval Reserve Officer Training Corps. He also noted that 3000 out of 8000 college graduates who applied for other Naval officer commissioning programs failed due to
insufficient mathematical knowledge and that 75 percent of the failures in navigation courses resulted from similar mathematical deficiencies (Reeve 1942a). His vivid portrayal highlighted the importance of mathematics education to a nation at war in the twentieth century. No doubt, Admiral Nimitz’s rapid rise to public prominence as the nation’s most visible Naval officer extended additional credibility to his message. Nimitz, in a letter of about 500 words, accomplished what mathematics educators over the previous four decades had been unable to do. He articulated reasons that would assure near universal acceptance for the widespread study of mathematics in some depth by most high school students, thereby elevating the subject to a position of prominence in the curriculum for the foreseeable immediate future. Although transitory, this legitimation provided the basis for those who advocated revising school mathematics to meet wartime demands of the military, industrial workers, and the home front.

The nation’s most visible educator, John W. Studebaker (1942, 246), the United States Commissioner of Education, called for a “curricular conversion” to maximize the schools’ contribution to the war effort. Among his suggestions was the incorporation of “military illustrations and applications” in mathematics courses. Although the wartime rhetoric contains many suggestions for possible military applications suitable for attention in mathematics classrooms, a small sample of these advocacies provides a sense of their extent. One University of Illinois professor, for example, urged mathematics curriculum change “so as to lay much greater stress upon aeromechanics, aeronautics, auto mechanics, navigation, gunnery, and other aspects of modern warfare” (Smith 1942, 115). His generalizations failed to offer teachers any practical advice about or examples of the actual teaching of such topics. Providing such advocacies of the generalized “what” that bypassed the more mundane but detailed suggestions of “how” became something of a cottage industry during the World War II years.

Fortunately for the busy wartime mathematics teacher who desired to implement suggestions such as Studebaker’s, a number of authors addressed the “how” question by offering examples of specific material deemed suitable for classroom use. Typical of these works was a Mathematics Teacher article by H. M. Bacon (1942) of Stanford University. Bacon not only suggested that mathematical problems associated with artillery fire could be addressed in high school classrooms but also included five examples with detailed solutions as well as four additional examples with only final answers provided. The extent to which such problems with a military basis ever entered actual classrooms remains unknown. Nonetheless, wartime teachers who were professionally active had access to a variety of military topics for classroom use. Still, many students who graduated or otherwise left school during World War II did not enter military service.

An immense number of people was needed for industrial work to keep soldiers, sailors, and airmen equipped with an unprecedented array of armaments and other supplies. Preparation for industrial work, sometimes viewed as less glamorous or significant than military service, called for mathematics problems perceived as less likely to motivate students than problems with explicit military references. Industrial work did not prompt a significant number of suggestions for wartime curriculum change. In fact, individuals concerned about the preparation of students for industrial work tended to focus on rather low-level mathematics outcomes for students, not those likely to raise the subject’s status in the postwar curriculum. The results of a survey conducted by Olin Roberts (1942) of Pasadena, Texas, for example, revealed that industrial workers seldom engaged in computations with whole numbers greater than 10,000, with decimals beyond three places, or with fractions with denominators other than two, four, eight, sixteen, thirty-two, or sixty-four. Such competence in basic arithmetic, although necessary, was far less than the “substantial secondary mathematics” including trigonometry for industrial workers suggested immediately prior to the war by Morse and Hart (1942, 199). Experience appears to support Roberts’s contention. Near the war’s end, a training instructor for Raytheon Manufacturing Company suggested that fundamental arithmetic “which must be mastered” was the schools’ concern. Other necessary mathematical principles and their application could be taught better on the job (Conklin 1945, 492).

Interestingly, although differing in depth, these suggestions were not dissimilar to those offered by some military officers. They recognized that curriculum change and new wartime topics were less important than helping students to learn mathematics well. For example, Colonel B. W. Venable (1942), on the War Department’s General Staff, wrote that while “fanfare and military glamour” (246) might attract some students to take more mathematics courses and to learn more in them,

the normal processes . . . of education need little or no adjustment to become valuable to our National
effort. It is not so much the increase in number and variety of subjects available to the student as it is placing the proper emphasis on those courses already established that have practical value, and teaching them in a practical way. (244)

Venable apparently preferred that educators tinker with the existing curriculum and somehow improve their instruction in hopes that more students would be able to apply to real situations the mathematics they studied in schools rather than undertake wholesale curriculum revision based on wartime topics and themes. Yet, a traditional curriculum modified marginally, if at all, seemed woefully inappropriate to many mathematics educators during those years while the nation struggled for what many understood to be its very existence.

Brehon B. Somervell (1942, 3), the commanding general of the Army’s Services Supply Department, claimed, “Every classroom is a citadel.” He warned educators,

Surely you will make certain now that no American soldier is ever killed or injured because you failed to do your part to provide adequate training. (6)

Such rhetoric that tended to “draft” students as well as teachers into national service with vital roles to fulfill, whether intended to be taken literally or offered primarily for its motivational and morale effects, served to spur teachers, including mathematics educators, to seek relationships between their subjects and the war effort. Thus, the general suggestion that the prewar mathematics curriculum, if taught and learned well, would suffice tended to have less appeal to many wartime mathematics educators than the suggestion that the curriculum be centered more directly on contemporary war-related issues and themes. After all, many of them sensed that they were engaged in their own protracted “war,” one whose outcome would determine the future prospects for their subject in the curriculum. Relevance and utility were their tactics, and no potential opportunity could be ignored.

The “home front” offered one such opportunity. Most if not all wartime students already participated to one degree or another in a variety of symbolic and practical patriotic activities. War savings, conservation, and salvage offered opportunities through which even the youngest school children could contribute to the war effort. Mathematics Teacher editor William David Reeve (1942c) pointed out

it would be a mistake to overlook the importance of the home front, which will obviously be so necessary in the days of peace that lie ahead. Social and economic arithmetic, or the mathematics of the consumer, should not be overlooked. (378)

Reeve’s suggestion foreshadowed for his readers the evolution of prewar social efficiency into advocacy of postwar Life Adjustment Education. What he failed to do in this editorial was to articulate any reason for the study of mathematics beyond the simple computations required of most Americans in their daily lives. Despite the surface attention accorded school mathematics during the Second World War, the foundations necessary for significant postwar improvement and growth largely were ignored and unattended.

Attention to topics such as “point rationing, ceiling prices, food supply, inflationary spirals, salvage, subsidies, agricultural parity, hidden inflation, victory gardens, [and] victory models” (Isle 1943, 284), although timely, was unlikely to provide an appealing rationale for a substantive study of mathematics by a large number of students for extended periods of time. For example, “Salvaging License Plates” (1942) suggested a variety of mundane and largely nonsensical calculations that were contrived for a mathematics class in a Philadelphia school engaged in a license plate recycling project.

Clearly, one major goal of such curriculum suggestions was to enable students to sense that they had a personal and direct role in the home front war effort. Under the auspices of the Education Section of the War Finance Division of the United States Treasury Department, Walter W. Hart, Veryl Schult, and Violet Coldren (1943) prepared for the Mathematics Teacher a comprehensive unit of study entitled “The Teacher of Mathematics and the War Savings Program.” In this twenty-one page guide, the authors did not offer suggestions intended to improve students’ mathematical competence. Rather, their goal was stated plainly:

It is hoped that the introduction of such [wartime financial] problems will increase pupil understanding of the current savings program. From increased pupil understanding will come greater cooperation on the part of students and their parents in the voluntary savings program of the country. (354)

Such a use of mathematics classes to address important wartime concerns, although symbolically important, offered
little help or encouragement for restoration of mathematics to a place of prominence in the postwar curriculum.

The perceived need for more students to learn more mathematics rapidly, whether for use in the military, in industry, or on the home front, was complicated by the fact that many students were inadequately prepared mathematically to begin intensive study. For example, many students who might soon find the need to apply trigonometry were in no position to enroll in a traditional trigonometry course. Special “pre-induction” mathematics courses such as that proposed in 1941 by Morse and Hart became widely discussed possible solutions to this problem.

A committee appointed by the United States Office of Education and the president of the National Council of Teachers of Mathematics prepared a widely circulated report entitled “Pre-Induction Courses in Mathematics” (1943). Based on a survey of the technical manuals used in military training, the committee recommended that schools establish one-year and one-semester “refresher” mathematics courses as well as make changes in their sequential courses. The one-year course was to address arithmetic, informal geometry, and algebra. Detailed outlines delineated the specific content suggested for such courses. The content for a one-semester course depended entirely on whether or not it was a “refresher” course. For those students who had studied mathematics previously, the focus was on geometry and algebra, while, for the mathematically weakest students, the emphasis was to be placed on “arithmetic plus certain essential topics from general mathematics such as scale drawing, including elements of blueprint reading, numerical trigonometry, informal geometry, and simple formulas and equations.” Facts and practical applications were to receive primary attention in the sequential courses. Questions about whether or not students with weak or nonexistent formal mathematical backgrounds, presumably those for whom pre-induction and refresher mathematics courses were designed, could complete successfully and profit from such a diverse array of topics addressed in so little time appear not to have been addressed. Undoubtedly, many students would have found such curriculum schemes challenging.

Another report, issued in the same year as “Pre-Induction Courses in Mathematics,” succinctly offered what was to be the guiding precept of many wartime mathematics educators:

The mathematics now taught in high school should be practical to the extent that it has immediate application or that it is needed for other essential mathematics or that it pertains directly to the war effort. (“Mathematics in Relation to Curriculum Adaptations” 1943, 172)

The idea that students could be given a one-semester or one-year “dose” of mathematics to remediate years of neglect proved alluring, if ultimately unrealistic. In any case, engaging students in whatever mathematics courses they took remained a persistent concern. Means of making school mathematics appealing to students, many of whom had shunned the subject previously, seemed worthy of pursuit.

Some mathematics educators believed that clothing the problems assigned to students in wartime rhetoric would motivate them to solve more problems, thus enhancing interest and improving learning. Aviation was a popular topic for obvious reasons. As literary scholar Paul Fussell (1989) observed:

If the illustrations [in popular magazines’ display advertising from 1942 to 1945] are to be believed, all young men are in the Air Corps, where they are officers almost by definition (or, in 1942, cadets destined soon to be officers). (127)

New York City mathematics teacher Lillian Moore (1942; 1944) described her use of the aviation theme to improve mathematics teaching and learning. Mathematics Teacher editor William David Reeve (1942b), the Texas Department of Education (1945), and the popular press such as Newsweek (“School ‘Air Conditioning’” 1942) were among the individuals and institutions that viewed the “air conditioning” of school mathematics as a wartime innovation that presented definite postwar opportunities. Changing the problems that students solved in mathematics classes would be facilitated by new textbooks, and some publishers attempted to avail themselves of the opportunity the war presented.

Despite widespread advertising in the professional journals, most mathematics textbooks changed little in substantive ways during World War II. That any attention and resources were devoted to the revision, production, and promotion of textbooks for schools in a nation fighting a world war, perhaps for its survival, is noteworthy. Problems with military themes dealt almost exclusively with aviation, although some problem sets included occasional naval references. The ground war remained virtually invisible in textbooks. Problems that addressed military issues did so mainly in nonviolent ways; they portrayed a war with neither enemies nor bloodshed (Garrett, 1991). One
wartime observer of purported textbook revisions noted the lack of thought and creativity expended by most authors:

   It didn't take much trouble either - the old problems still appear. Ship becomes plane, plane becomes
   ship, elevation becomes depression, or train becomes plane, box becomes airplane gas tank. (Levy
   1943, 311)

Although of dubious practical significance, wartime changes in school mathematics served a perhaps more important
symbolic function, providing every student an opportunity to engage in the war effort through preparation for
ultimately more direct contributions.

Eventually, however, the war would end. Many mathematics educators appear to have been blinded by the
sudden positive attention paid to their subject after years of neglect, if not outright hostility. They failed to develop
a compelling case for their subject that would remain convincing after the war, largely relying instead on the
convenient rationale provided by wartime conditions and concerns. As early as 1942, the weakness of depending
solely on the war as a legitimation for school mathematics was pointed out. Joseph Seidlin of Alfred University
warned, “Mathematics for defense is but a temporary objective” (162). Another educator observed:

   Teachers of mathematics, especially at the high-school level, will need to rally all their resources of
   influence and persuasion if the war is to result in any permanent improvement of the sadly neglected
   mathematical education of the general public. (Wakeham 1942, 555)

By 1944, the National Council of Teachers of Mathematics took action intended to sustain and improve mathematics
education in a postwar environment.

The National Council of Teachers of Mathematics authorized formation of the Commission on Post-War Plans
on February 25, 1944. Between 1944 and 1947, the commission issued three reports on its work. “The First Report
of the Commission on Post-War Plans” (1944) offered five “tentative proposals” for secondary school mathematics:

1. The school should insure mathematical literacy to all who can possibly achieve it.
2. We should differentiate on the basis of needs, without stigmatizing any group, and we should
   provide new and better courses for a high fraction of the schools’ population whose mathematical
   needs are not well met in the traditional sequential courses.
3. We need a completely new approach to the problem of the so called slow learning student.
4. The teaching of arithmetic can be and should be improved.
5. The sequential courses should be greatly improved.

Crucial to the Commission’s second proposal was a suggested three-track curriculum composed of “sequential
mathematics, related mathematics, and social mathematics.” Sequential mathematics, the traditional curriculum of
algebra, geometry, and trigonometry, was to be reserved for the highest “technically trained men and women,”
whereas related mathematics was intended for “a middle group of trained workers and thinkers at a somewhat lower
level.” Social mathematics, designed for the “many people who may not go into the type of jobs which require special
knowledge and skills in mathematics” was to “be limited to the things required for them to live a rich, well-rounded
life” (Zant 1944, 62-63).

1 to 14” (1945) offered increased details about desired reforms in mathematics education, the commission’s first
report, coupled with its final “Guidance Report of the Commission on Post-War Plans” (1947), essentially set the tone
for immediate postwar school mathematics. The curricular path a student followed would be determined by his or
her intended roles in later life. In essence, mathematics educators employed the rhetoric of what emerged as Life
Adjustment Education, the 1940s progeny of social efficiency (Kliebard 1995, 213).

Advocates of Life Adjustment Education contended that the conventional school curriculum served well only
those few students of highest abilities who would continue their formal educations at the postsecondary level. Viewed
by advocates as a means of providing more appropriate, although critics would contend not better, educational
opportunities for all students, Life Adjustment Education relied heavily on the basic tenet of social efficiency, “that
the principal function of schooling should be the adjustment (preferably the happy adjustment) of individuals to the
social world in which they find themselves” (Kliebard 1992, 105). Despite the democratic rhetoric commonly
associated with Life Adjustment Education, the scheme’s roots in the often mundane trivialities of “daily life” proved
largely uninspiring, especially after four years of world war. While the degree to which Life Adjustment Education
rhetoric actually influenced school practice remains problematic, the power of that rhetoric over public perception does not. It tended not to advocate academic excellence and paved the way for yet another round of severe criticism of public schooling in general and mathematics education in particular.

Mathematics education emerged from the World War II years better positioned than it had entered them. The usefulness and necessity of mathematical understanding and problem solving ability became clear, and criticism of the subject temporarily diminished. Unfortunately, despite wartime prominence and the work of the Committee on Post-War Plans, school mathematics again soon fell victim to curricular neglect. Shackled by the rhetoric of social efficiency and Life Adjustment Education, mathematics in the schools slipped back into relative obscurity. Most people, in their “well-adjusted” lives, perceived little need for learning mathematics beyond the rudiments of arithmetic. Although some mathematicians began to complain in print about the quality of precollegiate mathematics education as early as 1948, school mathematics languished until the next perceived crisis arose in 1957 with the launching of Sputnik (Kempner 1948; Schuster 1948).

The Second World War focused attention on school mathematics at least temporarily. Following decades of criticism, neglect, and decline, there remained during the war years little question of the importance of students learning mathematics. Unfortunately, mathematics educators by and large failed to pursue the ideas offered in Mathematics in General Education and The Place of Mathematics in Secondary Education and did not develop a compelling and robust case for school mathematics that would last beyond the immediate needs of war. Limited by the tradition of the sequential curriculum for “the best students” and the apparent belief that not all students could succeed in rigorous mathematics courses, mathematics educators sought to develop specific curricula for specific groups of students based on their theorized future uses of mathematics. Whether or not wartime mathematics educators could have pursued other arguments that would have resulted in the widespread expectation of significant mathematics study by all students remains an unanswerable question.

Inattention to School Mathematics by Some Progressive Educators: Articles in *Progressive Education, 1924-1957*

Karon Nicol LeCompte
Southwestern University
and
O.L. Davis, Jr.
The University of Texas at Austin

Progressive education appears to many Americans as having dominated the nation’s schooling throughout the twentieth century. Certainly, the rhetoric of progressive education or its understanding by educators and citizens trumpeted a philosophy of child-centeredness and a reduced emphasis on the traditional subjects, especially mathematics, in the school curriculum. During the decade before World War II, progressive educators advocated a minimized mathematics education and urged deferment of formal mathematics instruction from its previous levels, sometimes to the college level (Garrett 1991, 182-184). Enrollment in secondary school mathematics dropped throughout the inter-war years. Indeed this inattention to school mathematics was emblematic of the progressive challenge to the established order of schooling (Angus and Mirel, 1999, 11-14).

Heavily influenced by the writing of John Dewey, progressivism in education went through several stages including “administrative progressivism”, “child-centeredness”, and “social reconstructionism”. Although these forms appear sometimes to have been separate, at times they were clearly related. By 1919, enough interest in “progressive” school practices was generated that some educators, mainly ones who taught in private schools, founded the Progressive Education Association (PEA) (Graham, 1967). Through this organization, they aimed to reform American education.

Five years later, in April 1924, the PEA launched its journal, *Progressive Education*. This new periodical sought to offer PEA members and the general public a means of keeping in touch with the progressive movement in education (Cobb, 1924, 3). *Progressive Education* reported significant developments in education and in educational systems in other parts of the world as well as it published articles about both practices and theory of progressive education. The first issue contained a message for the President of the Progressive Education Association, Eugene Randolph Smith, a nationally prominent mathematics teacher and professor at Teachers College, Columbia University. PEA officials intended that *Progressive Education* occupy a position midway between that of popular magazines which allotted space to only an occasional article dealing with education and that of the strictly pedagogic magazines, journals concerned with the perfection of educational technique (Cremin, 1964, 193). Gertrude Hartman, the journal’s first editor, was interested in creative arts in education and the influence of this movement on the international scene. Early volumes of the journal under her editorship reflected her interest (Hartman, 1924, 2).

*Progressive Education* served as an effective instrument in the promotion of principles of both the PEA and of progressive education. By the mid-1930s certainly, the PEA and its journal achieved an important status in American education. In its rise to visibility, how did *Progressive Education* treat the teaching of mathematics in American schools? This paper reports a study that sought an answer to that question.

Between 1924-1957, *Progressive Education* published only fourteen articles that dealt specifically with mathematics, its curriculum and teaching. Recognizing that this journal published more than 200 feature articles during that period only highlights this very small number. Expressed simply, *Progressive Education*’s treatment of school mathematics was meager in the extreme. Still, several meanings can be developed from an analysis of the few articles on mathematics education published in *Progressive Education*. Discussion of this analysis is divided into categories suggested by Stephen I. Brown (1988, 23-25).

The learner, the initial category, stresses the nature of children as learners. This idea was central to progressive education. It underlay the progressive ideas that children learn best “by doing” and that formal education should be organized in ways such that children learn naturally. The teacher, the next category, acknowledged that progressive teachers exhibited roles in classrooms different from those of the past. In progressive classrooms, teachers were understood to be co-learners, not simply dispensers of information. The curriculum, the third category, constituted the substantive content to be taught. Progressive educators considered “curriculum” a concept of unity in the life of children. Units of study, they held, should be presented as integrated concepts, not as separate, disparate elements.
Emphasis on the learner

Of the fourteen articles about mathematics education published in Progressive Education, seven, or half of the total, highlighted topics of child nature, development, and study. Generally, they focused on children's learning by action and discovery.

Margaretta Voorhees, in the first Progressive Education article on mathematics education, stressed that arithmetic instruction should incorporate discovery and should be woven into the lives of children by immediate, constant, and understanding use. She noted that children discover for themselves the essential elements of numbers long before adults have any idea of teaching the subject to them. One way they exhibit their discovery, she observed, was in rhythm. Also, most children will sort small objects and make repetitions of sounds and motions until they are satisfied. They accept the notion of counting and become comfortable with both concepts and names of numerals. When children entered school, Voorhees believed that they should continue this same free flowing discovery of numbers. She also believed that children in their early school years should learn facts by using numbers not simply by memorizing the symbols of numbers. Voorhees reported that in "progressive" schools efforts were made to have arithmetic actually function in children's lives in realistic ways throughout all of the grades. Voorhees realized, however, that beginning in the fourth grade and continuing into upper levels, arithmetic properly should become more of an intellectual exercise that required definite skills. She believed that children should be tested scientifically in order to measure their development of the ability to solve problems and to use fundamental procedures to perform mathematical solutions. Children's instruction, according to Voorhees, should follow two lines of development. The first demanded that arithmetic meet an immediate and vital need in children's lives. The second recognized opportunities for further discovery and expression. In conclusion, Ms. Voorhees offered examples of programs (e.g., banking, school supply stores, and games) that might incorporate the two lines of development that she suggested (Voorhees, 1928, 124).

Nine years later, Brenda Lansdown's (1937, 106) article describes how children gradually developed concepts of space, time, weight, and formalized numbers from their own personal experience. Space, she explained, was the earliest of these concepts that most children develop. For example, a young child experiments with blocks and boxes to build structures. As children grow older, they can notice roofs and other aspects of buildings or groups of buildings. Eventually, children engage in the transition from block building activities to paper and pencil drawing activities. The article continues in a similar manner, to discuss children's experiences in weight, time, and numbers. The author contends that before age twelve, when formal instruction of arithmetic should begin, schools should follow several basic principles: 1) The need for arithmetic shall arise out of the activities of the group. 2) The concepts, ideas, and need for techniques shall be consolidated by invented similar examples whored by each child. 3) Drill is used in higher groups and can lead to other mathematical ideas and investigations. Foreseeable results of this plan was that the students should have a positive attitude toward the need for mathematics as a functional part of their lives and personal security in manipulating mathematical techniques.

Arnold Dresden addressed the development of scientific attitudes in students (1938, 294-295). Accordingly, his article sited the notion of intellectual integrity as an essential characteristic worthy of teaching. Dresden argued that mathematics contributes to modes of thinking through its abstract character. Concrete and abstract, for example, are relative terms. Abstractions of one stage become concrete instances at the next stage. Mathematics instruction initiates somewhere in the continuum of the two stages. Dresden hypothesized that students want to analyze their world. The arrangement and selection of educational experiences are such that the inclusion of larger concepts is possible. Students, consequently, will develop the ability to deal with principles of many topics in their most abstract form (Dresden, 1938, 294-295).

Gladys Risden's article (1940, 86-88) focused on the notion of "mechanization" in the learning of arithmetic. She composed her article in the form of a collection of stories about classrooms. Most stories portrayed children who were frustrated with arithmetic exercises. She asserted that the main cause of their problem was the lack of relevance of their mathematics exercises to any personal situation outside of the classroom. Risden advocated more experientially based instruction to remedy this situation. This attention would enable students to build upon their increasing awareness of the quantitative aspects of their everyday environment. Finally, she suggested that innovative teachers strive for changes in curricula that embrace meaningful learning and incorporate activities that reduce
"mechanical" exercises. Such lessons, she argued, would include realistic elements of everyday living.

In his early World War II article, Maurice L. Hartung (1942, 387) addressed the importance of mathematics to the field of aviation. Hartung charged that for nearly two decades before WWI, mathematical education was the topic of continuous and usually adverse criticism. However, when the nation began to train large numbers of young men to operate complex aircraft, mathematics became a prerequisite for their successful performance. He noted that armed service leaders wanted men entering the services to have better preparation in mathematics than most possessed. These recruits needed the ability to apply mathematics in the solution of widely varied problems in many branches of the armed forces. Hartung suggested curricular changes that would permit careful evaluation of topics that were coordinated with a realistic and intelligent treatment applications. He called upon all mathematics teachers, even progressive educators, to recognize the nation's wartime need, and to modernize their mathematics courses to emphasize mathematical application.

In another wartime article, Lowry W. Harding (1943, 311-312) implored for reform in school mathematics. He observed that pre-war American schools had been educating for a world at peace. He mentioned the depression and its attendant unemployment and the policies of industry in his effort to explain the shortage of skilled individuals needed to win the war. Harding emphasized that elementary schools must develop in students a sound foundation of fundamentals in mathematics. Although controversy about the nature of these fundamentals continued, Harding recognized that elementary schools of the day already had begun to reduce regimentation and to institute sound mathematics programs based upon principles of child development. Harding was concerned that pressure from the War Department might lead to methods of teaching likened to assembly line productions and mass training exercises. He fought instead, meaningful teaching for student success. Harding concluded by affirming that the chief responsibility of the elementary school should be to develop and maintain a sound, healthy emotional balance in children rather than to add to their insecurity and tension. Essentially, he held that basic progressive education principles could accommodate increased substantive attention to mathematics.

H. Van Engen's (1952, 17-19) post-war article analyzed what he regarded as a major defect in the teaching of elementary arithmetic and outlined a theory of instruction designed to remedy this shortcoming. Van Engen argued that this weakness was blind faith in the memorization of clusters of symbols and the belief that this procedure ultimately would foster children's development of basic arithmetic concepts. Solidly echoing progressive ideas, he offered an alternative method of instruction based on four principles: 1) Instructional procedures based on actions do not rely on words to establish meanings of symbols. The reliance on words assumes that students possess an experiential background of knowledge. If children do have this experience, it must be provided to them. 2) Instructional procedures should be "in-tune" with the way that children think about quantity in the initial stages of their thinking. 3) Problem solving does not rely on the "cue" of words and phrases for problem solving. Rather, it encourages children to generalize after they recognize similarities in mathematical operations. 4) Instructional procedures based on actions rely on the manipulation of objects (e.g. beads, pennies) to establish meaning rather than on symbols on paper, pencils, crayons, chalk and backboards.

Van Engen concluded that a program that places too heavy an emphasis on the rapid development of skills easily fails to teach children to be quantitatively literate and also fails to protect the personality of the child.

These articles focused on the learner. Authors described classrooms that upheld the importance of learning by doing. They encouraged teachers to engage children in exploration and experimentation with arithmetic that is part of the adult world. In these Progressive Education articles, authors clearly stated what later would be called a discovery approach to learning. What was the teacher place in this type of mathematics instruction? Only a very few Progressive Education articles focused on the role of the classroom teacher.

Emphasis on the Teacher

The progressive teacher was central to all instruction, certainly to mathematics teaching. This role recognized that the stimulus and control of the educative experience proceeds directly from the learner. However, only three Progressive Education articles emphasized teachers' roles in teaching mathematics.

The January 1938 issue of the Journal carried the theme, "The Concept of Needs in Education; Children's Work". W. Carson Ryan, Jr. the 1938 president of PEA, focused editorial attention on the desired cooperation between schools and other agencies of society. Ryan asserted that the school was obligated to insure that every
individual in its care has the opportunity to develop his potentialities to the fullest degree. This issue of the journal emphasized a growing concern of educators and citizens about the isolation of schools from other community agencies and elevated their concerns to support the development of more authentic curricula and, of course, authentic mathematics teaching. Two of the articles in this special issue focused on the teaching of finances.

Ella J. Barrows (1938, 55-57) reported a unit of study that focused on banking. Barrows taught a class of twenty boys in the seventh grade of the Lower School of the Montclair (NJ) Academy. She and her pupils became interested in the use and history of town banks. They decided to establish a class bank in which they could conduct a variety of financial transactions. She planned to make the class bank as authentic as possible. After she and the boys organized a company, they voted their capital stock and elected officers. Some of the boys even built a teller's cage in one corner of the classroom. Each boy wrote a letter to his father to explain the plan and to ask parental endorsement of a deposit. The bank opened with a cashier and bookkeeper in charge of transactions. Deposits were taken and checks cashed for real money to be spent at the school for supplies. At the end of the month, each depositor generated his own bank statement and mailed it to his father. Ms. Barrows claimed that the study was valuable.

