This journal is devoted to the reflective examination of educational issues and problems from the perspective of diverse disciplines. Volumes 19-25 were published under the title "Journal of the Midwest History of Education Society," while volumes 26-27 were published under the title "American Educational History Journal." Volume 19, 1991, (Editors: David B. Ripley; Norma Davis) contains 10 papers from the 26th Annual Meeting of the Midwest History of Education Society. Volume 20, 1992, (Editors: Norma Salazar Davis; David Ripley) contains 12 papers from the 27th annual meeting. Volume 21, 1994, (Joseph Watras, Editor) contains 17 papers from the 28th and 29th annual meetings. Volume 22, 1995, (Joseph Watras, Editor) contains 23 papers from the 30th annual meeting. Volume 23, 1996, (Joseph Watras, Editor) contains 26 papers from the 31st annual meeting. Volume 24, 1997, (Joseph Watras, Editor) contains 34 papers from the 32nd annual meeting. Volume 25, Number 1, 1998, (Joseph Watras, Editor) contains 28 papers. Volume 26, Number 1, 1999 (Anna Victoria Wilson, Editor) contains 33 papers. Volume 27, Number 1, 2000 (Anna Victoria Wilson, Editor) contains 15 papers. (BT)

On 5 October 1957, Americans learned that a small, man-made object was passing over their heads in orbit around the earth, placed there by a Soviet rocket. The Russian space achievement shook the confidence of Western nations in their scientific and technological superiority. In the U.S. the event also lent powerful reinforcement to a school reform movement that had begun in the early 50s and seemed to be on the wane. Sputnik gave this movement renewed vigor, expanded its base of public support, set in motion a fundamental shift in the historic relationship between the Federal government and the nation's schools, and shaped an educational policy "climate" that would last for at least six more years.

Educational historians and policy analysts have noted the similarities between this reform movement and the more recent movement symbolized by the Report of the National Commission on Excellence in Education, "A Nation At Risk." Both movements are said to be conservative, if not reactionary; both
valued something called "excellence" more than something called "equity;" both invoked fears about the U.S. falling behind other nations in international competition; and both called on the schools to become more focused on the teaching of basic subjects, science and mathematics in particular. There are, of course, some obvious differences. The 50s emphasis on the teaching of foreign languages has been eclipsed in the 80s by the demand for computer literacy. The 80s movement places reform leadership squarely in the hands of the states, while the 50s movement stressed the need for Federal action.

But beneath the level of comparing the thematic material of the two reform periods lies a deeper and more interesting question for historians of American educational policy; what are the similarities and differences in the alignment of interests—the coalitions of support for or resistance to reform—in the two periods? Is school reform in America merely a ritual dance in which interest groups take their customary places and waltz around the hall one more time, or does each reform period represent a realignment of forces interacting with a changing society and perhaps producing less predictable outcomes?

This study attempted to "locate" the positions of various groups with respect to the post-Sputnik crisis in education by focusing closely on a single city, Detroit, and on a fairly narrow time span, the Spring of 1958, when the crisis seemed to reach its peak. Major attention was given to three "groups" whose positions on the issues seemed to frame a particularly sharp conflict: the Detroit print media, the emergent leadership of Detroit's black community, and the University of Michigan, as represented by its agency for the accreditation of high schools. Passing mention was made of other groups such as high school students, school administrators, and parents.

**Detroit's Newspapers on School Reform**

The *Detroit Free Press* opened an attack on Detroit's public schools on 17 March 1958 in a four-part series with the theme, "What is a high school diploma worth?" The series ranged quite
broadly to present evidence to support its contention that the diploma was not worth very much. It included interviews with local personnel managers; a comparison of the transcripts of 50, 1958 graduates of Pershing High School with those of 50, 1933 graduates; an examination of the performance of Detroit high school graduates on the Wayne County Civil Service Examination; a case by case review of the test papers and high school transcripts of eight "C grade average" students; and finally, a comparison of our schools to those of the Soviet Union, relying mainly on the testimony of Admiral Rickover. The series' overall conclusion was that the declining value of the diploma was due to the weakening of standards that had occurred in the general, vocational, and commercial tracks, and to what it called "cafeteria-style" education. The Free Press ended with a call for a national standard for the high school diploma, as well as for the scholastic competence of teachers.

The Free Press series was certainly no "hatchet job" on the schools. They had not interviewed persons who were known "enemies of the public school" but rather people who wanted and expected the schools to do a good job. Further, they had done what they could to muster both informed opinion and empirical evidence. If they failed a basic test of fairness it was in not interviewing school officials to get their responses to the charges that the series leveled at the schools.

These responses were indeed forthcoming, but only at the end of a five-part series beginning ten days later in the Free Press's chief competitor, the Detroit News. As might be expected, the News' series began with a challenge to the Free

---

1 Detroit Free Press, 17 March 1958; Ibid., 18 March 1958; The overall finding was that "[in 1933] Detroit high school students spent 20 percent more time on academic learning than today's students do." Specifically, the 1958 students took 12 percent less English, 10 percent less history, 40 percent less mathematics, and 40 percent less science. The general track students of 1933 took only a few percentage points less academic work than the academic track students of 1958; Ibid., 19 March 1958; The paper reported that 90 percent of the more than one thousand graduates taking the Wayne County Civil Service exam for entry level clerical jobs failed the test, a test of verbal and arithmetic skills said to represent the seventh grade level; Ibid., 20 March 1958.
Press' main contention under the lead-in "short-changed?" and the headline, "Detroit High School Seniors Give Courses a Passing Grade." Based on a set of interviews of 50 Detroit seniors, "chosen at random from 50 Detroit high schools," the article concluded that students generally disagreed with the critics, and in particular, they disagreed with the critics' definitions of educational "frills," some seeing vocational courses as leading to jobs, others arguing that elective courses were a part of their "cultural" education. They expressed a confidence in their knowledge and capabilities, though a few thought that high school could have been a bit more demanding.2

Over the next few days, the series, under a new writer, took a different tone. Interviews of recent graduates now in college and of college admissions officers echoed the criticisms leveled by the Free Press. Typical remarks were, "Most high school courses are geared to the mediocre student and the slow learner." "It's too easy to get A's and the textbooks aren't practical." "Teachers don't tell how to study, stress memorizing and fail to encourage thinking in their classes." "There's too much stress on social activities." "It's too easy to slide through high school on snap courses." These college freshmen called for ability tracking, more emphasis on study skills and thinking skills, more homework, and complained that their teachers in math and science were not well prepared. The admissions directors of the state's three large state universities argued that Freshman failures were largely caused by a lack of basic skills, particularly reading, writing, and study skills.3

Finally, on the last day of this second series of critical articles, school officials got their chance. Speaking for the Detroit Board of Education, its President, Leonard Kasle, claimed that the answer to the range of criticisms that had been raised was "understaffed and overcrowded classrooms." Kasle pointed out that Detroit voters had defeated a $33,000,000 bond issue in April of 1957, a tax hike that was intended to provide 50 more classrooms in the city. Deflecting criticism

3ibid., 31 March 1958; 1 April 1958; 2 April 1958.
away from the schools and on to the voters, Kasle said, "Our children know the community does not care enough about their education to provide the seats and the staff necessary for a full day's educational program. They cannot be taught another attitude until the community itself revalues its standards."  

There can be no doubt about the financial difficulties of the system, but the papers had raised issues they felt had nothing to do with finance. What about the "bloated" curriculum, the "cafeteria-style" education, the "decline of standards?" In a classic evocation of the threat of the dropout, Arthur MacGrath, Assistant Superintendent for Secondary Education, said, "We are trying to keep the dropout rate down and keep youngsters in school as long as possible by offering interesting, attractive and constructive courses. Don't forget, many students are late bloomers and don't realize the value of education until they are seniors." 

Speaking for the teachers and admitting that many of their former students' complaints were accurate, Antonia Kolar, President of the Detroit Federation of Teachers, and Raymond Mroch, head of the Detroit Education Association, cited working conditions, particularly class size, as the chief causes of the difficulties. But much of the blame belonged on the students, themselves, since "many students don't realize the value of education until they reach college. They suddenly discover they should have taken other courses and consequently find themselves in trouble." 

Were Detroit high school students typical of high school students generally in their support for "cafeteria style" educa-

5 The Detroit Board of Education seriously debated a year-round school proposal by two of its staff members later in the Spring, and several of the high schools were severely overcrowded. Detroit Free Press, 11 April 1958; 12 April 1958; Despite their criticisms of educational quality in the city, both newspapers editorially supported the bond issues and mileage requests during this period. Editorial, Detroit Free Press, 20 March 1958; Editorials, Detroit News, 10 April 1958 and 14 April 1958.
7 Ibid.
tion? A survey by the Youth Research Institute, reported in April 1958 that 65 percent of those interviewed felt that the U.S. education system was the best in the world, 75 percent felt that they had access to the courses they wanted and that they should not be forced to take "tough" courses, and a solid 80 percent were convinced they were receiving a "good" education.8

What about school leaders elsewhere? Were Detroit administrators typical of the country as a whole? The American Association of School Administrators, meeting in Cleveland in the Spring of 1958, voted 4-1 for a 40 to 44 week school year, taking this position as a response to what they perceived as "increasing demands for expanded curriculum."9 The National School Boards Association took the curriculum as its main theme in 1958, yet little was said except that boards should exert more authority over curriculum matters. More revealing, perhaps, was a poll of eleven hundred high school principals taken by George Gallup. His poll showed that a large majority believed that "high schools today demand far too little work of students," that "there are far too many easy courses and too much 'automatic promotion,'" that there is "too little emphasis on reading and too much emphasis on extra-curricular activities such as athletics."10 They were also highly critical of teacher education programs, placing much of the blame for the educational crisis on poorly prepared teachers.

In Detroit, when the city's press raised serious charges about the deterioration of academic quality in the schools, school officials deflected the criticism onto the voters and onto the students, repeating a fundamental ideology of secondary education that had been dominant in their thinking at least since the thirties.11 In this, they seem not to have shared the views

of a majority of the nation's high school principals, who generally supported the contentions of the press that educational quality had slipped.

**Black Leaders on School Reform**

In 1955, Dr. Remus Robinson became the first black person to be elected to the Detroit Board of Education. In March of 1958, he became President-elect and ended his relative silence on racial matters. In an interview with the *Michigan Chronicle*, he detailed a list of grievances against the school system. Teacher assignment and the racial isolation created by school attendance boundaries came in for the heaviest criticism, but Dr. Robinson also went on to complain about the system's use of intelligence tests for grade placement.\(^{12}\) "Negro children out of the South are given tests according to mid-western standards. . . . To presume these children are not intelligent on the basis of standards new to them is unfortunate and unfair." One consequence of this, according to Robinson, was that "at some high schools (in the center section of the city) courses were 'watered down' so that students were hampered in college or failed to measure up to college entrance requirements. . . . If the curriculum is heavily influenced by previous testing, students are given less than their ability and as a result are unprepared to meet the challenge of college."\(^{13}\)

In other quarters, blacks had already begun to speak out on the issue of educational quality. In the Winter of 1958, the Parents Club at McMichael Junior High School, a nearly all black school feeding into Detroit Northern High School, blasted the

\(^{13}\) *Michigan Chronicle*, 12 March 1958.
school for low academic standards. Getting no satisfaction from the school principal, the parents met with Assistant Superintendent MacGrath, who offered to allow ninth-grade students at McMichael to "take science and standard English courses not regularly offered at the school." MacGrath pointed out to the parents that "students coming to McMichael from elementary school were not prepared to do junior high school work." He did not explain why school officials did nothing about this.

Not surprisingly, the McMichael parents were not satisfied with MacGrath's explanations and on February 6, met with Superintendent Brownell to present these problems: (1) students are not required to work hard; (2) McMichael is woefully lacking in adequate equipment, except in sewing, cooking and shop; and (3) there is no set discipline policy. Brownell told the parents that it might take four to six weeks to take care of these problems, but when he was called in mid-March, he said he assumed that MacGrath had taken care of things. Oscar Dotson, head of the Parents Club, pointed out that the students were using pamphlets in the science course and had not been encouraged to buy the regular English textbook. Dotson expanded his criticisms to include low academic standards at Northern High School and other predominantly Negro elementary and secondary schools.

On 24 March, Dotson and others aired their grievances at a Board meeting. Mentioned were the lack of college preparatory courses, the failure of teachers to encourage students to strive for high standards, outdated or no textbooks and other equipment, teacher indifference to bad conduct, no adequate punishment policy, and no efficient counseling system. Brownell responded that he had attempted to correct some of the conditions. He defended the use of pamphlets instead of a text in the science class on the grounds that students needed to have the most current information available. Generally, he

---

14 Ibid., 22 March 1958.
15 Ibid.
said that every effort was being made to counsel students to their "best advantage."  

On 12 April, this skirmish dropped from public view, but in its final moment, McMichael's principal, Luther Hail, made a crystal clear statement of the school administrators' understanding of educational opportunity. Mr. Hail said that the adverse publicity his school had received was not fair.

The faculty spends a lot of time studying the records of incoming 7Bs. We try and group them, by achievement tests, IQ scores, teacher ratings and reading score according to their learning capabilities. . . . We will take the children along as fast as they will go. Our teachers are making a sincere attempt to adjust the work to meet a student's needs. . . . In the present 7B grade, of five sections, there is one section of the better students. The other four sections are made-up of mediocre students.  

The administration's response to criticisms from Detroit’s black community was to defend an understanding of "equality of opportunity" that was at sharp variance with that of the McMichael parents. The parents were concerned with the lack of an educational climate which might prepare their youngsters for college. The view held by those within the family of professional educators, Detroit’s school leaders included, was perhaps best summed up in the report of a group of University consultants to a citizen's advisory committee appointed in 1957.  

Discussing in particular the general curriculum, the one followed by at least a third of all high school students in Detroit, the consultants operated from the premise that the primary purpose of this curriculum was dropout prevention.  

---

18 Detroit Board of Education, “Findings and Recommendations of the City-Wide Citizen’s Advisory Committee on School Needs,” November 1958. This was a large "blue-ribbon" panel chaired by George Romney, then Chairman of American Motors Corporation and was the first such major citizen study of an urban school system after World War II.
There are some laymen (and a few teachers) who . . . express the wish that many of these students now in high school and in the general curriculum would join this drop-out group. 'Good riddance' they say. This is a denial of equality of educational opportunity which is one of the basic freedoms that this country and other democratic societies have subscribed to. We have always believed that every boy and girl is entitled to all the growth and development that education can help him (sic) make. To do this for all types of students, it cannot offer all an identical program. Identical education does not provide equal educational opportunity. It denies it. The school must offer all types of courses to do for each what a limited narrow program will do for a few. . . . Otherwise public education is being used to produce a large group of second-class citizens by denying them a secondary education or forcing them to take one of little value to them [italics in original].20

The view of black leaders that equality of educational opportunity meant college preparatory courses with high academic and disciplinary standards was to have some endurance. Detailed research on the shifting politics of education in Detroit has shown that as new black leaders came to the fore in the sixties, they continued to demand an end to the unfair testing and tracking of black kids into what they perceived as the dead end curricular tracks, as well as an end to discriminatory practices in teacher and pupil assignment. As late as 1966, on the eve of the Detroit riot and a shift toward the ideology of

in fact Detroit, and her data was collected in the 1957-1958 school year; "Under modern conditions of urbanized life and of our industrialized economic life it is impossible to keep all youths in school for twelve years, but it is better that as many as possible be in school, at least during their 16th and 17th years. . . . The remedy is to accept the fact that these youths exist and that they should be in school, at work on a program which they can see has some relation to the conditions of their present and immediate future living." Detroit Board of Education, Citizen's Advisory Committee on School Needs, "Consultants' Report on the Curriculum," Collection, "Detroit Public Schools Division of Community Relations," Series 1, Box 2, Folder 2-12, p.97, Archives, Reuther Library, Wayne State University.

20 Ibid., 99-100. In contrast to this ideology, Sexton said simply, "all students could be processed through high school on the assumption that someday they might want to go to college." Sexton, Education and Income, 175.

Journal of the Midwest History of Education Society [Vol. 1915
black separatism, the students at Northern High School staged a walkout to protest low academic standards and the lack of college preparatory opportunities.\textsuperscript{21}

Were the views of these black parents different from those of white parents in Detroit? Did they echo the views of parents generally, about the post-Sputnik crisis in education? A cross-section of American parents were interviewed as part of the George Gallup poll mentioned above.\textsuperscript{22} Their views seemed to support the position of Board President Kastle in that overcrowded classrooms, low teacher's salaries, and lack of discipline were seen as more serious problems than the school curriculum. Further, these parents were opposed to any such radical reform as a lengthened school year. Yet in a curious twist, a solid majority of these parents felt that everyone should have a chance to attend college, and that the government should step in to provide financial help, either in the form of student loans or income tax deductions. This at least hints at a concept of equality of opportunity that was closer to the views of Detroit's black parents than to those of its school officials.

If in the Spring of 1958, Detroit's print media and Detroit's black leaders were criticizing the Detroit schools for declining educational quality and were presenting evidence to support their views, what was the stance of the agency most clearly responsible for setting and maintaining high educational standards?

\textsuperscript{22} Detroit Free Press, 6 April 1958 through 11 April 1958; Editorial, 8 April 1958, 8.
The University of Michigan's High School Accrediting Agency

From at least the 1930s some Detroit high schools were consistently overcrowded. These were the high schools that were farthest from the city center, none enrolling large numbers of black students. In 1958, for example, six fringe high schools were nearly 50 percent over capacity necessitating split-day schedules with students receiving less than a six-hour instructional day. In the late 30s, these schools had been placed on warning by the state accreditation agency, located at the University of Michigan, for class sizes and teacher loads that exceeded the standards. The warnings were removed when enough teachers were hired to bring the situation into compliance, even though the buildings remained overcrowded.

During the 50s, several teams representing the University of Michigan accrediting system or the North Central Association of Secondary Schools and Colleges, visited these high schools for inspection purposes. While the "difficulties of the overcrowded conditions" were often mentioned in their reports, at no time was the accreditation status of these schools placed in jeopardy.23 Neither of the two accreditation systems actually had a standard dealing with the issue of building capacity.

This situation contrasted rather sharply with what happened in the case of Holland Christian High School. In the midst of the school reform debate in the Spring of 1958, Fr. Francis

---

23 This conclusion is based on a thorough examination of the accreditation files on the six high schools contained in the Archives of the former Bureau of School of Services at the University of Michigan. A possible exception to this occurred when the newly built Osborn High School sought NCA accreditation in 1957 and was denied it on the grounds of inadequate facilities. As the Spring 1959 school bond election drew near, the director of NCA accreditation for Michigan sent a letter to Detroit's papers calling attention to the rejection of Osborn and threatening to disaccredit other high schools on the same grounds. This was correctly perceived by the editors of the Free Press as an attempt to pressure the voters, not the Detroit Board of Education. See Editorial, Detroit Free Press, 28 March 1959.
C. Wade of Marquette University, addressing the American Catholic Philosophical Association in Detroit, attacked the University of Michigan for dropping the accreditation of Holland Christian High School for its refusal to offer "frill" courses, such as cooking, sewing, driving, and shop. This high school was described by Fr. Wade as having academic standards "unsurpassed in Michigan."24

A few days later, Kent Leach, the Director of the University's accrediting bureau, replied that Fr. Wade was wrong. The school had indeed been dropped for "violations" in its curriculum offerings, but by the NCA, not yet by the University. The University had merely placed the school on probation, and had not yet made a final decision to drop its accreditation.25 This was a somewhat duplicitous response, since Dr. Leach's office was actually responsible for administering both accrediting systems, albeit on the basis of two different sets of standards.

The case of Holland Christian High School illustrated just how far the concept of high school accreditation had strayed from its original intention to guarantee the quality of entering freshmen by setting high standards for the high schools, and how thoroughly it had become committed to the ideology of the differentiated curriculum. The school was first accredited by the University of Michigan in 1924 and had often been acclaimed for its academic excellence by inspecting teams. Its curriculum "deficiency" was first noted by a University inspector in 1950. Commenting on the fact that the school's enrollment had doubled since 1946, he continued;

Your school is extending the boundaries of the area which you serve and reaches as far as Hudsonville and other outlying communities. The bringing in of these pupils requires that a program be developed of sufficient scope to meet their present and future needs. The lack of adequate facilities for physical and health education, music, art,

Despite the fact that the high school added music, art, business education, and physical education over the next six years, and in the face of a clear majority vote within the parents' assembly that they did not wish to offer homemaking and industrial arts, the NCA withdrew the school's accreditation in the Spring of 1957. The NCA's action against the school was a case of the agency attempting to impose its philosophy on a community which had a pretty clear philosophy of its own, an act which was arguably in violation of NCA's own principles that "... a school should be judged, insofar as is possible, in terms of its own philosophy and the purpose which it serves in its own community ..." and "... each school should be free to determine its philosophy to the extent that it promotes the principles and spirit of American democracy."27

In summary, then, Detroit high schools which were grossly overcrowded, with students on short programs and many classes enrolling more than 50 students and which had been charged with maintaining low academic standards, lax discipline policies, and a deficient college preparatory program, continued to be fully and unqualifiedly accredited while a high school on the other side of the state, of very high academic repute was dropped for its carefully considered refusal to provide courses in homemaking and industrial arts. The significance of this was not lost on the editor of the Free Press, who said, "Educators frequently plead that parental pressure is responsible for the frill courses that have swamped school curricula. In this instance, a professional education organization has flown directly in the face of this claim." He called on the University to renounce the action by the NCA and to "demonstrate to the public that educators are responsive to public will and that high standards are what professional education organizations seek to uphold

27 Ibid., Correspondence related to NCA's warnings and final action.
rather than dissipate." An editorial writer for the University's student newspaper, the *Michigan Daily*, which had actually broken the Holland Christian High School story a month before, took an even stronger line. "From our narrow perspective it seems that the major purpose of accreditation by an association of high schools and colleges should be to insure for the colleges and universities the academic validity of a diploma from a given high school as a basis for admission. . . . In short, it is to protect the colleges from any anti-academic tendencies in the community and the school board which represents it, not to dilute the academic content of the school's curriculum."  

Further evidence of the accrediting bureau's stance with respect to the pressing educational questions of the day was the response of its director to an inquiry from the President of the Economic Club of Detroit concerning the amount of mathematics and science being studied in the state's high schools. Director Leach said that it seemed to him that the problem was not the amount of mathematics and science being offered but that other areas of the curriculum were being slighted, such as art, orchestra, and boy's vocal work! This left little doubt as to where the University's accrediting agency stood as Detroit and the nation agonized over the question of academic standards and international competition.

**Summary**

In the 1980s, the nation was declared to be "at risk" of losing its international standing because of a deteriorating educational system. Educational reform proposals poured forth

---

28 *Detroit Free Press*, 13 April 1958, sec. C.
30 Kent Leach to Harlan Hatcher, 10 December 1957, The Hatcher Papers, Box 19, Folder 9-12, Michigan Historical Collections, The Bentley Library, Ann Arbor, Michigan. The other subjects mentioned as "slighted" were foreign language, "a diversified program of social studies," and physical education.
and the national media focused a jaundiced eye on the nation's schools. Those old enough to remember saw in these proposals and this media attention echoes of a previous period, the post-Sputnik educational crisis of the late 50s. This paper sought to analyze the views of specific interest groups as they responded to that previous crisis in hopes that we might better understand the dynamics of reform in the 80s and 90s.

Then as now, the media led an attack on the schools, citing a decline in educational standards and in student achievement. They called for such things as a national examination system, more emphasis on basic subjects and basic skills, and new and better methods to teach students to think critically. Perhaps in contrast to today, these views were strongly seconded by black parents and leaders in Detroit, though they seem not to have been supported by parents at large. A national sample of high school principals also agreed that standards were dangerously low and echoed the call for a national examination. Today, while the NASSP supports curriculum reform in the high schools, it remains to be seen what position they will take on the question of national standards.

Then as now, high school students were complacent about the education they received, taking the view that American schools were the best in the world and that it would in some sense violate their "rights" to "have to take" tough courses, rather than what they enjoyed taking. If there is anything surprising about this it is the persistence of our policy of expecting high school students themselves to determine the scope and depth of the secondary education they receive.31

Finally, the accrediting agencies which were historically responsible for defining and enforcing high academic quality in the nation's schools were at least minor players in the debate of the 50s. But by then, they seem to have become so thoroughly imbued with the philosophy of "student needs" that they no longer had anything useful to contribute to a national debate over educational values. Today, they do not seem to

exercise any significant influence on educational policy, despite their attempts to remain current by recognizing different "types" of schools or by shifting to an "outcomes-based" model of accreditation.
Northern Philanthropy: Ideology and Role of the Jeanes Supervisor

Bernadine S. Chapman,
Northern Illinois University

The men and foundations created a generation-specific sphere of knowledge production which in the main was accommodative to Jim Crow societal structure and helped to produce it.¹

From the very beginning, the leaders of the philanthropic foundations aligned with the Jeanes Movement supported racial inequality in the South and accepted General Samuel Chapman Armstrong's "Hampton Idea." Consequently, what emerged were two divergent schools of thought that focused on the educational training of African-Americans: namely the new England "classical" curriculum versus "black industrial education." The reference to "black" industrial education connotes a specific type tailored to African-Americans. A type of training which prepared African-Americans for menial, subservient positions that were readily becoming non-existent in the

expanding and changing industrial economy of the New South.² But in opposition to "black industrial" educational ideology was that ideology initiated first by the missionaries: classical or "liberal arts" training. The philanthropic funds or foundation agents were seen as advocates for industrial education which was accommodative to the Jim Crow societal structure.

During the Civil War and Post Reconstruction Era missionary philanthropies, philanthropic agencies, and foundations became quite prevalent. The first philanthropists were the missionaries and next emerged the philanthropic funds or foundations. Many of the foundation administrators, agents, or financiers were intricately involved with the missionary agencies, directly or indirectly. My purpose, however, is to concentrate more on the early philanthropic funds or foundations and to discuss how their ideology, regardless of their "goodwill," was practically the same as that of the hegemonic South. Therefore, the philanthropic funds were not used to change the existing social order, but rather to educate individuals for their place within that structure. Before discussing these foundations, however, I must note briefly that the missionary philanthropies were responsible for funding a number of important black institutions and many of them, excluding Hampton and Tuskegee, were schools that promoted classical training. Paralleling the missionaries' efforts were the contributions of the emerging industrial philanthropists. This group placed emphasis almost exclusively on industrial training. Industrial philanthropy began in the postbellum South with the educational reforms of the Northern-based Peabody Educational Fund founded in 1867, supported by the establishment of the John E. Slater Fund in 1882, General Education Board, 1902, and contributions by Julius Rosenwald beginning in 1910.³

---

Only a few people made great fortunes and accumulated wealth immediately after the Civil War, therefore many individuals who needed funds sought the support of that privileged few. As fund raisers grew in numbers, so did the individual causes and the interests of the philanthropists. This necessitated new arrangements and more structure; so foundations were created to assume the growing responsibilities incurred by the philanthropists and the increasing requests made by fundraisers. These new foundations took the form of independent organizations specializing in the efficient allocation of another person's money for philanthropic purposes. An individual who made his career by dispensing the money of others became known as a "philanthropoid." The philanthropoid was responsible for collecting information, evaluating it, and providing advice, encouragement, or criticism. The emergence of large, powerful, and influential organizations began and these organization's leaders greatly affected the ideological frame for education and the dissemination of knowledge nationally, and internationally. The role that these organizations assumed and their influence on the educational ideology of rural African-Americans is important and significant.

As Berman stated, "Those who control the production and dissemination of culture and ideas influence, to a great degree, the way in which people view the world and the common sense categories into which they organize their knowledge and by which they conduct their lives." Thus, the desire to utilize ideological hegemony to further their own interest became part of the focus of the controlling class. To accomplish this feat, the philanthropic foundations recruited trustees and staffs who shared their beliefs, values, and interests. These and other important elements, used as criteria for selection, contributed to the "understanding and furtherance of their hegemony." The foundations' emphasis on the training of experts combined with their support for educational institutions, gave them exceptional leverage in the "production and dissemination of knowledge".

This was the approach utilized by the early philanthropic boards: the General Education Board, the John F. Slater and Rosenwald Fund, together with the Anna T. Jeannes Foundation, which financed the Jeannes ideological model. Philanthropic foundations were characterized as the "gate keepers of ideas." In other words, because of the significant resources available to them to use at their discretion, they were "in positions to foster certain lines of inquiry while neglecting or de-emphasizing others."\(^5\)

The George Peabody Fund, established in 1867, was the first major philanthropic attempt to aid in the educational development of those Southern states that had suffered during the Civil War. The Peabody Fund was significant because it established a precedent for the others and this fund was used for "improving education among the poorer classes of the South without regard to race. But more importantly concerning the Peabody fund, according to J. M. Stephens' assessment, was its trend-setting philosophy toward the educability of African-Americans, and its enduring influence on Jabez Lamar Monroe Curry, the fund's second administrator. Curry's philosophy helped to shape the Peabody fund and it was used as a model for most of the subsequent foundations. As Merle Curti notes, "in 1892 Jabez L. M. Curry followed the policy of cooperating with Southern opinion. This meant that segregation was maintained, vocational training promoted, a policy of inequality established in allocation of funds ... and control of the institutions kept out of Negro hands."\(^6\)

The Slater Fund was established solely for African-Americans by John F. Slater, a Rhode Islander who became rich from the manufacture of textiles. Slater was led to support education for African-Americans after hearing a sermon delivered on the

---

"Opportunity of advancing human welfare by the proper use of wealth." This and other experiences caused him to tell the minister after the sermon that he intended to contribute a million dollars for the education of African-Americans. Slater appointed a board to administer the million dollar fund and gave them complete freedom to execute policy and the distribution of his gift. According to Slater, the fund could be managed better by a group of wise and experienced individuals as opposed to just one person. However, Slater did stress that his money be distributed "in no partisan, sectional, or sectarian spirit" and that it should promote rather than discourage self-help on the part of the African-Americans in the South. Black colleges and public school systems also benefitted from this fund. However, it was the county training school which evolved as a result of this fund with a community-centered program aimed directly at the task of helping rural African-Americans improve their living conditions within the framework of segregated living. The Slater and Jeanes funds ultimately joined forces to achieve the goals of teacher training and a community-centered program implemented through the county training school.7.

The trustees for the Peabody and Slater funds (which merged in 1890) insisted on implementing the "self-help" principle. This meant that any institution aided was expected to contribute an equal amount to show growth and commitment; individuals assisted were required to work with members of their own race as evidence of being worthy recipients of the money. Two noteworthy trustees for the Slater fund in order of their service were, J. L. Curry who was previously introduced, and Wallace Buttrick. These men were particularly significant because they were vocal and adamant supporters of the "white supremacy" ideology; yet they were major spokesmen and administrators for funds primarily responsible for the education

of African-Americans. As members of these major boards, they established policy for Southern rural education. Buttrick, like Curry, expressed his views on African-Americans to his friend Robert C. Ogden, "I recognize the fact that the Negro is an inferior race and that the Anglo-Saxon is the superior race." These statements were reflective of the racial views and/or racial hegemonic ideology of these leading philanthropoids. Finally, let me note that most of the men on the Slater board were also the organizers and trustees for the other foundations supporting the Jeanes movement.8

The General Education Board, better known as the GEB, was initiated in 1902 and incorporated in 1903. It earned special recognition because of its extensive influence and financial contributions to education in the South. Curti, in his observation of the GEB, states "no other agency, public or private exerted a comparable force in shaping Negro higher education."9 The GEB began with a $1 million bequest from John D. Rockefeller. An additional $50 million was added in 1909. By 1921, the Board's endowment had risen to $129 million. "The Board," served the needs of a broad educational clientele and used its influence and power to spread its educational mandate throughout the nation.10

The Jeanes Movement began in 1908 with one, then later a corps of African-American females teaching industrial education to rural, isolated, one-room school teachers in the South. Their work was extended to the surrounding communities and they served to "link the schools and the communities through their work. The Movement ended after six often turbulent, but meaningful decades. A $1 million endowment, contributed by Anna T. Jeanes in 1907, established the Jeanes fund. It, initially was called the "Negro Rural School Fund," because it was for the singular and specific purpose of "rudimentary education" in

8 Fisher, The John F. Slater Fund, Xi, xii, xiv; Anderson, The Education of Blacks, 92.
9 Curti and Nash, Philanthropy, 173.
10 Berman, The Influence, 11.
small rural African-American southern schools and communities.\textsuperscript{11}

Anna T. Jeanes' endowment emphasized her interest in the support of small, rural one-teacher schools. This was her largest contribution but it was only one of several contributions for African-American education. She made small contributions to Tuskegee Institute through Booker T. Washington in the late nineteenth century. Contributions were also made to the Normal Industrial Institute of Fort Valley, Georgia, and Hampton Institute, Hampton, Virginia.\textsuperscript{12}

In spite of the existing social, political, and economic milieu during the six decades of the Jeanes Supervisor's movement, the Jeanes endowment proved to be an investment crucial to the educational endeavors of the Southern disenfranchised African-Americans. As Lance G. E. Jones states:

I trust that no one will be left in doubt as to the significance of this movement in the educational and social history of the South. Not only has it covered the countryside with Jeanes Teachers and brought help and hope to many a rural school, but in times both of prosperity and adversity it has provided a channel through which the better elements of both races have been able to find expression in co-operative effort for the common good.\textsuperscript{13}

The Jeanes Movement was noteworthy for its pedagogical influence on the initiation of Southern rural education and racial cooperation which it inspired between the local black and white citizens of the community. However, at this point attention is given to the andragogical role of the Jeanes Supervisor which developed out of a segregated educational system. This system perpetuated a subservient livelihood and served initially to control the socio-economic environment of rural African-Americans.

\textsuperscript{12} Ibid., 8-9.
The role of the Jeanes Supervisor highlighted the educational activities of this era which were surely “adult education in their way,” even if the goals were not always “clearcut and incisive.” Ira De A. Reid’s assessment of the Jeanes Supervisor’s work emphasized the obstacles encountered due to “The very character of the sponsoring organization or by the special and restricted range of the folk reached. Too frequently the program was concerned more for the good of the sponsoring organization’s activity program than for the good of adult education.” The interest of the sponsoring organization rather than the good of adult education was frequently reflected in the philosophy and principles of the individuals responsible for structuring and organizing the Jeanes Foundation.14

The Anna T. Jeanes Fund, assisted by the Slater and Rosenwald funds, served as the modus operandi for generating the educational ideology endorsed by the other major philanthropic agencies. As indicated by Ullin Leavell, all these agencies touched every aspect of African-American education and frequently united to assist both public and private educational efforts for African-Americans in the South. As stated before, administrators and supervisors, who shared similar ideology as the philanthropists, were recruited and employed, thus enabling the philanthropic foundations to propagate the educational training and ideology they deemed appropriate for Southern rural African-Americans.15

In actuality, the Slater, Jeanes, Rosenwald, and General Education Board cooperated with Southern opinion. Its leaders believed this was essential for the advancement of African-American education. Funds were allocated mostly for agricultural and vocational training, which supported the Southern whites’ opinion of what was needed to keep the African-American subservient. Liberal arts training and professional instruction were not as readily supported.16

15Leavell, Philanthropy 58, 155-56.
16Curti and Nash, Philanthropy, 175.
Samuel Chapman Armstrong's actions and ideas were most important when discussing the ideology and role of the Jeanes Supervisor. Armstrong formulated the underlying educational philosophy of Hampton Institute, which resulted in the efficient exploitation of African-American labor and "fitting the Negro in his place." Consequently, Armstrong stressed that through Hampton, "Southerners could save themselves from vast vagrancy and secure for themselves a supply of the best labor in the world." Armstrong's educational philosophy and practices shaped his racial prejudices and views on black labor. Armstrong, a strong advocate for the New South philosophy, viewed industry and education as complementary. Donald Spivey stated that Samuel Chapman Armstrong reminded African-Americans that "what men want is not talent, it is purpose: in other words, not the power to achieve, but the will of labor." Armstrong encouraged African-Americans to devote themselves to labor because this would enable them to develop character and purpose. In other words, Armstrong looked upon African-Americans primarily in terms of their contributions to the economic prosperity of the country.

As Northern industry required more workers, fewer domestics were available due to the upwardly mobile Irish domestic servants in New York and Boston. Immediately, Armstrong sought to fill this void. According to him, African-Americans were the natural choice for those domestic service positions, which were abandoned by the Irish for the expanding factory system. African-Americans were well qualified to fill these positions because female students were trained to dust, cook, and make beds. The male students were taught how to cultivate crops, grow gardens, and how to do basic carpentry, shoe repair, and printing. Thus, Armstrong had Hampton Institute function as a service to both Southern and Northern employers

18 Ibid., 20.
19 Ibid., 22.
who wanted African-Americans as "faithful" and "competent" laborers. Out of this historical institution and with this educational ideology the role of the "Jeanes Industrial Supervising Teacher" (now Jeanes Supervisor) was born and nurtured.

Most significant at this juncture was the introduction of Virginia Estelle Randolph, who was appointed the first Jeanes Supervisor in 1908. This appointment proved to be a significant event in the development and expansion of educational opportunities for rural African-Americans in Virginia and throughout the former slave states of the South. Miss Randolph a small-framed, intelligent, African-American female educator, was credited with the transformation of the community through the influence of her school and its activities. This of course was the basis of the Jeanes work, linking the community and school as partners. It is interesting to note that even though Miss Randolph was credited with the initiation of the Jeanes work, hence the evolvement of the Jeanes Supervisor, that this work was not truly originated by Miss Randolph. An editorial from the Southern Workman reported on the Supervisor's Conference held at Hampton Institute in 1912 and referenced Hampton as the initiator of this school-community partnership. The editorial recounted:

Some years ago Hampton sent out a young woman to introduce cooking, sewing, and better methods of teaching, and to improve schoolhouses and yards in an endeavor to "tie-up" the work of the home and school in Gloucester County, Va. This Young Negro woman went from one schoolhouse to another and showed the teachers how the curriculum could be enriched by introducing instruction in the doing of the duties of daily life. The superintendent of Henrico County, Mr. Jackson Davis, an enterprising and devoted young Southern white man, adopted the plan for his county, securing the backing of some of the best people in Richmond, and employed, to introduce the work, a young

22 Jones, The Jeanes Teacher, xi.
colored woman of exceptional ability. In many ways he improved on the plan as worked out in Gloucester County.\textsuperscript{23}

The andragogical role assumed by the Jeanes Supervisor was that of teacher trainer and community developer. The teacher training initiated by Virginia E. Randolph began with Miss Randolph teaching both children and adults to make baskets from honeysuckle vines, and clothing from flour sacks and sugar bags. As Fred Alexander recalled, "In addition to teaching reading, writing and arithmetic, she was a teacher of life and ambassadress of good will between the races." Miss Randolph taught teachers how to plan lessons and to keep good records of their students' attendance and academic work. She encouraged parents to attend classes and she visited homes regularly. She also taught Sunday School classes and was a devout church member. Thus, the Jeanes educational ideology was not merely something which naturally evolved; instead, it was a well-designed and promoted ideal which strategically linked school and community goals. The goals complemented one another in the educational and social milieu prescribed for African-Americans.\textsuperscript{24}

The Jeanes Movement spread rapidly throughout the southern states, and brought about vast educational improvements which significantly affected the one-teacher rural schools and communities. The field of education began to reflect changes occurring within the larger society, progressive education began to flourish after the First World War, and many trends affecting instruction and teacher training earned attention.\textsuperscript{25}

Jeanes Supervisors were better educated and were constantly compelled to diversify the training techniques offered for Jeanes Teachers. Again, educational innovations within the society, the educational needs of the rural family, and the growing demands placed upon the rural teachers influenced this diversity, but the most important cause to diversify emanated from

\textsuperscript{23} Editorial, \textit{The Southern Workman} 61 (January 1912): 9.
\textsuperscript{24} Alexander, \textit{Education}, 103-04.
from the nature of the Jeanes work. The Jeanes Teacher's "specialty" was general, rather than specific. It actually translated into being a "Jean of all trades." Consequently, the teachers' training exposed them to a variety of activities outside the normal classroom setting which included visits to historical and educational centers, social and cultural activities, as well as summer institutes for improved teacher certification. The summer institutes and in-service weekend meetings featured outstanding speakers like Professor Mabel Carney, a rural education Specialist from Teachers College, and Dr. Ambrose Caliver, adult educator and specialist for the United States Office of Education.26

Finally, the Jeanes Supervisor's role, apart from teacher training and classroom instruction, embraced community development. The enormous need for adult activities, however, often demanded close cooperation with other community agencies. The Jeanes Supervisor, working with these agencies, assisted in the formulation of various clubs within the rural communities. Vocational, 4-H, Farmers of America, and "Negro Home Economics Clubs" were organized along with Parent Teacher Associations which involved literacy programs and Patron Leagues. The Patron Leagues became instantly popular. They cooperated with the Jeanes Supervisor and rural teachers in the implementation of a variety of activities (e.g. securing school transportation, extending the school term, promoting health care). These activities eventually became a part of the school's overall program.27 The Jeanes Supervisor monitored numerous and diverse community concerns, but the greatest community effort was directed toward health care.

From a community perspective the Jeanes Supervisor was most instrumental in converging African-American schools into

26 Sheilie T. Northcutt, "Problems of the Jeanes Teacher in Rural School and Community Work," Box 177, Folder 1657, General Education Board Papers, Rockefeller Archives, Tarrytown, New York: Summer School Reports, "Hampton Institute Summer School for 1940," Hampton Institute, Box 177, Folder 1657, General Education Board Papers, Rockefeller Archives, Tarrytown, New York.

27 Alexander, Education, 151.
community schools primarily designed to improve living rather than just teach individual subjects. Typically, the subject matter under study related to the conditions and problems of the community. Naturally, advocates of the Jeanes Supervisors believed that a positive start towards relating the instruction to needs of the children and community, would also spur the development of social intelligence. Thus, the Jeanes Supervisors worked with the adults for many years to improve living conditions and to relate the school's instruction to the community's socio-economic environment. This was a serious concern for the white-population because they frequently viewed the school and community for African-Americans as unrelated, especially those schools following strict academic programs. Therefore, wherever possible, the Jeanes Supervisor encouraged schools to focus on the problems and needs of the community as the major emphasis in instruction.28

In conclusion, the Jeanes Foundation, with the support of many philanthropic agencies, provided rural African-Americans with educational training for the existing Southern hegemonic social order. Even though this was not the education desired or sought by many, it did serve to improve basic conditions. But more importantly, it enhanced the educational awareness needed to foster change. However, change was not the goal of the industrial philanthropists who were in positions to innovate the "status quo."

Waldemar Nielsen placed into proper perspective the true test for philanthropic programs, especially those which supported the Jeanes Movement:

"One way to judge the significance of philanthropic programs for American society is to examine their relationship to the great contemporary issues of social change...." But to determine the extent to which the big foundations address themselves to urgent issues of social change and the kinds of actions they take in trying to deal with them, it is necessary to go beyond generalities and look at their actual performance on specific problems. None is more instructive

28 Ibid., 124, 148, 18.
than that of racial discrimination in the United States. It is the oldest, the most visible, and now, in the view of many, the most ominous challenge facing American democracy."29

Sor Juana Ines de La Cruz, Feminist Educator

Norma Salazar Davis
Northern Illinois University

This study deals with the life of Sor Juana Ines de la Cruz (1648-1695) a seventeenth century nun, poet, playwright, feminist, and educator, and will focus specifically on the life circumstances that led to her decision to enter the convent of St. Jerome.

There are two reasons why this study is important. The first reason, and the most important, is that women's lives in education have not been explored as extensively as men's. When they have been explored, women's lives have not received the same importance as men's nor have they been considered as worthy of any recognition by the educational historian. These struggles of a seventeenth century nun emphasize the need for exploring the lives of women in education from a woman's perspective.

The second reason this study is important to the larger field of educational history is that it is important to reach all segments of society in order to encourage them to participate in our system of education. In many instances, some of our students are not finding the relevance of their education to their lifelong experiences. If they did find relevance, it might prevent them from becoming dropouts. By including the life and struggles of Sor Juana Ines de la Cruz as part of the history of women in education, Latin American students are provided with a literary
figure that will instill pride in themselves and their heritage. This woman is long overdue for some recognition from educational historians.

Who was she? Why did she join the convent? How did she become an outstanding literary figure in seventeenth century Mexico? These questions will be addressed in the biographical sketch that follows.

**Juana Ramirez, the Child**

Juana was born in Nepantla, Mexico on 12 November 1648, of a Spanish father and a Creole mother. Juana was illegitimate, but this fact did not carry the stigma in the seventeenth century that it does today.¹ According to Josefina Muriel, illegitimate children were often awarded all the privileges of lawful birth. This depended on the recognition and status of the father.²

Josefina Muriel gave the example of the archbishop and viceroy Fray Payo Enriquez de Rivera. He was illegitimate, but rose to eminence because his father was the count of Alcala de los Gazules who recognized him and provided him with status and support.³

Unfortunately Juana did not enjoy the same privileges of lawful birth that her friend and protector viceroy Payo Enriquez de Rivera enjoyed because her father abandoned her and her family. Juana, the youngest, had two other sisters. This explains why Juana grew up in her maternal grandfather’s house in Amecameca. Her mother turned to him for protection and support.⁴

---

¹ A creole was a Spaniard born in the New World.
² Josefina Muriel, *Cultura Femenina Novohispana* (Mexico: Universidad Nacional Autonoma de Mexico, 1982), 143.
³ Ibid.
Juana had an intense desire to learn that lasted throughout her life. "I had not yet reached the age of three when my mother sent my older sister to receive reading instruction in one of the places called Amigas," she later recalled in an autobiographical account. "I was impelled by my love and mischief to follow her; and seeing that she [my sister] was given a lesson I developed a burning desire to learn to read."\(^5\) Juana did not stop there. Thinking that she was fooling the teacher, she demanded a lesson, saying that her mother had given orders. The teacher did not believe her, but to please Juana, she gave her a lesson. Seeing the little girl's desire and ability to learn, the teacher continued the lessons. Juana learned to read in such a short time, that she had already mastered the skill before her mother found out.

By the time Juana was six or seven, her education consisted of reading and writing "with all the other labors and sewing abilities degrading to women," as she eloquently recalls in her autobiography.\(^6\)

It was about this time that she heard that there were schools and a university in Mexico City where she could study "the sciences." She began pleading with her mother to allow her to dress in man's clothes to be able to attend the university. Her mother did not comply. Juana's revenge, she tells us, was to read as many books as she could, in fact several in her grandfather's library, but not without punishments and reprimands from her mother.\(^7\)

Detractors cite this incident of wanting to dress in men's clothes to accuse Sor Juana of being overly masculine. Her most vehement critic, Ludwig Pfandl (1881-1942), a German historian whose most important books comprise psychological studies of several Spanish kings and queens, insists that "it is evident that this nun experiments very early in her infancy with the desire and the impulse to be a man." He concluded that Juana,

\(^6\) Ibid.
\(^7\) Ibid.
in failing to realize her desire to be everything that a man can be, demonstrated a lack of intellectual ability.⁸

According to Josefina Muriel, women of this era frequently wanted to dress like men in order to realize what was forbidden to them. She pointed out that Spanish literature has countless cases of women dressing up as men. The difference between these women and Sor Juana Ines was that other women did it looking for adventure, in defense of their lost honor, or as vengeance due to some kind of abuse."⁹ Juana's was simply a childhood wish stemming from her most ardent desire to learn.

Juana's notoriety spread throughout Amecameca by the time she was eleven.¹⁰ At that age she wrote her first loa (prologue to a play) to the Holy Sacrament, "Loa al Santisimo Sacramento." She entered this work in a contest at the Church of Amecameca and won. Her prize was a book.¹¹

At age eleven Juana arrived in Mexico city. She went there to live with her Aunt Maria Ramirez and her Uncle Juan de Mata. Why was she sent to live with relatives? Several things happened around this time that might have something to do with her journey to Mexico. Paz, her most recent biographer, explained that soon after her grandfather died (1655), there was a new man in her mother's life.¹² Also, her mother gave birth to Juana's stepbrother Diego. According to Paz, all these things coincided with her move to Mexico. He concluded that these are the only reasons that could explain why such a young girl would be separated from her mother.¹³

---

⁹ Muriel, Cultura, 144.
¹⁰ Her birth date was assumed to be 1651 until her birth certificate was found which listed it as being 1648.
¹¹ Julio Jimenez Rueda, Los Empeños de Una Casa (Mexico: UNAM, 1940, repr. UNAM, 1964), ix.
¹² Juana's mother had three more children by Diego Ruiz Lozano y Centeno, also illegitimate.
Juana Ramirez, the Adolescent

Her move to Mexico City represented a childhood dream coming true. Her relatives provided a home for her. More importantly, they also provided a tutor who introduced her to the study of Latin. His name was Martin de Olivas. It was customary for women to receive instruction from private tutors since they were not able to attend the university.

After twenty lessons she knew enough to pursue the language on her own. In her autobiography she explained how she accomplished this feat. Knowing that women placed so much emphasis on their hair, especially during their youth, she cut the length of her hair if she did not learn her lesson. She used her fingers to measure how much to cut, usually four to six fingers, she recalls. She complained that her hair grew rapidly and she learned slowly. Therefore, she cut it again because this was an embarrassment and a sign of her stupidity.

Latin was the language of culture and along with some Greek, was common among educated women in Old and New Spain. Therefore, Juana with her knowledge of Latin was able to achieve the highest education without setting foot in the university.

By age sixteen, Juana was becoming known all over Mexico City because she was both attractive and intellectually accomplished. She had continued to write religious poetry. At about this time, her aunt and uncle were able to place her in the palace. She became part of the vicereine’s court.

In the palace, Juana established a long and lasting friendship with the Marquesa de Mancera. La Marquesa and her

husband the Viceroy became her family and provided her with warmth, friendship and protection.\textsuperscript{19}

Juana continued reading and expanding her knowledge with the Marquesa's approval. The viceroy was amazed at how much she had read and wondered how much she really knew. He arranged to have her examined by forty learned men from the university. These men were from the various faculties such as history, philosophy, and theology. Juana's examination was a success. She won the respect and admiration of all the men present. We owe this information to her first biographer and friend, Father Calleja who got the story from Viceroy Marques de Mancera himself.\textsuperscript{20}

After this examination, there were few people that had not heard of her erudition. Her knowledge continued to expand by daily contact with the prominent and learned men who visited the palace. They in turn were received kindly and were delighted with her poetry. As Josefina Muriel points out, nobody was against her studies during this time. She was living in harmony with her immediate world.\textsuperscript{21} Why then did she join the convent?

\textbf{Sor Juana Ines De La Cruz, the Nun}

Why she chose to join the convent has been one of the mysteries surrounding Juana's life. Sorjuanistas around the world have all reached their own conclusions. Most prevalent among these is that she suffered an amorous disillusion. Octavio Paz, her most recent biographer, disagreed noting that people were mistaken in "reading a baroque text with romantic eyes."\textsuperscript{22} Instead of reading her poems as authentic confessions

\textsuperscript{19} Paz, \textit{Trampas}, 130.
\textsuperscript{20} Antonio Alatorre, "Sor Juana y los Hombres," \textit{Temas de Historia Mexiquense} (Mexico: El Colegio Mexiquense, 1987), 135.
\textsuperscript{21} Muriel, \textit{Cultura}, 146.
\textsuperscript{22} Paz, \textit{Trampas}, 143.
Octavio Paz thought we should see them as archetypes of the religious poetry of that time.²³

Octavio Paz is correct on this issue. When we read Sor Juana's poetry, we must also place it in the period in which it was written. Many of Sor Juana's works showed her great inclination to learn. She expressed in her autobiography that what she wanted the most was the freedom to dedicate her life to her studies. She herself gave this as the reason for electing convent life, and there is no reason to distrust her account.

I don't want to have the expected occupation [of a married woman] that will hinder the freedom of my studies, nor do I want the rumor from the community that might impede the peaceful silence of my books. . . .²⁴

When Sor Juana referred to her "expected occupation" she is referring to becoming a wife, and she explained in her autobiography that she had a "total disinclination to marriage."²⁵ She also expressed that she did not want the "rumor from the community" that might interrupt her reading and studying. By "community" she meant that convent life might also interfere with her studies. She admitted it when she wrote, "This made me hesitate some in my decision, until certain learned persons enlightened me that it [hesitating to join] was temptation."²⁶

According to Josefina Muriel, the "enlightened" person was Antonio Nunez de Miranda, her confessor. Muriel points out that if we read Juana's autobiography and her conversations with Nunez de Miranda, which were documented in his biography by Oviedo, we note that it was almost like a dialogue between them. When Juana stated that she did not want any responsibilities that might interrupt her studies, Nunez told her that her religious obligations would not interfere. When she insisted in asking for reassurance that religious life would not force her to abandon her studies; Nunez reassured her that it

²³ Ibid., 148.
²⁴Monterde, Sor Juana, 831.
²⁵Ibid.
²⁶Ibid.

would not, that the church approved of nuns pursuing an education, quoting the Benedictine Order that had education as one of their rules.\textsuperscript{27}

Reassured that she would not have to abandon her studies, Sor Juana entered the convent of San Jose on 14 August 1667, but was forced to leave three months later due to poor health.\textsuperscript{28} Octavio Paz thought that it was the hard life of the Carmelites that made her leave the convent.\textsuperscript{29} Both reasons were correct. Carmelite life was one of penance and mortification that her weak disposition was not able to tolerate.

Once again, Father Antonio Nunez de Miranda intervened with spiritual guidance and practical help. He convinced her to continue a religious life, but helped her find a house more suited to her inclinations. This time she entered the Convent of St. Jerome. Instead of the austere solitude of the Carmelites, St. Jerome offered her the possibility of buying her own cell. She could also have servants without breaking any rules of the religious life of St. Jerome.\textsuperscript{30} Sor Juana Ines de la Cruz entered St. Jerome on 24 February 1669.\textsuperscript{31}

In 1680 Sor Juana was commissioned to write Neptuno Alegorico (Allegorical Neptune) in honor of the new viceroy Marques de la Laguna. She was chosen to take charge of preparations for the welcoming ceremony, designing a triumphant arch and selecting a theme for the occasion. She chose Neptune as her theme.

According to Antonio Alatorre, composing the Neptuno Alegorico was important since it provided Sor Juana the opportunity to demonstrate her writing abilities. Composing Neptuno Alegorico also helped her in establishing a friendship with the viceroy and his wife Maria Luisa Manrique Lara. Maria Luisa became Sor Juana’s friend and protector, encouraging Sor

\textsuperscript{29} Paz, \textit{Trampas}, 157.  
\textsuperscript{30} Muriel, \textit{Cultura}, 147.  
\textsuperscript{31} Arroyo, \textit{Razon}, 30.
Juana to continue her writing, which Maria Luisa later published for her.\textsuperscript{32}

Father Nunez de Miranda opposed Neptuno Alegorico because it was a mundane and inappropriate subject material for a nun. He accused her of rebelling against the "masculine authority of her spiritual guide."\textsuperscript{33}

Antonio Alatorre wrote that the Jesuits were socially powerful, but that Father Nunez was the most influential Jesuit in Mexico at that time. Seeing that Sor Juana had become the court's official poet, Nunez intended to redirect her activities toward religious life in the convent.\textsuperscript{34}

Sor Juana rejected Father Nunez de Miranda's argument and produced her poetry. She confronted him in a letter.

I, my dear Father Nunez, will continue to exercise the ability to write poetry; the ability everyone knows I have. It's a pity that God, in giving me this gift, has forgotten to ask your permission to allow me to do so. Tell me, where does it say that what I do is forbidden? Aren't women rational beings also, just as men are?...

In the end, I clearly see that we do not understand each other, and the best thing for us to do is to conclude our relationship. ...

God has given me this inclination, and I did not think it was against his laws, nor against my responsibilities as a nun. I was born with it and I shall die with it.\textsuperscript{35}

In 1690, Sor Juana encountered more reprimands when she criticized Father Vieira's sermon. He was a prominent Jesuit orator from Portugal. This angered some of her Jesuit friends, especially her confessor Father Nunez de Miranda. Her one time friend and protector Bishop Manuel Fernandez de Santa Cruz, published the letter in which she criticized Father Vieira's sermon.\textsuperscript{36}

\textsuperscript{35}Aureliano Tapia Mendez, \textit{Autodefensa Espiritual} (Monterrey, N.L., 1981), in Alatorre, \textit{Sor Juana}, 144-46.
Bishop Manuel Fernandez de Santa Cruz wrote her a letter under the pseudonym of Sor Filotea de la Cruz another nun. In the letter he told her to read more books about Christ our Lord "for knowledge should enlighten us and lead us to salvation." This reprimand provoked her to write "La Respuesta a Sor Filotea de la Cruz" (autobiography and Reply to Sor Filotea de la Cruz).

In his book, Octavio Paz explained that it was about this time that Sor Juana lost all political clout from the palace and support from the Bishop. Another important point that Paz makes is that hatred toward women, especially intellectuals like Sor Juana Ines, added to her fallout with her confessor and other Jesuits.

The year 1692 was especially difficult for Sor Juana because several of her friends and protectors died, including the ex-viceroy Conde de Paredes Marques de la Laguna. The social and political conditions in Mexico deteriorated. There were peasant uprisings culminating with the burning of the Cathedral chapter and the Archive. Communications were interrupted, the roads were impassable, and hunger began to take its toll on the people.

Sor Juana's conflicts ended when she gave up her writing, and all her worldly possessions. According to Francisco Zertuche, her extensive library was confiscated by the archbishop Francisco de Aguas y Seijas. All her books were turned in to him to be sold and the proceeds to be given to the poor. A year after that a plague spread through the convent of St. Jerome, killing several nuns including Sor Juana. She died 17 April 1695.

The Americanization of the Immigrant Child in Chicago: Primary Reading Textbooks, 1900-1920

Millicent Drower
Loyola University of Chicago

In the year 1900, Chicago was the second largest city in the country and the sixth largest city in the world. It had a population of over 1,500,000 people 75 percent of whom were European immigrants and their American born children. There were many changes in the early 1900s. The Sanitary and Ship canal made it possible to provide safe drinking water for Chicago's inhabitants. The lakefront was being developed as a cultural and recreational facility in accordance with the City Beautiful movement. However the growth of the city also produced housing and social conditions that were plagued with disease, overcrowding and hunger. ¹

According to Selma Berrol,

Childhood was not for the children of the immigrants. If he came to the United states before his tenth birthday an

immigrant boy was more likely to spend his time in school; if he came at a later age, he was more likely to go to work. This was true even if his family settled in a state with compulsory education laws because during the nineteenth century and for a good portion of the twentieth these laws were erratically enforced. Girls regardless of age arrival were even less likely to go to school for any length of time.2

If immigrant children did not attend school, it did not mean they spent their days in play. Boys were usually employed as unskilled workers or worked in street trades. Girls usually helped their mothers in the routine household tasks or if mothers worked outside the home, they became surrogate mothers to younger children. Even children who went to school had little time for play. Most youngsters, especially boys, often worked after school either in cottage industries within the home or in street trades as newspaper boys, bookblacks, and the like.3

As in the past it became the job of the public schools to educate and assimilate these divergent populations into the mainstream and to instill the American ideas and culture. One of Chicago's prominent educators of the time, Ella Flagg Young voiced her concern "for children of immigrants of the tenements and of the street who made up 67 percent of the pupils in Chicago Schools in 1909. . . . The public schools must be for the poor and the rich, native and immigrant, all faiths and races, all meeting on a common ground."4 One of the tools used by educators to perpetuate cultural uniformity, goals, and visions for the American society was through primary reading textbooks.

---

3 ibid., 349.
The Mission of the Primary Reading Textbooks

In the prefaces and introductions of the primary reading textbooks, the authors and publishers clearly stated their objectives. The chief objective of the primary reading textbook was to teach the child to read. The secondary objectives which were stated just as explicitly were to develop the moral character of the child through story and illustration, to idealize the joys and pleasures of childhood, and to assimilate the child into American culture.

The reading textbooks during the first decade of the twentieth century were still rooted in the ideals and values of the late nineteenth century. Harper's Second Reader (1888) stated that the lessons in the reader were those of moral truths: the love of right doing, and an appreciation of the beautiful in nature. "Subjects relating to the history and resources of our country and the achievement of the American people thus aided in cultivating a spirit of patriotism and the love for American institutions."5 The Jones Reader Book Three (1904) stated:

The chief value of a school reader lies in the quality of the reading matter which it gives to the pupils. The literature supplied in such books should be sane, pure, wholesome, and stimulating. It should present models of thought, examples of simple but heroic living and in every way prepare the children to strive after what is worthy rather than to drift in the direction in which a chance current of life may lead them."6

By the second decade of the twentieth century the reading textbook indicated an awareness that some of the students for whom the reader was designed did not speak English or that the English language was not the child's first language. The

Aldine Reader Book One (1916) addressed this problem. "Through it [the reader] hundreds of thousands of children, non-English as well as English speaking, have learned to read quickly and intelligently."  

The Natural Method Readers First book (1914) suggested a method by which the pronunciation of words could be improved. "Children should be encouraged to read aloud at home with good expression and articulation. The expression will be improved by the consciousness of having interested listeners and the articulation, which should be one of the results of the phonic drills, will be improved by practice."  

As scholars and scientists were beginning to recognize childhood as an important stage of development so did the reading textbooks. The reader through text and illustration depicted what an ideal childhood should be. The childhood of play, innocence, discovery, and games was an aspiration and not yet a reality for most immigrant children in Chicago. The Howe Primer (1909) stated in the preface the importance of childhood: "This Primer recognizes that a child's vocabulary must follow his natural interests in his pets, toys, games, sports, his playmates, family ties, and his relation with the postman, fireman, farmer, soldier and other familiar representatives of industrial, civic and institutional life."  

Rooted in Calvinistic teachings, the American primary reading textbooks were now to be influenced by the scientific movement and a changing society. The authors and publishers were concerned with what was grade appropriate for the child, a growing urban population, and an immigrant population that was religiously and culturally different. All of these factors had to be considered and yet the aim was to perpetuate the principles and tenets of the existing mainstream society. How

---

9 Will D. Howe, Myron T. Pritchard and Elizabeth V. Brown, *The Howe Readers: A Primer* (New York: Charles Scribner's, 1901), III.
this was to be achieved is demonstrated in the analysis of the content of the primary reading textbooks.

**The Family**

The children's literature of the latter half of the nineteenth century depicted mother as ruling the family with a wise and yet firm hand. The American reader during the first two decades of the twentieth century continued to portray mother as a gentle, kind, loving, forgiving, self-sacrificing, and virtuous woman to whom a child owed obedience and devotion. It was through the image of the "sainted mother" that many of the moral and ethical virtues were to be instilled in the child.

The Harper Third Reader (1888) showed the role of the mother in two diverse stories. In one story Lillie and her brother were quarreling. Mother, upon hearing the angry voices of her children, came to find out the source of the problem. Instead of mediating the argument, she gave both her children a short poem about kindness and love to memorize. In one-half hour she returned to the children. "They felt very much ashamed, but she (mother) did not scold them. Her eye and voice were as kind as ever, and she listened quietly to them as they spoke. . . . "And now Lillie," said mother, "you may tell your side of the story first, as you are the lady."10

Not only did the mother teach her children that displays of anger were improper behavior and that they must always show love and kindness to one another, she also defined the gender roles of the children. Lillie, as the girl, was to present her story first, and implicit in that request was the idea that women have a gentler nature and should not allow quarrels to develop. The son followed with his statement that only he was to blame. The manly thing to do was to accept all the blame and protect the women.

---

In another story, in the same reader there was a glimpse of why motherhood was so revered. The mother would sacrifice anything, including her life, to protect her children. In this story a mother endeavored to save her child who had been abducted by an eagle.

She climbed up steep rocks where no one had ever dared to go. Her hands were scratched and torn with briers and thorns; her feet were bleeding, being cut by sharp rocks. Yet she did not think of any of these things for her child was in the eagle's nest. . . . 'Truly,' said an old man, who had seen it all, 'Truly, God was with her, to guide her up the steep mountain-side and keep all harm out of her way.'

The self sacrifice of mothers and the arousal of guilt and shame were not the only ways mothers were able to instill virtues in their children. Sometimes the mothers in the readers allowed the natural consequence of an action to teach the child a lesson. In one story, Prissy found a doll and returned it to the rightful owner. "Nelly would like to give you the dolly,' said Mrs. Hunt. "She left her out on the rocks. I hope you will not be such a careless mama as she was." Once again we have seen that mother in the story was a role model for the daughter. Mothers were never careless with their children.

Mothers expected their children to be obedient. The readers often presented the tragic or near tragic consequences of disobedience. An example of the dire results of disobedience appeared in the Jones Third Reader (1904). "I am surely dying, 'thought Little Quiver. 'I wish mother could know how sorry I am that I disobeyed her.' Then everything grew dark about him."

Children were not only to be obedient, but were also expected to help their parents willingly and cheerfully. They were never to frown or express their own personal needs. Children were expected to please their parents and most readers had stories where the children on their own initiative provided

\[\text{References:}\]
11 Ibid, 44-45.
12 L. H. Jones, The Jones First Reader (Boston: Ginn, 1903), 40.
13 Ibid., 162.
the parents with a treat or pleasant surprise. A child was sometimes called upon to sacrifice something very dear for the sake of a parent. In one reader, a young boy killed a pet dove so his sick mother could have the needed broth to make her well.

It was not that the reader neglected fatherhood, but that father took a lesser role. His primary responsibility was to protect and provide for the family. He was shown as a companion for his children taking them camping or sailing. Moral teaching was the province of mother sublime, but father was the ultimate ruler of his household and even mother bowed to his judgment. In one story the child Lulu was missing, both mother and nurse searched for the child but to no avail. Father arrived, "You can be of no use here, 'he said, 'Go in and stay with little Willie. He needs you.' 'I (mother) obeyed him casting but one glance at his face which was pale and anxious."14 Thus, the saintly, virtuous mother and the strong, very protective, extremely responsible, hardworking father became role models for boys and girls to follow.

**Nature and Science**

Much of the content of the readers were based on nature. It was through the love of nature that children were to learn kindness, patience, responsibility, and the love of beauty. The story rarely presented scientific information about nature, but rather the content was more fanciful and poetic. The animals and plants often had human characteristics and traits. The stories taught a moral, inspired respect for life, and developed an appreciation for the beauty of living things and the miracle of growth. Preservation of nature was valued, and the readers taught children to avoid hurting or disturbing plants or animals in their natural environment unless it was for food or some other

---

necessity. This story appeared in a first grade reader. A group of boys built a bird house and placed it in a tree. "How glad the birds will be! No harm can come to them now. The boys will be kind to the birds. They will give them crumbs." In another reader, a bluebird was talking to an iris about a girl. "She never throws pebbles in the water to disturb the minnows, nor breaks the ferns only to let them die, nor troubles us as we work and play as most children do."  

However, not all stories commended children. Some of the stories chided them for their carelessness and hurtful behavior toward plants and animals. One tale was about elves that ran a hospital for bruised and hurt plants and animals. "In your world children often torment and kill poor birds and worms and flies and pick flowers to throw away, and chase butterflies till their poor wings are broken. All these we care for and our magic makes them live again." Throughout the readers wrong doing was portrayed as producing torment to the spirit. A boy killed a woodchuck and realizing that the family would starve repented by caring for the babies. A girl through carelessness caused the death of a parrot and was forced to remember the incident always. The young reader became imbued with the ideas that all life was valuable, and though humans were stronger they had an obligation to those weaker and more helpless.

Reading textbooks in the nineteenth century often stressed religious teachings and the love of God. As the school population became more diverse and students came from various religious and ethnic backgrounds, schools by necessity became more secular and concerned with the separation of church and state. A gradual change became apparent in the reader. The role of nature became more synonymous with God.

Many stories thanked nature for providing us with the necessities of life. There was a recognition that God and all nature were one. Children read stories about the changing of the seasons and the miracle of growth. In the prefaces and

---

15 Jones, The Jones First Reader, 40.
16 Cyr, The Children's Third Reader, 187.
17 Ibid., 187.
forwards of the readers, it was stated that nature stories were included because they were of interest to the child, but the underlying messages were that God was very much part of the child's world and could be viewed in the world around the child. It would seem that nature became a veneer for nineteenth century Protestantism.

The Work Ethic

All through the readers, the value of work was stressed and manifested in many different kinds of stories. Children were shown the pleasure derived by helping their parents. The stories showed children watering plants, doing household chores, and helping with younger children. In a first grade reader, a little girl baked a cake for her father. "He will say, 'Here is my little girl.' I shall say, 'Here is a cake for you.' Then he will eat the cake. He will say, 'How good it is. I am glad you can make cake.' This will make me glad." 18 Work also provided a purpose in a child's life. A mother asked her daughter to sing her sister to sleep. The child didn't want to do this. She wanted to play instead. However, she could not find anyone to play with because everyone was busy. Alice went to her mother and said, "Mother, I came home. I could not find any playmates. No one could play all day. I do not want to play all day. I will sing sister to sleep." 19

The value of work was not the only virtue taught in the reader; also stressed were the qualities that one must have in order to be a good worker. Hard work and virtue were always rewarded. A good worker was responsible and did not neglect his duty. One such story told about a hunter who while lost in the woods came upon a little shepherd boy. He offered the shepherd a great reward if he would show him the way out of the woods. The boy refused because he couldn't leave his sheep

18 Jones, The Jones First Reader, 41.
and betray his master. The hunter was really a prince in disguise and adopted the boy as a member of his family.\(^{20}\)

A good worker was clean and practiced good hygiene. Petro, an immigrant child was a newspaper boy who had been taught cleanliness by one of his patrons: "One day the man at the head of the newsboys said to him, 'Petro how should you like to stay here and be my head boy? You sell your papers so well and are so neat and tidy. I think I shall try you at the stand for a while.'\(^{21}\) Petro did not forget to thank his kind benefactor, thus, this story not only pointed out the value of being clean and neat on the job, but also revealed the stereotyped thinking that people had about immigrants. It also conveyed to its readers the possibility that with help immigrants could become assets to the society.

The important value of honesty appeared repeatedly in various themes and stories. The person was tempted to keep the money that was found, but in the end he returned it to the rightful owner. Thus, he was rewarded not only with riches but also with a light heart.

The books also showed the results of not working. The fable of the "Little Red Hen" was repeated in many of the readers. Its theme of "if you don't work you don't eat" was clearly explained to the young reader. A variation of this story appeared in the Jones First Reader. "The girls didn't help gather eggs for the cake. Little Fred did. 'Here is a cake for my boy, who is never too busy to help his mamma.'\(^{22}\)

Even though the United States was becoming increasingly urbanized most of the stories had their origins in rural America. However, the themes showing that hard work was always rewarded, and that success was dependent on personal qualities of integrity, work habits, honesty, and doing your best were all values important to an industrial society. It is interesting to note that the stories did not expect the children (or more accurately, the boys) to become entrepreneurs, managers, or professional

\(^{20}\)Baldwin, Harper's Third Reader, 58.
\(^{21}\)Jones, The Jones Readers By Grades: Book Three, 96.
\(^{22}\)Jones, The Jones First Reader, 95.
men such as doctors, teachers, or lawyers. Perhaps the authors of these readers believed this was an impossible dream for their young readers, who for the most part, were children of the working classes.

Prior to 1905 most readers included heroic stories about American patriots and pioneers, but these readers were more interested in teaching morals and developing ethical character of which love of country was only a part. Patriotism became important about 1905 and reached greater proportions just before and after World War I. The authors of the Elson Readers stated in the preface to the first reader that in addition to the regular stories themselves, this reader also included, "present day stories, rich in ideals of home and country and of helpfulness to others--ideals to which World War has given new meaning that the school reader should perpetuate." 23 Socialization, a sense of community, and the need for Americans to become less regional and more unified were forces that stimulated this new style of patriotism.

For the child, perhaps the most important symbol of the United States was the flag. The flag was usually in evidence in every classroom and was a visible reminder of their country and its ideals of freedom and liberty. Stories and poems about the flag appeared in a first grade reader: "This is our flag. It is the flag we love. It is red, white, and blue. There are stars on our flag." 24 The flag was described in other readers as being brave and pure and true. Children were taught that the flag must be protected and defended.

Idealized stories about Benjamin Franklin, George Washington, and Abraham Lincoln appeared in many readers. Stories usually portrayed these great men as being heroic or having strong moral character. The story which follows was unusual because it showed the tenderness and humanity of a great man. A tall man went for a ride. As he was going along a country road, he saw two baby birds that had fallen from their nest. The

24 The Heath Readers: Book One (Boston: D.C. Heath, 1907), 60.
mother bird was helplessly flying about. The tall man jumped from his horse and returned the birds to their nest. "Tweet-tweet, tweet-tweet!" said the mother bird. She was trying to thank the man. Then the tall man jumped on his horse. He soon caught up with his friends. 'I had to help the bird,' he said. 'I could not have slept tonight if I had not helped her.'

The tall man was Abraham Lincoln.

Other stories about the Pilgrims and national holidays were scattered throughout most readers. The reading textbooks were to inspire students so that they might become good Americans and develop pride in the country’s past accomplishments. In turn, the child was to fulfill the American dream and be faithful to the country’s ideals.

**Commentary**

The ideals of family life and childhood as presented in primary readers were seemingly a contradiction from the reality of life for over two-thirds of the school population of Chicago, but was it really? The immigrants from southern and eastern Europe brought with them religious traditions and cultures that were different from the prevailing society. Although their values may not have been white Angle-Saxon Protestant, they were rooted in the Judaic-Christian ethic. Crowded conditions and poverty did not diminish the value of the family. The role of mother as the instructor of religion and morals and father as the provider and head of the household were as esteemed by these new arrivals as they were by the established milieu.

The value of work and the work ethic was simply reinforced by the reading textbook. Work was not a stranger to new Americans, but what was new was the belief that hard work, diligence, responsibility, and honesty would bring about a change in class status and a better way of life. The dream was

---

that possibilities for success were unlimited. It was this dream that spurred the immigrants and lower class worker.

Most new arrivals to this country had already been imbued with the ideas of freedom and economic opportunity. Patriotism and citizenship as taught in the readers only reinforced already establish values and aspirations. This was the land of hope. True, life was not easy and would not be easy, but the future was to be brighter for generations that would follow. According to Henry Parkes:

The mass migration of Europeans across the Atlantic during the period of American industrial growth was the largest such movement in all history. Yet, although it radically altered the racial composition of the American people so that by 1920 only 40 percent of them were of Anglo-Saxon descent, it had remarkable little effect on their culture and mores. Regarding the United States as a higher civilization, the immigrants were anxious to become Americanized and assimilated as rapidly as possible. . . . This vast process of assimilation by which many millions of individuals learned to repudiate the traditions of the blood and ancestry and to assume for themselves the memories of the Mayflower and the Declaration of Independence was carried through chiefly by the public schools.26

An Italian sociologist and economist Vilfredo Pareto (1848-1923) stated:

that among animals social behavior is instinctive, but that human beings require a motive for it in their thought. The individual member of human society must often be reconciled to the roles he is called on to play in it, roles that involve, for example, subordination, the performance of unpleasant or fatiguing tasks, the running of physical dangers, the acceptance of burdensome responsibilities, the renunciation of sexual freedom. To some extent the individual does this under compulsion; to some extent he is induced to do so by rewards; but to an important extent also his cooperation is voluntary, and this is only possible because

of the way he perceives himself in relation to his social universe."²⁷

The immigrants may have wanted to preserve their own traditions and institutions, but most importantly they also wanted to become Americans and proudly proclaimed their allegiance to this country. They wanted to become part of mainstream America. Society was the teacher, the reading textbook provided the method, and the immigrant was the apt and cooperative student.

Rural School Attendance of African-Americans in the Nineteenth Century: A Focus on Cass County, Michigan

Ernestine K. Enomoto
University of Michigan

Introduction

History describing the education of African-Americans in the nineteenth century has focused primarily on developments after the Civil War, concentrating on the creation of segregated schools in the South. Prior to the antebellum era, documentation was sketchy and few schools existed in either the North or the South. Generally schools for African Americans were crowded, inferior in building structures, staffed by less qualified teachers of either race, and restricted in curricula offerings. At the same time, the education of Northern African-Americans was decidedly different from that of Southerners.

Northerners being fewer in number and "freedmen", rather than slaves, tended to locate in urban areas where skilled labor was sought. Their educational needs were for public education that would include them in common school reform efforts despite their small numbers and "colored skin." In addition, they banded together to make private arrangements for schooling and hired their own teachers. By contrast, the education of Southern African-Americans was not as collectively organized. What little occurred was arranged clandestinely. Accounts of their education were based upon what happened in rural areas, primarily on plantations.

Despite the rapid industrialization in the nineteenth century and consequently an increasing urbanization occurring in the North, much of the country in that region consisted of small rural communities. Among them were communities in which African-Americans had settled and lived together with white Americans. What were the provisions for schooling the children of these rural Northerners? Were there separate schools for them? Who of the African-Americans attended school? How different were they from whites?

One such community was Calvin Township in Cass County. Located in southwestern Michigan, the county was settled by African-Americans, many of whom arrived decades before the Civil War. With its location along the freedom route for fugitive slaves and the support of sympathetic Quakers, this rural community quickly became the home of many African-Americans. Given this rural Northern setting and a substantial population of non-whites, were there differences in the school attendance patterns between African-Americans and Anglo-Americans? Did the level of school attendance change significantly over time? What personal and family factors might have contributed to school attendance? How did these change over time?

This study seeks to address these questions by analyzing a sample of U.S. Census records of Calvin Township, and contrasting school attendance between blacks and whites in the

2 Woodson and Wesley, The Negro, 256.
years 1850 and 1880, before and after the Civil War. To set
the stage, background is given of the Cass County locale and
the rural township of Calvin. This is followed by a section on
research methodology, sampling, and analysis used in this
quantitative investigation. The findings of the study are pre-
sented and concluding remarks suggest future directions for
research.

Background: Cass County

Cass County in southwestern Michigan was selected for
several reasons. First, it was a rural farming community with
racial diversity among its townships. In addition to the Potta-
wottomi Indians and white settlers, Cass had a sizeable African
American population before the Civil War. "The rural Negro
population has always consisted of widely settled individuals
and small groups in the various Northern states."3 By 1850, the
African-American population in Cass County (roughly 4 percent)
was surpassed only by Wayne County (which included Detroit)
in the state of Michigan. But the proportion of African-Ameri-
cans in Cass far exceeded that of Wayne County.4

Second, the population of African-Americans grew rapidly
from the antebellum period until the end of the century.5 As the
county was a station for the "underground railroad" serving to
transport fugitive slaves from the South to Canada, many
passed through on their way to freedom.6 It is estimated that

3 E. Franklin Frazier, The Negroes in the United States (New York: Macmillan,
1949), 197.
4 George K. Hesslink, Black Neighbors: Negroes in a Northern Rural Community
(Indianapolis, Indiana: Bobbe-Merrill,1968), 54; U.S. Census Office, Seventh
Printing Office, reprint 1976), tables 1, 2, 8.
5 The largest increase noted in census records was between 1850 and 1860
when the African-American population grew from 389 to 1,368, increasing
two hundred, 52 percent. In subsequent decades, the increase was 24 percent
in 1870 and 9 percent in 1880. U.S. Census 1850-1880.
as many as fifteen thousand fugitive slaves passed through Cass County enroute to Canada. \(^7\) The "railroad" activity and the welcome given by the Quakers made the county a "refuge and secure retreat" for African-Americans; many decided to settle in the area. \(^8\) The increasing population meant an increasing school enrollment and pressures for school improvement.

A third reason for selecting Cass County was its school system. In 1827, Michigan established a common school system throughout the territory with rural communities governing local schools. \(^9\) By 1850, there were 143 one-room schools with each school taught by one teacher. \(^10\) Unlike the urban schools which provided separate facilities for non-whites, this arrangement suggested that Cass schools accommodated the different races in the one-room school. At the same time, there was an indication that some African-Americans might have attended separate schools. At the time of his writings in 1903, Booker T. Washington noted the presence of a colored school in Calvin Center, a residential community of African-Americans. However Matthews and Hesslink suggested that racially mixed schools were present. \(^11\) Examining Cass County school attendance and the difference in patterns between the races might offer some insight into the education of African-Americans in this rural Northern setting.

---

\(^6\) The "underground railroad" referred to a clandestine network of homes used by abolitionists to harbor runaway slaves and assist their escape to freedom. The "Illinois line" was the connection from St. Louis, Missouri through Illinois, Indiana, and Michigan to the Canadian border.

\(^7\) Mae R. Schoelzow, A Brief History of Cass County (Marcellus, Michigan: Marcellus News, 1935), 59-60.

Calvin Township

The focus of this study was on the township of Calvin within Cass County, Michigan. Together with Porter township, Calvin accounted for two-thirds of the entire African-American population in the county by the Civil War period.\textsuperscript{12} Settled by the first African-Americans in 1836, the area known as Calvin Center in the eastern part of the township was populated within the decade by several small groups of "freedmen".\textsuperscript{13} Historian Alfred Matthews noted the "great preponderance of the colored people, who far outrank, in number, the white population. Calvin (was) therefore one of the Republican strongholds of the county; and did the colored people desire, they could elect one of their number to represent them and the township on the Board of Supervisors."\textsuperscript{14}

Fugitive slaves were particularly encouraged by the aid received from Quaker settlers who actively supported and staffed the underground railroad.\textsuperscript{15} William Lawson and Quaker preacher Henry Way pioneered these efforts.\textsuperscript{16} "This settlement (Calvin Township) had become attractive to fugitive slaves and freedmen because the Quakers settled there welcomed them on their way to freedom in Canada and in some cases encouraged them to remain among them."\textsuperscript{17}

While the majority were fugitive slaves coming from North Carolina, many were freedmen who had voluntarily left the South with the full knowledge of their masters. Such a group was the "Saunders colony" who arrived from West Virginia in 1849 after being freed by their master.\textsuperscript{18}

\end{itemize}
The relationship between the races seemed to be a cordial one. Hesslink commented that despite the rapid increase in African-Americans during the Civil War period, there was no indication of any racial prejudice in Cass County.\textsuperscript{19} The same sentiment was echoed by Booker T. Washington in his observations of Cass at the turn of the century. "There (was) no social mingling but otherwise the relations of the races (were) entirely friendly."\textsuperscript{20}

\textbf{Research Methodology}

As noted by Angus and Mirel, the study of school attendance has stimulated vigorous research in understanding the "rise of mass schooling" and the social distribution of schooling.\textsuperscript{21} This study focused on the latter, examining the attendance rates between the races in two different periods. The findings were based on an examination of Federal Census data records as primary sources for information on Calvin township in the years 1850 and 1880.

\textbf{Sample Size and Data Sets}

For each of the census years, a sample of cases was taken and data sets were created. For 1850, as the number of African-Americans was small ($n=156$), all cases identified as either black or mulatto were taken. An equivalent number of

\begin{itemize}

\end{itemize}
cases with race identified as "white" was selected from records listed before or after those identified as "black". The rationale for selecting in this manner was based on the assumption that the census taker surveyed in neighboring geographical areas. Thus, census records for those living in the same communities were consecutively listed. For 1880, a proportion of the African-Americans was taken (n = 232) and this reflected an oversampling (more than twice as many as the number who were Caucasian-Americans) (n = 108). Again, the selection of white cases was based on proximity to African-Americans' records. There was an attempt made to keep the sample size the same and generally retain the same number of family units for both census years.

All of the data analyses were run using a statistical package (STATVIEW) providing descriptive and comparative statistics.22

22 Statview is a statistical package enabling the researcher to perform descriptive statistics and multivariate analysis on small data sets. A complete data dictionary for each year which specifies variables is available upon request.

Notes:

1. Mean real estate value in 1850 is based on land value of usually the head of household; no data were taken in this category in the 1880 Census.
2. Mean family wealth represents the aggregated sum of the real estate value indicated in 1850; no data were taken in this category in the 1880 Census.
3. Blacks were oversampled in 1880.

Limitations of the Study: The following are caveats to be noted. First, it was planned that census years before and after the Civil War be used. Originally, 1850 and 1870 were designated. However, the data on microfilm could not be read for 1870. An alternative was to examine census year 1880. While this expanded the period of investigation from a twenty-year period to a thirty-year period, this proved useful for two reasons. First, there were major educational reforms enacted, such as free primary schooling and compulsory attendance, which might...
account for the school attendance findings. Second, consideration could be given to socio-economic changes in the fifteen years following the Civil War.

A second limitation was the reliance on census information. Restricted to census data, the study was limited in scope. Questions about family member age, gender, race, and school attendance could be retrieved but detailed family socio-economic background was not available. Assessment was made solely on the basis of the occupation of the head-of-household and family real estate value at least for 1850. In addition, there was no measure of verification against other records to determine the accuracy of these data.

Third, categories of data were different between the two years studied. For example, the variable, family real estate value, was present in 1850 but not recorded in 1880. Thus, comparisons in family income were only made for 1850. Another variable, identifying the individual’s family relationship to the head-of-household, was collected in 1880 but had not been retrieved earlier. This information was useful in more accurately determining the family size. In the 1850 census, family surname was used to identify members of the same family. In some cases, there were individuals with different family names in the same household. These were not counted as members of the same family.

Fourth, school attendance was determined on the basis of census data indicating whether the person named attended school during the previous year. However, length of time or regularity of school attendance among the children could not be determined. A child might have only attended a few months out of an entire year or perhaps only part of the year for one session.

23 Legislation during this period included the creation of union graded schools (1859), establishment of high schools, free primary education (1869), compulsory school attendance (1871, 1883, 1885). Daniel Putnam, The Development of Primary and Secondary Public Education in Michigan, A Historical Sketch (Ann Arbor, Michigan: George Wahr, 1904), 121-22.

There were also discrepancies in information between the data on school attendance and data on occupation. To illustrate, a census taker might have written a note in the occupation column that a child "attends school" but might not have checked the related column, "Attended school during the previous year". For the purpose of this study, data in the school attendance column were used exclusively and data in the occupation column were treated as merely commentary.

Given these limitations in the study, the findings offer a general picture of what occurred in 1850 and 1880. Nonetheless, an examination of school attendance can offer the historian information about the day-to-day history of rural schools in the North. It suggested what factors might have influenced the family’s decisions regarding schooling and the changing role of the state in providing education. As Katz wrote, "shifting percentages of school attendance provide important clues into elusive areas such as relationships between social class and parental attitudes; the impact of economic fluctuation and technological advance on family future and behavior; or changes in the length and nature of dependency in different sorts of families over time."25

Findings

Analyses were carried out in two steps in terms of school attendance and race. First, for each year, the group attending school was contrasted with those of school-age not attending school. What were the significant factors between these two groups? What changes were noted over the time period? Second, the sample of African-Americans attending school was compared with whites in terms of personal factors (age, gender) and family factors (size and wealth of family). What were the differences between blacks and whites? Were these significant

and sustained over time? What conclusions if any could be drawn?

**Who Attended School?**

Of the school aged children (between 4 and 19 years) in Calvin Township in the 1850 sample, 49 percent were attending school, a total of 69 out of 142. The sample reflected the state's norm for school enrollment, which was 50 percent at mid-century. By 1880, the percentage of school age children attending was seventy-four percent, a total of 99 out of 134. It was anticipated that the state's norm had also increased with free primary education and the compulsory attendance laws.

Examining the personal and family factors, one finds significant differences between the two groups. Reference is made to Table 2 for contrasts between those attending and not attending school.

**Age of Child:** In 1850, the mean age of children attending school was statistically lower (9.7 years) than the mean age of those not attending (11.7). Notably there were more students attending in the younger ages (between 4-14) than the older ages (between 15-19). By 1880, the age difference reversed, the mean age of those attending was roughly half a year more than those not attending. But age as a discriminating factor was no longer significant.

**Gender:** One might suspect that there was a gender bias toward males attending school more than females. However, there was no evidence that gender differences existed between those attending school and those not in 1850. Also, no differences were noted in 1880.

---

26 By 1850 the state had a highly stable school enrollment rate, roughly fifty percent, meaning that half of all school-aged children were attending school sometime during the year. Kaestle, *Pillars*, 106-7.

Notes:

(1) Cross tabulations were computed to examine differences between gender and school attendance;
(2) Cross tabulations were computed between race and school attendance.

Race: The child's race was a significant factor in discriminating between school attendance groupings. Only 24 percent of the school-age African-American children were attending
school (only 16 out of 67). This percentage was significantly less than expected. Of white children, there were more than expected (71 percent) in school (53 out of 75) (See Table 2 and 3). Rephrased in terms of those attending school, the racial composition was 77 percent whites, 23 percent blacks. This reversed in the group of school-aged children not attending, in which the racial composition was 70 percent blacks, 30 percent whites (See Table 4).

By 1880, there was no race difference of those attending and not attending (77 percent blacks attending and 23 percent not attending, compared with 67 percent whites attending and 33 percent not) (See Table 3). In terms of racial composition of those attending (70 percent blacks, 30 percent whites), these mirrored percentages for the total school age population. The higher percentage for blacks might be due to the oversampling and would need to be adjusted accordingly (See Table 4).

Family Size: This is an interesting variable when used to speculate about those attending school. The findings revealed that those attending school were from larger families, 7.5 members in contrast with 6.8. One might speculate that having a large family meant a large enough labor pool on the farm to enable children to attend school. While this difference was significant in 1850, it was no longer found to be so in 1880. The two groups were comparable with those attending having an average family size of 6.3 members and those not attending having 6.9 (See Table 2).

Family Wealth: When the school attendance groups were compared in terms of family wealth, it was not surprising to find

---

28 Based on a study of Hamilton, Ontario in 1851 and 1861, Katz reported wealthy families with more children sent them to school whereas families with fewer children were less likely to do so. Katz, "Who Went to School?," 440-41.
that those attending school had on average $340 more than those not attending. Poorer families were less likely to send their children to school than richer families. One might anticipate the same discrimination would be visible even thirty years later. However as the data were not available, one can only speculate that this factor remained significant.

**Were There Differences By Race?**

Comparing the school attending African-Americans with the whites in the two census years revealed some differences but these were minimized thirty years later.

Age of Student: The average age of those attending school was not significantly different between the races. Generally blacks had a higher mean age than did whites, suggesting that they went to school later and perhaps for a shorter time. This was further examined by sub-grouping by age (4-8, 9-14, 15-19). The age range where percentage of those attending was largest fell between 9-14 for blacks and between 4-14 for whites. By 1880, while there were more students attending in all three age groups, there was a sizeable increase (more than 53 percent) in attendance at the older age (between 15-19). Overall for school-age children, the percentage of attendees had increased for blacks and whites with one exception, that of whites grouped between 4-8. This might have resulted because whites had sent children to school as young as 4 years of age. By 1880, school laws had regulated the age at which a child should be sent to school.

Family Size: School attending blacks had a slightly lower family size (6.6 members) compared with whites whose family size averaged 7.8 members. This was a significant difference noted also in children grouped by ages 9-14. This group of older school attending blacks had a much lower family size (6.5 members) compared to whites (8.5 members). While the black family size did not change when the three age groups were compared, family size for whites fluctuated from a low of 7.2 for ages 4-8 to a high of 8.5 for ages 9-14.

As was the case with the first variable, age of student, by 1880 there was no significant difference in family size between the two racial groups. Noteworthy however is that the white family size had decreased and was lower than the blacks in all age groupings.

Family Wealth: This variable provided the most distinct contrast between blacks and whites with significant differences between the races in family wealth. Of those in school, blacks had on average one third the wealth that whites did. One must keep in mind that in 1850, African-Americans were relatively new to Calvin Township. The Saunders colony for example had arrived the year before in 1849. There did not seem to be much difference between the wealth of the total black sample ($330) and that of those attending school ($375). This suggests that wealth did not make a difference in determining whether a black family sent their child to school. For whites, the findings show quite a difference between younger ($897) and older children ($1271), supporting the claim that the wealthy were more able to send their children to secondary schools (including academies and colleges).

**Summary and Future Directions**

Findings from this preliminary study on school attendance patterns offer some general trends, both in grouping by attendance and by race. First, as anticipated, school attendance for both races increased between the census years. This was not surprising given the increase in schools, compulsory attendance laws, and more established community settlements. However the one exception was noted for younger age whites whose attendance percentage decreased. It was speculated that whites sent their children to school at an earlier age and that this was curtailed with the compulsory school attendance laws in place by 1880. Second, factors associated with school attendance (age, race, family size and wealth) were significant in 1850 but not in 1880. Gender was not a significant factor in either years. Third, between blacks and whites, family size was
found to be significant in the earlier census year. However by 1880, this distinction could no longer be made. While family wealth was a distinguishing factor between the races in 1850, it could not be contrasted because census data were not available in 1880.

Given the findings of this preliminary study, it is hoped that more investigation be undertaken. The following recommendations are offered for future directions. First, consideration might be given to extend the current analysis conducted. Family wealth data might be obtained from a supplementary source to contrast the 1850 findings. A variable retrieved but not analyzed was the occupation of head-of-household. This might be used in support of the family wealth variable. Another variable retrieved was the relationship to head-of-household. One might explore whether a child's direct relationship to the head of the household (as a son or daughter rather than a niece or nephew) had a bearing on school attendance. On family size, Angus and Mirel note that there are discrepancies about whether size is a predictor of school attendance. They suggested that pairing family size with birth position would make for a stronger predictor. Information on birth position could be linked with family size as a predictor variable. Alternative ways to group by age might be explored.

A second recommendation is to examine if residential segregation existed by identifying school and residence locations, determining if separate areas existed between blacks and whites, and examining residential patterns affecting school attendance as was done in Bamman's study of spatial considerations.

Finally, to supplement and validate the census data, considerations might be given to obtaining other data sources. These might include school registers, vital statistics (births, deaths), school district and township educational reports, news-

---

29 Angus and Mirel, "From Spellers", 139.

papers and manuscripts from the County. It is hoped that this study has generated interest in further investigation in the question of what constituted differences between African-American and Anglo-American school children in rural Northern communities in the nineteenth century.
Catalysts for Change: Parents of the Handicapped, 1930-1960

Janis B. Fine
Loyola University of Chicago

In considering who changes society, some have divided the world into three groups. There are those who can tolerate the everyday stresses and strains of life; they say little, and these are the average people. There are those who cannot tolerate the everyday stresses and strains of life; and they shout, and these are our leaders. Then, there are those who cannot tolerate the stresses and strains of life; and they whisper, and these are our victims. Society has generally demanded that families of disabled children whisper.¹

Somewhere, even as we speak, a child is being born with a handicap. It may be deafness, which will make the wonder of a Mozart sonata a life-long mystery. It could be blindness, precluding the child from ever knowing the grandeur of a far-off mountain range. Or it could be muscular dystrophy, which will forever deny the child from running through a grassy field or climbing an old oak tree. And somewhere, too, the parent of a

handicapped child is being born into an unexpected world of heartache, despair, and shattered dreams.

The story of the handicapped on the pages of world history is saddening and pathetic. Available documentation reveals that since ancient times there has been a misconception that the handicapped are subhuman contaminants of the human race. They have been regarded as both product and progenitor of evil heredity and social degeneracy. The story of the handicapped not only reveals their particular plight, but also reflects the struggles and conflicts of the parents in their efforts to secure understanding and hope in a too often non-accepting social order.

Though compulsory education in the United States was well in place by the early 1900s, the law mandating free public education for all handicapped children did not come into effect until the mid-1970s.² It was indeed the parents who, through joint advocacy effort, brought about federal legislation that turned around the inadequacies of educational provisions for the handicapped. The long march toward this end began in the 1930s.

Yet, what took them so long? Why had the parents not banded together sooner? What had kept them from organizing their efforts decades earlier? Why had they stood idly by while society mishandled, mistreated, and often simply neglected their needy children?

Around the turn of the twentieth century, parents of the handicapped had themselves become victims of prejudicial images. They came to be viewed as causative to social degeneracy. Two concurrent scientific developments became popularized in distorted form: Social Darwinism and Mendelian genetics. Social Darwinism came to view limitations of intelligence as stigmatic and degrading to a complex social order. Mendelian genetics applied the principles of heredity to humans, claiming that mental ability as well as physical characteristics were transmitted to offspring.

²Education for All Handicapped Children Act (Public Law 94-142) 1975 (20 U.S.C. 1401).
By 1891, in an effort to identify the causes of idiocy, the following was read at a meeting of the American Association of Superintendents of the State Schools for the Feebleminded:

The most frequent cause of idiocy is, no doubt, ill-assorted marriages: marriages of persons of the same morbid tendencies. A tendency to consumption furnishes the largest number of cases. Intemperance of parents is another cause. . . . In twenty-five percent of idiocy there is antecedent maternal anxiety and over-tax sufficient to enter as a direct or accessory cause of the infirmity.3

Soon the negative eugenics movement based on Social Darwinism was launched. By applying the Darwinian theory to the human race, it would be possible to eliminate the unfit, and man could actively assist nature in promoting the survival of the highest quality of human being.

By 1913 the Eugenics section of the American Breeder's Association, at its annual meeting, appointed a committee of its members to study and report upon "practical methods of eliminating defective germ plasma from the human population.4

The Committee, meeting in 1914, proposed:

The following classes must be considered as socially unfit and their supply should, if possible, be eliminated from the human stock if we maintain or raise the level of quality essential to the progress of the nation and our race: the feeble-minded, the pauper class, the criminaloids, epileptics, the insane, the constitutionally weak, those predisposed to specific diseases or the diathetic class, the congenitally deformed, and those having defective sense organs, such as the deafmutes, and the deaf and blind.5

The second decade of the 1900s witnessed the emergence of sterilization laws in the United States, as well as a burgeoning of state institutions. The popular consensus of the time was

---

3 Proceedings of the Association of Medical Officers of American Institutions for Idiotic and Feeble-minded Persons in Frankfort, Kentucky, 1891 (New York: Johnson Reprint Corporation, 1895), 221.
5 Ibid., 187.
that the state must take control of the defective child away from the parent, who was viewed as causative to the problem, both genetically and environmentally. In "The Burden of Feeble-mindedness," Walter Fernald addressed the Massachusetts Medical Society:

At the proper time the parents should be informed of the conditions of the child, of the necessity for life-long supervision and of the probable need of institution treatment. Sooner or later the parents will probably be willing to allow their child to be cared for in the institution. The parents who are not willing should be allowed the custody of their child, with the understanding that he shall be properly cared and provided for during his life, that he shall not be allowed to get into mischief, and that he shall be prevented from parenthood. Whenever the parents are unwilling or incapable of performing these duties, the law should provide that the child shall be forcibly placed in an institution, or otherwise legally supervised.6

Taking control away from the parents was further stressed when Fernald questioned whether parents should even be able to take their children out on parole. "We want to keep a legal hold on them. . . . We either have the choice of doing that or allowing them to be discharged and losing control."7

When it seemed parents of the handicapped would unwittingly accept society's limited investment in them, the Progressive Movement's parent education, child study, and federal programs of providing assistance to the disabled all served as an impetus for the parents of the handicapped. It was time for the smoldering outrage of handicapped parents to erupt. It was time to put an end to the rejections, the indictments, the closed doors and closed faces, the guilt, the doubt and the despair. Though myths would die slowly, and prejudicial images would persist, the Progressive Movement had set the stage for the rise of the parents.

7 Ibid., 110.
Following the 1930 White House Conference on Child Health and Protection, Elise H. Martens, the Senior Specialist in the Education of Exceptional Children Office of Education, publicly called for the collective action of the parents:

Parents hold the key to the situation in determining how much shall be done in realizing the essentials of a program for exceptional children. . . . Parents will have in their hands a great power toward shaping community attitude, promoting the work of the schools, influencing state legislation, and helping to hasten the time when each one of the exceptional children will have both at home and at school that special care which is needed for his own welfare and for society's best interest.8

Parent groups for exceptional children began to emerge as early as 1933. A group of five mothers in Cuyahoga County, Ohio, found one another and got together in an "indignation meeting" because their children had been excluded from public school. Out of this protest came the forming of a special class sponsored by the parents themselves to serve excluded children. Elsewhere in Ohio, two years later, a Downs Syndrome child was excluded from school by the local school board. The father, who was a lawyer, took the case to court. It eventually went to the Supreme Court of Ohio where he won his contention that the local school board did not have the right to exclude the child. The publicity the case received rallied other parents around him and another parent association was formed.9

Another parent group formed in Ohio in 1938 when three mothers met by accident while shopping. All had school-aged children who had been excluded from public school because of mental handicaps. They decided to see if they could band together, find other parents with the same problem, and request the local school board to give their children a chance in a specially designed training program. They found nine other

parents who were willing to admit openly they had retarded children. The twelve parents approached the school board and found them surprisingly receptive. This was something the twelve parents had individually been unable to accomplish.  

In 1939 the first parent group with handicapped children in a state school was formed in New York State. A founding member recollected:

... A day to remember, for on this day a small group of parents took the initiative and obligation to eliminate the word "forgotten" and replace it with the word "remembered." We proposed to the director of the school that parents be allowed to participate in meeting the needs of the children and providing their welfare. Approval of this was granted without hesitation... Despite the stigma, the misunderstanding, and the almost insurmountable barriers which had confronted us at every turn, we never, for even one moment, forgot the great cause of our efforts—the lonesome, forgotten children who had so little and needed so much.  

Similar stories of parent group formations began to slowly emerge around the nation. Chicago, the center of progressive reform in regular education, also aggressively assumed the leadership role in the provisions of special education. Chicago's abundance of special education programs and involved social agencies created the atmosphere in which parents of handicapped children could readily find each other. And when they did, their common needs and frustrations moved them to assemble. Nationally, one of the barriers to the formations of parent groups had been the feelings of isolation and the tendency to keep the problems hidden as guilty secrets. But in Chicago a myriad of programs put the parents in touch with each other. Problems were exposed, and realities were admitted.

---

10 Ibid., 30.
In 1939 the Parents' Association for Spastic Children's Aid was founded. In describing its objectives, the association declared:

\[\ldots\text{Our helpless children are martyrs to a cruel situation which an indifferent society has done little or nothing to remedy. Because they are affiliated with many disabilities they are unable to take advantage of tax-supported treatment or education provided for those who are simply crippled, blind or deaf. All too frequently, these children are found in institutions for the feeble-minded even though they have normal and, in some cases, superior intellects. Besides assisting in establishing and maintaining homes for dependent spastic children, this association has the general aim of educating the public concerning the problems of spastic children.}\]

In 1946 the Parents' Group of the Chicago Hearing Society was formed, followed the next year by the Mothers of Preschool Blind Children. Beginning in 1948, five Chicago groups of parents of mentally handicapped children formed in various parts of the city. They came in throngs as they sought to develop programs for their children who had been excluded from the public schools as they were found to be uneducable.

Regardless of the handicapping condition for which the parent group was formed, all parent groups developed (1) educational activities which were aimed at increasing the knowledge of the parents themselves, (2) service programs and fund-raising efforts to increase programs and facilities, and (3) strong legislative lobbying efforts.

Through the lobbying efforts of many of these parents, in 1943 the 63rd General Assembly passed legislation in the form of an Enabling Act whereby school districts in Illinois would be reimbursed by the state for the excess cost of educating educably handicapped children up to one hundred dollars per eligible child. Due again to the lobbying efforts of the blind and

\[12\text{"What is the Parents' Association for Spastic Children's Aid?" (1943), a circular issued by the Association.}\]
\[13\text{News of the Chicago Hearing Society, May-June 1946, 1.}\]
deaf, in 1945 this act was further amended to include deaf, hard of hearing, blind, and visually impaired children under provisions for the physically handicapped. The amendment in 1945 made all these groups eligible for three hundred dollars maximum aid per child.14

On a personal level, the parent groups of all varieties appeared to offer great help to their members in overcoming the feelings of isolation and the sense of frustration associated with parenting a handicapped child. The group approach to facing the inherent problems offered the advantage of reaching numbers of parents simultaneously in a relaxed, supportive atmosphere. Describing the therapeutic values of a parent group for blind children, a mother proclaimed, "This feeling of security which comes from being part of a group cannot be stressed too strongly. Nor can we truly appreciate the release that comes when, for the first time, the mother knows that people will not look at her and her child with a curious expression and does not have to wonder what they will say."15

The rise of the Chicago parent groups for handicapped children during the 1940s represented a growing and dynamic movement that was beginning to burgeon in cities and towns across the nation. The decade of the 1950s would witness the coming together of parent groups into national organizations. What had been accomplished individually would multiply a thousand-fold as parent groups coordinated their forces. This act would be a healing one. The sharing of common problems, needs, and experiences would move from the nursing of "wounded parenthood" to concern for the broadened effort of dealing with the problem of handicapped children everywhere.

Parents realized that only by banding together could they bring about the widespread changes in society which were needed. Legislators and other government leaders listened to

groups when they would not listen to individuals. Therefore, in order to exercise their newly emerging clout, parents of the handicapped began to unite nationally. The first to emerge, all in 1950, were the National Society for Crippled Children and Adults (NSCCA), the Muscular Dystrophy Association of America (MDAA), and the National Association for Retarded Citizens (NARC).

NARC's first major publication, a national newspaper entitled *Children Limited* served as a means for communicating with the various groups and interested parents and professionals throughout the country.\(^{16}\)

The uniting of parents into national organizations caught fire in the early 1950s and spread wildly as parents representing a variety of handicapping conditions became eager to assemble. Even parents of children with very rare diseases found each other and formed groups in the hopes of raising funds to underwrite scientific research. The Dysautonomia Foundation was founded in 1951, and in 1957 Billy Barty organized the Parents of the Little People of America (LPA). Fundraising efforts for the LPA aided vocational training for little people as well as medical and scientific research in causes and possible treatment of dwarfism.\(^{17}\)

The 1950s witnessed the development of a wide variety of national organizations for parents of handicapped children. Formation of such groups was not always easy. The inherent difficulties were exposed at a meeting of the American Association of Mental Deficiency in 1950 by Edith Stern, an outspoken advocate for handicapped causes in the 1950s and, herself, the mother of a mentally handicapped child. According to Stern, local interest and splinter groups made it difficult to develop a sense of national oneness. Unearthing the more emotional difficulties experienced by parents of all types of handicapped children, Stern revealed:

We lose out on a great potential for public support. We parents of retarded children have so great a sorrow that it is hard for us to believe that anyone but parents of similar children could possibly realize it to the extent of wanting to help. Then too, we are inhibited by that sense of shame from which all of us are free among ourselves but which requires hard won adjustments before we are free of it among others. We must not, however, overlook the innate goodness and kindness of people who respond when they are shown a need.18

Edith Stern felt the time was ripe for the general public to demonstrate that it would indeed respond with goodness and kindness to a shown need: the too often deplorable, heartbreaking conditions of the handicapped. She would be one of the outspoken writers of the 1950s who would bombard the as yet virgin soil of women's magazines with conditions only previously known to those personally involved in the handicapped community.

In a speech presented in May 1950, Stern thanked the editor of The Woman's Home Companion, a widely read monthly magazine, for "the vision and humanity in breaking a long, long taboo on the subject" in publishing articles on mental deficiency.19 During the previous year women had found juxtaposed among gardening tips, recipes, and the latest fashion trends, the pathetically shocking details of the handicapped world. For many readers, exposure to these conditions was a first and torturous view.

In an article entitled "Take Them Off the Human Scrap Heap," Stern had written of her observations in an institution. She told of a condition which the institution had called "restraint." An epileptic boy was living in a straight jacket though doctors said movement should be free during seizures. Elsewhere, she had come across two girls tied "like dogs on leashes," one end of a rope around their waists, another attached to a hook on the wall. Furthermore, the brighter boys

---

19 Ibid., 11.
and girls were sometimes disciplined by being placed in "untidy wards," as they were called, wards for low-grade children unable to control their toileting needs.  

By 1950 most states had abandoned the notions of restricted marriage and sterilization as a primary means of controlling future generations of mentally retarded persons. The increasing number of mentally retarded persons identified, the proliferation of special programs, revised expectancies concerning the stability of IQ scores and heredity, and lack of public and legislative support for these archaic practices rendered such practices generally obsolete. There was also growing opposition to sterilization as a substitute for the adequate supervision of young adult retarded men and women in the community. Due to some yet muddled laws on sterilization, there were exceptions. Once again Stern revealed these to the public in an article in *Woman’s Home Companion*:

> How many wrong guesses have been made about the nearly fifty thousand boys, girls, and women who have been sterilized to date? Were they really undesirable parents? Certainly Jack is a tragic example of one mistake. Some years ago Jack was a "mischief maker" and "difficult to handle" in an Oklahoma orphan’s home. Without the sanction of any psychological tests, he was shipped to the state institution for the feeble-minded. There, as a purely routine matter, he was sterilized. During World War II Jack enlisted in the army, rose to the rank of master sergeant and became a tank mechanic of considerable ability. After the war he started his own business. Meanwhile, Jack had married a normal young woman who very much wanted a child. Eventually he was compelled to tell her what had been done to him. She got a divorce.  

Parents of the handicapped began to flood the media with accounts of their heartbreaking experiences. In 1950 Pearl S. Buck wrote *The Child Who Never Grew*. It was the story of the

---

futile journey she traveled in search of someone who would offer a ray of hope for her severely retarded daughter. The book was published in its entirety in the May 1950 issue of Ladies' Home Journal, where it, according to the editor, "evoked the greatest response of any single issue feature so far."22

Two years later, Dale Evans Rogers, country-western performer and wife of Roy Rogers, wrote Angel Unaware, a moving story of their daughter Robbin who was born severely handicapped and lived to be only two years old.23 The Rogers shared their story with the public as they entertained across the country. They drew compassion and sympathy from those whose lives had been spared such tragedy. They spread comfort and strength to those parents whose lives were similarly touched by a handicapped child. Parents of handicapped children began to look inside themselves, something they had never truly allowed themselves to do. Thus began the process of confronting the toll that raising a handicapped child had taken on them, their marriages, and their families. For decades they had fought on behalf of their children for education, legislation, and humane treatment by society. Now it was time to take care of themselves.

Mrs. Max A. Murray, President of the Virginia Association for Retarded Children, spoke for thousands when she addressed what seemed to be the most common problems facing families of the mentally handicapped in her article "Needs of Parents of Mentally Retarded Children." Included were the difficulty in accepting the fact that the child is retarded, the financial drain, the theological conflicts, and the inept and insensitive advice given the parents by the medical profession.24

Articles such as Murray's were widely discussed among parents of the handicapped children during the 1950s. Parents

became more comfortable owning up to the inevitable set of
problems they were encountering. They gave themselves per-
mission to deal openly in an emotionally honest manner with
those with whom they were so closely connected--teachers,
physicians, and parents of normal children. Eventually those
"significant others" began responding in kind. The new-found
attitudes began filling the pages of professional journals:

From a social agency:

The handicapped child's security, anxiety, or lack of it, will
depend largely on the emotional stability of the home. If he
is to develop to his full potential and remain in the commu-
nity, he must be protected from disturbing interpersonal
relationships. To achieve this goal it is most urgent that
parents too, receive acceptance and understanding, and are
helped to maintain a sense of personal integrity.26

From a physician:

We have learned to distinguish between abrupt, brutal
frankness, and a sympathetic statement of fact, between a
dictatorial, take it or leave it kind of recommendation and
the sort of presentation which would appeal to parents as
the most constructive and helpful procedure, best suited
under the existing circumstances.26

From a psychiatrist:

A doctor becomes a physician in the true sense of the word
when he recognizes and respects the parents' right to decide
what they want to do in terms of their total situation,
including their own ambivalence and conflict.27

From a dean of education:

You, as the classroom teacher, have an important part in
helping the parents of your pupils. You are the parents' most

active partner in the development of their child. Together, you and the parents plan for the child and meet concrete problems in his development. On your shoulders, then, must fall much of the responsibility for helping the parents of your pupils to accept their youngsters with the love and respect which is the right of all children.28

Throughout the existence of mankind, the handicapped suffered as victims rather than beneficiaries of society's conditioning factors and attitudes. Yet, beginning with the 1930s, through massive efforts in local and national parent groups, mass media appeal, legislative efforts, and a candid display of need and emotion, the parents brought forth their own Zeitgeist: the era of the handicapped child and his parents had arrived.

Max Beberman: University of Illinois Committee on School Mathematics

Mary Margret Grady Nee
Loyola University of Chicago

The University of Illinois Committee on School Mathematics (UICSM) was a vital leader and model in the reform of mathematics education. In this report, the University of Illinois project under the direction of Max Beberman, will be seen as expanding into a well known American mathematics program concerned with the curriculum, the student, and the teacher. Vital to the generation of policies in mathematics education, UICSM projects united the college professors and secondary school teachers in a developing, experimental program. An early leader in mathematics reform, the UICSM’s contributions were unique changes in America’s secondary mathematics education. Effectuating change itself was one of UICSM’s greatest achievements.

Contrary to popular opinion, not all reforms and regeneration of mathematics education began with the extensive funding of research programs through federal provisions. Some began very quietly within university settings as research to promote a better educational experience for the university’s own students. One of the first was the University of Illinois Committee on School Mathematics developed in 1952.
The new and creative developments in mathematics education began during the post World War II years as America addressed social, humanitarian, and educational issues such as reform of mathematics education which was examined for existing strengths, fundamental weaknesses, and developmental needs. Critics cited American educational problems as a widespread national crisis that must be addressed. The educators argued about philosophical ideals, goals, and objectives. In the early 1950s, critics such as Bestor, Rafferty and Rickover attacked what they regarded as progressive extremes.

However, both the critics and defenders of the educational system realized that a united effort was vital to improve education for the future. As the issues were faced, the university researcher, the mathematician, the mathematics educator in secondary school, and community members formed the coalition that was greatly needed to reform mathematics education. If the United States' leadership in the scientific community was to be maintained, then it needed to prepare America's students for the future. All projections revealed that this future would require innovative and creative ideas generated from research done by talented and trained minds. The educational atmosphere to develop such creative minds required an expanding subject matter content, new pedagogical concepts, well designed programs, and enthusiastic well prepared teachers.

To better understand the growth of the newly emergent programs of secondary school mathematics, an investigation of one program, UICSM was analyzed. The early work of this committee anticipated other mathematics projects, workshops, and summer institutes. UICSM was a model, with its varied adventures and contributions to mathematics education, for the ones that followed.

The Illinois Committee was established in 1951 at the request of the deans of education and engineering and the head of the mathematics department. A small committee was asked to investigate and recommend means of improving the competency of beginning students in engineering programs. Max Beberman (1925-1971) a teacher in the University High School, a laboratory school at Illinois, was appointed as the director of UICSM. If the colleges desired a mathematics student to be fully capable of sustaining calculus in the freshman year, then
secondary school preparation was critical and must be fully examined. Originally funded by the University of Illinois, the UICSM received two three-year grants of nearly a half-million dollars from the Carnegie Corporation.¹

The core of the UICSM staff remained with the projects for many years. This included Herbert E. Vaughan a mathematician from the Department of Mathematics of the University of Illinois. Gertrude Hendrix, William T. Hale, Eleanor McCoy, and Max Beberman were members of the University High School faculty at Illinois. Another contributor to the textual materials was Bruce E. Meserve, a professor of mathematics at Montclair State Teachers College in New Jersey. Later writings in mathematics established him as a leader in mathematics curriculum.²

Max Beberman stressed basic principles in all his work with secondary students. He wanted them to think, to comprehend, and to abstract. His approach to mathematics was via abstract generalizations. Beberman encouraged the student to think, to draw conclusions, and to take short cuts. He expanded abstract notation and concepts using modern mathematics making the College Entrance Examination Board recommendations appear very modest, even traditional by comparison. In a high school mathematics book he wrote with Vaughan, Beberman stated, "We hope you will find that learning mathematics is often a matter of partly understanding an idea, learning about it by using it, understanding it better in the light of ideas you get later and so on."³

The very heart of UICSM's purpose was to awaken the teaching community to the abstract ideas, structure, and language of mathematics which was missing from rote, practice material then currently used in secondary mathematics. In the UICSM's program, the structure of mathematics required the

¹Max Beberman, "Improving High School Mathematics Teaching," Educational Leadership 17, 3 (December 1959): 164.
student to observe a systematic organization using undefined terms, definitions, axioms, and logical deduction to generate new concepts.

Beberman said,

The university of Illinois' project for the improvement of the teaching of secondary school mathematics seeks to bring mathematics into the teaching of mathematics, to encourage the learner to discover as much of the subject as time and circumstances will permit.⁴

As the director, Beberman's view of mathematics permeated the work of UICSM. If the secondary school student was to comprehend mathematics, then it was essential to realize that the subject matter of mathematics consisted of abstraction. These abstractions were not just symbols, but demanding entities which possessed no physical reality. From a few examples of a concept, such as examples of number five, one learned to recognize instances of abstraction of "fiveness." This would lead to a comprehension of the abstract or general view.

To comprehend the lessons and the abstractions of mathematics, the student had to understand the language and symbols of mathematics. Beberman characterized the current mathematics education as an attempt to teach the student valid means of manipulating symbols without any meaningful awareness of the abstractions. It was his hope that the work of UICSM would change this deficiency in mathematics education.

In writing and preparing materials, Beberman placed a great deal of emphasis on abstraction rather than on symbols. Too many textbooks presented mathematics as recipe type of manipulations with clever terms such as; "borrow", "carry", "cancel", or "invert and multiply". Beberman desired mathematical continuity, a flow of logical ideas, within the secondary mathematics education which came from understanding, associating, and deducing. Using the discovery method and UICSM materials containing exercises designed to clarify and to develop the awareness of mathematical abstraction, Beberman sub-

⁴ Beberman, "Improving High School," 162.
jected new materials to the most demanding test, the actual use in a classroom setting with constant evaluation by students, staff and supervising personnel.\textsuperscript{5}

Howard F. Fehr, of the Teacher College, Columbia University, saw that effective learning of mathematics required the building of an ever wider and broader foundation of concept. Even the simple idea of division in arithmetic must extend throughout algebra until the concept was extended to the ratio of $\frac{\Delta x}{\Delta y}$ within Calculus. The abstraction of division was but one concept that seemed basic to elementary manipulation, but often was not understood as an abstraction critical for advanced mathematical principles.

In any learning situation, the teacher needed to guide the student's sensory experiences and stress the importance of concept as well as skills. These were all interrelated to the development of problem-solving. There was no fixed magical sequence. Key again to the clarification and utilization of any new curricula or material was the presence and direction of the knowledgeable, pedagogically aware, and enthusiastic mathematics teacher. Fehr's views supported Beberman's ideas for UICSM.\textsuperscript{6}

The National Council of Teachers of Mathematics continued to provide members with research information designed to improve mathematics education. The published articles examined motivation, sensory learning, formation of concepts, learning theory, as well as language and drill within mathematics. Kenneth B. Henderson and Robert E. Pingry, mathematics professors at the University of Illinois, Urbana, developed the theory and practical classroom procedure for problem-solving in mathematics. They identified the steps as: (1) having a question to answer the problem to solve, (2) defining a sustained activity to lead to a goal, (3) blocking outside distraction, and (4)

\textsuperscript{5}Ibid., 164-66.
thinking how to attain a goal. We can see a parallel approach with Dewey's Complete Act of Thought. Henderson and Pingry stated,

Mathematicians are well aware of the role played by the concepts and generalizations in the deliberative process in problem-solving. It is these abstractions which make it possible to restructure or reorganize past experience and bring it to bear on the problem at hand. There is no substitute for an understanding of relationships manifested by the possession of concepts and generalizations.\(^7\)

Thus, the work of Beberman's UICSM to develop the student's ability to form abstractions within secondary mathematics education was a concept accepted by other faculty members at the University of Illinois.

Early in his own professional career while teaching at Florida State University, Max Beberman stressed the theoretical description of a literal number as a symbol for an element of a set. For him, a literal number was defined as a variable represented by a letter which symbolized an abstract quantity. If the teacher approached the student with this view of the literal number, then the anticipated result was that the literal number would become a more meaningful concept for the student. From this realistic understanding of the literal number, the student would comprehend not only the nature on the abstraction, but also utilize the symbol of the literal number within equations and scientific formulas.\(^8\)

Gertrude Hendrix, a member of the University High School, a laboratory school for the College of Education at University of Illinois, and a member of UICSM was also a professor at Eastern Illinois State College. She added to the importance of developing a logical concept for students. With this skill, the student would also have an invaluable tool to assist in the solution of indirect

---

proofs. Hendrix saw developmental stages in the understanding of logical concepts with teachers assisting their students through these stages. First the student needed a problem. Then, deductive logical equivalent statements were to be formulated for a better understanding of the problem. In order to structure these statements, the student needed to comprehend tautologies as well as truth tables. Hendrix worked with UICSM to develop a curriculum which stressed logical concepts such as a literal number, and developed exact language using a discovery approach to generate new ideas and enthusiasm from the students.9

Several number examples led the student to discover a general relationship. An example would be as follows:

Nine is greater than eight.
Eight is greater than five.
This leads to the conclusion that nine is greater than five. Several examples would allow the student to make the following generalization:

If A, B, and C are literal numbers which are elements of the set of Reals, then if A is greater than B and B is greater than C the conclusion is A is greater than C. Although mathematics is a deductive logical system, induction, seeing many examples and drawing conclusions such as the above has a vital role in creativity and the discovery method.

One concern that needed to be addressed was the question of which students were to be identified to participate in mathematics education programs such as UICSM. Howard F. Fehr responded that any mathematics program which was "based on individual excellence, on the opportunity of each individual to excel to his highest capacity has great promise of successfully meeting American democracy ideals."10 Equality of opportunity for all students demanded that no restriction be applied to students who exhibited interest, talent, and motivation to

---

expand their mathematics education. If smaller schools did not offer a wide selection of mathematics classes or if teacher preparation and knowledge limited an indepth investigation of advanced concepts, the various school districts in the United States needed to reform educational policies and the structure of secondary schools to enhance the opportunities of all students.

Howard F. Fehr stated: "The experimental program at the University of Illinois will have force in changing college preparatory programs from a traditional to a modern one both in spirit and concept." In addition the UICSM program attempted to increase the number of less able students enrolled in mathematics classes. UICSM's major efforts were to develop textual materials to improve student attitudes towards mathematics and to generate teacher enthusiasm. According to Fehr, "These and other practices are giving us a workable set of criteria for establishment of a program in mathematics education for all." Fehr wanted all students to study mathematics according to their ability and interests, not being forced into any one track.  

Fehr wanted each secondary school to provide four years of high school mathematics with various grouping or tracks. Above all, Fehr stressed that a student must understand content in order to advance because mathematics was an organized structure of knowledge which demanded skills and concepts to improve one's understanding. He also considered it vital to know mathematics because so many quantitative situations existed in daily life and within other academic fields. Mathematics was both a way of thinking that described the universe and also an area of knowledge that was intrinsically valuable.

Beberman stated, in his Harvard lecture of 1958, that some seventeen hundred students had participated in UICSM's program. They represented a dozen pilot secondary schools from Illinois, Missouri, and Massachusetts with forty participating teachers. Although some six years into the program, Beberman still considered his classroom courses as being underdeveloped.

---

11 Ibid., 110.
12 Ibid., 111-20.
He believed that any new curriculum must not be developed within a vacuum, but it must consider the practical needs of the student and the expectations of the traditional courses. However, to really understand mathematics, the student needed to use the discovery method and develop precise language. With precision of language, the student would have the ability to explain his discoveries.

To illustrate the concept of precise language, Beberman discussed the mathematical entity, number, since he believed mathematical instruction was "frought with linguistic difficulties." It was critical that the student know the logical distinction between a number and a numeral. The number is the abstract concept or idea while the numeral is the symbol which characterizes the idea. Aware of the logical distinction, the student would have little difficulty accepting the use of letter in algebraic statements. Perhaps the student would then question what truly was a number.

Basic to the UICSM program was the use of the discovery method. After content was selected, the writers then developed directions for the teacher and lessons for the students to assist in the discovery of principles and rules. This was used in the development of signed numbers. A student found it much easier to identify and use numbers than to know and to verbalize the concept of number. Only with skill and precise language can a student give a clear verbalization to his discoveries. Since verbalization of the discoveries was difficult, UICSM recommended delaying it. Beberman considered this recommendation an important characteristic of UICSM's program.

The outstanding contributions to mathematics education achieved by UICSM under Max Beberman reached far beyond curriculum revisions. Very evident from the textual materials produced, were the structural strengths of this revolutionary attempt to revitalize secondary mathematics education. With emphasis on the discovery approach to the classroom lesson, UICSM wanted students to understand the basic importance of language, logic, and consistency within the whole of mathemat-

---

ics. Through the combined efforts of university and secondary educators who united with mathematicians, scientists, and business people, UICSM discussed, developed, and actuated an experimental approach to secondary mathematics which was tested by pilot schools, revised, rewritten, and retested. As Beberman said, the purpose of UICSM was to improve secondary mathematics education, "to bring mathematics into the teaching of mathematics, and to encourage the learner to discover."14

Among UICSM's expanded efforts were to: clarify mathematical language, emphasize logical equivalence, develop continuity within mathematics, expand teacher preparation and inservice education, introduce programmed learning, and enrich mathematics education through expanded applications of mathematics. Any one of these contributions was a noteworthy achievement. However, as Diliberto stated, UICSM brought to mathematics education serious investigation. From such investigation change was possible. Change moved from a desirable goal to an actual accomplishment. This contribution lifted the whole of the mathematics community from a sluggish existence. Stagnation in mathematics education need never happen again. Mathematics educators accepted the need to remove, revitalize, and reform. The very fear to change the existing approaches and curriculum of mathematics education was removed with the innovative experimental programs of UICSM.

14 Beberman and Vaughan, High School Mathematics, 162.
Introduction

Of all the institutions that endured reform and significant reorientation, American education experienced the most enduring and profound impact of the Progressive Movement. Schools became the laboratories in which educators attempted to redefine and refine educational purposes and methods and create improved and integrated programs for learning. Curricula were modified to reflect a "liberal smattering of subjects and study areas."¹ Educational aims were redirected from the traditional purposes of classical training and essentialist preparation toward educating for the improvement of American society. In a number of disciplines the focus of content and the method of

Instruction directly reflected the Progressive attitude toward practical social application. In particular, instruction in the unpopular and differentiated science curriculum at the secondary level found renewed emphasis and direction. Although the value of a scientific education was not generally disputed by Progressive educators, questions regarding its collective purpose in the general curriculum and its fragmentary organization into specialized areas of study provoked reform both in the nature and content of the three major science disciplines: chemistry, physics, and biology. Along with attempts to reform these subjects separately, progressive educators advocated adoption of a unified course called "General Science," particularly designed for eighth and ninth grades. Although attempts to link scientific contributions to the problems of everyday life were pursued separately in each of the special science disciplines, the Progressive desire for practical, integrated, and social emphasis inspired the introduction of the "General Science" course in secondary education. The evolution of the "General Science" course during the early years of Progressive education, 1890 - 1920, will be addressed in the following remarks.

**Philosophical and Historical Context of Progressive Education**

The period preceding Progressivism in America coincided with and bore some relation to the Victorian Era in England. Toward the end of the Victorian Era scientific inquiry and the development of scientific education had become prominent fixtures in American educational curricula. To many historians "Victorian Science" reflected not only the achievement of

---

Charles Darwin's evolution theory over religious dogma but a notorious allegiance to materialism as progenitor of the Industrial Revolution.¹ The conscience for this Victorian pragmatism toward science was embodied in the philosophy of Herbert Spencer. As the leading promoter of social Darwinism, he believed social progress was subject to processes of evolution that were independent of human intervention. According to Spencer, social evolution operated on scientific principles that humans were incapable of manipulating. However, by acquiring a knowledge of science, humans could learn to adapt to the environment they were powerless to change.² For this reason, Spencer advocated a curriculum that adhered to scientific principles intended to teach adaptation, or in his words, ensure "survival of the fittest." This rigidly conservative philosophy, which fostered increased commitments to science education in specific scientific disciplines, e.g., physics, chemistry, botany, and physiology, provoked scientific evaluation of philosophy of education and of society as well.

Nowhere did Spencer's philosophy have as profound an ideological impact as in the United States. Conservative industrialists pointed to social Darwinism to justify competitive free enterprise and forestall social reforms that threatened to interfere with their capitalistic operations and opportunities. However, by the turn of the century the Progressive movement challenged the repressive adaptational role that Spencer claimed characterized the extent of social will. The Progressives recognized an intuitive purpose behind social evolution, and insisted that it be manifested toward the betterment of society. In their view, human reason could affect change in social conditions and not be merely resigned to function for survival or adaptation. The implications for education were significant in redirecting its aim as an instrument for the progress and reform of society.

---
John Dewey suggested in 1897, "education was the fundamental method of social progress and reform . . . the teacher is engaged not simply in the training of individuals, but in the formation of proper social life".\(^5\)

Although Dewey's reformist perspective contradicted the purpose behind Spencer's educational philosophy, he nevertheless regarded the pragmatic value of science as essential to learning. Establishing unity, integrating social processes, and fostering a sense of community represented the amelioration of the individualistic and fragmented social stratification produced by the materialistic abuses of industrialism and competition. Education was the vehicle for remediating the social by-products of an irresponsible capitalism legitimized by Spencerian philosophy. Dewey envisioned the school as an "embryonic social community active with types of occupation that reflect the life of the larger society, and permeated throughout with the spirit of art, history, and science."\(^6\)

In essence, with a transformation in its philosophy, education was gradually restructured to reflect social needs and modern innovations. However, in spite of social responsibility regarded as imperative to its purpose, American education retained the self-sufficient, rugged individualistic perspective inherent in its cultural tradition and development. In fact, John Dewey recognized the convergence of social consciousness with individual freedom, and his perception of education relied on "both the individualistic and the socialistic ideals. It [education] is duly individual because it recognizes the formation of a certain character as the only genuine basis of right living." Many Progressives, especially those on the fringes of the Progressive Movement, tended to condemn the individualism that spawned competition and differentiated society. Progressive educators during this period recognized the value and practical necessity in promoting some semblance of self-interest. Appropriately,

both ideals found their way into pragmatic educational reforms and were particularly indispensable to innovations in secondary school curriculums.

Public high schools located in cities in northern industrialized states prior to 1890 typically offered a restricted range of subjects divided into two programs labeled Classical and English. The Classical program, derived from the traditional Latin grammar school—frequently considered archaic scholarship intended to prepare a student for intellectual leadership in the church and other professions as well as a preparation for college—lasted three years and offered Greek, Latin, and mathematics in addition to geography, English grammar, and ancient history. The English program, developed by private academies years earlier in an effort to respond to a growing commercial interest and demands for practical utility, generally lasted four years and included literature, philosophy, modern languages, bookkeeping, and those subjects necessary to the preparation for "general business life." Establishment of high schools in southern cities was slower than in the north; high schools in rural areas were scarce and often integrated with elementary schools. Regardless of this curriculum outline, high schools between 1865 and 1890 tend to defy general categorization, in part, because the curricula represented wide diversity influenced by local commercial interests, demands of labor organizations, and specific needs peculiar to given geographical areas. Another reason was the lack of universal agreement about the purpose for education and the importance of unified subject matter for the purpose of practical utility.8

A number of factors perpetuated the evolution of the curriculum, not the least of which was the growth of organized knowledge. Although it was particularly significant in the develop-

7 Kloppenberg, Uncertain Victory, 374; Cremin, Traditions of American Education, 157; Kloppenberg, Uncertain Victory, 375-76.
opment of specific subjects from traditionally broad disciplines, e.g., physical sciences derived from philosophy, the organization of knowledge tended to realign previously cloudy distinctions between subject areas into distinct and useful parcels of knowledge. This further clarified attitudes toward the role for knowledge not only in terms of its practical usefulness but as a means of self-cultivation. Consequently, such qualified attitudes frequently determined whether or not a student attended school and what was taught in the school. This, of course, is a reflection of the politics as well as the growing popular sentiment toward scientific interest which characterized the period. As Freeman Butts and Lawrence Cremin have keenly observed:

Spelling, geography, history, government, constitutional law, and any number of other subjects were demanded as "preparation for citizenship." Furthermore, such areas as natural science, natural history, physical training and drawing . . . were urged as vitally necessary to a "complete" common education—one that would yield a truly "liberal spirit" and "trained character." Generally, such demands for expansion reflected an attempt broadly to educate for citizenship and at the same time to bring the new scientific knowledge to the people.9

The demands for a practical or functional curriculum also tended to conflict with the more traditional requirements for college admission. The relationship between colleges and high schools was not clearly established. Prior to 1890, admission to college was principally based on examinations in a narrow range of subjects. Required subjects for college preparation, although frequently vague in focus, were offered by private academies from which most colleges drew their students. "College bound students, however, constituted a minority group in the high schools of 1890," according to Edward Krug. They made up only 14.4 percent of all private and public students in 1889-1890. When considered with respect to the percentage of students that actually graduated in that year, 3.5 percent, the number of students being served by college based curricu-

9 Butts and Cremin, A History of Education in American Culture, 179-84, 213.
lums was very small. Indeed, when compared to the estimated population of high school age students in America for 1889-1890, the value of the college oriented curriculum applied to a very select, 0.2 percent.\(^{10}\)

The salient features of philosophical and historical relevance preceding Progressive reforms set the stage for unified standards in public education, instilled in the high school the responsibility for exercising and preparing the "social conscience," and sponsored a variety of innovations and reoriented programs. Demands for more functionally oriented courses and requirements in a "core of practical knowledge" began to emerge during the 1890's as the Progressive movement materialized. According to Rexford Tugwell,

new subjects were introduced so rapidly as to lead to a universal four-year program, to electives, to parallel courses, and to a differentiation among schools themselves: we now [1934] have technical, cultural, commercial, and agricultural high schools.\(^{11}\)

**Progressive Changes in Curriculum**

In addition to the historical events that anticipated Progressive reforms and the Progressive philosophical response to laissez-faire social policies, progress in American education was influenced by other factors. Two ideas imported from Germany influenced Progressive tendencies. The first, German idealism, transformed sectarian orthodoxies into a nondenominational Christian outlook reflected in Protestant Evangelicalism associated with Progressivism. As alluded to earlier, this ethical...

---

transcendentalism motivated American educators of the late nineteenth century toward adopting a critical and rational idealism for education. As Cremin made clear, the rationalization of Christian spirituality with the scientific world resembled the rationalization of the individual with society. However, like the Spencerian view of the individual and the nature of adaptation and survival, the practical applications in education often ran counter to more moderate social pragmatism manifested in integration and a sense of community.12

This was most evident in Dewey's disdain for the dualistic approach to education, particularly in high school education, in which practical utilitarian training in the form of manual and vocational programs--advocated by vocational reformers like Calvin Woodward--was pitted against the pursuit of academic subjects. As previously mentioned, Dewey advocated an integrated approach rather than the divided, individualistic approaches frequently forwarded by the dualists. Nevertheless dualism in less fragmented form found support from William T. Harris and others who supported essentialism in education and sought to find utility in the necessity of education. This transitional approach to education facilitated the introduction of Progressive innovations in practical science and the proposals endorsed by influential groups like the Committee of Ten.13

The second German influence centered on discipline and professionalism. The German Research Model had inspired American educators with the need to professionalize teachers and teaching in order to transform education into a disciplined system of social reform. What had become organized in the German Research Model at the middle of the nineteenth century was clearly an outward manifestation of a scientific people. As

12 Kloppenberg, Uncertain Victory, 20-21; Butts and Cremin, A History of Education in American Culture, 328-30; Cremin, The Transformation of the School, 14-19.

Norman Lockyer, the editor of *Nature*, observed in 1870; "It is this great truth that the Germans, above all other nations, if not alone among nations, have thoroughly realized and applied" science and the scientific method. The German educational system, its laboratories, and scientific achievements were recognized as superior to any other nation in the world. American educators admired the efficient and organized scientific community established by the Germans in order to take advantage of material resources and utilize technology effectively. In their effort to improve science education, physical science classes were occasionally modelled on German scientific methods.  

Apart from these influences on ideas, what actually occurred in the schools did not immediately reflect the intention of the innovations. During the 1890's, integration of disciplines, introduction of new methods, and redirection of the curriculum were recommended by committees organized to determine appropriate reform. However, the lingering controversy about the purpose for curriculum changes continued to hamper these efforts. One of the more controversial considerations had to do with the "uniformity of prescribed programs" in secondary education.  

The National Education Association (NEA) in 1892 appointed a committee to organize conferences for the purpose of evaluating the curriculum in secondary schools. This committee came to be known as the Committee of Ten and included college presidents and educators from around the country, the most outspoken member being Charles W. Eliot, president of Harvard College. The question of uniformity was not formally the purpose for appointing the Committee of Ten but was clearly behind the intentions for its creation. It arose in response to demands for uniformity of college admission requirements.

---

Because the percentage of high school students attending college was a small fraction of the total high school population, high school administrators found it difficult to justify programs geared toward college preparation. Although they recognized the difficulty of their recommendation, the members of the Committee of Ten did not believe that subjects in the high school should be treated differently for students planning to attend college or some other school relative to those students who were not. An excerpt from their report states their rationale.\textsuperscript{16}

Secondary schools of the United States taken as a whole, do not exist for the purpose of preparing boys and girls for colleges. Only an insignificant percentage of the graduates of these schools go to college or scientific schools. Their main function is to prepare for the duties of life that small proportion of all the children in the country—a proportion small in number, but very important to the welfare of the nation—who show themselves able to profit by an education prolonged to the eighteenth year, and whose parents are able to support them while they remain so long at school. . . . The preparation of a few pupils for college or scientific school should in the ordinary secondary school be incidental, and not the principal object.\textsuperscript{17}

The Committee stipulated, however, that standards in the designs of curricula and implementation of coherent subject matter would ultimately provide some uniformity. Furthermore, they suggested the reorganization of subjects in the curriculum to reflect some semblance of unity that might serve as a standard.

A college might say—We will accept for admission any groups of studies taken from the secondary school programme, provided that the sum of the studies in each of the four years amounts to the sum of sixteen, or eighteen, or twenty periods a week—as may be thought best—and provided, further than in each year at least four of the subjects

\textsuperscript{17}Krug, Charles W. Eliot and Popular Education, 96-97.
presented shall have been pursued at least three periods a week, and that at least three of the subjects shall have been pursued three years or more. For the purposes of this reckoning, natural history, geography, meteorology and astronomy might be grouped together as one subject. Every youth who entered college would have spent four years in studying a few subjects thoroughly; and, on the theory that all the subjects are to be considered equivalent in educational rank for purposes of admission to college, it would make no difference what subjects he had chosen from the programme--he would have had four years of strong and effective mental training.¹⁸

In essence, the members of the Committee of Ten were advocating a tracking system that would accomplish several important functions. The curriculum was grouped into tracks within which subjects were chosen. These patterns included Classical and Latin-Scientific both of which required Latin, Modern Languages, and English. Since two of the tracks did not require Latin, the committee repudiated the need for classics as a college requirement. Although the committee did not present uniform criteria, they also did not endorse the distinction between college preparatory and non-college preparatory programs fostered by the earlier division of high schools into Classical and English departments. This was a new way of looking at the high school and led to a number of innovations not the least of which was the consolidation of subjects and the expansion of programs. While it opened the door to new methods for teaching and organizing content, the committee's recommendation validated the value of the high school. As Krug pointed out, "Preparation for college as regarded by the Committee of Ten, was something no different from a valid definition of a good high school education in and of its own right."¹⁹

Additional committees were organized to evaluate the progress of specific programs, e.g., the Committee on College

¹⁸Ibid., 98.
-Entrance Requirements, the Commission on the Reorganization of Secondary Education, CRSE, Committee on Economy of Time in Education, etc., and in 1897, the final report by one of these, the CRSE, recommended the following program in secondary education:

The major categories of study presented were:

- English
- Foreign Languages and Literature—including Greek
- History, Civics, Economics
- Mathematics—algebra, geometry, trigonometry
- Sciences—physical geography, biology, physics and chemistry

The program offered secondary schooling regardless of the pupil's destination and was designed for preparing the student for life. In addition, the report provided policy recommendations that included a series of constants or core courses required for all students with the remainder to be filled by freely chosen electives. The recommendations included:

- Foreign Languages and Literature: 4 years
- Mathematics: 2 years
- English: 2 years
- History: 1 year
- Science: 1 year

This simplified the curriculum considerably by instituting a modicum of standardization and also eliminated the need to evaluate parallel courses of study for college entrance requirements. What this meant for the science curriculum was quite compelling, since the relationship between science education and preparation for life was not entirely defined.

Science Curriculum and the General Science Course

The achievements born of scientific inquiry from the time of the Enlightenment to the start of the twentieth century altered the nature of human existence and ushered in an infinite variety of questions about natural phenomena. In fact, it was and is the question of how not so much why that really makes science a unique field of study. It is in descriptions, as Rexford Tugwell and Leon Keyserling suggest, that science becomes so enlightening.

A student for instance, when asked why a stone falls is apt to reply, "Because of the law of gravity." Careful analysis will, however, compel him to admit that the law of gravity is nothing but a generalized description of how things fall, and that, therefore, he is saying that a description of how things fall makes a stone fall.22

As significant an impact as science had on the development of humanity, its relative importance as a subject worth learning, either for its method or for the knowledge of its content, was not entirely appreciated. Not until 1854 when Herbert Spencer proclaimed that the knowledge of most worth was science, did the subject receive much educational respect. Spencer expressed confidence and optimism in the power of science, and he saw in its method the means for practical and useful application toward any human endeavor. John Dewey was also impressed by the scientific method, but he saw in it the power for solving society's problems and used it as a process oriented method to integrate all forms of knowledge. This was an often repeated theme of Dewey's that seemed most cogent in its treatment in Democracy and Education.

With respect then, to both the humanistic and naturalistic studies, education should take its departure from this close interdependence. It should aim not at keeping science as a

22Tugwell and Keyserling, Redirecting Education, 202-03.
study of nature apart from literature as a record of human interest, but at cross-fertilizing both the natural sciences and the various human disciplines such as history, literature, economics and politics. . . . A large part of the comparative ineffectiveness of the teaching of the sciences, for those who never become scientific specialists, is the result of a separation which is unavoidable when one begins with technically organized subject matter. . . . Too often the pupil comes out with a smattering which is too superficial to be scientific and too technical to be applicable to ordinary affairs.23

To a large extent Dewey was concerned with preparing pupils to think. Science was not merely useful in its specialized command of the processes operating in nature, but in its method of discerning, describing, and observing all that connected humans to the world. In this respect the scientific method was a valuable tool for social studies as well.

Not surprisingly, those who valued a scientific education sought to train students in the application of the scientific method.24 It was precisely this type of training, the acquisition of skills in observing, describing, recording, and inferring, that Charles Eliot intended for the science curriculum in secondary education. As Krug indicated, Eliot believed

The ability of the adult to get information depended on his training. Proper training could not easily be had outside the school. It was critically necessary for pupils not bound for college to get all the training they could while they had the chance.25

Training the mind to reason analytically or disciplining the mind through proper stimulus of "mental functions" was considered a worthy objective of science courses. Although certainly effective in the specific sciences, developing mental discipline

by training in the scientific method was seen as a prominent function of the general science course as well.\(^{26}\)

What value the General Science course would serve in the high school was a matter of opinion during the early part of the twentieth century and remains a matter for speculation today. Nevertheless, the general science course, although evident as far back as 1900, "when an example of it was reported in practice at the high school of Lincoln, Nebraska," evolved into a popular and permanent fixture in 1920s America. In principle it developed out of a need to provide, in the words of W. H. Brock, "a common core of factual information which covered the laws and phenomena of everyday life and familiar experience, and which formed an essential part of everyone's knowledge." Philosophically, the course was really meant to be flexible, to adapt to the changes in society and reflect the interaction of nature with society. A course in general science was also supposed to establish and foster correlative relationships between science and the other disciplines in order to emphasize continuity in the nature of scientific discovery.\(^{27}\)

In some high schools in the early 1900's, a physical geography course, the predecessor to general science, served as an introduction to science methods intended for college preparation; while in others "general science" was regarded as having "relatively little value in preparing for collegiate work." There were those who regarded general science as necessary for students who did not plan to attend college. They saw the value of scientific principles and knowledge at the secondary level as indispensable to living. In a practical sense, demand for the general science course realigned its function as both a survey of topics relevant to every student's complete education and an introductory course in the science sequence. However, this was not realized until after 1920.\(^{28}\)

\(^{26}\) Ibid., 207; Brock, \textit{H. E. Armstrong and the Teaching of Science}, 209; Otis W. Caldwell, "General Science or Special Science", \textit{The School Review} 23 (February 1915): 135.
Prior to 1920 interest in general education in science, and for that matter, science in general education, was waning. The enrollment in high school science courses between 1900 and 1915 dropped by 20 percent. This was substantial in all of the science courses offered but particularly devastating in physical geography, the precursor to general science. In its attempt to standardize subject matter, the NEA's Committee of Ten recommended the reorganization of many discrete, special science courses into a more comprehensive "general" course which they named Physical Geography. Physical geography was an extension of elementary general science that combined the subjects of geography, geology, and meteorology and was intended for first year high school students as an intermediate treatment of scientific methods of observation, description and inference. However, these courses were neither popular with students nor successful in their preparation because they were regarded as superficial. Their failure was also attributed to a lack of adaptability on the part of teachers with respect to materials and methods. In fact, all of the science courses suffered a crisis in popularity that can be attributed in large measure to their lack of practicality, description, and relation to common people.29

In response to this slump in enrollments, "along with attempts to reform chemistry, biology, and physics as separate subjects" efforts were made to create a practical and descriptive science course.30 In 1920, the NEA's Commission on the Reorganization of Secondary Education (CRSE) through its committee on science under the chairmanship of Otis W.

30 ibid., 372-75.
Caldwell, director of the Lincoln School at Columbia, sought to demonstrate that science education contributed to six of the Seven Cardinal Principles of education which had been presented two years earlier. The Seven Cardinal Principles identified the aims for secondary education and included:

1. health
2. command of fundamental processes
3. worthy home membership
4. vocational efficiency
5. civic participation
6. worthy use of leisure time
7. ethical character.

With the exception of command of fundamental processes, science found a place and a purpose in secondary education. Furthermore, the commission's report indicated that science provided pupils with "informal values" which were characterized as a "large body of facts and principles of significance in the home, school, and community." Because of its primary purpose, general science was relegated to seventh and eighth grades and the sequence for the high school science curriculum began with biology, followed by chemistry, physics, and electives. Interestingly enough, as Krug has observed,

It is remarkable how this recommendation corresponded to the science sequence developed in the high schools during the late 1950s. Schools on the 8-4 plan were advised to place general science in the ninth grade, biology in the tenth, and to offer the same range of electives for the two upper years.

---

32 Butts and Cremin, A History of Education in American Culture, 592.
34 Ibid., 374.
Prior to the recommendation that the general science course be placed at the "junior high school" level, a number of schools since 1910, had reported problems in both methodology and organization with their respective general science programs. From a survey of Iowa High Schools in 1916 it was startlingly clear that everything from a lack of consistent and effective teaching methods to a proliferation of widely divergent textbooks and a conspicuous lack of laboratory or field exercises had seriously undermined the value of general science courses.\textsuperscript{35} It was concluded that administrators and science teachers had not reached consensus about the value of general science in Iowa high schools.\textsuperscript{36} In the state of Washington, a 1922 report on science in accredited high schools indicated that the most popular elective science course was the general science course in spite of offerings in biology, botany, chemistry, physics, physiology, and zoology. The reason for this was attributed to the more practical and descriptive content and the more relevant application to "the material world" than was offered in the special sciences.\textsuperscript{37} From a 1918 study of general science in the University High School in Eugene, Oregon, given at the eighth grade level, the most effective approach involved "developing a proper pedagogical method of instruction . . . [in which] the laboratory approach to science study and the inductive method" were coordinated with "problem method instruction."\textsuperscript{38}

It was readily apparent that for the general science course to survive, the methods of instruction and its content organization were of the utmost importance. Regardless of its placement in either the "junior high school" or senior high school level, the course required special attention. It was not lack of interest on the part of students that caused problems for the course, but rather lack of direction, conviction, and methodology. On the contrary, interest in science among the general public, and from

\textsuperscript{35}Lewis, "General Science in Iowa High Schools," 426-35.
\textsuperscript{36}Ibid., 434.
\textsuperscript{38}Ruch, "General Science in the University High School," 393-400.
students in particular, was extremely high and the range extremely wide.\textsuperscript{39} Unfortunately for educators, this interest did not necessarily translate to better science education.

One of the most significant influences that hampered science teachers and administrators in their efforts to design and implement curriculum changes in the sciences was the steady and rapid growth in the student population during the first two decades of the twentieth century. Meeting the needs of "all the people" was not made any easier when school enrollments increased by 30-40 percent between 1900-1930.\textsuperscript{40} The difficulty was compounded by the fact that the increases were accompanied by a lowering of the socio-economic status of the general level of secondary school students, a lowering of the average academic intelligence, and a shift from predominance of students destined for upper middle class professions to those going into lower middle class vocations and occupations requiring little or no specific academic training.\textsuperscript{41}

In response, the general science course had to be tailored to the levels of the student in order to be of any value, and the values of the course had to have some relevance to the student to be taken seriously. In this way the general science course represented a convenient compromise between the advanced technical nature of the special sciences which were clearly intended for preparation for higher education and the expressed responsibility to provide a competent and practical science education for all.

Consequently the general science course became a kind of medley of miscellaneous values and topics oriented toward those subjects in science which were deemed most valuable to the student. Taking a cue from the 1920 bulletin issued by the

\textsuperscript{39} Francis Day Curtis, \textit{Some Values Derived From Extensive Reading of General Science} (New York: Teachers College Press, Columbia University, 1924), 111-12.

\textsuperscript{40} Commission on Secondary School Curriculum, \textit{Science in General Education}, 10.

\textsuperscript{41} ibid., 11.
United States Bureau of Education as recommended by the CRSE, teachers and administrators designed the aims of general science curriculums to resemble the values emphasized in the report. Values that appealed to the interests, habits, and abilities of students; provided methods for solving problems; stimulated direct and purposeful activity; fostered command of facts and principles useful in homes, school, and community; and contributed to the development of cultural and aesthetic activities.\(^{42}\)

The general science course emerged as both the representative of scientific values and the watershed between the serious study of science and the socially appreciative aspect of scientific phenomena.

Although subtle differences between general science and the special sciences arose in the methods employed to teach them and in the organization of their respective subject matter, in the beginning they were virtually identical to one another. Naturally, general science courses initially resembled a composite derived largely from "blocks of content from specialized science subjects" and typical units included "astronomy, biology, chemistry, geology, health meteorology, and physics."\(^{43}\)

The advent of the junior high school movement during this period not only helped establish general science as a significant course in the science sequence, but it fostered the integration between methods of observation and exploration with the theoretical nature of the special sciences. Most importantly the general science course incorporated the social manifestations of science and linked general scientific descriptions to more specific bits of specialized subject matter. In Wilford Aiken’s narrative about a later study undertaken to evaluate secondary education he stated that

> certain facts of physics and chemistry and important principles of biology are used in the work going on, but the center of organization is something other than the internal logic of any subject. Teachers and students are driving at something more important to them than learning the content of physics,

\(^{43}\) Ibid., 10.
chemistry or biology. . . . It may be that they are investigating the effect of certain vitamins on growth, or how and why the city keeps its water supply pure, or the nature and effect of certain kinds of artificial lighting.\textsuperscript{44}

The topics reflected the problems of society and how science helped to overcome them. In this way the student was introduced not only to scientific principles but to their purpose for, as well as their relationship to, the rest of humanity. Furthermore topics such as these offered a continuity between the discrete subdivisions of science; how discoveries in "chemistry have biological, geological and astronomical implications that cannot be overlooked if science is to have significance."\textsuperscript{45}

There were other methods that helped shape the content and teaching of the general science course and they reflected many of the innovations used elsewhere in the science curriculum and the school. [For instance, the "project method" proposed by William Heard Kilpatrick, which was often coordinated with laboratory or field study, became an important method in later years especially when the general science course focussed on "earth science."\textsuperscript{46} Not surprisingly, practically all of the innovations in the general science course were associated with direct experience. Observation of student conducted experiments, field and nature study, construction of apparatus to perform measurements on or better observe natural phenomena, analysis of the air, water, food and earth, these were the innovations that made the most difference in enriching students and fulfilling the objectives and aims of the course. The value of these methods was inherent in the student-centered approach toward direct discovery and direct experience as opposed to the vicarious methods of lecture and recitation which unfortunately, were all too common because they posed few demands on the teacher's time.\textsuperscript{47} By offering students the

\textsuperscript{44} Wilford M. Aiken, The Story of the Eight-Year Study (New York: Harper & Brothers, 1942), 50.
\textsuperscript{45} Ibid., 145.
\textsuperscript{46} J. Wayne Wrightstone, Appraisal of Experimental High School Practices (New York: Teachers College Press, Columbia University, 1936), 64.
\textsuperscript{47} Harrington Wells, Secondary Science Education (New York: McGraw-Hill,
opportunity to participate in the process that defined science, namely the actual performance of tests and experiments, and interaction with natural phenomena, students were engaging in the activities that, Progressive educators believed, linked the subject of science to society. This, of course, was all important to the Progressive mentality toward education and its manifestation in later years with the introduction of several general science courses: introduction to physical science, earth science, environmental science, world science, science and the community.  

General science matured into what the Progressives believed science education ought to represent. Although the tendency for change and flexibility in curricula and methods has not always been forthcoming or effectively administered, the science curriculum, secondary schools, and the entire educational system constantly seems to be on the verge of reform. In this respect, adaptation and reevaluation instigate various forms of education that enhance the progress of society and its students. Although they did not completely do away with specialized and independent fields of knowledge, Progressive educators managed to uphold a place for the general course that at the most opened a new world for some and at the least provided an educational opportunity for many. The Progressives accomplished "social progress" with the introduction of general science. In referring to the Progressive Era, Edward Krug recognized the mutual dependence between science education and society when he noted, "Progress was a magic word . . . and schools must have their share in it."  

The Honors Program on Trial: Swarthmore College in the late 1920s

Akira Tachikawa
International Christian University
Tokyo, Japan

In his now classical history of the American College and University, Frederick Rudolph has characterized the honors program as a revolt "against the impersonalization, the machine-like quality of the university-oriented education." Rudolph has further added that "the honors idea spoke for the recognition and encouragement of talent and for the return of intimacy and human considerations, even the return of the student, to the teaching-learning experience."¹ Now, if the honors program was largely introduced, as he has asserted, "in revolt against the impersonalization," why were there found, as we will see later, not a few alienated honors students, to say nothing of a great majority of ordinary students in the midst of the program? Why were there complaints, even among honors students, about professors' discrimination against ordinary students? Again, if the honors idea "spoke for . . . the return of intimacy

and human considerations," why did President Frank Aydelotte, the major spokesman, consistently deny traditional collegiate and secondary school education, where "intimacy and human considerations" must have been predominant? Furthermore, if the program had been a revolt against the university-oriented education, why didn't Aydelotte flatly reject the German method of instruction? For he clearly stated that the error lay, not in that method itself, but rather in the fact that America had applied that method to undergraduates, when it was in fact effective for advanced students.

In the current paper, the author tries to give a slightly different perspective to the history of the honors program in the United States, by focusing upon the changed status of the program at Swarthmore under Frank Aydelotte. The author will argue that a major purpose of the Swarthmore plan was Aydelotte's ambitious goal to bring a small liberal arts college back to the mainstream of higher education in 20th century America. In other words, the efforts were not so much an attempt to revive a good-old collegiate education, as a competition with research universities of the period such as Chicago, Michigan, Harvard, and Cornell.

A few major points included in Aydelotte's inaugural address in 1921 may serve to illustrate the argument. Having observed a serious confusion in American liberal education, Aydelotte proposed a few basic solutions. One of these referred to "a more limited program of studies and a more thorough standard of attainment in each," a direction of substantial specialization, rather than dispersion, in liberal arts education. He proposed that, by selecting academically talented students, Swarthmore could give them training at an academical level "roughly equal to that of current M.A.", a proposal for graduate level studies for undergraduates! Somewhat surprisingly, Aydelotte argued that because the honors program could save professors from much of the drudgery of teaching, it would reserve "more time for their study and research." He amplified the point by saying that "the provision of books and laboratories for this work is as necessary as a part of our educational expenditure as are the materials for purely under-graduate instruction."  

---

Journal of the Midwest History of Education Society [ Vol. 19
These points throw light on one of the roles of the honors work, which has been relatively ignored. As it started at Swarthmore, the system was in part intended to promote a liberal arts college into a more research-oriented institution. For a small college like Swarthmore, concentration on a limited number of programs for selected students was indispensable for establishing a high academic level, especially among its faculty. In other words, contrary to Rudolph's interpretation, the honors work and honors students were not simply ends, but also were means, means for advanced research activities in the settings of a small college.

Given this framework, we would better understand, the author believes, a few questions attending Swarthmore's honors program stated at the outset. But the task here is to trace the early history of the program, keeping the framework in mind. On introducing the new program, where did Aydelotte locate the basic defects of American higher education in the first quarter of the twentieth century? He incisively summarized the defects in just one phrase: namely the academic lock step. Aydelotte recognized a wide divergence among college students' abilities. However, American colleges and universities of the period remained strikingly indifferent to this fact, and they consistently adopted the principle of standardization, while a phenomenal error lay, not in that method itself, but rather in the fact that America had applied that method to undergraduates, when it was in fact effective for advanced students.

In the current paper, the author tries to give a slightly different perspective to the history of the honors program in the United States, by focusing upon the changed status of the program at Swarthmore under Frank Aydelotte. The author will argue that a major purpose of the Swarthmore plan was Aydelotte's ambitious goal to bring a small liberal arts college back to the mainstream of higher education in twentieth century America. In other words, the efforts were not so much an attempt to revive a good-old collegiate education, as a competition with research universities of the period such as Chicago, Michigan, Harvard, and Cornell. A few major points included in Aydelotte's inaugural address in 1921 may serve to illustrate the argument. Having observed a serious confusion in American liberal education, Aydelotte proposed a few basic solutions. One
of these referred to "a more limited program of studies and a more thorough standard of attainment in each," a direction of substantial specialization, rather than dispersion, in liberal arts education. He proposed that, by selecting academically talented students, Swarthmore could give them training at an academical level "roughly equal to that of current M.A.,” a proposal for graduate level studies for undergraduates! Somewhat surprisingly, Aydelotte argued that because the honors program could save professors from much of the drudgery of teaching, it would reserve "more time for their study and research.” He amplified the point by saying that the increase of students even widened the divergence. There ensued an academic lock step, detaining academically able students from proceeding at their own pace. In this process, held Aydelotte, academic work was much devaluated and few regarded it worthy of whole-hearted devotion. Students found athletic sports more challenging, alumni cherished dear memories of these, and business firms took seriously students' backgrounds in extra-curricular activities. And no wonder, because, if academic work entailed docility, only through sports and other activities could students exercise and acquire initiative and independence, virtues much higher in rank order than docility. The re-vitalization of initiative and independence in academic work required a prior recognition of individual differences in abilities, which, however, confronted strong oppositions here in democratic America.²

In contrast at Oxford, where Aydelotte had studied as a Rhodes scholar, they divided students into those academically talented and those who were not, and gave the former considerable freedom to study independently. Moreover, an ambitious Oxonian student tried to finish first in Honors class. The Honors work which Aydelotte introduced into Swarthmore in 1922 represented a radical transfer of the Oxonian system in which honors programs were offered in complete lieu of the course work for the third and fourth years in college.

²Frank Aydelotte, Breaking the Academic Lock Step (New York: Harper and Brothers, 1944), 14, 11.
The Swarthmore programs started with 50 junior participants, some 2 percent of the entire student body. The number steadily increased from year to year, and finally some 40 percent of the class participated in Honors work. In place of some 50 hours of course work, the participants received from four to six hours of training in small seminar settings. Typically, two faculty members and five or six students organized a group and discussed the papers weekly prepared by the students on the subjects of the program.3

A few visitors to Swarthmore during the 1920s almost idealized the program from educational points of view. Aydelotte, however, had a severe view of the program's status. According to him, ordinary students who needed constant stimulation and help from course work, did not fit into an honors program. On the other hand, ability grouping was far from satisfactory for exceptionally bright students. They needed a distinctly different approach which assumed independence and inspiration, qualities required of mature scholars. Aydelotte had seen a deep and wide divergence of ability among students, which was even qualitative. On one occasion he has stated the following to Swarthmore students: "You are not better educated than another man because you know one hundred things while he knows fifty, but rather because your knowledge of one fact or one book, or one language, or one subject, differs from his in quality--in breadth, in accuracy, in reasonableness, or in imagination." Thus, by introducing the Honors work and by setting its academic goals high, Swarthmore made itself potentially vulnerable to criticisms, criticisms with regard to its academic standards and with regard to its severe requirements on honors students.4

Its high academic goals precipitated a crisis in the spring of 1926. This year Swarthmore for the first time invited a British

scholar as an external examiner, Professor Helen Darbishire of Oxford who was then in Wellesley College. Having examined twelve honors candidates in English literature, the Oxford professor selected only five for honors, passed six others and even failed one. Her criticisms covered the major aspects of the Honors work in English literature. With regards to students' papers, Darbishire pointed to three fundamental defects: First, "ignorance underlying cocksure statement." Or students' "insufficient knowledge of the works read." Furthermore, their ignorance applied to other aspects such as the English language, literary history, and literary form, i.e. metre and style: second, failure to "argue a point clearly." Without grasping the question, "students started off an issue that interested them and rambled round it." Darbishire here pointed out the lack of training in writing upon thorough analysis: third, the Oxford professor referred to the "frequent violation of what might be called the decorum of the examination by personal statement, excuse, or explanation." She flatly outlawed some interpolations as ill-afforded to waste, and pronounced that "The style in which the papers were written was in some cases slangy and careless to the point of illiteracy." Following these criticisms, Darbishire proposed a few necessary improvements. First, she urged that a few main texts be prescribed for perusal by honors students, enabling them to "proceed independently to a further study." Then, she singled out Bradley's *Making of English* as the basic reference to insure the "necessary modicum of knowledge about the English language." Finally, Darbishire advised that Swarthmore offer "good concentrated courses of lectures," which would serve as "models to the students in method and style."

Thus, throughout her attacks and recommendations, focus was set upon the deficiencies in training rather than upon insufficient scholarship on the part of Swarthmore staff: the

---

Oxford professor pointed to the lack of adequate education, rather than of academic research, in Swarthmore for the successful prosecution of honors programs. This emphasis upon education marked a striking contrast to Aydelotte's inaugural address in which he advocated the introduction of the honors program in view of the promotion of research in a small college. And all the attacks and recommendations came from the very Oxford at which Aydelotte believed he had obtained his basic ideas for reform.

From the time when the Oxford professor delivered the heavy blow, Swarthmore students began to raise open questions about the honors work. One of these appeared in March 1927 when a student charged the program for not affording the alleged freedom to students. The sheer amount of assigned reading, among other things, left an honors student "little opportunity for doing any work on his own responsibility." There would ensue a grave consequence of isolation in the world where everything was "too disconnected," diluting the sense of community "which will have the pursuit of knowledge as its chief interest." This student proposed, the author believes quite rightly, that Swarthmore devote the first two years to the studies of Greek civilization and of nineteenth century English, a much more "educational" plan of Meiklejohn. In the following year, another critical student exposed the honors work in "real life" which was only for "those chosen few who are willing to give themselves entirely to intellectual pursuits." Then, the faculty would regard ordinary classes as "backward groups" and had these "in the back of their heads to eliminate." All this sharply contrasted with the Swarthmore of the old, he held, that represented "happy surroundings where young men and women grew up together on natural terms of friendship." Another serious opposition arose in regard to an attempt to expand the number of honors students. Thus, a critical student held that fifteen percent of undergraduates taking honors at Swarthmore was too high, and that the program should admit only those with "a real desire for intellectual pursuits." Again, the critic pointed out that those admitted to the program should not care for "the approbation of their fellow students," indicating that the honors work would bring about all kinds of hostility on campus, even between the faculty and honors students! Fully
aware of such conflicts, still another opponent asserted that thenceforth at Swarthmore three distinct boards should admit students independently; the honors professors board, the special experts board, and the athletics board, a plan to separate the college into three entities. Even a student who was generally favorable to the program admonished the administration against its expansion on the basis of students' reluctance to be discriminated against because of their honors status. Despite a lot of external appraisals, the honors work at Swarthmore thus confronted by the late 1920s a "violent and fanatical" opposition from students. Moreover, the criticisms pointed to the lack of educational strategies on the part of the college which would inevitably produce deep and un-educational splits in the college community.6

In 1926, Aydelotte conducted a survey of the first five years of honors work. Some twenty honors program graduates responded, based on which Robert C. Brooks, Aydelotte's major colleague, made an analysis. Although two graduates were rather negative toward their honors experiences, Brooks found "an overwhelming majority of the graduates to be strongly in favor of the new plan." As the graduates pointed out, held Brooks, the first of the program's strengths lay in the equal and intimate relationship of the faculty and students, a point lending support to Rudolph's statement. Second, the program helped these students acquire habits of independent study and research, thereby even producing a student who "couldn't stop studying."7 In his judgment, therefore, the honors work proved a great success in its breadth of training and in the encouragement of critical thinking.

To the current author, Brooks' conclusion seems to have been too optimistic. Despite Aydelotte's expectations, the answers from some twenty graduates were largely less than

7 Brooks, Reading for Honors, 101, 108.
enthusiastic. Many were apparently confused because of the uncertainty of the effects of the program upon them at such an early stage. Among meager answers upon its influences, two individuals flatly stated that extra-curricular activities and managerships of athletic teams, rather than the honors work, helped their later business career. This was a pronouncement that the program had failed in its intended educational goals. Then a female graduate pointed to the physical and nervous breakdowns observed almost universally among the honors students. Then, one of the above indicted professors who, judging non-honors classes in light of below par, were doing "great injustice to the students and college! And there were quite a few who did it." Students' oppositions in The Portfolio as well as these responses from graduates were serious, the author believes, because they share something in common with Darbishire's criticisms.8

Although given from rather different perspectives, these criticisms ultimately pointed to the educational deficiencies and sometimes positive neglect in the program which was allegedly very educational. Judging from the Swarthmore president's inaugural address, these deficiencies and neglect reflected in part what the college tried to do in the 1920s: to compete with the larger universities in the area of academic research by affording its faculty more time and opportunities for independent work.

Some ten years later in a speech which partly caused the resignation of President Aydelotte, the President of the Alumni Association expressed his fear that "the purely academic functions of Swarthmore are crowding out those vital activities that have to do with the development of ruggedness, courage, determination and better human understanding." He further added that the fear was driving "a wedge between Swarthmore and a large part of her alumni body." When they started the

program in the early 1920s, the Swarthmore administration set as their end-in-view to enroll all students in the honors program. To relieve the faculty from drudgery of teaching, this certainly was a necessary condition. However, even the elitist College could at its peak register slightly more than 40 percent of its students in the program. Throughout Aydelotte's presidency, the honors students remained the minority on campus. Confronting students' reluctance fully to comply with the plans of a research-oriented college, Aydelotte's honors work at Swarthmore had already faced a serious obstacle in the latter half of the 1920s.9

Miles E. Cary: Democratic Reconstructionist at McKinley High School, Honolulu, Hawaii 1921-1948

Shirley JoAnn Williams
College of St. Francis

When unfamiliar names surface in the chronicles of time, the historian functions as a reverse prophet, re-examining past details to redefine an otherwise familiar story. Miles Elwood Cary and McKinley High School are such unfamiliar names to be reborn in educational history, the social contexts of which make their stories significant. In the post annexation era, McKinley High School in Honolulu, Hawaii was an urban public high school whose multicultural student body reflected the ethnic composition of the Hawaiian territory. Changing territorial needs, a diverse public school population, and economic and political arguments about possible Hawaiian statehood made the islands an interesting focal point for education.

The political climate of the United States in the early twentieth century had created a need for a new type of educational system—one which assigned a central role to an educated citizenry. As progressive politics attempted to ward off the danger of a strong central government, it created the
need for a democracy in which people participated fully in its processes. Such a political philosophy required a new progressive theory of education, for an educational system designed to mold the student to the established system could not liberate the child for participation in a rapidly changing society. Vitalized curriculum provided interaction between students and their environment, and became a driving force of the progressive movement. "Laboratory schools" provided rich experiences to develop the connectedness of the complex phenomena which faced children daily. To develop character and the processes for cooperation in community life, students experienced the activities which provided an understanding society connected to the individual’s fundamental needs.

Miles Cary was one of many mainland educators who served as godparents to American educational ideals in the rapidly changing territory of Hawaii. While the democratic function of government passed largely unnoticed in most schools, McKinley High School became a crucible for democracy—an achievement made possible through Cary's commitment to progressive education and the laboratory school concept. Instead of a traditional curriculum of learning "the right" answers to problems laid down before them, students at McKinley High School emphasized finding problems, understanding them, and becoming actively involved in their solutions. Fixed indoctrination, was replaced with a curriculum organized around a vital center of experiences provided to stimulate inquiry for social ends.

Miles E. Cary was born on 1 November 1894 in the small town of Orting, Washington. Cary described himself as an athlete and a bookworm, with a particular interest in history, math, and historical novels. In spite of high school aspirations to be a lawyer or an engineer, he turned to education while at the University of Washington. "I'll never regret it [he said] . . . education is the most thrilling work a person can be engaged in today."¹ At the time of his graduation from the University of Washington in 1917, placement agencies in the Pacific North-

¹ *Daily Pinion*, Honolulu: McKinley High School, 17 October 1940.
west were heavily recruiting for teachers needed in the United States Territory of Hawaii. In 1921, Miles and his wife, the former Edith Brackett, decided to visit the islands. Intrigued by the new progressive movement in Hawaii coupled with the problems of a fast growing culturally diverse educational system, Miles and Edith Cary accepted the challenge of a new culture and a new home. Hawaii provided them an opportunity to implement developing principles which had gained recognition in Washington, into a school system ripe for the seeds of educational change.

In September 1921, Miles E. Cary made his debut at McKinley High School as a history teacher and coach of the junior football, track, and basketball teams. In 1922, he served as advisor for the newly formed school newspaper, The Pinion. After a one-year principalship at Maui High School, Cary returned to McKinley. A 1924 headline of the Honolulu Advertiser read: "McKinley High Starts Year As One of the Best Equipped In The World," and described buildings to be as well equipped as the best educational institutions on the mainland. However, the newspaper foreshadowed the most vital change, a new principal, Miles E. Cary.2

Cary's administrative concerns were first directed at the implementation of a new course of study resulting from a Federal Commission report of 1920. He recognized a need, however, to reform curriculum beyond that suggested by the territorial governing agency. In 1925, Cary addressed the Hawaii Education Association regarding uniformity of certain routine elements of the instruction and education of the child. He concluded with the following statement: "The centralized school system of Hawaii lends itself to a program providing a reasonable degree of uniformity among the high schools. Such uniformity should in no way interfere with the initiative and freedom of individual teachers and schools."3

3 Hawaii Education Association, Proceedings of Sixth Annual Convention (Honolulu, Oahu, Territory of Hawaii, 29-31 December 1925), 26.
Cary demonstrated early his intent for democratic schooling and a path to curriculum reform in which the teachers and students of McKinley High School demonstrated a new spirit of energy in its implementation.

Social unrest became a growing force in the United States, while the totalitarian movements of the 1930's and 1940's blocked the development of free civilizations in part of Europe and Asia. Freedom and democracy in American education were being challenged. America's depression created a famine amidst plenty. It was within this context that George S. Counts developed his educational approach to "build a new social order." Counts' concern that school was a social and cultural enterprise encouraged economic, social, and political reform.

Democratic reconstructionists viewed the schools as instruments to change and improve society--not merely reflect it. They believed the school's curriculum should educate youth to criticize society's wrongdoings and develop social action to correct and reconstruct them. Disagreement occurred, however, as to whether or not the school's teaching profession and administrative leadership should be a direct constructive force in the determination of the social order through defined educational goals or a more indirect approach. Some experimentalists were convinced that no one should predetermine a new social order and denied that one could be perceived and defined in advance.\(^4\) The advocates of indirect action rejected the idea of class struggle as an enduring feature of the social order. Instead, they saw the school as a site to discover conflicts in our cultural heritage, reinterpret the meaning of democracy, and "to become an energizing center for study and activity for the entire community."\(^5\) Nevertheless, both the direct reconstructionist beliefs of Counts and the more indirect approach of Miles E. Cary placed schools in the middle of reform movement controversy.

---

\(^5\) Miles E. Cary, "Integration and High School Curriculum," (Ph.D. diss., Ohio State University, 1937), 230.
Miles Cary realized that a significant factor complicating the Hawaiian educational system was the emphasis on traditional aims and objectives by community leaders. Three distinct attitudes toward education had crystallized. The first was that expanding educational opportunities should be compatible with Hawaii's basic industries, and education for nonhaoles (non-whites) should serve citizenship and contribute to the economy. A second group felt that education should be curtailed, "for education would destroy an economy based on the utilization of masses of ignorant workers." The third position had as its principal advocate, Miles E. Cary, who "urged education to liberate talent and creativity, with the hope of someday transforming the social structure of Hawaii." Cary quoted George S. Counts' view of traditional education in his plan to vitalize McKinley's curriculum:

... The traditional program, in so far as it was ever adapted to the achievement of any genuine educational purpose, was designed to provide a narrow academic education for the children of a small, privileged social class or for the exceptional children of less favored parentage. ...

