This chapter addresses the plight of migrant secondary students moving across district lines and encountering challenges such as credit accrual and lack of academic resources. Although graduation requirements differ from state to state, they all amount to a kind of bookkeeping that determines whether a student graduates from high school. The chances of attaining high school graduation are affected by state and local course requirements, continuity of curricula between districts, differing school schedules, and the efficiency of student record transfer systems. Many common school policies and practices diminish the cultural capital of migrant youth and their families, making it difficult for migrant students to stay in school. Linguistically and culturally diverse students face institutional barriers, and their parents often are excluded from involvement in their education. In addition, increased high-stakes testing places even greater pressures on migrant students, who may not be present for test preparation and testing opportunities. Migrant students who aspire to postsecondary education face additional barriers. College preparatory math acts as a gatekeeping tool in the selection of students for college, and migrant students often are placed in lower tracks without access to advanced math courses. Migrant students also lack access to the special knowledge that facilitates college preparation and admission. Fictional scenarios illustrate these difficulties and potential remedies that educators could pursue. (SV)
Graduation Enhancement and Postsecondary Opportunities for Migrant Students: Issues and Approaches

BY CINTHIA SALINAS AND REYNALDO REYES

In 1973, José Cárdenas and Blandina Cárdenas described the educational challenges for migrant children who move frequently:

The typical instructional program, with built-in continuity and sequences that assume that the child in the classroom today was there yesterday and will be there tomorrow, is incompatible with this mobility. The program discontinuity problem must be faced with either a mobile curriculum or with a highly individualized instructional program.¹

Each day, nearly 800,000 migrant students enroll in public schools² without the benefit of migrant-compatible schooling policies and practices. Within schools, migrant students can be described as

bilingual or monolingual, gifted or with special needs, and successful or failing. The complexity of their lives, their contributions, and the education landscape cannot be understated. These dynamics are most complex at the secondary level, where migrant students encounter numerous challenges that require educators to respond in highly individualized ways.

What We Know about the Education of Migrant Children

Student populations are growing increasingly diverse in urban, suburban, and rural schools, forcing schools to address the cultural and linguistic needs of their students. Despite reform efforts and decades of various programs, "social and demographic changes would appear to outdistance our ability to develop the technologies, practices, and capacity necessary to cope with classroom circumstances" of today's schools. This is especially true in migrant education. Migrant students and their families are a composite of valuable resources and experiences of cultural and linguistic diversity; yet, the challenging aspects of mobility and low income, characteristic of many migrant families and their children, can overwhelm educators.

The Elementary and Secondary Education Act of 1965, as amended and reauthorized by the No Child Left Behind Act of 2001, mandates that states must "ensure that migratory children who move among the States are not penalized in any manner by disparities among the States in curriculum, graduation requirements, and State academic content and student academic achievement standards." This requires secondary schools to pay particularly close attention to credit accrual for graduation, drop-out prevention, and postsecondary education transition as these issues pertain to migrant students.

Administrators and educators often overlook the importance of a systematic and effective approach to credit accrual. One study has

shown that "migrant secondary students face significant odds in graduating from high school due to lack of credit accrual. Their mobile lifestyle creates a need for innovative solutions to address what is generally perceived as a fragmentation in their education, making it very difficult to accumulate credit and graduate, if at all."6

Like so many immigrant and recently arrived students from different countries, cultures, and education backgrounds, migrant students and their families are typically uninformed about the American school culture and credits required for a high school diploma. School administration decisions and attitudes make it more difficult for migrant students to acquire the credits necessary for graduation even after attending class and fulfilling coursework requirements for a large portion of the school year. The most significant problem is that migrant students must disentangle many course and credit requirements as they transfer from school to school.7

The most recent of the rare studies of migrant student drop-out rates found that, despite an increase in migrant student graduation, the drop-out rate remained high at about 50 percent in the late 1980s.8 It is important to note that nearly 86 percent of migrant students are Hispanic and that 40 percent have limited English proficiency. One study found that "while accounting for just 56% of all U.S. immigrants, Latinos account for nearly 96% of all immigrant dropouts."9 Another study reported that lower academic achievement and high drop-out rates among migrant students can be attributed to frequent movement despite graduation.

