</tbody>
</table>
Symposium 3: Learning Measurement and International HRD
Neural Network Analysis in Cross-Cultural and Comparative Management Research: Implications for International HRD
Aahad M. Osman-Gani
Construct Validation of an Arabic Version of the Learning Transfer System Inventory (LTSI) for Use in Jordan
Samer Khasawneh, Reid A. Bates, and Elwood F. Holton, III
Validating Constructs of a U.S.-Based Transfer Instrument in Taiwan
Hsin-Chih Chen, Elwood F. Holton, III, and Reid A. Bates

Symposium 4: Gender in HRD
Women's Socio-economic Development in India: The Role of Non-governmental Organizations - Research and Theory
Meena Razvi and Gene L. Roth
Women in Information Technology
Rose Mary Wentling and Steven Thomas

Symposium 5: Intellectual Capital and Human Capital Theory
Continuing Professional Education and Human Capital Theory
Jasper B. van Loo and Tonette S. Rocco
Intellectual Capital: Opportunities and Challenges
Madeleine Doran
Human Capital Theory: A Reflection on Retention of Employees in the Hospitality Industry
Hanna B. Hayes, Meera Alagaraja, and Larry M. Dooley

Symposium 6: Connecting Education and Practice
Making Connections: The Link between HRD Education, Practice, and Research
Lindsay M. Taylor and Jamie L. Callahan
Kit Brooks, Fredrick M. Nafukho, and Mary Herrington

Symposium 7: Formal and Informal on-the-job Learning
Work Practice, Learning Worker Characteristics and Informal Learning
Anja J. Doornbos
Contextual Factors and Detractors Shaping Informal Workplace Learning and Its Facilitation: The Case of 'Reinventing Itself Company'
Andrea D. Ellinger
Unanticipated Effects on Trainers Using Structured OJT: The Literature Review
Dae Yeon Cho and Ronald L. Jacobs

Innovative Session 1
Organizational Development in Universities

Friday, March 5 • 1:30 PM – 3:00 PM
Symposium 8: International Human Resource Development
The Why's of Bhopal Revisited
Meera Alagaraja and Sudha Arlikatti
Socio-economic Status of Women in India
Meena Razvi and Gene L. Roth
The Role of HRD in Chinese State-owned Banks and Implications for Future HRD Policies and Practices
Jie Ke, Kenneth E. Paprock, and Susan A. Lynham
Symposium 9: HRD Methods and Tools
The Web-based Delphi Research Technique as a Method for Content Validation in HRD and Adult Education Research
Sharon Colton and Tim Hatcher
Competencies and Training Needs of Financial Aid Administrators
James F. Lane, Jr.
Development and Change through Scenario Planning
Thomas J. Chemack and John S. Walton

Symposium 10: Considerations for Distance Education
Online and Face-to-face Training: A Cost Matrix
Sharon J. Bartley and Jennifer H. Golek
Designing an Assessment Model for Implementing a Quality Online Degree Program
Rita L. Dobbs and W. Clayton Allen

Symposium 11: Gender and Mentoring
Organizational Politics and Culture: An Essential Attribute of the Mentoring Experience for Women Faculty
Sharon K. Gibson
Do Formal Mentoring Programs Matter? A Longitudinal Randomized Experimental Study of Women Healthcare Workers
Toby Marshall Egan and Manda H. Rosser

Symposium 12: Emotions in Organizations
Creating Consumer Resistance through Adbusters: Managing Emotion beyond Organizational Boundaries
Jennifer A. Sandlin and Jamie L. Callahan
Identity Consistency: The Role of Emotion Management across Contexts
Aubrie Horrocks and Jamie L. Callahan

Symposium 13: Creativity and Aesthetics
Developing the Creative Class: A Role of Human Resource Development Programs
Consuelo L. Waight, Shirley Ezell, and Katy Greenwood
Practise In and Perceptions of HRD: Do we Need an Aesthetic Perspective?
Stephen Gibb

Symposium 14: Collaboration
Building Web-based Communities: Factors Supporting Collaborative Knowledge-building
Jennifer Calvin, David S. Stein, and Joe E. Wheaton
There is No "We" in Team: Learning to Learn across Difference in Problem-based Teams
John M. Dirkx and Regina O. Smith

Innovative Session 2
Teaching the Ins and Outs of Evaluation in Organizations
Hallie Preskill and Darlene F. Russ-Eft

Friday, March 5  ▪  3:30 PM – 5:00 PM
Symposium 15: Cross Cultural Training
Context beyond Culture: Implications for Human Resource Development?
David Ripley and Irene Hudson
Intercultural Training for Business Expatriates: Cultural-specific Training Needs of US Business Expatriates on Assignment to Taiwan
Tien-Chen Chien and Gary N. McLean
Connecting Cross-cultural Training Transfer with Performance
Anne W. Drewry, Vickie Johnson Stout, and Brian Walker
Symposium 16: Strategic Human Resource Development
The Emotional Reactions of HRD Professionals to the Decision to Outsource HRD
Nicole Simons, Jean Woodall, and Stephen Gourlay

Testing a Model of Employee Selection: A Contextual Approach
Kiyoe Harada and Jeffry S. Bowman

An Integrated Approach to Planning in Organizations
Thomas J. Chermack

Symposium 17: Learning
Transformational Learning and Human Resource Development: Advances Toward a Knowledge Based Society through Humor
Joanne Parke

Escaping the Tyranny of Belief
Albert K. Wiswell and C. Leanne Wells

Asking the Right Questions, Looking in All the Right Places: Re-embedding Knowledge Construction in Professional Education
Suzanne J. Gallagher

Symposium 18: Mentoring
A Summary Analysis and Prescriptions for Mentoring in Multicultural Organizations
Ray K. Haynes

The Advantages of Reporting to Your Mentor: A Comparison of Managers with Supervisory and Non-supervisory Mentors
Sarah A. Hezlett

A Systems Approach to Mentoring: A Review of Literature
Jeeyon Paek

Symposium 19: Organizational Commitment
Voluntary Organizations: Commitment, Leadership, and Organizational Effectiveness
Terry P. Ekeland

Training and Organizational Commitment among Nurses in New Zealand and United States Public Hospitals Experiencing Industry and Organizational Change
Kenneth R. Bartlett and Dae-seok Kang

Commitment Elements Reframed (Antecedents and Consequences) for Organizational Effectiveness
Sandra L. Fornes and Tonette S. Rocco

Symposium 20: Knowledge Management
Knowledge Sharing in Organizations: An Analysis of Motivators and Inhibitors
Minu Ipe

Knowledge Management Leadership: Exploring the Role of the Chief Knowledge Officer
Tina M. Chindgren

A Critique of Selected Knowledge Management Models
Baiyin Yang, Wei Zhen, and Chris Viere

Symposium 21: Defining Human Resource Development
Human and Organization Studies: The Discipline of HRD
Neal Chalofsky

A Survey of Current and Former Members of the Academy of Human Resource Development
Fredrick M. Nafukho and Barbara E. Hinton

Bridging the Great Divide: Exploring Resistance to HRD in Adult Education
Laura Bierema, Wendy Ruona, Maria Cseh, Andrea D. Ellinger, and Karen Watkins
Innovative Session 3
Behaviorally Anchored Competencies as Assessment Tools
Kim E. Dooley, James R. Lindner, Larry M. Dooley, Meera Alagaraja, Gary Jedynak, and Elaine
Patterson

Saturday, March 6  •  10:30 AM – 12:00 PM

Symposium 22: Exploring International Human Resource Development
Grounding Our HRD Practice in the Challenges of Management Development: A Case of China
Jia Wang and Wendy Ruona
A Review of HRD Research in Three Areas of East Asia: Mainland China, Japan, and Taiwan
Yi-Hsuan lee, Jie Lin, Susan A. Lynham, Kenneth E. Paprock and Jie (Jessica) Li
HRD in Latin America: An Exploratory Review of the Literature
Michael G. Hasler, Monica D. Thompson, Susan A. Lynham, and Kenneth E. Paprock

Symposium 23: Change in International Human Resource Development
The Change Agent in the Global Environment: An Exploration of a Role in Transition
Toni Powell
Managing Effectively as a Global Manager in Thailand
Boon-Anan Phinaitrup
Institutionalization of Organizational Change: A Study of HRD Interventions in Singaporean,
US, Japanese, and German Companies
AAhad M. Osman-Gani and Ronald L. Jacobs

Symposium 24: Supervisory Social Support
Empirically Based Recommendations for Training and Development of Supervisory Social
Support
Duchduen Bhanthumnavin
The Value of Critically Reflective Work Behaviour
Marianne van Woerkom
Tools and Strategies for Engaging the Supervisor in Technology-supported Work-based Learning
Manuela Bianco and Betty Collis

Symposium 25: Organizational Learning and Culture
Organizational Learning Culture, Transfer Climate and Perceived Innovation in Jordan
Reid A. Bates and Samer Khasawneh
A Conceptual Exploration of the Antecedents of Organizational Trust
Sam Adams and Albert K. Wiswell
Diagnosing the Learning Capacity of a Financial Services Institution
Wayne Connell, Dana Papke, Robert Stanton, and Sue Wise

Symposium 26: Education Customization
Customizing Learning Programs to the Organization and Its Employees: How HRD Practitioners
Create Tailored Learning Programs
Rob F. Poell and Ferd J. Van der Krogt
Constructing a Theoretical Model of Human Resource Development Knowledge Innovation in
Corporate Settings
Yu-Shu Chen
Relationship between Learning Style Learning and Learning Modality of Employees of a
Healthcare Organization
Geri McArdle, Paul VanBuskirk, and Nancy Edwards
Symposium 27: Executive Training and Development
Applications of Psychology-based Theoretical Approaches to Executive Coaching: A Summary and Exploration of Potential Utility
Brandi L. Plunkett and Toby Marshall Egan
An Investigation of CEO's Learning Experiences: Implications for Leadership Training
Margot B. Weinstein
In Support of Coaching Models of Management and Leadership: A Comparative Study of Empirically Derived Managerial Coaching/Facilitating Learning Behaviors
Bob Hamlin, Andrea D. Ellinger, Rona S. Beattie

Symposium 28: Diversity Programs and Initiatives
Diversity Training in the Heartland: An Exploratory Study of Small and Mid-size Organizations
Linda M. Hite and Kimberly S. McDonald
HRD in Community Development: A U.S. Case Study of Diverse Community Development
Mesut Akdere
Diversity and Human Resource Development
Rose Mary Wentling

Innovative Session 4
Publication Tips and Strategies: A Scholar's Perspective on How to Get Published
Laura Boehme, Darlene Russ-Eft, Tim Hatcher, Tonette Rocco, and Baiyan Yang
# Volume 2

## AHRD 2004 Conference Overview

### Conference Papers

**Saturday, March 6 • 1:30 PM – 3:00 PM**

### Symposium 29: Learning Assessment

- Implementation of a Learning-oriented Evaluation for HRD Programs
  - Youngsook Song
  - Symposium 29
- The Constructivist Learning Environment Scorecard: A Tool to Characterize Online Learning
  - Barbara J. Helland
  - Symposium 29
- Organisational Factors Influencing the Assessment of Formal and Informal Learning
  - Nicholas R. Clarke
  - Symposium 29

### Symposium 30: Culture and Organizational Socialization

- Development of a Theory of Continuous Socialization for Organizational Renewal
  - Monica M. Danielson
  - Symposium 30
- Coworker Relationships, Acculturation and Socialization-related Job Knowledge
  - Thomas G. Reio, Jr. and Mike A Boyle
  - Symposium 30
- Cultural Effects on Medical Residents Evaluations of Interpersonal Skills and Professionalism
  - Carol Packard
  - Symposium 30

### Symposium 31: Theoretical Frameworks of Performance and Human Resource Development

- Toward a Meta-theory of Learning and Performance
  - Darlene Russ-Eft
  - Symposium 31
- Taking Hope to Work--Extending Hope Theory to Include Performance Communication
  - Vickie Johnson Stout, Kristye Yvette Raby, and Michael L. Morris
  - Symposium 31
- A Rationale for HRD-Ethics and its Inclusion as a Theoretical Foundation
  - Tim Hatcher
  - Symposium 31

### Symposium 32: Human Resource Development in Law Enforcement

- Vicarious Traumatization: The Role of the Human Resource Development Practitioner
  - Lynn A. Tovar
  - Symposium 32
- Understanding the Formation of Prejudice Attitudes of Police Officers
  - Lisa M. Snow and Rose Mary Wentling
  - Symposium 32
Symposium 33: Motivation
Motivating Employees During Lean Times: A Review of the Employee Participation Literature
Murray D. MacTavish
An Exploratory Examination of Selected Growth Theories of Individual Motivation and How They Inform Performance in Organizations
Melissa A. Noggle and Susan A. Lynham
Taking on the Teacher Supply and Retention Challenge: A Performance Focused Model for School-University Partnerships
Dorian Martin, William E. Reeves, Eric Wilson, Lisa O'Dell, and Toby Marshall Egan

Symposium 34: Human Resource Development Policy in Asia
State-led Policy in Human Resource Development: Korea Case
Hae-young Lee
Needs Assessment for Career Development Programs in the Taiwan Power Company (TPC): A Factor Analysis of Employees’ Career Development Needs for Their Present and Future Positions
Yi-Hsuan Lee and Walter Stenning
National Human Resource Development in the People’s Republic of China
Baiyin Yang, De Zhang, and Mian Zhang

Symposium 35: Diversity’s Impact on Change and Learning
Leveraging Diversity—Strategic Learning Capabilities for Breakthrough Performance
Terrence E. Maltbia
Viewing Older Workers’ Social and Human Capital Capacity Development to Evolve an Adaptive Future Workplace
Donald L. Venneberg, Vida D. Wilkinson, and Gary D. Geroy
The Relationship between an Individual’s Margin in Life and Readiness for Change
Susan R. Madsen, Cameron John, Duane Miller, and Emily Warren

Innovative Session 5
Cross-Cultural Multi-Theory Perspectives in Research: Dialogue Based on Theory and Data from the US and Netherlands on Action Learning Programs
Rob F. Poell, Lyle Yorks, Victoria J. Marsick, and Jean Woodall

Saturday, March 6 • 3:30 PM – 5:00 PM
Symposium 36: The Future of Career Development
Career Development within HRD: Foundations or Fad?
Marieke S. van Kijk
Career Development Challenges for the 21st Century Workplace: A Review of the Literature
Thomas J. Conlon
Perceived Effectiveness and Application of Organizational Career Development Practices
Carroll M. Graham and Fredrick M. Nafukho

Symposium 37: Organizations and Change
Involvement in the Investigative Phase of a Merger and Acquisition: Perceptions of HRD Professionals
Consuelo L. Waight
Organizational Identity and Its Implication on Organization Development
Yueh-Ysen Lin
Change and Higher Education: A Multi-disciplinary Approach
Julia Storberg-Walker and Richard Torraco
Symposium 38: Theorizing Human Resource Development
Conceptualizing a Theory of Scenario Planning
Thomas J. Chermack
Agency Theory: Implications for Human Resource Development
Mesut Akdere and Ross E. Azevedo
Neoclassical and Institutional Economics as Foundations for HRD Theory
Greg Wang and Elwood F. Holton, III

Symposium 39: Adult Learning Theory and Defining Training and Development
A Critical Evaluation of Adult Learning Theories and Implications for Human Resource Development
Baiyin Yang
Training and Development: An Examination of Definitions and Dependent Variables
Usha V. Somasundaram and Toby Marshall Egan
The Realities of Clarifying and Redefining the Trainer Role
Geri McArdle and Nancy Edwards

Symposium 40: E-learning and Culture
Cross Cultural Differences in Online Learning Motivation
Doo H. Lim
The Relationship between National Culture and the Usability of an E-learning System
Steve Downy, Rose Mary Wentling, Tim Wentling, and Andrew Wadsworth

Expatriate Practices in Taiwan's Multinational Companies
Chi-jung Fu and Hui-chin Chu
Training Evaluation: A Case Study of Taiwanese Benchmark Companies
Bella Y. Lien and Richard Y. Y. Hung
Devolving HRM and HRD to Line Managers: The Case of Hilton International's UK Hotels
Gillian A. Maxwell and Sandra Watson

Symposium 42: Performance Appraisal
Seeking Symmetry between Supervisory Ratings and Self-ratings of Employee Problem-solving Skill
Margaret C. Lohman
Preferences of Training Performance Measurement: A Comparative Study of Training Professionals and Non-training Managers
Diane D. Chapman
Using Behaviorally Anchored Self-assessment Instruments to Evaluate Employee Performance
James R. Lindner, James A. Buford, Jr., Kim E. Dooley, Gary Jedynak, Elaine Patterson, and Larry M. Dooley

Innovative Session 6
Playing with Perspective: Emotions in Organizations
Jamie L. Callahan, Aubrey Horrocks, Carrie Machala, Rose Opengart, Sharon Turnbull, and Darren Short
Sunday, March 7 ▪ 9:00 AM – 10:30 AM

Symposium 43: Perceptions of Online Education
Distance Learning Roles and Competencies: Exploring Similarities and Differences between Professional and Student Perspectives
Toby Marshall Egan and Mesut Akdere
The Competitive Advantage of Online Versus Traditional Education
Jillian A. Peat and Katherine R. Helland
Adult Students' Perceptions of Web and Interactive Video Classes
Dale E. Thompson, Cecelia Thompson, Buddy Lyle, and Betsy Orr

Symposium 44: Learning Transfer and Human Resource Development Effectiveness
Reconceptualizing the Learning transfer Conceptual Framework: Empirical Validation of a New Systemic Model
Constantine Kontoghiorghes
A Theoretical Framework for Addressing Training Needs Associated with Sexual Harassment Prevention Programs
Mary Lynn Berry and Michael L. Morris
Strengthening a Comprehensive Model for Explaining HRD Effectiveness
A. M. Wognum and Bernard P. Veldkamp

Symposium 45: Human Resource Development Degree Programs
Defining Human Resource Development Technical Knowledge and Job Skills at the Undergraduate and Graduate Levels: Where's the Beef?
Thomas R. Giberson and Monica W. Tracey
Identifying Benefits of an Internship Program through Appreciative Inquiry Interviews
Debbie L. Mackey and Connie Thomas
Academic Service-learning in the HRD Curriculum
Ovilla Turnbull and Susan R. Madsen

Symposium 46: Technology Perceptions
Conceptualizing and Measuring Employee Response to Imposed Technological Change
Robert Reardon
Effective Management Communication: A Study of Employees' Perceptions of Online and Face-to-face Communications
Sharon J. Bartley, Virginia W. Kupritz, and Jennifer L. Mills
Technology as a Critical Issue in HRD: Effects on the Organization
Meera Alagaraja, Jamie L. Callahan, and Larry M. Dooley