**Curriculum Revision**

Miles Cary worked to vitalize the curriculum of McKinley High School. His plan, developed in his Master's Thesis at the University of Hawaii in 1930, utilized the "Cardinal Principles of Secondary Education" and the National Education Association's research bulletin entitled "Vitalizing the Curriculum". Cary

criticized both, however, for their lack of "suggestions looking toward a broader concept of method, or possible regroupings, or integrations of subject matter." 11 Realizing the traditional tendency of the suggested reorganization, Cary turned to the writings of John Dewey, William H. Kilpatrick, Boyd H. Bode, and Harold Rugg. As Miles Cary looked to the experience-based, child-centered, experimental learning of the progressives, he urged that the curriculum must make full provisions for the improvement of society. 12 Cary's democratic movement involved McKinley High School students in the heart of community problems--problems which assisted curriculum development, provided school and community experiences, and placed emphasis on social and cultural aspects to organize the school as an embryonic society. By studying conflict from a student perspective, focusing on the contradictions between democracy and authoritarianism in Hawaii, and studying the impact of education on the economy, McKinley played a key role in transforming the vision of Hawaii's labor force. McKinley High School's student body largely descended from the plantation work force. Since economically deprived cultures tend to think in patterns oriented toward change, while economically affluent cultures think in patterns which at least subconsciously preserve the status quo, McKinley High School provided a center for change--a public school that planted seeds of educational liberalism which could one day destroy Hawaii's oligarchy. 13

The sugar planters who ruled Hawaii were confronted with a situation far more complex than that created by the Southerners in the United States, for the multiethnic population of Hawaii probably had no parallel elsewhere on the earth. Hawaii's students drank deeply of the educational and democratic idealism offered by dedicated teachers who provided an opportunity for students to criticize the social system and make decisions

15
Conflicts, inconsistencies, and issues might well be used as organizing centers of study. Careful records should be kept relative to what young people believe and why. If these records were cumulative the school would, in time, be able to report on what is possible in the way of stimulating young people to enter upon the task of building, each for himself, a criticized and more unified philosophy of life.\(^{18}\)

Miles Cary’s vision for curriculum change was most keenly reflected in a poem he wrote:

But in my present work I saw the possibility
Of creating a different sort of symphony--
An excellent school
In which boys and girls and teachers
Might work together
In a beautiful community.
The activities of this school
Would be of such a nature
That their influence would be felt
In every home and section
Of the larger community
Running through this symphony,
Like a mystic golden thread.\(^{19}\)

Cary believed every curricular procedure in secondary education should be scientifically scrutinized to promise wholesome child activity and social utility.\(^{20}\) Education’s aim lay in its method--not the devices by which prescribed subject matter is covered, but “the way in which young people live and work together.”\(^{21}\) According to Cary, such method is “purposeful,

\(^{19}\) This poem was found in some personal papers by Edith Cary’s niece, Eleanor Milholland and given to the author in March 1990. These are referred to as Milholland papers.

constructive activity carried on with thoughtfulness and in an atmosphere of democracy.\textsuperscript{22}

Miles Cary also addressed the role of the teacher as citizen and the socializing power of the school.\textsuperscript{22} "\ldots [T]he teacher as a responsible citizen. \ldots ought to be informed in the field of ideas \ldots [And] discuss these ideas with his neighbors. \ldots [P]eople outside the school have a right to look to teachers for help and guidance in dealing with the many complex problems that society has so suddenly been forced to consider."\textsuperscript{23} When learning is vitalized in terms of its relevance to life itself, vitalized curriculum reflects the social significance about which John Dewey wrote:

We must conceive of learning in its social significance, as the methods by which society keeps itself going, as agencies for bringing home to the child some of the primal necessities of community life, and as ways in which these needs have been met by the growing insight and ingenuity of man; in short, as instrumentalities through which the school itself shall be made a genuine form of active community life, instead of a place set apart in which to learn lessons.\textsuperscript{24}

\textbf{Student Government}

The first step toward McKinley's laboratory school operation occurred as a change from the traditional student council to the formation of a more far-reaching student government organization in a growing student population. The student government was reorganized to include the entire student body governed through an executive council and a representative assembly. The executive council consisted of three elected

\begin{footnotesize}
\begin{itemize}
    \item\textsuperscript{22} Cary, "A Vitalized Curriculum," 155.
    \item\textsuperscript{23} Hawaii Education Association, \textit{Proceedings of the Twenty-Seventh Annual Convention} (Honolulu, Oahu, Territory Hawaii April 2, 3, 1947), 20.
    \item\textsuperscript{24} John Dewey, \textit{The School and Society} (Chicago: The University of Chicago Press, 1915), 14.
\end{itemize}
\end{footnotesize}
student body officers, the class presidents and their respective faculty advisers, the principal, the student body government adviser, the treasurer appointed by the principal, and the editor of The Pinion. The representative assembly was comprised of members of an executive council, sixty-seven homeroom representatives and a representative from each of over seventy recognized clubs or organizations. The student body government activities were incorporated into the regular school program as a laboratory for deliberate training for citizenship with the intention that each homeroom become a local unit of the student government. The establishment of a school deputy and court system allowed for increased student responsibility in controlling the school.

Miles Cary believed that students should be addressed as "citizens" whenever possible to form the connection between their responsibilities in the school to those in the community. Thus, the citizenship laboratory was the organ which linked the school to the community.

**Communication**

One of the key means to developing the necessary skills for democratic thinking at McKinley High School was communication, especially through the student forum and the school newspaper. Both vehicles were utilized to help students build awareness of real life issues and clarify their own thoughts regarding them. The student forum was an open discussion of problems of the school, community, and territory. In 1925, the student newspaper became a daily publication. As the official organ of an active student government, The Daily Pinion, became a vital communication link between the community and the school. Replacing the older debate method of group discussion, the forum provided wider participation in a challenge for study and discussion. The unique place of the school newspaper at McKinley High School was described as a model. "While it naturally plays up athletics and other adolescent activities and
has occasional youthful jokes, the tone is distinctly serious and evidences a highly commendable spirit of fine citizenry.\textsuperscript{25}

Students would be helped to develop proficiency especially in those forms of communication that are particularly helpful in promoting cooperative enterprises. This would include extemporaneous speaking, the forum, reporting research, parliamentary discussion, planning and executing committee and group studies, and serving as representatives of local groups in deliberate bodies.\textsuperscript{26}

Miles E. Cary wrote almost daily to students regarding a variety of issues. The \textit{Daily Pinion} was the key to discovering the life and philosophy of Miles E. Cary. Even more than that, it reflected the pulse of a high school student body, teachers, and an entire community. It revealed the history of people seeking recognition and being transformed. The \textit{Daily Pinion} documented the problems and the definition of citizenship that the United States failed to legitimize in its chronology of history.

Miles Cary’s belief in free and open discussion impacted his students.\textsuperscript{27} The \textit{Daily Pinion} became a vital communication link to the Hawaiian community. Oren E. Long, a superintendent of Public Instruction who became the Territorial Secretary of Hawaii, expressed this in a letter to Cary:

\begin{quote}
I do not wish to take any chance on missing my copies of "THE DAILY PINION". I hope you will hand this note to the proper official with the request that The Pinion be addressed to me as Secretary of Hawaii. My office will be in Iolani Palace.
\end{quote}

\textsuperscript{25}Bolton and Cary, "Going to School in Hawaii," 46.
\textsuperscript{27}Richard H. Kosaki, telephone interview with author, 18 July 1989. Dr. Richard H. Kosaki was friends with Miles E. Cary from 1940 until his death. A student at McKinley High School, he was a senior when Pearl Harbor was bombed. Later he received his Ph.D. in Minnesota while Cary was there; Kosaki’s wife, the former Mildred Doi, was graduate assistant under Cary and in 1951 she took over teaching his classes when Cary went to New York from Minnesota. Kosaki has been instrumental in forming a McKinley Foundation as a means for McKinley graduates to rekindle the McKinley spirit through private donations and service.
Reading The Pinion is one of the habits I do not wish to give up.28

Core Curriculum

Cary's concern for a vitalized education evolved into a new, reorganized core curriculum. School policy under democratic conditions empowered students to develop a meaningful curriculum. Cary strongly believed that "in a democracy the educational outcomes for which the school should strive would be obviously quite different than those sought in an autocracy, or oligarchy."29

It is assumed that the central purpose of the public schools in an American community--and Hawaii is American--is that of preparing its children and youth for intelligent, effective participation in the affairs of the community. . . . this means helping children to improve their communication skills, to think critically concerning the problems of the day, to develop social sensitivity, to choose wisely and prepare themselves for a vocation, to grow in sensitivity to beauty, to develop wholesome personalities, and to learn how to cooperate to promote common interests.30

September 1931 marked the date in which the school commissioners gave approval for a trial of the core studies program. Developed through the assistance of parents, neighbors, teachers, and students, the core curriculum helped to identify critical problems of local, national, and international significance. Young people began to sense some of the connections of their problems with the concerns of people throughout the world.

28Daily Pinion, 29 October 1946, 1.
In addition to the study of genuine problems, McKinley's young people had the opportunity to sense the deeper meanings of democracy through participation in the management of the school. Instead of academic problems and subject matter, the core studies were based upon the out-of-school activities and pupil needs which encouraged study of vital problems faced in the real out-of-school world. The school was open from 7:30 in the morning until 9 o'clock at night. The teachers worked in shifts and pupils attended at the hours that were most advantageous in relation to their outside work. The procedure for problem solving was largely a directed study plan. Core studies rooms were equipped with tables around which groups developed working plans. Discussion and written expression were utilized in connection with the development of the problem. Students worked singly or in groups, with the teachers actively assisting students. Each problem was brought to a close with reports, questions, and general discussion. In addition, students assumed responsibility for carrying out classroom organization and management. They cared for books, took attendance, kept certain types of records, and maintained and improved the classroom environment. Mrs. Beth K. Gantt, head of the Core Studies teacher group in 1932 analyzed the students' progress as co-workers in the task of education.

Since this reorganization had promised to arouse the pupils to active citizenship, we were faced with need for doing something to make good this promise. The question of making the pupils genuinely concerned about their real problems and of so organizing them that they were in a position to do something about it, was a vital one.

According to Cary, "We learn to do a thing by actually doing it, just so we learn to be worthy citizens by carrying out activities in citizenship." Citizenship was the highest expected outcome

33 Miles E. Cary, "Purposeful Activities in the McKinley Senior High School, Honolulu, Education 53 (Boston: The Palmer Company, 1933): 266.
of school life, and the entire school organization contributed to the development of citizenship attitudes through activities which offered opportunity for participation in cooperative enterprises and in the clarification of social attitudes. It was such relevant, problem-based education and the degree of responsible citizenship which fostered and formed a strong base for democratic schooling. "Without a doubt there is as complete democracy in the student group [core group] of McKinley High School as there is in any high school in the world." Democratic citizenship had become the most valuable achievement of school life.\(^34\)

Only two years after the implementation of the Core Studies, McKinley High School was receiving national attention. If McKinley was a model for democratic process, it was because it was becoming a laboratory school for citizenship. Miles Cary's belief that "the real test of education is what people are encouraged to do in their own community to improve the quality of living" was leaving its mark.\(^35\) A core curriculum and citizenship laboratory, designed to have students participate in examining the real problems confronting them and to create effective solutions of critical community problems, resulted in one of the most important experiments in secondary education of its time.

In Cary's view, students' ability to make decisions regarding community needs developed the moral responsibility, commitment, and educational and ethical practices on which democracy is founded. McKinley High School students and teachers were empowered to evaluate the quality of their own work. Cary believed that students' school work should satisfy their needs, not limit their productivity or learning. Intrinsic motivation guided their civic actions.

\[\ldots\] McKinley's (and Hawaii's) young people are keenly proud of the fact that they are Americans; and, too, they want

\(^{34}\) Bolton and Cary, "Going to School in Hawaii," 43-44.
Americans on the mainland to see and accept them as Americans. Furthermore, through their parents and neighbors and a "core curriculum" developed in terms of critical problems of local, national, and international significance, these young people have come to sense some of the connections of their problems with the concerns of peoples throughout the world. Besides the study of genuine problems, McKinley's young people have had the opportunity to sense the deeper meanings of democracy through participation in the management of the school. In this connection, it needs only to be mentioned here that the continuing attitudes of mainland Americans toward the people of Hawaii will have much influence in shaping the attitudes and dispositions of the future citizens of that Territory.

When students learn thoughtfully and can analyze the results of the work before them, rather than on the results of standardized test scores, the whole child learns to deal with actual situations in the whole community. Human development and learning, which integrate thought and action, furnish the best basis for educating the whole child. According to Cary:

Since we claim to prize independent thinking, teachers would be careful to avoid giving the answers to questions. Stress would be laid on encouraging each pupil to work out his own philosophy of life. But here, again, the teachers would not be entirely neutral because the base lines for all thinking would be our democratic ideals.

Miles E. Cary developed a community at McKinley High School which, in some respects at least, might serve as a model for the reform and restructuring of school systems today. His non-authoritarian leadership empowered the entire school community. Cary disagreed with the claim that:

... curriculum makers should lay out all subject matter in advance. On the contrary, pupils should be encouraged to pursue a great variety of interests, there should be all sorts of constructive undertaking within the school and reaching into all aspects of the larger community. Also, we would

36 Cary, "Intergroup and Interracial Education," 43.
desire that due consideration be given to improving such
skills as reading, writing, speaking, and number. But as an
organizing or integrating center of the whole program there
would be a continuous effort to clarify thinking regarding
the meaning of democracy.  

In William H. Kilpatrick's analysis, Progressive Education
builds the foundation for democratic reconstruction of a social
order, dealing educationally in a social situation. It was Cary's
ability to achieve this that caused social historian Lawrence
Fuchs to credit Cary's efforts for a progressive curriculum as
the stimulus that encouraged McKinley High School students to
dream and bridge the gap between reality and their vision of
success. According to Fuchs, "McKinley was the leading school
and Cary the most significant educator in Hawaii during the
1920's and '30's," and "the battle of McKinley High School had
been fought and won for democracy."

In order for young people to conduct their organizations in
ways similar to how their parents conduct the adult organiza-
tions of the community, the school needs to provide the
opportunity for discussion of live issues. "The kind of social life
which prevails in our high schools today is a prophecy of the
social life of the community of the next generation." Miles
Elwood Cary and McKinley High School represent the American
democratic scheme of values. They experience a practical and
dynamic way of life--a means to develop the present condition
in such a way that the community is renewed, re-defined, and
reconstructed.

The Midwest History of Education Society meets annually in late October or early November. Since the society’s inception these meetings have been hosted by Loyola University at its Watertower Campus. Membership in the Society is open to anyone interested in the history of education.

The Vice-President announces calls for papers in late spring. Any paper presented at the annual meeting may be considered for publication in the journal.

Editorial Policy:

The Journal of the Midwest History of Education Society is devoted to the reflective examination of educational issues and problems from the perspective of diverse disciplines. The Journal strives to encourage communication among scholars of varied disciplines, nationalities, and cultures and it treats the most comprehensive issues and problems confronting education throughout the world. The editors solicit essays, reports of research studies, analyses and critiques that synthesize diverse points of view and encourage interdisciplinary dialogue.

The Journal has published authors from disciplines ranging from political science to philosophy to marketing to instructional technology to adult and continuing education. Its editorial board consists of a diverse group of professionals who referee articles according to their expertise. The main criteria for acceptance consists in a well articulated argument or point of view concerning an educational issue.

Papers must be submitted on a disk (3 1/2" or 5 1/4") accompanied by two (2) copies of a print out. Please specify the word processing program you used. Papers not submitted on readable disks will be billed at $12/hour for keyboarding.

Meta-Tyrannical Machines: Curricular Ideology as a Factor in Creating Tyrannical Machines

Barry Arbreton
University of Michigan

Adequate support and encouragement, unfortunately, is not being given to teachers and administrators who believe in rigorous intellectual discipline. In particular it is not forthcoming to the extent that it should be from the teacher-training institutions and the educational associations that ought to be the backbone of the profession. . . . One of the gravest charges that can be made against the professional educationists is that they have undermined public confidence in the schools by setting forth purposes for education so trivial as to forfeit the respect of thoughtful men, and by deliberately divorcing the schools from the disciplines of science and scholarship, which citizens trust and value.

Arthur Bestor

Time and again, reformers have pointed out the failings of American education. They have cited its unsuccessful practices repeatedly—and quite often futilely. Even when reformers have built consensus on a matter—that we do not train our teachers properly, for example—practice has frequently changed only at the margins. How is it that we can so often see where we are going wrong and yet be unable to change direction? Indeed, how is it that we get off track in the first place? . . . As James described it, ways of doing things that are well justified in the beginning tend, when established widely, to become tyrannical machines.

In her recent publication, Tyrannical Machines: A Report on Educational Practices Gone Wrong and Our Best Hopes for Setting Them Right, Lynne Cheney asserts that we need to focus our attention on the reasons behind what she, and others, have called the failures of the American educational system. In doing so, Cheney uses William James’ classic tyrannical machine metaphor to describe educational inertia in terms of the bureaucracy which accompanies institutionalizing on a large scale. However, I was disappointed that Cheney did not focus the metaphor on the process of calling for reforms as well. In this light, I found her work to be revealing as much for what it assumes, as for what it states explicitly.

A close examination of Cheney’s argument and supporting documentation reveals an important factor in the creation and maintenance of tyrannical machines which neither Cheney nor James have acknowledged—the reformer’s curricular ideology. In this paper I argue that Cheney’s curricular ideology is consistent

with a dominant line of reform literature written in the past 40 years. This dominant curricular reform ideology is best summed up by what Schiro has called the Scholar Academic Ideology.

Curriculum developers working within the Scholar Academic Ideology view curriculum creation from the perspective of the academic disciplines . . . An academic discipline is viewed as a hierarchical community of people in search for truth within one part of the universe of knowledge. The hierarchical communities consist of inquirers into the truth (scholars at the top of the hierarchy), teachers of the truth (who disseminate the truth that is discovered by the scholars) and learners of the truth (students whose job it is to learn the truth so that they may become proficient members of the discipline). 4

In short a Scholar Academic (SA) reformer or teacher would be one who is concerned with maintaining and advancing a core of knowledge which they believe well educated men and women must possess. SA reformers favor rigorous intellectual training and national standardized assessments of this corpus of important knowledge.

In this paper I would like to argue that William James’ tyrannical machines metaphor is an apt description of both the mainstream of American teacher education institutions, as well as Cheney’s inability to break through the assumptions her curricular ideology imposes on her reform choices and recommendations. Further, I propose that a curricular reformer working with the assumptions and beliefs of a Scholar Academic is bound to produce reforms which quickly become tyrannical machines. In an attempt to better understand the problems within the general reform of teacher education and Cheney’s curricular reform within a SA Ideology in particular, my analysis will focus on three closely related arguments:

1) Prompted by Cheney's use of William James' Tyrannical Machines metaphor, I have tried to examine the causes and assumptions of Tyrannical Machines. When an innovation works well in its original setting it often becomes the target of an attempt to duplicate or disseminate the ideas and practices which make it successful to a more general population. In this process, the innovation invariably becomes rigidified and less effective. The end result is what William James calls a tyrannical machine—a roadblock to future innovations and individual initiative. It is often these machines that reformers are attempting to fix. (More on tyrannical machines later.) I suggest that, given our current assumptions about knowledge and its inevitable growth, educational reformers do us a disservice by viewing reform as containing a possibility for a final solution to problems.

2) Most reformers fail to explicitly state that the natural progression of any educational institution (including innovations within that system) will need to be changed in the future, no matter how well that institution functions in the present, and that this is not to be feared. In fact, the very language used in SA reform literature perpetuates the view that prior solutions have failed. In part this is due to the partisan nature of calling to reform an existing system, but I would like to argue that this is also due to the assumptions which SA reformers take for granted about the process of calling for reform. In general, Scholar Academics view knowledge from a classical, Logical Positivist, perspective. In particular, each of the pieces reviewed implicitly accept Hume's conception of causation: each reform piece reviewed assumes that the educational system is closed and can be manipulated and understood in terms of predictable laws and outcomes. In an attempt to become more scientific, SA educational researchers, reformers, and theorists too often have accepted what is essentially an experimental design

---

intended for physical sciences and mis-applied it to social situations. As a result call for reform literature seems to repeat itself, primarily because reforming as a process that doesn’t have a fixed solution has not been strongly advocated.

3) In the process of outlining the assumptions used in call for reform literature I also touch on the importance of what is commonly referred to as diversity in the schools. In the past twenty-five years or so we have witnessed the emergence and the empowerment of a variety of different cultural perspectives as reasonable voices outside of the traditional academic circle. As the proportion of minority students rises in the school system, that school system’s aims come under greater scrutiny. While examples provided in the four calls for reform identified below suggest a paradoxical state of education which is both in a shambles and encompasses schools and educational providers which ARE working, I argue that this paradox stems in great part from the different perspectives and purposes that the educational system is now called upon to serve. I suggest that both types of example point to the fact that it may be this stated need for a national vision, a nation whose students all achieve the same things at the same time, which is the problem rather than the practices and programs found around the nation. Why, I ask, are curriculum reformers working within a Scholar Academic Ideology afraid of not having a shared vision for America?

I will approach these arguments from a variety of angles by analyzing four calls for reform that have been widely recognized as influential. These calls for reform were chosen as representative of the developing ideology which Cheney seems to be positing. The

---

first two, *The Restoration of Learning*, by Arthur Bestor and *The Education of American Teachers*, by James Bryant Conant,⁷ are central to Cheney's arguments and are referenced in her work.⁸ The next, *A Nation At Risk*, from the National Commission on Excellence in Education, although not referenced by Cheney, seems to me to be an integral part of her approach to the problems as outlined by the first two.⁹ In addition a review of *Tyrannical Machines*, by Lynne Cheney is also included.

I begin with a brief overview of each call for reform individually, discussing first the call's over arching educational goals and projected reform agenda and then move to the call's arguments surrounding teacher education specifically. In particular this review is meant to show the similarities and historical flow of these calls both in terms of specific content, issues, and form of argument used. Next, I discuss these calls for reform in relation to each of the three arguments outlined above. I then concentrate on pulling these four examples together as indicative of a curricular ideology under which Cheney operates and which I feel holds her back from proposing a reform which stands a better chance of not becoming a tyrannical machine. I close the paper with a critique of the reform debate in general and an examination of my evolving conceptions of knowledge, education, teacher preparation, and curriculum.

---

⁹ *A Nation at Risk*.
Arthur Bestor: The Restoration of Learning

This popular book was written in 1955 and targeted those Americans involved in academia or in the learned professions. Bestor's main thesis throughout the book is simple: Schools should be primarily an agency for academic training. The Restoration of Learning is an expansion of Educational Wastelands, Arthur Bestor's vehement attack on progressive education and John Dewey published two years earlier in 1953. Throughout his book Bestor describes (although one might argue he perpetuates) the strong rivalry between the “educationists” and the academic scholars and scientists—the former clearly being the bad-guys and almost always blamed for the ills of the educational system in America. While educationists of the time (1955) were pushing for life adjustment courses, Bestor, a history professor, “remained faithful to the concept of the school as a place of thorough and disciplined intellectual training.”

In a few places Bestor softens his stance to admit that scholars and scientists need to take some of the blame for “allowing” the educationists to gain control. But, he then goes on to state that the educationists, these “anti-intellectualists are in a position to ruin our schools” because they have the political clout and organization of the bureaucracy behind them.

Already [the educationists] have lost the faith of the public because their curricula are not intellectually rigorous . . . [because they set] forth purposes for education so trivial as to forfeit the respect of thoughtful men, and by deliberately divorc-

---

12 Ibid., 255-60.

ing the schools from the disciplines of science and scholarship, which the citizens trust and value.  

It is at this point that Bestor begins his criticism of teacher education, (or teacher training, as he calls it) and the focus of his criticism is quite similar:

Whatever else a teacher may need, he [or she] must possess ready command of a variety of intellectual skills and a fund of accurate knowledge . . . if his undergraduate program is directed by vocationally minded advisors—by professors of pedagogy for example—the liberal and liberating components of his education are almost certain to be neglected.  

What Bestor has done is to set up yet another good guy/bad guy dichotomy; the good courses are traditional academic disciplines, and the bad courses are the methods or pedagogy courses. In Bestor’s view an academic course of study provides prospective teachers with the ability to learn how to learn and training in rigorous intellectual disciplines which are of proven merit and scientific standing. In contrast, the methods courses are viewed only as places to learn lesser valued vocational tricks and attitudes. Bestor claims that nothing of value can be learned from professors of pedagogy that cannot be learned better through practice teaching! In a system reformed by Bestor, therefore, the role of professors of pedagogy would be limited to what Bestor might call vocational advice. Bestor wishes to bring the training of teachers under the supervision of Liberal Arts professors, with higher academic standards and more scientific administration of certification and supervision of secondary student teachers in particular.

As one might expect in a piece written by one person, this call for reform has a single and distinct voice. In many ways Bestor’s views and approaches to educational reform are prime examples of what Schiro has called the Scholar Academic ideology.  

---

13 Ibid., 4.
14 Ibid., 243.
15 Ibid., 264-68.
16 Schiro, Curriculum for Better Schools.
tional scholarship and the scientific method are seen as the source of knowledge. All learning should be placed in its hierarchical relation to established knowledge and systematically built upon. By exercising reason more rigorously the student becomes better at reasoning. The tone of this call for reform, therefore, is one of smug superiority. Bestor makes no pretense of objectivity or impartiality—in many instances he openly berates and denigrates those he refers to as "educationists." Being a scholar himself, he is sure of the merit of his arguments and produces copious examples of correspondence to support his position.

James Bryant Conant: The Education of American Teachers

This call for reform is the only one reviewed which deals specifically with teacher education and, in fact, starts with the authors views on teacher education. J. B. Conant, former president of Harvard, Ambassador to Germany, and noted chemist and educational scholar, initially presents himself as a former holder of Bestor's views. Conant began his teaching career as a chemistry professor, accepting the party line held by academicians without even thinking about it: liberal arts equals good worthwhile instruction for teachers and education courses and professors are useless. However, where Bestor's call for reform was highly partisan, Conant's call for reform is the culmination of both his highly regarded tenure as president of Harvard and, later, a thorough investigation of teacher education institutions in 1962-1963. As a result, Conant found himself in a position to thoroughly review both sides of the ideological debate which Bestor so clearly described. Conant states plainly that "it is generally the case that academic professors who advance these arguments [that methods courses are worthless, etc.] know far too little about education courses and, unfortunately, what some professors of education have written
about education can be labeled anti-intellectual.”17 Conant later clarifies this by asserting that he does not subscribe to “devil” theories of argument [what seems to be a clear reference to the best selling books of Arthur Bestor a decade earlier]—that they are too simplistic and essentially irresponsible.18

The problem with teacher education, then, in Conant’s view, is that of a power struggle between professors . . . The programs in many institutions seem to have been developed not by careful consideration of a group but by a process that might be called academic logrolling. In any event, one finds a complete lack of agreement on what constitutes a satisfactory general education program for future teachers . . . when one examines the education courses one finds almost as much confusion as in general education.19

In a sense, Conant has found a continuation of Bestor’s argument still present—the debate over the relative importance of content and academics over methods and pedagogy. But he has not dismissed educationists as the sole culprits. He claims that neither side should be criticized to the exclusion of the other. Conant asserts the importance of methods courses when linked to a field placement/practical teaching experience: “The art of teaching can best be developed by practice under suitable conditions.”20

Conant believes that no single curriculum has proven superior to any other in the field of teacher education. He, therefore, places the following recommendation at the top of his specific recommendations for teacher education: Universities should take it as their responsibility to guarantee that their graduates are fit to teach—both academically and including practice teaching. This approach should be an all-university effort with professors of pedagogy and

17 Bestor, The Restoration of Learning, 7.
18 Ibid., 15.
19 Ibid., 208.
20 Ibid., 13, 113.
academic professors having equal input and responsibility for program construction and teaching. In this way Conant hopes to introduce what he refers to as a free market system into the reform of teacher education institutions.\textsuperscript{21} In other words, teacher education providers should compete against each other by improving their programs of study in order to attract the best students and faculty.

In the end, Conant still advocates "either a program of concentration [which is] sequential, so that completion of the most advanced work ensures a grasp of what has preceded it, or it should be tested comprehensively and be capable of being tested."\textsuperscript{22} The assumption here still being that there is a body of knowledge which is essential for teachers to know. Thus Conant is continuing Bestor's call for academic accountability but he has added a bold caveat; he claims that as the best method to train teachers has not been scientifically established it should become our aim to find it via the competition generated by empowering different (academic minded) alternatives to teacher education and then to institute it. Conant, therefore, can also be placed in the Scholar Academic camp. However, while his conclusions do not differ radically from Bestor's call for reform, the tone of Conant's piece is much more compelling to me. This is due to the fact that, all in all, Conant's presentation is less of a singular voice than Bestor's. Conant's call for reform is an attempt to consider more viewpoints than one—an important distinction.

\textsuperscript{21}Ibid., 68.
\textsuperscript{22}Ibid., 104.
A Nation At Risk

An often cited publication, prepared by the Commission for Excellence in Education, and chaired by David Pierpoint Gardner, A Nation at Risk is geared for the general reader. It is presented in a carefully designed, albeit broad, format with little in the way of specific recommendations. This, it seems to me, is a direct result of this call for reform being written by committee, as opposed to the two singly authored pieces which have come before it. It is not coincidental that by this time inclusion of non-majority viewpoints and concerns were big national issues. We will examine the empowerment of diverse perspectives, and hence committee voices, later.

A Nation at Risk claims that "the educational foundations of our society are presently [1983] being eroded by a rising tide of mediocrity." A Nation at Risk then goes on to assert that "knowledge, learning, information, and skilled intelligence are the new raw materials of international commerce." Many have cited this and other passages as indications of the importance of economic considerations to the authors of this publication. In effect, this publication was aimed at linking poor national and international economic performance to the decline in education and the lack of more rigorous academic expectations to problems with articulation into the work force.23

In this call for reform, an attempt was made to include many scholarly, scientific, and learned societies in the reformulation of a national plan of action. The goal was to strengthen the resolve of the public and the economic base of the country as a whole. This position is closely akin to what Schiro has called a Social Efficiency model of curricular ideology: A model which assumes teachers are

23 A Nation At Risk, 5-7; Joel Spring, "Education and the Sony War," Phi Delta Kappan April, 1984.
best qualified and trained to help students find their place in society and to provide those students with the information and skills needed to efficiently enter the work force. By framing this call for reform in terms of economic success, A Nation at Risk hits at the heart of the average citizen by claiming that "what is behind this emerging national sense of frustration can be described as both a dimming of personal expectations and the fear of losing a shared vision for America."24

As for teacher education, A Nation at Risk calls for reform based on the fact "that not enough of the academically able students are being attracted to teaching. That teacher preparation programs need substantial improvement ... [and that] the teacher preparation curriculum is weighted heavily with courses in 'educational methods' at the expense of courses in subjects to be taught."25 Because of the brevity and general nature of this report, A Nation at Risk doesn't single out bad guys as clearly as Bestor (then again who could?) nor does it provide the specific recommendations which Conant does in an effort to move reform forward. This call for reform is clearly an attempt to "inform" and involve the public by linking education to jobs and standard of living in the United States. It has been argued that A Nation at Risk does not do a good job of substantiating this link between economic competition and the demise of educational standards, but by asserting that it is so they are able to achieve a rhetorical victory in focusing the argument on education for the work place rather than education for any other purpose.26 While this commission continues to support the Scholar Academic assumptions about knowledge and the place of rigorous academic instruction in teacher education, A Nation at

24 Schiro, Curriculum for Better Schools, 85-160; A Nation At Risk, 11-12.
25 Ibid., 22.
26 Spring, "Education and the Sony War."

167
Risk does so by reframing the issue in a more popularly interesting format.

In effect this call for reform is advocating many of the same reforms of the two previous calls for reforms (more academic rigor, less emphasis on methods and education courses, a possibility that alternative certification programs will be useful in key areas of need, i.e., science and math) but has framed the issue as one of economic necessity—competition not to find the best methods for instructing teachers, but competition to achieve on standardized tests in an effort to prove our international standing.

Lynne Cheney: Tyrannical Machines

Lynne Cheney begins her call for reform by resurrecting William James' tyrannical machines metaphor. A Tyrannical Machine is a system begun well with an innovation or a laudable idea that became bogged down with the spread of that idea or practice. Tyrannical Machines exist because in the process of diffusing innovation much of the flexibility of an innovation is lost and authority of the given innovation (or text of that innovation) is overemphasized. Cheney summarizes,

Practices that began by filling needs become detached from their original purposes, even counter productive. Having been adopted on a large scale, however, these practices take on a power of their own . . . tyrannical machines dominate American education and have contributed to its failures.27

The clearest failure which Cheney identifies for teacher education is that teachers need to study more academic material in a

28Cheney, Tyrannical Machines, 1.
disciplined way and avoid methods courses which are a "waste of time;" the same problem identified by Bestor in 1953. In addition, Cheney asserts that "attempting to make a little material go a long way educators parse the subject matter finely so that it can be presented in different ways on different but none-the-less repetitious lists," that, in turn, pushes academically talented teachers and prospective teachers away from the study and practice of education. And although Cheney, cites problems with tests used in American education, academically talented students seem to be defined as those who buy into the Scholar Academic ideology and achieve well on national assessments of achievement. Although Cheney does not discuss the additional academic content teachers are lacking, she does list examples of content she feels is needed by all college graduates: "To most college seniors, Jane Austen's *Pride and Prejudice*, Dostoyevsky's *Crime and Punishment*, and Martin Luther King, Jr.'s 'Letter from Birmingham Jail' were clearly unfamiliar." By citing specific content which American students need to know Cheney's reform ideas can be seen to favor a core-curricula.

Cheney is therefore placed in the awkward position of holding to a vision of education which strives to set a "substantial, coherent curriculum [which] is central to the teaching mission" at the core of our nation's priorities, but which also warns against instituting any one program as king for fear that it might turn out to become a tyrannical machine. She therefore proposes that "the most effective course for dealing with tyrannical machines is to provide alternative systems and to ensure that people can choose—and choose wisely—among them." Cheney provides a number of examples of alternative educational activities (coincidentally

29 Ibid., 6-7.
30 Ibid., 2.
31 Ibid., 32.
32 Ibid., 50.
funded by the National Endowment for the Humanities) and certification programs to show possible solutions to the nation's problems. Unfortunately Cheney does not explicate her next step.

We are left with a host of important questions: What might be the cause of poor methods courses being taught in teacher education? Why is information about teaching parsed so finely and what effect does this have on calls for reform? What is to be learned from the examples of programs Cheney has cited which work? Cheney fails to show how an exemplar can help others to institute similar programs without having the new programs become tyrannical machines themselves. Is it possible to reconcile alternative programs to best teach teachers and also strive for specific content which must be included in each of those diverse programs? Isn't advocating the equivalent of a Scholar Academic ideology opposed to the idea of alternative models of education? These questions are best answered by stepping back from Tyrannical Machines and examining Cheney's definition of education more closely. Cheney draws heavily on James' conceptions of education.

As William James described it, 'the purpose of education is to cultivate judgement. We learn what types of activity have stood the test of time; we acquire standards of the excellent and the durable,' we learn what James called a 'critical sense' . . . . Ultimately, education aims at cultivating the wisdom that democracy requires: wisdom to make sound political judgements about who shall lead and make laws, and wisdom to make sound personal judgements about how to live a life and know the purpose of ones days.  

Let us focus next on what seems to be a problematic point for Cheney—the assumptions of a Scholar Academic ideology.

---

33Ibid., 52.
Scholar Academic Assumptions

In *The Saber Tooth Curriculum* Pediwell argues quite persuasively that in an attempt to be more scientific, Bestor's key argument, educators have tried to adapt what is essentially a scientific model onto a social system. The assumption clearly was that investigating and learning about education can be equated with the methods of operation found in the physical science disciplines, which leads to an answer of our first question—why are methods courses the way they are? One reason might be that in an attempt to be more scientific, to gain academic respectability, educators have moved too far away from the social nature of teaching and concentrated on smaller and smaller pieces of instructional problems. Educational researchers routinely study classroom problems by removing students from the classroom to study—an effort to control extraneous variables and to be more scientific. It is ironic that Bestor's claim that education was not scientific enough may have propelled education in a direction which is too scientific. Many have argued that a social system cannot be studied in the same way as physical sciences. As we have seen, each call for reform reviewed primarily views education, a fundamentally social activity, as a part of a predictable world, one in which general laws adequately describe actions and events. This being the case, they do not see the contradictions inherent in using an experimental method to find the best approach to educating teachers.

Unfortunately, as Gage has recently summarized the state of educational research, "the search for scientifically grounded ways to understand and improve teaching has led nowhere." Relating

36 Gage, "The Paradigm Wars."
this to our investigation, House has taken Gage's claim to mean that

the assumptions of uniformity of nature, essential to Humean/regularity theory and the standard view [of knowledge and science] does not hold at the level of events, and it does not hold for educational programs and their effects . . . The standard view conceives of educational programs and their effects as existing in a closed system, like the components of a television set, when in fact the system is open to any number of influences, in spite of attempts to close it off by experimental design or, more likely quasi-experimental design and statistical controls. (The necessity of isolating the system from outside influences is seen from the fact that even a closed system like a television set will not produce the same results underwater.)  

In other words, the process in which a tyrannical machine is made, that is taking an innovation or exemplary educational program and trying to generalize it, hinges on the fact that generalizing or moving it from its site of origin assumes a predictable stable environment. It is instructive to note that many innovations which are created for broad dissemination are specifically structured for teacher proof instruction which will hinder individual adaptation. Rather than give up their view of knowledge and instruction both Scholar Academic and Social Efficiency ideologies of curricular design sacrifice teacher initiative and lead directly to bureaucratization and tyrannical machines. Not only have these curriculum designers been unable to challenge their assumptions about knowledge, they are also unable to give up their authority and trust teachers to join in the intellectual dialogue. As a direct consequence, these program transfers rarely work, as the system is nowhere near being closed! Consequently, teachers are blamed for poor instruction and education is seen as being in a constant state of crisis. All of which points to the fact that calling for a national shared vision and working to manipulate the given system to produce these goals leads directly to tyrannical machines. To break this pattern we must

---

37 House, "Realism in Research," 7-8.
look at the calls for reform and their hidden support of this machine building.

Call for Reform as a Tyrannical Machine

I'd like to look at the process of calling for a reform, and examine why seeing past reforms as failures perpetuates a negative view of education. If, in the process of identifying the underlying structures of what we observe, we can expect someday to go into ever more detailed layers of explanation it seems reasonable to assume that information and 'new' knowledge claims will continue to be produced. This, it seems to me, is an important assumption to make explicit.

We, as educators, are in the process of helping others to identify knowledge as a continuing intellectual dialogue which evolves and has been informed and shaped by past debates; to understand their relation to the intellectual dialogue; and to help these people join in and contribute to that dialogue. This being the case, it seems reasonable to assume that some of what we do will advance the intellectual dialogue; in the process of teaching and learning we add knowledge claims to the dialogue.

As we have seen, knowledge claims and experiments dealing with physical states and interactions are more easily controlled than social interactions. Complex problems dealing with social issues and investigated or carried out in a social context admit of a variety of different approaches to finding solutions. Where do these different approaches come from? Would a homogeneous society be more or less likely to question the accepted approaches to learning? While the opinion of the members in a homogeneous society

38 Bhaskar, A Realist Theory of Science.
may be widely different, it is likely that problems are analyzed and interpreted in much the same manner by all of its members.\(^{39}\)

In a society that is less homogeneous the diversity of perspectives and approaches to the same problem should vary to a greater degree.

Based on the ability of the diverse members of a society to voice their perspectives it seems likely that as a widened range of perspectives are empowered, a greater variety of perspectives are presented and produce 'new' knowledge claims which also enter into the intellectual dialogue. If the entire group were the same it would be less likely that alternatives would be viewed as necessary. It should also be more likely that the educational system would tend toward a more closed (therefore predictable) and experimentation friendly system. The significance of this statement can be seen in the gradual change in content of single authors (Bestor and Conant) to committee calls for reform (A Nation at Risk, and Tyrannical Machines). Committee reports, by their very nature, need to speak for the majority of the group, which means they tend to be more broad and less specific in their recommendations. This is clearly the case with the four calls for reform reviewed. It should also be noted that whereas for Conant choice was seen as a means to find the single best path for educating teachers, it could be seen an attempt to break out of a single path model for Cheney.

Fortunately, we have seen an expansion of opportunity for nonmajority perspectives to join in the intellectual dialogue. Certainly this is more true for the two calls for reform published after 1980 than those published before 1965. This means that as new sources for solutions to these complex problems are opened up with the widening circle of empowered perspectives, new knowledge claims and different (often more complex) problems arise to

---

Journal of the Midwest History of Education Society [ Vol. 20

174
begin the process all over again. In other words, we can't ever get it right. Reform is a never ending process.

Why then do reformers point with such disdain at the "failings" of past reforms or educational practices? By calling for reform and assuming that it is possible to get it right, these reformers are emphasizing the negative features of the system rather than the positive. Also, by striving for a national core-curriculum SA reformers are moving away from the expansion of knowledge available and toward the control of knowledge they feel is most important. Each call for reform reviewed has tenaciously held on to this belief—that some knowledge claims are simply more important than others.

Do We Really Share the Same Vision?

At this point it might be wise to step back from the individual calls for reform to examine the possibility that change is inevitable—that tyrannical machines are a function of this process but perhaps only when a shared vision or national curriculum is their projected usefulness. Those reformers working within the Scholar Academic and the Social Efficiency traditions, have historically taken for granted that a national curriculum is a good thing. In addition, they have assumed that this statement is self evident.

What lies behind this emerging national sense of frustration can be described as both a dimming of personal expectations and the fear of losing a shared vision for America.\(^{40}\)

However, we have seen that when a competition to find The Right Answer, and then to create a national curriculum around it, is the driving force behind innovation it should surprise no one when that innovation also becomes a tyrannical machine. In other words, the

\(^{40}\) A Nation At Risk, 11-12.
nation may be better served if we don’t try to force each innovation to perform outside of its original site of success, to share the same core-curricula, nor to continue to operate when the needs of that site are clearly in need of revision or change.41 Does this mean we should advocate change as our guiding principle? Would such a principle also end up becoming a tyrannical machine, forcing educational providers to change when programs are meeting the needs of their students, and site of instruction? Bestor addresses this issue of change directly:

As the problems of civilization alter—or more accurately, as the methods available for solving them alter and advance and become more powerful—the course of study must inevitably change . . . however . . . change is [too often] exalted into a supreme virtue, on the tacit assumption that schools can keep abreast of the times only by engaging in a frenetic quest for novelty. No idea more disruptive of education can possibly be imagined.42

Making education and educational research more scientific was seen as the path to respectability and also the path to understanding why teacher preparation was so ineffective. While we have seen a trend away from Bestor’s claim that there is one best and right way to know and to learn (the Scholar Academic model) and closer to a view which admits of a variety of effective strategies (Conant) we have nonetheless moved in the direction of choice (Cheney) because it might provide us with programs which, if not generalizable, might at least serve as the foundation of a national curriculum (A Nation at Risk). Whether consciously or not, these Scholar Academic and Social Efficiency calls for reform generally incorporate the scientific method, and it’s attendant assumptions, as the best hope for finding the best instructional methods. In other words Cheney is pushing for change, but not a change in the corpus of essential knowledge needed to be an educated adult or teacher.

The problem with a get it right approach seems to be the assumption that an enterprise as complex as education CAN ever

41 Schorr, Within Our Reach.
42 Bestor, The Restoration of Learning, 40.
have a fixed solution. By viewing change in a broader perspective is it possible to exalt in the past and in the challenge of adapting a system to accommodate a wider range of perspectives? In other words, is it possible for us to admit to the difficulties of finding a shared vision of education and move closer to empowering parallel visions?

While the reform literature reviewed here is not fully representative of the flow of the reform debate, they represent high water marks which preserve the important elements of the call for reform debate over time. Knowledge, at the beginning of our call for reform time line was seen as external to the student and in need of being given to them. For teachers this meant that there was a need to store more knowledge than their students could. It was also seen as hierarchical, with integration capable only at the highest level. Therefore, while Bestor admits that vocational skills are best learned by doing he denies that any student, including prospective teachers, can learn to integrate two separate fields of study unless they are advanced students in each discipline to be integrated. Since Bestor did not see the education of teachers as an intellectual discipline it made little sense to assume that methods courses were anything but vocational.

Over time this extreme stance has been softened somewhat. While at no time have these calls for reform lost respect for the academic training needed for teachers this view has shifted towards a view which at least accepts teacher education placements as more than vocational in nature—though most methods courses are viewed with suspicion. Conant seems to be the most sympathetic—and not incidentally he also is the reformer who spent the greatest amount of time with teachers and teacher educators. In the end, however, the only component of teacher education which all four calls for reform have identified as invaluable is the student teaching placement and a linked methods course to help integrate theory and practice. That theory and practice were ever separated in the first place can be seen as influenced by the Scholar Academic
push to view education and educational research more scientifically.

By the time we reach Cheney's call for reform, teacher educators and the conservative structure of education (which might be labeled in total as a tyrannical machine—see Holt, *Escape From Childhood*) are beginning to admit alternatives and educational choices which might lead to better teacher preparation. However, these choices are seen as alternative paths to the right answer, or at least as needing to share in the academic rigor and core of knowledge ascribed to scientific disciplines. In other words we should experiment with the process of teacher education but only if those experiments include certain content which we feel is important. Unfortunately, our analysis above indicates that the very process of calling for reform is currently played out in such a way as to resemble a tyrannical machine.

This line of reasoning shows the strong possibility that reform will always be needed—it also points out a serious flaw in the Scholar Academic and Social Efficiency assumptions that there is a "right" answer to reforming educational practice—either because this denies the widened circle of empowered perspectives or because it denies the possibility that our views on what is needed will evolve over time and that new knowledge claims make this evolution inevitable.

**Concluding Remarks**

Where does this leave us? It seems unlikely to me that there has ever been a shared vision of our nation's educational needs—other than a broad general feeling that education is important. In

---

particular, teacher education has never been directed by a national vision, nor I argue should it ever be. At times in our past various groups have made policy and directed various segments of the educational establishment. In general, a traditional, and some would say conservative Scholar Academic, view of education, knowledge claims, and instructional goals has held sway. The four calls for reform presented here are usually grouped in this traditional camp. However, as with all organizations which are semi-democratic, politics has made it difficult to institute a required national curricula for teachers.

By examining tyrannical machines more closely I have attempted to show why entering the debate over what is wrong and how we should fix it has proven less than helpful. Operating under what Schiro called a Scholar Academic Ideology (which can be loosely termed a positivist approach), these four reformers make the mistake of assuming that the educational system they are calling to reform is a stable and generally closed system.44 They further assume that the changes they suggest will have the effects they ascribe to them (for example, either by seeing them work in a smaller setting, or from experimental data which suggests that learners process information in a given way). By denigrating past reform efforts as failures they fail to see that the entire system in which the reform has played itself out has changed. In one sense, the reform has failed: it did not produce the desired and expected results of the curriculum designers. In another, more important sense, the reform hasn't failed, it has succeeded: by highlighting new, deeper structures of the problems facing us we are able to better meet the needs of an ever widening range of students and teachers. By enabling a diverse group of perspectives to enter the dialogue we are both more aware of the limitations which a positivist

44 Schiro, Curriculum for Better Schools.
approach places on education and on our views of which knowledge is of value.

I am not saying that we cannot strive for victories and improvement along the course of development, nor that we should not revel in these victories and the positive approaches which solve current problems. What I am pushing for is an explicit acknowledgement that these victories and solutions are plateaus which will become valleys as we accumulate more knowledge claims and empower more perspectives to join in the intellectual dialogue. And that as these plateaus become valleys we ought not to blame the process which took us to the plateau for the gradual loss of high ground... instead we should thank them for the progress to date, recognize the need to move yet higher, and work to positively build each new plateau.
The Life and Educational Career of Carlos de Sigüenza y Góngora, 1645-1700

Norma Salazar Davis
Chicago State University

Introduction

Hispanic figures and sources have been largely ignored in the history of American education, partly due to popular notions about Hispanics. It is time for a new lens through which to look at the past. By presenting the life of Carlos de Sigüenza y Góngora, I hope to fill one of many gaps in the historical record and generate friendly, constructive dialogue among historians so that in the future they might offer a sense of pride and inclusion to Hispanics.

The seventeenth century was a time of ferment in the development of education and culture in New Spain. An important figure in that development was Carlos de Sigüenza y Góngora, mathematician, historian, astronomer, cartographer, explorer, professor, sometimes poet—a "baroque scholar" and "Mexican Savant" according to historian Irving A. Leonard.
Family

Carlos de Sigüenza y Góngora was born in Mexico City on 15 August 1645. His father, Carlos de Sigüenza Benito, was born in Madrid. He tutored Prince Baltasar Carlos. At the end of his teaching assignment, he went to New Spain. He arrived at the port of Vera Cruz on 24 June 1640.1

Two years later, Don Carlos de Sigüenza Benito married Doña Dionisia Suárez de Figueroa y Góngora. Doña Dionisia was born in Seville, Spain. She came from an aristocratic family whose relatives included a well-known writer, Cristobal Suárez de Figueroa, and Don Luis de Góngora, a poet. Carlos de Sigüenza was proud of his family lineage. He specifically attached Góngora to his name to identify with the poet Don Luis de Góngora.2

Carlos Sigüenza was the second born of nine siblings and the first male. He and his family lived on the street of La Estampa de Jesús María where a convent by the same name was located. The proximity of the convent to the Sigüenza home may have influenced his sister María Lugarda de Jesús to join the convent.3

Francisco Rojas agrees that there was a special connection between the convent of Jesús María and Sigüenza's family life: his mother, Doña Dionisia, was buried in the convent; his sister Mother María Lugarda de Jesús entered its cloister; and much later, in the year 1684, Don Carlos Sigüenza wrote Paraiso Occidental (West-

J., “Sigüenza y Góngora’s Efforts for Readmission into the Jesuit Order,” Hispanic American Historical Review 33, 3 (1953): 391; Francisco Pérez Salazar, Biografía de Don Carlos de Sigüenza y Góngora (México: Antigua Imprenta de Murguía, 1928), 12. All translations from Spanish to English in the paper are mine.
3 Pérez Salazar, Biografía de don Carlos, 11, 13.
ern Paradise) which narrated the founding and history of the convent. Rojas firmly states:

This old neighborhood framed a great part of the life of Carlos de Sigüenza y Góngora: his birth and infancy in the [street] 'Estampa de Jesús María,' his visits to church and the convent which were frequent, and lastly, very close by, there [was] the Hospital del Amor de Dios, later San Carlos Royal Academy, now School of Plastic Arts, where Don Carlos lived many years and died at the end of the seventeenth century.⁴

Formation

Carlos Sigüenza’s first schooling began at home under his father’s tutelage. Carlos was barely fifteen when he entered the Novitiate of the Society of Jesus at Tepotzotlán on 17 May 1660. He took his initial vows on 15 August 1662. In keeping with standard Jesuit practice, he studied the humanities and some theology.⁵

The Jesuit Order proved to be too severe for the impetuous young Carlos Siguenza—or rather his inclinations may have been too impetuous for the discipline of the Society. On 3 August 1667 he was expelled for frequent “nocturnal escapades.” On that day he left both the Society and the College of the Holy Spirit where he had been a novice and then teacher. Filled with remorse, he requested reinstatement several times throughout his life, but unyielding superiors consistently denied his pleas.⁶

According to Ernest J. Burrus, S. J., the lack of documents available to explain the circumstances surrounding Sigüenza’s leaving the order has created conjecture among historians. One

---

⁴ Rojas García-Durán, Don Carlos de Sigüenza, 16.
⁵ Ibid., 19.
early account held that Carlos had been dismissed, but later historians rejected this view saying that his father had him leave. "Most historians [have] followed Andrés Cavo's opinion that Sigüenza left at the insistence of his father," wrote E. J. Burrus. Irving Leonard's careful 1929 biography of Sigüenza agrees with Andrés Cavo's conjecture.7

This remained the standard interpretation for several years. In the early 1940s, however, correspondence from the Jesuit General, Juan Paulo Oliva, "shed some light on this important detail concerning the life of Don Carlos."

According to historian Edmundo O'Gorman, the first letter (dated 15 August 1668) confirms that Carlos had been a novice at the Colegio del Espíritu Santo in Puebla and that he was dismissed for disorderly conduct.8 E. J. Burrus pointed out that Carlos could not have been a novice when he was dismissed. If he had been, there would have been no reason for a dispensation. "At the time of his expulsion he was a teacher in the Colegio Espíritu Santo in Puebla," he wrote. The college did not list any students, only teachers. Sigüenza was in the period of formation and getting ready for the priesthood. Burrus says that this would explain why Sigüenza was referred to as an "estudiante" (student) in the letter. He had studied philosophy at San Pedro and San Pablo in Mexico City and, according to Burrus, he would have returned there to study theology if he had not been dismissed from the order.9

---

8 O'Gorman, "Datos sobre D. Carlos," 596.

Journal of the Midwest History of Education Society
The second letter (30 March 1671) alludes to the fact that Carlos asked to be reinstated and the denial of his request due to the "ugliness" of the cause of his expulsion. The third letter dated (8 April 1671) is along the same lines as the previous two. By the time of the fourth letter (31 December 1677), the situation had changed. O'Gorman tells us that the Jesuit General Juan Paulo Oliva had become more flexible than before and that he was probably impressed with Sigüenza's intellectual accomplishments: "He tells me that he is an individual with natural talents, he is thirty years old, a professor at the University, and that he can serve religion well, and that he is extremely contrite and ingenuous."10

The Jesuit General removed the expulsion, but left the final decision about reinstatement up to the Padre Provincial. This official apparently refused. Sigüenza was not reinstated at this time despite his repeated efforts for readmission.11

Career

Unable to resume his studies in the Jesuit seminary, Sigüenza returned to Mexico City to study theology and mathematics on his own. He obviously succeeded. His affinity for mathematics and related sciences made him the leading mathematician of his time in Mexico.12

In 1672 there was a vacancy for the chair of mathematics and astrology at the university. Sigüenza applied, competing with José Salmerón de Castro who held a degree from the university. Sigüenza argued that even though he lacked the proper accreditation, he was better qualified than his opponent who had just recently

10 O'Gorman, "Datos sobre D. Carlos," 609.
11 Ibid., 596.
12 Leonard, Baroque Times, 197; Pérez Salazar, Biografía de Don Carlos, 24.
begun studying this field. Sigüenza claimed, on the other hand, to be an expert on the subject. As proof he reminded university authorities of the two almanacs he had developed, one in 1671 and the other in 1672.\footnote{Leonard, Baroque Times, 197; Rojas Garcidueñas, Don Carlos de Sigüenza, 30.}

Sigüenza won his argument and was allowed to compete for the chair of mathematics and astrology. The competition for selecting faculty members followed a system called oposiciones (disputation). The candidate publicly chose a printed source on the subject matter and within twenty-four hours was responsible for giving a lecture on a topic chosen randomly from within the printed material.\footnote{Leonard, Baroque Times, 197.}

After somewhat pompously demonstrating his erudition, Sigüenza was awarded the chair. The university chronicle recorded that:

On 21 July of this year, the chair [of mathematics] was voted on by degree-holders of the faculties in theology, canons, law, and medicine. . . . José Salmerón de Castro had fourteen votes; Don Carlos de Sigüenza, seventy-four; and Juan de Saucedo, seven. Don Carlos de Sigüenza was awarded the chair of astrology and mathematics, with an excess of sixty votes. He was told to take possession [of the chair] with a salary of 100 pesos, which he accepted 20 July of this year.\footnote{Cristóbal Bernardo de la Plaza y Jaen, Crónica de la Real y Pontificia Universidad de México, versión paleográfica de Nicolás Rangel 2 (México: Talleres Gráficos del Museo Nacional, 1931): 95, quoted in Rojas Garcidueñas, Don Carlos de Sigüenza, 33.}

Sigüenza's reputation as a university professor left something to be desired. He often had lengthy absences, leaving substitutes to deliver his lectures. Sometimes he just failed to show up for lectures.\footnote{Leonard, Baroque Times, 198.}
Numerous competing activities caused him to neglect his classroom duties. Most of his colleagues belonged to religious orders and were therefore assured of their basic needs. Carlos, on the other hand, needed to support himself as well as his parents, brothers, sisters, and a number of other relatives. For this reason, he held various other offices, which later brought him titles. These included Chief Cosmographer of the Realm, Chaplain of the Hospital del Amor de Dios (which offered room and board), General Examiner of Gunners, University Accountant, Corrector of the Inquisition, and numerous payed commissions from viceroys. While these activities competed for his time at the university, he never neglected his research in the areas of archeology, history, mathematics, and applied sciences.

Sigüenza considered his appointment at the Hospital del Amor de Dios the most remunerative because it provided him with room and board. His sponsor and protector Archbishop Francisco Aguiar de Seijas appointed him Chaplain after the archbishop assumed office in 1682. Archbishop Aguiar also authorized him to say mass as a lay priest, and this helped him to increase his earnings through fees.17

José Rojas says that for reasons that remain unknown, Sigüenza and the archbishop developed a special friendship. In the archbishop, Sigüenza found not only encouragement and support, but also sincere appreciation.18

This doesn't mean that these two strong personalities never clashed. There is an incident recorded in Father Robles diary that demonstrates both Sigüenza's blunt disposition and Archbishop Aguiar's authoritarian personality. Robles' entry is dated 11 October 1692, and it narrates the argument as follows:

17 Ibid.
18 Rojas Garcidueñas, Don Carlos de Sigüenza, 82.
1692-Fight.-Saturday 11, being D. Carlos de Sigüenza clergyman and priest, with Señor Archbishop discussing a few things, Don Carlos told Señor Archbishop to watch his words when he spoke to him, at which time his Illustrious[ness] used one of his crutches on him, broke his glasses spilling blood all over D. Carlos. 19

They were definitely two strong willed people. Despite their differences, they appeared to have developed a close friendship. According to Leonard: “Indeed the veneration of Don Carlos for his assailant increased until, in his mind, the prelate almost acquired the halo of a saint.” 20 Apparently Aguiar, who died a short time before Sigüenza, left his mitre to Don Carlos. In his own will, Sigüenza expressed that he had the archbishop’s hat in his possession and that people had been cured just by touching it. Sigüenza requested that the archbishop’s hat be kept in the oratory of Saint Phelipe Neri. 21

Sigüenza wrote extensively. His biggest regret was that he was able to publish only twelve of his works. Among his writing is La Libra Astronómica y Filosófica (Astronomical and Philosophical Libra). He wrote it in response to Father Kino’s criticism of a manifest in which Sigüenza was combating the presumption that comets were signs of bad omens. A comet had appeared in November 1680, causing grave alarm among the population in Mexico City. 22

Sigüenza’s most important historical account was Infortunios de Alonso Ramírez (Misfortunes of Alonso Ramírez). Ramírez, a native of Puerto Rico, had died at the hands of English pirates in

20 Leonard, Baroque Times, 199.
21 Pérez Salazar, Biografías de Don Carlos, 190.
22 Carlos González Peña, Historia de la Literatura Mexicana: Desde los origines hasta nuestros días (México: Porrúa, 1990), 98. Libra refers to the sign of the zodiac by that name.
the Philippines. Literary historian Carlos González has described Sigüenza as the best Mexican prose writer in the seventeenth century. González further stated that Sigüenza's best historical writings, are probably the ones he left unedited.23

Carlos was a great collector of Mexican documents. He left about twenty-eight volumes of manuscripts to the College of Maximo de San Pedro and San Pablo. During the revolt of 8 June 1692, he didn't hesitate to risk his life saving manuscripts and paintings from the burning palace.24

This incident is recorded in the minutes of the town council of 16 June 1692. Subsequent meetings—26 June and 11 July—alluded to the revolt, requesting that Sigüenza return the files:

The present secretary reported that they had seen the Priest Don Carlos Sigüenza and asked him to return the books he saved from the archive the night of the fire.... He agreed to return them but expressed that he was hurt because the city had not thanked him and at the same time wanted to let us know that he had incurred expenses transporting them to his house.25

He retired as a professor in 1694 and spent his last years gravely ill, writing historical accounts. He suffered from kidney stones. He died 22 August 1700. He left his library, rich in historical documents and scientific instruments, to the Society of Jesus. He donated his body to science hoping that the doctors would find a cure, at a time when "dissection was still counted a desecration." He bequeathed a mission of dedicated inquiry to future generations of historians. He may have received deathbed reinstatement into the Jesuit order, but this is not certain. Perhaps this ambivalent note

23 Ibid.
24 Ibid.

should remain to characterize a complex man who was simultaneously scientific and traditional.\textsuperscript{26}

Socrates on the Assembly Line: The Ford Foundation's Mass Marketing of Liberal Adult Education

Paul J. Edelson
State University of New York/Stony Brook

Background

In the ten years of its existence (1951-1961) the Ford Foundation's Fund for Adult Education (FAE) expended over $47 million dollars on behalf of adult and continuing education, and dwarfing the $8.5 million spent by the Carnegie Corporation during the period 1924-1958.¹ In fact, it is a significantly large proportion of the $76 million of the total adult education support spent by foundations in the "modern era" referred to by Knowles in 1962.²

The Ford Foundation, by virtue of its enormous wealth, estimated at $417 million in 1951, had the power and, concomitantly,

² Ibid., 97.
the prestige as America's largest philanthropy to do what it wanted in the area of adult education. Through the FAE it supported the fledgling Adult Education Association of the USA (AEA/USA), also founded in 1951, and its publication *Adult Leadership* as a way of forging coherence in what it perceived as a chaotic, directionless field. It supported the National Association of Public School Adult Educators (NAPSAE) in their efforts to persuade state departments of education to elevate adult education to a level comparable to elementary and secondary education.

In areas where it did not identify or acknowledge organizations willing to carry on the work it deemed necessary, the FAE created its own unique institutions. These were the circumstances surrounding the beginnings of the Test Cities Project, the Test Centers, and the Experimental Discussion Project, all pioneering efforts to firmly establish liberal adult education on a nationwide basis in post World War II America.

In the case of the Test Cities Project, the FAE created, with local citizen participation, adult education councils in twelve medium-size American cities ranging in population from 60,000 (York, PA) to 450,000 (Kansas City, MO). It funded the councils which were expected to implement and administer, and if possible create, liberal adult education programs, the major area of emphasis for the FAE. These councils were not intended to be simply coordinating bodies bringing together a panoply of other adult providers.

The Ford Foundation and the FAE wished to go a step further than the local councils funded by the Carnegie Corporation (and sometimes referred to as "Carnegie Councils") through the American Association for Adult Education (AAAE) which were viewed as "elusive and volatile." 7

Liberal Adult Education in the Post-War Period

By continuing liberal education the FAE meant more than the great classics of Western civilization that constituted the backbone of the Great Books program (also generously supported through major grants to the Great Books Foundation). The FAE defined liberal education broadly so that it might assist adults to intelligently participate as "mature, wise, and responsible citizens" in a free society. 8 Liberal arts and a liberal approach to education were thus fused with curricula on economics, government, and world events to promote individual development and citizenship that would strengthen both democracy and American society. Continuing liberal education was perceived as the most significant form of education, beginning where formal schooling left off and lasting a lifetime. 9 This took place within the context of an exceedingly confusing post War world.

America had finally come out of a wrenching depression, endured a long and costly war, and emerged triumphant in an uneasy peace, but was now beset by nuclear armed enemies that had recently been allies. Democracy/capitalism was now pitted

---

7 Knowles, A History of Adult Education Movement, 178.
against totalitarianism/socialism in a Cold War where once again the survival of the West was perceived to be at risk.

Additionally, the memory of the depression as a painful period of uncertainty and doubt was still vivid to most adults leading to a quite palpable fear that it might happen again. Prosperity and the "American high" were not yet an established fact.  

The Foundation's Agenda

A priority of the Ford Foundation was thus to strengthen democracy worldwide, but particularly in the United States. A major leitmotif in the Foundation's first major report, "Report of the Study for the Ford Foundation on Policy and Program" was to bring about a world order where we, as a nation, could be safe and prosperous, resisting totalitarianism and the tide of Communism "mounting" in Asia in Europe.  

The meaning of democracy was to be found in practice, the Report maintained, in daily application, not in a set of "rigid rules." America would prevail, not through war which was too costly and destructive, but by virtue of the example we could set for the rest of the world.

The Report, noting tendencies towards public apathy and skepticism, called for community demonstration projects to enhance confidence in civic life. The example of innovations in public health policy following successful demonstration projects was of-

---

11 Ford Foundation, "Report of the Study," 26. This study is also called the Gaither Report after Rowan Gaither who chaired the committee that produced it. He would later become President of the Ford Foundation following the resignation of Paul Hoffman.
12 Ibid., 21.
ferred as a model for what the applied social sciences might also accomplish in the urban arena, thus creating the idea for Test Cities that would be elaborated in subsequent passages of the document.

"Such experiments," the Report continued, "while sometimes difficult and expensive, are often catalytic in effect, producing widespread emulation. The Foundation may find it necessary to support such demonstration projects."\(^{13}\) In order to combat public apathy, for example, it was suggested that a community might run a "community workshop" in which "scientists or educators act as social engineers, in communities of manageable size, to stimulate an interest in public affairs."\(^{14}\) After this intervention the extent to which apathy was reduced could be measured and the experiment, perhaps modified, could then be tried in other communities to similar effect.

In this manner both a "raison d'être" as well as a format was established for the Test Cities Project, the Ford Foundation's first major experiment in urban redesign.

**The Test Cities Experiment**

In 1951 when Paul G. Hoffman former President of the Studebaker Corporation and Director of the Marshall Plan was made President of the Ford Foundation (1951-1953) his first senior level appointment was of Robert Maynard Hutchins to Associate Director (1951-1954). Hutchins, for many the "enfant terrible" of American higher education, had been President and then Chancellor at the University of Chicago since 1929.\(^{15}\) Probably best known by the general public for canceling the school's varsity intercollegiate

\(^{15}\)Sutton, 55.
football program, he introduced many other controversial changes at Chicago including eliminating compulsory class attendance, awarding bachelor's degrees to students who elsewhere would be considered sophomores, and abolishing more than three hundred courses. Railing against both the vocationalism, materialism, and pragmatism rife in American higher education Hutchins championed a return to a more traditional and scholastic form of education.

Before coming to Chicago he had held a number of positions at Yale, including Dean of the Law School, and had met Mortimer Adler, then a philosopher at Columbia. Through his association with Adler, Hutchins was introduced to a theory of education based upon the classics of Western civilization, the "Great Books" which he was to make the core curriculum of the College at the University of Chicago.

At the Ford Foundation, where Hutchins was instrumental in creating both the Fund for the Advancement of Education and the Fund for Adult Education (the former to address formal, traditional education) he was freed from the restraints of an often recalcitrant and hostile faculty (as well as alumni) who resisted his educational innovations.

In his book *The Conflict in Education in a Democratic Society* (1953) Hutchins made the case for adult liberal education as a way to improve society through the intellectual development of citizens. Though he did not see education as an "engine" for social reform in the mechanistic way it was portrayed in the Gaither Report, he nonetheless viewed it as essential in order to reach an "unlimited republic of learning," an ideal, but attainable social condition. Test Cities were a way of making focused educational materials ad-

dressing political issues close to Hutchins, especially on fundamental issues of personal freedom and social responsibilities.\footnote{Robert M. Hutchins, The Conflict in Education in a Free Society (New York: Harper and Brothers, 1953); Ibid., 53; Ibid., 76.}

C. Scott Fletcher was made President of the FAE and had the direct responsibility for developing the Test Cities Project. He had been associated previously with both Hoffman and Hutchins, respectively, through former positions he held as Vice-President for Sales with the Studebaker Corporation and as President of Britannica Films. Fletcher was known as a salesman “par excellence” who had the ability to motivate others to achieve difficult goals.\footnote{Robert J. Blakely, former Vice President for the FAE, reported that Fletcher had once brought elephants and other circus animals to a Studebaker dealers sales convention in order to get them “fired up” about selling. Interview by author, Chicago, IL, 18 October 1991.}

He also had community level experience as Director of the Field Development Division of the Committee for Economic Development for which he organized many discussion groups during the period 1942-44.\footnote{See Robert J. Blakely, “Cyril Scott Fletcher” in International Biography of Adult Education (Derby, England: Saxon Printing, 1985), 173.}

In the Test Cities, programs were to be organized in small groups to facilitate face-to-face discussion, another expression of the anti-establishment bias of Hutchins and Adler who believed that liberal studies materials could be accessed directly without the intervention of professional academics in traditional classroom situations. This method had been tried with success in the Great Books discussion programs Hutchins and Adler had started at the University of Chicago.

Two fundamental problems with the widespread discussion groups perceived initially by the FAE when it began to implement Test Cities were the “inadequate” liberal adult education study materials for adults and the need to train skillful lay discussion leaders.\footnote{It was essential to surmount these hurdles in order to}
make it possible for the adult education Test City councils to be more than coordinating or advisory bodies.

Some courses and discussion programs were developed specifically for the Test Cities market by other FAE grant recipients including the Great Books Foundation, the American Foundation for Continuing Education, the American Library Association, and the American Foreign Policy Association. The Fund’s own Experimental Discussion Project, which contracted directly with individual writers to produce the study discussion programs was also a source of programs.

The Test Cities councils were also encouraged to create and then offer their own programs including workshops for discussion leaders. It was intended that each council would be operated autonomously by its board, though coordinated by the FAE, and would find a way to become financially viable during the three year term of the grant (1951-1954).

The overall purpose of the Test Cities Program was to see if and how liberal continuing education could become integral to the life of a community. Central to the experiment was whether the programs could continue to exist once Ford funding was withdrawn. To gradually wean the councils away from foundation support the grants were tapered each succeeding year. It was anticipated that this would provide sufficient incentive for them to raise a larger proportion of their own income from program fees.22

21 Ralph W. Tyler, "Impressions of the Present Program of the Fund for Adult Education," 6 October 1952, FFA, FAE Administrative Office Files, Box 12, Folder 110.

22 Robert J. Blakely, with the benefit of hindsight, suggested that it might have made more sense to increase rather than decrease funding allocations each year as a way of helping the programs quickly expand and reach the “take-off” stage required for budgetary self-sufficiency. Instead, by decreasing the allocations the FAE compelled the Councils to devote more time to fund-raising than program development, impeding enlargement of the program base. Interview with author, Chicago, IL, 19 October 1991.
The inability of most of the community education councils to survive as “independent” entities without foundation support was a major disappointment and “finding” of the Test Cities Project.

A number of the councils were taken over by area colleges and continued to function under those auspices. The FAE quickly realized as the Test Cities succumbed to insolvency that higher education institutions furnished the most felicitous operational base for liberal adult education. They had the physical plant, administrative personnel, and in many cases a history of community involvement and experience in dealing with adults through evening and extension divisions. Most importantly, the Foundation recognized that these established institutions had the “prestige and authority to command the respect of adults seriously concerned about continuing liberal education”.23

In recognition of the importance of higher education’s potential contribution to liberal continuing education the Fund supported a proposal from the Association of University Evening Colleges (AUEC) to create a Center for the Study of Liberal Education for Adults and thereby stimulated innovation in liberal studies course development.24

**“Test” and “Demonstration” Centers**

The FAE also moved beyond Test Cities with a new concept for university based Test Centers for further experimentation in developing and marketing liberal adult education programs.25 A

---

25 FAE, *Ten Year Report*. 

total of eight centers were created at American higher education institutions. There were three additional centers— at the Pasadena Liberal Arts Center and at the University of British Columbia; the University of Utah was to use the materials on a statewide basis. These were to be coordinated by the FAE in a manner similar to Test Cities, but this time the grants were tapered over a four year period. Once again, it was hoped that fees derived from course registrations would make up the difference between actual costs to the campuses and the FAE funds. At the end of the four year period the fund anticipated that the colleges would assume full responsibility for the programs including any deficits. The Test Centers experiment ran from 1955-1959.

A major difference between Test Cities and Test Centers was the extensive involvement of a high powered Madison Ave. marketing firm, B. L. Mazel, Inc., to centrally direct promotional advertising. Mazel developed a promotion handbook to be used by all Test Center directors, produced promotional brochures (150,000 in 1957), planned and conducted direct mail tests to determine the effectiveness of varying types of mailing lists, conducted local workshops on advertising, prepared newspaper ads to be used by the Centers, and aided them in conducting their individual promotion campaigns.  

26FAE, "Excerpts from Docket for Board of Directors Meeting," 29 October 1957, FFA, FAE Administrative Office Files, Box 11, Folder 94.

Both the Test Cities and Test Centers projects represented a relentless and purposeful drive by the FAE to determine and identify the correct combination of product (adult liberal education), packaging (study-discussion groups), and promotion (modern advertising) at the right price (tuition) for the correct market (middle class adults). In the Test Centers the nature of the audience became more clear—a high proportion with some college experience, drawn from middle or higher income brackets, with professional
and managerial occupations, a slightly greater majority of females, families that were "well-settled" in their communities, and people active in civic and professional affairs.\textsuperscript{27}

The delivery of the commodity/service was to be under the control of an appropriate dealership—now presumed to be colleges and universities after the failure of the Test Cities Project to create viable independent adult education councils.

The genius of American organization and production that led to the creation of large-scale modern American industry documented by Chandler was now being applied to adult education.\textsuperscript{28} The FAE, much like large manufacturing concerns, successfully integrated the mass production of study materials from its grantees and the Experimental Discussion Program with mass distribution through the Test Centers, and after 1959 through other outlets. This "vertical integration" lent itself to mass advertising techniques which had been originally designed to broadly market other consumer goods.

Fletcher, the former Studebaker salesman, brought together the dynamics of modern business and the ideal of lifelong learning.\textsuperscript{29} The success of this approach was evident to the Fund which proudly proclaimed that Test Centers study-discussion programs had enrolled ten thousand people in 1957-58.\textsuperscript{30} In using this yardstick for success, the FAE had completely abandoned the language of social reform and experimentation used in the Gaither report to describe the goals of what became the Test Cities Project.

Despite the fact that the FAE gave grants to the Adult Education Association of the U.S.A., the National Association of Public School Adult Educators, the Center for the Study of Liberal Educa-

\textsuperscript{30} FAE, \textit{Ten Year Report}, 34.
tion of Adults, and the National Education Association it sought very limited advice from them on its own direct involvement in adult education through Test Cities and Test Centers. Instead, former automobile executives, newspapermen, lawyers, Madison Avenue ad-men, and foundation operatives, who were all more “bottom-line” oriented, and traditional academics who lacked a frame of reference for continuing education finally succeeded in creating through the Test Centers an educational product in an attractive program format, which the American adult consumer would buy. Socrates had been moved from the Academy in Athens to a Detroit-like assembly line and was churning out liberal adult education courses. Evidently these were compatible with the educational demands of a fast paced society which had insufficient time for the attenuated discursive approach to adult education found in the “Dialogues.”

Concurrent with Test Centers, the FAE experimented with Demonstration Centers which were direct grants to some colleges to expand their nascent adult education programs. This “final phase” of its effort to advance liberal education was launched in 1956 when the lessons from Test Centers were already becoming evident.31 Sixteen universities were involved in this project and received grants. These were followed in 1960 and 1961 by long-term grants to selected colleges which were encouraged to make adult liberal education a permanent part of their continuing education programs.

Since the emphasis was now on program viability and the experiment was more decentralized, and under local control, than in either Test Cities or Test Centers, the schools could veer away from study-discussion formats to larger lecture classes that could be more financially remunerative.

31 Ibid., 52.
Adult Education and the Marketplace

Through this progression the FAE firmly established the principle that non-credit liberal adult education could and, therefore, should pay for itself thereby locating it as a tuition supported educational product in American higher education. American university extension had been marching down this road for some time. A study by Morton, that had been financed by the FAE, recorded that over a twenty-one year period (1930-1951) there had been a tendency for university extension programs to become self-supporting to a higher degree than other university programs.\footnote{John R. Morton, University Extension in the United States (Birmingham, AL: University of Alabama Press, 1953).}

\textbf{Morton viewed this trend as a "problem area".}\footnote{Ibid., 104.}

He preferred a development for general university extension similar to that of agricultural extension in which foundation support had led to government support once the value of these programs had been demonstrated to the public.

This principle of having to pay its own way is the single most distinguishing feature of American continuing education today. The success of the model has driven out all serious alternatives to the extent that with the limited exceptions of grant supported programs for the disadvantaged and other targeted groups including veterans, adult education is the most blatantly market driven segment of all American education.

\footnote{John R. Morton, University Extension in the United States (Birmingham, AL: University of Alabama Press, 1953).}

\footnote{Ibid., 104.}
The FAE triumphed in this approach by sacrificing the most salient feature of liberal adult education as conceived of initially by Hutchins and Adler who envisioned peer led, small-size discussion groups as the embodiment of true adult learning. This was to be the driving force behind the Test Cities which would galvanize civic spirit and community cohesion in those communities where they were located.

Conversely, the larger number of discussion groups in Test Centers and the huge lecture classes that were ultimately popularized through the Demonstration Centers allowed for greater economies of scale, and consequently higher revenues, than were possible in smaller classes. This approach was much more attractive to university administrators, including those directly involved in adult education, who were searching for a rationale to support and increase support for continuing education.34

The story of the FAE and its iterations of adult liberal education is thus important to those who wish to understand the present-day fixations and priorities of mainstream American continuing education, particularly that which is university based. In addition, the elevated and exalted place of higher education in the entire pantheon of American education makes the higher education model attractive to continuing education providers in most other sectors such as in public schools and non-profit organizations.

The need to fill large classes has led to the popularization of adult liberal education as a form of broad based intellectual entertainment, a resurrection in spirit of the traveling Commercial Chautauqua Circuit which brought “entertainment and culture” to rural America, but now as an established part of university and, in some cases, public school continuing education.35 Moreover, a type of adult education Gresham’s Law can now be identified in which fee

34 Whipple, “Center for the Study of Liberal Education.”
35 Knowles, History of Adult Education Movement, 38.
supported programs that generate greater revenue ultimately drive out those which generate less.

Looking back, one may wish that had the Ford experiment in its original format of the Test Cities succeeded in improving community life in ways that could be convincingly documented it could have paved the way for increased government support of liberal adult education diminishing its reliance upon fees. But the Test Cities Project foundered on the shoals of vagueness and could never demonstrate tangible outcomes as palpably as agricultural extension. The FAE simply could not prove, by the yardsticks it selected, that liberal adult education made for a better life. Instead there was a "drift" or migration in the experiment until a measure for success was identified that could be met. For Scott Fletcher and the FAE, a series of test marketing experiments in adult education were conducted until the right combination of factors was found. A model that had proved itself in the mass production and distribution of consumer goods was superimposed onto another, commodity-adult education.

Postscript

The Fund's obsession with securing economic viability for liberal adult education led it to lose sight of what might actually be accomplished in community continuing education. Ironically, at a later period in the Ford Foundation's history, the Foundation resurrected the principle of urban demonstration projects, that was intrinsic to Test Cities, in the Gray Areas Project, an urban development program that it supported in New Haven, CT. This, in turn,

36See Edelson for a discussion of NAPSAE's "Saturation Project" which was intended to demonstrate the impact of adult education on a community as a way of leveraging political support.
became the template for Model Cities—probably the most ambitious project for urban reform ever attempted in the United States. In that way the spirit of Test Cities was revived, but without the liberal education core. Perhaps the goals of social renewal through liberal education are unattainable. However, it can be reasonably argued through an examination of the FAE and its innovative projects that the liberal studies concept was never given a fair chance to succeed.

A. S. Makarenko. A Reinterpretation

Rose Edwards
Loyola University, Chicago

Introduction

A. S. Makarenko (1888-1939) was a Soviet educator and writer who, after the Russian Revolution, achieved significant success in the education and social reform of homeless children and juvenile delinquents who had been orphaned by the wars and social upheavals of the time.

During his lifetime, Makarenko was the subject of much discussion and controversy in the Soviet Union; after his death, as his writings were translated and published in countries around the world, he gained international recognition. Scholars worldwide have interpreted his educational concepts in widely divergent ways. Sanctified after his death by Soviet educators, Makarenko is often described as the father of Soviet pedagogy and founder of communist education. Some Western educators have considered Makarenko a pedagogical genius, a creative teacher, a great humanitarian; others have seen him as a political ideologue who put pedagogy at the service of communism.
In 1968 Leonhard Froese, founder and director of the Philipps University's Research Center for Comparative Education in Marburg, Germany, together with other scholars, established a Makarenko Department within the research center. The Makarenko Department has made its sole aim the study of Anton Makarenko's life, work, and international reception. When asked by a visitor from the USSR why he and scholars at the Makarenko Department occupied themselves with Makarenko, Froese explained that Makarenko had captured their special interest because they believed that a "modern classic of pedagogy" (Froese's words) had not yet been sufficiently explored. Froese and researchers at the Makarenko Department distinguished Makarenko not only as the most outstanding Soviet pedagogue, but also as the most significant pedagogical writer in the Russian language, who, as Froese expressed it, had "something to say" to his own people as well as the rest of the world. Elsewhere, Froese elaborated this view:

Forty years of Makarenko in Germany, twenty-five years of Makarenko research, fifteen years of personal pursuits with Makarenko, and still—one might object—no end. Yet we [scholars at the Makarenko Department] know no answer other than a question in return: Will men ever have fully researched and explored a Comenius, a Rousseau, a Pestalozzi, or a Tolstoy to the point of having "enough" of him? A. S. Makarenko, the youngest among equals, is a phenomenon whom we have barely just begun to recognize and to interpret for the pedagogy of our and other times.2

The Makarenko Department in Marburg is the only Makarenko research center outside the USSR. (A more detailed description of

---

1 Address: Forschungsstelle für Vergleichende Erziehungswissenschaft, Makarenko Referat, Ernst-Giller-Strasse 5, D-3550 Marburg/Lahn, Germany.
their activities will follow.) Their research—since 1968 pursued by full-and-part-time specialists—and findings have changed the field of Makarenko scholarship and must be seen as a watershed in the Makarenko inquiry, providing for the first time a factual basis for the appraisal of Makarenko's life and work. The author, (whose mother tongue is German), was able to obtain some of the Makarenko Department's published literature through stores or through the interlibrary loan system, but most came from the Makarenko Department directly. This made it possible to base a study of Makarenko's life and work on well-grounded research and to assess the relevance and applicability of his pedagogical ideas to education in general.

Who Was Makarenko?

One might ask why this once obscure Ukrainian elementary school teacher, more than fifty years after his death, continues to make such claim on the interest and attention of modern scholars. A brief background of Makarenko and the international reception of his pedagogical ideas may help explain why he continues to demand our attention.

Anton S. Makarenko was thirty-two years old when, in 1920, he was asked by Ukrainian authorities to organize and direct a labor colony for homeless children and youth. As a result of Russia's many catastrophic political and social upheavals, countless young people had become orphaned and homeless and many turned to crime in order to survive. Under exceedingly difficult and challenging conditions, Makarenko found a way to cope with the pressing problems these youth presented and provided for their physical, social, and psychological care and, slowly, to restore their human nature. In his Pedagogicheskaia poema (A Pedagogical Poem), Makarenko described his successes and failures in resocializing the vagrant youngsters who came into his care, and his efforts in
helping them reenter society as healthy, responsible, socially conscious people. (Exact figures are not known, but over the years, hundreds of children and youth passed through his colony and later through his commune). Many of his colonists and communards, as Makarenko called them, became respected citizens and workers, some of them successful teachers, others doctors, engineers, or factory workers, with families and children of their own.

While the social and political events of Makarenko's generation provided the outer context of his work, they did not actually shape his educational ideas or provide the methods for his teaching. These he forged through direct contact with his colonists and through reliance on his own practical experiences from which he drew further conclusions. Yet political policies and official decrees determined the way in which Makarenko's ideas were received. Thus, in the 1920s, after the revolution, when early Soviet educators followed Western progressive thinking and experimented with liberal child-centered and permissive methods, Makarenko fell out of favor with the authorities for applying stern and disciplined approaches, and for using the community—in Soviet terminology “the collective”—as an agent for the resocialization of his often reckless youngsters.

In the 1930s, as liberal approaches were replaced by stricter procedures intended to provide the nation with well-disciplined and highly-trained cadres to meet Stalin's political goals, Makarenko's ideas and practices found official acceptance. After his death, in the 1940s, he was—by a process still not fully understood—celebrated as the founder of Soviet education, his pedagogy having been declared the authoritative Soviet system. Having been canonized as cultural hero, Makarenko was also revered for Soviet virtues that were either embroidered or not true at all. For example, early Soviet biographers claimed that he had been a convinced Marxist well before the revolution and that he was an exponent of Stalin's policies and pedagogy. Throughout his postrevolutionary career, in reports, books and articles on education, in novels,
essays, stories, and plays, Makarenko wrote of his experiences as teacher, guardian, and social worker of homeless youth. His writings were generally published in the Soviet Union by himself; in 1950-1952, the Academy of Pedagogical Sciences of the RSFSR published most of his works under the title *Collected Works in Seven Volumes*, known in the literature as *Academy Edition* and often cited as *Sochineniya* (Works). This edition was expanded and republished in 1957-1958, to include letters and stenographically preserved lectures on diverse educational topics. For many years the *Academy Edition* was the most complete collection of Makarenko's writings, providing the basis for translations in and outside the Soviet Union and shaping scholars' image of Makarenko.\(^4\)

**International Reception of Makarenko’s Writings**

The scope of the dissemination of Makarenko's works can best be expressed in numbers such as those gathered by the Marburg researchers, who reported in 1971:

This bibliography . . . lists 702 separate and omnibus editions of Makarenko’s publications in 59 languages. They convey an impression of Makarenko's reception in 34 countries. Up to the present the *Pedagogic Poem* and the works on family pedagogics *Book for Parents* and *Lectures to Parents* have had the widest circulation.\(^5\)

---

---

The Marburger researcher Götz Hillig published a report on the dissemination of Makarenko's works outside the Soviet Union up to 1979, showing publication of Makarenko's works in thirty-seven languages, seventy percent of which had appeared in socialist countries. His pedagogical writings have been studied in all Socialist and Communist countries and in Israel, China, India, Japan, and African nations. In the West, and in Germany especially, there has been increasing interest in Makarenko's writings. By 1966, twenty-seven years after his death, over eight hundred Makarenko titles existed in the German secondary literature, and by 1971, more than one thousand books had been written about him in Germany.

In the United States several authors have observed in the 1960s and 1970s that Makarenko was practically unknown in the English speaking West. Yet a continuous, if thin stream of commentary on Makarenko's educational ideas and writings can be found in the English language literature. The earliest reference to Makarenko is dated 1928, when he was at the height of his career. In 1927, on a tour through Soviet Russia, the American educator Lucy Wilson visited the Gorky Colony in Kuriazh (Ukraine), and in 1928 published a report of this visit and her meeting with Makarenko in The New Schools of New Russia. Ten years later, at the 1939 World Fair in New York, visitors to the Soviet pavilion could find a brochure in English, "Children in the Land of Socialism"

---

5 Götz Hillig und Siegfried Weitz, eds., Makarenko Materialien II (Marburg: VVG Verlag, 1971), 182.
written by Makarenko. Since 1936, the English speaking public had the opportunity to read the first volume of Makarenko’s autobiographical trilogy *The Road to Life* (the English title of *Pedagogicheskaia poema*, translated by Stephen Garry).\(^9\)

In the following decades, the Makarenko (English language) literature steadily increased. In 1949, British author W. L. Goodman published the first Makarenko monograph, titled *Anton Simeonovitch Makarenko, Russian Teacher*.\(^10\) In the 1950s, the Foreign Languages Publishing House in Moscow exported three of Makarenko’s major works in English translation: *The Road to Life, Learning to Live, Flags on the Battlements*, and *A Book for Parents*.\(^11\) With three of his principal works now available in English, Makarenko began to draw the attention of American and English speaking educators. Journal articles (typically on Soviet education) began to include discussions on Makarenko’s educational ideas, and in 1958 Frederic Lilge published a monograph *Anton Semyonovitch Makarenko: An Analysis of His Educational Ideas in the Context of Soviet Society*.\(^12\)

Interest in Makarenko’s writings gained momentum during the 1960s, which saw the first American dissertation on Makarenko, “Anton Makarenko and the Development of Soviet Education,” by James Bowen, and Makarenko’s name beginning to surface in textbooks.\(^13\) For example, Georg Z. F. Bereday et al mentioned him

---

several times in their landmark study *The Changing Soviet School*.\(^{14}\) In 1965, four of Makarenko’s lectures, *Problems of Soviet School Education*, published in London, Moscow, and New York appeared in English translation.\(^{15}\) In 1967, an American firm published *A Book for Parents*, renamed *The Collective Family: A Handbook for Russian Parents*, with an introduction by the acclaimed American psychologist Urie Bronfenbrenner, who told that in the USSR and other socialist countries this work was used by parents as a popular manual on child rearing.\(^{16}\) According to Bronfenbrenner, Dr. Benjamin Spock could be seen as Makarenko’s American counterpart, except that Makarenko’s concern was with the child’s moral health. The same year, two articles appeared in *The Sunday New York Times Magazine*, with such titles as “What the Soviet Dr. Spock Taught,” by Tobia Frankel, and “Soviet Too, Has Its Dr. Spock,” by Fred M. Hechinger.\(^{17}\) This may have been the only time that Makarenko’s name entered American living rooms.

The literature of the 1970s and 1980s showed an increase in discussion about Makarenko—the peak occurring in the late 1970s when authors, among them Soviet writers, commemorated the ninetieth anniversary of Makarenko’s birth (1888).\(^{18}\) Noteworthy were the doctoral dissertation by Sara M. Lehrman, “The Pedagogi-
cal Ideas of Anton Semenovich Makarenko," two books including reminiscences about Makarenko and excerpts from his lectures and writings, and, in the early 1980s, the (partial) translation into English of Makarenko’s book The March of 1930, published in several installments by Slavic and European Education Review, later renamed East/West Education. In 1981, Slavic and European Education Review published a review essay by John Dunstan, University of Birmingham, England, titled, “Demythologizing Makarenko,” in which Dunstan introduced American readers to the Makarenko Department in Marburg and summarized some of their surprising findings regarding Makarenko’s life and activities. Through this article the author first learned of the Marburg research.

Makarenko in the United States

Makarenko’s reception among American educators has been varied. Some saw him as the greatest representative of communist education, whose views and activities can be understood only in this political connection. Others admired Makarenko for his outstanding achievements in redeeming juvenile delinquents and for his success in transforming vagrant youth into self-respecting, useful citizens in the face of almost insuperable obstacles. Early in the American (and English language) literature, and with increasing

19 Lehrman, Pedagogical Ideas, 12.
persistence, educators considered the possible relevance of Makarenko's ideas to Western education, particularly in the area of rehabilitating problem youngsters. As early as 1933, Dewey suggested that the West could learn from Makarenko's work with juvenile delinquents.22

The educator most firmly opposed to the applicability of Makarenko's ideas in the West was James Bowen. While calling Makarenko a humanist "who worked wonders," Bowen believed that Makarenko based his educational system on a particular political ideology, that it was designed to meet political needs, and that it therefore had only immediate value.23 On this point he differed with other educators, particularly with Lilge (1958), who thought Makarenko went beyond ideological orthodoxies, looking directly at human nature for educational answers.24 Bowen rejected the applicability of Makarenko's ideas in the West but left a small loophole by saying that "... the future alone will indicate how accurate were his perceptions and how lasting will be his achievements."25

Indeed, the future did just that: In 1986, twenty years later, educator and scholar Kristen D. Juul reported that since around 1970, Scandinavia showed an expanding number of "intentional communities" for alienated youth (such as alcohol and drug addicted youngsters, or adolescents with severe adjustment problems), modeled on Makarenko's collectives. According to Juul, these collectives "show vitality and relevance to the needs of troubled youth." He suggested that other countries may consider this type or model of therapeutic community as a viable alternative for intervention.26 The Scandinavian example seemed to demon-

23Bowen, Soviet Education, 205-06, 209.
24Lilge, A. S. Makarenko, 2.
strate that Makarenko's perceptions had an appeal and usefulness that, in Dunstan's words, "transcends the temporal and spatial confines of their formulation."

The Makarenko Department in Marburg: Overview of its Research and Activities

When the Marburg Philipps University's Makarenko Department opened in 1968, its two principal researchers Götz Hillig (head of the Makarenko Department) and Siegfried Weitz (lecturer) may not have anticipated encountering facts that would lead to a revision of commonly held views of Makarenko. Essentially, they were focusing on the critical examination and textual analysis of Makarenko's writing found in the "inherited" Moscow Academy Edition, at that time still the dominant (and only) collection of Makarenko's work. In their textual research, they discovered (in the Academy Edition) numerous deviations from the first printings of Makarenko's manuscripts, as well as editorial additions and excisions that constituted substantial fact and content changes. The Marburg scholars traced the origin of such alterations to certain texts printed in the 1940s, when Soviet editors tried to present Makarenko in the most favorable light possible. Confronted with scientifically unreliable source materials, the Marburg researchers focused on producing a historically accurate reprint of Makarenko's writings. Their plan is to publish a twenty volume annotated edition, titled A. S. Makarenko Gesammelte Werke, Marburger Ausgabe (A. S. Makarenko Collected Works, Marburg Edition). This edition will consist of the original Makarenko text, with German translation

and detailed commentary. The first section (13 volumes) will contain works published during Makarenko’s lifetime, including some newly discovered writings. The second section (seven volumes) will consist of Makarenko’s posthumous works. All texts will be printed in chronological sequence.\textsuperscript{27}

To date (1991), eight volumes have been published, including most of Makarenko’s published writings between 1923 and 1937 and, among Makarenko’s posthumous works, four original stenographs of lectures found in Soviet archives. The Marburg scholars have visited the Soviet Union and examined texts from accessible Soviet archives. In the interest of accurately appraising Makarenko’s works, it was the belief of Leonhard Froese and the Marburg researchers that priority should be given to the critical examination of source material in order to produce an authoritative and reliable edition of Makarenko’s collected works.\textsuperscript{28} At this point, the \textit{Marburg Edition} is the most definitive edition of Makarenko’s writings. It must also be noted that between 1983 and 1986, the USSR Academy of Pedagogical Sciences published Makarenko’s pedagogical works. The first three volumes of this eight-volume edition have appeared in German translation.\textsuperscript{29}

\textsuperscript{27}Marburger Ausgabe, ed., \textit{Anton Makarenko. Gesammelte Werke} 1: 9-11.

Journal of the Midwest History of Education Society
Of great significance to Makarenko scholarship was the systematic examination of existing Soviet literature on Makarenko's biography undertaken by the Marburg researchers. They found, for example, alterations in Makarenko's letters and diaries, such as the replacement of "Lenin" with "Stalin." Makarenko's Soviet biographers, excessively hagiographic in their tone, attempted to create the image of a Soviet cultural hero. In addition to drawing on Soviet archives recently made accessible, the Marburg editors were able to locate Makarenko's younger brother, Vitalii, and secure his testimony. His written memoirs have contributed to a broader and far more differentiated understanding of Makarenko's life. Interim findings, published by Hillig in his article, "Der andere Makarenko" (The other Makarenko [1980]), revealed a more authentic and historically accurate image of Makarenko—one less perfect, but far more interesting.

The Marburg Makarenko Department has also published a number of books, articles, indexes, and bibliographies on his international reception, including bibliographies and collected indexes of Makarenko's writings worldwide, (periodically updated in 1969, 1971, and 1980), and several collections of contributions by Makarenko scholars from various eastern and western countries.

To stimulate discussion on Makarenko's life and work and to cultivate contact with interested scholars worldwide, the
Makarenko department has organized major international Makarenko symposia in Germany in 1966, in 1971, and in 1989. This author was invited to attend the most recent Makarenko symposium, on the theme “Der Stand und die Perspektiven der Makarenko Forschung” (Makarenko research: current status and perspectives). Some seventy Makarenko scholars from twelve countries attended including the USSR, Poland, Hungary, Czechoslovakia, Germany, England, Italy, Finland, Denmark, and Israel. Reports and papers centered on historic-bibliographic topics as well as current applications of Makarenko’s educational theories. This author reported on the present situation of Makarenko research and reception in the United States.

This was the first time that the majority of Makarenko researchers had gathered in one place, including scholars from the USSR and (then) East Germany. The next International Makarenko Symposium will take place in 1991 in Poltava (Ukraine). There was a consensus among all attending scholars to replace the inherited misrepresentations of Makarenko with a historically accurate account and to search for additional source materials in order to correctly interpret Makarenko’s life and work.

**Conclusion**

In this study the author has drawn extensively on the current *Marburg Edition* and other materials made available by the Makarenko Department, using their new findings as the basis for discussion. Her interpretation of Makarenko’s educational insights and their applicability to education in general is drawn mainly from her experience as a curative educator. The term “curative” was coined in Europe to mean educating “children in need of special care.” For eighteen years she worked with mentally retarded and emotionally disturbed children and youth, most from low-income families in Chicago. She recognized in Makarenko’s work observa-
tions and insights that corresponded to her own experience as to what elements in the total pedagogical process proved effective—many of them commonly overlooked in the traditional classroom. One could say that the uniqueness of Makarenko’s educational work lies not in his having created innovative methods or practices, but in having made full and original use of traditional educational principles. His talent surfaces in his special ability to take a fresh look at well known concepts and creatively apply—often in a surprisingly simple way—conventional ideas.

Makarenko gave new meaning and context to traditional concepts such as discipline and punishment, trust and responsibility. He imaginatively integrated the everyday need for hope and joyful anticipation of the future into the educational process. A man of practice who disapproved of being guided by theories, he liked to improvise his approaches. The literature is filled with stories illustrating his flare for responding spontaneously and effectively to problematic situations. He seems to have possessed intuitive insight into the particulars of a student’s situation and to have sensed immediately what was needed. This faculty may have resulted, at least in part, from the humiliations and miseries he experienced as a child.

The author believes that what made Makarenko remarkable as a teacher was the way he understood and responded to problems, his personal insight into his pupils’ needs, and his constantly alert attention to every detail of their daily lives. It was the way he applied himself as a teacher that was exemplary and worthy of our study.

Makarenko made his ideas and experiences accessible; he described his students and clearly formulated everything he did. He left a record that allows us to examine and evaluate his ideas and to determine whether he should be regarded as a historical relic, a political ideologue, or a modern thinker whose ideas and example have relevance to today’s troubled world.

Rural School Attendance of African-Americans: Cass County Integration in the Nineteenth Century

Ernestine K. Enomoto
University of Michigan

Introduction

Living in small rural Northern communities during the antebellum period were clusters of African-Americans, mostly freedmen and farmers. With the common school movement and the creation of one-room schools, their children were provided the opportunity to attend school. Little information is documented on the education of these children despite their presence in rural farming communities.¹ One such community was Calvin township

in Cass County. It represented according to historian Mathews, "a marked contrast when compared with other townships in the county" due to the "great preponderance of the colored people who far outrank, in number the white population." Located in southwestern Michigan, the county was settled by African-Americans, many of whom arrived as early as the mid 1830s. With the advent of the Civil War and the support of sympathetic Quakers, this rural community quickly became the home of many African-Americans, particularly in the townships of Calvin, Porter, and Penn. The county was located along the underground railroad and offered a sanctuary for those fleeing to Canada.

Little did the pioneers of this township, who were endowed by nature with a love for the whole human race, suppose, when they extended a helping hand to the trembling fugitive slave fleeing from a heartless task-master, that hundreds of this race would eventually become their neighbors and co-workers in the subduing and cultivating the soil, and take an active part in township affairs.

Focusing on Calvin township which had the county's largest population of African-Americans, this research study examined the one-room schools that existed during the nineteenth century and the nature of integration among Black and White settlers in the township. Did one-room schoolhouses exist for both races during

3 By 1850, the percentage of the African-American population in Cass (which was roughly four percent) was surpassed only by that of Wayne County (which included Detroit) for the state of Michigan. George K. Hesslink, Black Neighbors: Negroes in a Northern Rural Community (Indianapolis: Bobbs-Merrill, 1968), 54; U.S. Census Office, Seventh Census of the United States, 1850 (Washington, DC: U.S. Government Printing Office, reprint 1976), Tables 1,2,8.
4 The "underground railroad" referred to a clandestine network of homes used by abolitionists to harbor runaway slaves and assist their escape to freedom. The "Illinois line" was the connection from St. Louis, Missouri through Illinois, Indiana and Michigan to the Canadian border.
5 Mathews, History, 380.
6 Calvin accounted for two-thirds of the entire African-American population in Cass County by the Civil War period. L.H.Glover, A Twentieth Century History of Cass
the period before and after the Civil War? What effect did integration have upon the school attendance of African-Americans? Were there differences between the races in terms of school attendance? What differences were there in terms of factors such as age, race, family size, and family wealth? How did residential patterns influence attendance in this time period?

Initially, the research on this topic examined different rural school attendance patterns based on a sampling of federal census records from Calvin Township. A comparison was made of school attendance between the races in the years 1850 and 1880, before and after the Civil War. The findings from this examination suggested that first, school attendance had increased for both races. Given the increase in schools, enactment of compulsory attendance laws, and more established rural communities, this was not surprising. Second, factors associated with school attendance (age, race, family size, and wealth) which were significant before the Civil War (1850) were minimized substantially afterwards (1880). Gender was not a significant factor in either year. Third, between Blacks and Whites, family size was found to be significant in 1850 but not significantly so by 1880. Regarding family wealth, no comparisons could be made because of the lack of census data available for the 1880 year. However the initial study was limited by its reliance solely on census records and categories of data available. A subsequent investigation was made to obtain maps of the township, identify residences of Black and White families, establish school locations, and include data from annual school reports made by county investigators from 1859 to 1880. By considering other data sources and relating these to the census records, the intent of this research was to be more definitive about

---

the nature of integrated schools in Calvin Township during this time period. The findings of this investigation are presented in this paper.

Research Methodology

In the first study, a sampling of Federal Census records was obtained for the years 1850 and 1880, before and after the Civil War. The data retrieved from these records included family names, ages (in years), gender (whether female or male), race (whether Black or White), occupation of the head-of-household, real estate (property value denoted in dollars), family wealth (based on the real estate for the head of household), school attendance (whether or not the person had attended school during the year), number of members in family (based on a common last name).8

An equivalent number of Black and White families were obtained in each year. Selection was made of contiguous records, assuming that the census taker was surveying those living in the same communities and therefore those might be families whose children would likely attend the same school. However there was no way to be sure if this was indeed the case.

Thus, one of the priorities of this study was to obtain maps of the school districts if at all possible. During a visit to the Cassopolis Historical library in the county seat, nineteenth century maps of the area including names of landowners and/or residents were located and photocopied. Maps were obtained for the following years: 1860, 1872, and 1896; unfortunately the legibility of family names

8 The designation of Mulatto indicating mixed African-American blood was categorized as "Black"; The researcher established the following occupation categories: 1=farmer, 2=laborer, 3=carpenter, 4=other. Women were identified as "keeping house" and children were not designated with an occupation; If the child attended school, the census taker marked a "1" otherwise the column was left blank.
was poor on the 1860 map of the township. Located at the State Archives in microfilm copies of the Annual Reports of County School Inspectors (available from 1859 to 1931) were maps of the school districts. The first map found was for 1861, specifying eight districts, seven of which were whole districts and one fractional district shared with another township. A revision of school boundaries was made in 1866 to create a new school district and there was a map designating this boundary in the Annual Report for that year. What had previously been district 3 became two districts, identified as districts 3 and 9. From 1873 onward, there were maps included in each of the Annual Reports. Using the 1872 map of Calvin township because of its legibility, school boundaries were drawn as designated in the Annual Reports of 1866 and 1873. Also schools were located within sections of the township.

Given the maps and school boundaries, the next step was to identify family residences, distinguishing Black and White families. Data from all of the Calvin township 1870 Federal census records were retrieved. Categories identified were the same as those of the first study, specifically family number as designated by the census taker, family last name, age, gender, race, occupation of head-of-household, real estate, family wealth, family size, and school attendance. The census names were matched against the map, identifying Black and White families found in both the census records and located on the township map.

It became evident that most of the Black families lived in the Eastern section of the township, clustering in the middle and lower Eastern quadrant. According to Larrie, settlements in this section radiated around the area known as Calvin Center. In this area of the township, land speculators from New York and Ontwa had purchased large parcels that were later sold to Blacks; "the usual

---

prices being from four to five dollars an acre, with a term of ten years' credit.\textsuperscript{10} The school districts in the settlement areas included districts 3 through 9. A closer inspection was made of those families with residences in the four districts, two mainly settled by Blacks (districts 3 and 9) and two racially integrated (districts 6 and 7).

In building a data set for analysis, selection of records was based on the following criteria; (1) families whose census records matched those located in school districts 3, 6, 7, and 9; (2) those families who were residents rather than those identified as property owners in a particular district; and (3) those with school-aged children between the ages of five and twenty.\textsuperscript{11} All records that met those requirements were retrieved and tabulated.\textsuperscript{12}

To check whether the census records were appropriately allocated to school districts, the sequence of the family numbers on the census records was examined. It appeared that the census taker gathered information of families living in "neighborhoods" and recorded their family numbers in consecutive order.\textsuperscript{13} After matching as many possible records and identifying a school district, a sequence of family numbers was determined. For example, family numbers from 93 to 126 matched names of those families whose residences were within the District 7 school boundaries. If there

\textsuperscript{10} Mathews, \textit{History}, 386.

\textsuperscript{11} Ages five to twenty were designated in the Annual Reports as school-aged. For further reference on the Annual Reports, see Cornelius A. Gower, \textit{Forty-Fourth Annual Report of the Superintendent of Public Instruction of the State of Michigan with Accompanying Documents for the Year 1880} (Lansing, MI: W.S. George and Company, 1881).

\textsuperscript{12} The 1870 map designated dots for houses on the property with the label "RES" suggesting a residence. There were a number of families with property in several sections of the township and if the "RES" designation was not given, these were considered property owners and not residents.

\textsuperscript{13} Family number refers to a designation for all those in the same household. These included those who might not share the same last name but resided together. For the families in this 1870 sample, all did have the same last name.
was a match for a family name out of the sequence, say family number 244, this record was not included in the data set. The rationale was to eliminate a family with a similar name but not likely to be living in the selected school district.

In contrast with the first study which sampled Federal Census records, this subsequent study attempted to include as many records as possible in the 1870 data set in order to characterize the integrated school districts. Of the approximately eighty-four residences in the four school districts, fifty-six families (sixty-seven percent) were matched and included in the sample. The sample reflected sixteen percent of the total Calvin township, 290 out of 1788.14

The 1870 data set can be described as having a relatively even number of males and females, majority of Blacks (eighty-one percent), age range from one to eighty-one years with relatively young population (sixty percent younger than twenty-one years of age), family wealth positively skewed (with the majority having less than $1200), and family size ranging from two to thirteen and averaging seven members. This sample consisted of only those families with school-aged children and therefore had a higher percentage of children, forty-six percent as compared to thirty percent statewide.15 The percentage of Black families (eighty-one percent in the sample) was higher than in the township (sixty-one percent in Calvin as a whole) because it was drawn from integrated, predominantly Black school districts.

15 The statewide percentage was calculated based on the census count of those between five and eighteen noted as “school-age” in the U.S. Census 1870 Table 21.

Of significance between the races was the difference in average family size, Blacks having slightly higher family size with one additional family member and a greater range (between two and thirteen family members). Interestingly the average family size found in this sample was even higher than that for Blacks in the 1850 sample (6.6 members) and in the 1880 sample (6.5 members). Other factors such as gender, mean age, and mean family wealth were not found to be significantly different.

To set the stage for the findings of this study, the next section describes the schools in Cass County, beginning with the school system in the territorial government and through legislation in the 1880s of the state of Michigan.

Chronology of School Legislation

Even before Michigan became a state, a territorial act in 1809 formed school districts for children between the ages of four and eighteen. An annual tax was to be collected and apportioned among the districts. In 1827, a common school system was established, requiring that every township containing fifty families support a school. Those townships with larger populations were

17 Hoyt and Ford, John D. Pierce, 49; Glover, Twentieth Century History, 215-16; Daniel Putnam, The Development of Primary and Secondary Public Education
required to maintain schools for more weeks per year. Administration of these schools was to be managed by the townships themselves, marking a change from a centralized administration to a localized system. At the same time, the territorial governor appointed a superintendent of the common schools to oversee the system, reporting on the condition and funding of these institutions. In addition there was a board of commissioners to distribute school monies and arrange for district boundaries as well as a board of inspectors to examine and certify teachers.

According to historian Mathews' account, "educational interests have nowhere in the Union received more attention than in Michigan. Schoolhouses everywhere dot the landscape. The cities and villages have vied with each other in erecting the best school edifices; and it is no rare thing to see in towns of one, two or three thousand population schoolhouses admirable in architecture and arrangement, which cost ten, twenty and thirty thousand dollars."

The first schoolhouse in Calvin, however, was a modest log cabin built probably around 1834 on Peter Shaffer's property.

The little log schoolhouse being packed with what was often an unruly mob of youngsters anywhere from 5 to 25 years of age and woe to the teacher who failed to hold their respect and fear. Some of the pupils really wanted to study but more attended school to pass the time and be in the company of others, perhaps doing a little courting on the side. Teachers were more in demand for their muscle than their mental ability.

By 1835 with the formation of a state government, educational provisions in the constitution gave the governor power to appoint a
superintendent of public instruction and gave the legislature charge to provide schools operating at least three months a year and receive public funding. When John Pierce the first Superintendent of Public Instruction introduced his plan for a "system of common schools and a plan for a university and its branches" in 1836, he retained the main features of the territorial system with independent school districts, directed by the townships, and locally established boards of education.23

Let the schoolhouse and the church be planted, as they ever have been, in every village and hamlet throughout the length and breadth of our land, and no tyrant can ever arise that shall be strong enough to trample upon and tread down the rights of the people.24

To supplement school revenues, a rate bill was passed in 1843 which assessed parents or guardians of children attending school. The law was counterproductive in terms of school attendance because poor families would opt not to send their children to school. The bill was repealed in 1869 and primary schools made free for all children.25

By 1850 the common school system was firmly in place with the basic unit, the district school, located "close to the homes and hearths of the people" and directly controlled by them.26 Little change occurred in this arrangement during the next sixty years; district schools were essentially self-contained, one-room school-houses, community-run, and independent of each other.27 Specifi-

---

23 Putnam, Development, 35.
24 Holt and Ford, John D. Pierce, 90.
26 Putnam, Development, 65.
27 Regarding the independence among rural schools, Putnam comments that there was much less connection with urban schools than might be expected given the rural schools and neighboring graded high schools. Voluntary arrangements were made for pupils of district schools to be admitted to neighboring high
ally in Calvin township, the first school map in the Annual School Report for 1861 denoted eight school sites dividing the township's thirty six sections into eight school districts. The boundaries of these districts remained fairly stable over the period of examination from 1861 until 1880 except for the creation of a ninth district by the split of one district into two in 1866.

The Michigan Legislature enacted a law in 1867, stating that "all persons residents of any school districts and five years of age, shall have an equal right to attend any school therein, and no separate school or department shall be kept for any person on account of race or color; provided that this shall not be construed to prevent the grading of schools according to the intellectual progress of the pupil, to be taught in separate places as may be deemed expedient." The law was not invoked until 1868 when Detroit African-Americans appealed the question in the State Supreme Court. Legislation in 1871 further stipulated that "no separate school or department shall be kept for any persons on account of race or color," noting that there was no per age restriction and that any one desiring could attend school.

A compulsory school attendance law was passed in 1871, requiring that all children between the ages of 8 and 14 be sent to a public school. Parents were to be fined if found not complying. Initially the enforcement of this legislation was lax but in 1883 and also in 1885, additional laws addressed enforcement of the com-

The court case involved two African-Americans, Mr. Willis and Mr. Workman who appealed to get their children into the Duffield Union school. This legislation was passed in 1869. Gower, Forty-Fourth Annual Report, 327.

29 Larrie, Black Experiences.

30 Gower, Forty-Fourth Annual Report, 327.
pulsoy attendance legislation and increased the amount of school attendance required.

In sum, the changes in school legislation during the nineteenth century echoed the common school movement toward universal public education. Modeled after the common school system of the territory, Michigan state's system retained the decentralized district schools, administered locally, and overseen by the state superintendent. Funds for the school system were provided increasingly through publicly generated revenues rather than privately contributed funds.\textsuperscript{31} Compulsory school attendance was not only enacted but measures provided for enforcement by the mid-1880s.

In his annual report on schools in 1880, Superintendent Cornelius A. Gower commented that "Michigan was among the very last states to make her public schools free schools for all the people... the primary schools are now entirely free, and the school interest fund increased..."\textsuperscript{32} School attendance by 1880 in district schools was 75.6 percent with schools in operation for 7.5 months of the year.\textsuperscript{33} Mathews reports that in Calvin, "There (were) 615 school children between 5 and 20 years. For fiscal year ending August 31, 1881, there was paid $464 for female and $1356 for male teachers in the township."\textsuperscript{34}

With this background in school legislation and events particularly in Calvin township, a closer look at the four integrated schools is presented.

\begin{footnotes}
\item[31] School funds included interest from the primary interest fund, a one-mill property tax assessment, a dog tax, and library monies. Glover, \textit{Twentieth Century History}, 222.

\end{footnotes}
Findings: A Closer Look at District Schools

To examine the question of integrated one-room schools in Calvin township schools in 1870, the researcher first examined census records with school attendance data and compared the results with the Annual reports. Of the 132 school aged children (between five and twenty years) in the 1870 sample, only nineteen (fourteen percent) were said to have attended school, much less than expected given the state norm for school attendance in 1850 was roughly fifty percent, comparable to the 1850 census sampling of forty-nine percent school attendance.\(^{35}\) The rate increased between 1850 and 1880 to 84.5 percent according to Gower’s report in 1881.

As a second source to validate school attendance, data from the 1870 Annual reports for the four districts indicated a school attending rate of 75 percent, 105 out of 139. This was comparable to statewide norms reported in the 1870 census, indicating 74 percent of school-aged children were attending.\(^{36}\) However the rate is based on data from only districts 6 and 9 with missing data in districts 3 and 7. In 1871 with all four districts reporting number of school-aged children and those attending, the rate was 59 percent, 161 out of 274. These rates suggest that indeed the sample’s attendance rate was substantially lower than would be expected, raising the question of data reliability.

\(^{35}\) The state had a highly stable school enrollment rate, roughly fifty percent meaning that half of all the school-aged children were attending school sometime during the year. Carl F. Kaestle, *Pillars of the Republic: Common Schools and American Society, 1780-1860* (New York: Hill and Wang, 1983), 106-07.

Of those found to be attending school, the majority (seventy-four percent) were in District 7 which had largely a Black student population (thirty-seven out of thirty-nine were African-American). With such a small sample count and data discrepancy on attendance between the census records and Annual School report figures, it was not possible to conduct significance testing among the four schools. However the differences among factors such as gender, mean age, family wealth, and family size are noteworthy. In comparison with the other schools, District 7 was similar in terms of gender distribution, mean age, and family size. Its lower family wealth ($394), less than half of that for District 6 and lower than for the sample as a whole ($570), suggests that family wealth might not have been factored into whether or not a child attended school.

The most integrated district school in the sample was District 6, with a mix of fifty percent Blacks and fifty percent Whites among school-aged children. When examining factors such as mean age, family wealth, and family size, this district had the lowest mean age, highest family wealth reported (three hundred dollars more than the second highest), and smaller family size (less than 6 members). Based upon findings from the earlier study, this is what would be anticipated in a predominantly White school district. However the low number reported to have attended school (two out of fourteen school-aged children) remains puzzling.

To compare the census sample with the Annual report, the researcher calculated the number of school-aged children based on the assumption that the census sample represented sixty-seven percent of the actual number of school-aged children. For districts 3 and 9, the census calculations seem relatively close to those in
the Annual report; District 3: fifty-eight calculated as compared with sixty-six reported, and District 9: sixty as compared with fifty-seven. In districts 6 and 7, there was considerable disparity; District 6: twenty-one calculated as compared with eighty-two reported, and District 7: fifty-eight as compared with eighty-two.

To account for this, the researcher examined population trends reported in the Annual reports for a ten year period (1865-1875). The number of school-aged children reported in district 6 fluctuated from 87 to 102, declined to 78 in 1869, returned to 82 in 1870 and declined again to remain in the low 70s for the subsequent years. The difference between the census calculation and Annual report could not be explained. In the case of district 7 the disparity noted for 1870 was fifty-eight calculated as compared with eighty-two reported. In the following year, the number of school-aged children declined to sixty-four and remained in the sixties. The disparity between 1871 was only six, with fifty-eight calculated compared with sixty-four reported, suggesting perhaps a reporting error in the 1870 Annual report figures.

Data from the Annual report (Table 5) indicate that the schools were in session for approximately the same duration, five or six months out of the year which was comparable to 6.5 months, the average for all the schools in Calvin. Two districts maintained schoolhouses valued between five and six hundred dollars, while district 3 reported not having a schoolhouse. This might account for the lack of school attendance in this district. District 3 had only one male teacher in 1870 in contrast with the other districts which had one male and one female teacher. The different amounts paid in wages suggest the length of time that the teachers taught might have varied slightly among the districts.

Table 6 compares district schools with predominantly White students (districts 1, 2), Blacks (district 9) and integrated (district 6). The duration of the school term was at least 2 months longer in the White schools; the minimum term being five months. All the schoolhouses were frame structures of comparable value ranging.
from five to seven hundred dollars. The wages paid to teachers were slightly higher but there was an indication that teachers in the White schools were boarded. Room and board were commonly used to compensate teachers, supplementing the wages paid to the teacher. According to the 1870 Annual report, none of the teachers in the integrated schools (districts 3, 6, 7 and 9) were boarded. Thus the figure given for wages represents the total amount of compensation, suggesting an even greater disparity between White and Integrated schools in terms of teacher compensation.

37 Districts 1 and 2 are presumed to be predominantly White based on the assumption that White families lived in the Western section of the township.
Discussion

The inquiry for this study was whether or not one-room integrated schools existed in this township given the predominantly Black community. Historian Mathews describes the uniqueness of the township in the following way: "Should a stranger be placed in its center, he would at once conclude that he was in a Southern state."38 Most of the African-Americans settling in Calvin had come "in a destitute condition and obtained by contract possession of land which they have cleared and improved." "They take justifiable pride in the churches of which they have three, and schools which reflect great credit upon them." "Some of the schools are even now taught by colored teachers and are attended by a greater or lesser number of white children." By the 1880s the township did indeed seem to reflect an integrated community with school children attending integrated schools.39

The initial question sought to examine the existence of one-room schools before and after the Civil War in the same census years as examined in the first study, 1850 and 1880. The available map and Annual report data provided information beginning in 1859 but matching census, map, and Annual report data narrowed the focus to 1870. This represented the first year when all three data sources could be combined to describe the nature of one-room schools in Calvin township. Creating a census sample for that year and retrieving records to more closely examine racially integrated school districts proved to be a more challenging task. Census data reporting school attendance was much lower than expected and consequently the reliability of that data was questioned. The related

questions on effect of integration on school attendance patterns and differences between races in terms of age, family wealth and size could not be answered.

Nonetheless, racially integrated one-room schools were definitely suggested based on matching census records with maps indicating schools and their boundaries. The study has provided a description of four racially integrated districts. Three directions for further research are suggested. First, using the same research methodology, it would be possible to retrieve all of the 1870 census records and identify school-aged families, placing them in specific school districts. In this manner, a contrast can be made of all school districts, characterizing predominantly White, Black and Integrated schools in terms of school attendance, duration, facilities, and teaching staff as well as contrasting differences between Black and White families based on mean age, family wealth, and family size of those school aged children. A second research direction involves using a later map and Annual report data. With a later map, a similar methodology can be applied to the 1880 census records. Given the better reporting of school attendance in the 1880 census, a sampling of families residing in the racial integrated district schools might provide a larger, more substantial sample size of those children in school. Third, historical writings suggest that Calvin township "presented a marked contrast when compared with the other townships of the county." Further study might explore this anomaly in comparison with townships like Penn and Porter which also had sizable African-American settlements.

\[40\text{Mathews, History, 380.}\]
In October 1867 the Indians of the Great Plains met with representatives of the "Great Father" to develop the Treaty of Medicine Lodge. Prior to this meeting, the Indians had been warring against settlers who were encroaching on their lands. In response to these attacks, the U.S. Government had sent waves of troops to punish the "unruly savages" by setting fire to their homes and stripping the men of their wives and children. Both the Indians and the U.S. Government agreed to meet in order to make a peaceful settlement of these conflicts. The great council convened at Medicine Lodge Creek in Kansas. Unbeknownst to the Indians, the U.S. Government, in accordance with the wishes of President Johnson, planned to give back to the white settlers most of the lands the Indians had been granted in former treaties. Government officials told the Indians that they were now restricted to 5,546 square miles within the Oklahoma Territory. The Indians were also told that the "Great Father" promised that he would build schools and feed and cloth them as was "proper" to their "condition."¹ The Indians present

¹ T. R. Fehrenbach, Comanches: Destruction of a People (New York: Alfred A.
at the meeting—Comanche, Apache, and Kiowa, as well as smaller tribes—felt robbed of even more of their freedom. Ten Bears, a representative of the Comanche people, spoke:

But there are things which you have said to me which I do not like. They are not sweet like sugar, but bitter like gourds. You have said that you want to put us on a reservation, to build us houses and make us medicine lodges. I do not want them. I was born under the prairie, where the wind blew free and there was nothing to break the light of the sun. I was born where there were no enclosures and everything drew a free breath. I want to die there and not within walls. I know every stream and every wood between the Rio Grande and the Arkansas. I have hunted and lived over that country. I like my fathers before me and like them now lived happily. When I was in Washington the Great Father told me that all the Comanche land was ours, and that no one should hinder us living on it. So, why do you ask us to leave the rivers, and the sun, and the wind and live in houses? Do not ask us to give up the buffalo for the sheep. The young men have heard talk of this and it has made them sad and angry. Do not speak of it more. . . . The Texans have taken away the places where the grass grew the thickest and the timber the best. Had we kept that we might have done the things you ask. But it is too late. The Whites have the country which we loved, and we wish only to wander on the prairie until we die . . .

Despite Ten Bears' impassioned plea, the treaty was ratified, thus giving control of the Great Southwestern Plains to the United States Government. The land reserved for the Indians came to be called the Fort Sill Oklahoma Territory. According to the treaty, ten thousand dollars a year would be devoted to education. The government would provide, for twenty years, a school and teacher for every thirty children. In turn the Indians agreed to "compel their

3 Ibid., 480.
children, male and female between the ages of six and sixteen, to attend school."

For centuries the Comanche, Apache, and Kiowa had provided informal education for their children. Mothers instructed girls on how to sew by having them assist in making tents and clothing, how to cook, and how to help in the herding of animals. Fathers instructed boys in the art of hunting and ritualistic rites which were passed down through the ages. Parents also taught their children a sense of moral values and religious beliefs which had been a part of Indian culture for centuries. In addition, parents taught their children to work together for the whole tribe so that all would survive. However, this kind of life seemed petty and savage to whites who did not understand how the Indians could have survived before the settlers had arrived in the area. Laurie Tatum, the first agent in charge of the Wichita Agency, wrote in a report to the Commission of Indian Affairs that unless "they [Indians] become civilized and embrace the Christian religion it is not likely that they will last much beyond the present generation." 7

Such thinking led to the establishment of seven government-sponsored Indian schools in the Oklahoma Territory. 8 The Fort Sill Indian School, founded at the site of Geronimo’s alleged suicide jump from Medicine Bluff, in Fort Sill, Oklahoma, was a boarding school in accordance with the Treaty of Medicine Lodge. According to Julian Haddon, the first superintendent of the school, “[O]ur curriculum is mainly concerned with making agriculture and stock raising the leading features of our work.” Hence the school was placed on a farm of 160 acres of fertile bottom soil and 2,000 acres

5Ibid., 39.
6Flora Seymore, Indian Agents of the Old Frontier (New York: Apple Century Corporation, 1941), 94.
7See Bonnie Crump, Educability of Indian Children In Reservation Schools (Durant, OK: Southeastern State Teachers College, 1932).

of pasture land for grazing. The school had three basic goals: (1) to segregate the children from their families and tribes; (2) to teach the children to take the bottom rung on the social ladder; and (3) to assimilate the children into the dominant white society. This paper will show how this type of "education" was an encouragement of minority status and only allowed for the continuation of the dominant white power structure. It will also show strategies of resistance on the part of the Indians and the ultimate hopelessness that resulted from their status as perpetual children.

Wiping Out The Past

The education of the children at the Fort Sill Indian School was designed to isolate the children from their parents. Thus, all children were required to board there. In defense of boarding schools one superintendent wrote that such schools protected the "youth from the detrimental influences of his home surroundings." It was hoped that the children would forget their savage ways. Many whites believed "the Indian though a simple child of nature with mental faculties dwarfed and shriveled, while groping his way for generations in the darkness of barbarism already sees the importance of [Eurocentric] education." The children were expected to be blind and obedient followers, who would not only embrace enlightened Eurocentric thinking but also convert their elders. They were expected to be the bridge between savage life and appropriate civilized living.

---

9 Today the building, which closed in 1989, is located two and a half miles south of the military post of Fort Sill, Oklahoma; see also Rosentbluth, Fort Sill ORBS Survey, n.p.
However, a problem evolved which Superintendent Haddon of the Fort Sill Indian School had not anticipated. The children of these Indians were well loved and missed. It was difficult for parents to pass the responsibility of raising their children to someone else. According to James Baldwin, agent of the school, "I never saw a people so devoted to their offspring as the Indians are." At first only Kiowa would send their children to school and as a result Baldwin withheld rations and annuities and threatened arrest if the truants were not sent to school. The Indians knew that without government-supplied rations they would die, for they were no longer allowed to hunt without special permission from the agent. There were also problems with the quantity, quality, and distribution of rations. One Indian boy wrote: "... going to the nearest Indian agent to wait long time for beef rationing, it will probably be a long time before I get it." Many times the children went without food because of a lack of meat or in other cases the salt pork, lamb, and dried beef were too strong for their digestive systems. This was especially the case with salt pork and beef which were used when the regular rations ran out.

These reprisals taught the Indians—both parents and children—that the Anglo society had total control of them and that they were its vulnerable dependents. Some parents willingly sent their children to school, but being homesick a number of the children ran back to their families. One Indian recalled: “Mother took me to school and I was homesick in a week. I told the matron 'I am going home.' She said 'You are not going home.' And I told her I was going to 'gift you a black eye' if you don't let me go home." The children who stayed in school were isolated from their families and cultures.

for ten years, except for summer holidays. Most of these children either died in a literal sense, from disease and the lack of a "stable" diet while at school, or in the figurative sense in that they felt alienated from their people or their native cultures.

**Work Appropriate For “Children”**

A second goal of the Fort Sill Indian School was to develop a functionally based curriculum in order to prepare the children for their predetermined roles within society. These predetermined roles were at the bottom of the social structure. The Indian boys were taught to accept roles of farm hands and laborers as a part of assimilation into the settlers' society. They had no choice in their curriculum or in their occupations. The education for the boys included student projects consisting of raising field crops, row crops, and gardens. They also raised dairy and beef cattle, swine, and poultry.\(^{15}\) As the boys grew older, these projects became cooperatives which were money-making ventures for them. The reason for this type of functional curriculum was due to the apparent inability of adult Indians to adjust to the agricultural life envisioned for their reservation. As one agent put it, "We gave them the land to farm, but they only let cattle graze upon it."\(^{16}\) In effect, he blamed the Indians for their inability or unwillingness to transform themselves into successful farmers. Eventually, the Indian Bureau had to hire white farmers to plow the fields and to plant the crops. An Indian agent recorded that some of the “squaw men” plundered the watermelon fields before the plants had ripened. Apparently these Comanche plunderers were hungry and did not realize that the

---

\(^{16}\) Fehrenback, *Comanches*, 480.
watermelons were not yet ready for harvesting. Some of the Comanche ate green watermelon and became violently ill and as a result branded all farming as bad medicine.\textsuperscript{17}

Education for girls was designed to prepare them to be mothers. Field matrons were hired to circulate among the Indians instructing them in the household arts of cleaning, sewing, cooking, child care, and personal hygiene.\textsuperscript{18} In addition, the girls helped to tend gardens. This was a similar education to that which they had received from their mothers while living at home. The U.S. Government went so far as to publish a curriculum outlining the rudiments of cooking for “Indian girls to take charge of their homes and perform necessary household work.”\textsuperscript{19} The purpose of this curriculum was to teach the girls to prepare meals for a small family intelligently and economically. The lessons were designed for simplicity and for those who have not had experience with “proper living.” Proper living included experience with dining tables, forks, knives, spoons, and bunk beds. “In the night when we were going to bed I was afraid to lay on that high bed, because I might fall off in the night,” wrote Bertha Sheeply when she was just beginning school. “And then at the table I couldn’t eat with fork, knife and spoon, cause I was used to eating with my hands.”\textsuperscript{20}

As in other Indian schools, both boys and girls were expected to contribute to the functioning of the school itself. Half a day was devoted to those chores that were indispensable for the operation of the school. Boys ran the farm and gardens, and the girls cleaned, cooked, sewed, darned, and tended the gardens. After the boys left school in June for the summer holiday, the girls were kept to clean and prepare the school for the next year. Some of these children

\textsuperscript{17} Ibid., 480.  
\textsuperscript{18} Hagan, \textit{U.S. Comanche Relations}, 222.  
\textsuperscript{20} Golden, \textit{Red Moon}, 192.
did not get home until late July, only to have to return at the end of August.\textsuperscript{21} In reality, these children were subsidizing their "free" educations despite the fact that the Indians had been given the impression that the federal government would take responsibility for the cost and maintenance of the school. Making such demands on these Indian minors emphasized their marginal role in American society, for such requirements taught them that they were worthy of only a minimal financial investment.

**Outside and In**

The third goal of Fort Sill Indian School was to assimilate the children into the dominant white society. This goal was to be accomplished in two ways: through external constraint and through internal transformation. Strict militaristic discipline was believed to be necessary to control the students. The children were often seen marching up and down the campus like soldiers.\textsuperscript{22} School officials asserted that the strict discipline served to aid the children in understanding the rules and laws of the land. The children were given no opportunities to voice opinions or objections to the rules. They learned that if they wanted to eat and have shelter and a sort of life, that they had to follow the white rules without question. Charlie Tallbear wrote to a sympathetic Indian schoolteacher about his frustrations when he was forced to learn in class:

\begin{quote}
   The teacher was trying to talk to me. I didn't say a thing, because I don't understand them what they mean. In the school was very hard lesson for me. When my teacher try to make me read I won't do it, and so she try to make me read.\textsuperscript{23}
\end{quote}

\textsuperscript{21}Ibid., 194.  
\textsuperscript{22}Rosentbluth, *Fort Sill ORBS Survey*, n.p.  
\textsuperscript{23}Ibid., 189.
Corporal punishment was used on both boys and girls, and former students of the school indicated that it was administered harshly. Students over twelve years of age might also be imprisoned in the school jailhouse. Indian researcher Lewis Meriam wrote, "Unusual, cruel or degrading punishment' was prohibited. However, school jails were not abolished until 1927."24

In addition to external control, the Fort Sill Indian children were immersed in Christian teachings. It was believed that their conversion to Christianity would have many benefits. First, it would break the ties the children had with pagan ways and those of their parents, thus ensuring their salvation and eternal life. Second, Christianity would teach them a system of morality in keeping with the dominant Eurocentric culture. Third, Christianity would ease the pain of losing their culture and autonomy, and prevent them from fighting back.

Each of the tribes of the Oklahoma Territory had distinctive religious beliefs which became intertwined after their forced removal to the reservation. At religious festivals involving all the tribes, individuals learned about neighboring religious beliefs and then chose those with the most appeal. They were not so much concerned with theological purity as with "good Medicine," which was defined as an individual's feeling of well being. All tribes believed in the Great Spirit, the supernatural patron of all powers who did not interfere with human affairs. It was through an Indian's "dreams" induced by the drug peyote that the Great Spirit gave power, songs, and procedures needed to manipulate good Medicine. The tribes didn't believe in the afterlife; this life was a wondrous thing to be praised.25 U.S. Government officials had no respect for these religious beliefs. Christianity was the sword with

---

which they hoped to make a huge and final gouge between the children and their native cultures.

At this time there was a symbiotic relationship between the U.S. government and the Quakers. With direction from his political cabinet, President Grant in 1869 developed the "Quaker Policy" which was to ensure peace between the government and the peoples of the Southwestern Plains, specifically belligerent Comanche and Apache who refused to be placed on a reservation. Grant appointed the Quakers as leaders and agents of Fort Sill because of their longterm commitment to the evangelization and education of the Indians. Grant said, "If you can make Quakers out of the Indians it will take the fight out of them." According to Josiah Butler, who opened the Fort Sill Indian School in 1871, "Education cuts the cord that binds Indians to a pagan life and places the Bible in their hands."

The English language was used to complete the assimilation process. Without it, none of the other goals could be achieved. It was the means by which the children were taught the Eurocentric culture to which they were being introduced. Through English they learned school rules, Christian beliefs, and the laws the U.S. Government considered important for them to obey. All treaties were made and written in English. Even daily rations were doled out by a man speaking English. Thus it was the core subject in the Fort Sill Indian School curriculum. Native languages were called "barbarous" tongues; it was considered a waste of money and energy to spend any time on them. Nor were the children encouraged to preserve their folk tales and traditions. J. D. C. Atkins, Commissioner of Indian Affairs, wrote in 1887: "[U]tilize that time in the

26 Rupert Richardson, *The Comanche Barrier to the South Plains Settlement* (Glendale: Arthur Clark Company, 1933), 325. Also see Hagan, U. S. Comanche Relations, 139-40.
school in learning the language of the country of which [the Indians] are to become citizens—a language in which not only the scriptures can be read but all the extensive literature of the civilized world.” As a circular put it: “The Indian heroes . . . need not be disparaged, but gradually and unobtrusively the heroes of American homes and history may be substituted as models and ideals.”

These measures produced submissive students who were, at the same time, devoid of hope and energy. One child wrote of her experience, “When I went to the schoolroom the teacher told me to sit with another girl. I didn’t know what she meant and just stand there till she came and put me by that girl . . . she gave me a slate and a pencil and told me to copy the ABC’s on the slate; but I didn’t do it because I just couldn’t do it.” Some children ran away from school. Those who stayed returned to houses built by the government for them. The best male scholars were employed as herders, teamster, and laborers for the Indian agencies. The females were their housewives. After one generation their only apparent resistance to white domination was their continued use of the drug peyote, even though it had been banned by the Government.

Conclusion

The strength of the Indian population was perhaps best reflected in its resistance to white domination. At first Indian power seemed infinite: they massacred white settlers who encroached on their land; they tortured men, raped women, and snatched white

28Prucha, Americanizing the American Indian, 202.
29Golden, Red Moon, 192.
children and made them their own. They set fire to buildings, they stole horses, they robbed wagon trains. They left the white man feeling hopeless and insignificant. But the strength of the white encroachers was greater still, and after the “peace” Treaty of Medicine Lodge, these same warriors were forced to plea for freedom and then to submit to bondage. Yet the Indians continued to resist, at least for a time. They refused to send their children to school and balked at farming the way they were told to farm. They continued to practice their religious beliefs despite the continual bombardment of Christian teachings.

As has been stated, the United States Government believed that Christianity would be the sword that would cut the Indians from their past, but in reality it was something far more detrimental to the spirit of the nations of the Great Plains. In late fall of 1878 P. B. Hunt, an agent for the Fort Sill Reservation, got permission from the government to permit the Indians to go on a buffalo hunt. Government-issued passes allowed whole villages of Indians to leave their reservation to hunt. Yet it seems that this act of kindness was only a slap in the face. The Indians were not allowed to travel alone. They were told that the settlers might kill them, so troops escorted them into the prairie. Autumn fell into winter but the Indians found no buffalo. The children were hungry and crying for they were starving. The Indians prayed for good buffalo medicine and a great wind to bring the buffalo to them. Instead of buffalo, however, they found only dry bones scattered across the prairie. This was all that was left of the once mighty herds. The destruction of the buffalo—not the curriculum of Fort Sill Indian School—killed the strong spirit within the Indians of the Oklahoma Territory. Now, at last, they had become the perpetual children that the United States government wanted.31

Dr. Jessie A. Charters: Reclaiming Her Role In Adult Education

Carolyn K. Geyer
Augustana College

On May 14, 1928, Dr. Jessie Allen Charters received a telegram at the Edgewater Beach Hotel, where she was attending a conference. It was from her husband and read, "YOU WERE ELECTED CHAIRMAN OF THE NEWLY CREATED DEPARTMENT OF ADULT EDUCATION TUESDAY STOP ... FAMILY ALL RIGHT."¹ The same day a second telegram arrived, this one from Dr. George F. Arps, Dean of the School of Education at Ohio State University: "TRUSTEES DEFINITELY ESTABLISHED DEPARTMENT OF ADULT EDUCATION WITH YOU AS ITS HEAD STOP COURSES WERE ALSO AUTHORIZED."² It was an exciting moment professionally for Dr. Charters, who was 48 years old at the time and well-known in Illinois, particularly in the Chicago area for her volunteer work in adult education.

¹ W. W. Charters to Jessie Charters, telegram, 14 May 1928, Jessie and W. W. Charters Papers, George Arent Research Library for Special Collections, Syracuse University, New York.
² George Arps to Jessie Charters, telegram, 14 May 1928, Jessie and W. W. Charters Papers, George Arent Research Library for Special Collections, Syracuse University, New York.
When she had married Dr. W. W. Charters, Professor of Education, in 1907, according to the fashion of the day, Jessie retired from her college teaching job in psychology and got on with the business of being a professor's wife and later mother to four children. During the intervening years between her marriage in 1907 and the arrival of the telegram in 1928, she nevertheless remained active professionally through various consulting jobs and community projects, starting as early as her first year of marriage when she worked with rural women's groups in Missouri. But this was her chance at a full-time college position, and one can only imagine her reaction to this opportunity to bring her rich experience and outstanding educational background to the new field of adult education.

In personal recollections about her family, Jessie's daughter, Margaret Charters Lyon, said that Dr. Arps "laid a well-baited trap" when he offered both husband and wife jobs at Ohio State University. Jessie would have the chance "to organize a new department of adult education," and her husband would be challenged "to build the existing Bureau of Educational Research into one as strong as any in the country." The couple left the University of Chicago for Ohio State and spent their "most fruitful professional years in Columbus."  

References to Jessie, the wife in this professional team, are sparse. She is mentioned briefly in a 1987 book about the first generation of American women psychologists. Her inclusion in this volume was due to her early membership in the American Psycho-

logical Association and her biographical entry, although not atypical was still striking, in the 1910 edition of *American Men of Science*. Although her story has never been fully told, the details of her life and experience are instructive and worthy of study, not merely as fascinating biography, but as representative of women's contributions to the history of adult education.

This paper resulted from my research into the recently catalogued papers of Dr. Jessie Charters, papers donated by her nephew, Dr. Alexander Charters, to the George Arent Research Library for Special Collections at Syracuse University. It outlines the life of Dr. Charters and appraises her significant contributions to adult education.

Jessie Blount Allen was born in Canton, Texas, on 23 September 1880. After her father died when she was four, her mother moved first to Kentucky to be with her family, then to Seattle, where her brothers decided to relocate. Her mother was a college graduate who taught school in Seattle and invested in real estate. Tutored at home by her mother, Jessie went to a private girls' school, where she stayed until she was fourteen. Then she spent a year preparing for admission to the University of Washington, starting her undergraduate studies there in 1895 and graduating four years later with a B. Ped. and a B.A. in English. After teaching fourth and fifth grades at Snohomish public schools for a year, she returned to the University of Washington in 1900 as a student assistant in the English Department. She received her M.A. in English in 1901, when she was 21 years old.8

She decided to pursue doctoral studies, rare for women at the time, and was awarded a scholarship at the University of Chicago to work on a doctorate in psychology under the direction of John Dewey, James Angells, and other notable scholars. Also receiving a fellowship in neurology, her minor area of study, she worked as a technical laboratory assistant. She graduated with honors in 1904 with a Ph.D. in Psychology. In the fall semester of 1904, she became Chairman of the Psychology Department at the Los Angeles State Normal School.9

But she had acquired something else at the University of Chicago: a romance with classmate Werret Wallace Charters, a Canadian who had received his Ph.D. the same year. They had gone their separate ways after Chicago, he to become the principal of a training school on the campus of the State Normal College in Winona, Minnesota, and she to California, an exciting move to head an academic department. Yet their courtship continued at long distance. Three years later, W. W. Charters moved from Minnesota to the University of Missouri, where he had received a professorship in the Education Department. With this professional advancement, he felt ready to propose marriage to Jessie, and they were married 21 December 1907, at the Baltimore Hotel in Kansas City.10

Jessie Charters exchanged her teaching career for married life, doing volunteer work and other duties of a faculty wife and mother. During her child-raising years, there is little information about her professional activities. The best summary of her attitude during those years is found in a biographical newspaper article written after she became Chairman of the Adult Education Department at Ohio State. She explained that she tried to read and do her

9Ibid.
writing after the children were in bed. "It was hard to concentrate on technical stuff when I was tired, and harder still to force myself to write, but that was the way I kept in touch with what was being done in psychology until my children were a little more grown up."\(^{11}\) She managed to keep her research interest in women's psychology alive during this time, moreover, through her consulting work.\(^{12}\)

In 1925, the family moved to Chicago, where W. W. Charters joined the University of Chicago as Professor of Education. It was during these Chicago years, 1925-1928, that Jessie began her volunteer adult education activities with increased enthusiasm, working with parental education by organizing study groups and leadership institutes in Chicago and throughout the state. She was also appointed an instructor in the Home Study Department at the University of Chicago, where she directed a correspondence course on parental education. She even taught non-credit psychology courses during the evenings at the YWCA.\(^{13}\)

By the time the telegram came with Dr. Arps's offer of a full-time position at Ohio State, she had earned a reputation as a leader in parental education and had strong academic qualifications as well. Husband and wife both headed toward exciting and complementary new jobs, Wallace concentrating on educational research and Jessie becoming the practitioner.

During the five years during which she was Chair of the Adult Education Department at Ohio State, 1928-1933, Jessie Charters built a far-reaching program and state network. She served on White House Commissions, presented papers and conducted workshops at national conferences, spoke throughout the state about the work of her new department, started a graduate program

\(^{12}\) Ibid.

\(^{13}\) Jessie Charters, "For General Publicity."
in adult education, published over thirty articles and a book, and became a co-founder of the Ohio Association of Adult Education.\textsuperscript{14} She accomplished more in five years than many professionals do in an entire career.

But then, as suddenly as this rich professional period had begun, it was over. By 1931, when Charters was only three years into her program, the depression had impinged on all aspects of American life. Professors at Ohio State saw their salaries lowered and departments were threatened with staff cuts. In the 1931-32 academic year, Jessie Charters's salary was cut by 50 percent and her staff was reduced from five to just herself as chair. Allowed to keep a secretary, she tried to continue her extensive state and campus work alone. In her annual report, she described a university struggling to survive hard economic times with decreased state revenue.\textsuperscript{15}

The summer of 1933 must have been especially difficult for Jessie Charters, although there are no recorded personal reflections from this period. She received from Dr. Arps a letter in late July, which announced the end of her professional dream:

Enclosed is a copy of a letter setting forth the action of the Board of Trustees re Adult Education. This distresses me more than any of the distressing things with which I have been confronted. I was under the definite impression that everybody, from the President down, was agreed to the continuation of your services with Dr. Berry. This undermines my morale considerably, and further disintegrates my confidence—so much so that I am unable to discuss it at this time.\textsuperscript{16}

\textsuperscript{14}ibid.
\textsuperscript{16}George Arps to Jessie Charters, 26 July 1933, Jessie and W. W. Charters Papers, George Arent Research Library for Special Collections, Syracuse University, New York.
The other letter, enclosed with Dr. Arps's message of dismay, was from George W. Rightmire, President of Ohio State University. In it, Rightmire described the action of the Board of Trustees:

Yesterday when the budget for next year was being studied by the Board of Trustees, the members felt a heavy compulsion on account of the limited appropriation of the Legislature and other resources of the University and had to reach the conclusion that the University would be unable to finance the work in Adult Education longer. Therefore, the recommendation that Doctor Jessie A. Charters be included in the staff . . . was not approved by the Board of Trustees.17

There is, however, another version of the story from family recollections:

In the depth of the depression, when many professional people were out of work, there was a clamor at OSU against both husband and wife working. Since JAC and WWC had combined salaries above any other couple, she was one of the first wives to be sacrificed; her adult education job was given to a man.18

Even after this abrupt discontinuation of her services, Jessie Charters persisted in her important volunteer work in Columbus and the rest of the state. Her husband retired from Ohio State University in 1942, after a distinguished career as Director of the Bureau of Educational Research and consultant to numerous colleges and private companies around the country.19

During the five years that Jessie Charters was Chair of the Adult Education Department at Ohio State University, she contributed significantly to the field and played an invaluable role in the growing influence of adult education in Ohio. Yet the story of her contributions remains obscure, both at her home university and

17 George Rightmire to Charles S. Berry, 25 July 1933, Jessie and W. W. Charters Papers, George Arent Research Library for Special Collections, Syracuse University, New York.
19 W. W. Charters, 1943 vita.
within the overall field of adult education itself. As a first notable contribution, she organized and created an adult education department at a major university, one of the first in the country. When she came to Ohio State, academic study of adult education was in its infancy, with no current graduate programs to use as models. Yet she created a graduate curriculum and recruited graduate students to this new field. Besides course work, each graduate student was required to complete a project of stipulated practical value to that student’s community. One student, for example, served as Principal to the National Cash Register School for Home-Makers in Dayton and designed a curriculum for women.20 Another doctoral candidate in the department set up and directed a large alumnae project in Dayton.21

Another pioneering activity of her new department was an extensive outreach effort in parental education, supported in part by the Ohio State Department of Education. In the first two years of the department’s existence, Dr. Charters and her staff organized parent study groups all over the state in cooperation with the Ohio Congress of Parents and Teachers. They wrote study courses for these groups and provided follow-up consultation to group leaders. The department sponsored leadership training institutes, which were designed to train leaders of parent study groups and anyone interested in directing adult education activities. Delegates from Ohio colleges and other organizations interested in adult education attended these successful events. Dr. Charters had been at Ohio State only four months when she started publishing Better Parents Bulletin, which was sent free to over 4,000 people in the state. This bulletin was comparable to a small journal in appearance and content. She also established a speakers bureau for public rela-

---

21 Jessie Charters, “Fourth Annual Report.”
tions and educational outreach. During the second year of her departmental operation, she and her staff delivered over one hundred speeches.\footnote{Jessie Charters, “Second Annual Report.”} The Adult Education Department literally took the campus to the people.

A second contribution was the groundwork of Dr. Charters in starting the Ohio Association of Adult Education. In 1931, she invited a group of leaders to her campus to discuss cooperation among state agencies interested in adult education. Agencies represented included colleges, libraries, parent-teacher groups, Federated Women’s Clubs, AAUW, county extension offices, and the League of Women Voters. This meeting revealed widespread interest in the new field and a growing conviction on the part of participants that a formal organization would be valuable for coordinating efforts and advancing the adult education movement.\footnote{A. J. Arnold, “Report of the Chairman,” 16 January 1932, Jessie and W. W. Charters Papers, George Arent Research Library for Special Collections, Syracuse University, New York.}

As a result of this interest in cooperation, an executive committee was appointed to plan the details for a consolidated state adult education effort, and Jessie Charters served on that committee. The organizing group learned that California alone had a state association and sought the advice of Morse Cartwright, Director of the American Association for Adult Education. With Cartwright’s encouragement and their own enthusiasm, the Ohio committee moved to make theirs the second state organization, naming it the Ohio Adult Education Conference.\footnote{Ibid.} During this essential organizational period, Jessie Charters chaired the constitution and by-laws committee, was acting chairman for six months, and served as membership and publicity chair.\footnote{Minutes of the Ohio Conference on Adult Education, 16 January 1932, Jessie and W. W. Charters Papers, George Arent Research Library for Special Collections, Syracuse University, New York.} The second year she was
elected secretary/treasurer. She edited the first newsletter, which included a brief history of the new organization, a summary of the 1933 convention, and a description of such adult education projects as the Springfield Free-Time People's College.

Jessie Charters pioneered work in other adult education areas as well. She received a Carnegie grant for the study of alumni education on the basis of her work with Ohio State alumni in several cities. She designed a radio course in parental education, with programs airing twice a week before the supper hour in homes all over Ohio. In addition to programs such as "How to Manage the Difficult Child," problems of college students were dramatized so that parents might learn about difficulties which existed beyond the home years. She created an English study course for immigrant Italian women and a course in child development for parents of delinquent children under the auspices of the Franklin County Court of Domestic Relations. She wrote a correspondence course for foster parents in the Central District of the Child Welfare Division of the Department of Public Welfare. She experimented with a variety of methods in bringing adult education to the people in Ohio.

Many of the activities and ideas which Jessie Charters started continued long after she left. Evidence can be found, for example, in a 1950's brochure of the Ohio State Bureau of Special and Adult Education. It describes, among other things, the bureau's cooperation with officials of the Ohio Congress of Parents and Teachers in setting up leadership training for study group leaders. Still in the graduate curriculum were the courses "Parent Education," "Minor

28 Jessie Charters, "Fourth Annual Report."
Problems in Adult Education," and "Adult Education," three courses from the first years of the department when Dr. Charters was chair. Graduate students continued to do practical projects, and one of the professors carried on the tradition of editing the quarterly newsletter of the Ohio Association of Adult Education.²⁹

In conclusion, Dr. Jessie Blount Allen Charters brought academic reality to the emerging field of adult education. She focused her keen analytical mind on matters of curriculum, integrating the best ideas in the field with her extensive knowledge and experience. Through her work at Ohio State University and around Ohio, she advanced significantly the adult education movement. Hers was a time of experimentation in educating adults, a period of freshness and imagination in danger of vanishing as the field became more formally organized.

In an article which she wrote in 1929, the year after she arrived at Ohio State, she astutely summarized questions which adult educators are still trying to answer. She ascertained that the greatest problem facing the profession is how to motivate adults to learn, which involved a different teaching methodology than the standard lecture and textbook routine:

However, the most successful adult education courses are conducted in quite a different way. The group often selects its own subject or topic, discusses it freely with the leader or instructor, and insists upon the right to a judgment quite unrespectfully independent of authority. One correspondence student criticizing Herbert Spencer's "discipline of natural consequences" said, "it is good as far as it goes, but it only goes one step of the way, and we mothers have a long way to travel in order to make our children behave like human beings."³⁰

Such seminal ideas as these are found throughout her writing. Her work merits further study so that she can be awarded her rightful place in the history of adult education and so that her ideas can instruct adult educators today.
Robert Kennicott, 1835-66: Chicago's First Environmental Educator

Edward T. Klunk
Loyola University of Chicago

Robert Kennicott was the moving force in the establishment of the museum of the Chicago Academy of Sciences. Born 11 November 1835 in New Orleans, Louisiana he was brought to West Northfield, Illinois as an infant. Robert's father John Kennicott relinquished his medical practice to pursue horticultural science in Illinois. John Kennicott's residence "The Grove" eighteen miles northwest of Chicago quickly became a center of study in horticulture, agriculture, and natural history attracting the educated, refined, and scientific men from the adjacent countryside. Through the encouragement of family and friends Robert grew up in the "wildness" of the agrarian area around the Grove. Robert's delicate health interfered with his formal schooling and in view of this fact John Kennicott decided against regular formal elementary schooling for Robert. Robert was schooled at home largely in the fields, woods, marshes, and other wild areas around the Grove.

Robert showed a remarkable inclination for natural history and early developed a devotion for the study of natural history. Robert's interest, exploration, and collecting of natural history at the Grove convinced John Kennicott that formal study of natural science would benefit Robert. An old friend Jared Potter Kirtland suggested
and encouraged John Kennicott to send Robert to Cleveland. Robert studied with Kirtland, an expert in natural science and horticulture, during the winter of 1852-53. Through correspondence Kirtland introduced Robert to Spencer Fullerton Baird of the Smithsonian Institution. Following Kirtland's advice young Kennicott started a regular correspondence with the Smithsonian Institution becoming friends with Baird.

In 1854 Robert studied in Racine, Wisconsin with P. R. Hoy a well known ornithologist, who greatly advanced Robert's knowledge of practical field zoology. The study of local birds etched into Kennicott's brain an all inclusive catalogue of recognition by song alone. Hoy remarked of Robert, "Bob is a good kind hearted; and very conscientious boy; a little too bold and confident to suit everyone but he suits us." His periodic study with Hoy continued for several years.

In the winter of 1854 a serious attempt devoted to formal study and consideration of the medical profession proved ill fated. Poor health and recommendations from friends convinced Kennicott to take his entire education in the field. Freedom from formal schooling molded Kennicott into an authority on Chicago region animal life. The time spent in the woods, prairies, and marshes germinated and ripened his understanding and expertise of the natural world around him.

Looking toward opening the Illinois frontier to development the Illinois Central Railroad Company proposed to the State Agricultural Society their cooperation and support in a natural history survey of the state. Plans were developed and organized in the spring of 1855. Through the influence of his father Robert was

2 Ibid., 135.
appointed as the naturalist in charge of the survey and the railroad provided assistance with passes, services of their employees, and equipment needed to make collections. Robert began the survey on May 30 collecting throughout the state the entire summer. The material collected was catalogued, described, and identified during the fall and early winter. Kennicott's first professional expedition proved to be a success.

The Illinois expedition documented Kennicott's ability and fervor as a field zoologist. He constantly came into contact with men of science, influence, and wealth who shared his interest in natural history. During the spring of 1856 Robert associated himself with a group of prominent Chicago men that would soon organize the Chicago Academy of Natural Sciences.4

The state agricultural fair held at Alton in October 1856 brought public recognition to Kennicott's work on the state natural history survey. An Illustrated series of the vertebrates of Illinois collected during the 1855 survey was placed on display. The value of the collection and its description invoked strong acknowledgement from the agricultural community and men of science. So complete and detailed was the collection that Baird convinced the U.S. Commissioner of Patents to propose that Robert write for the Agricultural Report of the Patent Office. Titled Quadrupeds of Illinois injurious or beneficial to the Farmer the report detailed the natural history of Illinois mammals and their relationship to agriculture. Understanding the relationships of the natural world can be the farmer's most powerful tool expounded Kennicott:

However injurious wild animals may be to man he should not forget that he himself is very often the cause of their undue destructiveness... before waging war upon any animal, let us study its habits, and look well to the consequences which would

4 Robert Kennicott to Spencer Fullerton Baird, 10 March 1856, Spencer Fullerton Baird Collection, record unit 7002, Smithsonian Institution Archives, Washington DC.
follow its extermination. We must remember that it is an unde-
niable fact that the dangerous increase of any species is due
to the destruction of its natural enemies...

In 1857 Northwestern University of Evanston, Illinois instituted
a natural history museum for use by its students and to assist in
identifying the unknown natural inhabitants of the region. His
reputation established as a field zoologist, Kennicott was engaged
as curator by Northwestern University to gather specimens for its
museum of natural history. Soliciting public assistance by distribut-
ing a letter with detailed instructions for the collection and preser-
vation of specimens Kennicott evangelized his infatuation with
natural history and its collection.

Any person in the country while walking in the woods and fields,
or a farmer, while engaged in his daily work, could, by carrying
in his pockets a small bag for reptiles and mammals and a
strong half-ounce wide-mouthed vial of alcohol for insects, with
the loss of only a few minutes, secure many valuable and often
new or rare species. Several hours spent in searching among
the grass, examining flowers, turning over stones and old logs,
and stripping off dead bark, or fishing, in any region unexplored
by naturalists, could scarcely fail to expose species unknown
to science.

A true zealot he always looked toward advancing natural
history in an altruistic manner:

... duplicates of specimens obtained will be placed in the hands
of competent naturalists engaged in studying the various
classes, that all may be accurately determined and the new
species described; and the University will, by giving the Smith-
sonian Institution and other scientific organizations with large
opportunities for the diffusion of knowledge, the benefit of any

5 Robert Kennicott, “The Quadrupeds of Illinois injurious and beneficial to the
Farmer,” Report for the Commissioner of Patents for the year 1856 (Washington
DC: Cornelius Wendell 1857), 52.
6 Robert Kennicott, public letter of solicitation and directions for collecting
specimens for Northwestern University, Chicago Historical Society Library.
new collections and discoveries made, and by other means endeavor to make its collections of the most use to science, education and the agricultural interests at large. The time has come when the practical benefit resulting from such collections is too well known among the intelligent to need comment.7

The collection of specimens, their identification, and organization of the museum progressed successfully. In the winter of 1857 Kennicott made his first visit to the Smithsonian Institution to help complete his work at Northwestern. Arriving in the middle of December he worked through April of 1858. Selection, classification, and description of collections for the museum as well as specific work on herpetologic specimens gathered on various occasions occupied most of his time. The results of this work were published in the Proceedings of the Academy of Natural Sciences of Philadelphia.8 Kennicott established himself on the national level as a field zoologist of worth. Returning to the Grove he continued work at Northwestern through July 1858. In a dispute over compensation he broke his association with Northwestern and found future suggestions to place his personal collections in their museum objectionable.9

Encouraged by Baird of the Smithsonian Institution, Kennicott wrote to Sir George Simpson Governor of Hudson Bay Territory asking approval for an expedition to make collections. Receiving a favorable reply he began the expedition in April 1859 under the sponsorship of the Smithsonian Institution, individual patrons, members of the Chicago Audubon Club, and members of the Chicago Academy of Sciences.10 With some reluctance he re-

---

7 Ibid.
9 Robert Kennicott to Spencer Fullerton Baird, 20 November 1863.
10 Robert Kennicott to Spencer Fullerton Baird, 21 April 1859.
turned to Chicago in October 1862 as a result of hearing news of the Civil War.\textsuperscript{11} Taking the advice of family and friends Kennicott decided not to enter the army. He then proceeded to the Smithsonian Institution to work on the collections of the arctic expedition. The results of the expedition became recognized for their valuable specimens of the unknown natural history from the northern regions of North America. Upon return to Chicago in the spring of 1863 Kennicott was viewed as somewhat of a celebrity by the citizens of the city. This notoriety gave rise to a movement to bring Kennicott’s personal portion of the arctic expedition collections to Chicago.\textsuperscript{12} The stage was now set for the expansion of the museum of the Chicago Academy of Sciences with Kennicott in the leadership role.

It was undeniable that Kennicott wanted a world class museum established in Chicago.\textsuperscript{13} In November 1863 museum plans were sent to Spencer Fullerton Baird for comment and answers to specific questions.

Suggestions as to what is necessary to secure to Chicago a great scientific museum.

1. A collection illustrating natural science generally and especially American zoology, botany, geology, ethnology and archaeology. This is to be labeled, classified and every specimen identified with unquestionable accuracy.

2. Either temporary rooms secured for ten years, or a permanent building to contain the museum and laboratories. Dimensions of museum hall 50x100 feet—25 to 30 feet high and two or three small work rooms.

3. A sum (say $33,000) securely invested, the interest of which shall be permanently devoted to paying a suitable salary (say $1,500) to a secretary and the surplus ($500) to the expenses of preserving the museum.

\textsuperscript{11}“Biography of Robert Kennicott,” 133-226.
\textsuperscript{12}Robert Kennicott to Spencer Fullerton Baird, 24, 25 October, 16, 18, 23 November 1863.
\textsuperscript{13}Robert Kennicott to Spencer Fullerton Baird, 26 November, 4 December 1863.
4. A sufficient sum of money for immediate expenditure for museum furniture, (cases) mounting specimens, transportation, etc., to put the first collections in order. (The sum required will be more or less just in proportion to the magnitude of the collections to be exhibited.)

Excepting the museum furniture (cases) which are, in fact, properly a part of the building—from $3,000 to $6,000 would be sufficient—this to be used within about three years. As much besides would be required for museum cases. (This estimate is for a museum of the same scope and character as the largest now in America.)

It might reasonably be hoped that some of the extensive Chicago libraries would afford such facilities as would obviate the necessity of the museum's owning a library.

Such a museum would be the first and most important step toward the creation—in such shape as might be best—or a great institution devoted to the increase and diffusion of knowledge generally—or if thought better, of science and the arts generally—of science alone—or even of natural science only.

But the museum alone if well labeled and correctly illustrating natural science in its present advanced state would go far towards effecting the following objects.

A. The elevation of natural science to its proper dignity as a matter of common education in the west.

B. To afford facilities in this city for the study of natural science in any and all of its details.

C. To make Chicago the great center of science in the west—as it now is of wealth and of commercial intellect and energy—and by a combined effort on the part of even a few persons specially interested in natural science—and who appreciate it as a matter of general education—they might easily—in connection with such a museum eventually effect the following grand desiderator.

D. To thoroughly investigate the entire field of Nature in the west and apply the knowledge so gained to the best purpose.

E. The publication of such original investigations as may increase knowledge; or of any special and general works that
may diffuse more widely the knowledge now possessed only by a few.\textsuperscript{14}

Plans for a Chicago museum of natural history developed in Kennicott's mind early. As one in a regular gathering of natural history zealots in the offices of Dr. Edmund Andrews, Kennicott became part of a circle of men that established the Chicago Academy of Natural Sciences in 1857.\textsuperscript{15} The group of prominent Chicagoan founders of the Academy included Dr. James Van Zandt Blaney a founder of the Rush Medical College, Dr. Nathan S. Davis professor at Rush Medical College, Dr. Hosmer Allen Johnson teacher at Rush, Dr. Edmund Andrews a founder of Chicago Medical College, Dr. Franklin Scammon, Col. Samuel Stowe philanthropist, Richard K. Swift banker, Captain Joseph D. Webster, W. H. Zimmerman businessman, Dr. Henry Parker and J. A. Lapham.\textsuperscript{16} The promotion of scientific pursuits was the Academy's objective and the primary means to accomplish this goal was the formation of a scientific museum and library. Rooms were secured in the Dearborn seminary for the museum and library. Kennicott was appointed chairman of the standing committee on zoology and enthusiastically began obtaining and collecting specimens for display as did the other members of the society. "The objects of the Society commend themselves to all friends of science and education. The natural sciences would seem particularly fitted to interest and profit our Western people."\textsuperscript{17} Public contributions were sought to build exhibit cabinets to display and study the collections. The second object of the Society was to interest the various educational institutions growing up in Chicago in: "one extensive and valuable museum than for each to attempt to have one of its own."\textsuperscript{18} The

\textsuperscript{14} Robert Kennicott to Spencer Fullerton Baird, 10 December 1863.
\textsuperscript{15} Robert Kennicott to Spencer Fullerton Baird, 10 March 1856.
\textsuperscript{17} Ibid.
\textsuperscript{18} Ibid.
twenty-one year old Kennicott became frustrated with the attempts (including his own) at raising funds for the museum. “I don't mean to say that Chicago people are all ignorant of natural science and its results but as a class they care as little and know as little of such things as any folk I ever heard of that called themselves civilized and enlightened.”

Kennicott asked Baird if the Smithsonian Institution could make contributions to the Chicago museum to provide encouragement to the members of the Society, to persons who were giving financial support and, to help increase contributions from the public.

In the Academy's early years Kennicott's enthusiasm and frustrations in the establishment and development of a museum were evident. In the time between 1857 and October of 1862 his efforts were largely given to collecting expeditions. The major part of Kennicott's life was spent in field work, collecting, and exploring.

Kennicott had returned to the Grove in the spring of 1863 on receiving news of the illness of his father. John Kennicott's death in June 1863 kept Robert with his family through most of that year. It had been during this time that his energies were focused on creating a major natural history museum in Chicago.

Kennicott's reputation and renown as a collector and explorer provided the celebrity status necessary to interest the wealthy, cultured, and influential citizens of Chicago. Needing assistance and guidance with the 1863 plan Kennicott relied on Baird, his long time mentor and friend. His reputation as a field zoologist also attracted the attention of Louis Agassiz. Through Joseph Henry, then Secretary of the Smithsonian Institution, Agassiz approached Kennicott to work for the Museum of Comparative Zoology established at Harvard University. Agassiz, the preeminent natural scientist in the United States, was recognized as having great

---

18 Ibid.
19 Robert Kennicott to Spencer Fullerton Baird, 10 March 1857.
influence in raising funds in support of natural history. Kennicott concluded the wealthy and influential Chicago people could be moved to build a museum if Agassiz visited the city and offered his support: "The sons of wealthy men here tell me that Agassiz’s strong endorsement of my plan would be worth ten thousand dollars in raising money here. The fact is Agassiz’s popular reputation is all powerful here in such matters."  

Kennicott asked Baird to comment on his plan through correspondence during November and December 1863. Kennicott outlined his idea to gain Agassiz’s favor and commitment to come to Chicago in a November 18 letter to Baird. Indicating he felt the Chicago museum would go ahead and Agassiz’s support was needed to raise money. Kennicott did not wish to offend the prominent Harvard zoologist by declining his request to go to Cambridge and work in its museum of comparative zoology. Kennicott tells Baird "I confess to you I’m bound to try on a little claptrap and humbug to help me carry out the plan here."  

Kennicott further reasoned that working with or for Agassiz (even for a short time) will provide an "eclat" that would also facilitate his Chicago museum plans.

Kennicott's insight and planning were materializing. The idea was to have the museum plans in place and made public before Agassiz's visit so the museum will be Chicago's idea and Agassiz will give the plan a "boost."  

Baird and Agassiz were not on friendly terms. Agassiz was actively working to prevent Baird's membership in the recently formed National Academy of Sciences. In his desire to have his museum at Cambridge become the first ranked zoological collection in the United States, Agassiz made attempts to have the Smithsonian natural history collections controlled by Baird trans-

20 Ibid., 16 November 1863.
21 Ibid., 18 November 1863.
22 Ibid., 5 November 1863.
ferred to Cambridge. The entire scenario made Agassiz and Baird bitter opponents. Joseph Henry, then Secretary of the Smithsonian Institution supported Baird and was the third party necessary in establishing communications with Agassiz that brought him to Chicago in early February 1864. Agassiz’s Chicago visit brought George Walker, Horatio Loomis, Edmund Aiken, Daniel Thompson, Erza B. McCagg, Eliphalet Blatchford, J. Young Scammon, and William Doggett together as a committee of prospective donors to a Chicago museum. During the Chicago visit Agassiz spoke of the importance of Kennicott’s collections.23

Kennicott’s shrewd maneuvering of Agassiz through Henry and Baird brought the backing and support of prominent Chicagoans. Kennicott’s loyalty was to Baird who he repeatedly relied on for advice and answers to specific questions about the establishment and management of a museum. Baird advised Kennicott to be sure his friends controlled all funds as he would find both eastern and western men who would try to “cut you out” if the museum succeeded.24 Baird’s advice convinced Kennicott to accept personal donations from patrons such as George Walker, a prominent Chicago businessman. Information supplied by Baird also went into the Constitution and By-laws of the Academy.

A short time after the Agassiz visit sufficient funds were raised to meet Kennicott’s requirements for a museum to house his collections. Joseph Henry agreed not only to turn over Kennicott’s share of the arctic expedition of 1862 but felt the Chicago plan under Kennicott’s direction worthy of a series of all duplicates in the collections of the Smithsonian Institution. The Chicago Academy of Sciences, through Kennicott’s work and dedication, became endowed with the funds and collections to establish a natural history museum of worth. Kennicott was elected curator as work on the

---

23Ibid., 15 February 1864.
24Spencer Fullerton Baird to Robert Kennicott, 28 November 1863.
museum began in February 1864. An early 1864 estimate of the collections included 10,000 plants, 2,000 minerals, 75,000 fossils, 97,000 animals including 1,000 mammals, 3,000 birds, 2,000 bird eggs, 5,000 reptiles, 10,000 fishes, 40,000 insects, 5,000 crustaceans, 30,000 mollusks and 1,000 radiata. Kennicott personally supervised the packing and shipping of the collections from Washington to Chicago. The collections were arranged in the Metropolitan Building at LaSalle and Randolph streets and the museum opened to the public 1 January 1865.

The Western Union Telegraph Company in the winter of 1864 asked Kennicott to take part in the Overland Telegraph Expedition. His experience and knowledge of the northern climes brought an opportunity to further explore unknown northwest regions and collect natural history specimens. Supplementing the 1862 expedition would be of great advantage to the Chicago Academy and the museum. The Smithsonian Institution and the Chicago Academy of Sciences agreed to help to scientifically outfit the expedition and share in the collections made. Kennicott could not resist the possibilities unfolding: greater personal recognition, expansion of the museum in Chicago, and undiscovered natural history to be collected and identified. Accepting the offer he took command of the party destined to survey Alaska and the Yukon River for a route to lay an overland telegraph line to Europe. Provisions were set in place by Kennicott for the work on the Chicago museum to continue. He left the city in March 1865 never to return. Kennicott died at Nutalo on the Yukon River 13 May 1866.

Kennicott's zealous pursuit of natural history and his desire to make its tenets part of everyone's common education established him as Chicago's first environmental educator. Robert Kennicott

25 Robert Kennicott to Spencer Fullerton Baird, 24 February 1864.
summed up his life-long desire in a letter to a friend: "You have heard me speak of my wish to establish a good museum in Chicago which should enable me to work more effectively at what I consider my vocation—the making popular of natural history, and its advancement."  

Community or Curriculum? Experiences in a One-room School Circa 1940

Ruth K. McGaha
Iowa State University

Historical Background

The rural schools of the Midwest were the last bastion of nineteenth century educational philosophy. Whatever the critics and well-meaning reformers of the early twentieth century believed, they failed to recognize the rural schools as the living link to American education's past. Perhaps somewhat ossified, it still held to the structure and heart of the common school philosophy. The reformers' sociological and psychological perceptions could not break through tradition's bone.

What existed there was as old as the American ideal. Henry Adams expressed the underpinning of that ideal in his discussion of the philosophies of Jefferson and Gallatin when he said, "education should bring the masses into familiar contact with higher forms of human achievement, and their vast creative power would rise to the level of democratic genius . . ." Fuller, writing of the reformers' lack of success in the rural schools only a century later, reported the same philosophy or attitude existed among the board
members of the rural school districts. "Practical and conservative, they wanted to maintain the traditional curriculum, and they tended to look upon the attempts of the theorist as an effort . . . to restrict their children's opportunities to be whatever they wished to be . . ."^2

The concept of the school as a stepping stone to a better life is an old idea. The lyceums of the nineteenth century were "community education." They sponsored teacher training seminars, published pamphlets of support for the common schools, and provided the meeting halls for the fledgling teacher organizations. As the torch passed from the volunteer organizations to the schools, the schools became the community centers.

The communities continued to expect what they had always expected of their teachers. In 1848, Aronzia Perkins attended services in all the New Haven churches, including the Synagogue, the Catholic church, and the African Methodist Episcopal church. In addition, she attempted to meet community expectations by distributing tracts, teaching Sunday School, and working diligently in her spare time to raise money for a new school.\(^3\)

Elizabeth Dusenbury experienced the same expectations in 1855 in Joliet, Illinois. Dusenbury expressed her weariness in her journal after attending three services on Sunday at two churches and prayer meetings at both the Methodist and Presbyterian churches during the week. Three months after her arrival in Joliet, she joined the Presbyterian church. "It is another bond to bind me to this people," she wrote.\(^4\)

---

4 Ruth McGaha, "The Journals of Sarah Elizabeth Dusenbury: Portrait of a
Near the turn of the century, many of these community restrictions on teachers changed as “professionalism” became the dominant factor in the hiring of teachers. The old demands of “good moral character,” local examinations written by school boards or two commissioners, and “physical stamina,” were replaced by requirements for normal school graduation or state or county examinations which measured the candidate’s academic proficiency. But the old expectations, while perhaps not often discussed, remained in place. The teacher must be a model for her pupils and an exemplary member of the community.

Gone too were the days when a teacher’s education was a manual tucked in her pocket, but the reformers and critics suddenly found a new merit in the philosophies espoused by the manuals. The reformers had decided what the rural schools needed was a teacher active in community affairs. Charles Northend’s classic, The Teacher and the Parent, emphasized the teacher’s community role. “A teacher must be faithful in the performance of their public, as well as private, duties . . . ready, with cheerful earnestness, to cooperate with others in every suitable manner.”

When the reformers urged teachers to become community leaders, they were not suggesting a fresh concept of the teacher’s role. They were retreating.

Other reform suggestions seem to have been recycled from the past. Fuller told of a Wisconsin report in 1900 which read, “Country teachers are, in most cases, young, immature, half trained, ineffective and lacking professional ideals and ambition.”

This sounded remarkably like James Carter’s disgusted voice of 1824. “This is the only service in which we venture to employ
young, and often ignorant persons, without some previous instruction in their appropriate duties."

A Memoir

The critics of rural education, while far from original, were right. As one of those rural teachers of the middle west in the years before World War II, I know about the rural schools. Upon reflection I can see how they might have viewed my little Prairie Hill school in Rooks County, Kansas, as just one more sorry example of the state of rural education.

The Prairie Hill school house was much like the one described by Fuller in "The Teacher and the Country School." It was a plain, rectangular wooden building, with a row of windows down either side. It sat on a small rise in the midst of a scruffy square of pasture land with no trees to block the path of the unremitting wind. Unlike some other rural schools, Prairie Hill had playground equipment: a metal swing set with four chain swings with sturdy plank seats sat between the wooden privies. We also had a basketball hoop, firmly fastened to the rear of the building, a basketball, and several baseballs and bats.

The school, when I arrived, was immaculate. The interior walls had been repainted a creamy beige, the windows washed, floors scrubbed and oiled, the pot bellied heater resplendent with polished chrome. Two new brooms guarded the cloak room and half a dozen neatly folded dusting towels emphasized their expectations of a clean and orderly school. Prairie Hill, despite some limitations, was a focus of community pride. Two barrels on a scaffold outside the

8 Fuller, "The Teacher in the Country School," 101.
cloakroom provided fresh spring water. To the extent that the water in the barrels lasted, or didn't freeze, the school had inside running water. Two galvanized wash bowls sat on a wide bench by the water spigot. Children were expected to bring their own cup for drinking, and their own towels and soap. Appropriate hooks had been installed beside the wash bench along the cloak room wall.

In the center of the classroom was the bulging, black bellied heater, flanked on either side by wooden boxes. One held the precious kindling wood, the other the larger wood, which hopefully, the teacher would soon learn to split. It was the teacher's responsibility to build the fire. A farmer with a bent for organization had equipped the woodshed. A bin of corn cobs stood ready just inside the door, neatly stacked wood ranged along the back, on the opposite side stood the crib of bark and kindling, and in the well-swept center was a hard wooden block and the school board's pride—a glistening red handled new axe for splitting wood. I had never split wood in my life. Not only did I exemplify the critics' complaints of poorly educated teachers as to teaching practices, but I lacked the country skills to deal with the most rudimentary of my new duties.

**High School Normal Training**

I had only a high school normal training course even more rudimentary than those described by Herbst.\(^9\) It consisted of little beyond a few days substituting in the town elementary school, a few hours of educational lectures, of which I remember only that a teacher must demand the respect of her pupils if she was to keep

---

"order." I was not unusual. Most rural elementary teachers did not attend Normal school, although Kansas supported a Teachers' College in Emporia, Kansas. Many of the small, rural schools, such as Prairie Hill, often looked no further than the high school graduate who had taken the "normal training course." My older sisters moved into teaching by this route in the early thirties. By the time I attended high school, such programs were being phased out. As a result, only a few classes were available in the high school and those consisted of reading a thick book, some practical advice on discipline, and the occasional assignment to spend an hour or so each day in the local grade school assisting teachers with everything from playground duty to scrubbing up after a painting lesson. For many young women the more appropriate time to attend Normal school was after she had taught a year or two and additional skills might make her eligible to teach at the secondary level.

Institutes

Those, like myself, who were planning to teach had the additional option of attending an eight-week summer teachers Institute at Emporia. The Institute announcement advertised the course as covering philosophy, methods, discipline, and some school management. At sixteen, my interest was in being away from home. I reveled in being on my own. Even the steamy dormitory and terrible food failed to squelch my sense of adventure. Going to class was a bother. My memory of the class content is

---

10 Ibid., 113-Herbst mentions a similar curriculum on page 113. Philosophy may not have been included in my curriculum. I remember, however, a course in Geography and many intense discussions of the world's food distribution problems. My guess, in retrospect, is that this was a Sociology class.
clouded by my recollection of the heat, the long lectures, and the awful constraint of keeping dormitory hours.

Our classes centered around games, poster making, and record keeping. A course in “meeting children’s needs” met outside every other day at 11 A.M. Outside was preferable to the sweltering classroom, but the lecture was lost as the tired little instructor swatted flies, wiped the rivulets of sweat from her face, and constantly brushed back her hair. Her audience, in retrospect, seems to have been totally apathetic. To this day “meeting children’s needs” brings to me the memory of a strained voice, wind-milling hands, the incessant buzz of summer insects, and the occasional smack of a hand on the bare flesh of arm or neck. Unfortunately, this completed my teacher training.

**Motivation**

Has there ever been a sixteen year old with three younger siblings who truly loved children? I had no interest in children, or indeed in education. School teaching was a means to an end.\(^{11}\) To go to college, I needed money. Teaching school was one of the few ways in the rural community I could make money. True to the traditions of the nineteenth century, in the twentieth century teaching continued to be a respectable, acceptable, temporary occupation for a woman.\(^{12}\) Susan Carter explains in her essay, “Incentives and Rewards to Teaching,” that as late as 1970, 53 percent of female college graduates who were working for wages still taught school.\(^{13}\)

---

\(^{11}\)Ibid., 117. Herbst verifies that many attendees at normal schools were interested in other careers than teaching.

Teaching school was a bit of a tradition in my family. My older sisters had taught school before they married, my brother had married a rural school teacher. Teaching was, after all, only a temporary occupation. I wanted to be a journalist. My parents believed a year or two in a rural school would squelch such a ridiculous notion.