Immediately following the Barrows article appeared Marion J. Russell's (1938, 58-64) article. It addressed student voice in the determination of curricula. She believed in the progressive education notion that children should be taught what they themselves wished to learn. Thus, her students began their study by listing topics that they would like to study. The results were compiled into a list entitled "personal accounts". This article also described several other studies undertaken by the pupils that included banking, stocks and bonds, and income taxes. She reported that the entire class deemed these studies successful and she recommended that other classes should have a similar voice in the curriculum.

In the final article related to the teacher of mathematics, Nathan Lazar (1952, 19-21) developed his ideas about the improvement of mathematics teaching in the secondary school. Lazar suggested that teachers make curricular decisions that would stress relationships in arithmetic, algebra and geometry. Moreover, he urged that alliances between topics be represented as integrated concepts. At the time, only about half of American secondary schools required both algebra and plane geometry (Loomis, Lide, and Johnson, 1993). Lazar offered an alternative to the offering of these separate subjects through integration of their content. He further stated, without evidence, that this adjustment would necessitate only a minor change on the part of the teacher.

These articles about teachers reveal that the teacher was not the main figure in progressive classroom. Rather, students and their interests were primary. These Progressive Education articles supported classrooms in which teachers listened and responded to their students and communities. According to the authors of these Progressive Education articles, teaching intertwined with learning such as to emphasize the learner. Given this relationship, curriculum issues become important. What did Progressive Education authors judge important in the mathematics curriculum? What did progressive educators want to see as topics of mathematical study? The following section addresses these questions.

Emphasis upon the Curriculum

Only a few articles in Progressive Education focused attention on schools' mathematics curricula. Moreover, most of those published papers represented only partial concerns. Even the one major article that dealt with the mathematics program in the Eight-Year Study's cooperating schools did not receive attention in subsequent issues. Nonetheless, these few articles underlined the progressive ideal of curriculum integration.

Lucille Patton's article (1933, 256-258) described a classroom instructional unit that stressed economics that was developed upon the aspects of banking. She taught sixth grade in the demonstration school of Milwaukee State Teacher College (now the University of Wisconsin-Milwaukee). For a time, this class operated a school savings bank. The bank was organized as closely as possible in accordance with the requirements of the Wisconsin banking laws. Students investigated several questions as to the necessity and operation of the bank. Additionally, they investigated the purchase of bonds and the investment of capital stock. These sixth grade students deposited the bulk of their funds in a Milwaukee savings bank, withdrawing or depositing small amounts as their weekly needs demanded. The article did not describe the accounting procedures or the logistics of the bank's operations. Out of the organization of the bank and of the actual manipulation of the money developed the class' interest in the history of banking and money. Paper money and the concept of the gold standard were important issues raised by the students. However, the teacher
noted that she believed that these topics were too complicated for these children to comprehend. The article concluded with eight generalizations that were important outcomes of this unit: 1) An individual must consider group responsibility. 2) Our banking system is not without flaws and might profit by the introduction of closer supervision and regulations. 3) The stock market should be stabilized to offer some measure of security to the investing public. 4) High interest rates strongly suggest insecurity. 5) Bonds are safer than stock for investment. 6) Governments bonds are the safest of all investments. 7) Loans on good are uncertain and difficult to handle. 8) Dire need for new legislation in the banking industry.

Roswell C. Josephs and F. Martin Brown (1930, 16-19) addressed what they believed to be a serious problem of mathematics in the seventh and eighth grades. Simply, they recognized that most of the students had mastered the fundamental processes of arithmetic and already “applied” them to phases of their environment. However, the authors believed that these students did not have the mental maturity to engage the abstractions of algebra. Although newer textbooks had introduced basic principles of algebra and geometry at this level, Josephs and Brown believed that these students were handicapped by their lack of practical experience and by the absence of real situations to which mathematics could be applied. They claimed that college entrance requirements complicated the situation but claimed that it would only be exacerbated by introducing new and informal abstractions into the junior high math curricula. Josephs and Brown called for an expansion of students’ background through a variety of mathematical experiences (e.g., integrated units) and the incorporation of more protracted scientific work and study (e.g., study of physics). Indeed, they emphasized that teachers should not construct a definite syllabus, but that they should offer a suggestive list, topics or studies from which students might choose.

Possibly the most prominent curriculum article was Robert D. Leigh’s (1933, 373-375) reported analysis of a conference of the schools enrolled in the Eight-Year Study. Even so, he only briefly discussed mathematics instruction. Strikingly, these experimental curricula reduced mathematics instruction. After meeting minimum mathematics requirements ending subsequent to or following the completion of elementary algebra, experimental schools made mathematical courses elective. Leigh further noted that the schools advocated that mathematics be taught in its advanced phases only as a tool subject in connection with science courses. Furthermore, these schools appeared to promote advanced mathematics only for students who planned to emphasize fields such as engineering and science in their college programs. An anomaly, however, was one school’s arrangement for a smaller amount of mathematics to be taught each year for six years, thereby making it a continuous, if only a de-emphasized study. Strikingly, no other article in Progressive Education offered any insight into the mathematics programs of the participatory high schools of the Eight-Year Study, one of the celebrated accomplishments of the Progressive Education Association (Cremin, 1964, 189; Aikin, 1942).

The last published article about mathematics curricula was J. Wayne Wrightstone's research report (1936, 460-462) of students' abilities to read and understand graphs. This study focused on the advantages and disadvantages of pictorial illustrations. Proponents of the use of graphs contended that those illustrations implanted a “picture” in the student's mind, one which is recalled easily. Critics, however, held the view that the popularity of these new graphs depended upon novelty rather than real merit. Wrightstone's results revealed that pictorial graphs generated more student interest than did conventional graphs. In conclusion, he advised that picture graphs not be used to the exclusion of other more conventional graphs but that picture graphs are effective supplements to commonly used means of reporting information.

The few articles that focused on the mathematics curriculum emphasized student's interest and perceptions. Integration in units of study and courses of study were the fundamental format for presentation to learners. According to these articles, students had choice and voice in their mathematics courses.

### Mathematics in Progressive Education: Only a Trace

Less than once every other year for its thirty-four years of publication, Progressive Education brought to its readers an article about teaching mathematics in schools. This small number of articles on mathematics focused attention almost exclusively on arithmetic. Even most authors who mentioned high school courses in algebra and geometry, for example, asserted that their value lay in their relationship to students’ study of science. Most of these articles about mathematics focused attention on learners rather than on teaching and the curriculum. Moreover, the little attention received by mathematics highlighted its relationship to daily life (e.g. banking) that involved arithmetic.
Educators who wrote for and read Progressive Education likely believed that mathematics beyond arithmetic, in the main, was inappropriate for students in the schools but probably was an appropriate subject to be taught at the college level.

Although mathematics education appears lost in Progressive Education, this lack of attention mirrored, in part, the status of the subject in the schools. School Mathematics was besieged, to be sure, but it likely garnered more attention and respect than accorded in this journal. (Angus and Mirel, 1999, 8-10, Davis, 1995) Importantly, Progressive Education reflected one dimension of the progressive spirit of the times. For example, it featured attention to creativity, drama, art, students' interest, and expression, and some social issues. On the other hand, it devoted little attention to the efficiency movement, the central concern of contemporary "administrative progressives" (Callahan, 1962, 54-64). This journal, simply, represented one, but not the only, dimension of progressivism in education during the period.

That this journal de-emphasized mathematics actually may be too harsh a judgement. Perhaps more positively, most progressive educators likely understood school mathematics as so prominent a school reality that they could not dislodge it from the curriculum. They may have thought that, with the exception of basic arithmetic, they might reduce its prominence by a combination of their relative inattention to the subject and their strident belief that the school curriculum should relate to students' immediate and prospective utility of knowledge.

Another reasonable explanation of this situation, to be sure, was that progressive educators simply ignored or forgot school mathematics as they sought to emphasize student interest. Note, for example, Raleigh (NC) supervisor Mildred English's suggested daily schedule for her city's New Education (English, 1929, 250). She divided the timetable into an activity period, a conference period, a library period, and at the end of the day, a fine arts appreciation period. A curriculum constructed to emphasize only student interest likely would omit the study of mathematics.

The inattention to mathematics education by Progressive Education illuminates an aspect of the continuing controversy over the position of mathematics in the American school curriculum. Throughout this century, concern for school mathematics has endured conflict, continuity, and compromise (Stanic, 1987, 175). Certainly, it survived child-centered progressivism.

African-Americans had an active role in determining the conditions that shape their present. They have used education as a mean to increase their overall well being. An examination of the autobiographies of African-Americans born between 1925 and 1970 supports this contention. Education is a learning process and in some instances an enlightening experience. African-Americans participates in a dual educational process. They receive a formal, structured, education at school and an informal, less structured, education at home and within their community. This dual educational experience allows African-Americans to function in the many different situations they find themselves in because of their skin color and society's preoccupation with race. Distinctive educational patterns emerge throughout the autobiographies. Contained within the autobiographies are a consistent characteristic, form, style and method in regard to education. Certain thematic and structural educational patterns are evident in the autobiographies such as “mental liberation” the term mental liberation is used here to mean the freeing of one’s mind through the acquisition of knowledge of self and one’s cultural history, self-education and redemption.

Malcolm X, a social activist, born in 1925 in Omaha, Nebraska revealed in his autobiography, The Autobiography of Malcolm X his myriad educational experiences. The Autobiography of Malcolm X revealed his early educational struggles, his self-education process and the redemption that he received through the power of books. Malcolm X was in the seventh grade at Mason Junior High School when he encountered a teacher named Mr. Ostrowski. Malcolm X wrote:

English and history were the subjects I liked most. My English teacher, I recall—a Mr. Ostrowski—was always giving advice about how to become something in life. The one thing I didn't like about history class was that the teacher, Mr. Williams, was a great one for 'nigger' jokes. Later, I remember, we came to the textbook section on Negro History. It was exactly one paragraph long (Malcolm X, 1964, 30).

Malcolm X disliked his earlier educational experiences as a result of some of his teachers. Nonetheless he did well in school and was at the top of his class. "My grades were among the highest in the school. And I was proud; I'm not going to say I wasn't" (Malcolm X, 1964, 32). Malcolm X took pride in his academic achievements. "I kept close to the top of the class, though. The topmost scholastic standing" (Malcolm X, 1964, 37). However an encounter with Mr. Ostrowski, his English teacher, soured him on school. Malcolm X revealed:

Something happened which was to become the first major turning point of my life. Somehow, I happened to be alone in the classroom with Mr. Ostrowski, my English teacher. I know that he probably meant well in what he happened to advise me that day. I was one of his top students, one of the school's top students—but all he could see for me was the kind of future “in your place” that almost all white people see for black people (Malcolm X, 1964, 37).

Mr. Ostrowski asked Malcolm had he thought about his future. Malcolm X knew that he hadn't but he told Mr. Ostrowski that he had. Malcolm told Mr. Ostrowski that he wanted to become a lawyer. Malcolm X recalled Mr. Ostrowski stating:

'Malcolm, one of life's first needs is for us to be realistic. Don't misunderstand me, now. We all here like you, you know that. But you've got to be realistic about being a nigger. A lawyer—that's no realistic goal for a nigger. You need to think about something you can be. You're good with your hands-making things. Why don't you plan on carpentry?' (Malcolm X, 1964, 38).

Malcolm X was upset by this advice. He knew that Mr. Ostrowski had encouraged the white children in his class to go all the way and become whatever they wanted even though their grades where not as good as his. "It was then that I began to change-inside. I've thought about that time a lot since then. No physical move in my life has been more pivotal or profound in its repercussions" (Malcolm X, 1964, 38-39). Malcolm X's life took a turn for the worst after this experience with Mr. Ostrowski. It would be years before he rediscovered his interest in learning. As evident in his autobiography and later revealed in Carl Upchurch’s autobiography Convicted In The Womb, Malcolm X was basically forced out of school at and early age. Malcolm X and Upchurch came across teachers who expected them not to succeed and surpass the limits that society placed on them as African-Americans and that they as teachers enforced as individuals within a school system. As a result of this Malcolm X and Upchurch “abandoned” formal
Maya Angelou born in 1928 in Stamps, Arkansas, author and performing artist, revealed in her autobiography *I Know Why the Caged Bird Sings* the importance of education to her community. The whole community came out for graduations, expressing its pervasive and deeply entrenched commitment to the education of its young people. This is reflected in Angelou's recollection of her eighth grade graduation ceremony that was combined with the high school graduation ceremony in 1940.

The children in Stamps trembled visibly with anticipation. Some adults were excited too, but to be certain the whole young population had come down with graduation epidemic. Large classes were graduating from both the grammar school and high school. Even teachers were respectful of the now quiet and aging seniors, and tended to speak to them, if not as equals, as beings only slightly lower than themselves (Angelou, 1969, 142-143).

It is important to underscore Angelou's account of the graduation as a community affair. She defined it as a "graduation epidemic" and recalled the "spirit of shared understanding" (Angelou, 1969, 142). Clearly, in Angelou's remembrance the graduation and achievement of the African-American school children in Stamps was a noble phenomenon, reflecting the community's pride and fundamental values. She revealed the different relationships and roles that each individual played and took on as the event unfolded. The student body was described as an extended family, which was concerned with the academic progress and success of its members. In this context, black academic achievement meant "acting black," not an imitation of other people's values.

What would their educational future look like? "Only a small percentage would be continuing on to college-one of the South's A & M (agricultural and mechanical) schools, which trained Negro youths to be carpenters, farmers, handymen, masons, maids, cooks and baby nurses. Their future rode heavily on their shoulders, and blinded them to the collective joy that had pervaded the lives of the boys and girls in the grammar school graduating class" (Angelou, 1969, 145). The students' faced limited futures surely some had dreams of becoming something other than servants. Indeed they did, for it was a not case of aspiration and motivation but a result of limited opportunity and racism that bonded them in this informal caste system.

Nonetheless the parents of the graduating students were intent on making the event memorable for their children. "Parents who could afford it had ordered new shoes and ready-made clothes for themselves from Sears and Roebuck or Montgomery Ward. They also engaged the best seamstresses to make the floating graduating dresses and to cut down secondhand pants which would be pressed to a military slickness for the important event" (Angelou, 1969, 144). Much pride and effort was invested in graduation. Graduation was not only of importance to the Blacks in Stamps but also to the white folks. "Oh, it was important, all right. White folks would attend the ceremony, and two or three would speak of God and home, and the Southern way of life "(Angelou, 1969, 144). The whole community viewed graduation as being important and significant.

The importance of learning was demonstrated in Angelou's own achievement and commitment. As she put it, "My work alone had awarded me a top place and I was going to be one of the first called in the graduating ceremonies. On the classroom blackboard, as well as on the bulletin board in the auditorium, there were blue stars and white stars and red stars. No absences, no tardiness, and my academic work was among the best of the year. I could say the preamble to the Constitution even faster than Bailey. We timed ourselves often: "We the people of the United States in order to form a more perfect union" I had memorized the Presidents of the United States from Washington to Roosevelt in chronological as well as alphabetical order"(Angelou, 1969, 144). Angelou recalled taking much pride in her school achievements and striving always to be the best academically.

There were others in her community such as her classmate, Henry Reed, whom she admired greatly because of his academic achievement. Henry Reed was class valedictorian. Angelou had admired him for years because each term they vied for the best grades in their class. Most often he got the best of her, but instead of being disappointed she was pleased that they shared top places. Even the minister preached on graduation the Sunday before. Also among African-Americans at this particular time there was the tradition of giving presents to children going from one grade to the next. This took on a greater level of importance when the person was graduating at the top of the class. Angelou's brother gave her a soft-leather-bound copy of a collection of poems by Edgar Allan Poe. After receiving her gift from Bailey, Angelou "turned to 'Annabel Lee"' and we walked up and down the garden rows, the cool dirt...
between our toes, reciting the beautifully sad lines" (Angelou, 1969, 148). Angelou and her brother Bailey relished in the joy that books provided them.

Angelou's graduation captured and portrayed her personal values and beliefs about education along with her family's and community's educational values and beliefs. As an individual Angelou always strove to be the best she could be academically, even when obstacles were placed in her way. The healthy academic competition between her and classmate Henry Reed aided in her academic development. The educational games that she and her brother Bailey engaged in as children, whether performing a play for her family or reciting poetry amongst themselves, contributed to overall appreciation of education. Angelou as an individual along with her family and community valued education and schooling, but the opportunities that they received from the educational system inevitably shaped their chances for success.

Colin Powell, a General in the United States military, born in 1937, in New York City divulged in his autobiography My American Journey:

In later years, I would turn out to be a good student, but no one would have predicted it then. Marilyn continued to set the Powell standard in education. She had been an honor student at Walton High, and she excelled at Buffalo State. And so, in spite of my final high school average of 78.3, I started looking at college because of my sister's example and because my parents expected it of me.

Education meant all the difference between wrapping packages or sewing buttons all day and having a real profession. Education had led to an extraordinary record of accomplishment in my family (Powell, 1995, 21).

Powell's family believed in the value of learning and self-improvement and utilized education to better them for over one hundred plus years in American society. Powell's parents provided him with a moral influence that helped to shape his life. His parents instilled him at an early age, through their example, how to live a righteous life. Powell also recalled that he owes "an unpayable debt to the New York City public education system" (Powell, 1995, 22) for providing him with an opportunity to obtain a quality education.

Powell's family both immediate and extended used education as a means for social mobility. Throughout his family there are examples of how education changed and improved the lives of its members. Powell admits that he wasn't a great student, but nonetheless he valued the education that he received and used it to accomplish extraordinary things as did the members of his family. His parents and community valued education and relayed these beliefs to Powell who vowed to be an advocate for public higher education.

William H. Cosby Jr. born in 1937, comedian and actor echoed the sentiments of Powell: "As you know, I have always put the highest value on education" (Cosby, 1986, 147). Cosby is not alone in his belief, many of the autobiographers revealed in their autobiographies that they along with members of their family and communities valued education highly. Richard Pryor born in 1940, comedian and actor disclosed in his autobiography Pryor Convictions And Other Life Sentences, "My folks gave me a chance at something better by putting me in Catholic school, where I thrived. I made friends. I got straight A's. I showed promise. The teachers were impressed. They thought I was smart and encouraged me to aim high" (Pryor, 1995, 40). Pryor's parents, similar to Powell's, encouraged him to do well in school. Also Pryor's teachers respected him for his academic achievements and offered their support in regard to his academic endeavors. Pryor recalled a teacher by the name of Ms. Parker who took an interest in him at school:

I witnessed salvation come to people in a number of ways. I wouldn't say I was saved by Marguerite Yingst Parker, one of my teachers at Blaine, she did give me a shove in the right direction. What set Miss Parker apart from the rest was her ability to handle me. She did it with kindness and patience, a combination that's always slayed me. Ordinarily, I acted dumb in front of my teachers, but Miss Parker refused to believe my performances. Then she sat me down, assured me that I wasn't as dumb as I said, and in a gentle, sweet, reassuring voice she goaded me into at least trying to learn something (Pryor, 1995, 47).

Ms Parker encouraged Pryor to try and learn. She didn't believe that he was as "dumb" as he acted and took time to work with him. She recognized his talents early on as an entertainer and struck a deal with Pryor. She told him that if he did his schoolwork she would let him tell jokes at the beginning of the school day. Pryor
stated:

In truth, she blackmailed me. If I would make an attempt at working, she said, then she would permit me to stand in front of the class each morning and tell jokes. The deal was irresistible. I never thought of myself as having a gift, but I made my classmates laugh, and when I heard their laughter, I felt good about myself, which was a pretty rare feeling. But nice. Real nice. (Pryor, 1995, 47).

Ms. Parker realized that telling jokes was important to Pryor. She made this agreement with him because she knew that this was one way that she could get him to do his work at school. Pryor benefited from this situation in that he not only did his work but also by being able to perform in front of the class increased his self-esteem as a child and aided in overall development as a student. Ms. Parker represented the type of people that Pryor came across in his community as a child. They were individuals who were devoted to educating the children of the community. The community that Pryor lived in as a child in Peoria, Illinois valued education and the idea of self-improvement. Evident by the respect shown to Miss Whittaker, another woman in his community, for possessing the one thing that most in the community didn't have an, "education". Pryor's teachers were able to weave his unique talents into the fabric of the school day. His teachers recognized and supported his talents as an entertainer.

Diana Ross a fellow entertainer, born in 1944, disclosed in her autobiography Secrets of a Sparrow the following statement made to her by Berry Gordy of Motown Records after an audition, "Go and finish school, work on your music, and then come back and audition again" (Ross, 1993, 93). Gordy though supportive of Ross' talents realized that her education was more important. Ross wrote:

Mama understood my obsession with singing. If I promised to get my schoolwork done, she would give her permission. But Daddy was a different story. He was a practical man, solemn man, and he was very much opposed to my taking singing seriously. He was certain that singing would distract me from my schoolwork. He wanted me to go to college and get a good education so that I would be well equipped to take care of myself in a highly competitive world, one in which education would be the single most important element (Ross, 1993, 93).

In order for Ross to maintain the support of her parents, she had to be very careful at home, making sure that she did all of her chores and most importantly her schoolwork. Ross' parents viewed education as being very important. Like Powell and Pryor's parents though supported of their extracurricular activities they wanted nothing to distract their children from their education. Powell's Pryor and Ross' parents viewed education as means to a better life for their children.

Carl Upchurch, a social activist, born in 1950, in his autobiography, Convicted In The Womb, revealed his early educational experiences. Upchurch's early educational experiences were similar to Malcolm X's in that he came across some teachers that marginalized his abilities and envisioned a limited future for him.

My kindergarten teacher was named Miss Burton. I thought she was God and that all teachers in the world were like her. They weren't. From first grade on, all of my teachers were white-Miss Burton was the only black teacher in the school. My teachers had racist tendencies. The white teachers brought their values into the school-values that negated my world entirely. The message was subtle, but it was clear to me: everyone I respected and love was considered ignorant, irresponsible, and good-for-nothing. They weren't even represented in our schoolbooks (Upchurch, 1996, 18-19).

Some teachers at Upchurch's school conveyed messages to him about his self-worth that were counter to those that he received at home. At school Upchurch was made to feel inferior. He realized that because he was African-American his teachers would pay less attention to him. This caused him to withdraw from school. Upchurch recalled:

Our first-grade reading books, for example, were the Fun With Dick and Jane series. We read about perfect white Jane and perfect white Dick who played with their perfect dog, Spot, while their perfect white parents looked on. I couldn't have articulated it at the time, but I felt that they were making fun of me. Even though I hated the books they made me read, I was a good reader. Reading was the only part of school that was bearable (Upchurch, 1996, 18-19).

Similar to how Malcolm X felt in Mr. Williams' history class Upchurch thought that his teacher was ridiculing him based on the books content. After a while he began to turn away from school. For Upchurch each year at school was worst than the one before.
When I turned nine, three-quarters of the way through fourth grade, I just stopped going. My mother didn't know it for awhile because she saw me leave for school every morning. My mother did everything she could think of to force me to go back. She screamed at me, she beat me, she withheld things; she made me stay in the house, she cursed me. I had made up my mind, though. I wasn't going back, no matter what (Upchurch, 1996, 20).

Once again the school culture had succeeded on forcing another young African-American male out. Upchurch didn't want to contend with the mistreatment received at school from his teachers and fellow classmates. His mother tried everything to get him to stay in school, but he had decided at age nine that he had enough. At that point in his life he had began drifting away from home and eventually got into trouble with the law. Later on in life Upchurch found himself incarcerated. Similar to Malcolm X, while incarcerated Upchurch underwent a form of mental liberation and self-education. It was at this time in his life that he began an educational journey that changed his life for the better. Upchurch related:

"The fact that I'm neither dead nor still in prison is due to some folks I met in prison-poets and playwrights, activists, theologians, and philosophers. Desperate to pass the time during a stretch of solitary confinement, I opened up a book that happened to be propping up a table in my cell. It was a slim volume of Shakespeare's sonnets, and reading it started me on a journey of self-discovery I never could have foreseen" (Upchurch, 1996, 92).

"Once Upchurch had read and learned enough to identify the process that had gotten him to this point in his life, he then began to reconstruct himself. "This de-savaging of my soul began with Shakespeare; it continued in my voracious exploration of literature. Authors as disparate as Mark Twain and W. E. B. Du Bois, Carter G. Woodson and Victor Hugo, Malcolm X and Maya Angelou challenged me, inspired me, and taught me endless lessons" (Upchurch, 1996, 92). Through them he discovered the soul that he thought he had lost forever. "Discovering, through the words of others, that choices were available to me was liberating" (Upchurch, 1996, 93). Upchurch revealed that reading changed everything for him.

Similar to Malcolm X and later revealed in Sanyika Shakur's autobiography, Monster, and Jerrold Ladd's autobiography, Out Of The Madness, Upchurch discovered that, "Literature gave me a vocabulary I could use to express my deepest feelings and the insight to understand that my situation was universal. I escaped in a way far more satisfying than any tunnel under a prison wall, into a completely new world" (Upchurch, 1996, 93). Upchurch while incarcerated under took a journey into the realm of literature that would change his life. Upchurch with the help of his family and friends decided to use education as a means to change his life for the better. In prison he was "rescued" by books and engaged in a form of mental liberation that led to his redemption.

Sanyika Shakur, a community activist, born in 1964, in Los Angeles, California depicts a life story in the same vein as Malcolm X and Carl Upchurch. Sanyika Shakur is his autobiography Monster, recounts the societal forces that tried to destroy him and the "haven" that prison provided. Shakur undergoes a transformation while incarcerated and evolved from being the leader of the Crips, Los Angeles most notorious street gang, to a member of the New Afrikan Independence Movement, an organization that works for the betterment of African-Americans.

Shakur wrote in the beginning of his autobiography: "Bangin' ain't no part-time thang, it's full-time, it's a career. It's bein' down when ain't nobody else down with you. It's gettin' caught and not tellin', Killin' and not caring, and dying' without fear. It's love for your set and hate for the enemy" (Shakur, 1993, 1). While on the streets of Los Angeles Shakur lived by these words, however once in prison a fellow inmate by the name of Muhammad counseled him on the merits of living a life without indiscriminate violence. Muhammad provided Shakur with an opportunity to learn about the societal forces that until that time had conspired against him. Shakur revealed:

"Well here, read this. And if you ever feel like checking us out, come one by. You're welcome.' "Righteous," I replied, looking down at the pamphlet he'd given me, entitled Message to the Oppressed. That night in my cell I read the pamphlet, which began with a quote by Malcolm X (Shakur, 1993, 214).

Muhammad's teachings left an indelible print on Shakur. While incarcerated Shakur embarked on an educational journey that changed his life. Through the studying of history and literature Shakur was able to put together a life plan that freed him from his past life of violence, hopelessness and despair. Shakur recalled:
As I read on I felt the words seeping deeper into me, their power coursing through my body, giving me strength to push on. I was changing, I felt it. For once I didn't challenge it or see it as being a threat to the established mores of the 'hood, though, of course, it was. Muhammad's teachings corresponded with my condition of being repressed on the Rock. Never could I have been touched by such teachings in the street (Shakur, 1993, 223).

Shakur similar to Malcolm X and Carl Upchurch found salvation in books. This salvation enabled Shakur after his release from prison to continue his pursuit for knowledge and become a positive force in his community. The prison "community" that Shakur was a part of valued learning. Most of the inmates respected those inmates who could read, write and verbally articulate their ideas. Education held a place of prominence inside the prison.

Jerrold Ladd, a writer, born in Dallas, Texas in 1970 revealed in his autobiography Out Of The Madness an encounter with a black man named Fahim that changed his life. Just like Muhammad provided Shakur with guidance and support, Fahim helped Ladd to grow and develop into a strong African-American man. Fahim gave Ladd a copy of The Autobiography of Malcolm X to read. This book changed Ladd's life.