Symposium 47: Virtual Teams
Team Development of Virtual Teams
Sooyoung Kim
Leading Virtual Teams: Three Cases
James Johnson and Laurel Jeris
Two Group Development Patterns of Virtual Teams: Linear Progress and Adaptive Progression
Seung-won Yoon

Symposium 48: Ethics
Graduate Business Students Perceptions of the Qualities and Behaviors of Ethical Leaders: An Approach to Ethical Leadership Development
Catherine Marsh
The Relationship between Ethical Climate and Job Satisfaction in Small Businesses
Clyde T. Conine, Jr., and Robert W. Rowden
Ethics Teaching and Training Practices in the Workplace: A Review of Approaches Used in Academic and Corporate Institutions and the Special Challenges of Multiculturalism
Judith A. Kolb, Dee Frisque, and Hong Lin
**Symposium 49: Assessing Online Learning**  
The Effect of Flexible Learning Schedule on Online Learners' Learning, Application, and Instructional Perception  
*Doo H. Lim*  
The Development of a Research Instrument to Analyze the Application of Adult Learning Principles to Online Learning  
*Sharon Colton and Tim Hatcher*  
A Path Analytic Study of the Determinants of College Students' Motivation to Use Online Learning Technologies  
*Reid A. Bates and Samer Khasawneh*

**Innovative Session 7**  
Using Appreciative Inquiry to Build and Enhance a Learning Culture  
*Rachelle Lehner and Wendy Ruona*

---

**Sunday, March 7 • 11:00 AM – 12:00 PM**

**Symposium 50: Emotions at Work**  
Emotion in Organizational Learning: Implications for HRD  
*Sharon Turnbull*  
Women Managers: Learning about Emotional Expression in the Workplace  
*Rose Opengart*

**Symposium 51: Competencies in Human Resource Development**  
Speaking of Competence: Toward a Cross-translation for Human Resource Development (HRD) and Continuing Professional Education (CPE)  
*Laurel Jeris and Kathleen Johnson*  
Competency-based Human Resource Development Strategy  
*Noordeen T. Gangani, Richard A. Braden, and Gary N. McLean*

**Symposium 52: Human Resource Development Faculty**  
A Mediated Hierarchy Regression Analysis of Factors Related to Career Research Productivity of Human Resource Education and Development Postsecondary Faculty  
*Heather A. Williams and Joe W. Kotrlik*  
Variables Influencing Time Spent in Research of Human Resource Education and Development Faculty Members  
*Heather A. Williams and Joe W. Kotrlik*

**Symposium 53: Professional Development**  
Learning and Context: Connections in Teacher Professional Development  
*Barbara J. Daley*  
Professional Training Programs as Effective Interventions for Staff Development and Launch Pads for Learning Transfer: A Case Study  
*Khalil M. Dirani*

**Symposium 54: Leadership**  
An Examination of the Relationship between Emotional Intelligence and Leadership Style  
*Lisa A. Weinberger*  
Safety Leadership Development in the Oilfield: Operationalizing Lynham's Theory of Responsible Leadership for Performance  
*Jim Rushing and Susan A Lynham*
Symposium 55: Graduate Student Research Skills
Research in Higher Education: Graduate Student Perspective 55-1
Mesut Akdere
Lessons Learned in a Virtual Team: An Integrative Model for Graduate Student Research Skill Development 55-2
Kristie Abston, Cindy Crowder, and Vickie Johnson Stout

Symposium 56: Quality Management
Impact of ISO Certification on Training and Development Activities in the Electronics Industry in Taiwan 56-1
Wen-Rou Huang and Ronald L. Jacobs
Total Quality Management Practices and Their Effects on Organizational Performance 56-2
Richard Y. Y. Hung and Bella Y. Lien

Innovative Session 8
Learning Lessons from the (Dance) Floor 1-8
Jamie L. Callahan

Posters
Friday, March 5 • 10:30 AM – 12:00 PM
Toward an Understanding of Targets' Reactions to Workplace Abuse P-1
C. Leanne Wells
Rapid Adaptation To An Online Format P-2
Geri McArdle and Nancy Edwards

From the Editors

It is with great pleasure that we welcome you to Austin and the celebration of our eleventh Annual Academy of Human Resource Development Conference! This year’s AHRD 2004 Conference Proceedings once again reflect a rich collection of scholarly voices committed to the ongoing challenge of leading our evolving discipline through research.

The collection of research in the over 160 papers and conference sessions contained in these Proceedings celebrate the work and effort of authors from five continents. The papers cover a wide array of topics, methods, and contexts of enquiry and represent a growing consciousness and worldwide recognition of the importance of developing and unleashing human skills and expertise, and of celebrating and recognizing the greatness within every human being. As reflected in these papers, HRD continues to contribute to and influence thoughtful dialogue, discovery of new knowledge, and improved practice in HRD, and in so doing, have increasing impact in multiple contexts and domains of learning and performance.

Using the Proceedings

1. This year’s Proceedings are divided into two volumes, reflecting the Conference Program. Volume One covers all symposia through Saturday morning, while Volume Two covers the remainder of Saturday and whole of Sunday symposia.
2. The Table of Contents, provided at the beginning of each Volume of the Proceedings, covers the contents for both Volumes. The comprehensive Author Index and Keyword Index are included at the end of each Volume.
3. A Program Overview is included in both Volumes of the Proceedings. The full version of the Conference Program is printed as a separate document.
4. Papers are grouped by symposium number. Symposium numbers are used in the Author and Keyword indices.
5. As in past years, we also have a CD-Rom version of the Proceeding. Instructions for use of the CD-Rom are provided in digital text.

Our most sincere thanks to all of the authors featured in these Proceedings — without YOU this celebration of HRD scholarship would not be possible.

Our very best wishes to each of you for an enjoyable, engaging, and energetic conference in Austin! May you leave the Conference having had fun, made new friends, found new opportunities for collaboration and enquiry, and reenergized to continue to demonstrate and pursue our important professional mission of “Leading HRD through Research.” Yeeh-Hawh!!

Human Resource Development Scholarly and Professional Community

Dear HRD Professional:

The Academy of Human Resource Development strives toward a vision of “Leading Human Resource Development Through Research.” A key component in achieving this vision is our annual research conference, which convenes scholars, students, and reflective practitioners from business, government, non-profits, the military, the academic sector, and any other setting to discuss research and forge relationships that foster cooperation and collaboration. As the world grows increasingly smaller, we are particularly interested in extending that cooperation and collaboration to the international community. Accordingly, we extend a special invitation to international scholars, students, and reflective practitioners to submit manuscripts and attend the conference.

We urge every HRD scholar and professional to give the call for papers the widest possible dissemination. In addition to giving the hard copy of the call for papers to an interested associate, you may refer those interested to the EVENTS AND CONFERENCES section of the AHRD website http://www.ahrd.org or ask them to contact the AHRD office.

We are also interested in expanding the number and quality of innovative and poster sessions and, towards that end, have provided additional information on various formats, submission requirements, and acceptance criteria as part of this call for papers. Finally, in an effort to expand and refresh our preconference offerings, we have gone to a proposal format for those sessions, also. We urge you to be creative and innovative in putting together either half-day or full-day sessions that would attract the interest of the HRD community.

We look forward to receiving a wide variety of submissions and proposals from the worldwide HRD community and making this 11th annual research conference the best we have had. Thank you for sharing our vision, and I look forward to seeing you in Estes Park, Colorado, Feb 24 – 27, 2005.

Best Regards,

Gene L. Roth

Submission Address:
http://hrd.utk.edu/AHRDsubmit

Conference Hosted by:
Colorado State University

Questions about Papers:
Direct all questions regarding submissions to Lane Morris, Program Chair: AHRDsubmit@utk.edu

Questions about the Conference:
Direct all questions regarding the Conference to the AHRD Office: Office@ahrd.org (419) 372-9155

The Academy of Human Resource Development, an international organization having the mission of encouraging the systematic study of human resource development theories, processes, and practices, encourages you to submit manuscripts for the 2005 International Research Conference.

All scholars interested in HRD are invited to submit manuscripts for consideration. The conference is attended by researchers and students from the areas of HRD, business, psychology, education, economics, sociology, technology, and communication. In addition, HRD researchers and reflective practitioners from business, industry, and government participate fully in the conference.

Manuscripts may be submitted in five categories: Research and Theory Symposium, Poster, Research in Progress, Innovative Session, and Pre-conference. Research and Theory, Poster, and Innovative Session manuscripts will be blind reviewed and should be of new unpublished research. Research in Progress manuscripts will be blind reviewed but will not be published in the proceedings. Pre-conference proposals will not be blind reviewed but will be published in the proceedings. Manuscripts accepted for the conference program will be published in the conference proceedings and may be published elsewhere following the conference.

At least one author for each submission must register for the conference by January 10, 2005, in order for the submission to be included in the program and proceedings. The registration form will be available at www.AHRD.org.

Submission Deadlines
Manuscripts Due: 5 PM (Eastern) Monday, September 20, 2004
Decision Notification: October 25 – November 1, 2004
Camera-ready Papers: Friday, December 3, 2004

Online Submission Address: http://hrd.utk.edu/AHRDsubmit
AHRD International Research Conference 2005
Submission and Formatting Requirements

- Manuscripts must not exceed 8 pages in length (10 point font), including everything except the cover sheet (all figures, graphs, references, and tables must be included in the 8 pages). Submissions must be made via the online submission site (http://hrd.utk.edu/AHRDsubmit). The online submission form will not accept more text than what is stated in this document, so ensure your paper fits the requirements before trying to submit the paper. The deadlines are firm. The submission site will be disabled at 5:01 PM (Eastern) Monday, September 20, 2004. Exceptions to this deadline will be made only for true emergencies or extraordinary circumstances, so please submit your paper early. If you have problems or issues when submitting your paper, then immediately send an e-mail to AHRDsubmit@utk.edu for assistance.

- Upon successful submission and completion of the submission process, authors will receive a confirmation message via email.

- Manuscripts must be blind review ready upon submission. The cover sheet will be the only page with any identifying information. This information will be required during completion of the online submission form. The header, footer, and the body of the manuscript as well as the file properties must not contain any author names or identifying information. The cover sheet must include the following:
  1. Each author's full name, academic or business affiliation, complete address, work phone, fax, and e-mail address. All communications with authors will be via e-mail, so addresses are required for each author.
  2. Abstract (no more than 75 words)
  3. Category of the manuscript: Research and Theory Symposium, Poster, Research in Progress, Innovative Session, and Pre-conference
  4. Primary research methodology: Quantitative, Qualitative, Theory, Literature Review, etc.
  5. Three keywords – choose from those made available on the submission site.

- Manuscripts should be camera-ready upon submission. Formatting requirements for all manuscripts include the following:
  1. First page includes the abstract (75 words maximum), three descriptive keywords, and the primary research methodology immediately below the manuscript title.
  2. Margins of 1.0” (left, right, top, and bottom)
  3. Times New Roman font, 10 point
  4. Single line spacing
  5. The first line of each paragraph should be indented 0.25” from the left, except for the first line under a major heading.
  6. Full justification throughout
  7. Do not start references on a new page. Follow APA (5th edition) throughout except when specified otherwise in this Call for Papers.
  8. Embed tables and figures into the document.

- You and/or your co-author(s) must be available to present at any time throughout the duration of the conference. As soon as the conference program has been finalized, you will be notified about the assigned date and time of your presentation.
AHRD International Research Conference 2005
Category Requirements

**Research and Theory**
Full manuscripts of 8 pages are required for this category. Submissions must be new and unpublished research and theory. Research papers, as appropriate to the methodology used, should contain the following elements:

1. Title
2. Problem statement
3. Theoretical framework
4. Research questions or propositions
5. Methodology and/or research design with limitations
6. Results and findings
7. Conclusions and recommendations
8. How this research contributes to new knowledge in HRD

Research and theory papers will be combined according to the three keywords submitted by the authors and presented orally in symposium format with at least one other paper. AHRD also welcomes manuscripts presenting methodologies including new scholarly theory, models, conceptual analyses, literature reviews, and case studies. While these papers may not yet offer results (#6 above), they must otherwise follow the above requirements.

**Poster**
Manuscripts with a maximum of 8 pages (including the poster miniatures) are required for submission. Visual representations of the posters can enhance the clarity of the research and help us view the field of HRD in new and different ways. Posters are not a substitute for a scholarly paper. Posters will remain up throughout the conference, and a session will be scheduled to allow interaction between the author(s) and conference participants.

The following criteria MUST be included in the manuscript:

1. Title
2. Theoretical Framework
3. Substantive contribution to HRD knowledge
4. Reduced copies of the posters
5. Accepted posters will have no more than two, professional appearing, 2’ x 3’ poster boards that must be readable from a distance of six feet.

**Research in Progress**
Research in progress manuscripts have the same requirements as Research and Theory papers. While these papers may not yet offer results, they must otherwise follow the stated requirements. Furthermore, by the conference date, it is anticipated that the presenters be able to share preliminary results, conclusions, and recommendations.
Innovative Session

Proposals up to 8 pages in length may be submitted for this category. An innovative session is designed to present new and innovative HRD work through creative, interactive presentation formats that do not fit within the research and theory symposium process.

The formats described below are offered as suggestions only. The intent of these examples is to be useful to those considering alternatives to the standard paper and symposium session formats. Preference will be given to proposals with a research or theoretical basis.

| Debate | The debate format can be an effective way to present two opposing views about a topic. One structure for a debate is to have a moderator and two, two-person teams. The debate begins with the moderator stating a position. One team then presents arguments that affirm the proposition and the other team presents arguments against the proposition. Each team member has a fixed amount of time (e.g., 10 minutes) to present arguments. Time for rebuttal can be incorporated into the session and/or a discussant can sum up the main points of the session. When submitting a debate proposal, be sure to include a statement of the proposition to be debated and descriptions of the major points likely to be argued by each side. |
| Panel Discussion | In a panel discussion, the chairperson plays a very active role, serving as a moderator who asks questions of the panelists and ensures that all panelists (three to six people) have the opportunity to speak. Diversity among panelists is important to the success of the session. Further, all panel discussion members must recognize the need for advance preparation. Panelists and chair do not prepare papers. They make brief introductory remarks before engaging in ad hoc give and take for which they may have prepared themselves but which cannot be predicted or entirely controlled (a chair skilled in discussion management is essential). Panel discussions should generate spontaneous interaction among participants and between participants and the audience. A panel discussion proposal should describe the questions that will be addressed by the panel, the underlying issues or themes to be discussed, and the structure or format of the session. |
| Practitioner Forum | A Practitioner Forum provides an opportunity for HRD professionals to discuss challenges in the work environment and innovative solutions that are linked to HRD research issues. Each forum is devoted to a single topic. A chair introduces the session, three or four presenters take approximately 10 minutes each to discuss applied research and practice issues, and audience members spend the remaining time interacting with presenters and each other, offering their own ideas about applied research and practice. Practitioner Forum topics are welcome on any "cutting edge" topic. Special effort should be made to link theory and practice. |

The following criteria MUST be addressed in the proposal:

1. Title
2. Session Description
3. Presenters/Panelists (name, affiliation, and contact information for each person)
4. Purpose
5. Goals
6. Content of session with evidence that it is new, is innovative, addresses research or scholarship, and makes a substantive contribution to HRD knowledge. The content section should include a theoretical framework.
7. Description of format, style, and an agenda for the presentation that is to be innovative, intellectually stimulating, generative of a high level of scholarly dialogue, and participative by both presenters and audience.
Pre-Conference
The AHRD Conference Planning Committee seeks dynamic learning experiences that would be of significant interest to HRD researchers and reflective practitioners. Pre-conference sessions may be problem oriented, professional-development oriented, focus on knowledge transmission, address recent methodological and substantive developments in HRD research, or serve as organizing sessions for special interest groups exploring an HRD related subtopic in depth. AHRD welcomes sessions that extend beyond traditional research paradigms and methods and especially encourages offerings that merge research and practice.

- Full-day sessions and half-day seminars (4-hour) are available. Pre-conferences will run on Wednesday and Thursday before the annual conference.

- The following criteria must be addressed in the proposal:
  1. Cover page with each author’s full identification and contact information as required for all submissions
  2. Title
  3. Committee or Panel Members with affiliations and contact information
  4. Purpose including a statement about how the session advances the mission and vision of the Academy
  5. Constituency or target audience
  6. Specific goals
  7. Draft agenda

- Pre-conference proposals will not be blind reviewed but will be judged on their contribution to advancing the vision of the Academy. The Conference CEO will make the final decisions on pre-conference proposals. Pre-conference manuscripts will be included in the proceedings.

- An example proposal can be found on the AHRD website <www.ahr.org> under EVENTS AND CONFERENCES.

- No budgets are allocated by AHRD for pre-conferences, except for refreshment breaks.

- All pre-conference attendees are expected to pay the fee including invited speakers.

- No pre-conference is guaranteed approval from one year to the next.

- As with the other types of submissions, the pre-conference proposals must be submitted online at http://hrd.utk.edu/AHRDsubmit. All deadlines are firm. Exceptions will be made only for true emergencies or extraordinary circumstances.
Call for Papers

Academy of Human Resource Development, International
Jointly with the
Korea Academy of Human Resource Development (KAHRD), Korea

Announces the

Third Asian Conference of the Academy of HRD

November 21 - November 23, 2004
(Pre-conference Workshops: November 20-21)

Venue:
Seoul Olympic Parktel, Seoul, Korea

Host Institution:
Korea Academy of Human Resource Development (KAHRD), Korea

Conference Theme:
Human Resource Development in Asia:
Harmony and Partnership
The Asian Chapter of the Academy of HRD (the top global scholarly organization in the field of HRD), in cooperation with the Korea Academy of Human Resource Development (KAHRD), invites scholarly papers (empirical or conceptual) for its third Asian Regional conference. The conference will bring together researchers and practitioners in the field of HRD coming from various disciplines and fields of study (HRD and HRM, business management, education, IT, economics, psychology, sociology and others). It will also be an effective forum for networking and professional interactions among leading HRD researchers and practitioners from around the world who have interests in HRD in Asia. From throughout Asia, attendance is expected from Japan to New Zealand, from Vietnam to Saudi Arabia, as well as participants from the USA and Europe.

The Korea Academy of Human Resource Development (KAHRD), established in 2003, aims at a center for scholars’ and practitioners’ community who have interests in the field of HRD. It holds forums, seminars and other conferences designed to share and discuss HRD related ideas, research, practices, and programs in both corporate and not-for-profit settings and national policy areas.

The Academy of HRD, headquartered in the USA, is supported by four international publications: *Human Resource Development Quarterly (HRDQ)*, *Human Resource Development International (HRDI)*, *Advances in Developing Human Resources*, and the new *Human Resource Development Review*. All of these journals are published quarterly by reputed publishing houses in the USA and the UK. Papers from this conference may be submitted for publication consideration in these journals.