Teacher Certification

The criteria for a teachers' certificate in the state of Kansas was passing the state teachers' test.\textsuperscript{14} It was a test which put the GRE or the Miller Analogy to shame. The new professionalism in teaching was demanding stricter academic standards.\textsuperscript{15} My habit of keeping my nose in a book served me well, and, as there were no questions on teaching methods, child psychology, or discipline, of course I passed the test.

Methods and Practices

Once out in the rural school, I turned to the kind of teaching by which I had been taught.\textsuperscript{16} Long before I started attending school I had passed my first lessons in memorization and rote learning given by my older sisters. To this day, I can recite most of

\item \textsuperscript{15}Michael W. Sedlak, "Let Us Go and Buy a Schoolmaster," in Warren, American Teachers, 167.
\item \textsuperscript{16}Fuller, "The Teacher in the Country School."
\end{itemize}
\end{footnotesize}
"Little Orphan Annie's come to our house to stay, To wash the cups and saucers and brush the crumbs away, To shoo the chickens off the porch, and dust the hearth and sweep, To make the fire and bake the bread, An' earn her bread and keep. And sometimes in the evenings when the supper things is done, we set around the fire and have the mostest fun . . . a-listenin' to the witch tales that Annie tells about . . . ."

My teachers at school had encouraged this kind of memorization. Often entire class periods were devoted to each student standing and repeating from memory the Declaration of Independence, or the Gettysburg Address. They had emphasized phonics, memorization, and silent reading for meaning.17

Once out on my own, I followed the "course of study" guide presented to me by the County Superintendent, but my methods dated back to my own early school days. David Tyack laments this practice in his essay, "The Future of the Past." Tyack believes the methods used by public school teachers have varied little through the years because "teachers begin their socialization the day they walk into the classroom as students. They observe and internalize the teacher-centered classroom as the way it is in schools."18 The children in my little school memorized "The Raggety Man," and poems from Hamlin Garland (a great favorite of mine at the time), and the poems of Robert Louis Stevenson, in about the same progression as I had memorized them in school.

---

17 Richard L. Venezky, "Steps Toward a Modern History of American Reading Instruction," Review of Research in Education 13, (1986): 129-67. Venezky discusses the long battle for teaching reading comprehension on pages 147 and 148. He quotes Ayers and McKinnie, 1927, as quoted in Gray and Zirbes, 1927-1928, p. 39, "By the end of the 1920s, the aim of reading instruction was defined as training pupils to translate the printed words into ideas, thought, motives, and acts, which made for knowledge and efficiency."

18 Tyack, Turning Points, in Warren, American Teachers, 419.
Meeting Children’s Needs

Could I meet children’s needs? I was too close to being a child myself to consider meeting anyone’s needs beyond my own. Child psychology had an interesting sound to it, but my brief acquaintance with it in Emporia had not impressed me with its practical use. My mother, not my Latin teacher, not the tired, hot psychologist at Emporia, was my mentor in meeting children’s needs. My mother had preached responsibility, but she was always flexible and willing to listen. Flexibility with responsibility was necessary when you found yourself alone with nine children in a one-room school.

Contribution to Community Leadership

It would never have crossed my mind that I was expected to contribute anything to community leadership. The school board which had employed me did so because I was their rural mail carrier’s daughter, small, pretty, and reputed to be bright. I had been hired as teachers for the rural schools had been hired for a century. Just as Fuller describes the hiring process in the South, Prairie Hill school was controlled by the farmers in the district. They were competent people, but hardly educational professionals. They liked me because I read a lot, had won the high school oratorical contest, had my chalk pictures on display in the local general store, and had placed third in the state spelling bee. They didn’t inquire about my teaching philosophy or ask how I intended to keep order. Teaching methods? Women were teachers. What other method existed?

My contribution to the community was confined to arranging the school house for the monthly parent and neighbor meeting. Twice during the year, at the request of the school board president, the children contributed to the programs. They presented a very dramatic version of “A Visit from St. Nicholas” at the district Christmas party, in which our jolly St. Nick (an over-plump seventh grader named Elmer) came crashing down from his step ladder chimney as his faithful deer (two thoroughly intimidated fifth graders) dashed for safety. You could hardly do anything wrong at a country school Christmas party. Elmer bounced back with a hearty “Ho, Ho, Ho.” Everyone cheered and the play proceeded. While all the meetings were primarily social, county fair expenses, district and county elections, and school business such as new library books appeared on the agenda.

The farmers and farmers' wives in the district were warm and friendly. Like many other country teachers, I was talked “to” almost as much as I was talked “about.” I spent many a sociable hour in their homes involved in discussions of everything from current fashions and pickle recipes to the price of hog feed and politics.20

Conclusion

During my tenure at Prairie Hill School, little of Mabel Carney's inspiration for making the school a community center, and none of the farmer's former dissatisfaction with their children's education which had been displayed in the founding of the Smith-Lever Act of 1914, were evident.

Twentieth century critics of one-room school education may deny their effectiveness, but the children, comfortable in a non-threatening familiar environment, were often inspired and encouraged toward the first stirrings of ambition and intellectual achievement. If the teachers, like myself, lacked learning much beyond that of their students, they still brought an element of socialization to the country school children which was needed and desirable.

Rural school boards sought out teachers who were affordable and met their community standards. If the teachers' methods were not progressive, they transmitted the prevailing culture. The children moved from the rural school to gratify their parents' expectations, which might or might not coincide with the educator's ideal. These were conservative people. They expected the teacher to maintain order and teach the traditional curriculum. The young teacher was not there to change the family's expectations for the children or to alter the community mores, she was there as a member of their community. The current literature on country schools assures me that my experience was not different than that of most country teachers.

The country school has almost vanished. We have paid the price in community as we have adopted the reformers' policies for the professionalism of rural education.

Providing Excellence in Intercollegiate Athletics as a Preamble to Quality in Academic Program and Research

Joel Ray Nielsen
William H. Young
Northern Illinois University

For the past one hundred years intercollegiate athletics has served American colleges and universities in a variety of capacities. While being declared as an auxiliary enterprise in most institutions, it has been argued that intercollegiate athletics is an important component in the social education of all students. This social education fulfills one of the major areas of a higher education experience for the student. Today, intercollegiate athletics is also considered to be an integral component of the marketing mix in development strategies, affecting the outcome of quality ratings and rankings, and playing a major part within the political fabric of the organization dealing with constituents as well as external forces. Through these provisions intercollegiate athletics directly influences the institution's mission and direction.

Prominence in sports has oftentimes been equated in the minds of individuals with academic reputation and prestige. Garvin
writes that prestige (a reputation for excellence) is more important than actual institutional quality in the definition of the market to which an organization can appeal.¹ In an attempt to better understand the character of American colleges and universities, one must look beyond the regimented scholastic traditions and determine the importance and focus of intercollegiate athletics within the mission of the organization. The relationship, justified or unjustified, provides the foundation and direction of this writing.

Our interest in this topic began when reviewing the required textbooks for many history of higher education graduate courses offered through colleges and universities. Often times, the American College and University: A History by Rudolph appears in the listing. Among the chapter headings such as The “Colonial College,” “Financing Colleges,” and “The Education of Women,” and before the chapters of “Academic Man” and “The Organized Institution,” lies a chapter entitled “The Rise of Football.” This chapter is devoted to the effects that one particular sport had upon the development of American higher educational institutions. Sports have often been viewed as an important component in education; however, this point was truly emphasized when Rudolph identified the need to devote one of twenty-one chapters solely to this historical topic.²

The University of Chicago began formalized classroom instruction and football practice on the same day in 1892. President William Rainey Harper accepted a challenge to develop the ideal university. An important component in the organization of his mission was the need for money and prestige. His plan for gaining prestige included using the drawing card of sport. A successful sports program would lend evidence toward the University of

Chicago's ability to compete, academically and athletically, with the powerful schools of the Northeast. By luring to Chicago former Yale colleague Amos Alonzo Stagg, Harper brought with him one of the premier football coaches of the era and went a long way toward his objective of providing symbolic representation of institutional quality. Sport provided Harper the means of acquiring the resources necessary for institutional survival and growth. From this day forward, sport would play a significant role in the recruitment of superior students and financial supporters. By 1900, Chicago, along with Harvard, Columbia, Johns Hopkins, and California (Berkeley), accounted for 55 percent of all earned American doctorates. All of these institutions had placed considerable emphasis on their sport programs.

Dr. John Swain, an administrator at Indiana University, was hired in 1902 as president of Swarthmore College. He assumed a college which based its revenue on the students, and due to immense competition for the most successful student, Swain pursued strategies to make the college more attractive. He looked to develop and strengthen the idea of "life for fun" in the Quaker-based institution. The most significant directive within this concept was the implementation of major college football. Swarthmore provided one of the first examples of the marriage between the traditional college ideal and major college football for the sake of institutional recognition and survival.

While the crux of land grant university philosophy referred to, "... making education available to all of the people of the state, where the borders of the institution lie at the borders of the state, ..." it was quickly recognized that the most identifiable item or tool of the University of Wisconsin was not its outstanding

---

academic reputation, but the football team's fight song ("On Wisconsin"). Intercollegiate athletics was viewed as the one positive link with alumni and state inhabitants during both periods of prosperity and hardship. It allowed the establishment of statewide friendships, while providing a buffer to public sentiment. Many saw athletics as providing an alternate focus for university personnel; away from the ongoing internal, interdepartmental, and faculty situations of the era.\(^5\)

It became increasingly apparent that intercollegiate athletics provided a tangible indicator of institutional worth. As Veysey notes, to build a major university certain structures were necessary—a board of trustees, faculty of various rank, a president, departments organized by discipline, department heads, and an athletic stadium.\(^6\)

The importance of athletics was also seen at Southern Methodist University in Dallas, Texas. Hiram Abiff Boaz, SMU's second president, stated in 1920, "The spiritual atmosphere on the campus had been greatly improved, and since the faculty was doing most excellent work in the classroom it seemed to me that we ought to lay some emphasis on securing a winning football team." This philosophy became apparent when the university built Ownby Stadium (in promotion of the football program) thirteen years prior to building the institution's first library.\(^7\)

What is the relationship between former athletic excellence and the emergence of the modern research institution? It appears that a deliberate attempt has been made to use intercollegiate athletics as a vehicle to create an atmosphere where academic

---

\(^6\) L. Veysey, _The Emergence of the American University_ (Chicago: The University of Chicago Press, 1965), 340.

\(^7\) D. Whitford, _A Payroll to Meet_ (New York: McMillan, 1989), 75.
excellence may follow. Findings in recent literature echo this significant bond.

The University of Notre Dame is currently celebrating its 150th anniversary. With this recognized milestone, many articles are currently being produced. Recently, the Chicago Sun Times featured such an article. Immediately following the lead headline announcing the anniversary itself, the sub-headline read, “Old Notre Dame takes pride in academics, too.” This statement allows the reader to assume that another area of the institution may lay claim to the association which is responsible for the recognition, reputation, and prestige of the university.

Evidence dictates that the University of Notre Dame has made a concerted effort in its existence to capitalize on athletic successes to promote educational excellence. “Notre Dame without a comprehensive athletic program would seem to be almost a contradiction in terms. Without athletics, the university would not be the same as we have known it. The camaraderie of the various teams, not just football, contributes to the famed Notre Dame spirit,” states its own university-produced publication. Also, the development of a Catholic identification becomes a rallying point for creating what is viewed as the largest contingent of “subway alumni” in the nation—those people who take great pride and ownership in the university and its function while not having any detectable association through attending the university.

Notre Dame created and strengthened its graduate school during the years that famed coach Frank Leahy was concurrently stringing together national championship football teams. The reflection was seen academically as enrollments and professionals leaving with graduate degrees significantly increased.

---

Institutions such as the University of Akron have sought to become first-rank institutions through National Collegiate Athletic Association (NCAA) Division I-A membership. As President William Muse asserts, the hiring of former Notre Dame head football coach Gerry Faust has increased public exposure for the university. Such exposure is thought to improve student as well as faculty recruitment, enhance alumni donations, and increase student pride.\textsuperscript{10} Similarly, the State University of New York-Buffalo has sought to enhance its reputation with a gradual upgrading of its competitive stature to the Division I-A level.\textsuperscript{11} Recently, for the University of Akron and the State University of New York-Buffalo, enhanced institutional standing requires athletic competition at the highest levels.

Recently when Stanford University was considering eliminating a portion of its twenty-six athletic programs due to financial constraints, university officials undertook various compromises in order to maintain the current offering. Their reasoning was based on the ideology that the programs must remain available to remain competitive in the nationwide recruitment of the finest students to their institution.

In a public university’s desire to further advance the mission and direction of the institution, allocation of funding from legislative sources becomes a primary focus. Examination of the significance that successful programs have in relation to institutional funding continues to be discussed nationwide. Various examples exist in this area.

In 1870, the Massachusetts Agricultural College’s baseball victory over Harvard prompted a contemporary commentator to

submit that it “marked the agricultural school as a real college.” The chronicler of the incident noted that soon thereafter the legislature increased its appropriations accordingly. A reader of the history cannot escape the impression that the Legislature’s liberality was the result of the athletic accomplishment.¹²

Also, the Maryland State legislature was contemplating narrowing the University of Maryland’s discretion in fiscal matters due in part to the mediocrity of the football program. Much of the University’s autonomy in these affairs had been acquired two decades ago when the institution was a national football power. That may very well have been the case. One is left with the impression that the concern of the legislature was motivated by winless football at the University. Institutional control of federal dollars was placed under intense scrutiny surrounding this particular situation, so much as to prompt legislative action.¹³

In a special meeting called before the West Virginia University Board of Governors, M.M. Neely, then governor of West Virginia, stated that a change in the presidency at West Virginia University needed to be made, to put an emphasis on the mediocrity of the athletic program and lack of national recognition. He felt this mediocre direction in the athletic program contributed to the university’s unattractiveness to the students in the state of West Virginia.¹⁴ Intercollegiate athletics have probably never received such grandiose support as in Neely’s speech:

Duty, judgment, and conscience jointly warned me with trumpet voice that temporizing should end at once and reform should begin without delay. If you desire that the University may be lifted high above the Dead Sea level of inferiority in which visionless greed has long kept it, and that you join me in this

---

important fight for reform, and help render an inestimable service to all the average men and women of the state.\(^{15}\)

As the examples in the writing have thus far noted, intercollegiate athletics have played a significant role in the higher education setting. The association between successful athletic programs and excellence in acquiring the finest students to campus need further examination.

Goode defines prestige as "the esteem, respect or approval that is granted by an individual or a collectivity for performances or qualities they consider above average."\(^{16}\) It is paramount that an institution takes guard over the quality of its perceived image. A reputation for integrity and morality are vital, however the effects of a winner in athletics may be perceived very highly by those people the institution contacts. Prestige and reputation may very well attract a larger pool of prospective students to the university. This additional number of applicants allows the admissions officials to select the finest students for possible entrance to the university.

In Chu and Solomon's study, application rates at NCAA institutions which had won conference championships were compared to those institutions that had not won conference titles in either football or basketball. Findings revealed that significant differences existed in the number of freshman applications (1981-1985) between championship and non-championship schools. Depending on the conference studied, the average increase in new freshman applications for this period was at least doubled for conference champions. For example, whereas Big Ten Conference schools that did not win a conference championships in either football or basketball saw an average increase of 376 applications for each

---

\(^{15}\) J. Douglas Machesney, "The Evolution of Statewide Governance of Higher Education in West Virginia" (Ph.D. diss., West Virginia University Archives, 1971).

year in the period 1981 through 1985, schools having won a championship in either sport saw their applications rise an average of 730. These findings remain very suggestive.  

For most institutions, athletics serves as vivid evidence of the willingness and ability of the school to develop excellence in an identifiable field. This may lead to a psychological effect being placed upon the students in a variety of ways. Oftentimes, athletics provides a model for success, which when viewed individually, may affect the molding of individuals' values, personalities, and self concepts toward the qualities and benefits rendered by the university. This concept is nurtured by universities such as Notre Dame and Stanford.

Athletic success appears to be a means for an institution to acquire "status." It may even be used as a vehicle to create an atmosphere among the public at large about the overall quality of the institution and its graduates.

In today's higher education climate, the scarcity of funds is rapidly increasing. Intercollegiate athletics, although commonly a financial drain upon the fiscal component of the university, may promote the overall survivability of the institution because of the fact that sport has become an integral part of the image, reputation, and prestige associated with higher education.

Throughout history, private institutions of higher education have successfully developed their athletic programs into national prominence. The prominence or prestige is then used to cultivate and solicit the most distinguished faculty to campus, which in turn, attracts the most gifted students. Also, this prestige allows the university to gain enormous endowments to provide financial stability. Once these areas have been successfully addressed, a large  

number of private institutions have tended to de-emphasize or possibly abandon their athletic programs.

A study conducted by Springer, examined the make-up of senior colleges that have discontinued football. A total of 151 colleges were identified as either discontinuing their programs or de-emphasizing by reducing funding and classification. Of this group, a strikingly small number (ten) were public supported institutions.\(^{18}\)

There were a variety of reasons for the small number of public institutions on the list (five of the ten have since reinstated football). Among the reasons offered was the fact that state legislators are freer with taxpayer money than private donors are with theirs, and the fact that there are few state schools with huge financial deficits in football. However, the reason encountered most in the survey was that the tuition component of athletic scholarships were waived by almost every state (all but two in the study). Thus, since the primary reason for the discontinuance of football was the financial constraints on the university, a tuition waiver prevented discontinuation in part because it made the cost at publicly supported colleges look considerably less than it does at private ones.\(^{19}\)

Public higher educational institutions that achieve intercollegiate athletic success seem to maintain the level of athletic prominence for the continuance of academic reputation. This is in evidence since, until very recently, benefactors did not give significant endowments to public higher education. It will be interesting to follow the emphasis, positive or negative, placed upon the intercollegiate athletic programs once public higher educational institutions saturate their financial coffers.

\(^{19}\)Ibid., 419.
University leadership, although not possessing the power and influence it once retained, must distinguish the relationship between their particular institutional mission and the role of the intercollegiate athletic program. While curriculum and instruction is the driving force of any higher educational institution, it remains almost unnoticed in the perception of society. Leadership must recognize the visibility and symbolic importance inherited by their athletic programs. Once a relationship is identified and agreed upon, proper instruments and vehicles must be put into place to implement such an objective. For, as evidenced through the examples in this writing, intercollegiate athletics has played, and continues to play, a significant role in the development and character of the American higher educational system.

Former President of Yale and Commissioner of Major League Baseball, the late A. Bartlett Giammatti stated, “If education is intended to show us not only how we have gotten here and what we now are but also what we can be, then intercollegiate sport—in some form—perhaps does belong as part of higher education in America.”

In response to the findings and examples presented here, further examination into this topic will continue. As shown, in many cases the data will show quality in intercollegiate athletics occurred previous to the rise and reputational index of the institution.

The Era of Republican Motherhood: A Formative Period in the History of American Women’s Education

John L. Rury
DePaul University

The period extending from the American Revolution to the Civil War was one of tremendous change in the lives of American women. Changes in the political structure and a series of gradual shifts in the economy helped to define a new set of female roles. The question of women’s education lay at the center of this process. In recent years a new picture of the development of women’s education in the United States has emerged from the work of historians, most of them working in the field of women’s history. In this essay, I will identify major themes in this gradual but nevertheless dramatic turn of events, drawing on much of the scholarship which has informed our new understanding of women’s experience in these years. While other scholars have focused on one factor or another in this process, my purpose is one of demonstrating how the various elements of this large scale transformation may have fit together. This is an exercise in synthetic reasoning and integration, but it can be a potentially critical step in helping to develop a new interpretation of how women’s education developed in the United States.
There are certain themes in this process, of course, which now are well known. The Revolutionary War established a new political ideology: Republicanism, or the notion that government ought to be popularly elected. This meant that all males, as potential voters, needed to be trained in citizenship and principles of proper moral conduct. Republicanism, after all, would only work if the electorate were educated for its new duties. And the responsibility for this task fell to the nation's women. Of course, this meant that women themselves must be educated. As Linda Kerber, Mary Beth Norton and other historians have shown, in a sharp break with the prevailing custom of the colonial era, the years immediately following the American Revolution were marked by a veritable clamor for improved women's education.1

There are other dimensions of the process which are less well known, however. The Revolution and the political turmoil it occasioned served as an opening wedge for the development of schools for women. While women played no formal role in the new Republican political order, they were assigned a very important informal role. They were to serve as the moral guardians of American civilization, and to transmit its essential values from one generation to the next. Mothers were responsible for educating their sons, as well as their daughters, and even for helping maintain the moral integrity of their husbands. This meant that women too had to cultivate their minds. A generation of reformers in women's education agitated throughout the first half of the nineteenth century, criticizing the underdeveloped state of female schooling and defining new roles for educated women. During this period there also

---

appeared the nation's first generation of women authors. Writing for a largely female audience, these women helped establish an idealized domestic role for middle class white women which excluded them from most commercial enterprise. The principal social role educated women were allowed, and encouraged, to assume outside of the home was an extension of their domestic duties: as teachers, particularly of small children. With few notable exceptions, women's new roles were restricted to those associated with their highly regarded moral and nurturing capacities.

The period extending from the Revolution to the Civil War, in that case, was marked by a remarkable transformation of the social and economic roles women had played in colonial society. The shift from household production to a more highly commercial and industrial economy was associated with new restrictions in women's economic roles. The ideal of Republican Motherhood held that women should not work, but should reserve their energies for their families. This meant that women could be educated, but only for a narrow range of domestic and nurturing responsibilities. The early nineteenth century witnessed the appearance of the nation's first large class of educated women, but their activities were defined carefully. Nevertheless, this early movement to see women schooled in a manner parallel to men was a foundation upon which other, more radical developments in women's education would begin to take shape.

The Revolution and Women's Education

The transformation of women's education in the United States was associated with a range of larger social and economic forces. Perhaps the most important of these was the general intellectual and political context of the Enlightenment. Representing a new middle class or bourgeois perspective, writers extending from John Locke to Jean Jacque Rousseau challenged the feudal proposition
that social position, political rights, or even sensibilities were natural concomitants of birth. Instead, they argued that men (and, by implication, people) were born with equal status and, generally speaking, equal abilities. What distinguished social groups, in this view, was a series of arbitrary social and political conventions which were oppressive and economically backward. Enlightenment writers called for an end to monarchical rule, and celebrated the ideas of universal manhood suffrage and mercantilism.

The Enlightenment aided the promulgation of an ideology of generalized equality, and helped spark revolutions in North America and in France. In the eyes of many, it also discredited the prevailing theories of innate inferiority. In the latter eighteenth century, especially, there was widespread speculation on the intellectual equality of different radical and ethnic groups. John Locke's notion of the infant mind as a "tabula rasa" (or blank slate) and the French writers' theory of "natural rights," whatever the qualifications associated with such concepts, pointed to the conclusion that people everywhere were essentially similar. Given this, it was a short step to the conclusion that women were possessed of the same intellectual capacities as men.  

In British North America the American Revolution was the catalyst that popularized Enlightenment ideas of political and social equality. The war was fought over issues of political representation and popular rule, and popular sentiments were enjoined by Thomas Paine and dozens of other pamphleteers assailing the ideas of inherited status and inborn distinctions separating social classes. So great was the ideological turmoil over these questions, that petitions for the abolition of slavery were entertained in state legislatures, along with proposals to extend citizenship to American Indians. Such suggestions were not immediately successful, but

---

reflect the extent to which the Revolutionary epoch was characterized by a new view of human differences. Not least among these was the development of a different manner of thinking about women.

The Revolutionary War was also associated with considerable social and economic upheaval. Thousands of men left their homes to fight for one side or the other, leaving their families—and in many cases their wives—to fend for themselves. As the British and American armies moved across the colonies, families supporting either side were pressed into service or subjected to punitive harassment depending upon the situation of the war and their terms of involvement. These circumstances posed new demands for women. Many were required to manage business and supervise estates in the absence of their husbands. Because the war often involved them directly, colonial women also were forced to develop a political understanding of the major issues in the conflict. Many became "perfect statesmen," in the words of one, and as Abigail Adams, developed their ideas quite independently of their husbands. The result of these factors taken together was a new independence on the part of some American women, and determination to exercise the principles of equality expressed in the Revolutionary ideology. Although little is known about the extent of such sentiment, it probably found it clearest (and fullest) expression in the movement for improved women's education.

In 1791, Mary Wollstonecraft published her influential treatise "Vindication of the Rights of Woman," declaring women to be the intellectual and political equals of men. Though Wollstonecraft was sharply repudiated in England (especially after her untimely death), and certainly did not spark a feminist response in North America,

---

4 This is discussed in considerable detail in Norton, Liberty's Daughters, part II.
her work was widely influential. It represented a culmination of nearly a century of discussion about social and political equality which had largely excluded women. In the closing decade of the eighteenth century, after the experience of revolutions in North America and on the continent, and at a highpoint of egalitarian sentiments, women were prepared for a change. Many of them wanted to learn about the world, to study history, to discuss politics and religion, and even to become involved in public affairs. “Do not forget the Ladies,” Abigail Adams wrote her husband John during his deliberations on the new government for British North America. Of course, John Adams and the other men who framed the United States Constitution excluded women from direct political participation. But the very form of republican political life, popularly elected government, demanded a new social and educational role for women. And that meant that they too needed education.\(^5\)

The years immediately following the Revolution witnessed the establishment of schools and academies for women throughout the Northern states. The most famous of these was The Philadelphia Female Academy, promoted by Benjamin Franklin and Benjamin Rush. But there were dozens of others as well. What distinguished these schools from the “Dame” schools and vanity schools of the colonial period was their concern with giving women an education fundamentally equivalent to that of young men, short of actual collegiate studies. This meant studying history, literature, and the sciences, as well as reading the Bible and studying moral philosophy. These were serious academic pursuits and were designed to equip young women to serve as “Republican Mothers”—to rear sons ready to participate in the political life of the nation. Women’s education became a popular topic of discussion and the subject of

a flurry of books, pamphlets, and magazine articles. This was the response of the nation's leaders to Abigail Adams' advice: Women would exercise influence through their domestic ties, from their power of "heart." Viewed in retrospect, it seems a small concession, especially given the important political and social changes associated with the revolutionary period and women's wartime roles. But it did irrevocably establish women's education as a vital dimension of the new social order. This was a reform upon which later generations of women could build their own conception of equal rights.6

Education and Religion

A second major influence on the development of women's education in the years between the Revolution and the Civil War was religion. The nineteenth century was marked by the development of the Second Great Awakening, a religious revival of national scope extending from 1810 to 1840. In part a reaction to the secular humanism of the Enlightenment era, the Second Great Awakening (the First had occurred about a century earlier) was marked by the willingness of evangelical leaders to permit female participation in public exercises. This was an important development, for it encouraged women to practice religion in ways that had not been open to them earlier. While women still could not be ministers, they could proselytize others (particularly other women), to go to church and join the revival. Since public roles for women remained sharply circumscribed, most such activity took place in informal meetings of women. The extent of these activities is difficult to document, but

6Kerber, Women of the Republic, chs. 7, 8; Kendall, Origins of Modern Feminism, ch. 2.
women's historians have suggested that a wide network of female correspondence bound women together in this period. The Awakening gave women reason to anguish over one another's salvation, and to urge moral reformation. This in itself probably helped promote greater attention to education, and it almost certainly contributed to a distinctive female culture and feminine identity during this period.7

The context of religious revivalism also gave rise to the development of female voluntary associations. Insofar as the Great Awakening urged women to lend a hand in spreading the gospel, women were encouraged to assist the cause in novel ways. In the second and third decades of the century small groups of purposeful women began to appear in communities across the Northeast. Although there was some variation in the class and ethnic composition of these organizations, most were comprised of young, unmarried middle class women from Protestant (generally New England) backgrounds. And the overwhelming majority were quite small, generally counting no more than a few dozen members at any time. The women in these associations devoted themselves to any number of causes related to the spread of Protestant influence and humanitarian improvement. In many cases their activities revolved around raising money to support one or another cause; missionary work, collegiate training for local ministerial candidates, the education of local poor children and similar objects occupied their attention. In addition they also conducted self-improvement exercises among themselves, reading and discussing literary

works, entertaining speakers, and occasionally even sponsoring (or co-sponsoring) public exhibitions. The effect of all this was to give young women access to public affairs in a manner never before possible. They could develop critical organizational and public speaking skills to an extent unimagined by earlier generations of women. Many of these groups maintained small libraries, and encouraged members to read widely and to follow the latest trends in literature and criticism. They helped to define a female culture of learning that extended beyond formal schooling and into the everyday lives of young, single women. This was a variety of female education, moreover, that women themselves controlled. The activities of these groups formed the basis upon which a century of female voluntary reform agitation was established.8

The Second Great Awakening, in that case, had a big, although indirect, effect upon women's education. By encouraging women to participate actively in religious and humanistic reform affairs, the revival opened a new world to them. These activities, of course, made a proper education all the more imperative for young women. And it is possible, on the other hand, that the Awakening itself was in part a consequence of women searching for a way to employ their knowledge and abilities. Whatever its causes, however, the religious enthusiasm that swept the country in the opening decades of the nineteenth century helped to dramatically alter the lives of women—widening both their field of activity and their education.9

---

8 See the discussion of these societies in Mary Ryan, Cradle of the Middle Class: The Family in Oneida County, New York, 1790-1865 (New York: Cambridge University Press, 1981), ch. 3.
9 The best brief overview of this is provided in Kendall, Origins of Modern Feminism, ch. 3.
Women and Educational Reform

A third influence on the development of women’s education in this period was the appearance of a generalized reform movement focusing upon the issue of universal education. Although related to the Great Awakening and the reform impulse it initiated, the educational reform movement was more broadly secular and humanitarian in orientation. In regard to women’s education, the impact of this reform movement preceded the clamor for improved schooling associated with the Common School Movement. But the impulse behind the effort to improve women’s education was similar to the spirit that informed the Common School campaign. In both instances the aim was to make schooling more rigorous and effective, to increase its moral value, and to professionalize the teaching corps. In both cases education was seen as the keystone to a host of other reforms. And in each instance improved schooling was deemed vital to the continued health of the Republic. In many respects the campaign to establish a better education for women, however small, was a precursor to the educational enthusiasm which swept the country in the 1840’s and fifties. Indeed, without a movement to see women better educated, it is doubtful that the Common School agitation would have been as successful as it was.  

The nineteenth century movement for improved women’s education is usually dated from 1821 and the establishment of Emma Willard’s Troy Female Seminary in Troy, New York. The equivalent of a male academy, which was a widely popular institution of secondary schooling, Willard’s Troy Seminary was distinc-

---

tive on several counts. First, because of its relatively generous initial endowment, the Troy Female Seminary could charge low tuition rates, permitting young women from middle and even lower class backgrounds to attend. Secondly, Emma Willard's academy had a purpose: training Republican mothers and, most especially, teachers. This attached a new vocational end to women's education that simultaneously gave it moral purpose and a measure of financial return, however meager. Finally, the Troy Female Seminary was managed and staffed by women. This was a distinguishing feature of the schools established by women educational reformers in this period. Catharine Beecher and Mary Lyon also became well known women educators after establishing schools in the 1820's and thirties. At the same time that these women sought to make female education serve their existing social roles more perfectly, they also sought to establish new roles for women in the changing social and political order. By no means radicals, women educators in this period aimed both to preserve the existing social and political order while they augmented the power of women. In establishing her academy in Troy, Emma Willard marked a trail that many others would follow.\textsuperscript{11}

The 1830's and forties witnessed the establishment of dozens of other women's academies in the Northeast. To a large extent this movement was part of a general wave of school foundings which has led to this period being described as the "Age of the Academy." But the women's schools were distinctive in their mission to prepare female students for new tasks. The most important of these was homemaking. Catharine Beecher, probably the best known female educator of her age, established her reputation with the publication in 1843 of her \textit{Treatise on Domestic Economy}, which demonstrated

\begin{footnotesize}
\textsuperscript{11} Emma Willard's career, and the role of women educators at this time, is described in Anne Firor Scott, "What, Then, Is the American: This New Woman?" \textit{Journal of American History} 65 (December 1978): 679-703.
\end{footnotesize}
how middle class households could be most effectively run. In Beecher's view, and those of other women educators, a woman's most essential purpose was to serve her husband and children. By keeping a clean, warm house, preparing the best possible meals, and carefully monitoring their health, she believed that mothers guaranteed the physical well-being of American families. Furthermore, by keeping a busy schedule, maintaining frugality in their everyday accounts, and efficiently organizing their activities, American mothers taught their families (particularly their sons) important values. Through their own management of household affairs, women could transmit a sound sense of discipline, a calculated penuriousness, and a deeply rooted respect for order and authority to their children. Of course, if they were adequately educated as well, women could also teach their children how to read, to appreciate history and literature, and perhaps even to master the account book. Catharine Beecher and her associates promoted women's education because they believed it to be a foundation stone upon which future generations of middle class Americans would be built. More than a decade prior to the success of the common school campaign, women reformers conceived of education as a critical element in the continued health of American civilization.12

The other purpose of women's academies, of course, was to train women to become teachers. Again, Catharine Beecher was a leading advocate of women becoming teachers. This was in no way inconsistent with the idea that women were to serve primarily as wives and mothers. Teaching was a task for young women in the years before they married. And it was a vocation that, in the eyes of female reformers in this period, called for essentially the same qualities as motherhood: a nurturing instinct toward children (especially younger ones), efficiency in organization, and the ability to

maintain order. Teaching itself, in that case, became a part of the preparation to be an effective mother for many middle-class (and even lower class) women. A period of duty in a district school or two was often taken as evidence that a young single woman knew how to manage children and (by implication) household affairs quite capably. In this regard teaching, and the variable period of formal education that necessarily preceded it, may have supplanted the colonial domestic apprenticeship as a rite of passage for certain groups of women in the nineteenth century. The growth of the female teaching force will be considered in detail in another section below, but by the 1850's most middle class women in Massachusetts probably had worked for some period of their lives as teachers. This was, no doubt, partly a result of the reform campaigns then changing public education. But the movement of women into the teaching force in large numbers signaled an important change in female social roles. For the first time in American history women were given responsibility for an occupation outside the home which called for them to use formal education.13

The employment of women as teachers, of course, required the new vision of domesticity shaping women's lives resulted in near-universal female literacy (at least in Northern states) and encouraged academic achievement—within certain limits—for women. One reflection of this was the proliferation of academies run by women in this period. Another was the rising levels of female literacy recorded in the Federal censuses by mid-century. The meaning of these statistics is hard to determine, but high levels of female literacy, reaching parity with male literacy in the Northeast

by 1850, was probably associated with generally universal female participation in popular education. This meant that across the Middle Atlantic and New England states between the Revolution and the second or third decade of the nineteenth century women began to attend the district and town "common" school in large numbers. Indeed, most educational historians agree that by mid-century girls were attending school at the primary (or pre-secondary) levels in numbers generally the same as boys, and as David Tyack and Elisabeth Hansot have pointed out, the vast majority of them in coeducational settings.14

This was another important change from the colonial pattern of women's education. Whereas girls were excluded from schooling virtually altogether during much of the seventeenth and eighteenth centuries, by 1850 they attended primary schools at about the same rate as males. This was a revolutionary development, and underlay the rise of the female academies at this time. Yet it was accomplished without much controversy or fanfare. Because women were assigned a critical educational role in the home in the new republican social and political order, most people (and particularly most men) apparently believed that their education was a virtue rather than a potential threat. As long as women's education was restricted to the district or common school, and perhaps in some cases to an academy, it was seen as complementary to their domestic roles. The common school, after all, was not a college, and did not generally prepare young people for roles of real leadership in society.15

15 Ibid., ch. 3; Kaestle, Pillars of the Republic, chs. 4, 5.
Informal Education

In this period women's education also took place outside of the schoolroom. Continuing a practice widely observed in colonial times, young women continued to contract themselves out as apprentice housekeepers well into the first half of the nineteenth century. But this practice seems to have declined with each succeeding decade. By mid-century it was unusual, as the use of paid servants became ubiquitous and immigrant women flooded the domestic labor market. Domestic work gradually ceased to be a matter of women's training with lengthy contracts and instead became a form of casual labor, with women switching employers according to the changing circumstances of their lives.\(^\text{16}\)

The function of the domestic contract or apprenticeship, however, was fulfilled in part by a new manner of preparing women for their roles as wives and mothers. Between 1820 and 1860 a large number of women writers appeared on the American scene, publishing novels, short stories, and essays in a variety of forums. These "scribbling women" (to use Nathaniel Hawthorne's term for them) wrote for a largely female audience and featured domestic themes in their work. They glorified the role of the mother in family life, depicting it invariably as the very pinnacle of female accomplishment and satisfaction. These stories served as counsel, and warnings, to young women who contemplated making a career outside the home: a woman's place was by her hearth and caring for her husband and children. Women who did not heed that advice invariably suffered tragic circumstances until they saw the light.\(^\text{17}\)

\(^{16}\) On the use of contracts, with educational stipulations, in the colonial period, see John Rury, "Imagining Gender in Educational History: Themes from the Lives of Colonial Women," Educational Foundations 2 (Summer 1988): 53-56; on the transformation and development of domestic service in the nineteenth century, see David Katzman, Seven Days a Week: Women and Domestic Service in Industrializing America (Urbana: University of Illinois Press, 1981), ch. 2.
Of course women writers also concerned themselves with the technical side of housekeeping as well. In 1843 Catharine Beecher published her household manual, *A Treatise on Domestic Science*, and it immediately became a best seller. Several similar books appeared across the next two decades, as reformers worried that young women were not getting enough training in household responsibilities. The women who read these volumes learned both about technical aspects of good housekeeping, but they also were told that domestic work was a sacred responsibility for all women to fulfill.\(^{18}\)

Thousands of women read such books in the nineteenth century, and if most did not fulfill their household duties perfectly, at least they had a clear model to which to aspire. Women's magazines also proliferated at this time, the most successful and best known being *Godey's Ladies' Book*, and emphasized the same themes. One historian has referred to the battery of ideas represented in the female literature of this time as a "cult of true Womanhood." As such it was a conservative force, sharply restricting female roles to a domestic norm. But it may also have been essential to preparing women for the carefully defined domestic role most of them would play in nineteenth century society.\(^{19}\)

\(^{17}\) See the excellent and thorough discussion of these women writers and their work in Mary Kelly, *Private Woman, Public Stage: Literary Domesticity in Nineteenth Century America* (New York: Oxford University Press, 1984), passim.
\(^{18}\) Ibid., ch. 9.
Towards a Conclusion: Education and Women’s Rights

Women’s education underwent a dramatic set of changes between the Revolution and Civil War, and helped prepare women for a new set of roles in American society. The Republican ideology of the Revolution held that women had a vital task to perform in the education and political socialization of their children, particularly their sons. With the advent of elected government, all families were to become atomized educational agencies, with women—and their domestic duties—at the center. In order to perform this role, of course, women needed to be educated, and it appears that they enrolled in district and otherwise “common” schools in rising numbers across the early nineteenth century. As regarded this elementary level of education, women were as well schooled as men by the time of the Civil War.\(^20\)

Largely concentrated in the North, the mass literacy afforded by ubiquitous female elementary education became the basis for a distinctive female literature in this period. Women writers succeeded partly because women could—and would—read their work. Similarly, the female academies relied upon the common schools to send them young women who could read, write, and perhaps calculate a little. The growing numbers of female academy graduates, educated, middle class women, became in turn an important source of skilled teachers to staff the schools of the Common School Reform era. No doubt they also contributed much in the way of informal education as well, in church and community groups, their own female societies, and most of all in their own families. The education of women, initiated by the Revolution, was associated with a wide range of changes in women’s lives and status. Although

\(^20\)Tyack and Hansot, Learning Together, chs. 3, 4:
still largely restricted to the "Domestic Sphere," nineteenth century women were entitled to a full view of the world and an important role in the transmission of fundamental values.21

Beyond the conservative domestic character of women's education in this period, there was the issue of feminism. The rise of advanced levels of education for women, and the recognition of their ability to comprehend and act on intellectual matters, provided a window of opportunity through which some women could become involved in reform politics. In the ante-bellum period women became interested in a variety of political issues, but the most important undoubtedly was Abolitionism. It was a short step, after all, from the "natural" female propensity to nurture and care for others to a humanitarian sentiment of support for slaves and free blacks. Women became active in the Abolitionist movement by utilizing their literary skills, composing and circulating petitions against slavery. Hundreds of thousands of names were collected on such documents, most of them women's, before they were submitted to Congress. The Abolitionist movement itself, of course, provided some women with a practical education in political affairs. Although thousands of women became active supporters of Abolitionism, most male Abolitionist leaders refused to allow women to assume leadership roles in the movement. Citing Biblical proscriptions against female political activism, male Abolitionists denied a group of American women admittance to the World Abolitionist Convention in 1845. It was this incident that led eventually to a convention for Women's Rights at Seneca Falls, New York in 1848.22

22 Catherine Clinton, The Other Civil War: American Women in the Nineteenth Century (New York: Hill and Wang, 1984), chs. 4, 5; for an influential early essay,
There is little direct evidence that the new developments in women's education in the Post-Revolutionary period were associated with the appearance of the nation's first women's rights movement. The general thrust of most women's education in this period, after all, was quite conservative. Catharine Beecher, Mary Lyon, and other respected women educators believed that women belonged in their homes, caring for their husbands and children, and not on a speaker's platform. Beecher even engaged in a lively exchange of letters with Angela Grimke, one of the period's most vociferous women activists, and denounced the principle of female involvement in political affairs. This advice notwithstanding, however, it is also clear that most of the women who occupied roles of leadership in the Abolitionist and Women's Rights movements had benefitted from sound educational experiences. Unlike their counterparts a century earlier, women in the mid 1800's could read and write easily, they could draft pamphlets and manifestos, they could manage organizational affairs, and many were effective public speakers. The development of women's education had helped to prepare a generation of women to challenge the patriarchal oppression that delimited their lives. Without the critical skills, not to mention the historical and social perspective that women gained in schools and academies, justified in conservative terms, the modern Women's Rights movement probably would not have developed as it did in the mid-nineteenth century. And although women's rights remained popular only within a select strata of educated women for much of the next fifty years, it became an educational force itself—contributing to a variety of forces which would continue to transform women's education well into the twentieth century.23

23 For an account of the feud between Grimke and Beecher, and the general difficulties of female activism in the mid nineteenth century, see Gerda Lerner,
The Scott Twins Go To School, 1903-1911

James M. Wallace
Lewis and Clark College

"It is perhaps possible to discern . . . some essential elements that might inform attempts to synthesize the history of teaching: a primary focus on the teachers themselves that seeks to explain their motivations and daily work; a combination of a broad demographic view of the teacher population with the cultural constructions of meaning provided by the life histories of the teachers themselves . . . and an attempt to illuminate the neglected center of the teaching process, instruction, probing both constancy and change in ways of teaching."2

1 This article is something of a challenge to the author's historical objectivity, since he is writing about his mother and her twin sister, Ethel and Edith Scott. Drafts of chapters of a projected book about the twins have been presented at meetings of the International Society for Educational Biography and the Midwest History of Education Society. Another will be given at the meeting of the American Educational Research Association in spring, 1992. The author thanks Mary Guenther, Christine Tau, and Charles Stones for their helpful suggestions on a draft of this article.

In September, 1903, the Scott Twins, Edith and Ethel, began their formal education at the Pickering School in Wolfeboro, New Hampshire. The youngest children in a family of five girls and one boy, they were not permitted to begin school until they were eight years old, because their parents had let an older sister, Beatrice, start school early, and had decided that the experience had not been good for her. The twins walked the three blocks to school, entered the building, and were directed to a combined first and second grade room. The Pickering School was a venerable three-story structure, constructed in 1820 of old-growth pine, with hand-hewn timbers, hand-doweled together. The school had four teachers, each in charge of two grades, with as many as forty students in a room.

In their old age, neither twin could recall details about the first two grades, but Edith, at the age of 95, wrote that “we loved going for we had been kept home for a year.” Both, however, had vivid memories of the next two years. The teacher in grades three and four was Maude Cate, a good friend of the twins’ mother. Ethel recalled that Miss Cate “was an excellent teacher.” She began each day with Bible lessons, and had students memorize some of the Psalms as well as poems like Longfellow’s “Paul Revere’s Ride” and “The Village Blacksmith. . . . She also took us on walking trips to the grist mill and the dam and the lumber plant at Wolfeboro Falls.

---

4 Ethel’s notes for 13 December 1910 and 5 June 1911 from her 1910-11 diary said that there were about 162 students in the Pickering School, and that her eighth-grade class had 20 students, 10 boys and 10 girls. Ethel’s 1910 and 1911 diaries are now missing; however, in her old age, she took 26 pages of notes from the diaries. All diaries, notes, letters, and interviews referred to are in the possession of the author.
5 The quotation from Edith Scott Tinker was written on an early draft of this article in April 1991.
about a mile from the school] and we'd study nature as we walked. She told us about rocks and trees and all kinds of plants.”

Miss Cate wore ankle-length dresses and high-button shoes and walked slowly, with a bad limp. Edith recalled that “she used to stand on a chair, pull up her skirt and show us that one leg was shorter than the other... People said that she walked like a ship in distress.” Miss Cate was concerned about the physical health of her students and had them do calisthenics, standing by their desks and imitating her movements.

After two years with Miss Cate, the twins moved on to a big double room where Alice Given, the daughter of the Baptist minister at Wolfeboro Falls, was the fifth and sixth grade teacher. Ethel described her as “very kind and a very good disciplinarian.” The children all sat in pairs in double seats and carried on the usual activities of memorization, recitation, quizzes, and notebook-keeping. Ethel saved occasional examples of her schoolwork. For Thanksgiving of her fifth-grade year she wrote out a program for a presentation put on by the students. On the cover she drew a Pilgrim man carrying a Bible; the program itself lists fourteen activities, including a Thanksgiving proclamation, songs, a recitation on “The First Thanksgiving,” and the Doxology.

The twins made little illustrated booklets for other holidays and kept notebooks with quotations such as “good deeds are ever bearing fruits.” They learned the rules of punctuation and capitalization (God and the Bible were prominent in the sample sentences), wrote out musical notations for songs, and copied poetry dealing with patriotic and nature themes, love of mother, and other topics.

---

6 From a taped discussion between Ethel Scott Wallace and her husband, Clayton Morey Wallace, during the winter of 1980-1981. Ethel was 84 years old at the time. Unless otherwise noted, material in this article comes from this discussion.

7 Interview with Edith Scott Tinker and her daughter, Janet Tinker Lewis, 1 May 1991.
When the twins were in the sixth grade, Miss Given took advantage of the election of 1908 to teach some political lessons. Just before the election she required the students to memorize—and quizzed them on—all the presidential candidates, including those of the Prohibitionist, Populist, Independent, and Socialist parties. Students learned the procedures which a local voter would follow in the polling place, as well as the names of local officials who handled the balloting. After Taft’s election Ethel wrote in her notebook the following bit of doggerel: “Who are we? Come and see./We elected Billy T./Way from Boston safe and sound./Lodge was glad to see us round./Down with Hibbard, ditto graft./Give us men like Billy Taft.”

The students learned the states and capitals of New England, studied formal grammar, answered historical questions (“What Viking with a turned-down collar/Fights trusts and grafts and tainted dollar?” The answer: Theodore Roosevelt). They memorized inspirational poems (“Count that day lost whose low descending sun/Views from thy hand no worthy action done.”) and wrote out Whittier’s poem, “School Days.” They studied American history in detail; Ethel wrote five pages on the battles of the Civil War.

Ethel saved two handwriting books from the fifth and sixth grades. Each page of the books has a small line drawing of a famous person with a quotation and spaces for students to copy the script. Book five included British and American authors (including two women—Louisa May Alcott and George Eliot). Book six featured American presidents and statesmen and ended with this message to pupils:

By reading the lives of the great men pictured in the copies of this book, you will learn much that will be a help to you in choosing and following out your own vocation. Remember that a good movement handwriting will be of great value to you. James A. Garfield was a good penman and taught a writing-school to help pay his expenses while at college. When you have finished the year’s work in this book you should keep it
for future examination and comparison. When you are old it will
be a pleasant reminder to you of your school-days.8

Ethel faithfully reproduced the neat handwriting in the books,
starting with "A loving heart is the truest wisdom" (Dickens) and
ending with a related message: "Let not the foundation of our hope
rest upon man's wisdom" (Franklin Pierce).

Ethel kept a diary from 1 January 1909, when the twins were
in the sixth grade with Miss Given, through 31 December 1909,
when they were in Miss Fox's seventh grade.9 A few quotations
from the diary will give some impressions of what this young girl
considered memorable in her schooling. (Her occasionally creative
spelling and grammar have been preserved.)

February 2: "Miss Given feruled Edgar Low. It was the first
time I ever saw anyone feruled."10 February 15: "Today we had a
Valentine's party at school. Edith and I each got eleven valentines."
March 8: "We had an arithmetic test this morning. We staid in at
recess to finish ours." March 12: "Today is the last day of school for
two weeks. . . . We played managerie. We each had a half a stick
of gum. Then we had a slip of paper with a number on it and the
name of some animal then we had to make the animal out of the
gum. Then we put the animal down on the table and Miss Given
put the number on the board and if we guessed the animal we put
it on the board." May 28: "We had Memorial Exercises up in Miss
Hutchin's room. Miriam, Edith, Dorothy and I sang a two part song.
Miss Holt's and Miss Cate's room came up." June 8: "Had three
Exams today . . . in Arithmetic, Language, and Geography."

8 The Whitehouse Educational System and Natural Movement Method of Practical
Writing, 5 and 6, Parts Two (New York: Silver Burdett, 1905); the quotation is from
Book VI, p. 38).
9 The diary cover says Physician's Daily Memorandum for 1908, but Ethel did not
use the diary until 1909.
10 To "ferule" means to spank, usually with a stick or ruler.
The twins' teacher in the seventh and eighth grades was Miss Alice Fox, who was also the principal. In the seventh grade their report cards showed that they took a sizable array of courses: Reading, Writing, Spelling, Language, Grammar, Arithmetic, Geography, History, Physiology, Drawing, and Music. They received separate grades in each subject, as well as for Effort and Deportment. Parents were kept well informed about student progress, since cards were sent home ten times during the year. The back of the card had a printed note from the superintendent, which concluded: "Visit the school, consult the teacher and encourage the child." The twins presented their cards to their parents, and their father, the town doctor, usually signed them.

Miss Fox emphasized neatness and the attractive presentation of material in all subjects. Students made illustrated booklets at the end of each month, and included in them quizzes, spelling lists, Bible quotations, health vocabulary, lists of antonyms, geography terms, grammar exercises, short compositions, and carefully-drawn maps of various countries. Students learned to write music on printed staffs, and wrote out the music to "The Flag" and their graduation song (with seven sharps!). They kept notebooks with poetry ("We Hail the Flag"), physiology information, grammatical definitions, and the answers to "Search Questions." They kept two separate notebooks for American History, beginning with the founding of Jamestown and going, in great detail, through the Mexican War.

Ethel's diary again gives some impressions of school work and activities:

September 7: "Today is the first day of school. Miss Alice Fox is our teacher she is awfully nice. There are 23 scholars in our grade and 9 in the eighth." September 28: "Edith and I staid and did our Arith. at school instead of bringing it home." September 29: "Went into the library with Edith and Miriam to hunt up search questions. Clayton, Frank, and Ransom followed us in." [Clayton continued to follow Ethel, and married her in 1921.] October 1: "Had a social down to school. The school was lighted by Jack-o-lanterns."
Frank Cronin was Edith’s partner and Ransom was mine.” October 27: “The boys have got a track team down to school. They have high jumping, quoit throwing and racing.” November 3: “The girls are going to get up a track team. We practice jumping every recess.”11 November 4: “The girls elected their captain. Edith is one and I am the other.” November 5: “The class read ‘Three Sunday’s in a week.’ We took parts. Harry H. was my father. Charles was Rob or the boy who was going to marry me. I was Kate. Ralph was Smitherton and Harlan Kelly was Captain Pratt.” November 9: “We stay after school almost every night for track.”

November 12: “I was looking around in school this afternoon when I should have been studying my Geog. and I was laughing at Frank. Miss Fox asked what I was laughing at and I said Frank and she told me to get a chair and sit beside him. I did.” November 16: “We staid after school to practise. All the scholars had to sing alone. Miss Fox told Avis L. that Edith and I sang the best and Ruby Kent next.” November 23: “Frank and Herbert came up just before supper to do our examples. They came up again at about seven and staid until 9.” December 4: “There was a teachers convention down to school and Miss Fox asked Edith, Miriam, Dorothy, Hazel, Gladys and Myself to wait on the people.”

December 6: “Dora and Louisa came down and visited school this afternoon. [Dora was a future sister-in-law; Louisa was an older sister.] We had a Geog. match. Edith was capt. of one side . . . I was on Harry’s side.” December 17: “School closed for two weeks. Miss Fox gave us each a pink. [A flower.] Miss Fox read ‘The Other Wise Man.’” December 19: “The school choir sang Christmas songs tonight.” December 24: “The Xmas concert was in the church. E and I were in two exercises and sang a duet.”

11 This is consistent with findings that at this time school sports were usually initiated by students rather than teachers. See David Tyack and Elisabeth Hansot, Learning Together: A History of Coeducation in American Schools (New Haven: Yale University Press, 1990), 193, 336-7.
The twins continued with Miss Fox during their last year at Pickering. In February, 1911 they observed another example of corporal punishment when Miss Fox feruled two boys for throwing things at each other during a singing lesson. She feruled a third boy for hurting a smaller boy and also made him write a note to his mother about the incident.

In June the twins attended a school musical performance, and Ethel wrote: “Miss Fox looked perfectly lovely—if some of the boys had seen her they would act a little better in school.” (An interesting assumption—that beauty would somehow tame the savage beasts.) The twins’ elementary education ended on 5 June 1911 with a graduation program. “Judge Abbot made the presentation speech. Mamma, Louisa and Beatrice all came . . . Mr. Moore [the superintendent] gave a dandy talk.”

Not surprisingly, Ethel did not write about the standard school routines: memorization, recitation, drill, blackboard work. She recorded mostly special events and activities like tests, plays, games, and teams. But the impression one gets from this diary is that the twins enjoyed school, that they took pride in their academic work, that the teachers were kindly and fair, that corporal punishment was rare (and only inflicted on boys), and that relationships between the sexes were natural and comfortable.

The twins were beginning a process of schooling which would lead them, in 1919, to the two-room South Wolfeboro schoolhouse, where they would teach for two years before marrying and raising families. Although the above material provides background for the twins’ own teaching careers, their grammar school experience had an integrity of its own, apart from its role in preparing them for their future work as teachers, wives, and mothers. School, along with family, community, and church, was part of a web of significant, integrated experiences. The twins were living intense, active lives,

12Ethel’s notes from her 1910-1911 diaries.
and from the recorded evidence, not giving much consideration to their long-range futures.

But, given that, it would not have been surprising if the twins, as the youngest members of an educationally-oriented family, might occasionally have thought about becoming teachers. In 1867, at the age of seventeen, their father had "hired out to teach school on the hill [in Dalton, New Hampshire] at one dollar a day" before continuing his own schooling.\(^{13}\) Their oldest sister, Margaret, had graduated in 1905 from Plymouth Normal School (where they would study in the summer of 1919) and was teaching in the South Wolfeboro school during part of the time the twins were at Pickering. (The twins even got involved in Margaret's preparations, by making Valentines for her fifteen students in 1909.)\(^ {14}\) Their next-oldest sister, Beatrice, had begun teaching school at the age of sixteen before going to Wellesley College to resume her education. Beatrice also substituted for Maude Cate while the twins were in the eighth grade.\(^ {15}\)

In any case, whether they were already thinking about teaching or not, they were receiving informal preparation for that role. Only eight years elapsed between their graduation from Pickering and their teaching in South Wolfeboro. Those years were spent at Brewster Free Academy and the University of Maine; both institutions reinforced the prevailing assumptions that learning was hard but interesting work, that teaching was generally didactic, and that learning was primarily a process of memorization and recitation.\(^ {16}\)

\(^{13}\) Ethel's notes on her father's diary from 27 December 1867.
\(^{14}\) Ethel's diary for 12 February 1909.
\(^{15}\) Ethel's notes for 3 January 1911 from her 1911 diary.
\(^{16}\) See Larry Cuban, *How Teachers Taught: Constancy and Change in American Classrooms, 1890-1980* (New York: Longman's, 1984). The twins' experiences throughout their schooling and teaching demonstrate more constancy than change. Chapters one and three of Cuban provide a context in which to interpret the twins' experiences and those of other young women who became teachers.
When the twins taught in 1919-1921, they inevitably looked back on their own elementary education for methods and models. They knew, both from family and school experiences, that teaching was a respectable, useful, socially-approved, occupation for women. They assumed that schooling should be challenging, orderly, pleasant, varied, and—to the degree possible—non-punitive. Ethel never saw a student feruled until half-way through her sixth-grade year; when she taught in South Wolfeboro there was a cherrywood paddle hanging in her classroom but she never used it.\footnote{Telephone interview with John Wiggin, a former student of Ethel's, 30 April 1991.} But we must recall that the twins were obedient, agreeable, motivated students from a respected middle-class family. School may have felt like a less benign place for the children of working-class families. (We have no diaries from the boys who were feruled!)

The twins accepted coeducation as a natural, normal part of schooling. Whether coeducation in Wolfeboro was based on financial, social, or ethical considerations—or some combination of these factors—it was accepted, it worked, and it was not challenged.\footnote{Tyack and Hansot explore the varied motivations for coeducation in Learning Together. Wolfeboro's educational situation was more like that described in chapter three, "Coeducation in Rural Common Schools," than that in chapter four, "Urban Public Schools." Even if there had been a demand for separate schools for boys and girls, it would not have been economically feasible for Wolfeboro to have them.} Coeducation presented many opportunities for boys and girls to interact naturally and comfortably, perhaps providing part of the mutual understanding that lay the basis for long-term successful marriages for some of them.\footnote{Both twins had marriages that lasted for over sixty years.} But while ostensibly equal classroom treatment was apparently provided to both boys and girls, the twins were familiar with the unequal status of male and female adults in the schools. Throughout their careers as students...
and teachers they worked within the prevailing pattern of male superintendents and female teachers. They also learned that school was a place for religious, patriotic, and seasonal celebrations. Students and families expected that teachers would organize such celebrations and invite the community to attend. Religion of a mild Protestant variety was a natural and unchallenged part of school. Both at Pickering and later in South Wolfeboro, school opened with Bible lessons and psalms, and religious references were common in materials and activities.

Patriotism was pervasive in both schools. Students memorized patriotic quotations, wrote essays about the flag, and participated in national celebrations. When the twins were at Pickering, the memory of the Civil War was alive in the minds of many older citizens, and the Spanish-American War had occurred very recently. Veterans of both wars were prominent in patriotic activities in school and community. One expression of patriotism was the effort by teachers to educate students about politics. Miss Given taught about politics during and after the election of 1908, and Ethel would later do so during the election of 1920.

In both settings there was substantial emphasis on neatness and order. Students were expected not only to learn the content of various subjects but to present the results of their learning in an organized, attractive fashion.

Having taken eleven different subjects during some years, the twins shared the common assumption that learning came in discrete packages. Only rarely did a gifted teacher like Maude Cate,

---

20 For an explication of this pattern, see David Tyack and Elisabeth Hansot, Managers of Virtue: Public School Leadership in America, 1820-1980 (New York: Basic Books, 1982), Part II.
21 Letter from Ethel to Clayton Wallace, 2 November 1920.
22 The various notebooks and folders had much in common with the portfolios now increasingly used in assessment.
through her field trips, make any effort to integrate subjects. One of Ethel’s few expressed regrets about her own teaching was that she made little effort to integrate subjects like English and history.23

The twins knew that teachers were expected to deal with a range of ages and abilities in their classrooms. Pickering teachers had a more manageable challenge, with only two grades per room, than the twins would later have with four grades each. However, the Pickering teachers had larger classes than the twins later did.

The twins’ own grammar school experience was no doubt the most influential factor in shaping their own later—and similar—work as teachers. John Rury has recently written that “innovation in instruction is especially difficult because most teachers mold their behavior on the teachers they themselves have had.”24 Or, to put the issue more positively, as the optimistic twins might have done, they would have shared in Erica Jacobs’ recent expression of gratitude to her teachers: “Thanks. When I’ve plowed my way through school, I will teach as my favorite teachers have taught.”25

---

23Ethel said this in the interview noted above. One of her other regrets was that the twins did not get more involved in the activities of the South Wolfeboro community.

Information for Contributors:

The Midwest History of Education Society meets annually in late October or early November. Since the society's inception these meetings have been hosted by Loyola University at its Watertower Campus. Membership in the Society is open to anyone interested in the history of education.

The Vice-President announces calls for papers in late spring. Any paper presented at the annual meeting may be considered for publication in the journal.

Editorial Policy:

The Journal of the Midwest History of Education Society is devoted to the reflective examination of educational issues and problems from the perspective of diverse disciplines. The Journal strives to encourage communication among scholars of varied disciplines, nationalities, and cultures and it treats the most comprehensive issues and problems confronting education throughout the world.

The Journal has published authors from disciplines ranging from political science to philosophy to marketing to instructional technology to adult and continuing education. Its editorial board consists of a diverse group of professionals who referee articles according to their expertise. The main criteria for acceptance consists in a well articulated argument or point of view concerning an educational issue.

Authors are required to follow The Chicago Manual of Style. Papers must be submitted on a disk (3 1/2" or 5 1/4") accompanied by two (2) copies of a print out. Please specify the word processing program you used. Papers not submitted on readable disks will be billed at $15/hour for keyboarding.
From the Editor

It is with pride that I assume the editorship of the *Journal of the Midwest History of Education Society* and acknowledge the support of the dean of the School of Education at the University of Dayton, Dr. Ellis Joseph, in this endeavor. The satisfaction that I feel in producing this journal comes from the high quality of the papers that appear in these pages. They are well written, carefully reasoned, and scholarly. At the same time, I wish to recognize the capable assistance I received from the editorial board and from the associate editors, Robert Hanna and David Lewis, who worked diligently forming address lists, translating computer disks, correcting manuscripts, and proof reading. The University of Dayton Printing and Design set the format of the journal and arranged for the printing. They were pleasant and efficient helpers.

The *Journal* offers an important outlet for mature scholars and for students beginning professional careers. In these pages, as at the annual meeting of the Society, papers of all types appear together each reinforcing the other. The articles in this volume come from the 1992 and 1993 meetings of the Society. These proceedings are combined because unexpected problems in the transition of the editorship prevented the timely publication of the 1992 issue of the *Journal*. In the future, the *Journal* should include the proceedings of that year’s meeting and the quality of the papers will remain high.

The Influence of Educational Policies on the History of a People: Native Americans in Transition

When the Europeans arrived in the "New World," one of their goals was to educate and Christianize the native "savages" that they encountered. Most of the education that the Native Americans received came at the hands of missionaries. Some statements about the perspective of educating the Indian people during these early years reflect a somewhat demeaning attitude. For example, one report of the day said its "educational policy . . . is based on the well-known inferiority of the great mass of Indians in religion, intelligence, morals, and home life."¹

In order to better understand the history of Native Americans, there needs to be an interwoven discussion between the chronological oral and written traditions from the periods associated with this group of people and the white settlers.

The Traditional Period

In the time before the Europeans came to the Americas, the Native Americans taught their children using folklore and legends. This was also their way of passing on the knowledge and behaviors of their society.³ During the Traditional period, education was a positive force in Native American lives. The purpose of this traditional education was to prepare the child for whatever way of life he or she was to lead. Perhaps more
important than the purpose of education was the form of education. The people brought about the unity of tribal life through visual memories and personal dreams, songs and tales. Native people used oral tradition (storytelling). The stories were looked upon as a tool for educational purposes, and in this education explicit content was learned and the rules for behavior and belief were shared. This tradition covered every aspect of life. The children learned that through patience and watching they would acquire the skill perfectly, and then they would try it themselves, but only when it could be done to perfection; it was in this way the children learned the necessary skills to aid them in their everyday lives of survival. Education was more casual, informal, and unstructured than that of the dominant society.4

From quoting their oral history, to teaching their children the culture and discipline, to setting appropriate boundaries for behavior within a tribal system, to telling stories just for the pure enjoyment, storytelling was the education of the people. These stories were the people themselves. They were a rational way of explaining the way the people were and about the things around them.

Stories and legends often had highly symbolic meanings and involved intricate relationships. To teach these complex concepts, symbolism, anthropomorphism, animism, and metaphor were extremely effective and sophisticated methods.

This traditional form of education has been handed down from generation to generation and is still the basis for Native American learning styles. However, this positive force was nearly terminated during the ensuing generations because it was not thought to be of merit, because it was different, and just because it was Indian.

**Mission Period**

During the Mission Period, education was a concern of missionaries representing various religious denominations.5 These missionaries attempted to transform Indian education. This systematic destruction of Native culture and identity through the educational system has a long history in North America, and the methods of education changed little over time. Assimilation remained the dominant approach used by authorities. The early civil and religious authorities worked on the assumption that the Native people of North America were without religion or that they were pagans or devil worshippers. The missionaries set up rudimentary schools to teach the Indians basic tenants of Christianity, elementary reading and writing, prayers, hymns, and a few trades and agricultural skills. Schooling, however, meant more than just teaching new skills. It was to be a major instrument for the destruction of Native culture and for grooming the Native population for a lower place in society.
Among various educational approaches used by early missionaries were those that attempted to remove Indian children from their families and communities. The purpose of this was to facilitate the assimilation process by separating the children from their cultural roots. Generally, the mission school of this period had little influence in the lives of Indian people. Most of the schools operated briefly and met with little success. Nevertheless, seeds were planted for the future efforts to transform Indian education.

In 1802, Congress passed a bill to provide money to "promote civilization." In 1819, President Monroe received congressional sanction to employ teachers to teach Native Americans agricultural techniques and reading, writing, and arithmetic.

Treaty Period

The traditional Indian education drastically changed when the U.S. government made numerous agreements with sovereign tribal governments. These agreements were inspired by a desire to acquire Indian lands. Education was a function of the Federal Land Policy. Under this policy these things happened: first, the Indian tribes were thought of as separate nations and dealt with by treaties; second, as a separate nation, the internal affairs of an Indian tribe were the responsibility of the tribal authorities and were not to be tampered with by the states; and third, relations between nations were to be handled by the Federal government and not by the state.

The United States citizenry wanted to secure the possession of Indian land and natural resources. The role of the Federal government reflected this desire in its handling of the treaties. The Native Americans wanted the assurance of their survival in the matters of health, welfare, community life and education of their children.

In 1842, the government created the Bureau of Indian Affairs (B.I.A.). Its education policy was an extension of Indian policy in general, i.e., forced assimilation and expropriation of Indian land. The goal was to undermine their culture by uprooting them from their homes and imposing a different educational process.

Under the United States, the role of the religious organizations would be the basis of bringing "civilization" to the Indians, and education for Indians was left largely to the churches until the end of the "treaty period" in 1871. Teaching the rudiments of agriculture was considered part of the "civilization" and "education" process. Denial of certain educational and cultural rights became an acceptable part of government policy. Indian culture and education were totally ignored. Because of this, the conflict between government policy and Indian education only increased.
Allotment Period

By the 1880's, a different view was evolving by the U.S. government, that Indians should be incorporated rapidly into American society, whether they desired it or not. The Dawes Act of 1887 and the Curtis Act of 1898 formally defined the means for achieving this, expanding on earlier directives of the Bureau of Indian Affairs aimed at the complete replacement of Indian cultures. The Dawes Act gave 160 acres to each family head and 80 acres to both single persons over eighteen and orphans under eighteen.12

Several events occurred during this period, shedding further light on government policy as it relates to the conflict between school and the Native American community. First, the territories covering North and South Dakota, Montana, and Washington were admitted as states. Second, the allotment act had begun to take effect, transferring millions of acres which had been guaranteed to Indians by treaty into the hands of non-Indian farmers, ranchers, and timber companies.13 Indian families were separated as they were relocated on allotments, and adults were taught to be farmers while children were sent to day or boarding schools. The establishment of the Carlisle Indian School in 1879 marked a new era in Native American education and began the boarding school tradition.14 These schools were staffed by non-Indian people who were not expected to encourage Indian children to further their education. Boarding schools had become a way of life for many Indian youth. Two aspects of an Indian boarding school were a military discipline and a climate of deculturalization.

The Bureau of Indian Affairs made a serious attack on the use of Indian languages in schools, and by 1990 the languages were proscribed on entire reservations. This caused a severe social disorganization for the Indian family. Many families resisted the assault of the Federal government on their lives by refusing to send their children to school. Congress responded by authorizing the Secretary of Interior to withhold food or subsistence from those Indian families whose children did not attend.

The boarding school system came under criticism by elements of the government itself, but not until much later. In 1926, the Brookings Institute launched an investigation of Indian Affairs for the Federal government. The educational sections of the report were under the direction of Lewis Meriam of The University of Chicago. The Meriam Report of 1928 exposed the poor conditions in the boarding schools. The Report found the schools not only to be overcrowded, but also unsanitary; moreover, the children were undernourished, overworked, and severely disciplined. As a result of the Meriam Report, the Indian Reorganization Act of 1934 was passed, which stated that Indians should not be coerced into discarding their cultural traditions.15 The passage of this Act might have paved the way for Native Americans to restore the positive influences of early Indian education had it not been for the events that occurred during the following period.
The New Deal Period

In 1934 the Wheeler-Howard and Johnson-O'Malley Acts were passed by Congress. The Wheeler-Howard Act provided a basis for formalizing tribal self-government under the supervision of the Secretary of the Interior. This Act also clarified the powers of reservation governments. The Johnson-O'Malley Act authorized the Secretary of the Interior to contract with States to provide education, agricultural assistance, medical services, and social welfare services to Indians.

During the 1930's, President Franklin Roosevelt, Secretary Harold Hickes and Commissioner of Indian Affairs John Collier provided strong leadership in an ambitious effort to shape a "new deal" for American Indians. Under this administration, Congress passed the Indian Reorganization Act, defining a new type of Indian policy. It aimed to reverse the affects of the Allotment Act and the numerous B.I.A. regulations designed to force cultural assimilation. The provisions of the B.I.A. were far-reaching in their implications regarding the place of Indians as an ethnic group in American society.

John Collier's administration also sought to define new goals for the federally administered school system. Day schools on the reservations were emphasized over boarding schools. In both, an effort was made to change the content of teaching so that Indian cultures were dealt with positively rather than ignored. These changes also included the teaching of Indian languages and culture, adult basic education, and training of Indian teachers. These types of changes, however, were not popular with Congress, and there was little change in the schools by 1945, when Collier resigned in frustration.

Termination Period

Cultural termination became the sanctioned policy of the U.S. Congress when, in 1944, a House Select Committee on Indian Affairs offered recommendations for achieving "the final solution to the Indian problem." The Committee felt real progress would be made only when Indian children of elementary school age were again taken from their homes and placed in boarding schools, deeming that the goal of Indian education making the Indian child a better American rather than simply a better Indian. By 1954, ten termination bills were introduced. Fortunately, this period ended in 1958 when Secretary of Interior Fred Seaton announced the end of a formal termination policy. Nevertheless, the fear of termination threatened Native Americans throughout the 1960's.

With the assistance of civil rights activists, Indian educators became increasingly active during the 1960's. They began to recognize the need for unity. The National Indian Education Association was formed in the late 60's, while the Coalition of Indian Controlled Schools organized in
1971. At the same time there were radical groups forming, such as the American Indian Movement in 1972 that took over the B.I.A. headquarters building in Washington, D.C. and villages of Wounded Knee.20

Under President Johnson's administration the Economic Opportunity Act was enacted. This gave Indians the opportunity to control their own governments and programs. The Elementary and Secondary Education Act of 1965 was also enacted.21 It provided funds for improving the education of disadvantaged children; however, Indian education was still highly vulnerable to outside political pressure. The events of the latter part of this period again revived the potential for Indian control of their education. The Economic Opportunity Act was terminated in the early 1970's, but the spirit in which it had been formulated continued.22

**Self-Determination Period**

During President Nixon's administration, the new policy was to allow Indian people to control their tribal destinies. On July 8, 1970, Nixon announced a new policy whereby "Self-determination among Indian people can and must be encouraged without the threat of eventual termination ... To strengthen the Indian sense of community autonomy without the sense of community ... we must assure the Indian that he can assume control of his own life without being separated involuntarily from the tribal group."23

During this period other events were enacted which allowed for better Indian policies: The Indian Education Act which provided Federal funds for Indian Education; job opportunities within the B.I.A. which gave Indian preference; and the B.I.A. "Project Tribe" program, which invited particular tribes to become entirely responsible for their school program and to arrange for an Indian "takeover" on a contractual basis. A set of guidelines was developed for the transfer of Bureau Schools to local Indian boards of education and a national Indian Education Advisory Committee to Bureau Schools was established.24 For the first time since the time of contact, Indians had direct input in the educational programs of their children. The potential for Indian control of Indian education was never greater.

**Education Today**

Native American Education is currently in a growth period. This can be seen in the increased programming for Native American people and in increases in Native American content in the curriculum. This growth period is accompanied by the surge within Indian communities to maintain their identities and to make efforts to regain control of their lives. Within the past fifteen years, however, Indian education has made progress. Many Native Americans have become educators, curriculum
has been developed, and new research in Indian education has occurred. These changes are the result of concentrated efforts by Indian educators to solve the overwhelming problems of Native American education.

When reviewing the historical foundation of Indian education, one can see how these events have had the effect of diminishing the autonomy that Indians once had in the education of their children. Despite some gains in control of Indian education, it is apparent that the quality of this education is still not what is possible.

Public schools have come a long way in recent years to include curriculum on Indian culture and language. This has been a result of pressure from Indian educators and leaders. However, problems still exist. Some of the major obstacles Indian education is up against today are cultural and value clashes, poverty, curriculum and textbook bias, and lack of Indian teachers and support staff.

The U.S. Department of the Interior's Bureau of Indian Affairs is not the only agency that assists Native Americans. Over the years Native Americans have come to participate in a wide variety of social service programs administered by the Department of Health, Education, and Welfare, the Department of Agriculture, the Department of Labor, and other agencies, some of which are state funded.

Native Americans today look with great interest upon each Presidential election. History has taught them not to trust what has been, but what will be the policy of the next administration. Will governmental decisions allow them to be a collective whole and rekindle their values and culture, or will the government take steps to overturn the progress Native Americans have made in reclaiming their identity?

Few American women have received the number of accolades that have been bestowed on Jane Addams. The subject of numerous laudatory articles and children’s books, she was hailed as a leading American Progressive social reformer and was often compared to Joan of Arc. She was perhaps best known for founding and developing the influential settlement house, Hull House of Chicago, where she and her colleagues worked to liberate immigrants living in the urban ghetto from class-based oppression. They were also instrumental in the passage of both laws limiting the working hours of women and children and other legislation to prevent their exploitation. Addams lectured widely and wrote ten books and some five hundred articles. In 1931, after working for years in the cause of international passivism, she, along with Nicholas Murray Butler, was awarded the Nobel Peace Prize.

Jane Addams slipped into obscurity after her death in 1935, but in recent years she has become the subject of a plethora of scholarly articles and books. While most historians have focused on her career, a few have examined her education at Rockford Female Seminary, Rockford, Illinois, the school from which she received her B.A. in 1882. Generally, they have placed the seminary in the context of the larger nineteenth century female seminary movement characterized as Puritan, domestic, and conservative. Viewed from this perspective, Rockford Seminary was a repressive institution which Addams resisted individually and heroically. More recently scholars have begun to view the rigorous women’s institutions, such as Rockford, as moderately enlightened schools where
gender inequalities were resisted by women faculty and students. These scholars have focused primarily on group resistance. In the case of the Rockford Seminary, the middle class faculty and students have been viewed as collaborating in a successful struggle against the all-male board of trustees to gain something of the status of their brother institution, Beloit College, eighteen miles away in Beloit, Wisconsin. What is still missing from the Rockford analysis is an adequate conceptualization of the dynamics which fostered group resistance.

In the 1960s, a powerful conceptualization of resistance to oppression was articulated by Brazilian educator Paulo Freire. Freire's philosophy of liberatory education has had a profound influence on literacy programs throughout the world and has laid the foundation for what is called critical pedagogy in the United States. This essay explores the seminary women's discovery of their voices, their increasingly radical dialogue, and their engagement in liberatory action. In addition, it examines the role of the seminary ethos in the development of these radicalizing activities.

**Finding a Voice**

Paulo Freire's philosophy and practice evolved out of his literacy work with impoverished Brazilian adults who had been denied even the most rudimentary education. His experiences between 1948 and 1963 led him to envision the world divided into two categories: subjects and objects. Freire defines subjects as those having power, prestige, and privilege; objects are those who are means to the subjects' ends. For Freire, this uneven distribution of power is intolerable. He believes that the oppressors, corrupted by privilege, cannot free or empower the oppressed. However, the oppressed can and must free both themselves and their oppressors. To begin this transformation, the oppressed must reject the world as interpreted by their oppressors, and "name" it for themselves. For Freire, to "name the world" is to identify contradictions in a given situation which prevent the oppressed from developing autonomy. In this way, the oppressed "unveil" societal structures that prevent their development and attribute their powerlessness and poverty to these structures rather than to their own personal failures. Finding a voice to "name the world" is the first step in developing a critical consciousness capable of sustaining continuous cultural revolution. This revolution is the process by which the oppressed become Subjects, actively engaged in their society's political and historical processes. In Freire's ideal world, no one is reduced to the status of object. In the real world of nineteenth century Rockford Seminary, women were relegated to object status.
Anna Peck Sill founded Rockford Female Seminary in 1849 to provide advanced educational opportunities for women of every social class who, by virtue of their gender, had been denied all but the most rudimentary literacy skills. She never used Freire’s terminology of oppression. She did say that only men had been allowed to pursue advanced education and that women had been denied a fundamental right to do the same. Women needed this opportunity, she argued, in order to evangelize and uplift their families, their local communities, and the world.4 When she arrived in Rockford, she had a diploma from an unprestigious female seminary in frontier New York and little to fall back on should her women’s seminary fail. Through her personal and professional contributions she garnered considerable support from the local community.

Hoping to gain long-term financial stability and institutional permanence, she relinquished some of her autonomy by affiliating with a group of Presbyterian-Congregationalist ministers and civic leaders who had recently founded Beloit College in Beloit, Wisconsin. These men formed a board of trustees for Rockford Female Seminary and elected one of their number to serve as president of the board. Although the president of Beloit College also served as president of the Beloit College Board of Trustees, the Rockford trustees did not allow Sill to be a board member or even to attend meetings without an invitation.

Such gender inequalities were not unusual. Women could not vote in local or national elections. They could not hold political office. Married women lacked the legal right to buy and control property, their wages belonged to their husbands, and they were required by law to reside wherever their husbands lived. Women were barred from lucrative occupations and were usually paid around one-half the wages of men. They were not admitted into most institutions of higher learning, and if they acquired any formal instruction it was usually limited to a smattering of reading, writing, and arithmetic. They were censured for speaking in public meetings; it was argued that such activity was masculine and antithetical to woman’s nature. Women could sing, recite poetry or play a musical instrument, but they could not take part in debates because they were seen as incapable of expressing original, carefully reasoned arguments.5

But do such inequalities indicate oppression? Freire addressed gender inequalities first in the 1970s and more fully in the 1980s. At a retreat in 1979, he said that after the publication of Pedagogy of the Oppressed, he had received a number of letters from feminists all over the world who objected to the exclusion of gender from his analysis. Freire responded, “I wrote this book as a man with the ideology of a man inside of me. Since I received these letters, I think about men and women as human
He also stated that gender was not as important an issue as class. By the end of the 1980s, however, issues of gender and race had gained a more prominent place in his philosophy. “If we really want to reinvent society in order for people to be more and more free, more and more creative,” he said, “this new society to be created by men and women cannot be racist, cannot be sexist.” A society is oppressive when it grants privileges to one group on the basis of gender while denying them to another.

One key privilege granted to the male trustees of Rockford Female Seminary and denied the women was public “voice.” In the early years of the seminary, the trustees served as mouthpieces for the seminary women at most major academic occasions. They delivered commencement addresses and spoke in the local and eastern churches on the school’s behalf. They even suggested that a trustee deliver the seminary women students’ commencement essays, rather than allowing the students to deliver their compositions themselves. This was perhaps the first occasion when the students found their own voices in rebellion against male hegemony, and their threat to boycott the ceremony resulted in their first successful assault on male dominance. By the time Jane Addams entered the seminary in 1877, the students had expanded their vehicles and topics for expression. In the 1850s students had established two literary societies, and in the early 1870s they began to invite the Rockford community to attend their debates. They published several literary magazines, but none of these flourished until the decade of Jane Addams’s arrival, when the Rockford Seminary Magazine was founded. In this magazine, the students and faculty found an increasingly radical voice. For example, they questioned why seminary women had to perform domestic duties, when Beloit College men had no such chores. They wondered if amiability is a woman’s greatest virtue. And they asked why women were not able to vote. While the students glorified the traditional low-paid work of missionary and teacher, they also proudly reported the number of women in the professions of medicine and law.

Addams led student efforts to find even more opportunities to express their opinions publicly. While her efforts to hold a public German colloquy were unsuccessful, she was instrumental in instituting a number of other public performances in which students could express their views. She worked toward the establishment of class day exercises and a book burning celebration, both of which drew large crowds from the Rockford community. As a junior, she represented the seminary in its efforts to join the Illinois Inter-Collegiate Oratorical Association by attending its annual meeting. As a senior, she was editor-and-chief of the Rockford Seminary Magazine, publishing 384 pages of copy in one year.
Her essay, "Cassandra," appeared in a new seminary publication, a collection of all the essays of the graduating class of 1881. That she had found her own voice was perhaps most obvious in Addams's public address to the Rockford community as president of the Class of 1881. This was the first time in the history of the seminary that students had presumed to hold a class exhibition like those held by male college students. In her speech, Addams began by assuring the audience: "We are not restless and anxious for things beyond us." But she went on to say that while in the past women were educated to please men, now they were being educated to develop their own intellectual power and their own capacity to labor in the marketplace. "[Woman] wishes not to be a man," she said, "nor like a man, but she claims the same right to independent thought and action." While Addams reassured her audience that she did not intend to usurp male prerogatives, she also asserted that she would use her voice and her life as she saw fit. A Freirean subtext might read: The oppressed wishes not to be the oppressor nor like the oppressor, but claims the same right to independent action and reflection.

Developing a Dialogue

Another key element of Freire's vision for liberatory education is dialogue. Rather than dispensing prepackaged knowledge, a process Freire calls the "banking method," the teacher initiates a dialogue with students in which societal problems are posed and examined critically. Dialogue implies co-learners who create new knowledge, as opposed to students who receive pre-collected and pre-interpreted knowledge. "The pleasure of living is not studying the world," he said, "but in creating the world." It is dialogue that makes this creation possible; true dialogue, in turn, requires voice. Thus, voice and dialogue are interdependent. True dialogue requires authentic voices, and these voices are both strengthened and refined by the dialogic process.

Jane Addams, as we have demonstrated, had developed such a voice by the time she gave her "radical" junior exhibition speech in 1881. She did not develop this voice in a vacuum but in an environment which sparked a lively dialogue centered around pressing social, educational, and political issues. The students at Rockford Female Seminary edited and published articles exposing the unjust treatment of Chinese immigrants and the exploitation of hundreds of sewing women. They debated educational issues such as the content of the college curriculum and the role of co-curricular activities in students' social and academic development. Ignoring the popular notion that only males should learn the techniques of debate, they devoted a series of articles to the utility of these techniques. Despite the popular view that politics was a masculine
preserve, they discussed the presidential election of 1880 and polled the senior class, asking them whether they supported James Garfield or General Hancock; the reasons for their choices were published in the seminary magazine. They also explored the oppressive political structures of previous centuries and argued that their own century was moving “toward political freedom and equality.” They questioned the practice of electing only males to political office and suggested that it would be better to have a strong woman president than a weak man. Catharine Waugh, in her graduation address of 1882, catalogued women’s advancements over the century and said that she hoped that women would someday gain the vote.14

The setting in which these activities occurred was a frontier society, an ideal context for experimentation. Established at a place where covered wagons crossed the Rock River, the village had quickly expanded into a bustling city. By the 1870s Rockford was emerging as an important industrial center where entrepreneurs were inventing, manufacturing, and shipping products on the Rockford Central Railroad line, which had been laid along the edge of the seminary campus in 1871.15 At the same time that the community was poised for further growth and innovation, so women’s higher education was in its own frontier phase of development. There was no tradition of higher female education on which women’s educators could rely.16 In this time of flux, women had to demonstrate inventive not simply reproductive capacities. Their inventiveness arose out of need since there was no tradition of women’s higher education to bolster or constrain them.

Freire identifies such periods of social transition as opportunities for cultures of silence to find their own voices. Those who have been dominated find themselves in the midst of changes so pervasive that their oppressors lose, for a moment, the ability to impose a fixed version of reality on them. At this point, the oppressors also lose their power to silence the oppressed. “Silence is no longer seen as an inalterable given,” Freire writes, “but as the result of a reality that can and must be transformed.”17 In Freire’s view, when the oppressed begin to speak in their own voices for the first time, they may be forced back into silence by coercion or manipulation. To resist, the oppressed must continue to identify societal problems, redefine them at a fundamental level and develop solutions that require a total restructuring of power relationships. While Freire notes that dialogue depends on an openness to recreating the world, it also requires a supportive environment.

In many ways the Rockford Female Seminary campus was a place where dialogue could occur without reprisals. It was eighteen miles away from the male campus; thus, Jane Addams and her peers could speak radical thoughts without fearing ostracism by male students. Their
seminary administrators and faculty were predominantly female, so students were free from the pressure to please male authority figures or censor any remarks remotely offensive to males. Although the “banking” method was used in classroom instruction, there were many opportunities for dialogue outside the classroom. The campus had only two hundred women, fewer than half of whom lived in the dormitories, and they could not leave the campus or receive male visitors without the presence of a chaperone. This environment fostered intimate relationships in which students and faculty could safely express personal feelings and develop the kinds of intense female friendships so characteristic of the Victorian era. Seminary students felt free to explore views that challenged gender power structures. Anna Peck Sill nourished and reinforced this dialogue which expressed the frustration she was unable to convey to the trustees directly. Feeling humiliated by her second-class status, she was furious that the trustees were blocking her efforts to transform the seminary into a college. Refusing to give her credit, the trustees attributed the founding and success of the seminary to the first president of the board.

Yet gender was not the only topic of dialogue. The faculty and students probed issues related to wealth and poverty, the ascendancy of science, social problems in American society, current politics, the ideal collegiate curriculum, and controversial social theories. The one topic which was sacrosanct for Anna Sill and therefore closed to dialogue was Puritanism, the belief system which permeated every aspect of seminary life.

Even Anna Sill lacked sufficient power to stifle all unorthodox dialogue. Some students were from upper middle class backgrounds, and a few, like Jane Addams, had fathers on the board of trustees. In contrast, Sill and many of the teachers were from lower middle class backgrounds. Addams’s status, bolstered by her social class and connection to the board of trustees, seemed to have contributed to her confidence in resisting Sill and the other teachers who pressured her to make a commitment to evangelical Christianity. Despite this pressure, Addams kept her own voice, carrying on a sustained but private dialogue about the meaning of Christianity with her close seminary friend, Ellen Gates Starr.

Although the seminary environment fostered spirited dialogue, there is no evidence to suggest that it was as radical a dialogue as that proposed by Paulo Freire. For Freire, dialogue ultimately leads to the dismantling of all dehumanizing structures with their accompanying privileges rooted in class, race, or gender. In contrast, the seminary women had no single vision of the world they wanted to create. Some envisioned an enlightened Christian democracy growing out of the
frontier. Others, like Addams, were still casting about for a guiding vision. What the seminary women did have in common was the conviction that their sex needed the intellectual preparation and the power to play a primary, not subordinate, role in creating a better world.

**Praxis**

For Paulo Freire critical and liberating dialogue presupposes action. He believes that a dialectic develops as the oppressed begin in dialogue to reflect upon the ways in which societal structures determine their conditions. These reflections lead to efforts to dismantle dehumanizing structures in order to re-create society. Freire calls this process “praxis.” It is the continuous dialectic of action and reflection upon the world for the purpose of transforming it, and it comprises a third element in his vision of liberatory education.

In a similar fashion, the seminary women strove to move beyond dialogue to dismantle the structures which dehumanized them. The central obstacle for them was the belief that women were incapable of reflection and were expected to consume without question the prepackaged knowledge produced by males. Women were warned that if they presumed to attempt intellectual challenges beyond their capacities, they would endanger their health, lose their attractiveness to men, and risk becoming barren. Rather, they were supposed to preserve their energies for reproductive and nurturing tasks. The seminary women were supposed to use what they learned to enhance their performance as supporters of the very structures which dehumanized them. They did do two things to transform the institutional structures based on these questionable presuppositions.

First, they sought to achieve in academic subject areas believed to be too challenging for their limited powers. This vision was inspired by Anna Sill. Although she instituted courses of study designed to appeal to the less ambitious, she was careful to offer more demanding programs generally believed to be far too rigorous for the female mind. To master this rigorous curriculum was a political act. Jane Addams was energized by the opportunity to challenge the conventional wisdom and flaunt the intellectual achievement she was presumed to be incapable of. She had not been a brilliant student in her hometown school, but at Rockford she soon came into her own. See scored 9.9 in Cicero and 9.9 in Tacitus. In four Greek courses, she averaged 9.6. She sailed through university algebra (10.0), trigonometry (9.9), solid geometry (9.8), and spherical trigonometry (9.9). She also made outstanding grades in the courses considered less rigorous: with an average of 9.931 out of 10, she graduated valedictorian of her class.
Second, Sill, faculty, and the students joined forces to convince the community and the trustees that they had evolved beyond seminary status into an institution worthy of legal recognition as a college. Jane Addams also played a key role in this endeavor. Three months before she matriculated, the trustees had voted down the possibility of changing the name of the institution to Rockford College. They explained that its course of study did not contain enough ancient languages and higher mathematics to warrant the change. New courses were added to the curriculum while Addams was a student. Furthermore, Sill formed a coalition of students and faculty to combat any other delaying tactics the board might use. They built community support by orchestrating highly visible seminary celebrations matching the traditions of their male college counterparts.

What did Jane Addams gain from this process? In 1881, the trustees decided that if a few minor changes were made in the seminary curriculum, they would award bachelor's degrees the following spring. Thus, on June 21, 1882, Addams stood among the first group of seminary students to receive their college degrees. In her hands she held a credential that represented intellectual equality with men. In the students' work with the community, their academic accomplishments, and their pressure on the trustees, they had become actively engaged in political and historical processes.

These students may have been able to work together at the seminary, but would they be able to translate their activist experiences into post-school praxis? Jane Addams certainly did. Her classmates did as well. An analysis of the 1879-1888 graduates' later life choices reveals that the Rockford students were far less traditional in their occupational choices than were other American women of that decade.

Rockford graduates did not deviate sharply from the general population in their decisions to marry: 66% of U.S. women age 14 and older were married in 1890 while 59% of the Rockford graduates (1879-1888) were married by 1904. However, while only 11% of U.S. females 10 years and older were employed in 1880 and 13% were employed in 1890, 49% of Rockford graduates held jobs, 12% of which were professional positions. In addition, 73% of the graduates held voluntary positions in the more traditional women’s clubs and churches as well as the more radical labor unions and abolition societies.

Some Rockford graduates dedicated their lives to unconventional careers. Like Addams, they made significant contributions to the public dialogue: Eva Munson (Class of 1864) published 40 musical compositions; Mary E. Holmes (Class of 1868) edited and published the Freedman’s Bulletin; and Minnie B. Fenwick (Class of 1886) served for 14 years on the staff of the San Antonio Daily Express. Others broke through
barriers of professional status and political power: Annie J. Ellers (Class of 1881) was a medical missionary who served as medical attendant to the Queen of Korea; Augusta Scott, M.D. (Class of 1863) became one of the first fully credentialed women physicians in the United States; and Harriet Rosencrans (Class of 1865) was elected twice to the Colorado legislature. Other graduates dedicated their lives to social reform: Joanna Moore (Class of 1863) traveled throughout the South establishing schools and literacy programs for freed slaves; Anna Nicholes (Class of 1884) worked for the Chicago Neighborhood House Settlement and edited The Union Labor Advocate; and Rose Marie Gyles (Class of 1891) served as Hull House gymnasium director and was one of the faculty of the Chicago Froebel Association. From Addams’s graduating class of 1882, Kathryn Waugh McCulloch was admitted to the Illinois bar and became the legal advisor to the American Woman Suffrage Association.

Conclusion

The philosophy which arose from Paulo Freire’s Brazilian context provides conceptual illumination of Jane Addams’s experiences at Rockford Seminary in the late 1870s and early 1880s. The school she attended was a predominately female community whose formal power structure relegated her sex to an inferior status. However, the seminary women refused to accept their inferior rank in the gender hierarchy; they questioned not only their own subservient position but also that of other groups. These questions were publicly debated, both in oral and printed form. Once the women had initiated these dialogues, they experimented with political and social strategies to gain greater equality with males. This radicalizing process emerged in a period of rapid social change. The seminary was a young institution, having been founded in 1847 when Rockford was a tiny village in frontier Illinois. By the 1870s, however, the community had mushroomed into a prosperous industrial city. Just as the industrialization of the Midwest was in its infancy, so women’s higher education was in its own frontier phase of development. This phase was marked by heated debate, experimentation, and flux. As Freire has argued, in this type of environment voices emerging from cultures of silence begin to pose new questions.

Jane Addams attended Rockford Seminary during this interesting era. Several of her friends transferred to elite eastern colleges like Vassar, Smith, and Wellesley. They wrote letters telling about the joys and rigors of the “real” collegiate institutions they were now attending. When Addams compared her Rockford Seminary bachelor’s degree with theirs, she probably wished that she had gone east as well. Ironically, her collegiate experiences may have been much more valuable than those of her peers attending elite eastern colleges. A Rockford degree signified an
education Addams herself had helped to define. The strait-laced Puritan female seminary had nurtured her development into a leader whose settlement house would foster empowerment across socioeconomic and ethnic lines. She had learned that women working together could find their voices, develop a dialogue, and translate their insights into humanizing action.
ENDNOTES

10. For discussions of these events, see Sill Scrapbook, a collection of newspaper articles about the seminary from its founding until after Sill’s death, Sill Papers, Rockford College Archives, Rockford College, Rockford, IL (hereafter RCA), 95, 107; “Editorial,” Rockford Seminary Magazine 11 (July 1883): 223; Rockford Seminary, Thirteenth Commencement, Essays of Graduating Class, Wednesday, June 22, 1881 (DeKalb, Ill.: “News” Steam Press, 1881).

12. For a discussion of the banking method, see Ira Shor and Paulo Freire, A Pedagogy for Liberation: Dialogues on Transforming Education (Granby, MA: Bergin & Garvey, 1987);

22. An examination of the 1880-81 Rockford Seminary classical course of study reveals that all textbooks with authors' names included were written by males, a majority of whom were leaders in higher education, e.g., Mark Hopkins, James Dwight Dana, Charles Eliot, and Erasmus Otis Haven. Women authors such as Emma Willard and Catharine Beecher were avoided because they lacked elite credentials. Last names of textbook authors are listed in the *Thirtieth Annual Catalogue of the Officers and Students of Rockford Seminary, Rockford, Illinois, 1880-81* (Rockford, Illinois: Daily Gazette Steam Print, 1881), 21-22. Further information was found in *New Century Cyclopedia of Names* (New York: Appleton, 1954).

24. Jane Addams Transcript, 1881, RCA.
25. Minutes of the Board of Trustees, 10 June 1881, Trustee Files, RCA; “Home Items,” Rockford Seminary Magazine 10 (June 1882): 234-37.

26. We selected the decade 1879-1888 because a similar study was done of Smith College graduates during the same decade. Since Jane Addams later wrote that she wanted to attend Smith rather than Rockford and since John Rousmaniere has asserted that Smith was a more radicalizing institution than female seminaries, we sought to compare the life choices of graduates of the two institutions during the decade in which Addams was a student. Defining professionals as doctors, professors, college deans, and architects, Sarah Gordon found that 11.5 per cent of the 1879-1888 Smith graduates became professionals. Having defined professionals as indicated above, we found that 12 per cent of 1879-1888 Rockford graduates became professionals. See John P. Rousmaniere, “Cultural Hybrid in the Slums: The College Woman and the Settlement House, 1889-1894,” American Quarterly 22 (Spring 1970): 45-66; Sarah H. Gordon, “Smith College Students: The First Ten Classes, 1879-1888,” History of Education Quarterly 15 (Summer 1975): 164.

Addams' Textual (Mis)Representation of Female Education

In December 1880, almost a decade before beginning her settlement house community education program, Jane Addams crafted a discreetly political editorial for the Rockford Seminary Magazine that prefigured key elements in her later Hull-House pedagogy. Though her piece opened with a description of the seminary’s young women students as safely ensconced within the late nineteenth century’s middle-class feminine domestic role, Addams' anecdote progressed to an indirect call for a reconfigured social position for American women—one including female suffrage and the broader social activism it would facilitate:

Election day dawned on a community of excited girls who are supposed to be retired from the world, and to
be wholly absorbed in scholastic studies. The excitement was manifest at the breakfast-table, and steadily increased until chapel, when their feelings found vent in singing "America" with a vim which was deafening as well as patriotic. The polls were open from nine to three [for a mock election], and the ballots were deposited with each voter's leading motives attached. Among the Home Items we have printed some of the reasons given; not that they are very profound or wise, but we wonder if they are widely different from those which actuated the stream of men who were steadily voting but a few rods away from us.1

In this conflation of private school with public electioneering, domestic images of the "breakfast-table" give way to vocal political enthusiasm, and feminine "feelings" merge imperceptibly with masculine "reasons." By using such highly charged vocabulary, Addams' editorial embodied and anticipated her future pedagogy, both in Hull-House classes and in a wide array of popular teaching texts. Thus, though "supposed to be retired from the world" while attending the seminary, Addams was already in 1880 questioning the exclusionary boundaries between private and public, which were so often being invoked in discussions of the proper role for nineteenth-century middle-class American womanhood (Sies 1988, 193-210; Kerber 1988; Brown 1990). She was also already suggesting that educational institutions could strategically and constructively position themselves in a dynamic space overlapping both so-called spheres, thereby undermining any theoretical separation and giving the women of her day an entrée into empowered citizenship without threatening their femininity.

Tentative and implicit, the call for suffrage here (via the suggestion that the young women's selection criteria were probably identical with those of men who could vote) is radical in its goal but conservative in its rhetoric. According to Addams, these young ladies make no plea to abandon their domestic duties. Rather, they wish to extend their feminine influence, as embodied in both their enlightened breakfast-table discussion and their even more powerful, emotionally patriotic chapel singing of "America," into the larger society.

Within its careful imagery of purportedly cloistered female students entering the sociopolitical realm through education, this brief Rockford Seminary Magazine editorial foreshadowed the process by which settlement women like Dr. Alice Hamilton, Florence Kelley, and Julia Lathrop would later become powerful agents of social change (Bryan 1989). Similarly, though certainly not clearly formulated yet in 1880, the origins of Addams' Hull-House program—initially contained within a single
house on Halsted Street, eventually stretching outward to construct several other buildings and to reach, through a variety of sociopolitical campaigns, into the very public streets themselves (Hayden 1991, 163 ff.)—were evident in nascent form within this college article's discreetly outward-reaching language.

Throughout her autobiographical account of the settlement written years later, Addams would draw on the key imagery associated with her women's college education to gain support for her activist pedagogy. As in her earlier writing at Rockford, she would emphasize the supportive, nurturing (i.e., appropriately “feminine”) qualities of the Hull-House activities, thereby couching subversive moves—such as claiming the right for women to serve as public officials—within the accessible and seemingly unproblematic context of middle-class domesticity. To this end, Addams linked her program to the idealized, feminine, domesticated pedagogy long associated with names like Sarah Josepha Hale, Catharine Beecher, Emma Willard, and Zilpah Grant (Robbins 1993). Nonetheless, in seeking to claim a more empowered space within the traditionally masculine sociopolitical world of civic leaders like her home's former owner (Hull) and her own father, Addams also needed to present her settlement teaching as self-consciously extending beyond the sphere of those earlier feminine models. With this complex positioning in mind, her portrayal of her Rockford Seminary learning experience as simultaneously inadequate and stimulating was a complicated yet appropriate choice.

For today's reader, Addams' critique of the limits of seminary learning is probably more obvious than her acknowledgment of its strengths. For example, the closing passages in Addams' oft-quoted "The Snare of Preparation" chapter are representative of the negative tone her text often used when discussing her Rockford experience. Announcing her intention to leave behind the kind of life promoted by attending a women's school and touring Europe afterwards, Addams described a personal turning point. Determined at last to intervene directly in society's problems, she declared, "I had confidence that although life itself might contain many difficulties, the period of mere passive receptivity had come to an end, and I had at last finished with the everlasting 'preparation for life,' however ill-prepared I might be" (53). Addams went on to depict herself as about to move from mere "longing to construct the world anew" (53) to direct action: "The next January found Miss Starr and myself in Chicago, searching for a neighborhood in which we might put our plans into execution" (54). Reinforcing this dichotomy, Twenty Years at Hull-House repeatedly emphasized such contrasting associations as the unproductive "snare" of schooling and touring versus the "January" new beginning aimed at actual "execution." Along those
Addams' text often posited a binary opposition of (false) culture-seeking and (genuine) life-doing, condemning the former, which she associated with her Rockford education and European travels, but praising the latter, which she associated with the settlement. She became, she says, “much disillusioned... as to the effect of intellectual pursuits upon moral development” (47) and eventually realized she must “learn of life from life itself” (51).

Accepting Addams' words as a reliably literal record of factual events rather than re-vision of experience re-shaped to promote her complex pedagogical philosophy, a reader tends to interpret her seminary schooling reductively, merely as symptomatic of the kind of “passive receptivity” and excessive “study” (53, 51) she critiqued for preventing young middle-class American females from being able to “learn of life from life itself” (51). The search for culture embodied in the women’s seminary/college attendance and the complementary European tour, then, could be seen as reinforcing the restrictive gender-and-class-based roles Addams finally rebelled against when she moved to Halsted Street with Miss Starr. Indeed, Addams' Twenty Years backward-looking record of her seminary/college experiences included many deprecatory comments about the school's confining emphasis on routine, its “little” library, an inadequate economics and science curriculum, and the women students' tendency to avoid connecting literature with philosophy (29).

But Addams' dichotomizing moves in her “Boarding-School Ideals” and “The Snare of Preparation” essays may be better understood as astute rhetorical strategy rather than objective reporting. In that context, Addams' choice for ending the “Boarding School” chapter provides an apt example of that strategy in action. After graduation from Rockford, Addams indicated, between 1881 and 1889, she was “clinging only to the desire to live in a really living world and refusing to be content with a shadowy intellectual or aesthetic reflection of it” (39). The implication here, of course, was that Rockford had shut her away from that “really living world” she longed to enter. Similarly, Addams' autobiographical text constructed a critical distance between her “self” as current narrator and her “self” during boarding school days. For instance, in one episode she made fun of her own silly attempt, with several friends, to try “to understand De Quincey’s marvelous ‘Dreams’ more sympathetically, by drugging ourselves with opium” (28). She also skewered her pompous tendencies in composition: “Whenever we had chances to write, we took of course, large themes, usually from the Greek because they were the most stirring to the imagination” (29). And she described her reading habits in equally humorous but self-critical terms: “Of course we read a great deal of Ruskin and Browning, and liked the most abstruse parts
best; but like the famous gentleman who talked prose without knowing it, we never dreamed of connecting them with our philosophy” (29).

Nonetheless, Addams’ rhetorically effective protestations aside, the very success of the settlement itself suggests she must have been able to shape her education at Rockford toward creating a new, less restrictive social role for herself as a middle-class American female. In fact, a more complicated picture of the boarding school years than Addams herself painted in her autobiography does emerge from close, historically contextualized reading of archival records from her enrollment at the school. Texts she wrote while still a student at Rockford, carry traces of a complicated cooperative effort by Addams and her classmates to re(de)fine the institution’s model of feminine teaching and learning. These artifacts suggest that, rather than being a restrictive environment forcing rigid conceptions of female middle-class identity on passive students, Rockford promoted the early shaping of the author’s sense of her self as a social being, and of her educational philosophy, by providing sites for trying out cooperative teaching and learning strategies she would further develop in the settlement later.

Recovering this partially obscured record of the positive aspects of Addams’ shared seminary/college learning can help account for what might otherwise seem an inexplicable contradiction—her continued active support of Rockford throughout her life. (Addams served as a member of the school’s board of trustees, replicated specific elements of her own curriculum there within various study courses at the settlement, and used the Rockford campus as site for summer institutes for learners from the Hull-House neighborhood.) With the aim of highlighting links between Addams’ women’s seminary/college learning and her settlement teaching, in the remainder of this essay I will 1) clarify the school’s identity, during Addams’ enrollment, within the context of the nineteenth-century women’s college movement; 2) describe the collaborative nature of her learning there and outline the bread-giver role Addams and her fellow students developed together; and 3) characterize the creative reshaping of feminine middle-class subjectivity achieved by Addams and her classmates through their sometimes-resistant Rockford learning.

II. Dynamic Moment: Rockford’s Changing Institutional Identity in the 1870’s-80’s

For the author and her classmates, learning at Rockford became a shared, reciprocally-nurturing and outward-reaching experience, partly because they mounted a collaborative effort to change the seminary’s identity and purpose, so that the relationship between institution and students became more interactively dynamic than a too-literal reading of
Addams' own account would indicate. Like the interactions of Hull-House residents and neighbors with other Chicago institutions would often be, Addams' learning within the paradoxically constrained yet empowering site of Rockford was discreetly oppositional. Initially, in fact, Addams had been unenthusiastic about attending Rockford Seminary at all. Her older sisters had preceded her there, and her father was a trustee, but she had expressed a clear preference for Smith College, which had just opened in 1875. Her 1877 enrollment at Rockford represented a reluctant surrender to family pressure: she had visited Smith, taken an entrance exam, and been admitted—only to have her father veto that choice (Barker-Benfield 1979, 408).

Anyone familiar with the program Addams eventually established at Hull-House can sense the appeal Smith's emerging philosophy would have had for her. Under the direction of John Morton Greene, the college was conceived "in two prominent particulars" as a reaction against the system employed by Rockford and other female seminaries: instead of using one large dormitory-like structure, it would distribute students among several small, home-like cottages; instead of shutting away enrollees, it would promote student involvement in the community to keep women bound to what Greene called "real practical life," and "free from the affected, unsocial visionary notions which fill the minds of some who graduate at our girls' schools" (Horowitz 1984, 70 ff).

In contrast, Rockford was (according to Addams herself) the "Mount Holyoke of the West" (HH 27-28), modeled on the seminary system developed by Mary Lyon. Central to that philosophy, Lyon had explained, was the sequestering of female students in a "building shaped like a dwelling house," where young women could find a safe haven for "study, prayer, work, and rest" (Horowitz 1984, 12. See also Davidoff 1979, 64). So, with a conception of "house" quite distinct from Smith's community-connected homes, founder Anna Sill structured Rockford's learning environment to include domestic chores, a rigid schedule, a closed campus, and strict adherence to rules. Details in the "boarding Arrangements" portion of the catalogue published during Addams' enrollment underline this element in the institution's philosophy:

Punctuality at the commencement, and daily attendance during each session of the year, are indispensable to a high standard of scholarship. If education is worth anything, it is worth what it will cost to make it thorough. It is therefore expected that every pupil will be in her place at the appointed time, even at the expense of personal sacrifice and inconvenience (Rockford Seminary Catalogue 1878, 27. From Rockford College Archives; used with permission of Rockford College, Rockford, IL. Subsequent references will use RSC).
At least as important as the seminary's regimentally domestic setting was its inspiration in the ideology of the asylum. Besides basing the dwelling design for her model seminary on the typical asylum building, Mary Lyon's system rested specifically on her interpretation of the program of Hartford Hospital for the Insane, where her sister had been treated for a nervous collapse. The controlled discipline of the asylum cure, Lyon felt, was exactly what was needed to give educated women strength. A reader versed in Addams' biography can see the appeal such an educational setting and program would have had for her family, always concerned about her mental health. In fact, her family might have argued later that her collapse after one term at medical school and her subsequent stay at the famous Weir Mitchell clinic/asylum only served to confirm her need for just such a protective (learning) environment (See HH 40). After all, as Dr. Edward Clarke had argued, an excessively rigorous, unregulated academic program could be dangerous for women's health.

Addams' own preference for Smith, in contrast, is consistent with her later work as a Hull-House learner and teacher. The distinctive differences in the philosophies of the seminary she actually attended and the college she had aspired to give added force to her images in "The Subjective Necessity" chapter. The "educated young people" who were "shut off from the common labor by which they live" (68) and "shut...away from that half of the race life" (69), "restricted" with "no recognized outlet for their active faculties" (71), would only worsen their situation if they returned to college for "second degrees" (72). In the stifling environment typical of many such schools, Addams explained, they would be "buried beneath" the "mental accumulation" and denied meaningful action (72).

The sequestered environment of the seminary, however, may have been only one element that Addams was resisting in its stated program. Davis, for instance, has suggested that the 1870's Rockford curriculum may have matched her father's conception of a proper female course of study more closely than her own. Davis stresses the link between the seminary's mission and John Addams' personal views on education for women, who "should be taught to become better wives and mothers, not scientists or professors." Specifically, Davis notes, Jane's stepbrother George was "encouraged to become a doctor or scientist," while she "was quietly discouraged from any such ambition" (1973, 9. See also Hurt 1990).

If Jane Addams were, indeed, seeking to prepare for a professional career other than teaching or missionary work, Rockford would have seemed on the surface to have little to offer. The seminary catalogue published during her enrollment emphasized goals for its students
consistent with the ideology of domestic teaching as middle-class women's rightful identity. Besides the most desirable choice of wife/mother, the catalogue observes, "there is a great demand for liberally educated Christian women, in social life, as teachers, and in the various benevolent fields of labor. How can wealth be better applied than in the aid of those whose life work promises such a reward to the giver?" (RSC). Setting forth such nurturing plans for its female students, Rockford positioned itself somewhat ambivalently along the boundaries of nineteenth-century expectations for middle-class women—encouraging students to set noble work aims, but limiting those goals to traditional concepts of middle-class womanhood.

In particular, by the last quarter of the nineteenth century, the restrictions and powers associated with the middle-class feminine role of domestic pedagogue had been firmly recognized in principle but were still being debated in practice. Educated American women were "more than helpmeets"; they were, Helen Horowitz explains, "the Mothers of the Republic" who "nurtured the future electorate and representatives of the polity." The "keepers of the nurseries of the new nation," they "needed not only the virtue necessary for moral guidance" and the accomplishments associated with earlier finishing schools, but also the ability "to understand the world of political discourse." In this context, the rhetoric of Rockford's catalogue signaled its affirmation of what Horowitz characterizes as the increasing "seriousness" of women's education, since more "professional" conceptions of female roles like teaching, missionary work, or "Republican motherhood" necessitated it (Horowitz 1984, 12 ff.; Sklar 1973, 180; Robbins 1993). Thus, although the publication reflected traces of the finishing school, the tone and context for presenting these aspects of the curriculum were clearly connected to images of the seminary students as future pedagogues—at least in their own homes—rather than husband-catchers. For example, the "excellent advantages" of "Musical Education...Drawing and Painting, with special reference to teaching" were highlighted on one page of the curricular guide, just after the announcement of a "Collegiate education of young women" and a charter "with full college powers, and teachers of reputation" (RSC, 17). With the seminary already on its way to becoming a college, then, Addams may have enrolled reluctantly, but she and her classmates at least found Rockford a learning environment somewhat receptive to challenge and change—supportive, in fact, of collaborative or, more specifically, sororal social learning.

That other students shared Addams' concerns about the institution and joined her in resisting some of its philosophy and teaching practices is clear, in fact, from some of their letters. For example, correspondence from former classmate Mary Ellwood, who had enacted Addams' own
wishes by moving on from Rockford to Smith, provides corroboration for speculations about what Addams found lacking in the seminary curriculum. In a June 1882 letter, Ellwood warned Addams that trying to achieve classification as a Smith junior by examination might prove difficult, given the less rigorous course work at the seminary. A similarly critical tone marks a later letter from Helen Harrington, who had enrolled at the University of Michigan as one of the first women students there, after matriculating with Addams at Rockford. Harrington and Addams had been invited to return to their alma mater to receive its first B.A. degrees, and both were evidently uncertain about accepting. Addams was reluctant, partly because she was still intent at that point on joining Ellwood at Smith, although she never did. Significantly, Helen explained her own hesitancy by noting that, compared to the rigor of her current work at Michigan, she did not set much store in a Rockford B.A. Nonetheless, indicating that she would probably come to Rockford for the ceremony if Addams joined her, Helen implied an enhanced value for the experience if it were a shared one. (By April, Addams had evidently written back, as Helen sent along another letter enthusiastic about the commencement, in which they both participated.)

In much the same way, Addams herself had earlier used references to shared learning to try persuading Eva Campbell to come back to Rockford when, in a June 1879 letter, Eva reported she might not return. Addams' 23-page response letter was full of details about the intellectual and social life at college that Eva would miss if she failed to re-enroll, and included the plea:

Don't give up the idea of coming back, Eva, I beg of you, for it seems to me that we can both do better work at Rockford next year than anyplace I know of, let's go to work & do it, helping each other all we can & not make all our resolutions at the end of the year, I have been thinking my friend that what we need is a more systematic plan of recreation, that we want to recreate as hard as we study, we can do a good deal more & better study if we try it that way; we will make the experiment.

(Addams 1880)

In its emphasis on "helping each other" to "work," and on including a "systematic plan of recreation," Addams' argument not only foreshadowed her Hull-House program. It also represented how, for her and her classmates, their Rockford experience was emphatically social, and how, even though bound by institutional constraints associated with the seminary model, they were able to "experiment" toward shaping their own learning. Addams' letter did not dissuade Campbell from leaving school to marry.
Taken all together, although these letters from/to Addams and her friends reveal mutual doubts about the quality of their school experience, they also exemplify one of its paradoxical strengths. By seeking to sequester young women away from the larger society, Rockford may have precluded some kinds of knowledge-enhancing experiences in the larger world. Yet, as proponents of single-sex educational institutions today continue to point out, the supposedly closed setting can foster a different kind of supportive community, withdrawn temporarily (even if only theoretically) from the mixed-gendered competition of the larger world in preparation for more effective later interaction with it.

Significantly, this very ideal was clearly epitomized in a Class of '81 song written by Addams, Eleanor Frothingham and Martha Thomas for their Junior Exposition. Several stanzas commented on the potentially creative tension between seclusion and action. Examples include the following:

> Within a cloister old and dim,
> These seventeen maidens heard the hymn
> Of a wailing world, both starved and old,
> Awaiting the fate already foretold,
> For the year of '81.

> O, may we all, in years to come,
> Ennoble duty, but never shun
> The work for us long set apart,
> To give bread wrought for mind and heart,
> Bread-givers of '81 (Programme, Junior Exhibition, 1880.
From Rockford College Archives; used with permission of Rockford College).

Casting themselves as the “Bread-givers of '81,” Addams and her classmates announced their motto, which was also engraved on special stationery and figured prominently in other publications and speeches through the remainder of their school careers and beyond. Several speakers, for instance, drew on the motto for their graduation speeches the next year.

In her own valedictory address remarks to her classmates in 1881, Addams herself signaled the importance of both the motto and the sororally supportive learning/teaching model it embodied during her time at Rockford and afterwards. Labeling her group “the glorious seventeen,” Addams reminisced about how they “worked and planned and studied for four years.” Because they had “touched and stirred” each other so often, the class members had been able to express “to each other higher and nobler things than [they had] probably ever said to any one else.” If ever “tempted to flag and grow weary of ‘bread-giving,””
then, the “girls of ’81” would remember each other and be strengthened to achieve “higher things.”

A year earlier, in her Junior Exhibition welcome address to “Friends and citizens of Rockford,” she had offered still another affirmation of the bread-giving female ideal, through which “young women of the nineteenth century” could “proudly assert” their “independence,” yet still retain the old ideal of womanhood—the Saxon “lady” whose mission it was to give bread unto her household. So we have planned to be “bread-givers” throughout our lives...and thus happily fulfill woman’s noblest mission.

Addams’ nineteenth-century woman, she explained at the Junior Exhibition,

wishes not to be a man, nor like a man, but she claims the same right to independent thought and action. Whether this movement is tending toward the ballot box, or will gain simply equal intellectual advantages, no one can predict, but certain it is, that woman has received a new confidence in her possibilities and a fresher hope in her steady progress (110-111).

Downplaying female political aspirations while nonetheless acknowledging them, and advocating an independence built on collaborative study, Addams was already in 1880 describing a brand of activist education as conceived and practiced within the female seminary context.

III. Constructing a Counter-Curriculum

In several strategic ways, what the official core program of the seminary would not provide or fully affirm during Addams’ enrollment, the “bread-giving” students created together for themselves. Working along the blurred border between formal curriculum and informal social groups, Addams and her peers actively shaped their own learning, and, in so doing, helped reshape the institution toward a less authoritarian, more cooperative style of learning.

Sharing common interests, informing each others’ writing and thinking, is, of course, not unusual for students in any college setting, and historians of institutionalized learning like Arthur Applebee and Gerald Graff have taken note of the especially vital role social learning societies played in nineteenth-century American colleges (Applebee 1974, 12 ff.; Graff 1984, 44-45). But while the general histories by Applebee and Graff provide a useful context for examining the shared seminary/college “extracurriculum” literacy of Addams and her classmates, those studies tend to focus on male-dominated institutions and/or treat students as
genderless. In fact, what is especially notable in the many records of Addams' interaction with her school peers through their society-associated activities is their self-conscious attempt to foster a distinctively feminized reciprocal intellectual development through a social learning experience. Ironically, however, though the middle-class, single-sex student body at Rockford was clearly more homogeneous than the diverse mix that would share in the Hull-House educational programs, Addams found much in the feminized social learning of her seminary/college that she could adapt later to settlement-house education. A key element in that adaptation process was realizing that, just as she and her friends had especially enjoyed and profited from sharing texts by and about women, the immigrants needed to have their own culture represented in Hull-House's curriculum. As Holli has noted "To reach the immigrants, Jane Addams worked through the matrix of an old world culture to win their confidence and make the newcomers receptive to advice from Hull-House. Italians might be invited to the settlement house on Saturday for readings from Mazzini's works or to celebrate a folk holiday; Germans might be treated to folk leader or Schiller on Tuesday night..." (1989, 8).

The seeds of the settlement's carefully negotiated social learning experiences are evident in records of Addams' own sororal learning at Rockford. Some of the artifacts useful for tracking this ongoing collaborative process at the seminary/college include notes from club debates, multiple drafts of compositions, and articles from the student-managed magazine. Perhaps most important for Addams was her membership in the literary/social Castalian Society, a collegial, sometimes oppositional site for debate and discussion about such issues as defining the most productive social roles for women in society and questioning the potential conflict between institutional expectations about learning and individual needs. In goal, content, and method, the Castalian Society foreshadowed the social study clubs so crucial to Hull-House pedagogy. For example, the Society staged an elaborate debate on the following question: "Resolved, that the French women have had more influence through literature than politics." Addams championed George Sand as a model of direct intervention into society through literature-writing. Corinne Williams, from the class of '80, on the other hand, argued for the Mme. de Stael brand of indirect sociopolitical influence via the salon. Addams' title page denoting the debate as intended for publication in Harper's may represent a schoolgirl's over-ambitious goal for the particular piece at hand, but it also signaled her serious commitment to the topic. The specific arguments marshaled by both sides in this particular debate—one of many sponsored by the club during Addams' time at Rockford—clearly reflect competing ideologies for ideal womanhood.
that the students were striving together to critique and, in Addams’ case at least, to synthesize.

Williams, promoting the de Stael model, hypothesized a specific cultural tradition for its practice.

The French women have not the solid, home-like qualities of their English sisters. They live in and for society, and in France more than anywhere else, they rule. From the French girl’s earliest childhood the leading idea in her education has been to make her fascinating and through that fascination powerful. Thus the ambition to be influential was early instilled into her mind and to acquire power the aim of her life. She knew that this could be accomplished only through her influence over men, for as a direct ruler, a woman has never controlled France.5

Addams, on the other hand, began her presentation by insisting that traditions barring women from both politics and literature should be regarded as relics of the past:

The question then is not what it might with propriety have been twenty years ago, does woman exert an influence, for that is proven without a doubt, but in which of the two great spheres of action is her influence felt the most?6

Seemingly determined to move beyond arguing the specific case of Sand versus de Stael to an apology for woman’s “intellect” being “as vigorous in power as her charms are persuasive in society,” Addams moved from a chronicle of Sand’s dramatic self-representations in life and literature to an insistence that she wrote primarily to and for women. Mainly, Addams asserted, quoting an unacknowledged source, “For the first time in the history of the world woman spoke out as a woman, not as the plaything, the pupil, the satellite or the goddess of man.”

Within the fairly extensive body of available texts from Addams’ Castalian Society debates, the de Stael/Sand notes may be unusual in their highly emotional tone, but not in their focus on gender issues. If Barker-Benfield is right that Addams’ father “supplied her with masculine models and she...reciprocated by modeling herself on him” (1979, 398), in the formal and informal women’s college literacy activities like this debate and her letter exchanges with classmates, Addams was seeking out, with their help, appropriate alternative feminine ones. Sororally constructed rather than paternally or maternally imposed, these tentative models helped Addams reconceive and transform her own middle-class female subjectivity toward a new social role. Whether Addams’ unbridled praise for literary female influence or her opponent’s
plea for the salon model convinced more audience members on the day of the debate itself is probably not as important to understanding the evolution of Addams' personal and pedagogical identity as the fact that the debate occurred, and that it occasioned such extensive collaborative preparation. In this particular case, three different drafts survive, the longest at sixteen pages. (One of the drafts has extensive margin comments in another hand.) In its high degree of cooperative learning, then, the debate, like so many other informal literacy experiences the Rockford women shared, contrasts the less dialogic nature of official responses Addams elicited from teachers reading her assigned compositions. While the teachers tended to put only “excellent” or “very good” on her papers, Addams was receiving far more detailed and specific feedback from other students.

Addams herself understood, exploited, and attempted to replicate these cooperative learning ventures in her later Hull-House teaching. The shared reading, debates and drama of her college literary society all would have their counterparts in the Hull-House clubs program. Especially in the evening, the settlement’s club activities ranged widely, with everything from serious study of grammar or shared reading of Dante, to more hands-on learning like clay modeling, to more lively oral debates sponsored by groups like the Social Science Club (Moore 1990, 48). For instance, the Hull-House Players wrote and performed their own productions—often far more elaborate than playlets Addams had helped produce at Rockford, but similar in the enthusiasm of participants.

So too, Addams' main settlement publication, the Hull-House Bulletin, was anticipated in both form and content by the Rockford Seminary Magazine. Both publications were monthlies containing a mixture of news, features, and unabashed editorials written from virtually identical, almost stubbornly didactic perspectives. For instance, Addams' own Rockford magazine article about an upcoming presidential election (November 1880) has its counterpart in the bulletin’s series of pieces on the Chicago aldermen’s race. Equally significant, though both publications always included news specific to the site, both also printed a substantial amount of material about and from the larger world outside. Addams herself was “Clippings and Exchanges” editor of the Rockford Seminary Magazine her junior year. With regular mailings of newspapers and magazines circulating among a variety of schools all over the country, she had a wealth of material to draw on for her column. Sometimes she would join other collegiate authors in a dialogue running over several issues, as when she reported in the Rockford paper about reading a Yale reviewer’s positive reaction to one of her earlier pieces. With plenty of opportunity to carry on lively journalistic “conversations” among a wide range of far-flung students, Addams’ assertion in a March
1880 “Clippings and Exchanges” article that “we do not believe in co-education” may not be surprising (94), since the literary magazine was helping insure that her seminary experience was not really cloistered at all (From RCA in JAP, microfilm edition).

IV. Commencement: A Retrospective View of Addams’ Address in Context

Perhaps the best example of the complicated collaborative Rockford learning process that was leading Addams toward her settlement concept is provided by the interactive commencement speeches her class delivered in 1881. Taken as a group, these texts encapsulate the young women’s shared concerns about the middle-class feminine social role and prefigure some of Addams’ upcoming efforts to refine it. Contextualizing her speech with her friends’ efforts once again shows Addams to be a product of, resister against, and adapter of the specific culture of the nineteenth-century woman’s college.

Unsurprisingly, the main theme for the commencement addresses was “influence,” with graduates praising and situating it in varying degrees of proximity to the home setting. Most class members concentrated on advocating abstract qualities associated with female influence—charity, economy, promptness, thoughtfulness, love of culture. Many speeches basically echoed the college catalogue’s pronouncements, but their tone was uniformly enthusiastic and sincere.

What seems to have been the most impassioned presentation besides Addams’ own was Kate Tanner’s. Tanner argued that “woman’s realm is home,” since “at home she fills the mission of the Saxon lady who was a ‘Bread giver’ and feeder of the poor,” who has “fulfilled woman’s noblest work on earth.” In fact, Kate Tanner warned, when woman forgets that she “has already all she can successfully accomplish at home” and in “the social and literary circles without constantly striving for more avenues to power, more opportunities for employment and more gates to wing out upon into the political world,” she betrays her true destiny. After all, Tanner insisted, “At home is where woman’s influence is needed, and not in the public assemblies.” Clearly distressed by the efforts of some women to expand their influence beyond what she saw as its rightful boundary, she marveled that these confused females could say “they want power, political power, and yet the world is entirely what their home influence has made it.”

To juxtapose such a speech with Jane Addams’ own commencement address is to better understand the cultural context for her reformulation of feminine social identity and pedagogy. Trying to achieve a synthesis that would not undermine her more conservative sisters like Tanner would be a challenge indeed. Addams’ solution was represented in her
commencement address by a refigured, nineteenth-century Cassandra character. Drawing a parallel between Homer's time and her own, Addams predicted a similar difficulty for any nineteenth-century female prophet, since "men with hard research into science" were still dominating over "intuition," the more feminine brand of understanding which must struggle to make itself "intelligible" and thereby gain "auuthoritas." In depicting a refashioned Cassandra, Addams offered hope of imaginative change for woman through appropriation of male knowledge into female understanding. Significantly, however, she set the initial stage of transformation within the domestic setting, where "love" and its "ministering spirits" have fostered "woman's insight." In a charge at first glance ironic given Cassandra's childlessness, Addams urged women to continue carrying out their maternal role. But she followed that request with a plea to do more than "sit and dreamily watch" one's child. Through domestic-based but outward-looking scholarship ("accurate study" of life, perhaps via "one branch of physical science"), combined with experience in "the active, busy world," Addams argued, the new prophetess would acquire social power. She would, then, find a way to "test for the genuineness of her intuition." Thus, by safeguarding the traditional values of nurture, developing a knowledge of science through study, and pursuing an "active labor" in the larger world, she would gain authority to speak and to be believed.

By the time Jane Addams wrote Twenty Years at Hull-House; with Autobiographical Notes, the century of her Rockford education had given way to another, but the sometimes-competing ideologies of middle-class femininity represented by her seminary's official curriculum and by the students' collaborative efforts to interrogate and reshape it were still powerful forces in American culture. In this sense, despite its 1910 publication date, and especially with reference to its subtitle, Addams' book was clearly more a nineteenth than a twentieth-century text. So too was the Hull-House settlement's education program. Though well prepared by the collaboratively sororal learning atmosphere of Rockford to assume a role of intellectual (as well as sociopolitical) leadership, Addams clearly believed she should not try to claim too much, should not overemphasize the radical aspects of her pedagogy. So, to help develop and promote her settlement education program, she drew on her similarly constrained yet out-reaching learning at Rockford. Understanding those ties between her schooling and her teaching, therefore, can clarify her textual representations of Hull-House, especially in the Twenty Years retrospective, as a conserving/conservative force, even as she also showed it empowering marginalized city-dwellers and the settlement residents by linking shared learning to social action.
1. "Editorial," Rockford Seminary Magazine (December 1880): 280-82. "Home Items" was a regular column of recent quips, quotes, and general Rockford gossip. From Rockford College Archives (RCA); used with permission of Rockford College, Rockford, IL. For these and other references from the archives, I used the microfilm edition of the Jane Addams Papers (JAP), edited by Mary Lynn Bryan. That edition is available as part of the Jane Addams Memorial Collection, Special Collections, The University Library, The University of Illinois at Chicago.

2. One body of counter-evidence to this kind of interpretation of Addams' view of European travel is the notable number of contemporary representations (by Addams herself and by others) of the Hull-House founding as directly inspired and guided by her visits to England's Toynbee Hall. Several 1890 entries in the Hull-House scrapbook speak to this point. (See scrapbook, volume 1, page 2). For example, an article entitled "Work of Two Women" has as one subtitle "Old London's Toynbee Hall Used as a Model by Miss Jane Addams and Miss Ellen Starr." Several scholars have already done much to debunk the myth of the sudden inspiration to found Hull-House. See Davis (1973) Crunder (1982).

In the late 1960s, when Michigan residents and officials were beginning to discuss seriously education reform, fledgling Governor William G. Milliken used a vivid analogy to describe his frustration with trying to improve the state's school-finance system. Such efforts were, he said, like trying to fill a group of pans spread across a football field by using a fire hose. No matter how hard he tried, or how much water he used, he was simply unable to fill the pans with equal amounts — some overflowed, while others stood almost empty. The same applied to schools across the state — although some were abundantly endowed, others struggled to provide minimal educational services (Mich. Exec. Ofc., 1972).

Milliken's analogy, although accurate in its characterization of the wide financial disparities between school districts, incorrectly implied that the way the state distributed its school aid was a random process. Rather, as Milliken would come to understand in his more than four years of active involvement in school-finance reform efforts, such clearly inequitable funding schemes were the result of wider sociopolitical conditions. This paper will discuss those conditions in terms of the public debate over school finance reform in Michigan in the late 1960s and early 1970s, a time when such debate was at a peak in the state and nationally. As with other educational initiatives, public perceptions of school-finance reform limited the possibilities of that reform.

Most scholars discussing American efforts to reform public school systems from World War II to the 1970s generally divide them into three main time periods, each identified with a decade. In the 1950s, attention was focused on racial desegregation as mandated by the Brown v. Board
of Education decision and on improvement of math and science instruction after the Soviet launch of Sputnik. In the 1960s, events such as the passage of the 1965 Elementary and Secondary Education Act spurred efforts to improve schooling for pupils with special needs. And in the early 1970s, beginning with the California Supreme Court’s 1971 Serrano \textit{v. Priest} decision declaring the state’s school-financing system unconstitutional, school-finance reform became a widespread concern (See Ravitch 1983; Spring 1976; Augenblick 1986; Graham 1979). Yet such a nationally oriented view does not fully explain the reform of an institution as decentralized as education. Underlying the major events and government activity was a public discourse in the individual states that defined and delimited the prospects of reform. In order to see how reform came to take the shape it did, therefore, an understanding of the context in which the issues were being framed from state to state needs to be had.

Since the early 1960s, scholars who have sought to understand education in terms of its relation to the political realm have mainly concerned themselves with political-feasibility studies and analyses of the institutional forces that influence education (See Bailey et al. 1962; Masters et al. 1964; Kirst 1970; Campbell and Mazzoni 1976; Mueller and McKeown 1986). Others have discussed the limits of reform of a publicly funded institution in a capitalistic, meritocratic society (See Carnoy and Levin 1976; Weaver 1982). There have been no in-depth studies, however, of how educational reform is influenced by the public debate that surrounds it.

Similarly the literature on school-finance reform offers little in the way of analysis concerning how public perceptions define possibilities of reform. If, as one author puts it, we need to view school-finance reform “as only one manifestation of a much broader movement for social reform which manifests itself through the public schools,” (Hickrod 1983) then it would seem that we should understand how that movement and its opponents influence the debate. Yet very few writers concern themselves with this level of discussion. Instead, most studies of the politics of school-finance reform almost exclusively focus on how reform efforts are manifested in state courts and legislatures (See Berke et al. 1984; Elmore and McLaughlin 1982; Lehne 1978; Meltsner et al. 1973; Mulkeen 1984; Garms et al., 1978). Some scholars have discussed the ideological foundations of the debate over school finance, but only in general terms that are detached from the kind of rigorous analysis characterizing studies of political feasibility or legislative voting behavior (See Hickrod 1974; Hickrod 1987; Ward 1987).

On the basis of such impressionistic studies, however, a framework of analysis can be formed to understand how the terms of public debate
constrain school-finance reform. James G. Ward, in his discussion of the normative foundations of public school finance, identifies five main values that advocates and opponents of school-finance reform support to varying degrees at different times: adequacy of funding, efficiency in the use of funds, equity in either or both the raising and distributing of funds, liberty in terms of local control over schools and/or the ability to control one’s educational activity or financial support, and schools’ legitimacy or accountability as public institutions (Ward 1987, 474-475). In the 1960s and 1970s, liberty and equity were the two strongest values debated in American education. Liberty, usually discussed in terms of local control over schools, “ha[d] on its side the staunch allies of tradition and political inertia” stretching back to the earliest days of American public education (Jones 1976, 110-112). By the 1960s, however, many people began to dispute the value of local control, especially to the extent that it perpetuated inequities of wealth and race. This clash of liberty and equity advocates best characterizes the debate over school finance in the late 1960s and early 1970s, but each side also incorporated other values that Ward describes into their debate as well.

Liberty advocates in particular widened their base of support through their emphasis on issues other than local control. In his 1991 book Savage Inequalities: Children in America’s Schools, Jonathan Kozol claimed that the roots of the current inequities lie in the ability of liberty advocates to constrain the terms of the debate by incorporating issues of efficiency and accountability of schools in order to overrun the issue of equal funding:

At every level of debate, ... the argument is made that more efficiency accrues from local governance and that equity concerns enforced by centralized authority inevitably lead to waste and often to corruption. Thus, “efficiency” joins “liberty” as a rhetorical rebuttal to the claims of equal opportunity and equal funding. “Local control” is the sacred principle in all these arguments. (Kozol 1991, 210-211)

The debate over liberty and equity has recurred throughout American history, with the 1960s version of this argument effectively ended by the 1973 U.S. Supreme Court decision in San Antonio Independent School District v. Rodriguez, which upheld the Texas school finance system as constitutional despite gross disparities in per-pupil expenditures (Kozol 1991 213-214). The Rodriguez decision, writes one historian, “headed off a revolution in the funding of public schools in America” (Kluger 1977, 769) and provided liberty advocates with a resounding victory.

In Michigan, as in many other states, this liberty versus equity argument reached a fever pitch in the late 1960s and early 1970s. From the
publication in 1968 of a report describing the inequality of educational opportunity in the state to the passage in 1973 of an act reforming the school finance structure, Michigan and officials engaged in a consistent and sometimes fever-pitched debate over the role of the state in the financing of public education. While Kozol's division of the participants of the debates into "liberty" and "equity" camps is helpful in trying to understand the situation in Michigan at the time, it oversimplifies the matter. In Michigan twenty to twenty-five years ago, those who opposed school finance reform favored retaining local control over education, yet at various times issues of higher taxes, cross-district busing, and aid to parochial schools were important factors for the opposition.

Advocates of differing views about reform also made strange allies. Those who wanted property tax relief favored certain types of reform, while those who wanted greater equity or overall increases in school funding favored others. Thrown onto the political battleground, such disparate interests could form only the most tenuous alliances. In fact, studies of Michigan educational coalitions conducted in this era all characterized them as "fragmented."

As concern for restructuring school finance increased in the late 1960s, however, the battle lines seemed clear. In Kozol's terms, those who favored greater equity in school finance were opposed by those who wished to retain local control over schools. Only as the debate progressed, issues bifurcated, and participants polarized would it become clear that any reform would be minimal at best and designed to appease as many different interests as possible.

Like most states up to the late 1960s, Michigan supported its public schools chiefly through a combination of state aid and local revenue. The state provided aid to schools through "foundation" programs, which were designed to ensure a minimum level of funding for schools, and local revenue was derived from property taxes. Because local voters had to approve property-tax increases, and because of the wide disparities in different school districts' property-tax bases, substantial variations existed in the amount of local revenue available. These varying tax rates and tax bases translated into gross disparities in funding between school districts. In 1965-66, for example, per-pupil expenditures ranged between $400 in the poorest district to $741 in the wealthiest. Michigan attempted to compensate for these differences by giving poorer districts larger amounts of state aid, but wealthier districts still held a distinct advantage because of the relative ease with which they could raise their levels of funding (For technical aspects of Michigan's school-finance system prior to 1973, see Thomas 1968; Caesar et al. 1974; Brazer and Anderson 1976).

Education costs in Michigan began to skyrocket in the mid-1960s, sent upward by the Legislature's passage of an act authorizing public em-
ployees to bargain collectively. Teacher organizations began negotiating for higher salaries and improved benefits, leading to a large number of strikes over the next few years. From the 1964-65 to the 1972-73 school year, the average teacher's salary in Michigan increased 78.9 percent. Combined with a 14.4 percent increase in the number of pupils, school district expenditures rose 159 percent during this eight-year period. State expenditures for education were increased substantially in the period, generally compensating for the higher costs, but a large portion of the growing burden continued to fall on local property taxes (Caesar et al. 1974, 8, 35).

In addition to the growing cost of education, many school districts were facing decreased local revenue. In Detroit, for example, schools' income from local taxes had been dropping steadily for several years because of a declining tax base. This led to a "crisis" situation in 1966, when the Legislature had to give the Detroit school board $12 million to shore up its budget, under the stipulation that Detroiters increase their property-tax rate for schools (DFP 1 Jan. 1967, 4A).

By 1968, changes in public perceptions of the state's role in the control and financing of public education were apparent. Ann Arbor News columnist William Cote caught this new mood:

The winds of change blowing through Michigan's schools are stirring growing murmurs of things hardly whispered before. For one, might the state take over control, if not outright operation, of the public schools? The idea seems almost subversive to many citizens because it has become a near-sacred concept that local people and local school boards should run their schools, with some financial aid from the state. But now the increasing property taxes, state and city income taxes, potential federal income tax increase and inflation are driving some residents and officials to begin seriously thinking about a basic change in who finances and operates our schools. (AAN 27 Jan. 1968, 4A)

Significantly, it was financial constraints, not a concern for schools themselves, which began to convince many that the school-finance system was in dire need of an overhaul.

The education lobby helped to bring reform concerns into the public eye. There were two major teachers' unions in Michigan — the Michigan Education Association (MEA) and the Michigan Federation of Teachers (MFT). The MEA, one of the most influential major professional education groups in the state, had 512 local chapters in 1968, a number which increased to 561 (out of a total 650 districts) in 1971. Representing suburban and outstate districts, the union prior to 1965 had been "the
spokesman of educational professionalism," but with the advent of collective bargaining, it became much more concerned with representing teacher interests. Although it only represented between 20 and 30 districts in these years, the AFL-CIO-affiliated MFT represented the huge Detroit district as well as some of the larger suburbs. Because of this more urban base, the MFT tended “to pay particular attention to the social problems of schools in urban areas.” In addition to the teacher unions, there were groups of administrators and various citizens’ and business groups that concerned themselves with education. There was also what one observer termed a “Trojan horse operation” of ex-teachers and ex-administrators in the Legislature — fully two dozen of 147 lawmakers fit these categories (DFP 18 Aug. 1968, 3A; Pinner et al. 1971, 52-56; DFP 16 April 1967, 3B; Masters et al. 1964, 183-201).

Public concern for reform was bolstered by the January 1968 release of the report on school finance that the Legislature had commissioned in 1966. This study, conducted by J. Alan Thomas of the University of Chicago, identified a number of problems in school finance — most notably, “great variation in the educational opportunities available” to Michigan schoolchildren. Thomas characterized the problems in the financing of education as historically based: “A procedure which was appropriate for financing education in an agricultural era ... hardly meets the needs of an industrialized, mobile society, which is largely urban in nature.” Thomas cited the decentralization of both school administration and school financing as the reasons for this inequality of educational opportunity, and offered several proposals for remedying it. The “most effective” way to guarantee equal opportunity, Thomas wrote, would be through shifting more of the responsibility for school finance to the state level (Thomas 1968, 323-347). The Thomas report generated considerable interest, including the formulation of several proposals for school-finance reform (Pinner et al. 1971, 2).

In his first State of the State message in January 1969, Gov. William G. Milliken picked up the mantle of education reform:

We must develop a vastly improved state aid formula to help equalize educational opportunity, and we must do it as quickly as possible. We must improve our system of financial support to take undue pressure off property taxes. We must devise a means of more effectively spreading the industrial tax base. (DFP 10 Jan. 1969, 1A, 4A)

Milliken’s decision to make educational reform the “major thrust” of his administration was, in the words of one observer, “most likely based on a combination of personal commitment to improve education and a calculation that educational reform was an issue that could be politically
advantageous to him.” Combined with the atmosphere for educational reform in 1969, Milliken’s personal commitment did much to make school-finance reform an official concern (Pinner et al. 1971, 3, 12-13).

In April, Milliken called for “solid and total reform” of the state school system, appointing a blue-ribbon Commission on Educational Reform to devise a “more-equitable and more-adequate system of financing education.” Using the Commission’s report, Milliken, in October, made recommendations to the Legislature, including a call for a constitutional amendment to be submitted to the voters that would move from primary reliance on the property tax to state-levied non-property taxes. The plan also would have abolished the state Board of Education and replaced it with a director of education appointed by the governor; eliminated intermediate school districts and replaced them with 10 to 15 regional authorities; consolidated local districts to a total of about 250 (from over 600); increased aid to parochial schools (parochiaid) to 2 percent of the total public school budget; and established a centralized budgeting system for distributing school aid (DN 1 Oct. 1969, 1A, 8A). One observer called the proposals “the most radical restructuring of school financing ever officially backed on the U.S. mainland” (Pierce 1972, 426, quoted in Campbell and Mazzoni 1976, 222).

However, as one critic of Milliken’s proposals remarked, the plan was “a winner-take-all gamble” (Columnist Will Muller, DN 6 Oct. 1969, 14A). Indeed, the plan’s inclusion of the hot-button issue of parochiaid would prove to be its fatal flaw. Milliken clearly thought that he would not be able to get an education-reform package through the Legislature without the inclusion of aid to parochial schools, which was high on the agenda of many Democrats, including Senate Majority Leader William Ryan (DFP 7 Dec. 1969, 2B). As debate over the plan proceeded in the following months, however, it would become clear that issues of tax reform and funding equity could not be considered adequately when parochiaid was involved. In one observer’s words, parochiaid became “everyone’s tool in the education fight” (DN 3 Dec. 1969, 24C).

Issues of local control, tax relief, and funding changes were secondary to this polarized debate over the role of the state in supporting private schools, but they were present. Democrats and labor advocates opposed the increased state role in education in the proposals (DN 10 Oct. 1969, 9A; Mich. AFL-CIO News 22 Oct. 1969, 3). Fear of higher taxes or of continued inequitable taxation was another major reason for opposition to the Milliken plan, with Democrats and other opponents charging that the financing features of the plan would hit low-income individuals too hard and favor corporations (DFP 26 Oct. 1969, 6A). Also, many people were opposed to establishing a statewide taxing scheme. As one resident wrote to the Free Press, “It all boils down to this: The people should be
allowed to support the type of educational program they want. ... I don’t think the taxpayers in one area should be forced to pay more to bail out another district which won’t spend more” (Ronald C. Lucas, DFP 23 Oct. 1969, 8A).

Supporters of Milliken’s proposals clearly favored an increased state role in education, in order to provide more adequate and equitable services. The Free Press, for example, called attention to the state’s constitutional obligation to “maintain and support a system of free public elementary and secondary schools,” a provision which the paper said was being violated through the perpetuation of inequities: “The Legislature is the agency obligated to provide for education. It is well past time it faced up to that. Otherwise, that high blown constitutional guarantee and those fancy legal requirements simply add up to mockery” (DFP 5 Sept. 1969, 4A).

Also involved in the debate were issues of racial segregation and urban problems that would become important issues in school-finance reform. Detroit School Board President A.L. Zwerdling took Milliken’s plan to task for its failure to “give adequate recognition to the costs involved in providing a decent education for the large percentage of Michigan’s public school children who reside in this city” (DFP 3 Jan. 1970, 8A). State Senator Coleman Young of Detroit was more direct in claiming that the reason the public school funding crisis had been allowed to fester for so long was that it had been obscured by race problems, since the first districts to run into major financial trouble were predominantly black (DFP 13 April 1969, 1A).

In January 1970, recognizing the problems his plan was encountering and facing a softening economy, Milliken scaled back the amount of money requested and asked the Legislature to drop consideration of an income-tax increase. He did not, however, call for a change in his approach to parochiaid, which the Detroit News noted would likely have helped his plan immensely (DN 15 Jan. 1970, 1A; 16 Jan. 1970, 14A). But while parochiaid was an important issue, opponents of the plan were also critical of the extent to which it would centralize taxing and administrative authority (DN 16 Feb. 1970, 11A). In response to these concerns, House Democrats offered an alternative plan that would have increased funds to poor districts while retaining the local option of increasing funding and moving from reliance on the property tax to the income tax for funding schools.

In summary, the 1970 session “ended in disarray for educational reform.” Milliken was maligned for seeking to “grab” centralized power, parochiaid dominated and derailed the debate, the House Democrats’ plan was enacted without taxes to fund it, and fears of higher taxes were encircling reformers’ efforts. In 1971, however, a renewed mandate for
reform would arise. In April, Milliken renewed his plea for a state takeover of education in a 15-point program presented to the Legislature that included complete elimination of the local property tax. And in September, the California Supreme Court ruled in Serrano v. Priest that the state's system of financing schools violated the state and federal constitutions because it made the quality of education dependent on the wealth of a school district.

In 1972, this renewed mandate turned public attention away from statutory reform and toward constitutional reform. Proposed constitutional amendments were developed by both parties in the Legislature and by the Governor's office, but because of partisan wrangling none of these proposals were able to garner the requisite support to be placed on the ballot. At this point, early 1972, the Michigan Education Association undertook the circulation of petitions to place two amendments on the November ballot. The first amendment, which Governor Milliken soon joined with the MEA in supporting (not insignificantly because it borrowed from many of Milliken's 1969 proposals), would have required the state to assume primary responsibility for the financing of public education and to reduce reliance on the local property tax for school-financing purposes. Known as Proposal C, this amendment would have left to the Legislature what tax or taxes to impose at the state level to replace lost property-tax revenues and included a formula to distribute funds to local school districts "to assure equal and quality educational opportunity for all students." The second amendment, known as Proposal D, would have rescinded the state's ban on a graduated income tax, in order to give the Legislature the option to replace school revenue lost through Proposal C (TV 27 March 1972, 3; DFP 13 Oct. 1972, 3A; Citizens Research Council, 3).

In addition to Governor Milliken, early endorsements of the MEA petition effort came from the Michigan Chamber of Commerce, the Michigan Farm Bureau, the Michigan Retired Teachers' Association, and the Michigan Association of Elementary School Principals, among other groups. Much of the reason for this support probably came from the MEA's emphasis on tax reform and from its claim that the proposed amendments would preserve local control over schools, rather than from any concern for equalizing school funding. The MEA petitions made these emphases clear. The petition for Proposal C read "Give the PEOPLE of Michigan A Chance to Vote on PROPERTY TAX RELIEF AND IMPROVED LOCAL CONTROL OF SCHOOLS." In smaller type, the petition continued "Break the strangle hold that the present local property tax system has on local efforts to provide good schools and quality education" (TV 10 April 1972, 3; 15 May 1972, 3). In no uncertain terms,
the MEA was appealing to politically palatable concerns for tax relief and local control.

Significant opposition also developed, however. In October, the state AFL-CIO, which included among its member unions the Michigan Federation of Teachers, came out against Proposal C because of "its disastrous effects on taxpayers and education in Michigan." (Michigan AFL-CIO News 18 Oct. 1972, 1; 1 Nov. 1972, 3) Meanwhile, other opponents, such as Republican Senator Harry DeMaso, chairman of the Senate Taxation Committee and an expert on tax issues, warned that the proposal would lead to increased taxes and a loss of local control over schools: "The fact is that when the general school operating funds are administered and controlled by 148 legislators, the control is no longer local. It is in the hands of the state" (Michigan AFL-CIO News 1 Nov. 1972, 5).

To proponents of Proposal C, two issues were of paramount concern: reforming the state's system of taxation and improving the methods of funding the schools. As the Free Press argued, passage of C and D would be "a major step toward ending the terrible inequities that exist in school financing in Michigan and an end to reliance on a tax that is not based on ability to pay" (DFP 15 Oct. 1972, 2B; 22 Oct. 1972, 2B).

On the local educational level, opinion was mixed. In fact, even though the State Board of Education supported the Governor's proposals, a survey made in August 1972 and published in the Michigan School Board Journal showed that a majority of school boards in the state opposed Proposal C, primarily because they thought it would bring higher taxes and because they were dubious of its stated benefits (DFP 4 Nov. 1972, 6A). Delegates to the Michigan Association of School Boards convention in early November voted 159-73 against supporting Proposal C, with the major consideration being fear of the loss of local control over salaries and curriculum. As one delegate said "[Proposal C] is asking us to give up local control of our schools and put our faith in the Legislature. We have been crawling to the Legislature on our hands and knees for years to beg and we got nothing. Why should we think we would get anything now?" Yet while local control and a lack of faith in the Legislature were the main objections discussed publicly, a Detroit News reporter perceptively noted that "private conversations frequently were concerned with a fear of cross-district bussing." In the reporter's words, school board members thought that "uniform support of schools — as tax reform is supposed to provide — would remove one strong objection to widespread bussing, that some children would be sent to schools which are inferior to the schools they now attend." This fear was reflected by the votes of association delegates from suburban districts.
around Detroit, who “almost solidly” opposed Proposal C (DN 2 Nov. 1972, 3A).

As an extension of the argument that Proposal C would bring the loss of local control, the busing issue proved volatile. Two months before the referendum, the Free Press recognized the danger of voters associating Proposal C with the busing issue:

The great hazard is that zealots will succeed in entangling the busing issue, which is also heading for a climax in the courts this year, with the question of school financing. If the busing issue has not beclouded the sense of justice of the people of Michigan completely, the voters will surely recognize that, whatever happens on busing, change must come on school financing. To say no to greater equity in school financing is to forsake any pretense of a concern for justice. (DFP, 6 Sept. 1972, 7A)

Although never a primary issue in the public debate, some residents did conflate the loss of local control with a fear of busing. Writing to the Detroit News, Alfred R. Kelley made the connection clear: “With all funds centered in Lansing it will be a simple step for advocates of school bussing to zero in on these funds in Lansing for the purpose of more social experiments so that we will find our money being spent for school buses rather than educational purposes” (DN 27 Oct. 1972, 18B). Another letter writer (Mrs. J. Wietech) was more succinct: “Let’s vote to keep our schools supported by property taxes and keep our children from being bussed” (DN 26 Oct. 1972, 12B).

Up to three weeks before the November referendum, passage of Proposal C seemed likely. Detroit News polls showed support for the amendment rising from 58 percent of a representative sample of 798 residents polled on September 1 to 65 percent of those polled on October 11. In fact, the News polls showed that every subgroup of the Michigan population favored Proposal C through early October, and that the proposed amendment was gaining in Wayne County (which includes Detroit), among blacks, union households, and middle-income residents (DN 3 Oct. 1972, 1A, 14A; 17 Oct. 1972, 1A).

In the end, however, both Proposals C and D failed, the former by a 58-42 percent margin (out of 3.1 million votes). What seemed to be a comfortable level of support for Proposal C faltered in the final weeks of the campaign, primarily because of a negative campaign on the part of the amendment’s opponents. The AFL-CIO, the UAW, and other labor groups continued to charge that passage of the amendment would mean a windfall for business, which undoubtedly had a strong impact on the union vote. Meanwhile, Senator DeMaso charged that Governor Milliken was misleading voters in claiming that the income tax would go no
higher than 6.2 percent if proposal C was passed. He claimed that they would go as high as 10 or 11 percent. An opposition flier that was circulated prior to the election quoted DeMaso's figures, charged that the proposal would not cap property taxes, and predicted that it would erode local control over schools: "Can you imagine 148 partisan legislators doling out billions of dollars without strings attached?" (TV 27 Nov. 1973, 7) The Free Press claimed that on issues involving taxes and schools, voters across the country seemed to be saying: "Don't tamper with my pocketbook and don't mess around with my kids." Proposal C held out the promise of tax relief for millions of Michigan property owners, the paper said, but such a "promise" seemed to be insufficient to convince people (DFP 9 Nov. 1972, 1A).

In addition to the threat of higher taxes, another reason for Proposal C's failure was voters' fear of the loss of local control as manifested in mandatory busing. The Free Press reported that in the final days of the campaign, some opponents of the amendment ran radio advertisements charging that its passage would remove legal barriers against cross-district busing (DFP 9 Nov. 1972, 1A). Speaking to the closing session of the annual meeting of the Michigan Association of School Boards, Lieutenant Governor James H. Brickley claimed that the reason Proposal C failed was that feelings about school busing was high and that it was a presidential election year (DN 19 Jan. 1973, 9A). Lacking "the kind of consensus such fundamental changes really ought to have," as the Free Press observed, and buried on a ballot that was generally conceded to be overly long and confusing, the measure again seemed doomed to failure (DFP 8 Nov. 1972, 6A). The MEA also thought that in addition to "confusion," "selfishness" on the part of voters from wealthy districts, and "political partisanship," voters acted out of a "distrust of legislators and fear of loss of local control, of busing, and of more taxes." In fact, one-half of those who voted against Proposal C lived in the tricounty area surrounding Detroit, where busing would have had the greatest impact (TV 27 Nov. 1973, 6-7).

In the aftermath of Proposal C's defeat, a growing sense of urgency combined with a realization that school-finance reform would be much more difficult than previously thought. The urgency derived from financial crises in many school districts, most notably in Detroit but in many others as well. In the midst of this growing state crisis, many opponents of Proposal C came out in favor of greater state control over education financing. The AFL-CIO pledged to help solve the school-finance crisis, with President William C. Marshall now in favor of statewide funding: "We're going to have to go to state financing. We're not going to be able to rely on the property tax. We've got to have state equalization. The heat has got to be put on the Legislature to work out an
equitable solution” (Michigan AFL-CIO News 13 Dec. 1972, 1). The Detroit News, praising the state plan to aid the Detroit schools, said it would “begin the overdue process of placing all the state’s 600-odd school districts on an equitable funding basis.” Calling on the state to “assume a larger role” in collecting and distributing funds for education, the newspaper said education reform must be viewed as a “gradual change”; it would take years to “shift the funding burden and resolve the delicate issue of state-versus-local control.” Proposal C would not have done this, the News editorialized, because it was “laden with deceptions and promises” (DN 8 Dec. 1972, 10B).

A state Supreme Court decision also helped to create an atmosphere for reform. In late December 1972, the court ruled in Milliken v. Green that the state’s system of school finance was inequitable and therefore violated both the state and federal constitutions. Adopting the Serrano reasoning, the court stated that there was “no logical connection between the asserted justification of local control and the amount of school funds the state distributes in a school district based solely on the fortuitous circumstance that the district has more or less valuable properties per pupil within its borders.” The ruling did not throw out the property tax as a method of funding schools or offer remedies for improving the system, but it effectively directed the Legislature to prepare a new formula for distributing school taxes equitably (DN 29 Dec. 1972, 3A; 30 Dec. 1972, 5A).

Another reason for the urgency of reform in 1973 was that taxpayers were exhibiting increasing reluctance to approve property-tax increases. As Albert DeStefanis wrote in a letter to the Detroit News, taxpayers were at a “saturation point.” DeStefanis associated the development not just with higher taxes, but also with a fear of busing: “Many [taxpayers] have indicated that as long as there is a possibility of tax dollars being used to provide bussing in any future court-ordered mandate — a mandate which may well go against the will of the majority of people — they would never support any millage proposal” (DN 16 Dec. 1972, 4A). A few months later, another resident attributed voter rejections of property-tax increases to be “a lack of confidence in the system,” dubious of the schools’ accountability and efficiency (DN 27 March 1973, 6B). The Michigan Chamber of Commerce made the argument more explicitly; in the words of Chamber President Harry R. Hall, “internal reforms are mandatory before a tax-burdened public is going to agree to more taxes for education. ... Education needs to assure increased results commensurate with increased costs. Education needs to become result-minded, not just finance-oriented” (Michigan Challenge April 1973, 4, 6-7).

Such calls for improved efficiency in the use of school funds could not elude the basic problem of widespread distributional inequity, a problem
which the U.S. Supreme Court squarely thrust in the states’ domain in its March 1973 decision in *San Antonio Independent School District v. Rodriguez*. In this ruling, the court ruled that the Texas school finance system did not violate the federal equal-protection clause despite huge disparities in funding between school districts (*DFP* 30 March 1973, 5A). In public reaction to the *Rodriguez* decision, busing was once again of prime concern. The *Free Press* reported that the ruling upset the reasoning of those “who had feared the high court would use equal financing of poor city and suburban school systems as a trade-off for school integration.” That kind of trade-off had been “implicit in much of the debate over busing, and the opponents of busing have found solace in the views of those blacks who are more interested in black control of black schools than in integration.” In the view of Lynn Townsend, Chrysler Corp. chairman and retiring president of New Detroit Inc., “cross-district busing would not have been an issue” in Michigan “if we had moved to equalize the financing of our schools four years ago.” No one “really wants their children bused miles away from their homes,” Townsend continued; busing advocates were “trying to point out the inequality of educational opportunities for their children in the present situation.” The *Free Press* reporter stated that this view did not reflect accurately the pro-integration position, “but it is the view that many white leaders hold.” The *Rodriguez* decision, therefore, was a “jolt” to these white leaders, “who had hoped a favorable court decision on education finance would be an easy solution to the school integration problem” (*DFP* 30 March 1973, 5A).

Into this general atmosphere of court mandates, school-funding crises, tax revolts, and fears of busing, legislative reform advocates reentered. Once again, however, the legislative battles centered around plans that tried to outdo each other in appealing to tax equity, not to fundamental improvement of the school-finance system. In late 1972, Republican Senator Gilbert E. Bursley proposed a bill that worked on the principle of “equal (revenue) return for equal (taxing) effort,” in other words guaranteeing each school district the same total amount of funds per pupil for each unit of locally determined taxation (*Caesar* 1974, 11). The plan allowed for local control without increasing taxes (*DFP* 18 Dec. 1972, 3A). Demonstrating the politicization of the school-finance issue, Democratic leaders immediately came out in opposition to the Bursley plan. House Speaker William Ryan of Detroit expressed “considerable misgivings” about Bursley’s statutory solution, calling for a constitutional amendment to avoid the “fiscal chaos” of a continued year-to-year approach to the problem (*DFP* 18 Dec. 1972, 3A). Supported by the AFL-CIO, House Democrats also called for “more equity” in the tax system, such as by instituting a graduated income tax (*Michigan AFL-CIO News* 31 Jan. 1973,
1). The MEA, meanwhile, took a more tempered position, supporting the Bursley bill but only as an “interim step” toward a financing arrangement “that will be fair and equitable both to Michigan’s children and taxpayers” (TV 5 Feb. 1973, 3).

In his State of the State address in January 1973, Milliken made education reform his main concern. Calling such reform the state’s major failure in 1972, Milliken expressed his goals in much more mediated terms than he had used in 1969: “Our challenge now is to develop and achieve a legislative solution which recognizes the public will but still provides more equal educational opportunity for Michigan children, whether they live in rural areas or the central cities.” Further demonstrating his more moderate approach, Milliken said that financial equity must be “phased in” to avoid inflation, that school districts must show they are spending money effectively, and that “equity must be achieved not by robbing financially strong school systems, but by aiding financially poor school systems.” To achieve this, Milliken proposed limited property-tax relief, supported the Bursley plan, and called for a $108 million increase in education funding — the highest percent increase in per-pupil aid in state history. While providing more equity, Milliken’s plan still allowed local voters to increase taxes for schools. This inequity, Milliken claimed, was acceptable to meet the standards of the December 1972 Michigan Supreme Court ruling. Milliken’s plan was a much more gradual approach to school finance reform than he had followed in the past, tempered by concern for accountability and efficiency, featuring a tax cut for some property owners, and bereft of any suggestion of increasing state responsibility for funding education. He clearly had learned some lessons about the limits of education reform (DN 11 Jan. 1973, 1A, 10A).

Legislative Democrats, especially those from Detroit, were quick to criticize Milliken’s plan. House Majority Leader Bobby Crim of Davison said the plan would actually increase property taxes. In response to Milliken’s insistence that Detroit residents increase their property-tax rate for schools, Detroit Representative George Montgomery evoked the busing issue by claiming that the city’s voters were unlikely to approve more taxes “as long as the district is polarized by the question of busing.” Senator Coleman Young of Detroit claimed that Milliken was ignoring tax-base disparities between districts: “This is a classic Republican blind spot, the area of ability to pay: It’s like inviting an ADC [Aid to Dependent Children] mother into taxing competition with Henry Ford.” Young also criticized the governor for “making Detroit the whipping boy for the state schools” by neglecting to mention the problems in other districts across the state. Generally, the Democrats favored an alternative to Milliken’s plan that would mandate a low property-tax ceiling, a steep

In June, after months of partisan positioning, the Legislature began debating the relative merits of two bills representing different approaches to school-finance reform. The Bursley plan, offering more aid to districts with high property-tax rates, had passed the Senate, while an alternative Democratic plan, which provided more money for lower taxing districts, had passed the House. The *Free Press* called the ensuing debate "the biggest fight of the 1973 Legislature. ... The outcome will determine who gets the best school aid deal — taxpayers of rich districts like Ann Arbor and Grosse Pointe who already pay high school property taxes, or taxpayers of poorer districts like Detroit who pay a lower rate." The paper said that a party-line vote was not expected; rather, legislators would vote on the basis of which approach benefitted their districts (DFP 13 June 1973, 3A, 12A).

In late June, the House rejected the Democrats' approach to reform, seemingly clearing the way for the Bursley bill. But in a "political power play," the Democrats managed to squeeze their additions to the plan through at the last minute without a vote to spare, sending the bill back to the Senate. House Speaker William G. Ryan managed this by threatening to resign and throwing in a $4.8 million tax relief bonus for high-taxing school districts, in order to win back the support of suburban Democrats who had voted against the plan a few days earlier (DFP 28 June 1973, 3A). In the *Free Press*’s words, Ryan’s threatened resignation had a "sobering effect" on the wayward Democrats. Ryan said the threat "was riding on the Democrats' willingness to work out a well-balanced plan to benefit all school districts — not just the ones they represent — and they came through with flying colors" (DFP 30 June 1973, 3A). Others considered the Democrats’ action as much less altruistic: "They sold out for 4.8 million pieces of silver," complained Minority Floor Leader Dennis O. Cawthrone (DN 30 June 1973, 3A).

In an editorial printed while debate was proceeding, the *Free Press* lamented that school finance reform was caught in a "political cross-fire":

> What is needed now in Lansing is less politics and more reason, fewer brickbats and more compromise. Gov. Milliken and Speaker Ryan, jointly if necessary, should take the lead in promoting negotiations and preventing politics from damaging what can be significant improvement for Michigan’s schools. (DFP 4 July 1973, 8A)

But the damage had already been done, developed through months and even years of polarization on the issue of school finance. As *Free Press* columnist William Grant noted, in a "textbook world" the prob-

62
lems in Michigan school finance could easily be solved, but “school finance reform is not a question of what is right or wrong, but a question of what can get enough votes to become law.” In resigned tones, Grant lamented the loss of an opportunity:

This was to have been the year that Michigan got school finance reform. A year ago, Gov. Milliken had successfully completed his end run of the Legislature and put a reform amendment to the state Constitution on the ballot. A challenge to the state’s system of school finance in the courts seemed certain to succeed, just as similar cases had been successful in other states. Now the hope for immediate and complete school finance reform is gone, blown away like a wisp of smoke in a gale. What is left is what we had all along: the Legislature trying to deal with the problem. And what we are likely to get is only a partial solution to the problem. (DFP 13 July 1973, 6A)

In the end, partial reform is what Michigan got. The Republicans won the main points in the conference committee, so that the act basically followed the Milliken/Bursley plan with some concessions to the Democrats. The Free Press complained that the act did not “adequately answer Michigan’s long-range problems in public school financing” such as eliminating dependence on local property taxes (DFP 4 July 1973, 8A).

In an analysis of legislative voting on 1973 Michigan school-finance measures conducted a decade later, Robert Palaich and others demonstrated the overwhelming predominance of political parties as the main factor determining how a legislator voted, although it disappeared with the final vote on the conference committee’s report. Acknowledging that Michigan “has a reputation as a strong party state,” the authors contend that economic self-interest, interest groups, and median income had only secondary importance in determining voting behavior. Furthermore, Palaich and others showed that the political party of the representative of a House district was closely related to the characteristics of the constituency of that district. Finally, after controlling for political party, the authors concluded that median income of the lawmaker’s district was the only other factor that explained variation in the vote: “Relatively higher income districts, which were not necessarily benefitted but also were not taxed by the proposal, supported it” (Palaich et al. 1983).

The 1973 Michigan school aid act was the culmination of years of concern over the issue. In later years, analysts would conclude that the effect of the bill on the equalization of school funding levels was minimal, although it did help to equalize property-tax levels (Brazer and Anderson 1976; Carroll and Park 1983). That is not to say, however, that
the effects of the public debate were similarly minimal. Indeed, the way the debate was framed in the late 1960s and early 1970s has severely constrained the possibilities for true school-finance reform to this day. As one analyst noted in 1975: “Political and sociological philosophies that exist in Michigan have established certain ‘givens’ which quickly reduce the endless varieties” of school funding. Recognizing the constraints of these philosophies, as well as their historical roots, helps one to understand the limits of school-finance reform in Michigan (Wegryn and Andrews 1975, 1).

In that vein, this study has shown how the way supporters and opponents of school-finance reform in Michigan from 1968 to 1973 framed their arguments had a strong influence on defining the possibilities of that reform. Equity advocates, such as Governor Milliken and the MEA, focused their attention on garnering support by appealing to residents’ desire for tax relief and trying to appease their concern for local control, but by doing so they played into the hands of their opponents. The opponents of state taxation and increased state control over schools, led by Democrats and the AFL-CIO, were able to frame the debate as one of local control versus higher taxes and/or mandatory busing, with parochiaid serving as a roadblock in the early years of the debate. Certainly, none of these divisions were fixed. Many opponents of parochiaid, for example, moved to support school-finance reform as soon as that debate subsided. But supporters of real reform in school finance, which would have provided equity and adequacy in both taxation and distribution, never garnered enough of a consistent backing to bring their agenda to the forefront of concern. Local control advocates in all their guises, on the other hand, were numerous, outspoken, and represented enough to limit the possibilities of reform.

The Limited Experience
of Bona Fide, Participatory
Democracy for the
Common Man/Woman
in American History

This paper can be best understood within the conceptual framework which features institutions, including schools, as subject to the conflicting imperatives of capitalism and democracy. My own interpretation of this conflicting imperatives model is the power of capital has always been significantly stronger than its opponent. In spite of the realities of constitutional liberties and the right to participate politically with a good deal of personal freedom in this democracy, the lived experiences of most ordinary men, women, and children have not been of participatory, bona fide, de facto democracy. In all too many instances, persons and groups have been excluded; furthermore, throughout its history, the United States many battles conducted by ordinary persons have occurred in order to translate the promise of democracy into actual policies. Democratic decision-making is relegated often to comparatively unimportant issues, while those in command of corporate power, as well as their allies within the class-state, develop the issues and priorities which ordinary citizens are allowed to decide upon democratically. The argument featured herein is that democracy, such as we have had it, is mainly the accomplishment of ordinary persons who have participated in the political process—and sometimes in the streets and workplaces—in order to make democracy meaningful to their own fears, needs, and aspirations. It is especially important to focus on these historical facts and trends when many celebrators of the Cold War victory and the “New World Order” have been seemingly successful at equating the victory of the “free market” and privatization with bona fide democracy. Our students must have the opportunity to study about the struggles waged by popular, subal-
tern forces against the direct and hegemonic power of capital, as they occurred throughout much of this country's history.

This paper is taken from a larger study in which three examples of democratic mass movements are emphasized. The first is the industrial workers' movement of the 1930s. The second is the civil rights movement of the 1950s and 1960s. The third is the New Left movement of the 1960s. The important point is by the time the heterogeneous American working class began to show promise of collective action and class politics at the polls, they suffered a massive defeat at the hands of capital and the class-state. The use of firepower, the misuse of the courts, the denial of the ballot to many, and the blackballing of workers, as well as other tactics, paved the way for capital's overwhelming victory by the late nineteenth century, and it lasted until the early New Deal.

American democracy in the pre-Civil War period was limited to participation by white males; moreover, this form was not a threat to those who exercised economic power at that time. As the industrial revolution, under capitalist aegis, developed post 1840—and especially after the Civil War—a (mostly) bloodless coup was executed by capital and its allies, resulting in the defeat of organized labor's attempt to challenge seriously the emerging new order. Capital had successfully seized control of the State by the 1890s, making it very difficult for working men and women to oppose effectively the transformation of work, the economy, and American life itself. The election of 1896 resulted in one-party rule in both the North and South; furthermore, the size of the electorate was reduced significantly by "reforms." The working class threat to capital and property had been, momentarily, contained.

Staughton Lynd's *Intellectual Origins of American Radicalism* has provided a useful organizing framework with which to discuss the record of democratic aspirations, accomplishments, and failures in the United States. Near the end of his book, Lynd tries to summarize the American revolutionary tradition. He points out that the coalition which won independence from British imperialism failed to clarify whether natural rights applied to the human condition itself, because this would have forced the coalition to face-up to the terrible institution and practice of slavery. The Civil War settled the question of slavery as the great exception to inherent human rights, at least in the de jure sense, through the 13th, 14th and 15th amendments to the Constitution; however, it took the struggle by organized workers after the Civil War to begin to establish more definitive rights between men and women on one side and property on the other. The "third revolutionary movement" (after the War for Independence, and the abolitionists doing the Civil War) "prepared to be critical, not just of property in man, but of private property
Samuel Bowles and Herbert Gintis have stated, in *Democracy and Capitalism*, that a central dynamic of liberal democratic capitalist societies is the clash between personal and property rights. The authors explain that this clash is much older than the coming of the Industrial Revolution, industrial capitalism, and the proletariat; in fact, they refer to the Putney Debates of 1647 in England. Obviously the conflict between personal and property rights has occurred increasingly during the nineteenth and twentieth centuries. According to Bowles and Gintis, the clash of rights which came to dominate contemporary, liberal democratic, capitalist societies is rooted in "the expansionary logic of personal rights, progressively bringing ever wider spheres of society—the management of the economy and internal relationships of the family, for example—under at least the formal if not the substantive rubric of liberal democracy. The second tendency concerns the expansionary logic of capitalist production, according to which the capitalist firm's ongoing search for profits progressively encroaches upon all spheres of social activity, leaving few realms of life untouched by the imperatives of accumulation and the market."3 Tom Bottomore has written that since the 1880s the development of large-scale capitalism and the consolidation of the class structure in American society brought into existence opposing forces. "These diverse groups of intellectuals and activists engendered, in the first decade of the present century, a rapidly growing socialist movement through which, despite many differences of ideology and political practice, the essential ideas of Marxism about the conflict of class interests and the opposition between capitalism and socialism as forms of society began to be clearly expressed. At this time it seemed possible, and even likely that the divisions in American society would result in the formation of a political movement on a scale similar to that which already existed in many of the European countries."4 As we shall see, the owners in the capitalist North and the wealthy agricultural interests in the South acted successfully in concert to counter the growing threat against a regime of socially irresponsible property.

David Montgomery has written, in *The Fall of the House of Labor*, that "modern America had been created over its workers' protests, even though every step in its formation had been influenced by the activities, organizations, and proposals that had sprung from working-class life."5 Sidney Lens explains that the labor wars of the late nineteenth and early twentieth centuries occurred because of working peoples' need to respond someway to unbridled capitalist greed. "There existed on the one hand an ambitious entrepreneurial class ... which brooked no interference with its expansion, and respected neither the human rights of the lower classes nor their juridical ones. And, on the other hand,
there was a new proletariat, self-exiled from Europe or torn from small ... villages, which had no place to go for support, neither the courts, the government, nor the major political parties. In other words, there ... was no mechanism for easing the class struggle, and consequently, on innumerable occasions, it turned ... violent.”

Before the advent of the Industrial Revolution in the 1840s, and even after the Civil War, politics in the United States was unusually democratic for white males. Because of the franchise and the resulting need for leaders to be re-elected, the nineteenth century featured the gradual elimination of property, religious, and literary qualifications for voting rights—as well as increasing the number of government posts depending on popular election. It is important to remember that white Americans were armed when the Revolutionary War ended. From this revolutionary experience and tradition, popular forces, workers, small farmers, et al., forced increasing democratization on the rich and powerful. This was an important achievement by the lower classes. The rich and powerful resisted, because they understood that democracy is inherently redistributive. Frances Piven and Richard Cloward write about the reaction to democratization — especially in the United States: “Everywhere in the West, the hopes of peasants, artisans, and the urban poor were fired by the essential democratic idea ... that if ordinary people had the right to participate in the selection of their state leaders, their grievances would be acted upon. For just that reason, the propertied classes feared that the vote would give the ‘poor and ignorant majority’ the power to bring about a more equitable distribution of good things of this world.’ The right of ordinary people to vote [in the United States by the late nineteenth century] was ... sharply contested.” According to Piven and Cloward, by the beginning of the twentieth century, at the very historical moment when the working classes in other Western countries were gaining the franchise and contesting for State power, “a series of changes in American electoral arrangements sharply reduced voting by the northern immigrant working class and virtually eliminated voting by southern blacks and poor whites.” This diminution of the electorate by the forces of capital occurred because genuine, inclusive, participatory democratic politics had come to mean class and radical politics aimed at challenging the emerging capitalist hegemony.

The United States was unique in that it was the only country which was a democracy (albeit limited) before the development of industrial capitalism. In most other countries industrialization and the modernizing elites were insulated from popular politics. However, as has been noted, the kind of democracy practiced in the United States during the early and middle nineteenth century did not effectively challenge the most powerful economic forces and developments. The Anglo-core,
male, American democracy of the pre-industrial period could afford broad participation and raucousness because the real citadels of economic power were not yet threatened by such a politics. Adolph Sturmthal tells us that because the issue of equal franchise was more or less settled by the time a modern labor movement was formed, it was comparatively easy to integrate workers, who had not achieved a keen sense of class-consciousness, into the national community. Jerome Karabel is convinced that American workers valued popular sovereignty; furthermore, they did not have to fight to secure the franchise as the European proletariat did. He says that "the lower classes in America won the right to participate in parliamentary democracy well before the Industrial Revolution and the emergence of modern proletariat." American workers allegedly remained loyal to the political system even during the period of full brutality under early, unrestrained capitalism. There is truth in what Sturmthal, Karabel, and others who hold this view write; however, after 1865 a "series of wrenching economic transformations strained ... methods of incorporating working-class voters and poor farmers ... Increasingly, popular demands were directed to the states and even to the national government for action on economic grievances." But, as Piven and Cloward argue, after 1896 the franchise was systematically taken from many who would have challenged capitalism, and in this sense America was a very flawed democracy indeed.