It was The Autobiography of Malcolm X, written with assistance of Alex Haley. Though it was painstaking at first, I kept at it all evening and into the night. At last! Here was one, an example, though dead. A black man who was purely himself. I was so overwhelmed, I stayed up the entire night pondering the black hero. Malcolm said get off your knees and fight your own battle. That's the way to make the white man respect you. And if he won't let you live like a man, he certainly can't keep you from dying like one! (Ladd, 1994, 173).

After reading about Malcolm X's life, Ladd realized that he couldn't recall one strong black man from his youth. Ladd viewed the lack of positive African-American men in his life as being detrimental to his overall development. Ladd related:

Malcolm's life story was the first confirmation I was looking for in my quest for understanding. I began to search more than I ever had before, reading more than I had at the West Dallas Public Library. I would sit in the living room reading all the dead black heroes, philosophers, and thinkers. Why wasn't I told that we came to America before Columbus? My discovery of dead literary role models permanently cured my doubt and made me bind back to the fundamental truth. Knowing the great accomplishments of my people, when they existed in their own civilizations started a chain reaction that would change the foundation of my mind. But this change had nothing to do with my drive and confidence. These had always been there (Ladd, 1994, 173-175).

Ladd underwent a form of "mental liberation" similar to the one experienced by Carl Upchurch and Sanyika Shakur. This process began when he read books on African and African-American history. He constantly pursued knowledge in order to improve himself. Ladd valued the knowledge that he acquired through reading and used it to change his life. He used this knowledge and self-education to "make it out of the madness".

For most of the authors their educational experiences provided the foundation on which the rest of their lives where built, as evident in the autobiographies of Malcolm X, Sanyika Shakur, Carl Upchurch and Jerrold Ladd. Each autobiography presented me with a perspective that when combined with the others formed a collective picture in regard to African-American educational patterns, views and values. The life stories the authors revealed in their autobiographies presented me with a wealth of information. Distinctive patterns emerged in the African-American autobiographies, which involved the concept of self-education, education as a form of liberation and education's redemptive quality.

I critically examined these African-American autobiographies collectively, and I used them to balance and corroborate each other. Moreover, since I examined them around a central question (i.e., To recreate African-American educational patterns, values and beliefs in the context of family, community and society), I was able to determine the extent to which they rendered a common portrayal of the cultural foundations of African-American education. I believe that the autobiographies have value in and of themselves, the value is found in the life stories of the authors. The individuals educational experiences present a new context in which the education of African-Americans can be studied and conceptualized. It is my sincere desire as an educator that what is revealed here leads to a greater understanding of African-Americans' educational values.
References

A large number of Muslim immigrants started to arrive to the United States by the middle of the nineteenth century, though it has been argued by a number of Muslim scholars such as Muhammad Hamidullah that Muslims had arrived to the American continent before Columbus (Roghanizad, 1990). In addition, it is a known fact that a large number of Africans who were brought to this country were Muslims. The history of Islam in America began in the bowels of slave ships. The estimates are that 20% of slaves brought to America from West Africa were Muslims (Roghanizad, 1990; Economist, 11/96). Most of the slaves were forced to abandon their religion and adopt the masters name and religion. However some remnants of Islam remained with some Africans.

There are 6-8 million Muslims in America today. Within twenty years Muslims are likely to outnumber Jews to become America's largest religious minority (Economist, 11/96). Most of the Muslim growth comes from the changing patterns of immigration. According to Haddad, there are four waves of immigrants. The first wave arrived in this country from 1875-1912. They were primarily workers. They came from the area of the fertile crescent, which constitutes Palestine, Lebanon, Syria and Jordan. The early Muslim communities were established by small merchants and factory employees. These Muslims settled in industrial centers. Early Muslims associated most exclusively with other Muslims. The second wave of immigrants, 1918-1922, were mostly relatives or friends of early immigrants. The third wave, from 1930-1938, was impacted by the American immigration law which permitted a certain number of relatives to immigrate corresponding with the number of immigrants already settled from their nation of origin.

The fourth wave was from 1947-1960. These new immigrants came from South Asia, the Middle East, Eastern Europe and the former Soviet Union. They differed substantially from earlier waves of immigrants in that they were educated and urban. After the 1965 change in the immigration laws, more immigrants started to arrive from Turkey, India, Pakistan and the Arab world. Most of these immigrants in the fourth wave chose the United States for economic reasons. The last twenty years has witnessed a large increase in Muslim immigration to America, particularly from India, Pakistan and South Asia. They constitute approximately 25% of Muslims in America (Kloehm, 1997). The 1970's and 1980's witnessed an increase in the number of Muslim immigrants to the United States. Most of these immigrants were Muslims from the middle and upper class. This has been considered by some Muslim scholars, as the "Muslim brain drain" (Roghanizad, 1990).

One of the first Muslim communities to settle in the United States were Muslims from Albania, in Bedford, Maine in 1915. This Albanian community built one of the earliest Mosques in the United States. In 1919, a Muslim community was established in Waterford Connecticut. In 1921 Muslims built a Mosque in Highland Park, Michigan (Roghanizad, 1990).

In 1932, the Nation of Islam was created, by Elijah Muhammad. Most of the Muslims around the world did not accept his version of Islam. He and his group were viewed by other Muslims as a cult (Roghanizad, 1990). Malcolm X and Warith Muhammad, Elijah Muhammad's son, deviated from Elijah Mohammed's teachings and adopted the mainstream Islamic principles.

Muslims in America Today

Islam is the fastest growing religion in the United States. In the Chicago area alone, Muslims number 350,000-400,000 people, second only to Christianity (Kloehm, 1997). They are just beginning to become distinct in the larger community. Muslims are registered voters, and there is a Muslim "think tank" in Skokie, IL that has published its second book. American Muslims do not have one voice. Nor do they have an umbrella of representation. There is a clear separation between African American Muslims and other Muslims. Unity among Muslim groups did not move beyond the token phase. There is a large number of African-American converts to Islam, but according to Aminah McCloud, a Muslim scholar from DePaul University in Chicago, they are Sunni Muslims and they might feel like they have more in common with Rev. Louis Farrakhan than with immigrant Muslims (Kloehm, 1997). The reason is that African-American converts come from a working class and poor community, while many Muslim immigrants come from well to do families to attend college or graduate school, and tend to be mostly professionals (Kloehm, 1997).

Now Muslims number between six and eight million in the United States. Most of them are well settled and better educated (Roghanizad, 1990). Muslims in the 1990's for the first time are able to exert political, cultural and religious influence on American society. Muslims in the United States have developed a new style of worship. They are also developing new interpretations of Islam. Muslims in the 1990's do not view themselves as outsiders (Marquand, 1/22/96). Nevertheless they are going through a process of assimilation, similar to the process that Catholics in this country went through in the middle of the 19th century, as well as Jews in the early twentieth century. American Muslims' goals are no different than any other previous religious group in this country. They are trying to assimilate and in the meantime remain distinct. For example, one of the changes in worship that indicate assimilation among Muslims in America is that the Imam, or prayer leader, is assuming a role similar to that of the minister in a Christian church (Marquand, 1/22/96). This does not occur in Islamic culture. Also, Muslim children go to summer camps, and there are spiritual retreats for adults. These practices are unique to American Muslims and are not

1598
practiced in Islamic countries.

Muslims in America are considered conservatives. Most of them are considered middle class, as well. They are in almost every middle class occupation, small business owners and professionals in many fields. Immigrant Muslims earn higher wages than average. 51% of them have college degrees (Economist, 8/24/96). Most of these Muslims are not practicing Muslims; they are Muslims in name only. Estimates are that only 10-20% of American Muslims are practicing (Marquand, 1/22/96). That places the number between eight hundred thousand to one million Muslims. Most Muslims in the United States belong to the Sunni sect. There is a minority of Iranian Shiites. For the most part mosques, as well as Muslim schools in the United States, break down according to ethnic and racial lines. Muslims associate with their own ethnic group in America. For example, Pakistani Muslims rarely interact with Arab Muslims or Albanian Muslims. Each group clusters independently from the other groups. In the case of African American Muslims, particularly, there is very little integration. One of the issues that all Muslims in America agree about is that they feel that their religion in the United States is misunderstood and demonized. They feel that they have been targeted by the media and by Washington.

The 1990's have witnessed an awakening in the practicing of the faith among American Muslims. Recently, an increasing number of Muslims in America are returning to Islamic roots because they feel that there is a cultural anarchy in the United States. Within the American context which allows free inquiry and dissent, practical issues of interpretations are brought to the forefront. For example, Muslim women in America are searching the Qu'ran in their attempt to bring in the American experience of civil rights, which challenges the traditional Muslim patriarchy. Human rights and individual freedom are stressed in American society. In contrast, in an Islamic society, responsibility of the individual is to conform to the society's cultural value (Muhammad, 1992).

According to Haddad, the forces of assimilation in America are very powerful (Marquand, 1/22/96). The visible Muslim communities exist mainly for the support of new immigrants. The factors that will determine the formation of the Muslims identity in the United States for the future is the quality of internal discussion and the reinterpretation of Islam that will be allowed in the Muslim community, namely the spiritual rebirth, institution building, and the role of the black Muslims. Muslim's children in America for instance, ask questions about sex that could not be asked in Muslim countries (Marquand, 1/22/96).

One of the major issues that face Muslims in the 1990's in the United States is that they see their lives through the American dream and yet feel the necessity of maintaining their Islamic character and practice (Marquand, 1/22/96). These two desires are not always compatible. Issues such as marriage, raising children and gender relations can create a special demand for Muslims in America. Many Muslims feel that they are living in a melting pot but in the meantime they do not want to lose their identity. Issues such as marrying non-Muslims can be considered to be a threat to the continuation of this identity. American Muslims emphasize the Islamic ideas of family. Some feel that living in America constitutes a threat to the continuation of the Islamic family (Marquand, 1/29/96). They feel that the signs are there: Muslim families in America are witnessing increasing divorce rates, marriage outside of the faith, ignoring of Islamic principles, generational anger and sibling strife. "Their problems range from teenage hell-raising, to serious charges of adultery, incest and spousal abuse, as with any other group within American society" (Marquand, 1/29/96).

In spite of the increase of the number of Muslims in the 1990's and the religious awakening that the Muslim community is witnessing, essential Islamic principles are being questioned such as the role of women at home as well as in the community, the issue of wearing the hijab, and others concerning interest and credit. Many Muslim men in the United States still prefer women who are able to assume the traditional role of the Muslim woman, those who are obedient and who have not adopted western attitudes (Marquand, 1/29/96). Many of them go back to their original country to get married. The issue of the relationship between Muslim men and women in the United States creates disagreement and tensions. Traditionally, Islamic women do not have to work and they should be provided for. Complete authority is in the hands of the husband. These views are a source of tension in America. Muslim men feel that their position of authority in the family is being challenged. Muslim women in the United States are more involved in the economic life and in the family decisions. They are participants in the mosques and in the community organizations. For example, Sunday schools are usually administered by women (Marquand, 1/29/96). Muslim women in America feel that they have achieved better status, more than in Islamic countries. Further, they are more aware of their rights and their duties. They are currently dealing with issues such as work and housing discrimination, discrimination in schools and the issue of fear for their own safety (Marquand 2/5/96). American diversity is described as a "cultural Mecca" for Muslims. It is having Muslims rethink their faith. Primarily because of the openness of the American culture, American Muslims want a rediscovery of Islamic values, which can deal with real problems (Marquand, 2/12/96). Some American converts to Islam are questioning some of the practices of Orthodox Islam, such as raising issues of women's prayer readers. American Muslims "have a free and highly individual interpretation of Islam" (Marquand, 2/12/96). This is influenced primarily by the American context. A small number of Muslims in the United States who tend to be younger or educated professionals want a contemporary Islam. They want to rid their faith
from "cultural intolerance imported from the Middle East" (Marquand, 2/12/96). They want some of the contemporary issues to be addressed, such as women covering their heads or paying or earning interests. They want modern ideas, human rights, and issues of democracy in Islam to be addressed. Further, they want Islam to deal with their daily practices in the United States and the practical issues that they face in their lives. In Islam, charging interest is forbidden. Muslim financial cooperatives started to form in the United States allowing for the purchases of homes and cars without interest. But most Muslim progressives argue that it is not un-Islamic to develop *ijihad*, reasoning, that god wants Muslims to be safe and secure in their home. Therefore, interest becomes a secondary concern, indicating that Islam is being shaped by the American culture.

Religiously, Muslims who favor reinterpretation see a universal Islam where humanistic values of the Qu’ran are emphasized. Others believe that American ideas are Islamic because in their opinion Islam incorporates ideas of science, law and democracy. One of the Muslim scholars, Taha Jaber al-Alawani said “the United States constitution is Islamic. What the founding fathers teach is what we teach.” A number of American Muslims believe that the exposure to the American context and their knowledge of modern sciences affects the American Muslims interpretations of the Qu’ran. Some of them would like to see Islam as a means and not as an end (Omran, 1997). American Muslims who want change are not in a position of power or control over any Muslim organization in the United States. 20-30% of American Muslims are devout, most of these being traditional orthodox Muslims. The Fiqh council is a body of religious scholars that rules on problems and issues arising from Islamic practices in the United States. According to one of the members of this council, Jusef Deloranzo, half of the American Muslims are modernizing. Muslims who favor reinterpretation find it very difficult to speak in local Mosques where orthodox Muslims are dominant. However, among Orthodox Muslims, there are differences, some Muslims, for instance, believe that there is a fixed set of laws and others do not believe in this. At this point in time it is difficult to predict whether newer interpretations of Islam will take hold. Now, Orthodox Muslims are very powerful. For these everything that they do in their life is based upon Islam and they view it as an end for a reward in the after life. One Muslim said, “This life is a one time thing, you either go to heaven or you go to hell. You get one chance. Everything I do is based on that.” Everything that a Muslim does is for the sake of God. Clifford Geertz said “for every Muslim regards his religious commitment which is based on the shari’ah as the axis of his existence, his faith is what he lives for and quite willingly dies for” (Muhammad, 1992, p.32).

Not all American Muslims come from Arab origins. 25% of Muslims in America are African Americans. By the end of the 1990's, Muslims might outnumber Presbyterians (El-Badry, 1994). Muslims’ lives in America, like any other ethnic group, focus primarily on work, school, family and the pursuit of happiness. Muslims in America are divided by language, their level of religiosity, and cultural gap that exists between those who have assimilated and the new immigrants. An increasing number of organizations, publications, social clubs and schools are emerging as a reflection of the increasing numbers of Muslims. There are over twelve-hundred mosques in the United States. Eighty percent of them have been constructed in the last fifteen years (El-Badry, 1994).

There are two types of Muslims in America: those who follow the teachings of the Nation of Islam and those who follow mainstream Islam. Most Muslims in America tend to be conservative about social issues and support religious education and close knit family units (El-Badry, 1994). Muslims in America at times have difficulty reconciling their practices in a non-Islamic culture. Some of the issues that create conflicts between generations of Muslims in America are sexual permissiveness, alcohol, and lack of respect for elders. Ivonne Haddad, however, has argued that freedom of expression in America is allowing Muslims to practice their religion in the true sense (El-Badry, 1994).

The Islamic culture in the United States is a blend of Muslim and American institutions and the biggest challenge for Muslims in the United States now is the "image problem". American Muslims are reexamining their faith. They are highly diverse, where 25% come from South Asian descent, 12% are Arabs and approximately 42% are converts, mostly African Americans (Power, 1998). American Muslims are going back to the basic texts of Islam, and they are realizing that Islam is based on tolerance, social justice, and human rights. Muslims in America would like to send their version of Islam all over the world and want to influence debate on a variety of issues such as gender politics, free trade, etc. In the United States, Muslim women are very involved in the community, and they are on the Mosque boards of directors. Muslims in America in the 1990's are challenging convention, and that is playing a role in revitalizing Islam. Many questions are raised concerning the compatibility of Islam with Western style democracy or modern science or feminism. Muslims in America are standing between two cultures and they consider themselves in the position that enables them to modernize Islam and revitalize it (Power, 1998). Most Muslims in the United States believe that the multicultural nature of the United States makes it a very good place for them because of the guarantees of freedom of speech and religion. They believe it makes it easier than to live in a Muslim state. Some Muslims believe that the American Constitution describes the perfect Islamic State because it protects life, liberty and property. American Muslims are beginning to form some kind of political consciousness, and that is a sign of assimilation (Power, 1998). They are beginning to speak out and are beginning to be involved in American political institutions. Mosques
are educating their communities to be politically involved and assertive. They register voters and help Muslims to run for political offices.

Islamic Education in the United States

Education is vital to the maintenance of culture. Muslims are concerned about the role of education in the perpetuation of Islamic culture in the United States. Many Muslims see a conflict between the goals of public schooling and the goals, principals and cultural values of traditional Muslims. For example the Western interpretation of History and social studies and the highly competitive and materialistic school sub-culture. Also the school activities which centers around the Judeo-Christian standards. Muslims in America put forth an effort to establish full time alternative educational institutions (Ali, 1985). Muslims believe that all skills, knowledge and resources are important only enough to improve the community’s ability to serve God. The depth and the scope of Islamic educational principals might vary from one school to another. All of them should be based on the fundamental principals of Islam, contained in the Shari‘ah, Islamic law (Ali, 1985). Muslims try to adjust some of their Islamic values to Western cultural patterns in the name of coexistence. This is considered by some Muslims as the first steps towards assimilation (Ali, 1985). The orthodox Muslim community tries to encounter this process. And one of the ways to prevent assimilation is the establishment of full-time Islamic schools. Islamic schools are faced with a difficulty of following the rules of the Shari‘ah and in the meantime being flexible enough to adapt to the demand of new knowledge and social functions and to the continually evolving American ethos. The efforts to maintain and nurture Islamic values with the absence of models in a secular society have limited results (Ali, 1985). Schools provide cultural stability as well as academic knowledge for Muslim students. In an Islamic school, students obtain knowledge in science and technology as well as in traditional Islamic knowledge and practice. Muslim educators in the United States are in need of reliable scientific literature in order to support their commitment and skills. Whether education is considered a science or an art, education is a transfer of human values that influences human behavior (Khouj, 1988). Based on the fact that humans are fallible, science, which is a product of human nature should not be the ultimate source of truth. Education is objective and subjective measures. Both objective and subjective methods can be a source of knowledge and reaching the truth. But the ultimate source of knowledge according to Islam is the source that guides the previously mentioned two sources (Khouj, 1988). This source is external to human beings, and it comes from the creator, who according to Islam understands human nature better than human beings understand themselves (Khouj, 1988). The educational system in Islam deals with human beings from birth to death. It covers all aspects of their lives. Islam provides guidelines that directs Muslims search for knowledge and bring about the desired behavior. The guidance in Islamic educational system is derived primarily from the Qu’ran and from the hadiths, which are Mohammed’s traditions. The Qu’ran encourages Muslims to study and to seek knowledge. The hadith gives Muslims a practical explanation of the guidance in the Qu’ran. The prophet’s practices reinforce certain behavior (Khouj, 1988). The third source where Islamic education gets its guidance is the intellectual efforts of Muslims. These intellectuals deal with issues that have no clear or definite resolution in the Qu’ran or the hadith. “Ijtihad” can be one of two: “Quias”, anthology, or ijma, consensus. In a pluralistic society, Ijtihad is the Islamic contribution to education (Khouj, 1988).

Full time schools in America

Muslim parents are opting to send their children to Islamic schools as a solution to the problem of educating their children in a non-Islamic culture. Other Muslim parents are choosing to educate their children at home. The majority of Muslim children in this country remain in public schools, exposed to the American values (Mack, 1996). Many Muslim parents say that it is in conflict with the values of Islam. Private Islamic Schools supplement a local district curriculum with Arabic lessons and Islamic Studies. All other classes are taught in the lens of Islam. Some Muslims choose to home school their children. They become members of the National Coalition of Muslim’s Home Schoolers. This coalition has approximately 300 members (Mack, 1996). They school their children at home, depending primarily on textbook publishers and small Islamic publishing companies.

Across the United States, Islamic schools offer religion and Arabic classes as well as a standard academic curriculum. The educational structure of these schools advocates prayer, discipline and American style of teaching. (Sachs, New York Times, 11-10-98) These schools have an appeal for Muslims regardless of their national origin and background. In these schools, Muslims start the day with a prayer and they demand their students to wear uniforms. The classrooms and the hallways of the schools are decorated by posters that have some Islamic sayings on them by the prophet Mohammed, pictures of Mosques, and ayahs from the Qu’ran. (Sachs, NYT, 11-10-98) Along side their regular classes, students must take classes in Islamic studies and Arabic language. The rules of these schools are very strict. Students in Muslim schools have to watch the way they talk, the way they walk, and they have to watch what comes out of their mouth. There is a formula of piety and penalty. Muslim students who transfer to these schools from public schools experience difficulties. 

Sister Clara Mohammed schools were the first to have full time academic course loads. Weekend schools and schools that teach only the Qu’ran are not sufficient nor prepared to offer Muslim students academic proficiency. Full-time Islamic schools in the United States serve a number of purposes. The influence and development of Islamic
education allows Muslim children to learn in an Islamic culture with an opportunity for Muslim children to have an Islamic education (Omran, 1997).

A new type of Muslim School has emerged that serves all Muslims regardless of their race, ethnic background or country of origin. The number of Muslim schools that exist in the United States is two hundred, according to the Council of Islam Schools in North America. This is an informal organization that sponsors workshops for Muslim educators. The number of Muslim students enrolled in Muslim schools has increased drastically in the last decade. The reasons expressed by parents are very similar. They view public schools to be permissive, crowded and rowdy. Many Muslim leaders view the increase of the number of Islamic schools as a result of the Islamic community trying to define itself as a cohesive religious minority in a secular American society. Islamic schools within the United States are faced with a challenge in that they want to create a spiritual educational experience for students that is relevant to their lives in America. It has been described by many Muslim educators in the United States as a process of trial, error and self-discovery. A number of schools use books from other countries such as Yemen, Egypt or Jordan. Other educators advocate the idea for American Muslim schools to write their own texts, realizing that American Muslim students are different from students in Muslim countries in that they are always questioning, they always ask why. One of the teachers said “You better be prepared to answer more than because it says so.” Islamic full-time schools in the United States have a widely diverse student body. Muslims students originate from any of the Muslim countries (Sachs, 1998).

Despite the large increase in the number of Muslim schools and the increase in the enrollment in these schools, most Muslim Americans do not send their children to Islamic full-time schools. There is no official count. Many Muslim educators predict further increases in the enrollment of Muslim students because many of the schools are beginning to reach the point of critical mass in which they could attract more students because they offer advanced grade levels and have a demonstrable academic track record. There are a large number of Muslims who are willing to pay for an alternative to public schools. Parents are responsible for the spiritual instruction of their children, and the whole Islamic community also is responsible to educate Muslim children in the path of Islam. It is an obligation on all Islamic communities in the world to provide assistance for any Muslim community who is incapable of providing Islamic education to their children (Dwyer-Schick, 1988). Most Islamic full-time schools in the United States rely on the donations from Muslim organizations and Muslim individuals. In addition to charging tuition to students, they plan a number of fundraising activities. Some schools initiate educational projects that could raise some funds on an educational basis. Other schools have endowment funds to ensure their financial well being. Muslim parents and other members of the Islamic community supply the school with volunteer assistance and supplies. Islamic full-time schools in the United States are considered a community wide effort. Local Islamic organizations at times provide subsidies to schools. Some schools were able to obtain loans from Islamic centers and at times use the Islamic center buildings. For example in Seattle, the Islamic school was housed first at the Islamic center before they moved to their current location. Islamic schools offer tuition reductions and scholarships for families with financial difficulties. Most scholarship funds are paid for by donations from the community. In most Islamic schools, tuition does not cover all the cost of operating the school (Dwyer-Schick, 1988).

Islamic schools depend on major publishers for their curriculum materials. Some schools depend on texts donated by Muslim countries through the government or through educational channels. Other schools use texts that are developed, published, and distributed by Muslims through educational organizations, publishers and bookstores in the United States and from around the world. Emphasis on full-time schools in the United States is placed on providing an Islamic atmosphere and education. Therefore Islam is not only part of the curriculum but the essence of the schools being.

Awakenings: Portraits of Nineteenth Century Women Writers Transgressing and Transcending the History of Education

Rita E. Guare
Fordham University

She was conscious of yearnings for a more earnest life than this. Unsatisfied longings for something which she had not attained, often clouded what, otherwise, would have been a bright day to her; and yet the cause of these feelings seemed to lie in a dim and misty region, which her eye could not penetrate.

What then did she need? To see some results from her life’s work? To know that a golden cord bound her life-threads together into unity of purpose - not withstanding they seemed, so often, single and broken?...

It seemed to her that there was some better way of living, which she, from deficiency in energy of character, or of principle, had failed to discover.

Elizabeth Stuart Phelps

A renewed interest in the literature of women of the nineteenth century and the early years of the twentieth century has led to the recovery of some moving stories of American life. These stories are filled with realistic descriptions of family, domestic conflicts, work, and schooling. The literary works of Lydia Sigourney, Rebecca Harding Davis, Elizabeth Stuart Phelps, Charlotte Perkins Gilman and Kate Chopin, to name a few representative writers, all point to awakenings of possibilities inherent in the depths of ordinary experience. Their realistic writing led to what some writers have called a "cult of domesticity" (Solomon, 1994). Although this cult served to reinforce the deadening and destructive stereotypes of a culture that determined the ways women would be reared, socialized, and educated, some women artists searched for spaces within this narrowly contrived world where they could transgress and transcend the limits of history.

Many of the writers during this period struggled with the question: "How could a woman be the gentle, loving, sacrificing, and spiritual being she was idealized to be in the home, in the church, and in the classroom, and, simultaneously, pursue her vocation to write?" Furthermore, "How could a woman become her personal best when she did not even possess what Virginia Woolf identified as essential, namely, a room of her own, that is, a place and the money to support her efforts?"

The purpose of this paper is to examine the lives and the education of women who answered these questions with their lives. Within the history of education, the explicit and implicit curriculum that reified the cult of true womanhood and that advanced a cult of domesticity, paradoxically provided possibilities for women writers who were "conscious of yearnings for a more earnest life."

To capture the secret longings and silent hopes of nineteenth century women writers, I attempt to make visible through portraiture the artistic strivings of women who yearned for more. Portraiture is a powerful way to witness to the lives of women who leaned into the depths of their ordinary experience only to discover the inescapable horizons of their work as literary artists. In selecting portraiture as the process of inquiry for this historical project, I am choosing a method to illuminate the lives of nineteenth century women writers by capturing "the richness, complexity, and dimensionality of their human experience in social and cultural contexts, conveying the perspectives of people who are negotiating those experiences (Lawrence-Lightfoot and Davis, 1997, p. 3). To do justice to their lives and to their work as literary artists, I am eager to combine in this research effort what portraiture requires, namely, "systematic, empirical descriptions with aesthetic expression, blending art and science, humanistic sensibilities and scientific rigor" (Lawrence-Lightfoot and Davis, 1997, p. 3).

This blending of richness and rigor is not new. Throughout the ages, we have heard echoes of this integration. Whenever scientists or artists have attempted to probe the mystery, complexity, and interdependence of Creation, they recognized that neither scientific law nor art could capture life in all its abundance. Only a large and spacious canvas has the capacity to hold the interplay of life in all its richness.

As a method of inquiry, portraiture is an intentionally generous and eclectic process that begins by searching for what is good and healthy and assumes that the expression of goodness will always be laced with imperfections (Lawrence-Lightfoot and Davis, 1997, p. 9). The oppression that women experienced in the nineteenth century can never be seen as a good thing. What I am pointing to in this essay and what I believe portraiture can illuminate is the beauty and goodness of women who struggled against confinement and who hungered for a larger kind of freedom.
In order to begin this work, I had to see myself as a portraitist who would be dialoguing with her subjects as they negotiated the boundaries of their worlds. I had to understand that I would be participating with each woman writer in drawing the image of her life. Finally, I had to discover that the portraits would not simply be reflections of nineteenth century women writers. Rather, I came to appreciate that I was involved in and with a process of making visible some essence unique to each woman and distinctive of me.