**Possible Topics or Issues to be Covered in the Conference (not an exhaustive list):**

**Harmony and Partnership in HRD**
- Labor-management cooperative HRD, partnership building of HRD, partnership and alignment between government and business, and partnerships among academia, industries, and research institutes.

**HRD in Policy Areas**
- HRD at the National/Strategic Level (national policy initiatives, national innovation system, various strategies used, focus and interpretations of HRD in different countries, regional HRD, regional innovation system)
- Lifelong Education & Learning Policy and Practice (trends in research and practice, adult education & learning, international comparison of lifelong education and learning, future of lifelong education & learning)

**Training and Development in Corporate Sector**
- HRD in the Business or Corporate Sector (recent trends, leadership development, competency mapping research, roles and responsibilities of HRD staff, performance management systems, HRD Audit, career planning, coaching and mentoring and their effectiveness.)

**HRD in Non-Government Sector/Non-Profit Sector**
- HRD in the Not-for-Profit Sector (NGO, national & local development, social infrastructure, health, education, services sectors, community development)

**HRD Concept, Model, Tools, Techniques and Theory**
- HRD Theory, Concepts, Frameworks, Systems (relevance and application to Asian context)
- HRD Tools, Techniques, and Innovations (instructional technology, performance technology, performance management systems, adult learning & teaching methodology, assessment centers.)
- HRD Professionals and HRD Roles (emerging roles of HRD professionals, new competencies, new knowledge & skills, academics & consultants)
Diagnosis and Evaluation in HRD
· Measuring and Managing the Impact of HRD (HRD audit, HRD measurement & evaluation, implementation research, assessment centers)
· HRD and Information Technology Driven Change (role of IT in HRD, role of HRD in change management, particularly in technological changes, such as SAP, ERP)

Organizational Development
· Organization Development and Learning Organization (OD and change management, organizational survey feedback, team-building & development, group dynamics, inter-departmental cooperation, organizational learning & learning organization, action research case studies, appreciative inquiry, action learning)

Career Development and Change
· Career Assessment, Change, Development, and Planning (Career development theory and practices, CD and HRM, Career change and transition, Career coaching & counseling, Assessment of career interests and career seeking behaviors)

Global HRD
· International/global HRD (International flow of human resource: studying abroad, employment, immigration & emigration and its impact, cultural influences on HRD practice, cross-cultural differences, comparative analyses, culture change and change management)
· HRD Interventions Based on Indigenous Culture and Values
· HRD Research in Asia (potentials, problems, strategies used, partnerships among academia and industry)

[In all cases, please keep in mind that the list above is suggestive only. Any paper that forwards our scholarly understanding of the HRD field is eligible for review and consideration. While an Asian focus is desirable, it is not essential for acceptance.]

Guidelines for Submission of Papers

- Please send a summary of less than 200 words as an e-mail attachment in MS Word file. All summary will be accepted with no feedback. After you submit a full paper by August 15, 2004, you will receive feedback on whether your paper is acceptable.
- Please e-mail summary and full paper to: kahrd@plaza.snu.ac.kr.
- For the full paper, follow the same guidelines as for the annual AHRD Conference submissions. The guidelines are available from the web site, www.ahrd.org. All papers are to be in English and must be complete at the time of submission. If English is not your native language, please have the paper edited before submission.

- Deadline for sending 200 words summary: May 30, 2004
- Deadline for submission of full papers: August 10, 2004
- Information on the acceptance of papers: September 15, 2004
- Submission of final revised papers: September 30, 2004

Pre-conference Workshops and Skillshops
Interested professionals and institutions (research institutes, companies, consulting agencies, etc) are requested to offer pre-conference workshops on any related themes.
The following research themes are being considered at present:

- Partnership in HRD
- Leadership Development
- Ethical Dimensions in HRD
- National HRD
Each theme will be for one half/full day duration. The pre-conference workshop will be led by one person or a group of persons and should be designed for professional development. Those who desire to offer such workshops may send details of the workshop to pre-conference coordinator Dr. Young-sik Ahn at Fax: 82-51-890-1209, Tel: 82-51-890-2184, or e-mail: ays@deu.ac.kr.

The details should include the purpose and objectives of the workshop, coverage, time schedule, prerequisites, if any, for participation, and the presenter’s qualifications. One conference registration will be waived for offering a half-day workshop; if there are two presenters for a full-day workshop, both presenters will have their conference registrations waived.

Registration

Conference registration fee (payments received by September 20, 2004): For members of AHRD International: US $150 (covers opening cocktail dinner on November 21, conference materials, proceedings, and coffee breaks on November 22 and 23, and the concluding dinner on November 23); For non-members, US $200.

After September 20, the fee will be $185 and $235, respectively. (Student discount of US$75 will be provided upon recommendation from his/her advisor/supervisor).

Registration fee for each pre-conference workshop: US $30 per half-day and $55 for each one-day workshop or two half-day workshops. Registrants for a full-day pre-conference workshop or two half-day workshops on the same day will be provided with lunch as part of their workshop registration fees. Details of the pre-conferences will be mailed to all registrants as soon as possible.

To register: please mail, fax, or e-mail completed Registration Form to a conference organizer:

Contact person: Ms. Mihwa Lee

Mailing Address: Department of Education, Seoul National University
San 56-1 Sillim-dong, Gwanak-gu, Seoul, 151-742 Korea
E-mail: polk0070@empal.com
Tel: 82-11-9838-3790 Fax: 82-2-880-7635

For credit card payment: Please fill up the credit card payment information on the Registration Form. Be sure to include full name on credit card, type of credit card (acceptable cards are: Visa, MasterCard, Discover, American Express), credit card account number, and expiration date.

For wire transfer payment, and for local Korea delegates: Please remit the appropriate registration fees (including pre-conference) to bank account as follows. And please fax remittance slip to Fax: 82-2-880-7635. Be sure to indicate your full name and university or company on the remittance slip, as well as the amount submitted. Confirmation will be sent to you by e-mail upon receipt of payment.

Account Name: Mihwa Lee
Account No: Saving Account No. 079-12-665093 (same as Control Number)
Bank Name: National Agricultural Cooperative Federation (Swift Code: NACFKRSEXXX)
Bank Address: National Agricultural Cooperative Federation Seoul National University Branch .
San 56-1 Sillim-dong, Gwanak-gu, Seoul, 151-742 Korea

Conference Venue

Seoul is the capital of Korea with over 600 years of history. It is the heart of Korea’s culture and education as well as politics and economy. Seoul is unique in that historical sites such as grand royal palaces and modern cultural facilities coexist in harmony. Seoul is a world-class city with numerous amenities and shopping districts such as Myeong-dong, Apgujeong-dong, and Itaewon Special Tourist Zone.
Travel from Incheon International Airport to the conference venue at Seoul Olympic Parktel is easy. The best-recommended way is by airport limousine bus #606 (bus stop 5B, 12A at airport, 5:40 AM- 10:50 PM). It takes about 90 minutes to the conference venue. The best way to explore Seoul at a low cost is by subway. The public bus is also available at a low cost but not recommended for first timers to Seoul. Seoul map will be available in the conference package upon arrival.

**Accommodation**

For your convenience, hotel accommodation is available at the conference venue, the Seoul Olympic Parktel, located approximately one and half hours from Incheon International Airport. Seoul Olympic Parktel agreed to offer great discount rates for AHRD participants.

Single or double rooms are available at 119,000 Korean won (inclusive of tax and service charge) per room per night inclusive of morning buffet breakfast (which is about US $100 per room per night at current exchange rate of Korean won 1,200 per US$).

Advance booking **before November 1, 2004** is strongly recommended. For room reservation, please e-mail, or fax to Ms. Jeong Eun Kim at Seoul Olympic Parktel. E-mail: parktel@sosfo.or.kr, or Fax: 82-2-410-2100. Tel: 82-2-410-2514 or 82-17-290-1180.

Credit card information, your full name, and address are required for hotel room reservation. Please clearly indicate period of stay, bedding preference (SGL or DBL), arrival & departure flight detail, in your e-mail or fax for making reservations. Hotel confirmation will be sent to you by e-mail.

**Sightseeing and Excursions**

Delegates may plan for pre & post conference sightseeing excursions in Seoul and throughout Korea. Half-day and full day excursions in Seoul and its vicinities are available at special discount rates for conference delegates. Some are the must-visits: Royal Grand Palace(Gyeongbokgung Palace, Deoksugung Palace) Insadong, Itaewon Special Tourist Zone, Dongdaemun and Namdeamun Market, and Korea House. To explore more of Korea through full day excursions, recommendations are: Yongin Folk Village, City of Gyeongju (designated as a World Heritage by UNESCO, capital of the Silla Kingdom for almost a thousand years), or DMZ(Demilitarized Zone).

Advance reservation is recommended. A Tour Table will be set up at the venue for your convenience. For more details, inquiries, questions, and concerns regarding accommodation, excursions, package tours, and general information, please feel free to contact Ms. Yoonmi Choi. E-mail: ymchoi03@snu.ac.kr or Fax: 82-2-880-7635. Tel: 82-11-9749-8409.

**Conference Schedule** (Details will be announced later)

- Seoul city tour in the afternoon of November 19. Please make reservations with Ms. Yoonmi Choi (ymchoi03@snu.ac.kr). (Also, the city tour is available everyday if there are more than six persons per trip.)
- Pre-conference workshops will be held at the conference venue on November 20 and 21.
- Get Acquainted icebreaker on November 21 starting at 5:30 PM.
- This will be followed by a plenary session at 6.00 PM with introduction of the Conference and first Keynote speech.
- Opening Dinner will follow the first plenary session at the conference venue on November 21.
- AHRD conference parallel sessions will be on November 22 and 23 from 9:00 AM onwards.
- Conference will close on November 23 at 4:30 PM after the final plenary session.
- Cultural evening and Closing Dinner at Seoul Olympic Parktel on the evening of November 23 at 7:00 PM.
Conference Chairs and Committee Members

Conference CEO and AHRD Asia Chapter Coordinator:
Dr. AAhad M. Osman-Gani
Professor of HRD and International Business
Nanyang Business School (S3-B3A-27)
Nanyang Technological University, Singapore 639798

# Academy of Human Resource Development

## VISION
To Lead Human Resource Development through Research

## MISSION
The Academy was formed to encourage systematic study of human resource development theories, processes, and practices, to disseminate information about HRD, to encourage the application of HRD research findings, and to provide opportunities for social interaction among individuals with scholarly and professional interests in HRD from multiple disciplines and from across the globe.

## PUBLICATIONS
AHRD in cooperation with our publishing partners, provides a full range of scholarly and professional publications:

- *Human Resource Development Quarterly*, our research journal
- *Human Resource Development International*, our new international journal
- *Advances in Developing Human Resources*, a quarterly monograph series
- *Human Resource Development Review*, a quarterly theory journal
- *AHRD Standards on Ethics and Integrity* in Human Resource Development
- *Human Resource Development Research Handbook*, a book for both researchers and practitioners
- Blind Refereed Annual Conference Proceedings published annually in conjunction with the annual research conference

## MEMBERSHIP
AHRD membership includes the following

1. Being a member of the only global organization dedicated to advancing the HRD profession through research
2. Subscription to all four AHRD sponsored scholarly journals:
   - *Human Resource Development Quarterly*
   - *Human Resource Development International*
   - *Advances in Developing Human Resources*
   - *Human Resource Development Review*
3. Copy of *AHRD Standards on Ethics and Integrity*
4. Subscription to the *Forum*, the Academy newsletter
5. Subscription to the Academy Listserv, for timely professional and career information annual
6. Discount on annual conference participation
7. Research conference with full proceedings of research papers (1200+) pages
8. Research partnering, funding, and publishing opportunities

## ANNUAL RESEARCH CONFERENCE
AHRD holds an annual research conference in the early spring of each year. The 2005 conference will be held in Estes Park, Colorado. The conference will be hosted by Colorado State University.

## AWARDS PROGRAM
AHRD recognizes professional excellence in the HRD profession through its awards program, including:
- HRD Scholar Hall of Fame
- Outstanding HRD Scholar Award
- Richard A. Swanson Research Excellence Award
- Outstanding Human Resource Development International Article
- Malcolm S. Knowles Dissertation Award
- HRD Book of the Year Award
- AHRD Outstanding Academic Program
- “Cutting Edge” Top Ten Conference Proceedings Papers
Editor-in-Chief: Jean Woodall, Kingston Business School, Kingston University, UK
Editors: Allan Hixson Church PhD, Director, Organization and Management Development, Pepsico, USA
Rob Poell University of Nijmegen, The Netherlands
Reviews Editor: Darren Short, Office for National Statistics
Reviews Sub-Editor: Reid Bates, Louisiana State University, USA

Special note: Jean Woodall will be Editor-in-Chief for the journal from January 2003, and as of August 1, 2002 all new submissions should be sent to the new editorial office: Penny Macoustra, Editorial Assistant, HRDI, Kingston Business School, Kingston University Kingston Hill, Kingston Upon Thames, Surrey, KT2 7LB.
Monica Lee, in consultation with Jean Woodall, will continue to handle all manuscripts already under consideration by HRDI. All files, regardless of decision status will be transferred to Jean Woodall at the end of 2002.

Publication Details:
Volume 6, 2003, 4 issues per year
ISSN 1367-8868

*A preferential rate is available to accredited members of the Academy of Human Resource Development (AHRD) and the Univeristy Forum for Human Resource Development (UFHRD)

Wendy Ruona  
University of Georgia, Athens, GA

Submission Guidelines

Advances in Developing Human Resources provides a central focus for the reporting on sound theory and practice within topical areas of interest to the profession. Members of the profession are encouraged to submit issue proposals and should contact the editor-in-chief for current proposal guidelines. The Advances editorial board utilizes a two-tier blind review process. The first tier is the review of proposals for individual issues; the second tier is the review of completed manuscripts. Issue proposals are reviewed for (1) relevance to the HRD profession, (2) potential in advancing the theory in HRD, and (3) potential in advancing the practice in HRD. Complete manuscripts are reviewed for (1) completeness of the ideas, (2) quality of the writing, (3) advancement of HRD theory, and (4) advancement of HRD practice.
Human Resource Development Review

Elwood F. Holton III, Editor
Louisiana State University
Richard J. Torraco, Associate Editor
University of Nebraska

A quarterly refereed journal from the Academy of Human Resource Development
Published by Sage Publications

The journal provides new theoretical insights that can advance our understanding of human resource development, including:

- Syntheses of existing bodies of theory
- New substantive theories
- Exploratory conceptual models
- Taxonomies and typologies developed as foundations for theory
- Treatises in formal theory construction

Send manuscripts to:
Dr. Elwood F. Holton, III, Editor
Electronic submission (preferred) to eholton2@lsu.edu.

Human Resource Development Quarterly
Sponsored by the

Sponsored by the
Darlene Russ-Eft, Editor

Editor Darlene Russ-Eft, Ph. D., is currently with the American Institutes for Research in Palo Alto, CA. Human Resource Development Quarterly (HRDQ) is the first scholarly journal focused directly on the evolving field of human resource development (HRD). HRDQ has become the national forum for interdisciplinary exchange on the subject of HRD. Sponsored by the American Society for Training and Development and the Academy of Human Resource Development.

INFORMATION FOR AUTHORS AND CONTRIBUTORS
Human Resource Development Quarterly is a publication sponsored by the Academy of Human Resource Development and the Research Committee of the American Society for Training and Development (ASTD). It provides a central focus for research on HRD issues, as well as the means for disseminating such research. HRDQ recognizes the interdisciplinary nature of the HRD field and brings together relevant research from related fields, such as economics, concerned solely with the practice of HRD are not within the scope of this journal, but may be more appropriate for practitioner-oriented publications such as Human Resource Development International or Training and Development Magazine.
Authors may contribute to HRDQ by submitting three types of manuscripts:
· Peer Review
· nonrefereed Forum Section
· nonrefereed Review Section

Submit forum manuscripts to Darlene Russ-Eft, Edition, HRDQ, 1791 Arastradero Road, Palo Alto, CA 94304

E-learning in Human Resource Development

Theo J. Bastiaens  
Rob L. Martens  
Open University of the Netherlands

Panel Members

Theo Bastiaens, Rob Martens

Purpose

‘Web and internet technologies are transforming our educational world’ is an often-heard one-liner, which is true in one way. We indeed have many new educational opportunities, which especially overcome time and distance restraints. When it comes to Human Resource Development it is more difficult to answer the question ‘which are specific gains of technology?’. Nowadays there is no shortage of virtual learning environments, technical fixes and enthusiasts. There is no shortage of content available. However, where is the advice and assistance, based on models and theories, research evidence and good practice? It is time to start a special work-group or committee to take charge of this specific work area. The first initiative is this pre-conference workshop in which we want to share our experiences.

Target Audience

Everyone who is involved in e-learning research in the field of HRD or anyone who is struggling with the implementation of e-learning in an organisation or business.

Specific Goals

This one-day workshop wants to establish an state-of-the-art overview of e-learning initiatives, problems, questions etc. in the field of HRD in general and more specific in the AHRD. Wherever possible we want to give answers based on our 14 years of experience with e-learning in HRD.

Draft Agenda

Morning

08.30-10.30 What is e-learning? Why consider it? – experiences of attendees, demonstration of different kind of e-learning software.  
10.30-11.30 E-learning and collaboration  
11.30-12.30 Instructional design and e-learning

Afternoon

01.30-02.30 The implementation of e-learning, new roles and tasks  
02.30-03.30 Evaluation of e-learning  
03.30-05.00 Towards a research agenda for e-learning in HRD and further activities to establish an e-learning committee within the AHRD.

This pre-conference session will be an active workshop in where we provide a framework to discuss experiences and ideas. We will support the workshop with best practices, instruments and empirical results from research.
OD Consulting Engagements Gone Wrong:  
A New Framework for Analyzing & Learning from our Mistakes

Joanne Provo  
Personnel Decisions International

Monica M. Danielson

Gregory M. Henderson  
Henderson Consulting Inc.

Terrence Gray  
Personnel Decisions International

Kshanika Anthony  
Personnel Decisions International

As OD practitioners and scholars alike, we counsel client organizations to learn from mistakes and failures, but how often do we turn that reflective assessment to our own mistakes and failures in OD engagements? OD initiatives do fail. The purpose of this pre-conference is to consider the learning opportunities that a systematic evaluation of unsuccessful OD initiatives that fail can provide, and to provide a framework to do so.