Eric Hobsbawm explains that the European ruling classes learned to manage the potentially dangerous appearance of the working class upon the political stage. He argues that between 1880 and World War I democracy was tamed so that it was more or less compatible with the capitalist regimes. Marx and Engels had seen democratic republics as "ante-chambers" of socialism—in spite of bourgeois limitations. This hope existed because it was thought that the political organization and mobilization of the proletariat as a class were unintentionally permitted through the participation of workers in regular elections. Furthermore, Marx and Engels were quite certain that worker political participation as a class would lead eventually to socialism. The American Socialist Party believed this as well. The failure of socialism to come as a result of democratic politics caused Leftists to analyze the State, political participation, the rationality of the "masses," and the roles of propaganda and hegemony. This failure also led to a brand of radical action on the Left which eschewed democratic tactics altogether. In spite of the failure of the working class to come to power, many people came to realize that the State was nonetheless interventionist, and not laissez-faire; therefore, the central government was still the main prize to be focused upon. The recognition of the State's importance by workers and radicals caused
capitalists, other members of the ruling classes, and their government allies to turn back the clock on voter participation. Piven and Cloward write about the decisive American election of 1896 and how, in its aftermath, the winners "facilitated the introduction of a series of sweeping changes in American electoral institutions that made possible the near domination of the Republican party by business in the North and of the Democratic party by planter interest in the South ... The system's [the system of 1896] most important and long-lasting feature was the ... decline [of voter eligibility and turnout] that with relatively minor variations has persisted throughout the twentieth century."14 As voter participation declined, the needs and grievances of poor workers and small farmers became less well-known and consequently not crucial to political priorities. Business rhetoric dominated American politics from 1896 until the New Deal. According to Piven and Cloward, between the presidential elections of 1896 and 1920, turnout fell from 79 to 49 percent.

The industrial proletariat created after 1865 was best represented in the railroad and steel industries, and it was here that the labor wars, as Sidney Lens calls the struggles between capital and labor, occurred most frequently and ferociously. The toughness and resourcefulness of workers' responses to attempts to control them, reorganize production, decrease wages, etc. alarmed the owners and America's upper classes. Predatory capital, in alliance with governments at all levels, tried to crush labor organization. Workers and farmers tried to find relief through the ballot during this period of industrial warfare. Populism is a good example of this phenomenon in its organized form. Piven and Cloward argue that it was the first political movement that insisted the federal government had some responsibility for the common good.

Howard Zinn has written that in the year 1877, the signals were given for the rest of century: the blacks would be put back [in 'their place']; the strikes of white workers would not be tolerated; the industrial and political elites of North and South would take hold of the country and organize the greatest march of economic growth in human history. They would do it with the aid of, and the expense of, black labor, white labor, Chinese labor, European immigrant labor, female labor, regarding them differently by race, sex, national origin, and social class, in such a way as to create separate levels of oppression — a skillful terracing to stabilize the pyramid of wealth.15

Alan Dawley claims that although the American working class has not been represented by a single philosophy, unified strategy, or political party, still a common thread runs through its activities, namely its
attempts to organize, speak freely, and advance its interests against hostile employers and governmental authorities. The emergence of labor as a self-conscious entity necessitated a realignment of politics, which culminated at the end of Reconstruction in 1877. Northern businessmen and Southern planters put aside their differences in order to defend the property interests they held in common. According to Dawley, it was none too soon. Six months after the Compromise of 1877 when the Republicans got the presidency and pulled troops out of the South, the country was convulsed by the biggest strike ever, touched off by railroad wage cuts. Tens of thousands of people struck; dozens were killed, and millions of dollars in property was destroyed. The new Republican president, Rutherford B. Hayes, sent in federal troops recently withdrawn from the South to put down the strike. Then [the] ensuing realignment of political forces kept the working class isolated from national influence for the next quarter-century.16

Arthur Link explains how the Northern business interests began to emerge as the primary political power as early as 1861, upon the removal of Southern agrarian interests from the Congress that year. The passage of the Morrill tariff law (also in 1861) signified that control of the federal government had passed to the industrial, capitalist Northeast. The reconstruction of national politics which began in 1861 achieved its objectives by 1877. “Without altering the structure of American political institutions, the business classes had executed a bloodless revolution. They had ... wrested control of the political institutions from the agrarian majority and changed the character, but not the forms, of representative government in the United States.”17

Despite of the capitalist coup d’état, vigilantism, repression of labor, and military and police violence there were many who still believed that the republic belonged to the common people — albeit a people divided by many classifications. The struggle by the working class in the period between 1865 and 1896 climaxed in the May 1886 strike for the eight-hour work day. According to Dawley, “nothing like it had ever been seen before. Upwards of a quarter-million workers took part, beginning May 1, in actions that combined the spontaneity of insurrectionary crowds with the discipline of industrial organization. Reaching the proportions of a nationwide general strike, it was the most significant American contribution to the international working-class. This event is commemorated in May Day.”18 This strike for the eight-hour day came to be epitomized by the Haymarket Affair, the bombing by alleged radicals, which killed some Chicago policemen, and the subsequent
repression, including the execution of some accused and convicted "terrorists." Zinn explains that while the immediate result was the suppressing of labor, the long-term effect was to keep class anger alive. "After Haymarket, class conflict and violence continued, with strikes, lockouts, blacklisting, the use of Pinkerton detectives and police to break strikes with force, and courts to break them by law."19

Dawley thinks that although the socialists and anarchists defined the enemy as capitalism, the labor movement defined it as monopoly. Politics revolved around attempts to pass anti-monopoly legislation. There arose third parties such as the Greenback-Labor Party and the United Labor Party. The latter was a coalition of all the main currents of the labor movement. This unusual unity in 1886 was caused by "the special conditions of the moment—the strike wave, the major parties' subservience to plutocracy, the judicial lynching of the Haymarket anarchists, the assassination of strikers by Gould's mercenary army—all of which momentarily fused an inchoate class consciousness of the American workers into a unified movement."20 Thus the nineteenth century labor movement reached its peak in the middle 1880s. One has to wait until the New Deal to see workers join a grand coalition, which in that instance gave them access to the highest levels of power. Labor's nineteenth century strategy of pressing its claims against capital through independent political action, such as third parties and massive strikes, did not succeed. The labor movement continued to search for tactics and strategy which would allow America's de jure democracy to become de facto as well.

Zinn has written that in the pivotal election of 1896, the Populist movement was "enticed" into the Democratic party, but its candidate Bryan lost to McKinley. One of the major reasons for the defeat was the corporate mobilization of the first massive use of money in an election campaign—a campaign which featured solid support from the mainline print media of that time. "Even the hint of Populism in the Democratic party ... could not be tolerated, and the big guns of the Establishment pulled out all their ammunition to make sure."21 It could be said that in 1896 the economic elites unprecedentedly revealed their fears of ordinary people, who were armed with the franchise and with some idea of what was wrong with their society. The takeover of both parties by the rich after 1896 made it difficult for working people to identify with candidates; furthermore, the drive for voter registration resulted in complex barriers to voting. The old client-patron system of the earlier nineteenth century broke down under the hammer blows of industrial capitalism and urbanization so there was little connection between have-not voters and politics. Appeals based on class identity and interests became less possible, therefore, seemingly less real in American politics.
Once business realized the important role of government after the Civil War, it was motivated to control the central State. The emergence of class-based politics strengthened the resolve of capital to dominate government at all levels. It attacked the client-patron machine politics, which had been somewhat answerable to the needs of workers, immigrants, and the poor. The attacks on machine politics were done in the name of alleged efficiency, middle class expertise, and business values; the results were machine politicians had little remaining in terms of goods and services to deliver. The introduction of direct primary elections after 1896 reinforced one-party domination in both North and South. Most importantly perhaps, registration requirements restricted the suffrage. In the South, the Jim Crow laws and other efforts to exclude voters through difficult registration requirements allowed the re-establishment of a “quasi-feudal labor system.” According to Piven and Cloward, these strategies evolved systematically over time in the various southern states after 1876, and the results were about three-fourths of the population — black and white — were stripped of the right to vote. The better-known southern strategy was not without analogy in the North. Limiting the suffrage in the Republican-dominated North was aimed at allowing “better people” to assume firm control of government. The voiced fear was that waves of immigrants would sever political power from property and “intelligence.” Eleven states in the North and West established literacy tests between 1890-1926. These were aimed primarily at the lower class, and especially naturalized voters. Piven and Cloward quote from what William Riker wrote in 1953: “The real purpose, so artfully concealed, is to deprive of citizen rights certain minorities believed to have a low literacy rate. Eighteen states have adopted the test, seven to disfranchise Negroes, five to disfranchise Indians and Mexicans and Orientals, and six to disfranchise European immigrants.” It became increasingly difficult for working persons to register. The registrars would visit workers’ home when they were at work; furthermore, there were other inconveniences. Formal and informal barriers tended to exclude those who were less well-educated and less confident. This systematic attempt to shrink the American electorate worked, and the result was the decline of electoral competitiveness. The politicians could, and did, ignore those citizens who could not, and did not, exercise the franchise.

Participation in the electoral process has never been enough to move the class-State in the United States, or elsewhere, to act on behalf of the masses of working people in the modern era of industrial capitalism. Additional activities have had to be undertaken outside the confines of narrow legality. Sidney Lens, Norberto Bobbio, Pietro Ingrao, et al., have understood the need for mass activities being conducted on work sites,
in the streets, and elsewhere in order to pressure the class-State to act on behalf of the working class, people of color, women and other groups/persons who have been excluded from power. Lens writes that "had the workers abided by court injunctions against picketing and had they shown the expected respect for the organs of law and order—police, militia, federal troops [private armies]—unions ... would have been dwarfs in size [written in 1973] and impotent in influence." Martin Carnoy has argued that the class-State has not, and will not, reform in a progressive direction in the absence of democratic popular movements pressuring it. Specifically, Carnoy writes didactically: "The correct political strategy is to organize at the base both outside and inside the State, bringing those organizations to bear on the society's dominant institutions to reform them." In agreement with Charles Tilly, et al. (The Rebellious Century 1830-1930 [1975]), Carnoy states that the potential power of organized and angry masses has been demonstrated in the twentieth century in strikes, the civil rights movement, battles over women's suffrage and various revolutions outside of the United States. Referring to their thesis in Poor People's Movements (1977), Piven and Cloward write, "our view ... was that poor and working-class people sometimes exercised powers when they mobilized in mass defiance, breaking the rules that governed their participation in the institutions..." The right to vote serves as a "magnet" to which all activity is attracted; whereas, other forms of collective action are discredited. "Further, involvement in electoral politics exposes people to the fragmenting influences [where they can lose social class and other membership identities] associated with electioneering, and can thus weaken the solidarities that undergird political movements ... People are [sometimes] hypnotized by circuses of election campaigns ... In short, involvement in electoral politics channels people away from movement politics." In a system that is a de jure democracy, electoral political strategies along with allied contestations on many sites and terrains are the best ways for working people, minorities, the poor, women, and other excluded groups to be considered in decisions which affect their lives. In the 1930s striking industrial workers of the CIO were successful in convincing and pressuring a hesitant Roosevelt administration to offer protection against the wrath of the owners, and then to pass legislation making collective bargaining possible. The same was true for the civil rights movement of the 1950s and 1960s. The anti-war movement and the New Left, in some instances, attempted to use legal and extra-legal strategies in order to achieve their goals. The current attempt by organized women and their allies to force the federal and state governments to act on their behalf in order to secure fair treatment in paid labor and to control their reproductive conditions (among other issues) is similar in
many respects to the strategies pursued by labor, civil rights and anti-war movements. It is too early to tell how this gender-defined mass movement will end in terms of legislative, judicial, and other legally secured victories. Perhaps success will depend upon the ability to form broad coalitions with other progressive forces which are committed to voting, as well as to direct mass action.

12. Bowles and Gintis explain, in Democracy and Capitalism, how various reactionary
“accommodations” have weakened participatory democracy. In their view, the
Lockean accommodation reconciled representative government with capitalism by
disenfranchising the working class through property qualifications, literacy require-
ments, etc. This first accommodation is described by Bowles and Gintis primarily in its
European context. The second accommodation is the Jeffersonian one, which sought to
harmonize private property and democracy through the generalization of property
ownership in land rich America. This was undone by the closing of the frontier and
conversion to capitalist production conditions, as well as the accompanying proletari-
anization of many American workers. The Madisonian accommodation “maintained
that the few might be safe from the many even in a liberal democratic environment as
long as society is marked by a large number of fundamental and cross-cutting
cleavages, ensuring the lack of unity on the part of the majority ... [it] relied upon the
heterogeneous economic and social situation of the major producing classes ... upon
the strategic exclusion of some groups ... as well as upon racial, ethnic, and regional
antagonisms, to forestall the threat to the structure of privilege posed by the extension
of the suffrage.” p. 52. The fourth accommodation is the Keynesian one. It assimilated
the newly powerful class of wage and salary workers; although capitalist control over
investment and production comprise an effective counterweight to the inclusion of
workers into the State’s area of responsibility for well-being. This accommodation
depended upon comparatively prosperous times; although it was introduced during
the Depression of the 1930s. Bowles and Gintis’s analysis of the four accommodations
can be found on pp. 41-62.

Investigation into the academic freedom of Marxist and other radical faculty in the 1960s and 1970s reveals a number of unsettling trends. Though such faculty continued to be in jeopardy, as they had been from the turn of the century through the McCarthy era, their firings increasingly became couched in and justified by "neutral criteria." The overtly anti-socialist and anti-communist criteria of previous decades were replaced by subtler, yet just as ideologically biased standards. These new criteria were based upon conceptions of value-free science, dominant disciplinary paradigms, "professional" or technocratic standards of academic competence, and the marketplace-of-ideas. These four related concepts have their own inherent ideological biases and were invoked in the 1960s and 1970s to suppress and purge radical academics.

The academic freedom case of Paul Nyden, who was fired from the University of Pittsburgh, is a good illustration of these trends. In this paper, I will review the facts of the case, attempt to demonstrate the bias of the "neutral" criteria used in evaluating Professor Nyden, and briefly explore the issue of the relationship of knowledge and power.

Paul Nyden was an Assistant Professor of Sociology at the University of Pittsburgh. He was hired before completing his doctoral dissertation, dealing with reform movements in the United Mine Workers, at Columbia University. The appointment was initially to the Applied Sociology Program as an instructor. Upon completion of his dissertation, the department promoted him to the position of assistant professor, with evaluation for tenure to come after completion of the second of two three-year contracts. This, however, was dependent upon the renewal of his first three-year contract. That renewal never materialized.

Toward the end of his second year as assistant professor in the department, Professor Nyden was notified that his contract would not be
Dr. Paul Nyden was informed... on Tuesday that the department’s steering committee had reviewed his academic and scholarly work and recommended in a confidential report his appointment not be renewed. Professor Nyden was refused access to the confidential report itself. Consequently, the specific reasons for the recommendation were kept secret.

Subsequent to the Steering Committee’s recommendation, the department as a whole voted to terminate Nyden. Similarly, the Dean of the Faculty of Arts and Sciences upheld the recommendation. It was not until Nyden’s case reached the Faculty of Arts and Sciences Tenure and Promotion Hearing Board that an element of doubt was cast on the termination. The Board questioned and criticized the evaluation of Professor Nyden’s work “because it followed by only 15 months a favorable review by the same department.” For this reason, and others, the Board recommended that an ad hoc committee, capable of evaluating Nyden’s work, be appointed. However, this recommendation was ignored by the Dean, who said:

The findings of the TPHB itself that reasonable grounds for the stated cause for non-renewal—Dr. Nyden’s inadequacy as a scholar in the field of Sociology—exist in fact rule out the need for an ad hoc committee... This was a rather selective interpretation of the Board’s report. In fact, the report said that it was possible that the Department’s reasons for firing Nyden did exist. However, the Board said it could not conclude one way or the other. Thus, they recommended that an ad hoc committee, knowledgeable in sociology, resolve the dispute. Nonetheless, no ad hoc committee was formed, and Nyden’s termination remained. Also, the Dean “said it was not ‘unreasonable’ for opinions to change in that amount of time, and that the FAS had recodified its procedures for reappointment during the period between the reviews.”

It was not until Nyden’s appeal of the firing reached the University Senate Council, the final step of his appeal, that he was given some vindication. This council said that Nyden should be reappointed because the evaluation criteria for reappointment had changed. This change had not been made clear to Professor Nyden. The implication was that Nyden might have changed his scholarly emphasis to meet the new standards. He had spent time revising his dissertation for publication.

It was after this report that the University relented and offered Professor Nyden a new contract. However, this contract was not for the standard three years. Rather, it was for 15 months. Supposedly, this was to compensate for the equivalent period in which Nyden had operated
under changed criteria. Furthermore, Nyden was moved out of the Department’s main working area because of the hard feelings generated during the controversy. Professor Nyden was to be responsible to the Dean under this new arrangement.7

Nyden accepted the offer, but objected to the unusual contract, his removal out of the department, the nature of his next review procedure, and other details. The University took these objections or reservations to amount to a rejection of the contract offer. Consequently, Nyden was left fired. Professor Nyden protested that he had not rejected the offer, and he filed suit against a number of people. Subsequently, the University settled out of court with Professor Nyden.

This is a general overview of the Nyden case. However, it does not get to the real issues involved in the controversy. Professor Nyden was a Marxist and an active supporter of unions in general and the United Mine Workers in particular. He claimed that he was fired because of his politics. The Department and the University, on the other hand, denied these accusations. Although the Senate Council recommended that Nyden’s contract be renewed, it did so on procedural, not political, grounds. Consequently, if we want to determine the possible political motivation of the firing, a more detailed study will be required.

**The Politics of the Marketplace**

The allegation that Nyden was fired for political reasons was not altogether a unique one for the University of Pittsburgh. The Student Committee to Defend Dr. Paul Nyden pointed out how the case was symptomatic of the general political climate on campus:

> But the Nyden case is a symptom of a much larger crisis at Pitt. Over 100 students, professors, and staff workers have race, sex, union, or political cases pending against the administration...8

The substantial number of cases involved here lends credence to the possibility that politics might have prompted Nyden’s firing. Furthermore, it has been pointed out by Nyden’s defense committee that:

> Of the 36 trustees, the majority are heads of big corporations, like U.S. Steel, Consolidation Coal, Westinghouse, Gulf Oil and Mellon. There is no worker, one student, only two Black people, a few women, and a handful of educators...9

Clearly, the board was dominated by the area’s large corporations, including coal and steel companies. One could argue that it was these interests that Nyden threatened both through his activism and his scholarship. For example, in a pamphlet on the U.M.W., Nyden leveled criticisms at the anti-union politics of such entities as Consolidation Coal,
U.S. Steel, Gulf Oil, the National Association of Manufacturers, Mellon corporate interests. Each of these interests was represented on the Pittsburgh Board of Trustees when Nyden was fired. Furthermore, "Louis Antal, President of western Pennsylvania’s District 5 (UMW),...criticized corporate dominance at the University of Pittsburgh; he singled out the almost complete absence of pro-labor courses and professors, and Dr. Paul Nyden’s firing in particular, at a university where half of its more than 30,000 students come from working-class families." 

The above data provide only circumstantial evidence with regard to the political overtones of the Nyden case. If the analysis were left here, a convincing case on behalf of Nyden would not have been established. However, there is more to consider. A conspiracy by, or pressures from, the Board of Trustees was not the only way in which political and ideological bias could have intruded in the case. Arguably, the very criteria used to evaluate Nyden’s scholarship reflected a deep-seated ideological bias. Consequently, the criticisms of Nyden’s work need to be analyzed in order to expose their assumptions and possible biases.

The primary stated reason for Paul Nyden’s non-renewal was the alleged inadequacy of his scholarship. The Sociology department chairman, in a letter to the Dean, laid out the "fundamental principle" involved:

In its final deliberations, the Steering Committee agreed upon a fundamental principle which is: If minimal competence in sociological scholarship cannot be demonstrated, then no other activity or performance, no matter how excellent, could be substituted. The force of the principle is this: If a "floor-level" of competence is not exceeded, a recommendation for contract renewal cannot be made.14

Nyden’s work was not considered to have measured up to this "principle." The more specific reasons for this judgment can be culled from a number of sources. In the Department chair’s letter of March 22, 1976 to the Dean, we find the following summary of Nyden’s scholarly flaws: Nyden’s scholarship had exhibited a pattern of decline in its adherence to general standards of scholarly work, particularly with regard to such matters as respect for evidence, consideration of alternative viewpoints, responsible study and use of scholarly materials germane to his fields of interest, and the grounding of any polemical claims in actual fact. These properties of his work had been blended with some impressive writing, moral commitment and thoroughness of preparation in
the thesis. The SRC report noted that the later work, a paper entitled "Sociology of the Oppressed," exhibited primarily the most negative aspects to be found in the thesis. The general conclusion was that Nyden had shown promise of exciting future work in his thesis, but also signs of gross laxity in scholarship; the paper indicated the further development of the inadequacies rather than their reduction.\textsuperscript{15}

The Dean, in a letter to Nyden, supplemented these criticisms with a few of his own. He said that "(t)he department hoped that you would show improvement in your analytical sociological work in distinction from journalistic efforts."\textsuperscript{16} Consistent with these criticisms were those made by the Review Committee on Nyden's renewal. This Committee's "summary impression" was that Nyden was "extremely rash in his judgment, that he does not attempt conscientiously to conform to minimum standards of scholarly dispute, and that he has little interest in so doing. Indeed, we have the impression that Nyden, when pressed to do so, is unable to engage in a genuinely scholarly manner with positions with which he intuitively disagrees."\textsuperscript{17} Even Nyden's dissertation, which had been highly acclaimed, was said to be "only intermittently sociological."

The sum total of these criticisms describes a professor whose work is polemical, journalistic rather than analytical, poorly supported, and too narrowly proscribed (re: a failure to consider alternative viewpoints). Is this so?

First, it should be pointed out that with regard to the dissertation, no specific criticisms were explicitly made. Consequently, the charge that it is "only intermittently sociological" is not documented. In fact, just the opposite conclusion could be reached. Professor David Montgomery, a renowned labor historian at Pittsburgh, was quite favorably disposed toward the dissertation. As an outside evaluator of Nyden's dissertation both for the Sociology Department and the University of Pittsburgh Press (which was considering publishing it), Professor Montgomery was as knowledgeable about the area as anyone. Furthermore, he made many criticisms and suggestions regarding the dissertation. Yet his evaluation of the work was undeniably positive. Professor Montgomery said he was impressed with the balance in Nyden's judgment, and, secondly that balance seemed to me to be no accident. It came about precisely because of the thoroughness of the field research that he had done, and the sensitivity that he had to what was being told him by coal miners.\textsuperscript{18}

Montgomery further stated that Nyden's revisions of the dissertation had made it even stronger.\textsuperscript{19} Based upon this evaluation, Montgomery recommended that the Sociology Department renew Nyden's contract.
Despite this, the Department ignored the recommendation and thereupon voted not to renew Nyden’s contract.

Professor Montgomery was not alone in his praise of Nyden’s dissertation. Professor Herbert Gans, a prominent Columbia University sociologist and a member of Nyden’s dissertation committee, was equally impressed. Not only did he participate in the unanimous recommendation of the dissertation for distinction, but he testified as to its “sociological” merit. In fact, he said that it did contain sociological analysis, and that he was impressed by the use of “qualitative methodology,” which was “the same method essentially” that Gans himself used.

Professor Richard Cloward, another prominent Columbia scholar and member of Nyden’s dissertation committee, further supported the positive evaluation of Nyden’s dissertation. He explicitly stated that he thought that it was a “sociological” piece of scholarship. Furthermore, he commented on the level and degree of theoretical analysis in the dissertation, a point in the department’s criticism of that work. Cloward disagreed saying that there were “different sociological styles,” involving varying degrees of theoretical analysis.

Finally, one of the most telling sources of support for Nyden’s position was the behavior of one senior Sociology department member, who had also been a member of Nyden’s dissertation committee. This faculty member wrote a letter, circulated in the Department, saying that Nyden’s dissertation committee had taken two hours to decide to accept it. Additionally, he said the committee considered it to contain “little sociological analysis.” Yet these statements were contradicted not only by other dissertation committee members, but also by the faculty member’s own evaluation as a committee member. Professors Gans and Cloward both stated that the dissertation committee was unanimous as to the excellence of the dissertation. Their decision to approve it, to recommend its being given distinction, and to nominate it for a Bancroft award, took only 15-20 minutes. And, in fact, this committee member concurred in all of these actions. Additionally, he wrote the letter of recommendation, on behalf of the committee, for the award. It stated:

We all agreed that compared with our experiences with other dissertations, the present one far exceeds in amount and maturity of work almost any other dissertation any one of us had been sitting in judgment before.

The above facts speak to many of the criticisms made of Nyden’s work by the Department. It seems that the criticisms are at best debatable, and at worst severely biased.

A further source of bias, as noted by the Tenure and Promotion Hearing Board, was the undue emphasis placed upon the work “Sociol-
ogy of the Oppressed." This emphasis might not have been warranted. Nyden undertook the paper at the request of a senior department member and did not "regard it as a major piece of work." The paper had other problems for Nyden. The Tenure and Promotion Hearing Board summed up these difficulties, as well as Nyden's overall view of the article:

Dr. Nyden, on the other hand, had from the start been troubled by the paper. It would appear in a volume associated with the Greystone conference and hence, directly or indirectly, with the Office of Naval Research, a circumstance which would violate his principles. Secondly, because the paper would be published in a volume edited by someone else, and had to conform to a prescribed format, he had much less freedom than he would have with an independent article in a journal. He was deeply involved in revising his dissertation for publication, and in an upcoming study of insurgent groups within the United Steel Workers. For him, in other words, "Sociology of the Oppressed" appears to have had little more significance than as a favor he was doing...his mentor.

Professor Nyden further indicated that he thought this paper was supposed to be "quite critical and radical," and "that it was intended to be written very much on one particular point of view to balance out eleven or twelve other papers that were going to appear in a published book."

The Department's emphasis upon the paper, "Sociology of the Oppressed," seems to have been unwarranted. Nyden's dissertation, and its revisions, constituted his major work. It was being prepared for publication. Furthermore, it was considered to be quite an excellent dissertation by all members of his dissertation committee, as well as by others. Beyond this, however, the criticisms of "Sociology of the Oppressed" may have been too harsh. Given Nyden's perception of his mission in the paper, the charge that it was "one-sided" is unfair. Was such a charge leveled at Nyden's other 11 or 12 papers?

Part of the criticism of Nyden was based on the alleged "narrowness of focus" of one of his courses, namely, the Marx seminar. Nothing was said about any of the other courses he taught. The departmental review committee on Nyden's renewal made the following comments concerning the Marx course:

The latter course, as described in the syllabus issued to students and as elaborated orally by Nyden, is notable for the narrowness of its focus—which pivots upon certain aspects of the writings of Marx, Engels and Lenin. As far as we can tell, little or no attention is paid to the intellectual origins of Marx's work, nor to the possibility of there being differences between the work
of Marx and the work of Engels, nor to any of the major expositional or evaluative works on Marx and Marxism (other than those of Lenin). What perhaps is most disturbing is that there seems to be no attempt to discuss Marx (or Engels or Lenin) in a way that relates to definitely sociological issues. Clearly Marx was much more than a sociologist; but this after all is a sociology department and in spite of the great heterogeneity of the discipline called “sociology” there are some problems of a definitely social and cultural nature which the vast majority of sociologists regard as being of central concern to sociology qua sociology. Our sense is that Nyden is not sufficiently sensitive to such matters.32

The validity of this charge of “narrowness” was responded to quite strongly by Nyden himself:

The anti-Marxism of the department is sharply reflected in the SRC’s secret 14-page report attacking my reading list, an attack first made by Mr. Robertson. He contended the lists—for a one-term course—should have included the 1844 Manuscripts and the first volume of Capital. The further criticism that I did not include anti-Marxists (in a seminar on Marx!) is particularly bizarre in that I have never been allowed to teach the sequel to that course which I requested, a sequel designed specifically to examine twentieth-century Marxist and anti-Marxist thought.33

It should be further noted that distinctions between the “early” and the “late” Marx, as well as those between the work of Marx and Engels, are not universally regarded as important among Marxist scholars. Also, some sociology departments, such as SUNY/Buffalo, have devoted whole courses to the study of Volume 1 of Capital itself! Its exclusion from a one semester course on Marx is not exceptional. Other works, such as Critique of Political Economy, or the shorter Wages, Prices and Profit, could provide an introduction into Marx’s political-economic categories and perspective. On the whole, the Department’s criticisms are questionable.

At a deeper level, the critique of Nyden’s “narrowness” is much more dangerous and insidious. In fact, the charge itself reveals a decided “narrowness” of focus. That is, the Department based its accusation upon an arbitrarily restrictive conception of sociology. These assumptions manifest themselves in many of the criticisms of Nyden’s work.

A consistent theme throughout the attack on Professor Nyden was the charge that he was not “sociological.” Of course, we have seen testimony
to the contrary from prominent scholars. However, there is a flaw in the operative conception of sociology used by the Department. For example, the Department chair referred to Nyden's dissertation as "contemporary history." The review Committee criticized Nyden's Marx seminar for not concentrating upon sociological problems, as distinct from other areas in Marx's work. The Dean of the Faculty of Arts and Sciences referred to Nyden's work as "journalistic." The Review Committee considered Nyden's work on coal miners, including his dissertation, more in the line of public service, not scholarship:

In our view Nyden is not likely to bring intellectual credit to this department, although there is some likelihood that his dissertation published in book form will not merely attract much attention but that he will indeed be praised in the terms that he himself intends—namely as an elegant plea for justice for coal miners. That we regard as falling, as here described, into the category of community service rather than contribution to scholarship.

This is a cursory review of some pertinent criticisms and considerations. They betray the "narrowness" and possible ideological bias of the Department's conception of sociology. In the Department Chair's "contemporary history" remark, and the Review Committee's comment on sociology qua sociology in the Marx course, there is an implicit fragmentation of knowledge into discrete areas. Therefore, history is analytically separate from sociology, which is separate from economics, which is separate from philosophy, etc. To impose this separation on the work of Marx, for example, is arguable. These areas were necessarily fused in Marx's work and are essential to a Marxist perspective. Yet, the department made criticisms of Nyden based upon such assumptions. When Professor Montgomery praised Nyden's work and recommended him for promotion, this bias led the Department to reject Montgomery's advice:

Finally, we dealt with the letter from Professor Montgomery. This letter contains both positive and negative judgments about the Nyden thesis. The negative comments are those bearing directly on those features of the work closest to Professor Montgomery's specialty, and the reason he was asked by us to comment on the use of historical materials on the U.M.W. prior to Nyden's period of first-hand observation. On the other hand, where Professor Montgomery is generous in his praise, he passes judgment on the more sociological aspects of
the work, about which we fell competent to make our own judgments.36

Here the Department has rather explicitly separated disciplines into their respective compartments. It said that its concern was with the "sociological aspects" of the dissertation. What does that mean? Was it valid for them to segregate parts of an integrated whole? How can they consider the "sociological aspect" apart from its historical development? C. Wright Mills spoke to the more general issue at odds here, that is, the interconnection between history and social science:

More important than the extent to which historians are social scientists, or how they should behave, is the still more controversial point that the social sciences are themselves historical disciplines. To fulfill their tasks, or even to state them well, social scientists must use the materials of history. Unless one assumes some transhistorical theory of the nature of history, or that man in society is a non-historical entity, no social science can be assumed to transcend history. All sociology worthy of the name is "historical sociology." It is, in Paul Sweezy's excellent phrase, an attempt to write "the present as history."37

An understanding and use of history is important to the practice of social analysis. This obligation cannot be fulfilled by having a sociological specialty known as "historical sociology." It is incumbent upon all sociological analyses to understand the historical development of social structures and institutions, so that "regularities or relations as may obtain among several features of society" can be understood.38 For the Department to criticize Nyden's work as being "contemporary history" is to turn its back on the central importance of history to social analysis.

There is another area of criticism of Nyden's work that arguably reflects a narrow and biased conception of sociology. This is reflected in the statement that his writing on the coal miners is journalistic rather than scholarly. In fact, the review committee classified his work as community service. However, Professor Cloward, when asked if Nyden's work was journalistic, responded "Absolutely not."39 There is, as we've seen, testimony as to the sociological character of Nyden's work. But beyond this, his choice of topic was quite unique. Professor Cloward suggested this uniqueness when he said the following:

It was an extremely important case study of which there are all too few in either sociology or history, of the struggles of underclass groups for some small measure of social, economic and political justice in this society. It was finally, in my opinion, a creditable class analysis of
American society and the struggle of a particular group of oppressed people.\textsuperscript{40}

Professor Gans, in a March 18, 1976 letter to the department chair, further pointed out the uniqueness of Nyden's topic:

I should add that Professor Nyden's dissertation was a comprehensive combination of sociological and socio-historical analyses, dealing with important phenomena and issues that are too rarely studied by sociologists; consequently, his work will be a highly significant contribution to the discipline when it is published.\textsuperscript{41}

Professor Cloward observed that sociologists get much "support from the corporations, from government, from the military, and elsewhere. There are few sociologists in America who have had close and intimate and daily contact with working-class groups, with oppressed groups, with struggles against injustice—whether the civil rights movement, or any of the other movements in our times."\textsuperscript{42} One could argue that Nyden's work was both scholarly and a service to the community. Yet, the community he served was fairly unique among sociologists; it was a community of the exploited and oppressed. He treated the real, daily-life struggles of groups whose interests were infrequently represented in sociology. His scholarly pursuits stand in stark contrast to those of some of the other members of the Department. Of the 19 full or associate professors in the Pittsburgh Sociology Department at the time, "at least nine have done paid research directly for the U.S. military."\textsuperscript{43} Included among these were the department chair, the former member of Nyden's dissertation committee, and a professor who worked on the infamous Project Camelot.\textsuperscript{44}

The possible bias that becomes apparent in this picture involves the distinct ways in which these people practiced sociology. One could easily argue that Nyden was labeled as "journalistic" and a "public servant" not because his work was unscholarly, but because his work was totally at odds with the technocratically-oriented sociology practiced by many members of the department.\textsuperscript{45} Nyden refused military or corporate research and studied instead oppressed and exploited groups. Both his subject and method were quite unique and controversial. Professor Cloward connected this case to the sociological field in general, and its relations to controversial issues:

So the Nyden incident raised in my mind a question which had been raised by my whole experience with American Sociology, namely, that those graduate students who get into these more controversial areas are frequently dismissed as being polemicists, as being
propagandists. In other words, if you don’t like a man’s scholarship, you call him a propagandist. It is a typical academic strategy for dealing with people who think about and who care about controversial issues. The department’s possible bias against radical sociology was accompanied, at least in some members, by a more explicit bias. One professor not only referred to radical sociology as “garbage, rubbish, and trash,” but also referred to Marxist professor Herbert Aptheker as “nothing but a propagandist and a polemicist.” That same faculty member, who worked on Project Camelot, even accused Nyden of being “rigid” for not being willing to work for coal companies. Another professor, in reference to the controversy over Nyden’s firing, said that the Department was “the object of a well-healed, skillful, organized international assault of defamatory propaganda.” Since this does sound as if he is referring to a “communist conspiracy,” he was asked to explain what he meant. When pressed, he said he was referring to a possible resolution on the Nyden case from the British Sociological Association. Is that really the “well-healed, skillful, organized assault of defamatory propaganda” to which he referred? This veiled allusion was made more explicit when he reacted to Nyden’s dissertation. Here the professor objected to Nyden’s “rigid” use of Communist Party sources such as William Foster and The Daily World. As he put it: “I object to his basing important conclusions exclusively on one source and precisely a source that has a particular ax to grind as to the historical question discussed.”

The validity of Nyden’s observations and analyses seems to have been less of a concern than his use of Communist Party sources. There is also the implicit, value-free assumption that if one has an “ax to grind,” then one cannot engage in “objective” social science research. This faculty member, like Sidney Hook before him, has ruled out communist scholarship by definition.

Conclusion

The Nyden case is very important for at least one major reason: it suggests how political and ideological biases can be manifested in the “neutral” evaluation of radical faculty. The assumptions underlying the judgments on scholarship, collegiality, professional practice, objectivity and competence are at issue. These assumptions raise a number of questions: what is sociology?; what does it mean to practice value-free science?; does the alleged marketplace-of-ideas conceal disciplinary preferences and biases for models of practice and research paradigms? The University Hearing Board refused to consider these basic, “substantive” issues. Consequently, it found for Nyden on procedural grounds. Yet, the Nyden case is only really informative if these basic assumptions
and questions are examined.

Paul Nyden was fired because he was alleged to be too value-oriented, partisan, and intolerant of other viewpoints. His work was considered journalistic and, because he worked on behalf of coal miners, biased and unobjective. His explicit and implicit criticisms of dominant political and economic interests in the coal industry, university, and department suggested that he lacked collegiality and was unsupportive of the marketplace-of-ideas. Ironically, these criticisms were used to remove him from the department and that same marketplace.53

However, the belief in and adherence to value-neutrality in the academy reinforces the existing constraints on and uses of the knowledge generated. In the 1950s, C. Wright Mills noted the increasing development of a "bureaucratic ethos" in which social science practitioners concentrate upon narrowly viewed scientific method and techniques. The social and political context and consequences of the work are ignored and are supplied instead by the "bureaucratic clients":

As it is practiced in business—especially in the communication adjuncts of advertising—in the armed forces, and increasingly in universities as well, "the new social science" has come to serve whatever ends its bureaucratic clients may have in view. Those who promote and practice this style of research readily assume the political perspective of their bureaucratic clients and chieftains. To assume the perspective is often in due course to accept it.55

This analysis is certainly applicable. Nyden also was criticized by his department for being too value-oriented and biased in his research on miners. Yet many department members followed a technocratic model of sociological practice in which their research was conducted on behalf of "bureaucratic clients" in the military and defense industries. Nyden was criticized for refusing to practice sociology within this technocratic model. Because of their power, department members were able to implicitly define their model as "normal science" and Nyden's model, though no more partisan, as value-oriented and polemical. As Erik Olin Wright has observed,

Marxist theorists within bourgeois universities are under tremendous pressure to ask questions structured by bourgeois problems, bourgeois ideological and political practices. Such pressures are often extremely direct, taking the form of tenure criteria, blacklisting, harassment, etc. But often the pressures are quite subtle, played out through the intellectual debates within professional conferences and journals. To publish in the
proper journals one has to ask questions which those journals see as relevant, and such relevance is dictated not by the centrality of the questions to Marxism or to the revolutionary practice of the working class, but to the dilemmas and problems within bourgeois social science. Thus, the requirements of survival within the university necessarily push the theorist into a relationship of at least partial accountability to bourgeois class practices.56

Academic departments have the power to define, usually implicitly, the acceptable methods of acquiring knowledge, the theoretical perspectives used, the legitimate objects of study, and even the acceptable clients to be served. For Marxists or other radicals to practice within mainstream university settings, they may be forced to “cloak” their “discoveries, methodologies, and...culture in the guise of academic conventions.”57 Those objecting to and resisting this pressure, and who continue to propose a more activist and critically-oriented research agenda, may be seen as abrasive and not collegial. Here, the political becomes personal, and the radical faculty member’s activism may be criticized as violating principles of the marketplace-of-ideas, value neutrality, and pluralism. In fact, such charges were leveled at Nyden, who was considered strident and intolerant of views with which he disagreed. This was used as evidence of his lack of fitness for a scholarly position. The same criticism was leveled at Angela Davis during her academic freedom case at UCLA.58 Her critiques of Arthur Jensen, the university administration, and the Board of Regents were viewed as evidence of her lack of collegiality and disdain for a marketplace-of-ideas. However, there, too, the university system was involved deeply in partisan political and military research.59 Ultimately, what these cases reveal is the way in which value-neutrality, pluralism, and the dominant, technocratic model of practice can be used to effectively exclude radical scholars from the marketplace.

As Aronowitz and Giroux argue, these examples indicate the degree to which academic departments refuse pluralist practices even as they oppose radicals on the same ground. Their dedication to normal science, in Khunian terms, is completely understandable; the problem is that they rarely tolerate those not engaged in research that conforms to the norms established by the ‘scientific community.’ Thus, exclusion from tenure is not often announced on overt ideological grounds, but on the quality of the research of the denied faculty member. The concept of ‘quality’ is articulated in terms of a prefigured conception of normal science. Under
these circumstances, overt political repression becomes unnecessary. Anyone engaged in theorizing or research who adopts an antipositivist perspective or defines an object of knowledge in terms that vary or oppose conventional definitions may find herself out in the cold. Under these conditions the liberal self-perception of the pluralistic academic system is preserved.60

This analysis is echoed by Bertell Ollman, who argues that it is only when faculty are purged at the departmental level, using "purely professional criteria," that the illusion of objectivity or neutrality is preserved.61 As university administrations or governmental bodies intercede, the political nature of the act of repression becomes more obvious. This was certainly the case with Ollman's academic freedom case at the University of Maryland. He was hired as Department head by the Political Science Department, only to have the offer overturned by the university president under pressure from the state legislature. The reason given by the president and the legislators was that Ollman was a Marxist, and therefore they opposed him to preserve academic freedom.62

The 1960s and 1970s, then, saw the increasing obfuscation of the methods and criteria by which radical academics could be fired. Overtly political criteria became more covert. Ironically, the principles of value-freedom, objectivity, and the marketplace-of-ideas, when operationalized in ideologically biased institutional contexts, provided a rationale for excluding dissenting academics in need of protection. In the final analysis, the McCarthy era assumption that Marxists or Communists were incapable of pursuing the search for truth persisted.

53. In Scaling the Ivory Tower: Merit and Its Limits in Academic Careers (Baltimore: Johns Hopkins University Press, 1975), Lionel S. Lewis argues that data on AAUP academic freedom cases through 1970 indicate that fired academics were no less meritorious in scholarship, teaching, or collegiality than faculty who were not fired (p. 150). He further noted that the social activism of the late 1960s, and accompanying challenges to university authority and governance, generated double the challenged dismissals of the early 1960s and indicated that "the security of academics was greater during the right-wing vigilantism of the 1950s than in more recent times" (p. 153). As Lewis summarized it, "this increase in the number of contested dismissals may be seen as nothing
more than an administrative solution to a challenge to the existing distribution of power within the university" (p. 153).

The Expansion and Decline
of Secondary Schools
in the Archdiocese of Chicago, 1955-1980:
A Historical Study

Catholic secondary education in the Archdiocese of Chicago began with the College of St. Mary, which was established on June 3, 1844 by Bishop William J. Quarter. It was the forerunner of St. Mary of the Lake Seminary and University in Mundelein, Illinois. Since the establishment of the College of St. Mary, secondary education has continued, uninterrupted, in the archdiocese.

However, the period of expansion and decline of enrollment and facilities of Catholic secondary schools in the Archdiocese of Chicago from 1955-1980 is most important, in that this period witnessed the greatest change. This study focuses on the fifty-three schools which either opened during the High School Expansion Program or closed or merged with other schools. Twenty-five schools opened, and thirty-three schools closed. This includes three mergers and two schools which both opened and closed during the period studied. Historical documents were the basis for the research and writing of this paper. Most of the material was from primary sources. Published sources were used to provide an overview and to place the primary source material in a historical context.

Secondary education in the archdiocese expanded rapidly in terms of enrollment and facilities during the mid- to late 1950s and early 1960s, during a period of population increases in general and, specifically, among Catholics. Post-World War II economic readjustment had occurred and the nation was enjoying a period of economic prosperity.

Prior to 1950, the growth of facilities was minimal, apparently due to restrictions in availability of steel and other construction materials. Scarcities during the post-war years and the attendant high prices posed serious problems. Said then Cardinal Stritch: "The plain fact is that we
simply haven't facilities adequate to our needs. We have some high
schools planned, but the cost of construction is proving so much higher
than our estimates that we are facing difficulties." Cardinal Stritch
assured parents of the archdiocese that "we are working and laboring to
increase our Catholic high school facilities and that it is our hope to have
in the archdiocese sufficient high schools to meet the demands of Catho-
lic parents."  

Stritch's High School Building Fund and Cardinal Meyer's High
School Expansion Program were responses to this unprecedented need
for secondary facilities. With financial assistance from these funds,
secondary school facilities expanded from seventy-two high schools in
1955 to ninety-one high schools in 1966. Catholic high school enrollment
almost doubled, rising from 43,314 in 1955 to 76,491 in 1966.  

Reaching a zenith in 1966, a variety of factors contributed to the
decline in secondary school enrollment and facilities in the archdiocese.
These factors included a declining birth rate, a precipitous drop in the
number of religious faculty, economic problems created by the rising
costs due to inflation and the higher costs of lay teachers, attitudes
toward the institutional church and Catholic education, and shifting
neighborhood demographics. By 1980, thirty-three secondary schools
had either closed or merged with other schools. At this time, there were
sixty-four schools with an enrollment of 54,326 students.  

The need for additional high school seats was recognized during the
later years of Cardinal Stritch's tenure, especially from 1953-1958. He
initiated the Catholic High School Building Fund in 1953. Monies con-
tributed to this fund were strictly voluntary. The voluntary arrangement
was not enough to supply the need for funds, especially in the suburbs.
In 1958, Stritch asked pastors in the archdiocese to fulfill pledges and to
"promise that in the next five years they will contribute as generously as
they can to our Catholic High School Building Fund." During the years
1955-1958, seven secondary schools opened and two closed.  

Cardinal Stritch did not follow a standard procedure when establish-
ing high schools or utilize a formula when allocating construction
subsidies. Rather, he negotiated with the individual religious communi-
ties which sponsored the schools. It does not appear that formal con-
tracts were drawn up or signed between the archdiocese and the reli-
gious communities. The informal way of doing business caused difficul-
ties following Stritch's death in 1958. Correspondence and personal
recollections of meetings were used to substantiate promises and agree-
ments.  

For example, early in 1959, questions arose as to Regina Dominican's
financial debt to the archdiocese. Mother Gerald Barry wrote the chancel-
lor of the archdiocese recounting her understanding of the agreement
reached between the sisters and Cardinal Stritch. The chancellor responded that the debt corresponded to charges for the property. He informed then Archbishop Meyer that Cardinal Stritch had intended to give the Dominican Sisters this property upon which to construct a high school. Meyer said, “If a promise has been made, it should be honored.” The debt was canceled.

Stritch’s program provided religious communities with construction grants and in some cases a site on which to build the school. The disbursements were not uniform; some communities received both property and a construction grant and others received one or the other. In the case of Notre Dame and Regina High Schools, the archdiocese provided a $1,000,000 grant and property. The Sisters of Mercy and the Jesuits were each provided $1,000,000 for the construction of Mother McAuley High School and Loyola Academy, respectively. The communities were responsible for purchasing property. The Christian Brothers received a grant of $500,000 along with property for Brother Rice High School. Marian High School received a grant of $1,000,000; the property had been purchased some years earlier by the area parishes. Little Flower, a parish high school, did not receive any financial assistance from the archdiocese.

Negotiations often extended over a period of several years. The protracted planning caused problems as prices escalated due to inflation. Initial discussions about constructing Marian Central High School in Chicago Heights began in 1949; the school opened nine years later. Plans for Notre Dame High School in Niles began in 1951 with the school opening four years later. Informal talks with the Adrian Dominican Sisters about constructing a school in Wilmette began in 1953. Regina Dominican High School opened in 1958.

The more detached attitude of Cardinal Stritch, however, provided the religious communities with greater freedom in designing and operating their schools. Consequently, the schools built during this period are of a far more elaborate design than those of the 1960s. Stritch’s major stipulation was that the schools provide a comprehensive academic program, which would include college-preparatory, general, and vocational course offerings. In order to avail themselves of the construction and property grants, religious communities agreed to this provision. The requirement of a vocational track was a source of irritation to the Jesuits at Loyola. However, they acquiesced, informing the superior general of the order that “only by providing a school of this mixed type can we hope for financial aid from His Eminence.” Further correspondence raised the question of a quota in this nonclassical or terminal course of studies. The provincial superior stated that “it seems inevitable, if we are to meet the
cardinal's wishes, that we shall always have a certain percentage of students in the non-classical course."

Compared to Stritch, his successor Cardinal Albert Gregory Meyer was an expansionist. Msgr. William E. McManus, archdiocesan superintendent of schools, with Meyer's support, wasted little time in developing a high school expansion program. McManus noted that the number of Catholic school eighth-grade graduates greatly exceeded the number of available seats in Catholic high schools. In 1950, 16,333 eighth graders graduated from Catholic elementary schools. In the fall of 1950, there were 11,233 seats available for high school freshmen. In 1957, 24,466 eighth graders graduated; that fall, there were 16,642 seats available. It was understood that not all Catholic grade school graduates would seek admission to Catholic high schools. McManus acknowledged the need for additional high school seats in 1957 when he stated, "[But] the ideal of every Catholic child in a Catholic school will not be achieved. With few exceptions, the high schools have long waiting lists. In the suburban areas, many schools will be unable to accommodate all students seeking admission."9

Msgr. William E. McManus developed a more formal, expedient, and consistent system of constructing schools. With Cardinal Meyer's backing, McManus launched the High School Expansion Program in 1959. Contributions for the High School Expansion Program were solicited (in McManus's terms) in "a heavy-handed fashion." Pastors in areas needing high schools were called in groups, based on the wealth and location of the parish. Following a presentation on the need for additional construction in their geographic area, the pastors were given envelopes indicating the amount of their pledges to be contributed over a five-year period. Said McManus, "It was pure extortion, but it worked." Overall, the response to this project was positive. The mood appeared to be, "Let's expand; let's take care of the kids." There was no massive resistance to the assessment, and all assessments were paid off in the five-year time period.10

McManus relied on the male and female religious communities to expand and construct the new high schools. This followed a long established pattern in the archdiocese. The religious communities found this exercise of free enterprise appealing. In the parishes, the religious community managed the schools but did not own them; here, the religious community assumed responsibility and ownership for the high schools. Religious communities found the secondary schools to be an excellent source of vocations. This factor significantly influenced the decision of the communities to undertake the establishment, ownership, and staffing of large high schools.
The Sinsinawa Dominican Sisters considered the "potential benefits for membership in the congregation;" the Sisters of Charity of Cincinnati "agreed that the congregation could assume the debt [of Elizabeth Seton High School] especially in the expectation that the school would be a source of vocations." The vocational potential of the high schools was so important that Cardinal Stritch informed the superior of a religious community of men that he was in favor of their community’s getting vocations from the high school, but reminded him that the archdiocese also needed vocations. While the vocation factor significantly influenced the decision of many communities to accept responsibility for new high schools, in reality, relatively few vocations came from the students enrolled in the new schools.

McManus developed a formula for financing the construction of high schools. The archdiocese would provide the land and a grant amounting to $1,000 per student up to 1,200 students. Five hundred dollars per student would be provided for over 1,200 up to a maximum capacity of 1,600. No schools were initially designed to enroll over 1,600 students. The religious communities were responsible for the difference between the archdiocesan allocation and total costs for construction, equipment, fees, and expenses incurred in the construction and erection of the school.

Religious communities were invited to staff the new high schools based on their tenure in the archdiocese, along with their ability to finance such an undertaking. In addition to established orders, new communities were invited to sponsor high schools. Msgr. McManus attempted to secure a commitment from the communities to staff three additional elementary schools within a ten-year period as a prerequisite to obtaining the archdiocesan grant. McManus explained the rationale for this stipulation in 1961: "My request that the Sisters staff additional grade schools was made necessary by the grim reality that Communities simply will not pay any attention to our requests for Sisters for elementary schools unless we simultaneously give them some kind of promise that they will have a high school. There was moderate success in obtaining compliance with this stipulation. The Superior General of the Sisters of Providence stated that she did not see "how we can possibly open two additional elementary schools" for at least seven to eleven years. She further stated that if proposed dates could not be accepted by the archdiocese, "we can see no other alternative than for us to forego the opportunity of the new high school at this time." As the decade of the 1960s continued, this stipulation became impossible to fulfill as religious personnel were not available. It is interesting to note that this stipulation applied only to female religious communities, as no male communities staffed elementary schools in the archdiocese.
The initial plan of both Stritch and McManus was to build "twin" schools, one for boys and one for girls, in close proximity to each other. This was thought to provide the schools the advantages of co-education without the evils of co-education. It also helped to facilitate transportation. For the most part, this plan worked. However, in some areas, due to lack of space, and in later years, the inability to obtain a religious community to sponsor the endeavor, it was not possible to build two facilities. In the case of Carmel High School in Mundelein, it was decided to construct a co-institutional facility rather than a co-educational school.

The religious communities also agreed to establish comprehensive high schools that would enroll students of various levels of ability and would provide courses of study geared to these levels. Tuition and fees would be established by the archdiocese and would be subject to renegotiation every two years. The Catholic School Board reserved the right to review the architectural plans for the building. And, at the request of the archdiocese, the religious community would agree to accept all freshman applicants up to an established number. Meeting this condition might require the school to operate on an extended day, a practice McManus described as "destined to become quite common in schools of the Archdiocese."

Two religious communities chose not to accept any financial assistance and constructed their schools independently of the archdiocesan restrictions. In the case of Louise de Marillac in Northfield, the venture was successful and the school is still operating. The independent Sacred Heart of Mary High School in Rolling Meadows suffered financial problems. Eventually, the sisters were forced to relinquish ownership and withdraw from the school. The Religious of the Sacred Heart of Mary chose to forego archdiocesan financial assistance because of the stipulation that they staff three additional grade schools.

The expediency of McManus's plan is contrasted with Stritch's when one considers the case of Marist High School. Initial contact with the Marist Brothers and the archdiocese took place in July 1962. A formal invitation was extended to the brothers by Cardinal Meyer in October 1962. Ground was broken in June of 1963, and classes for freshmen began that September in an unfinished building. Fourteen schools opened during the years 1930-1965; three schools closed. Cardinal Meyer died in 1965.

In September 1964, the Archdiocesan School Board began planning a second phase of the High School Expansion Program which would run from January 1, 1954 through December 31, 1969. Money was to be raised and expended for the construction of six new high schools along with additions to existing facilities. Money would also be available for scholarships to inner-city schools. It was anticipated that this project
would add seven to eight thousand additional seats to the high school system. However, only one school, Louise de Marillac in Northfield, opened. Central high school for Girls in Oak Lawn was scheduled to open in 1968, however rising construction costs, a decreasing number of sisters to staff the school, and an unpredictable number of students caused construction to be postponed indefinitely. No new high schools opened in the archdiocese after 1967.

A major difficulty of the expansion program was its total dependency on religious communities to staff the schools. These communities were responsible for a significant portion of the schools' debts and helped keep costs down by providing a major portion of the faculties. As the number of religious in the communities decreased, expenses increased when religious teachers were replaced by more expensive lay teachers. Eventually the communities were unable to provide sufficient funds and staff for high schools.

After more than a decade of enrollment growth and facility construction, attendance began to decline, and secondary schools closed in the archdiocese. Several factors accounted for this decline. First, the falling birth rate affected the growth of both public and private schools. Second, higher tuition was made necessary by the decrease in the number of religious teachers and the increase in the number of lay teachers. In 1960, there were 2,633 secondary school teachers—1,894 (72%) religious and 739 (28%) lay. In 1979, there were 3,066 teachers—884 (29%) religious and 2,182 (71%) lay. Larger budgets were needed to pay lay teacher salaries, which, though smaller than those paid to public school teachers, were larger than the stipend for religious teachers. Third, demographic changes occurred in neighborhoods. The migration of black and Hispanic families into aging urban neighborhoods was followed by many ethnic Catholics abandoning the city for the suburbs. The new city dwellers often had lower incomes, a different religion, and no ties to the established parish schools. Fourth, disenchantment with the Catholic church, due to the impact of Vatican II, the birth control controversy, and the overall turbulent climate of the 1960s, hastened the decline. By 1980, there were 54,326 students enrolled in sixty-four schools, a decline of approximately 30 percent from 1966.

During the expansion years, five high schools closed. Three were small, parish schools. Their enrollment was absorbed by neighboring central high schools. Corpus Christi High School closed when Hales Franciscan opened. St. Louis Academy closed because of the deteriorated condition of the building. Loretto High School, located in the Englewood neighborhood of Chicago, closed in 1963. It was the first school in this study to close because of the changing neighborhood population. Beginning in 1968, demographic, economic, and staffing changes affected
larger schools as well. The decision to close large, central high schools was much more difficult. Emotional and subjective factors were considered along with objective data. Parents who had financially supported schools for many years felt excluded from the process and betrayed by the decision. At a meeting to discuss the closing of Marywood in Evanston, one parent was quoted, “You called on us when you needed money to fix the roof and you got it, and we always came to your aid when you needed help in other matters. Why didn’t you consult with us when you needed help this time?” Religious communities were reluctant to abandon schools they owned and had operated for many years. Within a religious community, some members supported a decision to close, while others advocated continuance. Eleven Servite faculty members wrote Cardinal Cody in September 1969, proposing that they administer and partially staff St. Philip High School after the provincial chapter decreed that the school be closed at the end of the 1969-70 school year. Critics assailed the closing of inner-city schools as the church’s abandonment of the black community. The Servites pointed out to Cardinal Cody that St. Philip was a good example of successful integration—50 percent of the students enrolled were nonwhite, and it was the only source of black vocations for the Servite Order.20 Paul Adams, principal of St. Providence/St. Mel charged that the closing of the school was racially motivated.

The closing of this school signals the Church’s abandonment of secondary education in the areas stretching from the Loop to the western suburbs. At the same time, an increasing number of grade schools are being closed. We will not stand by quietly while the Church continues to withdraw from a significantly large area of the city. It makes one wonder when the two high schools which are being closed this year, St. Michael’s and this school, have high percentages of black students. They are the only two secondary schools in the archdiocese which have black principals.21

The archdiocese struggled to support financially the high school system. Between 1955 and 1965, with over $23 million in construction grants were made. During the 1960s and into the 1970s, the archdiocese provided over $21 million in subsidies to certain inner-city schools to enable their continued operation. In some cases, the archdiocese assumed total financial responsibility for a school’s operation. These subsidies were a source of controversy. Their assignment and amount could be the difference between a school’s remaining open or closing. Usually, the schools required increasing amounts in subsequent years to remain solvent.22
When the archdiocese announced it would no longer subsidize Providence/St. Mel, the school became a private institution to avoid closing. Other schools merged in attempts to solve their financial problems and continued to provide education for the inner-city youth. It appears mergers allowed schools to continue for several additional years but rarely solved all financial problems. Although committing personnel to the ventures, religious communities surrendered their ownership of the institutions, thereby eliminating the benefits of ownership. Tensions often arose between the several religious communities staffing a school, especially when one community was providing the facility. Also, the religious communities were reluctant to assume leadership responsibilities for the new ventures.

The archdiocese, parishes, and religious communities had to prioritize how to best expend limited financial and personnel resources. The closing of some institutions was unavoidable. The case studies indicate that there was no easy way to close a high school. Perhaps the best method was to involve as many of the affected parties as possible in the decision-making process. A good example is illustrated in the closing of St. Augustine High School. The decision to close was made by a committee comprised of parents, teachers, students, parish staff, and parishioners.

Catholic secondary schools in the Archdiocese of Chicago have had a long and colorful history. They have been marked by periods of unprecedented growth and rapid decline. Although Catholic secondary schools may not again enroll the number of students as in former years, they will continue to be an important element of secondary education. Their role is very likely to be different from what it was in the past—in response to the changing needs and priorities of the church and the students taught—but it need not, for that reason, become less significant. Social factors will continue to influence their presence, but they will survive the challenges of the future.

Selected Case Studies

Selected case studies illustrate the expansion and decline of secondary schools in the Archdiocese of Chicago.

Marian Catholic

Plans for a central, co-educational high school for the Chicago Heights area were advocated in the late 1940s by Msgr. Walter E. Croarkin, a local pastor. Land was purchased and a fund-raising campaign began in 1949. An architect was hired in 1951. Original plans called for a co-educational school; however, Cardinal Stritch preferred “twin schools.” Plans were revised and drawn up for first a girls’ school, to reflect the
cardinal’s wishes. The religious community of women originally contracted to staff the school withdrew in 1953. The Springfield Dominican Sisters were approached in 1955 about staffing the school.\textsuperscript{23} It does not appear that a formal contract between the archdiocese and the sisters was either written or signed. Correspondence and meetings with Cardinal Stritch, area pastors, and the sisters continued throughout 1955 and 1956. Ground was broken for the new school in 1957.\textsuperscript{24} The initial plan was for the sisters to conduct a co-educational school until a boys’ school, to be operated by the Viatorians, was constructed on adjacent property. In the interim, the Viatorians would provide personnel to assist with the staffing of Marian Catholic.

Marian Catholic opened in September 1958. An addition to accommodate 400 students was constructed in 1961. The tentative plans were for the boys’ school to be constructed and opened in 1965. Mobile classes were provided in 1963. The archdiocese proposed allocating $1,200,000 to the Viatorians; however, at a later date, the need for a girls’ school in the vicinity of Marist High School was seen as more of a priority. This school, Oak Lawn School for Girls, was also never constructed.\textsuperscript{25}

In 1967, the local paper reported that construction of a boys’ school would begin “as soon as possible.” Marian would then be converted to a girls’ school. In 1970, it was determined that the difficulty in obtaining additional religious personnel made it unfeasible for the archdiocese to construct an adjacent boys’ school and that Marian would remain a co-educational institution in a building designed to be a girls’ high school. Another addition was constructed in 1971.\textsuperscript{26}

\textbf{Marist High School}

Marist High School, located on the southwest side of Chicago, opened in 1963. It was the last school for boys established by the archdiocese.

Soaring enrollment in this area compelled the Archdiocesan School Board to establish a third boys’ school. The Marist Brothers contacted Msgr. McManus in July 1962, expressing an interest in the possibility of establishing a school in the Midwest. A formal invitation was extended to the brothers by Cardinal Meyer in October of 1962.\textsuperscript{27} The original principal began recruiting activities in November. He recalls “selling a school that doesn’t exist” as being a challenging task. Ground was broken for the new school in June 1963, and classes began in the unfinished building for 326 boys in September 1963. Plans for an addition were developed in 1966 before the first class had graduated. Another addition was constructed in 1978.\textsuperscript{28}
St. Paul High School

St. Paul High School opened in 1965 as a cooperative experiment in dual enrollment and shared time between the Chicago Public Schools and the Archdiocese of Chicago. Under this plan, students were enrolled and spent a portion of each day in both schools. This idea was in response to the growing population on the southwest side of Chicago and the high costs of new school construction. The initial idea was to explore shared time with physical education classes, as the cost of insurance for athletics was four times as high for Catholic schools as it was for public schools, possibly due to the lack of physical education programs in the elementary schools.29

St. Paul was the first school to be owned by the archdiocese and administered by a religious order. While Superintendent Benjamin Willis was noncommittal to and none too enthusiastic about the idea, area pastors and principals were supportive.30 This proposal was presented to the Chicago Board of Education in November 1963. A public hearing was held on March 12, 1964 where over forty groups presented statements, both for and against the shared-time proposal. Neighborhood parents and the archdiocese spoke in favor of the project. Opposition to this plan came from several factions, including the ACLU, PTA, the Negro American Labor Council, and the Chicago Board of Rabbis.31 On April 23, 1964, the board of education voted 7-3 to approve a four-year experiment which would go into effect in September of 1965. A lawsuit, charging that shared time was an indirect subsidy of parochial schools and violated statutory and constitutional provisions, was filed within a month. The suit and its appeal were eventually dismissed.32

St. Paul High School opened in 1965 with 252 freshmen. One hundred thirty-seven attended classes at St. Paul in the morning and one hundred fifteen attended in the afternoon. Students studied religion, language arts, critical thinking, and social studies. These subjects were selected because they were considered value-oriented and essential to the Catholic school philosophy.33 The designated companion public school was John F. Kennedy High School.

Despite initial enthusiasm for the project, the number of ninth-grade students enrolling declined each year, from 252 students in 1965 to 105 in 1969. An enrollment study indicated that parents were uneasy about the experimental nature of the program and wanted some guarantee that their children would finish the program. Other parents and students preferred a full-time Catholic or public high school. Some students disliked the longer school day—one additional period (religion class) and a twenty-minute walking time.34

The Chicago Board of Education conducted an evaluation of the shared-time program in 1969. This evaluation determined that the
shared-time program was administratively feasible and not detrimental to the program of education in the public schools.\(^3\)

The St. Paul shared-time/dual-enrollment concept should have been extremely popular and successful, possibly an ideal prototype for future high school expansion projects—especially in the suburban areas. Yet, after operating for twelve years, the school closed in 1977. Primary reasons cited for its closing were declining enrollment and increased operating costs. As enrollment declined, so did tuition revenues, which caused an increase in the operating deficit.\(^4\)

St. Paul High School is remembered as a creative response to the demand for Catholic high school facilities and a unique cooperative venture with the Chicago Public School System.

ne of the most important perspectives from which to view the phenomenon of common schooling is that of its role in social and national development.¹ Nowhere is this more apparent than in the American case. As Lawrence Cremin, David Tyack, and Carl Kaestle, to name only a few, have shown, one of the major results of common school formation and growth in nineteenth century America was the socialization of immigrant children into American life.²

This was especially important given the character of America as a largely immigrant society throughout the era. Between 1830 and 1840, half a million immigrants, largely from the British Isles and Western Europe, arrived in the United States. During the remaining years of the century, immigration continued at the rate of about 200,000 persons per year, first from Western and Central Europe, then from Eastern Europe and the Mediterranean, and eventually, East Asia. Only with restrictive legislation in the 1920s did the flow nearly cease.

Given the cultural diversity of immigrants, the common school took on the task of basic education in the language. Even more, through its informal culture, it exerted a powerful socializing influence on the children, communicating values such as industry and hard work, a commitment to democratic institutions, and the normativeness of Protestant religion and northern European values. In many respects, common schooling was arguably the single most influential institution in the formation of the American republic during the nineteenth and early twentieth centuries.
From a variety of perspectives, the State of Israel affords interesting opportunities for comparison and contrast with the American experience. Like nineteenth century America, Israel is dramatically a nation of immigrants. On the eve of independence in 1948, the Jewish population of Palestine numbered about 650,000. By the late 1980s, this number had grown to nearly four million. Immigration from Europe in the aftermath of World War II swelled the numbers around the time of independence, while wholesale immigration of Sephardic Jews from the Islamic world, especially in the 1950s, resulted in this group's comprising about 42 percent of the population by the 1980s. During this latter period virtually the entire Jewish population of Yemen settled in Israel.

One important difference from the United States, however, lies in the structure of basic education. Unlike the U.S., Israel did not develop a form of universal state-controlled schooling. Instead, it opted for support of multiple educational arrangements with significantly different characters. At the primary level, the majority of children have attended "state Hebrew schools," which are analogous public schools in the United States. However, some families opt to send their children to "state Hebrew religious schools," which emphasize Hebrew-Zionist studies, as well as religious tradition and observance. Others have chosen "independent schools." These are affiliated with various non-Zionist Orthodox Jewish groups and offer intensive religious education in classes segregated by gender. Finally, members of the Arab and Druze minorities have their own schools, with an emphasis on instruction in Arabic and a focus on the needs of those communities. These latter even operate on a different calendar than those serving Jewish constituents.

At the secondary level, the same diversity has been evident. Besides general academic schools, technical schools have offered vocational training on three levels: agricultural schools have offered instruction in specialized subjects, military preparatory schools have trained future career soldiers and specialists in technical areas, and yeshiva high schools have provided intensive religious instruction in addition to the secular curriculum. Primary and secondary education has been characterized by a diversity of arrangements.

Thus, Israeli education has differed markedly from that in the United States. While curricula have been controlled by the Ministry of Education, the social settings of the individual schools have varied widely. This makes the role of the school as socializer into the national culture in Israel problematic. While the overwhelming majority of American children have been educated in public institutions which bear striking resemblance to each other in most respects, Israeli youngsters have been exposed to a relatively standard formal curriculum, but widely divergent informal ones. While a Hebrew common denominator of basic culture
and unique Israeli social behavior have developed, the school has simply not been able to exert the shaping social influence that has characterized American K-12 education.

**The Israel Defense Force as Educational Agency**

While its diverse educational framework mutes Israeli primary and secondary education's capability of exercising decisive direct influence as a national socializing agency for immigrants and children, there is an institution within the state that has the potential to serve this purpose. This is Zahal, the Israel Defense Forces.

For many years, the IDF has been the closest thing to a universal social institution to be found in Israel. Conscript service upon completion of secondary school is three years for men, two years for women. Among men, only some yeshiva students are exempt. Women are allowed to opt out for “reasons of conscience or religious conviction,” and, in fact, about 60 percent of those who report to recruiting officers are exempted for a variety of reasons. About 87 percent of the males born in a particular year actually are inducted, with about 3.5 percent of those not serving being exempted as a result of severe illiteracy. Until men reach their early fifties, they perform reserve service for thirty days. One unsurprising result of this is many men develop some of their closest relationships with other members of their military units.

Within the state, the military exert a profound social influence. Membership in it is part of the experience of the overwhelming majority of Israelis. The lack of discharge papers makes employment difficult, and individuals are frequently evaluated on the basis of rank achieved and the units in which they serve.

Given this social construction, the IDF is a logical agency to engage in both cognitive and social education. From its earliest days, the IDF has defined for itself a task that is oriented both toward national defense and the building of the nation. Unlike many military establishments, its training and education departments are separate. To the former belong the classic military tasks of instruction with direct military applications. The education department is tasked with a mission that more closely resembles that of civilian schooling. The result of this distinction is the creation of an almost unique entity within modern armies. It is an organized system of general education that concerns itself with the creation of motivated soldiers who will be socially and economically productive members of the wider society.

Accounts of army life also make it clear that the informal culture of the army exerts a powerful force in socializing the young and newcomers to regard themselves as citizens of the nation, as well as in creating a national culture. Emphasis on group loyalty, the informal relations
between officers and enlisted personnel, and a high level of institutionalized concern about the individual are several examples of ways in which the IDF’s culture attempts to model what are considered national virtues.11

There appear to have been two major epochs in the early formation and development of the Israel Defense Force’s Education Department. The tenure of Aaron Ze’ev, the first Chief Education Officer, established both the ideological basis of army education and the first concrete institutions designed to operationalize that philosophy. The time during the 1960s when Mordechai Bar-On led the Education Department was a period of significant transition within Israeli culture. During this era, the Education Department became more complex and more professional in its orientation. Taken together, these two periods can provide us with a sense of the formation of Zahal’s Education Department, as well as of the concrete structures developed.

The Beginnings of the Education Department: Aaron Ze’ev

The roots of the Israel Defense Force’s Education Department lie in September, 1949, in a meeting between Prime Minister David Ben-Gurion, the Minister of Education Zalman Shazar, Army Chief of Staff Ya’acov Dori, and the children’s poet Aaron Ze’ev.12 During the War of Independence, the fledgling army had had a “cultural services” unit under the direction of Yosef Krakovi. This had operated at the brigade and battalion level, utilizing cultural officers whose role was the maintenance of morale.13

After the war, it became obvious that Israel would have to maintain a standing army. The 1949 meeting seems to have represented an attempt to build an educational component into its structures from almost the beginning. Under Ze’ev, a “Tolstoyian socialist,” there was a shift from the view of morale as the principal task to a vision of utilizing the army as a vehicle for national socialization.14

All of this occurred at a time when most new conscripts were themselves immigrants. Indeed, during the 1948 war some had been taken from the boats, given cursory military training sometimes lasting only a few hours, and sent directly to the front.15 Those in charge saw a need to educate these newcomers and viewed the IDF as an appropriate vehicle.

This view of the importance of re-education would become a recurring theme in the Israel Defense Forces. At this time, the notion was the backgrounds of the immigrants were either unsatisfactory or wrong. They held little promise of creating the ideal Israeli.

One of the most important educational tasks taken on by the army during this period was the challenge of providing basic instruction in a national language which was the first language of almost none of the
Ben-Gurion’s support for the formation of the Education Department was to provide such instruction. Over time, it became extensively involved in diagnostic testing for Hebrew proficiency, as well as highly sophisticated intensive instruction in both the spoken and written language. At the same time the army radio station Galei Zahal was begun as an educational vehicle. In its earliest years, it broadcast for five hours a day from an improvised studio with second-hand equipment. Initially, it emphasized general education in a light style, with special emphasis on Hebrew. After the creation of the reserve army in 1950-51, it took this group to be its audience and expanded its programming. Like other activities under Ze’ev’s control, it was staffed by soldiers for soldiers, with an explicit educational mission.

In addition, Ze’ev had begun the IDF’s involvement in leadership training during the early 1950s. Major emphases for him were the study of Jewish history and Zionism, the history of the land of Israel. These served as motivational tools.

A final educational project begun during these years involved the army, though not under its auspices. This was the utilization of women soldiers as teachers of new immigrants. Under this plan, women from teacher training colleges were drafted and posted to assimilation centers and border settlements with large numbers of immigrants to complete their military service of two years. In this way, army women functioned in a role analogous to those in the United States who went West under evangelical auspices to “civilize” the American frontier. While these activities took place under the direction of the Ministry of Education and the Women’s Corps of the Army, rather than the Education Department, they still provide a dramatic example of the use of military personnel in education and socialization.

Ze’ev remained as Chief Education Officer until 1962. During his thirteen year service, the IDF had fought the highly successful Sinai campaign of 1956 in an effort to pre-empt an all out Egyptian attack. Within the IDF, proponents of the more informal structures that had come to characterize the Israeli army reinforced their views against officials who favored a military modeled on the British system with its emphasis on discipline. The makeup of the army had also changed. The majority of its personnel were either native Israelis or had come as young immigrants during the period from 1949 to 1954. Thus, the primary task of language instruction was less important than it had been previously.

At the same time, a shift in the pattern of immigration had begun to have profound effects on the society. With their local situations made increasingly difficult as a result of the 1948 war, Jews from the Arab
countries began to emigrate to Israel in large numbers. This influx of Jews from Islamic environments whose cultural background was Middle Eastern created significant social tension between them and the culturally northern European Jews, who dominated Israeli life.24

While the immigrants entering the IDF frequently had a basic command of spoken Hebrew, there were serious problems with their formal educational and cultural backgrounds. Many were functionally illiterate and viewed army service as a punishment. An attempt to put the most promising candidates through a crash officer’s course was a total failure in the estimate of Mordechai Makleff, then Chief of Staff:

We selected 150 candidates from different countries and tried to indoctrinate them .... The course lasted for ten months and was the first and last of its kind .... Altogether we succeeded in producing fifteen sergeants but not one officer.25

Even by the last years of Ze’ev’s tenure, while 50 percent of the IDF’s personnel were Oriental Jews, they made up only about 10 percent of the officer corps.26

The country’s demographic character had shifted dramatically during these years. Precisely because the IDF was already perceived as the primary agency responsible for basic inculturation into the society, its educational focus was also in the process of change. It was in this context that Mordechai Bar-On became Zahal’s second Chief Education Officer.

The Era of Professionalization: Mordechai Bar-On
While Mordechai Bar-On succeeded Ze’ev in 1962, he had in fact been in charge of the department for the previous year. In many respects, the two were a study in contrasts. Ze’ev was the poet who operated intuitively. Bar-On with a more sophisticated background including Columbia University, insisted that the principles of research be applied to the programs undertaken by the Education Department. Bar-On was also determined to modernize the army’s propagation of culture. His own assessment that he “de-Bolshevized” the Education Department is probably on the mark, moving as he did toward a more professional rather than ideological role for the unit.27

Their approaches toward leadership training reveal graphic differences. For Ze’ev, training was intensely Jewish-Zionist in character, oriented mainly toward morale building. This reflected his membership in the nation’s pioneer generation. On the other hand, Bar-On’s approach concentrated on aspects such as the development of leadership skills and group dynamics, similar to the form such activities take in other organizations.28
Opportunities for traditional education were expanded during this era. The policy was already in place requiring soldiers who had not yet completed primary education to do so in an intensive three month course, generally toward the end of their time of service. By the mid-1960s, a number of post-primary courses for draftees had been created up to the tenth grade level. A new program was also started that gave a special one year extension course to selected soldiers who were largely from Islamic countries. This was done during their time of service and at IDF expense. The goal was to prepare them more adequately for university admission. About ninety out of every hundred from in this program who entered the university eventually graduated.29

One of the most important issues confronting Bar-On was the teaching of battlefield ethics. On 29 October 1956, a massacre occurred at Kfar Kassem, an Israeli Arab village on the Jordanian border. Forty-three farm workers, unaware that a curfew had been changed from 7 to 5 pm, were killed by the paramilitary Border Police. In the investigation that followed, the defense that the soldiers were simply following orders was rejected, and several, including the major commanding the unit, received prison sentences. The verdict of the military court established the precedent that a soldier not only was obliged not to follow an illegal order but also had a positive duty to interfere with its execution.30

It was the responsibility of the Education Department to teach soldiers, especially those in officer training, what the army's expectations of them were in this regard. They were taught that hatred was a weakness, and they learned the doctrine of "purity of arms" that was derived from the pre-state army, Haganah. In this, Bar-On clashed with high ranking officers such as Ariel Sharon, who had already made his reputation during the Sinai Campaign and in reprisal raids.31 Bar-On also saw to it that the military judge's verdict in the Kfar Kassem case was reprinted and given to every soldier upon induction.

Bar-On viewed the Education Department's role as "cultural uplift" and general education. Noticing that soldiers in border units had little to do in times of inactivity, he published fifty books by writers like Dostoevsky in editions of 10,000 each. The army's weekly magazine, Bamachane, which ran over 5000 items each year, became a forum for a wide range of political opinions. In a series of articles about the military heroes of the pre-independence period, for example, while the majority of space was devoted to those who had fought with the mainstream Haganah and Palmach, attention was also paid to the extreme right Irgun and Lechi, considered by many Israelis to be terrorist organizations.

A major expansion of the era, too, was in the army radio station, Galei Zahal. Like other projects begun under Ze'ev, it underwent expansion and became more sophisticated. With a decrease in the need to empha-
size language instruction and citizenship education, it began to do more music programming, including a wide range of classical, modern, and folk performances. During these years, it sponsored six small theater groups comprised of conscripts and even its own string quartet comprised of soldiers who spent their service refining their musical skills.32

A variety of other fine arts activities were conducted under army auspices. These included the formation of musical and satirical groups, various light theater productions, as well as less frequent attempts to hold exhibits of art done by soldiers. After the Six Day War in 1967, a group of soldiers and officers from kibbutzim made a film in which they interviewed each other about their experiences. This film, entitled The Seventh Day, was rejected by the military censors because of its generally negative tone. Bar-On helped them re-edit it, had himself appointed as censor, and the film was released.

The Bar-On era was a time of increased professionalization and expansion of the army's educational services. Still committed to the original concept of utilizing the military as both indirect and explicit educational agency, Bar-On increased both the numbers and scope of activity. In part, this reflects such secular shifts in the society as the advent of the Beatles and the heightened sense of national security gained as a result of the stunning victory in the Six Day War of 1967.33 Utilizing a wide variety of innovative approaches, the Education Department became a national educational delivery system. This was acknowledged directly in the mid-1960s when the annual Israel Prize for education was given to Zahal.

Conclusion

The history of the foundation and early development of the Israel Defense Force's Education Department under its first two Chief Officers is a history of a nation's nearly universal educational agency. Driven by the twin factors of Zionist ideology and the necessity to make Israelis out of people with disparate backgrounds, it utilized both conventional and innovative ways to teach traditional subjects and to socialize newcomers and youth into the national culture.

This is not to say that the institution that emerged was perfect. One major issue seems to have been the department's status. Clearly, the Education Department was undermined to a degree by its place in Zahal's structure. Its personnel were subject to the commanders of the units to which they were attached. As a result, the Chief Education Officer had only a secondary claim on their loyalty. This may have been more of a problem at the battalion and brigade level, since most were young female second lieutenants. While at the division and area command level, the officers tended to have more rank (typically captains...
through lieutenant colonels), and although Bar-On had veto power over decisions made at this level, the education officers still were unable to function autonomously.  

A related problem was that of gender. The overwhelming majority of education officers were females. In a society so male in orientation, it seems problematic that a group consisting largely of females would have significant status.

Finally, the unwillingness of officers from combat units to serve in the Education Department can be seen both as a sign of its comparative lack of prestige and a cause of it as well. While Bar-On was able to bring in about six combat officers during his tenure, most officers were reluctant to make what they saw as a poor career move. The result is most education officers came from service units that had less prestige.

The question of the Education Department’s status within the military can be raised. On the one hand, the lack of real autonomy, feminization, and personnel from prestigious backgrounds might indicate comparatively lower status. On the other, the respect for education both within the army and the general culture might well serve as a kind of counterbalance.

A second major issue might be termed “cultural imperialism.” It was evident that the first two Chief Education Officers had a vision of what constituted culture and were determined to propagate it throughout Zahal. This culture was rooted in the Ashkenazic experience of northern Europe. Thus the novels made available to soldiers in cheap editions tended to reflect the tradition of Northern Europe, especially Russia. Similarly, classical music was preferred for performances and on the radio because of its “higher tone.”

Even today, while Bar-On admits that the issue of “cultural imperialism” is legitimate to raise, he continues to insist that his choices were fundamentally correct. He believes that elite culture has an advantage in the uplifting of society and seems to assume that European culture is normative. One might well question whether the Education Department did not actually perpetuate the Ashkenazic-Sephardic tension.

In spite of these concerns, the work of the first two Chief Education Officers of the Israel Defense Forces was impressive. During their tenure, the foundations were laid for an institution that would continue to broaden and deepen its role as nearly universal educational and socializing agency. Just as the common school was critical to the formation of American life, so also was Zahal’s Education Department to the formation of the Israeli state.

In later years, the Education Department would expand in complexity and sophistication. The posting of officers with field experience to senior posts within the department would further its credibility with field
commanders and provide necessary linkages with the actual needs and experiences of the ordinary soldier. The department's goals would become more sharply defined and critically evaluated. A contemporary Chief Education Officer has opined that:

The IDF, in that it is the corridor to the world of maturity for Israeli youth, is the "oven" that converts this youth into a society of mature adults. The "temperature" of the "oven" is education.³⁶

In that understanding, its Education Department continues the task begun some forty years ago by its innovative founder and his professionalizing successor.

Influences of European Tutors on Colonial Domestic Education

Edward E. Gordon, Ph.D.
Chicago, Illinois

To what extent were eighteenth-century colonial education practices in America an extension of education policies and philosophies found in Europe? This becomes a significant question since unlike educators in a far more densely populated Europe, colonial educators were forced to innovate and adapt to serve a predominantly isolated, rural, frontier environment. Tutoring at home was a natural, practical response to a unique educational challenge.

This paper will chronicle the work of professional tutors, governesses and family domestic educators to show how they melded European tutorial concepts with the teaching methods required by a distinctive colonial society.

In eighteenth century colonial America, as in Europe, the history of tutoring at home (domestic education) was linked to the development of schools in each local community. However, domestic educators were often the originators of schooling concepts. Three centuries ago the American family was the fundamental economic, educational, political and religious unit of society. The household was the institution primarily responsible for the education of children. The family performed many social support functions that have since been relegated to non-familial institutions.

Provenzo believes that the colonial child who learned reading was as likely to have been taught at home as through attendance at school. Spufford in her study of 141 colonial autobiographies also offers parallel findings. She discovered that reading was taught “in families and was
more widespread among all classes than previously conjectured.” Even though grammar school and college attendance was very limited, she perceives “a murky and ill-defined world” in which children somehow learned to read.5

A review of the personal writings of these domestic educators and their pupils challenges our modern perspective that has excluded home tutoring as a significant contributor to the overall schooling process. Josiah Cotton (1680-1756) of Massachusetts related in his diary,

My younger days were attended with the follies and vanities incident to youth howsoever I quickly learned to read, without going to any school I remember.6

Even by the end of the eighteenth century in many places outside New England, schools were maintained with difficulty, if at all.7 However, the colonists, freed from much of the restrictive social structures of their homelands, developed an ideology of political equality and a system of economic rewards based on individual educational competence. Commager sees education as many early American’s quasi-religion. Education was perceived as a means for any ambitious individual to improve his or her economic status.8 Cremin tells us that if a New England child grew up in a home of non-readers, neighbors often offered to tutor the child.9

A chronic shortage of qualified educators plagued colonial society. Many schoolmasters taught children in the day and tutored at night. In Boston, New York, Philadelphia, Savannah and other cities, teachers used colonial newspapers or public house bulletin boards to advertise their availability as tutors for children and adults, individually or in small groups. The large numbers of these advertisements provides evidence that tutorial services were in enough demand to keep many tutors in business throughout the eighteenth century.10 Woody also supports the view that women composed a large part of this audience educated at home throughout this period.11

How widespread were home tutoring activities in the English colonies? What influence did Europe have on these tutorial practices? A regional review of the colonies will fill in the details on these issues and other tutorial activities important to eighteenth-century colonial society.

New England

The Massachusetts Bay Puritans were heirs to what Cremin calls the English “Renaissance traditions stressing the centrality of the household as the primary agency of human association and education.”12 Imitating the Royal Injunctions of the House of Tudor (1546, 1547, 1559), they were the first among the colonies to legislate reading instruction of children at home by their parents (1642). The idea that the family was also a
“school” reveals the overbearing Puritan sense of purpose. Most of New England by 1683 had enacted some degree of compulsory schooling.¹³

A considerable amount of evidence indicates that beginning in the late seventeenth and throughout the entire eighteenth century, the colonial household was even more important as an agency of education than schools in the towns of New England. Many of the early education laws empowered local officials to check that parents were tutoring their children at home. One indication of the extent of domestic education’s role is the prevalence of court orders enforcing these colonial statues on negligent Massachusetts parents.¹⁴

The Puritan family was a primary educational and religious unit. Based on the writings of Martin Luther, John Knox and other Reformation leaders, the 1642 Massachusetts’ education statute required the heads of households to tutor their children in reading, thus insuring the religious welfare of their souls.¹⁵

There is no doubt that domestic tutoring was often supplemented, when available, by more secular schooling. However, the quintessential Puritan, Cotton Mather (1663-1728), insisted as a safeguard for the religious welfare of children “that parents are to teach their children... without that Knowledge our children are miserable to all Eternity.”¹⁶ At least once a week most fathers taught their children from a catechism. Learning was by rote, but a good parent taught older children to comprehend the significance of their answers and much more besides. Increase Mather (1639-1723) said of his own childhood, “I learned to read of my mother. I learned to write of Father, who also instructed me in grammar learning, both in Latin and greeke Tongues [sic].”¹⁷

The early “Reading School” or “Dame School,” found throughout New England, represents another variation of home tutoring. A mother might begin such a “school” by first tutoring her own children. Many then took in other neighbor children as young as age two. This form of small group tutoring flourished throughout the eighteenth century in the region’s towns and villages. Some “Dame schools” used peer tutors to supplement the teacher. Among these was a Reverend John Barnard of Marblehead, Massachusetts (b. 1681) who recollected of his schooling in Boston that “In my sixth year... my mistress had made me a sort of usher appointing me to teach some children that were older than myself as well as some small ones.”¹⁸

As in Europe, many clergymen were tutors. Church pastors supplemented their meager incomes by boarding young boys in residence. Many also undertook the education of their own families. Women in particular were often educated exclusively at home by a tutor, governess, or parent, if they were educated at all. Jonathan Edwards was tutored by
his father, along with his ten sisters. An early Fellow of Harvard, Reverend Colman, educated his daughter Jane exclusively at home.\textsuperscript{19}

The playwright, poet and historian Mercy Otis Warren and her equally famous friend Abigail Adams, received their education almost entirely at home. Although Mercy received no formal schooling, she grew up in an environment that stressed intellectual achievement. She was allowed to attend the tutorial lessons that her older brother James took with their uncle, Reverend Jonathan Russell, a religious and educational leader of the Cape Cod region. James went on to Harvard and became a successful lawyer and pamphleteer in the early struggle for American independence.\textsuperscript{20}

Mercy continued her own education based on books borrowed from her uncle’s library on such subjects as theology, history, philosophy and poetry. Later her History of the Rise, Progress and Termination of the American Revolution (1805) inspired the patriotism of the early United States.\textsuperscript{21}

In contrast to her illustrious compatriot, Abigail Adams’ (1774-1818) own education was limited to home instruction and local dame schools. The correspondence of Abigail (1774-1818) with John Adams (1735-1826), while he was on a myriad of diplomatic and political missions, chronicled the domestic education of their four children. Adams always assured her that she was well qualified to tutor their children.\textsuperscript{22}

Abigail read with great interest the tutorial guide On the Management and Education of Children by the English author Juliana Seymour (the pseudonym of John Hall). This was an example of the eighteenth century "domestic education" or "fireside" education literature written for parents tutoring their children at home. Beginning in eighteenth century England, Maria Edgeworth and other English "domestic educators" authored hundreds of books that popularized home tutoring. Abigail composed a poem (1773) that expressed her conception of a parent’s duties as the family tutor.

\begin{verbatim}
Parent who vast pleasure finds
In forming her children's minds
In midst of who with read delight
She passes many a winter's night
Mingels in every play to find
What Bias Nature gave the mind
Resolving theme to take her aim
To Guide them to the realms of fame
And wisely make those realms the way
To those of everlasting day\textsuperscript{23}
\end{verbatim}
The Middle Colonies

New York

Early New Amsterdam provided little opportunity for education at home or in school. However, we know that some children were taught by private tutors.

John Stuyvesant, Director General of the Dutch Colony, retained Aegidius Luyak as a tutor for his children. His curriculum included Latin, Greek, writing and arithmetic. It was not an uncommon practice to include classical languages in a tutorial program.

This curriculum was a continuation of the humanist Renaissance tutorial tradition of Thomas More, Juan Luis Vives, Thomas Elyot, John Cheke, Roger Ascham and many other illustrious tutor-educators. It was not unusual to see well-tutored four, five and six-year-old children throughout Europe conversing with adults in both ancient and modern languages. They were educated as “little adults” with a somber mood to match. Only during the seventeenth century did a new conception of childhood emerge that gradually acknowledged different subject material in the education of children, adolescents and adults.24

The Dutch also influenced the liberal education policy of the first generation of Pilgrims. Prior to their sojourn in the New World, the Pilgrims lived in Holland for twelve years as religious refugees. Since the local schools were only in the Dutch language, home tutoring directed by parents became an educational necessity. This experience influenced the Pilgrims’ outlook regarding the role of the family when adopting their education statutes for Massachusetts.25

Education was also encouraged by the government of New Sweden. After the coming of the English (1682) and absorption into the colony of New York, it was customary for Swedish children first to learn at school to read English and then their mother tongue. As in New England, home tutoring by a local pastor was also a component of Swedish colonial education.26

In 1664 the English seized the New Netherlands and renamed it New York. Kamen believes that between 1695 and 1775 the majority of children in New York City who received any education were tutored to read and write at home. Schultz also agrees with this conclusion. He has found that the little formal education then in existence was largely controlled by private tutors.27

Evidence of itinerant tutors can also be found in other areas of New York. In 1716 a travelling tutor from New Jersey “kept school” for families in several places in Westchester County, New York. This single woman earned such a scant living as a tutor that she was forced to give her eleven-month-old baby to one of the local farm wives. We might
conjecture the unhappy life of this nameless tutor, who, babe in arms, had perhaps moved to “the Jerseys” to find a happier life than in New York. Unfortunately, the low wages given many colonial tutors forced her to forsake her baby and career as a tutor.  

**Pennsylvania**

In Pennsylvania private tutors played an influential role in the educational development of Philadelphia. William Penn (1644-1718), the colony’s founder (1682), regarded schooling as a public necessity, but he employed a tutor for his own family. As a child, Penn was personally educated according to the English system of home tutorial education. Penn’s preference for his own child’s education was to “have an ingenious person in the house to teach them, then send them to school.” This procedure acted as a safeguard for the younger child since too many “vile impressions” were taught in the private schools of Philadelphia. The popularity of private home tutors in Pennsylvania can be partially attributed to the preparation of boys for the Latin schools of Philadelphia. Tutors were hired in England to teach these children privately Latin, Greek and mathematics. Further evidence of the prevalence of domestic education was the building of the first secondary school in Pennsylvania (1758) on a site first used by a private tutor to teach local children.

Another ardent supporter of domestic education in local Philadelphian society was Benjamin Rush (1745-1813), American physician, educator and signor of the Declaration of Independence. In *Thoughts Upon Female Education* (1787), he expressed the view that women had to assume the responsibility for the education of the family’s children at home. They were the principal guardians of domestic and moral authority. The new American republic required mothers to educate their sons in the principles of liberty and government. This prepared them for future public office.

In colonial American society, women were perceived as the ideal educators of their own children. To prepare women for this vital role, Rush and other colonial leaders, such as Washington, Jefferson and Adams, strongly encouraged education for women at home. Formal schooling was seen as an alternative, only if private tutoring at home was impractical.

For a woman’s tutorial education Rush advocated English, penmanship, arithmetic, bookkeeping, geography, as well as readings in history and biography. John Adams also included the study of French and Latin grammar. Both Benjamin Franklin and Thomas Jefferson offered an extensive selection from world literature that included Shakespeare, Molière, Racine, Pope, Addison, Dryden and the *Moral Tales* from the
leading English domestic educator, Maria Edgeworth. They also included Pamela (1740), Clarissa (1747), and Sir Charles Grandison (1753) by Samuel Richardson (1689-1761), a London printer and novelist. This influential eighteenth century figure used his widely read novels to advance personal theories on the tutorial education of women in England and colonial America. In Pamela Richardson has his central character avidly studying John Locke's Some Thoughts Concerning Education (1693), one of the most influential books ever written in England about home tutoring.

Richardson advanced the concept that a mother must begin a child's education at home and carry it to a fairly advanced stage. Girls and boys at first had the same tutorial lessons. Even later when their curriculum diverged, girls were still to learn spelling, good handwriting, French, Italian and the translations of Latin authors. Young women were also to read from the Bible, Milton, and Addison and to learn history and geography. If a woman's tutoring in her childhood was deficient, her husband was to remedy any lack by providing her with appropriate private tutors.

Franklin and Jefferson also included in their tutorial curriculum, The Ladies Library (1714). These three volumes, published in many editions in London, were edited anonymously by a woman. The volumes were a collection of writers on women's education including Mary Astell and John Locke, who both supported education at home. The widespread popularity of this work made their views well known throughout colonial America.

We must not be surprised to see a direct correlation between the age of the "learned ladies" in eighteenth-century England and the period of colonial tutorial education. Hannah More, Elizabeth Elstob, Mary Wollstonecraft, Elizabeth Carter, Mary Astell, Maria Edgeworth, and other "blue stockings" had great influence on American educational practices. Many of these women were advocates of tutoring children at home.

In colonial America economic activity and frontier conditions often took men from home and gave women greater social responsibilities. Whether a working class mother or a plantation mistress, most women lived a better life in America and were more literate than their European sisters. By eighteenth-century standards, many colonial American mothers were able to provide their children with a good tutorial education at home.

The Southern Colonies

In the Southern colonies tutoring was the most widespread educational method, due to a widely scattered population and a dearth of local
community schoolhouses. Most children in colonial Maryland who received any education were either taught by their parents or a professional tutor, or sent to school in England. The planter class in Virginia, North Carolina and South Carolina hired tutors from England or Scotland as well as scholars from northern colonial colleges. Occasionally even indentured servants served as tutors.

In 1766 Richard Corlin, a Virginia planter, wrote to a London friend an earnest plea for a qualified tutor.

I am greatly in want of a tutor to my children, it gives me pain to see them misspending the precious moments of their youth. I must earnestly entreat you therefore to procure me an honest man well skilled in the languages, that writes a good hand, and is thoroughly acquainted with arithmetic and accounts. This is so interesting to me that I flatter myself you will exert your endeavors to engage a gentleman qualified in all respects for this business and send him over by the first ship.³⁷

In many instances these family tutors also taught relatives and neighbors. This meant boarding both the tutor and his pupils on a large estate. Special “schoolrooms” were built on these plantations. The tutor often lived and slept on the second floor with the classroom below. (Both one or two-story tutor schoolrooms can still be seen at Shirley Plamation near Richmond, Virginia and Gunston Hall near Mt. Vernon.) The tutorial curriculum often resembled a private eighteenth century school or academy: French, Latin, Greek and arithmetic. Instructional methods were usually one-to-one or a small tutorial group.³⁸

The colonial southern “genteel family” delegated to others as intermediaries or surrogates the actual governance of their children on a day-to-day basis. These tutors and governesses maintained both authority and education. The parents appeared to these children as distant figures seen only intermittently. They were both lovingly indulgent and at the same time awesome, powerful, absolute respected domestic monarchs. In many ways this was a transplant of the English aristocratic household to a New World setting.³⁹

The best evidence of the prevalence and nature of this tutorial instruction for boys and girls can be found in the letters, wills, diaries and newspaper advertisements regarding tutorial employment. These accounts were written by either parents, tutors or governesses.⁴⁰

John Harrower, a Scot, indentured himself to find passage to America. In his diary (1773-1776) he relates how a Colonel William Dangerfield of Bevedira Plantation near Frederickburg, Virginia brought Harrower to tutor his three sons.
May 27
This morning about 8AM the colonel delivered his three sons to my charge to teach them to read, write, and figure. His oldest son Edwin ten years of age intred [sic] into two syllables in the spelling book, Bathourest his second son six years of age in the alphabete [sic] and William his third son four years of age does not know the letters... My school hours [sic] is from six to eight in the morning, in the forenoon from nine to twelve, and from three to six in the afternoon.

Harrower successfully recruited an additional ten children from neighboring plantations, receiving in payment cash, clothing and rum. In the evenings and on Sunday he also tutored a local adult carpenter, Thomas Brooks, in writing and arithmetic. This array of students was typical for many plantation tutors.

As the eighteenth century progressed, Virginians began complaining that it was increasingly difficult to obtain suitable tutors from England or Scotland. By mid-century parents began securing tutors from Princeton and other American colleges. Philip Vickers Fithian was a young theological graduate of Princeton College. He kept a journal during 1773-1774 while tutoring the two sons, five daughters and a nephew of Colonel Robert Carter of Nomoni Hall, Virginia. This tutor’s account is replete with details of his life, curriculum content and his tutoring methods.

Fithian lived on the second floor of the Carter’s school house with a clerk and other servants. There were two schoolrooms on the first floor. As the resident tutor, Fithian received a salary of thirty-five pounds, in addition to use of a horse, a personal servant and book borrowing privileges from Carter’s extensive library. These were very generous terms compared to the meager pay often given to colonial family tutors.

The tutorial curriculum followed for the Carter children showed a specific differentiation between his sons and daughters. The lessons for the five girls, while liberal in comparison to prevailing custom, lacked any significant depth. Their education consisted mainly of instruction in the English language and simple arithmetic.

The Carter boys received not only this basic instruction but also tutoring in Greek and Latin. Fithian tutored them from Sallust (The Cataline Conspiracy), Virgil and the Greek Testament, as well as in Latin and Greek grammar. Fithian taught all the children their catechism. It was the only instruction shared by both sexes. This gender separation of the children was not at all typical in the eighteenth-century home tutoring environment. As we have already seen, whether by plan or
default, girls often were allowed to participate in their brother's "classical" educational program.45

Fithian's day began at about seven in the morning with the children all gathered for "round one lesson" until eight o'clock. Breakfast was served at eight-thirty. Tutoring resumed from nine-thirty until noon, when the children left for their free time. Lunch was served at two-thirty or three o'clock. Lessons continued from three-thirty until five o'clock. Dinner occurred between eight-thirty and nine. Fithian usually retired between ten and eleven each evening. This instruction routine was generally kept from Monday through Friday.

Because of students' great age variance, from five to seventeen, many of his instruction methods were highly individualized, one-to-one tutorials. At other times he used small group tutoring techniques. The children also tutored each other to ensure complete mastery of a lesson. Peer-tutoring and cross-age-tutoring were common colonial domestic education practices, whether the tutoring was supervised by a tutor, governess or parent. It foreshadowed the later methods used by nineteenth- and twentieth-century one-room schoolteachers in mixed-grade, remote, frontier schoolhouses.

Fithian left extensive written advice to his successor on practical instructional methods. The foundation of his overall success as a tutor was Fithian's early recognition of the children's individual differences. This required great "ingenuity and industry" in varying his content and methods to meet each child's unique educational needs and personal interests.46 Not all colonial tutors were as insightful or as successful.

The papers of John Davis, born in Salisbury, England (1776), portray far less successful tutorial programs. From 1798 to 1802 he traveled down the eastern seaboard from New York to South Carolina seeking employment as a family tutor. Though Davis possessed only an autodidactic education in Greek, Latin and French, he later published twelve books on the subject of America. David had many unpleasant experiences as a tutor, commenting at the end of one three-month term with a Virginia family, "I was surrounded by a throng of oafs, who read their lessons with the same (tone) that Punch makes when he squeaks through a comb.” A New York bookseller warned Davis against attempting a career as a private tutor to uncouth Americans, "Alas! the labour of Sisyphus in hell is not equal to that of a private tutor in America!” Davis chronicled his experiences as a private educator in Travels of Four Years and a Half in the U.S.A.47

Women were often employed as governesses to tutor southern colonial families. Fithian recorded in his Journal that two governess were brought from England to tutor families near Nomoni Hall, Virginia. We

136

471

know that one of them, Sally Partan, tutored the daughter of Richard Hesly Lee in French, writing and English.

Local Southern colonial newspapers featured extensive advertisements by parents seeking a governess. Conversely governesses often advertised “seeking a situation.” The fifty years of the eighteenth century prior to the American Revolution witnessed an ever increasing number of women employed as family governesses. Woody believes that these tutors and governesses were the forerunners of the first recognized educational institution in the colonial South. Particularly before 1750, “schools supplemented... the work of tutors in the household,” since schools “were found chiefly in the cities.”

The principal reason that parents supported domestic education was the deplorable curriculum found in many schools. In the 1760s George Washington sent his fourteen-year-old stepson, John Parke Custis to the Reverend Jonathan Boucher for a private tutorial education. Boucher assured Washington that his ultimate objective was to ensure that Custis became “a good man, if not a learned one.” He denounced the schools of the day that taught boys “Words rather than things” and gave them “a parcel of Lumber by Rote.” Over several years Boucher tutored Custis well enough to enable him to be admitted to King’s College (Columbia University).

Conclusions

The American colonial experience contains ample evidence of how European tutorial concepts often were paralleled in American domestic education. During the eighteenth century, primary source materials tell us that many children received a broad education at home directed by a tutor, governess or parent. Cremin supports this view when he states that the family in colonial America was “the most important agency of popular education.”

For too long historians have looked only at schooling institutions to discover the primary sources of American education and societal literacy. America’s colonial era is replete with examples of how the practice of one-to-one or small group home tutoring was an integral component of that society’s response to their educational needs. More broadly Kaestle in his review of American literacy also supports this concept that “[n]ot all literacy was acquired in schools.”

The story of tutorial education in colonial eighteenth century America helps document the contributions of European educators. It also underscores the important role of these family tutors in providing a component of basic societal literacy for the future United States.

44. Ibid, 26, 62, 76.

In the late 1830s, Auguste Comte isolated sociology from the other sciences and gave the field its name. As a follower of Concorset and Saint-Simon, Comte emphasized the need for sociology to have a system built on a scientific methodology of observation, description, and classification of social facts and advocated the complete abandonment of philosophic methods. His proposed stand did not allow for any interpretation of these facts or permit any judgment of values.

Based on these “scientific” inductive methods advocated by Comte, sociology came into its own as a social science. By the mid to late 1930s, this inductive method of sociology was, in theory, upheld by most sociologists in the United States and abroad.

Catholic intellectuals in America strongly felt a need to develop a response to this modernist thought. Since Catholicism was a minority religion in America, these intellectuals also felt the necessity to articulate a distinct self-identity.

Until World War I, within the field of sociology, the acceptance of Catholic social thought moved like a pendulum from outright rejection to efforts at reconciliation and reconstruction. These changes were predicated in varying degrees by the shifting pronouncements of the papal encyclicals, changes in the American environment, and changes within the Catholic community itself. Between the First and Second World Wars, Catholic intellectuals, especially those identified as liberals, attempted to preserve the central elements of Catholic tradition while reconciling with the larger intellectual environment in the field of...
sociology. To accomplish this, they accepted and participated in the neo-Thomist or neo-scholastic revival that had already been underway in the European Catholic community for a half century. This neo-Thomistic stance allowed American Catholic intellectuals to chart theologically appropriate responses to their various academic disciplines.

In the social encyclicals written by Popes Leo XIII (1891) and Pius XI (1931), a social apostolate was demanded from the priesthood, laity, and even student bodies. It was suggested by the Holy See that Christian social education begin at an early age and continue throughout an individual’s life in order for Catholics to have a solid foundation in the “great principles” of Christian sociology. This was considered the beginning of a new epoch in Christian social thought. With these papal mandates in mind, Fr. William J. Kerby offered the first sociology course taught at a Catholic college in the United States at the Catholic University in Washington, D.C., in 1895. By 1938, sociology was taught in most Catholic colleges and universities. While managing to achieve departmental independence from social ethics and theology, sociology was not always a separate department from social work or criminology. In 1925, St. Louis University began its Department of Sociology and awarded its first Ph.D. in sociology in 1932 to Fr. Ralph Gallagher.

Eva J. Ross, receiving her Ph.D. from St. Louis University in 1934, is a good example of the Catholic sociologist trained in an American Catholic college in the 1930s. In her texts, *A Survey of Sociology*, written in 1932, and *Fundamentals of Sociology*, written in 1939, she clearly defined the position of the Catholic sociologist.

She stated that sociology is the study of man’s social life. Social science aimed at adjusting the individual to a social life as near the ideal as human society would ever reach. It included those activities that would help to improve the condition of the people. Pure sociology aimed at being a positive science in that it sought its understanding of social phenomena by observing, describing, and classifying actual social facts and conditions. It established statistical laws and proposed theories that accounted for those laws. Sociology used induction in its most limited sense. It did not intend to be a normative science, and, as such, it was not to be concerned with judgment of values. In actuality, sociology studied an individual’s relations with fellow people both in the past and in the present and tried to formulate, when necessary, the scientific principles of progress. Its purpose, therefore, was the scientific understanding of social phenomena and the promotion of man’s temporal welfare through the proper functioning of social groups. “Applied sociology,” which was viewed as the ultimate aim of the science, was the active promotion of man’s temporal welfare by formulating principles for social improvement in conformity with the axioms of ethics and religion. Sociology was
mainly concerned with man’s temporal happiness in its social aspects and with the study of social evils, their causes and possible remedies. Mankind’s greatest good could only be realized insofar as the principles of true moral philosophy and religion were applied. All human activity, even the economic, was to be governed by these principles. They were known as the moral law, which consisted primarily in a definition of the rights of God and the correlative duties and rights of individuals. Ethics dealt with the rightness and wrongness of human conduct and with the standards and ideals of morality as proven by reason. It was felt, since a person’s perfection was a higher end than merely temporal happiness, the sociologists must know the norms of right conduct before principles of social action could be effectually formulated. The Catholic sociologist must follow these principles to be certain that any ideas for social improvement were based on true philosophy and religion, and that the sociologist was working for man’s greatest temporal good.4

Ross felt that if the statements of Catholic sociologists differed at times from other sociologists, it was due to their belief in three fundamental considerations:

1. The laws that govern an individual’s social life are determined by rights and duties as imposed by God.
2. An individual’s temporal existence is only the precursor of an eternal life with God in heaven. Therefore, all social intercourse should be directed toward this end, and all conception of the individual’s happiness should be subordinated to it.
3. Although some measure of scientific rules may apply to the conduct of group life, a person is an individual possessed of a free will. Therefore, the observation of the conduct of mankind in the past will not infallibly bring us to a knowledge of future conduct.5

The Catholic sociologist considered the following truths as certain: (1) that the family and State are “natural” societies, (2) that the institution of private property is a “natural one,” and (3) that the Catholic Church is a supernatural society. The Church and the duly constituted State are considered “perfect” societies, that is, sovereign in their own power and not in any way dependent upon a power other than God alone. In the natural sphere, the family was considered more important than either Church or State since it is prior to both and the latter are composed of none other than families and their individual members.6

Ross argued that Christian social concepts must have a place in sociology and called for a Catholic sociology that would be both inductive and deductive. The deductive, or a priori, method would insure an appreciation of the ultimate source or cause of things and events in the
social world. Thus, her primary motive for advancing Catholic sociology was to counter various secular solutions to social problems. Catholic sociology would be both informed by Catholic social philosophy and would be used in the service of Catholic-sponsored programs for social reform.7

It was in the interpretation of the social facts that the Catholic sociologists had to take into consideration certain principles about individuals. They felt that it was obvious that the inductive method failed insofar as a human is not a wholly observable being. The social observer must be aware of the entire nature of the individual and take full cognizance of the findings of other sciences, be they of a scientific or philosophical nature. This awareness is even the more necessary the more the observer wishes to interpret the facts discovered or to effect improvement in man's social conditions.

A Survey of Roman Catholic Sociological Theory in the United States Since 1900 was initiated in 1939 at Duke University. This survey was undertaken to determine the nature, purpose, and methods of sociology as revealed in the works of Catholic sociologists in the United States in the twentieth century. Four interrelated phases in the development of Catholic sociological theory were defined. The first phase, though antedated by earlier Christian thinkers, begins with St. Thomas Aquinas' socio-political synthesis, which states that facts must be obtained through observation and experience, and that people acquire knowledge only through such experiences. The second phase is represented in the mass interest in socio-economic questions of the nineteenth and twentieth centuries in Europe and elsewhere, where Catholicism flourished. This social Catholicism was rooted in the social principles of the Church and the Christian tradition. The third phase saw a definite interest developing in "social science," in which sociology was considered to be a synthetic social science. The last stage, which was then considered to be in its infancy, was the attempt to make sociology an empirical science. Sociology was regarded in this stage as a definite and special social science in that it was cultural, systematic, and autonomous. The American Catholic sociologist, therefore, fell clearly into one of these four groups: those following the Thomistic position in social philosophy, those interested in social Catholicism, those regarding sociology as a synthetic science, and finally those regarding sociology as a definite and special social science.8

This early study of Catholic sociological theory proposed six conclusions. First, all Roman Catholic sociological thought is supported by and draws upon some phase of the Thomistic conceptual theory. Second, the study shows that the development of Catholic social thought has been influenced by numerous historical events (i.e., Protestant Reformation,
rise of modern capitalism, liberalism, naturalism, and humanism, etc). In reaction to these movements, Catholic social thinkers, on the whole, developed a definite social attitude. Third, the Catholic emphasis upon social problems and conditions, and social changes, necessitated the Church's taking some official action or stand on the social problems of the nineteenth and twentieth centuries. Fourth, the beginning of sociological writings by Catholics in the United States consisted primarily of restating Thomistic social philosophy and the encyclicals of Popes Leo XIII and Pius XI. Fifth, the development of sociology as a social science among Catholics in America grew out of the emphasis upon social Catholicism and the reaction to the humanistic and evolutionary philosophy of many non-Catholic sociologists. This phase of Catholic sociological thought in America was primarily a philosophical approach without any definite method or technique, in the scientific sense of the word, for studying social problems, social relations, and social conditions. Sixth, the science of sociology, as such, was regarded by American Catholic sociologists from two standpoints. On one side, a majority of Catholic sociologists view sociology as a synthetic social science, that is, a synthesis of Catholic social philosophy, social Catholicism (including principles for guiding social work and carrying out social reforms), and what Fr. Paul Furfey termed "factual sociology." On the other hand, there was a group who emphasized the empirical and autonomous nature of sociology. They also took their point of departure from St. Thomas, but in a different sense. They accepted the idea of the ordinate autonomy of the various sciences, maintaining that every science has a definite subject matter or object. The formal object of sociology is "sociation," that is, it is the purpose of sociology to determine which relations, processes, and structures integrate (associate) and which disintegrate (dissociate).9

Neo-Thomism was the ideological undergirding for a multitude of organization building endeavors on the part of American Catholic intellectuals.10 The American Catholic Sociological Society (ACSS) was one such example. Founded in 1938 by Fr. Ralph Gallagher and loosely associated with the American Sociological Society, the ACSS quickly developed its own goals and constitution. The society brought three factions of Catholic sociologists together. One group, like Fr. Gallagher, believed that Catholic sociology existed and proved to be an autonomous form of sociology. In the second group were trained sociologists, who happened to have a Catholic background. They felt very strongly about the non-existence of Catholic sociology. Dr. Clement Mihanovich, a member of this group, has said, "We did not baptize or confirm sociology. There is no more a 'Catholic' form of sociology than there is Catholic Algebra." The third group, represented by Msgr. Furfey, used
the society and its journal as a forum for spreading the concepts of Catholic social action.\textsuperscript{11}

The ACSS was to become an agency for developing a theologically grounded sociological position. It sought to utilize social sciences' tools that were in harmony with the Catholic faith. Thomism provided legitimation to their positions. It did so at a price because by definition Catholic sociology set limits on the way in which social life was to be studied. Catholic sociology was to be fused with a "social theology" that tended to include support for organized labor, appeals for an activist welfare state, and a staunch anti-communism stand. But, this social theology was never fully developed or articulated by the society's members.\textsuperscript{12} The second group rejected their counterparts' claim that sociology neither could nor should be value free. Nonetheless, they were not prepared to go as far as those in the profession who thought that sociology should be modeled after the natural sciences. If they had done so, they could not have defined themselves as Catholic sociologists, merely as Catholics and sociologists. Thus, while others being socialized into the profession became sociologists by abandoning their ethnic or intellectual marginality, Jews like Merton or Marxists like Bellah did not become, respectively, Jewish sociologists or Marxist sociologists, but rather sociologists with various personal histories that had been overcome. American Catholic sociologists had a much different collective self image. Dr. Franz Mueller argued that sociology could be seen as a vocation, and, as such, the Catholic sociologist could serve both the Church and society at large, and do so to the glory of God. His position only served to prove that neo-Thomism was far too pliable to provide an adequate bias for forging a single, widely accepted Catholic sociology. Both sides of the issue were equally capable of grounding their positions in Thomistic principles.\textsuperscript{13}

In less than two decades, the position opposed to construction of a Catholic sociology would become dominant within the Society and with Catholic sociologists in general. By the 1950s, the call for the creation of a Catholic sociology had virtually disappeared, and some people, such as Ross, had crossed over to the other side. Many of these scholars abandoned efforts to develop Catholic sociology and were directing their work towards a variety of areas in applied sociology. There is no evidence to show that any of these intellectuals had gone on with an attempt to create a distinctively Catholic approach to social reform or any other related field.\textsuperscript{14}

Loyola University of Chicago

The early decades of the twentieth century witnessed the growth and development of national interscholastic high school sports. Advocates of such competitions claimed that: 1) it promoted interest in the sport; 2) it set an example of excellence in conduct and sportsmanship through ideals and practice; 3) it provided opportunities for travel and other experiences that have important educational value; and 4) it developed a sense of community pride. This paper will describe an ideological context in which the development of interscholastic high school tournaments existed, chronicle the growth and decline of the National Catholic Interscholastic Basketball Tournament (NCIBT), and discuss the participation and contributions of several native American mission teams in the NCIBT.

American Pragmatism as Philosophical Context

The early twentieth century was a time when Pragmatism was the American ideology, and athletic competition fit well with the pragmatic tenets of shared experiences of individuals in groups, individual interest stimulated by direct experience as the best means of learning, and modes of moral conduct based upon individual development and social experience. More specifically, the very idea of an athletic competition “to quest together” in the pursuit of “excellence through victory in the contest” was well-suited to the 1918 pragmatic doctrine authored by the Commission on the Reorganization of Secondary Education. The Commission’s report called for high schools to offer extra-curricular activities, such as sports, in order to instill democratic values in its future citizens, to promote social solidarity between the various social classes of its stu-
dents, and to cultivate worthy use of leisure time and good ethical character, which are best taught by relating acts with their consequences.2 These values fit well with one of the first national competitions in high school basketball, hosted in 1917 by the University of Chicago under the direction of Amos Alonzo Stagg. Known as the National Interscholastic Basketball Tournament (NIBT), the competition was Stagg’s effort to provide fertile ground for picking talented athletic recruits to the University of Chicago. Stagg was fighting a battle with the university administration, who thought that the university’s athletes were not up to par academically. It was a battle he ultimately lost, prior to Robert Maynard Hutchins’ presidency, when a report from the Carnegie Corporation recommended that the university suspend its intercollegiate sports programs because it was to small to provide viable competition.

Nevertheless, in 1923 Loyola Academy, the secondary department of Loyola University of Chicago, asked that Catholic and other private high schools be included in Stagg’s tournament. Stagg refused to recognize Catholic schools, although his rationale was not clear. Undoubtedly Stagg would not have viewed Catholic high schools as the best feeders for the University of Chicago’s basketball program. Since that was one of his main motivations for sponsoring the tournament, Catholic schools would not have helped him achieve that goal.

The Beginnings of the NCIBT

Concerned about Stagg’s exclusive policy, Director of Athletics at Loyola Academy Rev. Joseph Thorning, S. J., proposed that Loyola University sponsor a tournament patterned after the NIBT. The tournament would be an invitational to outstanding Catholic high school basketball teams throughout the country. The newly constructed Alumni Gymnasium on the Lake Shore campus was to be the setting for the games.

Thorning received support for his plan from the Loyola community, including its President, William H. Agnew, S. J., the Chicago Catholic High School League, The Knights of Columbus Basketball League, and Chicago sports editors. Coaches from Chicago’s St. Ignatius High School and Loyola Academy worked with Thorning to provide an organizational structure.

A banquet was held to announce the tournament, and no one was more enthusiastic than Notre Dame’s Knute Rockne. A policy-making body in the form of a board of directors was named. It consisted of the members of the Catholic League of Chicago High Schools, with Thorning as its chair. The first tournament was set for March 1924. Invitations were sent to teams who had won local, regional, or state competitions.
Twenty-six teams participated in the first competition. The first set of teams came mostly from the Midwest but included teams from New York, Mississippi, West Virginia, Colorado, and South Dakota.

After the success of the first tournament, Thorning received many letters supporting the tournament. Rockne wrote Thorning expressing his interest in the tournament, stating that "It is a fine idea and you deserve a lot of credit." 3

By 1928 the tournament had expanded its invitational slots to thirty-two, and the tournament schedule was increased from four to five days so that no team had to play more than one game a day. The final game was moved from Loyola's Alumni Stadium to the Chicago Coliseum because the crowd of spectators had outgrown the gym. Thousands had been turned away from the final playoffs in 1927. Also the number of states sending representative teams had increased from the original thirteen in 1924 to twenty-two states in 1928.

From the beginning the Board of Directors had vision enough to realize that NCIBT support would be strengthened if there were state and sectional competitions. Winners of these competitions would then receive the invitation for the national meet. By 1933 there were state competitions in Illinois, Indiana, Iowa, Pennsylvania, and Wisconsin. District or sectional meets were organized in Minnesota, New York, Oklahoma, and Chicago. The National Catholic High School Association was also instrumental in organizing these state and district playoffs. They held their annual meetings during the NCIBT tournaments. In 1933 they represented more than seven hundred Catholic secondary schools.

In 1931 the directors grew cautious about the tourney's future. The North Central Association for secondary schools and colleges passed a policy stating that "No accredited school shall participate in any national or interstate athletic meet or tournament or in any invitational athletic tournament or meet not sponsored by the state athletic association. Accredited schools not eligible to membership in the State Athletic Association are Excepted." In Illinois as in many other states, the state association consisted only of public supported high schools and those run by normal schools. Therefore, Catholic secondary schools were not bound to the policy. 4

However, the policy did affect Stagg's competition. Seeing the writing on the wall, Stagg extended his competition to include Catholic high schools in 1929. The NCIBT board was ready to go into action to inhibit the participation of Catholic schools in the University of Chicago's competition. They planned to campaign actively against such participation in the Catholic press, but the problem soon disappeared. Stagg's national tournament folded in 1930. 5

In 1935, the National Catholic High School Athletic Association
developed a constitution with the following four purposes:
(a) To strengthen and unify eligibility rules governing participations in inter-school athletics.
(b) To assist the work of State Associations and affiliated schools in developing good sportsmanship and high ideals in athletic contests.
(c) To protect the interests of affiliated schools in every way possible.
(d) To cooperate in conducting the National Catholic Basketball Tournament.6

The constitution formalized the Association’s support of the competition, and throughout the rest of the 1930s the NCIBT continued to draw large crowds and maintain strong support from its financial backers and publicity personnel. The Board of Directors became more national in its membership, and in 1934 a consolation bracket was formed for the teams eliminated in the first round of play.

Even during the years of the depression, the tournament continued to draw large crowds. The meets from 1932 through 1941 attracted over fifty thousand spectators a year. More Native American mission teams were also invited, and in the tournament’s last two years “A Court of Beauty” was added to its opening ceremonies, composed of thirty-two senior girls from eight Chicago Catholic high schools.

The programs imply the demise of the league was not gradual. In the 1941 program, the greeting from Loyola’s president proclaims the benefits that such a tournament provides. The same program also discusses the past tournament stars who went on to college and post collegiate renown. The list included Ray Meyer, former coach of DePaul’s winning basketball teams; a football great, Marchmont Schwartz; and Henry “Zeke” Bonura, White Sox first baseman.7 The two main reasons for discontinuing the games seem to have been the country’s entrance into World War II and tougher policies from the NCA regarding interscholastic, interstate national competitions of any kind.

The tournament appears to have been successful in realizing the pragmatic/progressive goals of shared group experiences as an important means of promoting individual interest and learning, and developing values important to future citizens of a democracy. President Wilson of Loyola University affirmed these goals in his 1940 Greeting when he discussed snatching moral victories from defeats, and the way sports prepare students to become good Catholic citizens.8 To these ends the competition also provided opportunities for several native American teams at a time when racism was strong against them.
Native American Mission Teams in the NCIBT

When the tournament teams were welcomed to the NCIBT Tournament in 1932, teams of Native American boys from reservation mission schools in South Dakota were included. In fact, as far back as 1925, these Sioux Indian Mission Teams, most notably, St. Francis, captured the tournament's imagination with a unique, often victorious style of basketball, a style which would come to be adopted by basketball players across the nation.

St. Francis Mission was founded in 1886 by Father John Jutz, who had made an unsuccessful attempt at missionary work among the Arapaho Indians in Wyoming. It was located on the Rosebud reservation in South Dakota, in an area covering more than fifty-six hundred square miles and encompassing the three counties of Mellett, Todd, and Tripp. It boasted an Indian population of six thousand. As was the case in earlier Jesuit missions among the Potawatomi, the schools for the Sioux children were the chief agency through which the South Dakota missions sought to realize their programs of religious, social, and cultural endeavor.

The St. Francis Mission was inhabited by full-blooded Sioux Indians, many of whom were direct descendants of chiefs High Horse, Big Turkey, and Crazy Horse. During the early years of the NCIBT Tournament, 1925-1929, there were about four hundred and fifty boys and girls in attendance ranging in age between six and eighteen. The children were clothed, fed, and lodged at the expense of the missions from September to July. The government grant from the Sioux tribal funds of one hundred and eight dollars per child was insufficient, thereby creating a need for additional funding. Being as they were partly subsidized from tribal funds, the schools came under government inspection. The girls and younger boys were taught by the Sisters of St. Francis of Stella Niagara, New York, while the older boys were instructed by the Jesuits. The underlying philosophy of the Mission schools was to assimilate the Native Americans into white culture by cleansing them of their Indian culture through stressing the English language and American patriotism. While the girls learned domestic skill such as sewing and cooking, the boys learned farming and industrial skills such as carpentry and blacksmithing.9

The Jesuits believed strongly that the future of Indians depended on their ability to integrate into white society. Such cultural assimilation would require fearlessness, self control, and a competitive spirit. Basketball was seen as the sport which would allow Indian males to compete against whites in an acceptable way. Amid strong racism against Native Americans, the basketball court would provide a forum for healthy competition. 10

While a few mission schools around the country occasionally made their way to the NCIBT, it was the Indian team of the St. Francis Mission...
School that became the sensation of the tournament, capturing the fascination of fans, sports-writers, and fellow players alike. While the St. Francis team received much accolade throughout its participation in the tournament, such tribute was always juxtaposed against the blatant display of racism against the team's Native American culture. The St. Francis team's glorious career in the tourney can thus be examined for 1) its opportunity for assimilation into the American culture, 2) its strengthening of cultural pride and solidarity, and 3) its lasting contribution to the sport of basketball.

In 1925, the first year of the tournament, St. Francis was invited but lost in the first round. The cost of the railroad expense in bringing the team to Chicago was defrayed by the Knights of Columbus, who did so the following year as well. In 1927, the St. Francis team was forced to withdraw its application for entry to the NCIBT when an epidemic of scarlet fever broke out at the mission, and the Indians were not allowed to leave their reservation.

1928 witnessed another year in which the St. Francis team dominated all other teams in the state tournament. "We were cheered to the echo throughout the tournament and whenever we played, the S. R. O. sign was hung up," reported Father Birminghaus of the mission in a letter to the Knights of Columbus, once again solicited for railroad expenses. He further reported that their Provincial had "set his foot down that there must be absolutely no expenses involved should we be invited to Chicago." Even before the Knights of Columbus could respond, the financial consideration was revealed to be an apparent smokescreen for the real problem which the Provincial harbored. He stated his concern about "an overemphasis of athletics out there" and forbade the team from going to the tournament that year. It seems the Jesuits' original purpose of instituting basketball for cultural assimilation through acceptable competition with the white culture had taken off with a most hearty vengeance.

Such vengeance continued over the next few years. The Provincial never again kept the team from entering the tournament. Perhaps the fact that the St. Francis basketball games were considered to be huge money-makers for the mission helped the cause. By 1934 the St. Francis team was the darling of the tournament. Culminating a season in which they shut out every high school team they played, team members Williard Iron Wing, Leonard Quick Bear, Emil Red Fish, Collins Jordan, and Clarence Packard excited the fans and media alike with their unique style of play. They suffered only two defeats that year, and those at the hands of the Harlem Globe Trotters.

Widespread coverage by the media put these Native Americans in the spotlight, albeit with a mixture of praise and racism. True assimilation...
was sought to be limited, as demonstrated by the print media. For example, in *The Tourney Times*, the Official Program for the NCIBT, an article entitled, "Doug McCabe Seeks Scalping Knife."\(^{14}\)

While participation in the NCIBT provided the Native American boys opportunity for some assimilation through contact and competition, it resulted, too, in strengthening their group identification, values, and pride. Collins Jordan, a star of the St. Francis team during its banner years in the tournament, was hired in his senior year to coach "reservation style of play" elsewhere in South Dakota. Jordan explained this type of play as having at its roots the "Siouxian concept of victory togetherness, a psychology of teamwork—where every reward came through a feeling of togetherness—every reward came through a Siouxian display of 'Fokala', Indian team victory." Jordan believed he indoctrinated the boys with this Siouxian concept of interdependent togetherness when he coached them to resist making the easy shot as a solo endeavor, and instead to pass the ball through several players before its final destiny, the hoop.\(^{15}\)

Cultural pride was further solidified as the public, enamored with the St. Francis team, embraced them and their heritage. Indeed, in 1934, Paul Mickelson of the Associated Press wrote, "Since the big chiefs from South Dakota came to the tournament, I've forsaken my Norwegian ancestry and become an Indian. Some team always pops up to give this big basketball show a thrill, and the Red Skins from St. Francis did it." Mickelson ended his column on that day with the news that the Associated Press, reaching fifty million readers, fielded requests for results of the St. Francis team from worldwide sources daily. He culminated with, "Don't be surprised if Leonard Quick Bear runs for governor of South Dakota. He got his build-up at this basketball show."\(^{16}\)

The St. Francis Mission team continued to dominate the final years of the NCIBT. In 1934 they made it to the quarter finals, where they were defeated. The following year they took third place in the tourney, William Madigan was named Best Coach, and Leonard Quick Bear was named to the All Tournament Team. In 1938 William Iron Wing was named Best Coach, and in 1941, the final year of the NCIBT, St. Francis took second place, losing in overtime. Though St. Francis never captured first place in the tournament, their style of play, one that reflected their cultural roots, was gradually adopted by the world of basketball at large. Elements of play that were unique to the Native American high school teams, were later adopted by basketball teams everywhere, right up through the pros of the National Basketball Association. Two examples of St. Francis style of play stand out, leading a sportswriter to comment, "The lads from the great outdoors set a pace at the start and swing along at the same gait to the finish," and "The Indians shoot from any point on
the floor." These descriptions refer to what are known as the "run and gun" style and the side-open offense, respectively.\(^7\)

The Sioux Indian boys of the St. Francis Mission in South Dakota, through participation in the NCIBT Tournament 1925-1941, became the quintessential "clean fighters, honorable foremen, pride of the Catholic schools." The tournament provided them the opportunity to assimilate into American culture, strengthen their cultural solidarity, and leave a lasting legacy to the sport of basketball.

Two Catholic institutions of higher learning are in Milwaukee, Wisconsin. Each institution has a distinctive character. A few blocks beyond Milwaukee’s business district along Wisconsin Avenue, Gesu Church marks the entrance to Marquette University. South and west of the university, seventy acres of finely manicured lawn surrounds Gothic buildings. The setting identifies the campus of Mount Mary College, a small liberal arts college. Both institutions bear the stamp of Edward Augustus Fitzpatrick. He came to Catholic education in 1924 after a productive career in public education, a career cut short by individuals who feared his call for educational reform.

In a school system controlled by religious orders and clergy, Fitzpatrick was among a small number of lay men and women to occupy important positions. He was the first layman to govern the Midwest Region of the National Catholic Education Association. Editor of the Catholic School Journal, he conversed easily with men and women whose schools educated a large number of Catholics from grammar school through college. But his association with Catholic education did not imply a lack of critical perspective. He knew education within a religious context carried a twofold responsibility: to instill religious convictions and to provide sound academic programs. Fitzpatrick is a forgotten man in the history of Catholic education in the United States. Yet his books and numerous articles testify to his devotion to Catholic education.

The eldest of five children, Edward Augustus Fitzpatrick was born to Thomas and Ellen Radley-Fitzpatrick on August 29, 1884 in New York
City. The family resided in a working-class neighborhood near the home of Alfred E. Smith, the first Catholic to seek election to the presidency. To William A. Lamers,1 a colleague at Marquette University, Fitzpatrick used the words ragamuffin and uneventful in his description of his youth. He enjoyed competition in school and playgrounds, and competition prepared him for an active life. Ellen fostered the desire for education and instructed him on the importance of the Catholic faith. Rev. James T. MacEntyre, a friend of the family, strengthened his religious convictions.

Tuition was a hindrance to the family; Fitzpatrick was a student for only a few weeks at St. James School. From 1897 to 1900, he attended Boys High School in Manhattan. He graduated after successfully completing an examination issued by the State University of New York. During his years at Boys High School, the school changed its name to De Witt Clinton High School. The new name charmed him and made a lasting impression. His dissertation was a study of Clinton’s theory of education. Columbia University published his work as part of a series about education.2

Fitzpatrick’s career in education began as a teacher at an elementary school after graduation from Boys High School. Ellen encouraged Edward to continue his education. He acted on her advice and gained admittance to Columbia University. A Bachelor of Arts degree in English literature and a diploma for teaching English literature were his rewards. A devotee of John Ruskin’s poetry, he later embellished his books and articles with passages. From 1908 to 1912, at the High School of Commerce in New York City, Fitzpatrick taught English grammar and literature. More study at Columbia University followed. He completed requirements for a Master of Arts degree in English literature and a diploma for instruction in educational administration. A doctoral degree was granted to him in 1911. Paul Monroe and Edward Lee Thorndike were his mentors. John Dewey and William Heard Kilpatrick were members of the university’s faculty.

During a convention at the University of Chicago in 1912, the American Political Science Association founded the Training School for Public Service. The school acted as a resource for the resolution of governmental problems. Fitzpatrick joined the school in 1912 and secured a leave of absence from the New York Public School System. New York City would never again be his home; his assignment sent him to Madison, Wisconsin.

Charles McCarthy administered a review of Wisconsin’s rural school system on behalf of the Wisconsin State Board of Public Affairs. McCarthy utilized Fitzpatrick’s administrative expertise by charging him with responsibility for several parts of the review. Fitzpatrick’s work was thorough. Wisconsin’s legislature used Fitzpatrick’s research in 1913 to
support enactment of a minimum wage law for teachers. While gathering information for McCarthy’s review, Fitzpatrick met several leaders of the progressive wing of Wisconsin’s Republican Party. He wrote a statement about education for the party’s platform in 1914 at the party’s request. Not only did McCarthy and Fitzpatrick work well together, but friendship also blossomed. Fitzpatrick’s book, *McCarthy of Wisconsin*, was an account of McCarthy’s contribution to education in Wisconsin. Marriage to Lillian V. Taylor in 1913 deepened his roots in Wisconsin.

During World War I, the United States Army Reserve commissioned Fitzpatrick as a major, and he supervised the conscription of Wisconsin’s men for the United States Army. Obligations to the military did not prevent him from editing the journals *Universities and Public Service* in 1914 and *Public Servant* from 1916 through 1917. After the war, he edited the journals, *Wisconsin’s Educational Horizon* from 1919 to 1923 and *Expert City Government* in 1919. He also taught in the Education Departments at Marquette University and the University of Wisconsin. General Lewis B. Hershey, director of the National Selective Service, accepted Fitzpatrick as one his aides during World War II. Shortly after the war ended, Fitzpatrick sadly noted deficiencies in education as the reasons for the deferment of more than 100,000 men and women.

When he served as secretary to the Wisconsin Board of Education from 1919 to 1923, Fitzpatrick guided the passage of two bills into laws. The Bonus Law (1919) granted money for education to Wisconsin’s soldiers. The Half-Time Law (1921) enabled children employed in factories to attend classes on a half-time basis without reprisal from employers. In hope of eliminating greed and promoting equity in financial matters among all institutions in the state’s system of higher education, Fitzpatrick sought to reform the board. Investigations eventually forced the board to dissolve, but Fitzpatrick won praise for his effort. Dissolution of the board ended Fitzpatrick’s association with public education. His career in Catholic education would soon begin.

1923 was a pivotal year for Albert C. Fox, S. J., president of Marquette University from 1922 to 1928. Fox wanted to improve the university’s status among graduate schools in the United States. Fitzpatrick’s resume persuaded Fox to choose him for the position of dean of the graduate school in 1924. He later became dean of the university’s undergraduate programs, dean of what is now the university’s School of Education, and dean of the university’s College of Hospital Administration. In 1932, he became a fellow of the Council of the American Association for the Advancement of Science. For the Association of Presidents and Deans of Wisconsin Colleges, Fitzpatrick served as president in 1937.

Despite his administrative responsibilities, he found time to edit the *Marquette Monographs in Education* series. The monographs provided the
first translations into English of Ignatius Loyola’s work, *Ratio Studiorum*, and Mary Helen Mayer’s translation of Thomas Aquinas’s reflections on education, *De Magistro*. Mount Mary College watched with interest Fitzpatrick’s career at the university. Confident in his talent, the college selected him to be president in 1929. Fitzpatrick was in the unique position of occupying simultaneously important offices at two institutions.

From his observations, Fitzpatrick concluded the university’s graduate school had only a partial understanding of its role. Minutes from a graduate faculty meeting recorded Fitzpatrick’s rejection of the graduate school’s pleasant relationship with Milwaukee as sufficient for the university’s reputation. The graduate school, Fitzpatrick said, would thrive on “actual services or research finds inside the University.” He also challenged the assumption that appointment to teach undergraduate courses was a license to teach graduate courses.

Directives flowed from Fitzpatrick’s pen: scholarship became a necessary condition for promotion, doctoral degrees were demanded from the faculty, and the university intensified its effort to hire reputable scholars. The graduate school increased the number of courses offered, standardized requirements for graduate degrees, and stiffened the conditions for admission to graduate study. But change did not come easily. Rumor and gossip abounded. Fitzpatrick expressed his displeasure. Innuendoes threatened the university’s standing in academe and the public. He ordered the faculty to cease its prattle. Fox and Fitzpatrick happily announced in 1928 that requirements for graduate degrees were similar to the requirements of the best graduate schools. The Association of American Universities authorized the university to confer doctoral degrees in several disciplines. In his effort to change the course of the university’s graduate school, Fitzpatrick revealed a weakness in his demeanor. Was gab among the graduate school faculty a form of retaliation? Did Fitzpatrick fail to consider the effect of change on the faculty’s personality? Did the graduate school faculty judge him to be abrasive and obstinate? Fitzpatrick showed a lack of propriety on another occasion. He spoke to the National Catholic Alumni Federation on April 21, 1928. He characterized the Catholic school system as “disorganized and chaotic...[and]...the ‘demi-monde’ of scholarship were to be found in the Catholic seats of learning.” In the *Wisconsin State Journal*, A. M. Brayton wrote, “[Fitzpatrick’s] zeal for education may have caused him to neglect the tact that ordinarily characterized him.”

Fitzpatrick became editor of the *Catholic School Journal* in 1929 at the request of Frank Bruce, Fitzpatrick’s friend and chairperson of the Bruce Publishing Company. He remained editor until his death. Keenly interested in Catholic education, Bruce was convinced the journal did
not adequately represent the Catholic position on education. The company purchased the journal and agreed to underwrite expenses.

The journal recommended books and educational materials. Readers were alerted to issues and programs deemed important by the National Catholic Educational Association. Papal and synodal statements about education were published. Many columns reported the success or failure of different programs. Fitzpatrick welcomed articles from non-Catholic educators that would enhance the quality of Catholic education.5 Reflecting on two decades of editorship, he claimed the journal tried "to change the emphasis on our popular slogan that 'every child should be in a Catholic school' to the more significant slogan... 'every Catholic school should be worthy of the Catholic child.'"50

Fitzpatrick's relationship with Marquette University waned despite his efforts. Unfortunately, the university's archives has little information about his departure. Discretion is necessary. Speculation without evidence is unfair to the university and Fitzpatrick. Documents state Raphael C. McCarthy, S. J., president of the university, sent a letter of termination in July, 1938. Although the letter referred to an earlier discussion between McCarthy and Fitzpatrick, reasons for termination were not stated. In response to the letter, Fitzpatrick promised not to disclose the causes for his resignation.11 He resigned from his post in 1939 and continued his duties at Mount Mary College.

Jesuits from Campion College of the Sacred Heart had helped the School Sisters of Notre Dame and Mount Mary College since 1872 by providing instructors and advice on administrative matters. In his chronicle of the college, Fitzpatrick pointed to the solicitous attention given to the college by Albert Fox, S. J. The selection of Fitzpatrick as president in 1929 was propitious.12 The college had a small faculty and a small number of students. Only thirteen degrees were granted in 1930. Fitzpatrick's requests for funds from Milwaukee's business community and searches for students were vital. Generosity saved the college from bankruptcy. Fitzpatrick seized every opportunity to advertise the college. A former faculty member of the college succinctly described his greatest accomplishment for the college by saying "He put us on the map!"

Fitzpatrick's tenure at the college was calm. He had a firm grip on the college's day-to-day activities, and he enjoyed the college's pleasant environment. He attended regularly the college's Father and Daughter Day celebration. Edward and Lillian enjoyed dancing and tired many orchestras at dinner dances and other fund-raising affairs. He showed support for a student organized Greek festival by wearing a toga. Appointments were not necessary; the door to his office was always open. But goodwill and cheerful moments did not discount the need for
scholarship. He proclaimed Mount Mary College to be the first Catholic college—following the example of Harvard University—to require comprehensive examinations from seniors to qualify for graduation. Under his leadership, Fitzpatrick and Mount Mary College devised the first program in occupational therapy in the United States.13

Fitzpatrick retired in 1954. His final act was the bestowal of an honorary degree to Rev. John Tracy Ellis, the respected historian of Catholicism in the United States.14 The college granted to Fitzpatrick the title president emeritus, and he represented the college at various affairs until 1956. Because of Fitzpatrick’s skill as an administrator, the college has developed several graduate programs and has extended its influence in Milwaukee.

Edward and Lillian settled in Washington, D. C. Illness often forced Fitzpatrick to decline invitations to speak at civic ceremonies and academic affairs. In 1957, he accepted an invitation from the Brazilian government to review its educational system, and he was the commencement speaker at St. Procopius College, now Illinois Benedictine College. Later in 1957, the Catholic School Journal published his speech and reported his work in Brazil. Death came to Fitzpatrick on September 13, 1960. His body rests in Arlington National Cemetery. The New York Times and the Washington Post were among the many newspapers that announced his death.15 In 1967, The National Cyclopaedia of American Biography allotted more than two columns of small print to summarize his life and the many organizations to which he belonged. In honor and appreciation of Fitzpatrick’s efforts, the college dedicated a building in his name in 1991. Insights to Fitzpatrick’s thoughts on Catholic education can be obtained by examining the issues of religious education, Catholic education, and the philosophy of education.

After he became dean of the university’s graduate school, Fitzpatrick’s attention turned toward religious education. A debate among religion teachers and authors of catechetical materials focused on the nature of religious education. Should religious education increase knowledge or change behavior? The Baltimore Catechism was the basis of religious instruction. Memorization of questions and answers in the catechism was the primary teaching methodology. Should the methodology be changed? Was belief or behavior the index of one’s commitment to the Catholic faith? Answers to these questions determined the nature of religious education and the function of the catechism.

Fitzpatrick taught courses in religious education at Marquette University. His book, A Curriculum in Religion, recounted the solicitation from Rev. Daniel Cunningham, an archdiocesan school superintendent from Chicago, Illinois, for aid in the development of a religious education program.16 Fitzpatrick and five Jesuits from the university organized the
The institute viewed suspiciously both memorization as the primary teaching methodology and the language employed by the catechism. Fitzpatrick claimed memorization neglected to account for a child’s interests and development. Memorization did not present the Catholic faith as a response to a loving God. The language of the catechism was too abstract. Children acquired a meaningless vocabulary. Fitzpatrick and the institute did not lessen the importance of doctrine for religious education; rather, the institute balanced the demand for doctrine by the claim that the test for doctrine “is its effectiveness in and on life....”

The institute constructed a curriculum in religious education harmonizing the child’s development and Catholic doctrine. The goal was to create in the child a commitment to God and the application of doctrine to all aspects of the child’s life. To the content contained in the catechism, the institute added—in ways appropriate for each grade—religious art, hymns, poetry, biblical and church history, liturgy, and stories about virtuous living. Both series urged children to write stories or invent situations to internalize the content. The amount of material to be memorized was reduced. The institute changed the language of the catechism and made the textbooks appealing to look at and comfortable to hold. For the Highway to Heaven Series, Fitzpatrick wrote textbooks for the third, fourth, and sixth grades. The merit of the institute’s approach gained the attention of Franz De Hovre, a Belgian priest, educator, and director of the Catechetical Institute in Louvain, Belgium. De Hovre wrote articles about Fitzpatrick and the institute for a Catholic Belgian journal and encyclopedia.

The second issue was Catholic education itself. In 1919 Catholic bishops in the United States issued their Pastoral Letter. The letter discussed many topics considered important for Catholics in the United States, and education was among the topics. In the thirty-second article, the bishops declared education to be “a holy work, not merely a service to the individual and society, but a furtherance of God’s design for [humanity’s] salvation.” Five principles governing education were formulated: education as moral activity, the relationship between knowledge and values, the pre- eminent place of religion in the curriculum, the relationship between religion and other disciplines, and the contribution of religion and morality to the public welfare. All or most of the principles would be mentioned again or amplified in subsequent pastoral letters and papal encyclicals. Fitzpatrick’s theory of education
drew on these principles, and he expressed them in his book, *I Believe in Education*.

In his book, Fitzpatrick claimed that the function of education is not only intellectual, "it is human, it is Christian; it is dealing with the whole person, intellectual, moral, volitional." Catholic education should be a complete education, Fitzpatrick wrote in a later article, "of body, mind, and spirit, rich in the fruits of religion, science, literature, art, music, so taught that they form the 'holy spirit of [men and women]' and help [them] to approximate the comprehensive ideal living to the 'fullness and stature of Christ.'" Schools cannot provide all things to all students. Careful selection was necessary. In *I Believe in Education*, Fitzpatrick said the curriculum was "a selected, simplified, idealized organization of [one's] spiritual inheritance... It is a planned life, not an accidental life. The child lives in the school, but the school's life is not the life of the world outside. The school is a kind of life. It is not all of life."

The third issue examined the implications of a philosophy of life and a philosophy of education for the curriculum. Fitzpatrick rejected curricula based on theories of citizenship or career training or life adjustment as the purposes of education. The theories minimized the importance of culture. Culture transmitted values conducive to humane living. Fitzpatrick maintained in *I Believe in Education* that culture empowered "[men and women] to stand on the shoulders of all past generations and to utilize vicariously their experience to solve...problems." Education should help the student to attain a proper evaluation of the past as it was embodied in culture.

Education sought to develop students to their fullest potential. Sound educational theory recognized the fact that students learned by themselves; teachers and materials were instruments used to achieve self-activity. But the effort to encourage self-activity did not mean the student could do whatever he or she wanted. Self-activity was not self-indulgence. Fitzpatrick wrote in *I Believe in Education* that the student "must not only be doing something but have some idea of what [he or she] is doing. The experience must be purposeful and meaningful."

Fitzpatrick did not deny the relationship between the school and society. *How* the school contributed to society was his question. He believed the individual, not the school, produced social change. In *I Believe in Education*, the school was "a conscious, planned, organized agency of education." Education was a process of moral and intellectual formation. The relationship between the individual and society began *after* formal schooling.

Because Catholic education believed men and women have spiritual natures, religion and morality had necessary roles in the curriculum. Fitzpatrick countered critics claiming Catholic education minimized
existence with the rejoinder that only in the world were the Catholic understanding of existence and the Catholic theory of education able to be realized. Catholic education had a specific conception of human existence, and the concept included a supernatural end. Catholic education neither minimized the importance of human existence nor avoided social responsibility. His reflections on Catholic higher education were the culmination of his ideas on Catholic education.

The Catholic College in the World Today is the title of Fitzpatrick's book in which he defines the Catholic college to be “a college in which the principal order of the college, its hierarchy of values, its motivating center, its Weltanschauung is found in religion.” The spirit of religious humanism pervaded the college. Religious humanism regarded knowledge not as an end but as a means. It promoted intellectual and moral development. The Catholic college had the responsibility to society to enrich the meaning of life, to reveal values, and to show the goodness of life. Above all, knowledge was directed to the improvement of society. Love, service, and knowledge indicated the special position Catholic colleges had in society and in the Catholic Church. Catholic colleges were not institutions intended to extend one's opportunity for education. They were, according to Fitzpatrick, “essential to an intelligent program of Catholic action, and to [Catholicism's] maintaining an intellectual respectability.”

Graduates from Catholic institutions of higher learning were responsible for bearing Christian witness in their lives. Catholic colleges and universities educated men and women "stamped with certain traits which come into play and govern their approach to life in every sphere..." Catholic higher education could not afford to avoid the world. Avoidance, Fitzpatrick feared, would reduce Catholic colleges and universities to ghettos. Isolation would bring atrophy. Catholics had a mission to the world, and Catholic higher education prepared students for the mission. The success or failure of Catholic higher education rested squarely on faculty and graduates. In The Catholic College in the World Today, Fitzpatrick warned graduates of Catholic colleges and universities that they did only little good by "condemn[ing] contemporary culture as materialistic, secularistic, or reverting to older words, barbarian, pagan, alien.”

Catholic graduate education was also responsible for the development of a Catholic civilization. Catholic civilization, Fitzpatrick believed, emphasized "the moral as superior to the economic, the cultural as above the practical, the humanistic as ever against the material... [Catholic graduate education] must emphasize the cultural elements, the humanistic elements, the spiritual elements.” The importance of values applied also to professional schools in Catholic universities. Fitzpatrick noted in
The Catholic College in the World Today that the divorce of values from knowledge produced a pseudo-intellectualism, "a training in cunning, a formal training in intellectual pride, the hothouse product of schools instead of the vivifying energy of life." 32

Fitzpatrick's philosophy of Catholic higher education was guided by Pope Leo XIII's encyclical, Aeterni Patris. The encyclical endorsed Thomism as the official philosophy of the Catholic Church. Leo understood Thomism as receptive to questions raised by modern culture and able to demonstrate how a religious philosophy can answer questions posed by modern culture. A statement by George Bull, S. J., affords a contrast to Fitzpatrick's position. Bull wrote, "It is the simple assumption that wisdom has been achieved by man, and the humane use of the mind, the function proper to him as man, is contemplation, not research." 33 In The Catholic College in the World Today, Fitzpatrick admitted to difficulties in the reconciliation of knowledge and faith. Yet he was confident in his conviction that the world has unity, purpose, and values. The strength of Catholic higher education depended on faculty and students to consider seriously the relationships between faith and reason, knowledge and values, values and action. Less would diminish the purpose and possibilities of Catholic higher education.

An evaluation of Fitzpatrick's place in the history of Catholic education in the United States should be cognizant of two points: the years Fitzpatrick spent in Catholic higher education and the relationship between religion and culture. He came to Catholic education after the battle for the establishment of Catholic schools had been won and before Vatican Council II. The years witnessed the forging of the Catholic identity in the United States. It was an era of expansion and consolidation for Catholic schools. The effort to sustain an identity as Catholic and American and to be responsive to social issues taking place in American society fell heavily on Catholic schools. Catholic schools were extensions of the priest's pulpit.

Catholic schools were given the task of molding young minds for service to church and country. The schools needed to be properly prepared for the task. Fitzpatrick's call for revising religious education is instructive. If religious education—the core of the curriculum in Catholic schools—could advantageously incorporate improved methodologies in the process of learning, then all disciplines could follow a similar path. Catholic education would then be able to demonstrate that innovations in pedagogy—whether from a naturalist like John Dewey or a priest like Thomas Shields—would be welcomed by Catholic educators in their effort to fulfill their mission. Fitzpatrick's contention that education in religious doctrine can be integrated with sound educational programs would be amply proven.
The encyclical *Aeterni Patris* established the philosophical and theological basis of Catholicism. Fitzpatrick believed he interpreted the encyclical correctly by asking Catholic schools — especially Catholic colleges and universities — to be aware of Catholicism’s response to questions raised by American culture. Thomism offered to Fitzpatrick and to other Catholic intellectuals the opportunity to interpret culture from the Catholic perspective. Although Thomism is no longer widely accepted as the dominant philosophical and theological response to questions, Vatican Council II acknowledges the church’s duty to answer questions raised by culture.

Pluralism and secularism bring complex questions to educational institutions linked to a religious tradition. Fitzpatrick’s answers to questions of his day may not satisfy questions articulated by American culture almost forty years after his death. But the relationship of religion and culture continues to be the crucial problem for schools cherishing their religious heritage. Individuals who value today education in a religious context share Fitzpatrick’s efforts and stand up to similar difficulties.

As the United States became further involved in World War II, discussions arose within the Negro community about the incongruency between the rhetorical justifications for fighting the racist regime of Nazi Germany and the prejudicial and discriminatory treatment of Negroes on the homefront. While whites favoring involvement in the war argued the United States must fight to "preserve democracy and freedom for all," they were denying Negroes full participation in American society. For example, within the war effort, Negroes were denied equal employment opportunities in defense industries, segregated from white soldiers in the military, had their blood segregated from white blood in the Red Cross blood banks, and were relegated to low-status positions such as mess boys and janitors within the military. These injustices were in addition to the well-documented segregation of school children, inequitable housing and employment opportunities, and often brutal treatment by whites, including white police officers. As Mays aptly described the situation, "democracy works less perfectly for Negroes than it does for other Americans."

The obvious inconsistency between the rhetoric of "fighting for democracy and freedom for all" in Europe when democracy and freedom for all did not even apply to Negroes in the United States even led some Negroes to espouse support for the Axis powers. These Negroes hoped that a United States controlled by Germany or Japan would entitle the Negro to more freedoms than under the white, American power structure of the time. Alternatively, other Negroes, such as Benjamin Mays and Horace Mann Bond, concluded that American Negroes must
support the war effort despite their lack of full participation in the democracy guaranteed under the Constitution of the United States.\(^7\)

At least some of the Negroes who professed support for the United States in the war effort did not believe that the Negro would gain greater participation in the democratic processes of the United States as a result of the Negro's support of the war effort. As Mays proclaimed, "I make bold to assert that the present war will scarcely increase the Negro's participation in democracy." \(^8\) Graduating Negro high school students in Gary, Indiana also questioned "whether white Americans really mean to include the Negro in the post-war program of freedom of opportunity." \(^9\) A study conducted by the Negro Digest Poll revealed that the belief Negroes would gain little from participating in the war effort was relatively widespread. The Poll asked respondents to answer the question, "Will Negro success and achievement curb race discrimination?" Fully two-thirds of the Negroes interviewed from around the country did not believe that racial discrimination would end as a result of Negro success and achievement. Additionally, the majority of Southern whites expressed the opinion that racial discrimination against the Negro would always exist.\(^10\)

How could Negro leaders rationalize their call for all Negroes to support the war effort when they believed the Negro would gain precious little from supporting the war? Mays, in his 1942 article in *The Crisis*, provided some reasons for the Negro to support the war. First, according to Mays, the Constitution of the United States gave hope in the future to the Negroes in America. He argued that the Constitution provided the only protection for Negroes from inequitable treatment by others. Under a Hitler-dominated United States, Mays believed the Constitution would be abolished and the Negro would suffer far worse than the Jews in Germany. Additionally, Mays professed faith that the Constitution would ultimately provide the Negro with greater participation in the United States' system of democracy. Second, Mays emphasized that the Negro has always been loyal to the United States. He recalled that a Negro American, Crispus Attucks, was one of the first Americans to die in the Revolutionary War, and the Negro "mess boy," Doris Miller, received high praise for his heroic actions at Pearl Harbor. Mays concludes that "It is the conviction of this writer that the heroism and loyalty of the Negro in past wars will blaze forth again and again in the present war. All this is another way of saying that the Negro knows full well that this is his country and that he must not only be willing to live for it but to die for it. He knows no other. He is proud of his record and will not stain it."\(^11\)

Consequently, although Negro citizens in Dallas, Texas suffered racial discrimination, the rhetoric in the local Negro newspaper supported the
war effort. It is interesting to see why a Negro newspaper supported the war effort. But it is most important to see how Dallas-area Negroes used the local Negro school effort to support the war. Indeed, the evidence provided by the local Negro newspaper from 1941 - 1944 about the Dallas Negro elementary and secondary schools' effort to support the war leaves little doubt that these schools fully supported the United States' endeavor to defeat the Axis powers in the Second World War.

Racial Discrimination in Dallas during World War II

As in much of the rest of the United States at the time, the Negro citizens of Dallas experienced racial discrimination in a variety of forms at the hands of their fellow white citizens. The Dallas Express carried numerous articles depicting the injustices suffered by the Negro residents of Dallas. For example, white citizens of Dallas, protested the opening of a new Negro high school by threatening violence and actually temporarily closing down the high school. Additionally, at the beginning of the war, Negro school teachers in Dallas received less pay than white teachers in white Dallas schools. Negro citizens were also denied equal access to the war-related defense jobs. The Dallas Express also reported that the Negro citizens of Dallas were restricted in the areas in which they could live. In fact, when some Negroes moved into a "white" area of town, the Negroes' houses were bombed repeatedly. Moreover, the white-led police force refused to provide these citizens protection against these bombings. The police department failed to protect all Dallas Negro citizens from the violence of the times, and the police department often committed the violence against Negroes. On September 20, 1941, the Dallas Express reported that a Negro man was shot by an off duty police officer when the Negro boarded a bus in front of a white woman. Additionally, on April 3, 1943, the Dallas Express recounted that two Negro students from Lincoln High School were abducted from the sidewalk by white police officers and beaten.

Rhetorical Support for the War Effort

Similar to Mays and other national Negro leaders of the time, the editors and writers of the Dallas Express recognized the inherent conflict between the United States fighting a war against the racist regimes of Nazi Germany and Japan while maintaining racist policies and actions against the Negroes of America. For example, in the "Dallavantin" column in the October 11, 1941 edition of the Dallas Express, L.I. Brockenbury wrote, "If Hitler could see the local papers announcing that the whites of South Dallas are going to pay the policeman's salary for the time of his suspension for brutally beating a Negro, I'll bet the dictator would get quite a laugh." Brockenbury later compared the actions of the
Dallas police to that of the Nazi Gestapo in Germany and even described the police as "Worse than the Gestapo." This, and other articles published in the *Dallas Express* indicate that the Negro population of Dallas was clearly aware of the discrepancy between America's fight for freedom and democracy abroad while white America denied the Negro freedom and democracy at home.

Despite their awareness of this unjust contradiction, the editors of the *Dallas Express* professed full support for the United States war effort against the Axis powers. An editorial in the January 18, 1941 issue of the *Express* stated, "We are Americans and there is no possible way that we can be anything else except Americans. If America is to be attacked, Negroes must fight for America just as any other group fights for it." Additionally, the editors stated in the January 24, 1942 issue, "We believe that Negroes should support this war with everything they have."

**Justifications for Supporting the War**

The *Dallas Express* editors, similar to Mays and other national Negro leaders, offered two justifications for Negro support of the war effort. First, the editors argued that, even though Negroes did not enjoy all the rights afforded to them under the Constitution, they would be afforded far fewer rights under a Nazi regime. For example, an article by Herbert Agar said, "Intelligent Negroes themselves know well how incomparably worse their lot would be under any government dominated by Nazi doctrines of racial superiority. Under Nazism, the Negro would be hurled back in a day to the barbarism of the jungle." In the January 16, 1943 issue, an editorial proclaimed, "Anyone who is not daft should be more greatly concerned with what his status would be under the Japanese and Nazis than with wishing for an Axis victory." Second, the editors asserted that "Here (in the United States) are our homes, here are our hopes and aspirations, --to say that we will not fight for these, is to convict ourselves of being cowards and unworthy of citizenship." Since Negroes are also Americans, the editors concluded, then all Negroes must be prepared to fight in defense of their country.

The editors of the *Dallas Express*, however, did not simply advocate that the Negroes of Dallas should only fight for freedom and democracy abroad. The editors also proclaimed that all Negroes must fight on two fronts--one on foreign soil and one on the homefront. They declared, "We repudiate the theory that an all-out support of the war involves a cowardly acceptance of the abuse of the very principles for which we claim to be fighting." In the March 14, 1942 issue, the editors declared that the Negro should fight for the United States against the Axis powers, but they should also "fight for real Democracy at home at the same time."
The Local School as an Avenue to Support the War Effort

Through discriminatory hiring practices in the defense industries and segregation in the military, whites effectively denied Negroes the opportunity to exhibit their full support for the war in these areas. There were other opportunities available to Negroes, however, in which whites could not stymie Negro support for the war. The Negro community could involve themselves in scrap drives, war bonds sales, and conservation measures. An additional opportunity for the Negro community to support the war effort resided in their local Negro schools. As the Educational Policies Commission stated in 1942, "Education can--and must--play an important role in winning the war." Thus, despite the discrimination which prevented them from holding responsible positions in defense industries or military, Negro citizens could support the activities of their local schools as a method to reveal their unflagging support for America in its time of crisis. Unfortunately, precious little has been written on the role of the Dallas Negro community and their segregated Negro schools' support of America's effort to win the Second World War. In Education in Dallas: Ninety-Two Years of History 1874-1966, the white schools of Dallas were noted to have supported the Second World War effort through various activities and curricular changes while the Negro schools of Dallas were not mentioned at all. Likewise, in Rose-Mary Rumbley's book, A Century of Class: Public Education in Dallas 1884-1984, there was no mention of the Dallas Negro schools during any time period nor any mention of white or Negro school support for the war effort during World War II. The Dallas Negro school support has remained undocumented to such an extent that the best evidence of the ways the Negro schools of Dallas supported the effort during World War II is found in the Negro newspaper Dallas Express.

Unfortunately, reliance on newspaper accounts to discover the actual activities of schools introduces two serious limitations. First, due to the nature of the newspaper industry, the business must sell newspapers to remain a functioning enterprise. Since the necessity to make a profit entails enticing readers to purchase copies, newspapers tend to report those events which they believe will be of interest to their potential subscribers. Hence, relatively mundane topics with little inherent interest to the subscribers are rarely printed. In the realm of school news reporting, this principle translates to newspapers focusing primarily on unusual or extraordinary events which occur within the school. Special events and outstanding achievements, therefore, such as assemblies, sporting events, club activities, and honor roll memberships are more likely to be chronicled than curricular and instructional modifications. Thus, the Dallas Express focused its school news reporting on patriotic school assemblies, scrap drives, war bond and stamp sales, and
war-related club news more often than curricular and instructional issues.

A second limitation to the reliance on newspaper accounts for a description of the events and activities in schools is that newspapers usually do not provide a full description. A conscious decision is made about what to include and what to exclude in an issue. Such decisions are tempered by the issues previously discussed and the conscious or unconscious likes and dislikes of the individual reporters. The school news reported by the *Dallas Express* was written both by professional reporters and educators. In the case of the staff writers, their decisions were likely prejudiced by their lack of knowledge of schooling, personal biases, and desire to report high interest topics in order to increase readership levels. Educators’ decisions about what to report, on the other hand, were likely prejudiced by their personal educational philosophy and their lack of journalism knowledge. Disparities in the reporting of war-related events from school to school are likely to exist, which do not necessarily indicate that one school supported the war effort to a greater degree than another.

**Non-threatening Involvement: the Negro Elementary Schools of Dallas Support the War Non-Curricular Efforts**

As Ronald Cohen noted, “The elementary curriculum (during the war years) was somewhat marked by war concerns, but more prevalent were scrap collection drives, war stamp and bond sales, conservation programs, and other practical out-of-class functions.”27 Specifically, an article by Maud Roby in *The Elementary School Journal* urged elementary schools zealously support to activities such as” . . . buying war stamps and bonds; planting Victory Gardens and conserving produce from those gardens; learning how to give first aid; eating nutritious foods and establishing other important health habits; organizing story-telling clubs that actually function in the school, the home, and the neighborhood; making airplane models and teaching other children to identify planes; organizing a salvage club that assumes the responsibility of advertising and promoting all salvage activities; doing Junior Red Cross Work.”28 Although the curriculum of the Dallas Negro elementary schools during the war years generally followed the recommendations of Roby, the evidence provided by the *Dallas Express* indicates there were some differences in the response of Negro and white schools to the national call for schools to support the war effort.

According to the articles in the *Dallas Express*, the most popular activities in the Dallas Negro elementary schools were the scrap drives and the war bond and stamp sales. All of the schools participated in these activities, with many of the schools sponsoring inter- and
intra-school contests to motivate student participation. Additionally, as reported in the Roby article, both J. W. Ray and Julia C. Frazier Elementary Schools formed "Junior Ranger" clubs for boys to augment the regular scrap collection drives of the school.29

As in many of the white schools across the nation during the war years, the Dallas Negro elementary schools addressed the war effort through the utilization of school assemblies. Nationally, according to Loeb, assemblies appeared to have been the school routine most affected by the war. In general, however, the nation's elementary schools were less affected in this area than the high schools of the time.30 From the evidence available in the Dallas Express, this trend held true for the Negro schools in Dallas as well. From the large number of assemblies mentioned, the weekly presentation of assemblies was a common practice of many of the schools at that time. Of the large number of assemblies mentioned, at least a few of them addressed issues related to patriotism and/or the war. The topics of the assemblies ranged from, "A Speech for Uncle Sam" in the fall of 1942 at J.P. Starks Elementary31 to an address by the Negro war hero, Doris Miller, at Frazier Elementary in the spring of 1943.32 Although only a small percentage of the assemblies mentioned were patriotic or war-related, their very presence indicates the Dallas Negro elementary schools' intention to support the war effort.

Another out-of-class activity in which all of the Dallas Negro elementary schools participated was the Junior Red Cross program.33 Chapters included boys and girls and were active in both in-school and out-of-school activities. Although all the schools sponsored a Junior Red Cross, the actual activities of each group apparently were quite disparate. For example, at B. F. Darrell Elementary in the spring of 1942, the students raised money for the war effort,34 while Wheatley Elementary students collected Easter favors for soldiers a year later,35 and the students at Frazier Elementary collected stationery for the soldiers to use in the spring of 1944.36

Another interesting effort which involved both in-school and out-of-school participation was the emergence of the "Victory Garden" in all of the elementary schools and the Negro community at large during the spring of 1943.37 Evidently, these gardens were initiated in the larger community in response to the need for conservation of food. Many of the schools used the Victory Gardens to teach their students about proper nutritional habits necessary for the healthy development of young bodies and minds needed to fight the enemy. For example, the spring health classes of 1943 at H.S. Thompson Elementary School studied proper nutritional habits in a unit entitled "Uncle Sam Needs Us Strong."38 Likewise, students at Frazier Elementary learned "How to Eat Right and Win the Fight" in their health classes during the same semes-
Not only did the students study nutrition and help tend the gardens during school hours, but many also became involved in the after-school Victory Garden clubs and in their parents' Victory Gardens. The Negro community embraced the Victory Garden concept so wholeheartedly that the *Dallas Express* even began publishing a "Victory Garden" column in 1943. These columns described gardens throughout the community, offered hints on how to improve gardens, and even extended a "Victory Garden of the Week" award. The Negro elementary schools of Dallas, thus, integrated the Victory Garden into the health education curriculum while sponsoring after-school Victory Garden clubs, and utilized both activities as a means to support the war effort.

As noted by Cohen, most of the activities addressing the war effort in the nation's elementary schools were designed to involve students in a non-threatening manner; thus they did not directly engage the students with any substantive war issues. Unlike the typical white school of the time, some of the Negro elementary schools in Dallas formed clubs whose names suggest a more direct engagement with the issues of the war. For example, a history class at Wheatley Elementary School formed a "United States Marine Group" in the spring of 1942, while the sixth grade class at B.F. Darrell Elementary formed a "Defense Club" during the same semester. Additionally, all of the eighth grade students at Julia C. Frazier Elementary joined a "Victory Club" in the fall semester of 1944. If these clubs were even somewhat similar in nature to the High School Victory Corps, which will be discussed later, then at least some of the elementary students were more involved in the war effort than most of the elementary students in the United States at the time. Unfortunately, the *Dallas Express* did not elaborate on the activities or functions of these groups; thus, the level of engagement with war issues or the preparation of the students' future roles in the defense industries and/or military force remains obscured. The formation of groups with names even suggesting a high level of engagement, however, seems unusual for elementary schools of the time. The Negro elementary schools in Dallas, therefore, apparently went beyond the formation of clubs superficially related to the war effort and developed clubs which addressed the war effort in a more substantial manner.

**Curricular Efforts**

American elementary schools during the war, due to their emphasis on fundamentals and being further removed from participation in the war effort due to the young age of their students, were less affected by the war-related addition or elimination of courses as compared to the high schools of the time. In most schools, war-themes were simply incorporated into the existing curriculum in lieu of the addition of
courses specifically addressing war issues. Negro elementary schools in Dallas were no exception to this general pattern. For example, the principal of J.P. Starks Elementary reported in the *Dallas Express* on March 28, 1942, "It is true now that everything is for defense. We (the school) talk defense, sing defense, act defense. It is a vital factor, so all of us must put our shoulders to the wheel and do our parts." From the various other curricular events in the other schools mentioned by the *Dallas Express*, such as "Patriotic Themes" for all classes at Wheatley Elementary in 1943, the other Negro elementary schools in Dallas also correlated defense and war themes to much of their ordinary curriculum.

Specific curricular changes which occurred in several of the Negro elementary schools in Dallas were reported by the *Dallas Express*. Wheatley Elementary, for example, had students develop scrap books consisting of war-related newspaper articles in the spring of 1943. During the same semester, Wheatley Elementary also incorporated a war theme into its geography classes by marking the progress of the war on a world map, an activity engaged by pupils in a many of the nation’s schools. In the fall of 1943, Frazier Elementary School students learned about the current events related to the war and, additionally, its eighth graders were involved in their English classes in writing letters to soldiers. Different schools, then, implemented disparate curricular responses to address the war.

A few of the curricular adjustments implemented to support the war effort were common to many of the Negro elementary schools in Dallas. The first such curricular modification was the adoption of the United States Office of Education’s recommendation that students study “Latin America, the Far East, and other international relations in general.” For example, in 1941, the sixth graders at H.S. Thompson Elementary studied Mexico, while Frazier Elementary students produced a relief map of South America in 1943. Additionally, Wheatley Elementary students learned about Brazil in 1944. H.S. Thompson Elementary School even had a Latin American theme for a portion of the 1942 school year. A second modification, as previously mentioned, was the utilization of the community-wide involvement in Victory Gardens to impart the importance of proper nutritional habits to the students in the health education classes. The third and final curricular modification common to all of the elementary schools was the new focus of patriotic or defense-related themes in the music classes. For example, Frazier Elementary students learned to sing some of the Allied countries’ music in 1942, and all the students at Wheatley and B.F. Darrell Elementary Schools performed the Star-Spangled Banner in 1943. Also in 1943, Douglas Elementary even formed a “Victory Choir” to promote the singing of patriotic songs. Many of the elementary schools in Dallas,
therefore, implemented three curricular modifications intended to focus student attention on the war crisis, while still teaching the students the basics of the three courses.

In conclusion, the Negro elementary schools of Dallas responded to the call from groups such as the Education Policies Commission for schools to "... direct their programs to the end of maximum service to the war efforts of our nation." Each of the schools responded in its own unique manner, molded by the feelings of the principal, teachers, and parents of that particular community. Some schools emphasized non-curricular activities, while others placed more emphasis on curricular modifications, but all of the schools responded in one form another. Additionally, a few responses—such as involvement in scrap drives, war bond and stamp sales, Junior Red Cross, and Victory Gardens—were common to all of the Negro elementary schools in Dallas. The information related by the Dallas Express leaves no doubt that the Negro elementary schools of Dallas wholeheartedly endorsed support of the war effort and provided ample opportunities for their students to participate in various patriotic activities to boost morale and support the war.

Preparing Students for War: the Negro High Schools of Dallas Support the War Effort Non-curricular Efforts

The two Negro high schools in Dallas, Abraham Lincoln High School and Booker T. Washington High School, also supported the war effort through a variety of out-of-class activities. For example, both high schools were involved in scrap collection drives and the sale of war bond and stamps, but, based on the amount of coverage offered by the Dallas Express, did not place nearly the amount of emphasis on these activities as did the elementary schools for Negroes in Dallas. According to Wright, such non-threatening activities were considered more appropriate for the involvement of younger students than for young adults preparing for their future roles in the defense industry or military forces. Even though the Negro high school students in Dallas were involved these activities, they were not considered a primary method for the schools to address the war effort.

Another similarity between Negro elementary schools and the Negro high schools of Dallas was the use of patriotic assemblies as a method to build the morale of their student bodies. The two high schools presented at least fourteen patriotic assemblies over a four-year period while, the approximately ten elementary schools reported the presentation of only eight patriotic assemblies over the same time period. Both high schools offered assemblies entitled "Americans All" and "How to Evaluate Propaganda" in 1941 and "Brotherhood for All" in 1944. In 1941, Lincoln High School presented "Lincoln High School--A Citadel of
Democracy.”60 While Washington High School presented “The Consumer and National Defense” in 1942.61 The Negro high schools of Dallas, then, altered their normal school routine somewhat through the introduction of patriotic assemblies.

A final similarity between the Negro elementary and high schools in Dallas was their offerings of various club memberships to the students as a method to support the war. Fewer clubs, however, seemed to be offered by the high schools than the elementary schools and, of the few offered, were more likely to engage the students directly with substantial war issues or to train the students for positions in the defense industry or the military. For example, at Lincoln High School, the students participated in a Victory Press and a Victory Correspondence Club. The Victory Press was dedicated to the reporting of war-related issues in the school newspaper, while the Victory Correspondence Club contributed to the war effort by writing letters to the soldiers stationed around the world.62 One of the most important clubs formed by both the high schools was the Victory Corps. According to Ugland, the High School Victory Corps was a “... federal program to encourage and coordinate preinduction training for students in high schools.”63 In December of 1942, the faculty of Washington High School discussed the formation of a Victory Corps for the students,64 and four months later, the Dallas Express reported that Victory Corps buttons were receiving “widespread use” among the students.65 Additionally, in 1943, the Dallas Express reported that the students of Lincoln High School were involved with their Victory Corps project.66 Whether these Victory Corps in the Negro high schools of Dallas were similar to the preinduction training offered through the Victory Corps in some of the white high schools of the time is not known. In contrast to the opposition of some white administrators and students to the introduction of the Victory Corps in some of the Dallas high schools for white students, the Dallas Express did not give any evidence of any opposition in Negro schools from Negro administrators, students, or parents to the implementation of the Victory Corps. In fact, as will be discussed later, the Dallas Express editors were angered when Negro high school students were not offered the same war defense training as those offered white students. In all likelihood, therefore, little if any opposition was mounted to the operation of the Victory Corps in the Negro high schools in Dallas.

Curricular Efforts

The war had a much greater impact on the high school curriculum than it had on the elementary school curriculum.67 The two Dallas Negro high schools adopted a variety of curricular implementations in response to the national call for high schools to prepare students for their future
roles in the war effort. Some of the changes, similar to the elementary school curricular modifications, were incorporated into existing classes, while other changes were implemented by adding new classes directly related to war issues and student training.

As in the Dallas Negro elementary schools, at least one of the Dallas Negro high schools also implemented the recommendation of the United States Office of Education for schools to teach students about Latin America, the Far East, and international relations. As in the elementary schools, the high schools simply incorporated this recommendation into the existing curriculum. In 1942, Lincoln High students studied “Inside Latin America” and “Our Neighbors to the South.” Lincoln High School students, then, learned about Central and South American countries during the war years, in order to develop a greater understanding of different countries and cultures.

Unlike the Negro elementary schools and similar to many of the white high schools, the Negro high schools in Dallas offered entirely new courses to address directly the need for defense training and engagement with the war. According to the Dallas Express, both the high schools introduced defense classes in “… institutional cooking, shoe repairing, cleaning and pressing, and gearing of cars.” The editors, however, disapproved of the introduction of these particular courses because they were not the same courses introduced into the white high schools of Dallas. According to the Dallas Express, the white high schools introduced “… tool-making, mechanical arts, and the construction and repairing of defense machines.” The editors were angry that Negro students were not being offered the same preparation as white students and thus would be prepared only for low-level, low-responsibility jobs in the defense industry and military. The editors stated, “It seems shameful that Negroes who are anxious to serve their country are denied (the) defense training (that white students receive.)” Thus, although certain defense courses were introduced into the curriculum, the Negro community, as represented by the editors of the Dallas Express, seemed indignant that the Negro students were offered inferior courses as compared to the courses offered to the white students.

During the 1944-1945 school year, the Dallas Negro high schools added five additional “war courses” to the curriculum. With one exception, these courses were similar to the defense training classes introduced in 1941, in that the new courses also possessed a mainly vocational, rather than academic, orientation. The five new courses were entitled “Sewing, Auto Mechanics, Junior Red Cross, (Letter) Writing, and War Mathematics and Physics.” The reason for the emphasis on vocational courses at Lincoln and Washington High Schools was not mentioned by the Dallas Express, but the discrepancy between white and
Negro schools again angered the editors. Although some progress was evidently made in introducing the defense courses into the Negro schools, some inequity in the type of courses offered still existed. Regardless, the Dallas Negro high schools did introduce new courses, as did many white schools of the time, in an effort to meet the war-time needs of their students and the country.

Conclusion

In conclusion, the Negro schools of Dallas, despite all of the injustices inflicted upon the Negro race in Texas and the unlikelihood that the Negro race would gain any rights or freedoms from supporting the war, wholeheartedly championed America’s fight to win the war for freedom for people throughout the world. The activities implemented by the Negro schools to support the war effort closely paralleled the activities of white schools around the country; thus there simply must be no doubt as to the patriotism of the students, faculty, and the Negro school communities of Dallas. Unfortunately, reliance upon the Dallas Express as a primary source allows for only a limited glimpse into the life of these schools; thus research focusing on first-hand data would greatly enrich the description of the activities of the Negro schools.