Lydia Howard Huntley (1791-1865) was one such woman who revealed something of her uniqueness by illuminating a life lived from an artistic and spiritual center. Her work as a writer supported that kind of living. However, typical of many men during the nineteenth century, Lydia's husband, Charles, absolutely opposed her work as a writer, and she was forced to stop writing. Only with his permission and because of his failing business, Lydia began to publish anonymously.

"The Intemperate" (1834) is one of Lydia Sigourney's moving stories in which she describes the experiences of Jane, the wife of an alcoholic. Not unlike Lydia's own life, Jane's "journey was slow and toilsome" (Sigourney, 1834, p. 72). Autumnal rains darkened her journey even more, and "she strove to hide even from her own heart" (Sigourney, 1834, p. 71) the visible change in the one to whom she had given her soul.

Her husband, James, grew inattentive to his business, and indifferent to his family and the fireside of their New England home. The more he drank the more his mind became bewildered and confused; the more intoxicated he was the more his behavior was mean and perverse. His long day's journey into the tyranny of alcoholism hardened his heart to the point of resenting those he once loved.

Yet, Jane remained faithful to a life marked with incredible suffering. Underlying the family's difficult move farther west was Jane's surrender of the New England village and the home she had loved since her childhood in search of a new dream that might renew her husband's life. In the midst of poverty and among neighbors who were more like family to her, she was tireless in her efforts to sustain a new life. Nevertheless, her husband's mood intensified; he grew more uncompromising and unkind. When that unkindness visited their very sick first born son, Jane intuitively knew that more than her son was dying in this Ohio wilderness. After her son's death, she "hid her face in that grief which none but mothers feel... a deep and sacred solitude" (Sigourney, 1834, p. 80.). She was alone in her season of sadness. During that year, she watched from her own seat of darkness how intemperance continued to possess her husband's soul with a rage to destroy whatever life was left. His inevitable accidental death almost claimed Jane's own life. Bitter grief consumed her health until she received a letter from her brother welcoming her back home. "With her little daughter, the sole remnant of her wrecked heart's wealth" (Sigourney, 1834, p.84), she returned home. There she created the new life she had always hoped for; yet, traces of a sacred and deep-rooted sorrow always filled her memory.

This portrait of Jane is not unlike the portrait of the artist herself. Lydia Sigourney illuminates the grace and complexity of one woman trying to live an artistic and spiritual life. Had either Jane or Lydia not lived in the shadow of Transcendence they may well have been destroyed by a culture too narrowly conceived. In sketching this portrait, the image of my own vulnerability appeared as visibly as Jane's endurance and Lydia's creative fidelity. I recognize in these women and in myself the strength of a surrender to "a more earnest life" and to "some better way of living". Such surrender transgresses and transcends the restrictive boundaries of societal norms and searches for more open territory that supports and sustains women's ways of being and knowing.

Economic, political, social, and moral changes during the nineteenth century convinced many men that the ideal of womanhood had to be preserved. The public ideal that a woman was most fulfilled as a wife and mother within the home and as a teacher of young children within the community proved to be both appealing and powerful. A woman was expected to remain what society had always wanted her to be: an obedient wife and a devoted mother within the home.

The home was seen as a safe and sacred place, a haven away from the harsh affairs of a man's world. In their traditional roles, women nurtured and sustained the soul of the home. Their daily habits of the heart contributed to this cult of domesticity. Within the drama of their idealized lives, some women- creative women who longed for more in their lives- found ways to develop their spirits. Rather than become a totally invisible person or become overly identified with the home, some women struggled to find space in their daily lives for becoming writers.

Of all the arts, writing was the one women found easiest to combine with the domestic duties expected of
them (Anderson and Zinsser, 1988). Often, women wrote secretly before breakfast or anonymously. Through writing women were able to claim ownership for their emotional lives and give voice to their moral authority. By writing for the public, and especially by writing critically about women's roles, women writers of the nineteenth century contradicted and challenged society's prescriptions for them.

Elizabeth Stuart Phelps (1815-1852) was one such writer whose struggle to balance her own dreams with the demands of womanhood is captured in this passage:

_She lived one of those rich and piteous lives such as only gifted women know; torn by the civil war of the dual nature which can be given to women only... Now she sits correcting proof-sheets, and now she is painting apostles for the baby's first bible lesson. Now she is writing her new book, and now she is dyeing things canary-yellow in the white-oak dye- for the professor's salary is small, and a crushing economy was in those days one of the conditions of faculty life on Andover Hill... Now she is a popular writer, incredulous of her first success, with her future flashing before her; and now she is a tired, tender mother crooning to a sick child, while the M.S. lies unprinted on the table, and the publishers are wishing their professor's wife were a free woman, childless and solitary, able to send copy as fast as it is wanted. The struggle killed her, but she fought until she fell (cited in Solomon, 1994, pp. 3-4)._  

No doubt whatever creative freedom Elizabeth Stuart Phelps achieved she paid a high price for it. Her success as a writer was contextualized by her family relationships and responsibilities. Within this zone of family living, with countless interruptions, setbacks, and slow downs, women often discovered their hidden literary talents and made pathways for pursuing their writing.

The tensions and conflicts of yet another woman who was a wife and mother as well as a creative artist were played out in the life of Rebecca Harding Davis. The acclaimed author of "Life in the Iron Mills" (1861), Davis developed the first piece of naturalistic fiction in this country. The story follows the life of Hugh Wolfe, a laborer in an iron mill. The author's graphic and realistic detail exposed an environment with "Smoke everywhere!" (Davis, 1861, p. 231) and lives with old dreams almost worn out. The characters are trapped in a world without hope. Davis captures the hopelessness in her empathetic descriptions of Deborah as Hugh watches her sleep:

_Miserable enough she looked, lying there on the ashes like a limp, dirty rag,—yet not an unfitting figure to crown the scene of hopeless discomfort and veiled crime: more fitting, if one looked deeper into the heart of things,—at her thwarted woman's form, her colorless life, her waking stupor that smothered pain and hunger... Deeper yet if one could look was there nothing worth reading in this wet, faded thing, half-covered with ashes? no story of a soul filled with groping passionate love, heroic unselfishness? of years of weary trying to please the one human being whom she loved... If anything like this was hidden... no one had ever taken the trouble to read it... (Davis, 1861, pp. 237-238)._  

After she married, Rebecca expected to continue her career as a writer. However, she was unable to develop the serious fiction which she began early in her career. Instead, she was forced to publish popular and quick selling fiction in order to supplement her husband's inadequate income. Like Deborah who lived in the smoke and grime of the iron mills, Rebecca, too, felt herself choking to death with no one to look "deeper into the heart of things,—at her thwarted woman's form, her colorless life, her waking stupor that smothered pain and hunger." Trapped in a world that failed to recognize her deeper talents as a writer, Rebecca felt the panic and anxiety of losing her way. After fourteen months of marriage, she suffered a nervous breakdown.

As part of her treatment, Rebecca's doctor recommended that she stop writing altogether. What he was incapable of seeing was that writing was at the center of what defined Rebecca as a talented and creative woman. In time, Rebecca emerged from this crucible of suffering a stronger literary artist. Writing provided the distinctive opportunity to heal and to restore her life.
In drawing the portrait of Deborah in the iron mill town, Rebecca Harding Davis emerged simultaneously on the canvass. Each stands as a broken woman. Their brokeness is a visible one and through it determined spirits make their way to "a more earnest life", to "some better way of living." Their lives have opened me to my own brokeness. And, I wonder "Is my brokeness a source of strength? Is brokeness a place where healing can open infinite possibilities for the human spirit?"

Rebecca Harding Davis was not the only woman writer who had to negotiate impossible boundaries and suffer in the process. Charlotte Perkins Gilman (1860-1935) experienced severe psychological distress during her first marriage. "The Yellow Wallpaper" is the story of a wife's emotional deterioration before the eyes of her unbelieving husband who was her doctor. The story is about

"...what can one do? If a physician of high standing, and one's own husband, assures friends and relatives there is really nothing the matter... what is one to do?

Throughout the story, we hear the confused thoughts of the wife as she desperately tried to journal her way back from the edge of madness. We watch her intense hatred for the yellow wallpaper almost consume her. Ignored and neglected by her husband, she seeks the only diversion open to her the pattern of the wallpaper, "a constant irritant to a normal mind" (Gilman, 1892, p. 489). She remarks "the color is hideous enough, and unreliable enough, and infuriating enough, but the pattern is torturing." (Gilman, 1892, p.489). As her mind deteriorates more and more each day, the yellow wallpaper claims every aspect of her being. Finally, in one brave act, she announces her victory "I've got out at last, in spite of you and Jane. And I've pulled off most of the paper, so you can't put me back." (Gilman, 1892 p.496) Then with Gilman's ironic twist, the character concludes:

Now why should that man have fainted? But he did and right across my path by the wall, so that I had to creep over him every time! (Gilman, 1892, p496).

Charlotte Perkins Gilman's portrait illuminates the life of a woman challenged since her childhood to find a life worth living. After Charlotte's father abandoned his wife and two children, their life dramatically changed. Charlotte's mother was reluctant to show her any affection, and, only at night when the child slept did the mother show her any signs of love (Solomon, 1994).

That emptiness characterizes Charlotte's portrait as her longing eyes search for meaning. During her first marriage, after the birth of her daughter, she suffered emotional illness. The cure required her to abandon her heart's desire as a writer and occupy herself in only domestic responsibilities. It took years, and eventually by ignoring her doctor's advice, Charlotte regained her spirit and her art. Her portrait shines with the light of one who walked through the darkness and despair of her life into new space. Her life's journey reminded me of the critical moments in my own life when light pierced the darkness and hope was restored.

Each of these 19th century woman writers struggled with the question of their personal, artistic and spiritual identity. Each woman worked against the deadening and destructive stereotypes of a culture that determined woman's ways of being in the world. Each stretched the cult of domesticity to include time and space for writing. The portraits of each of these nineteen century woman writers, opened me to confront the barriers that prevent my crossing over into more open territory where a larger freedom waits to be lived by those "conscious of yearnings for a more earnest life."

Hunting for Witches in the Halls of Academe: The Struggle for Academic Freedom at the University of South Florida, 1962-63

Karen L. Riley
Auburn University at Montgomery

During the early 1960s, in the formative years of Florida’s newest university, the University of South Florida in Tampa, the then Florida Investigative Committee in true McCarthy-era style, set up its “Star Chamber” interviews with students and “others” at local motels near the University. The purpose of these “interviews” was to ferret out information about university administrators and instructors which would point to either their innocence or guilt in terms of communist party membership, homosexuality, or the teaching of atheism. After an exhaustive process which left the intellectual community on Florida’s West Coast shaken and dismayed at what they collectively believed was a mis-guided mission and waste of taxpayer dollars, academic communities in other university towns throughout Florida responded with outrage over the intrusion of politicians and perceived anti-intellectuals into the “business” of higher education. Some had already run the investigative committee’s gauntlet, others likely feared they would follow. In what could have been the sudden demise of the infant university, its leaders and faculty emerged from the experience, not as victors, but rather as survivors of a bitter battle over academic freedom.

This chronicle of events is set within the context of McCarthy era politics. Florida, owing to its close proximity to Cuba, was perhaps more susceptible to ideological influences from the far right than other states whose borders are more distant. In addition, Florida lawmakers in the 1950s responded to these high-pitched voices and guardians of localism who called for tight controls of the schools, including curriculum decision making. So strong was this “grass-roots” that lawmakers and the public alike often had a difficult time distinguishing between the role of public schooling and higher education. As a result, some viewed the university as a place to dispense “appropriate” knowledge and not to engage in debate. Such was the case at the University of South Florida in its formative years when a handful of parents, some educators, and other locals of varying stature, sought to influence the role of the new institution out of differing “fears.” While hindsight informs us that these fears were both misguided and misplaced, one should not lose sight of the fact that the early 1960s represented a time of great uncertainty brought about by a decade of Red Scare politics.

This uncertainty in turn shaped the perspective of a lay public who had been taught to believe that the United States was in a near-death struggle in the “race for space,” and that everyone from Hollywood figures to classroom teachers might be potential communist infiltrators. The story unfolds within this context of spies and lies. However, this paper does not seek the often sterility of objectivity; rather, the writer wishes to place the reader in the midst of the historical drama. With less emphasis on objectivity, one can get a better sense of the extent to which the emotional-laden battle over academic freedom in the early years of the University of South Florida raged in the halls of academe at Florida’s youngest institution of higher education.

The story of this war of words and political intrigues is possible owing to the deep involvement of 25 year-old John Egerton, a campus employee in the University Relations Department. Edgerton collected newspaper articles, took notes at meetings, copied important press releases and in general found himself in the “cat-bird’s seat” during the protracted battle between the Florida Investigative Committee, headed by Charley Johns, a Florida “good-ole-boy-styled “politician, and local witch hunters, all of whom pitted themselves against the university and its supporters, most notably, The Tampa Tribune. After Edgerton left the University, he boxed up his papers, including a book-length manuscript in which he outlined the entire debacle, and donated them to the University for preservation in its archives. To open these archival boxes is to unleash a torrent of accusations, unsupported allegations, ill will, and in general, a sea of misery for those professors whose reputations were damaged and whose curricula were dissected. The image of Florida’s then youngest institution of higher education hung in the balance.

While much has already been written about the general state of education and the role of teachers during the early days of the Cold War, few studies, if any, document the struggle for academic freedom in higher education classrooms on such a personal or intimate level as the story of the curriculum wars on the campus of the University of South Florida. However, the national picture over the issue of academic freedom during the Cold War era provides a backdrop from which we can view the events of the early 1960s on the South Florida campus. For example, in one early study (Lazarsfeld and Thielens, 1957/58) researchers surveyed social science professors from a stratified sample of 900 accredited colleges applying a tool they developed called the “index of apprehension.” What the researchers
wanted to learn was the degree to which these professors felt comfortable presenting controversial ideas, especially when they concerned freedom of thought, including aspects of communism.

According to Lazarsfeld and Thielens (1957/58), more than three-quarters of the professors surveyed “consider[ed] a better society an urgent or quite important goal of their teaching.” The noblest of educational goals notwithstanding, this social education approach to university studies, particularly in Florida schools during the 1950s, met stiff resistance from a lay public already media shocked by the McCarthy hearings into believing that a communist infiltrator lurked behind every red-blooded American tree. Thus, as the new decade dawned, armies of American patriots rushed to shore up “the American way of life,” which they believed was in grave danger owing to the seductive force of Communism, a growing immorality in the American social fabric, and America’s drift toward atheism, examples of which could be found on those bastions of liberal thought called university campuses. No where was the battle more intense than in Florida and on the campus of its newest university.

Methodology: This paper is based on both the Edgerton papers, housed in the special collections department, at the University of South Florida and corroborating evidence from the State of Florida Archives in Tallahassee, Florida. The evidence includes more than 1000 papers from these two collections. The methodology will be based largely on document analysis; however, the researcher intends to interview John Edgerton and several faculty members who remain affiliated with the University of South Florida (USF) and vividly recall the tumultuous months under the sharp eye of the Florida Investigative Committee and Charley Johns. This paper serves to fill the growing body of research on the McCarthy era and its influence on education. It will cover the entire struggle of the university over the issue of academic freedom and the attempts of “well-meaning” citizens to control what is taught and in what way it is taught at the most sacred of investigative places—the university.

The struggle for academic freedom at the University of South Florida was observed through the eyes and ears of John Egerton, a young (25 years old) public relations officer employed in 1960 by the university’s Office of Information Services. Egerton’s inside position made it possible for him to play a direct role in documenting the assault on academic freedom at the USF campus. In his 1996 speech to an USF audience, Egerton recalled the entire struggle and that when he left after more than five years of service to the university, he felt “a bit like a war veteran, a battle-scared survivor of an intense and emotional conflict.” In fact, one could assert, that Egerton’s attempt to chronicle this battle over academic freedom and autonomy from public scrutiny in a 300 page-plus manuscript was a defining moment in his life and career. Accordingly, Egerton told this audience that he “felt it was historically important for there to be at least one eyewitness account from the scene.” The “scene” as he put it began in the spring of 1962 with an “uncoordinated but overlapping assault on the institution.” The major players, according to his observations, were Thomas J.B. Wenner, Jane Tarr Smith, George Wickstrom, Sumter L. Lowry, and Charley Johns.

Despite his view that the attack on the University of South Florida was an overlapping of efforts by unconnected individuals or groups disgruntled with the direction of the new university itself, newspaper clippings and personal letters suggest that the USF “affair” was inspired by an earlier event on the nearby campus of the long-established University of Tampa, and involved Sumpter Lowry, named by Egerton as an instigator of the USF probe which followed the U. of Tampa affair by only a few months. On June 16, 1961, the Palm Beach Times published an article about the firing of University of Tampa philosophy professor, Thomas P. Hardeman. According to the newspaper, Hardeman believed that his impending dismissal was a result of a letter writing campaign instigated by University of Tampa board member and leader of the Florida Coalition of Patriotic Societies, Sumptor Lawry, along with members of the John Birch society. His dismissal, he stated, was a result of his “outside activities,” which included repeated attacks on the Bircherites and other ultra patriotic groups, and perhaps his participation as minister at a local Unitarian church. Other newspapers during the summer and fall of 1961, joined the Palm Beach Times in pursuit of the truth behind Hardeman’s firing. One article a few months later carried an explanation for Hardeman’s dismissal offered by John Scheffer, secretary of the newly organized “Committee for Academic Freedom” in Tampa. According to Scheffer, University of Tampa president, Dr. David Delo gave the following reason for the dismissal: Hardeman’s “teaching was not up to standard.” Yet, as Scheffer quickly pointed out, not one administrator had visited Hardeman’s classroom. More curious than Delo’s claim that Hardeman’s teaching was not up to standard, was the fact that only two months prior to his firing, the university awarded Hardeman a salary increase.

The attacks on Hardeman mobilized Tampans. Letters to the editor of local newspapers decried the firing.
Citizens of Tampa responded by asking Delo for an explanation. Repeatedly, Delo responded in the papers by stating that the firing was an "internal matter," which had the support of an elected body of the professorate. One reader was moved to write how perplexed he was at Delo's paradoxical actions, which included a well-publicized statement by the President that he had told Hardeman to "keep his mouth shut," regarding the professor's attacks on the ultra right, while shortly before his warning, uttering words of praise for freedom of thought at a convocation address at the University of Tampa. In the President's convocation speech, of which Reader Hornbrook obtained a copy, Delo stated that "he welcomed non-conformity vs. the herd. He welcomed the independent thinkers, saying their arguments bedeck the pages of books and magazines alike, they trouble the schools, they become subjects of political debate. For he who would excel is still suspect, even though he will lead us to salvation...our future will depend on people who excel with their minds and personalities who are in a sense non-conformists." While groups such as the American Association of University Professors (AAUP) stated that professors should enjoy the same rights as any other citizen, no clear evidence of wrongdoing on the part of "citizen" Hardeman, which would support Delo's actions, was reported in the press. To the contrary, Hardeman appears to have been targeted for his personal views and not for his conduct in the classroom. Hence, the newspaper wars over Hardeman's dismissal, with questions of academic freedom hanging in the balance, set the stage for a larger contest on the campus of the University of South Florida some six months later. Fresh from the campus battleground at the University of Tampa, at least one combatant, retired Lt. General Sumpter Lowry, emerged to fight again.

In Egerton's recollections of the investigation at USF, he referred to Lowry as "a retired military officer, ultra-conservative politically, and formerly a candidate for governor of Florida." He described Lowry as one of Tampa Bay's best-known and most outspoken anti-communist and right-wing extremist who was alarmed by what he believed was rampant left-wing radicalism at the new university. According to Egerton, the colorful cast of characters involved in the Florida Investigative Committee's (FIC) probe at USF aside from Lowry, included, Thomas Wenner, a lecturer in "The American Idea," a core undergraduate course, Jane Tarr Smith, mother of a first-year student, George Wickstrom, editor of a Zephyrhills newspaper, and Charley Johns, a state Senator from Starke, Florida and member of Florida's "Pork Chop Gang," an informal association of "good ole boy types." In Egerton's 1996 speech on the campus of USF, he linked Lowry and three others with Charley Johns, head of the Florida Investigative Committee, all of whom became involved in the investigations on the campus of USF following allegations by one of them, disgruntled professor, Thomas Wenner, who, in April 1962, reported to the committee that the university was soft on communism.

According to a statement in the Tampa Tribune, May 22, 1962, by USF President, John Allen, Wenner touched off Florida Investigative Committee's investigation into homosexuality, godlessness, and communist activity on the campus based on "unfounded and irresponsible charges." Governor Farris Bryant and Allen in separate actions promptly suspended Wenner. Allen then asked the Board of Control, the governing body of Florida's university system, to dismiss Wenner. Allen's swift actions may have stemmed from the nature of the investigation as well as Wenner's accusations. The Johns Committee, it seems, had been operating out of a local motel for more than a month, taking secret testimony from parents and students. The committee's investigation began in April 1962 more than a month before Allen was aware of its presence. According to one newspaper account, he did not learn about the investigation until May 15, 1962. Allen's fury regarding the investigation and its clandestine nature led the Tampa Tribune to print his version of events along with a strong denial of wrongdoing by Wenner. For Wenner's part, he admitted to the Tribune, that he had been giving secret testimony to the Johns Committee since the middle of April, yet denied that it was his actions that launched the investigation in the first place. Curiously, he told the Tribune that USF was "soft on communism," and as evidence cited the cancellation of his summer workshop on Americanism vs. Communism for public school teachers.

Wenner, however, was not the only "informant," fundamental to the FIC's case against USF, to deny his role as an instigator in the probe. Lowry in a statement to the Tampa Tribune in May, 1962, disavowed any link to the investigation—one will recall that he was earlier accused by Hardeman in the U. of Tampa affair which he vehemently denied as well. He claimed the following: "I had nothing to do directly or indirectly with the investigation. I know nothing whatsoever about the charges that have been brought." He went on to charge State Senator Samuel Gibbons, had knowledge of the malicious rumor that he, Lowry, was responsible for the investigation, a rumor Lowry claims
Gibbons knew was false. He cited Gibbons for failing to tell the public about his, Gibbons, own part in the spurious allegations against USF. According to Lowry, it was Gibbons who personally made an appointment with USF President, John Allen, for a parents’ group who had collected evidence against faculty and their teachings. The paper trail—newspapers, letters, memos, and others—is not easy to follow. Accusations were made and denied. Accusers pointed fingers while defenders scurried for armor. The press had a heyday.

The young public relations officer, Egerton, proposed a scenario surrounding the web of intrigue that goes something like this: Senator Johns since the creation of his committee in 1956 was ever diligent in searching for evidence of communism and immorality. Some might say his diligence was a sort of “job insurance,” not unlike the precedent set in the 1940s by J.Edgar Hoover’s hunt for Japanese and German subversives, or McCarthy’s nation-wide hunt for “commies” a decade later. Hence, Johns was poised for “battle” when approached by Wenner and Wickstrom, the Zephyrhills editor, who united in opposition to a proposed visiting speaker who allegedly had been labeled a subversive by the U.S. Attorney General. They were joined in their zeal by Jane Tarr Smith whose son attended USF and regularly complained about the immoral and atheistic teachings of his instructors. General Lowry, says Egerton, encouraged Mrs. Smith to notify the Johns committee. Meantime, Wenner leaked news of the investigation to the St. Petersburg Times in the hopes of receiving credit for exposing his university as a ‘campus of evil.’

Whether Wenner blew the whistle to Johns committee first, or Mrs. Jane Tarr Smith along with Ret. Lt General Lowry were the first to inform the committee of the evils on the campus of the University of South Florida, accusations were hurled at several faculty members. However, English professor, Dr. Sheldon Grebstein, bore the brunt of the Johns committee’s enthusiastic hunt. The committee accused the 34-year-old Grebstein, a new assistant professor, of using “salacious material in his class,” which led to his suspension by USF President Allen. At the heart of the charges against Grebstein was his selection of an essay which exposed the baseness and emptiness of “beatnick” literature. The essay in question was contained in a textbook not in use at USF, but used at more than 100 other colleges and universities, including Louisiana State, Duke, and the University of Virginia. Despite the good intentions of the Tampa Tribune’s editor in putting the question of Grebstein’s solid teaching record at the University of Kentucky before the public while positing the thought that “imaginative teachers will depart at the first opportunity; top professors in other institutions will shun Florida as the plague; and the remaining faculty members will be so careful to toe the line of the conventional and non-controversial that freedom of inquiry will steadily shrink,” he weakened his argument by suggesting that perhaps Grebstein used poor judgement in not omitting the repugnant quotations.

The beleaguered Grebstein came to his position at the University of South Florida with enviable credentials. He received his B.A. degree from the University of Southern California where he graduated cum laude. He went on to Columbia where he took an M.A. with distinction, and graduate from Michigan State with his Ph.D. As a new professor, he had published seven articles, one textbook, one scholarly book, several essays, two scholarly reviews and 125 newspaper reviews. The essay he chose for his English course which had come under heavy attack by a handful of parents was entitled “The Know-Nothing Bohemians,” by Norman Podhoretz, editor of the intellectual journal, Commentary. According to Grebstein, “Bohemians,” struck him as one of the clearest, most vigorous, most forceful pieces of its kind. The essay begins as a book review of two of Jack Kerouac’s novels, but it quickly turns into an indictment of the “Beat Generation,” with its low moral tone and emphasis on sex. Grebstein wanted his students to engage in works which contained in depth critical writing. He also took them through the rigors of writing in “normal” English, old fashioned rhetoric, and in a style that an ignorant writer would use. He said that he chose the article in question “because it seemed to illustrate everything we were doing: It was a fine example of mixed language levels, with the author’s skillful style contrasted to the poor work of those he was attacking; it was an excellent illustration of how effectively connotative language could be employed, and it was a typical review of the kind which appears in some of the most respected magazines.” Grebstein was quick to point out that the article was
not suitable for children, but that he did not regard university students as children nor himself a teacher of children, but rather a member of an adult intellectual community.

His measured and logical explanation stands in stark contrast to the actions taken by the few complaining parents, the fired lecturer, Tom Wenner, Wickstrom, an ultra-right journalist from a hamlet on the outskirts of Tampa, and Lowry, the retired Lt. General who was equally accused along with Wenner of launching the investigation in the first place—actions which included clandestine meetings and informal inquiries, all of which led to unfounded accusations. Grebstein mused that “A state builds a beautiful institution at a cost of millions of dollars, and then sits back and permits the viciousness of some people to destroy it as surely as though they had planted bombs beside its foundations.”

He also held the belief that the objections to his choice of the Podhoretz article overstepped the bounds of common decency.

Grebstein, however, was not the only faculty member at USF to come under attack. Dramatics professor John Caldwell was suspended, in part, for not reporting a homosexual advance made by an individual to a student. He subsequently produced a witness who supported his claims that he did indeed report the advance. Caldwell was reinstated by President Allen which sparked a “stinging denunciation of the university’s President by Charley Johns. Johns’ actions prompted Caldwell to resign citing “These police state methods have made me and my colleagues almost physically ill and I can’t tell you the contempt I feel as a result...I find I can’t work in a system where such reckless pursuit of a teacher can take place. Since I am unwilling to suffer such vilification and slander from a source immune from prosecution, I have no choice except to resign from the field of higher education in the State of Florida.”

He concluded his resignation by saying, ‘Florida’s state universities can’t hope to attain greatness under the withering scrutiny of reckless investigations, for no teacher of stature will be willing to subject himself to such irresponsible attack.’

Professors, however, were not the only targets of the Johns Committee.

Dean Russel Cooper had invited Dr. Jerome Davis, the son of a missionary in China and former professor at the Yale Divinity School to speak to his Sophomore class in “The American Idea.” According to the Daytona Beach Morning Journal, a professor (Wenner) from Zephyrhills—a small community on the outskirts of Tampa—along with an ultra-right small country newspaper editor (Wickstrom) objected to Davis’ talk on the grounds that he was allegedly a communist. Dean Cooper vigorously defended his choice of Davis by stating that the Western position had well been discussed, but that no staff member could adequately present a critical look at American institutions.