Keywords: Systems, Consulting, Failure

“There is much to be said for failure. It is more interesting than success.”  
Max Beerbohm, 1957

As OD practitioners and scholars alike, we counsel client organizations to learn from mistakes and failures, but how often do we turn that reflective assessment to our own mistakes and failures in OD engagements? OD initiatives do fail. Incomplete theories, inaccurate diagnoses, inappropriate change technologies, intractable organization members, incapable change agents, and inflexible organizations are among the many reasons why an OD intervention can go bad (Mirvis & Berg, 1977). The purpose of this pre-conference is to consider the learning opportunities that a systematic evaluation of unsuccessful OD initiatives that fail can provide. Based in systems thinking, a new framework for analyzing and capturing learning from OD engagements that have failed to meet their objectives will be presented and applied to a case study and the participants’ own experiences in OD.

How this Session Furthers the Mission of AHRD

This pre-conference has elements that address three of the four components of the Academy’s mission. The contributions to furthering the mission are as follows:

1. To encourage systematic study of the field of HRD – Through the use of small group work, individual reflection, and large group discussion, this session will encourage the systematic study of approaches to OD consulting engagements in organizations. More specifically, the systematic study of engagements that have not gone well. Reflection is often done individually and not shared with the larger HRD community, not to mention rarely published. Therefore, this new systems approach to analyzing “failed” engagements will prompt participants to engage with their experiences in a new way around OD interventions.

2. To disseminate information about HRD through publications, projects, partnerships, professional contacts and meetings – This session will begin with disseminating foundational as well as cutting edge thinking on the topic.

3. To provide fellowship for individuals with scholarly and professional interests in HRD – This pre-conference seeks to engage both scholars and practitioners in meaningful dialogue and promote future research and practice partnerships between those participants.

Session Audience

As the conference will be hosted by the Texas A&M staff and students, where there is a good proportion of adult working students, we believe there will be a fairly adequate mix of practitioners and scholars. Beyond the traditional academy members, these pre-conference committee members have connections with OD professionals practicing in the state of Texas; it is our hope to draw these members into the pre-conference and AHRD conference as well. Therefore, the agenda of the pre-conference will attempt to be broad enough to accommodate the interests and tap the expertise of the variety of possible attendees from the academic and practitioner communities.

Session Goals

The goals of this pre-conference session are, (1) to present a new framework for analyzing and capturing learning from OD interventions that failed to meet their objectives; (2) to apply this framework for analysis to real OD interventions and assess its utility and effectiveness; (3) to create a space where dialogue occurs between the academic and practitioner communities, including sharing of expertise and knowledge; and (4) to further weave the web of connections between attendees from the fields of research and practice, through participation in the pre-conference, next steps from action learning small groups, and a participant contact list.

Session Agenda

The pre-conference agenda is subject to change. Presently, the following agenda is offered. The pre-conference is a four-hour session, running on Thursday, March 4th, 2004. The session will begin at 8:30 am and end at 12:30 pm.

1. Welcome and Introductions, including:
2. Presentation of Systems Framework for Learning from Failure
3. Small Group Work on Consulting Case Study / Using the Framework
4. Individual Reflection Time on Personal Experiences
5. Large-Group Discussion/ Debrief
6. Assessment of the Effectiveness of the Framework

Continuing Professional Education: Linking CPE and Workplace Learning

Tonette Rocco  
*Florida International University, USA*

Jasper Van Loo  
*Maastricht University, The Netherlands*

**Purpose Statement**

Presently the field of continuing professional education (CPE) has no professional home. The majority of CPE practitioners and researchers affiliate with organizations within their individual professions, thus dividing the field of CPE into many diverse units. There remains a need for a national and international affiliation where CPE providers and researchers can come together to share research and practice ideas. This pre-conference assists in advancing the mission of AHRD by providing a professional affiliation for CPE providers and researchers by linking research and practice in CPE. The purpose of this preconference is to explore local and global issues that link CPE and workplace learning.

What are the foundations of structural and theoretical models for CPE?

- The relationship between CPE and workplace learning
- CPE across different professions and in multiple contexts
- The visible connections and subtle intersections between HRD and CPE
- Institutions and frameworks of CPE from an international perspective
- CPE and social justice

What is the significance of this research for CPE planning and evaluation?

- Different perspectives on the evaluation of CPE, ranging from economic cost-benefit analysis to social justice considerations
- Planning methods in CPE that incorporate political, economic, and cultural dimensions
- Connections/intersections of HRD and CPE

**Planning Committee Members**

Dave Branigan
Brenda Conley
Mary Cooper
Barbara Daley
Lilian Hill
Laurel Jeris
Vivian Mott
Bert Toolsema
Karl Umble
Margot Weinstein

**Target Audience**

CPE providers and researchers are making connections between CPE and HRD around the issues of workplace learning, competencies, and learning in context. The audience for this pre-conference will include CPE providers, researchers, and graduate students within the professions, including (but not limited to) such professions as law, engineering, medicine, nursing, social work, pharmacy, dentistry, accounting, and teaching.

**Preconference Agenda**

**Overview:** Paper presentations will last 15-20 minutes. Reactions will last 10 to 15 minutes. An open discussion will follow.

*Copyright © 2004 Tonette Rocco & Jasper Van Loo*
Day 1 (1 - 5:30 p.m.)

(1 - 1:30 p.m.)  **Introductions and Overview**  
*Jasper van Loo and Tonette S. Rocco*

(1:30 - 2:15)  **Work, Self and the Profession: CPE and the Inner Life,**  
*John M. Dirkx, Michigan State University*

For the most part, the practice of continuing professional education reflects a conception of lifelong learning oriented towards the demands of an outer world. In such a view, as knowledge within one’s profession evolves, practitioners seek to stay current to meet the needs of an ever-changing and demanding world. Focusing largely on the changing nature of the knowledge base, this perspective of lifelong learning fails to represent the ways in which learning and self-understanding are shaped by both the emotional and cultural contexts of our work, and the movement of the soul’s journey. In this paper, I develop a view of lifelong learning that springs from a dialectical and integrated understanding of the self, the socio-cultural context of one’s work, and the discipline in which one works. The goal of this inquiry is to encourage an approach to CPE that nurtures a sense of vocational integration and self-understanding within the work of the professional.

**Invited Reaction:** Work, Self and the Profession: CPE and the Inner Life  
*Suzanne Gallagher & Greg Salters, Florida International University*

(2:15 - 3:00)  **Asking the Right Questions, Looking in All the Right Places: Complexifying Knowledge Construction in Reflective Practice**  
*Suzanne J. Gallagher, Florida International University*

The paradigm shift in knowledge construction and the spiritual yearning in human resource development literature illuminate transforming questions and multiple sources of information for reflective practice. The shift in knowledge construction from a transmission model to a transformation model demands more complex models of reflective practice. Theological reflection, a form of reflective practice, embodies the knowledge construction shift, asks the praxis question, and incorporates social analysis and spirituality. The purpose of this of this paper is to review the literature on theological reflection to connect its purposeful questions and multiple sources of inspiration to reflective practice models.

**Invited Reaction:** Asking the Right Questions, Looking in All the Right Places: Complexifying Knowledge Construction in Reflective Practice  
*John M. Dirkx, Michigan State University*

(3:00 – 3:45)  **Participation in CPE: The European Union vs. the United States**  
*Jasper van Loo, Maastricht University, The Netherlands*

Professionals’ participation in CPE depends on many different factors. This paper attempts to explore the differences in CPE participation across a number of European countries with the participation in CPE in the United States. These differences might be explained through a preliminary exploration of the factors. These factors include the professional national organizations, policies and legal standards set by states. In order to optimize comparability between countries, the paper will focus on a limited number of ‘universal’ professionals, such as e.g. lawyers, accountants, nurses, etc.

**Invited Reaction:** The practitioner’s perspective: Participation in CPE: The European Union vs. the United States  
*Lynn Atkinson-Tovar, Northern Illinois University*

**Invited Reaction:** The researcher’s perspective: Participation in CPE: The European Union vs. the United States  
*Jean Woodall, Kingston University*

(Break 3:45 - 4)
(4:00 - 4:30) Keynote: Overview of Collaborative Directions for Continuing Professional Education

Alan B. Knox, University of Wisconsin

A preliminary plan for a Futures initiative on continuing professional education (CPE) includes two parts. The first part is on public issues and is underway with ten local exemplary programs. The second part is on collaborative future directions. The intent of each is to strengthen educational opportunities for adults for the benefit of adult learners and of society. The collaborative process can also strengthen the field. The mission for those who plan and implement this CPE initiative is to focus on forms of cooperation by people who coordinate CPE in various professional fields for a mutually beneficial exchange. Such cooperation depends on recognition of their enlightened self interest, so we will begin with people who value this connection.

(4:30 - 5:00) Discussion: How do we envision the CPE preconference connecting with the Futures project? What is the future of the CPE preconference? (To be continued over dinner, all CPE Preconference participants are welcome. To be arranged.)

Day 2 (8:30 a.m. to 1 p.m.)

(8:30 – 8:45) Greetings

(8:45 - 9:30) Using Teaching Perspectives Inventory and Critical Teaching Incident Questionnaire for Faculty Development of CPE Providers

Steve Ratcliff, DDS, The Pankey Institute
Tonette S. Rocco, PhD, Florida International University

Dental educators plucked from the ranks of exceptional clinicians and researchers, are expected to be able to facilitate the learning of others. They teach the way they were taught: turning out the lights, turning on the slides, telling “learners” what they do expecting that the telling deposits knowledge in the learner that translates into skill. This paper presents a critical reflection of an effort to foster the professional development of those that provide CPE.

Invited Reaction: Using Teaching Perspectives Inventory and Critical Teaching Incident Questionnaire for Faculty Development of CPE Providers

Steve Sligar, The Center for Sight & Hearing

(9:30 – 10:15) Portraits of Persistence: Professional Development of Academic Coordinators/Directors of Clinical Education in Physical Therapy

Alice Salzman, Northwestern University

The purpose of this study was to develop a model for the professional development of Academic Coordinators/Directors of Clinical Education (ACCEs/DCEs) in physical therapy academic programs. Comparative, qualitative case studies were used to examine similarities and differences in the professional development of six ACCEs/DCEs. Cross-case analysis resulted in a model with six themes: 1) responding to unexpected events, 2) match in interests and skills, 3) excitement for facilitating growth, 4) networking with colleagues, 5) supportive environments, and 6) mindful practice. Professional development requires the ability to learn from one’s daily practice and is enhanced by having a network of individuals as learning resources.

Invited Reaction: Portraits of Persistence: Professional Development of Academic Coordinators/Directors of Clinical Education in Physical Therapy

Mary Cooper, University of Missouri/St. Louis

(10:15 – 11:00) Human Resources’ Role in Helping Professionals Meet Their Mandatory Continuing Professional Education Requirements

Claire Kostopulos Nackoney, Florida International University

Each year organizations spend billions of dollars on both internal and externally facilitated HRD programs. Through HRD programs, employees acquire the skills, knowledge, and behaviors needed to help the organization be
successful and achieve its goals. Professionals, whether working within or outside of their professional contexts are required to complete mandatory CPE. This paper examines the link between CPE and HRD by exploring issues of benefits, resources, challenges, and organizational vs. professional needs.

**Invited Reaction:** Human Resources’ Role in Helping Professionals Meet Their Mandatory Continuing Professional Education Requirements

*Judy Bernier, Florida International University*

**(11:00 – 11:45)** Continuing Professional Education: A Historical View of the professions to move forward in the emerging professions

*Margot B. Weinstein, Kingston Group Inc.*

*William H. Young, Ed.D., University of South Florida*

This paper uses the “Characteristics Model” explained by Gilley and Eggland (1989) as Model to define and illustrate details of each field. Factors identifying and influencing professions are defined. Three categories emerge to frame these factors: traditional, service, emerging fields.

**Invited Reaction:** Continuing Professional Education: A Historical View of the professions to move forward in the emerging professions

*Cynthia Sims, Northern Illinois University*

**(11:45 – 12:45)** Orienteering for Boundary Spanning: Reflections on the Journey to Date and Suggestions for Moving Forward

*Laurel Jeris, Northern Illinois University*

*Barb Daley, University of Wisconsin/Milwaukee*

This presentation is based on a chapter that will appear in the February 2004 issue of *ADHR*. Continuing professional education and human resource development tend to have boundaries that are held strongly in place by theoretical premises, philosophical foundations, language, the practice arena, and the codification of knowledge in graduate programs. In this presentation, a grounded theory approach to boundary spanning is proposed using the Dirkx and Austin (2002) model as a compass to navigate between and among types of learning and development, focus of interest, and context. Future research directions for both continuing professional education and human resource development will be proposed.

**Invited Reaction:** Orienteering for Boundary Spanning: Reflections on the Journey to Date and Suggestions for Moving Forward

*Alice Salzman, Northwestern University*
Conference Papers
Corporate Universities v Traditional Universities: Comparison through Published Organisation Documentation

John S. Walton
London Metropolitan University

Michele C. Martin
HSBC

This paper is a part of an ongoing empirical, multi-modal comparative investigation into corporate universities in the US and the UK, the first stage of which was reported in Walton and Martin (2000). This second stage consists of an in-depth comparative study of the aims and objectives of corporate universities in the UK and US compared to traditional universities by means of mission statements/ guiding principles and associated documentation obtained from organisational web sites. The research has been undertaken to enable triangulation with data obtained from other sources.

Keywords: Corporate University, Mission Statements, Traditional University

Dasenbrock (2002) comments that: “references to the corporatization of the university are virtually ubiquitous in the discussion in the humanities about vectors of change in higher education”, a process that is being resisted by beleaguered humanists who are as decisively outnumbered as the Spartans were at Thermopylae. (p.1). From his perspective the phrase “corporate university” is a way of expressing that traditional universities are far more concerned with issues of profit and loss and competing in the marketplace than they were a generation ago. He alleges that the University of Phoenix in the United States is the icon of this shift, and that it is literally a corporate university. In reflecting on the core purpose of so-called traditional universities he goes on to differentiate between “credentialising” universities - where the student is purchasing essentially a credential not an education - and “research” universities.

This connotation is different to the dominant discourse in the HRD field on the subject of “corporate universities”, where commentary has focused on their emergence and rapid growth in the corporate world in recent years. Walton (1999) observed that “inspired by an original idea generated at the Walt Disney Corporation, the notion of a corporate university is becoming increasingly fashionable as an overarching designation for formal learning and knowledge-creating activities in an organization” (p.412). In 1990 there were held to be some 400 corporate universities of this type in existence, primarily in the United States. According to Corporate University Exchange (CUX), a New York consultancy firm that specialises in supporting corporate university development, this figure had risen to 2,000 by 2001. Heller (2001) forecasts that by the year 2010 the figure will have risen to 3,700. There is also evidence of this becoming increasingly a global phenomenon, with, for example, eight corporate universities reported in Germany. A number of definitions have been provided for a corporate university, of which the following are typical:

The strategic umbrella for developing and educating employees, customers and suppliers in order to meet an organisation’s business strategies. In a corporate university employees build individual and organizational competencies, thereby improving the company’s overall performance. (Meister 1998)

A corporate university is a function or department that is strategically oriented toward integrating the development of people as individuals with their performance as teams and ultimately as an entire organization by linking with suppliers and customers, by conducting wide-range research, by facilitating the delivery of content, and by leading the effort to build a superior leadership team. (Wheeler 1998)

A CU is an educational entity that is a strategic tool designed to assist its parent organization in achieving its mission by conducting activities that cultivate individual and organizational learning, knowledge and wisdom. (Allen 2002)

Taken collectively, the emphasis is instrumental, a strategic tool for helping an organisation to achieve its objectives and mission through learning processes. Learning, knowledge, research and wisdom are not perceived by these writers to be ends in themselves.

Problem Statement

These different connotations on corporate universities provide a backdrop to this paper. There have been a number of academic and other studies that have looked into the relationship between corporate and traditional universities. Assertions have ranged from future-gazing statements to the effect that corporate universities may become a major threat to traditional universities as they compete for students and faculty (Thompson 2000), to the view that it is difficult to establish any relationship between two independent phenomena with different objectives and values (Blass 2001). Hard comparative evidence has been difficult to find, and reported case examples have mostly been small in number and based upon convenience sampling in one country. On the whole, the academic studies have treated the corporate universities as an emergent phenomenon that have to justify their claim to be a “university” and have treated the so-called traditional universities as relatively fixed in their aims and objectives. A number of questions remain unresolved. Is there any evidence of convergence of outlook between entities coming from different roots and traditions, yet drawing upon the same overarching designation for their activities? If there is evidence that traditional universities are becoming more “corporatised” and instrumental in approach, is this reflected in their expressed aims and objectives? If the corporate world is drawing upon terminology historically reserved for the academic arena, is this reflected in the published purpose statements of their “universities”?

Theoretical Framework

The ethos behind traditional universities has been discussed over the centuries since their origins in the Middle Ages when teaching was viewed as a commodity like any other and it was expected that new students would sample lecture courses before making their academic purchases (Cobban 1999). Newman (1853) defines a university as “a place of teaching universal knowledge” (p.1) and contends that “the very name of university is inconsistent with restrictions of any kind” (p.25). This has led to the espoused views that, ideally, a university should provide a sanctuary for democratic principles, uphold uncensored expression, and encourage the unfettered exchange of ideas and the right to dissent under the name of academic freedom.

Virtually all of contemporary universities fulfill at least three missions or purposes, regardless of nationality or prestige: teaching, research and public service (Perkins 1973) although the balance between these and their practical expression vary considerably. American higher education in particular is held to have a bewildering variety of institutional missions and objectives, a fact which Graham and Diamond (1997) commented on as being probably one of its greatest strengths. In the UK at the time of writing there is a hot debate over whether there should be a differentiation between teaching universities and research universities, with only the latter being entitled to public funding for research.

A number of commentators has suggested that in the context of the corporate university, the term university is used more for its aspirational and symbolic connotations to position of learning activities within an organisation than for any attempt to replicate traditional university practices or values (Thomas 1999, Walton 1999). Walton (1999) argued that virtually no corporate university would meet the requirements set out in dictionary definitions of the word “university”, nor would they wish to. Walton and Martin (2000) pursued this in their UK empirical study that evaluated the extent to which corporate universities meet the criteria conventionally associated with “university”. Criteria used were “sponsorship of research”; “openness of access”; “focus on education” as opposed to “training”; “provision of high level qualifications”; “evidence of scholarly activity and independence”. They concluded that:

Despite adopting the university label, and in some instances a faculty structure, the corporations studied did not achieve the curriculum range, broad-ranging academic expertise and research sponsorship of a conventional university; in many instances, developing partnerships with higher education to overcome this deficiency. The study brought to the fore the inevitable difference between the performance-driven learning imperative for corporations and the independence of thought required of a true academic community (p.9).