From 1942-1945, Iowa State College, like several other universities and colleges, participated in a classified research and development project to build the first atomic bomb, popularly known as the Manhattan Project. The academic laboratory at Iowa State College, locally called the Ames Project, was first established as a scientific laboratory under the jurisdiction of the Metallurgical Project at the University of Chicago and then as an industrial and scientific project under the militarily-run Manhattan District. This paper will concentrate on how the issues of security, contracting, and health contributed to the final organizational structure of the Ames Project. The focus is upon the academic versus the military style of management, with Ames serving as a case study of other academic institutions involved in classified research. This study concludes that ultimately the Ames Project adopted an academic management style, despite the fact that it was under the aegis of a military unit, the Manhattan Engineer District.

On September 24, 1942, Harley Wilhelm, a young chemistry professor at Iowa State College, took a 5-inch by 2-inch 11-pound ingot of pure uranium metal from the casting furnace, placed it carefully in a traveling bag some students had given him from a coaching stint in Helena, Montana, and caught the night train to Chicago. Getting off the train in Chicago, Wilhelm had to catch the “L” to the University of Chicago campus. In transit, the handle of his case broke, so by the time he reached his boss Frank Spedding’s office in Eckhart Hall, he was carrying the precious cargo in its case under his arm. Spedding and Wilhelm
took the billet to Arthur Compton, head of the entire Chicago Metallurgical Project, who had never seen one piece of uranium this big before. Compton's immediate reaction was "I bet there's a pipe [hole] inside." Wilhelm took the ingot to the basement of the biology building and instructed a shop man to cut it open. After a small fire in the cutting process, a cropping from the ingot finally appeared; there was no pipe (Wilhelm 1988, Wilhelm 1989, Wilhelm 1990). Spedding, the head of the Chemistry Division at the Laboratory and also in charge of a small group of scientists at Ames, Iowa, evidently took a cropping to an administrative meeting soon thereafter. R. L. Doan, a laboratory director, later recalled that particular day:

I don't believe anyone took the work there [at Ames] very seriously until Spedding came to a technical council meeting one fine autumn day and smugly laid an "egg,"—an almost perfect cylinder of uranium metal, on the table for inspection. Even then, while admiring the accomplishment, everyone I am sure felt that it would be futile to look to a couple of college professors for the production of any significant quantity of metal. (Doan 1958: 2)

But it was not futile. Within a week, R. L. Doan, the Metallurgical Laboratory director, had arrived on the Iowa State campus to write an Office of Scientific Research and Development (OSRD) contract for the Ames Project to produce 100 pounds of uranium per day, using its simple and cheap process (Doan 1958). The intention was that Iowa State would demonstrate the process to companies like DuPont, Electromet, and Mallinckrodt and continue to make uranium until the companies could integrate the processes into their own plants (Spedding, 1980).

Even though a pilot production plant was established, the Ames Project remained first and foremost an academic laboratory, developed partly out of the experiences and expertise of its founder and director Frank H. Spedding. Spedding studied at Berkeley in the late 1920s where many of the ideas about organizational structures that were eventually incorporated into the Manhattan Project already existed. A typical graduate student, he worked with a research director and a group of students, examining critical chemical problems. Spedding's experience with the particular type of academic activity at Berkeley—seminars, group meetings and work with sophisticated equipment—probably inspired him to institute that mode in his Ames laboratory. Daniel J. Kevles, in his study of physicists, labeled the Berkeley style of academic management group research (Kevles 1971). By the time of the Manhattan Project, run scientifically in most part by physicists, group research was
a well-established part of the academic research structure at most larger institutions.

In fact, the structural organization of the atomic bomb project from top to bottom included the management apparatus of a typical large academic organization, complete with committee meetings, ad hoc review studies, and countless group leaders who had wide latitude in choosing research problems to study. Vannevar Bush, the guiding academic leader behind the entire atomic bomb project, used this academic style in creating the National Defense Research Committee (NDRC) and later the Office of Scientific Research and Development (OSRD), the governmental units that originally oversaw atomic research. He chose good research directors and allowed them the flexibility to develop their own laboratories with little interference from his office (Meigs 1982).

By early 1942 though, the scientific program had proceeded only sporadically. By summer, many of the problems in procuring raw materials were solved, but no single uranium separation process seemed to be the winner in what became known as the four-horse atomic bomb race (Smyth 1948). Vannevar Bush began to consider bringing in the Army to build the full-scale construction plants, and on September 17, 1942, Colonel Leslie Groves was offered command of the entire atomic bomb operation. He accepted the new post, receiving the new commission of Brigadier General just before the official announcement was made (Groves 1962, Jones 1985).

Although the Manhattan Engineer District was originally formed to oversee only engineering plant construction, by August 1943, the entire project fell under Groves' jurisdiction. Iowa State's production unit had initially come under District control in late 1942, but by July 1943, its research contract was under District military control also (Manhattan Project, Book 7, Volume 1, 1977). Though little contact existed between the Ames scientists and the District employees, military men and women were stationed at Iowa State College to oversee security, financial concerns, and shipments of uranium in and out of the College (Carlson 1990; Wilhelm 1990; Spedding, Manuscript, n.d.). At Iowa State, as at other installations, Groves and the Manhattan District set in place a military structure parallel to the already existing academic organization. The scientists still ran the site's scientific research for the atomic bomb, but the Manhattan District added staff in the three areas it considered strictly under military control—security and contracting. Health and worker safety were also important to the Manhattan District but will not be discussed in this paper since staff were not added by the military.

Security measures were implemented by scientists even before involvement with either Vannevar Bush's OSRD or the Manhattan Engineer District, agencies which contributed important security regulations.
that helped solidify governmental control of research during the war. As early as 1939, Leo Szilard, Enrico Fermi, and several other immigrant scientists debated publishing the results of their atomic research. Szilard, the most vociferous of the group, urged his fellow scientists to withhold publication of any mention of a chain reaction or the development of atomic weapons. Szilard's initial efforts brought him no success, but at a meeting of the National Research Council in 1940, Gregory Breit proposed controls on the publication of articles on atomic energy in American scientific journals through a censorship committee. The Reference Committee, established later that year, controlled publications in all fields of military interest. This censorship process was voluntary and completely in control of the scientists and journal editors. However, by the time the war was well underway, virtually no articles received review, since the Manhattan Project oversaw all uranium work, and security rules permitted no publications of any kind in commercial journals (Smyth 1948, Weart 1976).

It was Vannevar Bush, though, who had more influence on the policies of security for atomic research than Szilard or the Reference Committee. After Bush began to reorganize research on the atomic bomb under the aegis of the OSRD, secrecy became one of the chief tenants of management policy. Bush also added the concept of compartmentalization to the agency's policies. But since OSRD left so much of the security arrangements to the individual sites, it actually instituted only a modest security system, one that worked well enough until the expansion of the uranium production program began to tax OSRD's very existence as a secret organization.

The Ames Project came into existence in February 1942, so OSRD originally directed its security. With the establishment of its production plant in late 1942, though, that unit received a contract directly from the Manhattan Engineer District, while scientific research continued under OSRD until mid-1943, when those contracts as well were transferred to Groves' operation. Under the Manhattan District, Iowa State's security was the responsibility of the Chicago Branch Office of the Intelligence and Security Division (Manhattan Project, Book 1, Volume 14, 1977). Security regulations at Iowa State covered personnel clearance, document protection, materials shipping security, plant security, and compartmentalization of information.

Personnel clearance was much more rigid under the Manhattan District than under the civilian agencies; document handling and labeling procedures were tightened with various new codes of secrecy, and even installations had their own code names for the materials they were dealing with. For example, uranium was generally called "tube alloy" or "the metal;" radioactivity was often called "sensitivity;" and uranium
tetrafluoride (the compound that produced metallic uranium) was often call “green salt.” Codes were also developed for use on the telephone. Spedding recalled several farm terms developed by the Ames group. “Eggs” were 2” diameters of uranium, and often the caller would indicate “2 dozen eggs shipped.” Later, when Oak Ridge wanted a 1” x 4” length of uranium shipped, these were called frankfurters or hot dogs; billets 4” in diameter and 2-3-feet long weighing 250 pounds were called “cheeses.” Iowa State shipped uranium scrap turnings as “hay.” Boron, a dangerous poison and contaminant, was called Vitamin B. Reports referring to a percent of Vitamin B content contained in the metal or tube alloy meant that the uranium contained a certain percent of boron (Spedding, Interview with Calciano 5, 1979-80; Spedding, Manuscript, n.d; Spedding 1967).

Security on the Ames project was so tight that few in higher administrative positions at Iowa State knew all about the project. Spedding had contacted President Charles Friley at Iowa State College in early February 1942, for clearance to establish the Ames Project after he had previously received permission from him to spend several weeks in Chicago in January on a secret research project (Spedding Papers, 1942). The government gave Friley security clearance in late February or early March so that Spedding could release information on the nature of the research work at Chicago and Ames. The only other top-level administrator allowed access to classified information was Dean Harold V. Gaskill, dean of the Industrial Sciences Division, under whose jurisdiction rested all wartime research projects at Iowa State College (Spedding, Interview with Calciano 7, 1979-80; Spedding Papers, 1943). Even the purchasing officer of the university was told by Friley to order anything Spedding wanted and not to question the nature of the secret project.

The Manhattan District also tightened security concerning materials shipment, even determining which materials were to be shipped by freight, rail, or to be hand-carried. Plant security was also tight. Installations were inspected and rated frequently. Few documents remain recording the results of plant inspections at Iowa State College (Ferry 1943), but in one recorded instance, the security inspection team proposed some rather extreme measures to correct a perceived security problem. Iowa State disposed of slag material from the reduction experiments at the College dump. That material included calcium fluoride, lime and probably a little uranium that might be left in the slag. The calcium chloride, according to Spedding, served as a good rat poison, but the security officials for the Manhattan District were concerned about the uranium pieces as a security risk. The project employees were instructed to dig up material that had been deposited in the dump and ship it to New Jersey for storage as well as send any future waste to the
East. Security inspectors also noticed that small amounts of the uranium tetrafluoride were sometimes deposited in the soil at the Chemistry Annex building production plant. The Ames Project personnel dug up six inches of soil in a strip twenty inches wide all around the Annex to ship to New Jersey also. Filters were then installed on the exhaust fans to eliminate the continued deposition of uranium outside the annex.

The Iowa State College project administration searched in vain for containers in which to ship this material to New Jersey until Wayne Keller suggested that in his Kentucky hometown, whiskey barrels were quite often left over from the distillation process and could make suitable containers. Spedding approved the suggestion and asked him to order 1,000 whiskey barrels. By mistake, Keller's secretary typed on the purchase order, "one thousand barrels Hiram Walker Whiskey." The purchasing agent of the college, Mr. Potts, had been told early in the project that for security reasons he was to approve anything Dr. Spedding ordered, and the government would pay for it. Despite the security requirements, Potts called Spedding at 6 o'clock one morning and questioned why he was ordering whiskey through the College in Iowa, a dry state. Needless to say, Spedding straightened out the agent and assured him that it was just a typographical error; he needed only the barrels (Spedding 1980; Spedding, Manuscript, n.d.).

That was not the only trouble the project had with those whiskey barrels. When the barrels arrived, a group of men called the "Bull Gang," who did the heavy lifting around the project, were instructed to dig up the dump material. Suddenly, Dr. Wilhelm had too many men volunteering for this dirty and strenuous duty. He suspected something was amiss, and when he went to the dump, he found that the men were propping the whiskey barrels on the edge of a hill and draining about a cup of whiskey from each barrel before filling them with the dump material. Despite the happy workers, the slag was eventually crated and shipped to New Jersey as requested. What New Jersey finally did with the fine Iowa black dirt and slag is not mentioned in any records, and evidently no one who knows has been identified (Spedding, Manuscript, n.d.; Spedding 1967; Daane, Spedding, and Wilhelm 1967).

Security also prevented publication of the results of research, certainly a military management victory at first glance. But that requirement was imposed long before the military took over, and the scientists found a substitute for publication that served the secret project just as well—the report. In the beginning of the project, weekly reports were required, then biweekly, and eventually monthly reports of progress in each laboratory. Each project leader was responsible for his own group's report, and those were summarized by Spedding and submitted to the Metallurgical Laboratory (Spedding Misc. Papers). An elaborate process
of coding, numbering and distributing these reports was instituted, and the only way added security from the military affected this system was in requiring that only laboratory or project directors request reports from another facility. Written agreements had to be formulated with each facility as to what it could provide to others. But by the time this took effect in 1943, most scientists already knew, in a general way, who was working on the project and what each laboratory might discover. It was a matter of getting around the paperwork to obtain information.

The military, then, did not change the existing academic structure set in place by Bush and the academics; it merely added procedures and requirements alongside the other structure. In most cases when security was lifted, what was left was an academically-styled unit or laboratory.

Just as security challenged the academic administration of research, financial control also became an important issue in research administration. Each of the wartime national organizations — NDRC, the OSRD, and the Manhattan Engineer District — adopted a financial management device known as a contract, a mechanism that essentially redefined the relationship between government and the academe. Unlike security, which was by and large a temporary measure that affected primarily the administration of a wartime laboratory, the contract actually changed the nature of academic research administration itself.

Contractual arrangements developed out of a longtime and somewhat ambivalent relationship between scientists and the federal government. The academic scientist, particularly in the nonagricultural disciplines, generally taught courses while completing research and scholarship at his or her own expense as a part of the teaching appointment. Little governmental support of academic science developed before World War II, except some attempts at supporting application-oriented research that would have short-term benefits to a particular segment of society (e.g., that provided by agricultural support or public health research) (Dupree 1957, Greenburg 1967).

By the 1930s, some of the barriers to government funding were changed by a complicated set of circumstances. The financial situation, caused in large part by the Depression, eroded many university endowments, as well as those of private foundations that had supported scientific research through the 1920s. By the beginning of World War II, the transition to large group research, coupled with the advent of more sophisticated and expensive research equipment, and the need for large infusions of money to make new scientific discoveries in fields like nuclear physics, had caused scientists to begin to make overtures to the government for funding scientific research (Greenburg 1967, Dupree 1957).
When the National Defense Research Council (NDRC) and the Office of Scientific Research and Development (OSRD) were established, they did not create their own laboratories to support scientific efforts, but they decided to support research through existing laboratories, mostly in educational institutions. The idea was certainly novel, since during the last war scientists had most often worked in uniform at makeshift laboratories away from their home institutions. This new approach though necessitated some way to register the government/academic relationship, thus the NDRC looked at the contract as a device to cement that relationship with academic laboratories (Bush 1970).

When Bush looked around for a structure to administer NDRC research, contracts were fairly common. However, they were most often military procurement devices so fraught with requirements and special safeguards that they would not work with universities, which were free of such rigid controls. When Bush originally developed the plan for the NDRC organizational structure, he made a decision to split the actual research areas from the business side of the agency, under the assumption that once work started, the scientist need not worry about financial regulations with the Bureau of the Budget or the Patent Office or the other bureaucratic agencies that were concerned with the administration of research. He chose Irvin Stewart, a lawyer who had been a member of the Federal Communications Commission, to oversee the administration of contracts (Stewart 1948, Bush 1970).

The contract form adopted on August 29, 1940, contained two characteristics: work at the home laboratory and complete flexibility in the research plan of attack. The performance clause, the key to the new contract, was an exercise in simplicity, in that the contractor would conduct studies on a given topic and make a final report on a specified date. No details were provided as to how the work must be performed (Stewart 1948).

Another departure from past contracting procedures required contract negotiation with the investigator's institution, not the individual researcher. This legal precedent freed the researcher to do the work while protecting the institution from cost overruns. To provide further safeguards, the contract was written on a no cost basis to the institution, plus an overhead recovery, or administrative charge, of fifty percent of the wages and salaries to cover the institution's cost in providing research facilities (Stewart 1948, Stewart 1942).

Establishing research administration at the institutional level also involved splitting the functions of business and research. NDRC and then OSRD assigned each institution receiving a contract both a research officer and a business or contracting officer. Likewise, the institution receiving a contract was expected to assign someone to handle business
affairs for the institution, in addition to the principal investigator already chosen by OSRD to handle research. This important division became a characteristic of the wartime research, but it also continued as government relations with universities continued to grow after the war. It is still a common characteristic of academic research administration (Lomask 1975).

The Manhattan District followed the policies of OSRD and NDRC in the contracting area. It used the cost plus overhead basis for all its academic research program contracts. Payment for work completed continued by a reimbursement system just as it had under OSRD. However, the Manhattan Engineer District required each contractor to submit a voucher to its assigned area office first, where a preliminary audit would be conducted before the request for reimbursement would be forwarded to the District headquarters (Manhattan Project, Book IV, Volume 2, 1977).

The University of Chicago’s Metallurgical Laboratory negotiated the first contract with Iowa State College, actually a subcontract from its own OSRD Contract No. OEMsr-410 in February 1942 for $30,000, to last until July 1942 to conduct experimental studies on the chemical and metallurgical aspects of uranium and related materials. In the summer of 1942, the OSRD directly negotiated a separate contract (No. OEMsr-433) with Iowa State College for experimental studies of tube alloy and for experimental chemical and metallurgical studies in building a power plant. In late November 1942, the Manhattan Engineer District took over OEMsr-410, changing its status to a production or supply contract and continuing it as Contract No. W-7405-eng-7 until termination on December 31, 1945. OEMsr-433 transferred to the Manhattan District as Contract No. W-7405-eng-82 on May 1, 1943, when most other OSRD contracts were placed under district control. That contract, with some modifications, is the present contract with which the Ames Laboratory continues its work through the U. S. Department of Energy (Manhattan Engineer District 1947, Fulmer 1947).

The contract, then, encouraged universities to participate in defense work because of the benefits incurred doing government research, without experiencing many of the administrative problems that had previously plagued agency-supported research. At first, the contract was flexible, open ended and did not prescribe the work needed. Those principles laid down by NDRC and OSRD were in line with basic goals and principles of academic management techniques. The contract also allowed administration of research to be split from the actual work of research, and that appeased the scientists involved. It satisfied the educational institutions because they were to be reimbursed at cost, plus an administrative fee for providing facilities and other necessities to
enable the scientists to undertake the necessary work without jeopardiz-
ing the financial situation of the institution.

The contract helped cement the relationship between the academic
world and government in ways that heretofore had been unknown. The
contract remained the primary way of doing business with the govern-
ment until the National Science Foundation was created in 1950. At that
time, the nonmilitary agencies like the National Science Foundation
began to develop what they called a new mechanism to control scientific
research. However, if one looks closely at the grant, it was first and
foremost a flexible contract. It had all the characteristics of Bush’s earlier
device: nonlimiting in its geographical applications, supporting project
research with no prescribed formula except the demand of a report at
project’s end, the award of the funds to the institution rather than the
individual and fiscal as well as research responsibility demanded from
the institution. The contract then—first a wartime fiscal device—grew to
be the controlling device for most research administration after the war.
It was the foundation upon which the academic world and the govern-
ment built a long term relationship, a relationship that appeared to
benefit both parties mutually.

The Manhattan Engineer District represented itself as a typical mili-
tary organization. In my research though, I have seen no evidence that
the District successfully applied that military management style to
laboratories like Iowa State College’s, except possibly in the area of
security. Each of the areas, including security, had already been ad-
dressed before the Manhattan District took control of the project, and in
most cases, the organization and administration of these areas remained
essentially academic in management style. The Ames laboratory, even
under the Manhattan District, ran its organization by committee, as
exhibited by group leaders meetings every Saturday both to discuss
results and plan for next week’s activity. The sessions employed an
academic style in which everyone participated and added to the group.

If a military style triumphed at all under the Manhattan District, it was
in security control. The extreme need for adequate security wielded the
greatest effect on the academic laboratories. That desire for security was
built into the civilian organization that first ran the project, even though
it did not apply the concept as vigorously as did the Manhattan District.
For example, Vannevar Bush, not the Manhattan District, applied the
concept of compartmentalization first, although Groves certainly ex-
tended the concept to its ultimate limits. Because of the militarily-
imposed secrecy requirements, the Ames Project remained isolated from
the other installations, and this isolation probably meant that, to an
extent, no one knew when duplication was going on between this
laboratory and others. Personnel were also not as free to travel to
other installations, so later in the war, the group at Ames knew less of what was transpiring at Los Alamos or Hanford than at Chicago. Early in the project, there was a great deal of interaction between the laboratory and other facilities, partly because Spedding was more involved at a central facility early in the war. He became somewhat isolated from Chicago when Ames demanded his full attention. By that time, Groves moved the bulk of the activity to the secret, well-guarded sites at Los Alamos, Hanford, and Clinton. Even Chicago was out of the loop for what was going on at the secret facilities.

The strict requirements for secrecy, though, did not ultimately affect the academic style of management at the Ames because the laboratory's organizational structure had been established long before the Manhattan Engineer District took over the contracts. The Manhattan District did send security personnel as well as financial and safety advisors to Ames, but these personnel were essentially placed there to see that work was completed on time. They conducted safety and security inspections and reported those back to District headquarters, but they must have had little effect on the day-to-day operation because the research scientists barely knew these men and women were around. No reports remain of their activities in the files at Ames, and most of the scientists were never sure what they were there to do.

Contracting certainly influenced the direction of research in the Ames Project. However, it was not the Manhattan District that placed the basic tenants of contracting—flexibility, institutional responsibility and control, fiscal accountability, no cost/no profit terms—in place. Those characteristics, by and large complementary to academic management styles, were developed by the OSRD and NDRC, both civilian, academic-type organizations. The Manhattan District continued contracting under much the same system, although it often added more accountability or stricter controls on the laboratories.

However, the changes did not originate purely out of military style management techniques employed by the Manhattan District. In almost every case, rules and regulations adopted by the Manhattan District had their origin in the academic, civilian agencies that preceded it. Finally, even the Manhattan District itself came under the control of an academic management structure, the Military Policy Committee, which actually made final decisions on every activity that the District undertook—the final irony and certainly the ultimate victory for the academic management style.

The manifestations of "total war" in society during World War Two have been widely observed and discussed, including those with implications for educational institutions. Lowe's introductory essay in *Education and the Second World War: Studies in Schooling and Social Change* calls attention to the two great strains placed on schools during that era: the responsibility to supply a skilled, "modern" labor force adaptable to the technological demands of war, and the duty to transmit and reinforce the national values that were at stake in support of the war effort. "There is a very real sense," Lowe asserts, "in which education itself became mobilized during the Second World War". Lowe argues that commitment to a world war meant "a major reconsideration of the purposes and ends of education." In particular, Andrew Spaull notes the importance of "informed discussion of the efficacy of secondary school curriculum modification during wartime" and of the "tried and true sources for inculcating a war effort spirit in schools," such as school publications, drives, and conservation efforts.

A likely question for each American community during the war was whether it was more important to direct students to war tasks they could perform while in school or systematically to prepare students for assuming their patriotic duties upon graduation. Many American schools experienced the strains described by Lowe and responded in a variety of ways. Much attention has been given to the wartime changes in typically "American" urban settings.
O.L. Davis Jr. argues that "over half a century of neglect has left us with little understanding...of the nation's wartime curriculum." What curriculum responses were there "to the immense pressures occasioned by the war"? Were the responses "symbolic or practical," "substantial or trivial"? What were the differences between wartime rhetoric and the reality of school practice, and what special problems did wartime schools face? Under what conditions did the curriculum not change?

In particular, Davis calls for "studies that focus on the varieties of schooling in individual communities of different sizes and social compositions" and an understanding of "the many tacit offerings of the wartime school." Such studies may be able to shed light on the responses of different types of communities to the issues raised by Spaull and Davis, on "concerns for community and national affiliation during wartime, (and on) a more complete portrayal of the wartime curriculum." Oral histories, Davis asserts, may be particularly useful in this regard.

This paper raises the issue of the effects of "total war" within the context of rural American life. More specifically, in calling for greater attention to schooling in American ethnic communities, it examines a rural, ethnic enclave: an ethnic Czech community in Williamson County, Texas. According to Anne Pater, "the effects of the war were felt especially in the small rural communities around the United States" because of their lack of resources and already difficult school conditions that the war simply exacerbated. But furthermore, what is the special nature of a rural immigrant community during wartime? How did schools in this type of community respond to the patriotic demands of total war?

This paper reports the examination of community and school participation by members of this Czech enclave in the demands of war in their adopted homeland — a war that also involved the brutalization of their motherland. Particular attention is directed to the community’s high school and its activities, to the importance of Czech identity in participation in the war, and to the nature of a rural perspective on the war, especially the efficacy of certain types of wartime activities for a relatively poor population.

Immigrants from Bohemia and Moravia began arriving at the port of Galveston, Texas, in the mid-1800s and gradually moved up along the Blackland Prairie Soil region that stretched north to Dallas. Texas Czechs apparently "learned to identify with Texas regionalism, a powerful, romantic identity that was uncharacteristic of most other Czech-Americans." According to many accounts in fact, Czechs in Texas apparently became Americanized to the extent that they took to heart the American values of individual identity and free enterprise. Most worked on small farms that they owned while maintaining strong all-Czech communities, unique traditions, and mutual aid societies. The common
expression, “we’re Czechs; they’re Americans” denoted both a sense of superiority to white English-speaking neighbors and a “privileged,” distinctive cultural heritage. In most Czech communities, the immigrants preserved their heritage and language through both parochial and public school curricula, church activities, and in Granger, also through the continuing publication of a Czech-language newspaper. The residents of these communities for years “spoke only the Czech language, most were Roman Catholic, and they were clannish...They considered themselves nasinec (“our people”)...Anyone else was an Amerikan.”

Still, one observer in 1946 wrote that the Texas Czechs’ unity “has been cultural rather than nationalistic.” Another commented that “the loyalty of (Czechs) cannot be questioned. They have never formed organizations for the purpose of undermining the government of their adopted country, nor have they hesitated to take up arms for...their new country.” Even as early as 1855, a pioneer wrote to relatives back home that “the Czechs did not come to Texas to establish institutions which would have a tendency to slow down the process of Americanization...they want to become one of them, by attending the same schools and by helping to develop and support such institutions.”

Newly-arrived Czechs tended to build a community school as soon as possible and to establish reading clubs and newspapers to satisfy their educational needs. Reverend R.D. Miller, in the Bohemian Review, wrote in 1917: “(Czechs) are among the most progressive of our new citizens. They have an intense love of liberty which makes them most appreciative of all that America stands for...They have not been satisfied to do only the things that were expected of them as adopted children of America - they have gone farther (sic)...to show a spirit of sacrifice greater than that.” Skrivanek called attention to “(their) love of freedom...best exemplified in the person of Dominik Naplava, a Houston boy, who was the first Texan killed in the First World War.”

By the late 19th century Granger, located in northeast Williamson County at the junction of the Houston and San Antonio branches of the Missouri-Kansas-Texas Railroad, had grown into a small farming community, whose Czech population remained predominantly Moravian. Czech Protestant and Roman Catholic churches were established there by 1880 and a common public school by 1887. By 1925, Granger High School was established in a new building designed to accommodate grades nine through twelve. In 1932, the lone public school was declared an independent district by the state legislature. English was the official public-school language there, although Czech classes continued to be offered through 1942. At the onset of the Second World War, Granger had a population of 1,723 (seventy-five percent of
whom were Czech, according to several residents) six churches, and fifty businesses.20

Two days after the U.S. declared war on Japan, the Granger school board voted to allocate twenty dollars for the purchase of a “radio phonograph” from an R.E. Marek.21 Several participants in oral interviews remembered school assemblies during the war, at which they listened to President Roosevelt’s speeches.22 From an examination of the Granger school board minutes and from the recollections of several interviewees, the purchase of this radio phonograph appears to be the only war-related financial innovation specifically targeted for the school. Other suggestions of a world war in the board minutes were the hiring of substitute teachers, including several married women who agreed to resign upon their husbands’ discharge from military service, and a vote to allow the school band to use a school bus for travel to a nearby hospital to entertain wounded soldiers.23

No formal attempts at wartime curricular modification through budgetary means can be discerned from board actions taken during the wartime period. Vocational aid monies (all devoted exclusively to vocational agriculture in Granger) from the federal and state governments for the Granger Independent School District decreased from the pre-war years, a possible indication that the federal government had no particular industrial requirements or expectations for Granger, and that vocational education monies were needed elsewhere. However, spending for school athletic programs and band supplies increased during the war. School board minutes reveal the approval of bank loans for athletic uniforms, equipment, and renovation of the school gym. Finally, no record of formal discussion or actions taken on the modification of any aspect of the high school’s course offerings are recorded.24

In fact, only one curricular change is remembered by students who attended Granger High during the war. Czech language courses were dropped from the scheduled offerings in 1942 because the instructor moved from the community; school officials were either unwilling or unable to find a replacement teacher.25 Not one former student has recalled other types of changes in curricular form or content. Georgie Ann (Kocurek) Chamberlain, who graduated in 1944, stated emphatically that “teachers did not teach the war...they stuck to their subjects...they didn’t like to talk about it...they tried to make you focus on the subject (because) you heard enough on the news and on the street...they kept things as calm as possible for the kids (with a philosophy of) ‘let’s not disrupt class.’” She added, “We were not that curious (about the war); we were frightened...we didn’t understand it.” She also recalled that the husband of one of her teachers died in combat, but “things didn’t slack off just because (of this)...we didn’t dwell on it...she
didn’t talk about her feelings about the war because we were just children.”

Dan Gaida recalled the occasional discussion of current events in his classes. However, Mrs. Chamberlain’s comments illustrate how the viability of such discussions likely was limited. She said that many people got most of their war news “from the streets” and from their families, not from school. “The news in Nasinec was so old...it wasn’t useful...we didn’t take the Austin (Texas) paper...no one in town could afford the newspaper, and there was no delivery...maybe a few got it in the mail...there wasn’t anything in the (school) library either.”

Most war-related activities at Granger High seemed to have been confined within weekly school assemblies, which were standard, major school events both before and during the war. All respondents remembered the assemblies for listening to Roosevelt’s broadcast speeches, learning air raid procedures, praying for the soldiers, saying the pledge of allegiance, and hearing updates on major developments in the war—“very patriotic and religious,” according to Mrs. Chamberlain. At the same time, however, the assemblies often stressed the usual topics of school rules and business the administration wanted to discuss. Some of the assemblies became very emotional, as when a Granger High English teacher’s son died in combat and the school held a memorial ceremony for him.

In September 1941, the Texas Department of Education issued a call for the public schools to participate in “School Defense Week,” a call that was reissued more emphatically after the bombing of Pearl Harbor. All interviewees recalled the various “patriotic” drives that took place for paper, scrap iron, and, especially, war savings stamps and bonds. The state’s Department of Education suggested that schools direct their efforts toward stamp purchases in every classroom, at athletic events, and in school contests, and it encouraged children to “discontinue attendance at picture shows” in order to save money for defense stamps. However, three interviewees pointed out that a dime (which bought one stamp towards filling an $18.75 booklet needed to buy a bond) was “hard to come by...we were lucky to get a dime or quarter to go to the movies;” none remembered filling up a single booklet. According to these former students, the choice between using their spending money either on the savings stamps or the movies was an easy one to make: “We went to see the newsreels and comedies every chance we got.”

The respondents did not, however, remember whether the war-related drives originated at school or in the community. Neither did they recall the origins of drives to send care packages and cookie boxes to soldiers stationed overseas. Several noted that they sometimes wrote letters to
soldiers as part of their English classwork, but apparently no “official” school publications were produced during the war years. The main efforts to send soldiers news about Granger originated with a group of women from the Czech Brethren Church. These women regularly compiled a newsletter for local servicemen.32

Three interviewees talked extensively of the significance of their Czech identity in their participation in war-related activities. Mr. Martinets asserted that during the war, “people felt a connection with Czechoslovakia...what happened to the Czechs was partly a reason for people here to support the war and to have a great patriotic attitude...nobody was really disgruntled; everyone was together.”33 Mrs. Mikulencak remembered her friends and family saying that “England had sold out Czechoslovakia” and that she had nightmares of “the Gestapo knocking on the door” as they had done to innocent people “over there.” Mrs. Chamberlain recalled her mother “crying every day” over her friends and relatives in Czechoslovakia and “living in fear” after her contacts through the mail were cut off because of wartime censorship. “We didn’t understand,” she explained. “I’d say to my mother, So what? It’s not here. We’re not suffering’...only after the war did I hear of the total suffering there...I did know about Lidice34 from the streets and from my family, but there was never much information at school on the situation in Czechoslovakia.”

All three recalled taking Czech language classes at Granger High School until the Czech instructor left in 1942. Some remembered writing penpals and relatives in pre-war Czechoslovakia in class until wartime conditions made this activity fruitless. Nevertheless, most of their memories of activities that nurtured their Czech heritage derived from church, not school, sponsorship. Most notably, their most vivid memories of their cultural education and of identification with the plight of Czechoslovakia derived from their Catholic priest, Father John Vanicek, who was originally from Prague. “He really gave us the love of the motherland,” Mrs. Mikulencak explained, “teaching us the Czech national anthem, giving sermons, saying masses, and exhorting us to pray for our people over there.” Mrs. Chamberlain recalled that she and many other local young people took Bible classes throughout high school from Father Vanicek, “in English and in Czech,” every Friday at the church. Mr. Martinets remarked that the church “made us very Czech...we were ‘indoctrinated’ by its influence.”

An awareness of Czech identity also made some of those interviewed more aware of their differences vis-à-vis other communities during the war, but respondents had varying interpretations of those differences. Mr. Martinets recalled long-held prejudices of “Anglo rednecks” in the town; his grandfather’s store had been torched in the early 1900s. Rail-
road tracks in Granger, he said, for many years separated Anglos and Czechs “like the Berlin Wall.” Yet he emphasized that ethnic tensions eased during the war: “You were close together...everyone tried to keep their chin up.”

Mrs. Chamberlain also remembered living on “the other side of the tracks” from the “Amerikans” but noted no particularly hostilities arising from that arrangement: “You really associated with who you were, whether black, Mexican, or white.” However, she also had recollections of “even more hatred of Germans during the war because of what Hitler had done...but it was just talk, no fights...just private feelings that were maybe irrational, but Czechs didn’t trust the Germans.” Her father, who had fought in the First World War, disliked her dating boys of German descent: “Why not a Czech and a Catholic?” No one recalled any overt manifestations of prejudice in the community or discussions of this issue at Granger High School during the war years.

**Conclusions**

One interpretation of these accounts, with implications for a dichotomy of different types of wartime participation, is that farming communities were more a part of the “rhetorical” rather than the “actual” machinery of war because they had no viable role in industrialization. In rhetoric and in fact, Texas was on the road to industrial development at the onset of war. On September 15, 1940, Governor W. Lee O’Daniel preached the gospel of industrial progress in his radio address, proclaiming that agricultural and livestock pursuits were “not the way to bring prosperity to Texas” and that every local community, including its schools, must “mobilize” immediately to form “industrialization committees” to meet the demands of world war. Indeed, in the dozen or so years prior to the war, the number of manufacturing establishments and the number of people working in nonagricultural occupations in Texas were increasing apace. The war greatly accelerated this growth, especially with the prospect of new air bases, airfields, and over $16 million worth of defense contracts and awards to Texas business and industry.

“Total” war is not the appropriate characterization of the Granger High experience in World War Two if indeed it “spares no established thing in mobilizing people and resources” and “is a threat to institutions.” Expectations and resources simply were different for rural American communities like Granger. The pre-induction needs of the military forces apparently were not addressed in Granger as they were in more “urban” settings in terms of courses recommended by the Texas Department of Education in, for example, electrical and radio fundamentals, aviation, aeronautics, advanced mathematics, or special physical training.
Furthermore, Sitton and Rowold imply a certain neglect of rural schools and communities during the war. In the 1940s, the war diverted resources from many public schools and channeled them into the war effort; by 1945, Texas schools "had not been a priority of its citizenry for more than a decade." In 1936, eighty-four percent of Texas schools were rural. Sitton and Rowold suggest that schools in urban areas, with their burgeoning populations and industries, were the primary focus of state education reformers who promoted school consolidation in these areas, offering financial "incentives" and sometimes utilizing coercion to draw schools into consolidated systems. Many rural communities remained uncooperative throughout the war years because, according to Sitton and Rowold, they feared that their communities would disappear without a local school to hold them together.

The "community fabric" in Granger was such that differentiation between school and community activities was often difficult for interviewees to untangle. The school's activities all seemed to be in the realm of symbolic display — assemblies, paper drives, coupons — and keeping up morale through band and sports. Such activities fall under the heading of Spaul's "tried and true sources" of war spirit, or Lowe's "values transmission" responsibility of wartime schools. The extent to which students and the community in general could fully participate even in some of these activities is questionable because of their relative poverty; therefore, drives and coupons were predominantly symbolic. All respondents mentioned their lack of disposable income and their preference to go to the movies when they did have pocket change. Since hardly anyone subscribed to any newspaper but Nasinec, paper drives likely yielded little. In general, the symbolic support of the war through communication with hometown soldiers and manifestations of Czech identity seem to be the strongest forms of participation; these "tangibles" directly related to daily life in Granger. However, these appear to have had less to do with school activities and more to do with church and community leadership.

The story of education during World War Two must be grounded in specific communities. In rural American communities of the 1940s, the difference between school and community life often may not be discernible and in a variety of situations — not just in times of "national emergency." At Granger High School, at least, the war did not seem to affect "preexisting or newly-created institutions" or "the modification of the high school curriculum to meet wartime needs," nor did there seem to be high community expectations that the school and the students would be "an integral part of the war effort." Perhaps for the needs and expectations the small community had for itself, its responses to the war were appropriate and sufficient: attending to the morale of their neighbors
away at war, participating in commonplace religious ritual, and remembering of the motherland. Because these sentiments probably were addressed adequately at home and in church, school activities would have been merely redundant. Certainly, residents of Granger made sacrifices and worked together for a national goal. Their sacrifices were necessarily small and symbolic, and their involvement in "national goals" stemmed in some large part from their involvement in a closely-knit immigrant enclave.

34. In 1942, Lidice, a village near Prague, was made the scapegoat for the assassination of a prominent Nazi leader, Reinhard Heydrich. All the men there were rounded up and executed, the women sent to concentration camps, and the children "farmed out" to German homes. The village was burned into extinction. The town became a symbol of resistance to Hitler as towns around the world changed their names to Lidice to commemorate the atrocity.

The first decade of the twentieth century was a period in which the spirit of progressivism was expanding on many fronts. One intersection of two streams of progressivism -- in political life and in education -- lay in the composition of boards of education. Reformers sought to reduce the size of boards of education so that they could “function in ways similar to business boards of directors” (Button & Provenzo, 1983). Along with reduction in size often came a shift in their composition. In a move which paralleled the growing emphasis on civil service reform, school board members were less likely to be selected as representatives of specific neighborhoods or interest groups and more apt to come from the ranks of businessmen who sought to bring to education the methods of hierarchy, economy, standardization and organization which were currently revolutionizing American industry.

In Chicago, for one brief period between 1905 and 1907, the Board of Education appointed by Democratic Mayor Edward Dunne ran counter to the prevailing notion of a “businessman’s board.” During his two years as Mayor, Dunne had the opportunity to make fifteen appointments to the Chicago Board of Education. Several of his appointees were to take positions sympathetic to the aims of the Chicago Teachers’ Federation, positions which often ran counter to existing theories about progressive, businesslike administration of the public school system. Among these fifteen appointees, three were women: Miss Jane Addams, Dr. Cornelia DeBey and Mrs. Anita McCormick Blaine. A brief look at their biographies gives us a picture of three remarkable individuals.
whose lives demonstrate, among other things, the diversity as well as the strength of the role of women in the early years of the progressive era. Not simply the wives of prominent men, each of these women was an individual in her own right, with educational or professional credentials which would enable her to make a positive contribution to the Board.

As constituted in the spring of 1905, when Mayor Dunne took office, the Chicago Board of Education consisted of twenty men and one woman appointed by former Mayor Harrison. A brief examination of the backgrounds of these individuals (Leonard, 1905) shows that they typically fell into one of two categories: they were members of the city's business leadership or they represented a particular religious or ethnic constituency. Of these two, the business orientation was dominant; many of the members were connected in some way with Chicago's major industries — banks, foundries, packing houses. They belonged to the Chicago Athletic Club, the Commercial Club, the Union League, the University Club, and the Masons and to the same "mainstream" Protestant denomination churches; and they served together on civic and reform organizations. In addition to these businessmen, the Board had a few representatives from the city's ethnic and religious constituencies: a rabbi, a few Catholics who also represented Chicago's Polish, Bohemian and Irish communities, a representative of organized labor, and one woman.

Women were a rarity on the Chicago Board of Education. The first woman was appointed in 1888. According to Pierce (1957) "in that year, despite the plea that only businessmen would serve effectively, Mrs. Ellen M. Mitchell was appointed because of pressure from the Chicago Woman's Club." However, there was typically never more than one woman representative at any point. In 1905 this was Mrs. W. C. H. Keough, the wife of a local attorney and herself an attorney. According to the Tribune she was "one of the few woman lawyers in Chicago" and "has assisted her husband in his law office for three years." However, she was not appointed for her professional standing but rather as a representative of the Catholic community. She was a member of several Catholic women's organizations, such as the Catholic Order of Foresters, and "the Roman Catholic societies sent several petitions [to Harrison] for her appointment" (Chicago Daily News, 1906, p. 14.). The woman who had preceded her on the Board, Mrs. Isabelle O'Keefe, was also a Catholic, the wife of a journalist who later was admitted to the practice of law and who was "employed in a confidential capacity by Armour & Co., especially with ... Philip D. Armour" (Chicago Tribune, 1902).

One of Mayor Dunne's key advisors in the selection process was Margaret Haley of the Chicago Teachers' Federation, who had been an active supporter during Dunne's election campaign. In her autobiog-
Battleground Haley (1982) describes her role in Dunne's first appointment, Miss Jane Addams of Chicago's famed settlement Hull House.

...I asked him to consider Jane Addams as a type of citizen for appointment upon the Board. He told me that he viewed very favorably the making of this appointment and asked me if I would talk to her about it. When I went as Mayor Dunne's emissary, I found Hull House up in arms against the idea of their head resident going on the school board. Miss Addams herself felt that she should not assume this additional responsibility but, with assurance that Mayor Dunne would not appoint anyone on the Board not satisfactory to her, thus making it possible for her to put into effect her policy for the schools, she consented to accept the appointment, provided that Mrs. Emmons Blaine, who was one of the Harvester McCormicks by birth and a daughter-in-law of the Plumed Knight [James G. Blaine, unsuccessful Republican Presidential candidate in 1884], should serve with her.

Following Miss Addams and Mrs. Blaine, Dunne's third selection was Dr. Cornelia DeBey. Haley (103) observes that Addams "made no opposition" to DeBey's appointment "although Dr. DeBey was probably then, as she was afterward, a thorn in the Gentle Jane's side." With Mrs. Keough still a Harrison holdover on the Board, this meant an unprecedented four women members.

Best known of Dunne's appointees was Jane Addams, undoubtedly one of the outstanding women not just in Chicago's history but in that of the nation. The causes in which she was involved, in addition to the humanitarian settlement house work for which she is best known, include educational reform, women's rights, the peace movement and civil rights. She was a member of the Niagara Movement, which created the NAACP, a delegate to national and international peace conferences and the first president of the Women's Peace Party when it was organized in 1915; she was subsequently awarded the Nobel Peace Prize in 1931. Politically, Addams was one of the original members of the Progressive Party and was to give one of the speeches seconding the nomination of Theodore Roosevelt for President at the "Bull Moose" Progressive convention of 1916 (Goldman, 1955). When Dunne appointed her to the Board of Education in 1905, she was already nationally known and Hull House was the prototype for settlement houses across the country.

In his collective biography of the leadership of the progressive movement, Ministers of Reform (1984), Robert Crunden devotes much of his first chapter to Jane Addams and in fact cites the founding of Hull House
as the appropriate place for beginning the study of progressivism as an important cultural phenomenon. Crunden argues that in pioneering the "new career of social settlement work for women" Addams became the "preeminent role model for the next generation." Until this time higher and professional education were closed to most women, and even those who managed to earn professional degrees found employment (with the exception of the arduous and poorly paid task of elementary school teaching) difficult to come by. "Women expected either to marry and have children or to become maiden aunts, cultivating beautiful thoughts, neurasthenic diseases, and the children of close relatives" (Crunden, 17). Together with other remarkable women of her generation -- Ellen Gates Starr, Grace and Edith Abbott, Florence Kelly and more -- Addams was to begin to change this picture.

Jane Addams was born in Rockford, Illinois, the youngest daughter of a local businessman. Her mother died when she was an infant, and Addams grew up idolizing her father, John Addams. Crunden argues that many of Jane Addams' dominant characteristics were modeled on those of her father. "Like him, she, too, would be earnest, ethical, independent, and undogmatic" (18). When her father remarried, Jane disliked her new stepmother, who was an "example of the kind of woman approved in her day: cultivated, accomplished, appealing, and entertaining." For Crunden, Anna Addams provided Jane with a negative role model — she would grow up to be everything her stepmother was not (19).

Addams attended college at the Rockford Seminary, and shortly after her graduation in 1881 her beloved father died. During the next several years Addams tried to adapt herself to the life-style favored by her stepmother but grew increasingly unhappy. During a trip to Europe to round out her education she visited London's Toynbee Hall, the first settlement house, and on her return to the United States she and her friend Ellen Gates Starr determined to try to replicate this experiment in Chicago. They settled at Hull House, once the mansion of a wealthy businessman, now standing in the heart of an impoverished immigrant neighborhood on Chicago's West Side. By 1905, when Margaret Haley served as Dunne's emissary in approaching Addams about membership on the Board of Education, she was already one of Chicago's best known and most revered citizens.

Addams' view of education was a broad one; according to Cremin (175-76) she saw the settlement house both as a protest against a restricted view of education and as the living embodiment of an alternative view of education. In describing the breadth of Addams' views on education, Cremin contrasted them with the educational ideas of John Dewey.
But whereas Dewey turned to a reconstructed school and a reconstructed university as levers of social change, Addams assigned what was at best a limited role to schools and universities in the cause of social reform and turned instead to settlements and similar institutions as educational forces that would energize the community to become itself the most potent of all educative forces.

Addams' own writings are frequently concerned with educational issues. In her Democracy and Social Ethics, written in 1902, she set forth her position on the nature and composition of boards of education, an argument that might be expected to give some clues as to her own positions once she was appointed to such a board.

Is it possible that the business men, whom we in America so tremendously admire, have really been dictating the curriculum of our public schools, in spite of the conventions of educators and the suggestions of university professors.... Has the workingman been silent as to what he desires for his children, and allowed the business man to decide for him there, as he has allowed the politician to manage his municipal affairs, or has the workingman so far shared our universal optimism that he has really believed that his children would never need to go into industrial life at all, but that all of his sons would become bankers and merchants? (190-1)

At the time of her appointment, Addams had already endeared herself to Chicago schoolteachers, and Margaret Haley made no secret of her reasons for wanting Addams on the Board. Haley (102) says that For several years, Jane Addams had been peculiarly trusted by the teachers of Chicago. On two momentous occasions, she had proved herself the true friend and wise counsellor of the Teachers' Federation, once when she had advised us to join the Federation of Labor, and again when she had, at a public meeting in February, 1905, assailed the existing and so-called "promotional" scheme which had been established in the schools by Edwin G. Cooley, the Superintendent.

Addams herself addressed the subject of her appointment to the Board in her own autobiographical Twenty Years at Hull House. Much of this portion of her narrative deals with her perceptions of some of the key issues that were to divide the Board during the tumultuous years that Dunne was mayor, including those cited by Haley: the role of organized labor in the schools and Cooley’s promotional plan. However, she cites
as her reason for accepting the appointment the hope that she "might be able to forward in the public school system the solution of some of these problems of delinquency so dependent upon truancy and ill-adapted education" (109). Much of Haley's subsequent disillusionment with "Gentle Jane" is, perhaps, simply the result of their differing sets of priorities.

The second Dunne appointment, Mrs. Emmons (Anita McCormick) Blaine was made, according to Haley, directly at Addams' request (102). Mrs. Blaine was the middle child of Cyrus Hall McCormick, inventor of the reaper, and was raised, according to her biographer, "amidst luxury that was saved from self-indulgence by the constraints of orthodox Presbyterianism" (Harrison, 3). When she was twenty-three, Anita married Emmons Blaine, the son of James G. Blaine, who had had a distinguished career as representative and senator from Maine and who had been the Republican presidential candidate in 1884. Emmons Blaine, while not as wealthy as his counterpart in the McCormick clan, was a prominent clubman and Chicago businessman, president of the Chicago Shipbuilding Company. One son, Emmons, Jr., was born in 1890. In 1892, Emmons Blaine was stricken with a variety of uremic poisoning and died, leaving Anita a widow at only twenty-six years of age. The marriage apparently had been a very happy one, and Anita was devastated. After living for a year in New England, near her husband's aging parents, she returned to Chicago in the fall of 1893 and built an elegant home on the Near North Side, close to that of her mother (56-71 ff.).

From this point on, much of Anita Blaine's life centered around her son. In her concern that Emmons Jr. (usually called "Em") receive the best possible education, Anita soon became acquainted with the writings of Colonel Francis Parker, and she rapidly became an enthusiast for his theories of child-centered education. By 1899, she was ready to underwrite a school which would give Parker the opportunity to put these theories into practice — and would give Em the type of education she wanted for him. Not content with simply providing the funds (her contribution is usually estimated at one million dollars) for the "Chicago Institute, Academic and Pedagogic," later to become the Francis Parker School, she was deeply involved in all aspects of the planning, from physical construction to selection and recruitment of faculty (Harrison, 86-95 ff.). Blaine's combination of interests in progressive education and social reform, plus her connections with Chicago's governing elite families, probably explains Addams' request for Blaine's appointment to the Board of Education.

The third woman appointed by Dunne to the 1905-06 Board was Dr. Cornelia DeBey. Together with Addams, Haley, trades union organizer Mary McDowell and social reformer Julia Lathrop, DeBey was one of the
subjects of a 1906 article, "Chicago's Five Maiden Aunts," by journalist William Hard. The article's subtitle, "The Women Who Boss Chicago Very Much to Its Advantage," indicates the perspective from which Hard approached his topic. Unlike Crunden's neurasthenic maiden units, these five women wielded a great deal of political leverage and accomplished needed reforms by acting as the "maiden aunts" of the mythical Chicago "family." While from a contemporary perspective the article is occasionally patronizing and frequently chauvinistic, the author genuinely admires the accomplishments of his subjects. He describes DeBey in the context of an encounter with Philip Armour, head of one of Chicago's largest packing houses, when DeBey intervened in a 1904 meat-packers strike:

Mr. Armour ... looked up to see standing beside him a very slight woman, with very delicate features. She might have seemed a candidate for a convent if she hadn't been careful, as usual, to wear a man's collar and tie and a fedora hat. (Hard, 1906, 62)

Armour had refused to meet with the strike leadership, even though the men were willing to capitulate and return to work. DeBey's meeting with Armour resulted in his agreement to meet with the president of the Butcher Workmen and to end of the strike, albeit on the employers' terms.

Cornelia DeBey came to prominence in Chicago by a very different route than the archetypal progressive Jane Addams or the patrician reformer Anita McCormick Blaine. DeBey was born in 1865 in the Groningen province of Holland, daughter of Bernardus DeBey, a minister of the Dutch Reform Church, who was also affiliated with the University of Groningen. In 1868, Reverend DeBey emigrated to Chicago, bringing with him about half of his Dutch congregation. Amry Vandenbosch, historian of the Dutch community in Chicago, says that the impetus for the move was the famine which struck Holland in 1867. Vandenbosch adds that for the next twenty-five years, "Rev. DeBey was the leader and counselor of the Dutch in Chicago and a man of great influence on the Dutch through the west." He was a "forward-looking man" who was soon embroiled in a number of the internecine quarrels which appeared to split the Dutch Reform Church regularly. One issue which may have been germane to some of his daughter's later thinking was his insistence on using the English language exclusively in church services, an innovation strenuously resisted by many of his compatriots (Vandenbosch, 18-23 ff.). The DeBey household consisted of the parents, six children and a domestic servant (Swierenga). Interest in the medical profession appeared to run in the family; one of her brothers became a physician and another a pharmacist, while an uncle was also a physician.
While little information is available about Cornelia DeBey's childhood, we can get some clues from a children's book, *Cornelia*, written by Lucy Fitch Perkins. Mrs. Perkins was the author of a highly successful series of children's books written over a period of about thirty years. She was the wife of Dwight Perkins, architect for the Chicago Board of Education in the early years of the twentieth century, and it was apparently through this connection that she became friendly with Cornelia DeBey, during the latter's term of office on the Board. Perkins used DeBey's reminiscences of her childhood as inspiration for the adventures of the title character in *Cornelia*, whose subtitle, "The Story of a Benevolent Despot", indicates much the same character type as Hard's later "maiden aunt."

It is interesting to note the roles that their fathers played in the lives of all three of these women. Addams clearly patterned her life and character upon her father; as Crunden observes, "She ... fused her image of her father with this sense of moral righteousness. Like him, she, too, would be earnest, ethical, independent and undogmatic." Her life reflected her father's sturdy, Protestant values. John Addams' remarriage, forcing Jane to share him with a woman whom she disliked intensely, set up, according to Crunden, a reaction against the frivolity of the kind of social life that most women of her class led. "When Jane finally came to feel that such a life as her stepmother led was profoundly immoral, she began the process of becoming a progressive" (18-9). For Anita Blaine, her father's Presbyterianism provided a counterweight to the demands of the social milieu in which the wealthy McCormick family moved. Anita and her siblings were brought up in an atmosphere in which family prayers and the strict observance of the Sabbath were central to family life, and in which the importance of spreading the word of Christ was evidenced both by their father's endowment of a Presbyterian Seminary "dedicated to strengthening conservative theology in the Midwest" and by the whole family's involvement with the church. "The children could not remember when their home was not a port of call for seminarians, ministers of the gospel, and especially missionaries from far-off lands" (Harrison, 20-1). And, as we have seen, the Rev. DeBey was progressive in many ways: active in promoting the "Americanization" of his Dutch Reform congregation and tolerant, as evidenced by the anecdotes related by Mrs. Perkins, of the activities prompted by his strong-minded daughter's social conscience. Although there is no evidence, it is certainly probable that he supported Cornelia's decision to attend medical school at a time when few women would have made such a choice, and his concern for the education of his children is demonstrated by his employment of a tutor for their instruction (Vandenbosch, 55).

Cornelia DeBey graduated from Cook County Normal School in 1889 and taught briefly in Chicago high schools and at the Normal School. She
then returned to school and earned her M.D. from Hahnemann Medical College in Chicago, a school which trained homeopathic physicians, and she began practicing medicine in Chicago in 1895 (National Cyclopedia, 456).

During her years on the Board of Education, DeBey was regularly identified by the press as being the spokesperson for the Chicago Teachers' Federation. Certainly the Federation's Bulletin demonstrated its approval of her even before her appointment. A 1904 article wrote glowingly about DeBey after her intervention in the stockyards strike.

...when it become generally known that Dr. Cornelia DeBey was the woman (involved in the settlement of the strike) there has been a desire on the part of the public, to whom her name was not generally familiar, to know more of Dr. DeBey's personality.

To social settlement workers, teachers in the public schools and, beyond all, the very poor in all the most congested districts of the city, Dr. DeBey has needed no introduction for the past eighteen years.... Her professional work has been wide and her standing among physicians has not suffered because she has deliberately taken on her own shoulders the alleviation of distress among the very poor...

The lengthy article goes on to celebrate DeBey's accomplishments in various fields. It touches briefly on her relationship to the schools and to education in general.

Her interest in educational matters has always been great. Almost single-handedly she pushed through the state legislature the bill legalizing kindergartens as part of the public school system, and she led the fight that defeated the bill which sought to make married women ineligible as teachers in the public schools. To those who have any interest in the child labor problem it is unnecessary to point out how great a factor in the present improved conditions has been the help given by Dr. DeBey, who has spent every moment of her spare time in fighting this evil.

The article offers a final clue as to the positions DeBey would subsequently take as a member of the Board of Education. It quotes her as discussing the intransigence on the part of the employers which had led to the prolonged strike:

"There is a type of man who becomes nothing but a machine. Business is his god, and it rules him always."
He loses his human faculty, he has no sense of justice, and is powerless to analyze a situation.... They have no blood worth speaking of in their veins, and no gray matter worth mentioning in their heads. They are the stumbling blocks set in the path of progress to teach us the lessons of sorrow and patience.” (CTF Bulletin 3, No. 31, September 16, 1904)

Contemporaries were quick to recognize the significance of Dunne’s appointments. In the preface to her book American Labor: Some Ethical Gains Through Legislation, written in 1905, noted labor reformer Florence Kelley wrote

While the present volume was in press, Mayor Dunne of Chicago appointed to the Board of Education of that city, Miss Jane Addams of Hull House, Mrs. Emmons Blaine and Dr. Cornelia DeBey. It remains to be seen how far these able and public spirited women may disprove the argument advanced in Chapter V. [This reference is to Kelley’s discussion of the right of women to the ballot. Kelley argues that the first step in this direction is the appointment of women to public boards and commissions.]

Dunne’s appointments also received considerable comment in the local press. The Public, whose editor Louis Post was an ardent disciple of Henry George and his single-tax proposals, editorialized that the appointments “mark the end of the rule of the tax dodgers over our public schools and the beginning of a regime of sound educational policies.” To Post, the appointments were a “marked and gratifying contrast” to previous boards for two reasons: recognition of the role of women in the governance of schools, and the absence of the “canting” business element, which Post hoped meant a shift in emphasis so that the “interests” would give way to a concern for education (The Public, VIII, No. 377, June 24, 1905).

The Chicago Record-Herald also emphasized the significance of the appointment of three women as a “departure from custom” pointing toward a “general shake-up” of the Board and noted that having four women on the Board was a response to the appeal of the women teachers for fair representation. “The appointment of three women distinguished in educational, philanthropic and sociological circles will prove a welcome surprise to the women teachers of Chicago” (Chicago Record-Herald, June 16, 1905).

What actually occurred on the Board of Education over the three years that these women served demonstrated that, just as today, there was no monolithic “women’s position” or feminine voting bloc. While the three
were generally in sympathy with the women teachers who comprised most of the membership of the Chicago Teachers' Federation, the positions which they took on such issues as the "secret marking" of teachers, the democratization of the decision-making process in the schools through the establishment of teachers' councils, an experiment in segregating students by sex in an effort to curb the high dropout rate among boys, or the proper method of selecting textbooks, frequently diverged. DeBey tended to be the most contentious; her proposed plan for the establishment of teachers' councils early on demonstrated her support of the Teachers' Federation and set her at odds with the superintendent. DeBey became somewhat disenchanted with Addams, whose tendency was to seek compromise and consensus, and, when Dunne's second group of appointees took office in 1906, soon became identified with what the conservative press and churches called the "radical" group.

The reaction of the press to the three women was interesting. DeBey quickly lost the support of the newspapers and others who had lionized her at the end of the stockyards strike. Her eccentric mode of dress and forthright mode of speech easily lent themselves to caricature and misinterpretation. By October of 1906, little more than a year after her appointment to the Board, she and some of the other "radicals" on the Board were regularly attacked in the local press, culminating in an October 10 editorial attacking Dunne and his appointees: "When Mayor Dunne packs the board of education with freaks, cranks, monomaniacs and boodlers...he is doing much to bring Chicago into disrepute" (Chicago Tribune, 1906). Addams and Blaine typically remained immune from criticism by the press: the former presumably because of her national reputation, the latter as a McCormick, one of Chicago's leading families.

Mayor Dunne's attempt to reform the Board of Education by filling it with women, reformers and other "non-business" types came to a crashing end with his defeat in his bid for re-election in 1907. Dunne's successor, much to the delight of the local press, removed from office most of the "radical" members of the Board, including DeBey. Although this move was subsequently ruled illegal by the Illinois Supreme Court, so much time elapsed before the restoration of the ousted members that most of the reforms initiated by the "Dunne Board" were eliminated. Addams, DeBey and Blaine all left the Board in 1908: Addams to go on to wider activities in the peace movement, the Bull Moose Party and the civil rights movement, Blaine to continue her interest in progressive education as a private citizen, and DeBey to sink into obscurity. However DeBey apparently never lost her combativeness; during World War I she was several times to be brought into court because of her pacifist activities.
Mayor Dunne's attempt to challenge the prevailing wisdom of a "businessman's board" by installing women, reformers and other "non-establishment" types was short-lived and unsuccessful, in the sense that their proposed changes were not implemented at the time. But Cornelia DeBey's vision of teachers' advisory councils has become a nationwide reality; the arguments of Addams and DeBey against a sex-segregated school system in Chicago ultimately brought an end to the Englewood High School segregation experiment; Ella Flagg Young, chosen by the "Dunne Board" as superintendent of the Chicago Normal School, went on to become Chicago's first woman superintendent. There were no easy answers to many of the problems with which the "Dunne School Board" sought to cope; many of them are still unanswered today. But the three remarkable women appointed by Dunne to that Board amply demonstrated the capabilities of women in such roles; never again would it be quite as easy to ignore their voices.

Mr. Justice Brennan once affirmed that "one of the liberties we Americans prize most highly is our freedom to read what we wish and when we wish".¹ No doubt public school teachers would concur, for, while teachers recognize that anyone charged with defining curricula cannot possibly include all written materials ever produced within any given discipline, it is difficult to imagine implementing that curricula with restricted written materials for reading purposes. As soon as limits are placed on reading "what we wish," whether "we" refers to faculty or students, a liberty has been infringed upon. Or has it? Mr. Justice Brennan next noted the curiosity that "nothing in the body of the Constitution or the Bill of Rights says anything in terms about a freedom to read...Yet we know that such liberties are there just as surely as if they were expressly written into the First Amendment."² For good or ill, by the nature of their profession, public school teachers, librarians, and other educators can expect to find themselves at some time in their careers in the midst of an issue of censorship of written curricular materials. It is the purpose of this paper to investigate the historical legal parameters of censorship in general and the past twenty years of cases of censorship in the highest levels of federal and state courts in particular in order to inform educators of who attempts censorship in these precedent setting cases, how and why it is attempted, and with what degrees of success.

That an investigation and explanation of the processes of censorship of written curricular and library materials in public schools is important is made clear within the Statement and Principles on Academic Freedom and Tenure of the American Association of University Professors.

² Justice Brennan, supra note ¹, at 47.
"Institutions of higher education are conducted for the common good.... The common good depends upon the free search for truth and its free expression."3 Although this principle is stated within the context of higher education, at all levels of education there is necessarily a relationship between searches for truth and written materials. Restricting or eliminating access to written materials reduces the likelihood of finding truth.

Before proceeding with the investigation, however, it is important to specify limitations of this particular investigation. This study will focus on the distribution aspect of censorship on occasions when written materials have been deemed appropriate public school curricular materials by any teachers, administrators, school boards, or students. Such an operational definition excludes cases which deal with the censorship of student newspapers, except as they may be referred to within cases relevant to this study. Another limitation of this investigation concerns a teacher’s or student’s oral use of possibly objectionable words contained in written materials. To the extent that a legal challenge is primarily focused on what is said as opposed to what is read, such cases as Keefe v. Geanakos4 that involved a teacher who would not agree with a school committee’s request to refrain from saying a vulgar term contained in a magazine article which he had assigned as reading homework, will not be considered. A final limitation is the exclusion of cases in which written materials are not added to a curriculum in the first place. A court ruled in Minarcini v. Strongsville City School District5 and had its decision upheld two years later that censorship does not occur when a book has never been added to a curriculum.

Although it has been only in the twenty years from 1972 to 1992 that federal and state higher courts have specifically addressed the issue of censorship of public school written curricular materials, there are several earlier key US Supreme Court decisions involving schools which provided the foundation for the parameters which exist today. According to Mr. Justice Fortas, “as early as 1923, the Court did not hesitate to condemn under the Due Process Clause ‘arbitrary’ restrictions upon the freedom of teachers to teach and of students to learn.”6 He was referring to the case of Meyer v. Nebraska, in which an Act of the State of Nebraska “making it a crime to teach any subject in any language other than English to pupils who had not passed the eighth grade”7 was held unconstitutional.

In 1942, Mr. Justice Jackson delivered the opinion of the Court in West Virginia State Bd. of Education v. Barnette that the State of West Virginia could not compel students of the Jehovah’s Witnesses faith to salute the flag at school, in part, because “the Fourteenth Amendment ... protects
the citizen against the State itself and all of its creatures — Boards of Education not excepted.”

Mr. Chief Justice Warren maintained that “scholarship cannot flourish in an atmosphere of suspicion and distrust” and “teachers and students must always remain free to inquire, to study and to evaluate …” in Sweezy v. New Hampshire. Three years later, Mr. Justice Stewart quoted Mr. Chief Justice Warren’s words and added that “the vigilant protection of constitutional freedoms is nowhere more vital than in the community of American schools” in Shelton v. Tucker.

In 1967, the Supreme Court declared in Keyishian v. Bd. of Regents of the University of the State of New York that the State of New York’s teacher loyalty oath was unconstitutional, and Mr. Justice Brennan stated that “our Nation is deeply committed to safeguarding academic freedom, which is of transcendent value to all of us and not merely to the teachers concerned.” He interpreted the First Amendment as not tolerating “laws that cast a pall of orthodoxy over the classroom.” Finally, in 1969, Mr. Justice Fortas delivered the opinion of the Court in Tinker v. Des Moines Independent Community School District that students, in the absence of actual or potentially disruptive conduct, may wear black armbands in school as a symbolic act. He wrote that “it can hardly be argued that either students or teachers shed their constitutional rights to freedom of speech or expression at the schoolhouse gate.” He summarized all of the aforementioned opinions by adding that “this has been the unmistakable holding of this Court for almost fifty years.”

It was not, however, until 1972 that a major court case centered on a specific objection to a specific written curricular material. Todd v. Rochester Community Schools concerned a public high school student’s parent who objected to the inclusion of Slaughterhouse-Five by Kurt Vonnegut, Jr. in the curriculum of an English course in which the student was enrolled. The parent argued that because the novel “contains and makes reference to religious matters … the use of such book as a part or in connection with any course of instruction by a public school district or system is illegal and contrary to … the First and Fourteenth Amendments of the United States Constitution.” Presiding Judge Bronson, noting that “some of the legal questions suggested by these proceedings have apparently never been squarely passed upon by any other court in this country,” stated that “we have been cited no authority, nor has our own research uncovered any, which holds that any portion of any constitution is violated simply because a novel, utilized in a public school ‘contains and makes reference to religious matters.’” The judge sought and found no evidence that the book was taught subjectively by any teacher who either espoused or refuted the religious views con-
tained in the book. Accordingly, the original course curriculum remained intact.

Another 1972 case, Presidents Council, District 25 v. Community School Board No. 25, concerned a school board’s decision “to remove from all junior high school libraries in the District all copies of Down These Mean Streets, a novel by Piri Thomas.” The board’s decision resulted from parental objection to the book on the grounds that the book “would have an adverse moral and psychological effect on 11 to 15 year old children, principally because of the obscenities and explicit sexual interludes.” A group of parents, guardians, teachers, and administrators sought to have the board’s decision overturned, claiming that “the Board transgressed the first amendment rights of the plaintiff[s].” Circuit Judge Mulligan rejected this argument, noting first that:

It is predictable that no matter what choice of books may be made by whatever segment of academe, some other person or group may well dissent. The ensuing shouts of book burning, witch hunting and violation of academic freedom hardly elevate this intramural strife to first amendment constitutional proportions,

second that:

Here, patently we have no religious establishment or free exercise question, and neither do we have the banning of the teaching of any theory or doctrine.... A book has been removed but the librarian has not been penalized, and the teacher is still free to discuss the Barrio and its problems in the classroom. The action of the Board does not even preclude the teacher from discussing Down These Mean Streets in class or from assigning it for outside reading,

and third that:

The administration of any library, whether it be a university or particularly a public junior high school, involves a constant process of selection and winnowing based not only on educational needs but financial and architectural realities. To suggest the shelving or unshelving of books presents a constitutional issue, particularly where there is no showing of a curtailment of freedom of speech or thought, is a proposition we cannot accept. 13

Mulligan was satisfied both that the board had the authority to remove the book and that the resolution to do so was adopted in the proper manner.
Four years later, a tenured high school English teacher challenged his board of education's termination of his employment, in part, on the grounds that restoring a censored novel, namely *The Catcher in the Rye* by J. D. Salinger, to the curriculum was protected by the First Amendment and so could not constitute insubordination. In *Harris v. Mechanicville Central School District*, Justice Graves examined both how and why the book was removed from the curriculum in the first place and how and why the tenured teacher's employment was terminated. To begin, in 1973, a conference was held by the school principal, the school superintendent, and the teacher in order to review parental allegations that *The Catcher in the Rye*, an otherwise acceptable book, was being "misused" in class through emphasis on a particular word contained therein. Although "allegedly all parties to the conference agreed that the book would not be used in the curriculum again," the teacher, allegedly without the knowledge and consent of the school administration, restored the book in question to the English curriculum." The school board subsequently met and found the teacher guilty of the charge of insubordination. Although Graves stated that "the record indicates the school administration followed a formal procedure throughout the matter":

The procedural forms of due process were followed with one major omission: There was no allegation or evidence that the board ever adopted regulations or produced a valid directive for teachers' guidance concerning the teaching of "Catcher in the Rye" or similar books suitable for substitution if possible. Before a charge of insubordination could be properly presented and sustained it would appear the aforesaid action would be essential.14

Therefore, the matter was referred back to the board for consideration of a penalty other than dismissal, provided by statute. It seems, then, that, in the view of the court, under certain circumstances, a book may be removed from a curriculum, if an acceptable substitute book is located for it.

In a second case in 1976, that of *Minarcini v. Strongsville City School District*, the United States Court of Appeals, Sixth Circuit, affirmed a lower court's 1974 ruling that no censorship results when a book is not added to a curriculum for the first time, but reversed that court's ruling that the school board had constitutionally removed books from the library. The books in question were *Cat's Cradle* by Kurt Vonnegut, Jr. and *Catch 22* by Joseph Heller. Circuit Judge Edwards found nothing inappropriate about how the board's censorship motions were made and passed during its meetings; rather, he remarked that "the Board's silence
is extraordinary” as to why the books were voted to be removed. He concluded that “in the absence of any explanation of the Board’s action which is neutral in First Amendment terms, we must conclude that the School Board removed the books because it found them objectionable in content and because it felt that it had the power, unfettered by the First Amendment, to censor the school library for subject matter which the Board members found distasteful.” He then explained that, although there is no constitutional requirement for a school to have a library, once a library is established, conditions cannot be placed on its use in regard to “the social or political tastes of school board members.”15 Accordingly, the two novels were ordered reinstated.

The next case to come before a higher court was similar to the aforementioned Minarcini v. Strongsville City School District. In the 1978 case of Right to Read Defense Committee v. School Committee, a majority of the Chelsea School Committee, a committee directed by state statute “to purchase textbooks and other supplies for the schools,” voted to remove an anthology titled Male & Female from a high school library, after receiving a complaint from a parent. At issue was one poem in the collection, described as filthy, obscene, and disgusting. In seeking to keep the book removed from the library, committee members suggested that District Judge Tauro review Presidents Council from 1972. He did and found that the “defendants’ heavy reliance” on the case “presumes incorrectly that the holding there would afford a school committee the absolute right to remove a disfavored book from a library, without any concern for the First Amendment rights of students and faculty.” Unlike the school board’s removal of Down These Mean Streets, the committee’s removal of Male & Female was based neither on the criterion that the title was obscene nor on the criterion that the space occupied by the book was needed for other books. Tauro stated that “the record leaves this court with no doubt that the reason the Committee banned Male & Female was because it considered the theme and language of [a poem] to be offensive,” and, drawing a parallel to Minarcini, stated that:

The Committee was under no obligation to purchase Male & Female for the High School Library, but it did. It is a familiar constitutional principle that a state, though having acted when not compelled, may consequently create a constitutionally protected interest.

He explained that the constitutionally protected interest is “the right to read and be exposed to controversial thoughts and language — a valuable right subject to First Amendment protection.”16

One year later, in Salvail v. Nashua Board of Education, a school board was challenged for removing not a book but a magazine from a high school library. Objections to Ms. magazine focused on sexual and
political advertisements. District Judge Devine reviewed both why and how the action was taken by the board and determined that the board had erred in both respects. First, he cited Minarcini, as well as the more recent Right to Read Defense Committee, stating that once having created a library, a board cannot “place conditions on the use of the library related solely to the social or political tastes of Board members.” He then focused on the procedure by which the magazine was removed and found and ruled that having adopted the New Hampshire State Department of Education’s guidelines for review of any challenge to instructional materials, “the Board was required to follow them in its attempts at removal of Ms. magazine from the shelves of the high school library.” The board had not, in fact, followed these guidelines and had simply passed a motion at one board meeting to cancel the subscription and remove all issues from the library, as was subsequently done. Devine ordered all back issues to be replaced, the subscription to be renewed, and the board “to follow the current guidelines relative to any complaints about any publication ... whether said complaints are generated by a member of the Board or by any other Nashua resident.”

The United States District Court, D. Vermont, decided Bicknell v. Vergennes Union High School Board of Directors three months after the United States District Court, D. New Hampshire, decided the above case of Salvail. Just as District Judge Devine had done, District Judge Coffrin reviewed Minarcini and Right to Read Defense Committee in determining whether or not a school board could remove The Wanderers by Richard Price and Dog Day Afternoon by Patrick Mann from a high school library, after it had deemed the books obscene and vulgar. Coffrin acknowledged that “those cases hold that although a school board can determine what books will go into a library, and may even determine whether to create a library at all, it may not exercise the same wide discretion in removing works from the shelves after they are purchased.” He then rejected the applicability of either case, finding that “whatever merit there may be in such constitutional analysis, it is not the rule we are bound to follow in this circuit.” He instead looked to the earlier case of Presidents Council and quoted the Second Circuit Court of Appeals’ reasoning that “‘some authorized person or body has to make a determination as to what the library collection will be’” and that the “‘concept of a book acquiring tenure by shelving is indeed novel and insupportable under any theory of constitutional law we can discover.’”18 Coffrin was satisfied that the school board had the authority to remove the two books and that the board followed proper procedure. The issue of why the books were removed, although brought to light during the proceedings, was held to be irrelevant.
A third case decided in 1979 was Cary v. Board of Education of the Adams-Arapahoe School District. At issue was whether or not high school teachers could continue to teach from ten textbooks which had been removed from the curricula of elective courses by a school board. Circuit Judge Logan ruled that, yes, they could, but only within the written guidelines of the school board, guidelines which specified that “a teacher is free to comment upon, or to recommend that any student read any of the ten books,” and that “no student is prohibited from reading any book, except in class or otherwise for course credit.” He reasoned that “if the board may decide that Contemporary Poetry may be offered; if it may select the major text of the course; why may it not go further and exclude certain books from being assigned for instruction in the course?” He further concluded that “the board was acting within its right in omitting the books, even though the decision was a political one influenced by the personal views of the members.”

One year later, in Zykan v. Warsaw Community School Corporation, at issue was a school board authorized removal, for no stated reason, and subsequent destruction in a public book burning of a textbook titled Values Clarification. There is no indication given in the case whether the book was removed from a classroom or the school library. Of the book burning, Circuit Judge Cummings commented that “no self-respecting citizen with a knowledge of history can look upon this incident with equanimity, but its relationship to the legal issues in this case is tenuous at best.” Considering solely the removal of the book from the school, Cummings stated that “it is in general permissible and appropriate for local boards to make educational decisions based upon their personal social, political and moral views.” He further explained:

Noticeably absent from the amended complaint is any hint that the decisions of these administrators flow from some rigid and uniform view of the sort the Constitution makes unacceptable as a basis for educational decision-making or from some systematic effort to exclude a particular type of thought, or even from some identifiable ideological preference. Accordingly, the circuit judge ruled in the board’s favor, being additionally satisfied that the board had followed proper procedures.

An entirely different approach to examining the constitutionality of banning a book from a high school library was taken by District Judge Cyr in Sheck v. Baileyville School Committee. Rather than focusing on the merits of prior cases supporting either “tenure” for books on the shelf or broad discretionary powers for local school boards, Cyr examined in more detail the Fourteenth Amendment’s prohibition of states’ depriving anyone of life, liberty, or property, without due process of law. When
presented with undisputed evidence that the Baileyville School Committee not only voted to ban *365 Days* by Ronald J. Glasser for obscene language before adopting the Baileyville School Department Challenged Material Policy but also voted to retain the ban and not follow the policy after the policy’s adoption, Cyr concluded that how the book was banned was unconstitutional. Interim injunctive relief was granted, requiring the book to be returned to the library shelf, for “the important principles of federalism, soundly approached, do not require that federal courts cede their constitutional role to local school boards.”

It was not until 1982 that the Justices of the United States Supreme Court decided in a 5-4 decision the Court’s first, and as yet only, case “dealing directly with ... the right to read” in public schools. In *Board of Education, Island Trees Union Free School District No. 26 v. Pico*, the Court declared that while school boards can remove books from school libraries for vulgarity or educational unsuitability, “our Constitution does not permit the official suppression of ideas.” Members of the board of education had “unofficially” directed that ten “anti-American, anti-Christian, anti-Semitic, and just plain filthy” books be removed from school libraries. Later, the board appointed a Book Review Committee to read the ten books and make recommendations about their future status in the libraries, but “the Board substantially rejected the Committee’s report” and “gave no reasons for rejecting the recommendations of the Committee that it had appointed.”

The board’s actions had been challenged before the District Court, which noted “that statutes, history, and precedent had vested local school boards with a broad discretion to formulate educational policy” and had concluded that “while removal of such books from a school library may ... reflect a misguided educational philosophy, it does not constitute a sharp and direct infringement of any first amendment right.” The removal of the books had been thus allowed. The United States Court of Appeals for the Second Circuit disagreed, stating both that the board was “obliged to demonstrate a reasonable basis for interfering with students’ First Amendment Rights” and that there was a need to determine whether the board’s “removal decision was motivated by a justifiable desire to remove books containing vulgarities and sexual explicitness, or rather by an impermissible desire to suppress ideas.”

The case, having been appealed to the Supreme Court, resulted in a plurality opinion. Justice Brennan, writing for the plurality, affirmed that “the only action challenged in this case is the removal from school libraries of books originally placed there by the school authorities, or without objection from them” and then went on to say:

In sum, the issue before us in this case is a narrow one,
both substantively and procedurally. It may best be restated as two distinct questions. First, does the First Amendment impose any limitations upon the discretion of petitioners to remove library books from the Island Trees High School and Junior High School? Second, if so, do the affidavits and other evidentiary materials before the District Court, construed most favorably to respondents, raise a genuine issue of fact whether petitioners might have exceeded those limitations?27

In answer to the first question, Justice Brennan noted that, according to the records, library use by students is voluntary. Because “the libraries afford them an opportunity at self-education and individual enrichment that is wholly optional,” the attempt of the board members “to extend their claim of absolute discretion beyond the compulsory environment of the classroom, into the school library and the regime of voluntary inquiry”28 may not be supported by the First Amendment, which “protects the right to receive information and ideas. Stanley v. Georgia...1969).”29 Nevertheless, the Court did not state that a board cannot remove library books. The key factor is why the books are removed. “We hold that local school boards may not remove books from school libraries simply because they dislike the ideas contained in those books and seek by their removal to ‘prescribe what shall be orthodox in politics, nationalism, religion, or other matters of opinion.’” If, on the other hand, books are removed “based solely upon the ‘educational suitability’ of the books in question, then their removal would be ‘perfectly permissible.’”30 In this case, the books were returned because the decision to remove the books rested decisively upon disagreement with constitutionally protected ideas in those books,” so the judgment of the Court of Appeals was affirmed.

While the above case of Pico marked the first time that the Supreme Court directly addressed an instance of censorship of books in a public school, the ruling concerned only instances of school boards’ removing books from school libraries. Six years later, in Virgil v. School Board of Columbia County, Florida, the four plaintiffs argued that the judicial reasoning behind Pico should be applied to the School Board of Columbia County’s removal of a textbook titled The Humanities: Cultural Roots and Continuities (Volume I) for passages in Lysistrata by Aristophanes and ”The Miller’s Tale” by Geoffrey Chaucer deemed immoral, vulgar, sexual, and “inappropriate to the age, maturity, and development of the students in question.” District Judge Black, however, held that “this Court need not decide whether the plurality decision in Pico may logically be extended to optional curriculum materials. Kuhlmeier resolves any doubts as to the appropriate standard to be applied when-
ever a curriculum decision is subject to first amendment review.” Black here referred to another case not otherwise relevant to this study, namely Hazelwood School District v. Kuhlmeier, which concerned censorship of student writing in a school newspaper. This point was “that educators may limit both the style and content of curricular materials if their action is reasonably related to legitimate pedagogical concerns.” Thus, the judge said the “removal of Volume I of Humanities was reasonably related to the pedagogical goal of keeping vulgarity and certain matters of sexuality out of the curriculum.”

Two additional cases were decided in the following year. The first is Wexner v. Anderson Union High School District Board of Trustees, which continued the focus on why a board removed books. At issue were books removed from a library for use in an elective developmental reading course with no assigned reading list. The board examined and removed five of seven books by Richard Brautigan selected for possible use in the course, objecting to obscenities and sexual references these contained. Writing for the majority, Associate Justice Blease focused on the question of whether or not a board can “remove books from the high school library which are not obscene” and cited a section of California’s Education Code in ruling that the board did not have such authority. Presiding Justice Puglia dissented on the grounds that the court should have followed the guidelines of Pico and investigated “whether school authorities, absent sufficiently compelling reasons, were engaged in an attempt to suppress ideas for the sole purpose of suppressing those ideas.”

The second is McCarthy v. Fletcher, which returned in part to the original 1972 focus on religious content. Presiding Justice Franson asked if “the board’s decision to remove the books [Grendel by John Gardner and One Hundred Years of Solitude by Gabriel Garcia Marquez] rested either upon disagreement with constitutionally protected ideas contained in the books or upon the board’s desire to impose upon the students a religious orthodoxy.” However, since the school’s superintendent/principal had taken it upon himself to delete the two books from the curriculum, “rather than submitting the evaluations and his recommendation concerning the books to the board, [he] essentially usurped the board’s authority… contrary to the board’s own policy.” Accordingly, the trial court was directed to reexamine the facts of the case and determine why the board voted its acceptance of the revised curriculum.

The final major court case of public school written curricular or library material censorship after 1972 was decided in 1990. Roberts v. Madigan was markedly different from the previous cases, inasmuch as all four books in question were entirely of a religious orientation. At issue were
both Berkeley Gardens Elementary School's principal's various directives to fifth grade teacher Roberts to remove the Bible in Pictures and The Life of Jesus from his classroom and to keep his personal Bible "off his desk between 8:00 a.m. and 3:30 p.m." and "in his desk," and the disappearance of the school's library copy of the Bible after a parent conference.  

Circuit Judge McKay affirmed the district court's decision to remove the classroom books in question but to require the return of the Bible to the library, stating that "[t]he removal of materials from the classroom is acceptable when it is determined that the materials are being used in a manner that violates Establishment Clause guarantees." In a dissenting opinion, Circuit Judge Barrett maintained that "[t]here is no basis, other than mere speculation, for implying, as does the majority opinion, that the practices in Mr. Roberts' classroom constituted religious indoctrination," inasmuch as "[t]he maintenance of the two challenged books in Mr. Roberts' classroom library was entirely passive in character, just as was Mr. Roberts' practice of reading his Bible during the class' 15-minute silent reading period."  

A review of the above fifteen cases which have come before the higher courts since 1972 reveals that 1) in every case except the first, a school board or employees of the school district took the initial steps to remove formally the written curricular or library materials in question, 2) every approach to censorship focused on removing entire books or magazines, not just sections of them, and 3) about half the cases centered on both how and why the decisions to censor were made, with the remaining cases focusing primarily on just one of these two aspects. Overall, with nine cases heard on appeal and six not, seven and a half rulings prohibited censorship and six and a half allowed it, with one case directed to trial court to determine why a board of education approved two instances of censorship, before finally ruling at that lower court level on the constitutionality of the censorship.  

Clearly, the courts have yet to begin reacting uniformly in these cases when school officials have authorized the removal of written curricular materials from classrooms or libraries of public schools, and equally clearly, there has been since 1973 no legal activity initiated by parents, students, or tax paying community members in general to seek court directives at the highest levels to censor said materials in public schools. One must necessarily conclude that through 1992, no unified body of precedents has been developed and consistently relied upon. Wexner demonstrates that even the Supreme Court's one ruling is not necessarily being applied to the process of determining the legal parameters of censorship, and the most recent major case which "bordered on attempts at censorship" of Cujo by Stephen King in a public high school library,
1991's Moore v. Terwilliger and Berryville Public Schools, has not even been authorized for publication in the South Western Reporter, 2nd Series, even though the case was heard by the Court of Appeals of Arkansas, Division II, on appeal from the Arkansas Board of Review. Instead, this most recent case is "authorized for educational use only" through Westlaw computer access and West Publishing Company's printed publications. It is necessary to turn to the expertise of legal scholars for insight into the future of public school censorship and recommendations based on Pico in particular and the other fourteen "official" cases in general.

Inasmuch as Board of Education v. Pico is as yet the only case heard and decided by the Supreme Court on the topic of public school censorship of written albeit library materials, any meaningful review of legal commentaries in an effort to ascertain what legal scholars expect in the way of censorship and the courts' rulings in the near future needs to begin with legal opinions written in light of Pico. Jane L. Wexton in the Spring 1984 issue of the Hofstra Law Review interprets the plurality's position, in part, as "a concerted effort to limit the nature of the substantive question before the Court, presumably wishing to limit the significance of the case as future precedent." Specifically, she finds a major recommendation to make to "all local school boards around the nation," namely, "that library book removals must avoid the substantive effect of suppressing ideas," because, according to the plurality, the removal of a library book by a school board "violates the first amendment rights of students when the removal is motivated by the school board members' disapproval of the ideas" contained in the book. In summary, Wexton maintains that:

The plurality intimated ... that in making a removal decision, a school board should seek the advice of literary experts, librarians, teachers, and publications that rate books for schools. A board should also adhere to the book review policy, if any, adopted in the school district. Finally, a board should explicitly articulate its reasons for the removal decision.

Donald J. Dunn, on the other hand, finds no such intimation on the part of the Court. In his article in the 1984/85 issue of the Law Library Journal, he predicts that "further litigation is a virtual certainty" because "the Court neither defined the parameters of this newly recognized right of access to information nor provided detailed guidelines [sic] for the standard review for such cases." Nevertheless, he offers his own recommendations, based on his interpretation of Pico and the other court cases.

He goes on to explain that:
A mechanism for evaluation needs to be established. This mechanism could be a committee similar to the one used in Pico; however, the committee must be established prior to the time a title is called into question and should have developed some specific criteria for evaluating the suitability of the book. ... An informal or formal election of the membership from among the community is one possible approach. Another is to choose some members by election and some by board appointment. A librarian and at least one student in the school should serve on the committee, either as voting members or ex officio. Because of their training, law librarians could prove particularly helpful on such committees.

Finally, he suggests that:

Actual decisions about a challenged title can be handled in at least two ways. The committee can make the final determination as to whether to retain a title or remove it, or in a less favored alternative, the board can overrule the committee only by a super majority. The reasons for the removal must be articulated in writing. Such structures give at least the appearance of objectivity and help to protect the board from later challenges of narrow-mindedness.42

Norman B. Lichtenstein in the Winter 1985 issue of the University of San Francisco Law Review builds on Wexton and Dunn’s recommendations that schools should have previously established formal procedures for dealing with censorship efforts. He turns his attention to a rationale for responding to efforts at censorship. Acknowledging that in the 1970s and 1980s the “constitutional umbrella” was finally extended to children, he stresses that “children are treated differently when courts perceive that they lack judgment or capacity to act in their own best interests,” so that “the age, maturity level, and mental ability of a child may affect the extent to which constitutional rights will be applied.” He explains that books dealing with sexual issues may very well be appropriate for high school students and inappropriate for elementary school students. Equally plausible is the proposed use of a book which may require a certain minimum level of cognitive development. Barring such circumstances, however, Lichtenstein proposes an approach that requires ... that students challenging a censorship decision introduce some evidence tending to show that the action is not educationally supportable, but rather is ideological in character. At that point, the burden would shift to
the school board to demonstrate that its action was supported by a "substantial and legitimate" educational interest and will not burden the learning process. Such an interest might encompass the absence of any educational value in the book, the obsolescence of the material or the age and deterioration of the volume.43

James C. O'Brien, in the July 1988 issue of The Yale Law Journal, prefaced his article with the observation that "Justice Brennan's opinion for the plurality in Board of Education v. Pico has confounded commentators." His concern for the future is not so much that school boards will not establish sound procedures and rationales for handling challenges to books, but rather that "officials might mask prejudices behind legitimate administrative or educational rationales," or that some "members might refuse to articulate any rationale, leaving courts to rely on the crafted opinions of a few school board members."44 Lichtenstein would seem to agree with this possibility when he says that "the difficulty is that intent is often complex and not easily established."

Finally, Malcolm Stewart, in the Winter 1989 issue of the Journal of Law & Education takes a completely different approach to the possibility of censorship of written curricular or library materials in public schools. Insisting that "the assertion that school board decisions are more likely to be ideologically motivated — even if it is true — does not establish a presumptive constitutional violation," he proposes that because "our nation's educational system presumes the desirability of community control over public education,"45 the appropriate response to future instances of censorship should be more citizen involvement in the political process, presumably by teachers, librarians, and other concerned educators nominating and helping to elect school board members who support the freedom to read, and by attempting to influence those school board members who do not support this freedom. Stewart does not seem to support anyone's seeking redress through the courts.

All questions aside as to the practicality of specifications which Stewart would recommend that classroom teachers take in concert with librarians in anticipation of the need to protect and maintain curricula, it seems clear that the higher courts have promoted the possibility of an increasingly active censorship role for boards of education and school district administrators by specifying why and how they may legally censor written materials, while teachers and librarians are relegated to the passive role of waiting for certain circumstances under which they could seek legal redress and have some expectation that the courts might side with them. Of course, nothing would then prevent a board or administrator from censoring a title all over again by following a proscribed procedure and designating a different reason.
Given the infrequency which cases centering on censorship have reached the higher courts in the most recent twenty year period, not even averaging one case per year, and given the conflicting court opinions both among courts and within courts, including the Supreme Court in its only such case, it is apparent that a unified body of precedents cannot be developed before the turn of the century, even if this were a goal of the courts. The legal parameters of censorship to date indicate that until teachers, librarians, and other educators develop on their own an effective way to act instead of react to attempts at censorship, the “free search for truth and its free expression” in public schools will remain at risk, higher courts notwithstanding.

Papers presented to the thirtieth annual meetings of the Midwest History of Education Society held in Chicago in 1994

Editor: Joseph Watras
School of Education
University of Dayton
Dayton, OH 45469-0510

Associate Editors: Joseph Green
College of Mount St. Joseph, Ohio
Robet C. Hanna
University of North Carolina at Greensboro
Lori Hoffman
University of Dayton

Editorial Board: Janis Fine
Loyola University, Chicago
Lucy F. Townsend
Northern Illinois University

Editorial Policy: The Journal of the Midwest History of Education Society is devoted to the reflective examination of educational issues and problems from the perspective of diverse disciplines. With the Journal, the Midwest History of Education Society encourages communication among scholars of varied disciplines, nationalities, and cultures. Papers published in the Journal discuss comprehensive issues and problems confronting educators throughout the world.

The Journal has published authors from disciplines ranging from political science to philosophy to marketing to instructional technology to adult education. Its editorial board consists of a diverse group of professionals who referee articles according to their expertise. The main criterion of acceptance consists in a well articulated argument concerning an educational issue.

Articles published in the Journal do not necessarily represent the views of the editor, the editorial assistants, the members of the Society, or the University of Dayton. The authors of the articles are solely responsible for the accuracy and truthfulness of their work. The authors are solely responsible for ensuring that they do not infringe on copyright, violate any right of privacy, and do not use libelous or obscene language.

Authors must follow the Chicago Manual of Style. Papers must be submitted on a 3 1/2 inch disk formatted in a program that can be translated to a current version of Wordperfect for the Macintosh. A print out must accompany each disk. Authors should contact the editor for specific instructions before writing the paper.

Articles appearing in this journal are abstracted and indexed in HISTORICAL ABSTRACTS and AMERICA: HISTORY AND LIFE.
Several people made possible this issue of the *Journal of the Midwest History of Education Society*. Dean Ellis Joseph of the School of Education at the University of Dayton supported the project generously. The authors whose papers appear in these pages offered work of the highest quality. The editorial board and the associate editors worked diligently and carefully. The University of Dayton Printing and Design set the format of the journal and arranged for the printing.

The *Journal* offers an important outlet for mature scholars and for students beginning professional careers. In these pages, as at the annual meeting of the Society, papers of all types appear together each reinforcing the other.

Labor and Learning:
Adult Education and
the Decline of
Workers' Education

Although American workers' education can be traced back to the early nineteenth century, the American Federation of Labor's interest and involvement in formal workers' education goes back only to the beginning of the twentieth century. However, from the start, the AFL's attitude towards workers' education, especially an independent workers' education free from union control, was ambivalent.

The AFL's first significant dealings with workers' education occurred when Ruskin College was opened in Missouri in 1901. Under the sponsorship of the historian Charles Beard (a future president of the American Association of Adult Education) and Walter Vrooman, Ruskin College was based on Oxford University's famous workers' education college. Yet despite the fact that British unionists offered to support the college with an endowment, the AFL turned them down. Samuel Gompers, the AFL's longtime president, afraid of more radical elements, felt that the broad educational objectives of Ruskin were at odds with the organizations' business trade union orientation. For Gompers, the business of unions had little to do with education.

However, if the leadership of the AFL was ambivalent towards an education designed specifically for workers, many rank and file members, as well as unionists outside the AFL, were not. After the First World War, a flowering of independent labor colleges and schools threatened the AFL's dominance over the labor movement. As early as 1915 Seattle and Wyoming unionists reported on a successful model of workers' education. The Seattle plan "formulated upon the theory that co-operation with existing organizations and associations would result in much helpful information and assistance with a minimum of expense" created an entire network of groups involved in workers' education, from faculty members at the University of Washington to labor choruses.
and music study clubs. Most interesting, the Education Committee sought to collect "a book, poem an essay or any piece of literature written by a worker." The Gompers controlled AFL response, ever skeptical of workers' education, was lukewarm. While praising the Seattle organizers, it offered little support.5

Other labor organizations were less reticent. The International Ladies Garment Workers Union (ILGWU) founded its Workers University in 1917, offering a full course of study. By 1921, over two thousand people had attended the Workers University. The Women's Trade Union League, dedicated to the task of educating working women as to their rights as citizens and furthering unionism, was founded in 1906. Its curriculum included "folk dancing, labor chorus, and literary club along with trade union tactics and labor legislation."4 Similarly, the Rand School of Social Sciences, affiliated with the Socialist Party, was founded in 1906.5 But it was the ILGWU, a non-AFL affiliated union, which carried the banner of workers' education over the next decade. Their educational activities were developed under the leadership of Fannia M. Cohen. Cohen saw workers' education as a right to development in terms of culture as well as economic values. As a result, the ILGWU was among the first unions to inaugurate a system of workers' education for its membership. Its education committee declared:

We make it clear to [workers] that the work of their Education Department is based on a conviction that the aims and aspirations of workers can be realized only through their own efforts in the economic fields, and that while organization gives them power, true education will give them the ability to use their power intelligently and effectively.6

The ILGWU publicized the idea of Workers' Universities so much that the AFL was forced to appoint a committee to investigate the idea of workers' education. This 1919 report noted that the ILGWU offered nineteen classes in English throughout New York City as well as courses "consisting of 10 to 20 lectures" on Social Interpretation of Literature, Evolution of the Labor Movement, and Social Problems, among others. In addition, the ILGWU offered educational theatricals "attended by an audience of from 500 to 1,000," and an Extension Educational Service was established by which "every local of the international can have educational activities introduced at their own meeting places." These activities usually consisted of "topics related to the worker and his conditions, like Trade Unionism, History of the Labor Movement, Industrial Democracy."7 The same report documents activities in labor colleges in Philadelphia, Chicago, Boston and Los Angeles.

In 1920 it became one of the first tasks of the newly formed Committee on Workers' Education to organize a national conference dealing exclu-
sively with education for workers. But first it was necessary to secure information as to "the extent and nature of the movement." The convention itself was to be held on April 2, 1921, so in January of that year questionnaires were sent to twenty-six educational centers located in twenty-two cities in the United States. The completed forms, which were returned by all twenty-six institutions, showed signs that there was a wide range of activity. Indeed, schools throughout the United States were represented, although Southern schools were noticeably absent from the list.8

The survey revealed a wide range of information. All completed questionnaires indicated that the major object of the schools was to "spread education among the rank and file." Sixteen considered the training of future union leaders as the major immediate goal, while only three regarded propaganda as a salient aspect of their activities. Most of the questionnaires indicated that the need for social and political equality in the United States could become a reality only through the means of a "constructive social revolution." The Boston Labor College was organized, according to its founders, with "the belief that progress for organized wage earners can be assured by social and industrial policies shaped by their own right thinking, and their ambitions for self-betterment must therefore include a concern for the higher training of the mind." Educators for the St. Paul Labor College designed their program to "provide first, trained and educated workers; second, to develop better citizens; third, to afford some enjoyment hitherto denied." Founders of the Workers College of Greater New York hoped "to train workers to think fundamentally and constructively about economic questions." Those forming the leadership of the Amherst Labor College offered classes for workers "as an expression of the belief that an opportunity for liberal education should be open to all who fell the need for it." and to establish a "working connection between Amherst College and a group of working men and women so that each may offer to the other the window of wisdom that has been gaining through its experience and the joint problem applied to the solution of problems that are common to all."9

The report showed that, in fifteen cities, classes met in union halls, while in thirteen cities they assembled in public school buildings. Others reported that classes met in libraries or "other rented facilities." The Rand School, The Work People's College of Duluth, Minnesota and Brookwood owned their own buildings. Union hall preference can be attributed to a perception of "great freedom and independence" from state run public schools, not to mention a general "fear of hostile interests." In addition, "workers are more at home in the labor halls."10

The first Conference on Workers' Education in the United States was attended by hundreds of "concerned and interested" parties. The open-
ing statements of the Secretary of Amherst College Classes for Workers, F. Stacy May, addressed the pressing issue of the gathering. His comments were directed at the unfair nature of America's colleges and universities, for they "inevitably tended to reflect the needs and interest of the group for which they are intended." Moreover, "Every college offers and even requires many courses which are useful chiefly to maintain an established program that has come to be accepted as a necessary requisite of the educated gentleman and workers must counteract this particular prejudice so that a required course of study may contribute their culture in its broadest sense, doing much to make colleges genuinely useful organs of society." Fannia Cohen, with an eloquence that initiated considerable applause, outlined the goals of workers' education:

It has always been our conviction that the labor movement stands, consciously or unconsciously for the reconstruction of society. It strives for a new life. It dreams of a world where economic and social justice will prevail, where the welfare of mankind will be the aim of all activity, where society will be organized as a cooperative commonwealth, where a sturdy love and fellowship capable of enduring daily wear and tear will replace competitive greed, distrust, and selfishness. To attain this need, it is necessary not only to accumulate knowledge, but to develop a social consciousness the student must be trained for self-expression. He should obtain understanding of the great economic and social problems, and social facts which confront him.

In Pennsylvania, where the Philadelphia Labor College enrolled 700 students by 1927, the Director of Workers' Education wrote: "The labor colleges have proven so successful that organizations from other cities are now sending in requests for the services of the [Pennsylvania] Department in order that they may be established as labor colleges throughout the state." In Boston, the college's secretary wrote: "Behind it all was a response to a call for men and women who believed in and stood for the organization of the workers, who through its teachings should be more able to advance the interest of the cause they stood for, should be better fitted to hold their own in discussions and dealings with the representatives of the intellectual and moneyed classes whose interests do not always run parallel with those of the workers and whose sympathies are in opposition to unionism and all it stands for.

Israel Mufson, a graduate of Brookwood Labor College, described a Saturday class:

Serenely and with all the amenities of twentieth century civilization, problems are discussed in as good natured
mind-meet-mind atmosphere as in the most learned of philosophic associations. It is strange to see jewelry workers, hosiery knitters, operating engineers, clothing workers, painters and what not grapple with such problems as race prejudice, the nationalization of European industries, court injunctions, coal, and on and on and on.\textsuperscript{14}

At its peak in the late 1920s, over three hundred labor colleges were established with an estimated enrollment of over 20,000.\textsuperscript{15} Despite the explosion of growth of labor colleges and the rather glowing 1919 report, the AFL stance continued to be ambivalent. After praising the ILGWU over "the feeling of the students that the classes belonged to them, that they were at home in them, and took collective pride in them," the AFL committee concluded that "But such classes should be considered a stopgap. The sound solution is a progressive board of education, responsive to the public."\textsuperscript{16} The AFL still considered education to be largely outside the framework of business trade unionism. An independent workers' education movement, with its notion of transformation and a broad definition of education, was viewed as a threat to the AFL's business trade union policy.

The AFL had good reason to be concerned. A.J. Muste of Brookwood College stated that workers' education can provide three functions: (1) make real the theory that education is for all people; (2) end the notion that education is simply preparation for life; and (3) end the idea that labor and culture don't mix.\textsuperscript{17} Fannia Cohn, Education Director of the ILGWU, stated the objectives of the workers' education:

Many realize that the object of our educational system at present is to adjust the individual to the environment with a view to perpetuating our social conditions. But the object of workers' education is rather to adjust the environment to the needs of modern life. We believe that our education program for our members should be based on their daily experiences around the industry in which they are engaged and the union of which they are a member.\textsuperscript{18}

This note of social change was echoed by the workers. A comment by Stanley Dziengielewski, a member of the United Mine Workers of America, on workers involved in the labor colleges reflects this view: "From workers' education I want to get an interpretation of the world, and my place in it. In short, I want to know how it got this way: Why are we miners subjected to ninety-seven days of compulsory unemployment every year? Why, when we workers are jobless, must we also be breadless, homeless, and hopeless? They tell us that two hundred thousand of us miners are not needed in the industry. Why is this, and
what is to be done about it?"19

The success of the labor colleges led to a series of national conferences on workers' education. The conferences resulted in the creation of the most famous labor college of all, Brookwood Labor College in Kantoh, New York and the founding of the Workers' Education Bureau (WEB). The goals of the WEB were to gather information on workers' education, to assist in the educational work of existing labor colleges, and to stimulate the creation of additional workers' education projects throughout the United States. A major effort of the WEB was directed towards curriculum development. The Bureau started a professional journal, Workers' Education, and published two sets of inexpensive and easy to read textbooks known as Workers' Bookshelf and the Workers' Education Series.20

The Workers Education Bureau and the Decline of Independent Workers Education

The AFL, while commending the growth of the labor colleges, continued to be skeptical of the labor colleges' efforts. Partly because of Samuel Gompers long standing anti-intellectualism and partly because of the AFL's established position that education was somehow extraneous to the labor movement, the AFL continued to balk at involvement in the workers' education and the WEB. However, by 1922 the AFL allowed its Education Department to cooperate with the WEB. The AFL soon made its presence known. By demanding a change in the constitution which gave the AFL additional seats on the WEB's executive committee, the AFL soon pushed the WEB to expel some of the more radical labor colleges from the organization, including the Socialist Party's Rand School and the International Workers of the World's Work Peoples' College. The AFL was slowly increasing its grip on the WEB. In a 1923 address to the Workers Education Bureau, Samuel Gompers argued that workers' education should focus on English literacy as opposed to politics. Workers' education should focus on technical and vocational training and leave "higher" education to the nations' colleges and universities.21

William Green, Gompers' successor as the AFL's president, continued the attack on the WEB. Green, a strong proponent of vocational training and a militant anti-communist and anti-socialist, seized on two reports that condemned the WEB's Workers' Bookshelf Series as being pro-Communist and anti-religious. These reports were gross exaggerations. Caroline B. Rose, in a detailed content analysis, shows that the books fall into the category of a rather mild socialism. Nevertheless, the result of this imbroglio was the increasing control of the WEB by the AFL.22 The final battle occurred over the activities of Brookwood. Throughout the late 1920s, the AFL became increasingly concerned with the "radical"
activities of Brookwood. Despite protest from the ILGWU and some of its own locals, the AFL withdrew all support from Brookwood in 1928. A year later, James H. Maurer, President of the WEB, resigned after a bitter despite with the AFL's representatives. Maurer claimed that the AFL was not interested in workers' education and that it followed reactionary policies, exemplified by its withdrawal of support from Brookwood. In fact, Maurer continued, since the AFL's involvement in workers' education, there had been a decline in the numbers of individuals participating in workers' education. The AFL, through Spencer Miller, Jr., the WEB's president, now had almost complete control of the organization.

While individual labor colleges continued to exist and in many cases thrive, they had lost their central coordination agency, the Workers Education Bureau, to an AFL more interested in vocational and technical training than in broad based education for social change.23

The American Association for Adult Education and Workers' Education

The relationship between the American Association for Adult Education and elements of the workers' education movement were problematic from the beginning. In 1925, when the Carnegie Corporation was beginning its meetings to found what would become the American Association for Adult Education (AAAE), A.J. Muste, chairman of the faculty at Brookwood Labor College stated: "We here at Brookwood are very doubtful indeed whether we are going to go along with the American Association for Adult Education, which is expected to spring out of these conferences." He noted that the individuals present at the conferences "pretty definitely represent a point of view which is not the same as ours." Andrew Calhoun, Brookwood's Director of Studies, stated, "There can be nothing but war between the Adult Education movement with its 'civic' aims and the Workers' Education movement, with its class mission."24 The battle over who controlled the WEB was carried out in the Bureau's relation to the new adult education association. The WEB was split on whether to accept a grant from Carnegie. After a lengthy debate, the WEB voted 40 to 20 to accept the grant, with the conservative AFL representatives voting in the majority, over the vocal opposition of the independent workers' educators led by Muste.

Worker educators mistrusted adult education because of its connection with the Carnegie name. Carnegie was reviled for his anti-union stance and his brutal repression during the Homestead strike, less than thirty years earlier. The independent workers' educators were anxious about their own movement just at the time professional adult education was created. The independents had begun to lose control of the WEB
and, due to the anti-union climate of the 1920s, many independent labor schools were forced to retrench.

Moreover, Muste, along with other workers' educators interpreted Carnegie's vision of adult education as instruction to improve moral development for people too old to attend schools. The means to provide this education, which included universities, open forums, movies, YMCA's and correspondence study, seemed not only too amorphous to Muste but also smacked of an authoritarian delivery system in which the instructor's job was to impart knowledge and deliver material. Workers' education, on the other hand, was purposeful. The object was "to orient the worker, to place him in possession of the principal facts of his environment, to help him interpret the world in which he lives and to make him articulate." 25 The teacher in workers' education was to be a comrade of the students, learning as much from them as they did from him or her. However, pressure for funding and the triumph of business unionism led to an uneasy relationship between workers' educators and adult educators. While they participated in the early conferences of the AAEE and even held offices in the association, their primary commitment was never to adult education but to workers' education, a quite different endeavor.26

Workers' Education in the 1930s

Workers' education underwent a dramatic change in the 1930s. First, the Depression resulted in severe financial constraints for all unions. Second, the lack of support from existing organizations led to a decline and finally a collapse of the independent labor colleges. Finally, the rise of the Congress of Industrial Organizations (CIO) in the mid 1930s led to the integration of the educational programs within the process of organizations.

Moreover, universities became increasingly involved in the workers' education. Fernbach, in a study commissioned by the National University Extension Association, documents the increasingly instrumental and utilitarian view of education taken by such institutions as the University of Wisconsin's School for Workers. Labor unions, too, became more functionalist in their approach. Thomas Linton, in a classic examination of the United Auto Workers union, notes how the major concern of the UAW was to educate its stewards and to command the loyalty of its members.27 The transition in formal workers' education activities was now almost complete. Instead of a richly varied independent network of educational institutions which had a vision of a transformed society, much of formal workers' education had become a narrowly focused form of steward training and technical education.

In the current national debate over educational change, reformers repeat their old demand that teachers produce a better product for the nation's sake, or else we will all suffer adverse economic consequences in our standard of living. Throughout the twentieth century, educational reformers with the strongest presence are business men and women who seem to have a single solution to the problem of low educational quality: run schools more like businesses, so that good products will replace bad products. Unfortunately, corporate reformers tend neither to trust teachers nor to understand the conditions and culture of teaching. They tend to view teachers as much the problem as the solution, and they rarely consult teachers (Duke 1984). As a result, teachers resist change, the reforms fail, and reformers renew their attacks on "obstinate" educators, who then have even less reason to modify their behavior.

Terrell Bell, former U.S. Secretary of Education under President Reagan, stated recently that the "ten years since the publication of A Nation At Risk have been a splendid misery for American education," in which "we have not given up the quest to shape education in the super-efficient enterprise that it must become if America is to keep its proud place of leadership in the marvelous Information Age of this decade and beyond" (Bell 1993). In this statement, Bell continues the nineteenth century tradition of gauging educational success by its "businesslike" efficiency. There is a crucial difference, however, between current reformers and those of the century before. Educators and businessmen have in the distant past most often equated efficiency with the process and structure of schooling rather than with student results. In the One Best System, classification, grading, mass uniform recitation, and large buildings were the expected norms (Tyack 1974). When the economy changed enough for specialization to be necessary by the early twentieth century, students became differentiated into parallel courses of study.
leading to different but presumably equally valuable outcomes. Efficiency became scientific management, a processing of a product with clear quantifiable standards. Despite the efforts of pedagogical progressives, the fundamental definition of effective education as "efficient" did not change until after the reports of James B. Conant (1959, 1961).

In the 1960s, critics from the left argued that the process of education in most schools was inhumane, which led to an inhumane society, and that curricular differentiation led to different outcomes that precluded equality of opportunity, much less equality of outcomes. They also pushed for subsidized school choice so that lower income people could attend the same fine schools as the higher social classes. By the 1970s, Leon Lessinger led the attack with his demand for Every Kid a Winner! He insisted that educators be held accountable not only for good teaching, but also for successful outcomes for all students (Lessinger 1970). After continued pressures for equity during the Seventies, many critics argued that educators had sacrificed quality for equality (Ravitch 1983). So, by the early Eighties, with an economy stressed by inflation, stagflation, and Japanese competition, business reformers again took charge with the famous Nation At Risk report (Nation At Risk 1983). Now it was time to regain ground lost to the liberals by increasing educational standards with a simple solution to "mediocrity": get teachers and students to work harder (Shor 1986).

It was not that business values of efficiency, quantifiable standards, clear-cut goals, and cost-efficiency had ever died. Performance and competency-based education continued in the Seventies, a method which de-emphasized teachers' discretion over classroom techniques for a mechanical view of pedagogy set by experts outside of the school. But now the call was for longer school days and years so that all would have time to strive for higher standards. From the tradition of scientific management came demands to maximize productivity, increase regulatory and prescriptive approaches to education with mandated curricula, and introduce tougher tests, closer supervision and more explicit directions (Johnson 1990). The old hierarchical approach became reified.

In 1983, the Education Commission of the States released Action For Excellence; A Comprehensive Plan to Improve Our Nation's Schools (Education Commission 1983). Released the same year as The Nation At Risk report, Action For Excellence provided a more prescient agenda than its famous cousin, as its recommendations were more followed in states over the next decade. After all, not many districts have appreciably extended their school days or years as the Nation At Risk demanded. Both reports start with the same assumptions, however.

Action For Excellence stated that the nation had structural unemployment because "our factories, techniques, and workers are obsolete." It
also called for a "high average level of capability" of "highly skilled human capital," with workers capable of analysis and problem solving so to have "sustained economic growth which is essential" for us to compete in the international sphere. In other words, Japanese and German products had become preferable to American products because of American workers' ineffectiveness rather than poor management decisions that had, in fact, often made it difficult for labor to perform at its highest level. As usual, business people found it easiest to blame the producers of human capital, the schools, rather than those who managed that capital, themselves.

In true business fashion, Action For Excellence insisted that schools' failure to produce a high quality product was due to an "absence of clear, compelling and widely agreed-upon goals for improving educational performance," with the result that schools "taught the six R's: Remedial reading, remedial 'riting, and remedial 'rithmetic." As a result, there was a large gap between what educators thought they produced and what business people believed was needed in the work force. The report's eight recommendations provided a blueprint for change that reformers believed could be achieved in a measurable fashion. Recommendation number one called for state governors to improve all education below college, by promoting policies and alliances "to improve education on behalf of economic growth" and see that every school district develops a plan for improving education, focussing on jobs and economic growth, with specific objectives, timetables, and methods for measuring progress in the local schools.

Other recommendations have also been followed in many states: to create more effective business-education partnerships, to fight for higher teachers' salaries, smaller class size, more math and science in the curriculum, more demanding academic requirements, and improved local school leadership, and to promote the sponsorship of projects by business to reduce absenteeism and dropouts while recruiting minorities for college and teaching. Business reformers have yet to attain widespread career ladders for teachers, an objective measurement of teacher performance, or the abolishment of social promotions, but they have not given up on these items.

Their biggest demand is to provide "quality assurance" in education for students and teachers, and this remains the most difficult goal to attain (Berenbeim 1991b). The elusiveness of "quality assurance" is a problem for reformers because they want, in Larry Cuban's words, to move beyond First Order changes to Second Order changes. Most school reforms never go beyond First Order change, which attempts to "enhance existing arrangements while correcting deficiencies in policies and practices." It is much harder to complete Second Order change, which seeks to "alter the fundamental ways in which organizations are put
together" with new goals, structures, and roles (Cuban 1991). Examples of "fundamental" changes include nongraded schools, vouchers, and open enrollment districts, all of which exist at some level around the nation. It also includes school "restructuring," in which school staffs have the power to make personnel, curriculum, and budgetary decisions in a spirit of true professional autonomy. The latter reform is not only one of the most publicized goals of school reformers but also one of the most difficult to attain, as it means the potential destruction of the old bureaucratic, hierarchical arrangement so ingrained in American public education.

In the decade since Action For Excellence, corporations have undertaken four phases of reform in education in which they have proceeded from episodic interventions in specific schools to a systemic renewal effort. In the first phase, business leaders used a scattershot approach in which they mentored individual students to build self-esteem and good work habits as a method of raising test scores, promoted the use of technology, and trained Head Start personnel. In the second phase, corporations attempted to get educators to apply "sound management principles" so that schools could operate more like well-run companies. This meant the application of rational methods such as setting a well-defined mission supported by coherent theory, an organization plan, and protocols for evaluating results or "outcomes," as they call it. For example, they often tried to reform an entire school district through staff development workshops in Total Quality Management (Berenbeim 1991a).

The third phase has consisted of public policy initiatives in which new intermediaries such as the National Alliance for Business and the Business Roundtable endorsed tax increases for schools and developed state initiatives for programs such as school choice in Minnesota and Wisconsin (Lund and Wild 1993). The most noticeable event during this phase was the adoption by the National Governors' Association of the National Goals 2000 in 1990.

The National Goals 2000 showed its business influence as it stated that the time had come "to establish clear national performance goals in education that will make us internationally competitive" (DeLoughry 1990). Proponents insisted that we needed to "break the mold--decisively in a new way" to turn schools into a "high-performance organization" (Doyle 1991). The business led reformers believed the six goals would be adopted by the legislatures of all fifty states, each of which would require all local districts to subscribe to the goals if they were to receive additional state or federal funds to improve themselves. Experts in six core subject areas were to set "new American standards" toward which all schools would aim, with sanctions set for schools that failed to attain those standards (Clincy 1991). The irony is that the reformers also called for restructuring of local schools that would be "free" to attain the
national and state goals, while facing censure if they failed to do so.

A recent Conference Board analysis of 175 corporations demonstrates that business leaders believe some reform goals are much more important than others, based on clear needs of their respective industries. Goal 4, calling for American students to lead the world in math and science ability, is the best-supported goal, as it leads directly to future high-technology employment. Goal 3, calling for more challenging subject matter mastery of English, history, and geography, is also well-supported as businesses provide thousands of employee volunteers and sponsor recognition awards for students and teachers. Goal 5, adult literacy, also receives strong support through local improvement programs of businesses. These three goals all have direct consequences for business as these goals promise to produce workers for businesses. In addition, each of these goals can be monitored through measurable results.

The least supported goals have been the social goals: Goal 6, drug, alcohol, and AIDS prevention, and Goal 1, that "all children will start school ready to learn." Of least concern are programs aiding teen mothers, apparently because the payoff is indirect for the workforce (Berenbeim 1991b). It is clear that corporate reformers interpret the major task of education as the production of skilled future employees. They honor other goals through rhetoric but are willing to do little to solve the underlying problems facing families or even admit problems exist such as social, economic, and racial inequities and lack of employment at wages able to support a family.

Business reformers operate under the myth that if there were only more academically skilled workers then youth in depressed areas would work themselves out of poverty, even though there are few business people willing to locate in such neighborhoods, and little hope that these people can move out of such places. Equal opportunity and social mobility of American citizens are not significant goals of the corporate community; global economic competitiveness and U.S. work force requirements are the real goals, as The Conference Board admits. They want schools to produce highly skilled workers who can "process information" and "make informed decisions and understand the effects of those decisions" (Berenbeim 1991b). Presumably, if workers only thought better, corporations would outperform foreign competitors.

The fourth phase of business-led reform is the current campaign for systemic change. This includes national and state "benchmarks" and a "restructured" workplace which gives teachers more responsibility as front-line workers as well as accountability for results. The expected results include less bureaucracy, more innovation, and enhanced competition among students, teachers, and schools. Ideally, school administrators would facilitate rather than supervise teachers, who would "coach"
students into learning. All educators and students would also aim toward national standards. To this end, past U.S. Secretary of Education Lamar Alexander persuaded Congress to establish the National Council on Educational Standards and Testing. NCEST is to supervise eight committees whose members will set standards for subject areas. As of yet, despite the leadership of Diane Ravitch, the Congress has not funded assessment projects, but the corporate reformers will continue to press the issue (Ravitch 1993).

A major reform influence is the U.S. Business Roundtable, a group of more than 200 corporate CEO's. The Roundtable made a ten year commitment to work for educational reform. They developed a list of Nine Essential Components of a Successful Educational System, which has been used by many state Business Roundtables as a guide for school reform. They began by reiterating the corporate reform assumptions that all students "can learn at significantly higher levels" which will be attainable because "we know how to teach all students successfully." School performance must be "outcome-based", with strong assessment strategies, major staff development, increased technology use, and a reward/punishment system to motivate educators, as well as expanded pre-kindergarten programs and health and social services "sufficient to reduce the barriers to learning" (Delaware Business 1992).

Since the Business Roundtable intended that state-level corporate reformers would follow its lead, it is instructive to look at the case of a single state, Delaware, to see how reformers' assumptions are being put into practice. The Delaware Business Roundtable and Delaware Chamber of Commerce organized the Delaware Business/Public Education Council in October, 1990. A subgroup released a survey in March, 1992, noting weak skills in high school graduates seeking jobs, including writing, listening, and work habits (Delaware Business 1992). This report is reminiscent of progressive-era surveys by such men as Abraham Flexner and George Strayer that invariably showed a gap between the operation of an ideal school system and the current situation, which reformers then proposed to alleviate through expensive reorganization (Tyack 1982).

The Delaware Business/Education Council released the Delaware Gap Analysis in 1993, similar to other states' "gap analyses," undertaken by the national Business Roundtable. As elucidated by the survey, there is certainly room for improvement in Delaware's educational system. Math scores in 1993 were just below the national average, their lowest level since 1972, while Delaware's graduation rate was twenty-fifth in the nation. In order to close the distance between current educational performance and the ideal "world-beating" academic standards of National Goals 2000, the report suggested several costly reforms, totaling $55,000,000, equal to 4% of the entire state budget (Hornbeck and
The most expensive reform listed in the report is the institution of year-round schools for at-risk students, who represent about one-third of all students in Delaware. This is a refinement of the 1983 Nation At Risk report that insisted on more time in school for all students. The next most expensive reform is a complicated program to provide financial incentives for teachers to reward whole-school performance of at least 2% per year, which would hold teachers and principals accountable for results derived from working together rather than from pitting teachers against one another for merit pay.

Other reforms include state or districtwide mentors to assist schools in trouble, and negative consequences for schools that consistently fail their students, including a state takeover in the worst cases. As the authors mention, being the hard-nosed businessmen they believe they are, there will be “no excuses accepted for lack of student achievement” (Hornbeck and Anderson 1993).

One can see the business mentality of these reforms: set clear goals, rewards, and punishments and positive results will follow. Unfortunately, in education, the products are vaguer, since teachers deal with young humans and not mechanical objects to be made, marketed, and sold for profit. Corporate executives, of course, see this fuzziness as a problem of description, not of reality (Carnoy 1990). If educators would only make their goals clear and apply effective procedures, then the products will improve, they reason. The Delaware Gap Analysis states that each school must make an annual “profile report,” to include the dropout, graduation, and attendance rates, postgraduate success, and quality of citizenship. It adds that each school should not be compared with others, but only with its own past performance. Since the practice for years in Delaware has been to publish school test results in newspapers, which invites comparison, it is hard to see how competition will be avoided. Perhaps this kind of pressure is what the reformers have in mind anyway.

In order to set clear goals, reformers lobbied the state government to organize the New Directions for Education in Delaware program in 1992 to set high standards in several subject areas, modeled directly on the National Goals 2000 list of subjects. Led by the state superintendent and State Board of Education, four Curriculum Framework Commissions will set “clear, rigorous standards” by 1995 in math, science, social studies, and English/language arts that “all children should know and be able to do” (New Directions 1992). The Commissions include teachers, content experts, and community representatives in a New Standards Project, similar to that in twenty other states. They are to set prototype tasks and field test them so that by the 1996-97 academic year, there will be performance-based assessments in place. By that time, schools will be
"restructured" so that each school will have a shared-decision making system of teachers, administrators, and parents, with guidelines set by school boards. There is supposed to be decisive school-based authority over staffing, curriculum, scheduling, and the budget. The hardest part may be setting measurable and meaningful assessment procedures and goals.

Most recently, Governor Carper named an Education Improvement Commission to recommend specific changes as to school decision-making, accountability, and finance so that the legislature can implement them by 1996. The three subcommittees are all co-chaired by corporate executives and educators, with education administrators prominent as committee members. It remains to be seen whether the education administrators will use their knowledge to promote change or to delay it. It is particularly unfortunate that few parents and only one teacher are members (Dennison 1994a). After all, the point of the Commission is eventually to involve parents, teachers, and principals in restructuring the relationship between the state and local authorities, and to develop a Goals 2000 State Improvement Plan that must be submitted to the U.S. Department of Education for funding (Kesler 1994). It is ominous that the Governor has warned reformers that the state cannot afford all of the new initiatives without diverting funds from current programs. As an answer to such concerns, the new Commission is expected to identify "efficiencies" in education as part of its charge, which may include consolidation of the current nineteen school districts, an increase of discretionary funding from the state to local districts, and automatic increases in property taxes—all potential political bombshells that may prove disruptive to the entire reform effort. There has also been a school change initiative project in Delaware called RE:Learning in eighteen schools for the past two years, and a Principal's Leadership Academy at the University of Delaware to train cohorts of administrators as local change-agents, though mostly from other states.

Despite some attempts to change schools, there has been little attention by business reformers in Delaware or elsewhere to the real world of teachers or the conditions within schools. If these continue to be ignored, as they have been consistently by corporate reformers for years, then teachers are likely not to cooperate with reformers. As Ashton and Webb state: "The worth of ecological reforms ultimately will be determined by the effects they have on the classroom behavior of individual teachers" (Ashton and Webb 1986). Business reformers do seem to understand that teachers have a difficult job, but they fail to comprehend the full complexity of the task. A report of the Committee on Economic Development recognizes that "teachers face huge new responsibilities" that "far exceed the expertise or control of the classroom teacher," including special education and a decline in family stability. But then
the report states disingenuously that "these are appropriate roles for teachers, and their compensation should reflect their responsibilities," as if more pay would somehow make up for the teachers' extreme vulnerability in situations in which they control only a few of the student variables (Committee for Economic Development 1985). Corporate reformers tend to view school success in almost solely academic terms, whereas teachers see student development as much more than test scores. In interviews with more than fifty teachers, Susan Johnson found that the one theme that unified public school staffs was caring for children, which does not translate well into specific, accountable goals (Johnson 1990). Teachers want to see long-term improvement in children as students and to "make a difference" in students' lives as whole persons, not just in students' ability to attain a certain score on a particular exam (Cohn and Kottcamp 1993).

In addition, classrooms are complicated, fluid places in which a teacher may have up to 1000 interpersonal interchanges a day (Jackson 1969). In such a situation, increasing academic expectations without commensurate control over the inputs means teachers are expected to achieve more without more resources or time, which results in a decline in morale, that can then devastate a teacher's effectiveness or even her will to remain in the profession (Carnegie 1988). As a Delaware state senator stated this year, "Business people need to go to the schools . . . and understand just what is happening in education if they expect teachers to listen to them" (Dennison 1994a).

Corporate reformers fail to appreciate that teaching conditions must be improved before granting teacher autonomy or expecting major changes in teacher behavior. Though one report does recognize that teachers need "good, clean conditions," effective instructional conditions must include more than new paint and light bulbs (Committee on Economic Development 1988). Teachers are even more concerned with time, control, resources, and interruptions to their day, and lack of good conditions in these areas can lead to burnout. In a survey of former teachers, poor working conditions that interfered with instruction was the primary reason teachers left the profession (Harris 1985).

The biggest problem for teachers is the lack of time to do all the tasks they want to complete, as well as those required as a condition of employment. About one-third of teachers in an NEA survey mentioned that they lacked sufficient time for direct instruction, nearly half stated they did not have enough time for class preparation, and more than half said that they constantly or often lacked enough time to counsel individual students or to grade classwork (NEA 1988). Many teachers believe that fragmentation of the school day is the greatest source of stress, because it interferes with attempts to keep a schedule. There also is little or no time set aside for collaboration on a regular basis, as in
other professions (Johnson 1990).

Teachers also complain of a lack of resources. An NEA survey reported that a third of teachers believe a lack of space in classroom, storage, and special activity areas poses both quantity and quality problems, and that there are insufficient funds to purchase supplies or equipment (NEA 1988). Few schools provide professional work space for all teachers, with easy access to telephones, computers, or photocopying. Few elementary teachers are free from clerical tasks, whereas secondary teachers are often expected to supervise extracurricular activities for little or no compensation (Johnson 1990). In addition, unlike customers or employees of a firm, children are usually required by law to attend school, are subject to fewer sanctions, are offered fewer extrinsic rewards, and are new each year to the teacher. Teachers also have less control over students than executives have over subordinates, as well as more conflicting goals (Shedd and Bacharach 1990).

Reformers answer that if only educators would clarify their goals, then the tasks could be measured and attained more easily. The problem is that the teacher's job entails many tasks and expectations not set by her that are often in conflict. She is to achieve equity and excellence, promote subject matter acquisition and problem-solving techniques, academic mastery and social skills, independence of mind and conformity to socially accepted behaviors, while maintaining self-esteem and discipline in each child. As Shedd and Bacharach state, few occupations combine intensive, nonroutine problem solving with the management of relationships of large numbers of people. Teachers must be instructors, counselors, and supervisors at one time, and produce solutions to myriad problems with little help (Shedd and Bacharach 1990).

In Delaware, as elsewhere, corporate reformers reply that educators will be able to overcome many of the problems they face through a restructuring of power. Each school site will gain control over more of the variables that confound the teacher's job. Collegiality will be encouraged so that problems can be diagnosed and solved more quickly, enhanced by the clear and attainable goals and incentives offered by the state. Many questions remain, however. Will the academic competencies be set too rigidly or too high for most students to attain? Will the outcome-based assessments be measurable, and if so, be considered efficacious by educators at the school level? Early results are not encouraging. State education officials released results in August 1994 of the second Interim Assessment which show no significant change from the initial assessment of 1993. Since teachers have not had time to change instructional techniques or goals to fit the new assessment procedures, the results are not surprising. But the results as published in the newspaper make the schools look bad and are not likely to increase teachers' desire to be cooperative with reformers (Dennison 1994b). In addition,
even if school restructuring results in a noticeable increase in professional control at the local school level, will teachers be able to set their own agendas for solving their problems?

There is little historical evidence that corporate reformers either understand or even respect what teachers do. Why else would there be such a penchant for state and federal standards? Unfortunately, if the current expensive reform package is implemented in Delaware, and if the predicted improvements do not materialize, once again the frustrated teachers will be blamed, and we will continue to expect the schools to attain social and economic results they are incapable of achieving without significant changes outside of the schools (Reitman 1992).

Teachers Unite:
The 1977 Strike in Cincinnati

Susan Martin Macke
Indiana State University

In the late 1980s the Cincinnati Federation of Teachers (CFT) became a nationally recognized partner in education reform both for its participation in a cooperative style of negotiations and its development of programs designed to promote the professionalization of teachers. A Rand Corporation study reported that the CFT is a "highly influential union" and that union leaders, such as CFT President Tom Mooney, are "indispensable players in the improvement process from the very beginning."2

This position of influence, however, had not always existed; rather, it is in large part due to the nineteen day teacher strike in 1977 when over half the teachers took a stand to gain a public forum for their concerns and to fight for contract provisions that would correct the prevailing economic injustice for teachers, as well as increase their influence in school matters. The striking teachers overcame conservatism and individualism, characteristics traditionally associated with teachers,3 and realized that they must look beyond their own classrooms to the political and economic issues of the school district for the sake of all teachers.

Teachers nationwide had begun to challenge the traditional educational bureaucracy in the teacher power movement of the 1960s and 1970s when they took to the streets and closed schools. Many teachers acted upon the belief that "power is not given to a group. It is taken by it."4 By the early 1970s teacher strikes numbered approximately 130 per year.5 In 1978 teachers were the most militant public sector groups, conducting 264 of the 481 strikes that year.6

Naturally school boards considered these challenges from teachers a usurpation of their traditional authority and resisted with all lawful means.7 When teachers gained collective bargaining rights, "a realignment of power relationships"8 occurred, which gave teachers some influence within the bureaucratic hierarchy through the provisions negotiated in their contracts.

This paper will show how the power relationship between the teachers and the Board of Education was altered by the 1977 strike in Cincinnati. In spite of full use of its legal and management prerogatives, the
Board of Education was unable to break the strike. Equally as detrimental to the Board of Education was the loss of public support and trust. The striking teachers' unified and determined stand for economic justice, improved teaching and learning conditions, and some voice in school matters earned them the support of many community members and resulted in some significant contract gains. Consequently the CFT gained power in school matters and gained recognition from community members for its commitment to quality education. Without this strike, the CFT's role as a full partner in education reform a decade later would not have been possible.

Educational Decline

During the 1970s the nation experienced a severe recession that impacted heavily on some school districts. Cincinnati Public Schools, like other urban school districts, were fraught with economic problems. Ruinous decisions of the Board of Education since the mid-1960s had produced a city school system with buildings in a state of disrepair and a school program that was "inadequate and below par." Teacher morale was low due to large class size, with an average of twenty-eight; class time reduced by one period since 1971; some teachers' loss of their free period; and no raises in some years in the early 1970s. An Ohio Education Association salary survey of major cities in 1977 ranked Cincinnati teachers lowest in salaries. During the 1970s many teachers left Cincinnati Public Schools for more lucrative positions in the suburbs.

This dismal salary level did not exist for Cincinnati administrators, however, who were ranked by the Ohio Department of Education in 1977 as the highest paid among the city districts in the state. Nor were they experiencing cutbacks. Since 1972 the school district had lost 156,661 students and 184 teachers but had added thirty-four administrators, including a new layer of bureaucracy to serve a host of new alternative programs.

Since achieving collective bargaining rights in 1968, the conservative Cincinnati Teachers' Association (CTA) had negotiated teacher contracts. From 1968 to 1974 teachers became increasingly dissatisfied with these negotiations and began to consider the militant CFT as a viable alternative. In 1976 the CFT membership of 1,200 surpassed, for the first time, the CTA membership of 850 out of a total of 3,000 teachers. In November of that year teachers elected the CFT as its bargaining representative, twelve years after its founding. CFT President Roger Stephens immediately issued a public statement that the union's goal was to "teach the board a lesson or two" and "to stop the fifteen year decline in the quality of education in Cincinnati."
Because of the union's history of militancy and open criticism of the administration, the CFT threatened the power of the Board of Education by its mere presence at the bargaining table. The Board of Education wanted to preserve its management control, contain the influence of the CFT, and restrict economic concessions. Provocation, preparation, and punishment all played part in the Board of Education's negotiation and strike breaking strategies. The CFT, on the other hand, had teacher unity and perseverance to support its efforts during the strike. Thus, each side used every legal means to challenge and test the other. As a result of the strike, power was realigned in Cincinnati Public Schools, whereby teachers gained support from community and negotiated contract provisions that increased teachers' voices in school decisions.

**Negotiations Begin**

Negotiations began on December 16, 1976. The CFT demanded a 16.5 percent "catch-up cost of living raise" because teachers' cumulative raises from 1974 to 1977 had amounted to 11 percent, which was 16 percent below the increase in the cost of living.\(^1^8\) In addition, the CFT sought major noneconomic issues that included binding arbitration in all contract matters, a lowering of class size from an average of twenty-eight, some input into the teacher transfer policy, and a larger role in developing educational policies through teacher building committees.\(^1^9\)

On December 31, 1976 the contract expired. The CTA had negotiated a contract for 1977, including a 3 percent raise effective January 1, that was contingent upon their being elected the bargaining representative. When the teachers voted for the CFT, they were gambling that the union could negotiate a better raise. Clearly the CFT had to prove itself to the teachers who were anxious to have a new contract and a raise.

The Board of Education, on the contrary, had no motivation to proceed quickly with negotiations. Without a collective bargaining law in the state,\(^2^1\) the Board's members could control the negotiations both in timing and content. Prolonging negotiations allowed the Board to exert management control, to save money by postponing a raise, and to test the new bargaining representative.

For two months the Board of Education limited the negotiations to noneconomic issues. Negotiation of economic issues was begun in March, which coincided with the preparation of the annual budget. Superintendent James N. Jacobs expressed "deep concern" on March 7 that there was no money in the proposed 1977 budget for teacher raises\(^2^2\) and offered to open the financial books to the CFT.\(^2^3\) The teachers were "riled at the district's 'poor mouth'" story because there was a $7.3 million surplus from 1976,\(^2^5\) and the 1977 budget was only $5.8 million more than the previous year.\(^2^6\)
Teachers took action. On March 15, 350 teachers attended the Board of Education’s budget proposal meeting, while 500 to 600 others picketed outside, which "raised the specter of a strike." Slogans on signs included "Teacher Families Get Hungry, Too," "You Get What You Pay For," and "The Federation is Fed Up." One reporter noted that the teachers' "show of unity and strength ... (was) quite impressive" and that "teachers do not quite trust the board ... they feel the budget should reflect negotiations, not the negotiations reflect the budget."

At the meeting the superintendent expressed "anguish" over the teachers' plight. Board of Education members insisted that they wanted to give teachers a raise but argued that there was no money. They passed the 1977 budget, providing no funds for teacher raises.

To win community support for its position the CFT tried a new strategy. On March 20, it placed in two newspapers an advertisement that asked, "Will teachers have to strike?" It summarized Cincinnati teachers' low wage status and charged the Board of Education with fiscal mismanagement. The Board responded that the advertisement was "distorted."

Negotiations dragged on as teachers worked without a contract and without a raise. After 100 hours of negotiations with little progress, the Cincinnati teachers met on April 6 to consider a strike. CFT leaders charged the Board with provoking a strike. Stephens rallied the teachers saying, "If teachers are ever to have a good contract, we're going to have to make it stick now, this year, this spring." Teacher James Chapman said, "I am ready to strike for a better tomorrow." Teachers generally felt that a strike was the only way to get the Board of Education to listen to them. Eighteen hundred of the district's teachers were in attendance, and approximately 85 percent stood to show their support for a strike, expressing their belief that it was time to take action for the future good of all teachers.

At first the CTA, with a membership of about 850, gave conditional support for the strike but later withdrew it. Their support proved unnecessary because 1,700 teachers participated in the first days of the strike, showing broad based support.

**Teachers Strike**

The strike began on April 13, 1977. The administration was prepared and was able to keep all schools open, a crucial part of the Board of Education's strategy. Throughout the nineteen day strike about half the teachers were absent, with a high of 57.5 percent at the beginning and a low of 41 percent at the end. Teacher absence at individual schools ran as high as 80 percent. Custodial and lunch room worker absence averaged 33 percent, and student absence ranged from 40 to 50 percent. Nevertheless the schools remained open, allowing the Board
of Education to claim victory. Equally important, the Board could identify striking teachers, a vital factor in withholding pay, accumulating strike savings, and taking legal action against strikers.

At the end of the first day, the Board of Education sought a temporary injunction, a strategy that had been instrumental in ending the five day teacher strike in 1968. This time, however, the court did not act quickly. Meanwhile, the Board refused to negotiate, saying that it had to prepare for the injunction hearing.

On the fourth day, the Board of Education took action to further punish striking teachers, beyond loss of pay, by threatening to cancel their health insurance coverage after May 4. Although legally entitled to fire the striking teachers under the provisions of the Ferguson Act, the Board's members chose the threat of an injunction and the loss of health insurance, probably because they expected to receive support from the court and because it would have been difficult to replace 1,600 teachers.

The Board of Education prepared for the injunction hearing but was unprepared for the judge's decision. In an opinion startlingly different from Judge Bert Long's ruling in the strike of 1968, Judge Frank M. Gusweiler stated that the Board of Education's case was "utterly frivolous" and "one of the saddest cases I've ever seen." He denied a temporary restraining order against the striking teachers, stating that it "would accomplish nothing but would add to the utter chaos that both sides have created. You should solve it yourselves" (emphasis added).

Striking teachers, who had been prepared to defy an injunction, were elated. Board of Education members, five of whom were lawyers, were anything but elated. Board member J. Howard Sunderman stated, "I am surprised and disappointed. It is clearly an illegal strike and I had expected that it would be enjoined." Times had changed since the 1968 strike's injunction. The use of an injunction, the strongest weapon of a school board in the 1960s, slowed somewhat in the early 1970s because it was not shown to prevent or shorten strikes. Judges in the 1970s, highly visible in elected positions, tended to reflect society's more sympathetic attitude towards public employees' right to fair bargaining. Many judges, like Gusweiler, began to use more latitude in their responses to requests for injunctive relief as they became "aware of the power-distributive aspect of their decisions."

**Tension Mounts**

Having been denied the restraining order, the Board of Education filed an appeal and moved into a phase of action that involved taking increasingly stronger punitive measures against the striking teachers. On the sixth day, the Board cut off the striking teachers' medical insurance coverage, two weeks earlier than it had originally stated, and threatened to fire the striking teachers. With renewed vigor, the Board used its
economic and legal power, hoping to break the strike and perhaps the union.

As a result, tension escalated between striking and working teachers who saw the strike from very different perspectives that were usually irreconcilable. Picket line abuse, mostly of a verbal nature, began on the sixth day. Several striking teachers subsequently filed suit, including one who had been hit by an automobile driven by a working teacher. Several teachers involved in the strike who were interviewed by the author described the strike as "very acrimonious" with a bitterness between those strikers who "feel that they got everything for others then and now and those who said, 'I can't afford to strike.'" Some relationships between former friends who took opposite sides in the strike were "never the same again" and "even today are still cool about it." The strike had one positive effect--camaraderie--among a community of strikers who felt "an excitement that only insiders understood." Sustained by their camaraderie, striking teachers endured the struggle and the difficult times, achieving a unity that made the strike and its outcomes possible.

Five Strikers Fired

The picket line abuse provided the Board of Education with an opportunity to take further action against the striking teachers. On the eighth day, the Board announced its plan to fire five teachers for unprofessional behavior during the strike, three of whom had filed suit against working teachers. The Board described its intentions as "routine" but the CFT considered it to be an "overt act of intimidation... designed to scare the other people back." The tactic was largely unsuccessful because the number of strikers did not significantly decrease during this time.

The announcement provoked the ire and action of members of the community. Two hundred citizens, some of whom had walked with teachers in the picket line, gathered on April 23 to form the group Citizens for Responsible Education and to make plans to attend the forthcoming Board of Education meeting. Angry citizens and over eight hundred teachers picketed and packed the Board of Education's meeting the following day. Citizens angrily interrupted the meeting, and Board of Education President Henry C. Kasson said, "The Board will not be shouted down... we will not be intimidated nor will we run the public out of the meeting." When these citizens repeatedly attacked the Board for "failure to bargain in good faith," Kasson responded, "It's like we are the bad guys and not the illegal strikers." His plea for sympathy neither persuaded the community members, nor did the public outcry dissuade the Board of Education, which voted six to one to fire the five
teachers, further alienating community members of Citizens for Responsible Education.

At the same meeting the Board of Education also stated its intention to demand open negotiations, according to the two year old "sunshine laws," that permitted open negotiation sessions for public employee contracts.\textsuperscript{64} The CFT opposed open negotiations and so did federal mediator John Wagner, who declared on April 26 that the media would not be allowed at the negotiations. Thwarted in this effort, the Board of Education then refused to negotiate except in open sessions and did not return to the bargaining table until the sixteenth day.

Throughout the negotiations, the Board of Education never offered to give a raise retroactive to January 1. Rather, it offered only two kinds of raises: a "strike savings" raise that would be equivalent to the amount of money saved during the strike and an "if-come" raise based upon possible revenue income from the forthcoming levy.\textsuperscript{65} This strategy could explain why the Board of Education continued to drag out the negotiations during the strike—it was accruing the strike savings to finance a raise and gaining support for passage of a school levy.

During the weekend, five hundred citizens, teachers, students, and labor leaders gathered at a rally on Fountain Square.\textsuperscript{66} Teachers also held a rally to hear speakers including Albert Shanker, president of the AFT, who encouraged them to stand their ground and reminded them of the long-term goals of their militancy. The striking teachers remained steadfast in their commitment to bring about change for all teachers.

\textit{Injunction Granted}

Finally, on May 3, Judge Gusweiler issued a restraining order, but he stated, "I can find no evidence that either side has made a serious effort to accommodate a positive result."\textsuperscript{67} Although balanced in his criticism, he had favored the teachers and their collective bargaining efforts by having given the negotiations process more time. Stephens stated that "this is the toughest day of the strike that will be the real test of our courage and convictions. Defiance is justified because when you have a just cause, you have an obligation to disobey a law in an effort to change it." One news article reported that "teachers walking the picket lines say the decision to disobey the court order was not a hard one to make."\textsuperscript{68}

Most of the striking teachers defied the court order, and Stephens was prepared to go to jail. Only 125 teachers returned to work,\textsuperscript{69} while 1225 teachers continued to strike.\textsuperscript{70} A news reporter noted that "the union's loyal supporters have sacrificed a full paycheck ... the CFT's strength has been impressive ... Even board members admit that they didn't expect it without CTA support."\textsuperscript{71} Board member Edward Geers said he "had hopes for a lot more ... if 100 is all there is, I can't say that I'm overjoyed ... I hoped that about a half would return."\textsuperscript{72}
The Board of Education did not seek contempt charges, partially for fear of provoking "martyrdom" if teachers were sent to jail. Clearly the stamina, determination, and commitment of the striking teachers, as well as their financial sacrifice, impacted on the Board and proved stronger than the legal power behind the injunction.

**Ending the Strike**

After six days of refusing to negotiate, the Board of Education's stalling techniques were no longer tolerated. On the sixteenth day, the federal mediator Wagner required round-the-clock negotiating in private. Two days later, the CFT rejected an offer that the Board of Education considered "fair and reasonable." In response, the Board used its power to end the strike and voted unanimously to "unilaterally implement their contract terms effective immediately." Again threatening to fire the striking teachers, Kasson stated, "We are ultimately going to end the strike . . . (even though) there may be teachers no longer employed by the system picketing." Angry citizens picketed his apartment that night. Expressing "widespread indignation" over the unilateral settlement, one thousand CFT members voted "overwhelmingly" the next day to continue the strike.

On May 8, the CFT negotiating team obtained several changes in the Board of Education's settlement offer. On May 9, teachers voted to accept the contract offer. Thus, a nineteen day strike ended.

Highlights of the final contract settlement as stated in the *Federation Teacher* are as follows:

1. Wages: 6% pay raise effective immediately and a 3% raise retroactive to Jan 1 if the school gets any additional money from any source by Dec. 31.
2. Arbitration: Tenured teachers who are dismissed may go to binding arbitration. Other grievances regarding contract violations may go to advisory arbitration with the Board of Education having the final say.
3. Shared authority: teacher building committees will meet monthly to make recommendations about the contract, educational policies, and programs in the school.
4. Class size: no agreement was reached on this issue.
5. Teacher transfers: seniority will be the basis for determining voluntary transfers.

In terms of teacher work conditions, the 1977 contract defined by the minute the length of the school day, outlined detailed procedures for student discipline and high school student absences, and required that any grade given by a teacher can be changed only with the principal's initials.
Strike Overview: Gains and Losses

One way to determine who "won" the strike is to compare the initial demands of the CFT with the final contract provisions. In this respect the Board of Education was the winner. The contract, generally considered by the CFT to be weak,\textsuperscript{82} definitely favored the Board of Education in economic terms because the six percent raise, "strike-savings raise," had cost nothing, being entirely paid by the strikers with the $1.5 to $1.8 million saved\textsuperscript{83} from their withheld wages. By negotiating an "if-come" raise, the Board did not place any burden on the existing budget and also guaranteed strong teacher support of the levy.\textsuperscript{84} In addition community members would more likely vote for the levy because the strike had dramatized the teachers' need for a raise. The Board of Education had also been able limit the arbitration demands of the CFT and had totally ruled out consideration of class size, an issue with major economic as well as pedagogical ramifications. Based upon these provisions, the Board negotiated a contract that was economically in its favor. In these terms, then, teachers "lost" the strike.

Teachers, however, won in several significant areas that would prove instrumental in establishing the role of the CFT as a partner in education reform in the late 1980s. Several aspects of the contract provided "basic building blocks"\textsuperscript{85} in contract language that enhanced teachers' rights, according to Tom Mooney, a member of the 1977 negotiating team. The contract included significant language that enhanced teachers' voices in school matters at the district level and gave teachers more control over their work. It was agreed that long-term planning was "essential for an efficient and effective education program" and that "any Board of Education committee shall include representation from the Federation." The contract also stated that "all teachers have the right to scrutinize the entire budget for their schools."\textsuperscript{86} By the late 1980s the involvement and the credibility of the CFT in matters of education reform were taken for granted by community members.

Of long-term importance were the newly created teacher building committees that provided a forum for teacher voice in building policy. Even though teachers were limited to making recommendations to the principal, these committees prepared the way for the creation in the 1980s of district-wide committees with equal teacher-administrator representation and an equal voice for teachers in making recommendations to the superintendent in matters related to school reform. In this way the traditional imbalance of power was reduced.

Another important gain for teachers was the support of the citizens who became an attentive audience when teachers expressed their concerns about the quality of education. In the early 1980s the CFT enhanced this community support by developing a coalition with
citizens to pressure the Board of Education finally to take action about class size and grading.

The Board of Education, on the other hand, provoked community criticism and even outrage with its strikebreaking tactics and negotiation stalling techniques. In addition, public attention drawn to previous Board decisions that favored management over teachers and students further alienated citizens. Consequently the Board lost public trust, and the teachers gained a realignment of power in community support.

None of these teacher gains would have been possible had the strikers capitulated. Their commitment to economic justice, improved teaching/learning conditions, and teacher voice combined with their willingness to make personal financial sacrifice earned the respect of community members. The school board members also learned that the united striking teachers were not going to return to a subservient role in the education hierarchy. They had been willing and able to challenge the power of the Board of Education. The 1977 strike provided the foundation for the next ten years of CFT activism, which further realigned the power in the educational bureaucracy in Cincinnati to establish the CFT as a significant partner in school reform in the late 1980s.

The State and Popular Education in Wisconsin:

Teachers' Institutes, 1880–1920

Teachers' institutes were the dominant form of teacher education in Wisconsin in the late nineteenth century. This was especially true of teachers in rural areas, who would be adjudged poorly educated by today's standards. A normal school education was a rarity for teachers in the common schools until well into the twentieth century. Most rural and village school teachers had neither access to a high school education nor the option of attending a county training school for teachers until the 1920s, when these two forms of schooling became widespread. During the period between the Civil War and World War I, teachers' institutes were ubiquitous. To use Dane county in 1887 as an example, 257 of the county's 425 rural teachers attended institutes that year, while only 67 teachers had attended or graduated from a normal school. Even in the city of Madison, only six teachers out of thirty-nine attended or graduated from normal school; and Madison's teachers received much of their training through "institute work" at weekly Saturday morning meetings.¹ For most people seeking employment in rural schools, teachers' institutes were the only form of formal teacher education available. In the late nineteenth century, teachers' institutes played an important role even for teachers in Wisconsin's urban schools.

In spite of the past popularity of teachers' institutes, much of the history of teacher education ignores their role. Unfortunately, there is sometimes a tendency for historians to investigate only those institutions which exist and flourish, albeit in altered forms, at present. In the history of teacher education, then, research has often centered on the growth of normal schools and university schools of education, in part because of the roles these institutions played in the systematization and professionalization of public education. Often neglected by the historian, at least until recently, have been those public school institutions
that have, for all intents and purposes, ceased to exist: the one-room rural school and the teachers' institute.

Yet studying the alternatives to the modern educational system can also be a fruitful method of gaining insight into school and society: first, because a focus on unsuccessful educational institutions illustrates conflicts within education, and second, because these past "failures" may serve as guideposts for current educational reform. Teachers' institutes were written about extensively in the nineteenth century because many administrators viewed them as a viable form of teacher education. Few histories of teacher education of the past 20 years devote attention to teachers' institutes, the exceptions being Paul Mattingly's "Educational Revivals in Antebellum New England," Wayne Fuller's The Old Country School, and Kenneth Zeichner's "The Role of the Teacher's Institute in Nineteenth Century Wisconsin." These three outstanding works provided a starting point for this article.

In the process of investigating teachers' institutes, a central question emerged: Why did teachers' institutes fold? I argue that teachers' institutes, after a half century of variegated existence, came to have no place in the professionalization ethos of both the normal schools and the state Department of Public Instruction (DPI). Increasingly, other forms of teacher organization began fulfilling similar social outlets for teachers. From 1910 to 1920, normal school administrators and the state superintendent began to extricate themselves from the business of organizing and conducting teachers' institutes because these local affairs could no longer enhance the status of much of Wisconsin's educational leadership centered in normal schools and cities.

Some of the causes of the demise of teachers' institutes are found in moves to consolidate rural schools, to credential country teachers beyond passing grades on yearly exams, and to supervise teachers in rural schools. Thus teachers' institutes went the way of the one room school house and the county superintendency. This explanation is not enough, however, because teachers' institutes continued to survive even after the normal schools and state authorities withdrew official support. In the end, the teachers stopped attending because of the availability of other forms of educational and social outlets, including local County Training Schools for Teachers, regional teacher associations, teacher reading circles, and the rise of mass entertainment.

This article describes teachers' institutes, discusses their importance to the rural teachers who attended them, and examines the links between the institutes and the state normal schools and DPI. Through an investigation of these three areas, I conclude that 1) by their nature, teachers' institutes were neither prone to bureaucratic control nor suitable for the dissemination of a professional body of knowledge, and hence, became increasingly anachronistic to the growing system of public education,
and 2) teachers stopped supporting the institutes as other educational institutions and forms of popular entertainment, providing similar functions, grew in size and scope.

**Teachers' Institutes in the Late Nineteenth Century**

Perhaps the most striking feature of teachers' institutes in Wisconsin was their multiformity. Teachers' institutes varied in length of time from one or two days to three or four weeks. Their curricula were characterized by a tension between remedial academic work and professional development. Their tone was often hortative, as they spread the message of the common schools. Others again were designed to make the teaching methods in the rural schools more uniform. Some were designed to attract new people to teaching, while others were centered on more experienced teachers only. Superimposed on this picture of teachers' institutes as diverse and varied, however, is a fifty year history of state superintendents and heads of normal schools attempting to standardize the institutes through bureaucratic guidelines. This standardization peaked in 1899, when State Superintendent L.D. Harvey converted DPI suggestions to requirements.4

Since teachers' institutes came in so many different varieties, it is difficult to describe a typical one. Suffice it to say that teachers' institutes were a form of teacher education in which leading educators at the town, county, or state level organized gatherings of teachers at different locations for short periods of time in order to impart academic and professional training. In addition, the teachers' institute was a form of rural culture, and these gatherings were important to the rural communities which hosted them. Finally, until the early twentieth century, the teachers' institute represented the only formal teacher education that most rural teachers received.

By the early 1890s three groups of administrators had a stake in the governance of the institutes--the county superintendents, who were required by state law to hold at least one institute per year; the normal school policy makers, who helped conduct institutes in rural areas surrounding each normal school; and the state superintendent, who was responsible for authorizing institutes in those counties deemed furthest from normal school reach. The normal schools and DPI received from the legislature a fixed amount of money each year for conducting institutes, while the county superintendents received money raised from teacher examination fees, and more importantly, from modest tuition payments by the teachers in attendance. The three groups had different motives for sponsoring institutes. For the county superintendent, the chief concern each year was ensuring an adequate supply of certified teachers to meet the school districts' demands. Hence, teachers' institutes would be held at least in part to attract new teachers. The normal
schools sought to bring the normal school curriculum to rural teachers and recruit students to their schools. A substantial proportion of normal school students had previous teaching experience. The state superintendent sought to raise the status of rural teachers while at the same time advancing the careers of state level school administrators.

Two other groups also had interests in the institutes—the conductors and the teachers. The institute conductors usually consisted of normal school teachers, high school principals and teachers, and city and county superintendents. Usually a university professor or a prominent local citizen would also be called upon to deliver a keynote lecture. With the exception of the normal school conductors, who were on the road several months each year, no one made a career conducting teachers' institutes. Conductors took time from their regular duties to run institutes, usually earning some extra money in the process.

The institutes were very popular with the rural school teachers. Zeichner estimates that statewide, 1/3 to 1/2 of all teachers attended institutes each year in the late nineteenth century. Teacher institutes were never compulsory for teachers, although state superintendents often supported bills in the legislature to that effect. Informal pressures encouraged teachers to attend, however. These informal devices centered around certification and hiring requirements. At the turn of the century, there were three ways for teachers to become certified: they could attend a normal school or the university, they could attend a high school which offered a teacher training course, or they could pass an exam administered by a county or city superintendent. For most rural teachers, the third route represented the only choice.

County superintendents often held annual teacher examinations at the close of the institute, some superintendents even added five points to exam scores just for institute attendance, and exam questions were often based on the institute curriculum. The degree of difficulty of the certification exams is open to some debate. According to Mary Bradford, who had climbed the educational career ladder from rural teacher to city superintendent, her 1874 exam for a third grade certificate was so easy that "anybody with common sense and with recollection of one or two good teachers, could have answered." She passed the exam without attending a teachers' institute. According to an institute student of 1885, however, the third grade exam was unnecessarily difficult. This student asked, "Is a third grade teacher expected to be acquainted with every rock in the sea?" Probably the difficulty of the exam varied according to the demand for rural teachers, with the exam being reduced to a formality in areas of acute teacher shortages. Whatever the degree of difficulty, the lack of uniform standards in exams proctored by county superintendents conflicted with the systematizing objectives of state education officials in Madison.
The other informal pressure compelling teachers to attend the institutes consisted of warnings and admonishments from educational administrators. As one educator explained, "The teachers who will not make some sacrifice to attend them [the institutes] are not worthy to be employed." Again, in situations where many teachers competed for few jobs, a rarity in the rural schools since the pull of town and city schools attracted so many rural teachers, participation in institutes could be taken into account when the local school directors made their hiring decisions. More often than not, however, the teaching position went to the lowest bidder. The fact that teachers could get paid while attending institutes during the school year also motivated teachers to attend. Admonishments from education officials and preparation for third grade certificates were unlikely by themselves to cause nearly one half of rural teachers to attend institutes annually; teachers probably attended in spite of pressures from the educational hierarchy.

**Teachers' Institutes and the Rural Teachers**

Teachers' institutes were social events. Local newspapers announced and covered the institutes; the public attended the evening lectures; and the *Wisconsin Journal of Education* published the participants' resolutions in its "Notes" section until the 1890s. For young women teachers in rural areas who lacked the resources to attend a normal or high school and who were not yet inclined to migrate to the burgeoning cities, the teachers' institute held at a county seat or a large town offered opportunities for comradery and socializing without parallel. Attending a teachers' institute for the teacher of a one-room school often meant a first train trip, the opportunity to board away from home, and the excitement of meeting new people.

One example of the institutes' popularity among teachers and rural communities is taken from a *Wisconsin Journal of Education* article entitled "Three Plucky Schoolma'ams," in which three young women travelling by train to their first teachers' institute were snowed in before reaching their destination. As they lacked the cash to pay for a hotel room, they hired themselves out as domestic servants during their unscheduled stopover and then travelled to the institute the following week. Not only does this article illustrate, rather glaringly, teaching as an extension of domestic labor within a gendered occupational hierarchy--it also demonstrates the institutes' popularity among rural teachers. Perhaps the most compelling evidence for the popularity of the institutes is the fact that even in the 1910s, when a passing grade on a third grade exam was no longer the only requirement needed to teach in the common schools, over 10,000 teachers per year continued to participate in institutes.
In addressing the popularity of teachers' institutes, there is a difference in interpretation between Zeichner's article and Fuller's book, with Zeichner interpreting the glass as half-empty and Fuller seeing it half-full. Zeichner's article is critical of claims of success made by institute sponsors in the late nineteenth century. He argues that descriptions in the Wisconsin Journal of Education prior to the 1890s paint the institutes in glowing, but unrealistic terms. For example, almost all institutes passed resolutions praising the conductors and lauding the usefulness of institute work. On occasions when attendance at institutes was poor (and most institutes drew from 50-200 teachers), accounts of those institutes blamed the weather or teacher apathy rather than suggesting that the institute program had little to offer. Perhaps the firmest ground Zeichner has for characterizing the institutes as dispensable and unpopular is the fact that over half of Wisconsin's teachers stayed away from institutes each year.17

Zeichner stresses three examples that were critical of the institutes. First, he quotes Mary Bradford, herself a frequent institute conductor, as observing that institutes were often used by conductors to grandstand rather than help teachers in meaningful ways: "But there were a few men who were regularly engaged in important service for the state, who it seems to me were following after 'false gods.'" Zeichner also quotes Superintendent L.D. Harvey's 1900 biennial report to the state legislature, in which he argues that institutes often had "defects": the repetition of the same work from year to year, the reliance on political connections rather than teaching competence in the appointments of conductors, and the excessive reliance on the lecture method of instruction--all served to lower the quality of the institutes. Third, Zeichner uses an 1899 article by teacher Ida Baker, who states that "any teacher can accomplish more in one hour in her room reviewing than in the whole week of institute classes."18

Wayne Fuller, on the other hand, stresses the popularity of the institutes by emphasizing their functions for rural communities and appeal to rural residents. As evidence of this local control of teachers' institutes, Fuller stresses that they were financially self supporting and that the county superintendents had control of the timing of the institutes, much of the curriculum, and the selection of conductors. Indeed, county superintendents often passed over more famous educators in order to select "lesser-known men and women for their conductors and teachers." Fuller keeps in mind that the county superintendency was an elected position, and these officers would show responsibility to the farmers who elected them. The author goes so far as to dub the county institutes "the rural young people's colleges."19

It seems to me that the popularity of the institutes cannot be discounted, despite the often exaggerated claims of some institute sponsors.
and the criticisms of contemporary observers and participants. Mary Bradford states that, "They [the teachers] were receiving barely a living wage, and many of them could scarce afford the expense incurred for the two or three weeks of institute attendance." Nevertheless, nearly one half of the Wisconsin's teachers were willing to pay the dollar or two entrance fee, in spite of their low salaries. Fees at teachers' institutes remained far less expensive than tuition at normal schools.

Although Ida Baker's article levels serious criticisms against the institutes, she also praises them. In another passage, she states the following:

The friendships, the acquaintances among the teaching fraternity of the country, the relations of trials and successes, the pointers in regard to position, the chances to do one and other kindnesses and to appreciate the kindness of a thoughtful superintendent, and the chance to talk shop all we want to without being ill mannered are things worth saving.

Hence, when approaching the topic of teachers' institutes, social and cultural aspects of importance for teachers and local communities need to be emphasized along with decisions made at higher levels. Otherwise, an understanding of the institutes' decline would be incomplete.

Since the teachers' institutes were such important social events in the lives of rural school teachers and communities, county superintendents continued to sponsor the institutes even when the normal schools and the state superintendency quietly withdrew their support in the 1910s. Despite the professional aspirations of the educational hierarchy in directions away from the institutes, several thousand teachers continued to attend yearly until the 1920s. Zeichner reports that "authorization for the holding of teachers' institutes continued to appear in the annual edition of the Wisconsin Laws related to Education and was finally repealed somewhere between 1946 and 1953." What, other than withdrawal of official support, compelled teachers to stop attending the institutes?

It seems that the growth of two other educational institutions for teachers could have influenced at least some of them to divert their attention away from the institutes. First, reading circles for teachers grew in popularity during the early years of the twentieth century. Groups of teachers gathered a few times each year to discuss books that all the teachers taking part in the reading circle had read. In some states, as many as 5,000 teachers were enrolled in reading circles, and for a time in Wisconsin the State Department of Public Instruction sought to regulate them. In 1912, a committee of the Wisconsin Teachers' Association (WTA) even recommended that reading circles be made compulsory for beginning teachers. The reading circles often provided the
Another educational innovation for teachers that grew during the early twentieth century was the network of regional associations of Wisconsin teachers. The WTA began dividing into regional grouping in 1890. By 1914, the WTA had branched into several sections: the Northern, the North Central, the Central, Lake Superior, the Northwestern, and the Southern. All held yearly meetings which lasted two or three days and had formats that were similar to the nonacademic institutes. For example, the 1914 Southern Wisconsin Teachers' Association meeting featured several local and out of state speakers, and the topics included talks on literature and medicine. Thus, teachers formerly attracted to the institutes now had the choice of reading circles and regional association meetings.

Finally, it is essential to remember that other forms of popular education, including granges, workingmen's clubs, and the Chautauqua movement also declined in the early twentieth century. Perhaps the reasons for the general demise of these cultural forms can help explain the decline in popularity of teachers' institutes. Using the Chautauqua movement as an example, the decline "has been attributed to the swift popularity of radio, to improved roads and mass produced automobiles, and to the advent of talking pictures." Perhaps the growth of mass entertainment, marketed on a national scale by the 1920s, had an adverse impact on the teachers' institutes. Rural areas became less isolated and more integrated to population centers in the 1920s. Although earlier innovations such as the telephone and rural free delivery started this process, widespread use of the automobile by rural residents extended it and made "modern" forms of education and entertainment accessible.

**Teachers' Institutes, Normal Schools, and the State Superintendency**

Beginning in 1867, the normal schools had partial responsibility, along with the county superintendents and the state superintendent, for conducting teachers' institutes throughout the state. Each normal school had a district in which to hold institutes and a teacher assigned to conduct them. As the number of normal schools grew, from three in 1872 to seven by the early 1890s, the number of districts increased proportionally. These "normal institutes," as the normal schools called them, were often six weeks long and were organized at the request of county superintendents. Coordination of these normal institutes lay with the Board of Regents of Normal Schools and the state superinten-
dent, who also served on the institute committee. By 1892, the normal schools helped to organize 85 institutes in 60 different counties, with over 5,000 teachers in attendance at an annual expense of approximately $7,500. By 1910, the Board of Regents of Normal Schools allotted $13,448 for teachers' institutes, out of which $9,466 paid for conductors' salaries.29

From this point on, however, normal school spending for teachers' institutes decreased. In 1911 the normal school Board of Regents spent $4,558 on the institutes, and by 1914, only $1,959 was earmarked for them.30 The year, 1914, also marked the last year for the Board of Regent's standing committee on teachers' institutes. By the 17th biennial report, the president of the board of regents mentioned the teachers institutes as a thing of the past when discussing rural education. "The board, with the active cooperation of the state department and the local superintendence offered a mild substitution for continuous normal work, in institutes, or short term normal schools under the direction of faculty members specially qualified for that work."31 The board of regents tabulated no expenditures for institutes in 1918. Hence, in this year the normal schools abandoned institute work for good, and seemingly without explanation.

Normal school educators had viewed the institutes, and by extension the training of rural school teachers, with ambivalence. The institutes were considered as only temporary and partial solutions for the education of rural teachers. For example, a pamphlet covering the 1898 St. Croix teachers' institute describes it as "but a two week's chunk of a State Normal School with a reduced faculty."32 The normal schools' ambivalent policies regarding the teachers' institutes are understandable considering the normal schools' other interests. In his article "Wisconsin Normal Schools and the Educational Hierarchy," Jeff Wasserman persuasively argues that Wisconsin's normal schools were often more interested in building college level liberal arts programs than they were in the narrower focus of teacher education.33

It seems that normal school educators had three policy choices regarding rural teacher education. The first was to devote attention to teachers' institutes, which the normal schools did with varying degrees of effort until funding dropped off after 1910. The second was to establish a course of study for rural teachers on normal school grounds. Two year courses for the training of rural teachers were implemented in the normal schools beginning in 1909, and this program of study replaced the academic course, which was in reality the high school curriculum.34 The program was decidedly unsuccessful. At least as far back as 1881 most administrators knew that "graduating from normal school has become synonymous with turning one's back upon common school work."35 Total rural course enrollment in the nine normal schools stood
at 444 in 1914 and 396 in 1920. Numbers such as these could not have made much of an addition to the rural teaching corps. In the eyes of normal school administrators, there was little prestige in training young rural women to teach in one-room schools, whether courses of study were offered at normal schools or whether these educators travelled to remote sections of the state. For the rural students who gained admission to the normal schools, most saw rural training courses as steps back to farms, while enrollment in other courses of study provided opportunities for more lucrative urban employment.

The third policy avenue open to the normal school educators was to join forces with the state superintendency in lobbying for higher certification requirements coupled with state aid to all rural schools that conformed to minimum central guidelines. Ultimately this is the path that the normal school educators chose to take.

The state superintendency sought to further standardize and supervise the teachers' institutes until 1910, when state funding from the legislature to DPI for institute work was cut in half, from $14,000 to $7,000 yearly. Supervision of the institutes by the state superintendency peaked in 1899, when Superintendent Harvey gained greater control in certifying conductors and elevated the annual meeting of institute conductors in the city of Madison to the status of a conductors' school. A few years later, Harvey left his position to assume the presidency of the Stout Institute in Menomonie (an expanding normal school) and his successor, Charles Cary, hardly mentioned the teachers' institutes in his biennial reports.

Around the turn of the century, Wisconsin's state educational administrators began devoting more rhetoric and resources to the conditions of the rural schools, with their criticisms becoming ever more strident. "The old country school is moribund and must disappear," announced one editorial. "Poor teachers, in so great proportion to the whole number, are the bane of the rural school," suggested another. In the Wisconsin Journal of Education and the biennial reports of the board of regents of normal schools and the state superintendent, the backwardness of the rural schools received more press at the same time teachers' institutes were discarded as a method of rural teacher education. The state superintendency used the following methods to improve the status of rural common school teachers: increasing certification requirements beyond passing grades on exams, creating positions for rural school inspectors, earmarking state funds to provide minimum wages for teachers and supplemental funds to the rural schools, and founding County Training Schools for Teachers. Without exception, these policies bypassed the teachers' institutes.

Regarding certification requirements, the normal schools and the state superintendent were able to get laws changed in 1908 so that all teachers
needed at least six weeks attendance at a professional school for a third grade certificate, and teachers could renew their certification by attending a six week summer course rather than retaking the exam, as many returning third grade teachers had been doing each year. Over the next two decades, certification required ever increasing amounts of formal schooling: in 1913 two years past the common schools were required, one of which had to be "professional training;" by 1917 every teacher had to have at least two years of high school in addition to a one year professional course; and by 1927 every new teacher had to be a high school graduate in addition to obtaining one year of professional education, usually in a normal school or county training school.

Through the efforts of county superintendents, with support from DPI, the first county training schools were established in 1899. These schools were small, with one or two teachers offering a two year course of study for common school teachers. Nevertheless, by the 1920s the thirty-three county schools had a hand in educating the bulk of the state's rural teachers. The normal schools and the state superintendency were often critical of these schools, claiming they were expensive to operate and often drew students from the same areas as the normal schools. Undoubtedly the county schools began to serve some of the same educational functions as the teachers' institutes, and these schools had numerical success in placing teachers in rural schools.

New state guidelines also encouraged teachers to remain in rural schools. A 1915 act subsidized the salary of all teachers who were graduates of a normal training course and had at least one year of teaching experience. In addition, a minimum wage of $40 per month for rural teachers was established at approximately the same time, and rural schools rated "first class" by state inspectors also received state aid of $50 per year. During the early twentieth century, the state superintendent sought greater control over the county superintendents. To this end, the county training schools were attacked as inefficient, a growing staff of rural school inspectors reported to Madison rather than to the county superintendents, and the county superintendents were compelled to document more and more information.

As the county superintendents, underpaid as they were, devoted more time to satisfying state regulations, they had less time for teachers' institutes, for it was the county superintendency that still possessed much of the initiative for the institutes, despite state administrators' rhetoric to the contrary. Yet, normal schools and DPI decided to pass the institutes by, and in the process, the central authorities neglected the education of the rural common school teacher. By withdrawing state funds and expertise from the institutes, the informal pressures for teachers to attend were removed while the social and cultural motivations for rural teachers to take part in institutes lingered.
In the move to professionalize, the state normal schools strove to attract a student body of future high school teachers and educational administrators and interpreted their commitment to teacher education as one function among many, while the state superintendency moved toward the growing systematization of rural and urban schools alike. Jurgen Herbst interprets the history of teacher education in the United States as an abandonment of the elementary school teacher. "Normal pedagogues and professional educators, by and large, had given up on America's largely female elementary school teachers." Since these educators approached the teacher education of elementary school teachers as an endeavor which they were required to undertake but hoped to avoid, it is little wonder that the teachers' institutes, so important to the rural school teachers, were abandoned.

**Conclusion**

Teachers' institutes, then, contained a tension. On the one hand, the normal school leadership and the state superintendency attempted to standardize the institutes. On the other hand, local farmers and teachers used institutes as a form of popular education and culture. Wisconsin's educational leadership resolved this tension in the early twentieth century by withdrawing support for the institutes, concentrating instead on extending the reach of the normal schools as a means to professionalize. However, many rural teachers continued to attend institutes even after the normal schools and the state superintendency withdrew support.

By understanding the teachers' institute as a form of popular education, we can perhaps more fully explain their decline. First, teachers began to organize into reading circles and regional associations. These institutions formed alternatives to the institutes. Second, the automobile and the growth of mass entertainment contributed to the demise of preindustrial forms of popular education. Socio-technological developments--mass produced automobiles and mass communications--also helped propel the systematization of mass schooling forward. Perhaps, then, there is more to the story of the decline of the teachers' institute than professionalization.

In April 1940, seven months after the outbreak of war, German troops occupied Denmark and invaded Norway. What some British and American observers had called the "Phoney War" erupted into sudden fury. The awesome Blitzkrieg did not cease until Hitler's armies smashed their way through the Low Countries and France. Most of Europe fell under the domination of the Third Reich. The victorious German army assembled just thirty miles from the English coast, poised for an invasion of England. Only Britain, supported by Commonwealth forces and pledges, remained to counter Hitler's legions.

Although the expected invasion never came, the British people prepared for "total war." For five and a half years, from September 1939 to May 1945, every aspect of British civilian and military life was shaped by the brutal experience of war. No individual remained unaffected. No institution remained unchanged. Schools and their pupils were not exempt.¹

Even before Britain declared war on September 1, 1939, almost two million school children and their teachers were evacuated from the nation's cities. This mass exodus, undertaken in the expectation of massive German bombing of English population centers, became a central metaphor of the war. Evacuation thoroughly disrupted children's education even as it sought to protect their lives. For thousands of city children who were not evacuated, their schooling simply ceased. Evacuated schools struggled mightily to continue ordinary educational programs, but problems overcame most of the best efforts of teachers and reception area officials. Even after this great evacuation drained away to an ignoble conclusion, the government spawned subsequent evacuations of school children in the face of major emergencies.²
The Blitz was the first and most prominent of these emergency circumstances. Long expected, the Luftwaffe's bombing campaign opened suddenly and terrorized major English cities for more than nine months. Beginning on September 7, 1940, London was bombed on seventy-five of the next seventy-six days. On November 14, Coventry suffered a ten-hour raid which killed more than 4,000 civilians and destroyed a third of this industrial city. Thousands of school children and teachers suffered evacuation again during the Blitz, many to remain separated from parents for the remainder of the war. Bombing also destroyed more than a thousand school buildings. In one of London's boroughs, for example, only one of ninety-one buildings escaped damage. At its end, the Blitz claimed more than forty thousand civilian deaths and left two million people homeless. One in five London homes was destroyed. Despite optimistic reports that the British withstood the bombing with their stereotypically stoic fortitude and resilience, the reality remained grimly different, but seldom publicly acknowledged. British officials knew the seriousness of the situation. One report noted, "Of course the press versions of life going on normally in the East End of London are horribly distorted. There was no bread, no electricity, no milk, no gas, no telephones. There was, therefore, every excuse for people to be distressed." This war differed from others Britain had waged. It was truly a total war.3

The Early Years of War: Informing the American Audience

Westward across the Atlantic, the United States continued to claw from beneath economic depression. It failed to join the League of Nations following the Great War and, throughout the 1930s, remained officially isolationist in foreign affairs. The new European war, however, found most Americans sympathetic to the Allies, especially to Britain. This interest fed on dramatic reports from newspaper and radio journalists. American educators, in addition, had access to portrayals of wartime English schooling within the pages of their own professional journals.

These accounts began as a trickle in the Fall of 1939, but their numbers slowly escalated throughout the war. American teachers and administrators came to know about, if not truly to understand, the rigors of schooling during wartime. These articles had two additional effects. However tacitly, they fostered American support of the British cause. They also served to sensitize and prepare American educators for their own wartime emergencies when the U. S. entered the war. Long ignored, analysis of these articles adds a largely unrecognized dimension of the war's impact on American educational life.

Understandably, most of these articles published near the beginning of the war were written from news accounts or from the perspective of
English educators. As the war wore on, American educators who had earlier visited England or who had a special interest in English education began to write about wartime British schools. Articles authored by English educators also became prominent features in a number of American journals.

As the war drifted into 1941, many articles about English schooling appeared. Professor I. L. Kandel, for example, offered an explanation for this increasing thirst for knowledge of the British wartime situation: "Never was there so a great a need of understanding and perspective as in these days of crisis. Never was there as much need of knowledge to combat misunderstanding between countries whose future is in the balance." In that same month, these ideas were echoed in the editorial of another journal. It warned American educators, "At times like the present few people can preserve a cloistered aloofness toward the situation in Europe." The vast majority of these articles explored the massive effects of evacuation and wartime bombing on the lives of English school children and teachers.