However, Davis, author of the book Capitalism and Its Culture, already the victor of a libel suit against the Saturday Evening Post, possessed the depth of knowledge on the subject of communism which Cooper believed would help his students evaluate the merits and fallacies of both systems, an endeavor he likely believed was an aim of a university education. The attack upon Davis by Professor Wenner and Wickstrom was only one way in which these two communist hunters sought to influence matters at the University of South Florida.

In a ten-series probe into the investigations at USF by the Daytona Beach Morning Journal, editor Mabel Chesley uncovered what can only be called “unsavory background information.” Seems as though Wenner had summoned a USF female student to his home for what he called ‘an evening.’ Once there, she discovered other students entering and leaving a room one by one. She described her classmates as leaving the room with shocked expressions on their faces, or some with “smug expressions.” When it was her turn, she quickly discovered that she had been invited to a small inquisition in which she was to “tell tales on her professors.” Inquirers posed such questions as “Did she think that any of her professor had any ‘Communist ideas?’ Had she ever noted anything that was ‘queer’ in their behavior?” And, were teaching materials chosen by any of her professors ‘lewd?’ She left sickened.

This informal inquisition was replaced a few weeks later by the formal Johns Committee investigation whose members summoned “students [who] were taken to motel rooms in Tampa and queried about their professors and their curriculum, and heavens knows what else.”

Further evidence of unsavory conduct by the Johns Committee was reported by the Pittsburgh Courier in its May, 1963 issue. Newspaper writers for the paper exposed a sex entrapment scheme organized by former Tallahassee policeman R.J. Strickland and chief investigator for Charley Johns. Strickland it seems hired a night club singer to invite an Orlando Sentinel reporter assigned to cover events in Tallahassee to her room. When he walked into the room, the singer-turned-informant, as he recalled, ‘was wearing a robe open at the waist. I went in, and she turned out the lights.’ ‘I was sitting on the edge of the bed when everything happened at once.’ The reporter described how
the women pushed his head down at the same time a flash bulb went off followed by shouts of "I caught you at last." According to the Courier, "the motel room had been reserved by Strickland, who was in on the kill, also. Good ole Johns Committee, strictly on the job. No telling where Florida would be without it." The irony of the Johns Committee hunting for examples of immorality in the halls of academe cannot be missed, yet where did the commission get the idea in the first place that USF was a hot-bed of immorality?

Perhaps a look at the actions of Jane Tarr Smith, mother of a USF student and early whistle blower, can shed light on this aspect of the investigation. Mrs. Smith, who usually signed her letters Mrs. Stockton Smith, wrote a lengthy explanation of the whole affair. Her 30 page, plus letter arrived on Egerton’s desk in June 1962, shortly after news of the USF probe hit the stands, although by her own admission she had placed the letter on file with the State Investigating Committee in the latter part of April, 1962. According to her account, her son “Skipper,” an outstanding former student at Washington and Lee University, now attending the new University of South Florida in his hometown, commented to his mother that “he felt that higher education should encourage good morals, faith, and patriotism, but that everything he had studied would tend to destroy these things.” Smith was quick to observe that these accusations should be taken seriously as they came from her son, who was “a well rounded student, having a background of varsity football in high school and college, [and] being voted the most popular male student in his graduating class of 500, and receiving the Danforth award for leadership, one of the two awards given in the graduating class.” She launched into her rationale for intervening in what she believed to be a “bad situation” on the campus. However, she failed to present a line of reasoning that one could easily follow. Her words and analogies seemed more appropriate as testimony for a revival meeting than as a serious outline of events. She claimed the following: “The student is admonished to cast aside all previous beliefs and convictions, and through required reading material, and classroom discussion, by the vile approach to sex, destruction of faith in God, and extolling of ideas that are of socialist and communist origin, he would no longer have a choice in a way of life. His indoctrination in the teachings at the university would be complete, whatever they might be.”

Smith took her objections to Deans French and Cooper and three other faculty members. The mother of another student joined her in this endeavor. After presenting their case regarding vulgar readings and exposure to communist ideology, the academicians accused them of witch hunting and promptly dismissed them. Smith, however, was not finished. According to her own chronology of events which were guarded and somewhat sketchy, she continued to make contact with other parents and began to formulate a plan to bring a number of issues regarding the curriculum at USF before President Allen. Sometime in the spring of 1962, she and her husband, along with two other couples, sent letters to some 50 other couples in Tampa who she described as “responsible citizens, interested in the affairs of our community.” Smith’s “Dear Friends” letter spoke of communist front activities on campus in addition to “the daily problem of extreme, liberal, atheistic teaching by those who feel they have a monopoly on the cry for ‘academic freedom.’” She invited representatives from two area newspapers, but they declined. Mayor Julian Lane, however, volunteered to speak for the group. Apparently he contacted Charley Johns on their behalf, along with Harrison, chairman of the State Board of Control. They were advised to present their evidence to Allen, but did not do so because as Smith put it, “they had already been caught up in the investigation through efforts outside their own.” Now Smith could cast her name in the I-am-not-responsible-for-the-investigation-ring along with those of Lowry and Wenner.

Smith took particular aim at instructional strategies and curriculum choice. Accordingly, she looked over the first semester English program and noticed that the bulk of material was on evolution, which she claimed was taught more as fact than theory. While she did not mention English professor Grebstein by name, much of his work, including a book, was on the Scopes Monkey Trial, a perfect irony. In any event, Smith cast her net wide and hauled in material such as Patterns of Culture, preface by anthropologist Margaret Mead, which she described as a book that dealt with the sex life of the African tribes. The author of Patterns of Culture, according to Smith, claimed that “there is no right or wrong behavior that it is whatever the culture or civilization determines it to be at the time—that homosexuality is determined right or wrong in the same manner; that, in some cases it is a sign of greatness or special talent.” As for Mead, Smith interpreted the message in her book, Sex and Temperament in Three Primitive Societies (1935), a required text in USF’s Human Behavior course, as simply a matter of making a behavior legal in order to make it OK, such as murder. She went on to describe Aldous Huxley’s, Brave New World, as “a waste of time,”
and that it was “stupid and boring as well as immoral, but still required.”

Perhaps most frightening of all Smith’s remarks is her own admission that “What little I know about Communism, I have learned just recently.” Yet, Smith clearly viewed herself as an authority on what should be considered good and proper for the rest of us, including views on communism. She said about her role in bringing the issues of communism, immorality, and atheism forward that “[h]er interest in all this is motivated by a desire to preserve that which I have found good, so that others may have a choice of belief and way of life. If they do not so choose [to follow her lead], that is their concern. They will have had an opportunity. I am interested in preserving Christianity, and in so doing preserve democracy, for Christianity is the author of individual rights, as God is the Father of liberty.” Throughout Smith’s often rambling letter, she offered quotes from speeches or writings made by J. Edgar Hoover in support of her ideas and actions. For example, in support of her criticism of academic freedom, she quoted Hoover in the following dependent clause as saying “I do fear so long as school boards and parents tolerate conditions whereby Communists and fellow-travelers under the guise of academic freedom can teach our youth a way of life that eventually will destroy the sanctity of the home, that undermines faith in God, that causes them to scorn respect for constituted authority, and sabotage our revered Constitution.”

The tragedy of this soap-opera is that it was real. Tom Wenner really did turn on his university and colleagues based on perceptions that USF was a hot-bed of communism; Lt. Gen. (RET) Lowry really did participate in both the University of Tampa debacle and the probe at the University of South Florida; Jane Tarr Smith really did “put her oar in the water” based on suppositions from her son Skipper who “chose” to come home to Tampa and attend the new university rather than remain at Washington and Lee; and, Senator Charley Johns really was the head of the Florida Investigative Committee which “terrorized” university campuses throughout the state of Florida for a decade. Despite the dark days of Florida’s witch hunts, a few actors on the historical stage emerged with integrity somewhat intact. Certainly, press organs of the 1960s which carried stories to inform the public about the travails on Florida campuses, and support the idea of academic freedom on college campuses, did so despite the prevailing conservative climate. Professors whose curriculum and teaching methods came under attack, such as Sheldon Grebstein’s, who later assumed the Presidency of New York State at Purchase, went on to distinguish themselves at other institutions. And even the young John Egerton, who created our “looking glass,” is today recognized as one of the leading writers on the South. Yet, the purpose of this paper is not to show that “every cloud has a silver lining,” but rather to examine the historical stage and its actors regarding Florida’s “porkchop” politics, conservative public, and the struggle of one university to not only survive but to support and encourage its faculty and students in the pursuit of investigation, and freedom of thought in a South that Will Rogers once described as “staggering to the polls to vote for Prohibition.”

J. Wesley Null
The University of Texas at Austin

Historical investigations into American education often reveal the efficacy, or inefficacy, of attempts to improve the education of youth. Studies that attempt to uncover past reform proposals often reflect back to the first half of the 20th century. To understand the complexity of the ideas of this period, any such study should take psychology into account. Since no degrees in education, curriculum, or educational psychology existed at the turn of the century, many individuals who hoped to improve American education completed graduate preparation in psychology. American psychologists at the turn of the century, however, were only beginning to break away from the philosophical traditions from which psychology arose. In making this break, they began to concentrate on scientific, experimental based investigations (Marx and Hillix 1963, 113-152; Boring 1950, 550-583). For at least the first fifteen years of his career, William C. Bagley considered himself a psychologist who was attempting to improve the education of youth through the application of scientific principles to teaching and learning.

As one of Bagley’s most significant professors, Cornell psychologist Edward Bradford Titchener attempted to explain the structure of the adult, human consciousness through the individual process of introspection. Titchener’s psychology, known as structuralism, grew out of his reverence for and close alliance with Germany’s Wilhelm Wundt. To conduct studies, the process of introspection required highly-trained, mentally disciplined “observers,” or subjects. Importantly, neither Titchener nor his students at Cornell conducted studies that related specifically to students, child study, individual differences, animal psychology, or abnormal psychology (Roback 1952, 180-191; Flugel 1933, 176-190).

In opposition to Titchener’s philosophically related structuralism, another approach to psychology began to capture the interest of American psychologists. Known as functionalism, this very different outlook for psychology worked toward its application to contemporary social issues in general and education in particular. Psychologists such as G. Stanley Hall, John Dewey, and James Rowland Angell eagerly advanced this new movement. By the early 1900s, functionalist psychology began to secure the more dominant role in the field (Dewey 1902; Hall 1903; Turner 1967). Without question, the zeitgeist enabled Hall and the other functionalists to influence many psychology graduate students and contribute to the growth of functionalist-related studies (Schultz and Schultz 1996, 119-120).

During his graduate work at the University of Chicago, the University of Wisconsin-Madison, and eventually Cornell, William C. Bagley’s professors introduced him to both of these approaches to psychological investigation. In Madison, Bagley studied with psychologist Joseph Jastrow. In the developing functionalist tradition, Jastrow had worked as a student, in the 1880s, with G. Stanley Hall and John Dewey at Johns Hopkins. As one of Jastrow’s Master’s degree students in Madison, Bagley became introduced to the practical, functionalist approach. He completed his Master’s thesis, entitled “A Study in the Correlation of Mental and Motor Ability in School Children,” in May of 1898.

Interestingly, Bagley then traveled to Ithaca, New York, to work toward a Ph.D. under the nationally famous E. B. Titchener. Titchener’s disagreement with the functionalist approach did not allow Bagley to continue his studies along this line. During Bagley’s four years at Cornell, as evidenced by his dissertation, he was immersed in Titchener’s structuralist psychology (Bagley 1900). To be sure, Titchener’s views on the relationship between psychology and education impacted Bagley’s thinking for the rest of his career. Titchener’s basic position that structuralist psychology was essential and that functionalism was secondary, if not superfluous, was replayed by Bagley, consciously or not, throughout his career. Although the arena was education and not psychology, the basic positions of Titchener in 1900 and Bagley in the 1930s, which both assumed an “essential” role, were strikingly similar (Marx and Hillix 1963, 113-138; Roback 1952, 189-191; Titchener 1898; Bagley 1938).

In the spring of 1900, Bagley completed his Ph.D. under Titchener. Following the completion of his degree and unable to locate employment in the “public school service,” Bagley continued to work in Titchener’s laboratory, through the spring of 1901, as a laboratory assistant (Johanningmeier 1969, 8; Kandel 1961, 7-8). After his one year as Titchener’s assistant, Bagley accepted an elementary principal position at Maramee Elementary School in the St. Louis public schools—a school system spearheaded by William Torrey Harris two decades prior to Bagley’s arrival. After this one short year in St. Louis, Bagley, his wife, and their three-month-old daughter, traveled over 2000 miles west to the western Montana mining town of Dillon.
Five years prior, in 1897, Montana legislators chose Dillon for the state’s first teacher training institution. Founded as a land grant school whose sole purpose was the preparation of teachers for the entire state, Montana State Normal School (MSNS) quickly became the pride of this tiny, mountain-nestled community. The city directory aptly described the inhabitants’ elegant view of their quintessential western frontier town:

Dillon is a city of 2,600 inhabitants. It is situated on the Oregon Short Line, being a part of the Harriman system. It is one of those marvels of the aggressive West, and is to-day one of the solid, substantial towns of the great Northwest.

It is the County Seat of Beaverhead County, and is most beautifully laid out in one of the prettiest mountain valleys. Located on the banks of the Beaverhead river, one of the headwaters of the mighty Missouri, it looks out upon a broad, level valley, with silvery streams flowing from every side to the Beaverhead river. Few towns in the Northwest can present such a splendid record of progress, or such bright prospects of future greatness as Dillon (R. L. Polk and Company 1906, 17).

Upon his arrival in Dillon, Bagley’s position consisted of professor of psychology and pedagogy and the Director of the Teacher Training School. As a typical normal school, Dillon’s professors divided instruction into the normal and training departments. Teachers in the normal department formed the general education equivalent and instructed students in such courses as physiology, English, history, physics, biology, German, and calculus. Upon the completion of approximately two years of general coursework, Bagley directed students toward the more advanced topics of psychology and its relation to teaching. After a firm foundation in psychology, Bagley arranged for the students to conduct their practice teaching in the Dillon Public Schools.

After his arrival in Dillon on August 14, 1902, Bagley worked toward improving the education of not only his normal school students but also the students of the Dillon Public Schools (The Dillon Tribune 1902a, 8; The Dillon Tribune 1902b, 4; The Dillon Examiner 1902, 2). In an interesting twist of fate, school board members released the superintendent of the Dillon Public Schools, and, after a good deal of controversy, Bagley accepted the superintendency on January 21, 1903 (The Dillon Examiner 1903a, 5; The Dillon Tribune 1903a, 7; The Dillon Tribune 1903b, 8). In its coverage of the former superintendent’s release, the Dillon Examiner reported that the school board “wished the position for another.” This “other” was not specified, but Bagley was very likely the desired candidate. In fact, he accepted the position, without the report of any other candidates, only ten days following the previous superintendent’s resignation (The Dillon Tribune 1903b, 6). This appointment to superintendent permitted Bagley to assume what some Dillonites viewed as a revolutionary position. He now occupied the twin roles of Director of the MSNS Training School and the primary decision-maker for the entire school district. By doing this, he assured that all the normal school teachers-in-preparation could work closely with Dillon’s teachers and students. Also, the students of Dillon now benefited from more intense instruction and a significant number of additional teachers. To many Dillon residents, however, the most laudable aspect of Bagley’s new dual-position was his declination of any sort of payment for his role as superintendent. Every mention of Bagley as the new superintendent, in both papers, proudly stressed that he worked “without pay” (The Dillon Examiner 1903c, 5; The Dillon Tribune 1903c, 7).

While he acted as superintendent, Bagley, of course, continued his work as professor of pedagogy and psychology at the MSNS. Class descriptions for Bagley’s five years show a conspicuous pattern. In each psychology course, Bagley first had students read works of structuralist psychology with a particular emphasis upon Titchener and William James. In fact, Titchener’s *A Primer of Psychology* and *An Outline of Psychology* were used as texts in several of Bagley’s psychology and pedagogy courses (Montana State Normal School 1902, 14-15; Montana State Normal College 1903, 17-23). Only after this structuralist foundation had been formed did Bagley venture into the functionalist readings of Dewey and Hall. By no means did he neglect functionalism, but the practical, problem-solving related branches of psychology such as child study, individual differences, and mental testing, were for certain secondary in his courses.

After their completion of normal school requirements and a foundation in psychology, students at the MSNS then entered the classroom to begin their observations with “critic teachers.” The Montana State Normal School paid critic teachers, or, in today’s terms, “cooperating teachers,” a salary as they created the link between the normal school and the public school classroom. Not all residents, however, reacted positively to Bagley’s ideas for change. Some
of them initially criticized his emphasis on experimentation with children. They viewed him as a "foreigner" who targeted Dillon's students as "guinea pigs." Nonetheless, Bagley quickly earned the admiration of Dillon's residents and, in one short year, was highly regarded throughout the community (Spiegle 1958, 56-60).

In the spring of 1903, after Bagley's first full year on faculty, the normal school adjusted its curriculum profoundly. In order to offer the Bachelor's of Pedagogy and the Master's of Pedagogy degrees, the curriculum was extended and thus the name of the school changed to Montana State Normal College (Montana State Normal College 1903, 7-8). Faculty meeting minutes from this period indicate Bagley's heavy involvement with the changes in curriculum, and his presence on campus no doubt aided the school in its ability to enlarge its curriculum offerings (Lucy Carson Library Archives 1903).

The school's expansion to college status corresponded with yearly increases in student enrollment. From a graduating class of 3 in 1901 to a class of 21 in 1903 and finally to 24 in Bagley's final year, news regarding the college and its efforts to improve Montana education was overwhelmingly positive (History Statistics Studies of Western Montana College n.d.). In the spring of 1904, Bagley accepted the position of Vice-President for the upcoming 1904-1905 school year and retained his Director of Training and professor of psychology and pedagogy appointments. Thus, since his arrival in August of 1902, Bagley had rather quickly assumed the three important roles of superintendent, director of the state's only teacher training school, and Vice-President of the Montana State Normal College (MSNC).

In addition to these three important roles, Bagley also traveled throughout the state to extend the teachings of the MSNC. College administrators required each professor of psychology and pedagogy to instruct, throughout the year, at various county teachers' institutes. The state superintendent of public instruction required each county superintendent, usually in fall or summer, to host a teachers' institute. During his five years in Dillon, Bagley instructed at no fewer than 23 of these institutes and became well known, by teachers and administrators, throughout the state (The Inter-Mountain Educator 1906, 332).

Naturally, Bagley's lessons for Montana's teachers corresponded closely with the classes he taught at the MSNC. Specifically interested in, but somewhat skeptical of, psychology's application to education, Bagley's initial lectures at each of these institutes consisted of his definition of psychology as "a collection of facts about consciousness." He also emphasized those aspects of psychology that could possibly be applied to education (The Montana State Normal College 1903a, 1). Importantly, Bagley also stressed that "the utility of formal psychology to the practical work of teaching has probably been overrated." (The Montana State Normal College 1903a, 1). As he pondered the relevance of psychology to education, Bagley prioritized several important attributes of good teachers:

The teacher needs (1) common sense, (2) sympathy with childlife, (3) knowledge of subject matter to be taught, (4) cleverness at devices, and then formal psychology. The last named cannot, in itself, compensate for deficiencies in the others. (The Montana State Normal College 1903a, 2)

Although acutely aware of the limitations of psychology, Bagley held firm to the conviction that science and psychology provided the best available insight into the improvement of instruction. The titles of other lectures that Bagley delivered at the county teachers' institutes included "The Function of the Mind" in which he spoke on life as the adjustment to future situations by the collection of experiences, "Attention" which he defined as a state or pattern of consciousness, "Habit and Fatigue" where he distinguished between automatic and reflex actions and spoke on the pedagogical importance of understanding mental fatigue, and "Memory and Language" in which he discussed the importance of language and its role in educational advancement (The Montana State Normal College 1903b, 1-5).

As has been seen, the possibility, or impossibility, of psychology's application to education occupied Bagley's thinking considerably during this period. Obviously eager to improve teaching through the application of science, Bagley attempted to discover the underlying principles behind the teaching process. Through the discovery and then teaching of these underlying principles to future teachers, he hoped that the educative process could be made more efficient. However, Bagley's mentally disciplined manner led him to hold doubts about the importance of experimental psychology in general and functionalist psychology in particular to education. In August of his second year in Dillon, he wrote:

Works on educational psychology are of two kinds: (1) books written by psychologists who have
little or no practical knowledge of the elementary school and its requirements; (2) books written by
school men who have an inadequate knowledge of psychology. Of these two types the former
possesses, probably, the greater value (The Montana State Normal College, 1903b, 6).

Indicative of his views toward what he would later term “the much-abused cult of ‘Child-Study’,” Bagley also
wrote that the “standard works on child psychology are, however, numerous enough” (Bagley 1905, 185; The
Montana State Normal College 1903b, 6).

Bagley’s writing during the Dillon years concluded with his publication of The Educative Process in the fall
of 1905. As a significant work in the attempted application of psychology to education, the topics that Bagley
addressed spanned practically every substantial educational issue of the time. Representative of his combination
of structuralist and functionalist psychology, Bagley accepted some of the approaches to the adaptation of psychology
to education, but only in moderation. Due to the immense scope of The Educative Process, only a few of the most
important points that Bagley addressed will be discussed.

Bagley began The Educative Process by “reducing education to its lowest terms” and, in true scientific form,
tentatively defined education as “the process by means of which the individual acquires experiences that will function
in rendering more efficient his future action” (Bagley 1905, 22). In other words, to Bagley, education provided the
means through which individuals acquired those experiences that would allow them to learn from their own mistakes,
and the mistakes of others, in hopes of making better decisions in the future. After detailed descriptions of formal
and informal education, Bagley delineated five “aims” of education, each of which he described as important, and
sometimes detrimental, in differing degrees. The first, “The Bread-and-Butter’ Aim,” he defined as that which would
“enable a student to earn a livelihood” and then concluded that this aim was what motivated most parents to send their
children to school (Bagley 1905, 44). The second aim, “The Knowledge Aim,” consisted of the antithesis of the first.
In this definition, the knowledge aim reflected “a view of life that would minimize its material expressions and
emphasize the ideal... representing the life of leisure” (Bagley 1905, 46). His third educational aim, which he titled
“The Culture Aim,” emphasized the importance of certain elements of culture that adults should be responsible for
passing on to children. When he contrasted “The Knowledge Aim” with “The Culture Aim,” Bagley distinguished
the two by writing:

In the latter case [The Culture Aim]... knowledge is to be acquired, not for its own sake, but
because tradition has developed certain standards of culture which imply the acquisition of certain
items of knowledge,--the assimilation of certain conventional experiences (Bagley 1905, 48).

This third aim, The Culture Aim, remained highly important to Bagley for the remainder of his career. In fact,
many of the arguments that he would raise against certain aspects of progressive education, over thirty years later,
were based on the unwillingness of some “progressive educators” to address ideas closely related to The Culture Aim.

Bagley inelegantly titled his fourth aim “The Harmonious Development of All the Powers and Faculties of
Man.” He described this approach as aiming toward the student who would become “the jack-of-all-trades” or the
“general utility man.” In short, he contended that society should desire a system of education that produced some of
these generalists but not an entire nation of them. Bagley again addressed the positive and negative aspects of this
goal, as he did with all the others, and concluded that some, but not too many, “jacks-of-all-trades” were important
(Bagley 1905, 50-51).

With Bagley’s fifth and final aim, “The Development of Moral Character,” Bagley drew upon Aristotle and
Johann Friedrich Herbart to describe his position. Closely related to Bagley’s use of the phrase “social efficiency,”
to be described shortly, Bagley wrote, “morality consists in the dominance of the lower and more primitive impulses
... by higher ideas; a point of view, it will be seen, quite similar to that of Aristotle” (Bagley 1905, 56-57). The
theme of suppressing one’s individual, primitive impulses by reaching toward more remote and higher ideals for
society pervaded The Educative Process. This highly important concept to Bagley took its most concentrated form
in his description of “social efficiency.”

Attractive and romantic terms in education often grow out of control and take on meanings quite dissimilar
from the means by which they were originally employed. Somewhat like “progressive education,” “outcome-based
education,” and “total quality learning,” social efficiency, during the first three or four decades of this century, took
on a variety of meanings to disparately thinking individuals. Though many Americans of this period worshipped at
the altar of efficiency (Callahan 1962), Bagley was one of the first, if not the first, to employ the phrase social efficiency. In The Educative Process, Bagley’s use of this concept had nothing to do with the training of individuals for work, the sorting of students into their “inevitable place in society,” or the elimination of monetary waste in school administration. In contrast, social efficiency, to Bagley in 1905, was nothing more and nothing less than a moral position. As he drew upon the moral philosophy of Herbart and elevated social efficiency to the ultimate end of education, Bagley defined social efficiency as:

The standard by which the forces of education must select the experiences that are to be impressed upon the individual. Every subject of instruction, every item of knowledge, every form of reaction, every detail of habit, must be measured by this yardstick. Not What pleasure will this bring to the individual, not In what manner will this contribute to his harmonious development, not What effect will this have upon his bread-winning capacity,—but always, Will this subject, or this knowledge, or this reaction, or this habit so function in his after-life that society will maximally profit? (Bagley 1905, 60)

In other words, to what extent did education help individuals to learn the importance of suppressing their own individual wants and desires for the good of society as a whole? Only after certain individuals rushed this view to its extremes was the idea intended to sort and train individuals for their “destined” role in society (Callahan 1962; Kliebard 1995, 77-105; Chapman 1988). Importantly, Bagley’s most frequent use of “social efficiency” can be found in The Educative Process; and, as the efficiency movement gained momentum, Bagley applied the phrase less and less until he very rarely wrote it at all.

As important as Bagley’s definition of social efficiency is to the understanding of his early work, contemporary readers discover the most instructive portion of his 1905 book in the introduction to his chapter on Child Development. While Bagley labored to improve educational offerings in Montana, the child study movement took shape, and, as the years passed, increased in influence. Though the child study literature emanated from points over two thousand miles east of Dillon, Bagley nevertheless posited well-informed positions on these ideas. His writing of this period revealed that he read child study literature and then cautiously addressed his students with carefully selected aspects of functional psychology. However, in typical Bagley form, as the movement gained momentum and popularity, Bagley’s emphasis upon it weakened. Even though he fully recognized the importance of child study and what would become one important aspect of “progressive education,” Bagley predicted some possible negative repercussions of what he later termed “soft pedagogy” (Bagley 1939). The insightfulness of his introduction to child study warrants its lengthy citation:

The charge of “loose” schoolcraft and a demand for a return to the older and harsher educative methods frequently recur in contemporary educational literature. Under the present regime, it is asserted, drill and discipline have become obsolete terms, effort is at a discount, and the net result is a loss of stamina and a weakening of the moral fiber. But when these charges are made, the “new” education seldom lacks a champion to defend it. The harsher methods, it is maintained, have been justly eliminated. The well-drilled, finely disciplined individual is at best a machine, and modern life requires delicate judgments, adequate to ever differing situations, rather than the machine reaction adapted only to typical situations.

Both parties to this controversy appear to have neglected some very important data that have been accumulated during the past ten years by the now unpopular and much-abused cult of “Child Study,” and this neglect is the more unfortunate because the light that child study throws upon the main question at issue renders these heated and speculative discussions quite superfluous. Effort and interest, habit and judgment, repetition and organization, all have a legitimate and indispensable place in the educative process. If certain methods have been emphasized at the expense of others, it is simply because, with his human propensity to hasty generalization, the enthusiastic educator has assumed that a factor which he finds to be efficient at one period of development is equally efficient at all periods of development (Bagley 1905, 184-185).

With a quick interpretation of Bagley’s comments, one might conclude that his position regarding child study was ambivalent at best, or, at worst, inchoate. Nothing could be further from the truth. Closer inspection of Bagley’s career revealed his lifelong tendency toward intellectual eclecticism and a mentally disciplined, passionate-free
approach to educational reform. Without question, he strongly supported some elements of developmentalism. However, he always tempered his advocacy of these ideas with cautious comments about their possible overemphasis.