---

from school to school throughout the academic year, constant adjust-
ments to different social and academic environments, and confusing
systems of record keeping and credit transfers. A number of programs
have attempted to address the complexities that contribute to migrant
students dropping out; however, a lack of cohesiveness among
programs from state to state has added to the number of migrant
students not finishing high school.10

A real impediment to addressing conditions contributing to high
drop-out rates is the paucity of research related directly to migrant
student education. While many studies have focused on the best
practices for linguistically diverse students, little attention has been
given to the unique needs of migrant children and their families. An
orchestrated research effort needs to target the many facets of migrant
education, especially effective secondary education models and
approaches that serve migrant children.

This chapter addresses the plight of secondary education students
moving across district lines and encountering challenges such as
credit accrual and lack of academic resources. The chapter looks at
beneficial programs and how secondary educators can help migrant
students.

**Course by Course: Working toward Migrant Student Credit Accrual**

Though graduation requirements vary from state to state and even
district to district, they all amount to a kind of bookkeeping that
determines whether or not a student will receive a high school
diploma. As migrant students move from school to school, they run
the risk of losing course credits in several ways. As a result, high
school completion becomes increasingly arduous for them. Several

key issues factor in, including inconsistent state or local course requirements, continuity of curricula, differing scheduling configurations, and efficiency of record transfer systems.\textsuperscript{11}

An example of the inconsistencies in course requirements is that New Mexico's minimum requirement for high school graduation is 23 units while Texas requires 22. Additionally, elective requirements for each state differ. For example, New Mexico requires a minimum of 7.5 electives while Texas requires 5.5. Migrant students may move from Texas to a New Mexico high school believing erroneously they have earned all elective requirements. The additional coursework to meet New Mexico's elective requirements could conflict with other required coursework and further delay credit accrual and graduation. Thus, migrant students often encounter deficiencies in their degree plans and are forced to disregard previously completed courses. Some migrant students also are expected to catch up quickly on local credits.

Despite a significant need for a national system, little uniformity exists among or even within states.\textsuperscript{12} As migrant students move from school to school, the repeated changes of teachers, textbooks and materials, and curricula (including state/district standards) can affect their ability to complete credits. Migrant students may encounter differing approaches to teaching algebra, or new writing programs in their English courses, or local course requirements.

In an ethnographic study of migrant families, Joseph Prewitt-Díaz and his fellow researchers found that continual moving has a deep impact on the social, psychological, and academic lives of the children. One student commented that moving from school to school is hard "cause you don't know anything, you don't know what they are going to teach, you don't know the people around." He added that his

friends "don't like moving around all the time a lot, and it's hard to
make friends and to adjust." The end result, which often magnifies the
possibility of losing credits, is a need to adjust abruptly to new friends,
school, teachers, texts and materials, and curricula.13

Another growing challenge is differing high school scheduling
configurations, based upon the pressures of growing state and local
course requirements. Florida, for example, requires a minimum of 24
credits for graduation while Texas requires 22. The credit require-
ments vary within subjects as well (e.g., three credits of science in
Florida and two in Texas). To meet graduation requirements, some
high schools offer students the traditional scheduling format of six
courses to be completed in the academic year while other high
schools have implemented a block or accelerated block scheduling
schema, through which students can receive eight credits per aca-
demic year. Imagine the potential problems when students transfer
from a six-course to an eight-course block schedule high school. A
student is faced immediately with a mismatch between the courses
previously taken and the courses at the new school. Consider a
student taking six courses at high school A, including Algebra I as a
year-long course. The student transfers in October to high school B
that offers Algebra I as a semester-long course (accelerated block).
The student instantly is behind other students and will need to receive
accelerated instruction. Keep in mind that this student was enrolled in
six year-long courses while her peers were enrolled in four courses
each semester. In sum, this migrant student would need to receive
accelerated instruction in four courses and drop two courses until the
spring semester.