Consequently, American educators followed these and other English wartime educational matters in some detail. They learned of the government's careful planning and execution of the evacuation process and of the uncommon disadvantages and alleged benefits afforded by this massive undertaking. For example, Harry N. Rosenfield of New York University's School of Education mirrored official English statements in his comments that evacuation constituted "one of the greatest mass migrations in all history" and was awed that "the whole plan worked as well as it did." Similarly, Seattle's superintendent wrote, "Yet triumphant above myriad hardships and frustrations has been that immortal something which we call school - the spirit of teachers, and boys and girls living, working, and enduring." Fascination with evacuation continued throughout the war.

Particularly striking was the amount of specific detail contained within the articles published in American educational journals. Not only were readers informed about the practical and logistical problems of evacuation, but also the intimately personal experiences associated with the enterprise. For example, American educators learned in detail what school children could carry on their train journeys to their new, and unknown evacuation destination. As one report explained,

Each child carried with him hand luggage containing a child's gas mask, a change of underclothing, night clothes, house shoes or plimsolls, spare stockings or socks, a toothbrush, a comb, towel, soap and face cloth, handkerchiefs, and if possible a warm coat or mackintosh and a packet of food for one day.
Another article reported the experiences of a fourteen year-old girl who arrived tired, confused, and frightened by the prospect of finding a new home. She arrived with her little sister whom her mother insisted remain with her and her two other sisters. She wrote in her diary, 

We trudged wearily along, knocking first at one house and then at another, asking the same question over and over again: 'Are you willing to take any evacuees please?' Sometimes the answer was 'Yes,' at other times 'No.' Gradually we became fewer and fewer, till only a handful of tired and forlorn looking girls turned down a road. I was one of them. All the occupants of the nearby houses came out to look at us, the children crowding round us, staring in wonder. About half an hour passed but it seemed ages, and then one lady in the group standing round us said, 'I would like that little girl and her sister please,' so my other sisters Edith and Joyce went off down the road.9

Readers of these articles became acutely aware of the human dimension of wartime conditions and the distinctively personal experiences of evacuation. Each person had a private story to tell; nevertheless, a number of experiences typified the commonplace. For example, many articles point out that some children benefited enormously from evacuation. Leaving the grime and smog of a city slum, many children found new delights of life in the countryside. Other children developed emotional scars from their separation from parents, in some cases, for six years. Still others resented the habits and rules of their new foster parents and were eager to return home, even to the bombing, at the earliest opportunity.10 Some accounts related the disturbing and alienating affects that evacuation had on parents. Agnes E. Meyer, along with her husband, Eugene Meyer, publisher of The Washington Post, visited Britain in November 1942. She reported some of the debilitating affects of the war on mothers in England. Meyer told a story, recounted to her by a friend, of one mother who desperately wanted to visit her evacuated child.

For months she had saved her meager earnings to add to the government allowance for a railroad ticket to visit her little boy in the village where he was billeted. The foster parents were considerate and sent mother and child into the garden to be alone. The favorite candy, which formerly had been the boy's Sunday treat, did not interest him because he had better desserts every day. The little toy could make no impression on a lad who now had a rocking horse. Bored with this semi-stranger
he ran back to the house and to his new, more alluring life. My friend could do nothing to comfort this mother who had lost her only son. She sat staring out of blank eyes, at the two grimy, useless packages in her hands.  

Such a poignant story reflected the harsh reality of living in a society consumed by war.

American Educators Learn from the Evacuation Experience

Several articles appearing in American journals raised the issue of the appropriateness of evacuation and suggested that it may have caused more problems than it solved. For example, an article in The American Teacher argued that, "the damage resulting to educational services from aerial attack is, however, almost certainly less than that produced by the preventive measure of evacuation." Similar views were shared by a review published in the Journal of Educational Psychology. This analysis claimed that greater psychological damage was caused by separating youngsters from their parents through evacuation than from the harm inflicted by air raids. The report concluded as follows:

In short, children show greater adaptability, and recover well from air raid effects, but the strain of separation from parents by evacuation is generally greater, and the effects more profound. Every investigation has demonstrated the fundamental importance of the home ties in the emotional development of the child.  

Numerous articles referred to problems associated with evacuation such as lack of school equipment, disruption to daily routines, inadequate facilities, overcrowded classrooms, and the paucity of male teachers. However, in considering the drawbacks of evacuation, most attention was allotted to problems of juvenile delinquency. Authors of many articles remembered that, although evacuation was first carried out in September 1939, the intensive bombing of British cities did not occur until September 1940. As a consequence, thousands of evacuees drifted back to their urban homes. An article in The School Review estimated that, "more than half of the children removed from the cities at the start of the war have returned because bombing has not materialized" and claimed that over four hundred thousand children were receiving no schooling. The Education Digest reported that since schools remained closed in the cities "children are simply running on the loose." Several of these articles reported extracts from readers of the London Times outraged by the presence of street gangs and the lack of formal education and discipline. In another report, Agnes Meyer remarked that petty theft was frequent, that the blackout encouraged teenage lawlessness, and that as "thousands of young girl war workers are away from
home and parental supervision for the first time illegitimacy is causing some concern.\textsuperscript{14}

Nevertheless, despite such responsible criticisms, other writers approved of the evacuation policy as necessary in order to save children's lives. This argument was strengthened by observations "that over half of London's schools have been bombed."\textsuperscript{15} Yet, surprisingly, many journal articles did not make continued reference to the factor of children's safety. Indeed, most articles reflected on the positive effects of evacuation.

Accordingly, American readers learned that some English educators believed that the immersion of city children into rural life had salutary benefits on both their health and their general attitude to life. Indeed, some articles noted that, despite the shortages and widespread suffering caused by the war, English children had never been healthier. In a long article about the mental and physical well being of English school children, one author concluded that "the available evidence suggests that on the whole neither the physical nor the mental health of English children has been seriously affected."\textsuperscript{16}

This conclusion was explained by information that appeared in other American journals. Throughout the war, the British Government provided daily school meals to more than 750,000 school children, free medical and dental facilities for all, and the available milk for every British child attending school.\textsuperscript{17} Furthermore, several articles praised the massive extension of nursery schooling during the war. Before the war, British local education authorities provided only twenty-one nursery schools, but by the end of 1942, nearly one thousand were operating. The necessity of mothers to work in essential war industries stimulated the rapid rise in the availability of nursery facilities for their children. In fact some authors claimed that the expansion of nursery schools was one of the major long-term successes arising out of the bleak wartime experience.\textsuperscript{18}

Despite the massive dislocation and upheaval caused by the war, several articles emphasized that British school teachers worked to create a normal school environment. Many articles referred to the "amazing normality" of school life in Britain. One author remarked that "the aim of the schools has been to keep education as normal as possible; "another described the achievement of stability as a "miracle." A U. S. Army officer, formerly an assistant superintendent of schools in New Jersey, was impressed by his observations in England that "no attempt was made to propagandize or indoctrinate the children with a hatred for all things German" and noted that "the British, amazingly enough, went about doing their daily tasks and the English school teacher went on to teach the ordinary school subjects." Only one author complained that "schools had to abandon much of the old school curriculum."\textsuperscript{19}
Preparing America for War: The Example of English Schools

Following American entry into the war, the purpose of many articles about wartime British schools changed. They continued to inform but now they contributed to strengthening the peculiar sense of unity between Britain and the U.S. so essential to the successful Allied war effort. By sharing British wartime experiences, the articles helped to inure educators to the ravages of war.

These articles also fueled American preparation for war. During 1942-43, a flood of articles in American education journals drew on the British experience explicitly to assist wartime preparation in the United States. Significantly, one of the first articles published in any American journal following the U.S. entry into the war was entitled, "What We Can Learn from England." An address by Professor Max Black at a "Conference on War Problems of the Schools" in Urbana, Illinois, held just ten days after Pearl Harbor, drew extensively on the British experience and offered an informed perspective of education during times of war. Professor Black, then at the University of Illinois, had been a member of the University of London's faculty when Britain entered the war. Central to Black's view of education was that, as evidenced by the example of Britain, schools in the United States likely would undergo "enormous changes," but that they must not become a war casualty. He emphasized that the most important function of wartime schools was that they play their part in preparing for post-war reconstruction.

If there is one thing which ought to be clearly before the minds of all of us engaged in the present conflict, is that victory itself is not enough. This is one thing the English have been taught by bitter experience to understand. We are fighting to win not only the war but the peace as well, and winning the peace means starting now.

Other authors shared Black's conviction. They argued that, although schools in America should play an important role in wartime, they should not be so distracted as to deviate from upholding the traditional ideals of a liberal education.

By learning about the British wartime experience, American educators became informed about the need to prepare their schools for a wide range of war-related issues. Some articles stressed the importance of establishing nursery schools for the children of women war workers. Others detailed the use of gas masks, discussed teaching children during air raids, and suggested how best to remove and transport students to the safety of the nearest bomb shelter. One article described a panoply of activities in which English youth were engaged to support the war effort. Drawing on President Roosevelt's comment that the war was one in which every man, woman, and child had a part to play, the author suggested that American youth should be diverted towards similar activities.
Extensive preparation by American educators for the coming war was advocated some nine months before Pearl Harbor. Written by a supervising principal in New York, the author warned that, "it is the moral responsibility of every school administrator to be awake to the dangers." He drew on an "eight months study of what has been done in the British Isles" and implored the need for "vigorous action." The article is breathtakingly detailed and strident in its advocacy. The author considered issues such as training school nurses for gas attacks, the transportation of children from dangerous areas, the need for loud speakers and sirens in the school grounds, and comprehensive specifications for the construction of trenches, sandbag walling, and arched shelters. He emphasized the need for precautionary measures to be planned in minute detail. For example, he advocated the following precaution:

School buses should be equipped with special devices such as, lookout devices while transporting children to and from school. Buses would need to be repainted and camouflaged so as to prevent their being easy moving targets for strafing by pilots. Operation of buses should be confined to the time of day when visibility from the air is the poorest.25

Likely, few American educators seriously accepted this detailed advice. The article, on the other hand, clearly contributed to the language of national defense preparation during that year.

American educators obviously were extremely concerned by the effects that war would have on U. S. education. They seemed eager to learn from the British experience. For example, in this regard, Education for Victory, the renamed School Life published by the U. S. Office of Education, announced that, "because of widespread interest on the part of schools in air raid protection and evacuation planning and the desire to make any helpful information available Education for Victory will devote a regular section to these problems."26 Accordingly, in the same issue, an informative article appeared written on the basis of advice offered to Detroit school officials by a London school administrator who visited Detroit. As the war continued, an increasing number of articles outlined precautionary measures for protecting school children from air raid attack. Significantly, many of these articles were based upon the advice and experience of English educators.27
Britain. American educators learned, for example, that some of London's nursery schools were established with funds sent from the United States. Also, articles provided information about how Americans eagerly were housing British "refugee children." According to one article, "requests for them exceed available numbers" and the author emphasized "this unparalleled opportunity for strengthening the ties of the already closely co-operating English speaking peoples." In addition, other articles reported gifts sent to British school children.28

Articles over the course of the war referred approvingly to the unified purpose of the Allies and the brotherhood of the English speaking peoples. As such, by emphasizing significant American contributions and the subsequent gratitude of the British, these articles boosted American morale and reinforced the idea that Americans and Britons were marching toward victory. For example, an English headmistress wrote as follows:

We are glad to be given this opportunity to write to America for we should like to thank you for all you have done for us. When, in 1940, we were forced to stand alone with our backs to the wall, it was America who came to our aid and we do not cease to be grateful for that.29

The enormous hardships endured by British teachers and school children exhibited in some articles likely had the effect of alerting American teachers for the sacrifices they, too, would make when the U. S. entered the war. Following that entry, articles emphasized how London teachers stoically overcame enormous difficulties in order to play their role in the nation's quest for victory. In this respect, an editorial introduction to a dramatic account written by a British educator warned American teachers, "if we think we are having a hard time - well perhaps we'd better read this!" Similarly, another American journal editor commented, "Teachers in the United States who find their work difficult may consider themselves fortunate that, as yet, they have not had to carry on teaching in air-raid shelters."30

Many articles referred to the "heavy burden" borne by British teachers during the war. Some are written by Americans who observed British teachers at work, and others by English teachers themselves. The theme of self-sacrifice runs through all of them, and the notion that all should "play their part" in the war effort resounds loudly and clearly.

American teachers must have been influenced by such accounts and by the ubiquitous belief that individuals needed a sense of mission to preserve common ideals worth fighting for. Without doubt some of these articles were written explicitly to motivate American teachers to sacrifice for the national good just as their British counterparts were doing.
These gentle motivations were undergirded by strong and deliberate efforts to influence American educators. In early 1943, the British Government established the British Information Service with offices in New York, San Francisco, and Chicago. This organization sought generally to inform Americans about Britain. More than this, however, the organization sought to maintain and increase American support for the British war effort and to reinforce the wartime unity of the two nations. Accordingly, the British Information Service sent out a steady stream of "information" to American educational journals. These articles, although accurate, constituted explicit British propaganda to influence American teachers. In addition, The British Information Service sponsored educational exchanges and conferences and offered American teachers a variety of "loan packets" containing material portraying the British school experience for classroom use.31

Another British organization called "Children of the Fighting Forces" explicitly promoted Anglo-American friendship and cooperation. For example, this agency sent packets of letters written by English school children to US state departments of education. These letters were used in many classrooms across the United States and undoubtedly had an impact on those who read them. The letters portrayed some very vivid and harrowing experiences and were intensely moving. The English children wrote with an appealing innocence and simplicity as evidenced by these extracts: "We have not got skyscrapers like you have in America. Thank goodness for if we had they would be as flat as pancakes now. I wish I lived in California right now as I would have some oranges and lemons. I have not got a father. He got killed during a raid. He was on duty and my mother was left with three more besides me."

Seductively persuasive, the letters draw their American readers into sharing the British experience and thus emphasize the special relationship between the two nations. That many of these letters targeted Californian schools raises the interesting prospect that the British organization's officials believed they should enlist the support of citizens on the West Coast who otherwise may have been distracted from European concerns by the war in the Pacific.32

**Consideration of the Purposes of Education in Wartime**

Several articles emphasized the British experience in deliberations about the extent to which schooling in America consciously should be altered as a result of the war. Indeed, many educators on both sides of the Atlantic were eager to wrestle with this basic question. Emerging from these articles is the commonly held belief that, despite the dislocation of war, the existing values and ideals of education should not be perverted by the expedience of war. Some articles, for example, noted approvingly that throughout the war, spending on British education
continued to increase. William C. Bagley, commented, "This, England's way of planning ahead for the fourth year of the most costly and devastating of all wars, deserves wide publicity in the United States." Similarly, other authors were impressed by Britain's attempt to preserve and support its educational system even as it endured harrowing wartime difficulties and suggested that this was a salutary lesson for America.33

In their observations of the course of education in Britain, some authors vehemently advocated the preservation of education and expressed considerable alarm at those who felt school children should become agents of the state. For example, an English education officer argued that schools should not be diverted from their traditional goals. The educational service of a country reflects the values of the community which sets it up. And when a totalitarian war changes the values of the community, it is hard for the school to withstand the pressure and to retain a normal sense of values. If the post-war society is to be totalitarian, there is nothing to be said against this. But it is this very evil of the complete domination of the state over the life and actions of the individuals which we are fighting.34

Many American authors, as well, looked to the future and implored that education not be impoverished by the exigencies of war. Typically, these arguments were based upon the theme that, "after winning the war will come the winning of the peace - a work that we shall hand over to the generation now in the schools."35 These articles advocated that schools should not be diverted from their true educational purpose by the war, nor should the purpose of education be confused with the war aims. Orway Tead wrote accordingly:

To turn educational enterprises largely over to special training purposes is to bring up a generation which is in danger of being strangers to the very undergirding of life and outlook which they are being asked to work and fight for. It will be next to fatal if in the continuing war we bring on a body of young citizens who are technically competent but morally untutored and humanely illiterate. Our faith in education, I repeat, is sublime. But it will be a faith warranted by performance and results only if we keep the educators loyal to their faith and the fighters loyal to their function.36

A large number of the articles underscored the belief that education had a vital role to play in preparing citizens for a future after the war ended. In this vein, some articles focused not so much on how education in Britain was being affected by the war itself, but instead, on how education in Britain was to be shaped beyond the war. Notably visions
of the post-war world were concentrated in articles written between Fall 1943 and Summer 1945. As the war neared its end, British and American educators increasingly urged that military victory constituted a unique opportunity to reform key educational matters in both countries.37

Planning for the Postwar World: The British Experience and its Impact in America

Several authors commented on the sweeping changes in British education to result from the 1944 Education Act. This wartime legislation authorized a radical departure of policy and practice from the existing organization of British education. Its most salient features included a raising of the school leaving age to 15, separation of elementary and secondary education, and provision for widespread compulsory education at the secondary level. Authors in American educational journals variously described the 1944 Act as "one of the most sweeping measures in the history of education," "the biggest, most significant reform ever undertaken," and as a symptom of the "positive whirlwind of change sweeping through the English system." One observer informed readers of The School Board Journal that on visiting England he had observed the following spectacle:

People who have not been satisfied merely to maintain schools through the grim unpleasantness of the blitz but who, in the midst of total war with the enemy only minutes away, are confidently planning for the greatest educational advance in their history.38

Editors of American educational journals surely believed that U. S. educators genuinely were interested in such matters. They also thought that the British experience should influence peace time educational planning in the United States. Consequently, they detailed information about changes occurring in the British education system as result of the 1944 Act. Education for Victory, for example, regularly published news about the British legislation in a section devoted to "News From Abroad."

Some journal articles, however, went beyond this important educational legislation by recognizing that Britain's desperate need for the postwar recruitment and education of teachers mirrored that of the United States. Other articles focused on postwar problems such as the need for newly constructed school buildings to keep up with the mood of optimism and renaissance expressed by British educators. Indeed, through the use of architectural plans, photographs, and elaborated accounts, periodicals such as School Executive and The American School Board Journal informed American school administrators of Britain's proposals for school planning.39
Consequently, articles related to the theme of postwar reconstruction became an increasingly important feature of American educational journals as the war drew to a close. Authors stressed the importance of Anglo-American unity in the years to follow. Several articles emphasized the important role that education must play in fostering feelings of brotherhood and mutuality. For example, many authors noted that the British Government had advocated the teaching of American history in English schools in order to avoid a traditionally nationalistic view of history.

Articles also suggested increased cultural exchanges between the two countries in order to foster greater understanding and friendship. Significantly, *Education for Victory* eagerly approved the proposal of the British Education Minister, R. A. Butler, to establish "future international co-operation among Allied Ministers of Education."  

A recurrent feature of many American educational periodicals was the belief that Britain and America had a peculiarly close, cordial, and productive relationship and that its continuance was desirable in peace time. One American writer remarked, "We thrill at the devotion and heroism of these British youth and pray that they may soon see the dawn of a new day in which they and American youth can display those same high qualities of service in a world at peace."  

Similar sentiments were expressed in articles published in other American journals. They advocated greater Anglo-American cooperation in educational matters and a strengthened belief that the unity of "these like-minded nations" was essential to the future of a civilized world.

**Images and Impact: A Final Word**

Between 1939 and 1945, American educators were exposed to a flood of images and experiences portraying life in a Britain besieged. These often graphic accounts documented the disruptive, and often harrowing, impact of war on British school children and their teachers to an American audience genuinely interested in British education. Commonly, the journal articles served to inform an interested and engaged readership. As the war progressed, other articles drew on British experience to enable Americans to prepare for the inevitability of war. They also influenced American deliberations on the role and function of schools in times of crisis. Furthermore, such accounts provided a valuable reference point for shaping the future of American education in the postwar world. More than this, however, the accounts contributed to the maintenance of American morale and prompted intense feelings of unity and brotherhood as the American and British people advanced towards a common goal. Such images and portrayals likely had a profound although long unacknowledged influence on American educators and the nature of American schooling in wartime.
ENDNOTES

3 The war had an impact on all aspects of daily lives. For example, one survey carried out on September 12, 1940 observed that 31% of London's citizens did not sleep the previous night, 32% received less than 4 hours sleep, and only 15% enjoyed more than 6 hours sleep. Nigel Kelly and Martyn Whittock, The Era of the Second World War (Oxford: Heinemann, 1993): 51. See also, Evan Davies, "British School Defense Activities," Education for Victory 1 (November, 1942): 3.

4 The first article to appear in an American educational journal was Harriet Shoen, "The Evacuation of School Children from Britain's Crowded Cities and Industrial Areas," School and Society 50 (September, 1939): 399. It was constructed entirely from accounts published in the London Times of September 1-5 "which reached New York City on the evening of September 16."

8 Harriet Shoen, "The Evacuation of School Children From Britain's Crowded Cities and Industrial Areas," School and Society 50 (September, 1939): 399.

10 Some authors chose to portray the evacuation of school children to rural areas as a positive experience. See, for example, Norman Wymer, "Bombs Bring Rural Understanding," The School Executive 64 (March 1945): 48-49; H. L. O. Flecker, "The School Situation in Wartime England" School and Society 51 (March 1940): 403-404. Other articles, however, were more critical of the debilitating affect evacuation had on British school children. See, for example, John H. Moehle, "Bombs and Books," American School Board Journal 102 (March, 1941): 30-32; W. E. Williams "In Wartime Britain," The Education Digest 5 (March, 1940): 17-19; "Offsetting Educational Demoralization in England" School Review 48 (April, 1940): 245-246; Margaret D. Clarke, "Wartime Tasks

20 As America became embroiled in war so the amount of detailed information on war preparation in Britain grew. For example, this study located only six articles concerning education in the war written in 1939 and 1940. However, during 1942 and 1943, forty-one articles were identified; often they were written for the explicit purpose of assisting war time preparation in the United States.

24 L. D. Gresh, "How English Youth are Helping Win the War," Journal of the National Education Association 31 (March, 1942): 87.

32 See, for example, Helen Heffernan, "School Teachers Carry On in Wartime England," California Journal of Education 12 (November, 1943): 116; "Correspondence with British Children," California Journal of Education 12 (August 1943): 46-54. A feature of the British propaganda campaign was the widespread effort to encourage American educators to support the British war effort and share in the common struggle. In this regard, American teachers, through publications of the American Federation of Teachers, were able to learn of the British experience. Indeed, in August 1941, teachers in America were offered extensive excerpts from letters written by Elsie Parker, the Ex-President of the National Union of Teachers in England, depicting the wartime situation in British schools and openly appealing for American support.

Intercultural Education and Negro History During the Second World War

The United States’ entry into World War II heralded a new sense of direction, purpose, and change for educators. For many teachers, World War II provided impetus for classroom discussion of current events and the construction of new units of study. While most educators agreed with the necessity of revised roles, goals and aims, duties and curriculum for wartime elementary and high schools, other teachers insisted that the proper time for children to participate in conservation efforts, in scrap and salvage drives, and in productive leisure time activities was outside the normal school hours. A vivid contrast to this attitude of exclusion was voiced by Elizabeth Coleman, a Chicago educator. She said that "at no time, in peace or in war, can businesses, social agencies, government, or the schools ignore the responsibility of adapting their products or programs to the needs of the society served. To remain static in the face of social change results in failure in peace as it does in war."

As schools began to rethink their role in wartime education, the very fabric of American society changed. To support and prosecute the massive war effort, the United States experienced massive changes, some of them wrenching. Volunteers and conscripts flowed into training camps and prepared for battlefront assignments. Businesses and industries joined forces to outfit soldiers and to produce weapons, ships, and aircraft, as well as the supplies to maintain far dispersed forces. Housewives joined the work force in record numbers for military victory.

During the war years, American schools responded to the social pressures of the times because they are highly resilient social institutions. Little has been recorded, however, about the nature and extent of these changes. For example, in the only historical treatment of schooling during the Second World War, I.L. Kandel, professor of education at Teachers College, Columbia, writes, "The process of self examination had already been started during the years of the depression; it was further
stimulated by the changes of totalitarian ideologies to the ideals of democracy. World War II served as the culminating test in a process which had already begun."

A major part of the educator's reflection and self examination of which Kandel wrote was also reflected in the greater American population. Much attention was given to speculation about how to organize a "new world order" when World War II came to an end. A debate over the advancement of a United Nations organization raged, and the pitfalls of the League of Nations were recounted. Messages about intercultural, international, and global education were especially prevalent in the professional educational literature of the times and in newspaper and magazine reports. An analysis of the intercultural education content of educational periodicals and literature published between the years 1934 and 1944 revealed that two hundred and twenty articles from forty-two periodicals had been published in the previous decade. The majority of these articles contained information about "intergroup relations, examinations of the concept of race, characteristics and problems of special groups, and analysis of the treatment of groups in literature." Several trends were reported in the study, including a "preachment of the American ideal of fair play in a moralistic tone" and sociologically unrealistic "pep talks." Authors identified needs in the areas of specialized teacher training and teaching materials. As in the popular literature of the time, these intergroup education articles looked to the schools for solutions to the problems.

Still, even as numerous lofty ideals about the future of America's people and their place in a peacetime world became commonplace by the midpoint of the war, tensions on the home front did not go unnoticed. Race riots in Detroit, East St. Louis, and Harlem were widely reported prior to and during World War II, as were instances of religious intolerance and acts of violence toward immigrants during the war. Despite its boast of democracy, America had "failed to solve the problem of its minority groups and hostility between national, racial, and religious groups ranged from "a voiceless holding aloof to open combat and injustices that makes mockery of our principles." Minority groups struggled to advance socially and economically during the war, and even though minorities experienced overt discrimination and were often under represented in military service, they were encouraged by their representative newspapers to support the war. For example, Drake and Cayton, who have reported extensively about life in the south side of Chicago, reveal that "most Negro papers continued to follow the policy that the Pittsburgh Courier dubbed the 'Double V'--a fight for the victory of democracy at home as well as abroad."

Highly publicized social issues of tolerance and intolerance gave rise to the publication of many articles by educators and citizens urging
social studies teachers to advance racial and religious understanding. Most educators expressed righteous indignation, some speculated about probable reasons for the social ills; others compared the times to World War I; some suggested solutions to the problems. Not surprisingly, it was widely reported in America that the public school classroom would end social injustice.

**Initial Efforts Toward Intercultural Education**

Some educators were determined to introduce activities in schools which would promote kindness, fairness, and unity. From the rhetoric surrounding intercultural education in professional journals and popular magazines, two themes emerged. To some, intercultural education meant learning about peoples of the world in order to achieve a world community. Citizenship themes, those of being a good neighbor, being fair, and being understanding were encouraged. Understanding the interrelationships of the world's nations and realizing that similarities exist among different peoples was identified as an aim of intercultural education. Examples of programs in two schools illustrate the revision of school programs to incorporate elements of intercultural education.

The San Dimas Elementary School District was located in a small California town of 2,700 with twenty percent "Mexican and Mexican Americans." By 1940, racial tensions were running rampant in the community. With the assistance of some respected educators, a practical community intercultural program was implemented with the formation of a group of Mexican American "young people" with the specific purpose of seeking solutions to school and community problems. In 1941, a seventh and eighth grade intercultural club was organized to plan problem solving and recreational activities. In school, eighth grade units of study were designed to improve attitudes. In 1942, an intercultural club for adults began with language classes, war programs, monthly educational meetings, and social events. In 1943, Claremont Colleges administered for the San Dimas children a summer school program which included music, dancing, crafts, and languages. Recreational programs for children and young people, as well as an educational program for adults, were begun. The San Dimas Community Council, formed in the fall of 1943, soon opened a Community House to tend to the health needs of children, developed a 1944 summer program for children, started a teen recreation center, and sponsored a nursery school to assist in the teaching of English to young children. The success of the program was described as "painfully slow" but one which was producing "definite changes" in the community.

In Hamtramck, Michigan, teachers were determined to meet the needs of their community, which was ninety percent Polish, largely independent, and surrounded by Detroit. They became aware that pupils in
elementary schools held serious prejudices. When young people left Hamtramck, they almost always experienced difficulties adjusting to a new environment. Consequently, they often returned home. To solve this problem, teachers enhanced the fifth-and sixth grade social studies curriculum with a project to help resolve racial conflicts and to help ease tension between children and their foreign born parents. One teacher's efforts were reported by Helen F. Storen,\textsuperscript{10} director of social studies in the district. During a current events class, student discussion led to the resolve to find out more about the nationality groups of the community represented by class population: Polish, Ukrainian, Italian, German, Austrian, and Czechoslovakian. School events recorded in the teacher's journal revealed the following activities: construction of a large world map and location of countries of origin, writing statements about why students' parents came to America, an oral report about the problems faced by parents when they came to America, a listing of sources of disagreement between parents and children, a comparison and contrast of the lives of the students with those of the parents, a study of contributions by cultural groups to the community, an exhibition of foreign made articles, visits by parents during the exhibit, and study of other communities in which many foreign born adults lived.

\textit{Chicago Public Schools Negro History Project}

Although educators and the general public wished for improved relations between various cultures, effective leadership was necessary for any reform to take place. Still, some school districts, school leaders, teachers, parents and students made valiant efforts to initiate change in their schools and their curriculums. For example, the Chicago Public Schools sought better racial understanding with a massive contribution to the social studies whereby "the Negro youth is taught to respect himself and the white youth is taught to appreciate Negro achievements."\textsuperscript{11}

After attending the Negro Exposition of 1940 several times, teacher Madeline R. Morgan "became impressed with the contributions that had been made by Negroes in science, health, art, and literature to American life." She began to "dream and hope for the time when Negro boys and girls would be given an opportunity to read about the achievements of our leaders and their deeds." Morgan began to speak to her school principal, Miss Elinor C. McCollom, about the possibilities of creating a Negro history curriculum for young Chicago school children. The principal encouraged her to propose a plan to Dr. William H. Johnson, superintendent of Chicago Schools. She presented a plan to Johnson to augment the existing social studies curriculum with a study of the Negro's contributions to America. Superintendent Johnson realized that "the logical place to teach a real and practical democracy is in the public
school, and there also is the logical place to begin the practice of ideals." He readily accepted the plan.

Dr. Johnson appointed a committee to research the history of the American Negro. According to the *Monthly Labor Review*, Madeline Morgan and her chosen partner for research, Mrs. Bessie King, were assigned to the Bureau of Curriculum and were "relieved of all teaching duties and devoted their entire time for 18 months to this subject and work." The larger biracial committee was composed of elementary school principals and teachers. Extensive research ensued, primarily conducted at the George Cleveland Hall Branch at the Chicago Public Libraries, the University of Chicago libraries, and the Chicago Art Institute. As units of study were finished, they were submitted for approval, suggestions, and corrections to outside experts. Among the experts who reviewed the material were Carter G. Woodson, editor of *The Journal of Negro History*; Melville Herskovits, anthropologist at Northwestern University; Avery O. Craven, professor of history at the University of Chicago; Charles H. Wesley, president of Wilberforce University; and Walter Johnson, professor of English at the University of Illinois. Experts within the district included Maudelle Bousfield, then the only Negro high school principal in Chicago, Ruth Jackson, the only Negro elementary school principal, Eleanor McCollum, principal of Emerson School, Lois Morstrom, principal of Betsy Ross School, and three Negro history teachers who were selected on the basis of their outstanding teaching performances: Clara Anderson, Du Sable High School; Thelma Powell, Wendell Phillips High School; and Samuel Stratton, Du Sable High School.

Superintendent Johnson explained the purpose of the new social studies material:

> The pupils of our public school must learn about these achievements of the Negro; just as they have learned about the Pilgrims ..., the Indians ..., and the immigrants from Europe. ... The Negro has given his toil, his talents, and even his life to create and perpetuate our democratic way of life.

In separate accounts, both Johnson and Morgan submitted aspects of the development of Negro history curriculum units for use in the elementary schools of Chicago. The units of study were developed for each elementary grade level, one through eight. In the primary grades, community life was to be studied, and "stories were written for these grades that show the Negro not only as private and public servant, but as educator, musician, and scientist." The intermediate grade curriculum included attention to Negro relations with early white settlers, to plantation life, and as part of the general study of Africa. The upper grade curriculum included the study of Negroes during the Revolution-

---
ary War and the Civil War, achievements of the Negro after emancipation, and contemporary Negro leaders. More specifically, the organization of these curriculum units is amplified below:

**Grade One: Community Helpers**
This study included "Billy's Ride" where students learn that there are brown policemen and "Sally's Ride to the Farm" where students learn about "the services rendered by the Pullman porter." In addition, there were stories about Marian Anderson, concert singer; Florence Prince, symphony writer; and Paul Lawrence Dunbar, poet.

**Second Grade: Community Helpers Continued**
The stories in this unit of study focused upon George Washington Carver, agronomist; Dorothy Maynor, singer; R. Nathaniel Dett, composer; and Langston Hughes, poet.

**Third Grade: Occupations and Faraway Cultures**
This unit of study included details of life in West Africa's Dahomey. It detailed the lives of Chicago's Negro Neighbors such as Maudelle Bousfield, high school principal; Arna Bontemps, author; and Dr. T. K. Lawless, dermatologist. A continued study of songs and poetry from Negroes was also found in the third grade unit of study.

**Fourth Grade: Early Settlers and Negro Inventors**
The fourth grade unit of study featured Jan Matzeliger, inventor of the shoe lasting machine; Granville T. Woods, inventor of electrical appliances; William Trial, settler in the Indian territory; and Paul Robeson, singer.

**Fifth Grade: Early Settlers and Plantation Life**
Fifth grade students encountered Chicago's first settler, Jean Baptist Point de Saible; plantation life in Virginia; economic and industrial contributions; and contributions of folk music and spirituals.

**Sixth Grade: Explorers/Discoverers**
Sixth grade students were taught about Negroes who traveled with early explorers, including Alonzo Pietro, who piloted Christopher Columbus' ship Nina back to
Spain; Estavenico, who discovered Arizona and New Mexico; and Matthew Henson, the only American to accompany Admiral Perry in his discovery of the North Pole.

**Seventh Grade: Negro Soldiers in Revolutionary War & Civil War**

**Eighth Grade: Famous Militarists and Contemporary Negro Leaders**

In the eighth grade unit of study, students learned about West Point Military Academy graduates Henry Ossian Flipper, John Alexander, Charles Young, and Benjamin O. Davis; Pilot Robert Smalls, for whom Camp Robert Smalls at Great Lakes Naval Training School is named; and, among Chicago community establishments, the Chicago Negro Art Center, the Hall Library, Good Shepherd Community Center, Providence Hospital, several insurance companies and businesses, and three newspapers—The Chicago Defender, Pittsburgh Courier, and Chicago Bee.

All the stories were tested in classrooms. That is, they were first read to students so that reactions and interest could be noted, and so that vocabulary difficulties could be found, if any existed. Content of each story was mindful of student interest, capabilities, and existing social studies curriculum. According to Morgan, "the children, both white and colored, were eager to hear the stories and were surprised to learn that Negroes had made so many contributions to the development of American life." Selections from the stories provide insight into the types of history teaching in elementary schools prevalent during the war years. For example, a first grade story, "Sally’s Ride to the Farm," told the following story of a Negro train porter:

Now the train was coming to a big steel bridge. Under the bridge was a wide, rough river. Sally did not like the high bridge. She did not like the tumbling, dirty, brown water. Sally sat as far back in the corner of her seat as
she could. Just then, a smiling, brown faced man, dressed in a clean white coat, came down the aisle. He was called the Pullman porter. He saw Sally and he knew that she was frightened. He sat down beside her. He began to tell Sally a story. He told her that when he was a little boy he lived very near this big river. The river had been his friend because he had fished and waded in it. He liked the river!

'See,' he said, pointing to a little house near the shore, 'my house was like that one. It was very near the river too.'

Sally looked at the house. She looked at the river. Suddenly, she wasn't frightened any more. She was thinking of the fish that lived in the river. She was thinking of the little colored boy who swam and waded in the river.

'Yes,' said Sally happily, 'I believe I like it too.'

Malcolm S. MacLean, president of Hampton Institute would certainly have opposed the content of this story. He claimed, "We have poured millions of dollars of public money into the education of thousands of American youngsters and thus wasted the whole investment by making cooks and red caps, janitors and elevator men, shipping clerks, and ditch diggers out of the graduates in science, law, education, social studies, and the humanities." Indeed, stories such as this were a part of the Negro History Curriculum in Chicago. Similarly, a third grade story of African life had a purpose of "showing that the African farmers are not carefree:"

The African Negroes have to work very hard for a living. Most of them make their living by farming. Farming is not easy. There are two long rainy seasons. Sometimes the storms damage the crops. Often the hot boiling sun bakes the earth. This makes hoeing very difficult. Sometimes the birds and the insects eat every sign of vegetation. These things alone show that the farmer has to work hard if he is to have any crops.

Teachers also seemed enthusiastic about the new Negro History Curriculum. According to Morgan, "Some teachers reported, 'When I read the stories about Negroes my room is as quiet as death. The children simply love the stories.'" Another teacher reported that "the study of Negro history in my eighth grade class led to pupil research activities. Simple research methods were introduced. So many books from the library came in and such lengthy discussions followed that it became necessary for me to organize a Negro history club." Hundreds of letters poured into the Chicago school system as citizens began to hear
about the new Negro History units of study. Morgan revealed her findings from many school children and teachers after the initiation of the program, and she highlighted the vast amount of attention it produced:

Many articles are appearing in school newspapers and city papers about Negro contributions, and the children enjoy finding material about Negroes. Plays, round table discussions, and stories about Negroes are taking a greater place in school programs. Forty states have been reached and almost a thousand sets of units have been mailed since September. Among some of those receiving the units are people so far south as South America; as far north as Maine; as far west as California; as distant as Italy and Africa; and the United States Office of Education in Washington, D.C., the board of education, social agencies, ministers, principals, teachers, soldiers, colleges, city interracial commissions, and interested citizens.26

The Chicago Negro History implementation seems to have been successful, although, possibly since the project was not conceived until 1940, long term results were not reported for some time, if at all. We know that the Negro History Curriculum was in practice at least from 1942-1945. Evidence of the continued widespread use of the Negro History curriculum in Chicago schools remains to be found. Superintendent Johnson, in his 1943 report stated "the anticipated results are worth any effort, because they mean a unification of our country from within and a strengthening of our democratic ideals."27

Chicago was probably the only city in the United States to implement a widespread program about Negro history so ambitious for the times. New York State's course of study boasted inclusion of "The Negro in American Life" in Grade Five,28 and Pittsburgh schools recommended the "pervasive approach" to history teaching in fifth grades by including "study of the Negro song and spiritual as evidence of true folk music."29 The magnanimity of these efforts must not go unnoticed. The intent of intercultural education was expressed by the Children's Book Committee of Teachers of English: "If we are to win the peace as well as the war, it is essential that we provide tomorrow's citizens with the fullest possible understanding of the world which will be theirs."30

To be sure, these early efforts to educate young Americans about varied cultures seem unsophisticated. The record of their implementation is important to the field of curriculum history, however, so that the rich memories may be shared in the future. As modern school districts across the United States reflect upon and revise their present multicultural education courses of study, a glimpse into past efforts seems prudent.

Patriotism and Education

in der Vaterland

of Texas During

World War II

Appearing December 11, 1941, in the weekly Fredericksburg Standard, was a front page editorial written by Colonel Alfred Petsch. In this newspaper column, Petsch recounted his disagreements with the "foreign policies of Mr. Roosevelt" and with Roosevelt's "apparent war inclinations." Yet Petsch strongly condemned the Japanese empire and its "engines of death . . . killing our soldiers, sailors and civilians," and he urged "every citizen of the United States to support the country's objective whole-heartedly and unequivocally." This objective, he asserted, was "the continued existence of our nation as an independent country," and for its protection "every true American will subscribe cheerfully his every resource and his very life." Petsch continued his call to arms, "The question is not whether we will serve the nation; it is how we will serve. The young and able bodied men, the finest specimens of our people will be called upon (in many instances volunteer) to tender their very lives as service to our nation. Every citizen's property resources must support the war program in fair proportion. Everybody must carry his part of the load. There is no excuse, and we trust there will be no opportunity, for any citizen to shirk his duty. This now is our WAR, every citizen's fight."

Apparently, Petsch, like many Americans, assumed a wartime duty for the schools of his community. Indeed, many schools throughout the country did become involved in war related activities. However, the nature of their wartime participation merits fuller exploration.

The Impact of the War Upon American Education by Isaac Kandel identifies new demands that the war placed upon educational institutions: "The normal programs of secondary schools had to give way to a large extent, if not wholly, to programs of 'Education for Victory' and to vocational preparation." According to Kandel, schools were undecided about replacing traditional academic studies with courses designed to prepare students for the armed forces or other wartime occupations. "It
was not clear," writes Kandel, "whether the high schools should prepare youth directly for some form of war service or whether they should bend their efforts to maintaining the academic tradition as far and as long as possible."²

Clearly, Fredericksburg High School, in rural Fredericksburg, Texas, was inclined toward the latter goal: the maintenance of its academic traditions in the face of political, economic, social, and cultural changes brought on by America's entry into World War II. Superintendent S. H. Smyre succinctly articulated this goal. In describing his "business as usual" approach to administering the Fredericksburg schools during wartime, Smyre announced that "no substantial change has been made in the curriculum."³ Almost fifty years later, this same sentiment on curricular changes is echoed by teachers, students, and community members as they remember wartime schooling in Fredericksburg, Texas.

During World War II, American civilians and soldiers shared responsibility for the services and sacrifices demanded by total war. Moreover, the physical heroism of the military forces was matched, deed for deed, by the moral heroism of those men, women, and children who remained behind. Thus, both civilians and soldiers were inseparably linked by a sense of togetherness based on common purpose and mutual appreciation.

World War II affected the civilian population of the United States. America's schoolchildren made numerous wartime adjustments related to events taking place halfway around the world. Spaull's analysis of the relationship between war and society yields four distinct themes in this regard. First, the war disrupted normal school activities; second, actual curricular changes were suggested on national, state, and some local levels in response to the demands of war; third, schools were expected to participate along with communities in activities and programs that supported America's war effort; and, fourth, the psychological effect of war on society placed enormous responsibility on the schools for the generation and preservation of morale.⁴ Each theme is further developed in this portrayal of wartime schooling in rural Fredericksburg, Texas.

The Setting

Fredericksburg, Texas, the Gillespie County seat, is home to many descendants of its original German inhabitants. In May of 1846, a hundred and twenty German settlers gathered on the bank of a stream meandering through the hill country of central Texas. On this spot, overlooking an oak grove, the German immigrants unloaded their worldly possessions from twenty ox drawn wagons. Green hills, abounding with game, rose and fell much like those of the fatherland, providing a climate suitable for raising sheep, goats, and cattle.
Although the cedar, oak, and cypress trees of the area hardly resembled the great coniferous forests of Germany, and the nearby streams were tiny compared to the great rivers of Europe, the immigrants were delighted to be in their new home. Here was a place to make a fresh start, to build "homes and public buildings that were reminiscent of the fatherland but with a southwestern influence." Fredericksburg had within its boundaries "people of many types and talents -- skilled craftsmen, builders, tradesmen, farmers and professional men." Representing all classes of European society, these settlers were "people of integrity and perseverance; God fearing, industrious, and thrifty." Most inhabitants of Fredericksburg, regardless of vocation also farmed the land. Thus, in keeping with the tradition of their native Germany, very few of these settlers built residences on their farms. Instead, they clustered their homes together in the village of Fredericksburg, residing in what remains "the most German of all the German settled towns in Texas." Even today, almost one hundred and fifty years after its settlement, a clear majority of Fredericksburg's six thousand residents are ethnic Germans and the culture of "Der Vaterland" permeates this rural Texas community.

Disruption: the First Consequence of Wartime

One of the first casualties of World War II was Fredericksburg's interscholastic sports program. Within a month of Pearl Harbor, Fredericksburg High School athletic officials announced the cancellation of the 1941-42 basketball schedule. They stated that the decision was based on the "inability to secure transportation for players to the games" in anticipation of gasoline and tire rationing. An alternative to the interscholastic basketball program emerged in the formation of an intramural program.

Six senior teams and six junior teams, "all of whom invaded the animal kingdom to select a team name," began intramural play the last week in January. The teams played a ten week schedule with games on four weekday afternoons. Wednesdays were scheduled for practice sessions. Mildred Roundtree, a high school English teacher at this time, remembered that "canceling basketball was no big thing" in Fredericksburg. "Back then we were a football town. Very few people followed basketball." According to Roundtree, "the only people who got upset were the players and their parents." However, in the autumn of 1942, Fredericksburg High resumed interscholastic competition and played its regular football schedule against neighboring schools. Taking notice of the football schedule, the basketball supporters voiced their protests and successfully prevailed upon school officials to resume the school's prewar schedule. Consequently, both sports continued regular interscholastic competition throughout the war.

Journal of the Midwest History of Education Society Volume 22 1995
Significantly, Fredericksburg High School had no physical education program, in its curriculum before or immediately after World War II. Neither did it establish a wartime physical fitness program as a response to the poor physical condition of young men who sought to enlist in the service. Nationally, the physical condition of Americans who sought to join the armed forces during both world wars was abysmal. In Fredericksburg, if young men were not physically fit for military service, the school officials neither assumed the responsibility nor attempted to develop a new school program to remedy the situation.

The war also created a void in the agricultural work force of Gillespie County. Many daily wage farm hands chose to enlist and serve in military forces rather than to labor long hours for low wages. To alleviate this manpower shortage, Fredericksburg High School students were recruited by the local Agricultural Adjustment Act office to assist peanut farmers during the fall harvest of 1942. Farmers were advised that high school students were willing to help with the harvest and that interested farmers should contact the AAA office in Fredericksburg to make the necessary arrangements for student work. The high school boys labored each day after school and on Saturdays. When the harvest was completed, they were paid the customary per acre wage for their work.

A relatively minor disruption of the regular school program was a change in the beginning and closing hours of the school day. The school board voted to begin the new schedule on Monday, February 9, 1942. "The Fredericksburg Public Schools shall open at 10:00 a.m. and continue until 5:00 p.m. each day except Saturdays and Sundays with one hour recess beginning at 1:00 p.m. for lunch." The Board gave no reason for the change. This "War Time" school schedule lasted only a few weeks, until April 20, 1942, at which time the regular class day reverted to the normal 9:00 a.m. to 4:00 p.m. schedule. No other mention of a "War Time" school schedule appears in the Board minutes for the duration of the war. Moreover, this temporary inconvenience is not remembered by interviewed former students and teachers at Fredericksburg High School.

Undoubtedly, the most disruptive consequence that the war had on education, both nationally and in Fredericksburg, was the exodus of teachers from schools to the military service or to war related industries. Most taxpayers remained either unaware or unconcerned that spending money on buildings and facilities was no guarantee of a quality education. All too often, they voted bonds for bricks and mortar rather than to raise taxes to increase salaries. Thus, many teachers opted for higher paying jobs in wartime industries. However, the increased prospect for more money was not the only reason teachers resigned their positions during the war. Many joined military service for avowedly patriotic purposes. Throughout the war, those teachers who remained at their
jobs were expected to carry their fair share of the load. Elected officials and school administrators required teachers to participate in various war related activities. Governor Coke R. Stevenson, for example, designated February 16, 1942, as a legal holiday throughout Texas, but he demanded that State Department of Education employees and all public school teachers use the holiday to assist with the selective service registration of men throughout the state. Fredericksburg teachers participated as directed.  

Rural schools were hardest hit by the wartime teacher shortages. These rural districts paid lower salaries to teachers, and the working and living conditions in these areas were frequently less desirable. A survey by the United States Office of Education estimated in 1943 that the turnover rate was more than twice as high in rural schools as in urban schools. However, this statistic does not disclaim the fact that teacher shortages were also problematic for America's urban schools. By war's end more than a third of all competent teachers employed in 1940-41 had left teaching for higher paying jobs elsewhere.

Teacher shortages forced school systems to initiate emergency measures: employing women teachers who had left the profession to get married, engaging substitutes and less experienced teachers, lowering standards and granting emergency certificates, increasing the load of teachers who remained in their positions, dropping certain courses, and in rare instances, awarding salary increases and bonuses. However, these measures failed to stem the migration of teachers from the profession. Consequently, experienced teachers were often replaced by inexperienced young people who had been granted emergency certificates, although some of those teaching on emergency certificates were "former teachers with fair preparation."  

Fredericksburg High School struggled with mixed success to deal with the repercussions of wartime teacher turnover. In 1939, the high school faculty numbered five men and five women under the leadership of a female principal. By war's end, after repeated wartime personnel changes, the faculty of Fredericksburg High School assumed a completely new look. In 1945, the staff comprised only one man, who joined with nine women to teach in the high school under the administration of a male principal. Entries in the wartime school board minutes reveal that board members expressed continued concern about midyear teacher resignations which "hampered educational progress." Teacher turnover at Fredericksburg High School was common. In fact, the Fredericksburg Standard reported a vacancy on the high school faculty because a newly hired teacher "resigned on Wednesday after having reported for duty on Tuesday." Undoubtedly, most wartime replacements stayed on the job longer than a single day. In their June 1942 meeting, the school board declared that "any instructor who resigns his position or severs his
relationship with the school except through death or other unavoidable circumstances shall forfeit all rights to any part of his or her annual salary payable during the summer months." However, this policy was not strictly enforced; records indicate that the board granted leaves of absence with no penalty for up to three years to both men and women teachers with "exceptionally high standards of instruction" who left for "patriotic duty," throughout the war.

On January 7, 1943, the board suspended several longstanding requirements for employment in the Fredericksburg Public Schools. They agreed to hire younger, less experienced people, and married women. The marriage bar was not reinstated at war's end.

Wartime Curriculum: Continuity and Change

Curriculum changes prescribed at Fredericksburg High School during the war largely were cosmetic and inconsequential. Mildred Roundtree, an English teacher at Fredericksburg during the war, recalled that "we didn't teach anything differently during the war, although sometimes we did talk about the war and what was going on." She continued,"I also taught music. We sang a lot of patriotic songs and conducted assemblies with patriotic themes." Roundtree's recollections are substantiated by Art Kowert, publisher of the Fredericksburg Standard. He also recalls that the schools attempted to "continue teaching students just as they had before the war."  

Official records of the Texas Education Association reveal several course offering changes during the war years. The annual superintendent's reports list eight new courses that were introduced at Fredericksburg High School during the war: Spanish, physiology, music, modern history, English history, trigonometry, health education, and vocational agriculture. Three of these additions (Spanish, health education and vocational agriculture) persisted in the postwar curriculum, although the other five disappeared after only a year or two. One explanation for these course changes is the instability of a teaching staff pressed into service.

It is not clear if German was taught during the war. W. C. Westerfield, who taught at Fredericksburg High School before the war and became its principal in 1948, alleges that German classes were phased out of the high school curriculum in the early 1930s due to a "lack of interest." Further, he takes credit for returning both German and Spanish to the high school curriculum in the late 1940s. Mildred Roundtree disagrees with Westerfield, maintaining that high school German classes were discontinued during the war as an overt demonstration of patriotism. Her account is supported by Hans Bergner, a 1939 graduate of Fredericksburg High School, who later served as Fredericksburg school superintendent. Bergner remembers German language classes at the
high school as late as 1939, but he is unable to verify what happened to
German classes at Fredericksburg High School during the war.\textsuperscript{29} State
Department of Education records, on the other hand, offer a contrasting
view. Instead of supporting accounts of no foreign languages in the high
school during the war years, official state records reveal that the high
school routinely offered three year sequences in German throughout the
war years, and that a Spanish course was offered every year except one
(1942-43).\textsuperscript{30}

Another war related change at Fredericksburg High School was the
addition of the National Youth Administration Defense Course for out of
school youths. This vocational training course was designed to prepare
workers for jobs in the defense industry. Early in the new year following
the Pearl Harbor attack, Fredericksburg High School sponsored this
defense course and provided classroom space for seventeen local youths
between the ages of seventeen and twenty-five. From 7 to 10 p.m., five
nights a week for ten weeks, these youths were taught wartime voca-
tional skills at no personal cost. The federal government furnished
supervisors, instructors, and cost free consumable raw materials (e.g.
lumber), but operation and control of the Defense Course remained in
the hands of the Fredericksburg schools.\textsuperscript{31}

\textit{Practical Patriotic Activities: Drives and Collections}

In a 1943 address to the National Education Association, John W.
Studebaker, United States Commissioner of Education, applauded the
contributions of American schoolchildren to the war effort. Studebaker
praised pupils' wartime ventures: selling bonds and stamps amassing
scrap iron for war industries, appropriating old garments for the Red
Cross, growing Victory gardens, and collecting waste paper and waste
fats.\textsuperscript{32}

This picture has another side. The success of the children's experi-
ences is staggering, but it offers little insight into the process that pro-
duced these results. In her wartime article, "Making War Drives Educa-
tional," college director of rural education, Kate Wofford emphasized the
importance of using "democratic procedures" to conduct war drives,
emphasizing the appropriateness of having students plan, implement,
and evaluate these drives. Moreover, Wofford opposed "any form of
adult domination" that might cause the activity "to deteriorate into an
exploitation of the children for the benefit of the state."\textsuperscript{33} Under
Wofford's criteria, the wartime drives at Fredericksburg High School
were patriotic but educationally insignificant. These activities repres-
ented a unified effort by schoolchildren to serve their country on the
home front, but neither students nor teachers appeared to be particularly
involved in the planning process.
Barely two weeks after the bombing of Pearl Harbor, the teachers and trustees of all the schools in Gillespie County, including Fredericksburg High School, met in the office of County Judge Henry Hirsch to "hear an explanation of the role they are to play in national defense." This meeting dealt with the sale of defense bonds and stamps in the Gillespie County schools. A week later, at a second meeting with teachers and trustees, Postmaster R. W. Klinghoefer explained in greater detail how teachers could impress upon students the importance of the Defense Bond-Stamp programs at their respective schools. Klinghoefer declared that "the teachers of the various schools are to make a survey of their schools and report to the County Judge's office the number of stamps that will be needed for their schools." The postmaster expected that all school officials would participate in this undertaking, set to begin after January 1, 1942.

Nine months later, Judge Hirsch once again enlisted the help of Fredericksburg's teachers and students in the war effort. During the previous summer, a community wide scrap metal drive disappointingly netted only one thousand tons of scrap. Judge Hirsch announced that a second scrap drive would be held between October 5 and 17. This second drive was designated a school project and every school in Gillespie County became an authorized Junk Scrap Depot. A contest was held among the schools in Gillespie County, and a "Scrap Metal Queen" from one school was selected and crowned. At the end of the drive, each school sold all of its collected scrap and kept the proceeds. During this second scrap drive, a Standard editorial reminded Fredericksburg's high school students that their effort was part of a great attack "against the worst enemy within our borders today. This enemy [starvation at the steel mills] could stop our factories from making guns and ships and tanks and planes." Local school pupils were exhorted to join this great "Junior Army" and to gather up "rusty pipes, broken bed springs, and air guns that won't shoot any more" so that American factories could "turn this junk into bombs for the Nazis and bullets for the Japs." The success of this second scrap drive may be inferred from a subsequent account in the Fredericksburg Standard stating that "the entire community is indebted to the teachers for the patriotic assistance they are giving to this program."

Later in the war, the students of Fredericksburg High School were asked to assist in another kind of war drive. In January, 1944, the Fredericksburg School Board agreed to conduct a blood donation drive for the armed forces. San Antonio's Mobile Blood Donation Unit petitioned the school board for permission to direct this drive and requested the high school's Home Economics building as its headquarters. School board members acknowledged the possibility of "interference with the progress of school" but justified the drive, acknowledging that it offered...
the opportunity to the greatest number of citizens in the Fredericksburg area who "otherwise would be prevented from rendering such service [giving blood] to our armed forces."\textsuperscript{41}

**The Development of Home Front Morale**

The onset of World War Two ignited a firestorm of patriotism in Fredericksburg. Even so, German ethnicity remained a source of discomfort for many who lived in this small Texas community. Their culture may have been German, but their politics were American. Residents of Fredericksburg still bristled at the hostility they had encountered during World War One, when many German Americans were immersed in the rising tide of xenophobia that swept Texas and the nation. During this period "one hundred percent Americans" demanded the eradication of German culture, including the elimination of German as the language of instruction in ethnic German communities. Many German Americans changed their names and the names of their businesses, and numerous towns, streets and buildings with German names were rechristened.

German Americans who lived in Texas were not immune to wartime prejudice and discrimination although, among the state's minorities, they were outnumbered only by Negroes and Mexican Americans. While melding into the general pattern of Texas life, German Texans, particularly in the hill country, retained much of their traditional German culture which apparently fostered resentment among non-Germans who lived nearby. "In medicine, in engineering, in ranching and in many other fields, German Texans are heavy contributors to the state's general prosperity," yet the size of the German ethnic group in Texas allowed it to operate as a society within a society.\textsuperscript{42} German Americans in Texas considered themselves "trapped in a crisis of loyalty."\textsuperscript{43} Their unquestioned allegiance was to their adopted homeland, although they loved their German culture. Evidence of their loyalty was incontrovertible. For example, Louis Jordan was a local hero whose exploits were known by every citizen of Fredericksburg. Jordan, football captain at the University of Texas, was named to Walter Camp's first All American team, and was later the first officer from Texas killed in France during World War One.

Of considerable importance during the Second World War was the fact that Fredericksburg was also the birthplace and boyhood home of Admiral Chester Nimitz, America's first five star admiral. Nimitz served his country as wartime Commander in Chief of the Pacific fleet. He directed "more military power than had been wielded by all commanders in all previous wars."\textsuperscript{44} Nimitz' position of prominence and responsibility and his ethnicity were sources of immense pride for the German Americans of his hometown. Dubbed "Fredericksburg's favorite and
number one citizen" by the City Commission, Nimitz became the first native son honored with a special day. Just three weeks after Pearl Harbor, on December 27, 1941, Fredericksburg celebrated a citywide "Chester W. Nimitz Day." In honor of the occasion, the Fredericksburg Standard printed a letter written by prominent Austin attorney and former state official, T. H. McGregor. Contrary to the anti German sentiments expressed by many Texans, McGregor's letter celebrated both Nimitz' accomplishments and his ethnicity, and included the following passage:

Putting Chester Nimitz at the head of our Pacific fleet stirs a feeling of pride in the bosom of all Texans. He was born and spent his childhood in Texas -- in Central West Texas -- in Gillespie County, at Fredericksburg. He is of German extraction -- is pure German in his blood lines. I will wager my law license that he speaks German as it is spoken along the Rhine. His father was not only a pioneer but was a refugee from Germany -- a fugitive from conditions of tyranny which were intolerable to free men...I have always believed that the Germans who were impelled to come to America in 1848 and other years along about that time were more to be admired for their courage and love of liberty than were the Pilgrim Fathers.45

Chester W. Nimitz was an authentic American hero, commanding thousands of ships and millions of men. To citizens of Fredericksburg, Nimitz served both as a link to world events and a buffer against ethnic prejudice and resentment. During the war years, hardly a week passed without a feature article appearing in the Fredericksburg newspaper updating his exploits in the Pacific or recalling stories from his boyhood in the Texas hill country. Ethnic Germans living in Fredericksburg, eager to reaffirm their loyalty and patriotism, thrilled to the exploits of Admiral Nimitz, an American naval leader who shared their German heritage.

The German language continued its prominent usage in Fredericksburg. The Fredericksburg Standard also printed a German language edition titled the Wochenblatt, which was necessary because some seventy-five percent of Fredericksburg's population was ethnic German, and half of the townspeople spoke German at home.46 The Wochenblatt ceased publication in 1946 at the end of its 73rd year. Art Kowert, its managing editor, stressed that "there were plenty of subscribers, but not enough advertisers who would pay to have type set in both English and German."47 During the war, however, the high school principal, B. L. Enderle, attempted to prohibit students from speaking German on the high school campus. Interestingly, the success of this
mandate is remembered differently by teachers and students. Mildred Roundtree, the high school English teacher, recalls that the students feared punishment for speaking German, so they stopped conversing in German on the playground and around the campus. On the other hand, Belton Klinksiek, a high school student during those years, claimed that the principal's directive was ignored, (as is often the case by students) and that German was spoken on the campus of Fredericksburg High School as it always had been. Arguably, in Fredericksburg, the use of the German language in ordinary discourse was not affected by wartime conditions.

German ethnicity did not diminish the manifest patriotism of Fredericksburg's citizens. For example, Hans Bergner, the aforementioned Fredericksburg native who later served as school superintendent, recalled that his father, a Lutheran minister in Gillespie County, had been jailed in Tennessee during the First World War. Reverend Bergner had refused to stop preaching in German because it was the only language that many in his congregation understood. Young Bergner refused to let his father's earlier imprisonment dampen his patriotism for the American cause. When Japanese bombs fell on Pearl Harbor, Bergner, a 1939 graduate of Fredericksburg High School, was attending Texas Lutheran College. Like many of his friends, Bergner was anxious to quit school and join the fight in Europe. "We couldn't wait to get over there, even though our parents thought we were crazy. They were afraid that we had a glorified idea of what war was like. Their greatest fear was that we would leave and never come back." These fears were not unfounded. A number of Fredericksburg's young men were killed in service to their country, a fact that did not go unnoticed by students at Fredericksburg High School. On May 30, 1945, the senior class presented Fredericksburg High School with a bronze memorial plaque to be inscribed with the names of graduates "who have paid the supreme sacrifice in World War II."

Most accounts of Fredericksburg's school life during wartime recall events and activities that reinforced morale while demonstrating unwavering loyalty to America and its way of life. Art Kowert, whose family published the Fredericksburg Standard, remembered no instances of trouble or pro German sentiment within Fredericksburg's ethnic German community. Kowert asserted emphatically that the citizens of Fredericksburg were "patriotic, red blooded Americans." Erna Dietal Heinen, however, hinted at the possible existence of pro German sympathy in Fredericksburg during the war. Heinen was a Fredericksburg native who taught in San Antonio during the war years, but who often returned home to visit with her family. She alluded to wartime rumors of government investigations into the loyalty of some of Fredericksburg's citizens. Possibly significantly, German was not spoken in Heinen's
home, and her family expressed little interest in the remembrance of German culture or customs. To support her argument of possible pro German sentiment in the Texas hill country, Heinen recalled a story, likely apocryphal, of a man in nearby Stonewall, Texas whose two sons fought, according to their father's wish, in World War II—one in the United States Army and the other in the army of Nazi Germany.

Ethnic Germans in Fredericksburg seemed ambivalent about Nazi Germany. Certainly they were unable to forget their cultural ties to the Vaterland. However, their loyalty was never to Hitler's German war machine. During World War I, "loyal" Americans had directed their military and civilian war efforts against German forces when they disparagingly called "Huns" and "krauts." German Americans seemed relieved when World War II presented "loyal" Americans with an alternative target for their resentment. Ethnic Germans found in the Japanese a new enemy whose culture and physical appearance differed greatly from that of most Americans, and whose moral code seemed totally unaffected by "the ethical principles of the Christian faith."54 Indeed, Japan represented a fitting foe for the citizens of Fredericksburg. Here was an enemy whom German Americans could feel comfortable fighting.

Throughout the war, subtle inconsistencies appeared in Fredericksburg's newspaper coverage of wartime events in Europe and in the Pacific. The Fredericksburg Standard benignly referred to America's enemies in Europe as "Germany," "the Germans," or "Nazis." The Japanese, however, were usually called "Japs," and frequently they were portrayed in a negative manner by the local press.

Newspaper accounts of V-E [Victory in Europe] Day and V-J [Victory over Japan] Day indicate a pronounced cultural bias. Following the surrender of Germany in May of 1945, the Fredericksburg Standard ran the following headline, "PEACE IN EUROPE MARKED WITH SOLEMN OBSERVANCE." The accompanying newspaper article asserted that Fredericksburg was not the scene of rousing celebrations like those occurring throughout other parts of the United States.

After V-J Day in August of 1945, the Fredericksburg Standard's headline read "JAPS SURRENDER," and the article described a joyous celebration in Fredericksburg marked with "fire sirens and the ringing of church bells." This pro American, ethnic German community perceived America's victories over Germany and Japan differently. Thus, it is reasonable to assume that, in Fredericksburg, these dissimilar emotional reactions to similar events can be explained, in part, by identifiable, preexisting, ethnic and cultural biases.
Conclusion

Any reflective examination of American high schools during World War II must keep in mind several factors before drawing conclusions about the impact of war upon the schools' curriculum. In order to maintain both historical accuracy and reasoned interpretation, considered factors should include: community size, geographic region, ethnic composition, local history, and economic realities. Previous understandings of wartime schooling have been based on a disproportionate number of urban settings and situations. This study suggests that generalizations reached in these previous accounts of school practice fail to acknowledge fully the heterogeneity of American education during the war years.

Fredericksburg High School served a remote rural community in the hill country of central Texas. School officials explicitly attempted to maintain the school's academic tradition throughout the war rather than devoting its resources to preparing students for service in the armed forces or for work in war related industries. This is not to imply that no changes occurred at Fredericksburg High School during World War II. On the contrary, this study reveals that a number of wartime changes did take place at the high school, but that these changes represented a response to community and cultural demands rather than a concerted effort to fuel the American war machine.

While World War II was devastating to people around the world, the effects of the war were felt especially in the small rural communities around the United States. For several years previous to World War II, rural education had been a target for educators and committees intent on improving schooling in these areas. Rural schools were some of the poorest in the nation, and the lack of wealth manifested itself in the form of inadequate instructional materials, seldom used because of their urban viewpoints, and poorly prepared teachers who were forced to teach under difficult conditions.

By the early 1940s, surveys of education included judgmental statements about rural education, such as "every commonly employed statistical measure suggests that the quality of the educational service provided by rural schools, ... falls far below national norms." The onslaught of World War II only magnified the problems of the rural schools. Faced with rationing, teacher shortages, and an unstable political climate, these schools were forced to be additionally creative in educating their students.

In a report published by the Commission on Rural Education and the War, rural schools were challenged in the following ways:

- to strive more efficiently than ever before to help each individual ... a) understand the basic principles and values of democracy, b) develop a deep-seated confidence in and loyalty to democracy and all that it means, c) take part in some real-life activity that makes a significant contribution to the life of the community and gives each child a feeling of responsibility for maintaining and improving the democratic way of life.2
Other reports concentrated on what experts believed to be some of the major problems faced by rural schools during World War II. From a report entitled "War Time Guide Posts for Rural Youth," rural schools were admonished to address five major problems: (1) How is democracy to be taught? (2) What shall be the relation of schools to the farm labor shortage? (3) Shall the rural schools' program be accelerated? (4) How shall the threatened teacher shortage be met? and (5) What administrative adjustments are needed? Suggested solutions were long on rhetoric and short on practical solutions, and they always included the footnote that these suggestions should be implemented at the state and local levels, yet with no direction as to how to make the changes.

Near the end of the war, the largest problem to hit the rural schools was the teacher shortages caused by the war. At a White House Conference on Rural Education in October of 1944, Howard Dawson reported that over 50,000 persons were teaching on emergency certificates issued by state agencies to ease the teacher shortage. Many of these individuals were unqualified and possessed little education beyond high school or even elementary school. Because rural schools usually paid low salaries, they rarely attracted qualified, well trained teachers. Consequently, emergency certified teachers, consequently, constituted the bulk of rural teachers. Rationing affected school materials available for students, and other services, such as busing, were either eliminated or curtailed by the war. Rural schools were hit so hard that President Franklin D. Roosevelt, in his remarks to the White House Conference on Rural Education, commented that "[w]e cannot be proud of the fact that many of our rural schools, particularly during these years of war, have been sadly neglected."

Many parts of the country faced similar problems as rural education in Texas did. The Texas Legislature had focused some, but inadequate, attention on the problems of rural education prior to the outbreak of war. In the late 1930s, the Equalization Law was passed by the Texas Legislature. This legislation demanded longer school terms, better prepared teachers, and financial support for weak school districts. Further attempts to reform rural schools in Texas failed because rural communities dominated the legislature. Thus, a "totally decentralized system of education" continued in Texas, with each tiny community exerting its personal influence over the local school. This becomes clear in a study of the modifications of the curriculum, war drives, rationing, and the impact of the war on the children in Ellinger, Texas.

Ellinger, Texas, and the General Effects of World War II on the Ellinger School

Ellinger is located in Central Texas. The town is primarily a farming community composed of people mainly of Czech or German origin.
During the era of World War II, the town had approximately 250 residents. In 1936, a new school had been built. It featured three large classrooms, an auditorium that also served as a gymnasium and lunchroom, and a kitchen. This school offered instruction in grades 1 through 10 and had three full-time teachers. In contrast to most reports on rural teacher preparation at that time, the teachers in Ellinger were well educated and had earned teaching certificates. The two teachers interviewed from that era, Mrs. Irene Meyer who taught grades 1-3 and Mrs. Ruby Martinek who taught grades 4-6, had teaching certificates from Sam Houston State Teacher's College.

The teachers of Ellinger had success with their pupils, with many of their former students going on to neighboring high schools to become valedictorians, salutatorians, and honor students. Classes at Ellinger School were small, and the students received individual attention from the teachers. The students also learned to become independent workers because when the teacher was working with one group of students, the others were either doing homework or tutoring the slower students. In addition to these positive aspects, Ellinger was a tight knit community and the teachers had the full support of the community and parents. All these factors combined to create a school environment in which, as Mrs. Irene Meyer remembers, "we were like a family . . . and the students would help each other."9

Prior to Pearl Harbor, the ongoing conflict in Europe had little affect on the small community of Ellinger, even though most of the people living there could trace their ancestry back to Czechoslovakia or Germany. Blanche Hrachovy Pater, a student at that time, recalled "we would call each other . . . Nazi . . . that was the ultimate in calling somebody bad, but we didn't know what it meant because the war didn't affect us. . . . I never thought my German friends were like the Germans in Germany."10

This rural American innocence was shattered on December 7, 1941, with the Japanese bombing of Pearl Harbor. The next day, a Monday, teachers across the nation tried to explain the news to the students and comfort and soothe them. Mrs. Ruby Martinek, for example, remembered events on December 8th:

We called an assembly of the students and teachers and all met out in the gymnasium. We talked about how our entry in World War II might affect our lives. We sang some patriotic songs. We said a prayer and the students were very aware that we were going into something that was going to affect their lives and the lives in their community and country greatly.11

Students had a different perspective of what happened. Blanche Pater recalls:
I remember my first grade teacher explaining that Monday in December, writing Pacific Ocean and Hawaii on the board and trying to explain the war to us . . . I think most of us had a difficult time because we had no concept of 'states.' We were so isolated . . . we couldn't possibly imagine even California.

Clearly, the war was to have an effect on everyone. New expectations of teachers and the educational system were formed. Men left teaching positions to enter military service, leaving vacancies that had to be filled mainly by females in the local community, some of whom received quick certification. Ellinger was fortunate not to be affected by the departure of qualified teachers, and the Ellinger teachers soon became the leaders in the community. For example, they dealt with the government regulations on issuing ration booklets, organized scrap metal and paper drives, and helped with the Red Cross. Many teachers in rural communities may have felt burdened and overwhelmed by the sudden increase in work, but the teachers in Ellinger believed they owed something to the community and the nation, or as Mrs. Meyer commented "I was real proud to help out."

Within the school and its day-to-day proceedings, the war's influence was subtle, yet present. Overall, the curriculum of the typical rural school did not change radically with the beginning of World War II. Rural schools at this time had few authorities to whom to answer, and as such, continued to educate their students to meet what teachers felt to be the needs of the community. As Elizabeth Yeager points out, "Expectations and resources simply were different for rural American communities." Thus, the impact of the war tended to be expressed mainly in extracurricular and symbolic activities, such as scrap drives, growing victory gardens, and the buying of war bonds. Still, a few curricular modifications were made.

Curriculum Modifications Made in the Rural Schools in Response to the War

In an article by Lois Clark on adjustments that could be made to the war curriculum, she stressed that most of the adjustments "[could] be made by modifying the activities or instructional materials used in the units or courses now in effect." However, the modifications suggested by Clark were not sweeping reforms. Clark's wartime suggestions were ways simply to improve rural schooling, such as requiring mastery of basic skills, maintaining physical health and fitness, and teaching students how to apply their learning to real life situations.

As for specific subjects, the war influenced classroom topics and themes. In arithmetic, Clark suggested that teachers use examples related to the war, such as how much gas or rubber was needed in solving word
problems. In art or music, the theme of democracy could be used, especially with school plays or pageants. An increased emphasis on health and physical fitness was suggested, and in other areas such as science, language arts, or social studies, the war could be used to explain conditions for rationing, to suggest subjects for English themes, or to explain the importance of democracy.

At local levels, school administrators tried to determine in what way "the public schools [could] best serve the needs of this nation." This included teaching the principles of democracy and freedom, maintaining morale, teaching the aims of the war, increasing the emphasis on physical education, and building leadership qualities. At Ellinger School, although teachers received no guidance on how to teach these important lessons, they still managed to instill a sense of pride in America and also bring the war into the curriculum. As Barbara Hrachovy, a former student, remembers that the war "was entwined all day long... it was just there throughout the entire day."

Discussion on why certain things were rationed became a lesson in economics and geography. As Mrs. Martinek recalls, students "came to realize that no country is self-sufficient in meeting all our needs. Nations are interdependent one upon the other." She further remembers impromptu lessons in supply and demand. "When students would ask, 'Well, why can't we get more gasoline? Why can't we get more tires?' I would try to explain to them that we didn't have enough raw materials to produce what was needed."

Geography also became important to students as they searched the globe to find out where beloved uncles, brothers, and fathers were stationed. Australia, Guam, Bataan, and the Philippines became more real for the students when they had a loved one fighting in those areas.

The most important change in the curriculum, albeit of a symbolic nature, was the increased emphasis on democracy, freedom, and patriotism. Assemblies were held at least twice a week, where students would gather together to say prayers and to sing patriotic songs. Charlie Hrachovy, a former student, remembers the patriotism at school vividly. "I think the flag and the pledge of allegiance was very important to us... there was a lot of pride in being an American." Students were also encouraged to support the men fighting for our country. As Blanche Pater recalls, "we made joke books. We were always making things for the service people... The teachers encouraged us to write letters to our family members... as a writing assignment."

Every part of the school curriculum was affected in some way by the war. Although most of the changes were not dramatic or long lasting, they were memorable and helped to shape a generation of students.
War Drives and Rationing: Their Effect on Rural Schools

The war's largest impact on the schools, particularly rural schools, was in extracurricular and community activities. Scrap metal and paper drives were held. Bonds and war stamps were bought for the duration of the war. Victory gardens were planted at home and at school. These activities were important, not only for the aid provided to the war effort, but also because war drives were vehicles for educational opportunities. For example, Kate Wofford commented on how war drives could be a healthy outlet for tensions caused by the war. In addition, children's hatred of and fear toward the enemy and their tendency toward destructive activities such as war games could be channeled into the more constructive activities provided by the drives. War drives also provided the children with the sense that they were needed, were a viable member of the community, and were doing their part to help the war effort.

But affective gains were not the only positive aspects of war drives. They could also be used in the classroom as a starting point for class discussions about why bond and stamp sales were necessary, why scrap metal needed to be collected, and why conservation was important. Victory gardens were also able to play an important role in the wartime curriculum. Through a school victory garden, students could learn the importance of proper nutrition and science in everyday life. Victory gardens helped students gain an understanding of how activities throughout the world were related to each other and to the activities in their own community.

In Ellinger, the war drives and the outside community activities in which students participated played a vital role in both their education and their awareness of the war. Paper drives, scrap metal drives, and buying bonds were part of every schoolchild's life. The students at Ellinger even converted their school flower gardens into victory gardens filled with vegetables that they could eat.

These activities were seen as ways that the even the smallest of children could help the community. As a local newspaper article of the time pointed out, "To the child... the idea of being a patriotic citizen is not for mere show, but is for the purpose of helping, even if that help is small." Many of the students helped out by buying stamps towards buying a bond. The school created contests to see which class could save the most money in war stamps. An important thing to remember is that when the children bought bonds, they were not only helping Uncle Sam, but they were also being taught the valuable lesson of how important it was to save.

For those students who found money difficult to come by to even purchase the ten cent stamps needed to buy a bond, there were other ways to help out. Barbara Hrachovy remembers collecting scrap metal.
"There was an old railroad near our house... I would go looking for the railroad spikes for the scrap iron and it was helping the war effort if you could find some kind of metal." In whatever way the students participated in the war drives, they learned. Through it all, the school was the central, stabilizing factor in these rural students' lives.

Perhaps the hardest part of the war for the millions of people on the homefront was the widespread rationing that occurred. Almost all commodities, from meat and sugar to gasoline and tires were effected. The rationing was particularly difficult for those living in rural communities. To conserve gasoline, children walked to school. In the warmer months, to save shoes, children came barefoot to classes. The rationing was particularly hard to live with when the weather suddenly turned bad. Mrs. Meyer remembers those instances vividly. "Sometimes the weather would change during the day and [the students] had no raincoats... I remember many times when I would take three or four layers of newspapers and put it over their shoulders." Students who were younger during the war, such as Barbara Hrachovy, remember other hardships that gasoline rationing caused. For example, she remembers being homesick because she had to live during the winter with relatives in town to be closer to the school. Gasoline rationing restricted transportation for everyone and further isolated the students of Ellinger and other rural schools in the nation.

Rationing affected Ellinger's school lunch program. Ellinger was a poor school that received government help during wartime. It received surplus agricultural commodities, such as prunes, cheese, milk, and grapefruit juice. Mrs. Martinek particularly remembers the school's lunchroom cooks. "Our cooks were good and they used what we had to the fullest... They were very creative because we did get good meals -- tasty and nourishing."

Little children were warned by Mrs. Meyer to not take more than they could eat and to save food. If the students finished several of their meals completely, they qualified to become a Clean Plate Commando. Not all children, however, were happy about doing their parts. Barbara Hrachovy particularly remembers her feelings about the surplus grapefruit juice provided.

At a certain time of day, you lined up and went up on the stage and they had these huge tumblers of this grapefruit juice which was so bitter and so awful, but you had to do your part and drink the whole thing.

Rationing of chocolate, at least from the children's point of view, was particularly troubling. Instead of real chocolate, they received imitation chocolate that, in the words of Barbara Hrachovy, "tasted horrible." The rationing was difficult, but they learned valuable lessons, such as saving for a rainy day and conserving materials. In addition, as Charlie Hrachovy
remarked, "... because of the shortages that we went through, you appreciate what you now have and the abundance."

**World War II and its Lasting Effects on Rural Children, Schools, and Communities**

Perhaps the people most affected by World War II are the ones least heard from in publications about this era. These are the schoolchildren who lived through that era and whose lives were irrevocably changed by world events. Children across the nation were faced with fathers, brothers, and uncles going off to war. They were scared and frightened and very aware that something terrible was happening in the world of adults.

The reaction of the children in Ellinger, Texas probably was similar to those of children across the nation. Children were scared that they would never see their brothers, uncles, or fathers again. For Blanche Pater, whose brother Daniel was fighting in the Pacific arena, one of her main memories was of her parents constantly "praying ... that [Daniel] would return."

The war was with the children every day and there was little they could do to escape. The children saw movies featuring the Flying Tigers of China or dealing with famous battles such as the Battle of Midway. At recess, children pretended to be American soldiers fighting the Germans or Japanese. Even when they went to town to buy goods at the local store, they would be reminded of the people from their town serving in the war by a display case which had souvenirs sent home from the soldiers serving abroad. The war was not just something heard about over the radio broadcasts. It was everywhere.

World War II clearly affected American education. Its impact on rural schools like the Ellinger, Texas, school is also apparent in the statements made by former teachers and students. Because some local schools officials, however, viewed many of the war activities as extraneous to their accustomed curriculum, they did not use the war as an opportunity to revitalize their sometimes sagging educational programs. Observations such as these were evident even near the end of the war. Roscoe Pulliam, for example, wrote in an article that by the end of the war, "important values in long-time social education and immediate vital information about the war effort ... have been lost."22

Statements such as this may have been true, but for the people who lived through the World War II era, the effects were real and persist fifty years later. Students and teachers learned the value of saving and the importance of not wasting food and other materials. All learned the value of democracy and freedom. Perhaps the best statement on the effect of World War II on not only rural education, but also on all education was made by Mrs. Ruby Martinek:
Yes, we learned many things from our experiences in World War II, but one very important lesson we have not learned is to love our neighbor as ourselves, regardless of race, color, creed, or whatever. Until we follow that command, we will continue to have war and strife in our world. It is only by sharing with our fellow man and respecting the rights of others that we can hope that the dream of the person who wrote "Let There Be Peace on Earth" will come true.

School gardening remains a special curiosity of American children's involvement in World War I, the United States' first total war. Ubiquitous, along with Liberty Loan drives and Red Cross sewing and knitting, gardening has helped define the remembered insignificance of children's wartime work. The very curiosity of children's gardening obscures its context and leaves it utterly misunderstood. In fact, wartime school gardening contributed in important ways to the American war effort. Ironically, wartime school gardening, clothed in militaristic appeals and organization, also marked a beginning of a profound shift in the purpose of American schooling.

For more than a hundred years, America's schools had served the academic and citizenship needs of the young nation's children. This purpose would continue its central role during most of the 20th century. However, during the short interval of the Great War, the purpose was altered. Wartime schools within national mobilization also began to serve the interests of the nation state. Specifically, schools were enlisted to serve the nation's efforts to win the war. With the Armistice, the altered purpose lay dormant. Now, 75 years later, the changed purpose appears prominently in school reform proposals. Its beginnings were embedded, innocently enough, in American efforts to insure that the Great War truly would be the war to end all wars.

Wartime school gardening began simply. It responded to obvious need. The United States' declaration of war in April, 1917, launched a multitude of war mobilization efforts. An army was raised, hastily equipped, trained, and transported to France. Production of munitions and uniforms and other necessities of war proceeded as fast as the nation's industries could be converted from peacetime purposes. One absolute necessity to the conduct of war could not be rushed: the
production of food. In the Spring and Summer of 1917, the availability of necessary foodstuffs, principally meat and cereal grains, grew into a serious military concern. The American public swiftly learned of the need for increased food production and food conservation.

The American expeditionary army was not the only focus for increased foodstuffs. Because European agriculture lay devastated by two and a half years of warfare, armies and civilians of the allied nations needed food; the United States was the only source of that supply. Joining the queue of needy Europeans were many thousands of refugees. American farmers recognized this swelling market, but, in frustration, could not seize the opportunity by their own efforts. As customary, war arrived at an inopportune moment.

America entered the Great War in the aftermath of two years of varying decreases in agricultural yields. American farmers hoped that their 1917 harvest would increase. Theirs was an annual hope, in peace and in wartime, over which they had no effective control. Still, the war required even more food than normally produced. Thus, war planners decided that America would supply it. A special wartime slogan proclaimed their decision: "Food Will Win the War."

Even Potomac bureaucrats knew that slogans would not provide the enormous quantities of meat and grain that the war surely would consume. Consequently, the new emergency U.S. Food Administration and the U.S. Department of Agriculture initiated several major programs. Although the growing seasons could not be controlled from the nation's capital city, farmers at least could cultivate more cropland, and thereby, the agricultural yield could increase. Farmers across the nation plowed more grassland and planted additional acres. Other actions followed. With the ranks of military aged men depleted, many school boys were released from school to help farmers harvest crops. Thus, the new United States Boys' Working Reserve was created and directed by the federal Department of Labor. Other efforts, including camps for use by city boys who worked on farms, were originated and conducted by some states' Departments of Education. Additionally, the U.S. Food Administration, initiated a number of measures. For example, with the assistance of school children, it sought pledges from the nation's citizens to conserve food by eating less and to save fat for the manufacture of explosives. As the war dragged on, this agency encouraged Americans to enjoy meatless and wheatless days as measures to conserve food.

Soon after the US entered the war, the independent, voluntary National War Garden Commission began to advocate expansion of home gardens across the nation. An immediate success, it claimed at the end of 1917 that gardeners of 3 1/2 million home gardens had produced canned vegetables and fruits valued at $350 million. Food production remained a high priority throughout the war.
The U.S. School Garden Army: Children Garden Soldiers to Produce Food

By the Spring of 1918, a year into the war, the U.S. Bureau of Education belatedly announced its contribution to increased food production. It appealed to every public school in the nation to organize local units of the United States School Garden Army and to enlist school children as USSGA soldiers. Both boys and girls were eligible for enlistments. This new organization built on the foundation of a quarter century of school gardening in many of America's city schools. In fact, during the previous year, the first growing season of the war, 488 city school systems supervised 355,715 children in school-directed home gardening projects and 278 city systems involved 29,308 children in school gardens. The School Garden Army swiftly expanded interest in school gardening throughout the nation. Children's gardening would "kick the Kaiser."

This special wartime emphasis by the Bureau of Education signaled a sharp departure from its usual activities of gathering information and compiling statistics about American education. The Bureau's ordinary routines and lack of references contributed to the slowness with which it responded to the national need for food. Otherwise, it might have responded earlier. Commissioner of Education Philander P. Claxton, for example, had long supported school gardening. Additionally, the Bureau had operated a Division of School and Home Gardening since its congressional authorization in 1915. On the other hand, the Bureau had no funds to launch an activist program until President Wilson allocated $50,000 from the national defense budget to support school gardening.

On February 25, 1918, President Wilson wrote Secretary of Interior Franklin K. Lane to announce his public support for the establishment of the School Garden Army. Wilson hoped that every school would enlist a "regiment" of children gardeners. Subsequently, President Wilson also became the nominal commander-in-chief of the new garden army of school children.

The U.S. School Garden Army enjoyed immediate and widespread success. Within six months, it claimed a membership of one and a half million garden soldiers. It drew recruits from schools in villages, towns, and cities across the entire nation, from all forty-eight states and from Puerto Rico, as well. Indeed, historian Edward A. Krug noted that the School Garden Army was "one of the most widely applauded practical activities during the War." It was more than a practical patriotic activity, however. Similar to the National School Service and other activities of the U.S. Committee on Public Information, the School Garden Army represented direct federal intrusion into the conduct of local schools. Its widespread popularity in the nation's schools provided a wry irony to the general opposition to the establishment of military
training units in high schools by many school boards and administrators. Militaristic units of young garden soldiers simply differed from older school boy cadets drilling with and firing weapons subsequent to their military conscription. Also, in the U.S.'s first total war military terminology was acceptable symbolism.

The avowed purposes of the U.S. School Garden Army included increased food production and the education of town and city children about thrift, patriotism, service, and responsibility. Less trumpeted but certainly as important, the use of school children to influence their parents about the war's meaning was another major purpose of the garden army. President Wilson's initial allocation was expended during the first six months of USSGA operations. Subsequently, Wilson shifted $200,000 for the garden army's next ten months of work.

To direct the School Garden Army's operations, Commissioner Claxton appointed J.H. Francis, former superintendent of schools in Los Angeles, California, and in Columbus, Ohio. Francis subsequently divided the nation into five regions, each led by a director, and fifteen sub-regional areas headed by assistant directors. The School Garden Army issued a manual and dozens of gardening leaflets by the September beginning of the school year, and encouraged gardening in schools through a variety of means. For example, Secretary of the Interior Lane sought support for the USSGA from individual directors of state councils of defense, particularly influential if coercive groups. Francis, Claxton, Lane and other officials clearly expected the School Garden Army to succeed.

With its leaders likely believing that an elaborate organization might burden its operations, the School Garden Army adopted a simple structure for its local units. The basic unit of organization was a company of no more, and commonly fewer than, 150 children above the third grade supervised by a teacher. Individual schools could have several companies. A captain, assisted by a first and a second lieutenant, officered each company. All other pupils in the unit were privates. Local boards of education bore the expenses of School Garden Army units except for nominal costs likely donated by parents. Federal funds paid only for national administrative and operational expenses. This federal failure financially to support a national program clearly fore-shadowed late twentieth century federal forays into education.

The School Garden Army's martial trappings, however, were provided from federal funds. All garden soldiers received insignia of their ranks to wear on their shirts or blouses. Privates wore a bronze service bar on which "U.S.S.G." was stamped. Officers wore a similar bronze bar, but with distinctive stars rather than the initials. Bars for second lieutenant had one star in the border; bars for first lieutenants had two stars, and those of captains had three stars. Insignia proved popular with chil-
dren. A Chicago garden director requested 20,000 insignia bars "at a very early date . . . as the bars will do a great deal to stimulate the interest in caring for and maintaining our school gardens." The Bureau of Education also provided each "enlisted soldier" with a free School Garden Army flag on request. It was white on a red background with the Army's symbol, a crossed hoe and rake with the letters, U S S G. To assist local schools in their recruitment of garden soldiers in the Fall of 1918, the Bureau of Education provided free of charge a 16 1/2" x 23" poster that portrayed Uncle Sam playing a pipe and followed by children carrying hoe, rake, shovel, and trowel and planting seeds with the slogan emblazoned, "Follow the Pied Piper. Join the United States School Garden Army." Garden soldiers could sing special lyrics composed by Joe Lee Davis, an SGA gardener in the Lexington, Kentucky, Junior High School, to the tune of Irving Berlin's popular "Over There."

Johnnie, get your hoe, get your hoe, get your hoe;
Mary dig your row, dig your row, dig your row;
Down to business, boys and girls,
Learn to know the farmer's joys,
Uncle Sam's in need, pull the weed, plant the seed,
While the sunbeam's lurk, do not shirk, get to work,
All the lads must spade the ground
All the girls must hustle round
Over there, over there;
Send the word, send the word over there,
That the lads are hoeing, the lads are hoeing
The girls are sowing everywhere,
Each a garden to prepare.
Do your bit so that we all can share
With the boys, with the boys, the brave boys
Who will not come back 'till its over, over there.

School children easily were enlisted into School Army service. However, the recruitment of teachers to work with the school gardeners, especially during the summer, proved difficult. Most teachers were considered unprepared to teach gardening or to supervise children gardeners even though the nation continued to be mainly rural. A majority of city teachers may not have had childhood agricultural experience. Also, the era emphasized a new academic professionalism which required formal courses as preparation. School Garden Army Director Francis and other Bureau of Education officials, therefore, encouraged the development of special summer courses for teachers in normal schools and colleges. Commissioner Claxton reported that 50,000 teachers received instruction in gardening through SGA garden leaflets. In unreported circumstances, many thousands of teachers participated in garden army activities.
The School Garden Army enrolled units mainly in city schools. This development effectively ignored rural schools, but it occurred less by design than by circumstance. Gardening had been a feature in many American pre-war city schools. Its expansion capitalized on that experience. Commissioner Claxton’s plan to foster gardening in all the nation’s schools, however, encountered strident opposition from the Secretary of Agriculture, D. F. Houston, and many state agricultural extension agents. This inter-agency territorial squabble, in retrospect, epitomized the pettiness that appears to flourish in government bureaucracy, even during wartime. Secretary Houston insisted that Claxton’s move trespassed on the Department of Agriculture’s efforts for several years to establish agricultural club programs in the nation’s schools. Nebraska’s state director of agricultural extension, for example, protested the Bureau of Education’s invasion of his programmatic territory; he was rewarded by being named to direct Nebraska’s School Garden Army operations. The conflict amongst Washington, D.C, bureaucrats was less easily resolved. For some eight months, Claxton’s and Houston’s representatives negotiated until their agreement was announced on November 13, 1917, two days after the Armistice. The agreement only recognized the current reality. The Bureau agreed to limit its school gardening efforts to schools in cities, towns and villages. The Department of Agriculture promised to concentrate its attention to rural children and youth. The agreement notwithstanding, the conflict continued until Claxton’s School Garden Army disappeared the following year.30

National policy makers’ disagreements had little effect, however, on local SGA activities. Productivity of SGA child gardeners in the 1918 season reached high levels. Reports from schools in several towns and cities illustrate the work of the nation’s garden soldiers. In Malden, Massachusetts, 3,500 SGA gardeners cultivated 15 acres of small plots. Every Richmond, Indiana, school child had productive gardens. In New York city, gardens carried the name of a soldier serving in France. In one week in July 1918, sales of produce from these gardens totaled $686.59. An eight year old Batesville, Mississippi, SGA boy cultivated a 61’ x 33 1/2’ garden that yielded food for his family of four and he sold surplus vegetables for a $22 profit. East Orange, New Jersey, companies enlisted 696 garden soldiers. In Cleveland, Ohio, 13,500 children tended plots totaling 227 acres with a season's yield estimated at $30,000. In Boston, 2,500 garden soldiers cultivated 20 acres in the city’s Franklin Park. Cincinnati SGA companies enrolled 18,000 children and the Board of Education provided street-car tickets to boys and girls "in the congested sections of the city" to travel to and return from their suburban gardens. In Columbus, Ohio, SGA Director Francis’ former school system, 5,949 school children completed their garden season with a production valued at $43,043.65. In Greensboro, North Carolina, 1,092 Negro and white
girls and boys cultivated 113 acres of gardens. Every school in Austin, Texas had SGA companies; each elementary school had ten companies with each captained by five girls and five boys. The SGA garden soldiers cultivated an impressive number of acres and their work produced abundant foodstuffs. Many of the claims, however, surely were excessive. Thousands of gardens failed and many children were credited for work conducted by adults. Criticism of the School Garden Army, even by distinguished individuals liked Harvard's President Charles W. Eliot, went mainly unreported.

Another largely obscured element of SGA operations involved Negro elementary school children. Work of these garden soldiers was rarely reported. Attention to the activities of the Greensboro and Raleigh, North Carolina, Negro child gardeners clearly was a notable exception. Julius Rosenwald personally pledged $10,000 to pay one-half of the salaries of many Negro garden teachers in unnumbered Southern cities during the 1918 gardening season. Sadly, consistent with other consequences of segregated schools, most of this generous gift was not touched; only a third of the money was requested.

The School Garden Army's enrollment goal for the 1918-1919 school year was an optimistic five million school children. The war's conclusion surely dampened enthusiasm for the Army and its work. Still, by May 1919, more than two and a half million garden soldiers enrolled, half the target figure, but a very large number, nevertheless. The School Garden Army moved easily into peacetime. Officials continued to issue publications for use by its units. The Bureau, through School Garden Army officials, distributed more than 4,500,000 leaflets and 750,000 manuals of lessons by the end of the school year. It claimed 40,361 teachers in 36,558 public schools and 3,803 parochial schools on its mailing list. Also, the Bureau made motion pictures of USSGA special programs (e.g., in Boston, Massachusetts; Lexington, Kentucky; and Redlands, California) as well as of gardening instructions. More than 300,000 people viewed the films. Although Commissioner Claxton and others planned for the School Garden Army to continue, it soon died. Even the prospect of receiving a small savings bank constructed from a hand grenade casing, a "weapon of peace," did not attract increased Garden Army enlistment.

Without fanfare, the United States School Garden Army simply disappeared in the Fall, 1919. The Bureau of Education had no funds to support it, to be sure. On the other hand, the war's patriotic metaphors and military organization simply ill-suited a nation turned away from war toward normalcy. The Bureau continued to encourage school gardening, nevertheless, by other and less expensive means.

The School Garden Army constituted the federal government's principal effort to foster children's wartime gardening. However, two additional developments merit acknowledgment. First, a number of
school systems actively promoted gardening by local school children, but may not have organized them into USSGA units. For example, Superintendent Jesse Newlon recognized the contribution of school gardening among the rich details of wartime activities in the Lincoln, Nebraska, schools. Uncharacteristically, he may have overlooked the School Garden Army program. On the other hand, he and his advisory War Work Committee may have screened out Commissioner Claxton's appeal. At any rate, his end-of-war report failed even to mention the School Garden Army.38

Second, many children who attended small, rural schools participated in food production activities as members of the "Junior Soldiers of the Soil Army." Edwin T. Meredith, Des Moines, Iowa, publisher of Successful Farming, formed this organization of rural children in January, 1918. Through it, he sought to support the fledgling club program of the U.S. Department of Agriculture and more actively to involve rural boys and girls in increased food production efforts during the war. Meredith, the Soil Army's commander-in-chief and a post-war US Secretary of Agriculture (1920-21), aggressively promoted the organization through his magazine that reached thousands of Midwestern farm families. He enlisted individual "soldiers" as well as groups of "soldiers" organized as squads. Meredith also established a $250,000 fund from which he loaned children small amounts of money for their projects (e.g., pigs, poultry, seed) with no security and at six percent interest. He championed their success through laudatory reports in a special Successful Farming supplement, Junior Soldiers of the Soil, initially published in January, 1919. He also advocated membership in the Junior Soldiers of the Soil Army in his Rural Schools Bulletin, distributed free of charge to rural school teachers from September, 1918 through August, 1919. More than 50,000 children enlisted as soil soldiers in Meredith's army, and some of their leadership and direction came from teachers in rural schools. Meredith's Soil Army program, consistent with the Department of Agriculture's position, completely ignored the Bureau of Education's School Garden Army activities. By the Fall, 1919, Meredith disbanded the Junior Soldiers of the Soil Army but continued his vigorous support of the Department of Agriculture's boys' and girls' club program, later to become the 4-H Club movement.

Wartime School Gardening and Mobilization: Contributions to Altered Educational Purpose

In retrospect, American school children contributed impressively to increased food production during the first world war. The attempted militarization for gardening was mainly symbolic. It sought a patriotic link only with one childhood activity and was benign if not a little pretentious. The United States School Garden Army, however, offered a
new vision for schools of the nation. First of all, it was a tardy response for city school children to a pressing national concern for food production. Most importantly, however, it was a federal intrusion into local schools. As such, the School Garden Army contributed to the beginning of a shift in the purpose of American public schooling. With President Wilson's direct assistance and an even implicitly altered purpose, Commissioner Claxton's Bureau of Education rapidly changed, at least for wartime school gardening, into an activist federal agency.

This altered role lay unrecognized at the time. During the war, groups of educators (e.g., National Education Association) backed increased federal support of schools and a cabinet level department of education even as they opposed federal control of the nation's schools. They failed to recognize, however, that the Bureau's activism in wartime school gardening amounted to federal intrusion into local schools. Apparently, few school officials noted the Bureau announcement in School Life that explicitly asserted the School Garden Army's purpose to be "to nationalize and unify" school gardening.39 During the war, this federal gardening activity generally was recognized as a benign means by which the war might be brought into the schools. This "experiment in working out the relation of education to war"40 constituted one of several largely silent and forgotten precursors to an increasingly obvious change in the purpose for American schooling.

The Fort Wayne Normal School: History and Issues

The Fort Wayne Normal School, the oldest teacher training institution in Indiana, had a growing student population, an excellent reputation, and an expanding curriculum in 1921 when its budget was suddenly and unexpectedly eliminated from that of the Fort Wayne Public Schools. This paper explores the history of this Normal school, from its inception through its termination, and particularly considers factors which led to its demise.

Following the Civil War in 1865, Fort Wayne hired a young, ambitious educator to oversee and give direction to its quickly expanding public school system, a system that had suffered a lack of leadership and funding during the Civil War, like school systems throughout the country. At age twenty-six, Superintendent James H. Smart, a New Englander, brought to the Fort Wayne Public Schools an organizational zeal and talent that transformed them during his ten years of service.¹

The new superintendent energetically took on all aspects of the public school system, which consisted of ten rooms designed to accommodate 634 students, but actually served 1,245 students.² With the approval of the school Trustees, Superintendent Smart built several elementary schools, as well as a high school. He expanded the high school curriculum to include math and science, purchased lab equipment for science classes, improved the examination system, increased attendance, reduced the number of grades from twenty-eight to fourteen, and collected statistics on all aspects of the system.³

In 1867 Smart established the Fort Wayne Training School, the first Normal school in Indiana, predating even what came to be Indiana's two largest state normal schools, now Ball State University in Muncie and Indiana State University in Terra Haute. The previous year Superintendent Smart had noted that Fort Wayne's High School had "suffered the loss of its best pupils, from the lower classes, who have been called away..."
as teachers in surrounding towns. Thirteen such pupils had been lost in this way; Smart had been unable to fill an additional twelve requests for teachers. To Smart this indicated the good reputation of the high school, but he hoped the students would return. Under such conditions, a Normal school course in the high school would retain high school students longer, as well as better train more teachers for the greater Fort Wayne area.

The new Fort Wayne Training School based its curriculum on Johann Heinrich Pestalozzi's method of Object Teaching. The first principal of the new Training School, Miss Mary H. Swan, and the supervisor of the practice school, Miss Mary L. Hamilton, both graduated from the Oswego State Normal and Training School in the state of New York, which was a center for teaching the then new educational ideas and practices of Swiss educator, Pestalozzi. In her report to the Superintendent, Principal Swan echoed the Superintendent's concern for hiring well trained teachers, especially for the primary schools. She, like he, hoped for the Training School's expansion, so it could train teachers for a larger geographic area than Fort Wayne.

After the Training School's first year of operation, the President of the Board of Education proudly proclaimed it successful, as well as cost efficient. The Training School, located on the first floor of the Fort Wayne High School, and serving between six and twelve students a year, offered a one year course, which usually followed a student's high school graduation. The School had two departments, the training department and the practicing department. In the training department students learned the newest methods; in the practicing department students, referred to as pupil teachers, practiced the methods in actual classrooms. Half of the Training School students studied methods in the training room for a month, while the other half practiced teaching under a critic teacher in one of the four classrooms. At the end of each month, the divisions switched places. The year course consisted of a total of four months of methods and four months of pupil teaching.

The Training School continued in operation for nineteen years, until 1886, training teachers for work in the primary grades. For a brief period during those years, from 1877-79, the school also trained teachers for the intermediate and grammar school grades. Most graduates were hired to teach in Fort Wayne; many eventually became elementary school principals or critic teachers for the Training School.

In 1886, the Training School ceased operations for a period of eleven years, but it was reopened in 1897 by another ambitious, young superintendent, Justin N. Study. Study had indicated, prior to his appointment, and as a condition of it, that he intended to reopen the training school. In fact, since many high school graduates without teacher training had been hired as teachers in the Fort Wayne schools since the closing of the
original Training School in 1886, Study also hired a Primary Supervisor
to observe and give in-service training to teachers already hired. In
addition, he required all teachers to improve their teaching skills by
participating in Reading Circles, initiated and run by teachers.13

The Primary Supervisors, like the Principals of the past and the soon
to be reopened Training School, had extensive background at Normal
schools, which would allow them to keep the primary teachers abreast of
the newest methods of teaching. The first Primary Supervisor, Miss
Annie Klingensmith, hired in 1899, was a graduate of both the State
Normal School in Indiana, Pennsylvania, and the Oswego Normal
School in New York, and had experience teaching in Normal schools.14
Miss Gail Calmerton replaced Klingensmith in 1905, and served in that
position until 1923. Calmerton, a graduate of Oshkosh, Wisconsin, State
Normal School and also Chicago University, with graduate work at
Columbia University, had taught in the Milwaukee Public Schools and
worked as a supervisor of kindergarten and primary education at a
Normal school before coming to Fort Wayne.15

When the Training School was reopened in 1897 it was housed in the
newly built Lakeside School, a primary school, and was referred to as the
Lakeside Training School, or the Lakeside Normal School. In 1900 the
course was increased to one and a half years, and in 1910 to two years. In
1907 its name was changed to the Fort Wayne Normal School.16

Superintendent Study, like Superintendent Smart, served in Fort
Wayne for many years.17 Study, like Smart, was aware of the newest
trends in education, for he, too, was active in professional organizations.
He, as well, chose women directors of the Training School who, like the
Primary Supervisor, had training as well as previous teaching experience
in Normal Schools, women who could bring the "New Education" to Fort
Wayne.

Jesse B. Montgomery, the first Principal of the reopened Training
School, was a graduate of Indiana State Normal School. She had been
employed as a critic teacher at Michigan State Normal at the time of her
hiring. Montgomery led the School successfully for five years, during
which time it expanded from a one to a one and a half year course of
study.18

The year and a half course of study adopted in 1900 included History
of Education, Psychology, Methods, Child Study, and Practice Teaching.
Students took courses in a fixed sequence during the first two semesters.
In the second semester students presented trial lessons to a class of
pupils while their Normal school classmates and teachers watched and
criticized them. In the third semester students practice taught in different
grades for periods of five weeks at a time. The students taught on
Tuesday through Thursday, observing the regular classroom teachers on
Monday and for a time on Friday. Students discussed their work with
the critic teacher afterwards and, then, met with the other practice teachers for a weekly seminar. During all three semesters students met once a week for drawing, reading, physical culture, and music.

In 1902 Miss Flora Wilber became Principal of the Training School and remained in that position until the school closed in 1921. Wilber had graduated from the State Normal College in Ypsilanti, Michigan, but had also attended Oswego Normal College in New York, and Michigan, Wisconsin, and Clark Universities. Before coming to Fort Wayne, she was principal of the City Normal School in Moline, Illinois. During the course of her tenure as Principal of the Training School in Fort Wayne she earned two Masters degrees at Columbia University; she also studied at Jena and Berlin Universities in Germany.

During the first few years of Wilber's principalship, the one and a half year course of study changed only slightly by adding Manual Training for two periods a week throughout the course of study, and Nature Study and Penmanship one period a week for two of the three semesters. Practice teaching in the third semester consisted of ten week experiences in different grades, with the pupil teachers giving lessons on Monday through Wednesday, and observing on Thursday.

In 1910 the Fort Wayne Normal School increased its course of study to two years, or four semesters of twenty weeks each, with a minimum of one year in residence. Students could also apply course credit taken at the school toward a degree at a university. The two year curriculum included practice teaching, now called Practice, Observation, and Educational Conferences, which was required for four hours a week in the second semester and ten hours a week in the third semester. The students progressed during the second and third semesters from teaching individual pupils to groups of pupils to whole classrooms. The Normal students studied Algebra, Trigonometry, Methods of Teaching Mathematics, Geography, Contemporary History, Sociology, and Hygiene. The professional education sequence no longer included educational history as a separate course, but offered a course in the development of public school systems, as well as one on "tests and scales."

The "culture" of the school had also developed over time. The school's basketball team competed with the High School's. The annual Flower Festival, initiated in 1910 and popular at other Normal schools hosted the public in an afternoon of song, drama, and dance in a nearby park. During the 120th birthday celebration of the city in 1914, students put on a special historical pageant in the city's honor. During World War I the school was actively engaged in War related support activities.

The nineteen teens was generally a time of increased visibility for Fort Wayne's teachers. In 1915 the city's teachers' organization successfully lobbied the state for a pension fund. May A. Griffith, a graduate of the
Fort Wayne Training School and later a teacher and elementary school principal in Fort Wayne, had been a leader in that effort. In 1919 Fort Wayne's teachers, like many teachers across the country, actively and successfully obtained a salary increase to make up for pay losses during World War I. The spokes persons for the teachers were often experienced teachers and former Fort Wayne Normal School graduates, many of whom later became principals in Fort Wayne.

Fort Wayne teachers were not just finding their voices on a local level at this time. In 1919 the National Education Association voted to initiate the Department of Classroom teachers, giving teachers' representatives the power collectively to establish policy. Fort Wayne's teachers were active in the political action behind that vote, and the Fort Wayne Teachers Association, led by several Fort Wayne Normal School graduates, was selected as one of the first working units of the reorganized National Education Association.

At the state level, legislators were revising, upgrading, and streamlining the administration and organization of professional training for teachers in the post World War I era. These changes, codified in Indiana's Vesey Bill of 1919, changed the accreditation requirements for Normal schools so as to make it more difficult for small schools and easier for large schools to certify teachers, giving the state closer control of the fewer remaining teacher training programs.

Fort Wayne's Normal School had fared well with the new law in spite of the school's small size. Its rigorous program with many and well integrated field experiences had been highly praised by the state supervisor of teacher training, Oscar H. Williams, in June of 1920. He claimed the school presented "a rare opportunity for both sound academic and specific professional training of teachers." He found the "thoroughness of the practical work" of student teachers to be "unexcelled," therefore recommending that the school's "splendid work" be brought to the attention of graduating high school seniors by every means possible. Dr. Charles H. Judd from the University of Chicago stated that "graduates in high standing" from Fort Wayne's Normal School would be granted two years college credit if they transferred to the University.

During this time Fort Wayne's elementary and secondary school age population was growing. Construction was soon to begin on the city's second high school, which was the first of many new schools constructed during the twenties as postwar prosperity and an industrial boom attracted people to Fort Wayne.

As the city grew, increasingly bitter political battles erupted among the three appointed School Board members, which prompted constant cries by citizens to keep politics out of the schools. Board members were alleged to be pawns of the local Democratic and Republican party machines. This fear was allayed somewhat, though the political squabb-
bling continued, when the state approved the expansion of the School Board to seven members in 1921.29

In the summer of 1920, the Normal school held its first summer session. In the fall of 1920, the school began its 42nd term with an expected record enrollment of students. In the spring of 1921, the Normal school opened a midyear class, so that February high school graduates could begin their training directly following graduation. In 1921 the summer session offered two terms, open to both beginning and advanced students. The summer term offered work for all courses offered in the regular term. Also, for the first time for the Normal school, men were included as students in the summer school session.30

In early June of 1921, the Normal school held its eleventh annual and largest ever Flower Festival at Lakeside Park, an event open to the public and featuring community dances and games, as well as student led music, drama, and a flower queen crowning ritual. The 42nd Annual Commencement was held the following week for the seventeen graduates. On the evening prior to the graduation, over 130 alumni of the Normal school were banqueted by the class of 1921. Many of the city’s public school administrators also attended.31

On 21 June 1921, the Normal school opened its summer session to a record seventy-five students, an increase of twenty-five students over the previous year’s summer session. Both men and women from Fort Wayne, northeast Indiana, and nearby states enrolled.32

Then, on 27 June 1921, the School Board announced that the Normal school would be abandoned in one year. The present class would be allowed to finish, but no new pupils would be admitted in September. Superintendent L. C. Ward claimed that the cost of educating a Normal school student, $1500 each, was far too much for the city; that the money might be better spent on hiring teachers; and that city Normal schools were becoming extinct everywhere.33

Normal school alumni immediately protested the school’s closing. They organized to pressure the community and School Board members to keep the school open, and they planned to raise an endowment to achieve this end. Alumni claimed that the training cost was $300 per student, not $1500. They insisted that the higher figure had been incorrectly derived in order to make it appear that the school was too expensive. Since its beginnings in 1867, the school had graduated 447 persons, 174 in its first nineteen years and the rest up through 1921. All but one graduate taught school an average of seven to eight years, compared to a five year average in the U.S. at that time. One hundred and twenty of Fort Wayne’s teachers in 1921 had attended the Normal school. Thirteen graduates of the school had become principals in Fort Wayne Public Schools. An alumna and Fort Wayne teacher made the case for the school to the League of Women Voters. The alumni group met with the Cham-
ber of Commerce and other groups to secure signatures on a petition requesting the continuation of the school.34

As with most school issues, Fort Wayne’s newspapers took opposing points of view: The Fort Wayne Journal-Gazette and The Fort Wayne Evening Press favored the continuation of the school because it served the local population; The Fort Wayne News-Sentinel took the side of the School Board, saying it was a state, not a local function, to provide Normal school training.35

The School Board defended its move by claiming the school was "unwarranted, expensive and inefficient"; that it may have been necessary in the past when low salaries could not attract good teachers from outside Fort Wayne, but that salaries had become competitive; that teachers drawn from a larger geographic area would result in a more broad minded faculty; that training young persons for professions was a state function, and that citizens already paid the state for Normal school training. The Board further argued that much more money would have to be spent for facilities and faculty to keep up with state standards. Also, most students who had entered the city Normal school in the past ten years "had such unsatisfactory high school records that they could not possibly have been certified for entrance into any college or Normal school outside the state."36

Yet, the Board’s strongest argument remained that the money saved by eliminating the Normal school would buy Fort Wayne’s schools "a finer equipment of books, maps and other supplementary material than is now possessed by any school in the country, with enough surplus to pay for six or seven teachers." The Board’s choice, as it saw it, was whether to spend its money "to train a favored dozen or score of girls, or whether it should be spent for the good of the 11,000 school children of Fort Wayne."37

The alumni group continued to circulate a petition to retain the Normal school. The group publicly presented copies of statements by Indiana’s Superintendent of Teacher Training, explaining how the Normal school had readjusted its curriculum to meet the new requirements and was fully accredited. The local W.C.T.U., as well as the Y.W.C.A. protested the school’s closing. Twenty-six young women who were to have been admitted as students in the fall of 1921 petitioned the School Board to admit them.39

The controversy ensued throughout the 1920-1921 school year.40 In May of 1922, a committee from Fort Wayne’s Common Council petitioned the Board to rescind its motion to abandon the Normal school. In June of 1922, exactly one year after the Board had announced its decision to abandon the Normal school, the Board rejected the request of the Common Council, stating that it was, in fact, illegal for a school corporation to devote funds "to the maintenance of other than the Common
Schools." According to the Board, a recent ruling by the state attorney-general had finalized the matter.41

The Fort Wayne Normal School appeared to be in its heyday of development when it was suddenly abandoned. Throughout its long history the school had been in the forefront of practicing the newest, most Progressive ideas in teacher education, practices that were assured by the Normal school training of the school's principals, and city school superintendents active in the network of professional administrators who believed in the importance of trained teachers. Graduates of the school served the schools well for many years, often in leadership positions.

Although Fort Wayne's School Board abandoned the Fort Wayne Normal School, present, past, and future students supported it steadfastly, as did Fort Wayne's Common Council, W.C.T.U., and Y. W. C. A. The school, however, was caught in the middle of changes beyond its control. The city and its school age population were growing. State laws demanding ever higher standards for teacher training and certification were driving small city and private Normal schools to their limits. School boards were changing and, as in Fort Wayne, growing. Teachers and future teachers were losing access to training on a local level, but they were beginning to gain a collective voice over their conditions of work through their local, state, and national teacher organizations. Meanwhile, the state university was expanding in Fort Wayne. While not offering a degree or even teacher certification, IU offered a wide variety of courses in Fort Wayne, more than the Fort Wayne Normal School. These courses apparently were aimed at teachers seeking to upgrade their licenses or to work toward degrees, as state requirements were raised.

Changing patterns of control over education, patterns that were being negotiated at the state level by legislators caused the elimination of many city Normal schools at this time. The larger state universities and/or richer private universities became the only institutions capable of keeping up with changing state certification requirements. Legislators trimmed the responsibilities of city boards, as they expanded those of the state. City school boards, then, could redirect funds toward the K-12 schools, as the state's institutions of higher education paid an increasing share of the funding for training teachers.

Ultimately, a issue was not the quality of the Fort Wayne Normal School education, nor the school's small number of students. Its existence, reputation, and history appear to have been casualties to the process of changing economic and political relationships. It is to these forces, particularly at the state level, that we should direct our study to understand the "whys" of changes in the professional training of teachers, both during the era of the Fort Wayne Normal School and perhaps today.
The research for this paper was partially funded by a CLIO grant from the Indiana Historical Society.

The City Normal School of Cleveland, Ohio from 1874 to 1936

Melinda J. Kline
Brunswick City Schools

This paper will document the pre-service training of nineteenth-century Ohio school teachers, specifically those teachers trained in city normal schools. The presentation of historical facts will be limited to one of Ohio's city normal schools, the Cleveland Normal School. Information for this paper was taken from a larger study and will relate those factors which necessitated the establishment of the city normal school, admission requirements, and the curriculum and training experience for normal school students. The role of public school officials, public school board members, and officials of Western Reserve University who were important in the history of the Cleveland Normal School will also be chronicled.

Factors Influencing the Establishment of the Cleveland Normal Training School

Historian Willard Elsbree, within the context of his study, recognized the growth of city normal schools in urban centers for the purpose of training city school teachers. Elsbree attributed this growth, which occurred after the Civil War, to the rapid population expansion experienced by urban areas and to the need for cities, such as Cleveland, to place trained teachers in their city public schools. Aside from the issue of Cleveland's population growth, the Cleveland school system was forced to consider its own normal school due to a lack of state supported normal schools in nineteenth-century Ohio and the inability for the private normal schools in existence to produce sufficient numbers of graduates to staff the Cleveland city schools.

A third consideration influencing the establishment of a normal school in Cleveland was the cultural environment of Cleveland and the problems associated with urban living which almost necessitated a teaching corps qualified to deal with the diversity of the student population.
Cleveland's increasing immigrant population; the dilemma of dual income homes leaving children in many instances to their own devices; and the problems of health, sanitation, and recreation were not commonly experienced by rural school teachers or graduates of a private normal school who may have been teaching in Cleveland. The establishment of a city normal school, drawing upon Cleveland's own high school graduates to train and staff city elementary schools, would almost insure a teaching staff cognizant of urban life.

Rules for Admission, Course Work, and Training Experience for Normal School Students

The Cleveland Normal School opened September 1874. The following rules of admission were published in August of that same year. First, the prospective student must have graduated from a Cleveland city high school; or second, hold a certificate from the Cleveland Public Schools City Board of School Examiners; or third hold a certificate from a County Board of School Examiners, with at least one school year's experience in teaching.

Students graduated from any one of the Cleveland city high schools were entitled to school privileges and free tuition into the Normal School; persons over the age of twenty-one or not a graduate of a Cleveland high school had to pay a tuition fee of twenty dollars. No one under sixteen years of age was admitted to the Normal School.

The work of the Cleveland Normal Training School was divided into two separate departments. One was a theory department which contained the academic or review studies plus the professional subject matter. The second was the training department where students received their practice teaching. The course of study taken by Normal School students for the 1886/1887 school year was as follows. First, in Professional Studies, the courses included History of Education, Mental Science, Moral Science, and School Management. Second, in Review Studies, courses were Arithmetic, English Language, Geography, History of North America, Physiology, Reading, and Music and Penmanship. Third, in Practice, the curriculum consisted of practice in presenting subjects to their fellow-pupils under direction of the principal, practice in the Practice Schools under direction of practice teachers, and practice as substitutes in primary and grammar grades.

By 1890-1891, the academic feature of the Normal School had largely been eliminated, and the subject matter now taught was kept in the context of improving instructional abilities in order to prepare for teaching. The Normal School course, originally one year, was extended to two years in 1898.

The training department was the second department of the Cleveland Normal Training School and it involved the practice teaching in the
training schools. Within the Normal School's first year of operation six classes of B, C, and D primary grades were used as practice or training schools. The stated purpose of the Training Department, at this time, was to furnish Normal School students with all of the following: an opportunity to learn the art of teaching and of control, to put into practice what they had learned in theory, to familiarize them with the actual work and responsibility of the calling they have chosen, to demonstrate the pupils fitness as teachers, and to allow those persons charged with the responsibility of assigning teachers to positions in our schools, to know where they may be placed with greatest profit to themselves and the schools.

In the 1874-1875 school year, prospective Normal School teachers spent four to five weeks in the training school. In 1885 the Training Department expanded to include a Primary practice school and a German practice school.

By the 1892-1893 school year the number of grades in the Training Department included the first five grades of the Cleveland Public Schools. By the 1894 school year, practice teaching for Normal School students had been extended five to ten weeks under the supervision of a critic teacher, and when possible, these students acted as substitute teachers in the city elementary schools.

The Cleveland School of Education

The Cleveland School of Education, a summer term of six weeks conducted jointly by the Cleveland Normal School and Western Reserve University to provide training for teachers in the Cleveland schools and suburbs, was established in the summer of 1915. Although President Thwing of Western Reserve University had explored the possibility of the Cleveland public schools and Western Reserve University jointly training teachers as early as 1908, no such institution was forthcoming until state law regarding teacher training and certification required such a change.

The Cleveland School of Education was formally established by the Board of Education February 1, 1915. This six-week session was to be conducted with Western Reserve University whereby all the equipment and educational resources of the Cleveland Normal Training School and part of the equipment and educational resources of the University were utilized to train teachers in Cleveland and the surrounding suburbs. The course offerings for the school in its first summer consisted of professional courses, such as work in methods, practice teaching, observation, and the philosophical and social aspects of education. Also offered were the academic studies provided for teacher review. These
courses were taught by faculty from the University and Normal School. In the fall of 1920-1921, the Cleveland Board of Education and Western Reserve University expanded the work of the Cleveland School of Education to include the granting of degrees—the Bachelor of Education degree or the Master of Education degree—to those students who had completed prescribed course work as determined by the two institutions.20 By the 1924 to 1925 school year, the organization and course work of the Cleveland School of Education consisted of five divisions: the Junior Teachers College, the Senior Teachers College, the Observation School, the Training Schools, and the Educational Museum. An explanation of each division follows:

The Observation School was a regular elementary school financed in the elementary school budget but located in a building adjoining that of the Cleveland School of Education. It provided the opportunity for Junior College students to see and participate in the work of elementary classes under practically normal conditions. The Educational Museum provided teachers of the Cleveland public schools with illustrative material and demonstration lessons adopted to classroom use in all schools. The Training Schools were for the students in the Junior Teachers College who spent one semester in practice for their future work.21

The Junior Teachers College also known as the Normal School Course was a two-year teacher training course, extended in 1926 to a three-year teacher training course, which prepared students for service in the elementary grades of the Cleveland public schools.22 Students who graduated from the Junior Teachers College were immediately offered positions in the Cleveland elementary schools. Upon completion of their work in the Junior Teachers College, the teacher could enter the Senior Teachers College. The courses leading to the Bachelor of Education degree could be taken by enrolling in the extension or summer work offered by the Cleveland School of Education.23

The Senior Teachers College of the Cleveland School of Education was created in the summer of 1920. The requirements for the four-year degree were 120 semester hours of study. The University would accept ninety of these hours from the Cleveland School of Education and it would provide extension and summer courses to complete the full degree requirements.24

Four different units of credit were available to teachers through the Senior Teachers College of the Cleveland School of Education. One type of credit led to the Bachelor of Education degree, another to the Master of Arts in Education, another toward state certification, and the last was toward advancement on the salary schedule of the Cleveland Board of Education.25
School of Education, Western Reserve University

By December 1926, Western Reserve University President Vinson formulated an organizational plan for a University School of Education. This plan included the following features: The present building of the Cleveland School of Education was to be rented to the new corporation at a nominal rent. If a contract be entered into between the Cleveland Board of Education and the new corporation, the Board of Education would appropriate an agreed upon sum to be credited to the tuition account of the school not to exceed two hundred students.26

Certain points included in the final agreed-upon contract between the Board of Education and Western Reserve University were for the Cleveland Board of Education to continue the Cleveland School of Education whose curriculum, staff, and students were to become part of the University School of Education. The entire enterprise was to be under the direction of an administrative board with representatives of the University and of the school board under the chairmanship of the President of the University.27 By late spring 1928, the Cleveland Board of Education and Western Reserve University combined to form the WRU School of Education, Western Reserve University under the control of the University but supported by the University and Board of Education.

The work of the School of Education was conducted in three distinct sessions for teachers, supervisors, administrators, and students of education. There was a two-semester session from September to June for undergraduate full-time students who wished to complete a three-year diploma course in preparation for teaching in the kindergarten, primary or intermediate grades, or a four-year degree course in preparation for teaching in these grades or in the Junior or Senior High School. A winter session was conducted from October to May for part-time students in which teachers, principals, and others, who possessed either a Normal School diploma or two or three years of undergraduate professional education, could complete the requirements for the degree by taking occasional courses in the late afternoon or evening. A summer session of six weeks was held primarily for teachers, students, and others who had two or more years of professional education and desired to take further courses in this field.28

The curricula offered by the School of Education included professional course work for elementary school teachers which led to a diploma in three years or the Bachelor of Science degree after four years of full-time study. The School of Education only awarded their diplomas and degrees to those individuals preparing to be elementary teachers. For the training of junior and senior high school teachers it cooperated with the other undergraduate colleges of the University for their preparation.29
Dissolution of Relations Between the Cleveland Board of Education and Western Reserve University

Early in 1932, University officials were facing the possibility that the Board of Education would withdraw their financial support from the University School of Education. In January 1933 the Cleveland Board of Education reduced its funding for the School by thirty percent.

In November 1935 the Board of Education officially confirmed its withdrawal of funds from the School of Education. The reason for this, as stated by Superintendent Lake, was that Western Reserve University had never met all the provisions of the original agreement. In particular, provisions were not met relating to the training of school administrators, supervisors, and other teachers of all grades; transferring to the School of Education the teacher training work from the other colleges and departments of the University; and the inability of the University to meet the financial obligations of the School of Education as set forth in the original agreement.

Other conflicts existed for the School of Education relative to its relationship with the other colleges on the University campus. The function and status of the School of Education was questioned by the other colleges who believed the School should only train elementary school teachers. Also, the dual administration of the School with the Dean reporting to the Superintendent of Schools and the President of the University created indecision in policy making, and competition existed between the School and the other teacher training units on campus as they all sought to acquire students. There were additional problems involving curriculum, number and distribution of scholarships, and the administration of the Summer Session.

The Cleveland Board of Education officially terminated its support of the School of Education in June 1936. The role it now assumed was providing practice and observation opportunities for the students of Western Reserve University.

Conclusion

Institutional histories of nineteenth century city normal schools offer insights into the early growth of teacher training as perceived by public city school officials and provide documentation of a profession, which initially was loosely organized and possessed few requirements for membership. The work of the city normal school was vitally important to the school system of Cleveland, Ohio, as school officials felt it necessary to train their own staff in order to meet their staffing needs and to have properly trained personnel. The alliance between university and public school officials, a partnership necessitated by state mandates regarding teacher certification requirements, demonstrated cooperation between these two institutions whose achieved ends were for professionally trained teachers.
ENDNOTES

1. Normal schools were a concept modeled on European training schools for teachers which appeared in the New England states in 1823, and in Ohio during the 1830s and 1840s. The city normal schools, in the latter half of the nineteenth century, arose in popularity as a means to train teachers through the public school systems due to a lack of state supported normal schools and private normal schools in the state of Ohio. Literature from this time period indicated there were three university departments of teacher pedagogy, a dozen private normal schools, five city normal schools, and thirty school systems of fifteen or more teachers which provided some sort of normal training for prospective teachers.

5. Ibid., 4.

7. Ibid. When the school board first initiated the Normal School, free tuition was offered to the young women of Cleveland to encourage them to enter the teaching profession. Many years later state law required free tuition to all who desired admittance since city normal schools were public institutions supported by city tax dollars. Taken from *The Report of the Superintendent of Schools to the Board of Education of the City School District of the City of Cleveland* (Cleveland Board of Education, 1927/1928), 49; and Administrative Office Files of President Vinson, letter to R. G. Jones from Alfred Clum (13 October 1927), 3.

11. The organization of grade levels in the Cleveland Public Schools during much of the nineteenth century was A Grammar - eighth grade; B Grammar - seventh grade; C Grammar - sixth grade; D Grammar - fifth grade; A Primary - fourth grade; B Primary - third grade; C Primary - second grade; and D Primary - first grade.

13. Ibid. The classrooms for practice teaching were referred to as training schools.
14. "Superintendent's Report," *Fiftieth Annual Report of the Board of Education* (Cleveland, Ohio: 31 August 1886), 28. The study of German and a course of study known as the German course was offered to Cleveland city school students of German parentage. In order to train teachers for the German course, the Normal School provided training for teachers in the German course.

16. Taken from the catalog of *The Senior Teachers College of the Cleveland School of Education and Western Reserve University* (Summer Session, 1925), 3.

17. The new certification laws required on and after January of 1915 training of one year or its equivalent in summer school work, in a recognized institution of college or normal school rank for the training of teachers, or a year's course in an arts college on the recognized list, maintaining a practice department. By 1920 the requirements had changed to that of a two-year teacher training course with one-fourth work in educational subjects including observation and practice teaching.

19. Taken from the 1915 and 1919 catalogs for the Cleveland School of Education.

20. "Report of the Committee to Confer with the Board of Education," *Minutes of the Joint Meeting of the Trustees of Western Reserve University and Adelbert College* (Cleveland, Ohio: 14 July 1920).

21. Taken from the *Reports of the Superintendent and the Director of the Cleveland Public Schools* (Cleveland, Ohio: Board of Education, 1924-1925), 49-55.

22. It is unclear in the research exactly when the Normal School of the Cleveland city schools began to be referred to as the Junior Teachers College, but it was soon after the agreement between Western Reserve University and the Cleveland public schools to jointly train teachers to receive the Bachelor degree awarded by Western Reserve University. Students who were residents of Cleveland received free tuition. The newspaper *School Topics*, 28 November 1927, reported on the new three-year program for elementary teachers. The additional year was thought to attract a finer quality of entrant and provide the student with additional training in principle and actual practice in the elementary school.

23. *Cleveland School of Education, The Junior Teachers College or Normal Department* (Cleveland, Ohio: 1921/1922), 6.

24. *Trustee Minutes of a Joint Meeting of the Trustees of Adelbert College and Western Reserve University* (Cleveland, Ohio: 14 July 1920).

25. *Cleveland School of Education and Western Reserve University, Extension Courses for Teachers* (Cleveland, Ohio: 1922-1923), 4-5.

26. *Administrative Office Files of President Vinson*, Letter to Professor Robinson (Cleveland, Ohio: CWRU, 8 December 1926). The Junior Teachers College of the Cleveland School of Education was graduating classes of two hundred students. In order for the University to make the proposed School of Education work financially, they needed tuition fees of a guaranteed amount. Since the Board of Education was required by law to provide free tuition to its city Normal School students, it was anticipated that when the Board of Education and the University contracted jointly to train teachers, the Board of Education tuition fees would be credited to the University.
27. Administrative Office Files of President Vinson, Minutes of Committees on Educational Policies (Cleveland, Ohio: CWRU, 7 March 1928).

29. Western Reserve University Catalog of the School of Education (Cleveland, Ohio: 1931/1932), 11. The University had the units of Adelbert, Flora Stone Mather--up to 1931 known as the College for Women--Graduate School, and the Cleveland College preparing teachers. The staff of each of these units was listed in the School of Education and then permitted to organize and operate their own programs independently. The feeling of these colleges towards the School of Education was that it should only prepare teachers in the elementary field, leaving the Arts Colleges or Graduate School to prepare the rest. Cleveland College opened September 1925 in a downtown location for students unable to attend classes at the regular University campus. In 1926 it was formally affiliated with the University and Case School of Applied Science. Course work was divided into three groups: Business Administration, Chemistry, and Arts and Sciences. Taken from "Cleveland College Opens," School Topics (16 September 1925): 2.

30. The very earliest indication that the Cleveland School Board was going to drop their support of the School of Education appeared in a 1931 Plain Dealer article. Taken from "Tax Trimmers Keep Eye on School of Education," Cleveland Plain Dealer, 7 February 1931, 7.

32. Official Proceedings of the Cleveland School Board (Cleveland, Ohio: 11 November 1935), 121. In the original agreement between the University and the Board of Education the school board appropriated the amount expended for the maintenance of the Cleveland School of Education and credited to the School of Education. The University agreed to appropriate the sum expended for the Department of Education of the College for Women, for the Nursery-Kindergarten-Primary Training Department, and for the Senior Teachers College and the Summer Session and credit it to the School of Education. During the period of the agreement 1928-1936, the University was unable to use all the income from the courses in education in the arts colleges for the education program and consequently the Cleveland Board of Education carried half of the total budget for the University School of Education, and the University was unable to secure additional funds through endowment or grants to reduce the school board's appropriation.

33. Administrative Office Files of President Leutner. Report to President Winfred G. Leutner and Charles H. Lake Relative to the Organization of the School of Education (Cleveland, Ohio: 10 December 1935). In the matter of curriculum, while the Dean of the School of Education was expected to approve all applicants for State certification, the School did not have a voice in the curriculum for teaching or other school service within any of the other units who also provided teacher training. The problems within the administration of the Summer Session were the charge that favoritism was practiced regarding course work offered and appointment of staff to teach simply because they were clientele of the Director of the Summer Session. These charges were dismissed by Dean Irwin as being no different if any of the other colleges on the University campus were operating the School.
The Origins of Manual Training
In Austin, Texas,
Schools

On September 26, 1896, eighteen boys began their school day as the first students of the John T. Allan manual training department of the Austin (Texas) High School. Unlike the schedule of any previous Austin students, they attended classes in woodworking and mechanical drawing. Apparently, their manual training work proceeded smoothly throughout the year. At the close of school in Spring, 1897, objects created by these first eighteen students in their manual training workshops were displayed in downtown shop windows, and local citizens proudly observed their school children's accomplishments.

Only days before the students walked into the manual training workshops for the first time, Austin Superintendent T.G. Harris issued his annual report. "I feel hopeful", he wrote, "that the organization of the John T. Allan manual training school as a department of the high school will prove to be a wise movement both as to the manual training school and the high school. I believe that the opportunities thus offered to boys will have a tendency both to keep them in school longer, and also to give more profitable direction to their work." Although optimism accompanied the initiation of manual training at Austin High School, caution still flavored its beginning.

In this first year in which manual training was offered in Austin, enrollment in the city's schools totalled 3,461 children and youth, only eighteen of whom were enrolled in the manual training classes. Eleven years later, these numbers totalled 4,236 and 540. Harris' early, cautious optimism had been overwhelmed by success. While total enrollment in the schools rose by 20 percent, the manual training department was flooded by a thirty fold increase in students. The citizens of Austin could thank John T. Allan for the school's successful new manual training program.
Austinite, lawyer, and former Texas State Treasurer, John T. Allan bequeathed, at his death on January 22, 1886, nearly $44,000 "to establish in the City of Austin...an Industrial School in which shall be taught practical use of tools as well as scientific principles as applied to labor." The source of Allan's attraction to manual training has been lost to history. A reasonable surmise holds that, during a visit to St. Louis late in his life, he became acquainted with Calvin Woodward. At such a meeting, Woodward, as befits a zealot, must have expounded the benefits of manual training to his visitor from Texas.

Calvin Woodward, a professor of mathematics and applied science and Dean of O’Fallon Polytechnic Institute at Washington University in St. Louis, initiated a three year secondary school in 1880 as an experiment to foster tool awareness in students before they arrived at college to study engineering. This school integrated wood and metal work with regular school subjects of science, mathematics, history, languages, and English. The school proved to be a quick success. Woodward, the "acknowledged leader" of manual training, "turned to propagandizing for manual training as essential to general education."

Likely, Woodward’s ideas sparked Allan’s interest in manual training because of the nature of Allan’s childhood in Scotland. Born May 21, 1821, in Edinburgh, Allan was the son of a Scots wheelwright and cabinet-maker. As an adolescent, young Allan was “bound as an apprentice to a cabinet-maker at Inverness, Scotland.” Upon completion of his apprenticeship at age 21, Allan left Scotland for America. He settled in Austin in 1850 and later became a lawyer, a judge, and a prominent civic leader.

Allan’s bequest could not be acted upon immediately. On the other hand, the Austin school board established the Allan Fund Committee to conserve the bequest’s resources and to plan the manual training offerings. The committee consisted of Chairman D.B. Gracy, Z.T. Fulmore, and W.J. Matthews, all school board members. For the next decade, the Allan Fund Committee accomplished at least three major activities. First, it conserved the Allan Fund. Second, with other Texas leaders, these Austinites lobbied Texas’ State Superintendent of Public Instruction, Oscar H. Cooper, to permit payment of salaries to manual training teachers from local tax revenue. In 1896, State Superintendent Cooper ruled to permit such payment. Third, the Fund committee members employed N.S. Hunsden to be Austin’s first manual training supervisor and teacher.

A graduate of Woodward’s Manual Training School in St. Louis, Hunsden arrived in Austin with sterling credentials. His leadership assured that Austin’s manual training school would have a course of study and an organization similar to that of Calvin Woodward’s premier school. Under Hunsden's direction, the school developed a solid pro-
gram of offerings with successful graduates and increased student enrollment and size of teaching faculty. Hunsden's success was so prominent that he was lured to San Antonio in 1908 by a much increased salary to launch a similar program in the Alamo City. Success begat success and after the passage of the Smith-Hughes Act in 1917, Hunsden returned to Austin as director of vocational industrial education in the Texas State Department of Education.10

Some six years after the John T. Allan manual training school opened, Director Hunsden described the systematic introduction of manual training work into Austin's schools. Each year, for several years, some new base of manual training work was added until the school had a "complete four-year course with...valuable and up-to-date equipment."11 Austin High School, at this time, included grades 7-10; later in the century, grades 11 and 12 were added.

Manual training courses offered to ninth (junior) and tenth (senior) grades in 1896, continued in operation three years later. They included in Low Junior: Free Hand Drawing, Instrumental Drawing and Joinery; in High Junior: Free Hand Drawing, Instrumental Drawing, Turning and Carving; in Low Middle: Free Hand and Instrumental Drawing continued and Forging; in High Middle: Free Hand and Instrumental Drawing continued and Forging continued, Pattern Making and Moulding; in Low Senior: Drawing continued and Machine Work; and in High Senior: Drawing and Machine Work.12 The manual training course curriculum was revised in 1902. At that time, younger students were enrolled in manual training and new courses like mechanical drawing were added to grades seven and eight.13

By 1907, the manual training department offered a one and one-half year sequence of courses in woodworking. Classes met for two 45-minute periods each week in the first term and for three 90-minute periods each week for the next two terms. Subsequent courses in the department (e.g., pattern making and moulding, forging, and machine work) met weekly for three 90-minute periods. The department also offered a four year sequence in drawing and a four year sequence in domestic science.14

Hunsden described elements of the manual work courses as follows: The manual work begins in the seventh grade and is optional. The first term of this grade is devoted to Venetian iron work. This consists of making articles such as lamp mats, picture frames, ink stands...etc. Here the pupil gets a splendid idea of both mechanical and free-hand drawing. Working drawings are made by the pupil and he often constructs after his own design. This is a splendid means of teaching values of drawing and gives the teacher of free-hand drawing an excellent
opportunity to get good results. The pupils of the high seventh grade begin the subject of joinery. Here the boy uses the saw, hammer, chisel, and a number of tools.
The pupil is taught the elementary principles of construction, and the care and use of many wood-working tools.15

As noted, manual training very quickly was introduced into the upper grades of elementary schools, with the prospect that all students would be involved in this instruction.

The manual training workshops were spacious and filled with light. The 1902 Catalogue of the Allan Manual Training School asserted that "the walls are made attractive by having neatly-framed pictures of trees". Additionally, "it has been the aim to make the shops as attractive as possible."16 These descriptions may have contained elements of puffery, but they underlined the increasing status of the manual training department.

In 1902, in The Texas School Journal, Hunsden reflected on equipping manual training classrooms. He listed the equipment necessary to teach one pupil in each manual training class. He added that the number of pupils in the largest class will determine the size of the equipment. Hunsden gave an exhaustive list that included saws, planes, and pencils. He added 26 items necessary for instruction just in the joiner room. Equipment for other manual training courses filled two and a half additional pages of the March, 1902 issue of The Texas School Journal. Not surprisingly, with such an extensive set of equipment, and its rapid increase in enrollment, the manual training department grew out of two subsequent buildings before 1917.17

The thirty fold enrollment growth in the manual training department was mirrored by the rise in numbers of teachers in the department. In 1896, N.S. Hunsden, the director, was the only manual training instructor. By 1902, six years later, another teacher, O.A. Hanszen had joined the manual training department. A new assistant director, E.S. Blackburn, arrived in 1903 after Hanszen resigned to head the new Dallas Manual Training School.18 Two additional teachers were added to the school in 1905: Fred Hofstetter, and a Domestic Science teacher, Eleanor H. Nesbitt. A fifth teacher, Laura Lee Abadie, joined the department's staff in 1907 to assist Miss Nesbitt in Domestic Science. Thus in eleven years, the department expanded from one teacher to five teachers, and its teachers constituted more than thirty percent of the total high school faculty.19

Important Dimensions of Manual Training in Austin, Texas

The story of the manual training program in Austin, Texas during the period 1886-1916 diverges on several points from the accepted practice of manual training in other American schools. A discussion of several
major points constitutes an interpretation of the Austin experience with manual training.

The beginnings of a manual training program in Austin appear to have been unique. Allan's munificent bequest to fund initial purchase of machines and supplies for the program preempted community and school board discussion of legitimacy. Thus, Austin was spared the debates that occurred in many other towns such as Boston and Philadelphia. The economic benefits possible from manual training to the student or community were asserted and accepted.

Moreover, manual training in Austin apparently never sought to be strictly vocational preparation. N.S. Hunsden, the program's director, explicitly asserted its purpose:

The work is broad and liberal in its scope and universal in its applications. The school aims to fit the boys and girls for their environment. The course provides intellectual, manual, and art work in such proportions as to train the pupils mentally, physically, and aesthetically. The school does not aim to produce mechanics any more than it aims to produce any other class of specialists. The manual exercises are educational, the same as are the intellectual exercises. No special trade is taught, yet the underlying principles of many trades are so taught that the pupil will have ability which will enable him to take up any trade. It is not expected that all who take manual training will become mechanics; in fact, we expect very few to be mechanics.

Hunsden also promoted manual training as a major contribution to citizenship preparation. These purposes fit neatly into the prevailing conception of the high school curriculum.

Allan's gift to Austin schools enabled manual training in Austin to begin on a strong financial footing, which the Allan Fund Committee intended to continue indefinitely. In 1902, for example, the fund included $11,139.19 in cash, 2140 acres of land in surrounding counties, more than five city blocks of Austin property, and notes amounting to $27,700.12.

Despite the earlier 1896 ruling by the Texas State Superintendent of Public Instruction, amounts for teacher salaries in 1904-1905 were the Allan Fund's second largest disbursement after interest payment on notes. The cash level of the Fund on August 31, 1905, dropped to $3,227.36, and the land holdings in nearby counties decreased to only 340 acres. Receipts from the sale of the land totalled only $494.80.

The Allan Fund Committee handled many transactions during the period from August 31, 1905 to August 31, 1907. The 1907 report reveals that $21,000 was expended to purchase real estate, presumably property
for the planned Allan Junior High School. The cash level rose to $6,872.64, but the level of notes dropped sharply to $5,348.56.24

Throughout the infancy of Austin's manual training program, the Allan Fund Committee conserved the bequest's resources and fostered manual training at Austin High School. Local debate about the legitimacy of manual training apparently never surfaced.

Nationally, many labor unions initially opposed school manual training programs. They bristled at employers' advocacy of these programs and feared school intrusion into the control of union affairs.25 This characteristic enmity of unions toward manual training was absent in Austin. In fact, by 1908, they enthusiastically embraced manual training. For example, apprentices of Austin's Carpenter's Union began to attend evening classes in woodworking and drawing on October 12, 1908. These apprentices enrolled for tuition-free courses or suffered the loss of their union cards.26 Other American schools suffered a lack of support, if not outright hostility from local trade unions about the introduction and continuation of manual training programs. The Austin program was spared these consequences and, indeed, enjoyed labor union support throughout the existence of the Allan School.

Manual training for Austin's Black students was unavailable until after the program was assured for White students. Traditional school subjects filled the sparse curriculum for students at the separate high school for Blacks in Austin, Texas. Not until November 27, 1911, were "woodworking, drawing, domestic science, and domestic art added to the negro youth curriculum."27 L.C. Anderson, the principal of Austin's school for Blacks, had lobbied diligently for more than three years for the addition of manual training to his school's offerings. This development offered a striking contrast to the experiences of many Southern school districts which only taught manual training to Blacks during this period.

On April 1, 1898, Board member and Allan Fund Committee member Fulmore signed a resolution opening the Allan manual training department "on an equal advantage basis of girls." This ruling came more than seven years before domestic science courses were added to the manual training department. Consequently, Austin girls stood next to boys and learned to use hand tools for at least seven years before the introduction of the department's first courses in domestic science. Cooking classes were opened to girls in 1906, and the meals the girls prepared soon filled the first lunchroom in a Texas high school.28

Ever proud of graduates from the Allan manual training department, Hunsden trumpeted their successes in his regular column in The Texas School Journal, a magazine for Texas teachers.

As for utilitarian value of the work, I think the following record of a few graduates will demonstrate that it is of great value to the boy seeking a livelihood. Out of
thirteen graduates from the department, one is getting $95 per month as a draughtsman; another is getting $75; another $65 as a draughtsman; another is employed in a bank; eight are in higher institutes of learning and two boys who had not finished the work are receiving $2.50 per day. This shows that the work is decidedly valuable for one who has to earn his living upon leaving school.29

Differing from the common rhetoric on manual training, Austin’s advocates believed a boy’s occupational chances were increased after attending manual training programs. The efficacy of school-to-work transition through manual training was avowed.

Austin’s schools were affected little by passage of the Smith-Hughes Act in 1917. By that time, the Allan manual training department at Austin High School had operated for almost a quarter century. Its strong program drew abundant local support. Austinites likely believed that no additional changes were necessary in Austin schools. On the other hand, significant reform was underway. The name John T. Allan was revered in Austin and soon graced the first junior high school to open in Texas. The John T. Allan Junior High School opened its doors in 1916. The new school provided woodworking and drawing courses and all students were advised to enroll in these manual training offerings.30 With this new school, and its manual training courses, Austin High School continued to offer manual training instruction.

Another reason for the entrenchment of Austin’s manual training program was the 1916 gift of $100,000 to the schools by another prominent Austinite, Colonel A.J. Zilker. This grant solidified the political power of the manual training advocates. Not until 1922 were the first Smith-Hughes courses, auto mechanics and printing, opened in the Allan Junior High School’s manual training department.

A special symbol of the entrenchment of manual training in Austin was the city’s notable decision not to establish a vocational high school in the city. Other Texas cities such as Dallas, Fort Worth, and San Antonio developed strong vocational high schools only to see them become comprehensive high schools by mid-century.

Austin’s school experience with manual training quickly extended to other schools in Texas. Its first two teachers left Austin to direct similar programs in San Antonio and in Dallas. In 1901, a much smaller high school in Devine, Texas, began to offer manual training on the Austin model. C.C. Harris, Devine’s superintendent of schools, later lauded manual training and accurately predicted that this program would expand throughout the state.31

Two years later, in 1903, based on legitimation centered on Austin’s success, the state legislature appropriated $10,000 for distribution as matching grants to schools which established manual training courses.
Within months, schools in Austin, Devine, Belton, Waxahachie, and Itasca received allocations. Without question, the Allan manual training department influenced educational reform throughout the state.

**Manual Training in Austin: Never A School-to-Work Program**

According to H.A. Kantor:

> The belief in school-based solutions to economic problems has proven remarkably resilient over the years. Today, as concern about the nation’s economic competitiveness, rising youth unemployment, and the growth of dead-end jobs has intensified, interest in the vocational purposes of schooling once again commands public attention, though, in contrast to the past, policy-makers currently contend that general academic rather than specific skill training is more vocationally efficacious.

To emphasize Kantor’s point, many policy-makers insist that general rather than specific preparation and academic progress rather than job skill training usually are more "vocationally efficacious." Manual training advocates stressed education of the whole child, hands as well as intellect. Aims of contemporary school-to-work advocates appear closely related to purposes advocated by supporters of manual training. On the other hand, few current policy-makers and educators would advocate a return to a manual training curriculum that captured American schools nearly a century ago. It clearly was a product of its times and irrelevant to contemporary social and economic needs. Still, this historical antecedent to current school-to-work transitional advocacies merits interpretation as a part of the nation’s usable past.

Several interpretations of the Austin case of school manual training appear reasonable. School-to-work transitions remain a continuing saga of emphasis. Manual training, like so many other school reforms, was incorporated into the "grammar of schooling". It became a small part of the high school’s general education program; in fact, it was never considered to be exclusively vocational.

The Austin program’s greatest success accompanied funding beyond local tax revenues. Over the years, manual training offerings declined, but they were not replaced for most students in Austin schools by strictly vocational programs. The school-to-work transition remains problematic. Recently, to meet this perceived need, several proposals, including apprenticeship training, have been advanced in Austin. These and other proposals currently lack the practical implementation efforts that launched manual training in Austin High School a century ago.

Problems of school-to-work transition continue even in the face of successful experience with different solutions. Of course, social, economic, and educational contexts shift or profoundly change over time.
Earlier solutions no longer hold. Quite possibly, resolutions for a particular circumstance and era are more promising than are plans conceived as "one best" solutions for all times and settings.

A Matter of Course:
Curriculum Transformation and Academic Decline in St. Louis

Karen L. Graves
Denison University

An article in the 9 February 1994 issue of the New York Times reported that the Clinton administration's school reform agenda stressed both educational achievement and a school-to-work connection. Critics argued that legislation supporting the Clinton school policy known as Goals 2000 is based on "empty promises to reach unattainable goals." Yet the goals are similar to those expressed in earlier reform movements. After Sputnik began circling the earth, educational policy makers in the United States worked diligently to improve educational achievement in the public schools. Once Americans agreed that the nation was "at risk" economically in the 1980s, policy makers again targeted scholastic performance in school reform efforts. In each of these periods of reform, policy writers demanded academic excellence in a school system long devoted to supporting the industrial sector of the United States, attempting to harness intellectual development with vocational preparation. Scholars, however, have questioned the viability of dual objectives in schooling which are designed to prepare students for the world of work in the present American political economy and to encourage the full intellectual, ethical, and social development of students. The stage upon which the contemporary acts of school reform in the United States are played out was set early in the twentieth century. In that period an educational philosophy emerged which advocated the implementation of the differentiated curriculum, a course structure which provided different schooling experiences for different students, as it embraced the notion of schooling for work and citizenship training. Educators abandoned the pursuit of intellectual development as a primary objective of schooling and, in the process, dismantled a solid academic curriculum. Although not often acknowledged in the public debate on school reform today, those who controlled the curriculum transformation in the United States...
in the early years of this century purposely sacrificed academic components of the curriculum in the effort to fit students for their assumed societal roles as worker and citizen.

To understand this widespread phenomenon better, it is helpful to consider the events as they developed in one school system. David F. Labaree provides a strong argument for historical case studies which examine exemplary schools in his work on Philadelphia's Central High School. He argues that the study of institutions which served as forerunners to the contemporary American high school extends our knowledge of educational development in the United States. My work focuses on the public high schools of St. Louis, Missouri, which presents itself as an appropriate school system for study for a number of reasons. The St. Louis public school system rose to national prominence in the late nineteenth century under the leadership of Superintendent William Torrey Harris. Harris, "undoubtedly the commanding figure of his pedagogical era" according to Lawrence Cremin, addressed key educational issues, first, in his work at St. Louis, and then, on the national scene as U.S. Commissioner of Education. The manual training movement originated in St. Louis, springing from Calvin Woodward's work at Washington University. St. Louisans were no strangers to educational innovation since they established the first public school kindergarten in the United States under the direction of Susan Blow. Readers of the St. Louis Post-Dispatch were, then, probably not surprised to read in 1903 that President Charles W. Eliot of Harvard University regarded the St. Louis school system as the "best organization of public education in the United States." Central High School, founded in 1853, and Sumner High School, founded in 1875, stood as sterling examples of the nascent public high school, atop the St. Louis system. The establishment of Sumner High School, identified by historian Horace Mann Bond as a superior secondary school among large, segregated city systems, is another significant factor in selecting St. Louis as a case study.

The curriculum transformation that occurred in St. Louis public high schools with the introduction of the differentiated curriculum resulted in academic decline. In this essay I define academic studies as those studies which sustain liberal or classical education, with particular attention to intellectual development. Academic education targets the refining of critical thinking skills as a major schooling objective and promotes the notion of gaining knowledge simply for the sake of learning. Under this definition vocational studies are not considered academic; however, that is not to say that vocational subjects do not belong in the high school curriculum. That is a separate argument and one beyond the scope of this essay. Academic decline may be measured in a number of ways. One might consider the governing educational philosophies of a school, the fluctuation of course enrollment patterns of students, or changes in class
content or objectives. I have considered these factors elsewhere, but in this paper I will discuss academic decline as it was measured by changes in the course of study. Prior to addressing the academic recession in St. Louis high schools in the early years of this century, it is important to realize the academic strength of the nineteenth century high school curriculum.

A Piece of Life Itself

In 1871, a school administrator in St. Louis made the following statement to show that a rigorous course of study equipped graduates to enter the nation's best colleges to start in the world of work:

Those who have an intelligent interest in education will not expect these same pupils to be turned out at the end of four years as linguists, chemists, practical mechanics, architects, historians and authors. What may be reasonably demanded is, that they shall have learned how to study, shall have become familiar with the outlines and fundamental principles of different branches, and shall be ready to enter our best colleges and scientific schools, or else to begin life with such general knowledge, and with abilities and habits of thought so trained, that they shall be impelled towards all that is high and useful, and be protected from the baseness of ignorance.

This school administrator's perceptions of the strength of academic study are well intended. However, it is appropriate to avoid romanticizing the nineteenth century high school. While St. Louis did establish Sumner High School for African Americans in 1875, the system remained racially segregated for decades. Further, only a small portion of St. Louis youth attended secondary school in the nineteenth century. As late as 1920 just 10.65 percent of the total day school population in St. Louis went on to high school.

The 1871 statement delineated a mission for the St. Louis high school in a clear manner and stood apart from much of the educational rhetoric of its day which praised the virtues of the "people's college." Schooling objectives, specifically learning how to study and gaining a knowledge of fundamentals in various disciplines, together with preparation leading to further study, whether in formal institutions of learning or in living one's life, became the primary pillars which supported an academic education. School data regarding the structure of the curriculum and issues of pedagogy sustain this point.

William Torrey Harris favored a high school curriculum which combined a study of the classics with study in the sciences, history, modern literature, philosophy, and rhetoric. That is, he argued that high school study should aim for a union of "discipline" and "knowledge."
the 1890s as a member of the National Education Association's Committee of Ten, Harris wielded significant influence in the national debate on the articulation of high school and college curricula. He changed the discussions concerning the fate of the classics at both levels. Harris articulated his philosophy regarding these issues two decades earlier as the nineteenth century high school curriculum in St. Louis took form. He believed that it was educationally unsound to put off study in the sciences, history, and literature until the last years of college, as had been the tradition. Harris argued for a spiral model of learning, in which aspects of a discipline were studied early and then revisited as the student matured intellectually.

The mind should grow with all its windows open from the beginning. What it acquires in its early stages will be rudimentary, but will furnish a rich native store for future thought when the period of reflection sets in stronger and stronger. The roots of the sciences and literature and history should go down deep into the earliest years, so that the unconscious influence derived thence shall assist in molding the taste, will and intellect, during the most plastic period of growth. Without this thorough assimilation with the whole intellectual being, . . . later scientific and literary studies are likely to be barren, lacking a fruitful soil.\textsuperscript{11}

Harris' paradigm resembled the St. Louis High School Curriculum of 1870 which incorporated either a classical or general course of study (Table 1).

Throughout the remainder of the nineteenth century, the high school curriculum in St. Louis did not vary much from the 1870 curriculum. Students in most years could elect either the Classical or General courses of study. The two courses were quite similar, but the major difference was the substitution of the classics for the fuller mathematics and science program. Students headed for college took the Classical Course in order to prepare for entrance examinations in Greek and Latin. A quick survey of the classes in both courses of study indicates that all St. Louis high school graduates would have completed an academic curriculum which covered a range of disciplines. The General Course appeared to best represent the curriculum advocated by Harris, one which he described as almost equal to the academic program of students who had completed the sophomore year in most colleges.\textsuperscript{12} The nineteenth century St. Louis high school curriculum, then, was solidly academic in design. Evidence other than the actual course structure, such as written class objectives, exam questions, and pedagogical discourse, established this point further.

From time to time the High School section of the St. Louis \textit{Annual Reports} included information which allows greater insight regarding
classes. School officials printed a complete set of questions from the written examinations for the school year ending in 1870 in the Sixteenth Annual Report. These questions comprised a thorough canvas of the subject material in the various classes. The exams consisted of both high and low order questions; some required confirmation of basic knowledge, while others targeted analysis of material. For example, the physical geography exam asked students completing their first year of high school to name the facts which cause the change of seasons and to explain how the change is produced. The second year exam in natural philosophy required students to draw a diagram and explain circular motion, discuss what forces produce it, and give examples of bodies in motion which illustrate this principle. One question for third year students asked for the purpose and applications of history. The Shakespeare exam, taken by fourth year students, required one to cite one or more passages showing that crime had not deprived Lady Macbeth of all amiable traits of character. The range and depth of the questions on the yearly examinations suggest that a rigorous academic education was the standard in the nineteenth century St. Louis high school.

Reported class objectives serve as another indication that education in St. Louis high schools was of high academic quality. In 1880 the Annual Report included a rather detailed outline of the material to be covered in each class. Although we have no way of knowing to what extent these guidelines were followed in actual classes, it is significant to note that care was taken to encourage teachers to go beyond the practices of drill and recitation and to concentrate on thoughtful, critical study. The description for the first year class in analysis of English grammar, for instance, stated that tabulation, elaborate sentence diagrams, and other practices which overburdened the subject and prevented analytical study were to be avoided. The work in fourth year rhetoric, designed to develop intelligent and expressive readers and fluent writers and speakers, directed students to the preparation of essays and orations as well as critical examination of selected literature. The primary objectives of algebra classes were to teach general principles supplemented by concrete applications. Geometry teachers were advised to proceed very slowly until the students had a clear understanding of the material. The central goal was training in logical processes and, thus, teachers were warned against letting the students "remember" what they should perceive rather than think through problems on their own. In higher mathematics the principal concern was to deepen the student's knowledge of fundamental ideas through an understanding of the unity of all mathematical axioms and their many applications. History teachers were encouraged to focus on the interlocking relationship between principles and "facts." The class on the U.S. Constitution clearly valued ideas over trivia. The report noted that teachers were to help students to
avoid learning the verbiage lest the pupils replace instruction by meaningless words and phrases lodged in the memory." The worst excesses of faculty psychology, schooling methods which simply attempted to fill up the "vessel of the mind," were discouraged by St. Louis educators.

Promotion of an active, intellectual education continued in St. Louis schools throughout the nineteenth century. The 1895 report of the superintendent in the Forty-First Annual Report described learning as a dynamic process, one that required an assimilation of information and the expression of ideas through language, skill, or other activities. The teacher was to be a leader (not ruler) who sifted through the massive field of knowledge to obtain challenging material for the students' consideration. School officials encouraged laboratory or other experimental work in addition to regular study of texts. School reports regarding pedagogy urged teachers to supplement a comprehensive survey of key principles and laws with detailed study in particular areas. Educators expected students to then be able to apply the given method of study to other areas which had not been covered in class due to time constraints. Again, it is difficult to know how close teachers and their students came to achieving these goals in the classrooms. Yet, the evidence we do have indicates that critical thinking was at the center of the prescribed pedagogy in St. Louis. While the connection between school and college, school and work, or school and whatever life held after high school was often addressed, educators did not limit their plans for the high school curriculum to these concerns. As the superintendent wrote in 1895, "The high school should not only prepare for life; it should be a piece of life itself." This is akin to that kernel of a liberal education, learning for the sake of learning. The evidence left for our examination speaks of a strong academic program of study in the St. Louis high school of the nineteenth century: the course structure, class objectives as defined by written reports and examination questions, and descriptions of suggested pedagogical methods. For the students fortunate enough to attend high school in St. Louis in the late 1800s, school was a grand "piece of life," indeed!

An Academic Recession

St. Louis school officials altered the course of study in the high schools near the turn of the twentieth century. Contemporary references to the new curriculum described it as a simplified course of study which was designed to lessen the difficulty of the work for students. Termed the "differentiated curriculum" the program created different schooling experiences for different students; a decrease in the overall academic quality of public secondary schooling accompanied its implementation. Academic decline is evident in a number of areas: the structure of the
curriculum, the underpinning educational philosophy, the percentage of students enrolled in academic classes and courses of study, and the changes that occurred within academic classes themselves. This paper focuses on the first of these, the academic decline which resulted from a transformation of course structure in St. Louis public high schools.

From the founding of St. Louis Central High School in 1853 until 1894, students in St. Louis public high schools could choose either the Classical or General course of study. Gradually, the curriculum expanded to include additional courses of study: Classical, Scientific, General, Art, Normal, Commercial, Domestic Art and Science, Manual Training. The inclusion of nonacademic classes in the Commercial, Domestic Art and Science, and Manual Training Courses distinguished them from other courses of study in the curriculum. Vocational classes entered the St. Louis High School curriculum via the Commercial, Domestic Art and Science, and Manual Training Courses just prior to the passage of the Missouri compulsory school attendance law in 1905. Whereas the total school curriculum in 1870 consisted of academic courses, by 1905 the curriculum was no longer solidly academic. That is, academic courses of study began to represent a lesser percentage of the total school curriculum. Clearly, school officials understood the distinction between the academic courses of study and those which maintained a vocational emphasis. In the St. Louis Annual Report for the school year ending in 1905, an effort was made to classify the various courses of study for students and their parents. Listed under the title of "Best General Education" and "recommended in the order in which they are here given" were the Scientific, Classical, General, and Art Courses. The Commercial, Manual Training, and Domestic Art and Science Courses belonged to a separate category labeled "Special Course of Training." In the early years of the differentiated curriculum these courses of study singled out for training still contained many classes with an academic focus, to be sure. Yet, with the addition of every class geared to "practical training" such as stenography or sewing, students eliminated one more opportunity for an academic class in their program. In this way the alteration of the course structure produced academic decline in St. Louis schools. In St. Louis the practice of distinguishing high school students by course of study began to be phased out in 1927. After 1930 a single curriculum replaced the multiple courses of study, yet differentiation among students continued as students were tracked by their choice of electives.

Although some students chose their classes in preparation for college and, thus, continued in an academic track, eventually most took their classes from the general course of study. During the twentieth century, however, the general course of study evolved into a form quite unlike the nineteenth century General Course with its classes in advanced mathematics, languages, and the sciences. In 1916 the St. Louis Board of
Education approved the superintendent's recommendation that students in the General Course be permitted to substitute work in subjects from various courses of study for third and fourth year work in the languages, mathematics, and the sciences. For students in the General course of study in 1917, electives claimed eleven of twenty-four classes over a four-year period (Table 2). Nine of the twenty-four slots were reserved for chorus, physical training, community civics, and vocations. Many of the classes in the pool from which electives were to be chosen had been added to the curriculum via the Commercial, Manual Training, and Domestic Art and Science Courses of Study and were specifically vocational in nature: Industrial History, Commercial Geography, Manual Training, Mechanical Drawing, Household Arts, Bookkeeping, Stenography, Typewriting, Commercial Law, Salesmanship, and Advertising. Thus, while it was still possible for a student to graduate from the General Course having taken most classes from the academic realm, such a program of study was no longer guaranteed. The academic content of the General Course was further weakened by 1927 (Table 3).

The general track claimed increasing numbers of students even as the academic content of this program of study declined. In 1939 the general track of the curriculum accounted for 95 percent of St. Louis high school students. In a circular fashion, the fact that most students completed the general track fed the notion that academic requirements for graduation were inappropriate. A Columbia University survey committee suggested to St. Louis school officials that year that it was "...absolutely indefensible...to pattern the program for the 95 percent on the [academic] requirements laid down by colleges for the 5 per cent. General education in the high school curriculum must be evaluated in terms of the development of all youth of high school age of understandings, abilities, and attitudes needed for effective participation in the social and civic life of St. Louis and the nation." Concern for citizenship training and vocational preparation overshadowed intellectual development. Although an academic strand remained in the school curriculum, few students completed a course of study comparable to that taken by all graduates in 1870.

Curriculum evolution in St. Louis was a slow process, and in the earlier years of the differentiated curriculum many classes overlapped the various courses of study. For instance, in 1903, Botany was a required class in all courses of study. In these years it was possible for students in a given course to find themselves in classes with students from other courses of study. Yet as the transformation of the curriculum progressed, it became less and less common for classes to be required across various courses of study. If one compares the data from Tables 1 and 3, it is clear that the number of classes held in common across the school curriculum decreased from 1870 to 1927. In 1870 all graduates took classes in algebra,
geometry, Latin or German, English analysis, Shakespeare and English literature, physiology, astronomy, physical geography, universal history, U.S. Constitution, and drawing. In 1917 the only classes all graduates had in common were chorus, physical training, community civics, vocations, English, and history. By 1927 health, English, social studies, and science were the only classes specified for all graduates.

Further analysis of course content indicates that some academic classes evaporated altogether from the curriculum. Comparing the classes required in 1870 with those offered in 1927, one notes the disappearance of Astronomy, Greek, Philosophy, and Shakespeare as distinct classes, and the collapsing of Botany and Zoology into Biology. A closer examination of Tables 1 and 3 allows one to draw stark comparisons between the General course of study in 1870 and the general requirements for graduation in 1927. In 1870 four years of mathematics were required: algebra, geometry, trigonometry (if taken in place of botany), and analytic geometry and calculus. In 1927 graduates had only to complete one year of mathematics; ninth-grade mathematics would suffice. In 1870 graduates of the General course of study took French two years and German or Latin four years; no units of foreign language were required in 1927. English requirements in 1870 included analysis, literature, and Shakespeare; by 1927 two units of English were required. Three years' study in history, geography, and the U.S. Constitution (1870) eventually translated into one year of social studies (1927). What had been four years of science, natural philosophy, chemistry, zoology, physiology, and astronomy, was replaced by one year of science and three units of health. Additional classes required in the General course of study in 1870 included two years of drawing, one year of manual art, one year of mental and moral philosophy, and music and rhetoricals throughout. In 1927 nine units of electives constituted the remainder of students' programs of study.

A comparison of courses of study from the 1870, 1917, and 1927 curricula in St. Louis public high schools, then, shows the following: academic courses of study decreased in percentage of the curriculum, academic classes which were taken in common by students across all courses of study declined, some academic classes simply evaporated from the curriculum, and academic substance (as measured by the type of classes that were required) in the General course of study contracted from 1870 to 1927. Academic regulation of the curriculum receded in response to the installation of vocational courses.

The vocational movement exploded in American high schools during the twentieth century. Educators in the nineteenth century tended to anchor their schooling philosophies in intellectual and moral development. The anti-vocational tone of a statement from the 1869 St. Louis Annual Report was not unusual."Our national idea and the interests of
humanity alike protest against a one-sided education that shall predestine the youth to some special art or trade.” When Manual Training and Domestic Art and Science courses were first introduced into St. Louis high schools, Superintendent F. Louis Soldan explained, with great care, that these courses were strictly educational, and he assured that they were not conducted in a way to prepare students for specific vocations. The courses, as described by Soldan, fit Calvin Woodward’s original conception of manual training. Woodward intended that manual training supplement academic study, helping students to better understand theoretical principles.

This vision of manual training, however, did not survive in public high schools. The differentiated curriculum served to separate students by course of study, and in the process, severed ties linking manual training applications to academic study. The 1927 curriculum, for instance, barred college-bound students from taking more than two units of vocational subjects (Table 3.) In addition, social efficiency reformers pushed for a vocational emphasis in high school training. These forces combined to squeeze out much of the academic content in classes which distinguished the Manual Training, Domestic Art and Science, and Commercial courses of study. Consider, as an example, the classes comprising the Domestic Art and Science program as reported in the St. Louis Annual Report for the 1906-07 school year. Classes in the first two years were devoted to sewing, while classes in the third and fourth years concentrated on cooking, laundry work, and home nursing. Students enrolled in the Domestic Art and Science Course spent a considerable amount of their school time making petticoats and nightgowns, canning, pickling, salting, and smoking food items, and discussing the best methods for stain removal. While the value of such tasks is not to be diminished, this work was not academic. As classes became increasingly devoted to this sort of activity, the academic share of the curriculum decreased.

Academic components of the curriculum were pushed even closer to the periphery as vocationalism picked up steam in the first decades of the twentieth century. Work preparation replaced academic study as the defining element in curriculum construction in St. Louis high schools early in the twentieth century. The administration acknowledged a "radical change in the determinants of the high school course of study" in 1911, which reflected the academic decline of the curriculum. School officials linked the radical change in the high school curriculum to the most recent additions to the course of study: "... commercial and manual training courses for both boys and girls have grown up, offering opportunity for High School study arranged with direct regard for the kind of work the pupil intends to pursue after leaving the High School; still there remains much to be done to arouse in the students the motives
for their school work which will associate it vitally with the vocation to be followed."

In 1924 the St. Louis Board of Education created the Division of Vocational Counseling, finally cementing the emerging relationship between school and work in St. Louis. Counselors in all elementary, intermediate, and high schools aided students "in intelligently choosing their vocations and in getting the most out of their educational opportunities." The counseling program for students included two meetings prior to high school matriculation at which the courses of study in the high school were discussed and advice was given to individual students regarding their programs. Counselors arranged more meetings after the school year began. Early in the year counselors met with first year students to emphasize the need of vocational information and to encourage the study of vocations. The idea of a school-to-work transition claimed a prominent position in the school curriculum. The notion that schooling should be a "piece of life itself," now carried a label of anachronistic idealism.

**Conclusion**

Throughout the nineteenth century the St. Louis high school curriculum was devoted to solid academic study. The structure of the course of study provided clear evidence of this fact. Other school records, such as published class objectives, examination questions, and pedagogical discourse, shored up this point. As the curriculum shifted early in the twentieth century, the academic status of the high school occupied uncertain ground. Nonacademic courses of study made inroads into the curriculum, students increasingly took classes in a general course of study from which academic content was seeping, the number of academic classes overlapping various courses of study decreased, and the academic requirements for general study in the high school receded. School officials reversed an earlier stand and embraced vocational education as a primary goal of schooling. Thus, the die for secondary schooling in the United States was cast. Forces which influenced the curricular transformation included new liberal intellectualism, vocationalism, a nation-wide concern with the "boy problem," and a form of conservative feminism, but that is a story for another time. The curriculum paradigm was set in such a way that generation after generation of school reformers would struggle to reconcile a system that, at once, tried to fit students for a place in the modern capitalist workforce as it claimed to promote thorough intellectual development.

Amid the furor that erupted in the post-Sputnik era, one insightful educator's comments appear to have been lost. When asked why Americans suddenly found themselves with an inadequate public educational system, Arthur Bestor remarked, "The basic trouble is that the persons
running our public school system lost sight of the main purpose of education—namely, intellectual training."37 In St. Louis, the differentiated curriculum was the vehicle through which intellectual training gave way to job training. As public schools in the United States prepare for the year 2000, goals must transcend a school-to-work transition if we are to reclaim a vision of education that has been clouded throughout the twentieth century.

Latin is not required for the Bachelor of Science course offered at Harvard, Princeton, and Yale, but a third year of a Modern Language, and a fourth year of Mathematics are required.
Electives for college-bound students may not include more than two units of vocational subjects (Commercial subjects, Drawing, Household Arts, and Manual Training.)
All graduates must complete two majors (a field pursued for three years) and two minors (a field pursued for two years.)

This study is part of a concentrated area of research on the impact of the differentiated curriculum on women's secondary education. Other historians have documented the class bias inherent in the differentiated curriculum; I argue that the turn-of-the-century curriculum shift was rooted in a gender bias as well. Although recent studies [John L. Rury, Education and Women's Work, and Jane Bernard Powers, The "Girl Question" in Education] analyze the sex stereotyped courses of study which developed in secondary schools during the Progressive Era, my interpretation focuses on the nexus between these developments and modern liberal ideology.

The history of American higher education is generally a history of the expansion of types of students, the expansion of curricula, and the expansion of institutional forms. The role that evening undergraduate education might have played in this history, however, has not been explored in detail. There have only been a few investigations of how and why evening classes appeared. The results of these few studies will be summarized here in an attempt to determine whether evening classes originated as the result of a thoughtful philosophy or of student demand. Who were the students who took these classes and what were their reasons for enrolling? What effect did these evening classes have on higher education?

All of the major studies of evening classes have consolidated data from institutions in as many as ten urban areas. It is not inconceivable that population demographics, the pattern of business and industry, and the characteristics and number of higher education institutions in any one particular urban area could cause the pattern of evening classes in that urban area to differ from that of the composite. For that reason, this study will look in depth at the origin and impact of evening classes in one urban area, Chicago, and identify the similarities and differences between this evening class "market" and what occurred on the national level.

Most of the studies of evening higher education in America concentrated on their development rather than on their origins. In almost all cases, what began as a disparate set of evening classes were subsequently organized into evening sessions and then into evening colleges. Their origins have been muddied by their development. John P. Dyer, who wrote the self proclaimed "first full length book on the subject" of the university evening college movement, said the origin of evening classes "is the despair of the historian who tries to fasten on something specific." There was no one unifying philosophy which inextricably bound them together. James T. Carey said their existence was the product of a "silent revolution"—an attempt to meet the needs of the
thousands of students who continued to show up on higher education's doorstep, rather than of ideology. That Dyer named his book *Ivory Towers in the Marketplace* reinforces his perception of evening classes as consumer driven.

Dyer stated that the evening college movement's roots were in two academic developments that resulted from the popularization of knowledge that took place between 1874 and 1925. These two academic developments were the university extension service and the municipal university. Each of these developments had in common the desire to extend higher education to more people. On the other hand, Brubacher and Rudy credited privately endowed and religiously affiliated urban universities with being pioneers in new fields such as coeducation, extension, afternoon and evening instruction, and specialized service to urban society. This is borne out in Daryle Keefer's 1946 study of thirty-five selected institutions in six of the largest urban areas. Fourteen of the sixteen institutions in his study that were the first to offer evening classes for credit were privately endowed or religiously affiliated. Four were located in Chicago, including the University of Chicago which was the first institution to offer evening classes for credit in the country. Only two of the institutions he listed were municipal universities (College of the City of New York and Hunter College) and both were in New York City.

As extension work was incorporated into urban universities in the late nineteenth century, regardless of whether they were municipal or privately endowed or religiously affiliated, a bifurcation of extension took place. The first type, called "agricultural extension" became the province of the land grant universities. The second type became known as "general extension" and became the province of the urban universities. While the land grant and state institutions were concerned with spatial expansion, the urban institutions were concerned with time expansion. This was reflected in the advent of late afternoon, Saturday, and evening classes. At the heart of the extension philosophy was the idea of bringing the university to the people. The original format was popular lectures or a series of lectures. That the roots of evening classes are planted in the university extension movement is a point of agreement in the studies cited. Whether extension was considered a thoughtful philosophy has been debated. A brief history of university extension is necessary for clarification.

Herbert Baxter Adams, professor of history at Johns Hopkins University, introduced university extension, based on the English model to the United States in 1885. There were a few attempts by groups such as Chautauqua, the Brooklyn school teachers, and the New York State Library to form extension agencies after Adams first introduced it. These agencies were accused of misunderstanding the importance of the university link in the English extension model. In the 1890s, university
extension caught the attention of several university leaders and three American university extension agencies, more firmly based on the English model, were developed. The first was the Philadelphia (later American) Society for the Extension of University Teaching. William Rainey Harper who was the founding president of the University of Chicago served on its general advisory board. The second extension agency was developed at the University of Wisconsin. Henry Wade Rogers, president of Northwestern University and President Harper organized the third extension agency in 1891 as the Chicago Society.

University extension work soon expanded beyond the extension agencies into the urban universities, where, as mentioned previously, they took on the new forms including lecture series, evening classes, and correspondence classes.

The evening classes that were the result of the university extension movement were successful because of the extraordinary student demand for them. This demand allowed the universities to be able to offer evening classes minimally at a break even, and often times on a profitable basis. There were a number of reasons why student demand for these classes was high. The rapid urbanization which helped spawn the urban universities also expanded industry and commerce, changing the nature of work. The American belief that social mobility could be achieved through education was strong. Higher education was seen as a "vehicle of ambition" for the middle class. The creation of new higher educational opportunities (including evening classes) made a difference at a crucial moment when aspiring middle class persons were struggling to define new career patterns, establish new institutions, pursue new occupations, and forge a new self identity. These aspirations increased the demand for university degree related evening classes for nonresident students.

The earliest evening classes catered primarily to teachers and teacher training. These evening classes were often the precursor of such classes in the regular sessions--the beginning of the professionalization of vocations. Even students in institutions whose evening classes mirrored the traditional curricula of the day classes enrolled for the purpose of advancing their employment status. While student characteristics, such as sex, occupation, and religion differed from institution to institution and with the nature of the academic program, the students had in common the fact that they were overwhelmingly working adults.

On the national level, the very beginning of evening classes seemed to be rooted in the university extension model imported from England. Student demand played a large role in the development of these classes in urban universities, moving them out of the pure extension model into different forms based on student needs. These needs were primarily based on the desire to achieve status and career advancement through
higher education. This was a major shift from extension's original focus on purely popular education.