Blass (2001) conducted an exploratory study into differences and similarities between CUs and traditional universities. The criteria she adopted for her comparison were: origins from which universities took their title; historical development; aims and outcomes; level of education aspired to; size and diversity of student bodies; knowledge generation; issues surrounding ownership and control including notions of academic freedom; and linkages with other public universities. She concluded that finding any similarities at all was difficult. She also concluded that many of the corporate universities approached were often unable to answer her questions, as the issues had never previously been considered. Her overall conclusion was that the corporate university and public university are two very different configurations that will always remain separate entities. She also commented that corporate universities are eroding the value of traditional universities by taking on the title of “University”. In the
UK she had difficulty in identifying which organizations had a corporate university and only investigated two in detail. Thompson (2000) identified a common focus on lifelong learning as the only point of similarity with traditional universities. He also suggested that corporate universities should be perceived as a source of support to their counterparts in that they provided more than “20% of the voluntary support for higher education in the United States” (ibid. p.327).

Terminological confusions bedevil this field. Not all organisations that claim to have a corporate university use the term “university”. In the UK there are some legal restrictions on its use. “Academy”, “Institute of Learning”, “School of management”, “Learning network”, “College”, “Business learning” are all featured labels of organisations operating as members of Corporate University Exchange (CUX.). There is also a propensity to changes in nomenclature or even disappearance, especially within the CU arena. During the period covered by this study, Deutsche Bank dispensed with its CU and the Arthur D Little CU was acquired by Kaplan Higher Education, a division of Kaplan, Inc., which is a wholly owned subsidiary of The Washington Post Company. As a part of the agreement, the name of the ADL School of Management was changed to the Concord School of Management.

In recent years there has been greater clarity on what corporate universities value, with the New York based Corporate University Exchange introducing in 1999 five criteria for excellence, listed by Murray (2002) as: 1. Alignment: aligning corporate learning to business strategies. 2. Alliances: developing strategic learning alliances with external providers. 3. E-learning: creating a learning environment through technology. 4. Marketing: developing and implementing innovative marketing and branding techniques. 5. Measurement: measuring the value of an organisation’s investment in learning. This would seem, at face value, to reinforce that corporate universities are different beasts to traditional universities. In order to obtain stronger empirical data, this paper has reviewed published statements such as mission statements, core values, guiding principles, aims and objectives from a sample of traditional universities and corporate universities in both the United States and the UK.

Such published documents from organisational web sites could be termed “value oriented texts”, designed to communicate with a range of internal and external audiences. They include core values and guiding principles; vision and mission statements; aims and objects. Such public expressions of what the organisation holds dear have become endemic in organizational life, although they can be perceived at one level to be no more than rhetorical declarations of intent, examples of “espoused values”, as opposed to “theory in use” (Argyis & Schon 1978). It was not the purpose of this research to establish whether what was written was replicated in practice, rather to establish a tangible source of data that could legitimately be used for purposes of comparison. David (1989) and others refer to mission statements as being distinctive to each organisation. However, the research looked for areas of similarity as well as difference, recognising that “organisational mimetics” and “institutional isomorphism” (DiMaggio & Powell, 1983) could lead to common areas of focus.

King and Cleland (1979) list as the espoused reasons given for organisations having mission statements: 1. to ensure unanimity of purpose within the organisation; 2. to provide a basis or standard for allocating organisational resources; 3. to establish a general tone or organisational climate; 4. to serve as a focal point for individuals to identify with the organisation’s purpose and direction; and to deter those who cannot, from participating further in the organisation’s activities. 5. to facilitate the translation of objectives into a work structure involving the assignment of tasks to responsible elements within the organisation.6. to specify organisation purposes and the translation of those purposes into objectives in such a way that cost, time and performance parameters can be assessed and controlled.

David (1989) identifies from a content and statistical analysis of seventy-five mission statements that were obtained from chief executive officers of large companies the following nine areas of focus.1. Customers. 2. Products or services. 3. Location. 4. Technology. 5. Concern for survival. 6. Philosophy. 7. Self-concept. 8. Concern for public image. 9. Concern for employees. He goes on to argue that mission statements should 1. Define what the organisation is and what the organisation aspires to be. 2. Be limited enough to exclude some ventures and broad enough to allow for creative growth. 3. Distinguish a given organisation from all others. 4. Serve as a framework for evaluating both current and prospective activities. 5. Be stated in terms sufficiently clear to be widely understood throughout the organisation.

Johnson and Scholes (1999) respond to criticisms that such statements are bland and too wide-ranging by commenting that it might be politically necessary to have published statements with which most if not all stakeholders can identify (p.243).
Methodology

For sampling purposes the population was first stratified, and then randomized. Thus, for traditional universities, the first stratification was between the UK and the US, and then within each country further sub-divisions were undertaken. In the UK 20 universities were initially sampled which was 15% of the total population. The 40 universities sampled from the US constituted just over 1% of the total population of 3,500 universities. This difference between the two countries was discussed by the researchers at the outset, and reviewed at various stages of the study, but it was always the intention to engage in non-probability sampling and not engage in a statistical analysis. Issues that were considered were that the primary methodology of content analysis is notoriously time consuming and that there was anxiety that the volume of data could become unmanageable. From the standpoint of the overall research project, this was always seen as a relatively small part of the investigation confirming or otherwise data obtained from fieldwork and the consistent conclusions being drawn in the literature that corporate and traditional universities were different types of entities. Had the findings in any way presented unexpected or interesting new data about the traditional universities then further sampling would have been undertaken. But by far the most significant reason influencing judgment over whether to engage in probability versus non-probability sampling concerned the corporate universities. Here appropriate web site data was patchy, subject to significant change over the course of the investigation, and in some instances non-existent, and the number of reported CUs was rapidly increasing over the course of the investigation. Web sites were randomly accessed until a sufficient number was reached from which meaningful comparative data could be obtained.

Using the terminology of Carley (1990), the original intention was to subject the texts from each institution to a conceptual content analysis in which both the existence and frequency of terms and associated constructs was elicited, coded and compared. This was the approach followed by David (1989) who subjected to a simple content and statistical analysis, seventy-five mission statements that were obtained from chief executive officers of large companies. However it quickly became apparent that the existence or otherwise of terms was sufficient for the purposes of coding and demonstrating similarities and differences between traditional and corporate universities. This was then followed by a relational analysis, in which the context in which terms were used and their relationship vis-à-vis each other was established and compared, where apparent areas of similarity emerged. The constructs identified by Walton and Martin (op cit.) were used by the authors as the initial basis for coding, but were modified and added to in accordance with the findings from the textual analysis. A variant of discourse analysis was used to identify key concepts, isolate and establish frequency of categories and themes that emerged from both the traditional and corporate university texts. Key themes and messages of each in turn were then compared and contrasted.

Findings

Each of the UK universities from the original sample had a web site that gave a clear indication of its value orientation. There was less consistency in the US universities, perhaps reflecting the conflict between academics and top management of what a university is about that emerged from the literature. The corporate university web sites were very variable in the volume and quality of information provided. Figure 1 is a simple content analysis of key terms that were identified, based on those universities from which appropriate data could be obtained.

Following the notion of institutional isomorphism, the higher level of congruence in traditional universities is not unexpected. Collectively, they have been in existence over a far longer period of time than their corporate university counterparts. But mere words in themselves can be deceptive – it is the context in which they are used that adds significance, the words they are associated with, and the meanings attributed. It is this realisation that underpins the relational approach to content analysis (Carley, op. cit.), and is essential to understand in comparative studies. As discovered in the Walton and Basra (2002) comparative survey of continuous improvement initiatives, the same word can denote very different things, both within and across organisational settings. Prior (2003) reinforces the perspective that textual analysis needs to attend to the “full pattern of referencing between objects cited” (p.122).

</table>

Below are some examples that are derived from the comparative analysis. By far the most common term used by corporate universities was “learning”, referred to in 78% of the CUs sampled. By comparison, usage of “learning” in traditional universities was about 56%. Below, in Table 2, are some typical examples of the context in which these words are used.
Table 2. “Learning” as Referred to in the Data Sample

Traditional - “seeks to establish a learning culture in which teaching and research of the highest quality are able to flourish equally” (University of Kingston, UK). “To support scholarly learning is the central mission of the University” (Syracuse University, US). “In the interest of learning and in recognition of the special role that society assigns to universities, we make parallel and inseparable commitments to teaching and research” (Case Western Reserve University, US).

Corporate - “Learning is a key part of our competitive advantage. To build that advantage and exploit it to enhance our employer brand we have created the BT Academy” (BT Academy, UK). “Where learning never ends - The Tennessee Valley Authority, like most businesses today, operates in a constantly changing environment and must constantly reinvent itself to survive and thrive. At TVA, we view employee training as a tool that helps us achieve this. TVA University – our learning system is organised with that in mind” (TVA University US). “Oracle University offers a full range of organisational learning services and training products. By bundling services and training methods, we can give you maximum effectiveness and maximum value” (Oracle University US).

“Learning” within the traditional university is here associated with “scholarly” activity and a “teaching and research” culture giving a meaning oriented towards intellectual pursuits and a means unto itself. “Learning” within the corporate university is here associated with “competitive advantage”, “survival”, “effectiveness” and “growth” giving a meaning oriented towards the bottom line and a means to an end.

The words “develop”/“development” represent the second highest word used within the corporate universities’ sample and were referred to 61% as opposed to 39% in traditional universities. Many different connotations emerged, covering both institutional and personal aspects. See Table 3 for examples of usage.

Table 3. “Development” as Referred to in the Data Sample

Traditional - “To identify new areas of study and research for development and enhancement, responding to contemporary developments in both the intellectual and national environment” (University of Oxford, UK). “Deliver that mission by the continuing development of its distinctive academic style, based on a belief that teaching and research are enhanced where the application of knowledge to useful ends, is seen as complementing the basic processes of acquiring and disseminating knowledge” (University of Bath, UK). “The university will provide personal development and social justice” (London Metropolitan University). “Develop responsible students capable of critical reasoning and practical action” (University of Plymouth, UK). “Students are the focus of the University as they seek intellectual, personal and cultural development” (Utah State University, US). In all areas, the goal is to develop students’ communication and critical-thinking skills, ethical judgment, global awareness, and scientific and technical knowledge. Students remain the primary focus of the University” (Clemson University, US).

Corporate - “The main elements included the development of a corporate-learning database for sharing best practice and publicising learning resources” (Rover Business Learning, UK). “We believe that people starting their careers will increasingly want to work in companies that make such a commitment to the long-term development of their employees” (BT Academy, UK). “The Center is recognized as one of the world’s premier facilities for business education and professional development” (Arthur Anderson, US). “Optimize your return on investment while saving on employee development” (Oracle University, US).

In this case, our sample of traditional universities shows the word “development” referring to the development of themes such as a “distinctive academic style”, “intellectual and national environments”, identifying new areas of study, and personal growth. Our corporate university sample refers to “development” in the context of themes such as a “corporate learning database” and “employee development”. We get a sense here that development in a corporate university context is primarily conveying sustainability of the business and is unabashedly corporate-centric in its usage. We did detect some overlap when talking about staff development. The University of Lancaster in the UK was typical of a number of traditional universities in seeking to fulfill its mission by *inter alia* “recruiting, retaining and developing high quality academic and support staff”.

The word “research” was the second most common term used by traditional universities (77%) as opposed to only 17% by corporate universities. This supports earlier research reported in Walton and Martin (2000) that found that only 3rd generation corporate universities look toward “sponsorship of research” as a core value. They write that a 3rd generation CU “combines continuous learning with research and technology acquisition and strategic development focused directly on the local and global needs of the business and employees”. Therefore, the findings
support the expectation that only a small percentage of the sample held any evidence of corporate universities utilizing the word “research”. These were most likely to be from CU’s of this 3rd generation classification.

<tr>
<td>“We are committed to the advancement of knowledge through critical and independent scholarship and research of international significance” (University of Southampton, UK). “Serve the national, regional and international communities through: The conduct, dissemination and exploitation of internationally recognised research and scholarship which increases knowledge, skills and understanding, both for their own sake and as a means of contributing to economic, social and cultural development” (University of Durham, UK). Because research is essential to the mission of a land-grant university, Auburn University will continue development of its research programs. The primary focus of this research will be directed to the solutions of problems and the development of knowledge and technology important to the state and the nation and to the quality of life of Alabama citizens (Auburn University, US). “The University is committed to the advancement of knowledge and to the cultural improvement of society through the production of research and scholarship and the presentation of creative works in the arts” (Indiana State University, US).</td>

<tr>
<td>“Committed to build a self-sustaining culture of learning and continuous improvement right across the company through education, training and research in partnership with academia” (BAE Systems, UK). “Learning and research will be designed to contribute to improvements in healthcare standards” (National Health Services University, UK). “Air University conducts research in air and space power, education, leadership and management” (Air University, US).</td>
<td></td>
</tr>
</tbody>
</table>

Table 4 illustrates a different emphasis on the meaning of the word based - on its context. “Research” in a traditional university is here associated with knowledge generation and “cultural improvement of society”. Research for a corporate university is much less aspirational in tone, very pragmatic and applied, and where appropriate to be done “in partnership with academia”, perceived as a separate entity.

The word “knowledge” represents the third highest word used within the traditional universities sample and was referred to by 67% as opposed to 28% in corporate universities. See Table 5.

Table 5. “Knowledge” as Referred to in the Data Sample

<table>
<thead>
<tr>
<th>Traditional</th>
<th>Corporate</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Freedom as a means of advancing knowledge and the continuous development of teaching, research and scholarship” (London Metropolitan University, UK). “We will seek an environment in which faculty and students are engaged in the search for knowledge” (Tufts University, US). “Engage in research, artistic and scholarly activities that advance learning through the extension of the frontiers of knowledge and creative endeavor” (University of Pittsburgh US).</td>
<td></td>
</tr>
<tr>
<td>“The promotion of better acquisition and transfer of knowledge within the organization” (Rover Business Learning UK). “We are a knowledge company working in a knowledge economy and we are deploying state of the art technology to give our people the learning edge we need” (BT Academy UK). “At TVAU knowledge isn’t locked behind ivy-covered walls. We believe in giving people training they can use on the job” (TVA University US). “Building knowledge bridges worldwide to create synergies. The CU aims to promote the participants’ strategic orientation, competencies and capabilities to achieve the strategic goals” (Schering US).</td>
<td></td>
</tr>
</tbody>
</table>

“Knowledge” in the traditional university is associated with words like “advancing”, “search” and “extension of the frontiers” implying knowledge is a pursuit that adds to the stock of wisdom and entails profound understanding. Whilst “knowledge” in the corporate university is associated with “transfer of”, “company”, “economy” and “strategic goals” and indicates “knowledge” as a business tool aligned to furthering corporate objectives.

One last note of analysis, there was absolutely no evidence (0%) of the use of “intellectual” and/or “freedom” in any of the corporate universities sampled. Whereas in the traditional universities sampled, “intellectual” and “freedom” represent 40% and 27% respectively. As stated by Lou Henry Hoover House, President of Stanford University in 1997, “The traditional university has values that it prizes above all others: freedom (not just academic freedom), nondiscrimination and equality of opportunity to assure intellectual openness” (House 1997). Perhaps issues of “freedom” and “intellectual openness” reflect the fundamental differences in espoused value orientations between a traditional university and one coming that from the corporate world.
Conclusion

This study gives broad support to other reported findings that corporate universities and traditional universities have different aims, objectives and values. There is little evidence of convergence of outlook between entities coming from different roots and traditions. It also reveals a common set of values for traditional universities across the two countries as seen in the rhetoric, be it old or new universities in the United Kingdom or public or private in the United States. It reinforces the instrumental orientation that CUs attach to their activities. There is less evidence of expressed values reflecting the corporatisation of traditional universities. It also demonstrates the importance of conducting a relational analysis when studying texts, and establishing the context in which words are used. There is also evidence that CUs are still “feeling their way” in terms of projecting what they stand for. The question remains as to why corporations feel the need to use academic terminology to justify their learning initiatives.

Current Status of Executive Coaching Interventions as Identified by Selected Consultants to Multinational Organizations

Brandi Lyn Plunkett
Toby Marshall Egan
Marco Garza
Texas A&M University

This exploratory study examines the HRD role of executive coach and the theories, tools, techniques and steps utilized by experienced executive coaches in their work with multinational corporations. Executive coaches identified thirteen approaches to related theories, twelve commonly utilized tools and techniques, and supported action research as a coaching process model. Additionally, these executive coaches identified factors contributing to successes and challenges along with projections regarding the future of this rapidly emerging HRD practice.

Keywords: Coaching, Human Resource Development, Consulting

Executive coaching is one of the fastest growing HRD interventions in organizations today (Bennet & Martin, 2001; Bobkin, 2002; Deane, 2001; Filipczak, 1998; Fulmer, 1997; Hall, Otazo, & Hollenbeck, 1999; Maher, 2001; Morris, B., 2000; Morris, T., 2000; Peterson & Hicks, 1999; Smither, London, Flautt, Vargas, & Kucine, 2003). Coaching’s position in HRD as a legitimate intervention has steadily grown over the past fifteen years (Berglas, 2002). Organizational leaders are looking for qualified HRD professionals to help them improve their ongoing performance. One explanation for the increase in executive coaching practice are the limitations often presented by other HRD interventions such as classroom training or interventions involving groups and departments (Peltier, 2001). Although group and large-scale HRD activities are important, they often fail to address specific executive needs (Conger, 1993; Edelstein & Armstrong, 1993; Filipczak, 1998; Zenger, Ulrich, & Smallwood, 2000).

Much of the current academic coaching literature has explored executive coaching from the perspective of counseling or clinical psychology (e.g., psychodynamic theory or psychotherapy or behavioral modification) (Foster & Lendl, 1996; Kilburg, 1997; Laske, 1999; Levinson, 1996; Richard, 1999; Rotenberg, 2000, Sperry, 1993). Despite a handful of articles examining core approaches associated with executive coaching, there appear to be a very limited number of articles exploring common theories, techniques, and tools associated with executive coaching interventions. This paper explores several dimensions regarding the practice of executive coaching including factors that influence the outcomes of executive coaching and the projected future for this HRD practice.

Purpose of the Paper and Research Questions

The purpose of this paper is to explore the practice of executive coaching with particular emphasis on theoretical influences, tools, and techniques influencing design, development, and implementation of executive coaching interventions used by coaches in multinational corporation settings. The research questions include: 1) What theories influence executive coaching applications?; 2) What tools and techniques are used by executive coaches?; 3) What are the general steps or processes used by executive coaches?; 4) What factors contribute to the success of executive coaching relationships?; 5) What factors have hindered executive coaching relationships?; and 6) What is the projected future for executive coaching?