These three lessons from *The Educative Process* should most certainly inform teachers and administrators when they arrive at decisions today. Bagley’s level headed approach to reform attempts, his five aims of education, and his instructive definition of education combine to provide an important historical lesson. To repeat Bagley’s most concise view of education:

> Education may be tentatively defined, then, as the process by means of which the individual acquires experiences that will function in rendering more efficient his future action (Bagley 1905, 22).

Bagley’s positions on these issues raise several important questions. First, and to use his terms, to what extent have educators acquired the experiences of Bagley, and other historical figures, to render more efficient their future actions? In other words, how important are the experiences of historical figures in typical contemporary educational discussions? Secondly, have teachers, administrators, and policy-makers attended to Bagley’s warnings? Or, do some educators continue to suffer, almost a century later, from a “propensity to hasty generalizations”? If policy-makers choose the dimmer path and ignore the experiences of Bagley, and other past educational leaders, their decisions lack historical depth.

Disagreements between psychologists such as Titchener and Dewey are absolutely necessary to the consideration of lessons from this period in educational history. The attempted application of psychology to education, through the functionalist approach, followed Bagley as he departed Dillon in June of 1906 and accepted the Director of Teacher Training position at Oswego, New York. Bagley’s Oswego appointment corresponded with the shrinking importance that psychologists placed upon Titchener’s structuralist approach. In his subsequent work, he had little choice but to practice some aspects of the functionalist psychology that many viewed as directly applicable to teaching. These formative years of Bagley’s career, which consisted of his graduate school preparation and his time in Dillon, indicate several important precursors to his future positions. His choice to work with E. B. Titchener required his study of non-education related topics that were in opposition to those aspects of psychology that would form the basis of progressive education. Also, Bagley insulated himself from the leaders of developmentalism, child study, and mental testing when he relocated to Dillon. He most certainly read the literature that emanated from more eastern locations such as Chicago and New York, but his isolation from the centers of progressivism no doubt affected his association with and attitude toward the “new education.” The differences in context between Dillon and larger cities cannot be overemphasized. That which would have been considered more “traditional” in Chicago was most certainly progress in Dillon.

Interestingly, Bagley virtually ended his relationship with functionalist psychology toward the middle portion of his career. Rather than write on psychological topics, Bagley focused his efforts on issues such as curriculum, American and world history, and the general acceptance of teaching as an art rather than an applied psychology (Johanningmeier 1969; Bagley 1931; Yoakam, Bagley, and Knowlton 1938; Beard and Bagley 1935; Nichols, Bagley, and Beard 1938; Beard and Bagley 1925; Bagley 1937; Bagley and Macdonald 1933). In the late 1920s and 1930s, he practiced a form of psychology much closer to that of Titchener’s structuralism. Rather than his concentration on the direct application of psychology to education, in the functionalist tradition, Bagley assumed the philosophical role of mental reflection. With this disciplined, meticulous, mentally controlled approach to educational issues, Bagley avoided advocating any of the unfortunate reforms that he often referred to as “the new fashions in education” (Bagley 1931, xi). Perhaps today’s educators could benefit from Bagley’s approach.

Middle 19th Century Heartland Schooling: A View from the Top

Mark McKenzie
Illinois State University

Here in the State of Illinois (sometimes called the "heartland") at the beginning of our "grand experiment" of public education, there were few if any qualified professional educators to serve on our (or any other mid-west state's) State Board of Education. Thus, out of necessity the "tradition" of lay boards began. At least some of the members of these lay boards (and the Board in particular) have been portrayed in the histories as educational heroes (Marshall 1956, Teacher Education 1957), often characterized as leaders without fault and faultless decision makers.

Whether the lay board is still the only option in any state is debatable, but in contrast to those previously published histories, a not very careful reading of this Board's work as preserved in the Board's proceedings indicates that they were "shooting in the dark," uninformed by rigorously debated theories of education and training as far as their decisions of educational policy were concerned. Instead of men of "vision" imbued with foreknowledge and special insight into what our society needed, a great deal of what they accomplished was situational. That is to say that the experiment worked (survived, persisted, grew) this time because the time was right. For this particular situation, never before experienced concentrations of population and wealth and the demands of a changing economy defined the time. To be blunt, the experiment worked because it made sense in the context of these times while other experiments (or theories that never made it to the experiment stage) did not because in their times they did not make sense. And once started, mere inertia accounts for a great deal of the continuance of their enterprise.

That is not to say that the study of the work of these early "directors" of the public education experiment is not worthwhile, for even when all of these influences are factored out, there is still something left. Something that can perhaps inform us about the working of present day boards of education and how much faith we ought to have in the decisions and pronouncements they make. For after all, the work of the boards of education had meaning, impacted the lives of many, and is worth investigating to see how they approached problems and implemented attempts at solutions, even when they got it wrong.

**Purposes**

Why did we so involve ourselves with the schooling of the state's children? Why did we involve ourselves in the training of teachers to teach these children? The answer is paternalism, a paternalism of the community's elite members directed to all others, including both the adults and children of the State. This perspective is manifested as the central ideology of an address given by General C. E. Hovey during the quarter Centennial of the University.

This principle has its foundation in the fact that every child has an absolute right to an education at the hands of somebody, to an extent that shall properly qualify him to discharge his duties as a citizen. Experience shows that when education is left to the voluntary actions of parents and others, it is greatly neglected, and amounts almost to failure. Children come into the world in a helpless condition and remain so for years. They cannot educate themselves anymore than they can provide for themselves food and clothing. Hence, the duty and necessity of government, providing general laws, ample means for their education. (Hovey 1882, 184)

The general meanings (elitist paternalism) of Hovey's looking back assessment are upheld when we examine the minutes of earlier Board meetings. In a report to the Board, a committee, consisting of only Board members, addressing the addition of a course in agricultural studies, say, "So far as the letter and spirit of the charter (and in the spirit of this essay it is interesting to note that while they say charter here, there is no charter, there is only the legislative act founding the University) are concerned, there is no doubt but the object of the University is to furnish competent teachers for the Common Schools" (Illinois State Board of Education 1868, 9). The committees use of the word "competent" would seem to imply they are conscious of practicing teachers' general incompetence. Thus, the paternalism of Hovey's comment on ample means for the education of the State's children can be extended even unto the teachers of those children. This paternalistic ideology will, however, undermine the development of a clear mission for the new Normal University.

In another report, this time authored by the full Board and read into the record by S. W. Moulton, President of the Board at the December 20, 1860 meeting, reflecting upon the accomplishments of the Board and the University, they state, "In section four of the act the object of the Normal University is defined to be, to qualify teachers for the
common schools of this State, by imparting instruction in the art of teaching in all branches of study which pertain to a common school education, in the elements of the natural sciences, including agricultural chemistry and animal and vegetable physiology, in the fundamental laws of the United States and of the State of Illinois in regard to the rights and duties of citizens, and such other studies as the Board of Education may, from time to time prescribe” (Illinois State Board of Education 1868, 4-7). Thus even within the language of the legislative act is the implicit assumption that the teachers working in the Common Schools were not academically prepared for the task of teaching.

While the founding legislative act does not explicitly so state, there is such a belief explicitly evidenced by the language of the Board’s members that the teachers now working in the new, free Common Schools of the state are not academically prepared for the work. This view of teachers employed in the free schools is exemplified in a report to the Board in 1857 by one of the founding Board members, Dr. George P. Rex:

No person can teach that which he does not himself fully understand. To understand what to teach is therefore the first logical step in his course of preparation. Our Normal University should not be required to take this step, but will be compelled to do so by reason of the defective superficial teachings of our primary schools. Could our Normal University be supplied with pupil-teachers already qualified in respect to mere scholarship, the labors of our institution would be vastly abridged and simplified, and it would be far more efficient and useful. (Rex 1868, 9-10)

Not only are the teachers in the free public schools poorly qualified in the act or art of teaching, they lack proficiency in the subjects and knowledges being taught. The tension caused by the competition for time and energy in the training of the teaching art and teaching the knowledge to be taught will persist for a long, long time in the University.

Indeed, every few years the question reemerges of where the boundary ought to be between teaching the art of teaching scholarship to others and teaching the pupil-teachers scholarship. Periodic challenges will be made to the level of funding the University receives because of how much time is spent in academic instruction. The dissatisfaction with teaching candidates’ academic preparation (a preparation achieved in the State’s Common Schools) exists at the beginning and will persist regardless of the numbers of Normal School graduates who begin teaching in the Common Schools of the State. So, while the University may be improving the competency of the teachers, the students they teach never become competent enough to eliminate academic instruction at the Normal University.

The other important element of the 1857 act creating Illinois State Normal University is the broad and non-specific powers granted the Board in bringing about improvements in schooling in the state. The Board will not ignore this gift of power. They will exercise it, and in the beginning without any consultation with any versed in or “students” of the schools of the United States. By virtue of their appointment to the Board of Education, they become qualified to rule on what ought to be in all areas of schooling in the state.

Goals, Tensions

Some problems seem truly intractable. As today, when efforts to improve school teachers come into conflict with a voracious school system that chews up huge numbers of new teachers and is willing to go outside the professional route and employ any warm body if the numbers of available teachers ever falls below replacement values there is a problem. As a result anything done in teacher preparation to sort out the worst candidates or increase the standards for professional admission which might decrease the numbers of available teachers must be balanced against the possibility of becoming irrelevant.

This type of situation is normal for the Normal University during the early years. The number of graduates are small, there are just ten members of the first graduating class (three of who are hired to work in the University’s model school) for example. And public schools wanted the teachers trained by the normal schools. Public schools wanted them so much that they often would not wait until they had graduated. Even attending just one or two terms would get the normal school student a job offer at one of the better common schools and with higher than average wages. Is it any wonder the completion rates for people entering the four-year training program were so low despite all attempts to convince pupil-teachers of how important completing training would be in their work?

The Nature of the Board, Lay Expertise

The Normal University begins very humbly. There are only two faculty members, C. E. Hovey, the principal
of the University, and Ira Moore. While the numbers of faculty increases in the early years, for the first two years, as Hovey was traveling around the state drumming up support for the new University, Ira Moore was left with the responsibility for the instruction and day-to-day operations. Mr. Moore is of interest because he is an exemplar of what can happen when non-professional educators hold ultimate power of judgement over professionals.

In July 1861, a complaint is filed against Mr. Moore because of demerits he assigned to one M. I. Morgan, which prevented Mr. Morgan from graduating. Twenty-five students sign a letter (with some writing additional letters to the Board) about the matter. In the group correspondence, the students write that Mr. Moore showed "unwarrantable bitterness of reproof, and gross injustice, in recording undeserved marks against Mr. M. I. Morgan and others" (Illinois State Board of Education 1868, 4-5).

The documents were placed on file and a special committee was constituted to investigate the matter. The committee, consisting of Mr. Post, Mr. Green and Dr. George Rex, reported that while "they are unwilling to interfere with the discipline of the school by ordering the removal of the misdemeanor marks against Mr. Morgan and others, they are at the same time clearly of the opinion that the treatment of Mr. Morgan by Mr. Moore, and other acts of the latter, in the premises, were much harsher than the circumstances required or justified" (Illinois State Board of Education 1868, 9).

While the school Board may have been unwilling to remove the marks, they are more than willing to make sure the marks mean nothing. The Board allows M. I Morgan to graduate with the 1861 "class" even without completing the class "Theory and Practice of the Teacher" (what we today would call a foundations of education course, of course) as he did not need it because of prior teaching experience.

While unwilling to interfere with the discipline of the University, they are willing to change the make up of the faculty when the next year's contracts are made. It is not surprising that Ira Moore's new contract, while submitted to the Board, is voted down.

Perhaps Mr. Moore was a very bad person and perhaps Mr. Morgan did not deserve to be so treated that it would prevent his graduation. It is often difficult to know these things even after the passing of time. In this case, however, there is some interesting information that comes out over the times of their respective lives to support the proposition that the Board ruling perhaps did not do full justice.

The United States Civil War has begun before Ira Moore is fired. Eventually both Ira Moore and M. I. Morgan will join up. Mr. Moore will join an Illinois company led by his old colleague, the soon to be General Hovey. Mr. Moore will serve until the end of the war and then go on to a long career in schooling, including holding the principalship (presidency) of a Normal School in Minnesota, the vice principal position of San Jose Normal and the Presidency of Los Angeles Normal (Harper 1939).

In contrast, Mr. Morgan will teach for a year, then resign to join the military as an officer. He will serve for about a year before leaving because of "ill health." Back in Illinois, he will serve as principal of a common school until his health recovers (one year) and he moves to Ohio to become a farmer. After the Ohio move, M. I. Morgan disappears from the "educational" scene having been involved in schooling (post Normal University experience) only two years.

At the celebration of the school's existence for 25 years, old students return and share stories about their experiences. These stories consist of retellings of many of the misdemeanors they committed, often targeting their instructors (including Ira Moore). There is no lack of complaining about various habits, demeanors, and behaviors (academic or otherwise) of various instructors who served at the University in those 25 years. This tearing down does not include Ira Moore. Indeed, the episode of the challenge to Ira Moore is absent from these tales. It is also interesting that the student M. I. Morgan is not only absent from the celebration, he is also absent from the reminiscences of his classmates.

Considering how the comments made by the various principals/presidents of the Normal University during the 19th century about the lack of seriousness and dedication of too many of the students it is entirely possible that there was some justification for using the formal power of the institution to chastise and punish a few of the students in Morgan's class. Considering how many people who want to be students in the Normal University will be either turned away or counseled out in later years for either lack of preparation in academic skills and knowledge or the self-discipline needed to acquire those skills and knowledges, it is possible that M. I. Morgan was just an earlier example.
of one of the people who had not exactly found their life's calling in teaching.

Following the explanation of the Board, it is possible that in the courts of law the demerits given for what are legally only misdemeanor offences did constitute unjust punishment. It is also possible that the same hot, fiery pot belly stove pranks would produce more laughter if it occurred somewhere other than a school, the prankster was someone other than a student, and the person being “pranked” was other than the teacher (John W. Cook and James V. McHugh 1882).

Politics and the Board’s Powers

The Board also adopted several interesting positions on politics. Perhaps following the model of the United States Supreme Court, the Board believes that despite the political process by which they are appointed to serve, once appointed they will conduct their affairs “independent” and “without recognition” of any political party. Here the analogy breaks down, however, for the relationship between a justice and their law clerks perhaps ought to be different than the relationship of Board member to University faculty. Yet the Board believes it can impose its decision about its own actions to the rest of the University. In 1864, the Board resolves, “That in the sense of this Board it is improper for teachers in the Normal University to take an active part in partisan politics; that to do so distracts their attention from their duties, and tends to impair their usefulness to the cause of education; by exciting political prejudice against not only the participants but the institution itself” (Illinois State Board of Education 1864, 4). The Board is aware of the perhaps constitutional import of their words so they qualify their first resolution with another resolution saying, “Resolved, That in expressing these views, the Board disavow any intention to interfere with the right of teachers to exercise the elective franchise, or to enjoy their political sentiments, free from censorships or dictation from any source” (Illinois State Board of Education 1864, 4). Thus 130 years ago we have a model of “don’t ask, don’t tell.” Teachers are able to think political thoughts and even think they identify with and belong to political parties, just do not let anyone know what you think or believe. In this way the Board is able to protect both the University and the United States Constitution. Indicative of the relationship of the professional teacher, administrator, or professor to the Board, at least at the level of Board challenge, no formal protests are made to either of these resolutions.

There are also few limits the Board places upon itself regarding what goes on in the University. Just how controlling they can be is evidenced in an interesting resolution voted on and passed by the Board (with only one dissenting vote) regarding the pronunciation of the name of the State. For on the grounds of “euphony, and taste, and historic association” the Board decides that the “s” ending the name of the state of Illinois must be silent. All but one member of the Board found the “hissing sound of the s distasteful” (Illinois State Board of Education 1868, 11). This distasteful sound had practical consequences for, by its grating upon the ear, songwriters would avoid using the State’s name in song and epic. And if songwriters would not use the State’s name, then how could the deeds of the State’s sons be immortalized?

The Board even realizes the possibility of challenges to foundation of its authority in this matter, for included in their directive to the personnel of the University is a statement indicating that “while we have great deference for the opinion of persons authorized to teach in high places” (Illinois State Board of Education 1868, 11), but even so, we still know better than you how to use the English language and how to pronounce the name of the State. An earlier Board, of course, could have said the same thing when they considered the punishments meted out by Ira Moore. They have great deference for the opinions of people qualified to teach in high places, but they hold to the belief that their knowledge is better than that of the professors.

The Board’s expertise is not just about how to speak of and in the state, its expertise also includes the knowledge base a teacher ought to have. In 1865, the Board decides that all candidates for graduation write and give to the President of the University a paper on a subject in the fields of Geology, Botany, or some other subject in Natural History. What perhaps is more interesting is what the papers may not be about. There may be no titles about pedagogy. It is interesting that a higher education institution devoted to preparing people to teach would have the students doing the work of Natural History as a prerequisite for demonstrating their capacity for teaching the many skills and knowledge’s of the common school.

The Board also extends the curriculum of the university beyond the subject of Natural History. In a resolution adopted in 1862, in part most likely motivated by the United States Civil War, states that the University should, as
a “leading feature,” teach “subordination to rules, obedience to laws, respect for Legislative enactment, and a high love for the state of Illinois (naturally pronounced with the s silent), as our own State” (Illinois State Board of Education 1862, 9).

The View of Public Schooling (including the University) From the High Places

The look of the new Normal University is important. Image may not be everything, but to the President of the University and to the Board, it is a definite something. In the case of Illinois State Normal University, this concern with a “look” for higher education will be manifested in a tree-planting program. The beginnings of this can be found in Principal/President Richard Edwards’s address to the Board in 1865. Principal Edwards states:

I feel that, in keeping up the tone and vigor of the institution in its internal life, there has been less attention paid to the externals--to the trees, grounds, etc.--than would have been desirable. But two things must be remembered in this connection: first, that it is not easy for one man to do all things well; and secondly, that of the two things mentioned, the internal life, the soul of the school, is by far the most important. It is said the curious traveler some times finds it very difficult to ascertain the location of some of the most eminent European Universities, so little display do they make externally. But this is a state of things by no means to be commended, either in the abstract or as applied to our own institution. No institution of learning should consent to be shabbily surrounded, except as a result of the direst necessity. (Edwards 1865, 6)

The way to dress up the University, sited as it is amongst grasslands and marshes, is to plant trees. Jesse Fell, one time newspaper editor and nursery man turned land developer, influential in Bloomington’s winning the bid for the new school and now member of the Board, undertakes the task to acquire and plant mature and well-grown trees about the grounds. While Jesse was the most expert tree planter on the Board, Fell might not have done such a great job with his assignment. Despite the school still having an arboretum that carries Fell’s name; we have no idea if any of the trees still living were trees that Fell planted, for Jesse kept no records. Perhaps even more telling than the lack of records about the planting activities is Fell’s speech to the Board in 1876. While Fell was no longer a member of the Board, he was present at the meeting and was asked to speak. What he told the Board was that there were too many trees planted too close together on the grounds and many should be cut down. The Board then resolves to have Fell select and take down the problem trees (Illinois State Board of Education 1876).

While the Board has committed itself to not being political in its decisions about schooling in the State, other government officials are less so and have more strategic or vested interests in what they ask for. Thus we have periodic appeals to the Board to append what the University and the free public schools will teach. An example is a letter to the Board from I.N. Hayne, Adjutant General, asking for military “education in high schools and college.” The logic runs something along the line of: since it took 18 months to prepare young men to fight and die in the Civil War, and skills of fighting are not beyond the capacity of even an elementary student, it would be more efficient and cheaper to train all boys to be fighters rather than wait until they are needed and only train some (Hayne 1866, 5).

At the same Board meeting another letter is read into the minutes, this time from W. L. Pillsbury, a faculty member calling for physical training to be made part of the curriculum. The object of Physical Exercise, he says, “is to give a man command over his body, so that he can use it with vigor, ease, and grace; and to promote such a degree of health that he may be, so far as health has anything to do with it, in the best possible condition for his work” (Pillsbury 1866, 6).

Just for fairness sake, at the time of this letter, there are 100 males and 279 females enrolled at the University. Although there are more women at the University than men, Physical Exercise is just for men. And while the exercise is to make the man more capable of his work and the work of the student is the study of teaching, during the exercise, if it is proper exercise, he should not think of his work. Therefore, the exercise must be of “such character that it shall wake up his interest, and make him forget, for the time, all thought of study” (Pillsbury 1866, 6).

The Curriculum

The State Board of Education has within its domain of responsibilities all the public or common schools in the state and not just the Normal University. At the Board’s and the University’s beginning, a committee is formed to examine and then recommend textbooks for use in the common schools. While the men given this responsibility are not professional educators and do not seek out the advice of any whom might have expertise in schooling and
teaching, they cannot be accused of not having an ambitious schedule of work. A list of the titles recommended in 1857 included: Davie's, Ray's and Thompson's series of Arithmetics; McGuffey's and Sander's Revised Spellers and Readers; McElligott's Analyzer, Manual; Thomas' First Book of Eymology; Cornell's and Warren's Geographies; Green's, Clark's, Wells' and Pineo's Grammars; Weber's, Berard's, and Wilson's Histories; Quackenboss' Composition and Rhetoric; Cowdries' Moral Lessons; Well's Science of Common Things; Canning's Physiology; Parker's and Wayland's Philosophies; Youman's Chemistry, Atlas and Chart; Johnson's Agricultural Chemistry; Ray's and Davies' Algebras; Perkin's Geometry; Gillespie's Surveying; School Harp and School Melodies; Payson's, Danton's and Scribner's Writing Books; Webster's series of Dictionaries; Spencerian System of Penmanship; Bryant and Stratton's Bookkeeping; Bryant and Stratton's Commercial Law; Bryant and Stratton's Commercial Arithmetic (Committee on Textbooks, Illinois State Board of Education 1868, 14).

In total 21 books or series of books to be used as the common school curriculum. All to be completed in just six years. Although certainly very ambitious, nothing particularly outrageous is suggested by this curriculum list. The Board believed the children of the state ought to be able to read, to speak in public, and to write using clear sentences (and spell consistently when they wrote). The children ought to know something about the "lay" of the land they live in, both the physical and the cultural or historical lay of the land. They ought to be able to find their way about that land using maps and to mark their places on the maps using surveying techniques. They ought to know how the common things of their experience worked, they ought to be able to keep their financial accounts, lay out a field for playing that new fad baseball, as well as find the area of their farm fields and the volumes of containers (geometry and algebra). In addition, the children ought to be able to think deep thoughts (philosophy) and appreciate the finer things in life (playing the harp and singing melodious songs).

The last four books are additions to the list suggested four years later in 1861 and focus on what someone interested in running their own business might want to know. In this we already see the start of vocational training in the public schools.

The companion list for use at the university is somewhat smaller, but no less ambitious. The readings, not including what work the pupil teacher would complete in their professional studies classes and readings included: Mitchell's Series of Geographies; Gray's Botanies; Hanford and Payson's Book Keeping; Robinson's Elementary and University Astronomies; Robinson's Elementary and Analytical Geometries; Robinson's Surveying and Navigation; Guyot's Earth and Man; Maury's Physical Geography of the Sea; Haven's and Hamilton's Mental Philosophy; Andrew's Series of Latin Books (Illinois State Board of Education, 1868, 14).

Comparison of the two lists is revealing in that they are not the same in their breadth of knowledge. The areas or subjects of study do not exactly match up. Those who would be teachers are being asked to go beyond what they will be asked to teach their future students. This is not intended to be either simply remedial training to compensate for what they missed in their own common school experience. This is not intended simply to train the teachers for what they will be expected to teach. They are pursuing a course of study that combines with teacher training a curriculum similar to what would be found in a liberal arts college. In addition, if it is the intent of the Board for teachers to teach all these subjects to their students, then some will be taught by the teacher using only their own memory as resource for there are no comparable texts suggested for use in the schools.

It is also interesting to see the Board include a text on the physical geography of the sea, a text on astronomy, and a text on navigation. As studies of the stars and other celestial objects, sometimes-called astronomy, was practiced for centuries without the benefit of telescopes, it is possible to make this a subject of study in the common schools. Attempting to answer the question of the intent of these studies from an application perspective, however, it would seem the three subjects when put together would have the most immediate application when traveling across the oceans. I have no idea how many of the state's young men and women went to sea (or possibly Lake Michigan) for their careers. Perhaps members of the Board were just romantically influenced by the 1853 publication of "Moby Dick."

We can also see how this curriculum was internalize and operationalized by the early students because they were required to write a thesis for graduation and the Board decided to officially recognize this scholarship. As a result we have the titles of the thesis written by the graduating class of 1869. The titles of those works of scholarship, first from the women students, included: The Osage Orange; The Pines; Geraniums; The Linden; Water; Oak Trees;
Grasses.

And from the men students we have the following titles: Topography of McLean County; Combustion of Coal; The Common Locust (with illustrations); Arboriculture; The Elm Tree; Frogs (with illustrations); The Wild or Black Cherry (with Illustrations); Ventilation; Ventilation (with Illustrations); Coal Veins of McLean County; Relative Strength of Different Lengths of Wood; The Two Maples (with Illustration) (Illinois State Board of Education, 1869, 6-7).

It does not take much analysis of these lists of to realize that there were some interesting processes occurring in the minds of the University’s students in the selections of themes and the genders of the authors. In 1868 men graduates are still outnumbering women graduates (despite the predominance of women in attendance). The men also seem to like drawing more than the women do (although this could just be strategic action by the men to reduce the words they need to write while still producing an appropriately weighty tome). All of the titles are referring to items of personal experience, trees, plants, grass, and terrain. And when we consider the ongoing concern with the poor ventilation in the University’s new building, even the two papers on ventilation make sense.

It may be no more than coincidence, but six months later at the next Board meeting, President Edwards reports that they have made efforts to raise the standard and quality of scholarship at the University. It is also resolved at the meeting that “Professors and Teachers in the University are requested to discountenance the presentation of gifts to them by students” (Illinois State Board of Education 1870, 9).

The construction of schools and the teacher training institutions producing teachers for those schools was a work in progress. Illinois State Normal University was the ninth public teacher training institution in the nation. There were few experts available to rely upon for advice. The powerful individuals within the community saw that the conditions of their society were slowly changing from agriculture to industrial businesses. Voting rights were expanding. Concerns for how much your neighbors and workers know becomes an important consideration for the lives and goals of these men.

The men who made up the Board felt the need to act and they did act. These acts, however, were not as certain or always successful as many of the histories of public schools, state school boards and universities seem to suggest.

References

The Chinese of the Mississippi Delta comprise one of the lesser-known currents of the Chinese diaspora. Their settlements are cultural islands as well; for the immigrant Chinese and their descendants are remarkable for their collective independence, preservation of homeland customs, and maintenance of traditional social organization in a variety of alien environments. The experiences and struggles of the overseas Chinese attest to being accused of refusing to assimilate, as well as give vivid testimony to the resilience and adaptability of their old world institutions.

The Chinese of the Mississippi Delta are sui generis; their community stands out from those established by their ethnic compatriots throughout North America as there is no Chinatown in the Delta. These Chinese have been cut off from the religious, medical, educational, familial, village, and communal institutions that Cantonese brought with them to America. Most significant there are no clans, hui kuan [speech and locality associations], secret triads and temples established among the Delta Chinese (Kwong 1987). Such institutions are the mainstay of the overseas Chinatown — not only in the United States, but also throughout Southeast Asia, Latin as well as South America, and Africa. The Mississippi Chinese have forged a community without these traditional forms of organization. They have constructed their community around two other institutions: the nuclear family and the family-centered grocery store (Loewen 1971).

The Delta Chinese have been able to create their own type of community, first, because of the presence of sufficient women among them to make marriage and domesticity possible; second, because they took up a strategic if unwanted position between the White and African American populations, providing goods and services to the latter, while preserving and protecting the caste superiority of the former.