There are three major impacts that evening classes had on higher education in general. First, a new population of students, working adults, were added to the rolls of higher education. Second, with the emphasis on professionalization of vocations, many higher education institutions added courses and programs in education, business, social work, or technical subjects first in their evening sessions and later in their day sessions. Lastly, evening classes were revenue generating. Many universities relied on this revenue and some even required it for their existence.

As mentioned earlier, the pattern of evening classes in one urban area could be influenced by the demographics, size, commerce and industry, number and type of educational institutions in that urban area. This, along with the fact that students who attended evening classes were constrained by their geography, was the rationale for investigating the origins of evening classes in one "market" to determine whether there were any similarities or differences between it and the national pattern. The city of Chicago was chosen for this study because of its early involvement in the extension movement, the diversity and number of its higher education institutions and their early involvement with evening classes.

At the turn of the twentieth century, the Chicago metropolitan area generally reflected the national scene in terms of the number and variety of colleges. One major and very startling exception, however, was that Chicago had no public institutions of higher education, either of the land grant or municipal type. The institutions in this study include two privately-endowed universities, The University of Chicago and Northwestern University; two religiously affiliated universities, DePaul University and Loyola University; and two technical institutes, Armour Institute and Lewis Institute. These technical institutes merged in 1939 to form Illinois Institute of Technology.

The University of Chicago was the first institution in this country to offer evening classes for college credit. This was due to the vision and unique background of its founding president, William Rainey Harper. Harper's inclusion of university extension as an organic part of the new University of Chicago can be traced to his conviction that higher education should be available to those who, for social or economic reasons, could not attend the university at its campus location. Harper believed it was the university's duty to assure that this extension work was "systematic in form and scientific in spirit." His strong commitment was probably shaped by his involvement in the first university extension movement which swept America between 1885 and 1899.
Harper organized his extension division into five departments, the two most important of which were Lecture Study which followed the English extension model of sending university professors all over the country to deliver lectures, and Class Study which offered regular courses of class instruction in university subjects given in the city of Chicago. Harper's recruitment of faculty to the University of Chicago Extension Division was a raid on the top extension organizers and lecturers of the time. In its first ten years of existence, the Lecture Study component of extension delivered 1,326 courses with 1,637,802 attendees at 368 centers in 21 states. Despite its seeming success, Lecture Study was discontinued in 1911, while Class Study thrived.

One not so obvious reason for the demise of Lecture Study and the success of Class Study, was the erroneous assumption on the part of the University of Chicago that men and women were not interested in converting their work into university credits. In considering the relation of university extension work to regular university studies and university degrees, one of the committees of the University Extension Congress stated the following in 1895:

We are forced to recognize distinctly another class of constituents -- namely, those who, for various reasons, are unable to reside at the university, but who nevertheless desire to pursue nonresident study parallel with that given in the classrooms of the colleges and universities. Many of them have in mind subsequent residence, the completion of the courses thus begun, and the taking of degrees.

The Class Study Department of University Extension of the University of Chicago duplicated their regular course offerings at various sites in Chicago. Initially, only one half of the credit for a bachelor's degree could be earned through Class Study. This was subsequently reduced to one third of the credit, despite the increasing demand for degree credit. In its first year of existence, 1892-93, eleven courses were offered in the autumn and winter quarters with a total enrollment of 129. Two years later, there were 1,142 enrollments in 111 courses. Despite this growth, many problems continued to challenge the continued health of the Class Study Division including lack of an endowment and a suitable building downtown. The students who attended Class Study in increasing numbers were overwhelmingly teachers. In 1898, only ten percent of the 5,000 teachers in the Chicago public school system had a college degree. While Harper undoubtedly saw this as a fertile business opportunity, he showed a sincere desire to improve the education of individual teachers:

It is not our purpose to offer courses which shall teach teachers how to teach. In other words, the work is
university work and not the work of a normal school. My own opinion is that in too many cases the instructors have fallen into this mistake. What teachers need is information, not method.  

With the promise of a yearly donation for five years from Anita McCormick Blaine, who possessed an avid interest in education, Harper created the College for Teachers of the University of Chicago in 1898. It began classes on September 30, 1898 in leased rooms in the Fine Arts Building in downtown Chicago.  

Meanwhile, the Class Study Department continued to offer its classes at times working students could attend at sites around the city. Many of its classes now were being offered at the College for Teachers building and, of the 895 Class Study students, 669 were teachers. The distinctions between Class Study and the College for Teachers became increasingly blurred. On April 7, 1900, the Board of Trustees consolidated the two and named this new unit University College.  

In 1906, Harper died and Mrs. Blaine's endowment ended; it had been extended two years beyond its original pledge. For economic reasons, Harper's successor, Harry Pratt Judson, moved the University College from its downtown location to the south side University of Chicago quadrangles. This move proved to be a disaster and enrollment plummeted to 150 in 1907-08. Students petitioned Judson to reestablish the College downtown. A balanced budget and low rent classrooms through the educational department of the YMCA allowed the University of Chicago to move the University College back to a central, albeit inadequate, location in 1908. These inadequate accommodations did not deter enrollments despite the continued concerns of the University College dean, Walter A. Payne. This was because until 1911, the University of Chicago had no meaningful competition for this expanding evening student market.  

Like William Rainey Harper, Northwestern University's tenth president, Henry Wade Rogers, was also involved with bringing university extension to Chicago. In November 1891, Northwestern, along with Lake Forest, Madison, Beloit, the University of Illinois, and Dr. Harper representing the nascent University of Chicago announced their plan for carrying on university extension work in Chicago and its vicinity through a local extension society. The Northwestern faculty's enthusiasm for university extension did not match that of their president. By February, 1893, Northwestern's participation ended. Rogers resigned in 1900 to be replaced eighteen months later by Edmund Janes James, who had previously served as director of the University of Chicago Extension Division and Dean of their University College. He had also been involved with extension work prior to his University of Chicago appointment. James planned to build Northwest-
ern into a leading center of research and teaching; however, he did not wish to sever his connections with the university extension effort. "The fact that one university in a country or a locality carries on university extension work with success is no reason why others may not do as well."29 James was not able to put his plans into effect and left Northwestern for the presidency of the University of Illinois in 1904.

The interim president, Thomas F. Holgate, Dean of Liberal Arts, was instrumental in securing "Courses for Teachers" which were offered for the convenience of Evanston teachers in 1904.30 During the fall months of 1905, the work of the college was extended by offering various evening classes at the Northwestern University Building in downtown Chicago. These courses were "arranged to meet the needs of persons who are unable to attend regular lectures during the day."31 The demand for these courses was assured because of the relocation of the University of Chicago's evening courses to the south side.

In 1910, Northwestern assigned the organization of the evening courses to Dr. Arthur H. Wilde, Ph.D., Professor of History and Secretary of the University Council. Wilde was listed as Director of Extension Work in January, 1911.32 Despite Wilde's and the interim president's advocacy for extension classes, the faculty moved to limit acceptable extension credit. Wilde knew this action would block the expansion of extension work at Northwestern. He was proven correct; Northwestern's six year experiment with liberal arts evening courses ended in 1911.33

In the meantime, Northwestern founded a School of Commerce in 1908. It was to be an evening program with its own faculty and outside funding. Unlike the liberal arts evening classes, the commerce classes were organized as a college and had the full support of the business faculty. Its enrollments flourished.

A third Chicago institution to enter the field was Lewis Institute whose benefactor required maintaining "a regular course of instruction at night." Founder Allen C. Lewis desired this instruction to be free and adapted to the purpose of obtaining "a position and occupation for life."34 In 1895, the estate grew large enough to seriously consider founding the type of school described in Lewis' will, the newly incorporated Lewis Institute board of trustees turned to William Rainey Harper to assist them.

Harper recommended George Nobel Carman to head the Lewis Institute. Under Carman and Harper's plan, Lewis Institute became a six year coeducational institution—a four year secondary school (academy) and a two year college (junior college) offering work in arts and engineering.35 Harper's influence extended further than the original plan. No detail was too small for his attention. He concerned himself with the calendar, terminology, credits, and system of faculty rank. He recommended faculty. His influence was nowhere more evident than in the
structure of the evening classes. The first evening class bulletin divided the night work at Lewis into the Class Study Department and the Lecture Study Department — the identical model of the University of Chicago's Extension Division.36 None of the evening courses offered through Class Study were college level, yet additional monies had to be allocated the first year to keep up with student demand.37 By 1900, the enrollment in the evening classes reached 1,190.38

The demand for evening classes continued to rise. As Lewis Institute celebrated its twentieth year in 1916, it restructured itself into a four year college by discontinuing the academy and adding to the four year degrees already offered a Bachelor of Science degree. Engineering began in 1909 and Domestic Arts began in 1912. This restructuring allowed the students in the evening classes to secure credit for junior college level courses.

Yet another Chicago institution to offer evening classes was Armour Institute, which opened its doors on October 14, 1893. It envisioned itself as a manual training school providing a practical education to men and women. Night classes "intended for those who may not be able to avail themselves of the opportunities offered by the Institute in the day time" were announced from the very beginning.39 Only two years later, Frank Wakely Gunsaulus, Armour's president, changed the focus of the Institute from training mechanics and technicians to training engineers. He renamed it Armour Institute of Technology. By 1901, it was no longer coeducational. Whether Gunsaulus' reorganization of Armour was influenced by his European travels or by his close association with William Rainey Harper is open to speculation. What is clear is that Harper had his eye on making Armour Institute of Technology part of the University of Chicago and the reorganization may have been done with this in mind.40

The evening classes that were offered in the first ten years of the Institute's existence were designed to provide practical, useful information for application in one's daily work. They focused on technical skills. Since there was no correlation between the day and evening classes, no degrees or certificates were awarded for completion of these utilitarian courses. According to James C. Peebles, Armour's unofficial historian, during the academic year 1902-03, the faculty studied the evening school to improve its effectiveness. The faculty were convinced that evening school was an important component of the academic program of the Institute and necessary in a great industrial city like Chicago.41 The faculty's recommendation was to offer a wider range of subjects and attempt to improve the organization of the evening work. Over the next several years, this was accomplished, but these classes remained technical and preparatory and were not offered for college credit until 1934.
Despite this, the evening enrollment continued to increase—from 530 in 1904-05 to 798 in 1906-07.42

One of Chicago's two major Catholic universities, DePaul University, began in 1898 as St. Vincent's College. It followed a typical Catholic college evolutionary pattern—movement from a combined all male academy or college to an all male university. When St. Vincent's was rechartered as DePaul University in 1907, the president, Fr. Peter V. Byrne, C.M. used the charter of the University of Chicago as his model for DePaul, substituting the word "Catholic" for "Baptist" but leaving all else virtually the same. Fr. Byrne had concluded that in order for DePaul to survive, it would have to be a modern, Catholic university complete with professional programs and a modified elective undergraduate system. This decision helped open the doors for extension classes.

Archbishop Quigley requested DePaul open their Summer School to women in 1911. This summer school was attended by about one hundred sisters and lay teachers.43 The success of this venture led to the "Extension Courses" for the following Autumn term which had the approval of the superintendent of the city schools for promotional credit.44 The summer session Outline of Courses explicitly emphasized that, since the charter of DePaul University allowed them "to provide, impart and furnish opportunities for all departments of higher education to persons of both sexes on equal terms," degrees may be conferred on women.45 This policy was unique for two reasons. First, this action gave DePaul the distinction of being the first coeducational Catholic institution in the United States to offer degree related programs to men and women.46 Other experiments in this vein were either not degree related or not sustained. Second, the announcement that extension work could lead to the conferral of a degree was atypical for the times. Most institutions still required some amount of resident credit for a degree.

DePaul's main extension population were teachers. Thus courses were offered in the late afternoon and Saturday, not in the evening. Initially these classes were offered exclusively on their near north side campus, but in the summer of 1915 many extension classes joined DePaul's law and commerce classes in the downtown Tower Building, called the "Loop Center."47 They also experimented with other sites including a "South Side Branch" of the Extension Department in the Visitation School Building in 1913.48 Unlike Northwestern, DePaul's extension classes were supported by the faculty and thrived. Like Northwestern, DePaul founded a successful evening College of Commerce in 1912 which also began as an evening college and only later added day sessions. It was open to men and women, Catholics and non Catholics.49

Chicago's other major Catholic university, Loyola University, also followed the typical Catholic higher education evolutionary pattern, rechartering from St. Ignatius College to Loyola University in 1909.50 In
1912, Fr. Frederic Siedenburg, S.J., who possessed a great interest in American Catholic social thought and action, organized the Loyola University Lecture Bureau. His purpose was to provide in a central location extension lectures of a popular character relating a knowledge of Catholic philosophy and theology and of what the Church had done in the social field. The lecture series was broadly announced and well received. This led to the opening of the "School of Sociology" in Fall 1914. Space was rented in downtown Chicago in the Ashland Block. The School of Sociology offered late afternoon and evening classes and was a two year, upper division program leading to a Bachelor of Philosophy degree. Unlike Loyola's College of Arts and Sciences, the School of Sociology was coeducational.

The following academic year, 1915-16, Loyola expanded its offering of allied or non sociological courses. Called extension courses, the classes were offered to provide "a cultural background for the sociological courses" and could be taken as electives. Credit could be used toward degrees or promotion in the public schools. In its second year of existence, the School of Sociology enrolled 212 students. The School of Sociology continued to expand its offerings. In Fall 1916 it established centers at Catholic high schools on the South and West Sides primarily to provide university classes for the teaching sisterhood. These classes enrolled 150 students in addition to the approximately 200 enrolled at the Ashland Block. The addition of these and other centers in Catholic schools allowed the teaching sisters to earn Loyola University extension credits without having to leave their convents. In 1917, there were 579 students enrolled in the School of Sociology; 555 women and 24 men. Of the 555 women, 315 were nuns. The demand for the allied courses soon outstripped that of the sociological courses.

The beginning of evening classes in Chicago was rooted in the university extension philosophy that William Rainey Harper brought to his conception of the University of Chicago. Extension took on two forms--the first modelled on the popular university extension movement imported from England which extended the University to all parts of the country and the second which Harper may have originated extended the courses of the university proper to other parts of the city. Both forms extended the time frame in which classes were offered. From Harper's original concept, student demand and fiscal support transformed the extension model into the University College as a separate self supporting college with space in a downtown building, faculty, and a dean.

Until 1911, the University of Chicago had a virtual monopoly on credit evening undergraduate liberal arts classes except for Northwestern University's brief experiment with evening classes downtown. The basic policy of University College was to not be a degree granting school. This policy and student demand would continue to clash for many years.
The University College students were primarily teachers seeking credits for promotion and raises. This new institutional form was instrumental in bringing to fruition Harper's desire to upgrade the educational background of Chicago's teachers. This was a major step in the professionalization of teaching.

The University of Chicago was the pioneer in expanding higher education to working adults. Harper's influence and vision extended into the evening programs at Lewis and Armour Institutes from their inception. His motivation may have been self serving -- structuring Lewis as a two year college to enhance transfer to the University of Chicago and reorganizing Armour Institute for an eventual takeover, but the results extended to working students new types of educational opportunities, such as technical courses, at locations on the near West and near South sides.

Northwestern University's experiment with extension courses in the liberal arts failed for fiscal concerns and lack of faculty support. Their College of Commerce, however, was among the first evening business programs developed and among the most successful. It was initially a diploma program but soon evolved into a degree program—a move toward professionalization of business administration. The College of Commerce, which had financial backing from the business community, helped Northwestern form closer relations with the influential men of the business world. It also hoped to produce graduates who would become influential businessmen. It is from this evening program the Northwestern's Kellogg School of Management evolved.

DePaul's extension classes were the result of an appeal on the part of Catholic women through Archbishop Joseph E. Quigley to offer classes to meet educational requirements for promotions in the school system. Until then, neither Loyola nor DePaul offered education to women, thus forcing Catholic teachers to attend a secular or Protestant university.

Loyola's extension classes were the result of the branching out of its School of Sociology evening classes. The School of Sociology was founded to introduce professionalization to the field of social work in a Catholic setting. It introduced coeducation to Loyola as well as a curriculum which deviated from the Jesuit Ratio Studiorum. The great need for classes to service the Catholic teachers and teaching sisterhood was the impetus for the extension classes which were offered in Catholic schools as well as at a downtown location. The extension classes at Loyola and DePaul were degree related from their inception.

As was the case nationally, in addition to broadening the student population and curriculum, evening classes in all these institutions were required to be minimally self supporting. In some cases they were crucial to the fiscal survival of the institution. For example, in 1919-20 Loyola's College of Arts and Sciences enrolled 124 students, while the
School of Sociology enrolled 1,094. Evening students in Chicago attended for primarily vocational reasons and a chance at upward mobility regardless of whether the curriculum was traditional or vocationally oriented.

While evening classes played a vigorous role in municipal universities elsewhere, Chicago's higher education institutions were all either privately endowed or religiously affiliated. Chicago's higher education institutions showed considerable diversity with regard to their evening curricula and students. Indeed, each institution seemed to fulfill a unique higher educational niche with its evening classes rather than competing with each other. Whether evening programs at other urban universities followed a pattern similar to Chicago's is a subject for further research.

In retrospect, it is obvious that there would be many similarities with regard to the origin of evening classes nationally and in Chicago because of William Rainey Harper's pioneering influence in both. In Chicago and nationally, the advent of evening classes allowed countless students to pursue higher education who were not able to previously. In some cases these classes introduced curricular innovation, coeducation, and were responsible for the rental or purchase of a downtown campus. Their role in the expansion of higher education in this country should not be overlooked.

The field of adult education has been continuously racked by a definitional crisis. Writers have categorized definitions by purpose, population, and activity, yet agreement has eluded practitioners. Part of the problem has been that at different points in time, the primary focus of adult education has shifted. A key aspect of the debate has centered upon definitions of adulthood, that is, who is being served by the field of adult education. It is generally agreed that while chronological age is an important factor, it is not sufficient. Social role is also a key aspect in deciding who is an adult. That is, a twenty-three year old full-time graduate student would not generally be seen as participating in adult education, while certainly a twenty-three year old with two children who was working on a GED would be. Thus, the issue of age is a key but not critical aspect of the definition of adult education.

Beyond definition, however, issues relating to adulthood are often at the heart of what are considered to be some of the unique aspects of adult education. Although there is little agreement on this issue, many writers conclude that if there is something unique about adult education, it lies in the adult’s potential for self-reflection, critical analysis, and the use of a broader experiential base. Critical to this view is the notion that adults change, grow, and develop, and that this can be accomplished through education.

In the 1920s, when adult education began to be considered a field or discipline, there was already discussion of the unique aspects of adulthood. This paper will begin to outline some of the issues relating to the development of adulthood as a time of growth. While the issues relating to the development of the field of adult education are complex, they are intimately tied to ideas about the unique aspects of the adult in society. Unfortunately, there has been little research into this connection. This paper is but a beginning.
The Question of Definition

Debates about definition go back to the 1920s, when educators began to discuss "adult education" as an entity. Even then, however, the issue of definition was usually sidestepped, as was evidenced at a series of founding conferences held around the country for the American Association for Adult Education (AAAE) in 1925 and 1926. Beginning in 1925, these conferences, sponsored by the Carnegie Corporation, were held throughout the United States in order to explore the possibility of organizing an association for adult education. The foundation invited those perceived to be adult educators to come and debate the question of forming such a group. Very often the participants attended out of curiosity, but with little concept of what adult education meant, or even what such an organization could accomplish. At these conferences, much time was spent discussing the viability of the proposed association, and who would be included, but even at this early point, it was concluded that perhaps adult education was undefinable.1

Thus in 1925, at the first national conference on adult education, held in Cleveland, Leon Richardson, president of the National University Extension Association and the chair of the Executive Committee which drafted the proposed constitution for the AAAE, stated:

We discussed that [the definition] at great length and it was decided that the wisest thing was to leave it to the good sense of the officers and persons connected with this Association, inasmuch as it seems that at the present time it is quite impossible to answer that question.2

At these meetings, there was little agreement about what adult education was or whether those identifying themselves as adult educators shared anything in common. One of the key questions was whether adult education was for individuals at a particular point in their own individual development. This issue was closely bound up with the question of purpose, as it was debated at the founding conferences. In searching for an area of commonality for all those engaged in adult education, sociologist Leroy Bowman asserted that adult education dealt with the problems of adult life:

Adults have problems and those problems are affected by a great many of the activities of life. We can't take the time of the adult to go through all the 'rigmarole' of science. We must take his problem and bring in science, psychology, sociology, physics to meet it.3

For many of those participating in this founding effort, adult education would help individuals live more intelligently and would aid them in facing the unique problems of adulthood in modern life. But what were these unique problems? In fact at that time, the research was sparse and very little was known about adulthood as a stage of life.
Studying the Lifecourse

Differing aspects of the life cycle have been studied by historians. Most obviously, childhood, adolescence, and old age have all been examined in terms of changing societal perspectives. In the past twenty years, related studies have focused on the lifecourse, that is the entire trajectory of the life cycle throughout history. As historian Michael Kammen noted in 1979,

This history of the life cycle in American thought is one of the most engaging subjects that I have encountered or explored. Essentially, it involves nothing less than a primary shift, over the past four centuries, in humankind's perception of itself.4

Kammen identified three important periods of shift in writings and thought about the life cycle. He wrote that in the seventeenth century, a four-stage view of the lifecourse was predominant, although other approaches involved three, four, five, six, seven, and nine-stage cycles. The Four Ages of Man prevalent at the time were childhood, youth, manly age, and old age. The portrait of each of these stages indicated life as a series of troubles. Manly age, or what we today call middle age, was a perilous time, when the individual was vulnerable to illness and disease. It was also a time of hard work. Old age, on the other hand, was a time to take pride in one's accomplishments.5 An increasing dependence on others was an accepted part of life, and the limitations imposed by this phase of life were offset by its greater wisdom and acceptance. Thomas Cole says that this era embodied the ideal of "civilized aging".6

By the early nineteenth century, this view of the different ages of man had shifted to the metaphor of life as voyage, and the focus was more pessimistic. The time of manhood was a time of trouble and sorrow leading to "contemplation of suicide, intemperance, and murder.7 Old age was depicted as a period of gloom.

Kammen saw a marked period of transition from 1840-50, as the writings and art work of the time indicated a growing a distinction between the internal and external effects of aging. At this time there was new concern with delimiting the chronology of aging and correlating these with the moral attributes of aging. Old age was a period of decline, and middle age, around fifty, was seen as "the pinnacle of human existence."8 Indeed, the problems associated with old age were seen as suffered by those who failed to maintain themselves or who were sinful. Thus, there were two old ages, the good and the bad.9

Over the next twenty years, a number of writers played with the idea of adulthood as a significant lifestage. Certainly it seems that the growing interest in midlife (however it can be defined) was related to the increasing study of the aging process and the increasing concern with the
problems of the aged. The period of midlife became a time of growth as well as a time of preparation for old age. Thus, albeit somewhat facetiously, in 1899 The Outlook called for "Vater and Mutter Gartens", which it correlated with Kindergartens:

The old need resources and diversions as surely as the young need them; and mark the Spectator's words, just as fortunes have been made by those who wrote the first books for children, worth calling books, supplanting the thin diet that the poor little souls had been fed on for generations, so will fortunes by made for those who shall (as some one will) invent resources and amusement for the old.10

According to Kammen, interest in the life cycle shifted to the domain of the social and biological sciences around 1930. In the twentieth century, Winthrop Jordan noted:

The general tendency in various schools of psychology in the early twentieth century was to segment the life cycle into increasingly discrete and well defined units. An accompanying tendency was fully as important: the various segments of the life cycle were seen not merely as temporal stages but as descriptions of inner life and external behavior.11

The two key aspects of this segmentation were the identification in the late nineteenth and early twentieth century of the particular needs and developmental issues of adolescence and then in the 1920s, the growing interest in old age as an area of scientific inquiry. Interestingly enough, G. Stanley Hall was a prime mover in both areas. While Hall began his career studying children and later adolescents, he ended it with his work on old age, Senescence: The Last Half of Life, published in 1922.

According to Hall, the period of adolescence lasted into the twenties. The prime or middle life was attained by the mid-twenties and lasted until about age forty-five. Senescence or old age began at forty-five or earlier in women who reached old age when they ended their period of reproduction, and was followed by senectitude or old age proper, which continued until death. While laying out in great detail the problems and research associated with aging, Hall also saw the aging process as a time of growth and development, and it is this aspect that is a contribution to our contemporary understanding of aging. What he called "senescents in the post-climacteric phase" accumulated personality eccentricities and could be see as selfish, repulsive or unsocial. Typically, Hall related these changes to the loss of sexuality during the later years. He explains that this was really an indication of:

... groping toward a new and higher type of personality, evolving a new synthesis of the factors of life when the
chord of sex shall have passed in music out of sight. It means man's reaffirmation of the self and of the will to live, although this points not, as the immortalists would argue, to a post-mortem rehabilitation of the ego but only expresses again the fact that man is as yet incomplete and that even the old now die prematurely because they have not yet learned how to build the last story of the house of many mansions.\textsuperscript{12}

Hall put forward a program for preparing for old age. He stated that the preparation needed to begin in one's forties, "the dangerous age" and suggested that the old have a distinct task. They must construct a new psychological self which would compensate for the loss of other faculties.

By 1930, professional social scientists had taken over the study with aging. They were studying it from psychological, sociological, and anthropological perspectives. Anticipating much of the work on aging and the life course that has taken place since the 1960s, this worked focused on both cross-cultural dimensions of aging, and on the stories of individuals.\textsuperscript{13}

\textbf{Searching for the Mature Adult}

Just as research on the aging process was pushed forward and reconceptualized during the early period of the twentieth century, so too was the idea of adulthood as a time of development. Although it has been noted that the history of notions of maturity do not seem to correlate with questions about the history of aging, it does seem that the two at least came together beginning in the 1920s.\textsuperscript{14}

Even before that time, there was a growing interest in middle age. Writing in Scribner's in 1911, one author indicated,

\begin{quote}
Now we catch glimpses of middle age as an art to be studied, practices, perfected... In terms of everyday, our business in middle life is self-culture and self-conduct: the betterment of our manners, the cultivation of the so-called minor virtues, the acquirement of new graces, and the pondering of mysteries which we can never hope to solve.\textsuperscript{15}
\end{quote}

Beginning at this time, there was also a growing scientific interest in the period of maturity as a period of growth beyond preparation for old age. The mental attributes of maturity were "poise, deliberation, economy of effort with the largest output of judgement."\textsuperscript{16} However, works on aging, as with Hall's work on Senescence, emphasized the end of old age.

At this point it seems that the integration of the new social science research with the resulting implications for adult education was not completely achieved until the 1940s, when the writings of Harry
Overstreet pulled together the diverse research to popularize the notion of adult education. Harry Overstreet was trained as a psychologist, and he came to see his primary focus as the popularization of research from the social sciences. In order to explain adult education, Overstreet integrated (in various works) ideas from behavioral psychology on motivation and changing patterns of behavior while applying psychoanalytic theory to aid in understanding “normal” people. He used these concepts to describe personality types that either blocked or retarded the growth of individuals. Building on these ideas, he noted that human life was characterized by a series of stages of growth. In later writings, he drew on the notion of cultural lag to discuss how modern individuals were not keeping pace with technology. People failed to interpret successfully the modern world and thus had failed to establish a rational and peaceful social order. Overstreet's program called for a wide variety of social reforms to be achieved through the agency of adult education.

Looking at the new approaches to the literature on the stages of living and their application to education, Overstreet noted, as early as 1925, that adulthood needed to be seen as a “process of continuing-education-with-living.” Adult education was not to be remedial but should take into account the new thinking about the life stages and should put forward the ideal of what would today be called lifelong learning. For Overstreet, the concept of psychological maturity was the cornerstone of twentieth century life:

We have known in a way about psychological maturity - but vaguely and intermittently. Its full meaning now begins to dawn upon us. As it begins to dawn, we realize that the maturity concept is central to our whole enterprise of living. This is what our past wisdom have been leading up to. This, it would seem, is what we must now accept if we are to move forward out of the confusions and despairs of our day.

The key to Overstreet's thinking, however, was that maturity was both an aim and a state of being. The problem with civilization was adults were often in arrested development, they had not sufficiently matured, and therefore they could not function in the contemporary world. His theory rested on five areas of research: (1) the idea of psychological age; (2) the idea of arrested development; (3) theories about behavioral psychology and conditioning; (4) the idea of aptitude uniqueness; and (5) the idea of adult capacity to learn.

Of greatest interest to this paper are his remarks about psychological age. Drawing on Binet's work on IQ and the consequent implication that psychological age did not necessarily correspond with chronological age, he notes, "Not all adults are adult." For adults, this concept of psycho-
logical age had implications for understanding individual success. It meant that chronology alone should not be considered evidence of maturity. For Overstreet, this meant that adult education had the potential for aiding the maturation process. The entire learning enterprise needed to be segmented by psychological age and the needs of adults needed to be addressed.

Another of Overstreet's points is adult education had to take into account the literature on individual uniqueness. The maturation process must coincide with each person's area of strength. His definition of maturity comes from this view of individual talents: "To mature is to bring one's powers to realization. To waste those powers, or to force individuals to try to exhibit powers they do not possess, is to defeat the maturing impulse of life."25 For Overstreet, as more people approached maturity, the better the world would be, because "the movement toward maturity is the movement toward happiness."26 Maturity involves knowing one's limits and one's talents. In general, the new approaches to learning, combined with psychoanalytic theory, and a concept of contextual learning, all played a part in his formulation of maturity.

Conclusions

The history of adult education has usually been traced institutionally. For some reason, the intellectual strands on which the entire field were based have been ignored. Yet the development of the field of adult education, as opposed to the introduction of new institutions or agencies for the education of adults, is predicated on these new views of the life course and of the possibility of growth and change during adulthood. While these ideas were not new, in the sense that philosophers have been grappling with these issues for centuries, what we see here is adult education as the manifestation of the new social science theories. Certainly, the study of midlife is considered to be a post-World War II innovation. Most writers generally start discussions of adulthood with Erikson's pioneering work Identity Youth and Crises, but more attention needs to be paid to the work before Erikson, particularly as this work laid the theoretical groundwork for the field of adult education.

Adult Education

in the Oneida Community:

A Pattern for the

Chautauqua Assembly?

As a relatively new field of university study, the historical roots of adult education practice present interesting issues and research problems. Understanding the forces and sources of influence upon major adult education institutions, such as the American Lyceum and the Chautauqua, may have important implications for theory and knowledge about contemporary developments. Given the visibility of the Chautauqua Assembly in New York, it is appropriate to engage in efforts to understand how its education program came into existence.

Explanations for the reasons and purposes of the Chautauqua Assembly are found in a number of sources. But similar attention to questions about the origins of format, method and structure of the Chautauqua is lacking. Stubblefield makes an unsatisfactory effort to explain the origins by stating that "it was not an extension of popular secular education movements in the pre Civil War period nor an adaptation of the campground as Herbert Baxter Adams mistakenly maintained as late as 1900." If Stubblefield was referring to the American Lyceum as an example of the popular secular education movements, it is not difficult to agree with him. Noting the absence of a connection between the Chautauqua Assembly and the American Lyceum, however, fails to explain the origins of some of the ideas underlying the Chautauqua. Stubblefield describes the Chautauqua as having its Sunday School work being quickly overshadowed by the "expansion of the cultural and general education programs." Furthermore, he says "the programmatic work itself rested upon clear ideas about learning in the adult years." Stubblefield's comments fail to resolve the problem. On the one hand he disagrees with Adams' efforts to link the Chautauqua with the campground activities associated with the ubiquitous nineteenth century religious revivals in America, but on the other he fails to suggest any particular source of influence on the institution. If Stubblefield's rejection
of Adams' opinion is correct, and if the Chautauqua was some kind of extension of religious activity and thought of in an earlier period in the nineteenth century, historians should examine some of the other religious groups and activities for information. Although Stubblefield's assertion is not difficult to grasp, he stops short of seriously justifying his observation by failing to provide meaningful evidence of any religious institution or agency that may have reflected similar goals and purposes prior to the Chautauqua's creation.

Stubblefield identifies three general categories of ideas central to the Chautauqua Assembly program created by John Heyl Vincent and Lewis Miller in 1874: (a) education as a right and duty, (b) adulthood as a unique time for learning, and, (c) the relationship among education, contemporary thought, and social movements. Three subjects developed under the first heading include the religious basis. Vincent, a co-founder of the Chautauqua, is quoted as saying "the true basis of education is religion." A second idea developed under the topic of education as a right and duty is "self-culture." Stubblefield says "the educational theory that most influenced Chautauqua was the theory of self-culture." Vincent is once again quoted as follows: "This then is the Chautauqua thought: Self-improvement in all faculties for all folks, through all time, for the greatest good of all the people." Individuals were expected to develop the four faculties of the mental, social, moral, and religious. The third idea addressed by Stubblefield concerns access to knowledge. Two aspects of this idea are (a) the belief in a universal right to education, and (b) democratic association in learning that encouraged the association among people of various economic strata and activities in learning.

The second major concept Stubblefield identifies with the Chautauqua Assembly is the belief that adulthood is a unique time for learning. Four ideas are included in this concept: (a) adults can learn, (b) education at any age and place, (c) educational influences present throughout life, and (d) cooperation among agencies. Vincent is quoted as saying "between the ages of twenty and eighty lies a person's best intellectual and educational opportunities." Secondly, the Chautauqua emphasized education or "culture" through correspondence as well as attendance at the Assembly in New York. The third idea is closely related in Vincent's position that "the whole of life is a school." Cooperation among agencies is the fourth idea developed by Stubblefield in this section of his article. While the emphasis is not upon religious instruction, it is difficult to divorce Vincent's ideas of education from religious motives and purposes.

The third major concept identified by Stubblefield concerns the relationship among education, contemporary thought, and social movements. He associates the founding of the Chautauqua with the increasing schism between religion and science. The Chautauqua Assembly's creation in 1874 is thus represented as a means of "confronting directly
the scientific challenges to faith and by addressing the social and human problems associated with industrialization and urbanization.\textsuperscript{10}

In conclusion, Stubblefield correctly observes the founders of the Chautauqua Assembly were not alone in their belief that learning should extend into the adult years. He identifies five ideas found in the Chautauqua Assembly that are relevant to modern adult education: (a) the ability of adults to learn, (b) how adults learn from everyday experiences, (c) how to make educational opportunities available to adults, (d) how to link the various providing agencies together, and (e) how to enhance the intelligence of the citizenry for the solution of social problems. Finally, continuing to learn throughout life was a religious obligation, according to Vincent.

Stubblefield's description of the ideology of Miller and Vincent is helpful in developing one view of the purpose and mission of the Chautauqua. He suggests that the leaders of that enterprise held ideas that were not greatly different from those espoused by others at about the same time. It affirms the perceived importance of education for adults as well as for children. It even connects these ideas with the powerful religious influence of the nineteenth century. Thus, it tells us that we should not look to the American Lyceum, a secular enterprise, as the inspiration for the Chautauqua Assembly.

This inquiry, thus, examines one possible religious organization as a precursor to the Chautauqua Assembly. It is possible that Miller and Vincent may have been influenced more by John Humphrey Noyes' Bible Communist community, commonly identified as the Oneida Community. Several facts support this hypothesis. First, both the Oneida Community and Chautauqua emerged from religious influence. Secondly, the theological positions of Noyes and Vincent seem to have roots in the revivalist perfectionists. Third, the philosophical positions concerning the adult's learning ability are similar. Fourth, Noyes, before Vincent and Miller, associated learning with life, and with the individual's responsibilities to others. Fifth, Noyes and his followers recognized the importance of learner input into the development of programmatic strategies. Sixth, Noyes preceded Vincent and Miller in the use of print media as an educational medium. Seventh, Noyes believed a positive relationship could be maintained between religion and science, and that knowledge of science could be used to improve individuals and eventually society.

Miller and Vincent were associated with the Methodist Church, one of the Protestant denominations associated with the doctrine of "perfectionism" that became popular with the "second reawakening" that spread across America between 1830 and 1850. According to Mandelker, Noyes' Perfectionism theology was not dissimilar from Wesleyan thought.\textsuperscript{11} While it is obvious that Noyes' theology was more radical, he shared
some similar ideas with his Wesleyan colleagues. Both emphasized piety in daily life, and both felt that individual improvement contributed to social progress. Noyes, however, was convinced, by his theological interpretation, that the gap between the ideal sinless life and reality no longer existed because of a spiritual union with Christ. Self-improvement, also referred to as self-culture, was a common element in the theology-philosophy of the founder of the Oneida Community as well as and the founders of the Chautauqua.

Noyes' radical Perfectionism is complicated because he shifted to a paradigm that differs from the moderate theological position of Finney, Miller, and Vincent even though it looks like and sounds like the secular paradigm of progressive improvement. Though there is a great risk in doing so, it is important to attempt to explain Noyes' Perfectionism, because it is related to his views about education, intellectual development, and use of the brain. While Noyes adopted millenarian utopian views, he made a significant modification in asserting that Christ had already made his second appearance with the destruction of the Jewish Temple in Jerusalem in AD 70. Thus, unlike his Wesleyan brothers who were yet awaiting the millennium and perfectionism, perfectionism was possible according to Noyes because the millennium was here.

Secondly, he believed that perfectionism was first a spiritual act that resulted in an integrating of the individual with Christ. This integration, based on Noyes' interpretation of Pauline doctrine, resulted in perfect spiritual security, leading to perfect obedience. In a complex rationalization, Noyes further associated sin with the Jewish Law, which was set aside by Christ. Hence sin was a product of the law, whereas perfection was the product of the relationship with Christ by individuals who were not bound to the Jewish Law. Yet, perfectionism, according to Noyes was not a completed stage, because in Christ the individual aspired to a morality that included good health and self control. These moral imperatives subsequently were addressed by the perfectionists by advice (education) concerning morality, social behavior, community and nature. Even though Noyes partially separated his followers from the larger society, they were not removed from personal and social responsibilities. Noyes' theology, thus, emphasized a range of personal and social behaviors that reintegrated man-society-God. Education became an instrument for self-improvement that had a spiritual dimension for Oneida residents.

Noyes believed that adults were under a special religious obligation to continue their learning. Hence, there was no question about adult learning ability. In his "talks" to the community he sometimes emphasized the brain and its development, but he also warned about the need for a balance in life. He presaged Jung and others concerned with the
idea of racial intelligence in his ideas that the mental improvement of one generation naturally leads to mental improvements in subsequent generations. Yet, he placed certain conditions on the efficacy of education. Material knowledge was related to one's spiritual condition. Within Noyes' theology-philosophy he envisioned a dialectical relationship between the human's spiritual condition and the effects of education. As a consequence of education the spiritual person moved on to a higher mental level where additional education contributed to even further advancement in psychological and physiological structures. He also related age to attitude. In his opinion, age was more directly related to outlook than to the calendar. When in his fifties, he described himself as being twenty-two years old and stated he would not get any older because of his outlook.

Noyes' ideas about education were essentially those of a democrat. He fervently subscribed to the belief that education was a common right. Furthermore, education was a means of "lifting of the masses up to a higher standard, equalizing the general intelligence, and thereby placing people upon a platform of more democratic equality." Improvement was a constant and universal theme among the community members. Because of the theological intertwining of the mental and the spiritual, improvement for the community members naturally included the intellectual as well as the religious. Their activities were described as "partly social, partly intellectual, partly industrial and partly religious in character." Despite the fact that only a modest number of the community had a higher education, many having been farmers or artisans with limited education, there was a passion for improvement. Yet, it is important to note that "improvement" was not a scholastic exercise; Noyes is credited with observing that "the true kind of improvement is to be doing something all the time that requires courage."

Some have made a point concerning the increasing conflict between science and religion, which had enjoyed a relatively peaceful coexistence in the first half of the nineteenth century. As he noted in 1860 and later in 1870, Noyes continued to believe that the conflict was not insurmountable. His belief was founded in the concept that the material aspects of science could not be adequately fathomed without spiritual insight. In one of his home talks entitled "Full Growth," Noyes commented that people had not really been born until they came into fellowship with God, and they were to be considered "in embryo" until their religious character was developed.

Noyes developed four major instruments of self-improvement: First, there were newspapers published by the community. Second, among the members there was mutual criticism. Third, the members had a discussion group known later as the Society of Inquiry. Finally, there
was the Oneida systematic education program. Even though the print media, mutual criticism, and the use of the Society of Inquiry are interesting, the systematic education program that emerged around 1850 is more than likely an activity with which Miller and Lewis may have been aware.

**Oneida Education Program**

Even though the Oneida educational program is referred to as "systematized," it was also conceptualized as an harmonious or harmonizing activity. The point is that it is difficult to separate some of the educative or intellectual pursuits of the Oneida Bible Communists from other endeavors. In their efforts at self-improvement, they wove educational activities into the fabric of daily life. Nevertheless, it is possible to identify some of the major aspects of the educational program.

Improvement was not only spiritual, which might be expected in a religious community, but intellectual. They believed regulation of their community was based on religious influence, free criticism, and education. They described their "whole association" as a school. To them the ideas that life is learning and that learning is life was a practical reality rather than a philosophical premise. A key to a better understanding of perfectionism theology and education is presented in an item appearing in the Circular under the title of "The Plodding Spirit." Immediately it might be surmised that the plodding spirit is a negative, but as discussed the opposite is true:

The *plodding spirit* is much honored in our Association, as the first requisite to all improvements. If I were to be asked to define it, I should say it is the spirit that is willing to learn little by little; it has everlasting perseverance in it, and does not despise the day of small things. It seeks improvement for its own sake, and has fellowship with God in so doing. It enjoys the details of the process as well as the results.

Another view of the attitudes concerning improvement is revealed in the criticism of one of the members who worked as a peddler for the community. In his job the individual referred to as M had apparently been overly influenced by his contacts with the world beyond Oneida. While his good points were noted, he was criticized for lack of purpose, selfishness, strong love of dress, foppishness and among other things the lack of the spirit of improvement and the failure to apply himself intellectually. It was recommended that he withdraw from the peddling business, take steady employment in the community, and to "put himself to school intellectually and spiritually."

Attitudes toward the evening meetings reveal the integration of life at Oneida. One description says they were "partly social, partly intellec-
tual, partly industrial, and partly religious in character. Variety in the evening meeting was also perceived as a way to keep out of a rut; comments on this point also help to define the attitude toward intellectual activity.

Personal relationships were considered to be important contributors to self-improvement. As a result, Noyes conceptualized human relationship as well as spiritual ones in three ways: ascending, horizontal, and descending. Ascending fellowships focused on an upward development and was characterized by a superior and inferior social interaction. The scheme was delicate, however, as the superior in the relationship was theoretically drained by too many relationships with inferiors. The practical aspects of the concept are found in modern tennis "ladders" where the best players are at the top and the weaker players are at the bottom. Poorer players may improve their game by playing better players, but not vice versa. This idea was not limited to intellectual matters, it was also used as a guideline in sexual relationships within the community, which, along with other aspects of the concept of group marriage, has received notable discussion.

It was also accepted that any member's knowledge was to be of service to all. If one could draw or sketch, or sing, they should be ready to teach others. Hence the democratic ideal of peer teaching was institutionalized in the educational program. From the earliest days of the Association, Noyes believed a significant part of each day should be spent in intellectual activity. In 1874, he argued for a six hour work day with the rest of the day devoted to study and recreation. This position is consistent with a comment appearing in the Circular of April 14, 1859. It was attributed to Noyes that the legitimate purpose of labor was to secure leisure for social, intellectual, and artistic cultivation. This is a good place to observe that the Bible Communists at Oneida also provided educational opportunities for their workers.

The idea of continuing education is also found among the Oneida Bible Communists. It was suggested that following their schooling at age twenty the young men should not consider their education finished, but should deem that they had only laid the foundation for further advance. Finally, the role of the community in stimulating educational interests is noted. They believed that enthusiasm for knowledge was communicated from those that had "a lively taste for knowledge by contagious enthusiasm."

Educational Activities

Various descriptions of educational activities of, and by, adults are found in Community literature. Some examples are provided below. For example, one individual had this to say about education: "After supper helped J. study his Greek; attended class and the evening gather-
ing in the parlor. I have lately desired the elevation of my attractions, and feel a confidence in the confession of Christ that it will effect in me what I desire." Another described the aftermath of the evening meetings in glowing terms. This Community member indicated that following the conclusion of the evening meetings "the majority of the family remain in their seats, and the transition from meeting to after meeting is mainly marked by a buzz of cheerful conversation." The same individual reported that after one evening meeting some of the scholars recited from their studies.

Educational or intellectual activities were not limited to the evening meetings and the formally appointed times for study. The Community often devised special work projects that within themselves might seem to be drudgery. Therefore, to minimize the negative aspects of the activity, which they called "bees," they would recruit a reader who read to them during the bees. As a result, "they got through a great number of books, much to their pleasure and edification."

The community took pride in the extent of the members' erudition. For example, the Circular as quoted in Robertson (1970) provides the following comment:

There is no sect in which the parents allow their children the freedom of books written in the spirit and interest of other sects that we do; nor do they encourage them in freedom of thought as we do. We keep ourselves saturated all the time with worldly influences through our library. We keep our library crammed with the ideas of the world. We meet the world with freedom in music, and in literature."

The enthusiasm for learning was maintained at a high pitch for some of the family members.

Mrs. N (over 40 years of age) is very enthusiastic about study and says she now cares nothing about her work, but wants to be studying all the time; while she used to be all absorbed in her work, and care nothing for books. She now attends to three regular studies - grammar, German and French - besides reading Cromwell and superintending the kitchen.

This scholar is in the 'sober afternoon of life.' According to Mr. Greeley's horology - but quite early in the morning, if we judge by the freshness of her own feelings and tastes.

Other descriptions and observations concerning educational activities in which community adults engaged represent the attitudes toward intellectual activity as being enthusiastic. In November of 1874, one observer said, "the enthusiasm [concerning study] is intense."
Courses
The educational curriculum for the Oneida Community was not lightweight. An excerpt from the Circular, dated November, 14, 1864, describes some of the courses for that winter. They include arithmetic, at two levels, grammar and composition, Latin, French, natural philosophy, geometry, algebra, astronomy, chemistry and "thorough bass."47

To address the challenge posed by the heavy demand on some of the courses like arithmetic, the community leaders engaged in creative scheduling. As all members of the community could not be at leisure at the same time, they scheduled the classes at different hours of the day. Thus, the fifty members who wanted to take arithmetic met one of the three classes scheduled at the following hours: 9:00 a.m., 3:00 p.m. and in the evening.

In order to meet the needs of the community members a committee was established to develop a survey. All members were invited to make out a program of study they wished to pursue, the time at which they could conveniently meet classes, and the preferred teacher. The system must have been successful, based upon the number of courses offered and the number of students enrolled in the different subjects.

Library
All educational activities were not restricted to formal classes. As noted above, the Community members were avid readers. In the earlier days of the organization they maintained their library even when food was limited. After becoming more prosperous they were not reluctant to fill their library with a range of books, magazines and newspapers. In 1875 the library was reported to have the following materials, including other unnamed items: the Daily Graphic, lively, gossipy and picturesque. The Daily Tribune, crammed with information but not always of the juiciest kind. The Utica Herald and the Utica Daily Observer. The Evening Post, semi weekly, has always been on the reading list, as is true for the Tribune. Political sheets included The Nation, Religious newspapers included The Independent and Methodist.48

Science was represented in the library by such papers as the Boston Journal of Chemistry, Journal of Applied Chemistry, Nature, and the Popular Science Monthly. The arts were not overlooked as they subscribed to Scientific American, American Artisan, the Telegrapher, and the Manufacturer and Builder. Five unnamed agricultural papers, one music publication, and an unnamed publication on field and aquatic sports were available.49

Publications addressing health, law, spiritualism, and natural history, also, were obtained for the Community. These and other publications arrived in Oneida from numerous sources such as Boston, New York,
Philadelphia, and St. Louis. But it was noted that the "greater part of our current literature comes from New York."  

All of the books in the library, for which we have no complete list, were not limited to heavier works on history, language, math, and science. Lighter reading fare was available. In fact thirteen library shelves were devoted to novels and poetry. Novelists from Bronte to Virgil included such luminaries as Bryant, Burns, Cooper, Dickens, Goethe, Longfellow, Milton, Pope, Scott and Thackery.

Conclusions

It should be stated clearly that there were differences between the Chautauqua Assembly as developed by Miller and Vincent and the Oneida Perfectionists Community created by Noyes. Yet, there are a number of provocative similarities that raise the possibility that Miller and Vincent may have been influenced by Noyes. Since Noyes' work at Oneida pre-dated the Chautauqua and other religious activities in which Miller and Vincent engaged, the direction of potential influence is logical. The religious community in the mid-nineteenth century had a good communication network, and given the common heritage of the Wesleyan Methodists Perfectionists and Noyes' Perfectionists, it is not unreasonable to assume that Miller and Vincent were aware of the Oneida Community. Just as the Oneida group received the Methodist and other religious newspapers it is possible that Miller and Vincent had an awareness of the Circular and other public information written by such luminaries as Henry James and Horace Greeley. Thus, they could have learned many things about Oneida educational activities in the 1850s.

Apparently, Noyes and Miller and Vincent shared some of the same ideas. Yet, the fact they held some views in common does not necessarily mean that Miller and Vincent took those ideas from Noyes. As noted in the beginning of this paper, the idea of self-culture or self-improvement was a central theme in the idea of progressive amelioration of the human condition. This idea was broadly discussed by such divergent groups as the transcendentalists, the leaders of the secular American Lyceum, and the socialist reformers such as Fourier and Owens, as well as the revivalists. Thus, the idea was common to both secular philosophers and to theologians. Noyes and Miller and Vincent placed the concept within their theological framework. Even though it is not possible to trace directly the concepts Miller and Vincent used to create their commune, the Chautauqua Assembly, to Noyes' Oneida Commune there is reason to believe in that possibility until other better hypotheses concerning the origins of the Chautauqua are available.

Areas of agreement between the Oneida Community and the Chautauqua Assembly are summarized below:
1. A religious justification for self-improvement.
2. Ability of adults to learn.
3. Education as a right.
4. Education as a democratic endeavor.
5. Education within the real world for application and life.
6. Education as a continuous activity that is not dependent upon a place and time.
7. The importance of written materials as an aid to education.
8. Belief in educating the individual.
9. Belief that self-culture could be entertaining as well as intellectually stimulating.
10. Interest in general education topics as well as religious concerns.
11. A kind of withdrawal from the world. Chautauqua participants withdrew to the lake front community on a temporary basis whereas, the Oneida members partially withdrew for longer times.

There are, also, some differences between the two organizations.
1. The Chautauqua was more "expert" driven by the use of paid professionals than Oneida, which was based on peer teaching.
2. Spiritual dimensions of learning were emphasized more by Oneida programs.
3. Oneida programs were limited to their members and workers and was provided by community resources without charge.
4. Chautauqua programs were open to the public upon payment of appropriate fees.
5. Historical treatment of the two organizations is vastly different. The Chautauqua and its founders are subjects of more favorable comment. Because of some of Noyes' strange beliefs, including Bible communism, group marriage, and the practice of eugenics by the label stirpiculture, Noyes more often is negatively portrayed in history.

Regardless of the importance attached to the more bizarre aspects of Noyes' theology and life, he must be credited with innovations in the education of adults. His surveys of commune members to determine educational opportunities foreshadowed the practice of educational needs assessment by more than one half a century. His emphasis on aesthetics in education also appeared at least sixty years before Lindeman addressed the topic. The use of a Likert type scale in evaluations was also a novel approach for the time. Provision of educational opportunities for the Oneida work force also merits attention as an innovative practice. Finally, the integration of educational activities into work schedules seems to be prescient.

The Evolution of Employee Education in the American Work Place

Rapidity of change has become the central issue facing management development. Why? Look at the historic record of human technological progress. Between 1750 and 1900, human knowledge doubled. In the first fifty years of the twentieth century, it doubled again. Each decade since 1960 has seen a further acceleration in the pace of change (Steinmetz 1976).

The challenge for training is to teach the principle of managing others during today's "future shock" period of rapid change and intense international economic competition. In order to perform the elastic, evolutionary jobs of the future, more employees than ever before must develop leadership abilities that require higher level thinking and problem solving skills. Static jobs for life have become a relic of the past.

I predict that the need for developing these leadership abilities will reach deeper and deeper into all businesses both large and small. This is symptomatic of fundamental changes taking place throughout the U.S. and worldwide marketplace (Conner et al. 1992).

As the economy becomes increasingly high-tech, existing jobs are being permanently wiped out through computerization, improved machinery, and new ways of organizing work. These are not all blue collar jobs. Government data show that between 1982 and 1993 the country's 500 largest manufacturers slashed nearly 4 million jobs. Seventy percent of these lost jobs were white collar jobs. During the 1980s new technology enabled U.S. policy makers to increase output by 30 percent and reduce labor rolls by 4 percent. In 1993, this trend is extending into service industries, affecting skilled professionals such as computer designers and programmers. Lifelong education for all American workers who will continuously experience job obsolescence is one of the realities of advancing technology (Myers 1992; Zachary & Ortega 1993).
This environment hardly encourages employee productivity and high personal motivation unless business adopts "lifelong education" thinking. Otherwise, America is faced with the prospect of hordes of educated people either underemployed or unemployed. If we factor in the up to 84 million currently undereducated employees, many of whom are incapable of handling almost any job in a high-tech twenty-first century workplace, the entire nation can anticipate serious social economic displacement. Many of these Americans face the prospect of becoming the "new peasants of the information age."

Competition for goods and services revolve around two main questions. How well does any business manage its "information content" of sophisticated technology and management design? How cheaply can it mass produce goods or provide a service?

In 1992, U.S. business invested over $40 billion in employee training and development, trying to become more competitive (Lee 1992). However, Henry Conn, coauthor with J. H. Boyett of Workplace 2000 (1991), estimates that only 10 to 15 percent of all training was retained and used on the job. He sees a more realistic target in the 80 percent range, if America hopes to beat its global competition.

At issue for most companies are two questions. To what extent will more extensive and effective management development retool the workforce? Will corporate decision makers adjust their strategic thinking to include lifelong education for all employees? To begin finding answers to these questions, we will review the evolution of training in the United States.

Training's Evolution

Before 1820, America adapted an apprenticeship system from Europe. Trade guilds, which ensured that products met standards of workmanship, had developed in Europe during the twelfth to fifteenth centuries. This guild system was a forerunner of today's unions. It strictly regulated members' hours, tools, wages, and, most importantly, training (Sonnenfeld & Ingols 1986).

At the top of this work hierarchy was the fully trained master. He had many years of experience. Through the local guild he enforced professional craft quality standards and regulated the training of new workers. He supplied the tools and materials, and managed his shop. Apprentices, who lived with the master, learned their trade by passing through prescribed stages of training. If successful, they became journeymen traveling from town to town, receiving a fixed wage for their labors. Some remained in their master's shop to gain the requisite knowledge and take their final craft examination. If the journeyman passed the guild's examination, he became a master craftsman and was entitled to set up his own shop. A variant of this guild system was the
organization of the medieval European university faculty system that awarded bachelor's, master's, and doctoral degrees. Modern Germany continues to use a formal craft training program as part of its dual educational system (Federal Republic of Germany 1987; Miller 1987; Nothdurft 1989).

The apprenticeship system never worked well in early America because of a severe shortage of skilled labor. Colonial America was largely an agrarian economy based on small farms. There were few large cities. Most manufactured goods were imported from Europe. As a result, the majority of potential workers were never employed as tradesmen but were either farmers or associated with the shipping trade (Eurich 1985).

The characteristics of the master-apprentice-journeyman craft system made it a very close knit work team. Apprentices were often viewed by masters as sons. Though the technologies employed were meager and simple, this working by doing learning approach required a very long term commitment. The training program was geared to the individual artisan's craft needs and expectations. Employee motivation was critical to the success or failure of the entire training system (Sonnenfeld & Ingols 1986).

By 1820, the Industrial Revolution was well under way in America. An average of 77 patents was issued each year prior to 1810. By 1860 Yankee ingenuity had raised the annual average to over 4,500.

Industrialization required training for specific tasks. The pattern of stable, lifelong occupations began to change. Work was not home based but became focused on larger, depersonalized organizations, usually established in growing urban areas (Steinmetz 1976).

Between 1820 and the outbreak of World War I (1914), factory schools were established to supplant the apprenticeship system. Hoe and Company, a manufacturer of printing presses, founded in 1872, established one of the first factory schools to train machinists. As the nineteenth century advanced, available machinists often proved incapable of operating more complex technology. Most machinists until then had relied on rule of thumb methods and had neither the mathematical nor the technical knowledge required to make precision parts (Stevens 1990).

Factory schools were established by Westinghouse (1888), General Electric (1901), International Harvester (1907), Western Electric (then part of AT&T), Ford, National Cash Register, and many other manufacturers. They provided specific task education within the emerging modern business organization (Miller 1987).

This early industrial period was driven by a work force of largely unskilled machine operators. Both unskilled and skilled workers were viewed as a variable cost. Worker employment fluctuated with market demands. The technology of new machines was still evolving with the
development of energy sources. Even though some technical training was offered, fewer skills were taught to fewer people in comparison with the prior craft system. The importance of individual employee motivation was replaced by the market forces of a unified national economy. By 1900 the United States had emerged as the world's largest industrial power (Sonnenfeld & Ingols 1986).

Mass Production Triumphs (1915—1945)

In 1910, Henry Ford introduced assembly line manufacturing based on Frederick Taylor's principles of scientific management. The assembly line system consisted of small divisions of labor and machine work, further reducing the need for skilled workers. An individual tightened a specific bolt rather than assembling a complete product. Workers were not required to think, learn, adapt, or solve problems, but only to endlessly perform mechanically simple tasks.

World War I provided a major stimulus for mass production. Charles R. Allen's "four step method" (show, tell, do, and check) became a standard method for on the job training (OJT) adopted by burgeoning assembly line war industries (Miller 1987).

The ending of the Great Depression with America's entry into World War II sparked a reformulation of the OJT approach. America became the "arsenal of democracy" during World War II defeating the Axis powers with mountains of assembly line products. These tanks, guns, trucks, and jeeps all had mass produced, interchangeable parts made by many different manufacturers, all of whom used assembly line training systems.

A train the trainer system called Job Instructor Training (JIT) was designed for first line and second line supervisors to support the expansion of assembly line production in the U.S. defense industry. Over 2 million supervisors received JIT or offshoot programs in job methods and human relations.

From 1915 until 1945, the work force was composed of large numbers of unskilled men (and, for the first time, women), who were largely interchangeable and driven by machine pacing. Employment downturns occurred at the end of World War I and during the Great Depression. Layoffs were based on seniority. A machine technology clearly dominated. The training provided by business stressed functional expertise and administrative efficiency. Individual employee motivation was not considered an important factor in making this system successful (Miller 1987; Sonnenfeld & Ingols 1986; Steinmetz 1976).

The Cold War Era (1946—1992)

The United States emerged from World War II the most powerful and prosperous nation on earth — a position it enjoyed until the 1990s. The
technologies that had made America into a world power were now exported overseas. A postwar baby boom helped ensure that the great industrial capacity built during the war years was retooled to support a large scale, consumer driven society. Management development was mobilized to meet these new complexities of production and distribution, using the military chain of command model with twelve layers of management.

By the early 1950s, business training began to focus on supervisory development. This interest was directed, at least in part, by the rediscovery of Elton Mayo's Hawthorne studies, conducted in the late 1920s and early 1930s at the Hawthorne plant of Western Electric, near Chicago. This was the telephone manufacturing arm of AT&T then employing over 40,000 workers. The Hawthorne studies led to the recognition that managers trained in leadership can influence human relations, thereby improving employee morale and personal motivation (Roethlisberger & Dickson 1941).

Later studies (Landsberger 1956) debated whether the "Hawthorne effect" was behind the achievement of desirable productivity goals. Additional research conducted during the 1950s by James Worthy, Charles Walker, and Robert Guest documented the negative effects of repetitive, low skilled, machine paced work on employee morale and productivity.

For the first time in American history, the Engineering, Science and Management War Training Program (ESMWT) established during World War II, and the GI Bill after the war, exposed millions of adults to college courses on almost every aspect of management, technology, psychology, and education. These continuing education and management training programs provided the impetus to the formation in 1944 of the American Society for Training and Development and fueled the vast expansion of the American Management Association that was founded in 1923. These organizations helped increase the popularity of off site management and executive development programs. By the mid 1950s, human resource development (HRD) had become a widely respected field. Training and development programs began to feature business games, "in basket" exercises, simulations, and the extensive use of role playing exercises.

The performance based psychological theories of B. F. Skinner at Harvard University had a significant impact on training practices that were designed both to control human behavior and to bring about behavior change. Training laboratories of the 1960s used behavior modification techniques, programmed instruction, teaching machines, and training hardware designed to shape and control desirable work related behaviors (Miller 1987; Steinmetz 1976).

The 1970s witnessed another behavioral application in HRD with the widespread growth of company assessment centers that "objectively"
measured employee management potential. In 1987, Malcolm Knowles stressed more humanistic or cognitive approaches to learning. He saw the role of the trainer as the facilitator of the learner's needs, rather than as the controller who sought to shape desired behaviors.

The concepts of organizational development (OD) also gained widespread support during the 1970s, interlocking all areas of business HRD. OD shifted the focus of concern from "people development" to one centered on the well being and efficient operation of the entire organization.

Training and development in the 1980s witnessed the rapid growth of quality circles (based on Japanese models) throughout American business. Computer based training and interactive video were introduced into many companies. They spread quickly with the increasing availability of personal computers (PCs) and appropriate software. However, entering the 1990s, their major limitation remained the lack of customized, inexpensive training and development software for specific company applications. Undoubtedly this issue will begin to fade as increasingly powerful PCs drastically reduce local software development costs.

Management development of the 1980s and early 1990s also saw the continued use of behavioral models of training. They were considered by many trainers and course designers as constituting the best practices for management development, technical, and educational training programs.

During the Cold War era, training and development programs characterized the work force as groups of employees under a supervisor. Most workers were viewed as long term, career oriented community members. Business emphasized employment stability. Because technology had become more complex and interactive, training began to stress teams and retraining, while still emphasizing technical skills. Employees were motivated through raises, promotions, and benefits (Knowles 1987; Miller 1976; Rush 1987; Sonnenfeld & Ingols 1986).

Preparing for Work Force 2000

By the early 1990s, the training and development needs of American business had begun undergoing significant dynamic shifts. Many employees at all levels have discovered that much of what had been learned in school or on the job was now obsolete. They struggled to master high-tech skills or were forced to seek new employment. Many lamented that supple minds had become more important than supple joints. America won the Cold War by rebuilding and reequipping former adversaries. However, their new industrial base has produced complex technologies and an organizational versatility that place extreme competitive pressures on most U.S. business sectors (Gordon et al. 1991).
The 1990s reshaping of American business often will mean the elimination of many middle managers. But the success of this strategy will largely depend on how well newly empowered supervisors and line workers are educated to maximize their individual talents. Strategic manpower planning requires training programs that are designed to foster workers' abilities to perform complex jobs through the development of abstract thinking, problem solving, and comprehension skills (cognitive abilities) (Boyett & Conn 1991).

Future managers, supervisors, and workers must learn how to rethink new solutions to the old ways of doing business. These Total Quality Management (TQM), ISO 9000, business process re-engineering, team building programs feature problem solving, creative ability, cognitive based learning. They are far more complex than past behavioral based company training. They will challenge both manager and worker alike to develop leadership for tomorrow that maintains organizational competitiveness (Goldstein & Gillian 1990; Greenwood et al. 1993).

The organizational structure of the work force for the year 2000 will most typically be smaller companies utilizing work teams. An employee will be viewed as a human resource who needs constant development. Individual employment will be very changeable and intermittent, driven by rapidly changing technology and the need for extensive continuing education. The training and development offered will be committed to lifelong learning that copes with these frequent changes. Employee motivation will become vested in these job changes and in enrichment that broadens daily work assignments (Sonnenfeld & Ingols 1986).

**Future Work**

Societal changes in the next decades will be enormous. The entire world is now in the midst of a second industrial/technology revolution. Over the next thirty years major scientific breakthroughs will significantly alter technology, the workplace, and daily life. International economic competitiveness will demand that America create and maintain a world class, universal worker educational system. If both employees and organizations are to thrive, training and development must become a force in strategic planning that educates all people to their highest potential. However, too often in contemporary business, "wisdom" and "creativity" are seen as opposites. Many managers view creative people as "mavericks," not quite fitting into the corporate culture. They certainly are not the people who should be running the shop!

Yet many of these same managers have embraced quality as the competitive cure all of the 1990s. A comparison of Crosby's fourteen steps, Deming's fourteen points and Juran's seven points finds a common call to expand training that promotes employee problem solving on the
job. All three call for empowered work teams that can integrate a range of complex thinking tasks into their daily work activities. The quality "continuous improvement process" requires that people make decisions, analyze systems, investigate, invent new processes, classify, compare, and generally manipulate information. Increasing personal creativity has become the name of the game for American business (Hunt 1992).

We believe that most companies need to encourage employee education at all levels. A business that cannot bridge the "business wisdom" versus "employee creativity" culture gap will soon experience serious trouble. The worldwide competitive marketplace has already begun this winnowing process.

The foundation of America's national wealth is really its human capital—people. Their knowledge, skills, and motivation remain the primary assets of any business. In 1987, William Wiggenhorn, director of training at Motorola, noted, "We've documented the savings for the statistical process-control methods and problem solving methods we've trained our people in. We're running a rate of return of about 30 times the dollar invested" (Peters 1987).

The $40 billion a year corporate training budget of U.S. companies sounds impressive. But it is only a fraction of America's annual corporate capital hardware bill, which runs about $400 billion each year. Motorola is not a nationwide industrial leader by accident. Employee education is at the heart of its short term/long term planning.

As part of any company's strategic business plan, executives need to reconsider training by assessing your total work force's skills. What are the employees' educational skill levels in relation to your domestic and foreign competition? Is this educational skill gap increasing or decreasing versus key competitors? In many instances individual businesses will find that they are far behind in the education and training they will need to offer all their employees for the ultra modern, post twentieth century marketplace (Peters 1987).

However, the experience of too many managers is that for the most part training is "not worth what I've paid." People go and listen and say it was wonderful, and they do it for a while, only to forget it and go back to their old habits. Training is useless unless change results, and it is part of a process that awakens people to their own strengths and weaknesses (Harte 1990).

In the 1980s, many new adult learning strategies were discovered for stimulating thinking and intelligence. Frederick Goodwin, director of the National Institute of Mental Health, believes that educational programs cannot make a 70 IQ person into a 120 IQ person. "But you can change their IQ in different ways, perhaps as much as 20 points up or down, based on their environment" (Kotulak 1993). There are many
untapped abstract reasoning capabilities that currently are not being
developed by traditional business training/educational programs.

I propose FutureWork as part of this human development revolution
reshaping American business. Companies will continue to offer training
such as basic management, supervision, service, and assembly behaviors.
They will add a component for employee skill requirements that increase
overall personal comprehension: writing, math, reading, foreign lan-
guage, and English as a second language. Only after addressing these
two employee development areas will a business be able to successfully
address the education issues of building higher thinking skills for TQM,
ISO 9000, business process re-engineering, work teams, problem solving,
personal creativity, and advanced technical or professional education.

I see FutureWork as being based on the Work Force Education Triad
of training, skills, and education. For the rest of the 1990s, maximizing
the talents of all people is emerging as a major business goal. How
America will reach these objectives will be presented in the following
chapters.

Henrietta Rodman and other Modern Feminists: Redefining the New Professional Teacher

omen educators have seldom been the subject of traditional or feminist texts. They are also absent from studies of educational reform at the beginning of the twentieth century. Educational policy makers and historians have overlooked the central actor in the education process, the teacher, and in doing so, have neglected the female teacher who dominated the profession numerically by the early 1900s. In fact, very few scholars have explored the historic experiences and perspectives of teachers (Altenbaugh 1992). Female school teachers, however, played an extremely important role in the changes that took place as they pushed and negotiated the educational policies made by dominant Anglo middle- and upper-class males on local school boards. In her study of female civil servants, Desley Deacon (1989) argues that policy formation and implementation cannot be fully understood unless the history, interests, resources, and effects of public servants, such as school teachers, are considered seriously. I will argue in the same way that women teachers of this period were central actors, not only in educational reform, but also in the larger societal reform for women led by modern feminist groups.

Henrietta Rodman was both a modern feminist and a school teacher in New York City in the early 1900s. Modern feminist school teachers such as Rodman played integral roles in reframing educational policy issues and redefining the modern professional woman. As such, the voice of Rodman, along with the other modern feminist school teachers, must be examined as they challenged the dominant discriminatory policies of the era.

Methodology

This study argues that by examining the life of one woman, we can demonstrate the extent to which women resisted patriarchal authority
and influenced educational policy. As Kathleen Barry states, "women can be reconceptualized as 'historical agents' through a biographical method which locates itself in social interaction and interprets subjective meaning at a critical juncture between political and social history, daily life and epochal events, macrostructures and microdynamics" (Barry 1989, 563). Thus, I examine closely the multivoiced social events and dialogues of the participants in educational policy making -- the dialogues of teachers, administrators, and school board members of that time.

The Dominant Discourse

In the rapidly changing context of increased industrialization, immigration, and urbanization at the turn of the century, the Progressive educators were successful in promoting an image of the new modern professional female teacher: She would be cost efficient by accepting lower wages; she would be controlled by the new "scientific" centralized administration; and she would be committed to her career for a period of years or until she decided to marry, at which point it was her duty to return to the home to raise a family. Indeed, Charles Bardeen in Education Review expressed alarm that the biological functions of women were destroying American education: "...twenty-eight should be the maximum age for women teachers and six the total years she be allowed to work. After that they develop a pessimism, a contempt for mankind that is not healthful and that boards of education shrink from" (Bardeen 1912, 19).

The power afforded the male educators over the female school teachers allowed discourse such as that of Bardeen to become dominant. The hegemonic views of the Progressive male educators -- for example, Ellwood P. Cubberly at Stanford; Edward Elliott at Wisconsin; Nicholas Murray Butler at Columbia University; and William Rainey Harper at Chicago -- defined the new modern school teacher (Douglas 1977; Tyack and Hansot 1982). Most stories that challenged this definition and the interests of the educational reformers were sequestered by framing devices such as the discussion of a woman's biological and intellectual inferiority, her appropriate "private" sphere of domesticity and child rearing, her "natural" tendency for emotional/irrational behavior, and her efficient employment at a lower wage. Modern feminists such as Henrietta Rodman, however, had radically different views than most new Progressive male educators on the definition of the new professional school teacher.

Henrietta Rodman -- New Teacher and New Feminist

Henrietta Rodman was one of the new teachers recruited by Progressive administrators to teach in the New York Public Schools. Born in
New York City in 1878, she was educated at Columbia Teachers College. In 1898 she began teaching at Wadleigh High School in the New York City Schools. A new "professional" school teacher, Henrietta Rodman was also a modern feminist whose personal and professional views and actions were influential in reframing the way school boards across the nation viewed marriage, motherhood, and educational policy. With other members of the modern feminist group, Heterodoxy, in Greenwich Village, Rodman challenged the Victorian worldview and rigid moral values, arguing for the pragmatic character of knowledge, the erasure of social barriers, and the importance of experience as a guide to truth (Singal 1991). Rodman was a "charismatic personality who attracted attention to feminism with her sandals and loose-flowing gowns, her habit of smoking in public, and her gatherings at the Liberal Club in the Village" (Sochen 1972, 16). Little is known of her life before 1910. Her parents, Washington and Henrietta Rodman, were native New Yorkers and apparently believed enough in women's education and independence to give their daughter a college education. By 1910 she was thirty-two years old and a practicing feminist. She is said to have lived openly with many men before her marriage in 1913. When she married Herman DeFremery, she retained her maiden name. DeFremery remained in the background of his wife's feminist activities. They adopted two teenaged daughters, because Henrietta did not care for babies but enjoyed teenagers.

Rodman was a charter member of Heterodoxy, the unique luncheon club for "unorthodox women" in Greenwich Village founded in 1912, and there she networked with other modernist feminists who taught at various times of their lives. A few of these women devoted their lives to education, but none matched the dramatic role of Rodman and her attempt to redefine the modern professional school teacher (Schwarz 1986).

**Challenging Victorian Moral Codes and Social Barriers**

One radical group of which Rodman was a member and organizer was the Liberal Club, originally based at 132 East 19th Street and founded as a lecture society with clubroom advantages. Young artists, radicals and social reformers from the universities, the settlement houses, and the apartments and garrets to the south of 19th East Street began to make the club a home. Rodman was part of this group. Although she never used this organization as a platform for equitable educational policy for women, she did make contacts there with many members who supported her radical activities and challenged the nineteenth century moral codes and racial boundaries of men and women alike.
Floyd Dell was one of Rodman's staunch supporters from his arrival in Greenwich Village in 1913. As editor of The Masses, he described Henrietta as he knew her, but he called her by the name of Egeria.

Egeria (Rodman) had the rare gift of being able to start things. Some people, it is true, said that what she inevitably started was trouble; but that was scarcely just to her. Incredibly naive, preposterously reckless, believing wistfully in beauty and goodness, a Candide, in petticoats and sandals, she did always manage to involve herself in complicated difficulties serenely, and fought her way out of them - into some new thorn-patch. People laughed at her a good deal, and loved her very much indeed, and followed her beck into the beautiful and absurd schemes she was forever inventing.

The Village had been quietly there all the time; but from the moment Egeria (Rodman) moved the Liberal club down there, it was different. She touched it off, and it went up like a sky-rocket: the bright gleams of that pyrotechnic spectacle have hardly yet faded from the sky.

There was no common center, no meeting place for the Village as a whole. And Egeria (Rodman) determined that there should be one. Indeed, without such a center, how would the new invaders, Egeria and her friends, ever get acquainted with those shy and timid aborigines, the artist-folk?

'We need each other,' she declared. 'They have something to teach us -- and we will wake them up!'

Egeria's 'we' meant the group of university people, students, and professors, the social workers, the newspaper men and women, who accepted her as their leader in rash idealistic enterprises. Egeria herself was a school teacher.

Yet, let it not fail to be recorded among the paradoxes of our American social history, that the Greenwich Village of which all the world knows was founded by a schoolteacher in all earnestness! (Richwine 1968, 211).

In the fall of 1913, two disputes fractured the five-year-old organization. The first was over the issue of sexual morality. Henrietta Rodman endorsed free love and inspired one member to take a mistress who then moved in with him and his wife to the dismay of other members. On September 12, 1913, The New York Times alluded to this member being inspired by Ms. Rodman who had married another member of the club, DeFremery, with the full consent of DeFremery's common-law wife, who
had come to the home of the bride and bridegroom (Richwine 1968). The second issue concerned racial discrimination. Rodman insisted that the club admit Blacks, something many members resisted. Consequently, she and her followers found alternative space at 137 MacDougal Street above Polly's Holladay's restaurant and flourished there until 1919 (Miller 1990).

**Challenging the Private Imprisonment of the Modern Professional Woman**

Not only did Rodman and the modern feminists attempt to break the moral traditions and racial barriers imposed on the new professional woman, they also challenged the notion that married women who worked allowed their homes and families to deteriorate. In 1914 Rodman founded the Feminist Alliance, built on the ideas of Charlotte Perkins Gilman. The Alliance issued the following declaration:

Feminism is a movement which demands the removal of all social, political, economic, and other discriminations which are based upon sex, and the award of all rights and duties in all fields on the basis of individual capacity alone (Sochen 1972, 47).

The Alliance focused on admission policies concerning women to universities, graduate schools, and professional schools in the face of men's fear of feminization (Douglas 1977; Rosenberg 1982). It also proposed a new type of housing for women -- an apartment house with meal service, minimum housework, and childcare which "would free the middle-class professional woman to work at her profession at day and be a companion to her husband in the evening" (Sochen 1972, 51). This "middle-class professional woman", of whom Rodman spoke, fit right into the plans of the centralized school administrators who wanted a new type of teacher who was efficient, manageable, and desiring a commanding career (Murphy 1990). Rodman, however, in contrast to the male educational reformers, intended for these professional women, many whom were teachers, to continue working after marriage and motherhood.

Dolores Hayden (1981) calls women such as Henrietta Rodman material feminists because they dared to define a grand domestic revolution in women's material conditions. They demanded economic remuneration for women's unpaid household labor. They proposed a complete transformation of the spatial design and material culture of American homes, neighborhoods and cities. Rodman and the other members of the Feminist Alliance were determined to rearrange home life so that women could combine a career and marriage successfully, by creating women's housing less tied to specific types of work than the settlement houses which reinforced the stereotype of women's labor.
being solely domestic. Unfortunately, because of a lack of financial
support, the apartment house was never built. This proposed project,
however, served to strengthen the Feminist Alliance and to prepare its
members for their next battle -- fighting for the rights of mother-teachers.

**Challenging the Inferior Status of Professional Teacher-Mothers**

As seen in their plans for the feminist apartment house, the modern
school teachers believed the middle-class professional woman who was
committed to her career as a teacher could successfully be a mother, a
view which differed drastically from the male school board and adminis-
trators for whom many of them worked. One of the Alliance's most
successful crusades was its battle with the New York City School Board
of Education to eliminate discrimination against married women in city
schools. Inspired and initiated by Rodman and determined to success-
fully incorporate the public and private domains of teacher-mothers, the
Alliance fought for maternity leave for female school teachers. In 1914,
the Board’s practice was to hire married women only if they had been
separated from their husbands for at least three years or were widowed.
If a woman married while teaching or became pregnant, she could not
return to her work after having her child. In 1915, a male educator
warned, "The farmer that uses his land for golf-links and deer preserves
instead of for crops has but one agricultural fate; the civilization that
uses its women for stenographers, clerks, and schoolteachers instead of
mothers has but one racial fate" (Clifford 1989, 305). This warning along
with the current Board policy prompted The Masses to write tongue-
in-cheek:

> The impulse of life to reproduce itself will probably not
be entirely annihilated by the New York Board of
Education, but we are glad to see that institution doing
what it can to suppress this craze. Women teachers at
least shall not be allowed leave of absence to have
children. Maybe it does not come within the province of
education to prevent babies from being born, but at least
it makes their education unnecessary (Max Eastman
1913, 1).

Determined to break the boundaries between the public and domestic
spheres, Rodman adamantly opposed the Board’s policy. In March 1914,
Rodman challenged Board policy by announcing she had been married
to Herman DeFremery a month earlier and reported that her admission
of marriage was calculated to force a test case with the Board of Educa-
tion. She could no longer tolerate the "silence agreement" used by other
married teachers to protect their positions ("Aided Mrs. Edgell" 1913).
Rodman felt:
The Board of Education of the City of New York is opposed to married women continuing to teach in the schools. If it had the power it would simply expel them. Since, however, the law does not permit a woman to be deprived of her occupation simply because she is married, the Board seeks to attain its ends indirectly. It refuses to appoint or reappoint teachers already married, it-withholds promotion from those who marry subsequently to their appointment, and it denies to married teachers leave of absence before and after childbirth. Life is to be made so unendurable for married teachers, they are to be compelled to make such heartbreaking sacrifices, that they will sooner or later accept defeat and allow themselves to be driven out of the schools ("Restoring the Family" 1914, 8).

Even though the Board of Education did not take action on Rodman's admission of marriage, later that spring Rodman decided to take up the cause of Mrs. Engell, a New York City school teacher who had been dismissed for refusing to leave her job after becoming pregnant. Rodman organized rallies with the aid of the League for Civil Service of Women. A group of twenty women and men met at the Liberal Club on June 27, 1914, to plan widespread local protest meetings in the city and a large citywide rally at Cooper Union (Richwine 1968). Charlotte Perkins Gilman and sympathetic male allies such as John Dewey and Rabbi Stephen Wise participated in the rallies and appealed to the mayor. Rodman was suspended on November 12, 1914 for writing to the New York Tribune about what she called the new sport of mother baiting. This was a new game, she wrote:

The majority of the members of the Board of Education are expected to play on one side, and on the other, two women, each with a baby a few days old. The object of the game is to kick the mothers out of their positions in the public schools. It will be played according to the rules of the Board of Education. Mother-baiting is popular with the majority of the Board. The game is rather rough, but like wifebeating, which used to be so popular, it is always played for the good of the women (Rodman 1914).

Rodman quickly became a martyr in the cause of free speech. Rather than argue the strictly feminist line — that she had been discriminated against because she was a woman — Rodman contended that she had been deprived of her civil liberties. As main speaker at meeting after
meeting, she proclaimed the injustice of her suspension. Her fight, she said, was different from that of teacher-mothers. Their cases, "involve the question whether married teachers shall have the right to have children. My case involved my right to be a citizen as well as a teacher" ("Mother-Teacher to Fight" 1914).

In a closed session in December 1914, the noted civil rights attorney Gilbert Roe defended Rodman. Despite her protests that she had a right to free speech, she was fined and suspended without pay for eight months. After the decision Rodman commented, "My suspension amounts to a fine of $1,800 for writing a satirical letter about the Board of Education which in ten years will be universally regarded as immoral and absurd" ("Miss Rodman Suspended" 1914). This decision provoked a new commitment from Rodman's supporters to end discrimination against teacher-mothers. Some even considered forming a union which could strike in retaliation to unjust board policies (Sochen 1972). Floyd Dell wrote in The Masses:

In the great city of New York these gifted amateurs [the board members] decide that a mother is not fit to teach school, and make pregnancy a crime punishable by dismissal. They are so certain of their right to decide these matters, or so filled with a sense of their own administrative dignity, that they prohibit criticism from within the teaching body. The case of Miss Rodman is the latest and most notorious example of their parochial temper and quality. We have a 1915 public school system. How long must we blunder along with an 1830 board of education? (Dell 1915, 11).

An unsigned editorial, To the School Board, in the same publication states:

In his anxiety to defend the New York school board for its policy of discharging teachers who become mothers, a member of the board, William G. Willcox, urges that a distinction should be made between voluntary and involuntary indispositions.

This implies that motherhood is a preventable indisposition. That is true, but it is true also that many women, married and exposed to it, do not know how to prevent it.

We suggest that the Board institute a course of instruction in the matter of voluntary and involuntary motherhood, and place Margaret Sanger, who is now under a criminal indictment for mentioning the subject, in charge of the course ("To the School Board" 1914, 18).

The energetic cries of feminist indignation forced a special committee of the Board to recommend a two year maternity leave for married
teachers on December 31, 1914. The Commissioner of Education reinstated seventeen teacher-mothers with full pay for their suspended time. In June 1915, Henrietta Rodman’s suspension was removed with a transfer to Julia Richman High (Richwine 1968).

The modern professional woman school teacher was now allowed to become a mother and retain her position in the school. The hegemonic view of the inferiority of teacher-mothers, exacerbated by professionalization of the "new" teacher and rhetoric of women's appropriate domestic sphere, was being eroded. Men, as well as women, were beginning to understand what modern feminist Elsie Clews Parsons argued eight years earlier:

Pedagogy cannot afford to entirely overlook the experiences of maternity. All teachers do not need to be parents, but parental experience in pedagogy is a valuable asset. No community can afford to segregate any number of healthy women as non-child bearers. Is it not utter folly to harangue against race-suicide and yet to place women in a position where they must choose between celibacy, or childlessness? (1906, 146).

Challenging the "Efficient" Lower Wage of the Modern Professional Woman

In addition to defying the discriminatory policy of dismissing teacher-mothers, modern feminists also challenged the lower wages of female teachers through forming unions. The new teachers' unions were not just woman-led; they were feminist. They challenged the structural and psychological handicaps to women's economic independence.

This emancipation was nearly impossible with the discriminatory low wages female teachers earned. Affiliation with the union movement, however, gave women new access to the halls of political power. Women such as union activist Margaret Haley in Chicago could not believe that the city could not scrape together enough money in taxes to pay teachers a fair salary. Haley traveled across the nation during the Chicago tax crusade and found a basis for uniting women to obtain better wages in each city. Between 1902 and 1910, over eleven of these organizations joined the American Federation of Labor. They became the nucleus for the American Federation of Teachers (AFT) (Murphy 1990).

These organizations, in contrast to the National Education Association founded forty years earlier and which remained firmly in the hands of male administrators, were formed by women teachers. For example, in New York City the Interborough Association of Women Teachers (IBTA) formed in 1906 and argued to the Board of Education that female teachers ought to receive the same salaries as male teachers. In 1911,
under the leadership of Grace Strachan, this organization steered through the state legislature a new law prohibiting discrimination in salary because of sex and giving women teachers a pay raise. IBTA eventually grew into Local 5 of the American Federation of Teachers to which Henrietta Rodman and other modern feminist school teachers belonged (Urban 1989).

A new sense of confidence seemed to emerge from new professional women's groups which contrasted with the male administrators desire for a manageable, "efficient" teacher. Teachers considered themselves autonomous in the classroom and resented incursions on their autonomy. With the help of the union in 1922, for example, Henrietta Rodman fought against the Lusk Law, an anti-sedition law backed by New York Senator Lusk, which required all teachers to appear before an advisory board to be questioned concerning their civic beliefs. Rodman was one of twelve teachers denied a certificate of loyalty.

**Conclusion**

The early 1900s was a time of major reform in American education. Immigration along with urbanization and the commitment to universal schooling allowed cities such as New York to hire many women to fill new teaching positions. New Progressive administrators, favoring centralization, attempted to define a new middle-class professional teacher who would see the economic benefit to the district of her accepting lower wages, promptly resign her position after marriage especially after motherhood, and accept the fact that all the policies which affected her would be made by the male administrators and board members. Unfortunately for the reformers, they did not predict the reaction of the modern feminist school teachers to this definition/appropriation of their selves. Women teachers' unions as well as modern feminist groups such the Feminist Alliance and the Liberal Club organized by Henrietta Rodman challenged this new definition of the modern professional woman. Contrary to the definition of the new Progressive administrators, this new middle-class woman could raise a family and work outside the home, receive a higher education, be economically independent, and have a strong voice not only in education but also in larger political movements. Henrietta Rodman continued to defy the patriarchal frame of the schools until her death in 1923. Current feminist educators and policy analysts have much to learn from the struggles of Henrietta Rodman as we attempt to reframe new discriminatory patriarchal definitions placed upon us even today.

Alice Miel: Ideas on Democratic Curriculum Development

Elizabeth Anne Yeager
The University of Texas at Austin

A study of Alice Miel's contributions to the curriculum field and of her role in the larger historical context offers a type of perspective on the past that, according to Kliebard and Franklin (1983), is "most appropriate for reaching conclusions about curriculum thought and, in a more limited way, curriculum practice." They note that prominent curriculum leaders may not necessarily influence the actual school curriculum, but they may be viewed as "barometers of the direction the school curriculum was taking." Miel's career offers an excellent source of knowledge and deeper understanding about a vast, shifting span of historical time in American schooling.

Alice Miel, one of the foremost female contributors to the American curriculum field and a leading curriculum development scholar-practitioner, frequently has been overlooked in much of the research on the nature and evolution of the curriculum field. This paper, part of a larger study of Miel's career, specifically examines her contributions in the area of democratic, participatory curriculum development in schools. Laurel Tanner (1994) describes Miel's major book, Changing the Curriculum: A Social Process (1946), and her continuing work in this area, as helping to state "the ideas that are foundational for collaborative decision making in schools and school systems (which help to) constitute the legacy from which contemporary workers draw." Huebner (1994) characterizes the book as a "masterpiece," while Foshay (1994a) cites her work in this area of the curriculum field to support his assertion that Miel "exemplifies the best of the meanings of the Progressive Education Movement of 1925-1960."

Several themes emerge in Miel's body of work. First, Miel advocated democratic ideals and the development of democratic behavior as the ultimate goal of schooling. Second, and to that end, she applied theories...
of social learning and democratic principles and processes to various aspects of curriculum development and school administration, emphasizing that curricular change was a social process involving an array of participants on the local school and community levels. Third, she focused generally on the democratic social learning environment of children in schools and articulated aspects of cooperative learning and other democratic procedures available to teachers. Fourth, she applied her ideas on a democratic social learning environment to specific areas of the curriculum, particularly to the social studies and to the elementary curriculum as a whole. A fifth theme emphasizes "process," or the "dynamics of change in curriculum matters" (letter to author from Kliebard 1994), and cooperative action research (Foshay 1994b) as the vehicles for curriculum development and improved school planning. Miel’s advocacy of action research was based on her belief in testing "in a specific situation the findings of research carried on in other places and situations" in order to allow teachers and other participants to work together on school problems, try out and evaluate new procedures appropriate to their school setting, and gain new perspectives on their practices (Ambrose and Miel 1958).

Miel’s Career: An Overview

One of only a handful of doctoral students supervised by Hollis L. Caswell at Teachers College, Columbia University, Miel went on to a fruitful career there as an instructor, assistant and associate professor, and professor (1942-1971) and as head of the Department of Curriculum and Teaching (1960-1967). Her teaching and writings focused on democratic curriculum development and policy in local schools (e.g., Cooperative Procedures in Learning, 1952; Changing the Curriculum: A Social Process, 1946); social studies education (e.g., More Than Social Studies: A View of Social Learning in the Elementary School, with Peggy Brogan, 1957); and children’s social and democratic values (e.g., Children’s Social Learning, with Edna Ambrose, 1958). She was also involved in the action research movement of the 1950s and 1960s (e.g., The Shortchanged Children of Suburbia, 1967).

Miel’s career at Teachers College, first as Caswell’s student and, later, as faculty member and department chair, spanned the latter years of the College’s preeminence as the "intellectual crossroads" of the progressive education movement under Dean James Earl Russell (Cremin 1961), its decline and disarray in the 1950s as the main target of conservatives who attacked progressive philosophy and demanded a return to the basics of schooling, and the shift of national mood again in the 1960s when Silberman and other humanist educators decried conformity and rigidity in school curricula and wanted to return the focus of education to the needs of individual learners (Zilversmit 1993).
In addition, Miel helped professional organizations that attended to the curriculum. She was one of the early presidents of the Association for Supervision and Curriculum Development (1953-54). In fact, she succeeded Caswell, her mentor, and preceded in this role by two other Caswell advisees, William Alexander and Galen Saylor who were her classmates at Teachers College. She also edited ASCD's 1949 Yearbook. In the 1970s, she became a guiding influence in the founding of the World Council on Curriculum and Instruction (WCCI). She served as this group's first president and, later, in other capacities. The establishment of the WCCI was a natural outgrowth of her interest in improved curricula for all children and her work with doctoral students from all over the world. In addition, she played an active part in the Association for Childhood Education, International (ACEI), for many years.

Miel and Curriculum Development

The formative years for what would become the centerpiece of Miel's career in education can be traced to her experiences at Tappan Junior High School in Ann Arbor, Michigan, where in the early 1930s, she taught Latin, French, and history. Most importantly, her principal at Tappan was G. Robert Koopman, who led a "democratically run school" (Miel 1978), who nurtured her interest in the application of democratic principles to education, and who initiated the involvement of teachers, parents, and community members in curriculum development (Miel 1994; Berman, 1992).

Koopman put Miel in touch with Hollis Caswell in 1942. Caswell, then chairman of the newly organized Department of Curriculum and Teaching at Teachers College, Columbia University, had already enhanced the visibility of the curriculum field, developed the idea of method in curriculum making, focused attention on the process by which a variety of people interacted in order to make the curriculum, tried to reduce the gap between theory and practice by defining curriculum as actual experiences undergone by learners under the direction of the school, and provided a curriculum design that helped teachers to apply concepts from organized knowledge to the solution of social problems (Seguel 1966; Miel 1989; Burlbaw 1989).

Caswell encouraged Miel to attend Teachers College for her doctorate and offered her a position as part time instructor. He agreed to become her major advisor and helped her to formulate the problem of curriculum change as a social process for her dissertation (Miel 1978; Miel 1994; Berman 1992). Later published as Changing the Curriculum: A Social Process (1946), this work synthesized many of the ideas that she had developed with Koopman and Paul Misner, superintendent of the Glencoe, Illinois, public schools, on the processes of change in schools. She was interested in "ways of bringing about desirable changes in the
curriculum at the local community level" (Berman 106). Miel devoted particular attention to cooperative procedures because she considered them essential to problem solving in a democracy, and to the fundamental importance of people having "the opportunity to determine purposes toward which they will work" (Berman 106).

To begin with, Miel argued that certain "cultural maladjustments" existed in the schools that caused them to lag behind society and sometimes to ignore social problems altogether. This tendency, in effect, made the curriculum "unreal" and "irrelevant" because the curriculum did not fit life as it was being lived in particular communities (Miel 1946; Miel 1994). A second, related basis of Miel's argument concerned crystallization as a recurring phenomenon in American education; that is, she criticized approaches to curriculum development that were good beginnings which had turned in upon themselves and had reached a point at which "an idea or habit is accepted uncritically so that it limits the integrity, autonomy, and opportunities for self expression of individuals and groups" (Miel 1946, 1).

The focus of Miel's attack on crystallization in curriculum development was the "course of study" approach to curriculum making that excluded teachers and members of the community. Through her experiences as a teacher in a school that developed curriculum "democratically" at the local level (see Koopman et.al. 1933), and later, through her exposure to the ideas of Caswell, Harold Rugg, George Counts, and L. Thomas Hopkins at Teachers College, she concluded that the curriculum development field had "simply stopped" at the point of written courses of study. "My enemy was this course of study," she explained, "and (this problem) just seemed worth spending time on...Someone could come up with a new course of study and call it `curriculum change,' but that wasn't the kind of change I wanted to see. Curriculum change should mean something that is growing and emerging" (Miel 1994).

Miel found that a statement by Harold Rugg (1926), one of her professors at Teachers College, captured the essential problem of the "crystallized" process of curriculum change:

Partial, superficial, and timorous "revision" rather than general, fundamental, and courageous reconstruction characterizes curriculum making in the public schools... the existing program is always taken as the point of departure...Thus curriculum making becomes a process of accretion and elimination. There is little, indeed almost no movement under way in public schools to initiate curriculum making from the starting point either of child learning or of the institutions and problems of American life. For over fifty years, tinkering has characterized the attack on the curriculum. (426)
Miel's Definitions and Conceptualizations of Curriculum Development

Miel defined "democratic cooperation" as "participation all along the line - in planning, in execution, and in appraisal of results; it is not cooperation if it means you help me to achieve my purpose" (1938, 343). As for the concept of "curriculum" itself, Miel continued to revise and refine a definition throughout her career, but the definition that she had developed by 1972 was the one with which she felt most comfortable: "a set of intentions about opportunities for engagement of persons to be educated with other persons and with things in certain arrangements of time and space" (Lewis and Miel 1972, 27). Though originally influenced by Caswell's definition of curriculum as experiences undergone by the learner under the school's guidance, she was later informed by Huebner's (1966a, 1966b) notion of "opportunities for engagement" and felt that his definition was less ambiguous than one that attempted to grapple with "experience" (Miel 1994).

With regard to the concept of curriculum development, however, she emphasized separating out the idea of intentionality in a definition of curriculum. "When you see curriculum as a set of intentions," she asserted, "then curriculum planning makes more sense as an activity once you know your intentions, you can begin to think about the process of developing them into curriculum" (Miel 1994). Consequently, because the school curriculum is a "changing assemblage of opportunities for educative experience," with a number of elements that must be "ordered and reordered," the process of curriculum planning and development "is a process of making many kinds of decisions", such as what is to be taught, to whom, when, how, under what circumstances, and how are results to be evaluated, to arrange learning opportunities (Miel 1960, 115).

All curriculum decisions are governed by the basic values of the society and by the nature and scope of the responsibility which the community and the education profession have settled upon as appropriate for the school. In other words, those making curriculum decisions are working in a direction and within limits that have been agreed upon (1960, 116).

Miel continued, "It is the proper function of curriculum development to provide opportunities for experience which have educative potential for each student" (1960, 117).

Aspects of Curriculum Development

Clearly, Miel believed there was a "better way" to bring about curriculum change, first, by acknowledging that it is a type of social change.
Fundamentally, she argued that "the changes involved when the school curriculum is really modified are actually changes in the attitude and behavior of persons" (Miel 1946, 14). Most importantly, she believed that "a curriculum change has not actually occurred until it has been registered in the minds and hearts and habits of people" (1945, 189).

Miel also emphasized the social learning that took place through group efforts to effect change. She considered social learning to be "changes in understandings, attitudes, and skills that enable the individual to take a satisfying and useful place (in terms of democratic values) in the various groups with which he is associated" (Miel 1950-51). The overarching goal of social education was "democratic socialization of the individual, which is also a process for working toward the goal and which includes individuation and socialization as two sides of the same coin" (Miel 1950-51; see also Koopman, Miel, and Misner 1943; Miel 1949; Ambrose and Miel 1958). She asserted:

The first and most important trend in the modern approach to curriculum change is the group approach. Education is a group-linked profession. (Teachers') education must be continuous. If we want the effort of these people to add up, then we ought to find ways for them to plan together and pool their strength." Teachers must ask, "What is this job we are trying to do? How are we doing it? How could we do it better? Using the group approach, we can get more consistency. People will build with each other rather than canceling out efforts. We can get more richness because different people will be willing to pool their particular interests and strengths (1957, 7).

Miel drew from social theory and from educational and social psychology to support her emphasis on appropriate group processes that could eventually bring about curriculum - and, therefore, social - change. The "cooperative way," according to Miel, meant that the group "made plans together for experimentation with teaching smaller groups to be followed by exchange of experiences, evaluation of results, and planning of next steps. That is the way real growth takes place" (1938, 44; Miel 1994). Miel added that group processes themselves "must contain (their) own guarantees if (they are) to be judged sound and adequate" for planning change; the guarantees that she considered essential included security, individual and group growth, and accomplishment (1946, 21).

She addressed human motivation as a fundamental factor in processes of change, arguing the importance of the group setting goals for itself, articulating its own values in operational terms, and utilizing dissatisfaction in bringing about change (1946, 33). Miel outlined three essential conditions of effective group endeavor as well: organization and pur-
poseful participation, group solidarity and unity of purpose, and creative use of individual differences in a heterogeneous group setting (1946, 61). Additionally, Miel suggested that participants in the process of curriculum change operate continuously on the basis of new knowledge, with opportunities to "grow slowly and naturally toward new beliefs as the result of a series of experiences" (1938, 343); that "expertness" be developed along many lines and brought to bear on the process of change; and that educational leaders help to develop and extend techniques of group action (1946, 191; 1948, 300). Finally, she consistently stressed the obvious significance of time and freedom in a satisfactory process of curriculum development. She believed that participants must have sufficient time to work efficiently and to make progress, while they "must have assurance that they will be able to carry out plans that have been thoughtfully worked out and can be justified" (1948, 300; 1957, 7-10).

In broader terms, Miel's ideas on curriculum development suggested the reconfiguration of power relationships as decision making shifted to and diffused at the local school level. She maintained that "constructive social power" could be built in groups and individuals in order to "counteract destructive power tactics commonly employed by selfish or shortsighted individuals and interest groups in local communities" (1946, 191-192). Moreover, Miel stated that authority should be regarded "as something residing in a working group to be delegated to any and every person to whom it becomes desirable to assign responsibility" (1946, 192). She advocated the development of shared leadership "in every participant in the process of curriculum change, along with the ability to follow the lead of others" (1946, 192).

Some Implications of Miel's Work

Several characterizations and points of departure emerge from this account of Miel's approach to curriculum development. First, the essence of Miel's work in the curriculum field is an instance that curriculum must be developed at the local school level. This assumption clearly remains as problematic as it is true, partly because of the difficulty of defining and untangling the intertwined terms "curriculum" and "development." For instance, she appeared to understand "development" in at least two ways. On one hand, it consisted of the participants' agreement on topics, issues, factors in the environment, processes, and sources of ideas with regard to the curriculum. On the other hand, development meant the personal reeducation of the teacher.

Second, the curriculum becomes the teacher's meanings that guide his or her choice of emphasis, topic, time allocation, assignments, and so forth. Clearly, Miel believed that, if curriculum development meant the planning of learning opportunities, the most important factor was the
teacher. "If that person doesn't become possessed of some new understanding, and new skills," she argued, "then you have not changed the curriculum" (1957, 5).

Second, Miel's view of cooperative curriculum development implies that one of the great strengths of this approach is how it strengthens each member of the group, "leading to efficient results and being within the concept of democratic action" (1947, 398). Further, Miel argued that "people must be helped to see that new ways and ideas can usually be made to work if they are thoughtfully selected as the basis of group action and if enough attention is given to making them work" (1946, 19).

Third, through her emphasis on collaborative decision making that included the involvement and interaction of teachers, administrators, community adults, pupils, and "expert" consultants in education, she addressed the gap between educational theory and practice that has long existed. Through the processes that she advocated, participants could discuss questions such as, "What do we mean by 'theory'? Who holds it? Where does it come from? Why should we consider a particular theory? How do we decide what is needed and how to do it?" In effect, Miel implied that the involvement of various participants in the curriculum development process creates a relationship between theory and practice and allows that relationship to flourish. Furthermore, participatory democracy "lets people have experiences so that they will have something to judge with otherwise, there will be gaps in experience and practice when someone is trying simply to push a new idea through" (Miel 1994).

Fourth, Miel believed that her research and observations in schools helped to explain why such efforts often fell by the wayside in actual school practice: they were "empty of the people who will have to carry them out" (Miel 1994). She held out more hope for the success of "grassroots" reform efforts at the local school level than those designed by academic, business, or political leaders, but she acknowledged that teachers' efforts failed when "people got tired of working this way, lost patience, and decided to take a 'top-down' shortcut. It was quicker to tell people what to do - and to be told what to do" (Miel 1994).

Fifth, Miel admitted that the phenomenon of teachers in change posed its own problems, and that the "patience factor" was formidable in the curriculum development process. Her work continually emphasized that people need to feel comfortable with change, that much depended on how people built up their security and to what degree they felt their security to be threatened by change. For her, the advantages to working through group processes addressed these difficulties: she believed that working on problems "in the open" enabled participants to see evidence of "things that were not working," to identify changes that needed to be made, to "find like-minded people" with whom to work on particular...
problems, and, most importantly, to "move from mere griping to responsibility and action" (Miel 1994).

On the larger question of schools and social change, Miel did not see the school merely as a reactive institution or only as the target of social change efforts. Her conceptualization of the school's role was an active one, albeit indirect. She was influenced by Counts, Rugg, and other "social reconstructionists" in education and was informed by the stirring discourse in the 1930s on the question of whether the school dared to build a "new social order" (Counts, 1932). She did not, however, understand Counts to mean that people should have "ridiculous expectations" for the school to be directly responsible for social change. Rather, she claimed that the educational process - and the curriculum - should be "the beginning of helping children to understand social problems and to feel a responsibility for helping to solve them. If you have a curriculum where you're looking at community problems, drawing attention to certain issues, and helping children study them, you're already initiating a look at change" (Miel 1994). Moreover, addressing social problems was, for her, a natural outgrowth of the development of relationships between school and community. Schools were in a unique position to be influential, she posited, because they affected all children and their parents, and in many places one could see "shining examples" of education as a major factor in community solutions to problems.

Finally, all of the aforementioned implications of Miel's work are underscored by her firm belief that creativity thrived as groups worked together productively in the process of change, and that this type of creativity enhanced teaching and helped to accomplish social purposes:

Creativity is something where everybody puts in a piece and together we can create an outstanding educational program, which is our product. The children coming through it are not products. They come out of the process, but we don't fashion and mold them like clay. All we can fashion is opportunities for them to have experience and the guidance we give them in trying to get something out of their experience. Together the teacher and the educational leader can create a curriculum, an educational program that we can all be proud of. Working in some of these ways will mean that we can have many more people in our profession whom we can call creative (1962, 28).

he issues of cultural literacy and what Americans need to know have been two of the most controversial in American education. One of the leading advocates of cultural literacy, E.D. Hirsch, Jr., has argued that Progressive education played a major role in the demise of the teaching of history and traditional culture. Specifically, Hirsch targets creation of social studies. Social studies, Hirsch argued, contributed to the decline of history teaching, the loss of shared historical information and ultimately a fragmentation of our common culture. Earlier, however, Carleton Washburne, Superintendent of the Winnetka Schools from 1919-1943 and progressive educator, compiled a list of people, places, and events related to history and geography comparable to Hirsch's vision. The list was created in order to identify definable common knowledge that all students in Winnetka Schools must know to communicate effectively and for effective learning to take place.

Hirsch’s Criticism of Progressive Education

In his influential book, Cultural Literacy: What Every American Needs to Know, E.D. Hirsch, Jr. pointed directly to progressive education as the key factor behind the problems American students have with the subject of history. Hirsch charged that over the past fifty years, the faulty educational theories of Rousseau and Dewey have replaced traditional content-oriented curriculum by curriculum favoring abstract skills development. Specifically, Hirsch argued that these theories have led to the disappearance of history from the curriculum.

Hirsch argued that:

Believing that a few direct experiences would suffice to develop the skills that children require, Dewey assumed that early education need not be tied to specific content.
He placed too much faith in children's ability to learn general skills from a few typical experiences and too hastily rejected "the piling up of information." However, as Hirsch pointed out, "only by piling up specific, communally shared information can children learn to participate in complex cooperative activities with other members of their community."

Unfortunately, Hirsch contended, the faulty theories of Rosseau and Dewey have taken hold of American education and supplanted the focus on traditional content with a new focus on a variety of courses to meet the educational needs of the many instead of the chosen few. Hirsch saw the *Cardinal Principles of Secondary Education* as the vehicle for these changes. According to Hirsch, the aims implicit in the *Cardinal Principles* combined many new conceptions, but fundamentally they rested on the ideas of Jean Jacques Rousseau and John Dewey. Educators latched on to Rousseau's notion of the significance of first-hand experiential education over abstract bookish education. Hirsch noted those educators believed "the most appropriate replacement for bookish, traditional culture would be material that is directly experienced and immediately useful to life in society." According to this theory, history was a flat indirect subject without obvious social utility, which missed the dimension of direct experience. This view of history is precisely what Hirsch decried, claiming that history was pushed out of the American curriculum as soon as educators viewed it "as an indirect and inefficient means of achieving the social goals of inculcating the traditions and duties of Americans." He pointed out that social studies courses were directed to the activities of life rather than to the demands of any subject as a logically organized science. But since the application of social studies to the activities of life were infinitely various, different schools came to teach different sorts of information in them, and the transformation of history into social studies led inexorably to a lack of shared historical information.

Hirsch argued that the lack of shared historical information has resulted in a fragmentation of our common culture and a fragmentation of the American school curriculum. He admonished the educational community for not doing its fundamental duty "to teach shared content." He specifically blamed Dewey and Rousseau, but he generally targeted progressive education for this fragmentation. Hirsch believed that education professors and policy makers approved and adopted the theories of the progressive education movement, and as a consequence American education has deteriorated.

Ultimately, Hirsch blamed the decline of American education on our reluctance to decide "what knowledge is of most worth" to teach children.
He also pointed to the decentralization of the elementary school system itself. "Americans have hesitated to make a decision about the specific knowledge that children need to learn in school. Our elementary schools are not only dominated by the content-neutral ideas of Rousseau and Dewey, they are also governed by approximately sixteen thousand independent school districts." Indeed, Hirsch maintained that the problem was worse than it seemed. He argued, "the American curriculum is fragmented both horizontally across subjects and vertically within subjects. For one student in grade nine, social studies may focus on family relations; for another, the focus may be on ancient history." Moreover, just because a course shared the same name with a course in another school, there was no guarantee students were learning the same thing. Educational authority was in so many people's hands that it became hopelessly diffuse. Hirsch argued, "We have viewed this dispersion of educational authority as an insurmountable obstacle to altering the fragmentation of the school curriculum. We have permitted school policies that have shrunk the body of information that Americans share."

The problems also related to teacher education courses in which teachers were taught how to teach skills, and they in turn taught skills—not content. Hirsch expounded, "teachers are not expected to have mastered particular factual and traditional information of any special academic discipline; they are trained only to impart skills." The emphasis on skills over content was a monumental educational mistake: "To miss the opportunity of teaching young (and older) children the traditional materials of literate culture is a tragically wasteful mistake that deprives them of information they would continue to find useful in later life." Moreover, according to Hirsch, "the inevitable effect of this fundamental educational mistake has been a gradual disintegration of cultural memory, causing a gradual decline in our ability to communicate."

Hirsch believed that the ever-widening gap in our ability to communicate was the fault of progressive educators: He asserted "the polarization of educationists into facts-people versus skills-people has no basis in reason. Facts and skills are inseparable." Learning facts is an everyday activity for young people. They learn minute details concerning baseball, football, and basketball stars.

The old prejudice that facts deaden the minds of children has a long history in the nineteenth and twentieth centuries but it isn't facts that deadened minds of young children, who are storing facts in their minds every day with astonishing voracity. It is incoherence—our failure to ensure that a pattern of shared, vividly taught, and socially enabling knowledge will emerge from our instruction."
Hirsch suggested "a radical change in school policy," underwritten by a new 'corrective theory'—an anthropological theory of education based on the anthropological observation that all human communities are founded upon specific shared information." His theory for educational reform would 'break the cycle' of illiteracy by changing the fragmented curriculum to a unified, integrated one. In order to do this, American educationists must identify and define the common knowledge that is used every day in order to communicate, and then they must build a curriculum around it. As Hirsch stated, "the remedy must be to institute a policy of imparting common information in our schools." With that goal in mind, Hirsch collaborated with Joseph Kett and James Trefil on compiling a list, or index, of what the common reader should know.

Was Hirsch right in this assessment of progressive reform? The next section of this paper will consider Hirsch's accusations in the context of a representative progressive school district.

**Winnetka As a Model Progressive School System**

The Winnetka Public School System became nationally renowned in 1919, when Carleton Washburne became the superintendent of its schools. According to Washburne, the Winnetka Public Schools "became the first progressive public schools of the century and were known throughout the world for the effectiveness of their education." For the next two decades, according to Lora Townsend Dickinson, "Carleton Washburne brought the Winnetka schools national and international recognition as a center of progressive education." Many educators and scholars have recognized and singled out Winnetka and its school system as a national laboratory for educational innovation from the early 1920s to the early 1940s. For example, Lawrence Cremin pointed to 1919 "as the year that a relatively different venture in public school progressivism began in Winnetka, Illinois when Carleton Washburne assumed the superintendency of schools there." John Tewksbury, in his mammoth historical study of the Winnetka Public Schools, stated that "the Winnetka schools were unique, because they combined in one place so many of the new approaches to education developed during the first half of the twentieth century." J. Minor Gwynn underscored this belief when he stated, "Perhaps the most outstanding system wide movement in curriculum revision was that which was in operation from 1919 in Winnetka, Illinois." *The Encyclopedia of Education* (1971), in its article on the progressive education movement, called the Winnetka schools representative of progressive systems of the 1920s.
Washburne and the Social Studies

When Washburne took the helm in Winnetka in 1920, he encouraged the faculty to do research studies in order to change the social studies curriculum. At the same time, vigorous national criticism of the courses in the social sciences had prompted reorganization and research by other school systems. Noted educator Harold Rugg and his associates at the Lincoln School of Teachers College, Columbia University, had already begun to answer the criticism leveled against the existing social studies courses and the methods by which they were organized. Rugg's group had conducted investigations into what subject matter in science and social studies was essential to solving problems in terms of facts, concepts, and relationships, and proceeded to produce an experimental edition of seventh- and eighth-grade social studies pamphlets.

According to Tewksbury, "one of the principal features of the Rugg material was that information from many disciplines was integrated and presented to the reader in the form of units." Washburne shared the belief that a single course of study that would draw from history, geography, and civics would be superior to the existing one covering them as separate disciplines. According to Tewksbury, "Washburne was familiar with Harold Rugg's initial efforts and wanted to use Rugg's text material in Winnetka." The material for both grades dealt primarily with the major trends of societal development and were, according to Washburne, "an excellent beginning for a social studies course of study." Washburne and his staff adopted the Rugg materials for the seventh and eight grade as did hundreds of other school systems across the country, as soon as they were available in the early 1920s.

According to Tewksbury, "because of the availability of these materials for older children, and because of the dearth of the type of materials Washburne wanted for younger children, he decided to focus his attention on developing a social studies fact course for younger children." Washburne's faculty then formed a social science seminar in order to conduct research for creating a course of study in social studies for the first through sixth grades. Washburne said simply that these studies "had as their object the improvement of the content and the methods of instruction in the elementary grades."

Washburne's initiation of research to change and improve the social studies program generated virtually no controversy. The new faculty was familiar with the existing program and found it wanting. One of the many questions raised by the teachers concerning what they were teaching in social studies and the usefulness of the texts they were using was "Did the books contain, and did the curriculum call for the study of facts that the children might be expected to use frequently in the present, and in their later life?"
In an article in the *Journal of Educational Research*, Washburne explained and summarized the Winnetka social studies research. He stated that the entire study was organized around one question, "What notable places, persons, and events should be presented to children in the public school curriculum?" Washburne believed wholeheartedly in finding the answer to the question through scientific investigation. Moreover, he said, "the answer probably can be secured by scrutinizing the usages of intelligent adults. The children should be taught the facts which as a man he will need to know."

The scientific development of a curriculum was central to Washburne's philosophy, and for Washburne that meant a commitment to research studies. Ultimately, this was the underlying force behind his philosophy. According to George Thompson, "the social studies curriculum that was developed in Winnetka was radically different from the more traditional social studies curricula across the nation." Before discussing the details of the study produced by the Winnetka Social Science Seminar, it is appropriate to illuminate the unique component behind the research that served to make Winnetka's social studies course different from all others. Fundamentally, it was Carleton Washburne's philosophy at work.

**Washburne's Philosophy**

Carleton Washburne's philosophy was synonymous with the doctrine stated by his good friend and mentor, Frederick Burk, who held that "there is a body of common knowledge that must be learned one way or another, some time or another, if people of any culture are to exchange ideas, thoughts, and information." Washburne believed this doctrine to be a fundamental principle in education. When some progressive educators opposed this idea, Washburne explained that "if forced into a corner, they will grudgingly admit that of course there are some things that everyone needs to know."

Ultimately, according to Washburne, the progressive educators who were against learning facts, believed over time "that these things will be learned inevitably and incidentally just through living or when the need arises, if the child has skill in using reference material he can fulfill the need for himself." The reality was that these same progressive educators were afraid of falling back to old patterns. That is why, according to Washburne, "these educators warned against making lists of places or persons or dates or scientific principles that everybody must know that is what killed the joy of learning, what sterilized the educative process in the traditional school."

Washburne acknowledged "that the fear of a fixed, over-planned, stereotyped curriculum is a well-founded fear, based on past, and, too often, current practice in schools but the righteous revolt against this
practice must not carry us to the opposite extreme of planlessness and a failure to coordinate the work of successive levels."

On the contrary, Washburne argued that "part of the business of the schools was to find out specifically what the common essentials of communication and social interaction are." He argued further, that it was the job of wise and technically trained teachers to play a vital part in helping the child to select and organize those things which he needs and desires to learn," and to help him learn them. Washburne emphasized the importance of a common body of knowledge by describing the deficits one faces without it.

Without the common base of understanding and knowledge, expressible in a common language, self expression is thwarted. An individual has no sense of security... a realization of social integration cannot be achieved. The coordinated work, the specialization and exchange of labor that make society an organic whole, are impossible. Washburne was convinced that

Washburne maintained that students needed to have knowledge of the vocabulary of "common currency" found in the daily newspapers, in magazines, in conversation and in books. It is a vocabulary of associations or allusions, that we share with others in our society without which understanding is lost. Washburne elaborated, "If a person does not know whether Paris is a city, a mountain, or a river, he cannot read or converse intelligently with people who assume that he has this knowledge." In order to discover the requisite "allusions," students needed to know, teachers who formed the Winnetka Social Science Seminar surveyed periodicals to provide the necessary list of items. He stressed the fact that "since many writers of books also write for periodicals, the allusions in one are probably those of the other. The seminar therefore decided to investigate the allusions in periodicals."

**Determining the Program**

Crucial to interpreting the method that Washburne and his teachers chose to develop was an awareness of two underlying themes in his philosophy: his wholehearted belief that learning could not be left to purely incidental and haphazard stimuli and his sensitivity to the
importance of content as fundamental to creating a good program. Over and above these two themes was the one criterion used to plan systematically the curriculum and that was the criterion of use.

Washburne defined two uses of subject matter. He said, "one is the vocabulary use. To talk with each other and to read intelligently, we must be familiar with those persons, places, events, concepts and scientific facts to which common allusion is made." The second use that Washburne turned to was the ability "to have access in our thinking, and in our action based on thought, to those facts, relationships and concepts which have a direct bearing upon problems we are almost sure to have to help solve."

Both uses of information can be determined by research. Along with the criterion of use for subject matter there were two “sub” principles of Washburne’s educational philosophy that spurred this departure from the more standard approaches being used throughout the country. These two principles were: the principle of functionality and the need of an education for world-mindedness. Washburne’s most concise description of the principle of functionality is “we have no right to induce a child to acquire any knowledge, skill, or convention which we are not reasonably sure, from objective evidence, will be used by him.”

The first principle, functionality, was equally applicable to all curricular subjects. But the second principle, world-mindedness, applied particularly to social studies. Washburne believed in the interdependence of all human beings. According to Washburne,

The fundamental purpose of the social studies course was at all times to awaken children and students to the realization that we are all members one of another, that the long-run good of the individual is inextricably bound up with the long-run good of society. Society is not made up of isolated groups; it is an organic, world-wide whole.

Washburne was unequivocal when he explained that in preparing the social studies course, "one is not exclusively concerned with facts. The focus must be woven together in such a way as to produce certain desirable attitudes." He went on to single out two attitudes which he said were of primary concern when organizing the history work in Winnetka: "First, a depth of understanding of American culture and institutions, and second a breadth of understanding which will include America’s relationship to other nations." Washburne maintained that "a depth of understanding of our country necessitates a world background." He then named particular markers that explain the deep rootedness of American institutions. He argued that children must have an understanding of our American heritage from the philosophy of Greece, to the religion of
Judea, to the laws of Rome, to the discoveries of the Renaissance, to Anglo-Saxon struggles for individual liberty and the struggle for liberty of thinking that came later in the Reformation, to the ideals of the Pilgrims and the early settlers in America, to our frontier days, to the Declaration of Independence and the making of the American Constitution, to the industrial revolution as factories and machines began to replace man’s work, and so on up to the cementing of our nation in the civil War and to the problems of the present day. 49

Although Hirsch quarreled with progressivism in education, on closer examination he and Washburne, the consummate progressive, share many common beliefs. Both shared a belief in the importance of all Americans knowing a specific "critical mass" of information.

**Similar Methods in Developing the List**

The Winnetka Social Science Seminar that drew up Washburne's list comprised twelve to fifteen well-trained and experienced teachers who met once a week from September 1920 to May 1922 for discussion and research. Their work was funded by the Commonwealth Fund, a subsidiary of the Rockefeller Foundation. According to Washburne, "the group read 266 magazines and newspapers which represented eighteen different periodicals and which covered nearly every month of the last eighteen years."50 He further explained that "from these periodicals every allusion to persons, places, events, and dates was culled, with careful note of the place and date of its occurrence."51 The periodicals to be used were decided upon based upon the type of subject matter covered. According to Washburne,

Washburne explained further, "we chose about fifteen issues of each of these periodicals, three every third year, in such a way that one periodical or another covered almost every month of every year from 1905 to May, 1922."53 According to Washburne, "on our final list, we included only those names, dates, and events which occurred in more than 6 periodical-years."54 The Seminar also consulted the best authorities to reaffirm the importance of specific items. According to Washburne, "these authorities include some source materials, some works on recent
research in the field, and some advanced standard works, such as the Britannica. 

Tabulations on the number of these allusions most frequently written about were recorded, and the final list was created from this.

Hirsch, whose field is English, created his list with collaborative assistance from a scientist, James Trefil, and a historian, Joseph Kett. The Exxon Education Foundation funded the Hirsch, Kett, Trefil project. According to Hirsch, "each of them took the primary responsibility for developing the vocabulary [items] within his field, consulting numerous sources--indexes, reference books, textbooks, general books, magazines; one combed through a large dictionary page by page." The three also looked at each other's list and then submitted the final list to more than a hundred consultants. They also asked John Casten, then Secretary of Education of the Commonwealth of Virginia, dean of the Graduate School of Education at Berkeley, and Diane Ravitch, educational historian and professor at Teachers College, Columbia University, to examine and give suggestions about the list.

The Lists

Hirsch's list had 4,547 items on it, while Washburne's had 1,439. Washburne's list was compiled by using names of people, places, and events related to history and geography to which frequent allusions were made. Hirsch's list was compiled similarly, only he extended it to cover many other categories, including terminology related to science, economics, business, art, music, psychology, math, medicine, anatomy, literature, law, politics, and grammar. He also included foreign phrases, names of famous literary characters, book titles, song titles, names of myths and the gods associated with them, references to religion, holidays, geography, and famous sayings.

In order to compare both lists and to form a conclusion of just how similar the two are, given the seventy years separating their creation, I recorded all the items on Hirsch's list that covered the same categories as did Washburne's, up to and including 1922. My list included all religious references, U.S. holidays, geographic place names, and historical names. I eliminated terminology associated with the above categories not utilized by Washburne. Of course, a person's name, place, or event that occurred after 1922 was automatically eliminated as well.

Allowing for all of these delimiting criteria, I arrived at a reduced total from Hirsch's list of what knowledge is most worth knowing of 1,180. Matching these items to Washburne's list of 1,439 items reveals an amazing similarity. Almost sixty percent of the items on both lists is identical. Six hundred ninety-six of Washburne's items are on Hirsch's list of 1,180.
The similarity is evident in many areas. Both contain the same presidents, including Washington, Jefferson, and Lincoln. Woodrow Wilson was the last one Washburne included. Both contain the same battles: Waterloo, Lexington, Yorktown, Gettysburg, and Bunker Hill. Both contain the same cultural references: the Statue of Liberty, Wall Street, Uncle Sam, Union, Columbus, Valley Forge, Salem witch trials, Wright Brothers, Pilgrims, Monroe Doctrine, General Custer, Aaron Burr, Coney Island, Nobel Prize, Harlem, Federal Reserve, Benedict Arnold, Appomattox, and prohibition, just to name a few. Furthermore, both lists contain all of the states of the union, including Hawaii and Alaska and large cities in America and throughout the world, from Birmingham, Alabama to Baghdad and Bombay; from Nantucket and Nashville to Munich and Madrid; from Dallas and Des Moines to Dublin, Belfast, Peking, and Berlin. Hirsch's list includes more African cities and countries than Washburne's, undoubtedly as a result of national movements after World War II.

There is an additional duplication in items that name leaders or kings and queens such as Charles I, George III, Henry VIII, Louis XIV, Marie Antoinette, Robespierre, Napoleon, William the Conqueror, and Charlemagne. Hirsch and Washburne include the same references to music such as Beethoven, Bach, Brahms, Chopin, Liszt, Mendelssohn, Mozart, Schubert, Strauss, Tchaikovsky, Handel, George M. Cohan, Gilbert and Sullivan, and Caruso.

Religious references are another area in which the same names and terms are found. Both lists contain Abraham and Isaac, Jacob and Esau, Christ, Buddha, Confucius, Mohammed, Moses, Mormon, Moslem, Jew, Jesuit, Presbyterian, Catholic, Protestant, Quaker, Solomon, and the Vatican.

The greatest duplication occurs in two areas: names of countries and names of literary people. Here the scope is greatest, as well. Both lists contain countries ranging from Austria, Australia, and Japan to Ireland, Afghanistan, and Syria, and include such non-western countries as Ecuador, Guatemala, Peru, Costa Rica, Chile, Borneo; and cities such as Delhi, Cairo, Damascus, Alexandria, and Buenos Aires. The literary figures ran the gamut from Nathaniel Hawthorne to Oscar Wilde and from the Brontes to Alexander Pope. George Bernard Shaw, Henry Fielding, Flaubert, and Joseph Conrad are also on both lists.

Conclusion

Given the strong resemblance of both lists, it is apparent that Hirsch was too quick to condemn the progressive philosophy of education. Carleton Washburne, the most famous progressive superintendent of the era, followed almost the plan and method that Hirsch proposes for today.
Moreover, there was substantial agreement between Washburne and Hirsch in general beliefs. Essentially they both believed that there was a body of identifiable and definable common knowledge that all Americans must know. They both believed that the acquisition of this knowledge was critical in order to communicate effectively in society and for effective learning to take place. They shared in the belief that this knowledge can be taught systematically to all students.

In the final analysis, Hirsch acknowledged that schools need progressive methods coupled with traditional content. Hirsch's assertion is not a new idea; in fact it is an old, Progressive idea, and it is just as valid today as it was seventy years ago when expounded by Washburne.

his paper reviews much of the literature on the history of alternative and experimental programs in the public schools from 1900 to 1960 and sorts it into two main categories. The first contains histories or accounts of individual programs or schools, while the second includes histories of education in the twentieth century or the nineteenth and twentieth centuries. In general, there was an overwhelming concern with the Progressive Era, perhaps because there was little experimentation going on in the public schools after the nineteen thirties, although some of the sources point in different directions. There is little consensus in what I read on what “progressivism” meant and I will not enter the fray here. Progressivism generally was used to describe an array of trends and movements during the Progressive Era, from the late nineteenth century through the first two decades of the twentieth. Others would argue about the dates as well.

I first want to discuss two issues of definition, one being what “alternative” or “experimental” meant, and the other being when does a program cease to be alternative, especially if some of its precepts are accepted into conventional wisdom or practice. What was considered alternative or experimental in 1918 might look very different from an alternative program in the late 1950s. Therefore, I relied on the labels of the era or the labels others applied back towards the era. This seemed to work fairly well since by the turn of the century and certainly by World War One there was a consistent view and continued conversation about experimental schools and alternative methods of education. This was perhaps due to the reform focus of the times and the new sciences and experimental methodologies. Most of the conversation in the first three to four decades of this century centered on the Progressive Movement; indeed, it was difficult to find information on any alternatives that were not associated with the progressives.

The second question centered on when an alternative or experiment stopped being so. For example, when did kindergarten cease to be an alternative or experimental program and become an established part of
the public school system? Vocational education raises the same issues. Even though some experiments were never integrated in public schools at large, some of the attitudes and approaches tested during the Progressive Era have had a profound influence on how public schools have operated since. Several elements from that time continue today: the general disappearance of rote learning; the view of children as individuals having a variety of needs; and the use of projects, group work, life skills, etc. all continue in many elementary and high schools today. The long term effects of educational alternatives is perhaps one of the more tantalizing avenues for future research.

I looked only at public schools, as opposed to private, in part due to my own interests in improving public schools today, in part due to the complexities of innovation within public schools, and in part due to the relationship of the public schools to the society at large. Public schools are both a reflection of society and the main vehicle for producing members of society. There was a great deal of interaction between public and private schools during the Progressive Era, especially as reforms were promulgated, so the distinction may be in some ways an artificial one. What this paper will not deal with is the rhetoric about alternatives, the philosophy of schools or school reform, or the people who moved these programs forward. I am interested in the programs themselves, what they looked like, how they came about, and how they ended up.

Several different types of histories emerged, each containing several trends. Most of the writings on educational experiments and alternatives in the twentieth century deal with progressivism in some capacity. The first group deals with the effects and nature of progressivism in a general sense, and most of these writings are the larger histories of education, as well as some scholarly articles. The views range from that of R. Freeman Butts (1953, 591) who characterizes all of twentieth century as modern and sees American education as an experiment stemming from the Progressive Era to historians such as Newton Edwards and Diane Ravitch who consider progressivism a movement without a distinctive philosophy and with limited effects.

Within the study of the larger movement, however, there are several strands of research. The first deals with the various plans and programs developed during the first three decades of this century. Winnetka, Dalton, Gary, and others are the most widely studied and explored, although other cities and groups certainly disseminated information as well. At the same time, there are contemporary critiques of public education and examinations of innovative programs. Though not strictly history, the latter were generally written after the schools were started and serve to recount the events and circumstances of formation as well as describe the school or program as it existed. The following items fall into this category: Washburne’s writings on the Winnetka plan (1929),
Parkhurst’s description of the Dalton plan (1924), Agnes De Lima’s work on the state of experimental education in the late teens and early twenties (1926), and the Dewey’s account of experimental education (1915).

Finally, there is a group of papers on specific types of reforms or groups within the reform period. Centralization of districts, particularly urban districts, is discussed here as well, but I will not explore it in any depth as it lies outside the boundaries of this paper. A second set of articles deals with the role of teachers in the Progressive Movement. There is a certain amount of disagreement over how much teachers participated in the spread of progressive ideas reflected in these papers.

**Examination of the Literature**

Outlines and histories of the various plans and programs proposed in the early years of this century often began with those closest to them. Washburne wrote various accounts of the Winnetka plan (1929; 1932; 1963), as did contemporaries of the Dalton plan (Parkhurst 1924). The Gary plan, or platoon schooling, attracted great attention throughout the country and the world, and several pieces were written about it (Spain 1924; Flexner 1918; Bourne 1916; Bourne 1970). The plan attracted many people from across the political spectrum.

The other relevant type of account from the period was the review of educational programs and experiments around the country. Agnes De Lima’s collection of New Republic articles, Our Enemy The Child (1926), was by far the most complete. She spent several years tracking down programs, observing schools and classes, and interviewing teachers, professors, and students. Even with the author’s agenda, the book provides the only overview of the range of activities carried out during the 1910s and 1930s. Another broad review of programs is found in Schools of Tomorrow by John and Evelyn Dewey (1915). An example of a work on a specific program is Ellsworth Collings’ An Experiment with a Project Curriculum (1923), which examines the author’s own research in local public schools.

Current scholarship on these plans seems relatively sparse. There is an anthology of oral histories published in 1976, Roots of Open Education in America, collected by Ruth Dropkin and Arthur Tobier, but this work offers no analysis or contextualization. Carol O’Connor (1980) wrote a piece on the application of the Dalton plan in Scarsdale, New York. She concluded that this application, and others, helped set the standard for suburban schools from the 1930s onwards. Ronald Cohen described the Gary plan as an example of the growth and spread of a progressive educational program. He claims that aspects of the plan worked themselves into all public schools in the country over time. More recent work on the Gary schools includes Cohen’s Children of the Mill (1990).
Many authors look at the application of general ideas in a specific geographical area. McBride's article (1974) on industrial education in Massachusetts from 1900 to 1917 and James' paper (1988) on reforms in the Navajo schools in the 1930s fall into this category. Several dissertations look at the impact of progressive ideas in general and not necessarily at alternative programs. Among these are Getz's (1990) research on New Mexico in the 1920s and 1930s, part of Moyer's (1986) study of progressivism in Arkansas, and Link's (1981) investigation of rural school reform in Virginia, and Prewett's 1993 analysis of Alabama's educational efforts.

The disagreement over the role of the teacher in the Progressive Movement was the closest thing to a scholarly debate in the material. During the summer of 1967, two articles about the role of teachers in the progressive education movement were published in History of Education Quarterly. Gary Peltier wrote about the beginnings of the Denver curriculum revision program from 1922 to 1928. He saw the teachers as pivotal and the administration as facilitating the central position of the teachers in the reform process. In the same volume, William Issel looked at Pittsburgh and concluded that from 1904, teachers have played a major role in transforming the schools. The then newly formed Pittsburgh Teacher's Association pressured the administration and won reforms in setting up special schools for truants, instituting industrial education, reducing overcrowding, advancing public health, and implementing a school code.

In 1976, Wayne Urban reached an opposite conclusion after looking at reform movements in Atlanta, Chicago, and New York. Although Urban was looking primarily at centralization of governance, he found that organized teachers were neither educational nor political progressives. Teachers were often opposed to progressive reforms because they were more concerned with their economic well being and with job security.

Ravitch considered curriculum revision and the role of teachers and administrators in some depth in The Troubled Crusade (1983) and seems to agree with Urban. She generalizes about the curriculum revision process coming primarily from administrators who saw the progressive light and initiated a training program in their schools. Ravitch describes several accounts in which teachers resisted the changes and were fired for doing so. Her account of the progressive reforms and alternatives is one of the fuller ones contained in any of the general histories of education. Few of the volumes give more than a short section to the progressive educational experiments, let alone any other alternatives in U.S. public education.

In a very useful book, Tyack (1974) covers administrative progressives, who he says enjoyed a great deal of success in moving their reforms through the public school system. Tyack makes short shrift of
those he calls the libertarian or educational progressives, who "had little practical impact on urban schools" (196). Other authors sound similar refrains. Though Meyer gives a whole chapter to progressivism, he concludes that progressives played essentially a gadfly role. Only the best of their ideas were adopted by the slower moving public schools.

On the other hand, Butts, Edwards, and Ravitch assess the impact of the educational progressives. Their conclusions about the long term effects of the educational progressives revolved around four core ideas. First, progressive efforts broke the lock step of formalism and formal learning. Second, the progressive educators placed the needs of the individual child first. Third, they made educators aware of the importance of experience and purposeful activity. Fourth, they influenced the adoption of teaching methods and curriculum that stressed the importance of developing personality and improving behavior.

This is one of the more fundamental historical arguments about the Progressive Era and points in definite directions for future research. There remains a great deal more to be explored and explained in a number of areas.

**Future Research**

With regard to the direction future research might take, there is a fair amount of work to be done. The first area is to increase the number of case studies of specific schools, districts, cities, and programs. The second is to build on this work in the general histories. In many of these, there is little to be said about innovations in education. Although as one gets closer to the present, the chapters tend to get longer and more detailed. Within this framework I propose the following projects or areas of research.

First, there is some work on the administrative progressives, but less on the educational progressives. I do not want to confuse the matter here. I am not suggesting more work on the history of ideas or writings of the educational thinkers of the early twentieth century. I seek answers to the following questions: What kinds of programs were being tried in schools? How did they get into the schools; that is, who initiated them and who supported them? Did social, religious, and ethnic groups fight over curricular reforms in the same way that Mirel (1993), Urban (1976), and Shrader (1980) documented that they battled over administrative reforms?

Second, a great need exists for work on what reform programs of the Progressive Era were adopted and put into widespread use in other U.S. public school systems. How did these ideas spread? What were the patterns of their dissemination? O'Connor (1980) provides one of the few accounts I could find of the spread of one such program, the Dalton plan. She concludes that only wealthier suburbs could put these plans
into place. How true is this statement? Did urban districts attempt these sorts of reforms in the same way Mirel (1993) showed that Detroit adopted the platoon aspects of the Gary plan? Ravitch (1983) goes into some detail on the patterns of the spread of curriculum reform in her chapter on progressivism. More research is definitely called for. A follow up question would be the following: which of these ideas is at work today?

Third, there is a great geographic disparity in the research to date. The work has been concentrated on urban education, principally in the East Coast and the Midwest in large and well publicized programs. There is a need for research on alternative programs in the South and in the West, particularly in rural areas. If such programs did not exist in certain geographic areas, why then were they concentrated in particular places?

Fourth, the relationship between ethnicity, race, class, and experimental education needs to be addressed, as almost no research on this subject exists. Most questions in this area are rather basic. What was the relationship? In the 1970s and 1980s, the new and the alternative programs tended to be in wealthier districts. Was this true at other points during the century? There is some evidence to suggest that this was the case, notably the Scarsdale, Winnetka, and other suburban programs, but more research is needed to explore whether there is a historical pattern or if this is a recent development.

Fifth, whether alternative programs existed in the 1950s is a question justified by the lack of material on the period following World War Two. One gets the impression that with the death throes of the progressives, the alternatives stop until the late 1960s. Mitchell (1950) merely hints about this time period.

All in all, the possibilities are rich. I am particularly interested in the geographic question and in the post World War Two era. The beginnings of the civil rights movement brought in a number of changes. Accounts of new kinds of schools and education, such as Dropkin's, are fairly easy to find. What was going on elsewhere, outside of this movement, under the shadow of the McCarthy hearings and the dawn of the Cold War? This information is harder to find.

A specific project that would address both of these areas would be a look at a program in Holtville, Alabama covered by Life magazine in 1941 and a paragraph by Mitchell. The program had been established for ten years and representatives of all community organizations met several times a year to decide what share each organization, including the schools, was going to take in the solution of community problems.

In the larger picture, this could affect the assessments of such programs in the general educational histories. The Life magazine reference came from Ravitch and was in a footnote after a section on innovative programs. How innovative was it really and how uniform was the
group in which Ravitch placed it? What were the differences along many of the points I outlined above? There is a great need to press the issue of specificity of historical research on education, as Mirel did in his work on Detroit (1993), especially education in which there is a great deal of rhetoric and a deficit of underlying substantive research.
REFERENCES

any of us have learned to cope with Charles Dickens' historical dilemma of living through "the best of times and the worst of times." Where we seem to flounder is in "the in-between times." Our current turn-of-the-century anguish of knowing the "post" but not the "pre" threatens to elevate chaos, ambiguity, and arbitrariness to positive states.

Sixteen hundred years ago, in perhaps history's most dramatic time of inbetweeness, the Bishop of Hippo, Aurelius Augustinus, stood at the "Axial Period" of universal history--the sack of Rome. That "shudder which passed over antiquity" was the very watershed between the old and new worlds.1 Augustine, the postancient and premodern, was a central mediator in the transference of cultures and the transformation of ideas. An examination of his analysis of verbal discourse might demystify some of our inbetweenness as well as enhance our insight into public speech.

Like all seminal thinkers, Augustine was most puzzled by the taken-for-granted: the simpler the issue the greater the mystery. For example, take the mystery of memory.

When the memory itself loses something, as happens when we forget and try to remember, pray, where do we look for it, unless in the memory itself? And in it, if one thing is presented in place of another, we reject it until the thing we are looking for turns up. When it does turn up, we say: "This is it." We would not say that unless we recognized it, and we would not recognize it unless we remembered. Yet we certainly had forgotten it.2

But the greatest of all mysteries for Augustine was learning in general and the role of words in particular. Throughout his Confessions, Augustine charged that the Roman schooling he experienced as a student and a teacher was little more than "tongue science." Students practiced exercises in "smoke and wind" producing a "hollow verbalism" which tacitly denied the connection between words and things. Teachers were "sellers of words" and students learned only words about words. And the
words were like food in dreams—they had the appearance of reality, but without substance and nourishment.

In *The Teacher*, Augustine went even further:

> What I am above all striving to convince you of, if I can, is that we do not learn anything by means of the signs called words. For, as I have said, we learn the meaning of the word—that is, the signification that is hidden in the sound—only after the reality itself which is signified has been recognized, rather than perceive that reality by means of such signification.\(^3\)

He went on to say, "By means of words, therefore, we learn nothing but words; in fact, only the sound and noise of words."\(^4\) Augustine rejected the postancient virtual reality, which countered the Greek pursuit of the ideals of truth, beauty, and goodness with assertions of universal uncertainty. Roman education implicitly defined the real and the practical in terms of rhetoric and oratory. By the fourth century, the pursuit of the real had devolved into talk about the real; or finally, into talk about itself. This reified, verbal, virtual reality was the ultimate meaninglessness for Augustine.

Augustine identified the dilemma of "ex cogitate" as carrying the world within while endeavoring to go beyond it; ideas, those shadowy phantasms of images derived from experiences, had the capacity to extend beyond experience to imagination.\(^5\) Words, the signs of the shadowy phantasms, "serve merely to suggest that we look for realities."\(^6\) For Augustine, postancient education was signs about signs with little regard for any experience, lived or otherwise. Quoting Cicero, Augustine maintained that "the wise man should not be an artificer of words, but an inquirer into realities."\(^7\) The starting point for the quest for reality is experience.

The abstract theorizing of the postancient world separated the lived experience from memory and voice by means of words. Rhetoric and oratory divorced the shadowy phantasms from experience, thereby replacing meaning with memorization and mystery with superstition. For Augustine, such verbal/conceptual virtual reality was merely a juxtapositioning of shadowy phantasms in search of bridges, warrants, and relationships which were themselves abstractions. The resulting esoteric, gnostic cosmologies had difficulty with both mystery and rationality, but retained the faith that the universe could be condensed to human intellectual categories. Words became things and the map became the territory.

Words may have been inadequate for Augustine, but he did not deem them impotent. At the height of his professional/political career, the twenty-nine year old Augustine reached the depths of his intellectual/moral sensibilities; he was overcome by a "realisation of my misery. I
was preparing an oration in praise of the Emperor in which I was to utter any number of lies to win the applause of people who knew they were lies." Words can mitigate against insight because understanding can be "darkened or confused by zeal for vain verbal victory." His pride in verbal victories spawned a mid-life crisis and a return to experience rather than words.

When related to experiences, words have the power of "dislodging [the student] from his hiding place." Through the confrontation with experience, the student is "pricked by the sting of personal concern [so that] he may arouse himself." Fostering a confrontation with one's own experiences, words can awaken voice, but only as they resonate with experience.

In seeking the conceptual watershed between ages, ideologies, paradigms, or whatever, edges can be pushed for at least two reasons: one is to expand boundaries to encourage new beliefs, and the other is to move boundaries to marginalize opposing beliefs. Although a degree of both are at work among these two, most "post" movements seek to draw clear lines of demarcation between the old power and the new challenges. Therefore, boundaries which exclude tend to amplify negation; more is spoken about what is rejected than what is anticipated. Being controlled by what is reacted against can turn distinctions into differences and elevate abstraction over experience. Such "tongue science" culminates in a true-believerism of assertions rather than voice, discourse or public speech.

Our current age of inbetweenness reflects insecurities similar to those of Augustine's time. Postancient claims of universal uncertainty resemble the metanarratives of indeterminacy in that both assert the certainty of uncertainty. During such times, verbal signs or words take on a reality or life of their own; High Theory becomes reality and postmodern discourse inhibits public dialogue.

Although it is much easier to identify what postmodern theorists are against rather than what they advance, Jean Anyon has identified three generally agreed upon analytical heuristics: "the importance of the local, the validity of deconstruction, and the centrality of discourse." Despite its claimed centrality, the openness of and access to this discourse is problematic. How does this discourse differ from the abstract (virtual) verbal "realities" of Augustine's time or the privileged tone of modernist metanarratives of determinacy? Does postmodern discourse promote or retard contemporary public discourse?

Accepting Derrida's arguments that discourse/language does not reflect fixed meaning, postmoderns seek to free linguistic meanings from externals. Regardless of their opposition to the privileged discourse of modernist meta-narratives, postmodern theorists are dangerously close to a type of discourse which marginalizes sympathetic others as well as
potential publics. Susan Bordo noted that the slipperiness of some postmodern discourse can be maddening to many wishing to enter into critical dialogue.\textsuperscript{13} Even more serious than what might be excused as unintended marginalization is the use of language to create intentionally a very specific audience; purposeful exclusion is a limitation of public discourse. An example is needed.

The Summer 1994 issue of Curriculum Inquiry contained Stephanie Kirkwood Walker's review of Patti Lather's Getting Smart: Feminist Research and Pedagogy With/in the Postmodern and a response from Lather. Walker contended that although Lather "clearly understands the crucial role that 'access to discourse' plays in her emancipatory programs," her language has a "separatist tone" which denies access to all but those included in Lather's "exclusivist salon."\textsuperscript{14} The charge is that the form of discourse is at war with the supposed intent of the discourse; i.e., a discourse of emancipation which results in marginality.

In her response, Lather asserted that "developing a more 'flexible' narrative style that speaks to a broad based audience seems much less the answer than does using the site of writing to construct audience."\textsuperscript{15} Noting that Walker's concern is "widely shared by other reviewers: my use of dense language and an intertextuality so thick it borders on parody,"\textsuperscript{16} Lather further acknowledged that "my book works at one level to construct leftist theater for the consumption of the educated."\textsuperscript{17}

The issue raised by this interchange between Walker and Lather focuses on the role of discourse in the creation of public speech—or public silence. Walker asked, "Is her [Lather's] work an example of the inaccessibility of institutions of knowledge to marginalized groups who know differently?"\textsuperscript{18} The question raised here is broader than Walker's: Does discourse which creates exclusivist audiences contribute to the erosion of public discourse? Can the cacophony of private words culminate in public silence?

In a recent article in Teacher College Record, Thomas Green argued that public speech has deteriorated into silence. "And this silence, I think, has permitted us to engage in a flurry of deeply confused talk. Without public speech there is no public, only a babble of lamentations and complaints, pleadings, pronouncements, claims and counter-claims."\textsuperscript{19}

The constitutive nature of public speech presumes that the denial of voice both marginalizes and silences; where there is no dialogue and discussion, there is no public discourse. Furthermore, any type of listening which does not entertain "the speech of another as a candidate for one's own" thereby makes the other invisible, hence nonexistent.\textsuperscript{20}

While the exercise of personal voice may create a constituency or an audience, it may also serve to further diminish public discourse. Green noted that our current public babble has created a "culture of suspicion" wherein nothing that anyone says can make that person anything but an
"other." Green holds that we must move from the "culture of suspicion" through the "hermeneutic of suspicion," (recognizing one's personal history, biases, and preferences toward the "other") to the "hermeneutic of affection" with its intent to identify, share, and engage in public speech for the common good.  

Perhaps this "hermeneutic of affection" could replace the repressive public silence with a permissive private silence, a silence of personal experience and reality sought for by Augustine. "We are more charmed and arrested by that which we perceive in silence in our minds, and do not wish to be called off from it to the babble of words which fall far short of reproducing it."

Mentoring Students for Professorships

During the 1994 meeting of the Midwest History of Education Society, several members of the society at various stages of their academic careers agreed to discuss mentoring from a personal perspective. All set out to earn doctorates in anticipation of becoming university professors of education. Marie Hassett is a doctoral candidate in Curriculum, Instruction and Media Technology, Indiana State University. She is seeking a tenure track position while writing her dissertation, which she hopes to complete in spring, 1995. John C. Scott received a doctorate in Higher Education Administration from the University of Toledo in 1991. He teaches history and sociology at Northwest State Community College, in Archbold, Ohio, while continuing his search for a university teaching position. Maureen McCormack is a tenured associate professor in the College of Teacher Education at Eastern Michigan University, where she has taught for the past seven years. Since 1972, Gerald Gutek has been a full professor at Loyola University of Chicago, where he served as dean of the School of Education from 1979 to 1985. He was a co-founder of the Midwest History of Education Society. Joan K. Smith is professor of education and history, associate dean of the Graduate School of Loyola University of Chicago and past president of the Midwest History of Education Society. Lucy F. Townsend of Northern Illinois University organized the panel.

While it is a commonplace that everyone who makes it has a mentor, an article in the May-June, 1992 issue of the Journal of Teacher Education by Terry Wildman and others argues that researchers have yet to find compelling evidence that teachers need mentors. It is not even clear what the term "mentoring" means. Yet, doctoral students have limited prospects for employment in academe. In such a climate, older professors must play increasingly important roles in placing their graduates. For the purpose of this panel, the participants decided to apply the term "mentor" to professors who attempt to prepare their doctoral students for and assist them in finding employment in academe.

In an effort to more fully understand the role of mentors, each of the individuals on the panel answered two questions about having a mentor and being a mentor. The first question was the following: In what ways, if any, have your professors been mentors to you?
Marie Hassett answered as follows: Four persons have gone to great lengths to assist me in making decisions about teaching, research, and searching for jobs. Only one is on my dissertation committee, while another is at a different university. What has made them so helpful has been their willingness to give advice and assistance without also making the assumption that I am uninformed. Two professors contribute primarily to what I call my procedural knowledge base about university cultures and practices, and the other two focus on the conceptual knowledge that drives teaching and research.

The two faculty members who probably contributed the most to my awareness of issues in education have done so through informal contacts rather than in classroom settings. The professors have offices on the same corridor, and I can wander in and out to ask questions or join discussions. One professor frequently suggests that I read a specific article or book, probing my knowledge of a topic in discussion and cautioning me of potential problems in my research. With the other professor, discussion is more open ended and issue driven. I stop to talk to her about things that bother me in a class or in my reading, and we trade viewpoints. Both professors provided me with models of the professorate that I hope to emulate: their commitment to their students, to their own continuing growth, and to the growth of their profession.

I began working with my assigned supervisor almost three years ago while doing a study with another doctoral student on the communication skills of students in undergraduate teacher education programs. At the time, my supervisor was teaching the introductory course for our department. When the study revealed problems in students' communication skills, particularly their writing, I began working with him regularly to enhance the writing component of the course. At the beginning of this partnership, students had "lecture" days and "writing" days. Although we were trying to integrate the two components of the course, neither of us had done much team teaching, and we weren't sure how to proceed. Now we team teach two intermediate courses, working together to develop a syllabus, leading group discussions, and determining grades based on our personal observation and mutually agreed upon criteria. This experience has contributed greatly to my repertoire of teaching skills and my ability to work comfortably with another teacher.

I met the fourth professor at a conference last spring. He alerted me to two other conferences where I have since presented papers. A number of his former students, now professors, also attended those conferences. He has given me extensive advice about searching for jobs, about problems I'm likely to encounter, and about how I might make myself marketable. Spending time with him and groups of his former students is like participating in a seminar on every conceivable topic. This professor provides socialization into the profession.
Based on these experiences, I would define mentors as those persons who have contributed to my professional development and who have demonstrated ongoing concern for my success in academe. Mentoring relationships, which are personal in nature, strengthen my professional skills and commitment to the scholarly life.

John C. Scott answered as follows: At the University of Toledo, I specialized in history, a discipline in which few of my professors in the Department of Higher Education Administration had experience. They told me that it was nearly impossible to secure a tenure track position in higher education administration, which turned out to be true. They said they could not do much for me, but they are still supportive of me and believe that I can find a position.

My dissertation committee accepted my rather ambitious dissertation proposal and allowed great flexibility in my research methods. This is one reason I studied at the University of Toledo instead of an institution where my research agenda would have been constrained. Unfortunately, my doctorate has not yet proven valuable in the job market.

None of my professors have networked for my employment. No professor has ever helped me publish. Few students or older faculty in my department wrote for publication while I was a student. However, an educational foundations professor who did publish frequently told the class that he expected all written assignments to be of "publishable quality." This statement was a great revelation and spurred me to improve my writing. My dissertation was published by Mellen Research University Press in 1992.

My fellow doctoral students and I often felt "kicked around" by our professors. We came to the conclusion that holding a Ph.D. could be comparable to a fraternity membership and that the abuse was like hazing. I would advise professors to be more human and less professorial. They should encourage attendance at regional and national conferences and subscribe to The Chronicle of Higher Education, which lists jobs, conferences, and calls for papers. I would also advise professors to encourage their students to have some college level teaching experience before seeking employment. Lack of experience may limit their marketability. Probably just as important is publishing as soon as possible.

Maureen McCormack answered as follows: During the first semester of my studies in educational foundations, a professor who was not my assigned advisor said, "I want to be your mentor, so let's start today with lunch!" Six months later she resigned from my doctoral committee and in so doing also resigned as my mentor. The ending of that relationship was one of the most traumatic events of my life. I believed my mentor when she told me that if I stuck with her, my name would be professionally known and respected nationally in five years. At forty-
three years of age, I had missed the opportunity for what could have been a major advancement in my career. What went wrong?

The conflict began the night before my doctoral program review, when my mentor presented me with two volumes describing a large national grant she was directing. She wanted me to read the volumes prior to the next day's meeting, as she was going to propose that I work as her assistant. I told her I was not certain that I wanted to work in an area far removed from my research interests. The next day, at the program review, the other members of the committee objected to my working on the grant. However, my advisor said that I needed to make the decision. I declined the offer.

After the meeting I went to my mentor's office to show my appreciation for her interest in me. She pointed at a chair and ordered me to sit down. She then told me that she had made me an offer that could have made me famous within five years. She did not make offers to be refused. When I said I would be glad to work with her on another project, she said there would be no more offers. She was very angry. I was totally unprepared for it, and I began to cry. However, a few weeks later she told me she had an opening for a data collector on her grant. I met with her and agreed to travel to five cities to collect data. All went well on the first trip. On the second trip, one of the professional data collectors refused my offer of assistance, but after I had finished my own work and was scheduled to return by air to the university, the data collector suddenly asked for my help. I declined and took my scheduled flight home. Upon hearing about this decision, my mentor angrily told me I had "missed a golden opportunity." Again I was unprepared for her anger; however, this time I did not cry and stood my ground. However, in a few days she asked me to fly to another city and be away during the Christmas holidays. I refused, but no excuse or reason was good enough. My mentor said it was clear that I put my personal life before my professional life and that I would not go far! She said that I greatly disappointed her. After that, she made no more requests for my assistance.

When I learned that this woman was to be my professor for a required course, my anxiety began to mount. During the course she made a great display of throwing my paper across a large seminar table. She said I had not read enough, and she cited authors I had neglected. After that incident, I began to avoid her. Students assured me that this had happened to others. However, I grew increasingly depressed. How I could possibly pass my comprehensive exams with her on the committee? I began to consider withdrawing from the doctoral program, but another student who had worked closely with my "mentor" and knew of our conflict went to the department chair with the story. Subsequently, my committee met in the chair's office. At the beginning of the meeting, my
former mentor informed me that she was resigning from my committee. I was, however, asked why I had not stood up to her. I answered that my attempts made matters worse. The two of us were the same age and had rich educational histories; however, I was the subordinate, and I thought I was expected to act as such. The committee members stated that my response to my mentor had not been assertive enough and that my reactions to her behavior were inappropriate. Thus, they urged me to see a counselor. My former mentor insisted that I see her personal counselor, and after some resistance on my part, I finally agreed to do that. I was not surprised when the counselor advised me to seek assistance from a different counselor.

I was not wise enough to understand fully this conflict. I felt that it was inappropriate for my mentor to order me around, berate me, and throw my papers across a seminar table in front of my classmates. Yet the faculty women who met with the chair seemed to support the professor entirely and blame me. My confusion was intensified because the other professors were all females who called themselves feminists. I had assumed that our common commitment to women's equality meant that we shared the same humane values, but apparently I was wrong. For me, the doctoral process was one of almost constant anxiety and doubt, and I was vulnerable to discouragement and manipulation.

I think the process could be made caring and fair. Perhaps it would help to publish a handbook describing a doctoral student's rights and expectations. Certainly, much of the anxiety comes from rumor and from finding out too late that word had not reached you about some expectation. Most of the help and encouragement I did receive was from other doctoral students. They supported me in my conflict with my mentor and helped me to see that she treated other students as she was treating me. They also helped me find employment by explaining that the Chronicle of Higher Education lists job prospects. I scoured The Chronicle, found listings to which I applied, and was granted several interviews. One of the schools was Eastern Michigan University, where I am now tenured.

Some professors did assist me during my doctoral work. The greatest help came from a professor who advised me to seek out professors who would insist that I write. Another professor urged me to submit an article for a writing award and offered editing assistance. The worst mistake was not returning major pieces of writing. I think that dissertation advisors can be helpful if they take responsibility for seeing that the dissertation is completed in a reasonable amount of time. They might also help the student prepare the work or part of it for publication.

Gerald Gutek answered as follows: My mentors were J. Leonard Bates, who directed my master's thesis in history, and Archibald W. Anderson, who directed my doctoral dissertation in the history of education at the
University of Illinois at Urbana. I think my recollections are useful in illustrating how mentorship develops as a line of continuity. When I received my doctorate, the University of Illinois was well known for its Foundations of Education Program, particularly its progressivism and social reconstructionism and its work in consolidating what was called the social foundations of education approach. The essential pattern of doctoral study was to concentrate in an area of disciplined inquiry in educational foundations, such as history of education or philosophy of education; to develop a broad competency in the other related foundations areas; and to complement that program with work in an academic discipline. Anderson was my mentor, while professors Joe Burnett, William O. Stanley, and Harry Broudy took an active and highly supportive interest. They were all highly visible and active even though busy in the profession. For instance, Anderson was editor of *Educational Theory* and had been editor of *Progressive Education*.

The doctoral program was our mentorship for becoming professors. The courses required the writing of papers and their defense. The professors were close enough to the students to be imitated but distant enough so that we did not become familiar with them. There was also a kind of network operative in placing doctoral students. John Wozniak, dean at Loyola University of Chicago, needed a foundations person. Harry Broudy called him, an interview was arranged in 1963, I got the job, and I have been here ever since. What we can gather from my own mentoring? (1) The institution I attended had a good reputation in the area in which I was working; (2) the professors in the program were well connected professionally; and (3) the program was academically suited to replicate in its graduates the scholarly activities of its practitioners.

The second question has two parts. The first part is "Do you try to mentor your students?" The second part is "If so, how do you view your role?"

Maureen McCormack answered as follows: I'm not sure I am a mentor. I would say that I have a fear of expecting too much, and thus my relationships with students are marked by detachment. I do not choose this detachment because I am wise to the ways of Oriental philosophy; it is out of selfishness: it protects me as well as the student. I try to have an open door to all my students. Because I am concerned about the abuse of power, however, I begin by speaking about the power relationship between a professor and student. I do not invite the students to assist me in my work. While I share my research with them, I prefer to work alone. I ask them what they would like to do with their lives, and I try to give guidance as to academic and political processes that could be helpful to them. While I do see them outside of the university, such meetings are infrequent. I do encourage them to attend
conferences, give them leads, read their papers when asked, and occasion- 
ally write and present with them and encourage publication.

Gerald Gutek answered as follows: Directing doctoral students is 
something that I do routinely, but I really haven't reflected about the 
activity in a generalizable way. I followed the course that many young 
Ph.D.s take when hired by a university. I followed and implemented the 
U. of I. model. Loyola's Department of Education had been involved in 
doctoral level work since 1926, but primarily in educational administra-
tion and professional education. Although some candidates did histori-
cal or foundations dissertations, there was no specific foundations 
doctoral program. If such a program had been in place, I would probably 
have been an understudy for many years. As it was, I was able to take a 
key role in establishing the doctoral program in foundations in 1969, 
with the encouragement of the administration.

In the past thirty plus years, I have directed about sixty Ph.D. and Ed. 
D. doctoral dissertations to completion. The majority of these students 
have been school administrators, classroom teachers, university and 
college administrators, and other kinds of professional educators. I 
believe only about six have become professors. My doctoral level 
activities assume that I am preparing professors, but the results suggest 
something very different for the majority of people I have directed. 
Perhaps a leading question might be "Is a program designed to prepare 
professors appropriate for those who are unlikely to become profes-
sors?" Since the middle of the 1970s, numbers of professorships avail-
able in my foundations area have greatly declined. There are some jobs 
but many more candidates than available positions. Helping students 
find faculty positions in this very tight job market takes consummate 
political skills that I don't have. I also think it takes a kind of positioning 
in the national scene that only a very few schools of education occupy.

What contributes to my satisfaction has been a persistent belief that 
the history of education is a significant area to work in. Moreover, the 
knowledge and competencies that historians of education possess have 
both an applicability and intrinsic value that encompasses but also 
exceeds the utilization in a professorship.

Joan K. Smith of Loyola University, Chicago made the following 
statement: Mentoring doctoral students in the 1980s and 1990s has 
developed a character that is quite distinct from its earlier form, which 
lasted throughout the 1960s and 1970s. There are many reasons for this, 
including changes in affirmative action policies. While originally the 
mentoring process had been a more informal one in which the full 
professors worked through their informal networks to place their 
graduates in professorships, currently the process is much more formal. 
Today's mentors must be certain that, in addition to strong research and 
teaching skills, their new graduates are prepared for a rigorous inter-
viewing process.

Loyola students who want to move into foundations faculty positions within the higher education structure chose from four foundational areas in which to take courses: historical, philosophical, sociological, and comparative/international. Along with an appropriate research base, this path prepares students to meet a higher educational market that expects new professors to be able to teach general foundations while maintaining a foundational research specialty focus. As students are interviewed and accepted into the program, I try to discern what their goals are, so that I can guide them in the appropriate directions for attaining their destinations, given the foundations market in higher education.

Although Loyola's Ph. D. is defined as seventy-two hours beyond the baccalaureate, our students usually come to us with at least one earned master's degree. In preparing their programs, I try to keep in mind their professorial goals, their past work, and their academic interests and talents. These aspects become the framework for their program plan and for which three of the four foundational areas they enter, what research strengths and weaknesses they have in terms of their future research potential, and what kind of topics interest them for potential dissertation material. For example, let us take the case of student A, a thirty-eight year old, female high school English teacher, with a master's degree in curriculum and instruction that included some English and foundations course work. Her literary background becomes a useful context for her foundational study. She has an understanding of the structure and method of the English discipline, and she is attracted to historical and philosophical aspects of education. She is also interested in the sociopolitical dimensions of women's roles in education. At this point I would channel her in the directions of historical, philosophical, and sociological foundations. I would also ask her to start thinking about a dissertation topic vis-à-vis women and education, explaining to her that it is never too early to be thinking about possible dissertation topics.

As the student moves through the program, completing course work and taking comprehensive examinations, I continue to work with the student in developing a dissertation proposal that has potential for research, publication, and paper presentation. Regardless of whether or not the student seeks a Research I or II type of university or a small liberal arts college, it is important for her to maintain an inquiring attitude beyond the dissertation stage and to become active in professional and scholarly societies where foundations colleagues converse. As mentor, it is my responsibility to advise my students to participate in this larger academic arena, providing opportunities whenever I can. For example, I usually encourage them to start by attending regional conferences earlier in their programs. Because we are located in Chicago,
it is easy for them to participate in this way. By the time our students reach the dissertation stage, they have attended at least one regional conference: either the Midwest History of Education Society and/or the Midwest Philosophy of Education Society. Organizations such as the latter are also good places to begin the presentation of papers, because of the smaller, friendlier and more trusting nature of the culture. The society’s proceedings afford an excellent publication outlet. Studies continue to reveal that the sooner students incorporate research and publishing into their professional lives, the more likely they are to continue this activity throughout their careers.

Next, it is important for prospective faculty to gain some national and international convention experiences. There are numerous foundations oriented organizations whose conference formats allow for wide participation of their regular and student membership. These include the American Educational Studies Association, various divisions and special interest groups (SIGs) of the American Educational Research Association, the History of Education Society, and the Philosophy of Education Society, to name a few. At the international level, the Society of Educational Biography meets annually in a North American city and sponsors a journal entitled *Vitae Scholasticae*. The International Standing Conference on the History of Education meets annually in a European city. It jurors its published proceedings, and it also has several topical working groups that meet in conjunction with the main conference. These include the following: Education and the Enlightenment, History of Early Childhood, and Education and Gender.

As part of the mentoring process, I have also co-authored papers that were presented at various national and international conferences. When co-authoring I usually make certain that both of us contribute original work. If the paper is based on the student’s dissertation research, I usually provide the conceptual interpretive framework from an intellectual historical perspective. My name appears second on the paper. If the piece is part of my research agenda, my name appears first.

Finally, I try to arrange for the individual to have some form of formal college/university teaching experience. Loyola does not have teaching assistantships, but it does have opportunities for the part-time teaching of undergraduate foundations courses, including sections offered at night and on Saturday mornings. In today’s market, I think it is important for prospective faculty to have these teaching opportunities.

To date, our students who have actively pursued the professoriate or other university positions have been quite successful. Mobility is, of course, very helpful, even though there are many opportunities in the greater Chicago metropolitan area. Thus, while the mentoring picture has changed dramatically from the one of decades earlier, it is still an important commitment for professors to make to their students. Success-

---

---
ful mentoring seems to foster the future successful mentors who will be
needed if we are to keep foundations alive and well.

Editorial Policy: The Journal of the Midwest History of Education Society is devoted to the reflective examination of educational issues and problems from the perspective of diverse disciplines. With the Journal, the Midwest History of Education Society encourages communication among scholars of varied disciplines, nationalities, and cultures. Papers published in the Journal discuss comprehensive issues and problems confronting educators throughout the world.

The Journal has published authors from disciplines ranging from political science to philosophy to marketing to instructional technology to adult education. Its editorial board consists of a diverse group of professionals who referee articles according to their expertise. While the main criterion of acceptance consists in a well articulated argument concerning an educational issue, the editors prefer those papers that offer a historical analysis. Authors should contact the editor to receive a copy of the style sheet before writing the paper.

Articles published in the Journal do not necessarily represent the views of the editor, the editorial assistants, the members of the Society, or the University of Dayton. The authors of the articles are solely responsible for the accuracy and truthfulness of their work. The authors are solely responsible for ensuring that they do not infringe on copyright, violate any right of privacy, and do not use libelous or obscene language.

Articles appearing in this journal are abstracted and indexed in

Historical Abstracts and American History and Life.
Several people made possible this issue of the *Journal of the Midwest History of Education Society*. Dean Patricia First of the School of Education at the University of Dayton supported the project generously. The authors whose papers appear in these pages offered work of the highest quality. The editorial board and the associate editors worked diligently and carefully. Anna Victoria Wilson of the University of Texas at Austin set the format of the journal.

The *Journal* offers an important outlet for mature scholars and for students beginning professional careers. In these pages, as at the annual meeting of the Society, papers of all types appear together each reinforcing the other.

Development of the Music Conservatory in Europe and the United States

Tim Hays
Elmhurst College

Since its earliest organization during the Medieval epoch, the music conservatory has prepared students for careers in music. Reaching an apex as one of the symbols of cultural development for Western European nations during the late nineteenth century, this unique institution was reborn in the fertile soil of the New World. Beginning with a survey of the roots of music education, this paper will chronicle the development of seminal European conservatories and explore the influences that these institutions had on the formation of music conservatories in the United States.

Music has been a discipline of inquiry since ancient times. The systematic study of music has been linked to contrasting attributes such as emotional and spiritual expression or intellectual pursuits like geometry and astronomy. Music was included by Aristotle as one of the seven customary branches of knowledge necessary for education in the liberal arts. Through these influences music becomes codified as a requirement in the classical educational system of the Medieval and Renaissance periods, the quadrivium.

At its essence, music’s inclusion in the quadrivium was a humanistic and intellectual orientation to music education. Education for the performance of music was another matter entirely. Herein, an important distinction needs to be made. To use the language of the Renaissance, the humanistic study of music theory as a science was known as musica speculativa. This is to be contrasted with musica practica, the study of music performance, called applied music today. While musica speculativa was an integral part of a Renaissance liberal education, musica practica was often not included, and in some cases, was looked down upon. Knowing this, it is not that surprising that the first school for the study of music performance did not occur at one of the venerable European universities, but rather at an institution known for its practicality.

The first music conservatories developed from hospital asylums, or ospedali, for orphaned and illegitimate girls in Italy. The oldest of these institutions were in Venice (Ospedale dei Mendicanti, 1262; Ospedale della Pieta, 1346), but the name "conservatory" originates from the name given these institutions in Naples: "conservatorio" (Conservatorio Santa Maria de Loreto, 1537). The rationale for this name is cited in The New College Dictionary of Music. "In Italy a conservatorio was originally an orphanage, where children were ‘conserved’ and given an education with emphasis on music." Funded by charity, the ospedali provided girls with vocal and instrumental training and gave regular public concerts. The public supported the ospedali due to the immense popularity of these concerts and because the best of these trained musicians went on to staff the orchestras of the burgeoning opera movement, all the rage throughout the Italian provinces.

The abilities of the girls of the four Venician ospedali were particularly celebrated. After a concert at the Mendicanti, Jean Jacques Rousseau was so compelled to meet the singers that he broke church rules to do so. In 1784, Goethe exclaimed that he "never imagined such voices could exist," upon hearing the Mendicanti. During the seventeenth and eighteenth centuries, Italy’s most famous composers--Monteverdi, Cavalli, Lotti, and Galuppi--taught at the ospedali and wrote music for their ensembles: choruses, orchestras, and chamber groups. The most famous composer of the period, Antonio Vivaldi (1678-1741), was superintendent at the Ospedale de Pieta in Venice and premiered nearly all of his non-operatic music using ospedali musicians.

About the time when the ospedali were fading (during the reign of King Murat, under Napoleon) another, far more professional model of the music conservatory was beginning its influence. The Conservatoire National de Musique was formed on August 3, 1795 by decree of the Convention Nationale. While the forces which gave immediate genesis to the Conservatoire were wrought during the French Revolution, there were a number of institutional antecedents relative to schools of music. During the seventeenth and eighteenth centuries, wealthy French nobles supported teaching academies connected with the musicians engaged by the courts. While these small academies served the purpose of providing musicians for the courts, "their pedagogical importance was perhaps negligible." However, a few of these academies went on to achieve a more privileged position.
The Modern European Music Conservatory

The most immediate precursor to predate the founding of the Paris Conservatoire was a school of sorts that was connected with a band that was engaged by the Municipality of Paris in 1790. Titled Ecole gratuite de Musique de la Garde Nationale Parisienne, the school was the seed for the founding of the Conservatoire during the revolution. Given the climate of the times, it comes as no surprise that musicians were expected to take up the cause of liberty. The republicans, and specifically, the Committee of Public Safety, posted musicians on street corners to teach revolutionary and patriotic songs to the people. In a report (1796) to the legislative body, citizen Lockpeiser sets out the purposes of the young Conservatoire, which is to provide musicians for national holidays and celebrations "as prescribed in the Constitution," supply "the Government with musicians for the armies," and maintain the "lyriques theatre." The report goes on to posit that the Conservatoire needs support since it is the only music school in France and will further "national glory."!

From the beginning, the Paris Conservatoire was administered under strict guidelines approved by the government. The French talent for bureaucracy, which had produced the most powerful army in Europe, was applied scrupulously to the Conservatoire. It was funded by the National Treasury; instruction was free; salaries were fixed by the state; and the number of teachers and students per department was predetermined. The educational philosophy of the Conservatoire can be expressed in two guiding principles which shaped the curriculum: (1) emphasis on individual competition, and (2) progress and accomplishments measured against strict predetermined standards. Individual competition was assured through the prize system in which students performed for a faculty jury at public competitions. The winners (first and second only) were awarded instruments, books, or printed music. Failure to win a prize after three years of study meant dismissal.

Regarding the second principle of strictly imposed standards, the curriculum developed to require prescribed tracks for the study of voice, keyboard, and orchestra instruments, with heavy early emphasis on sight-singing (solfege) for all students. Music theory, orchestration, composition, and ensemble performance were major subjects of study. However, most students concentrated on applied music, particularly piano, violin, and voice (1850). There existed four "degrees" of study through which a student progressed. The first three were pure music, but the fourth had some minimal requirements in science, mathematics, and philosophy. In the broadest scope, the Paris Conservatoire offered a complete music education to the student. Its world-wide reputation grew as it set up twenty-eight branch campuses (1957) and its alumni went on to success in the concert halls: Berlioz (awarded the prestigious Prix de Rome), Bizet, Debussy, Dukas, Faure, Massenet, Ravel, and many others.

Given the musical legacies of masters such as Bach and Handel, it seems strange that a full scale music conservatory did not develop earlier in the German provinces. For centuries, the courts of the German states (particularly the Prussian courts) and churches had sponsored music to a level surpassing all other European patronage, except perhaps Italian. Vienna, particularly, seemed ripe for such an institution, given its favorite sons during the late eighteenth and early nineteenth centuries: Haydn, Mozart, Beethoven, and Schubert. And in fact, a Viennese school for children was founded in 1812. Gesellschaft der Musikfreunde grew to include an Opera School and Dramatic School and had a wealth of famous alumni and teachers associated with it, names like Bruchner, Mahler, and Hugo Wolf. Still, this school was not a professional conservatory in the manner of the Paris Conservatoire. The next European and first German institution that was comparable was the Leipzig Conservatory, founded in 1843.

The city of Leipzig had a considerable tradition of music activity to make it a logical choice for a major conservatory. There was the renowned Lutheran church, the Thomasschule, with its list of important cantors, including J.S. Bach. There were a major publishing house, an influential music periodical called Allgemeine Musikalische Zeitung, and an established concert series centered around the performance venue, the Gewandhaus. Two months before the coronation of Frederick IV of Prussia in 1840, a citizen named Blumner bequeathed 20,000 thalers to endow an institute for the arts. Composer-conductor Felix Mendelssohn (1809-1847), a favorite at the Gewandhaus series, then sought support for such a venture from the Dresden court in a lengthy letter which appealed to the state for support.
The King expressed his support for the project since it would bring more glory to Saxony, and added his financial backing. Das Conservatorium Der Musique opened its doors on April 3, 1843 due to tireless effort on Mendelssohn's part. Notable teachers were Hauptmann on counterpoint and harmony, Robert Schumann (1810-1856) on composition and piano, and Mendelssohn himself, who refused the directorship yet continued to help guide the Conservatorium until his death in 1847. Leipzig Conservatory historian, Leonard Phillips, states that the "Paris Conservatory was an impractical model for Germany," but the "scope and vigor of the school, together with its place in the French government" had a significant influence on the founding and the scope of the Leipzig Conservatorium.

While the Conservatorium's curriculum evolved to include many of the subjects taught at the Paris Conservatoire, there existed distinct differences in pedagogy. While the Paris Conservatoire continued the tradition of individual instruction that predated any conservatory founding, the Leipzig Conservatorium also used class groupings for applied lessons, music theory, and other subjects. Eschewing the Conservatoire prize system of applied instruction, the Leipzig Conservatorium emphasized a unified view of music over the extremely technical approach of the French. As with the Paris Conservatoire, the Leipzig Conservatorium expected students to complete their general, liberal education elsewhere, either before or during their conservatory study.

Four principles guided the new Conservatorium and set it apart from other similar institutions, particularly the Paris Conservatoire. (1) The faculty members were successful musicians of note and were expected to continue their professional careers while teaching. (2) Nationalism was not overtly emphasized and foreign students were welcomed. (3) A broad music theory foundation was required of all students. (4) There was no contest or prize system characteristic of the Paris Conservatoire and other European conservatories to come. As will be demonstrated, these principles will later be attributes associated with the first conservatories established in the United States.

As the nineteenth century progressed, the Paris and Leipzig conservatories grew in stature and influence, while a number of new conservatories were founded throughout Europe. Most, like the Prague Conservatory of Music (1811) or the Imperial Conservatory of Music at St. Petersburg (1862), were national adoptions of earlier, private music schools. A few were the enterprise of a single architect. The Budapest Academy of Music (1875) was founded due to the singular efforts of pianist-composer Franz Liszt (1811-1886), who played a series of concerts to endow the first conservatory in Hungary.

Some institutions were the direct result of charters originated at the highest level of state. Belgium's Conservatoire Royal De Musique (1832) in Brussels or the Royal Academy of Music in London (1822) as chartered by King George IV are examples of conservatories originating with royal patronage. Given the multitude of British linkages with the United States, one might be inclined to surmise that the Royal Academy could provide a model for music conservatories in the United States. This is not the case. Perhaps this is because nineteenth century England serves up little in the way of significant music, or maybe it is as American Allen Sigel later critiques in regard to the climate for the Royal Academy's financial foundation (1968), "The lack of financial support was overwhelmingly apparent. Many of Britain's finest musicians have refused positions here because of inadequate remuneration and poor facilities."

Rather than the Royal Academy or even the Paris Conservatoire, the nineteenth century institution of influence for music in the United States was the Leipzig Conservatorium. This is due to a host of factors. To begin with the most sweeping influence, the waves of immigrants who came to America following the European political upheavals of 1848 included many professional musicians and artistic-minded people who strengthened the German orientation of American cultural life. The German models of education -- the gymnasium, the university, and the conservatory -- became increasingly prominent in American educational thought.

Regarding music, Germany was, after all, the wellspring of great music and famous composers. The city of Leipzig's claim to Felix Mendelssohn, a composer of immense popularity in the United States, had already made it a mecca for music students and music lovers, even before the founding of the Leipzig Conservatorium. It is not surprising, then, that Mendelssohn's own institution was viewed with special reverence. American born students who studied at the Leipzig Conservatorium were admitted to the ranks of the United States' music elite, and Europeans who journeyed to the New World with this pedigree enjoyed immediate prestige and success as performers. Leipzig's alumni went on to further both the reputation of the Conservatorium and the popularity of German music in general. While this synergy of influence may appear unusually focused in its locus on a single city and its school, the overall European domination of all things musical
in America had certainly been the norm for centuries. Before reflecting on the genesis of American conservatories and their European connections, it is necessary to provide a context for music-making and music education in the New World.