Overview of Executive Coaching: Review of Current Literature

The notion of coaching employees in an organization can be found in the management literature as far back as the 1950’s (Evered & Selman, 1989). The next two decades found business writers attempting to make connections to sports coaching. However, several scholars and researchers find athletic coaching to be lacking specific consideration of complex and unpredictable issues unique to coaching in an organizational setting (Evered & Selman, 1989; McLean & Kuo, 2000). Currently, we find terms such as executive coaching, managerial coaching, executive development, and several other derivations of the term to generally imply one of two types of relationships; a one-on-one relationship with a high level executive, frequently involving an external coach, or a
relationship involving a manager and his or her subordinate (Peltier, 2001). There are a number of other fields that use the term coach including: psychology, management training, industrial/organizational psychology, counseling, adult education and more (McLean & Kuo, 2000). The scope of this paper is limited to an examination of the one-on-one relationship of an executive and a coach, and the manager-as-coach phenomenon.

Defining Executive Coaching and Executive Coach

Similar to the field of HRD, there is no uniform definition of executive coaching, neither are there universally agreed upon practices, or aims (Morris, T., 2000). The International Coaching Federation (ICF) defines coaching as, “…an ongoing relationship that focuses on clients taking action toward the realization of their visions, goals, or desires,” (Bennet & Martin, 2001, p. 6). Executive coaches approach their work in different ways and are identified by clients for different reasons. “Some executives use coaching to learn specific skills, others to improve performance on the job or to prepare for advancement in business or professional life, and still others to support broader purposes, such as an executive’s agenda for major organizational change,” (Smither, et.al., 2003, p. 24). Overall, the literature identifies executive coaching to be a short-term, confidential, one-on-one development strategy featuring a variety of desired outcomes that often depend on client needs and the abilities of the executive coach. Approaches to coaching executives or managers include assisting them to overcome problems, increase confidence, solidify new behaviors, increase motivation, and link individual performance with organizational goals for the primary purpose of achieving better business results (Bobkin, 2002; Ellinger, Ellinger, & Keller, 2003; Hall, Otazo, Hollenbeck, 1999; Judge & Cowell, 1997; Koonce, 1994; McLean & Kuo, 2000; Mellema, 2001; O’Brien, 1997; Witherspoon & White, 1996).

For the purposes of this paper, executive coaching will be defined as processes and interventions facilitated by qualified consultants utilizing psychology and other HRD-related knowledge, skills, and techniques to assist positional leaders in the improvement of individual effectiveness, learning, and performance. An executive coach is defined as a trained HRD specialist who utilizes knowledge, skills, and techniques from psychology and HRD-related fields in the design, development, and implementation of individually focused change efforts aimed at improving executives’ effectiveness, learning, and performance. These definitions contrast from coaching literature emphasizing feedback techniques by managers in day-to-day manager-employee contacts where the focus of interest is exclusively on the behavior of the manager in relation to an employee(s). According to Witherspoon and White (1996), executive coaching leads to: clearer goals and roles, better self-awareness, better support for performance improvement, shared goals for success, better discovery of developmental needs, and better support for continuous development.

Gaps in the Current Research

Although the popularity of coaching as an applied field is experiencing growth, research and scholarly writing on the subject is sorely lacking (Ellinger & Bostrom, 2002; Ellinger, Ellinger, & Keller, 2003; Kilburg, 2000; McCall, 1988; McLean and Kuo, 2000; Smither, London, Flaautt, Vargas, & Kucine, 2003). In addition, a study conducted in 1999 by Personnel Decisions International (PDI) showed that less than 10 percent of organizations using executive coaches were actually calculating the return on investment (ROI), indicating a lack of informed decision making (Peterson & Hicks, 1999). Finally, in 2001 Manchester, Inc. conducted what is believed to be the first major study to evaluate the impact of executive coaching and found the ROI to be almost six times the amount initially invested by corporations (Business Wire, 2001). While this study, and the popularity of coaching, speak the perceived value of executive coaching, it is clear that more scholarly research is needed to inform human resource development professionals regarding related theories, effective practices, and outcomes associated with the phenomenon of coaching (Ellinger, Ellinger, & Keller, 2003; Kilburg, 2000; McCall, 1988; McLean & Kuo, 2000; Smither, London, Flaautt, Vargas, & Kucine, 2003).

Role of Executive Coaches from the Perspective of Available Popular Literature

The following section reviews the role of the executive coach as informed from popular literature. Popular literature is defined as information found in periodicals not typically refereed or perceived to be scholarly in nature. However, popular literature can be an indicator of key issues that are the focus of HRD practitioners and the organizations to whom they consult. Three broad roles were identified. They are divided into three broad categories, (1) Change-Oriented roles; (2) Growth Oriented roles; and (3) Therapist – Change and Growth Oriented Role Combination.

Change oriented roles. Change oriented roles are aimed at improving certain behaviors or skills (MacRae 2002; Management Development Review 1997; The Economist 2002; McKee 2003). The executive coach may take the role of the motivational speaker, performance improvement consultant, therapist, or personal confidant. In the role of the motivational speaker, the executive coach helps the executive develop the stories that will inspire those they lead. This role is heavily influenced from the sports psychology arena. From the perspective of change oriented
roles, the executive coach serves as a content expert hired by the client system to help the executive (Development and Learning in Organizations, 2003). In this role, the executive coach has a high amount of industry knowledge and is seen as an expert. The coach has achieved a high level of success utilizing there given formula of success. The executive coach then teaches/coaches the client to follow and mirror what has made the coach a success. The reoccurring theme in this style of coaching is, “do what has been successful for me and you too will be successful”.

**Growth-oriented roles.** Growth oriented roles are designed to sharpen overall performance. In this role, the executive coach may take on elements similar to the performance improvement consultant (Bergles 2002; Downs 2002; Fisher 2001; Hamilton 2000; Management Development Review 1997; O’Shaughnessy 2001Wozniak 2002). When operating from this role, the executive coach’s task is to help the assigned executives increase the breadth as well as rate in which information flows to and from the executive. The belief is that because executives are in high impact positions, the company is better served if executives maximize their abilities to enable information flow. The growth-oriented executive coach assists the executives improve their communication skills, improve relationships, improve behavior, and increase effectiveness. The danger in operating from this role is executive coaches can easily get trapped into using one methodology. As Bergels points out, “If all you have is a hammer, everything looks like a nail”

**Therapist – Change and growth oriented role combination.** The third role is a combination of both change and growth oriented roles. In this role, the executive coach serves as a personal therapist (Berglas 2002; Development and Learning in Organizations 2003; Foxhall 2002; Management Development review 1997; McRae 2003; The Economist, 2002). Elements found in the literature range from helping the executive adapt to change, empathetic listener, and stress manager. Specifically the coach helps the executive clarify personal and professional goals, identify the barriers to success, and assist them to remove the mental barriers preventing them from achieving the identified ideal mental state. In this role the coach “leads” the client and creates an environment that promotes reflection and encourages self-awareness. This is accomplished first by assisting the executive self-identify gaps between current performance and future performance and then lead the executive through self-exploration. The coach increases the executive’s self-sufficiency.

The coach’s primary role is to ask the “right questions” and provide the “right feedback” (MacRae, 2002). Coaching is a behavioral approach that both the executive and the organization in which the work in benefit from. It cannot be a one-time event, but rather a strategic process that adds value to the coach and the person being coached as well as the organization (Goldsmith, Lyons, & Freas, 2000). The danger in most popular literature is that coaching is positioned as a low cost and time efficient way to “fix” low performing executives. This creates a dangerous dilemma for organizations whose executive are looking for quick fixes to problems that actually require a more comprehensive and informed intervention approach. The need for the silver bullet and quick fix solutions has drawn sports styled coaches to the forefront. If not remedied, the credibility of executive coaching will suffer.

**Theoretical Frameworks and Approaches**

**Action Research as a Framing Process**

Action Research (AR) has been identified as an underlying framework for executive coaching interventions. Rothwell, Sullivan, and McLean (1995) indicated that AR may be used as a specific framework consultants engaging in individually oriented change efforts. Pareek (1995) identified three action research approaches including person-focused interventions, participant-active interventions, and consultant active interventions. AR is a framework for diagnosis, implementation and evaluation of executive coaching efforts. “It allows for collaboration between practitioner and client throughout the process in order to distribute knowledge and understanding within the organization” (Cady & Caster, 2000, p. 80). Additionally, AR utilizes well defined data collection and feedback systems. AR approaches varying from five to fourteen steps (Egan & Lancaster, *in press*). Most AR approaches include the following: entry, start-up, assessment and feedback, action planning, intervention, evaluation, and adoption (McLean & Sullivan, 1989; Egan & Lancaster, *in press*).

**Specific Theoretical Frameworks Influencing Executive Coaching**

AR appears to sufficiently describe a preferred course of action taken by an executive coach for a useful developmental relationship with an executive. However, AR does not make explicit assumptions regarding with individual development. Although clarification of appropriate steps in the coaching process is an important element of effective coaching, the nature of the relationship implies that the coach will, in fact must, have underlying assumptions regarding individual development. Ten applied theoretical frameworks associated with coaching were identified including: psychodynamic; Adlerian; Jungian; Person-centered; existential; cognitive; behavioral; systems; feminist; and athletic coaching approaches. Each framework is briefly reviewed below.
Theories associated with coaching provide distinctive frameworks for the framing of both the client-coach relationship and the underlying assumptions about the nature of human development. Some perspectives, such as the psychodynamic, Adlerian, and Jungian approaches, presume essential issues such as individual history, family of origin, or psychological type account for present behavior. Utilizing these perspectives in coaching implies that there is a need to support the client in developing a basic framework for understanding the interaction between personal underlying orientations and workplace interactions. Unlike the therapeutic approach from which these frameworks emerge, coaching applications involve much less emphasis on client self-disclosure and more on assessment techniques that will support the client’s understanding of some of the underlying workplace and decision-making issues.

Person-centered or existential view the present with much more emphasis than the three approaches identified previously. Similarities between person-centered and existential approaches are the focus on personal perspectives and individual responsibility for challenges being faced by the client. These two approaches often position the coach as an active listener but more passive talker than other approaches to working with clients.

Cognitive and behavioral approaches overlap in their more directive focus on the part of the coach and their focus on observable behavioral outcomes as a key indicator for goal setting and measured progress. Behavioral approaches focus more on the actions of clients in the context of their consistency or inconsistency with desired outcomes while the cognitive approach explores the manner in which the client has supported or inhibited belief systems that are either desirable or undesirable. In recent years, cognitive and behavioral approaches have been combined to cognitive-behaviorist approaches to coaching. These frameworks attempt to provide support and action planning for behavioral modification or reinforcement while paying attention to self-image, learning, and client use of the scientific method to solve problems.

Because of their focus on large scale impacts on individual functioning, systems and feminist perspectives overlap. Both perspectives insert an assumption involving interconnectedness of the parts of an organization or system and the potential for those parts to influence individual understanding, and outcomes. Both perspectives believe in the need to take a nonlinear approach to engaging a specific problem or issue in an organizational context. The departure between systems and feminist approach is at the point of causality, as feminist perspectives have a more narrowly defined set of explanations for the manner in which a system operates and by which outcomes occur.

Finally, athletic coaching is likely what influenced the term “executive coaching” (Peltier, 2001). Of the theories identified, athletic coaching is the least well formulated. However, in practice, athletic coaching is the most frequently used approach of all the areas identified in this study. Some key themes identified by Peltier include: 1) focus on individual drive; 2) focus on the development and use of fundamentals; 3) utilizing individualized approaches involving flexibility and ingenuity; 4) setting goals relevant to individual progress versus “top status” or “becoming the best.”; 5) using visualization; 6) accessing video feedback when possible; 7) learning from defeat; and 8) focusing on communication, trust, and integrity. Until recently, insights regarding athletic coaching have been communicated in popular literature and have lacked coherence and scholarly organization. However, academics in kinesiology, sports psychology, sports education, and sports management, and in business schools have begun to assemble more coherent discussions and research associated with theoretical and applied dimensions of athletic coaching. This literature may provide more specific conceptualizations of the influences of athletic coaching approaches to theory and practice in other realms of human development.

Methodology

This study was descriptive and exploratory. Two major methods of data collection were used: semi-structured face-to-face interviews and e-mail follow-up. The first stage of the study was in-depth, semi-structured face-to-face interviews with executive coaches. For the purpose of this study, multinational corporations are defined as businesses with an origin in one country, but subsidiaries in multiple countries. Twenty-two executive coaches with current coaching relationships involving several executives from multinational firms participated in the study. The data accessed through the interviews consisted of words in the form of rich verbal description (qualitative) as well as numerical description (quantitative). The quantitative data provided specific detail regarding activities and perspectives captured in the interviews, while the qualitative data provided specific description and context. Follow-up questions were sent via e-mail to participants asked for clarification regarding one-on-one interviews as well as reactions to data collected from all interviews. Both responses to clarifying questions as well as respondent reactions to the data collected overall were incorporated in the analysis and reporting for this study.

Population and Sample

The respondents for this study working primarily with multinational corporations and who had over twelve years of experience coaching managers and executives from a variety of cultural, ethnic, and national backgrounds.
were all members of the ICF, had home bases in the Midwestern US, traveled to other US regions and internationally to provide coaching for executives. Participants were selected from a conference attendance list. Twenty-six executive coaches were identified to have a geographical location convenient for the researcher. Of the 26 executive coaches contacted, 22 met the criteria for the study and agreed to participate. The identified criteria for inclusion to the study were: (a) participants must have at least twelve years of executive coaching experience; (b) participants must be working regularly with multinational corporations; and (c) participants must coach executives with a variety of ethnic and national identities. Participants provided brief biographies as part of the interview process. Of those participants interviewed, ten executive coaches had formal training in counseling or psychology, twelve did not. Fourteen had experiences prior to becoming coaches in which they worked for-profit business and industry (with six having worked with large multinational firms prior to becoming executive coaches). Twelve participants were female, ten were male, fifteen were Caucasian, two were Hispanic, four were African-American, two were Asian-American. Nineteen of the participants were born in the US and nine had lived in at least one other country for a period of one year or more. All had done executive coaching work outside of the US.

Data Analysis

The data from the interviews were content-analyzed. Content analysis is an analysis technique used to systematically examine the content of communications—in this case, interview data. Data obtained from interviews were analyzed quantitatively and qualitatively. Qualitative data in the form of descriptions and examples were used to provide basic research evidence, while quantitative data (frequencies and percentages) were used to support qualitative data. Reliability was further explored by the inclusion of an outside person who was an experienced executive coach and researcher. The interpretation and ratings of the frequencies and emergent themes were reviewed for five randomly selected interviews and related correspondence. Interpretations and results similar to those of the research team were produced.

Results

Participants in the study were asked to describe their domestic and international executive coaching experiences (the previously identified definition of executive coaching was used for this study) for the purposes of answering the research questions identified above.

Coaching Processes

Study participants were asked to identify those steps they typically took from the beginning to the end of a coaching relationship. A content analysis from each face-to-face interview involved the identification and categorization of the steps identified by each participant into an existing AR model. The steps identified from the analysis were crosschecked with the interviewee to ensure accuracy. A tally of the steps identified is found below (Table 1).

Theoretical Influences

The study participants were provided a list of ten theoretical perspectives associated with executive coaching (Plunkett & Egan, 2003) and asked to identify those that had influenced their approaches to executive coaching. They were also asked to add any additional frameworks or concepts (“eclectic,” “none” and “other formal framework(s)” were added). Participants reported having a variety of exposures to theoretical frameworks associated with psychology and executive coaching. As might be expected, those who had formal training in counseling and psychology (n=10) identified theoretical frameworks to be more important in the shaping of their executive coaching practices than did those without formal backgrounds in psychology (n=12).

Tools and Techniques

Twelve tools and techniques utilized in executive coaching were identified by participants. Executive coaches made connections between their approaches and their outlooks on how executive coaching should be approached. With the exception of listening, questioning, paraphrasing, and goal setting, executive coaches identified the use of tools and techniques to be circumstantial and dependent on the client’s identified interests and needs. Many coaches indicated that they consider at least parts of their approaches to be unique to them or utilize proprietary information either developed by them or copyrighted by an organization with which they have affiliation.

Pathways and Pitfalls: Conditions Enabling or Restraining Successes in Coaching

Eleven pairs of “pathways and pitfalls” identifying enablers and restrainers of the success of coaches were identified. Many coaches indicated that the combination of environmental support and individual motivation to change were essential for successful executive coaching relationships and performance outcomes.

Future Trends and Outlook of Executive Coaching

In general, executive coaches were optimistic about the future of executive coaching. Most felt that although some approaches to executive coaching could be identified as “fads” or “trends,” the HRD practice of executive coaching was perceived to be a long-term intervention approach that will be around for the foreseeable future. The most frequently identified future trends were: 1) internet, phone, and web-based coaching; 2) more in-depth coaching certification; 3) exploring return-on-investment; 4) cultural awareness training for coaches; 5) individual-group coaching for executive teams; and 6) using appreciative inquiry in coaching.

Conclusion

This study reviewed available executive coaching literature, confirmed the use of an AR approach by participating executive coaches, supported the use of several theoretical approaches utilized by coaches, identified twelve related tools and techniques, clarified conditions typically enabling or restraining the successes of coaching relationships, and identified six future trends associated with executive coaching. Although not generalizable, the findings from this study contribute additional insight into this frequently utilized, but understudied HRD practice.

An Evaluation Case Study of an International Student Services Office: Assessing Satisfaction and Productivity

Laura Hammons
Yi-Hsuan Lee
Ralitsa Akins
Usha V. Somasundaram
Toby Marshall Egan
Texas A&M University

Multinational student involvement has emerged as an important feature to US education. Along with dramatic growth, the demands on colleges and universities to provide services and support to international students from a myriad of backgrounds has increased. This study explores the use of evaluation approach by researchers of an international student services office housed within a public university in the central US to explore international student satisfaction of an international student services office.

Keywords: International Student Services, Evaluation & Assessment, Performance Improvement

Multinational student involvement has emerged as an important feature to United States (US) education providing mutual benefit. Rudenstine (1997) noted, “There is simply no substitute for direct contact with talented people from other countries and cultures. We benefit from international students; they drive research and teaching in new directions that are very fruitful” (p. 3). The numbers of international students attending US universities has been expanding continually with only a recent downturn due to post-September 11th reactions by the US government. From 1954 to 1997 international college and university student enrollment increased by 1,200 percent (Davis, 1997) and the overall growth remains relatively stable into the new millennium.

Along with dramatic growth, the demands on colleges and universities to provide services and support to international students from a myriad of backgrounds has increased. This numerical growth, and the commitment of many higher education institutions to further increase their student populations, creates complex demands on college and university service personnel in support of students from around the world. Additionally, by admitting increasing numbers, colleges and universities have an obligation to welcome, serve, retain, and involve international students while ensuring that they follow appropriate immigration related procedures (Peterson, Briggs, Dreasher, Horner, & Nelson, 1999). As the numbers and variety of international students increases, many international student services (ISS) offices find themselves in need of ways to assess both the status quo and future needs for serving a growing international student body in an environment with increasing demands. Despite this identified need ISS offices have had difficulty integrating evaluation into practice (Tillman, 1990).