In addition, the children born of these intra-ethnic marriages also helped to solidify the Chinese group and deter its inter-ethnic marriages with African Americans. Ironically the very fact that these children were citizens of the United States by reason of their birth in America while their immigrant parents remained "aliens ineligible to citizenship" until 1943 — caused them to suffer the rigors of segregated schooling. When Mr. Gong Lum brought suit in the United States Supreme Court in 1927 to prevent his children from being sent to the school for "colored" children, the Court decision was that Mr. Lum could not avail himself of the equal treatment clauses of the Burlingame Treaty between the United States and China because they applied only to Chinese aliens.

The first Chinese immigrants to the Delta were classified as "colored." They and members of the second and third generations managed to transform this pejorative identity tag and to establish a functional Chinese community. Nonetheless, their search for education as Mississippi Chinese and as Americans occurred against a background of shifting economic pressures and changing race relations. Though many if not most of the Chinese have left this region, the American South is richer as a result of their presence as a community.

In Search of Education

Since the arrival of Chinese immigrants into Mississippi during the 1870s, public state educational institutions in their districts of residence were set aside under the law for white students, and Chinese Americans were allowed to attend only on an individual basis (WPA 1939). African American schools were available to them, however their conditions were far from equal to their counterparts. Rejection from white schools was simply tantamount to complete exclusion from public education.

By the 1920s, several Chinese merchants who had managed to bring over their families from China faced the problem of providing their children with an education. Furthermore, many Chinese by this point in time were trying to evade their "colored" classification and did not want to utilize the existing African American schools (WPA 1939). Chinese men with families were particularly likely to feel this pressure, since they had already begun the transition from sojourner to immigrant (Loewen 1971). They made desperate attempts to avoid discrimination against their children.

Previous to the year 1924, Chinese children were admitted to the local public school for White children — the Rosedale Consolidated School. For many years, there were no restrictions in Rosedale on the Chinese race, perhaps because of their small numbers while, in some of the other towns and in surrounding counties, they were unwelcome (WPA 1939). Therefore, when news spread amongst the Chinese families of this particular town, several families attempted to send their children, by boarding them with another Chinese family, or, by moving into the Rosedale
district themselves. This situation continued for approximately fifteen years, until the first case of the exclusion of Chinese from Mississippi schools occurred in 1924 in the circuit court case of *Lum v. Rice* (139 Ms. 760).

When Mr. Gong Lum’s daughter, Martha, was asked to leave the Rosedale Consolidate School because of her race, he resolved to fight for her right to do so. His lawsuit set out to establish that being Chinese was different, and as such, should have different rights. Judge Alcorn, of the Mississippi Circuit Court, ruled that the Trustees had no right to forbid the Chinese the right of scholarship – that they were of the Mongolian race and not of the Negro. As such, “it is unreasonable, unjust, and arbitrary discrimination and classification to put the Chinese in a class with the members of a race wholly different from them in racial characteristics and thus to extend school facilities in such shape and under such conditions as to deprive them of their value or render them impossible of enjoyment” (139 Ms. 760). The case was then carried to the Mississippi State Supreme Court where in which Judge Alcorn’s ruling was reversed, and the case dismissed. Judge Etheridge’s Court found that under the Constitution of 1890, the Caucasian race had the right to preserve its race from a mixture with other races; and that, while the law was primarily made to protect the white race against amalgamation with African Americans, the Constitution Convention used the word, “colored,” and the Court considered that it had been used “in the broad, rather than the restricted sense, its purpose being to provide schools for white, or Caucasian race, to which schools could not admit any other race, carrying out the broad and predominant purpose of preserving the purity and integrity of the white race and its social policy” (139 Ms. 760).

The Chinese were not satisfied with his finding, and therefore took their case to the United State Supreme Court. They too were unanimously disposed against the Chinese family’s claim to exemption from the laws of Mississippi directly referring to the 1890 Mississippi Constitution where in which “separate schools shall be maintained for children of the white and colored races.” Yellow, after all, was a color. Although the case did not triumph and resolve the problem of exclusion, it settled the debate on the definition of “colored races” as well as the status of Chinese and other non-whites, as understood in Mississippi (275 U.S. 78). In addition, it further exemplified how certain race relations were handled in the South where it occurred in small numbers.

One interviewee commented on the educational situation in the mid-1920s:

> The Chinese legally weren’t allowed to go to the Bo Guey [White] schools, but because there weren’t hardly many Chinese families back then, some went anyway. If a Chinese lived in a smaller town and interacted with the Bok Guey, they would let them attend their schools. Why you wonder? ‘Cause they don’t know no better. But as soon as someone objected on account of the law, they had to get rid of ‘em (Wong, interview).

Another Delta Chinese resident added:

> Schooling was sure messed up in those days. I mean, if somebody – anybody – said you’s colored, you’s Chinese, then you would have to be dismissed. You see, that’s what happened to Mr. Gong Lum. He got angry with the Rosedale School Board because they wouldn’t let Berda and Martha in the Bo Guey school. But after he lost that court case in Mississippi, and then in Washington, the Chinese were bitter and unhappy (Gong, interview).

Although they were not necessarily upset at Mr. Gong Lum, the loss of this important case further decreased their educational options. Where in which prior to *Lum v. Rice*, Chinese children were able to attend White schools in small numbers, however, with the US Supreme Court’s ruling, not only was this no longer possible, it was also considered illegal. Furthermore, this case exemplified that perhaps being a Chinese national was a far better choice for Delta Chinese in terms of their educational rights and privileges as granted by the Burlingame Treaty of 1868. Henry Joe, a Delta Chinese resident, commented on this while remembering the intervention of the Chinese ambassador on behalf of the Chinese during the hearing of that case.

> At that time, the Chinese were protected under the United States and China’s Burlingame Treaty and Chinese citizens were supposedly entitled to live and go to school here... Even the Chinese Ambassador, V. K. Wellington Koo, attended the U.S. Supreme Court hearing. But you see, the Supreme Court said that Lum’s children were not Chinese citizens. Both of them, Berda and Martha were born here... so they were American citizens. The Chinese lost the case. We might have won it if the children were Chinese nationals (Joe, interview).
After that ignominious setback, the court case set the parameters for the Delta Chinese in terms of new choices they could make as well as the paths they would have to create in order to attain education. One of their solutions included sending their children out of state for their education rather than have them attend the African American schools. If the parents chose not to take this option, another alternative was to hire private tutors, and the children therefore received their education at home. Often several families banded together and hired a Chinese tutor from California, or if this was not financially possible, they would seek the services of several local White schoolteachers.

In 1936, a more effective solution was finally agreed upon in the towns of Cleveland and Greenville. The school boards in both towns were willing to employ two White teachers, paid for by tax funds, to teach in a separate Chinese School. These separate Chinese schools would teach the same curriculum as the neighboring White schools during the day, and in the after school hours along with any vacations, the Chinese teacher, hired by the Chinese community, would supplement the children’s studies with Chinese language, literature, and culture lessons. The Delta Chinese I interviewed noted that the these school were built with funds solicited from local businessmen and Chinese merchants in communities as far away as Chicago, New York, and San Francisco (Gong, Joe, Wong, interviews).

A desegregation process begin in 1945, when the school boards in both towns sought to close the Chinese schools because of their additional expense. By this time, the Chinese community had gained considerable influence in the Delta, and had several patrons to sponsor their admittance into the public schools. Although there was a large amount of local controversy regarding this matter, the Chinese won, and were admitted to the White schools in Greenville in 1946. As Greenville took the lead, many of the other Delta towns soon followed suit. However, in each case, the admittance required the passing of a city ordinance to this effect. It would not be until 1953 when the last town in the Delta, Leland, finally admitted Chinese students into their public schools (WPA 1939). Once they were open to the Chinese, the Cleveland and Greenville Chinese Schools lost their raison d’être.

Although the Chinese of the Mississippi Delta historically suffered discrimination throughout their quest for educational opportunities, they were nonetheless able to successfully establish alternative schools which paralleled the White educational institutions they were barred from. The schools that were founded prior to 1945 in the Delta were the results of the efforts of leading Chinese of the County and their friends, who, with tenacity and continuity of purpose, made it possible for the Mississippi Chinese children to be taught, not only English, but the Chinese language, literature and culture as well. As such, these schools not only functioned as sights of instruction, but as custodians of tradition.

Bilingual Education and the Campaign for Federal Aid

Joseph Watras
University of Dayton

In the late 1960s, advocates of linguistic minorities tried to persuade the federal government to adopt legislation that would force educators to follow particular models of curriculum planning. These advocates claimed that educators had denied the rights of their constituents. Using this argument, they recruited parents and teachers to join their organizations. They hired lawyers who had worked for the NAACP, filed litigation in federal courts, and used the pressure from their political organizations and the resulting legal victories to shape federal legislation (Salomone 1986, 87-109). Unfortunately, questions arose about the role of public schools in preserving the family’s heritage. For example, should programs of bilingual education teach Hispano children Spanish if they spoke only English? These concerns weakened the efforts to gain federal support for bilingual education.

Advocacy groups for linguistic minorities began as political associations whose aim was to advance the social and economic integration of immigrants into American society. For example, from 1920 to 1929, more than 500,000 people emigrated from Mexico to the United States. These people joined together to help each other. For example, in 1918, a fraternal society in South Texas, the Order Sons of America (OSA), succeeded the former mutual aid society, Liga Mexicamista de Beneficiencia y Proteccion, and expanded its concerns to voter registration, citizenship applications, and representation in jury selection. In order to coordinate the activities of such groups as the OSA, several prominent Mexicans met in 1929 in Corpus Christi, Texas and formed LULAC, the League of United Latin American Citizens. In 1956, LULAC began a series of pre schools called the Little School of 400. Named after a list of 400 essential English words for children to learn before they entered first grade, the Texas legislature imitated this model from 1960 to 1964 (Marquez 1989, 15-17, 51-52).

Professional educators organized efforts to help linguistic minorities. In 1965, the National Education Association (NEA) surveyed the Mexican American children in the southwestern region of the United States. In their report, The Invisible Minority, the NEA committee noted that there were 1.75 million Mexican American children in Arizona, California, Colorado, New Mexico, and Texas. Although the region once belonged to Mexico, these people spoke a language and held a culture different from most of the people. The NEA committee asserted these Mexican Americans did not try to assimilate nor did they strive to succeed as did the English speaking Americans. Consequently, poverty was prevalent among Mexican Americans (Committee on Education and Labor 1978, 169-177).

The NEA was most concerned that the Mexican American children failed academically. In California, for example, in 1960, more than half of the males and nearly half of the females more than fourteen years old with Spanish surnames had not gone beyond the eighth grade. In the general population, however, less than 30 percent of the males and twenty-five of the females had not gone beyond the eighth grade. According to the report, Mexican American children left school at a high rate because they started school with a language disability and each year their academic performance fell behind that of their English speaking peers (Committee on Education and Labor 1978, 177-179).

The NEA committee traced the language problem to the children’s homes. For example, in 1965, a study of six hundred Mexican American adults in San Antonio, Texas found that 71 percent of the parents spoke only Spanish to each other. Thus, although the children knew some English, the language of their home and childhood was Spanish. In schools, they had to use a language foreign to them and frequently the parents could not help. While some schools reduced the content of most subjects to give the children time to learn English, this caused the children to fall behind even more. The NEA report noted that other schools forbade the children from speaking any Spanish and punished the children for lapsing into it on the playgrounds. One member of the NEA committee found a school where teachers admonished the children, “If you want to be American, speak American.” However, the NEA report concluded that such compulsion caused the children to withdraw, to feel inadequate, and to fail (Committee on Education and Labor 1978, 179-186).

In March 1966 in New York City, personnel from the US Bureau of Indian Affairs, members of the Modern Language Association, the Center for Applied Linguistics, the National Association for Foreign Student Affairs, the National Council of the Teachers of English, and the Speech Association of America officially formed the organization, TESOL, Teachers of English to Speakers of Other Languages (Committee on Education and Labor 1978, 330).
During the process to renew ESEA in 1967, the US House of Representatives' Committee on Education and Labor held hearings where witnesses testified that the problems of linguistic minorities were pressing and existed in all parts of the United States. For example, in Hoboken, New Jersey, the population of Puerto Ricans rose from 3 percent in 1953 to 34 percent in 1967. At the same time, the population of foreign-born students was 9.4 percent, and this gave the Hoboken schools a student population with 43 percent linguistic minorities (Committee on Education and Labor 1978, 521).

With little controversy, the US Congress approved and President Lyndon B. Johnson signed the US Congress passed Title VII of ESEA also called the Bilingual Education Act in 1968. This authorized federal funds to carry out imaginative elementary and secondary programs to meet the educational needs of children who came from an environment where the dominant language was other than English and who attended schools with a concentration of low income families. As a result, from 1969 to 1973, $117.9 million of federal support went to bilingual programs, most of which were in elementary schools (US Commission on Civil Rights 1975, 171-172, 180-181).

The law did not specify whether the children would learn English or learn it in addition to their own language. However, in 1971, when the US Department of Health, Education, and Welfare released its instructions for applications for the federal funds, it noted that the goal of bilingual education was a student who functions well in two languages on any occasion. To some people, this implied that schools would teach children their own language as well as English. This was important because some educators believed that it was insufficient to teach English as a second language (ESL) to the children. ESL was a method of instruction developed in the 1930s for university students and foreign diplomats. In the 1950s, many elementary schools offered this instruction to non-English speaking students in special classes away from their regular work. However, since ESL ignored the children's unique language and heritage, some educators feared that the children came to dislike their culture (Crawford 1989, 27-28, 38).

How did advocacy groups use the federal courts to support bilingual education?

In the 1969, a member of the newly formed, militant Mexican American Youth Organization, Jose Angel Gutierrez returned to Crystal City, Texas seeking an issue on which he could organize a movement to begin a third political party. He had graduated from the high school in 1962, and he asked the school board to sanction a home coming celebration for former students. When the board refused, Gutierrez organized a boycott by Mexican Americans. On 6 January 1970, the board agreed to the students demands, and on 23 January 1970, the parents and citizens form a political party, Cuidadanos Unidos, and filed applications to challenge the members of the school board in the coming election. Three candidates from Cuidadanos Unidos won seats on the Crystal City Board of Education. The party soon changed its name to La Raza Unida and for a short time competed with the two main political parties, Republicans and Democrats, in Texas state politics (Garcia 1989, 37-61).

Gutierrez's work in Crystal City is often cited as a model for Chicano activists (Hammerback, Jensen, and Gutierrez 1985, 81). However, one of the most wide reaching effects was the demand the students of Crystal City High School made for bilingual and bicultural education. In reaction to controversies similar to Crystal City's, then director of the US Office of Civil Rights, J. Stanley Pottinger, issued a memo on 25 May 1970 warning that all school districts with more than five percent national origin-minority children must take affirmative steps to rectify any language deficiencies that would exclude them from effective participation in educational programs. Pottinger pointed out that school districts had to comply with these orders or they would be in violation of Title VI of the Civil Rights Act of 1964 forbidding discrimination on the basis of race, color, or national origin (US Commission on Civil Rights 1975, 204-205). This was a serious threat because, once found out of compliance, the federal government could deny the school district federal funds.

The biggest legal victory for bilingual education came in January 1974 with the US Supreme Court decision in the case, Lau v. Nichols. In this case, the Human Rights Commission showed that, in 1971, there were 3,457 Chinese students enrolled in the San Francisco, California school system who spoke little or no English. The plaintiffs who brought this suit did not urge any particular remedy. They agreed that teaching English as a second language would be acceptable as would teaching the children in Chinese. Although the parents lost in the US District Court, they won in the US Appeals Court and in the US Supreme Court.
In writing the opinion, Justice William O. Douglas noted that, although English was to be the basic language of instruction, the California Education Code allowed bilingual education. The justices based their judgement on the US Civil Rights Act of 1964 which banned discrimination on the basis of race, color, or national origin in any program receiving federal financial assistance. It was obvious to the justices that the Chinese speaking children received few benefits from the schools. Consequently, they ordered the district to take affirmative steps to rectify the language deficiencies. For example, any tracking system had to be designed to meet the language needs of the children.

In February 1974, the US Department of Health Education responded to the US Supreme Court’s decision by issuing a memorandum clarifying federal regulations. The Department reminded schools of the need to provide services for children of limited English speaking ability. However, the memo stated that the Department has never indicated what form these services should take. For example, it had never adopted a position on whether the schools should help the children maintain their original culture (Schneider 1976, 106).

In 1974, the US Congress had to reauthorize the Bilingual Education Act of 1968. US Senators Edward Kennedy and Alan Cranston introduced the bills to expand the bilingual and bicultural education. In part, the Senate was receptive to expanding the legislation because of the active involvement of ethnically based organizations. The most active was the Raza Association of Spanish Surnamed Americans (RASSA) which later changed its name to the National Congress of Hispanic Citizens. RASSA produced supportive materials, argued and lobbied during the conferences, and was able to influence senators representing states with Hispanic voters. The Puerto Rican Forum, the Puerto Rican Association for National Affairs (PANA) and ASPIRA argued for Puerto Ricans. Representatives from various native American tribes and associations testified at hearings and the US Bureau of Indian Affairs urged the expansion of the legislation (Schneider 1976, 41, 63-65).

The series of reports of the US Commission on Civil Rights on the education of Mexican Americans influenced the senators to act as well. In 1972, the Commission released the third report in that series. Entitled The Excluded Student, this report focused on the linguistic and cultural problems that Mexican American children had in schools and considered programs to alleviate those difficulties. The members found that schools excluded the Spanish language, the Mexican heritage, and the Mexican American community from participation in school affairs (11-12).

As the US Senate drew up legislation for bilingual education, the staff from the US Commission on Civil Rights interacted with the Mexican American lobbying groups and with education groups. These three forces often participated in planning sessions with the senate staff charged with drafting the legislation for bilingual education (Schneider 1976, 65).

During the congressional hearings and conferences, two issues arose repeatedly. One was whether bilingual education was to establish a bilingual society. The second was whether bilingual education should include instruction in the cultural heritage of the children. In line with the US Civil Rights Commission reports, the advocacy groups lobbied for instruction in the proper use of the native language as well as in English. They wanted to include lessons about the cultural traditions so that the children who were not proficient in English would not feel inferior to their peers. The final bill did not include these requirements, yet the lobbyists from the bilingual advocacy groups accepted the legislation. The law required that federally funded programs include native language instruction and cultural enrichment, and it did not forbid such programs from persisting into the secondary schools where the children could acquire a sophisticated understanding of their own language. Although such dual instruction was necessary only as long as it took for the children who were not proficient in English to learn as effectively as their peers, programs using only an ESL approach would not be acceptable because ESL provided instruction in English without reference to the children’s cultural heritage (Schneider 1976, 128, 146-147).

The same year, 1974, the US Congress passed Title II of the Equal Opportunities Act. This bill was designed to prohibit the transportation of elementary or secondary school students to enhance racial desegregation. However, one paragraph of the law read as follows: "No State shall deny equal opportunity to an individual on account of his or her race, color, sex, or national origin by the failure by an educational agency to take appropriate action to overcome language barriers that impede equal participation by its students in its instructional programs” (US Civil Rights Commission 1974, 197). Although the US Congress did not define what appropriate action meant, the law allowed
people to sue in federal court for redress. As discussed below, African Americans used this law to force the Ann Arbor, Michigan schools to include Black English in the curriculum.

Was bilingual education effective?

In 1975, the US Commission on Civil Rights visited several sites to examine bilingual bicultural education. The members liked what they saw. However, they complained that there were no systematic evaluations that would indicate the results of the effort (103-105). In 1978, such a survey was published. It was extensive, thorough, and disappointing to the advocates of bilingual education.

The nation wide study of the impact of ESEA Title VII was contracted by the US Office of Education with American Institutes for Research (AIR). During the 1975-1976 academic year, the AIR researchers gathered evidence from all Title VII Spanish/English bilingual education projects that had received funding for four or five years. The general design was to compare the performance of the students enrolled in the projects with similar students who did not participate. Initially, the researchers chose 11,500 students in 384 classrooms in 38 sites across the United States from which they sampled smaller groups at random for specific examinations (Danoff 1978, 10-12).

The results showed that the bilingual programs did not seem to help the children master academic subjects. That is, for second to sixth grade students, the achievement gains in English, reading, and mathematics computation were what they would have been without participation in the bilingual project (Danoff 1978, 22-23).

In addition, the study indicated that bilingual programs did not serve the goals of the legislation. That is, less than a third of the students attended bilingual education classes to learn English. About 75 percent of the children in the bilingual education programs either spoke only English or spoke English better than they spoke Spanish. When the AIR researchers asked about the goals, they found that most project directors wanted the children to be fluent in both Spanish and English, and the teachers engaged in activities consistent with this aim. Further, when the AIR researchers tested the children’s ability to read Spanish, there was an increase in this ability among the students in the Title VII classes (Danoff 1978, 18-20).

Although a major claim about the need of bilingual education was that it would increase children’s affection for school, the AIR researchers did not find this happening. In both groups, those who were in bilingual education and those who were not, the children held neutral feelings about their schools (Danoff 1978, 23).

Bilingual advocates complained that the AIR study was unfair because it collected a patchwork of classes labeled bilingual and compared them to children in regular classes. This treatment, the advocates argued, did not allow investigators to focus on well designed classes and examine their success (Crawford 1989, 87-89). Other researchers claimed that the AIR study was inaccurate. For example, K.N. Nickel noted that the two groups of children the AIR study compared were not similar. That is, the children attending the non Title VII classes had a better command of English than did the children who attended bilingual Title VII classes. Further, since most of the teachers in the Title VII classes were not bilingual themselves, Nickel contended, the Title VII classes could not represent bilingual education (1979, 260-261). The lead researchers for the AIR study responded to Nickel’s criticisms by claiming that they had used statistical controls to avoid those biases (Danoff and Cole 1979, 261-262).

Researchers went back and forth about the effectiveness of bilingual education. For example, in 1981, Keith A. Baker and Adriana A. de Kanter reviewed twenty-eight studies of bilingual education. They found that some programs helped some children. Nonetheless, they did not find enough evidence to justify the federal government relying on this method, and they believed that other models such as immersion in English might be more valuable. On the other hand, in 1985, Ann Willig conducted a meta analysis of twenty-three of the same twenty-eight evaluations used by Baker and de Kanter. Employing different statistical procedures, Willig found the bilingual programs to be beneficial.

Did bilingual education include African Americans?

As researchers debated the effectiveness of bilingual education, advocacy groups continued to use the federal courts to advance their cause. Although Lau v. Nichols was the only case about bilingual education that the US Supreme Court decided, federal district courts considered these issues and expanded the requirements for bilingual education to include African Americans. In July 1977, lawyers filed suit in federal district court on behalf of fifteen Black elementary school age children who resided in a housing project. They claimed that the Ann Arbor, Michigan
Bilingual Education

Warms

school district failed to establish a program enabling the children to overcome the cultural, social, and economic deprivations that prevented them from making normal progress in schools. The court dismissed all of these allegations except the question of whether the children suffered from a language barrier that impeded their participation in schools (Martin Luther King, Jr. Elementary School Children v. Ann Arbor School District Board 3-9).

In its decision, the court directed the school board to submit a plan defining the steps it would take to identify the children who speak Black English and describing the ways that the teachers will use that knowledge to help the children learn to read standard English. In August 1979, the school board submitted a plan that called for training the professional staff in identifying Black English, providing assistance to the teachers in planning lessons and in offering instruction that used Black English to learn standard English, maintaining a link with the most current professional information on the educational effects of Black English, and establishing improved communications with the parents for suggestions and support. The lawyers for the children asked for several changes such as including a parent’s representative on the teacher’s supervision team. Although the court found these requests reasonable, they did not impose them on the school board. The court asked for more complete evaluation of the effectiveness of the children’s instruction and declared that the plan complied with the Equal Opportunities Act of 1974 that required schools to take appropriate action to overcome language barriers (Martin Luther King, Jr. Elementary School Children v. Ann Arbor School District Board 24 August 1979).

Why did some people disagree with the aims of bilingual education?

In 1977, Noel Epstein published Language, Ethnicity, and the Schools. He criticized the federal government for requiring local school districts to implement bilingual education even though evaluations of bilingual education were not positive and the direction such programs should take was unclear. He wrote that bilingual education advocates wanted the federal government to finance and promote pupil attachments to their ethnic language and history because the advocates wanted to provide bilingual instruction to students who were already proficient in English. Further, Epstein complained that the US Office of Civil Rights allowed some school districts, such as San Francisco, California, to segregate students and teachers in order to maintain their culture in such bilingual programs. For Epstein, ironically, if such programs succeed in teaching children their native languages and English, they will find English more useful and the native language will fade (1-4).

Epstein claimed he did not oppose parents seeking to maintain ethnicity among their children. For him, the central question was whether the federal government should take a role in encouraging students to feel an attachment to their ethnic languages and cultures. This might not promote better relations among groups, and within ethnic groups, some people supported teaching the children the native language and other disagreed. Although bilingual educators claimed that such instruction led the children to school success, Epstein pointed out that research studies did not demonstrate these claims to be true (6-8).

Despite these criticisms, in August 1980, US President Jimmy Carter sought to extend the federal regulations making bilingual education essential in schools where more than 25% of the students belonged to the same minority group. Public reaction was immediate, overwhelming, and negative. The US Congress voted to block Carter’s changes. Further, in 1981, federal officials loosened the regulations to allow Fairfax County, Virginia to conduct intensive ESL programs instead of bilingual education with cultural components. The reason was that the Fairfax schools enrolled students representing more than fifty languages (Crawford 1989, 42).

In April 1981, Senator S. I. Hayakawa of California proposed an amendment to the US Constitution that would make English the official language of the United States. Although his proposal languished in a congressional committee, Hayakawa claimed his amendment was necessary to counteract the ethnic chauvinism of Hispanic leaders who wanted to use public schools to advance their language and culture. He added that he did not oppose people learning foreign languages: his son and daughter learned to speak and read Spanish fluently. However, Hayakawa said he wanted to prevent the United States from being torn apart by linguistic differences as was Canada, Belgium, and Sri Lanka (1992, 98-99).

An organization that Hayakawa founded, US English, supported efforts in forty states from 1986 to 1988 to make English the official language. Ten states passed such resolutions, among them were states with high concentrations
of foreign language speaking immigrants (Casanova and Arias 12). Although US English, sometimes called “Only English,” spent more than $18 million in these campaigns, the group’s influence weakened in 1987. Several administrators and a prominent spokesperson, television personality Walter Cronkite, severed ties with the group when the chair person wrote anti-Hispanic comments in a memorandum (Crawford 1992, 171-172).

In 1985, US Secretary of Education William J. Bennett called bilingual education a failed effort and made clear his intention to allow funds from the Bilingual Education Act to finance methods of teaching children who were not proficient in English without using their native language. He claimed that since 1975, the US Department of Education had required educational programs for students be conducted in large part in the student’s native language. Bennett argued that the federal government did this because of an arrogance in Washington that local school officials could not be trusted to devise the best means to teach the children. Yet, he contended, after intensive federal involvement spending more than $1.7 billion, there was no evidence that bilingual education helped the children. Consequently, he asked the US Congress to give the local school districts the flexibility to find their own best ways of dealing with the problems (1992, 359-362).

The US Congress did what Bennett wanted them to do. In 1984, when the US Congress reauthorized Title VII, it changed the law to allow about four percent of the appropriations, up to $140 million, for special alternative programs that would not use the students’ native language. When Title VII came up again for consideration in 1988, the US Congress increased the percentage of appropriations available for English only instruction to 25 percent and stipulated that, in general, three years of bilingual education was adequate for a child. Although individual evaluations could lead to exceptions, programs would not maintain a longer transition to English (Crawford 1989, 44, 83-84).

Why did the bilingual education advocates enjoy only limited success?