Music in the New World

From the public records available, the first publicly announced concert in the colonies occurred in December of 1731 in Boston, a direct result of the energies of music and performing arts societies that began to form in the colonies in the middle 1700s. While Boston does dominate the literature regarding early concert life, there also existed plenty of activity in the South and Middle Colonies. There was the St. Cœcilia Society (1732-1765) in Charleston, the Francis Hopkinson Society (1757-1776) in Philadelphia, and the Ranelagh Garden concerts (1733-1760) in New York. While it was not yet the practice to publicly announce the program, European music most certainly made up the performance pieces. Concert societies go on to figure highly in the cultural life of the United States after the Revolution and in the founding of America's first music conservatories.

While the motivation guiding the early concert societies was to bring European culture to the wilderness, the first music education efforts were not so secular in design. The singing school movement spread from its beginnings in New England throughout the colonies. It did not diminish until oratorio societies began to replace it and music education in the public schools began to enter the culture during the second half of the nineteenth century. Lowell Mason (1792-1872), prodigious composer of hymns, method books, and alumnus of the singing school movement, became president of Boston's Handel and Haydn Society and founded a singing school for children, the Boston Academy of Music (1832). Like the first European efforts, this academy was not a full-fledged conservatory, but its precedence set the stage for a number of new developments.

Chief among these was the first inclusion of music instruction as a requirement in the public school curriculum. Mason argued that music literacy was an important skill that could and should be taught in the Boston schools. After a series of highly successful experiments at various schools, the resulting concerts paved the way for what the Boston Academy called the "Magna Carta of Music Education." The Boston School committee made music a regular part of the curriculum on August 28, 1838 and appointed Lowell Mason Superintendent of Music. The year before, Mason had journeyed to Germany and Switzerland to study Pestalozzian methods and went on to create a significant body of educational materials and books based on Pestalozzian principles. In fact, the Pestalozzian method "became so closely associated with perceived excellence in music education that the name became a generic term that implied quality but not necessarily authentic Pestalozzian.'

The Music Conservatory in the United States

The public school initiative was but one of a number of factors that created the climate for the founding of America's first conservatory in New England. By the middle of the nineteenth century there existed a Philharmonic Society (1810), which sponsored the first orchestra concerts; the Harvard Musical Association (1837), the Handel and Haydn Society, which sponsored oratorios; and a number of other musical associations. Eben Tourjee, the "New England Psalm Singer" and another alumnus of the early singing schools, received a charter to found "The Musical Institute" from the State of Rhode Island in 1865. Tourjee had visited music conservatories in Paris, Leipzig, and Stuttgart and sought to establish the first American conservatory of music in Providence.

Six years later Tourjee moved what is now called the "New England Conservatory" to Boston. The new Conservatory received a lot of public attention when the Peace Jubilees of 1869 and 1872 utilized many Conservatory musicians for performances with popular conductor-composer, Johann Strauss. While the institution's curriculum provided essentially music courses vis a vis the European conservatories, it added departments of "Elocution, Art, Literature, Languages, Tuning, and Physical Sciences" by the turn of the century.

Depending on the source, the Oberlin Conservatory of Music is either the first or second conservatory in the United States. (Some sources have the New England Conservatory founded in 1867.) In any case, Oberlin College, Ohio does boast the first American college appointment of a music professor with a Professorship of Sacred Music, established in 1835. Although not an official part of Oberlin College when the conservatory was founded in 1865, the Oberlin Conservatory of Music was the outcome of decades of musical activity at the College. The influence of the Leipzig Conservatorium figured highly in the curriculum at Oberlin since one of the two founders, John Morgan, had studied at Leipzig. The other founder, George Steele, succeeded Morgan as Professor of Music and went on to study at Leipzig before
taking the over the reins of conservatory administration.  

The other two early American music conservatories are the Cincinnati Conservatory of Music, developed and operated as the property of German pianist Clara Baur (1835-1912) in 1867, and the Peabody Conservatory in Baltimore. Although conceived by benefactor George Peabody (1795-1869) as early as 1857, the Peabody Conservatory did not open its doors until 1868. Peabody, a self-made Yankee millionaire, was a magnanimous and avid promoter of higher education and artistic culture. He lamented the paucity of such activity in the New World. His many European travels led him to believe that the most retarded aspect of the United States lay in the arts, since the American people "would hang with ecstatic [sic] delight upon the miserable melodies of Foster, while the florious [sic] and seraphic outbursts of Mozart and Beethoven would remain unheeded." Peabody's considerable endowment and his vision for a complex that would include a library, a music academy, and an art gallery were without precedent in the United States. Johns Hopkins University, with which the Peabody Conservatory later became affiliated, was also inspired by Peabody's ideas.  

Given the antecedents of Peabody, Oberlin, Cincinnati, and New England, a number of other music conservatories such as the Leipzig-influenced Chicago Musical College (1871; now part of Roosevelt University) emerged by the late nineteenth century. So, too, did the study of music enter mainstream higher education with a key precedent being the appointment of John Knowles Paine as the first Professor of Music at Harvard in 1862. Given the prominence of music (musica speculativa) as a liberal art in European Universities, it seems surprising that its first appearance in the curriculum of the American college takes more than two hundred years after Harvard's founding (1636).  

Why is music the sole liberal art, of the seven arts and sciences, that did not find a place in the curriculum of the old-time American college? Scholar Maurice Faulkner argues that, while both institutions had music professorships, Oxford and Cambridge (unlike other European institutions) tended to conceive of music in terms of extracurricular activities, such as student music societies. Given the domination of the English higher education model on the formation of the colonial college, one might expect music to appear solely in the extracurricular offerings at Harvard, Yale, and the other early schools. And, indeed this is the case.  

**Toward an American Music Conservatory Model**  
Like the other United States music conservatories, the Peabody Conservatory transformed the European model as it was transferred to America. The European systems of state and church agency did not exist in the New World, so private endowments and tuition support structures were needed. Moreover, given the nature and the conditions of American culture, it is not surprising that the music conservatory as an institution changed as it adapted to the new soil.  

In founding his conservatory, Peabody was acutely aware of this. He not only advocated a more humanistic orientation to the study of music but also saw the primary purpose of the conservatory as a vehicle for educating the populace, in addition to fulfilling the strictly European mission of training virtuosi. Very early on, the American conservatory curriculum began to reflect this humanistic orientation by requiring humanities and sciences not found in European conservatories, and later by granting baccalaureate degrees. Eventually, nearly all American conservatories became associated with colleges or universities.  

This link is in direct contrast to European conservatories, which remained independent of the university. In 1966, American researcher Allen Sigel studied six important European conservatories in an effort to draw comparisons with university and conservatory music programs in the United States. There existed strong similarities among the European conservatories. All were state supported institutions that possessed a vocational mission of training performing musicians, for which only diplomas were granted. Intellectually and physically isolated from the degree-granting universities, most conservatories shared common types of curricular structures.  

Sigel also found that the "old schism" was still in force: applied music at the conservatory and the purely intellectual study of music, now called "musicology" (the theoretical, scientific, and historical study of music), at the university. The classical division between musica practica and musica speculativa was still the modus operandi of modern European music education. By contrast, the United States music conservatory currently includes many salient features of a liberal education as well as requiring musicology as a curricular cornerstone. Moreover, music degree programs at American universities require considerable applied music in addition to musicology.  

In closing this study, four conclusions can be reached. First, as described by Sigel and developed in this paper, a common model of the European conservatory does seem to exist. While each conservatory may possess a singular genesis,
their missions, curricula, and support structures are much alike. Second, when organized music performances and, later, music conservatories originated in the United States, it was through the German influence of immigration and Americans who studied in Germany. Third, due to the sheer number of Leipzig alumni who go on to teach and perform in America, the European conservatory of most influence in the United States is the Leipzig Conservatorium. Finally, the European conservatory changes considerably as it is transferred to the New World. It remains private, develops an affiliation with the university, and broadens its curriculum to include liberal studies. Most importantly, the American conservatory possesses a more holistic view of its students and of music itself. Musica speculativa and musica practica are, in a sense, fused in an educational mission that is humanistic as well as professional.

In contrasting the European approach with the American, Sigel finds a fundamental divergence. "The striking difference between the philosophy and the humanistic concept of American universities is evident. It is also increasingly obvious that in most American institutions of higher learning, including conservatories, a tremendous effort is being made to weld professional and academic education and, in the process, create a stronger, more viable basis for comprehensive musicianship and scholarship." In adapting to the conditions of the New World, the music conservatory changed, and in doing so, it has gone about the task of mending an ancient rift in the conception of music education itself.

Colonial Evening College Provisions

Huey B. Long
University of Oklahoma

University extension and evening college programs are modern educational provisions that emerged during the final quarter of the nineteenth century. Such a view of the urban American college (university) fails to recognize the responsiveness of some of the earlier colonial institutions to social and economic change. King’s College (Columbia) and the College of Philadelphia (University of Pennsylvania) provided an array of educational activities in the late afternoons and evenings as they shifted from the classical curriculum to more practical instruction. Failure of educational historians to recognize the eighteenth century college provisions contributes to an incomplete perspective of the early American college scene. Bailyn blamed the oversight among earlier educational historians to a failure to grasp the role and relationship of education to the pre-revolutionary society. Cook notes that there have been few investigations of how and why evening classes appeared. Others such as Bailyn and Hofstadter and Metzger have encouraged studies of the kind reported here to address the neglect of the eighteenth century American college.

While it should be obvious that the evening and afternoon education activities of King’s College and the College of Philadelphia did not perfectly reflect the evening college as known in the twentieth century, it is equally clear that they reveal some historical similarities. First, the lectures, some of which are identified later in this paper, were made available by experts at hours that facilitated attendance of individuals who had matriculated in the regular college curriculum. Second, as a consequence of the timing, they attracted participants who were engaged in the world of work. Third, the lectures represented some kind of innovative approach in the delivery of education services.

Bailyn suggests the College of Philadelphia, beginning about 1760, purposely and innovatively approached the college curriculum. In contrast, it appears that the evening provisions at King’s College were less deliberately associated with a curriculum theory or philosophy. All of the reasons for the efforts to provide an education that differed from the classical approach of Harvard and Yale are not clear at this time. Some of the justifications are revealed in the philosophies of individual supporters such as Benjamin Franklin, Benjamin Rush, and William Smith, when he was an advisor to Samuel Johnson in New York. Johnson and Smith may have indirectly contributed to the attitudes favorable to the medical lectures at King’s College. Furthermore, it appears the introduction of the medical instruction at both schools was the result of the great interest of physicians such as New York’s Bard, Clossy, and Jones, and Philadelphia’s Morgan, Rush, and Shippen. Both Smith and Johnson seem to have been aware of the implications of the momentous changes taking place in science and commerce for the college curriculum and the hours of instruction. Smith and his colleagues in Philadelphia were more direct in espousing a curriculum that, according to Hofstradter, Miller, and Aaron, featured everything that is useful and everything that is ornamental. "King’s College... advertised that while teaching of religion was its principle objective, it is further the Design of this College, to instruct and perfect the Youth in... the Arts of Numbering and Measuring, of Surveying and Navigation, of Geography and History of Husbandry, Commerce and Government."

While this writer has been unable to identify any specific comment on the college schedule attributed to the three college presidents during the time period studied, other evidence concerning their philosophical orientation is available. For example, had any one of the college presidents objected to evening instruction, it is unlikely the proponents would have prevailed. Second, while neither Cooper nor Johnson appears to have been as enthusiastic about science as Smith, who championed the establishment of the American Philosophical Society, Johnson reveals an awareness of the idea of knowledge obsolescence. He also supported the admission and participation of non-matriculated students in the evening lectures.

Given these characteristics it is reasonable to believe that the evening instruction at both colleges was the result of several forces: pragmatic philosophical orientations of the presidents, the desires and goals of powerful physicians and others, and social conditions (including hours of work) favorable to a modification of the traditional day schedule. Given...
the popularity of societies and public lectures among the British, it is feasible to assume that the evening activities at King's College and the College of Philadelphia were evolutionary.

The idea of evening lectures had existed among British Americans from early in the eighteenth century and even longer among their British ancestors. Therefore, it is not surprising that evening lectures became popular in British America. The evening lectures contained a combination of entertainment, social activity, and enlightenment. As a result they enjoyed a level of popularity from Savannah to Providence. Thus, it does not challenge credulity to imagine that some creative minds such as New York's Bard, Cadwallader, Clossy, Jones, and Smith along with Philadelphians Franklin, Kinnersley, Morgan, Rush, and Shippen associated their knowledge of the evening lectures with their ideas about a new college curriculum.

Long has traced the British origins of such important colonial adult educational activities as public lectures, private teachers, coffeehouses, and intellectual social clubs. Of these four educational provisions, the public lectures seem to have been more often associated with higher education than the other activities. Sixteenth century religious lectures, referred to as prophesying, appear to have prepared the public mind for secular lectures that soon became identified with faculty and students of Oxford and Cambridge. For example, Kelly reported the 1588 mathematics lectures of Dr. Thomas Hood, a graduate of Cambridge. Other early lecturers include Dr. Richard Forster, who delivered a lecture series in surgery as early as 1584. John Florio, while a student at Oxford, taught Italian and other modern languages through public lectures in the 1580s.

At the same time, the legacy of Sir Thomas Gresham, a wealthy London merchant, led to the establishment of Gresham College. According to the provisions of Gresham's will, his former residence became a college in 1597 with seven professors. The college was intended for the common benefit of the people in London. It was anticipated that the auditors (learners) would be merchants and other citizens. By 1700 public lectures were rather common occurrences in London.

The colonists were not opposed to adopting the public lecture as an educational and sometimes entertaining activity. One of the earliest American lecturers was Isaiah Greenwood who delivered a series of lectures in New England from 1726 to 1727. For a fee of four pounds, Greenwood promised that he would provide learning experiences in such things as natural knowledge by means of various instruments and machines and the wonderful discoveries of the incomparable Sir Isaac Newton.

First, it should be noted that early American higher education institutions were called colleges rather than universities. Only in the nineteenth century does the term university begin to appear in the titles of American postsecondary education institutions. Second, it is equally important to observe that the term "evening college" was not connected with the college or university education until well into the nineteenth century. Therefore, the evidence cited does not use the term evening college.

King's College and the College of Philadelphia reflected an increasing attention to the more utilitarian concepts of education. The College of Philadelphia, under the leadership of William Smith, appears to have represented what Cremin calls the general principles of Scottish realism. Smith, born in Aberdeen in 1727 and educated at King's College of the University of Aberdeen, was the son of a substantial landholder. In 1753, he prepared a pamphlet entitled A General Idea of the College of Mirania that quickly attracted the attention of influential citizens of New York and Pennsylvania.

There is speculation that the pamphlet, which proposed a curriculum designed not to form poets, orators, and scientists, but rather to form men who were rational about the business of life, was a factor in Smith's selection as Provost of the College of Philadelphia. The narrator of the pamphlet, Evander, notes that "a great stock of learning, without knowing how to make it useful in the conduct of life, is of little significance."

It is believed that Smith, who supported Johnson's efforts to establish King's College in New York, may have been interested more in that institution than the College of Philadelphia. Franklin, however, was attracted to Smith by his pamphlet and subsequently recruited him for the Philadelphia school. Soon afterward, however, Franklin and Smith became estranged. A practical thrust to education had adherents in both Philadelphia and New York. A New York newspaper advertisement illustrates the dissatisfaction of some residents of that city with existing colleges. The ad appearing in the September 21, 1767, issue of the New York Mercury announced the opening of a seminary of learning with "the ablest tutors, who will teach all the several branches of literature taught in any college in America."

The source of the practical thrust of the King's College curriculum is obscure. The leadership that led to the establishment of medical professorships in 1767, and the interest in continuing education could have come from...
Cadwallader and Clossy's lay leadership and pressure from the City, rather than from Samuel Johnson and Myles Cooper, the college's two presidents between 1763 and 1775.

The College of Philadelphia, noted as being a cosmopolitan institution, derived its character equally from its urban location as from the Scottish modernism of the provost. King's College remained somewhat more provincial due to the political ineptitude of the New York Anglican establishment and the mediocrity of its presidents. Nevertheless, both institutions antedate Josiah Holbrook, creator of The American Lyceum, and Benjamin Silliman, a public lecturer of New England fame, by fifty years in the provision of educational opportunity for individuals not normally served by the traditional college curriculum. Both institutions frequently resorted to the pages of their city newspapers to advertise the evening schedules of educational activities and lecture topics, such as electricity, medicine, and at King's College, chemistry and hydrostatics. The medical lecturers appear to be identified most closely with current ideas about higher education curricular matters.

Standard adult education references such as The Adult Education Movement in the United States and the 1960 edition of the Handbook of Adult Education in the United States virtually ignore the role of the colonial colleges in adult education. Knowles (1962) devotes 14 lines to a discussion of the "universities" and generally appears to discount their adult education role during the colonial period. Colleges received even less attention in the 1960 book. There is, however, ample evidence to believe that the College of Philadelphia and, to a lesser extent, King's College purposely engaged in the provision of educational opportunities for "older" adults as well as for the younger full-time students.

The first identified advertisement of an evening lecture about medicine, provided by an American college, was placed by King's College. The relatively detailed announcement appeared in the September 23, 1765, issue of the New York Mercury. The advertisement stated that "Dr. Clossy's Anatomical Lectures will begin with the History and Uses of Anatomy, and proceed to the dry and fresh bones, with their uses, motions, and diseases." A 1767 announcement of the medical lectures removes all doubt concerning the explicit policy of the King's College administration about the provision of educational opportunities for non-matriculated adults not normally associated with the college. The announcement specifically addressed "gentlemen who will choose to attend for the improvement of their minds..." Further, "all possible care will be taken to render it useful, not only to those whose indispensable business and duty it is to be acquainted with the human structure and anatomy. But to gentlemen of other professions who may be inclined to acquire some knowledge of these subjects, as a part of philosophy." Similarly, a 1768 advertisement noted that the introductory lectures to each topic were open to the public.

By 1768, the medical lectures of King's College had expanded to include lectures by four doctors. Dr. Peter Middleton discussed the "theory of physic." Dr. Clossy's topic continued to be anatomy until 1770 when he also gave pharmacy prelections. Dr. John Jones discussed the theory and practice of surgery, while "the practice of physic" was discussed by Dr. Samuel Bard. Later advertisements indicated that the lectures were helpful to a broad public. Clossy's anatomy course was more than lectures, as his advertisements reported that different topics were frequently illustrated. He accomplished the illustration by the use of demonstrations, "preparations," and projected images through the use of the solar microscope.

Twenty-four advertisements of the medical prelections sponsored by King's College between 1765 and 1771 have been identified in the New York Mercury. In addition to the public lectures, there is evidence that the instructors were available to students on a private basis. Clossy's 1765 advertisement quoted his fee for private pupils as ten pounds for the anatomy course.

The availability of medical lectures for both serious and casual students of medicine requires an explanation. The relative sophistication of Clossy's lectures contrasts with the favorite medical treatment that included the lancet and staggering doses of purgatives. There is a measure of the efficacy of some of the kind of instruction provided at the College of Philadelphia and King's College. This is that, in 1827, Dr. John Richmond of Newton, Ohio performed the first successful Caesarian section in the American West. Richmond was an itinerant preacher who had taken up medicine after listening to lectures at a medical school where he worked temporarily as a janitor. Richmond had neither seen a Caesarean section performed, nor heard it described by another physician; he had only rudimentary knowledge of how to proceed, based on reading ancient accounts in Greek and Latin.

The development of the medical curriculum at the College of Philadelphia from 1765 appears to be identified with John Morgan, a member of the first graduating class. While serving as an apprentice to Dr. John Redman, he enrolled in classes...
at the college and completed his baccalaureate in 1756. After four years as a regimental surgeon with the Pennsylvania militia, he went to London and then to the University of Edinburgh medical school. Morgan returned to Philadelphia in 1765 and successfully promoted the idea of developing the medical school under the aegis of the College of Philadelphia. His plan was promptly accepted and he found himself elected as professor of theory and practice of medicine on May 3, 1765.27

The absence of a medical school in the colonies prior to the College of Philadelphia's degree program indicates that probably most of the American doctors had gained their knowledge and skills as apprentices, as Morgan himself had started out. Consequently, it is likely that a large city such as Philadelphia contained a number of practitioners who could profit from participation in the medical lectures. The advertisements of the lectures invited the participation of individuals who were not currently students.

An advertisement appearing in the December 17, 1767, issue of the Pennsylvania Gazette noted that the medical lectures were to be provided on an "extensive" basis during the winter.28 The statement went on to note that the lectures would be "gratis," with a view to encourage the new medical school and to extend "the usefulness and reputation of the college." Any gentlemen, who had formerly been educated at the college and who desired to renew their acquaintances with the branches of knowledge covered in the lecture were welcome to attend.

In 1769, an announcement of Dr. Smith's course of lectures in natural and experimental philosophy contained an invitation for "any of his former pupils who may be desirous of refreshing (italics are mine) their memories in their branches of knowledge, will be welcome to attend the course; and also any other gentlemen who may think proper to apply to him."29 Another advertisement reported that Dr. Rush's introductory lecture to his chemistry was to be delivered publicly.30 In 1771, an advertisement proclaimed that the medical lectures were open to the public. That advertisement, announcing Dr. Benjamin Rush's chemistry lectures and experiments, said the course "will be taught in such a manner as to be intelligible to the private gentleman and engineering artist, as well as the student of medicine."31

These and other advertisements appearing over a five year period provide sufficient reason to believe that the medical lectures were designed to reach a broader audience than what would be identified today as the usual university student. Meanwhile, eight other lecturers were identified in the ads published between 1766 and 1773: Morgan, Shippen, Bond, Kuhn, Rush, Graham, Smith, and Kinnersley. Each lecturer had his own area of specialization. Morgan's lectures appear to have been the most general, including botany, chemistry, and materia medica. Shippen's topics included anatomy, surgery, art of injecting, art of dissecting, and midwifery. Bond lectured on the theory and practice of physic based on cases from the Philadelphia Hospital. Kuhn addressed the subjects of botany, materia medica, and pharmacy. The noted Benjamin Rush limited himself to chemistry. Graham presented a three part lecture series on "that curious and most important organ," the eye. Smith's topic was natural and experimental philosophy. Kinnersley lectured on electricity.32

The advertisements provide little insight concerning the content of the different lectures, although Shippen's lectures were described in comparatively more detail. An advertisement of 1771 noted the that "Doctor Shippen will begin his lectures on anatomy, surgery, and midwifery on Monday, the 28th of October; in which will be demonstrated and explained the figure, situation, structure and uses of all the parts of the human body on the first subject; after which the Doctor proposes to perform and explain all the necessary operations of surgery." He promised to "give a course on bandages; and conclude the whole with seven or eight lectures, containing plain rules for the safe practice of midwifery and useful directions for the proper management of mother and child during the month."33

Knowledge of the colonial American college may improve understanding of the development of higher education in the United States. Historians such as Bailyn, Cremin, and Hofstader have commented on the need for additional study. Cook's study of the evening college at the University of Chicago reveals how little is known about the development of specialized curricula and departments that served adult students. While there was no such college division known as the evening college at the time, it is obvious that King's College and the College of Philadelphia provided evening instruction in a manner that is not dissimilar to modern evening college provisions.

Sources reviewed for the purpose of this study support the contention that British colonists who immigrated to America came from a culture where educational activities such as public lectures were frequently provided by individuals who had some college experience. They may have been graduates of Oxford or Cambridge, and in some instances they were students. It can be argued that the American familiarity with evening lectures combined with an interest in an applied
college curriculum provided an impetus to the provision of evening lectures by the New York and Philadelphia colleges, as early as the 1760s.

The Beginning of the Women’s Fraternity Movement and the Growth of Coeducation

Fran Becque
Southern Illinois University

During the period from the close of the Civil War to the turn of the century, the history of the women’s fraternity movement mirrored, in many ways, the opportunities for women in the male dominated world of American higher education. A brief summary will be presented of the growth of the women’s fraternity system and its contribution to the acceptance of women in American higher education.

In 1870, less than one percent of all American females 18-21 years of age were enrolled in any form of higher education. Of those women, fewer than half attended coeducational institutions. In 1870, there were 582 institutions of higher education in the United States; of that number only 169 (29%) were coeducational; 70 (12%) were female only and 343 (59%) were male only. By 1890, women represented a little more than two percent of the student body. Of that small number, seventy percent were enrolled in coeducational institutions. Women sought out support systems, friends with whom they could share the experience of higher education. Out of this search came the concept of women’s fraternities.

The women’s fraternity movement began in the Midwest after the end of the Civil War. The movement had its start in small church-affiliated institutions. In 1867, in Monmouth, Illinois, twelve Monmouth College coeds formed I.C. Sorosis, the women’s fraternity that is today known by its original Greek motto, Pi Beta Phi. A year later, in 1868, one of the Pi Beta Phi founders enrolled at Iowa Wesleyan University in Mt. Pleasant, Iowa, and formed a second chapter. P.E.O., now a community philanthropic educational organization, was founded as a collegiate group at Iowa Wesleyan University shortly after the appearance of I.C. Sorosis on campus. In 1870, Kappa Alpha Theta came to life at Indiana Asbury University, now DePauw University, in Greencastle. Later that year, Kappa Kappa Gamma began at Monmouth College. Thus, by 1870, the Midwest was home to several women’s fraternities.

When Alpha Phi was founded in 1872 at Syracuse University in Central New York State, the ten founders "were pleasantly unaware of the existence of any other similar organization and immediately began calling themselves a national fraternity."[2]

In 1873, in Oxford, Mississippi, Delta Gamma began at the Lewis School for Girls. The following year, Gamma Phi Beta appeared on the Syracuse University campus. Alpha Chi Omega was founded at DePauw University in 1885. Three years later, Delta Delta Delta came to life at Boston University. In 1895, Chi Omega was founded at the University of Arkansas.

Although a Panhellenic meeting had been attempted in 1891, it was not until 11 years later that a successful attempt was made to foster Panhellenic spirit. The same seven groups that had previously come together in Boston met in Chicago in 1902 at the invitation of Alpha Phi. Alpha Chi Omega and Chi Omega were invited to the meeting but were unable to send delegates.3 This second attempt resulted in the creation of what is today known as the National Panhellenic Conference [NPC]. Only the nine groups invited to the first NPC meeting will be discussed in this paper.

During the first six years of growth, from 1867 through 1873, the women’s fraternity system involved mainly church-affiliated institutions. These included Carthage College, Cincinnati Wesleyan College, Moore’s Hill College, Smithson College, and Fairmont College. Extension was largely unsuccessful and most chapters did not survive very long. In many instances, the chapter did not survive because the institution ceased to exist. There are, however, several private institutions which have been home to women’s fraternities since the 1870s, including Syracuse University (Syracuse, New York), Simpson College (Indianola, Iowa), Butler University (Indianapolis, Indiana), Illinois Wesleyan (Bloomington, Illinois), Hillsdale College (Hillsdale, Michigan), and the University of Akron (Akron, Ohio).

Coeducational state institutions, fostered in part by the Morrill Land Grant Act of 1862, became prime spots of expansion for the women’s fraternity system. Before the Civil War, the University of Iowa was the only state institution to admit women. In 1863, 30 women began teacher training at the University of Wisconsin. The Universities of Kansas, Indiana and Minnesota enrolled women in 1869. A year later, the Universities of Missouri, Michigan and California followed suit. While women were allowed to attend classes, there were often restrictions placed upon them. It wasn’t until
1871 that women at the University of Missouri were admitted to all classes. But even then, they did not have full use of
the library or permission to attend chapel with the men. In their early years, California, Iowa, Kansas, and Minnesota
admitted only women from the home state.

Among the first state institutions to welcome women's fraternities were Indiana University (1870), Kansas University
(1873), University of Wisconsin (1875), University of Missouri (1876), Ohio University (1876), Iowa State University
(1877) and the University of Michigan (1879).

From 1867 until 1881, only four groups, Delta Gamma, Kappa Alpha Theta, Kappa Kappa Gamma, and Pi Beta Phi
attempted to start chapters beyond the founding campus. The early efforts at expansion were quite simple in comparison
to today's standards. In many cases, it took only a few interested women to begin a chapter. Methods of expansion included
sending an initiated member to another institution to recruit members for a new chapter; recruiting friends and relatives to
start chapters at other schools; contacting women students, sometimes blindly through college directories and asking them
to start new chapters; and soliciting information from professors about potential fraternity women at other institutions.4

Women were not always wanted on campus. Men were sometimes openly hostile to the women students. Women's
fraternities took on the nature of a protective league, providing moral support and academic encouragement. The University
of Vermont's institutional history admits, "Women were second class citizens for their first twenty-five years on the
campus." Only ten women were enrolled at the University of Vermont [UVM] in 1883, and all but one of them eventually
graduated. This same claim cannot be made for the men enrolled at UVM that year; more than 30% of those men failed to
graduate. Chapters of three women's fraternities were chartered on the UVM campus before the turn of the century: Kappa
Alpha Theta in 1881 (when there were 10 women attending), Delta Delta Delta in 1893, and Pi Beta Phi in 1898.

Women's fraternities played another key role in collegiate life in the late 1800s. When the Alpha chapter of Alpha Phi
built the country's first women's fraternity house in 1886, it signaled the start of a new relationship with the institutions
at which the women's fraternities had chapters. Before the advent of the women's fraternity house, the typical female
student either roomed with town families or lived at home and traveled to campus.

The 1890s saw the rise of the women's fraternity house. Allowing women's fraternities to house their members in
genteel refinement under the watchful eye of a chaperon (or housemother as she later became known) filled a housing void
at little or no cost to the institution. Moreover, the watchful eye of each of the fraternities' national officers added insurance
that the fraternity women would be held to high moral and academic standards.

The Kappa Kappa Gamma chapter at the University of Wisconsin, in the spring of 1891, rented the furnished home
of a professor on leave. "The experiment was so successful that in the fall another house was rented." At St. Lawrence
University, "until the construction of our Women's Residence in 1928 and Men's Residence in 1931, the fraternities and
sororities were the only places available for the students to live among their fellow students in a free and democratic
fellowship."7

Between 1867 and 1900, women gained a foothold in the world of higher education. The first American Ph.D. was
awarded to a Yale University man in 1862. The first Ph.D. conferred on a woman was in 1877 at Boston University. In
1880, Cornell, Syracuse, and the University of Pennsylvania each awarded a Ph.D. to a woman. The first woman to receive
a Ph.D. at Syracuse University was Rena Michaels [Atchinson], a founder of Alpha Phi. By the end of the century, 228
women and 2,372 men had received Ph.D.s. Many of these women who had been educated in coeducational institutions
were fraternity women.

Women's fraternities became an established entity and provided fellowship, academic support, and social opportunities
for their membership. In some cases, they also provided housing. By 1900, most national women's fraternities had
volunteers serving on a "Grand Council," whose job it was to oversee the operations of the national fraternity. Expansion
became a standardized process whereby local organizations petitioned the national organization for a charter. Most chapters
installed between 1890 and 1900 prospered. By 1900, the women's fraternity had become a mainstay at private and public
institutions throughout the country.
Endnotes

4. Burton-Roth, F., and M. C. Whiting-Westermann. *History of Kappa Kappa Gamma Fraternity: 1870-1930*, N.p., 1932. The Kappa Kappa Gamma Chi chapter at the University of Minnesota was formed with the help of Allen J. Greer, Chi Psi, a college professor who was teaching in Indiana. Mary Goodrich, the Minnesota coed Greer recommended, in addition to a letter asking her to start a Kappa Kappa Gamma chapter, also received one from Kappa Alpha Theta.
Since its beginnings in 1776, the American college fraternity has been a constant, if often controversial, part of higher education and student life. The rituals and traditions of fraternity life have often been questioned, scrutinized, and condemned, even to the point of the banning of these societies at many colleges and universities in the 19th century. Secrecy, brutality, conformity, and racial and religious discrimination are just some of the charges that the fraternity system has faced throughout its history. The negative side of fraternity life has been portrayed in many books, articles, and films. Possibly the strongest image many people currently have of fraternities is the one lampooned in the movie "Animal House." The indefensible acts of hazing that cause emotional and physical harm, even death, have been well documented in the press.

On the positive side, fraternities and sororities have been the sources of housing, social life, self-government and discipline, support networks, and lifelong friendships for millions of students. Many of the values and traditional ideals of brotherhood and sisterhood have had positive effects for the students and their alma maters.

One positive, and practical, effect has been the financial return to colleges and universities. A 1987-89 study at Indiana University of the undergraduate experience of alumni from 1949 to 1975 who contributed financial support to the university reinforced previous research showing that fraternity alumni support their alma mater in a "much greater proportion of their population than non-Greek alumni." Using the Clark and Trow Taxonomy of Student Subcultures, the study found that over 56 percent of the donors to Indiana University during the established period had fraternity affiliation, even though the percentage of the student population during the period was only 18 percent.

Despite the many obstacles that the fraternity system has faced throughout its existence, it has continued to grow, although the numbers have fluctuated with the times. In 1994, there were an estimated 2,834,126 sorority members (including 220,000 collegiate) and 4,500,000 fraternity members (including 400,000 collegiate). While these numbers statistically may not be a large percentage of the total college graduates and students, the figures do represent one of the largest, most influential, and best organized of the student subcultures in the history of higher education.

Honor, recognition, service, and professional groups are also part of the fraternity world, even though they are often viewed as quite different from the social organizations. While they do differ frequently in their purposes and membership requirements, there are many similarities in their history, development, organization, and structure. Phi Beta Kappa provides an example of the historical ties between the different types. Founded at the College of William and Mary on December 5, 1776, Phi Beta Kappa was the first American college Greek-letter society. It had most of the characteristics of a fraternity today: secrecy, oaths of fidelity, a secret handshake, a motto, a badge, and a strong bond of friendship. Of course, today Phi Beta Kappa is arguably our most prestigious honor society.

The history of the fraternity system's struggles, successes, and contributions to higher education provides important insights into the educational process outside the classroom. Any comprehensive scholarly work on the history of higher education would be negligent if it did not include at least some reference to the role of fraternities on American campuses. If for no other reason, the catalyst they provided in the development of student life is too strong to ignore. Helen Horowitz states that "unlike earlier student associations, they served as the base out from which the undergraduate moved, not the final stopping place." In discussing the documentation of fraternities and sororities, I will be using the University of Illinois and its student life and culture archival program as a backdrop. Not only is the type of documentation available at the University of Illinois Archives representative of what can be found at other institutions of higher education, but also its endowed archival program for documenting student life provides an opportunity to examine sources that are either unique, difficult to locate, or often inaccessible to researchers. The student life and culture archival program serves as a research center for the preservation and study of material documenting the total student experience in higher education. The program was established in 1991 and is supported by the Stewart S. Howe Archival Program Endowment.

Stewart Howe, a 1928 graduate of the University of Illinois and member of the Kappa Sigma fraternity, was a public relations and financial management consultant to fraternities, sororities, colleges, and universities. For over 30 years,
branches of the Stewart S. Howe Alumni Service could be found in many university communities. The nature of his business allowed Howe to collect material on fraternities and sororities, student life, and higher education for more than 40 years. As a lifelong supporter of his alma mater and its library and archives, Howe decided that the University of Illinois Archives should be the permanent home for his collection. He made his first donation in 1967: newsletters from over 50 University of Illinois fraternities and sororities. When he died in 1973, the rest of his collection came to the Archives. Today, the Howe Collection is the world's largest and most comprehensive on the American college fraternity system.8

The collection contains documentation from 1867 to the present on more than 220 active and defunct Greek-letter societies. Given the breadth and scope of the collection, a description of the types of items contained in it provides an overview of the documentation that exists for the study of the history of the fraternity system in higher education.

Part of Howe's business was to publish chapter newsletters for fraternities from the 1930s through the early 1970s. His collection contains a large selection of these newsletters, as well as others that were published by different companies. The collection also contains national and chapter histories (both published and unpublished), membership and alumni directories, pledge manuals, songbooks, and magazines.

Fraternity magazines are a particularly rich source of information on the exoteric aspects of Greek-letter societies. In an 1888 article in Century Magazine, John Addison Porter wrote, "The hideous reptiles and winged monsters, the burning altars and dungeon bars, and other such fantastic symbolism with which the magazines and newspapers of some of the fraternities are decorated, prove to cover interesting and often useful tables of contents, including reminiscences of college life and literary articles by prominent graduates."9

An example of the information that can be gleaned from these magazines can be found in an article by Jack Matthews in The Southern Review. The article on college student life in the 1890s was based on looking at only three early issues of Beta Theta Pi Magazine that he picked up at a used bookstore.10 The Howe Collection has journals for around 200 organizations dating from 1885 to the present.

In addition to publications, Howe collected brochures, reports, photographs, newspaper and magazine clippings, and other assorted items on the nationals and their chapters. He assembled these loose items in folders, arranged alphabetically by name of organization, and put the more fragile or significant items in envelopes on which he wrote descriptive information.

The collection includes minutes, reports, publications, and other documentation of many interfraternity organizations, including the College Fraternity Editors Association, Interfraternity Research and Advisory Council, National Interfraternity Conference, National Panhellenic Conference, and Professional Interfraternity Conference. It also contains complete sets of Baird's Manual of American College Fraternities, Banta's Greek Exchange, Fraternity Month, and Fraternity Insider. Baird's Manual has long been considered the authoritative source on American fraternities and sororities. First published in 1879 by William Raimond Baird, a new edition appeared about every 5 to 10 years and was a compilation of facts and figures about all the different types of Greek-letter societies. The information was gleaned from the organizations themselves and included a brief history and list of chapters with their founding dates. Following Baird's death, others continued the tradition. The most recent update was published in 1991.11

Banta's Greek Exchange was a quarterly interfraternity magazine that was published by George Banta from December 1912 to July 1973. As its title suggested, the magazine provided an opportunity for exchange of information between the various fraternities and sororities concerning their activities and ideas. Organizations shared stories from their own magazines and other news items. Prominent fraternity individuals provided articles and editorials on fraternity and national issues. Fraternity Month was a similar interfraternity magazine that was published from 1933 to 1971. While the basic idea was the same, it contained more articles on fraternity history and traditions.12

The Fraternity Insider was a different type of publication altogether. Published from 1960 to 1983 by the idiosyncratic and often controversial Wilson Heller, the Insider was a monthly mimeographed, stapled multipage newsletter written in a shorthand style.13 It purported to give the "true" inside scoop on fraternities. Each issue highlighted a different institution and fraternity and presented historical and current information. With the aid of a system of "spies," Heller often "tattled" on his fellow fraternity members.

The Howe Collection also includes Howe's correspondence with many individuals who were prominent in the fraternity world and higher education from the 1920s through the 1970s, including Lloyd Balfour, George Banta, Wilson Heller, and...
Leland F. Leland. Howe had written articles and columns for their various publications. They provided him with copies of all the different types of items that they published, for his collection. Topics of the correspondence include publishing and business plans, fund-raising and alumni support, politics and activities of the National Interfraternity Conference, fraternity membership statistics, and restrictive membership clauses. One of Howe's main concerns was the importance of developing active alumni members. In a 1958 speech, he said, "Alumni members are the keepers of the tradition, preferred stockholders in the enterprise, the mark of its accomplishment." Much of his writings and correspondence speak to this philosophy.

In addition to his correspondence with leaders in the fraternity world, Howe was responsible for obtaining the personal papers of some of these individuals to augment his collection at the University of Illinois. These collections included the Clyde S. Johnson Fraternity Collection, 1931-70; Leland Publishers Records, 1933-71; and Wilson B. Heller Papers, 1937-83.

Clyde Sanfred Johnson, Professor of Educational Psychology and Social Foundations at California State University-Long Beach, was an important supporter and chronicler of the American college fraternity. The author of many articles and publications about the fraternity system, Johnson's most significant work in the area was Fraternities in Our Colleges, published in 1972. He was an active leader of his fraternity, Phi Kappa Epsilon, and played a significant role in the NIC as a member of the Executive Committee and as Research Editor.

Johnson's collection is an extensive source of information for research on the debate over fraternity membership selectivity in the 1950s and 1960s. It includes correspondence and source material on autonomy, membership restrictions, and other topics included in his book. It also contains NIC Executive Committee minutes, 1945-70; NIC programs, 1948-70; and a bibliographic card file of articles and books on fraternity and college life.

Leland F. Leland and his wife Wilma established Leland Publishers, Incorporated, in St. Paul, Minnesota in 1933. He was editor and publisher of Fraternity Month from 1933 to 1971. Leland was an active and prominent member of Tau Kappa Epsilon. He served as editor and manager of The TEKE journal from 1924 to 1949, as well as editor of a 50-year TKE history, manuals, and many other of the fraternity's publications. Wilma Helen Leland was a member of Alpha Omicron Pi and editor of its magazine To-Dragma. The Leland Publishers records, which include the papers of both husband and wife, contain primarily source material for published and unpublished articles for their magazine. The collection is particularly useful for research into fraternity publishing and the history of fraternity traditions.

Wilson Benton Heller was known as "Doctor to the Greeks." In 1912, he started the College Survey Bureau to provide annual comparisons of college fraternities and sororities. The comparisons were based on surveys of student views of the "importance, prominence, and power" of individual chapters on each campus. During the 1920s and 1930s, Heller was a Hollywood press agent, but gave up that career in 1945 to devote full time to his interest in the fraternity world. In 1960, he began publishing Fraternity Insider, which attained a monthly circulation of more than 5,000. Heller's papers consist of correspondence, notes, surveys, and other documentation used in compiling the annual comparisons. The collection also contains correspondence and source material for articles in his newsletter. His running battle with leaders of NIC is reflected in his correspondence, as are his long personal and legal battles with Balfour. He was a prominent actor in the anti-monopoly case against the Balfour Company, maker of fraternity jewelry. This collection provides a unique view of many aspects of the fraternity world.

In addition to the personal collections of prominent fraternity individuals such as the ones just discussed, the University of Illinois Archives, like most college or university archives, holds a wealth of source material on the fraternity system in the institution's official records relating to students and student affairs, student and alumni papers and scrapbooks, photographs, and student publications. Especially worthy of mention at the University of Illinois Archives are the papers of Thomas A. Clark and Fred H. Turner. Clark was one of the first Dean of Men in the nation and a strong supporter of fraternities. A prolific writer and speaker on fraternity subjects, Dean Clark was author of The Fraternity and the College and The Fraternity and the Undergraduate, as well as numerous magazine and journal articles. Turner, Clark's colleague and successor as Dean of Students at Illinois, was also a prominent individual in the fraternity world. The Clark and Turner papers contain extensive material on fraternity issues and are especially valuable sources for an examination of a university administration's use of the fraternity system for its own purposes.
Perhaps the most useful documentation of research into the fraternity movement is to be found in the records and archives of the organizations themselves. However, there can often be difficulties for researchers in obtaining access to the records of these private organizations. Indeed, it is in the very fabric of the groups to safeguard the secrets of their rituals and traditions. Often, unless a researcher is a member of the fraternity or sorority or at the very least part of the fraternal world, access to records may be denied. At best, an outside researcher may see selected material. Even with their publications, fraternities deal in the esoteric and exoteric. Most of the publications discussed in this article have been of an exoteric nature. Esoteric items are meant for members only.

During the initial discussions with Alpha Tau Omega concerning the placement of their archives at Illinois, it was decided that ATO would conduct a survey of other fraternities and sororities to determine how they were handling their archives. The results of this survey provide a glimpse of the difficulties facing researchers into fraternity history.

Only 20 social fraternities and sororities, out of a possible 87, responded to the survey. Six of the respondents had established archival programs with either volunteer or paid archivists working either full or part time. Two others had agreements with universities to preserve at least some of their records. Three had most of their records organized and some type of cataloging done. Seven were either doing or had done indexing of their magazines. Only two gave any information about access to their records. One had developed a policy statement and user forms. The other had computerized all their finding aids to assist with locating material. Both stated that internal and external use was by permission of the archivist and executive director or president.

Despite some potential roadblocks to research, it is possible to have access to the historical records of some fraternities and sororities. One of the goals of the Student Life and Culture Archival Program is to work with these organizations to ensure the preservation of their records. This work takes the form of communicating with the groups to help them set up their own archives, providing for the preservation of their records in the University Archives, or advising them on other institutions where their materials could be preserved.

The University of Illinois has established contractual agreements with several honor, professional, recognition, and social fraternities, including Alpha Lambda Delta, Alpha Tau Omega, Beta Alpha Psi, Order of the Coif, Phi Eta Sigma, and the National Panhellenic Conference. An agreement is being finalized with Sigma Alpha Iota. A brief discussion of the archives of the National Panhellenic Conference and Alpha Tau Omega provides a view of the types of records that are generated by an interfraternity organization and a national social fraternity. The National Panhellenic Conference was formed in 1902 as an interfraternity association for women's fraternities. As the oldest interfraternity group, their records reflect the contributions of NPC and its member sororities to both the fraternity world and higher education for women. Records that are available for research in the NPC archives include: conference proceedings, reports and programs; chairman's correspondence and bulletins; city, alumnae, and college files; committee records; Interfraternity Research Advisory Council correspondence, bulletins, and annual reports; information manuals; directories; rushing guidelines; sorority handbooks; NPC newsletters; seminar materials; and photographs, slides, and videotapes. There are no restrictions to access. An NPC Archives homepage, which includes some finding aids, is available on the World Wide Web.

Alpha Tau Omega was the first fraternity founded after the Civil War in 1865. It was part of the Lexington (Virginia) Triad, which also included Kappa Alpha Order and Sigma Nu. ATO is one of the larger and better known fraternities in existence. There has been a long relationship between ATO and the University of Illinois. Dean Thomas Arkle Clark began that relationship when he was the first initiate on the Illinois campus. He was instrumental in locating the ATO national headquarters in Champaign. In July 1995, ATO signed an agreement with the University of Illinois to preserve their archives. The agreement provides for funds for a graduate assistant to arrange and describe the records and provide reference assistance.

The ATO archives will be over 300 cubic feet when processing is completed. The types of records that will be available for research in the ATO archives include correspondence, minutes, reports, photographs, publications, and other documents from the Fraternity Board of Directors/High Council; ATO Foundation Board of Governors and Executive Director administrative staff and services, including Executive Director, Development, Communications, Business and Financial Services, Chapter Services, Member Services, Volunteer Services, Expansion, and Leadershape; national officers; congresses, conferences, workshops; and collegiate chapters and alumni groups. The Archives is working on guidelines for the preservation of ATO electronic records.
The correspondence in various record series throughout the ATO archives provides an extensive source of research material on the development of a major fraternity from its inception. The chapter files are especially rich sources of historical information on many fraternity issues. Confidential and sensitive material does exist in the collection, so the establishment of access guidelines were essential. As a research institution, the University Archives' basic policy has been not to take any ATO records that would be permanently closed to research use.\textsuperscript{23}

In the final analysis, the value of any archival documentation is based on its use. In the last year and a half, a total of ten researchers from other universities used materials on fraternity and sorority history in the University of Illinois Archives: four for dissertations, three for history monographs, two for history journal articles, and one for a video history.\textsuperscript{24} Those research uses are in addition to the undergraduate, alumni, media, administrative, and personal uses of the collections that occur on a regular basis.

Much more research needs to be done on the historical role of the fraternity in American colleges and universities. The documentation described in this article can provide some of the source material needed for that research. As new research topics emerge, the University of Illinois Archives and other academic archives are committed to providing the sources needed by scholars of the history of higher education and all of its components.

As of this writing, the ATO Archives are being arranged and described by Archives graduate assistants, under the supervision of the student life and culture archivist, at ATO headquarters in Champaign. The records will be transferred when processing is complete. The chapter files are the largest record series in the collection and will likely exceed 150 cubic feet when processed.

How School Supervisors Responded to the Human Relations Movement

Janis Fine
Loyola University

School supervision in America has gone through many transformations. Supervisory philosophies, policies, and practices have been influenced by several major bodies of administrative thought originating outside of education. Often these ideologies have been products of industrial and social science research. With the advent of the Human Relations Era and the influence of industrial administrators, and socio-political influences, democratic approaches to supervision replaced scientific management in the schools. The belief that improvement of instruction would be achieved through a democratic form of leadership resulted in the human relations management of schools.

The purpose of this paper will be to examine the development of the human relations model of supervision in American schools from 1930-1960. More specifically, this model will be discussed as it developed in response to industrial, socio-political, and educational forces of this era. Discussion will focus on emerging views of human relations in management as they directly influenced supervisory change for education during this period.

From 1910-1930, Frederick Taylor's Scientific Management was widely adopted by American schools in response to the swelling school populations, the expanding educational services and curriculum, the educating of diverse student populations, and a growing need for accountability. Taylor's system of management, developed during his involvement in industrial unrest at Midvale Steel in the late 1800s, was based on the assumption that people will come to realize what is best for them economically and act accordingly to maximize their economic benefits.

Taylor's ideas about efficiency and reorganization were published in his famous work *The Principles of Scientific Management* in 1911. His new system of management was scientific in nature and included scientific design of each task, scientific selection of workers, rewards for productivity, and division of labor and responsibility.

The principles of scientific management had a profound effect on the supervision of schools from 1910-1930. Schools were not simply viewed as educational institutions, but as industrial plants where pupils represented the raw products to be processed, teachers were the workers, and school administrators served as the industrial managers who monitored the flow of the educational assembly line.

Beginning in the 1930s, industrial practice again shaped educational administrative thought. Following the suggestions of social scientists, industrial administrators and engineers recognized the human element in production. The problems of business were not merely scientific, but also human.

As represented by F.W. Taylor and his followers in the scientific management movement, managerial thinking began with one of the basic assumptions of orthodox economic theory: man is a rational animal concerned with maximizing his economic gains. If the assumption were that man's goal in the factory was to make money, then it naturally followed that he could be motivated to earn more if he were paid in accordance with the amount he produced.

Yet, as early as 1921, D.H. Robertson, noted British economist, stated his case against the economic motivational assumptions of scientific management when he stated that a "high wage will not elicit effective work from those who feel themselves outcasts and slaves, nor a low wage preclude it from those who feel themselves an integral part of a community of free men" (Robertson 1921).

Mary Parker Follett, a lecturer on management in the United States and England, wrote many theoretical studies that contributed to industrial administrative thought both here and abroad. In a final lecture in a series delivered at the London School of Economics in 1932, she advocated for workers and managers sharing in joint control on the grounds that all elements of the factory had to be considered.

Empirical endorsement for the idea that organizational effectiveness impacted on the social and psychological climate in industry was presented by Elton Mayo and Fritz Roethlisberger, members of the Harvard Graduate School of Business, in their publication of the famous Hawthorne studies in 1930 (Mayo 1930). While the original intent of the studies was to explore the effects of illumination, temperature, and other physical variables on worker productivity at the Western Electric Plant in Chicago, the interplay between economic and social functions of industrial groups became the central subject of the Western Electric research. It became evident to the researchers that while the test group of workers was
performing its economic, or technological, function, the activities of the group were also being modified by the group so as to heighten the social solidarity of the group within itself, and also to stabilize its relations with other groups. Mayo and Roethlisberger examined social relations of the workers with variations of working speed. Their findings, published in the Journal of Industrial Hygiene and Toxicology in an article entitled, "The Effects of Social Environment", reported that it was the organization of human relations, rather than the organization of technics, which accompanied spurts of productivity in these cases. They argued that this illustrates the futility of attending exclusively to the economic motivation of workers or to their physical conditions of work. No group of workers, they contended, can be expected to remain satisfied, or to cooperate effectively unless their social organization and sentiments are also protected (Henderson et al. 1936).

Kurt Lewin, internationally known researcher in experimental psychology, along with his associates at the University of Iowa's Child Welfare Research Station, conducted a series of experiments in 1938 to examine how leadership skills shaped group behavior. The researchers considered how three types of leadership styles enacted by adults (autocratic, laissez-faire, and democratic) would affect the behavior of children in an after-school program. The results indicated that while the children in the autocratic and laissez-faire environments were discontent, aggressive, and lacking initiative, the children in the democratic environments were independent, less hostile, and more original in thought. Publication of these findings gave impetus to social psychology's interest in democracy in administration (Lewin et al. 1939).

While the human relations approach originated in industrial and social science research, democratic administration in the schools was first championed by educational reformers who stressed democratic rights and individual welfare. One of the earliest of these reformers was John Dewey, who argued in Democracy and Education against the rise of Scientific Management's preoccupation with efficiency. Dewey disputed Taylor's efficiency in the schools, saying that under no circumstances should the school become "an instrument of perpetuating unchanged the existing industrial order of society, instead of operating as a means of transformation" (Dewey 1916, 316). Scientific Management's preoccupation with efficiency did little to advance what he identified as a "well-balanced social interest" and was thus in conflict with the proper purposes of education.

In addition to Dewey, there were numerous other advocates for democratic leadership among the educational professoriate from 1930-1960, among them William Russell and Jesse Newlon of Teachers College, as well as University of Chicago's William Burton and Stanford's Jesse Sears. Democratic values were also greatly advanced by social reconstructionists such as William Kilpatrick, Harold Rugg, and George S. Counts as well as Archibald Anderson and William O. Stanley at the University of Illinois. In 1934 George S. Counts, in Social Foundations of Education, called the ideal of democracy "the highest and most characteristic ethical expression of the genius of the American people."

In 1929, the Department of Supervisors and Directors of Instruction was created by the directors of the National Education Association. Originally organized in 1921 under the name National Conference on Educational Method, this new department already had behind it eight years of achievement: its magazine, The Journal of Educational Method; two yearbooks; and an active membership of about one thousand, with members in every state belonging to state, county, and city educational offices.

The Department of Supervisors and Directors saw as their first task the need to address the functions and techniques of school supervisors. In an address at the first meeting of this newly formed department, James F. Hosic, Professor of Education at Teachers College, Columbia University, called for the members to "exemplify the modern conception of cooperation." He suggested that direction and leadership, being the two aspects of supervision, must be kept in balance. Hosic remarked that school supervision had for a long time been "purely individual." He maintained that now, with the growth of interest in social psychology and its application to education, the concept of group development had taken root. As a result, Hosic eschewed the reliance on only Scientific Management tenets for supervision in the schools.

Beginning in 1930 leaders in school supervision began a movement away from supervisor as scientist to supervisor as educational leader (Brim 1930). In contrast with the authoritative type of supervision, supervision through educational leadership attempted to improve conditions by enlisting the teachers in some large constructive program of school improvement. Problems were presented to teachers in a constructive, rather than corrective way. This program of study supported the spirit of cooperation that industry was seeing as vital for effective progress. It removed supervisor and teacher from the relation of superior and inferior, master and novice, or director and worker. As reported in The
Educational Method, it assumed that "the teacher has intelligence and that she is able to think constructively." It also presumed that "supervisor and teacher will as equals think together constructively upon problems of basic importance to the schools" (Brim 1930, 133).

The supervisor, as professional leader, now had the duty to help his teachers grow professionally. Again, rejecting the dogma of scientific management, and in support of democratic and cooperative supervision and individual growth, the duty of the principal was to surround the teacher with such an atmosphere as will encourage her to think her own thoughts and to express them frankly (McMurry 1930).

Democratic and cooperative supervision had become common terms with a fairly consistent meaning. They signified a spirit of equality, friendly attitude, mutual respect and confidence, working together, and growing together through shared responsibility. This model of school supervision held that since growth came through activity and responsibility, the teacher had a right to share in the direction of the educational program. Since she was a member of the staff, she had a right to share in deliberation on aims and policies. Since she had knowledge and understanding from her contacts with children that others did not possess, she must be partly involved in the decision making for the program to be effective.

As early as 1923, in The Principal and His School, Elwood P. Cubberly had relented somewhat from the autocratic model of administration, yet only in the area of supervision of instruction. He posited that though the supervisor was to formulate the program, organize the work, direct the activity, and make the decisions, "in supervisor-teacher relations in the classroom, the principal should allow great freedom and independence of judgment" (Cubberly 1923, 434). He allowed that though the principal must still be the controlling factor in the school, in matters of supervision of instruction, he must change from an inspector to an education leader.

The function of the supervisor as one who improves instruction through the recognition of effective content and methods and elimination of ineffective material and practice had been discussed at the Twelfth Annual Meeting of the National Association of Secondary School Principals (NASSP) in February of 1928. Further agreed upon at that meeting was that principals generally do not recognize good or poor teaching when they see it (Helble 1929, 38). It was clear that the supervisor of instruction needed assistance in effective supervision. Recognizing that teachers resent supervision, one member of NASSP warned members that autocracy on the part of the supervisor is in itself an obstacle to supervision (Helble 1929, 39). A conference devoted to "Appraisal of Supervision" was held at the American Education Research Association Meeting in Cleveland, February, 1929. Discussed were the two extreme philosophies of supervision: the philosophy of efficiency and the philosophy of growth. The philosophy of growth was hailed as appropriate for education. The educational process should be thought of as a cooperative enterprise, with no domination of one agent by another (Courtis 1929).

In 1932, Frank Pierrepont Graves prefaced his book Administration of American Education with the thought that new works on educational administration were desperately needed due to the feverish pace of changes in the field (Graves 1932, vii). In addressing the changed attitude away from that of scientific management, he proposed that the supervisor's attitude toward the teacher should be that of an adviser and friend, rather than a dictator and autocrat. Qualities for the job of supervisor should include a vital need for energy, enthusiasm, and optimism. Graves stated that in order to produce the necessary cooperation among groups, supervisors should be imbued with friendliness, kindness, and sympathy (Graves 1932, 365).

This concept of changed ideology in supervision was advocated in 1935 by Will French, Superintendent of Schools in Long Beach, California. He offered that those who are to lead in planning, administering, and supervising in teaching must be saturated with a social philosophy which sees in democracy the means for providing a proportional opportunity for everyone in all aspects of living. According to French, "Leadership in education will mean not only exceptional skill in the processes of educating but real insight into the social program underlying that effort" (French 1935, 5).

Support for the theory and practice of school supervision based on human relations and democratic ideology continued to flood the educational literature throughout the 1930s and 1940s. "Snoopervision or Supervision" discussed the
continuum of supervision practices ranging from the snooper and ignoramus to the cheer dispenser and grapevine counter (Friedman 1946). "Changing Concepts of School Supervision" deliberated the various types of supervision with emphasis upon the cooperative-democratic style. The cooperative-democratic form of supervision was advocated in three mid-1940's publications of The Association for Supervision and Curriculum Department of the National Education Association: "Group Planning in Education" (1945), "Leadership Through Supervision" (1946), and "Group Processes in Supervision" (1948) (Association for Supervision and Curriculum Development).

How did school supervisors apply the tenets of human relations and democratic administration to their supervisory practices? Policy and practices were designed to model the underlying assumptions of these ideologies. In addition, methods for examining the job performance of administrators and supervisors were developed which analyzed skills and behaviors characteristic of human relations beliefs. A number of studies were conducted to determine traits and qualities which would be prerequisite to success based on these beliefs. Summarizing 124 studies, Ralph Stodgill concluded that leadership was a product of cooperation with other members of a group (1948, 66).

The next year, 1949, articles on social engineering for educational change appeared in Progressive Education. David Jenkins outlined a method for educators to apply to the problems in education. Because teachers and principals were working cooperatively in groups, Jenkins held that as they attempted to do something constructive about a problem, they were, in effect, social engineers (Jenkins 1949). He advocated Kurt Lewin's 1947 Force Field Analysis Theory for analysis of the changes to take place. The cooperation of the "social engineers" in the schools would, through this process, effect efficient change through the controlled planning and arranging of events and procedures.

In the same issue of Progressive Education, Kenneth Benne raised the ethical problems that existed if school administrators were to see themselves as social engineers. He considered whether deliberately planned social change, or social engineering, which proscribed the manipulation of persons by other persons, could be reconciled with democratic values. He concluded that there was no inherent contradiction between a democratic ideology and the training of persons and groups committed to and skilled in the stimulation and development of planned change in social patterns and in human relationships. He warned, however, that, "Educators or other change agents must be trained in ways of stimulating and guiding change which incorporate the democratic norms as basic elements of their operating methodology" (Benne 1949, 204).

Based upon research and feedback from the field, administrators developed approaches for school supervisors to effect successful cooperative and democratic leadership. Katz used studies to formulate a three-skill approach to administration. The three skills were technical, human, and conceptual. Human skill was defined as "the executive's ability as a group member to build cooperative effort within the team he leads" (Katz 1955, 34). Conceptual skill was seen as the ability to see the enterprise as a whole, recognizing how changes in any one part affect all the others. Recognizing these relationships, the administrator would be able to act in a way which advanced the overall welfare of the total organization. The supervisor who would develop these skills would be one who was skillful in understanding others' words and behaviors because he accepted viewpoints, perceptions, and beliefs which differed from his own. In addition, he would create an atmosphere of approval and security for all in his organization (Katz 1955).

A variety of studies validated the emerging practices of school administrators as being more concerned with human relations than the mere technical aspects of administration. Ovsview, for example, found that of 97 practices deemed "most promising" by superintendents, only 9 were connected with technical classification, the other 88 being concerned with relations with the staff, the public, and the board of education (Ovsview 1953).

The emerging concept of the human relations approach to education was further developed largely through the leadership of Daniel Davies, coordinator of the Cooperative Program in Educational Administration (CPEA). This was a nationwide effort to improve the quality of school administration, enacted under a grant from the Kellogg foundation and administered through eight universities. Promoted by Davies, this concept had three elements: the administrator's job, the man he is, and the local setting in which he functions. Davies described the job as the tasks and responsibilities. The man brings certain capacities of body, mind, emotion, and spirit. The social setting encompasses the pressures and compulsions of society (Rice 1950). In summarizing several case studies of school administrators using human relations, Wynn wrote, "The foregoing accounts illustrate the simple truth that good human relations are applied good will. The humanistic spirit, lucidly expressed in the Golden Rule, thus becomes the basic test of human relations in school administration as in life.
itself" (Wynn 1954).

Throughout the 1950s, school administrators believed that in order to achieve the skills necessary for successful human relations and democratic leadership, they must understand the content of human relations as it related to the job. Desired areas to be developed were motivation, communication, morale building, group decision-making, and leadership. Participatory techniques such as role play, buzz sessions, the Quaker Meeting with no chairman, unanimous decision making, and no recognition of status were employed in school supervision.

Burton and Brueckner's text for school administrators, Supervision: A Social Process, originally published in 1938, with reprints in 1947 and 1955, advanced the notion of participatory supervision. The first edition advocated replacing the traditional supervision practice of imposition of training and guidance on teachers with the view that supervision was a cooperative enterprise in which all persons concerned with child growth and development work together to improve the setting for learning. The 1947 edition elaborated the principles further. The 1955 edition contained a summary discussion of social process in general and a more detailed discussion of the process as carried on in small groups. Using extensive and detailed consultation with practitioners in the field, Burton and Brueckner gathered information from dozens of superintendents, supervisors, and principals from around the country about the social processes they employed in school supervision over the previous decade. In response to their findings, Burton and Brueckner declared that all people in school supervision should embrace the human relations approach (Burton and Brueckner 1955, vi).

The period 1930-1960 witnessed a turning away from the tenets of Scientific Management in school supervision to thought influenced by industrial human relations and social ideals of democratic administration. However, it was only one more in a series of eras in educational administration influenced by administrative thought originating outside of education.

Endnotes
Sunday, December 7, 1941, for most Americans, began like any other--breakfast with family, religious services, and perhaps an afternoon of visiting friends and relatives. The events of that fateful day still register a vivid imprint in the minds of those who heard the profound words of President Franklin Delano Roosevelt the next day, as his message before a joint session of Congress filled the radio airwaves. With gravity, he said: "yesterday, December 7, 1941--a date which will live in infamy--the United States of America was suddenly and deliberately attacked by naval and air forces of the Empire of Japan." He concluded his remarks by saying, "as Commander and Chief of the Army and Navy I have directed that all measures be taken for our defense" (House Documents 1941, No. 453). These dark words not only laid the groundwork for constitutional challenges over the evacuation and relocation of Japanese families from the west coast, but also set in motion a series of events which eventually resulted in the loss of freedom for scores of American school-aged children (German, Italian, and Japanese), as they followed their parents into internment (Fukei 1976, 113).

The fires at Pearl Harbor were still burning when Roosevelt issued a chain of proclamations--2525, 2526, and 2527--aimed at the immediate apprehension and arrest of German, Italian, and Japanese foreign nationals (House Documents, 1941). All three proclamations noted that after a formal declaration of war, "all natives, citizens, denizens, or subjects of the hostile nation or government, being of the age of fourteen years and upward, who shall be within the United States and not actually naturalized, shall be liable to be apprehended, restrained, secured, and removed as alien enemies" (Code of Federal Regulations 1943, 273-279).

From coast to coast, FBI agents were poised to immediately apprehend hundreds of German, Italian, and Japanese nationals who, up until then, had been working and raising families in towns and cities all across the nation. Despite the natural affinuity many of these foreign nationals felt for their mother country, a great number of those arrested were the parents of American citizens and believed that while they as foreign nationals might be affected because of the bombing, their children who were American citizens would remain unmolested.

The story of internment camps in the United States during World War II has received little notice. To date, most of the attention has been focused on America's evacuation and relocation program which involved some 120,000 Japanese and Japanese Americans on the west coast. Moreover, even the term "internment" is often confused with "relocation" in popular and scholarly works so that the reading public has come to believe that they are one in the same. However, the internment program practiced in the United States was not at all connected to the relocation program; it is the former which provides the backdrop for the subject of this paper, which is an overview of Crystal City's internment camp and its three school systems during World War II--American, German, and Japanese.

The subject of interned American and Latin American school children, however, must be examined within the context of America's social and political climate in the late 1930s, and how this milieu influenced our Latin American neighbors. In addition, pre-wartime schooling in America, which emphasized patriotism, is worthy of a penetrating study. After all, many students participated in scores of victory drives in school and at home--from victory gardens to victory bonds. More than one public school student rolled tin foil in order to help the war effort. Like their "middle America" cousins, German and Japanese American students joined in with salutes and songs to the United States in their classrooms. Hence, their schooling and home experiences enrich our understanding of the perplexing government program of internment that involved entire families. Crystal City's interned children sang patriotic songs and learned about American liberties, all within view of watchtowers and armed guards.

America's internment program, developed prior to the bombing of Pearl Harbor, was formulaic: first, surveillance and arrest; second, jail or other detention facility; third, hearing before a civilian hearing board; fourth, internment, if ordered, then shipped under guard to one of ten main internment camps (Jacobs, Kamasato, Lunz, Strassburger, 1995). The internment camps were operated by the Immigration and Naturalization Service or INS, under the Department of Justice. The Relocation program, however, belonged to the Department of the Interior and was administered by the War Relocation Authority. Its primary responsibility was to remove more than 100,000 Japanese and Japanese Americans, as a result of
Unlike relocation, internment involved the surveillance and arrest of not only Japanese nationals, but also German and Italian nationals who were charged as subversives by the Federal Bureau of Investigation. Since 1939, a number of German nationals had been under surveillance by the FBI, which was successful in breaking up several well-oiled spy rings here and in South America (Weyl 1951, 153). German espionage and sabotage were great concerns of Justice Department officials charged with the protection of sensitive information and war production plants (Hoover 1943, 397). Japanese nationals, too, were watched, more for pro-Japanese propaganda than for actual sabotage. In addition, Latin American governments, especially Peru, deported German and Japanese nationals to the United States as security threats and subversives who might allow the Axis powers to gain a foothold in the western hemisphere (Gardiner nd, 142). Once here, the United States interned them for the duration of the war and beyond. Both Latin American Germans and Japanese, along with their American counterparts, were divided up among various internment camps in the United States. Families of internees faced extreme hardship and were therefore permitted to apply for voluntary internment. They eventually ended up in one of two Department of Justice family camps where they were reunited with the arrested family member. Both family internment camps were located in Texas—Crystal City in the south central region, and Seagoville on the outskirts of Dallas.

The voluntary internment program involved whole families. However, it was not instituted simply because government officials felt responsible for the internees’ families who faced difficulties at home. Rather, it developed as an effort to secure the safety and well-being of American families interned in hostile foreign lands. The Department of State urged the Justice Department to establish a model program of family internment in order to insure against the separation of American families overseas. According to one State Department official, "the Special Division operated on the theory that the Japanese government kept a score card of sorts and metered out reprisals for deemed injustices to Japanese nationals" (Corbett 1987, 32). Hence, a family internment camp in Crystal City, Texas, was established, complete with schools for the citizen children of interned German, Italian, and Japanese enemy aliens, and, later on, German and Japanese children from Latin America.

The small dusty town of Crystal City, Texas, lies approximately one hundred and twenty miles southwest of San Antonio and was named for the clear cold underground springs which gave rise to the growth there of wintertime farming. The pristine waters which surround the town belie both its appearance and its history. Crystal City, not unlike many south central Texas towns, retains a certain timeless frontier quality. For all of its "remoteness," the town was the site of two important historical events, both of which have made an impact upon the "politics" of American civil liberties. The enemy alien internment program of World War II was one such event.

Crystal City’s internment camp was a paradox. On one hand, students enrolled in the American school system—either Federal Grammar or High School—studied democracy and the American way of life, while students registered in either the German or Japanese school learned the standard curriculum taught in Germany and Japan. In addition, both Federal Grammar and High Schools followed recommendations issued by the "Evaluative Criteria" Committee from the State of Texas, which studied over a seven-year period the elements of an effective school (Standards and Activities Bulletin). On the other hand, their lessons on democracy were taught within the barbed-wire, watchtower-ringed compound of Crystal City’s internment camp, which seemed to present the ultimate irony. Not only did internment camp students in the Federal schools learn about democracy in their classrooms, their parents were required to "vote" for representatives from their respective compounds (Instruction No. 58). Thus, the so-called enemies of the State, and their children, practiced elements of democracy in what was a most un-democratic place.

Justice Department officials adopted a "democracy program," which required camp administrators to organize elections for self-government from internee ranks. In the Crystal City internment camp, both the German and Japanese sections voted for council members and a spokesperson, all of whom represented the interests of their respective sections. These exercises in democracy were not missed on the children who no doubt observed their parents’ participation in such endeavors. Moreover, for those children who attended either the Texas accredited Federal Elementary or High School, communal democratic politics probably reinforced their lessons on American government and democracy which were elements of the Texas Education Commission’s accredited curriculum.

The camp received its first families on December 12, 1942. Crystal City's first internees were 115 Germans which, after the arrival three days later of an additional 15 family members, made up a total of 35 families (Historical Narrative of Crystal City, 6). The internment camp at Crystal City was originally designed to only detain Japanese nationals and their families. However, by the time it opened, that idea had been abandoned in favor of a mixed nationality group (Ibid). When Crystal City's internment camp received its first internee families, plans for schooling were already in place. The earliest document which discusses the proposed personnel strength for the camp was dated January 6, 1942, less than one month after the bombing of Pearl Harbor. It lists some 79 authorized employees—including a German/Spanish interpreter—and its assessed needs as 144 total (U.S. INS to Officer in Charge, Crystal City 6 January 1942). Out of that total, the education department required 19 positions, including a superintendent, 2 principals, and 16 teachers. Robert Clyde (Cy) Tate was hired in April of 1942, as the superintendent of schools and reported directly to J.L. O'Rourke, Officer in Charge.

The first objective of both the Supervisor of Education and the Officer in Charge was to establish school policy. The general belief of Immigration and Naturalization Service officials was that a good many of the enemy aliens interned in this camp would either voluntarily return to their homeland or perhaps be deported. Therefore, a "native language school system was approved for each group. Internees served as teachers, and pedagogical procedures and organization were vested in them, subject to the Administration's approval and sanction of subject matter" (Historical Narrative nd, 25). In order to construct the history of both the German and Japanese schools, the author interviewed dozens of former students. Their oral histories are the source of rich classroom stories such as the Japanese custom of bowing to one's teacher, or the gruff sounding German language which penetrated the air and caused more than one American boy to sit up straight.

Otto Strassburger was 13 years old when his father was arrested by the FBI in 1943. Otto recalled that after months of separation, he and his family traveled to Crystal City to be reunited with his father. At his father's insistence, Otto enrolled immediately in the German school. However, he was unhappy over the prospect because he did not speak German. When asked why his father insisted that he attend German school, Otto replied, "I think he felt that since everyone else was, practically all the Germans I believe at that time went there whether they were planning to stay in the United States or had plans to go to back to Germany." Otto went on to say about his experience in German school that he "hated it in the beginning because I was a pretty big guy for an eighth grader and I was stuck first in the normal class I should have been in, I couldn't hack it and they put me in the seventh, the sixth all the way down to the fifth... but I was a big hulk, this big guy in a class with little children" (Strassburger, 1995).

Art Jacobs, like Otto, enrolled in German school. Art recalled that the decision to attend the German school was probably his father's because in his words, his father "had decided that we were going back to Germany and figured his boys better learn the language if they were going over there." Art's first impression of his first few days in school were negative. "My teacher was, I hate to say this, but I would classify him as a Nazi. He may not have been," Art said, as though contemplating what he had just stated. His German teacher may very well have seemed to this eleven year old the epitome of what an impressionable young boy would deduce to be a Nazi. After all, Art had attended large public schools in Ridgewood, New York, prior to his father's internment, and was, therefore, used to an American style of education complete with the mannerisms and customs of American teachers and classrooms. This was to say, teachers who spoke English and conducted class with a certain familiarity. These were the practices Art Jacobs found lacking in the more austere, rigid classrooms in Crystal City's internment camp's German school (Jacobs, 1995).

Cheiko Kamisato, a Japanese Peruvian, did not remember with clarity her schooling in the Japanese language school in Crystal City. Cheiko was raised in Lima, Peru and attended Japanese language school there. When Japanese nationals in Lima were rounded up, the language schools were closed—many of those arrested first were Japanese language school teachers—therefore, some students enrolled in neighborhood Spanish speaking schools, while others, including Cheiko, stayed home and took their lessons from private tutors. When her family was reunited in Crystal City, Texas, Cheiko enrolled in the Japanese language school along with other children from Peru and some from the west coast of California (Kamisato, 1995). One of the greatest problems faced by teachers in the Japanese school was to provide services for children who primarily spoke either Spanish or English, not Japanese. Unfortunately for language school administrators, an overwhelming number of Japanese children spoke the language of their country of birth, not that of their parents' homeland.
Although Cheiko does not remember specific instances relating to her education in the internment camp, others recall the ritual of bowing to the teacher when entering or exiting a room and the many stories imbedded with ethical or moral values, a common trait of the Japanese style of language education. One incident remains, however, in the memory of almost all Japanese students, whether they were citizens from Latin America or from the United States—the issue over the Junior/Senior prom for students of Federal High School.

The internment camp’s Officer in Charge, Mr. O’Rourke, sanctioned the end-of-the-year prom for Juniors and Seniors at Federal High School, along with school Superintendent Cy Tate. The Japanese section of the camp contained a number of vocal political factions, one of them, pro-Japanese. This faction, led by several Buddhist priests and other language school teachers, denounced the dance as un-Japanese and immoral. Their spokesperson, Ryuchi Fujii, sent letters to Tate, O’Rourke, and the Spanish legate—the protecting power for Japan—and warned the parents of language school students that the teachers would resign if the dance proceeded. Mr. Tate offered to withdraw the dance, but Mr. O’Rourke said that the dance would go on because Federal High School was an American high school and the pro-Japanese faction should not be allowed to have influence over the decisions made regarding American students. The dance went on, the teachers resigned, and to this day all of the students, regardless of which school they attended, remember the Junior/Senior prom well (Fujii to O’Rourke 1944, Fujii to Harrison 27, O’Rourke to Kelly 1944).

School newspapers which survived speak for the "Americaness" of both the Federal Grammar and High school. One issue of Federal high school's Campus Quill, (1945) contained the names of honor-roll students as well as news about the upcoming play "The Night Owl," directed by Miss Katherine Goldsmith, a teacher who enjoyed the love and admiration of every former student interviewed. The grammar school's Yehudi Express, June 2, 1945, recounted the elementary school's history noting that when Federal Elementary School began only seven pupils of the present graduating class lived in various relocation centers.

Mrs. Lee Lunz, a former grammar school teacher in the internment camp, still lives in Crystal City. She was recruited by Superintendent of internment camp schools, Cy Tate, with whom she worked prior to the outbreak of the war. Mrs. Lunz taught seventh and eighth grades and recalled that her time spent teaching Japanese American children was the most rewarding in her teaching career. However, she also stated that she experienced times of mixed emotions because she had relatives who were fighting in the Pacific (Lunz, 1995). Her former students, though, remember her with equal fondness. Toni Tomita remarked in her interview that Mrs. Lunz was the reason that she herself became a teacher (Tomita, 1995).

Each former student brought a new insight into the internment camp story and what it was like to be schooled not only during wartime, but inside a compound which was the size of a small homogenous city. The internment camp housed some 4,000 residents, divided by nationality groups. The family internment camp in Crystal City was monitored, its mail censored, and the internees' visitors restricted. At the same time, internees were expected to organize through a democratic process and vote on councilmen and spokespersons, which would then decide upon rules for communal living. The children of internees attended either native language schools--German or Japanese--or the American schools, where they took their lessons in English and studied the history of both Texas and the United States as well as other regular accredited subjects.

Almost none of the Japanese Americans involved in this study recalled negative impressions of their days in Crystal City. Most said that it was a happy time, a time of friendships. As for the political situation, nearly all former students agreed that they were politically unaware as their parents made most family decisions; therefore, war and internment really did not concern them. Many failed to see the great irony of their situation until adulthood, when they began to realize that until the outbreak of World War II, they believed that they were regular American kids living an average American life. Not until their parents' arrest and internment did they understand that to the outside world they were the enemy.

School Bands During World War II

H. Stanton Tuttle
The University of Texas at Austin

It is Saturday, December 19, 1942. Austin's House Park is packed with more than 700 excited fans, anticipating great things from their football team. Today's contest is against the Breckenridge Buckaroos, and a lot is at stake: the winner moves on to the final game for the state championship, the loser goes home to contemplate what might have been. As usual, the marching band is present to instill pride and provide encouragement to all. The fans, the announcers, and the team are all ready for the big game. A big halftime performance by the Maroon Band is planned, which will surely encourage the fans and spur the team on to victory. Before the game, the crowd rises to its feet as the band, under the direction of Mr. Weldon Covington, prepares to play the school song, written by Mr. Covington, "Loyal Forever." The players, standing like soldiers on the forty yard line, prepare for the school song as well. All sing the words as the band plays. On this cool December day, the Maroons go on to an inspired 28-7 victory over Breckenridge.

This description sounds like a rather routine event that could take place in any Texas town during any football season. However, in December 1942 these events took place in the context of World War II. The fans and band were actually listening via radio, broadcast over the loudspeakers, in front of an empty football field in Austin. The football team itself was in Breckenridge, some 250 miles to the northwest. Wartime travel restrictions and rationing of gasoline and rubber precluded the band and most fans from travelling to away games, and this state semifinal game was no exception. Since this game was significant to the state football championship, all possible game day conditions at Breckenridge were replicated at House Park. On cue, Mr. Covington struck up the band. The football team and the few fans at Breckenridge sang as the band played and fans sang at House Park. The band performed its halftime show for the fans crammed into the stands. Austin High not only won this game, but also went on to its first and only state football championship one week later by defeating Dallas Sunset High School at the University of Texas' Memorial Stadium in Austin, in what, for all intents and purposes, was a home game for the Maroon faithful.

Just as the preceding story demonstrates how one high school band was a very important part of life for its school and community during World War II, this paper will discuss the importance of bands to both schools and communities during the war. The Austin High School Maroon Band's story, not atypical, will show the ways high school bands could and did contribute to the war effort.

Bands had been an important part of many high school curricula for at least twenty years when the United States entered World War II. Bands had found their way not only into the school curriculum, but also into the very way of life for many American communities. As the number of bands grew rapidly, citizens generally came to believe that bands "proved to be an indispensable part of the school and community activity." Academic credit for band as a school subject had slowly become the norm. Communities came to expect the school band to be a part of its activities as well, even if there was little if any "educational value" for the band members. The demand for the band to perform at community functions "has in itself brought about many of the band problems that have caused much concern on the part of band directors and school administrators."

In Texas, during the 1939-40 school year, 241 schools participated in the University Interscholastic League band contest. During 1940-41, 357 bands, with more than 20,000 students, participated in UIL-sponsored band competitions. Across the nation, school bands showed similar popularity. Both state and national competitions were held yearly, demanding more and more of the bands' time and money. In 1941, the Texas Association of School Administrators decided that the schools of Texas would no longer participate in national contests, "due to enormous expense, scholastic difficulty, and community confusion." It is safe to say that had the administrators not made this decision prior to America's entry into World War II, participation by Texas bands in national competitions would have ceased anyway, at least for the duration of the war.

As the nation mobilized for war, many routine expectations of the American lifestyle changed dramatically. Gasoline and rubber rationing prevented many from travelling by automobile. Travel restrictions kept nonessential and non-military travellers from using trains and buses. Food was also rationed, and many commodities taken for granted, such as fresh meat, milk, and sugar, became scarce.
The school curriculum was not exempt from wartime influence. An increased emphasis on science, mathematics, history, and physical education caused changes in the day to day experiences of most high school students. School assemblies, an almost weekly occurrence in many schools, became more and more patriotic in their themes. War bond drives, patriotic send-offs for new recruits, and memorial tributes to those who had given their lives in service to their country became commonplace across America. The bands helped solidify patriotic feelings in both schools and communities.

Teachers were not exempt from being conscripted into military service. As male teachers went off to serve their country, many positions were filled by women who had been laid off during the hard times of the Depression, and other new teachers were taken from college campuses, prior to graduation. Talented men from all academic disciplines went off to war, leaving gaping holes in expertise and experience behind in the schools. Music teachers and programs were no exception.

It is one thing for an inexperienced teacher to teach a subject such as history, of which she can improve her knowledge rather quickly through reading. It is quite another thing altogether for an inexperienced teacher to be thrust into one of the most visible positions, that of music teacher and band leader, requiring instant acquisition of many skills, from the logistics of moving a band and its equipment from place to place to the technical expertise required to synchronize the sounds of the many different instruments and marching techniques of the band.

Fortunately, the music educators’ professional journals of the era gave these “emergency teachers of music” advice on how to organize, equip, practice, and perform. Helpful hints, tips, and bibliographies of resources helped point the way for quality program planning. One article, "Aiding the Emergency Teacher Of Music," stated "that the emergency teacher still wants to do a good job and is therefore anxious to be re-oriented to present day teaching technics [sic]. With help... plus a little display of energy the good job can be done." Another article encouragingly stated, "...and all you have left to do now is to read the article, try the ideas, then send a note of thanks to [the author]."

Other professional literature of the era indicated that music and band programs were very important in both schools and communities. Authors emphasized the importance of music and bands, the necessity of quality teachers and programs, and how the bands could make a very positive impact on both the school and community. Although cautioning against overuse, one author stated, "The band is really one of the best forms of advertisement to the public of the results of a sound educational program in the school."

High school music and band proponents were using every means at their disposal in order to maintain quality, quantity, and funding for their bands. The words of President Franklin D. Roosevelt rang out from the cover of The Enude Music Magazine in July, 1943 that "music builds morale. Music inspires our fighting men. Music spurs soldiers on the production front to new goals. Music refreshes all of us..." Further, Mrs. Eleanor Roosevelt, as Assistant Director, Office of Civilian Defense, also endorsed music, especially school music, as a way to improve morale.

Other authors of the era wrote about such topics as "Music’s Part in Winning the War," "Wartime and Music Education," "School and Community Music in Time of War," "Music and the Present Crisis," "School Bands in Wartime," and "Aspects of Change in the Wartime Music Program." The themes that ran throughout these articles included an emphasis on the patriotic nature of music and bands, the shortage of students and teachers for music, and how the difficulties being encountered could provide innovative teachers opportunities to excel. Program suggestions and techniques were also provided.

Other articles, apparently published to encourage administrators, teachers, and students, highlighted the importance of school music and band programs to the nation’s military effort. "Music--A Military Necessity" and "Public School Music Finds Its Niche in the War Effort" both provided the reader with examples of how the military was using bandsmen to stimulate the forces to victory. These articles also pointed out that the pool of bandsmen being drafted were of very high quality, and the average GI was smarter musically than his doughboy father who fought in World War I.

Several high school band programs were described in contemporaneous literature. "A Year in the Life of the Hobart [Indiana] Band" listed and described the band’s academic year of practices, contests, and parades. Over 200 appearances were listed, which "represent[ed] a minimum of appearances since many solo and ensemble performances were never reported." Baltimore’s vocational-professional music curriculum, adopted in 1942 and implemented in the midst of the war, was designed to prepare students for a professional career in music. Students could take part in this course of study...
by attending either a boys' or girls' high school, with up to ten hours of music courses each week. The curriculum "reflected current thought and practice."²¹

Music thrived during the war. Bands were in constant demand. When the band played, morale improved. More war bonds were sold. Disabled veterans, recovering from wounds, felt better. GIs on Saturday nights got to shake a leg as a dance band played. In Austin, Texas, the Austin High Maroon Band contributed greatly to the war effort. As the only white high school band in the segregated capital city of Texas at that time, the Maroon band thrived in a time when people needed to get their minds off the war.²²

When the city of Austin first opened its schools to students in September 1881, the high school, with grades eight through eleven, had two teachers and two departments: mathematics and classics. After several years of transient homes including the Temporary Capitol Building, Austin High found its permanent home in 1925 on Rio Grande Street. The school moved to a new campus on Austin's Town Lake in 1976. In 1952, as the city prepared to open two new high schools, "the name was officially changed from 'Austin High School' to 'Stephen F. Austin High School' to honor the father of the state."²³ The oldest high school in Texas and Austin's only white high school until 1953, Austin High is rich in history and tradition. Significant in this history is the Maroon Band.

*The History of Stephen F. Austin High School* explains the beginnings of the band program:

Instrumental music began about 1924. John Philip Sousa conducted the band during a performance in 1928. Weldon Covington took over the band and orchestra in 1931. When he first directed the band at a football game in the 1930s, he said he played a horn with one hand and beat a drum with the other. Conditions improved, though, for under his direction the band donned uniforms and both the band and orchestra acquired instruments, music, and awards.²⁴

From rather inauspicious beginnings, Mr. Covington built the band from almost nothing to national prominence during the 1930s. The Maroon Band won national championships in 1938, 1939, 1940, and 1941. It won state UIL band championships each year a competition was held from 1935 until Mr. Covington left as director in the early 1950s. During World War II, the Maroon Band, with over 100 members, was a truly outstanding organization.

As elsewhere in America, World War II changed the way of life for the Maroon Band. State competitions were suspended for the duration as travel restrictions and rationing took effect. Travel to away games of sporting events was nonexistent. Purchases of new equipment and uniforms were suspended. Little was available to be purchased anyway. Repairs and taking care of what equipment was available became the order of the day. Although travel was restricted and times were tough, the band nevertheless became a prominent part of the Central Texas scene.²⁵

The band played at weekly school assemblies. The music performed was more patriotic and martial, almost all marches, than before the war. A typical assembly would generally include honors for those students who were joining the armed forces and memorials for those alumni who had given their lives in service to their country. Winners of school war bond and stamp competitions would also be honored. For example, in 1943, some students were honored for selling over $100,000 in war bonds during a bond drive. Another group collected over 4200 books for a Red Cross book collection drive.²⁶

The band also had the opportunity to perform in the community at war bond rallies, parades, and other patriotic gatherings. Mr. Covington stated that the band played at almost "all of them."²⁷ Celebrities, such as Jack Dempsey and Lyndon Johnson, were often guest conductors of the band during such events. Mr. Covington and his band especially enjoyed travelling to nearby military posts, such as Camp Swift in Bastrop, Texas.

The Army provided buses to transport the band. When the band finished its performance, the members would be treated to a meal and other refreshments, which meant the students would get such things as real milk shakes, meat, sweet pastries, and other items which were rationed in the civilian community. The Army was happy to feed the band members, since the band helped improve the morale of those they entertained.²⁸

Since most men of draft age were serving in the armed forces, Austin's local dance bands disappeared during the war. Mr. Covington organized a group of about a dozen Maroon Band members into a dance band which played regularly on weekends at such places as the Stephen F. Austin Hotel. Mr. Covington related that the parents would let their high school age children play in the dance band as long as he was with them. As chaperon and sponsor, Mr Covington saw to it that
the bandsmen didn't drink at the dances. (He said that he was almost always successful with that task). Servicemen from all around Central Texas would come to Austin on Friday and Saturday nights to dance and relax to the tunes provided by this professional dance band. Since the band was not an official part of Austin High, they were paid for their work. And, since they played together regularly, they "got pretty good."

The winter concert, given December 14, 1944, featured two guest conductors. Both were Maroon Band alumni who were in military bands. Irving Berlin's "White Christmas" was included in this holiday concert, while most songs remained patriotic. Sousa's "Stars and Stripes Forever" was the finale. The school newspaper, The Austin Maroon, reported that "Proceeds from the [December 21st] concert will be used to buy band equipment. Servicemen were admitted free." In October, 1944, a feature article in The Austin Maroon listed the large number of band alumni serving in the armed forces. The article added that the school band had helped them in their work in armed services.

Even though the Maroon Band's pre-war routine was changed dramatically, the band thrived during World War II. With all that the band did in the way of performances at assemblies, parades, rallies, and nearby military bases, it's probably just as well that state competitions and travel to away games were suspended. The Maroon Band made a very positive contribution to the war effort, both in Austin and for the armed forces.

When the war ended, the nation started to return to normalcy. Austin High was no exception. But lives had been changed forever, and this generation of high school students probably felt more appreciative of many of the things of life that they and their families had taken for granted just a few years earlier. Additionally, Maroon Band members and their fellow bandsmen across America could take great pride and satisfaction in the very significant, positive impact they had on the war effort.

Endnotes

Early in the 1800s, schoolmasters accounted for most of the teachers in the country. As common schooling spread through the states and territories, however, the relatively low numbers of qualified schoolmasters could not fulfill the rapidly expanding demand. At the same time, Horace Mann, Catherine Beecher, Henry Barnard and others who championed the cause of women teachers helped inspire a movement where women not only assumed these positions, but eventually dominated the field. As women's participation in teaching increased, men found the work decreasingly gratifying for a number of interconnected reasons, and many left the field. Those who remained sometimes found their masculinity challenged in what many regarded as a newly feminized profession. However, a few men managed to create niches, such as school administration, where their masculinity could not be impugned.

Historical accounts of the development of school administration tend to detail the events and lives of early school administrators, tracing a steady evolution of bureaucratic educational structures and practices. Often missing from these accounts are the stories of teachers. As a result, these analyses tell little of how school administrators interacted with teachers, reacted to teachers, and shaped and defined themselves in the context of "feminized" work. The stories of teachers and school administrators, however, are integrally linked. To tell something of how male superintendents created and structured the superintendency, then, I must first offer a brief overview of the process by which teaching became women's work.

The Feminization of Teaching

The burgeoning popularity of common schooling in the early decades of the nineteenth century required ever greater numbers of qualified teachers. The burdens of campaigning for local school taxes, overseeing the construction of school buildings and working in sometimes chaotic and overcrowded classrooms often overwhelmed many young men who found that a wide variety of other pursuits offered easier labor, higher wages and faster promotions. If sufficient numbers of teachers were to be found for these schools, new groups of persons would have to be identified, recruited and trained.

Horace Mann anticipated the impending difficulty in attracting and training a large cadre of teachers. He reported to the Massachusetts Board of Education that women made excellent teachers for young children because "their minds are less withdrawn from their employment, by the active scenes of life; and they are less intent on scheming for future honors or emoluments. As a class, they never look forward, as young men almost invariably do, to a period of legal emancipation from parental control, when they are to break away from the domestic circle and go abroad into the world, to build up a fortune for themselves."2

Others who championed the cause of women teachers argued that women's essential maternal instincts suited them better for instructional work than men. Catharine Beecher advocated that "our Creator designed woman to be the chief educator of our race and the prime minister of our family state.

Debates may have raged about the natural superiority of women as teachers. However, there was no disagreement over their cheaper cost since women tended to work for one half to one third the wages of men in equivalent positions. Women accepted lower pay because fewer employment opportunities awaited them. Parents needed their daughters' domestic services less as production moved out of the home. Besides teaching, the two other jobs most available for women, domestic labor in other homes and factory work, entailed a loss of social standing. Through teaching women not only maintained their social standing, but in many cases improved it since female teachers often received significant community respect.

The increasing availability of normal schools and other types of formal education also contributed to a rise in the percentage of women teachers. Many school administrators eventually required teachers to formalize their credentials by attending summer institutes as well. Such institutes provided instruction to nearly a quarter million teachers by the turn of the century. Interestingly, they also exacerbated the drop in the number of male teachers. Some men who taught during the winter and worked the fields during the summer found that the extra training cost more than it returned. In some regions
of the country, many male teachers also worked in other professions, but with the increased year-round demands of the classroom, the feasibility of pursuing both professions proved unworkable. Eventually these men left teaching, and the overall percentages of male school teachers plummeted.\(^5\)

Numerous scholars have documented this steep decline in the numbers of schoolmasters in the nineteenth and early twentieth centuries. Although surveys differ in their estimations, men probably accounted for around 40% of school teachers in 1870, but only around 15% by 1920. Strober and Langford have attributed much of this change to urbanization and the "formalization of schooling." Rury contends, however, that urbanization may not have been as important a factor as school enrollment rates. Schools with large enrollments tended to have proportionately greater numbers of female teachers than small ones, whether or not the schools were urban.\(^6\)

Regardless of why teaching became 'women's work,' many scholars have noted the feminization of teaching in conjunction with the simultaneous development of school administrative structures. Some historians have argued that the large increase in the number of female teachers may have provoked some school systems to construct bureaucracies for managing their behavior. It is also possible that teaching became feminized because bureaucratic structures started to emerge. The determination of ultimate causality may prove to be a futile exercise, though, since the two phenomena undoubtedly interacted in complex and mutually dependent ways. What is clear is that the bureaucracy of school administration rapidly became a male enclave within the feminized teaching profession.\(^7\)

### The Rise of School Administration

Common schools grew, changed and adapted in an industrial era. Not surprisingly, educators spoke of schools in industrial terms; politicians and experts sought to build schools based on industrial models, and personnel structures in schools eventually came to resemble those in manufacturing sites. Ellwood Cubberley reflected on the connection between schooling and industrialism when he explained that "our schools are, in a sense, factories in which the raw materials (children) are to be shaped and fashioned into products to meet the various demands of life."\(^8\)

Factories not only shaped raw materials, but a supervisory class of men ran them. This administrative feature seemed desirable and provided a ready model for those seeking to build schools. Josiah L. Pickard, superintendent of Chicago schools from 1864 to 1877, described the need for a school superintendent whose functions and roles resembled those of the industrial supervisor: "In every branch of human labor the importance of supervision has grown with the specialization of labor. The more minute the division of labor, the greater the need of supervision. . . . [The worker] might acquire the knowledge, but at the expense of his efficiency in the special work he is to perform. Over him . . . stands one whose special work is to adjust the parts, make himself familiar with each, but freed from active work in any part. He is the overseer, the superintendent."\(^9\)

The addition of supervisory classes of personnel in schools paralleled the emergence of managers and superintendents in industry. Also, to insure the "more minute division of labor," schooling advocates soon lobbied for the construction of schools larger than single classroom buildings. School boards then usually selected a well-respected teacher to serve as the teaching principal, essentially the overseer, who provided curricular leadership, managed the logistics of acquiring instructional materials, and directed building cleaning and maintenance. As school enrollments and building sizes grew, formal school organization also changed. A strictly administrative principalship eventually replaced the teaching principalship, a change with which the principal received increased powers and responsibilities.

When men taught in schools, they usually became the leaders or principals, positions for which a man's strength was supposedly needed. One educator explained, "One man could be placed in charge of an entire graded school of 500 students," a large school at the time. "Under his direction could be placed a number of female assistants. Females are not only adapted, but carefully trained, to fill such positions as well as or better than men, excepting the master's place, which sometimes requires a man's force." The nature of a man's force is not clear here. Women might be carefully trained, but that training did not necessarily point to school leadership positions. With their manly force, men directed the activities of women who in turn were expected to be well trained, yet compliant.\(^10\)

In some respects, early women teachers broke with traditional expectations when they left their homes and domestic duties. When they arrived in classrooms of graded schools, however, they discovered that they were still expected to assume their diminutive positions in relationship to males who served as administrators. Said Aaron Gove, Denver Superintendent of Schools, "If teachers have advice to give their superior, it is to be given as the good daughter talks with the father. . . ."
The dictation must come from the other end." If women behaved in a noncompliant manner, administrators accused them of behaving unprofessionally. Such accusations effectively stripped women teachers of one of the few public rewards conferred by their position, middle class status.11

Male teachers, however, faced a different problem. With the increased polarization of school roles by gender, men found that they either had to fulfill their gender expectations by aspiring to administrative positions, or they had to accept a compliant role, one usually reserved for women. A group of New York schoolmasters in 1904 complained that "the profession has become so feminized that men have felt a loss of social standing while engaged as teachers." Some men lashed out at the profession of teaching, complaining about the disrespect it received and criticizing the increases in the number of women teachers. In 1853 at a schoolmaster's convention, Susan B. Anthony responded to some of these men who first debated whether or not to break with tradition and let a woman speak: "It seems to me, gentlemen, that none of you quite comprehend the cause of the disrespect of which you complain. Do you not see that so long as society says a woman is incompetent to be a lawyer, minister, or doctor, but has ample ability to be a teacher, that every man of you who chooses that profession tacitly acknowledges that he has no more brains than a woman? And this, too, is the reason that teaching is a less lucrative profession, as here men must compete with the cheap labor of woman. Would you exalt your profession, exalt those who labor with you."12

Rather than attacking the increasingly feminized nature of the teaching profession, other men who valued their independence in making classroom decisions attacked the authoritarian control exerted by the men serving in the newly created administrative layers. Said one male teacher in Oregon, "By degrees there is being built in our state a machine among the 'aristocratic element of our profession that ... will make teachers serfs."13

This top-down, gender defined school organizational system did not meet with universal acceptance among women teachers, either. Mary Abigail Dodge Hamilton, teacher, philanthropist, and educational leader, wrote in 1880 that "the thing which a school ought not to be, the thing which our system of supervision is strenuously trying to make the school into, is a factory, with the superintendents for overseers and the teachers for workmen ... teachers ought to run the schools exactly as doctors run a hospital. The superintendent is a mere modern invention for receiving a salary, whose beneficence seldom rises above harmlessness, whose activity is usually mischievous."14

Advocates and critics alike noticed the parallels between the emerging shape of educational administration and industrial management schemes. Even though Mary Hamilton noted that alternative organizational strategies might be adopted for schools, school administrators consistently spoke of the value of adopting hierarchical management systems. With such systems, their power would clearly be based in their positions, unmuddied by the complications of teachers' ideas or desires. Administrators would have dominion in the schools, just as many believed men should have dominion over their wives and children. The organizational structures adopted by many school systems, then, came to resemble those of traditional families with gender-bound power relationships just as much as they paralleled hierarchical industrial management schemes of the time.

The Woman Peril in School Administration

Where administrative classes appeared in schools and systems around the country, men ascended into them. In schools, men would automatically receive promotion to teaching principal or principal over women since they were not expected to serve under women. If no men were available, though, a woman would be promoted. Likewise, in city and county school systems, men were appointed to superintendencies unless there were no men available, in which case women might receive promotions.

Many midwestern and western states, however, elected their county superintendents rather than having appointive positions. In some cases local women campaigned for and won these positions even before they could vote. Eventually a number of these states granted women school suffrage so they could vote in elections pertaining to local education. Some viewed this limited suffrage as a test for women's worthiness for general suffrage. Since many women actively participated in these campaigns, a number of these states granted women full suffrage in the late decades of the nineteenth century.

By the turn of the century, midwestern and western states employed numerous women county superintendents, and in some states they accounted for the majority of superintendents. Overall, 288 women county superintendents served in 1900, a number that increased to 876 by 1930. The State Report of Kansas in 1873 explained that "as county superintendents, the verdict is that those elected in this State 'have done their work faithfully and well, as well as the best
and far better than many of the men. ' The superintendent hopes that this new field, as well as professional chairs in high schools and colleges, will remain open to all, male and female, in fair and honorable competition."

The work of county superintendents demanded a great deal of traveling, paperwork, and supervision. Some rural county districts covered so much land and contained so many schools that even the most hardworking superintendent completed her work with difficulty. William Chancellor, political science professor, explained that "the average county superintendent has something like six to ten times as much to do as the average city school superintendent." To make matters worse, county superintendents tended to make significantly less money than city superintendents, a matter that further discouraged men from vying for the position. Some contended that the men attracted to this kind of work were more interested in maintaining their political stature than in supervising schools effectively. Chancellor argued that perhaps the salaries of county superintendents should be reduced further to increase the number of women superintendents, since they tended to invest themselves fully in their work."

Rather than be deterred by the demands of difficult work, many women aggressively sought superintendencies, regarding these positions as signifiers of women's increasing power and influence during the suffrage campaigns. As a group, however, male school superintendents around the country soon rallied together to reshape the superintendency into a position for which few women would be able to qualify a few decades later.

**Masculine Structuring of the Superintendency**

It is difficult to find explicit evidence that superintendents spoke of keeping women out, since, as Louise Connolly complained in 1919, "You may search the educational literature of the past two decades for this tendency and you will search in vain! The journals which they edit, the conventions which they run, the associations which they form, say nothing about it." However, the structural and practical changes instituted by organizations of male superintendents consistently reduced the numbers of women in school leadership positions around the country. While superintendents justified these actions as making the field more professional, it is no coincidence that women eventually found themselves closed out of this work."

There were a number of strategies by which male superintendents established this securely separate position. First, they sought to form associations of male school administrators. Second, they aggressively labored to increase the credibility of their work by pushing for a national bureau of education through which members could collaborate for professional causes. Third, they worked to enhance the scholarly quality of their work, to establish journals and other publications to chronicle and legitimize their efforts, and to create administrative preparation programs in universities and colleges that would screen future administrative candidates.

Around the country a number of cities with growing school systems established superintendencies in the nineteenth century; for instance, thirty were established from 1837 to 1888. By August 1865, a group of male superintendents of urban school systems banded together to create the National Association of School Superintendents, an organization devoted to increasing the professional prestige of education in general and the superintendency in particular. In 1870, these superintendents joined with allied education organizations to form the National Educational Association. NASS then became the Department of School Superintendence of the NEA."

The annual meetings of the Department of Superintendence took on several different functions. For one thing, they produced lively debate about the identity and role of the superintendent, as well as discussions about emerging national schooling issues. However, another important function of the annual meetings was for superintendents to meet, compare notes and offer each other support. Superintendents faced many humbling problems in their daily work. Newspapers criticized school officials routinely, and many local politicians scored points with voters by decrying the management of tax funded school systems. In one response to these attacks, the newly formed Department defended itself by passing a resolution that read, "Members of this Department... welcome and encourage all fair and candid investigation thru commissions or other agencies into the soundness and effectiveness of the policies and methods used and the results obtained, but... we condemn and resent all such investigations whose obvious purposes are to debase the systems or exalt the investigators."

Besides defending themselves against public attack, many superintendents found that through their organization they could work together to gain professional clout, expertise, funding, information, and to build networks of influence. Some members of the Department of Superintendence controlled the NEA as a whole, forming a group that David Tyack has
called the "educational trust." This superintendent-heavy ruling body usually selected presidents of the NEA.

Not coincidentally, the Department of Superintendence had few female members. The "education trust" had none and further did not allow women to speak at its meetings held during NEA conventions. An early challenge to this closed system came during the 1901 convention. William Torrey Harris (U.S. Commissioner of Education from 1889-1906) commented on the advisability of asking the wealthy to give money to schools. Margaret Haley, the organizer of the Chicago Federation of Teachers, stood up and furiously charged that the first consideration for the meeting should be given to improving woefully inadequate teacher salaries rather than to asking the rich for charity. Harris responded, "Pay no attention to what that teacher down there has said, for I take it she is a grade teacher, just out of her school room at the end of the year, worn out, tired, and hysterical. It was a mistake to hold NEA meetings at this time of year... and if there are any more hysterical outbursts, after this I shall insist that these meetings be held at some other time of the year." When Harris accused Haley of a hysterical outburst, he employed a powerful rhetorical weapon that usually silenced women -- he implied that women were not capable of rational thought but instead could only create emotional outbursts.20

By establishing organizations for superintendents that excluded or discouraged women's participation, women were effectively closed out of many discussions in which members determined future policies and practices. Since the Department of Superintendence eventually became one of the most powerful lobbying and policy-writing educational organizations of its day, women's exclusion from influence was virtually guaranteed.

After the establishment of the Department of Superintendence, members worked to broaden their influence by forging strong links with the federal government. One of the first actions of the Department was to send a contingent of lobbyists to Washington, D.C. to work for the creation of a federal office of education. Not only were these efforts rewarded, but the Department also succeeded in getting the favorable attention of a future national president. The Department also made efforts to court relations with universities and colleges, as well as with foundations, businesses and other brokers of power.21

Finally, organized school superintendents sought to sharpen the intellectual quality of their work by increasing scholarship, publishing works related to their profession, and helping in the establishment of administrative preparation programs in elite universities around the country. An important route to attaining this intellectual status was for superintendents to portray themselves as philosopher-leaders with valuable intellectual skills. For the most part, superintendents in the late 1800s were not particularly well educated or trained. Those superintendents who had received liberal arts education tended to view themselves as "scholars or statesmen rather than business managers." These scholarly leaders included William T. Harris, William Maxwell (later the New York State Commissioner of Education), John Philbrick, and William Payne (later the president of Peabody Normal School).22

William Payne, for example, wrote Chapters on School Supervision (1875), the first published book about the school superintendency, while serving as a superintendent in Michigan. In this work he described the natural development of the superintendency as the process of separating the thinking person from the person who executes, the general from the troops, the superintendent-philosopher from the teacher. He wrote, "The hand and the brain both toil. Each has its appointed office to fulfill... The commanding general, who, at one glance, takes in the whole military situation, and wields his forces so as to meet the exigencies of the situation, is the natural superior of the thousands who, with powers of mind less comprehensive, merely execute the plans prescribed by their leader... Superintendence is therefore not only a necessity, but is the highest and most productive form of labor." Payne's ideal superintendent, then, produced the highest form of labor, that of thinking about and directing the actions of large numbers of subordinates. The growing complexities of large schools and systems, he argued, necessitated such an intellectual, responsible leader. He concluded that the superintendent had to be well educated and thoughtful and that this background and ability would separate him from his minions.23

Payne was not alone in arguing for a philosophical orientation for superintendents. Charles Francis Adams, a prominent businessman, challenged superintendents at the 1880 meeting of the NEA to move to a new level of sophistication. "We want supervision badly enough, but not that supervision [which is mechanical.] It is certainly not the province of the Normal Schools to supply it." Normal schools provided instruction mainly for women. "They educate teachers, it is true, but the work in hand is something more than direct teaching;--it is the philosophy [sic] of teaching. It is a distinctly-higher walk of the profession. It accordingly implies in those who devote themselves to it a preceding groundwork of general education not required in pupils of our Normal Schools." He did not discuss why normal schools
could not provide this type of education. "It is in fact a legitimate portion of University training, which always supposes the groundwork of an undergraduate course." Few women at the time had access to universities or this type of education.24

Adams went on to explain that the tradition of education at the Eastern colleges "singles out teaching . . . as an unworthy thing, as a mere calling, which can lay no claim to being an honorable profession . . ." At the time, teaching provided honorable employment for women, even though it may not have been considered as such for men. Also, men were honored for pursuing the call of the ministry. The fact that teaching was considered a calling did not provide sufficient explanation for why it was considered "an unworthy thing." He continued, "Any 'prentice hand is equal to it. And holding this tradition in regard to elementary teaching, the Universities hav faid [sic] to draw the line between the superintendent from the usher." He went on to suggest that universities, which at the time limited or excluded women's admission, find it within their dignity to offer programs to prepare superintendents. These programs should be academically rigorous so as to legitimize the study. Adams challenged the superintendents to make themselves more respectable as a group. This should be done through the creation of professional programs at the university, programs that not only prepared superintendents for their distinctly higher philosophical walk, but also made education into a science. He also dared universities to take the needs of common schools seriously and to contribute to the development of such programs. Within three decades of Adams' speech, several of the prominent universities in the country had taken up his challenge and developed special programs for persons aspiring to school superintendencies.25

Stanford, for example, hired Ellwood Cubberley in 1898 to build the school's education program with leadership components. In time, programs such as Cubberley's provided the pathway for aspiring school administrators not only to receive professional training, but also to gain access to desirable positions. Graduates of such programs often maintained their ties with their professors and formed networks of mutual support. Professors enhanced the prestige of superintendents and, as Ella Flagg Young complained in 1913, the Department of Superintendence was being co-opted by the university professors who hoped to place their graduates. The Chicago Tribune reported her description of a meeting of the NEA: "It was perfectly evident that the departments of education in the universities of Columbia, Harvard, Chicago, Yale, Michigan, Illinois, and Wisconsin were more in evidence than ever before in any meeting of the National Education Association. Those departments in the universities seem to be trying to gain control not only of the department of superintendency but of the National Education Association generally, so they might place graduates in desirable positions throughout the country, regardless of the fact that they have had a very limited experience."26

Increasingly, the process of attaining superintendencies required candidates to obtain the proper credentials without necessarily first rising through the teaching ranks. Such a change effectively limited the number of women who could pursue superintendencies. Not only was it difficult for women to gain admission to such programs, but often professors made it difficult for women to finish or to receive their necessary "blessing" in a job search. Robert Morrison in 1926 described the type of person he believed should not enter such programs in the first place:

The writer was particularly impressed with the disappointment of one graduate who majored in the field of educational administration. . . . She applied for positions as teacher of history and social science. None of the superintendents to whom she applied offered her a position. In the fall of 1924 she enrolled in the graduate school and spent an entire year in preparing herself for a position as a school administrator. During the spring and summer of 1925 she continually sought a position as a principal or a superintendent. When schools opened in September she had not secured employment. Other students trained in the same classes under the instruction of the same professors secured very attractive positions in which they are succeeding. This indicates that students lacking qualities making for success in supervision and administration should be advised against entering classes training them for such positions.27 (emphasis added)

When early superintendents sought to make themselves more respectable, they attempted to associate themselves with higher mental functions, philosophical and scientific. Teachers could have been offered the opportunities to develop intellectually as well, but superintendents sought educational advantages as a means of distancing themselves from teachers. Eventually the perceived needs for philosophical/scientific preparation were translated into courses of study at predominantly men's colleges and universities, a strategy that tended to remove administrative access from women.

William Payne went even further in his text, Chapters on School Supervision, where he made an explicit appeal for the division of educational labor between men and women. He described the necessity of making teaching a woman's job...
and the superintendency a man's job.

However, by relegating men's and women's respective roles to nature, Payne side-stepped the necessity of explaining the qualities needed for leadership and how those could be nurtured. Instead, he argued simply that women should not be school leaders while men should be sought.

Conclusion

In an era where men teachers found themselves part of a profession newly identified as "feminized," school administrative positions emerged and were quickly filled with men anxious to distinguish themselves as an authoritative class rather than as compliant workers at the level of women teachers. When women began to assume school leadership positions, prompting Ella Flagg Young to declare in 1913 that "in the near future we will have more women than men in executive charge of the vast educational system," some feared that women would eventually feminize education. Male superintendents, then, organized to enact changes in their professional structures that would essentially assure that women's chances of attaining superintendencies would diminish. Although organizational alternatives existed to the rigidly hierarchical industrial models of the time, organized male superintendents effectively created a domain within the teaching realm that neatly paralleled the place of men within the family, thereby justifying women's exclusion from decision-making positions. Through such efforts, women not only failed to dominate school administration numerically, but they also barely ever secured a foothold of power.

The implementation of the differentiated curriculum in the public high school in the United States transformed that institution profoundly in the early years of the twentieth century. Quite simply, the differentiated curriculum allowed for different education for different students. Although schooling for many students was altered as a result of this transition, the argument can be made that, as a group, girls' high school experiences changed most drastically. It is well known among historians of education that girls constituted the majority of public high school students and graduates in the nineteenth century, and that the curriculum at that time consisted of academic subjects. With the advent of the differentiated curriculum, the percentage of girls taking chemistry, geology, algebra, trigonometry, and physics dropped.¹ That this information is not known by the general public today attests to the potency of the system which followed.

Educators introduced the differentiated curriculum at a time when American society was infatuated with the notion of social efficiency. The modern, industrial order depended on role differentiation and specialization of skills; schools took on the task of preparing workers and citizens with a heightened commitment. In contrast to the nineteenth century high school, which articulated its mission as intellectual and moral development, schooling in the twentieth century became a means for fitting each individual student into the "appropriate" social niche.²

While the belief that girls' schooling should be directed toward preparing women as wives and mothers is an old one, its proponents in the Progressive Era packaged their argument in a manner which reflected modern liberal thought; for the first time public high schools began to accept such training as part of their curricula. Jane Powers has made the argument that, although success in vocational courses of study for women did not materialize as school reformers had hoped (with the exception of commercial education), reform rhetoric was strong enough in and of itself to effect a powerful change in the way girls experienced secondary schooling.³ Thus far, research on women's secondary schooling has targeted school and other governmental reports, articles published in educational journals, professional papers presented at such organizations as the National Education Association, school surveys, and other statistical data. Educational historians have connected modern liberalism to the transformation of the high school curriculum and, more recently, others have analyzed how these changes in the curriculum have affected the education of girls.⁴ Yet, in order to move beyond an analysis of reform rhetoric and institutional change in secondary schools, it is important to consider the degree to which teachers were influenced by modern liberal thought in the classroom. Since teachers' recorded responses on this issue are scarce, perhaps it will be enlightening to consider the texts written for teachers in this period. The purpose of this paper is to examine the impact of modern liberal ideology on the transformation of girls' secondary schooling, as represented in education texts published in the early decades of the twentieth century.

I have analyzed twenty-two texts written for teachers and published in the years from 1906 to 1934. The list of authors (all male except for, possibly, two writers) includes professors of education whose works were widely read: Bagley, Counts, Cubberley, and Thorndike, to name a few. The textbooks provide some clue as to what teachers were being taught across the nation; the contents represent the thought of leading voices in colleges of education at Brown University, Colgate University, Colorado State Teachers College, Columbia Teachers College, Cornell College (Iowa), Harvard University, Stanford University, State University of Iowa, University of Illinois, University of Kansas, and University of Wisconsin. The books treat issues in history, philosophy, and sociology of education, educational psychology, and pedagogy. In each of them, the ideological structure is that of modern liberalism. A content analysis reveals themes centered on schooling for social efficiency via role differentiation and an emphasis on "practical" study. The notion that the predominant purpose of schooling was to benefit the state emerges as well.

The Texts on Modern Liberalism

I am using the term "modern liberalism" to denote the dominant ideology in the United States, which began to break away from classical liberalism in the latter part of the nineteenth century, as characterized by Clarence Karier, Paul Violas, and Joel Spring.⁵ Sparked by Charles Darwin's publication of Origin of Species, and in the face of tremendous change in the U.S. political economy, many in the intellectual community began to perceive society as a social organism, growing and evolving. Sociologists Charles H. Cooley and Edward A. Ross suggested that the self found definition only in relationship...
A popular metaphor emerged, that of the individual as a single cell in the social body. Each "cell" was to perform specific functions to insure the health of the body; at the same time, an interdependence among the cells would develop. For modern liberals, the complexity of U.S. society demanded role specialization. For progress to occur, individuals had to be trained to perform distinct functions. In contrast to the nineteenth century conception of schooling for full human development, the differentiated curriculum became the means by which schools prepared students for varied tasks in society. An emphasis was placed on subjects with "practical" applications, to better prepare for the transfer of training from school to life roles. The progress of society became the key concern, rather than the complete development of individual students.

These tenets of modern liberal thought formed the core of the educational philosophy advanced in the textbooks analyzed in this study. Paul H. Hanus of Harvard University identified the discovery and development of each pupil's dominant interests as the special aim of secondary education and, therefore, the teacher's greatest responsibility. David Snedden went further in his 1913 text in a defense of the differentiated curriculum. Rather than speak of adapting curriculum to each student's interests, Snedden argued for group classification: "A uniform program of education is no longer possible. To an indefinite extent programs must be adapted to varying groups." The choice of program was not to be made by the student; decisions were to be reached according to "expert" evaluation of which students might profit from various educational opportunities. Snedden continued, "Prescription and forced classification there must of necessity be; but only as determined by the incapacity of the individual to profit from a given type of opportunity."

Edward Thorndike, arguably the most influential force in teacher education in the early twentieth century, also upheld the practice of choosing a special line of action for an individual. His rationale for such action was based on the benefit to society. He wrote, "When education becomes able to select the work best fitted to each individual as well as to fit the individual to his work, it will not only increase economic productivity, but also the health, morality, and culture of society." Thorndike illuminated the alteration in school philosophy brought to bear by the implementation of the differentiated curriculum. The purpose of schooling was now to create a specialist, not one equipped with an education which reflected the breadth of the liberal arts. "Education beyond certain fundamentals should narrow itself to fit every man for a certain probable course of life, not for all life's possibilities." This specialization, which highlighted preparation for the world of work, also included specific preparation in social, civic, and recreational arenas. In short, teachers were advised to train students for specialized roles in their complex society. It was suggested that this required an increased emphasis on "practical" studies.

Unmistakably, twentieth century educators argued that social efficiency required schooling which emphasized citizenship, job preparation, and the effective use of leisure time. Every discipline came to be evaluated by this standard. Professor Alexander Inglis of Harvard University articulated the position in his 1918 text, *Principles of Secondary Education*: that "the value of any subject of study is to be measured according to the degree in which it may contribute directly or indirectly to the attainment of [socio-civic, economic-vocational, and individualistic-avocational aims], and the aims or purposes of any accepted subject of study in the secondary school are to be determined accordingly." Inglis went on to declare that all of the subjects included in the secondary school curriculum could not and should not be studied by all students. In reconfiguring the secondary school curriculum, a line was drawn between the "practical" subjects and those which, traditionally, had been championed in the cause of mental discipline. Perhaps George H. Betts, Professor of Psychology at Cornell College, Iowa, captured this precept best: "Such values as knowledge, culture, power, no longer satisfy the educational ideal; these must in some way combine to spell efficiency." It was widely held that the classics as well as the modern languages, mathematics, and history did not factor into the efficiency equation for most students. In his lectures on the theme "Education for a Changing Civilization," William Heard Kilpatrick prescribed that "for most pupils, Latin can and should follow Greek into the discard. Likewise with most of mathematics for most pupils. Much of present history study should give way to study of social problems.... Modern foreign languages can hardly be defended for most who now study them." University of Illinois professor William C. Bagley also wrote that the study of higher mathematics was appropriate only for future engineers. Teachers who read his text met with the opinion that the average high school student had little need for algebra, geometry, and trigonometry. In 1912, Betts traced the school response to public demand for practical subjects, noting the proportional reduction of academic subjects. He concluded that social efficiency was soon to become the "ruling concept throughout the whole range of the curriculum."
As the twentieth century high school turned its attention to training students for differentiated roles in society, "practical" courses came to occupy a larger portion of the curriculum. Throughout this transformation, individualism was held subordinate to the perceived good of society. Scholars such as George Counts and William H. Kilpatrick reminded teachers that "interdependence has replaced individualism" in the U.S. political economy. Thorndike was bolder with his assertion that each "child should have as much high-school work as the common good requires." For modern liberal educators, a primary objective of schooling was social stability, as Inglis indicated with his definition of the school as a social institution. The school was to be "maintained by society for the purpose of assisting in the maintenance of its own stability and in the direction of its own progress."22

Thus, modern liberal ideology supported the notions that the function of schooling was to train students for specific roles in society, that a "practical" curriculum was best suited for this purpose, and that the good of society would take precedence over individualism. What impact did such thinking have on girls' secondary schooling? Some clues in answer to this question can be found in the textbooks for teachers of the period.

The Texts on Sex Differences

The clear message was that traditional secondary education, in which girls and boys studied the same curriculum, did not serve girls or society well. During the transformation of the high school curriculum, educators ferreted out perceived differences between girls and boys. Thorndike stated that the sexes differed in mental qualities, though not so much as public opinion might suggest. The important distinction, he wrote, was that males deviated more from type than females. That is, in any specific quality the highest males were more gifted than any females, and the lowest males were inferior to all females. Thorndike concluded that although "girls in general rank as high or higher than boys in high school and college, they less often lead the class; thus there are far more eminent intellects among men than among women and also twice as many idiots."23 Although Thorndike wrote that sex differences were slight, he presented a substantial list of qualities which appeared to him to be stronger in one sex or the other. For instance, he described women as more subjective, emotional, and passive than men.24 Thorndike's colleague, Lewis M. Terman, also noted that few women attained eminence. He found this puzzling, given that the average measured intelligence of women was as high as that for men. Terman suggested that the emotional traits of women favored the development of the sentiments at the expense of innate intellectual endowment.25

This was the sort of scientific reasoning which, no doubt, led to some of the beliefs expressed in An Introduction to High School Teaching, such as, "The giggling girl, one of the most disturbing factors in the high school classroom, is not merely silly; she lacks control of both body and mind."26

Of course, this image contradicted the fact that girls did better academically in high school than boys, grouped by sex. In 1914 Irving King, a professor of education at the State University of Iowa, explained that girls exceeded boys in high school work because they matured earlier than boys.27 He pointed out that the nineteenth century arguments against coeducation, such as girls were not capable of academic work or they lacked the necessary physical strength for such work, were not supported by the evidence. He went on, however, to discuss new arguments against coeducation. His key point was that girls' greater maturity was "sufficient to warrant a reconstruction of our whole system of education for the middle teens."28 While King favored the type of gender segregation piloted at Englewood High School in Chicago, he recognized that such a system of complete segregation by sex was not practical for most schools. Therefore, he suggested that in smaller schools "the difference in the reactions of the sexes must be met by more skillful and sympathetic teaching. In every such school the supervising officers must be on the alert to see that the methods of instruction do not develop altogether in favor of the girl."29

Thorndike's position that mental ability did not vary significantly between girls and boys did not preclude specialized education. He taught that "even if the mental make-up of the sexes were identical it might still be wisest to educate them differently."30 Harvard professor Inglis agreed that differences in interests and abilities between girls and boys were greater than any difference in mental abilities. Inglis argued that students' interests and abilities were influenced by the character of the lives they would lead after secondary school. "That those interests are in part quite different for boys and girls is too obvious to require comment," he wrote.31 This theme was picked up by George A. Mirick in his 1923 text on Progressive Education. Mirick reported that "vocational purposes are determining the kind of education boys and girls shall receive rather than sex differences."32 Yet, given the sex-segregated division of labor in the United States during the 1920s, schooling characterized by vocational differences was, in effect, schooling characterized by sex differences.
The Texts on Girls' Schooling

Role specialization, a cornerstone in modern liberal educational policy, factored greatly in the transformation of girls' secondary schooling. Educators were clear in their belief that whether or not girls and boys would be taught differently would depend on the degree to which they were to perform similar societal functions. Professor Betts established this point in his 1912 text Social Principles of Education. The issue was reinforced in 1918 in Inglis' Principles of Secondary Education. Drawing upon some of the purported differences between the sexes, Inglis declared that the aim of certain phases of secondary education was to "recognize differences between boys and girls in interests and attitudes by dealing with them in different ways with the intention of preserving such differences and fostering them." He specified that this was especially true with vocational interests.

David Tyack and Elisabeth Hansot make the claim in their book Learning Together: A History of Coeducation in American Public Schools that since many of the changes in the high school curriculum did, indeed, target vocational education, girls' secondary schooling was altered only on the periphery. Evidence collected from texts for teachers, however, indicates that the concern for schooling girls and boys for different vocations seeped out of the formally identified vocational track and into academic areas as well. We should not be surprised with the decline in the percentage of girls taking mathematics courses in the twentieth century, given the repeated message that mathematics would prove of little use to the average woman. University of Wisconsin professor M.V. O'Shea argued that algebra was to be studied only by those who would utilize it as a tool for engineering or mechanics. O'Shea suspected that this would be a necessity for the majority of boys but ventured that fewer than one of a hundred thousand girls in the public schools would find the study of algebra valuable. O'Shea did not deny that a "very rare woman" might become a mechanic and would, thus, require a study of algebra. Rather, educational policy was to be designed for the majority of girls who would come to "live the typical woman's life, and who must continue to do so in order that society may prosper." Betts also recommended the discontinuation of educational policy which prescribed mathematics and language study for girls. He reasoned that such subjects prepared students for processes that women would never employ. Similarly, he posited that mathematics and languages did little to prepare girls for the life experiences they were expected to encounter, those in the home.

Consistently, intellectuals criticized the traditional academic curriculum which had characterized the nineteenth century high school. It simply did not prepare girls for their prescribed twentieth century social roles. In this context, educators raised the concern that the traditional academic curriculum had tended to guide females away from activities connected to the home. Often, the next step was to suggest that some amount of domestic education constitute a part of the secondary education of all girls. Inglis advocated this, adding that since boys would balk at domestic training, they should be trained in science, economics, civics, and vocational arts. Social efficiency educators even went so far as to assault girls' access to a profession traditionally held by women, teaching, and with it, the validity of an academic education for girls. Betts capped a discussion of wastes in education by saying that "for women, their career ultimately lies in the home, and there most of them are to be found after a year or two in the schoolroom." He went on to question whether teaching could even be labeled as a profession, given the large proportion of women in the vocation. On a related note, David Snedden recommended that, as the work in high schools became increasingly differentiated, "a certain amount of it should be placed in charge of men teachers only." It is difficult to believe that, in this climate, girls' secondary school experiences were altered on the margins only.

The social efficiency forces which transformed the high school curriculum through the inclusion of practical studies "at once" raised the question of whether girls and boys should follow the same course of study. O'Shea praised the Stout Institute in Menonomie, Wisconsin as a "concrete expression of the prevailing dissatisfaction with the influence of the traditional subjects of study upon the girl's interest and capabilities in the home." In its quest to prepare girls for the actual problems of home life, the homemaker's course at the Stout Institute concentrated on practical applications. It was devoid of foreign language study and offered no instruction in mathematics or science, except as these disciplines were applied to concrete problems of domestic life. In dismissing the study of mathematics and languages, O'Shea, representative of others in the educational community, relied upon the argument that discipline of mental faculties did not prove of little use to the average woman. University of Wisconsin professor M.V. O'Shea argued that algebra was to be studied only by those who would utilize it as a tool for engineering or mechanics. O'Shea suspected that this would be a necessity for the majority of boys but ventured that fewer than one of a hundred thousand girls in the public schools would find the study of algebra valuable. O'Shea did not deny that a "very rare woman" might become a mechanic and would, thus, require a study of algebra. Rather, educational policy was to be designed for the majority of girls who would come to "live the typical woman's life, and who must continue to do so in order that society may prosper." Betts also recommended the discontinuation of educational policy which prescribed mathematics and language study for girls. He reasoned that such subjects prepared students for processes that women would never employ. Similarly, he posited that mathematics and languages did little to prepare girls for the life experiences they were expected to encounter, those in the home.

Consistently, intellectuals criticized the traditional academic curriculum which had characterized the nineteenth century high school. It simply did not prepare girls for their prescribed twentieth century social roles. In this context, educators raised the concern that the traditional academic curriculum had tended to guide females away from activities connected to the home. Often, the next step was to suggest that some amount of domestic education constitute a part of the secondary education of all girls. Inglis advocated this, adding that since boys would balk at domestic training, they should be trained in science, economics, civics, and vocational arts. Social efficiency educators even went so far as to assault girls' access to a profession traditionally held by women, teaching, and with it, the validity of an academic education for girls. Betts capped a discussion of wastes in education by saying that "for women, their career ultimately lies in the home, and there most of them are to be found after a year or two in the schoolroom." He went on to question whether teaching could even be labeled as a profession, given the large proportion of women in the vocation. On a related note, David Snedden recommended that, as the work in high schools became increasingly differentiated, "a certain amount of it should be placed in charge of men teachers only." It is difficult to believe that, in this climate, girls' secondary school experiences were altered on the margins only.

The social efficiency forces which transformed the high school curriculum through the inclusion of practical studies "at once" raised the question of whether girls and boys should follow the same course of study. O'Shea praised the Stout Institute in Menomonie, Wisconsin as a "concrete expression of the prevailing dissatisfaction with the influence of the traditional subjects of study upon the girl's interest and capabilities in the home." In its quest to prepare girls for the actual problems of home life, the homemaker's course at the Stout Institute concentrated on practical applications. It was devoid of foreign language study and offered no instruction in mathematics or science, except as these disciplines were applied to concrete problems of domestic life. In dismissing the study of mathematics and languages, O'Shea, representative of others in the educational community, relied upon the argument that discipline of mental faculties did not prepare girls for real problems in life. When met with the critique that the study of algebra might train a girl's judgment, O'Shea resorted to a wide-sweeping rejection of faculty psychology, noting "when a person holds a view of this kind, it is almost impossible to convince him of the fallacy of his psychological thinking." For social efficiency educators, the notion that academic work...
could offer students training in accurate reasoning, judgment, perception, and memory was an anachronistic application of educational philosophy. 48

O'Shea's treatment of girl's schooling in Everyday Problems in Teaching centered upon the belief in the practical value of schooling. O'Shea argued that educators must be aligned with "the actual problems which women must meet and solve in order to get the most out of life for themselves and for those who are dependent upon them."49 This statement reflects the modern liberal principle that schooling's primary objective was to prepare individuals to contribute to the progress of society. Never mind that one might enjoy studying trigonometry or Latin for the joy of learning; schooling was designed to prepare each student as a functioning member of society, for the good of those "dependent upon them." Betts reminded teachers that each girl would "function as a member of a family, a community, a church, as a citizen of a state, and in other social capacities. All must, through their education, be fitted into these social activities..."50 For many, it was a tight fit.

Thus, modern liberal ideology exerted a strong influence on the content of textbooks written for teachers in the first decades of this century. In the age of social efficiency, it was incumbent upon teachers to train students for differentiated roles, concentrate on practical subjects, and, in so doing, insure the stability of society. Key educators stressed the differences between girls and boys which, they believed, required differentiated schooling. It followed that the authors of these texts prescribed different educational experiences for girls and boys.

What evidence is there that teachers conducted their classrooms in the manner designated in these texts? As yet, there is no direct evidence, but the following warrants careful consideration. The percentage of girls in U.S. public high schools taking courses in chemistry dropped from 55 percent in 1900 to 42 percent in 1928, in physics from 57 percent to 34 percent, in algebra from 58 percent to 47 percent, and in trigonometry from 47 percent to 22 percent.51 In addition, I believe the overwhelming amount of commentary on girls' secondary schooling aimed at teachers through texts and other college course work did have an effect on the perceptions held by classroom teachers.

To be sure, teachers do possess a degree of autonomy in their classrooms. It is naive to suggest that all that is taught in college education courses has been implemented in the public school classroom. Yet, it is also a mistake to dismiss the teaching and scholarship of professors of education. Hegemonic theory recognizes schooling as a powerful force in shaping the way people think, including those enrolled in teacher education programs. The dominant ideology of the period under examination accentuated the expertise of educational sociologists and psychologists whose work included "scientific proof" of significant sex differences in education. Also, we would do well to factor in the observations of the textbook writers themselves. In 1916, Terman noted that the training given to girls, and the general atmosphere in which they grew up were "unfavorable to the inculcation of the professional point of view, and as a result women are not spurred on by deep-seated motives to constant and strenuous intellectual endeavor as men are."52

The information I have gleaned from these texts provides one picture of what professors of education were teaching in their colleges from 1900 to 1930. Did modern liberal rhetoric filter through teachers to affect the educational experiences of high school girls? It is apparent that the professors, themselves, were hoping for just that possibility.

Community Institutions and African American Women in Chicago from 1900 to 1920

Anne Meis Knupfer
Purdue University

In a speech before the National Negro Business League of Chicago in 1901, Alberta Moore-Smith reported that for every "five avenues of employment" available to white women, only two were open to African American women. This was true, as most African American women in Chicago were employed predominantly in domestic and laundry work. Although domestic work was considered "dignified," as women sought to provide for their families, the associated problems of long hours, substandard pay, and lack of child care provisions compromised many women's roles as mothers. Recognizing the dilemmas faced by poorer women, African American club women took a proactive stand as they webbed child care issues to increased employment opportunities for women and, ultimately, to economic self-reliance in the communities. More specifically, they helped to establish settlements, institutes, and colleges which taught various female trades so that women could earn a "respectable" living; they created employment referral services to assist women in procuring suitable work; and they founded nurseries and kindergartens for young children while their mothers worked. This paper examines these efforts of the Chicago club women, as well as the ideologies, purposes, and curricula of the community institutions they helped to found.

African American women have historically been the primary wage-earners in their families, not only because of plentiful domestic work, but because suitable employment was often denied to their husbands. As of 1900, 42.5% of African American women in Chicago were breadwinners, slightly under the national rate of 43.2%. As a point of comparison, only 20.6% of white women, 0.4% of whom were married, worked outside the home. As of 1910, this pattern remained essentially unchanged, as over 80% of African American working women were employed as domestic workers. During World War I, non-union industry jobs became available to African American women in Chicago who worked on segregated factory lines in embroidery, needlework, and garment work. Although the pay was higher, women still spent long hours away from their children.

Department stores, business firms, public schools, and juvenile courts also were discriminatory in their hiring practices. Even when not denied employment, African American women were often given menial jobs. In department stores, for example, many African American women were employed not as saleswomen but as maids. In cases where women were employed in better positions, they were often segregated or placed in non-public assignments. Such was the case with Montgomery Wards, which was the largest employer of African American clerks in the early 1920s. However, most of their African American female clerks worked not in the store but in isolated offices. Furthermore, the Chicago branch built its own cafeteria in response to complaints from local restauranteurs who were concerned that they would loose white patronage if African Americans lunched at their counters.

The African American club women were well aware of such practices, as they had been denied similar employment opportunities. In turn, they protested through boycotts, walkouts, and letter-writing campaigns. At a Paul Lawrence Dunbar celebration in 1915, the audience passed a resolution protesting Marshall Field & Company's refusal to hire African American women. The following year, the Negro Fellowship League sponsored a conference on the company's discriminatory practices, encouraging every women's club and organization to send delegates, as "something must be done, and that something must be done in union." Marshall Field & Company, however, was not alone in discriminatory hiring practices. A motion was also forwarded by the Negro Fellowship League to send a letter to Libby, McNeil & Company, which likewise refused to hire African American women.

Discrimination in employment, which paralleled that in housing, education, and public institutions in Chicago, increased with the African American southern migration. From 1910 to 1920, the African American population in Chicago grew from 44,103 to 109,594, by 148.5%. From 1917 to 1918 alone, more than 50,000 African Americans migrated to Chicago. Most migrants were directed to the Black Belt upon their arrival to Chicago. As a result, the neighborhood became increasingly segregated and overcrowded. The African American club women were alarmed not only at the poverty of the Black Belt but the "unwholesome" businesses of pool rooms, saloons, cabarets, movie theatres, and dance
halls which proliferated there. They were especially concerned about the plight of young women who were often placed by employment agents as maids in prostitute houses in the Black Belt's vice areas and then arrested on prostitution charges. The club women's vision for these women, as well as for poorer women, was two-fold: to assist them in securing not only gainful but respectable employment.

Respectability assumed various forms during the Progressive Era, but was most tied to women's roles as mothers and home-makers. Long denied the opportunity of expressing their motherhood and home-making in culturally specific ways, African American women relished these roles and responsibilities. In the spirit of Republic motherhood, many prominent club women argued that mothers, as first teachers, were critical in their young children's moral and intellectual development. It was in the home, they further argued, that race progress originated. Such views, according to Claudia Tate, espoused a "domestic rhetoric of racial affirmation." The ideologies of respectability and the Republic motherhood dovetailed with the Christian motifs of womanhood, as well as the tenets of Washingtonian industrial education and the home economics movement. Such ideological lessons were folded into the domestic classes for young women and girls.

It was within such a framework that Nannie Burroughs and Elizabeth Ross Haynes sought to professionalize domestic work. Fannie Barrier Williams in Chicago was in agreement, pointing out that whereas the apron had been a symbol of "servility" and the kitchen not a place for "ladies," there was now "a new dignity [that] has been added to the occupations that concern[ed] our health, our homes and our happiness." Accordingly, cooking, nursing, and dressmaking were considered legitimate professions, made "dignified" through industrial education. Although the ironies and contradictions are apparent to historians today, such concepts attempted to reconcile the prescriptive ideologies of respectability, true womanhood, and Christian ideals with the harsh realities of discriminatory hiring, adjustments to urban conditions, and lack of educational opportunity for women.

Five African American settlements in Chicago provided some form of domestic training or employment referral services for young women. These included the Emanuel Settlement, the Frederick Douglass Center, the Wendell Phillips Settlement, the Negro Fellowship league, and the Clotee Scott Settlement (formerly the Hyde Park Settlement). With the exception of the Negro Fellowship League, whose clientele were primarily African American men and boys, all of the settlements offered domestic classes for young girls and women. The Clotee Scott Settlement was particularly known for its sewing classes, which were taught by teachers from the Tuskegee Institute and the Frederick Douglass Center. One teacher, Mrs. C. L. Wilson, was considered an excellent seamstress, especially since she made clothes for the "richest class of white women."

The settlement encouraged young women to improve their employment opportunities, rather than relying on laundry or domestic work. Clotee Scott, founder of the settlement, especially encouraged young girls to enroll in sewing classes as "we desire our young women to take up this trade." Classes in Irish crochet and cooking were also taught and "guarantee[d] work." Such work not only provided a livable income but was touted for those "looking for higher things in life and not for those who are looking for big crowds and excitement." Clearly, respectability and domestic feminism were implicit in such occupations.

Following completion of the sewing class at the settlement, a diploma was given to girls aged fourteen and older. It is not entirely clear to what degree the diploma functioned as a credible credential or to what extent the settlement procured employment for its graduates. At one point, the Clotee Scott Settlement acknowledged that it was unable to procure employment for several dressmakers, owing to "many securing white help." As many immigrant and native-born white women also opened dressmaking shops, the competition was fierce. To offset such competition, many African American dressmakers catered to African American clientele.

The Wendell Phillips Settlement, like the Clotee Scott Settlement, taught cooking, sewing and millinery skills through its night school. Courses in shorthand, Spanish, French, history, and stenography were also taught, although they were most often attended by "prominent women." Social class differences were likewise reflected in the classes offered at another settlement, the Frederick Douglass Center. There, sewing, cooking, gardening, and dressmaking classes were mostly attended by poorer women. Conversely, the more academic courses of sociology, English literature, and English grammar were frequented by middle-class club women. Nonetheless, middle-class women engaged in sewing and handiwork, although most often for the purpose of charity.
 Settlements were not the only institutions to offer domestic classes. The Chicago School of Domestic Science and Arts provided a domestic course of study to young African American women. Not only did the college hope to professionalize domestic work but to "relieve[e] this type of employment of its subtle embarrassments." Endowed through an anonymous white female, plus scholarships from the Chicago Urban League, the school was committed to a "standardization" of wages and hours for African American domestic workers. In describing itself as "exclusive," the school sought to further elevate the status of its students and their study. The Enterprise Institute taught the handicrafts of china painting, needlework, dressmaking, and domestic service. Although one of its principals pointed out that such trades led to economic independence, it is questionable whether one could have earned a living from china painting. Rather, such art classes, which were also taught through the African American YMCA, were praised for their "recreative" value.

Three of the settlements organized employment referral bureaus. These included the Emanuel Settlement, the Negro Fellowship League, and the Frederick Douglass Center. However, none of the settlements reflected the commitment to domestic service training and employment, such as that of the Flanner House of Indianapolis with its schools for laundry workers and for maids. Furthermore, with the exception of the Frederick Douglass Center, most of these employment services were directed toward male employment. Although the Emanuel Settlement and the Frederick Douglass Center organized employment bureaus, exact records pertaining to their services were not located.

In the case of the Negro Fellowship League, employment referrals were not usually enumerated but reported collectively. For example, one 1915 report documented that over 10,000 men, women and children received some type of benefit, be it a job, lodging, or charity." Occasionally, anecdotal reports of the league's intervention were given, as was the case of a female domestic servant who had worked for a white family for fifteen years for a salary of only one dollar a week. The president and founder of the league, Ida B. Wells, swiftly took action: "The president of the league got her clothes and money from the white people to whom she had been in slavery all that time and saw that she had a good home with an excellent Colored family, who will pay her good wages." Several women's clubs provided employment referral services as well. The 20th Century Penny Club, a rotating credit association, functioned as an employment agency or "exchange" which provided the "housewife a chance to dispose of any kind of work" which she performed at home. The Phyllis Wheatley Club, through its Phyllis Wheatley Home for young working girls, not only offered a "safe and Christian home" for girls new to the city but assisted them in procuring domestic work.

Given the lack of public records, questions arise about the relationship between the domestic classes and actual employment, as well as the perceived worth of certificates and diplomas. Did certificates advantage women in domestic work? How many women were actually employed through referral agencies? Did the agencies also assist in negotiating working conditions or pay? And did trade work provide any kind of social or economic mobility? There may well have been the perception that sewing classes provided upward mobility economically. Indeed, a number of African American middle-class women were successful as seamstresses and milliners. Hattie Arrant, for one, took up millinery work when she moved to Chicago in 1901. By 1910, she became so well known that she created hats for the leading women "of both races." Maude Seay, another milliner in demand, was known for her French-styled hats which many women wore to the charity and New Year balls. Her protege, Mayme Clinkscale, opened her own shop of "imported French patterns" on fashionable State Street.

The Clotee Scott Settlement encouraged thoughts of social and economic mobility: "The young Negro girl will not always be compelled to hunt for work as laundress if she will only grasp the opportunity to make an honest living by becoming a competent dressmaker." Although the settlements did not organize domestic schools, the handing out of certificates and diplomas certainly paralleled a credentialing process reflected in the female work of chiropody, manicuring, and beauty culture.

Many of the women's businesses were service-oriented ones which required low capital investment and little training or education. Of these, the most plentiful were beauty shops, dressmaking and millinery shops, and manicuring parlors. Located within the Black Belt, these businesses served a largely segregated clientele, although some beauty businesses were located along State Street, reputed for its wealthy patrons. Although businesses in the Black Belt reportedly promoted and advanced the African American community economically, some historians and sociologists have concluded that individual
African American businessmen and women had more to gain through a segregated business community.\textsuperscript{37} What is missing from such an analysis is the extent of discrimination in mainstream businesses, as well as the ways in which economic and social relations in the African American community were intricately linked. To illustrate, many of the African American charity balls and benefits in Chicago were attended by the city's African American "Elite 400."\textsuperscript{38} These social occasions relied upon the services of dressmakers, milliners, manicurists, beauty culturists, and hairdressers. In addition to providing customers, such charity events served as forms of advertisements, especially as the African American newspapers reported in great detail the evening gowns of the prominent club women. In effect then, three economic strata were layered in these events: philanthropy for the less fortunate; social and economic exclusivity for leading African Americans, as invitees were selected for their ability to support philanthropy, as well as their social prominence; and those in service-oriented trades, whose businesses relied, in part, upon such occasions.

Such trades assured customers, as African American women preferred to patronize their own, especially if their work was considered "first class." "First class" work entailed technical knowledge, as well as aesthetic sensibility. A good milliner, according to Katherine Tillman, studied the facial features and complexion of her customers, as well as matched the hat's style to the gown. Hairdressers not only considered the clients' features and attire; they drew from their knowledge of herbal and chemical treatments for the scalp and hair.\textsuperscript{39} A beauty culturist's skill and experience were measured by the results obtained through facials, toilet waters, beauty creams, mole banishers, as well as the ubiquitous facial bleaches. A chiropodist's reputation was built from his or her original creations of balms, powders, and soaking solutions. Katherine Dunham's account of her uncle's admixtures, derived from African American and Choctaw herbal remedies, pointed to the skillfulness and art of chiropody, as well as the high demand for such services by leading society women.\textsuperscript{40}

Many of the Chicago women, even some of the club women, were successfully employed in chiropody, hairdressing, and manicuring businesses. The Burnham Beauty College graduated its first African American student, Grace Garnett-Abney, in 1896. Although most known for her "hair tongs" which stimulated the hair growth of African American women, Garnett-Abney also opened two beauty shops for white women.\textsuperscript{41} Carrier Warner, a Vice President of the Phyllis Wheatley Club, learned manicuring and facial treatments through the Moler College of Chicago. She opened her own chiropodist and manicure parlors, which were acclaimed as frequented by "the best and wealthiest white ladies of this city."\textsuperscript{42} Others were reputed for their special treatments and cures, such as Minnie Sinclair who treated facial blemishes, or Alice Bemby, whose tonsorial parlor, the Palace of Art, specialized in manicures.\textsuperscript{43} Women, though, were not the only clients of beauty services. Irene Goins' husband, known as the "Father of Manicurists" on Chicago's South Side, owned many shops where men could get hair cuts, singes, shampoos, shaves, massages, witch hazel steams, and manicures. Female manicurists were employed in his shops to curb the male clienteles' "profane language, loud talking, lounging and sleeping."\textsuperscript{44}

Most of the beauty culturists-entrepreneurs were educated at proprietary colleges and institutes which cropped up in Chicago at the turn of the century. Some institutes wedded technical skills to traditional female roles. Poro College, for example, included the study of chemistry while also emphasizing the female attributes of "dignity, grace, and beauty."\textsuperscript{45} The Clio School for Mental Science and Character Analysis not only taught character analysis and vocational guidance but "poise, individuality, and wide-awakeness."\textsuperscript{46} Other institutes stressed the scientific basis of their studies. Estelle Kenton, principal of the Enterprise Institute's Beauty Culture Department, insisted that beauty culture was not mere "vanity" but promoted "health and comfort." Accordingly, the institute offered courses not only in hairdressing and manicuring but chiropody, electrolysis, facial massage, and scalp treatments.\textsuperscript{47} The Provident School of Beauty Culture emphasized the healthful effects of its treatments, which were prepared in its own laboratory. Under the directorship of Mme. E. M. Scott, a certified chiropodist, the school's courses were purported to be "as thorough and complete as the schools of the opposite race."\textsuperscript{48} The recruitment strategies of the Universal College of Beauty Culture revealed more pecuniary purposes. Students who enrolled in their home study courses of "hair culture, scalp treatment, facial massage, and manicure" were supplied with the college's products: "1 hair straightening comb, 6 boxes Universal Hair Grower, 1 Manicuring Set and a Diploma."\textsuperscript{49}

The proliferation of beauty culturist work was not unique to African American women. As Lois Banner has documented, the growth in beauty businesses from 1890 through 1920 was phenomenal. In 1890, there were 9,000 female
hairdressers in the United States; by 1900, that number had doubled. By 1907, there were over 36,000 hairdressers, 25,000 manicurists, and 30,000 specialists in skin and face care. Such professions were relatively lucrative, as beauty culturists were often paid more than nurses.\(^{50}\) Denied employment in mainstream department and drug stores, a number of African American women were also hired as door-to-door agents for beauty products. In Chicago, Marjorie Stewart Joyner recruited and trained African American women as "Walker Agents" who sold Walker's products from their homes.\(^{51}\)

Obscured within most studies of beauty culture employment is an historical understanding of ethnic women's beauty aesthetic. Most references have assumed that African American women's concepts of beauty were derived from white women's standards. However, as Peiss has pointed out, native-born white and immigrant women used hair tongs, skin bleaches, and facial products.\(^{52}\) Such inclusiveness illustrated the ideal of middle-class domesticity, as the use of beauty products was tied to respectability and class positioning. For African American women, lighter skin and the coiffures of French rolls and buns not only reflected domesticity and respectability but a distancing from the painful images of field and plantation work. Indeed, most club women referred to slavery as a point of departure from which their progress was measured.

Perhaps more importantly, African American women, in purchasing products through saleswomen, knew well that they were contributing to another African American woman's livelihood. As one agent wrote to Madame Walker: "You have opened up a trade for hundreds of colored women to make an honest and profitable living where they make as much in one week as a month's salary would bring from any other position that a colored woman can secure."\(^{53}\) Not only did beauty culture provide employment for women, but it also contributed to race progress. Annie Turnbo Malone, for one, claimed to have founded Poro College in the "spirit of true Christianity and dedicated to the advancement of the race."\(^{54}\) Individual beauty culturists' accomplishments were praised in the newspapers as evidence of race progress. Provident School of Beauty Culture was noted as the only such school operated and owned by an African American woman.\(^{55}\) Marjorie Stewart Joyner was celebrated as the first African American woman to receive a patent for her invention of a permanent wave machine.\(^{56}\) Even Ida B. Wells, although initially skeptical of Madame Walker's fame, said of the hair culture inventor, "To see her phenomenal rise made me take pride anew in Negro Womanhood."\(^{57}\)

When faced with discriminating hiring practices in mainstream society, African American women created viable alternatives for employment. Through the establishment of settlements, "Ys," colleges, and institutes, African American women were able to enroll in classes in sewing, embroidery, millinery, beauty culture, and domestic work. Such course work prepared many women to open their own trade businesses or to engage in employment other than laundry or domestic work. In the case of domestic employment, further training was encouraged to "professionalize" and "standardize" the work. Lastly, employment referral services were created by the settlements and women's clubs to assist women in procuring work. Although there were social and economic distinctions within the African American communities, middle-class club women were acutely aware of the discrimination which all African American women faced when seeking employment. As such, they "lifted" those less fortunate while they "climbed."\(^{58}\)

Amercans expected that 1963 would be a banner year. John F. Kennedy was ready to announce his candidacy for a second term, the United States continued to dominate world politics resulting in the American empire coming of age, and Negroes envisioned an end of segregation, especially in the South. On New Year’s Eve (December 31, 1962), the descendants of slavery celebrated one hundred years of freedom. The leaders of the civil rights movement hoped President Kennedy would issue a proclamation commemorating the centennial of Lincoln’s historic Emancipation Proclamation. Their hopes were dashed: President Kennedy did not issue the proclamation. Despite the U. S. Supreme Court’s decision in Brown v. Board of Education of Topeka (1954), eight years earlier, that the segregation doctrine of ‘separate but equal’ was unconstitutional, most Negro children continued to attend segregated schools. Segregation in education was just a part of the larger pattern of segregation throughout American society. This paper focuses on the examination one aspect of the contradictory position between the concept of equal educational opportunity in a democracy and the maintenance of racial segregation in education.

Segregation was a system of racial etiquette that kept an oppressed group, in this case African Americans, separate from the oppressor, white Americans, when both were doing equal tasks such as studying history, civics, reading, and mathematics. At the same time, segregation allowed for intimate closeness when the tasks were hierarchical, like cooking or cleaning for white employers. The rationale of segregation implied that the oppressed were an ‘unclean’ people, a pariah. Segregation has been referred to as the American caste system, where ‘unclean’ was the caste message of every ‘colored’ water fountain, waiting room, and courtroom Bible. Segregation was a way of behaving with specific rules for mingling between the separated peoples. The rules were numerous with but one purpose, to maintain the superiority of the white and the inferiority of the African American. Certainly, ‘inferior’ was the implication of every school that excluded Blacks (or other minorities). Clara Luper remembered:

Growing up in a segregated society meant that I had to go to a substandard school, where the books that we received were passed on from the white school. I remember reading on page 10 and the next page would be eighteen. I never saw an amoeba until I went to Langston University. At our school, we finally got a microscope but because of the ways schools were financed based upon population, we did not have enough money to buy a lens. Seeing an amoeba was a big thing for me. Most of the time I had to walk 5 miles to the Black high school until we were finally able to get enough money for a bus. My father became the bus driver. But once again we had the same problem, our buses were handed down from the white school so we had a lot of bus trouble.

The ideology of segregation was born and nurtured during slavery, and continued to rationalize the second-class citizenship imposed on African Americans after Reconstruction. The policy of segregation resulted in unusually severe restraints for African Americans, taking the form of multiple legal exclusions, limited and highly unequal economic well-being; minimal political power; many forms of legal and illegal coercion; little social respect; restricted social mobility; customarily accepted invidious social discrimination; and in particular submission to the authority of whites in most important spheres of life, such as occupation, residence, politics, and schooling.

The ‘separate but equal’ doctrine as practiced by the dominant group was strong on equality in theory and equally strong on separateness in practice. This doctrine satisfied both the American commitment to democratic education as an ideal and its demonstrated reluctance to see the ideal put into practice. America’s insistence on separate education made equal education impossible. How then did African American teachers, especially those who taught civics, deal with the cognitive dissonance engendered by the ‘separate but equal’ doctrine? This question is especially pertinent for those teachers during the civil rights movement in the early 1960s.

This historical inquiry concentrates on the multiple perspectives of African American teachers during the civil rights era. In particular, this narrative focus on the contradictory position of teaching civics to students whose civil rights were actively denied solely on the basis of their color. Historical inquiry enables readers to experience historical
events through the description of the narrator, thus providing a structure which offers meaningful understandings such that individuals and their actions are known in company with their perceptions and motivations and the times and the world in which they lived. Historical inquiry provides a rich and robust source of the particularities of events which create powerful narratives.

Over the years, multiple stories have been told about the enslavement of African Americans. For example, the most popular novel, in each of the last two centuries, was set in the South: Uncle Tom's Cabin by Harriet Beecher Stowe and Gone With the Wind by Margaret Mitchell. The two books tell very different stories. Uncle Tom's Cabin presents slavery as an evil to be opposed; while Gone With the Wind presents slavery as an ideal structure whose passing was to be mourned. The multiple stories were not confined to popular novels. They invaded every part of American culture.

In the 1920s, Pierce noted that Southern states passed laws requiring textbooks to "Secure[ing] a Correct History of the U.S., Including a True and Correct History of the Confederacy." Textbook publishers were compelled to call the Civil War the "War Between the States," implicitly denying the existence of a nation torn asunder.

Furthermore, textbooks written between 1890 and the 1960s portrayed an unappealing representation of oppressive Republican rule of the South in the post civil war period, a picture Loewen calls "the Confederate Myth of Reconstruction." In the 1930s, aging freed slaves, whose stories were recorded by WPA workers, maintained their pride in the roles of African Americans during Reconstruction, and kept the truth alive about that era. In fact, Escott found some still remembered the names of African Americans elected to office some sixty years previous. However, an eighty year old former slave said, "I know folks think the [text]books tell the truth, but they shore don't." Not surprisingly, when the people who experienced Reconstruction died, the myth perpetuated through textbooks took over, even in the African American communities. The vast majority of Americans who finished high school prior to the 1970s encountered the Confederate Myth of Reconstruction in their American history and U.S. Government textbooks.

Until the Civil Rights movement, American textbooks, especially history and government textbooks, presented a picture of the South similar to Mitchell’s Gone With the Wind. A 1950 textbook The Growth of the American Republic written by Morison and Commager clearly stated that, "As for Sambo, whose wrongs moved the abolitionists to wrath and tears, there is some reason to believe that he suffered less than any other class in the South from its 'peculiar institution.'" The peculiar institution referred to here by Morison and Commager was that of slavery straight out of Mitchell’s book. In 1959 a high school history textbook presented slavery as not a bad thing: If bondage was a burden for African Americans, well, slaves were a burden on Ole Massa and Ole Miss, too. Besides, slaves were reasonably happy and well fed. Such arguments constitute the "magnolia myth," according to which slavery was a social structure of harmony and grace that did no real harm to anyone, white or black. As a consequence, the textbook discourse prior to the civil rights movement denied the reality of slavery, the Civil War, and segregation for African Americans and America itself. Ideological contradiction is very important in history. Ideas have power. Yet American history and government textbooks gave students, especially African American students, no way to understand the role of ideas in America's past.

African American teachers, particularly those who taught history and government, were in a special and difficult position. Textbooks used in many Negro schools were discarded texts from the white schools. They were seriously outdated, marked up by former students, and often had missing pages. Odessa Woolfolk remembered what it was like for her teaching in a segregated school:

American History was not correct. Historians have taken history and rewritten it. We know African Americans did more than just come over here as slaves. Many inventions which Blacks contributed to America, whites were given credit for. White society did not want Blacks to read or write or be educated. How then could we go back and correct our history for our students?
Clara Luper, an African American teacher in Oklahoma, had a slightly different perspective. She recalled:

You can’t separate Black history from white history. Many of my students who have been white have been unable to understand it. For example, let’s just take a course in black history. The Revolutionary Period. The first person to die for this country was a young black by the name of Crispus Attucks. You can’t study about Crispus Attucks unless you study about all the white soldiers who were there with him. Therefore it has been an experience in both. If you study slavery, you have got to study the abolitionists. You study the civil rights period, you have got to study the blacks and whites, especially you have got to know about Lyndon Johnson. 13

In fact, African American teachers were very creative in finding ways to inform their students of the inaccuracy of the history as presented in their textbooks. Mrs. Luper remembered:

Not only did I study history at Langston I also studied it in high school and our parents taught us about black people who had made contributions such as black writers, I was extremely interested in black history, in high school we would study black history for a week around Lincoln’s birthday. I was extremely interested in black history and white history. I was never able to separate one from the other. For example, I could not study the history of slavery without studying the slave owners and abolitionists and the people who were in government who applied political pressure to perpetuate the system. I was always interested and at Langston University I came under the guidance of some outstanding teachers who taught in a segregated society but they believed some day that things would be better because of the documents that we had. 14

African American teachers and students did not need textbooks to present ideological contradictions, however. They continually experienced cognitive dissonance each day of their lives. A basic tenet of the African American culture was a deep and abiding faith in the power of education. The public school was a symbol of American democracy and equal opportunity. However, many African American teachers questioned how

... if democratic behavior is one goal of our educational program ... in the public school our youth must be indoctrinated with democratic ideals ... Can this be done in a segregated system? Does the segregation of the Negro present a situation inconsistent with democratic tenets we profess? 15

The obvious answer to this question, from a thirty year perspective, is a resounding "yes." Segregation is inconsistent with democratic ideals. Ms. Woolfolk described how she approached this ideological contradiction with her class.

It’s really ironic, here we are studying about the Constitution. The Constitution is so beautiful. We know the meaning of our U.S. Constitution. Birmingham is not that and we have to do all we can to make the things happen in our town to be consistent with our documents (the Constitution and Bill of rights). ’ I believed in education. We had to prepare ourselves to be better than whites in occupations. To go to the job market and show that you could do it, even though you had been oppressed and held back. ‘Give me a chance and I won’t blow it.’ That was the message we gave our students. I was aware we were studying about a system and living in something that was just the opposite which denied what we were studying. It was up to us to do something about it. 16

Younger African American teachers seem more likely to confront openly their cognitive dissonance proscribed by segregation than many of the older teachers. Connie Pegues, a teacher at Ullman High School in Birmingham, reveals her feelings during the 1960s civil rights movement.

The marches and demonstrations were really troubling to me. I was raised not to cause trouble. I believed that, over time, everything would work out. Integration would happen. I really didn’t talk with my students about desegregation. I was worried about what would happen to all of us. 17

Doddy and Edwards’ study of Negro teachers in 1955 supports the differences between younger and older Black teachers. Of those Negro teachers younger than forty-five, seventy-three percent talked with their students about the possibility of desegregation. But only fifty-six percent of those teacher than older forty-five did so. 18 Mrs. Woolfolk described her thoughts during this time:

I thought my talent was working with youth, and saying to them, ‘we don’t have to put up with this, but we have to be very good.’ The system was based on saying ‘we [Blacks] are ignorant and we have to disprove that.’ My commitment was to go out and help us get what was promised to us as Americans.
I believed in the documents: The Constitution, the Bill of Rights, the Declaration of Independence. I believed in the system of government but I also believed we could change it.

During the early 1960s, many African Americans were optimistic. As Ms. Woolfolk recalled:

In the early 60s there was an optimism, we had Kennedy and those folks and a lot of young people began to believe we had support at the national level. Young people had a lot of faith in the Kennedy and King association. What happened in the South was that we were fighting concrete barriers, not subtle barriers. We could not go to the public library, there were things we could not do -- it was visible in the south. Progress was the removal of these barriers. Once the barriers were removed, we began to realize that it was more complex than just sitting at the lunch counters or getting a college degree. There were still barriers and those barriers were harder. People became bitter about that but in the 60s we were optimistic about progress occurring.

Ms. Luper held a similar view. She said, "I remember one of my professors who constantly reminded us that this country had to change if it was to remain a leader in the free world. His words really became true."

The contradictory positions of African American teachers, as presented in this narrative, provide an opportunity to examine the realities of segregated schooling in the South before and after the Brown decision. Each teacher operated within the constraints imposed by the segregated systems of their communities.

The public school is a product of time, place and circumstances. Patterns of education are determined by the particular conditions existing at that moment in time. Prior to integration, African American teachers were forced to confront the stereotypes about their race perpetuated in the educational materials they were required to use. Textbooks and other literature, films, and television all depicted an all-white society. Educational materials often sustained negative ideas about African Americans specific to physical features, dress, mannerisms, living conditions, occupations, and abilities.

Each teacher, in this narrative, attempted to foster integration. Each voiced a commitment to help their students discard incorrect assumptions and beliefs about themselves and others. Each tried to provide opportunities for their students to see and think more honestly and realistically about all people. In resolving the contradictory positions each person, in this narrative, tried to provide an enriching and empowering experience for their students. Each teacher opened the closet of segregation and kept it open. Each teacher moved their students from the shadow of segregation into the full sunlight.

12. Ullman High School was the Negro High School in Birmingham, Alabama. It was ultimately closed in 1973 after a long battle to desegregate Birmingham's schools. See Anna V. Wilson, "Stranger in a Strange Land," for additional information.
The National School Service and American Schools During World War I

O. L. Davis, Jr.
The University of Texas at Austin

The National School Service greeted American teachers when they returned to classrooms in late August and early September, 1918. Unlike other journals and magazines for teachers, this new 16-page "paper" arrived free of charge to recipients. It was a substantial publication from the beginning, even though the Committee on Public Information, also called the Creel committee, was both the nation's wartime propaganda agency and the journal's publisher. Planned for many months, the National School Service enjoyed only five issues before the Armistice ended the war in Europe. Nevertheless, those issues and the twelve that followed throughout the remainder of the 1918-19 school year fulfilled the singular purpose of the publication.¹

Stripped of its easy justification as a resource for the nation's teachers, this twice monthly periodical lauded national war aims and programs. After the war ended, it publicized the nation's official efforts for recovery in Europe, including the fragile peace and domestic post-war programs. These two goals promoted patriotism among school pupils and teachers and increased their support of U.S. contributions to the Allied war effort. The National School Service accorded minor attention to other Allied powers, their people, leaders, and activities. However, the Creel committee marginalized these contributions in order to indoctrinate Americans. Never overtly stated, but apparent in every issue, was a breached federalism, a conviction that asserted national government influence during wartime substituted for state purposes for schools. Specifically to that end, the National School Service fostered national patriotism and promoted the study of the war in American schools.²

Earlier efforts of the Committee on Public Information (CPI) to mobilize the nation's schools for national purpose were much less effective than was the National School Service. By September 1917, the beginning of the first year of wartime schooling in the United States, Creel's CPI sought to influence elements of the school curriculum. In league with state and local Councils of Defense, the CPI distributed many thousands of copies of its first propaganda booklets. Many of these materials actually reached local schools, but the route from the Washington bureaucracy to local classrooms was indirect and uncertain, certainly cumbersome. The procedure largely depended, for example, on advertisements, bulk mailings by congressmen, and requests for copies by local Councils of Defense. With the National School Service, the CPI discovered a direct and efficient means of getting its and other federal agencies' information into the hands of the nation's 600,000 teachers. In this process, the CPI ignored the federal Bureau of Education and the states' departments of education. More importantly, it largely bypassed school superintendents and principals. It mailed enough copies of the National School Service for each teacher directly to every American rural and city school building.³

The National School Service (NSS) was staffed ably for its task. Guy Stanton Ford, an historian and publicist, served as its initial Director. William Chandler Bagley, a national leader in secondary education at Teachers College, Columbia University, edited the NSS throughout its year of publication. Historian Samuel B. Harding edited its Historical Section. Included as members of its Advisory Editorial Board were the following individuals: Colorado's state superintendent of public instruction and Nebraska's assistant state superintendent; the superintendents of schools in Richmond, Virginia, Cincinnati, Ohio, and Oakland, California; the dean of the University of Minnesota's College of Education; the Boston diocesan school supervisor; the president of the Michigan state normal school at Kalamazoo; and the president of the National Education Association. In January 1919, the Committee on Public Information relinquished publication to the Division of Educational Extension of the federal Department of the Interior. Still, the bureaucratic changes were few; J. J. Pettijohn replaced Guy Stanton Ford as Director and Alberta Walker replaced Fannie W. Dunn as editor for intermediate grades. Editorial philosophy and the nature of contents continued without noticeable effect.

Ordinarily, anonymous staff writers prepared all articles. Only a very few articles attributed authorship, although most issues included short messages from prominent Americans including President Woodrow Wilson, Commissioner of Education P. P. Claxton, and food czar Herbert Hoover.

Many NSS articles ostensibly reported news, even though much of it must have been stale to most readers. Other articles contained analyses of war related issues and elaborated announcements of special federal government programs...
(e.g., victory loan drives, food conservation drives, special Red Cross programs). Each issue included reproductions of photographs, charts, line drawings, and posters, including those prepared by school children. The National Geographic Society prepared the maps published in the NSS. Major articles provided background information to teachers, and, perhaps, heightened motivation to use the ideas in lessons. At least six pages of each issue carried specific teaching suggestions often related directly to information contained in that issue.

**Regular Features of the National School Service**

Until the November cessation of hostilities, the National School Service carried major analyses of battles on the war front and overviews of periods of the war. For example, the initial issue featured an account of the U.S. Marines at Chateau Thierry in the previous June and a recapitulation of the war during 1918. Other September features included a narrative of an American sailor whose ship was sunk by a German submarine and an account of the Allies’ victory month of August. "American Aviators Bomb Hun Airdromes," "Topography and Strategy on the Western Front," and "American Offensive at St. Mihiel" were major October treatments as were "Poison Gas A German Weapon," "German Empire Reverses," and "Controlling Spanish Influenza."64

Although an inconspicuous editorial note warned against "peace rumors," the November 1 issue carried two major features. "The United War Work Campaign" focused on the army’s morale. The second, "The German Schools as Nurseries of Autocracy," compared German and American educational systems; Editor William Chandler Bagley signed the article. In his article, Bagley observed that "our schools have faults, and some severe grave faults . . . (but) they have developed consistently with the democratic ideals - they have kept the children of all classes together during a most impressionable period of their lives, and they have kept the doors of opportunity open."65

The November 11 Armistice was soft pedaled in the November 15 issue. In fact, had teachers not read carefully, they could have missed the announcement in "Central Powers Sue for Armistice." Editors clearly may have believed that the Armistice was only a temporary cessation of hostilities. This issue, highlighting the work of the American Red Cross, featured articles on "Helping the Disabled Help Themselves" and "Feeding French Children." By the December 1 issue, however, the reality of the Armistice became transformed into Allied victory. "A Peace with Honor" and "Hoover Outlines World Food Policy" were its page 1 features. "Germany in Revolution" and "A League of Nations" were the major stories in the December 15 issue, the last published by the Committee on Public Information.66

During the final three months of war, the NSS additionally called attention to reasons that Americans must support the war. It also emphasized reasons that American school children should study about the war. For example, one article claimed that the war was "the biggest and most important happening in history" and that the war "already plays a large part in his (the child’s) school life." Thus, the NSS echoed the CPI theme- the war should receive systematic treatment in the schools. Furthermore, study of the war would enhance the regular work in "practically every other subject in the curriculum." In the initial issue, Director Ford observed that the National School Service did not bring the war into the schools. He claimed that the periodical did not intend to make American teachers "the intellectual drill sergeants of national prejudices and vainglories of international suspicion and envy." Still, he held that "if the war were not in the thought and program of the schools it should be brought there." He chillingly noted that "the stern demand (that) is made in every school teacher to know the causes of this war, the efforts of America, the dangers she confronts, and the aims she has set for attainment." "No one else in the community," Ford concluded, "is so singled out as a leader and center of information in these things.67

The National School Service’s vigorous and unreflected support of federal initiatives continued consistently throughout the school year. Both its indoctrination for patriotism and its slight of Allied nations’ contributions served its purpose to mobilize American opinion to support the war. For the NSS, the messages targeted teachers and pupils, but, also important, they likely intended to reach parents through their children.

Suggestions to teachers for lesson material constituted the heart, if not the soul, of each issue of the National School Service. Only seldom were suggestions restricted to a single theme. Routinely, they simply fostered the study of the war. Some teaching suggestions related to information contained in the issue’s major articles and announcements; other advice was independent of any issue theme. Also, division of the suggestions into the four departments (rural schools, primary, intermediate, and upper grades and high school) seemed practical and convenient rather than arbitrary. The suggestions
for high school studies of the war appeared to be appropriate for that level; these ideas commonly called for expanded
reading and advanced discussion and writing.

Especially within a wartime climate that required public displays of patriotism, many teachers probably found the NSS
advice to be usable. Almost all suggestions required no more than commonplace or easily available supplies and other
resources. Some suggestions even included texts of stories that teachers could read to pupils as well as complete scripts
for pageants, plays, and other dramatic activities. The NSS also published lists of pamphlets and posters available free or
at low cost from a number of federal agencies including the Committee on Public Information. In the poor schools of the
period, teachers could read these suggestions and immediately improvise lessons.

Throughout its existence, the National School Service offered a great variety of lesson material. Many issues focused
attention on fuel and food consumption. Not only did articles explain the serious need for conservation, teaching
suggestions drove home its necessity. For example, articles urged rural and intermediate teachers to establish "Circles of
the Black Watch" complete with "officers" (e.g., monitors of the lights, the thermometer, the kitchen, the woodpile) assigned
specific duties to conserve coal in schools. Subsequently, an article urged that a "Captain Sugar" maintain watch over
efforts to reduce use of sugar in schools.8

Each issue of the NSS suggested geography and history lessons keyed to the war. Lessons encouraged construction
of posters, purchase of savings stamps, and salvage of tin-foil and rubber. A number of lessons supported map work and,
for young children, the use of sand tables. One article, for example, called for teachers to have their pupils make sand table
trenches positioned with model houses, soldiers, and airplanes. Suggestions to teachers even included teaching about
pigeons, heroic conveyors of messages from front lines to headquarters. Articles encouraged teachers to post newspaper
clippings about the war, even if a cloth were to hang over the classroom's blackboard to serve as a background for the
cippings. Suggested often were arithmetic problems that emphasized war and home front elements: distances, tonnage of
war supplies, measures of sugar, and amounts of savings stamps purchased. Some articles suggested topics for pupil
compositions. Each issue published patriotic poems and short essays with the implicit advice that they be used in
classrooms. The NSS also provided suggestions for such disparate subjects as handwork (manual training) and French.
Advocacy of school study of the war took many forms.9

From January 1, 1919, nine issues completed the life of the National School Service. The transition from war to peace
was the overarching theme of these issues, four of which emphasized special concerns (e.g., gardening, thrift). Continuingly
featured were food production and availability, at home and in Europe. Hospitalization, work, and schools for returning
soldiers received frequent mention. Of course, school children could not do anything about these problems; however, they
could know about them. In addition, Allied army and navy commanders and statesmen were featured. Consistent with the
NSS' original intentions, U. S. General John J. Pershing outshone Marshals Ferdinand Foch and Sir Douglas Haig,
Britain's Admiral Sir David Beatty and the Royal Navy's brilliant record received pride of position, but U. S. Admiral W.
Sims and the U. S. battle fleet's mainly insignificant roles were also highlighted. It accorded kind words for Britain's
David Lloyd-George, France's Georges Clemenceau, and Italy's Vittorio Orlando, but it lavished unreserved praise on U.
S. President Woodrow Wilson, "Spokesman of Democracy." After all, the National School Service was a federal
government periodical and its purpose was served by acknowledgment of foreigners only as they contributed to American
war aims.10

The NSS' path into peacetime was filled with information accompanied by exhortation. The NSS applauded the
League of Nations and other U. S. proposals for a peace settlement. Throughout the winter and spring of 1919, the
periodical emphasized that the study of war, particularly the just completed war, leads to peace. For example, an editorial
claimed, "The persistent war problem of the schools will be to insure that the lessons of the great war are not forgotten."
As long as the National School Service appeared, that war was not only not forgotten, it was replayed and restudied. The
NSS, in this vein, also supported the announced initiative of the National Education Association to collect local sources for
the study of the war's history, particularly of the roles played by schools. This idea for a national archives of school war
work apparently never developed beyond the stage of proposal.11

In the Spring of 1919, issues also placed frequent and insistent calls and suggestions for the Americanization of
immigrants. This theme dominated every issue, even special numbers on thrift and school gardening. Additionally, the
NSS regularly referred to the "rural school problem" and underlined solutions by consolidation and centralization. It featured concern for the control of influenza and the cure of its victims during the devastating, nationwide epidemic. It also campaigned for thrift, the Red Cross, school gardening, Boy and Girl Scouts, and the work of boys' and girls' clubs, forerunners of the 4-H movement. Also, it encouraged school plays, pantomimes, and pageants under titles like "Union Forever," "King Good Health Wins," "Making an American," "A Victory Pantomime," and "Portraits of Peace." It offered Alfred Noyes' copyrighted "At the Altar of Freedom" for use in all the nation's schools. As well, the NSS continued to offer teaching suggestions. Some of these lessons treated special war problems, others the new circumstances of peace. Some translated war programs into peacetime initiatives. Articles advanced teaching suggestions in almost every curriculum area. An apparent anomaly among these features and suggestions was the attention accorded in the NSS about the new mental tests developed during the war. Robert M. Yerkes, the army's chief psychologist, signed a long article about the potential advantages of school use of these tests and an editorial enthusiastically recommended them. Of all the suggestions included in the NSS, this one undoubtedly became the most widely implemented during the next decade.12

Demise of the National Service: No Need for Propaganda in Peacetime

The May 1, 1919, issue of the National School Service was its last. An editorial pronounced its "wartime work done." During the Spring, many teachers apparently requested the journal's continuance, but peacetime could not sustain it. The war was over. Federal government agencies, consequently, no longer had special war emergency programs to promote. Also, a peacetime United States would support neither a propaganda agency nor federal intrusion into American schools.13

Only one hesitant but insistent question accompanied the wake of the National School Service. Still obscure across almost eighty years is any fulsome sense of the extent of its use by teachers. Indeed, only fragmentary evidence exists on this point. Its editors claimed that teachers and administrators urged its continuance after CPI sponsorship ceased. Several superintendents reported its use in classrooms of their schools. Notably, the Seattle, Washington Board of Education ordered the city's schools not to use the three volume Outlines of European History co-authored by James Breasted, James Harvey Robinson, and Charles Beard. The Board observed that the war pamphlets issued by U. S. government agencies were more than adequate substitutes. Tactily, at least, the Board included the National School Service among its preferred federal government publications. Rather than ape the Seattle experience, however, teachers in most American schools probably used the National School Service in predictably practical ways. Many must have read what interested them. They likely took none or a few suggestions. In the end, they probably laid most of each issue to rest.14

The National School Service's editors, still true believers in an overriding federal presence and intrusion in the nation's schools, closed the journal's pages by reminding their readers of an unfinished agenda of national needs. They topped their list with an emphasis on Americanism, a newly robust patriotism, and the obligation of national service. Also, they claimed that American teachers and schools must attend specifically to widespread illiteracy, poor health, the need for thrift, and problems of citizenship. Only a few elements of this agenda were addressed during subsequent years, but federal bureaucrats and funds did not direct them until the Depression era. Not until the new world war exploded a decade later did schools and teachers become other than bit-players in renewed federal efforts to impact significantly the nature of American life. By that time, American teachers did not remember the National School Service.15