Authors of HRD-related research have been active in exploring a wide array of approaches and contexts associated with evaluation as an important step in the performance improvement process (Nilson, 1999; Pedler, 2002). This study explores the growing arena of international student services (ISS) offices in college and university contexts with particular focus on improvement-oriented evaluation implemented in an ISS office at a university in the central US. A review of the literature and discussion of the evaluation of an ISS office conducted by the authors precedes an exploration of more general need for comprehensive ISS evaluation approaches.

Problem Statement

Throughout the US, ISS offices are adjusting to the increased workload caused by changing immigration regulations that involve tedious monitoring, increased reporting, and greater demand in the advising of international clientele. As with most university offices that serve students, international student services offices strive to provide quality service; however, the new demands to meet federal regulations, coupled with limited resources, have caused great strain. Like other organizations, university international student services offices are struggling to survive amidst ongoing change. The use of assessment and evaluation is thought to assist organizations to increase their overall effectiveness (Rothwell, Sullivan, & McLean, 1995). However, training of ISS employees often does not include education in evaluation or related areas.

Purpose and Research Questions

This study explores the use of an evaluation approach by researchers of an international student services office housed within a public university in the central US to explore international student satisfaction of an ISS office. We explore what was learned through the evaluation process, actions taken by stakeholders in response to evaluation and feedback, and suggestions for general approaches to ISS evaluation. The research questions forwarded in this study include: (1) What are the critical elements or framework(s) identified in the literature for the evaluation of student satisfaction within a college or university international student services office?; (2) What is the applicability of evaluation findings in the current case study to performance improvement? (3) What are some of the unique challenges and opportunities in conducting evaluations in ISS contexts and what considerations should be made?

Review of Literature

The following section provides a review of related literature associated with this study, including literature on Student Services, Student Affairs, and HRD Assessment and Evaluation.

Student Services

Although there have been several HRD publications exploring student related issues, we found only one student services related article in the HRD literature. Brewer and Clippard (2002) explored burnout, and job satisfaction of a population of general student service workers at a large US university. Findings from this study indicated a significant inverse relationship between emotional exhaustion and job satisfaction, a significant positive relationship between personal accomplishment and job satisfaction, and an overall significant relationship between three identified components of burnout and job satisfaction among student support personnel.

A review of student services literature revealed few studies applicable to assessing the adequacy of services to international students by ISS offices. One relevant study by Selvadurai (1991) assessed the adequacy of academic and personal services to international students attending the New York City Technical College (NYCTC), City University of New York. Survey results showed that students were not satisfied with academic services provided in any of the areas surveyed (English language proficiency, academic advisement, instructional practices, format of examinations, and grading practices). In the area of personal services (finances, cultural adjustment, and personal problems) satisfactory levels of services were found only in the areas of financial aid, immigration, and tax counseling. Selvadurai noted that the study based its conclusions on the perceptions of international students on the selected variables and that different samples studied at a different time might reveal different results. Selvadurai also concluded that, because international students’ needs change, dependent on a number of factors, ongoing assessment of student satisfaction is necessary.

Tillman (1990) argued that, in many cases, higher education institutions that enroll international students do not provide the necessary support services to meet the needs of this unique group and that “[t]he development of effective support services for international students is tied to the commitment of the college to an overall strategy and set of clear goals in support of international education activities” (p. 97). The need for the designation of a specific unit to be responsible for coordinating the services provided to international students was identified as one of the determinants in gauging the effectiveness of services to international students along with provision of services to encompass international students’ experiences—from arrival to the US and arrival on campus through students’ pursuits of studies and their preparation for return home (Tillman, 1990). According to Tillman (1990) the ideal array of services should include: 1) administration of the foreign-student advising office; 2) consultation and advisement with faculty and staff; 3) development of programs; 4) participation in academic-guidance programs; 5) coordination of financial aid; 6) fulfillment of immigration requirements; 7) advising and counseling, 8) coordination of community relations; 9) development and support of student activities; 10) maintenance of liaison with non-university agencies; 11) coordination of response to emergencies; and 12) provision for personal services.

The Student Services Program Review Project (SSPRP) (1986) was a unique, voluntary effort on the part of many California community colleges. Its purpose was to develop evaluation models to measure the efficacy of the various student services programs provided by the colleges. The SSPRP included the development of evaluation models, data collection, data analysis, and information-reporting procedures that could be widely disseminated for use in community colleges. The SSPRP study notes that there are certain criteria, which are essential to any evaluation. These include: 1) the evaluation should produce information which is useful to the program participants, administrators, and other intended users; 2) the program evaluation should be developed so that it can be done within the resources of the institution; 3) the evaluation being conducted should be appropriate to the institution and to its purposes; the college should be asking questions to obtain the appropriate information; and 4) the evaluation should be conducted with concern for attention to validity and reliability of the data being collected (p. 99)
The ISS office at a large US university was the target of this study. Samaha (1997) recognized that ISS is a service provider to a unique population with special needs. Samaha identified four key issues that need to be addressed by international student services offices: academic, legal, economic, and social. Major differences addressed by international student services offices are related to institutional foreign academic credentialing systems (study requirements, course equivalents, grading systems, etc.), student language proficiency, and perceptions about relationships with faculty. Additionally, international students face legal problems related to immigration restrictions and economic limitations related to visa status. Samaha (1997) considered intercultural and cross-cultural differences, such as moral values, social life, customs, involvement in group activities, and expectations related to “friendship,” as the most pervasive and overwhelming challenges for foreign students. Thus, international students have special needs for counseling and help in making adjustments to the change in their academic and social environment.

Grieger (1996) argued that, in contemporary pluralistic society, educating an increasingly diverse group of students in multicultural competencies is central to the educational mission of US colleges and universities. Schuh and Upcraft (2001) presented successful models for the assessment of student services and critically questioned the rationale, importance, and results of such evaluations. For the purposes of our study we defined assessment as “any effort to gather, analyze, and interpret evidence which describes institutional, divisional, or agency effectiveness” and evaluation as “any effort to use assessment evidence to improve institutional, departmental, divisional, or institutional effectiveness” (Upcraft & Schuh, 1996, pp. 18-19). Upcraft and Schuh (2001) referred to designing an evaluative investigation in academic settings as an art, where the translation of logic into procedure depends upon context, purpose, and the expected payoff. Thus, meticulously following the scientific study design and methodology may be inadequate in guiding the evaluation process; for any evaluation study many good designs can be proposed and both qualitative and quantitative research methods would provide useful information (Upcraft & Schuh, 2001).

**Student Affairs**

The role of student affairs in supporting international students through campus programs has been identified by Peterson et al. (1999) to: recruit, provide a welcoming environment, develop exchange relationships between US and international students, support intercultural development of US services personnel, and to create co-curricular experiences focusing in multicultural awareness and exchange. Although international student services offices face a number of unique challenges, they also bear a number of similarities to other student oriented university functions. Evaluation studies conducted in this realm may provide insight into assessment within an international student services office. Mines, Gressard, and Daniels (1982), presented a “metamodel framework for selecting evaluation models in student affairs and student services in order to assist practitioners in determining the merits, limitations, and utility of the various models and to guide decision-making of which model to choose in evaluating a particular program or organization” (p.195). This model provides specific questions regarding the intent, involvement in and formation of the evaluation purpose and procedures.

Pope (1993) proposed Multicultural Organizational Development (MOD) as a planned, proactive, comprehensive, systematic, and long-range model for introducing change for student affairs offices committed to transformation into multiculturalism. Pope (1993) developed a checklist, consisting of 58 items organized in 11 categories, based on MOD theoretical model to serve as a guide in the transformational process. The development of the checklist followed qualitative rather than quantitative procedures, where each category reflected an issue that has been repeatedly discussed in academic journal articles. Major categories in the MOD checklist are: mission, leadership and advocacy, policies, recruitment and retention, expectations for multicultural competency, multicultural competency training, scholarly activities, student activities and services, internship and field placement, physical environment, and assessment.

**Evaluation**

Evaluation has been identified in the HRD literature as a strategic process important to researchers and practitioners (Holton, 1996; Phillips, 1994; Swanson, 1994). Systematic evaluation and needs assessment have been identified as critical to performance improvement efforts, which can be utilized in support of an organization’s strategy and objectives (Brinkerhoff & Gill, 1994; Robinson & Robinson, 1995). “Evaluation” can be defined as the process of specifying or identifying goals, objectives, or standards of performance; identifying or developing tools to measure performance (Gardner, 1977). Evaluation is identification and judgment of actual outcomes irrespective of goals, standards, etc. and/or the “concerns of constituents”, where the principle focus of evaluation is professional judgment or an expert opinion of qualified professionals (Gardner, 1977).

According to Philip (1981), the purpose of the evaluation system is intended to aid in improving service (assure excellence), identifying weak services (those which lack viability), and providing an informed rationale for administrative decisions regarding expansion, deletion or modification of services. The primary use of evaluation is
to obtain information that will aid the improvement of existing programs and the design of new services and programs. This information can help administrators, managers, trainers, and designers to make decisions about the future (Pfeiffer, 1988). Stake (1974) proposed a guiding framework for conducting an evaluation. Stake proposed the “prominent event cycle” to guide any evaluation process: 1) talk with clients, staff and audience; 2) identify program scope; 3) overview program activities; 4) discover purposes and concerns; 5) conceptualize issues and problems; 6) identify data needs according to identified issues; 7) select, observe, and analyze data using appropriate instruments; and 8) prepare and deliver presentations and formal reports. Because the researchers for this study had limited access, the approach used was implemented with the intent of educating the client as to the importance of larger systematic considerations in both continued evaluation as well as in the utilization of the findings from the evaluation. The recommended long-term approach is similar to that suggested by McLean and Sullivan (1989), and Swanson (1994).

Methodology

The approach to evaluating student satisfaction used for this study was a practical approach for ISS assessment. The research team had representatives from four different countries. This approach explored the perceptions of the international students, administrators, and support staff of ISS using surveys of ISS stakeholders. The choice of using a survey was a result of the access and time limitations for this initial evaluation. Given limitations provided to the evaluation team, surveying was thought to be an important first step helped to collect and document information about the services rendered to international students at the ISS, and to provide opportunities for clarification of direction, reasoning, and justification for the activity under scrutiny.

In examining the international student services office under study, we used the steps outlined by Upcraft and Schuh (1996): 1) define the problem; 2) determine the purpose of the study; 3) determine the appropriate assessment approach; 4) determine the outcomes; 5) identify control variables; 6) identify environmental variables; 7) select measurement instruments; 8) determine study population and sample; 9) determine modes of statistical analysis; 10) develop and implement plan for data collection; 11) record the data in usable form; 12) conduct appropriate analyses; 13) evaluate the analysis for practical implementations; and 14) develop strategies for utilization of the results. The outlined model was followed in conducting the evaluation. Some of the steps were modified by the research team to better fit the office activities that we studied.

Design of Questionnaires

Limited time and the difficulty of in-person access to a large population of international students determined the web-based survey method as the best option. The survey instrument was developed by the researchers based on the literature review. The survey was designed and administered to the international student population at a public university. The survey assessed the 17 closed-ended questionnaire items on a 5-point Likert-type scale, where “1” represented “very dissatisfied” and “5” represented “very satisfied.” A “non-applicable” answer also was a valid option. The three open-ended items in the survey instrument were used to request the respondents’ comments and suggestions. Five experts in the field of human resources and student services were asked to evaluate the content validity of the survey questionnaires. Ten international students at the university were asked to evaluate the readability and terminology used in the survey. The final survey questionnaire contained 19 items. Six items were used to measure the participants’ general perceptions toward the international student services office’s services, and 11 items were used to measure the participants’ satisfaction regarding the programs.

Population and Sample

The international student services office at the university under study approximately 3,500 international students from over 100 countries. The international student services office staff consisted of ten full-time staff members: one administrative position, seven advising positions, and three support staff positions. A randomly selected sample of two hundred and fifty international students was surveyed using an on-line instrument. The response-rate was 80% with a total of 199 respondents. In order to eliminate any gender or racial/ethnicity/nationality bias, no information regarding the ethnicity or gender of the participants was requested.

Data Analysis

In order to establish the reliability of the instrument, Cronbach’s coefficient alpha was used to assess the reliability of the scale and was determined to be .90. The data were analyzed using both quantitative and qualitative research methods. The quantitative data were analyzed using inferential descriptive statistics (mean, mode, and frequencies).

Limitations

The results of this study may have been limited by two factors: the disadvantages of using a web-based survey and the influence of self-report measures. Through the on-line survey, sampling bias may occur since some students
may be uncomfortable using the Internet. In addition, delivering the items by using an interactive homepage on the Internet may add bias to student answers (Hanson, 1997). Furthermore, the study is limited to the willingness of the international students to participate in the study, as it may reflect their perception toward the services of the international student services office. The finding may also be influenced by the bias present in self-reported measures (Dooley & Linder, 2003).

Evaluation Findings

The quantitative results indicated that students were most satisfied with the information/news provided and most dissatisfied with the response time by staff. Responses revealed that students were mostly satisfied with the services; however, there were a substantial number of neutral and negative responses in each of the areas. Clear satisfaction was shown in the area of provision of special programs for clientele, degree level changes, and support letters for international students. Tables 1 and 2 (below) report the results of the questionnaire descriptive statistics analysis. Throughout the survey, even when the results revealed many “satisfied” responses, a high number of “dissatisfied” and “neutral” responses could be found. Student responses in the qualitative portion of the survey lent insight to why this may have occurred.

Note: 1= Very dissatisfied, 2= Dissatisfied, 3= Neutral, 4= Satisfied, and 5= Very Satisfied.

The open-ended responses (N=228) revealed a number of themes: 1) perceived insensitivity of staff to language and cultural issues (6.9%); 2) long waiting times for appointments/advisors (9.2%); 3) perceived staff knowledge (20.7%); 4) perceptions of staff being rude and not helpful (20.7%); and 5) low service/dissatisfaction with service (10.3%). Analysis of historical data kept by the international student services office revealed that there was great demand placed on the office and very limited resources with which to meet these demands. The international student services office, in general, faces a number of unique challenges. The ISS must strive to provide quality service to a large, diverse group, must be able to assist students with a variety of language and cultural barriers, and must serve students with diverse educational purposes, pursuing a number of different majors and degrees (requiring knowledge of the various policies and requirement of the different departments and degree levels). In addition, the office was, during the time of this study, in a time of transition, as new immigration regulations (that required a number of fundamental changes in the way that the office operated) had recently become effective. Since the office was funded almost entirely by fees paid only by international students, financial resource limitation was the primary hindrance in meeting these challenges.

Applicability of Findings toward Performance Improvement

The results of the assessment showed that there were a number of issues that warranted further review. First, the study revealed a need for better communication. The office needed to build staff communication skills in order to be
able to effectively communicate with students from a variety of backgrounds, cultures, and languages. The study results emphasized the need for greater cultural sensitivity and better understanding of the cultural needs of the international student population. Next, clientele perceived that there was a need for improved staff knowledge of immigration regulations in order to be able to assist with special immigration regulations and requirements. Finally, access and response time were concerns for international students. The office needed an improved approach to dealing with student issues (many of which may be time sensitive) by providing greater access to advisors. Based on the results of the study, the following recommendations were made to the international student services office: 1) change in workflow; 2) redesign of the office structure; 3) address students’ negative perceptions of the international student services office; 4) establish consistency in office policies and procedures; 5) increase the capabilities of the reception desk to meet students’ needs; and 6) increase interaction of international student and staff in informal settings.

At the conclusion of the study, a presentation was made to the lead administrator of the office. Although her first response was guarded, the lead office administrator found that the assessment was accurate and would be useful to the office. The overall response by university administration was very positive and the response by office staff was mixed. Following the presentation, several changes were made in response to the report. To increase the capabilities of the reception desk, the office established a drop-off procedure for applications and placed an advisor at the reception desk. Communication was improved by requiring the use of name-tags, and staffing the reception desk with advisors on an as-needed basis for enhancing student access to advising resources. The researchers recommended that a follow-up study be conducted to determine if these changes in the ISS operations have increased student satisfaction.

The researchers also recommended that further organization development changes be implemented in the ISS. This study serves as a potential first step in the refinement of assessment tools and processes that could further benefit the ISS office under study, as well as other university offices. Future work in the development and improvement of the process reported here is currently underway.

**Lessons Learned and Considerations for Future ISS Evaluation: Unique Challenges and Opportunities**

There are three major insights that the researchers believe are important for HRD practitioners in conducting ISS evaluations: 1) it is beneficial to take a systems-oriented approach in evaluating ISS offices; 2) evaluation capacity building is an important long term goal for ISS offices; and 3) continuous improvement in the integration of multicultural understanding in evaluation and services is essential.

**Systems-Oriented Evaluation**

As previously mentioned, the researchers in this study approached the initial evaluation with some significant limitations in terms of access to stakeholders and resources. Despite these shortcomings, the evaluation was framed as an early stage of a systematic approach to service evaluation (Holton, 1996; McLean & Sullivan, 1989). As authors featured in our literature review have identified, it is important to recognize that evaluation will have little impact without being integrated into the larger system. This means that work performance and results must be tied to areas needing improvement and overall work processes.

**Evaluation Capacity Building for Long-term Success**

According to Trevisan (2002), the concept of evaluation capacity has just begun to emerge. Milstein and Cotton (2000) defined evaluation capacity as “the ability to conduct an effective evaluation; i.e., one that meets accepted standards of discipline” (p. 1). Evaluation capacity building refers to the integration of evaluation into practice in a manner that includes elements from the following framework recommended by Milstein and Cotton (2000):

- **Forces**: Policies, tacit expectations, and incentives that drive an organization toward evaluation;
- **Organizational environment**: Properties of the agency in which evaluation is conducted;
- **Workforce and professional development**: The knowledge and skills of those who conduce evaluation;
- **Resources and supports**: Funding, models, and methods for example, that an evaluator uses to ensure evaluations are effective and efficient; and
- **Learning from experience**: Lessons learned during and after evaluation activities that can positively impact future evaluation work.

By utilizing the above framework as an inventory to identify and assess factors impacting evaluation capacity in ISS, focused plans to strengthen both future evaluations and the integration of evaluation findings into a performance improvement system can be accomplished. Without such considerations, evaluations of ISS efforts will be haphazard and disconnected from meaningful practice activities.
Extending Multicultural Awareness

As a study team consisting of individuals from four different countries, we would like to highlight the importance of continuous pursuit of multicultural perspectives in ISS evaluations. Because of the study limitations, we were unable to utilize demographic information and did not undertake cross-national or cross-ethnic comparisons. In addition to pragmatic assessment problems such as the manner in which individuals may interpret survey items intercultural considerations such as those forwarded by Kluckhohn and Strodbeck (1961) are important elements to consider during evaluation, analysis, and in taking action to address issues associated with student questioning and feedback. Kluckhohn and Strodbeck emphasize that individuals vary in the manner in which they order the complex principles and considerations “which give order and direction to the ever flowing stream of human acts and thoughts as these relate to the solution of human problems” (p. 4). How respondents organize their perceptions regarding their primary relationships, community, and authority may influence the way in which they interpret evaluation questions and processes in which they are involved.