Finally, secondary migrant students are confronted with a patch-
work of student record transfer systems. No comprehensive national
record system for migrant students has existed since the demise of the
Migrant Student Records Transfer System (MSRTS) in 1995 (see chap-
ters by Branz-Spall or Pappamihel). As a result, migrant students have
needed to rely primarily on the informal inter- and intrastate coopera-
tion of counselors or registrar officials. Overworked and understaffed

GRADUATION ENHANCEMENT AND POSTSECONDARY OPPORTUNITIES FOR MIGRANT STUDENTS

School officials are hard pressed to deliver records in a timely fashion. Though some states have formed joint systems to help facilitate the transfer of records (e.g., New Generation System), these impressive efforts are not an all-encompassing approach. Without a network of well-informed, skilled migrant educators, inevitable delays or errors will occur in student credit accrual.

In fictional Scenario 1, educators should address three basic areas to support Angela's education. First, she should be helped to develop a graduation plan that acknowledges her strengths, considers her postsecondary options, and addresses the unique challenges she will encounter as a migrant student. Second, she needs to receive a variety of academic services, including those that help her complete credits and achieve a passing score on the state's standardized tests. For example, correspondence courses, computer programs and services in labs, and distance-learning curricula like Summer Migrants Access Resources Through Technology Program (SMART) are readily available or can be found by checking with regional service centers or state migrant offices. Each of these, however, is aided by the third consideration of academic support. Teachers, counselors, paraprofessionals, and students should contemplate how they collectively can help ensure that Angela will be successful.

Educators are most responsible for helping all students accrue the necessary credits. They should raise their awareness about

---

**Scenario 1: Credit Transfer Problems**

Angela Gomez is just registering at McAllen High School in McAllen, Texas. This coming school year, Angela's family will return to McAllen in February after living in the Fremont, Ohio, area for three years. Before returning to McAllen, the family plans to migrate to Galveston, Indiana, to pick tomatoes, then to Michigan to pick cherries, and so forth. They will continue into Indiana and Florida before finally returning to McAllen in February. In Ohio, Angela was a junior, but she is not sure how many of her credits will transfer. She was enrolled in General Consumer Math, English III, Biology, World History, a local credit, and a vocational education course. McAllen High School follows a block schedule with eight courses credited per year, while the high school Angela attended in Ohio followed a more traditional approach of six courses per year. She is worried about her classes transferring from Ohio to Texas and about taking the Exit-level TAKS, the standardized test required for graduation in Texas.
credit-accrual issues and dilemmas that migrant students encounter. Educators need to understand the consequences to migrant students when making curricular and course-requirement policy decisions. Above all, educators should be proactive in addressing the needs of migrant students.

Keeping Migrant Students in School: Valuing Migrant Children and Their Families

In general, many common school policies and practices diminish the cultural capital migrant children and their families bring to school, making it very difficult for migrant high school students to stay in school. Anne Salerno and Mary A. Fink have concluded that approximately 50 percent of migrant students today do not complete high school—an improvement from 20 years ago, when 90 percent were dropping out. This positive trend is in danger of reversing for a number of reasons. First, linguistically and culturally diverse students face institutional barriers. Second, like parents of other linguistically and culturally diverse students, migrant parents are much more likely to be left out of the equation. Finally, high-stakes testing places even greater pressure on migrant students, who often are not present for many of the test preparation and testing opportunities.

Mobility issues. While some educators see only the problems created by student mobility, it is important to also recognize the various strengths of migrant students. Migrant students bring cultural diversity and bilingualism to the classroom; continual moving from place to place tends to build in migrants tenacity and a sense of responsibility. At an early age, migrant children come to understand

GRADUATION ENHANCEMENT AND POSTSECONDARY OPPORTUNITIES FOR MIGRANT STUDENTS

the dilemmas and perspectives unique to their migrancy. Good practice would dictate that we build upon migrant students' existing knowledge base and help design instruction that fits them better. Instead, it is easier for many educators to continue with existing curricula and pedagogy while belaboring the inconvenience of having migrant students arrive late and leave early during the academic year. Schools should realize the strengths of migrant families and organize resources that will enable migrants to stay in school and achieve academic success.