There is no simple answer why a group of advocates does not succeed. A serious possibility is that teachers could not or would not make the commitment to learn another language. In California in 1985-86, only 25 percent of the elementary school age children with limited English proficiency were taught by teachers fluent in their language. One district bilingual coordinator noted that the schools did not expect teachers to be fluent. Instead, they wanted teachers to have some acquaintance with the language, to know some phrases, and to be able to put the children at ease (Crawford 1989, 157). A second explanation bilingual educators wanted to advance the training in the native language and the cultural traditions. Once empirical studies called this process into question, the advocates could not easily deny requests for flexibility in choosing curricula.

Most important, bilingual education may have lost some support among Chicano leaders. In a series of interviews of 241 Chicano politicians and organizational leaders from 1978 to 1980, Rodolfo O. de la Garza found that 97 percent of the leaders supported bilingual education in principle and 67 percent strongly supported bilingual education that stretched from kindergarten through twelfth grade. Despite this apparent consensus, Garza noted several important distinctions. For example, some leaders were upset that bilingual education was implemented with teachers who were not fluent in Spanish. Other leaders felt that Mexican American students should not be segregated from other students from the elementary schools through high school. Some leaders thought that bilingual educators were promoting themselves not the children (1982, 12-14).

In all, there was no clear mandate for bilingual education. It was not clear what should be done for children whose native language was not English and it was not clear who should be entrusted with determining the curriculum. Most important, there was not a strong organization of advocacy groups who supported bilingual education. Not surprisingly, bilingual education received some federal attention, but not to the extent that its supporters wanted.

Expectations of College Life Before 1940

Mark McKenzie
University of Illinois

The entertainment products of our mass media culture are important archives of popular cultural understandings and interpretations of large social/cultural phenomena, including the social institution of higher education. This paper examines one possible way to decode the interpretive content of mass media sources and applies it to the question of student expectations of college life before 1940 as contrasting with institutional statements of student life and institutional purposes.

This work, therefore, is a study of the "sights" presented an American populace, from which they would "see" and "make out" the institution of college while they sat and watched the lights and shadows (language and visual symbolism patterns) of "picture shows". Through the use of a form of "voyeurism" (the particular "seeing" needed for criticism/critical perspective), this project makes one examination of the complex cultural message implicit in the mass media of pre World War II cinema.

Within the "postmodern present," cultural logics of mass media are privileged definers of social discourse. This definitional power persists despite the presence of private/personal knowledge of the social subject/object. Indeed, mass media's definitional power is given such primacy that interpretation of experience, even at the level of the private/personal, is defined by the images of a "public" interpretation communicated by the media.

Although the time period of this study predates the beginning of the postmodern period, in 1920's to 1940Os America, mass media agencies already existed, and of those, American cinema was the most "massive". The global context of the postmodern may not yet exist, but one of the two agencies (cinema) for knowing the reality of the "post" world (Baudrillard 1988) is already "performing" for its audience, acts/actions implicitly capable of modeling perspectives usable for constructing political conditions (Downing 1987). Consequently, in this particular instant of cinematic analysis, application of postmodern perspectives to pre-postmodern acts seems appropriate.

Cinematic Experiences

The predominant presentation pattern of fiction, both written (novels and stories) and cinematic (movies) consists of narratives recognizable and acceptable as possible worlds or possible world models. Regardless of how imaginative or innovative, how outrageous or offending the work, there remains a pattern recognizable to the observer/participant as possible or "real"(in a very loose sense the word "possible" and the word "real" are interchangeable in this context)(Booth 1961; Krieger 1984). These cinematic works, experiential texts, and private narratives are all methods of theorizing (Blum and McHugh 1984). They are methods of creating both the actors and possible societies in which they may act their roles.

These possible societies (or for this paper, possible social institutions) are "thickest" in their descriptive and interpretational potential when the observer's own experience is "thinnest" (here meaning limited). For the average cinema patron before World War II, limited "college life" experience was the "norm." First person experience of college life was at best meager for the vast majority of people alive during this period.

College from the 1920s to the 1940s was still the purview of a select elite. While John Thelin (1982) stated that by 1930 there was some small amount of public pressure to force college enrollment beyond 4 or 5 percent of 18 year olds, and Seymour Harris (1972) in "A Statistical Portrait of Higher Education," reported that by 1930 .9 percent of the total population had any college experience, and only 7.2 percent of people aged 18 to 24 were enrolled in college. Even land grant colleges had not meaningfully extend the participation in "college life" to great numbers of Americans. Again, Harris reported that in 1930, of the small percentage of the total American population enrolled in college, a nearly equal number of students attended public colleges (53%) as attended private colleges (47%).

When cinema of the prewar period told stories about college and college life only 1 in 100 Americans had any personal experience with college. Thus all but a small minority of movie theater patrons had no basis for deconstructing those cinematic collegiate images. For those who neither attended college nor intimately knew anyone who attended college, the pattern of college, life "theorized" in the cinema would be the only pattern available.

Academic History

Society and societal institutions tend to be large, complicated, and always changing (Dewey 1937). The social institution of college at the end of the progressive era was no different. It was big, complicated, not unitary and had an internally inconsistent understanding of itself.
Further, during the progressive era the "role of higher education shifted to serving the needs of the corporate state" (Spring 1994, 268). The generalizable "needs" of the corporate state meant applied research, the products of which could be put to practical use to maintain business' competitive edge in the market place.

Despite these internal inconsistencies and shifting foundational purposes, historians of higher education have declared that colleges served a consistent and universal purpose regarding the "education" of students. That characteristic purpose of the progressive college/university was "the preparation of young Americans for active lives of service" (Rudolph 1962, 356). Colleges were for "clean, hard-working, honest young men and women, determined to live good lives in a good world, gone down or up to the state college, there to broaden their horizons and to perfect their ingrained common sense" (Rudolph 1962, 264).

This last characteristic, the perfection of ingrained common sense uses the values of small town/rural America to bridge the purposes of progressive era undergraduate schooling (even at the large land grant universities) and the older collegiate purpose of creating ladies and gentlemen (Thelin 1982). Evidence supportive of this interpretation of "foundational" purpose is embodied in the rapid progressive era growth of the honor system (which sought to make students responsible for one another) and the honor society (which "identified" and "publicized" the man or woman with the most "character" [read "virtuous"] on campus) (Rudolph 1962).

These perspectives on the official purpose of college can be found in historical documents pertaining to Illinois State University. For example, to anchor the official understanding as far back as possible in time there is the statement of purpose as it appears in the Proceedings of the state board of education June 23, 1857, as reported by Dr. George Rex, chairman of committee appointed to visit various Normal schools already in existence. Dr. Rex stated that "The exclusive objects of a Normal School are and should be to train teachers, both theoretically and practically, to the complicated and responsible duties of their profession. Thus, a person capable of taking on the responsible duties of the profession would seem to be a person we might consider as possessing character. How would this be accomplished? Again, according to Dr. Rex, "this is to be accomplished by a thorough and rigorous mastery on the part of the pupil-teacher, of all those subjects which are necessary to be taught in the public schools, by a careful and systematic study of the principles of education, including teaching properly, so called, government, and the development of moral and physical power & c., and by in actual application of his knowledge to the practice of his proposed profession, in the model school." (Rex 1857, 9-11)

Reinforcement of the character building aspect of college can be found in the Statement of Purpose and Qualification in Illinois State Normal University Bulletin of 1937 June 12- August 6. On the inside of the front cover it is stated,

"The Illinois State Normal University is a character-building institution of high ideals. The attitudes, motives, and practices of students and faculty are highly comparable with the most favorable ideals prevailing in the best colleges and universities emphasizing such important characteristics."

So, college is complicated. There are even aspects of college that the inner circle of institutional membership is not happy with--mainly each other. Yet, the stated expectation of student preparation for service in life after college transcends both the complexity and internal squabbling. Such complexity is difficult (impossible) to capture in the simulacra. Will the commonality of student "education" be the image dominant in cinematic re-presentation? Will the cinema "see" and thereby "show" the same acceptance of the necessity of college for the perfection of "common sense?" The primary question of this work remains, What aspects of college life will be re-presented in film?

The Films

THE BLOT (1921) opens with a progressive sequence of views from the back of a classroom of taller and
American Educational History Journal  
Volume 27 Number 1 2000

taller students (and hopefully older). "Written" across these scenes is the proverbial saying, "Men are only boys grown tall." Once these boys are as tall as men the school classroom becomes a college classroom and the story of a college professor's family and the liabilities and disadvantages resultant from his "professions" low wages begins.

The plot of the movie was inspired by an expose on the "sorry state" of pay for the nation's college professors and local religious leaders. We are even shown, and given sufficient time to read (a technique missing in today's films), an excerpt of a Literary Review article stating that the 1921's laborer made more money than the average college professor at an endowed institution, and too many professors were leaving teaching as a result. For the movie, this social "reality" of poorly paid educators is acted out by Professor Griggs, Mrs. Griggs (his wife), their daughter (Amelia Griggs), and Mrs. Griggs' mother all "living" at the edge of starvation.

There are three young men interested in the professor's daughter. The three men see themselves in a contest for the daughter. One is a student of the professor, Phil West, son of the wealthiest college trustee. The second is the town's minister, Reverend Gates. The third is the only son, Peter Olsen, of the immigrant shoe maker neighbor. Peter is, however, only a suitor from afar, for he is never invited into the Griggs' house for even the "poor" tea.

Each suitor has different social/economic strengths and weaknesses, and the balances of these strengths and weaknesses determine who will be accepted as the husband. The "winner" of the contest is the young man able to offer the "desirable" professor's daughter the "best" life.

What does a young Indian require to become the next chief of his tribe? In BRAVEHEART (1924) it is apparently an Anglo college experience. Braveheart, whose tribe's treaty rights to salmon fishing (without which they face starvation) are denied them by the nasty cannery owner, wants to take their "case" to the Anglo court system.

Even though Billings, the foreman of Nelson Cannery, has murdered one of the tribe, Chief Standing Rock, Braveheart's father, accepting that to respond with violence is futile, declares that the tribe must "fight" in the Anglo's courts. To fight this peaceful war however, Chief Standing Rock decides that Braveheart (who has attended the government schools) must be trained. That training occurs at Strathmore College, the expenses of college paid for by the tribe after several years of patient sacrifice.

The son of the cannery owner, Frank Nelson, is also attending Strathmore College, and Frank and Braveheart are both members of the football team. While Frank Nelson squanders the money sent him by his father on gambling and parties, Braveheart writes a best selling book about the "romantic life of the red man" to pay back the tribe for his schooling.

While Braveheart and the cannery owner's daughter, who just happens to be visiting Strathmore College discover the joys of young love, Frank loses too many gambles and makes a deal with the gamblers to get out of debt by throwing the "big" game.

Braveheart catches the Frank in the act of passing the teams plays to the gamblers at half time of the big game, but is himself accused of the "act" by Frank. The football coach defers any decision of guilt to the College Committee which will meet much later. Braveheart and Frank both play in the second half of the game. During the play, Braveheart becomes the hero by scoring the winning touchdown and even kicking the *Eta point. At that later meeting of the College Committee (made up scholars, faculty and administrators and not coaches or players), however, they privilege a piece of written evidence over the physical actions of the players during the game. Despite the committee's experience with written "texts," and despite Braveheart contribution to winning the game, they misinterpret the written evidence and Braveheart is expelled.

Even though Braveheart has been wronged by the Anglo's institution of college, he stoically refuses to excuse himself or explain how he was wronged. His tribe, apparently having great faith in an Anglo justice that has twice ruled against them in their fishing rights battle, brand Braveheart and cast him out of the tribe as a liar.

Holding no grudges to either culture wronging him, Braveheart wins the tribe's case in the state supreme court just as a militant "brave" in his tribe (Ki-yote) runs out of "patience" and kidnaps the cannery owner and his daughter. Braveheart challenges the militant and impatient Ki-yote to combat and wins the day and saves everyone but Ki-yote.

With all the melodramatic trials and tribulations resolved, Dorothy sends for Braveheart and professes her love for him. Braveheart, portraying the greater awareness of race relations learned from a lifetime of persecution from Anglos (just as Peter Olsen was aware of his "low" class status), tells Dorothy, "You are white, I am red. Return to your people with an Indian's blessing--as I return to mine..."
In the film COLLEGE (1927), a poor but studious lad (Ronald) from a single parent household follows the girl of his dreams (Mary Haines) to college to win her hand from the not so studious athletic hero (Jeff Brown). Even though they are in college, the only way to compete with the athlete is to excel at athletics himself. Academic achievements do not count for much, at least in the contest that counts the most—the marriage game.

Despite early setbacks in his every attempt at athletic competence, Ronald perseveres against conniving and vicious fellow student athletes and coaches to help win the big rowing match. When his main competitor for the attentions of Mary is dismissed from school and kidnaps her (hoping to get Mary expelled as well once they are discovered together in her dorm room), Ronald almost magically becomes expert at all the physical activities he has previously demonstrated such incompetence and saves Mary from .... Ronald's victory within the physical proves to Mary that the fellow she was emotionally drawn to from the very first reel is the "real" fellow for her.

The Metaphors

The dominant class of metaphors for the portrayal of college life are those of competitive games. As such, much of the talk revolves around winning and losing. Regardless of your eventual status as "winner" or "loser", being a "winner" while in college is not dependent upon academic excellence. Braveheart became economically successful and independent of his tribe/family by authoring a popular and exploitative book, titled "The Red Skin: The Remarkable Story of the Red Man by an Indian Football Player," about the "romance of the Indian." The point is clearly made that this is a story by a football player, not by a college student. And with the advertisement for the book featuring a photograph of Braveheart in his football uniform, I doubt his book qualifies for inclusion into his "classic literature" studies at Strathmore College.

Trying out for sports team after sports team may require so much of a student's time that they may fail at their studies, but even this may not constitute failure at college if your reasons are part of a "strong human theme." Ronald, in College, who was called into the Dean's office because of poor academic performance, left that office as coxswain of Clayton's rowing team as his reward for failing in all his studies. While this gift of athletic team membership was motivated by a desire by Dean Edwards to help Ronald "win" Mary ("the girl" for Ronald), he was awarded this opportunity despite his poor academic performance. In this instance, neither failure at academics or athletics prevented Ronald from being rewarded (thereby "winning") at college.

Being a winner at the "game" of college is not necessarily to win at life. The Blot and College provide examples of people who have "won" at college but are "losers" now that they are "through" college.

Professor Griggs and Reverend Gates are both college "educated" and attempt to serve others, but are not "successful" professionally or personally. Reverend Gates can neither help himself or his church enough to meaningfully change the lives of the poor of his community or "win" himself a family. Professor Griggs can neither "win" the respect of his students or help the family he has.

In contrast it is possible to be a "loser" at college and still be a successful in life's journey. The most common way of "closing the road" through college in cinema is to be kicked out. For a female, being caught with a male in your dormitory room is reason for expulsion. Dean Edwards, discovering Mary and Ronald in each others arms in her dormitory room, asks Mary (referring to her impending expulsion), "Young lady, do you know what this means?" Mary replies, 'Yes...it means we are going to be married.' Neither Mary or Ronald finish college yet they still have the greater "prize" of one another for life. Mary and Ronald may have "failed" college, yet by their beginning a life-long commitment to each other and starting a family they are "winners."

Conclusion

We have an archive of material usable to answer important questions about public perceptions of important social institutions and phenomena. In this particular application, films are a source of information which can tell us that college, as represented in the cinema, is part of the journey of life, but neither a necessary part of or directly on the "path" of life. College is a place with walls and boundaries that separates the student from the main path of life. College is a "next step" and therefore belonging to or attached to the path of life, but because of its closure, it may be an obstacle, a side trip or detour. While as stated in College, you either "went to work or went college" after high school, indicating that there is a branch in the road, but when college ends then there is the same destination of work,
wife, and family. So, no matter which branch in the road is taken, eventually the branches in the road rejoin and the journey of life continues.

Just as it is not necessary that you attend college to proceed with life, it is not necessary that you complete college to continue on the path of life. This is part of the college as a game or contest. In games and contests there are losers and in cinema's college there are losers at the college game. Braveheart, Mary, and Ronald are all examples of students not able, for some reason or another, to finish the college race or contest. Yet they continue on in life with a capacity to serve. Braveheart wins his peoples case in court, defeats Ki-yote, and becomes chief of his tribe. Ronald and Mary marry, raise a family and upon their deaths are buried side by side after having given each other a lifetime of service.

In contrast, the people who are winners at college, particularly the college faculty in these films, are not portrayed as people better able to serve or service either themselves or others. There was Dean Edwards, successful at college but without a wife, lonely and sad--a failure at life. Professor Griggs, lecturing to students but unable to either feed his family or effecting positive change in his life. The college committee, the members of which allowed race to cloud their judgment and expelled the wrong person. And finally, the college coaches, overseeing the performance of already skilled athletes, unwilling to assist or teach someone in need, but more that willing to denigrate the lacking person.

Few characters within the films were able to positively grow in capacity and motivation to serve, but this growth was the consequence of experiences had, perceptions altered, and beliefs forged outside the walls or boundaries of college and college life. It was the experiences on the journey of life that had the greatest potential for the "education" of people. Indeed, if the college life cinematically portrayed, had any influence upon the change that occurs for some college students, that influence was negative. Frank Nelson certainly did not experience positive growth in college. He started smoking, gambling, and then cheating while in college. And since Frank gambled and cheated at college football, those behaviors were connected to his college life.

In sum, college is not the place of learning in life. You go to college either when you are able to go, or when there is something at college that you want. Most often the student's desires are either a husband or a wife. Nothing is ever learned at college. And even sports, which is more prominent and shown as more "important" and "valuable" than academics is not learned at college. Athletes simply "do" sports at college. And lastly, if you want to be successful at gaining the interest of and eventually marrying the best possible husband or wife, academics or scholarship gives no comparative advantage.

Illinois State Board of Education. Proceedings of the State Board of Education, June 23, 1857. Report by Dr. George Rex, chairman of the committee appointed to visit various Normal schools already in existence.
A 1993 political cartoon depicted the entrance to Houston, Texas's High School for the Performing and Visual Arts with the American flag flying bravely amidst dark storm clouds. The label "SCHOOL CLOSINGS" was superimposed on the clouds in white letters (School Closings 1993, 2). This cartoon represented neither the first nor the last time the community would worry about the school's continuance (Denney & Nipper 1997; Hurst 1987, 1). Founded in 1971, the school was the first of its type in the southwestern United States. As the Houston Independent School District's high school with the highest academic standardized test scores and largest number of national artistic honors, how could continuance of this exemplary school ever be seriously called into question?

The 'limelight' enjoyed by the school informally known as HSPVA was recognized both nationally, in large numbers of honorable mentions, finalists, and Presidential Scholars in the prestigious Arts Recognition and Talent Search, and locally, in the media attention and applause which greeted outstanding HSPVA academic and artistic performances (Cox 1990, 1; Magnet schools 1985, 2; Moore, D. 1997; Morgan 1997; NFAA 1988; NFAA 1998). Despite the presence of the school in this limelight, an undercurrent of tension persisted over what some people called a 'private school' funded by public dollars (Garver 1997). This tension suggested that the school teetered on the edge of a precipice.

Document and oral history research of HSPVA's twenty-five year history, from 1971 through 1997, uncovered lingering questions about the multiple purposes conceived for HSPVA in its early years, and their individual effects on HISD policy decisions. In their multiplicity and individual maturation lay the potential for discontinuance of the school.

**Dropout Prevention for the Artistically Talented**

Founding director Ruth Denney's original purpose for HSPVA was dropout prevention for the artistically talented, a purpose which was verbally reaffirmed by the succeeding three principals (Adams, A. 1997, 1, 4; Cox & Daniel 1983, 5; Stanton, 1991, F1, F7). Their reaffirmation appeared to be hollow, however, in light of 'the catch' revealed in this excerpt from a 1991 interview with the school's third principal, Annette Watson:

> We find that some students who were marginal or at risk in the past come into an environment [at HSPVA] that builds their self-esteem. We've seen some real turnarounds as a result (Stanton 1991, F1).

The catch came in these words:

> Students have to be organized and able to budget their time, prioritize and be self-disciplined (Stanton 1991, F1).

Such an ideal seems problematic certainly, or maybe just unrealistic. Marginal or at-risk students likely have not learned the time-management and self-discipline skills Watson described as necessary to survive at HSPVA. Additionally, potential dropouts, even if they had a favorable artistic audition, improbably could qualify for the highly competitive school which HSPVA had become. On-grade-level academic status was a criterion for admission for twenty of the school's twenty-five years, including those lead by Watson (Karpicke 1997; Merrill 1997; Moore, D. 1997). The purpose of dropout prevention may have remained an ideal, but, as the school matured and became more popular, the ideal became less reachable and reaffirmation of the purpose became an empty slogan. Dropout prevention, however, had never been the official HISD purpose of the school.

**Natural Racial Desegregation**

HISD General Superintendents Garver and Reagan, as well as the Boards of Education during their tenures from 1971 through 1986, hoped HSPVA would become a naturally racially desegregated (Garver 1997) or integrated (Reagan 1997) school because of its educational focus on performing and visual arts. Both superintendents believed that this goal was met when HSPVA enrolled a tri-ethnic student body (Garver 1997; Reagan 1997). However, some Black members of the HISD community questioned whether or not the school had true desegregation value (Anderson 1997). Its reputation from the 1980s through 1997 as HISD's only majority-White high school helped fuel the controversy (Markley 1992, 1E). HISD official insistence on more aggressive minority recruitment from 1986 through 1995 (Merrill 1997; Moore, D. 1997) eventually increased minority enrollment in the school's student body. The White student percentage, however, never fell below 51.5 percent, although the district's White high school population dwindled to 12.3 percent (Fall 1994 & 1996). Other aspects of HSPVA's history may have affected this outcome, but their significance remains unanalyzed. These aspects include the school's history of a color-blind philosophy, all White principals, and a predominantly White faculty.
The question of whether HSPVA's ethnic diversity should have been or should be reflective of HISD's ethnic diversity has never been publicly addressed by HISD officials (Blank, Levine & Steel 1996, 167).

The school's fourth principal, Herbert Karpicke, instituted a mentoring program in 1997 which focused not on minority under representation in his student body, but on schools which rarely sent graduates to HSPVA. He hoped to prepare talented students for audition at the school who would look forward to attending (Karpicke 1997). This sidestepping of the natural racial desegregation goal is characteristic of the HSPVA community which liked to believe the school's primary purpose was artistic meritocracy. The larger educational issue of meritocracy versus equity remains problematic within Houston as well as in the educational, scholarly, and political communities of the United States (Blank 1989, 15; Doyle & Levine 1983, 11; Klauke 1988, 2-3; Tannebaum 1995, 485).

Artistic Meritocracy

HSPVA's meritocracy was rooted for the entire twenty-five years in the artistic standards of the school's pre-professional arts preparation. Those standards were evident in rigorous auditions and graduates who immediately obtained lucrative post-secondary jobs and arts scholarships. For example, in May, 1985, 22 graduating art majors topped all previous HSPVA records by becoming the 'million-dollar class,' after art teachers worked to promote their talented students and bring them to the attention of scholarship providers (Feigelson 1985, 11; HSPVA's Million 1985, 3). On the other hand, it is impossible to ignore the fact that no HSPVA graduates have become artistic 'household names.' Evidence suggests that only 40 percent of graduates continue as adults to pursue their arts area professionally (Thomas 1997, 1D). HSPVA jazz studies director Bob Morgan offered one possible explanation for why more graduates from his program have not pursued jazz full-time:

It's a very hard career to pursue these days. I think that only a very few should have any business actually pursuing it, so I actually tell my students that. Basically, I try to talk to the upper level kids, juniors and seniors, at least once a year, and basically try to talk them out of doing this for a living. I know officially our school is career preparatory, and the way I figure it, if I can talk a kid out of doing it, he shouldn't be doing it...If they just can't imagine doing anything else, then, okay, they may have a chance (Morgan 1997).

Talking students out of making a living with their art may also have occurred in other arts areas (Schulman 1985, 580).

HSPVA's clear intention across its history was to develop each student as a whole person, not just as an artist. If the faculty and administration had emphasized solely career preparation in the arts, and if their goal had been preparing national standouts in every arts area, question exists as to whether they would have been able to recruit 600 students at all times to fill the student body.

Academic Excellence

Student academic excellence was consistently the goal of HSPVA's academic faculty members. Originally intended to provide strong fallback possibilities for students who chose not to pursue the arts professionally as adults, many of HSPVA's arts faculty supported this purpose throughout the school's history (Morgan 1997). Strong academic achievement was evident in the high standardized test scores of the student body, often the highest in the district (Cox 1990, 1; Denney & Nipper 1997; Gray, T. 1991, 9; Magnet schools 1985, 2; Richards 1993; Sanchez 1994; TEA 1997; Top-notch 1995).

Academic strength likely was an attribute of admitted applicants rather than skill fostered by HSPVA academic teaching, although most interviewed participants failed to acknowledge this possibility (Barrow 1987, 294). This understanding of causality seems particularly probable during second principal Norma Lowder's tenure, when admission required both high academic standards and artistic talent demonstrated in an audition. Whether the net effect of her emphasis on strong student academic backgrounds was positive for both students and HSPVA, or negative, destroying the school's original mission and eliminating the very students who needed the school's help, remains a matter of opinion. Unresolved conflict over this issue was evident in most of the oral history interviews conducted with adult members of the HSPVA and HISD communities. The power elite of Houston, however, revealed no such conflict.

Promoting Houston's Greatness
For Houston's White arts community and wealth/power elite, HSPVA's purpose was to promote the city's greatness. Civic leaders long had understood that great cities must have excellent arts organizations (Carleton 1985, 8; Houston/Harris 1993, 3, 4; Lanier 1992). To that end, they were happy to support financially HSPVA's visibility, through activities such as international Sister Cities' tours (Morgan 1997), and to intervene with HISD officials when they believed necessary, as they did in 1980 when they convinced Superintendent Reagan to build the school's new physical plant in the city's arts corridor (McLanahan 1997).

All four principals worked to strengthen the school's connection with the Houston power elite in order to foster support and to fund HSPVA's continuance within HISD (Anspoon 1992, 16; Moore, D. 1997; Morgan 1997; School and community 1985; Watson 1997).

In actuality, each new HISD Board of Education trustee, USD general superintendent, City of Houston mayor, and Greater Houston Partnership member personally determined how important it was for HSPVA to represent HISD, Houston, and the Houston area to the world. They did so with their public recognition or lack of recognition of the school as exemplary (Cunningham 1987, 8C; Five 1987, 1; 150 1986, 18). One nagging question remains today. If HSPVA became a majority non-White school, would it continue to enjoy the support of Houston's White power elite?

The Confusion of Multiple Purposes

From its beginning in 1971, HSPVA has stood both in the limelight and on the edge of a precipice. In part, this awkward situation seems to have persisted because stakeholders have never agreed on a unified mission for the school. Also, policy makers and administrators never seriously considered HSPVA's ability to meet simultaneously all its avowed purposes of dropout prevention, desegregation, professional artist preparation, academic excellence, and exemplary representation of HISD, Houston, and the greater Houston area. The risks of never making a decision, or of shifting purposes over time, may continue to mean that HSPVA never is fully illuminated by the limelight.

On the other hand, the multiplicity of purposes conceived for the school may, in reality, have been responsible for its continuance and exemplary status both within the local and national educational communities. With HISD's 1997 adoption of a magnet admissions policy which ignores race and ethnicity (HISD Board 1997, November 20), HSPVA is now free to flourish as the artistic meritocracy its participants wish it to be. The school community's 25-year espousal of a color-blind philosophy outlasted the political need for racial desegregation. As the purpose of natural racial desegregation expired, artistic meritocracy gained the necessary prominence to perpetuate the school's exemplary status. The same adjustment of purpose may have occurred in the 1980s when academic excellence replaced both natural racial desegregation and artistic meritocracy as most significant. Although at some points the impression was one of political peril for HSPVA, the school's continuance was assured.

Perhaps most neglected from the start has been the issue of which of the multiple purposes best serves the HSPVA students. Although continuity and dedication of faculty members sustained the academic and arts programs for a quarter century, no guarantees exist for the future. A unified mission based on student needs might help ensure the school's continuance, excellence, legitimacy as an HISD high school, and exemplary status within the performing and visual arts magnet high school genre.