Parent involvement. Compounding these challenges is the exclusion of migrant parents from the schooling of their own children. Again, researchers have documented the failure of schools to include linguistically and culturally diverse parents in the schooling process. Schools often cite language difference and lack of interest on the part of parents, but the reality is that many schools intentionally exclude communities that do not reflect the values and beliefs of White, middle-class America.16

An often-overlooked provision of ESEA legislation is the required involvement of parents in the district/campus decision-making process. Schools that do not involve parents of migrant children create additional barriers. Not only do migrant parents retain a rich understanding of their children, they also possess resources that could ensure their children's success.

High-stakes testing. Finally, the use of high-stakes standardized testing exacerbates the challenges encountered by migrant students. The current testing mania that consumes public schools increases the chances of a migrant student dropping out. Consider that migrant students are present sporadically or not at all for much of the test preparation and testing that occurs throughout the year. Regardless of their inherent goodness or badness, test preparation and practice help students and their parents better understand test formats and the

significance of testing—in many states, high-stakes testing now affects promotion and graduation. The barrage of tests and consequences of testing can easily discourage migrant students and their parents.

Several school strategies could improve situations such as fictional Scenario 2. First, school administrators should ask themselves whether the curriculum engages students like Amanda: Is the material relevant to the lives of our students? How do we incorporate the knowledge of migrant children and their families into our teaching? Second, secondary schools need to make a special effort to involve parents; while involvement at the elementary level is quite common, secondary schools have struggled with approaches. Schools should undertake a self-study, immerse themselves in the parent involvement literature, and make changes that value all communities. Finally, personnel at the state, district, and campus levels should become familiar with the testing practices, policies, and procedures of other states and share this information with students, families, and teachers.

Migrant children face the same difficult odds that other marginalized students encounter in completing high school. Schools must adopt policies that embrace the cultural resources and knowledge of entire communities and acknowledge the value of diversity. Educators ought to form

Scenario 2: Family Involvement and High Stakes Tests

Amanda Guerrero is in the 10th grade at Taylor High in Seattle, Washington. She lives with her grandparents in a community housing project. The family migrates every summer to Illinois, Indiana, Michigan, and Ohio to detassel corn, pick tomatoes, and pick cucumbers. This past school year, Amanda was in trouble a lot. She was suspended twice and started hanging around with gang members outside of school. Amanda doesn’t like school. She thinks of it as a waste of time, regularly skips class, and is indifferent to her failing grades. Her grandmother has gone to the school several times to talk to Amanda’s counselor and the assistant principal. On one occasion, she explained to the counselor that when the family is down south, Amanda attends summer school and does quite well. The grandmother boasted that Amanda received a certificate for best attendance last summer and will be eligible to take the Texas standardized high-school-level test (Exit-level TAKS) in any of the above receiving states this summer. Obviously, her grandmother is worried about the test and Amanda’s chances of graduating from high school.

partnerships with parents to help all children succeed. These partnerships are especially important in overcoming the barriers created by the numerous and growing standardized testing demands.

**Pushing Open the Gates: Gaining Access to a Postsecondary Education**

It is difficult to provide accurate statistics on migrant students' attendance and graduation rates in postsecondary education because few programs, if any, track students beyond high school graduation. However, logic would imply that migrant students face similar, if not greater, barriers than other linguistically and culturally diverse students when trying to access higher education opportunities. This section analyzes two significant issues confronting migrant students in their postsecondary education efforts. First, as with many other students, math remains the greatest obstacle to college access and success, acting as a gate-keeping tool in the selection of students for college. Second, a body of knowledge, or hidden curriculum, exists for the college bound; however, it is difficult to access, especially for migrant students.18

For the most part, access to college preparatory math remains an elusive goal for migrant students. Many schools begin a two-tiered math curriculum as early as sixth grade by creating a single and exclusive pathway toward Algebra I courses in middle school and, ultimately, the calculus course in high school. Students in this upper tier are better prepared for college admissions and placement tests as well as for college curricula. Advanced math courses also provide a strong foundation for related high school courses, such as chemistry and physics, that complete the college preparatory curriculum. While districts should help more students gain access to these courses, few have offered such right of entry to all students and parents.19

---

A discreet ensemble of knowledge assists students wanting to pursue postsecondary education. Prerequisites for higher education include a maze of financial-aid forms, college admissions tests, placement exams, college applications and essays, and other unpublicized details. Clearly, some privileged students have access to this hidden curriculum while many other students are vaguely aware of it through informal conversations. However, migrant students are not likely to be part of the chosen group, nor are they likely to participate in the informal conversations. Schools need to consider how to institutionalize access to this knowledge for all students.

In fictional Scenario 3, Sylvia is right on track but will need plenty of help from her teachers and counselors. First, they must encourage and support her in math and science coursework, a necessity for any future engineering studies. Sylvia's movement from school to school will make continuity of curricula and completion rather difficult. The schools must use comprehensible and supportive language to inform Sylvia and her family about necessary college financial aid, standardized tests, and admissions. For example, high schools participate in college nights but often fail to deliver effective and/or bilingual notices and information. If Sylvia attends a high school with a large enrollment, she could easily fall through the cracks. Above all, schools should recognize their responsibility to students like Sylvia by revealing the many hidden elements of the transition to postsecondary education.

Because economic demands place greater emphasis on education beyond K-12, it is important for schools to reexamine their policies and practices with regards to future attendance and success in higher
Graduation Enhancement and Postsecondary Opportunities for Migrant Students

Education. State accountability systems throughout the country have begun to scrutinize the enrollment of students in the varying types of high school diploma plans. Particular attention should be given to the numbers and types of students tracked into diploma plans that provide access to higher education. Schools with an emphasis on college-bound plans are not only publicly recognized but also touted as models for others to follow. Beyond the important coursework are the many facets of preparing students for college, including standardized admissions exams and application forms that can sometimes discourage migrant students. Again, schools should be compelled to demystify these processes, ensuring that all students have the opportunity to gain access to and experience success in higher education.

The Next Step: Addressing the Needs of Secondary Migrant Students

The array of formal and informal practices that affect credit accrual, prevent dropping out, and promote postsecondary transition have vital implications for educators. First, educators need to enact more considerate policies and have greater awareness of migrant issues. Second, migrant drop-out prevention depends heavily on culturally relevant pedagogy, increased parent involvement, and improved approaches for high-stakes standardized testing. Finally, migrant students must have access to advanced math and the hidden curriculum.

Education is primarily a state responsibility, creating little impetus for instituting a national high school diploma; thus, migrant students probably will continue to experience credit accrual difficulties. In response, educators should advocate vigilantly for the reinstatement of an easily accessible and useful national record-keeping system. A long-neglected imperative is the establishment of a national database that includes cross-referenced state/district requirements and that records a student's progress toward a high school diploma. On a local level, policies need to be more flexible in recognizing the previous work migrant students have accomplished toward a high school diploma. Likewise, school staff must be provided with greater awareness and support as they work through the maze of credit requirements.

While a great deal of research has targeted drop-out prevention
CHAPTER NINE

for women, ethnic minorities, and English language learners, such efforts have not necessarily considered the complex social and academic needs of migrant students. The high mobility of migrant students should be given special consideration when designing, restructuring, or implementing drop-out prevention programs and policies. Educators should foster culturally relevant learning environments in which migrant students can comfortably incorporate their knowledge and skills.

Effective communication between the school and parents also is critical in enhancing the education experience of migrant secondary students. Schools must inform migrant parents about students’ educational progress, options at the secondary level, and possibilities for postsecondary education. Finally, researchers should examine how high-stakes testing policies negatively affect the education and graduation opportunities of migrant students. Migrant students should be adequately prepared to tackle the exit-level standardized tests required for graduation in many states.

Migrant students should have equal access to higher education. The hidden curriculum and, in particular, the key math courses, must become target areas of advocacy for educators. Without opportunities and support within the college-bound curriculum, migrant students will remain excluded and disenfranchised. Migrants must have access to the rich curriculum that adequately prepares them for postsecondary education. Simply having entry into a track labeled “college preparatory” is not adequate. A diploma in hand is meaningless if students have not been equipped with the necessary tools, skills, and knowledge to have access to and succeed in higher education. Secondary educators must ensure that migrants, along with all other students, learn the content material that will ensure achievement at the postsecondary level. Like all students, migrant children and their families deserve an egalitarian and democratic education system.