Contributions to HRD

This research filled a gap in HRD research (in regard to evaluation in international student service offices) and helped the organization to identify the areas, which needed to improve their efficiency. The study helped construct a framework for assessment through evaluation in international student services office. Evaluation was based on determining the effectiveness and efficiency of the service provided by international student services offices and student perceptions about the services rendered by those offices. Scherer (1984) argued that effective HRD practitioners use their familiarity with the content and the learners (including the context in which assumptions seem warranted in a particular instance) to explore the importance of any assessment. It was evident from the study that formal assessment procedures can help in identifying important discrepancies between participants’ current and desired proficiencies, as perceived by themselves and others. Assessment and evaluation help HRD practitioners to bridge the gap between the current and desired proficiencies and identify both implicit and explicit needs in strengthening the organization.

Conclusion

The study revealed that the framework identified by Upcraft and Schuh (1996) for assessment in student affairs is applicable to the evaluation of student satisfaction within a college or university international student services office. Evaluation findings did prove applicable, in the current case study for performance improvement within the organization. The research team was able to use the study findings to identify a number of potential issues. Based on the study results, recommendations were made for the improvement of the organization. The study identified a number of unique challenges and opportunities in conducting evaluations in an ISS context. The primary challenge related to finding a means to assess such a diverse group of students and retrieve accurate results. In addition, developing realistic recommendations that could be implemented by the ISS office also proved challenging, given the limited resources of the ISS office. When developing and conducting an evaluation study within an ISS office both aforementioned issues should be taken into consideration. Furthermore, using a systems-orientation, building evaluation capacity for long-term success and extending multicultural awareness need to be considered. Researchers need multi-faceted knowledge and experience, as well as a diversity of practical and theoretical knowledge. Finally, the high response rate by respondents reveals a great opportunity in conducting future evaluation studies. Students appear to show great concern and desire for involvement in assisting ISS offices toward performance improvement.

References

Increased policy emphasis on lifelong learning at the European level has been reflected in a drive to increase participation in learning in the UK, especially through Adult and Community Learning initiatives that take HRD beyond the workplace. Such an approach is important for promoting social inclusion since the unemployed are usually excluded from learning opportunities provided by employers. In 2001 a new framework was established for delivering Adult and Community Learning in England and this paper reports on the first evaluation of the perceived effectiveness of the new arrangements.

Keywords: Adult and Community Learning, Learning and Skills Council, Local Education Authorities

The research on which this paper is based (Winterton & Winterton 2003) was contracted by the UK Department for Education and Skills (DfES) to provide a baseline study of Adult and Community Learning (ACL) and explore the early impact of the new arrangements with the Learning and Skills Council (LSC), which assumed responsibility for all post-compulsory learning in England in April 2001. The UK Government sees ACL as facilitating wider participation of hard-to-reach learners, promoting social inclusion and community renewal, and developing the basic skills that individuals need to be active citizens and to engage in further development to enhance employability and quality of life. This is the first comprehensive study of ACL in England and was undertaken at an important juncture as the LSC took responsibility for ACL in conjunction with the Local Education Authorities (LEAs).

Theoretical Framework

The Secretary of State’s remit letter to the Learning and Skills Council (DfEE 2000) describes ACL as a ‘great heritage ... which developed in the 19th Century, when the pioneering efforts of the community movements helped many men and women to improve their lives through the power of learning.’ The letter states the task of the LSC as being to build on this tradition to restore a culture of commitment to learning through working in partnership with others.

ACL is a narrower category than ‘adult learning’ in general. A succinct definition is elusive, but ACL takes place in a very wide range of settings; local authorities are major players; a strand of social action or regeneration is often present; much of the learning is non-vocational and non-accredited, though by no means unconcerned with the skills and employability of individuals; and this mode of learning is particularly suitable for outreach to disadvantaged people. ACL at its best takes the community aspect as central, and explicitly aims to play a central role in the efforts of communities to take control of their own destinies, as the report of the Policy Action Team on Skills, Skills for Neighbourhood Renewal (DfEE, 1999b) argued: ‘Where learning really engages people’s interests, it can have a pivotal role in helping communities to cohere, to identify what they have in common in terms of both needs and opportunities and to work together.’

Participation in ACL has significant benefits to individuals, communities and the economy. One survey of ACL participants revealed that despite largely social, recreational and self-developmental reasons for enrolment, a significant proportion also had practical and economic purposes in mind. Work on family learning showed that many of the adults moved into employment from these courses, and those in work progressed to more demanding jobs. Social and personal benefits are well documented, including health (Aldridge and Lavender 2000) and active ageing, self-esteem, communication skills, and improvements in family relationships. One of the most important benefits of ACL is that it provides a route back into more formal learning for individuals who would not otherwise participate. A further benefit is to cultural infrastructure involving imaginative approaches to learning in museums and arts centres, which enrich the learning experience for participants and raise interest in the arts within deprived communities.

Sources of information on adult participation in learning differ by reference period and by the defined scope of ‘learning’. Surveys may take a snapshot of current participation or investigate all learning over an extended period such as three years. ‘Learning’ may be defined as formal taught provision only, but can also include self-directed and informal learning. Even broader conceptions of learning are current (Tight 1998a) according to which no adults are ‘non-learners’ since experiential learning is a daily phenomenon. However, a broadly consistent story of

Copyright © 2004 Jonathan Winterton
polarisation is evident. As the House of Commons Education and Employment Committee (1999) points out, ‘a side-effect of the substantial improvement in participation during the last two decades has been to widen the gap between the educational “haves” and the “have-nots”.’ This polarisation is confirmed by the National Adult Learning Survey (NALS), National Institute of Adult Continuing Education (NIACE) surveys (Sargant et al 1997; Sargant 2000) and a wide range of analyses and independent studies (Field 1999; Gorard et al 1998; La Valle & Finch 1999; McGivney 2000; Yang 1998).

The first report of the National Advisory Group for Continuing Education and Lifelong Learning, NAGCELL (Fryer, 1997) identified a number of changes that made lifelong learning (and by implication ACL as one of its major components) an urgent priority:

♦ Economic globalisation, bringing about a shift in skill needs in the workplace;
♦ Demographic change, particularly in the age and sex profile of the workforce;
♦ New working practices such as team working and flatter management structures;
♦ A decline in unskilled employment;
♦ Greater need for key skills, at all levels;
♦ A need to recognise diversity and a range of cultures, with their associated needs for learning; and
♦ Shifts in traditional employment structures, which have often weakened communities and created a need for regeneration.

In recent writing on lifelong learning there is a predominant concern with ‘globalisation’, often addressed from a ‘human capital’ perspective focusing on economic competitiveness, possibly at the cost of curricular breadth according to critics (Bhola 1998; Eccleston 1999; Forrester 1998; Gierke 1994; Tight 1998b; Uden 1996). The two core purposes of adult learning – social learning and economic competitiveness – are rooted in the nineteenth century autodidactic working-class education tradition of organisations like the Plebs League. As W. E. Forster said in introducing the 1870 Education Bill in the Commons: ‘Uneducated labourers – and many of our labourers are utterly uneducated – are, for the most part, unskilled labourers, and if we leave our work-folk any longer unskilled…they will become over-matched in the competition of the world.’ (Fieldhouse 1996). Community cohesion also features prominently in the literature. Schuller (1998) argues that the postponement of working life has been mirrored by a de facto reduction in the retirement age. From a societal perspective, not only is human capital lost when older people are ejected from the labour force, but social capital is eroded as networks and connections are broken. A learning society requires different patterns of working, which would allow a better mix of work and education.

Such is the rationale for increased policy emphasis on ACL, and this paper seeks to explore the extent to which the new policy arrangements in England are perceived as appropriate to achieving these diverse ends, while at the same time undertaking a mapping exercise and exploring explanations for the patterns of participation in the provision offered by LEAs.

Research Questions

The following research questions were formulated in discussion with representatives of the DfES, the LSC and LEAs:

♦ What are the main features of the emerging ACL sector?
♦ What is the role of partnerships in developing and delivering ACL?
♦ What are the views on LEA provision from those most closely involved?
♦ What are the views of those most directly involved concerning the role of the LSC?
♦ What are the patterns of participation in ACL and how can they be explained?
♦ What is the rationale for ACL policy in the LEAs?
♦ How is quality of provision assured given the multi-player character of ACL?
♦ How is access and choice of provision guaranteed?
♦ How is coherence of provision assured given the multi-player nature of ACL?
♦ What is the perceived impact of Formula Funding on ACL provision?

Methodology

The research comprised a questionnaire, administered as a mail survey (with telephone prompts and option of email) of all 150 LEAs in January 2002, in-depth case studies in 15 LEAs undertaken between March and July 2002 and a consultation exercise with stakeholders and experts to validate the findings.
Completed questionnaires were obtained from all but three LEAs (Havering, Isles of Scilly and Torbay), a response rate of 98 per cent. The survey was designed as a baseline study to establish the mode of delivery of ACL, especially where there is a mixture of direct and contracted out provision, and to capture LEA perceptions as the new arrangements with the LSC came into effect. In combination with published statistics and information from Adult Learning Plans submitted by LEAs to the UK Government, the survey was also designed to identify a range of LEAs for in-depth study.

Fifteen in-depth case studies were conducted between March and July 2002 in LEAs selected to capture the diversity of ACL provision in terms of the following characteristics:
- Predominant form of contractual arrangement for delivery of ACL (5 LEAs from each of the 3 different groups of contractual arrangements: direct, contacted out and mixed).
- Socio-demographic environment as measured by LEA multiple deprivation index quintile (MDI derived at LEA level from the official MDI at ward level).
- Level of ACL activity (2 LEAs in each of the bands of ACL participation rates identified in the published statistics (i.e. < 1 per cent, 1-1.99 per cent, etc. up to 6 per cent and above), with three cases drawn from the modal participation band (2-2.99 per cent).
- Trajectory of ACL provision (capturing increasing, decreasing and constant level of provision).

The characteristics of the final list of LEAs selected for detailed study are shown in Table 1 and are identified by a code made up of the delivery mode and MDI quintile to preserve anonymity and confidentiality.

**Results and Findings**

Findings from the research are summarised below under the ten areas relating to the research questions established above:
- The emerging ACL sector
- Views on LEA provision
- Views on LSC role
- Participation in ACL
- Rationale
- Quality
- Access
- Coherence
- Impact of Formula Funding
The Emerging ACL Sector

The study provides a comprehensive picture of the emerging ACL sector in England. The survey confirmed that ACL is delivered in three different ways: direct delivery; contracted out; and a mixture of the two. For the 143 LEAs where such information was provided and unambiguous, 50 per cent reported that they secure ACL services entirely through direct provision, 27 per cent entirely through contracted out provision and 23 per cent through a combination of direct delivery and contracted out (‘mixed’, defined as less than 85 per cent provided through one of these routes). Taking a more liberal definition of ‘mixed’ (where there is any combination of direct and contracted out delivery) this category increases to 47 per cent.

Among the direct delivery authorities, the main advantages are control, coherence and QA. The main disadvantage is the weakness of community and voluntary delivery. The main attractions of the mixed delivery mode are ability to respond to local needs, flexibility and value for money, while the disadvantages are inadequate control, insufficient consistency and lack of coherence. In the outsourcing authorities, the main advantages are enabling the LEA to have a more strategic role, avoiding competition with providers and cost effectiveness, while the disadvantages are lack of control, inadequate information from providers, insufficient targeting of community needs and (in contradiction to the above) higher cost of cost of provision.

Partnerships

Irrespective of the mode of delivery or extent of local deprivation, all the authorities studied were involved in extensive partnerships, with both external and internal partners, for the delivery of ACL. Most LEAs work with other authority departments in delivering ACL, such as schools, community colleges, youth offending and youth and community teams, community development and neighbourhood renewal departments, local economic development and regeneration departments, Libraries, Museums and Music Services.

The quality of the relationships established with partners inevitably varies both between authorities and between partners within the same authority. The case studies suggest the quality of partnerships is unrelated to delivery mode, extent of local deprivation or participation rates, but is rather a function of the relationships established with individuals. However, the range of partners was less impressive in the outsourcing authorities, which tended to devolve the bulk of activity to relatively few providers.

Views on LEA Provision

In the survey, those responsible for ACL were mostly optimistic about the extent to which their LEAs are committed to developing appropriate provision and providing the necessary support. Over two-thirds of respondents felt their LEA monitors participation in learning of target groups; provides HRD to equip LEA staff with the competence to secure ACL; and demonstrates understanding of the roles of the LSC and DfES regarding ACL provision. Only a minority of respondents were positive about their LEA’s Information Advice and Guidance, although there has been significant investment in this area since the survey.

In the case study authorities, perceptions of LEA support for ACL were more varied with a high degree of concordance between respondents in each case. Where authorities were showing real commitment to ACL and matching this commitment with financial support, all respondents recognised this. A number of authorities appeared to have increased their commitment to, and support for, ACL with the advent of the new arrangements for ACL. Those LEAs that have traditionally shown a major commitment to ACL were continuing to do so and others demonstrated enthusiasm to put in place new structures and processes to expand ACL, especially in the direct delivery and mixed delivery authorities. Notwithstanding these encouraging signs of improvement, in half of the cases, those involved believed there to be little real commitment to ACL, which was viewed as under-resourced and a poor relation to schools.

Views on LSC Role

In the survey, LEA respondents were more uncertain about LSC activity in relation to ACL since the new arrangements for ACL were not only just in place. Nevertheless, positive views on the LSC role heavily outweighed negative ones: 74 per cent thought that communication between the LSC and LEA was effective; 68 per cent that the LSC was promoting partnership working; 61 per cent that the LSC had a clear view of priority target groups; 58 per cent that the LSC had provided adequate support in preparing their ALP for 2002/2003; and 53 per cent that the LSC was having a positive influence on strategic planning of ACL.

In the case studies, views on LSC capacity and relations were less clear cut; those interviewed acknowledged LSC effectiveness and enthusiasm in some areas and lack of understanding in others. The main criticisms were lack of understanding of ACL by LSC staff and the bureaucracy associated with LSC activity. Most authorities reported similar concerns over capital funding: purpose-built premises were needed to take ACL into the community and existing premises needed funding to be made compliant with the Disability Discrimination Act. Since the study there has been major investment to meet the latter need.

2-1
Participation in ACL

Gauging penetration of ACL services in the local adult population from official statistics is notoriously difficult, with official statistics expressing enrolments for each LEA as a percentage of the total adult population for the 19-59 age group, rather than headcount per head of population, and some learners may be enrolled on several courses. Participation rates for November 2001 varied across LEAs: most were in the range 1-4.99 per cent, but twelve LEAs had participation rates of 5 per cent and over.

ACL participation falls with increasing deprivation (MDI): among the 30 LEAs in the lowest deprivation quintile, six have participation rates under 1 per cent. However, of the seven LEAs in the top participation band (6 per cent and above), one is in the second to highest deprivation quintile. In the participation band 5-5.99 per cent, one of the five LEAs is in the second to highest deprivation quintile. Similarly, relative affluence is not universally associated with high levels of participation in ACL. Most respondents challenged the official statistics and offered different perceptions of actual participation rates.

Rationale

The rationale for ACL is a function of wider agendas of LEAs and councils, such as promoting neighbourhood renewal and improving the local economy. All LEAs gave details of activities conducted to analyse needs, such as postcode analysis and community profiling using census data, but many acknowledged the difficulties and the lack of systematic plans to meet the needs of target groups.

Notwithstanding local priorities, the case studies show a broad consensus concerning target groups, but exhibit significant differences in the degree of sophistication and detail, with the outsourcing authorities having much less well developed mechanisms. No significant differences were apparent in terms of extent of local deprivation or level of participation in ACL. Specific curricula have been developed to attract certain target groups, mostly relating to basic skills in combination with other subjects.

Quality

LEAs employ a wide range of processes to achieve improvements in the quality of ACL provision and some are developing coherent Quality Assurance systems for all Adult Education.

Direct deliverers were perceived as having the strongest QA systems, although LSC respondents felt that there was room for improvement. LSC respondents working with mixed delivery LEAs had contrasting views about their QA standards, while LSC respondents for outsourcing authorities thought QA was significantly underdeveloped. However, many LEAs sub-contracting their ACL work had procedures for monitoring and assessing quality. There was wide variation in the proportion of staff with ACL qualifications in the LEAs studied and some authorities were unable to supply details of staff qualifications. Many LEAs had chosen to develop staff expertise as a way of improving quality standards but even where financial support is offered to tutors, take-up of development is not guaranteed.

Access

Social inclusion is central to the UK Government’s agenda for ACL and forms the rationale for widening, as opposed deepening, participation in learning. Two target groups for WP are people with additional learning difficulties or disabilities and men in different age bands. Half of all LEAs have an enrolment rate of 20-25 per cent for men aged between 19 and 55 and less than one LEA in fifteen has an enrolment rate of over 30 per cent for this group. In addition to these required groupings, many LEAs target other groups with particular needs, such as older adults, those in need of basic skills, black and ethnic minority groups.

In the case studies, respondents described learner support provided, which included general financial support, concessionary fees, travel costs and child care. Some LEAs were unable to supply details of retention rates and three simply referred to attendance rates. Several authorities reported difficulties in facilitating progression and in the majority there was no systematic and coherent tracking of ACL learners.

Coherence

Respondents were divided between and within case authorities as to whether information was shared between providers in their LEA and whether there were gaps in existing provision, but the majority reported overlap and duplication. The achievement of coherence in ACL delivery is an area where there are still significant problems to be addressed since competition between providers is rife. Some respondents believed the LSC should be developing coherence, and all emphasised the role of partnership working.

Apart from two of the outsourcing authorities all those studied were members of formal Local Learning Partnerships (LLPs), enabling them to develop a coherent approach with providers. Direct delivery authorities appear to be more implicated in LLPs than outsourcing authorities, suggesting that those authorities more directly engaged with ACL recognise the need to work in partnership to meet community needs. The limitation of partnership, especially when established to secure funding, was a common theme. Mixed delivery authorities
reported more problems with partnerships, which may be the result of the complexity of this delivery mode and competition between the LEA and external providers.

**Impact of Formula Funding**

Respondents in the case study LEAs reported a number of perceived challenges to ACL provision in the move to Formula Funding (FF). In general, there were reservations concerning the impact of FF on resources and costs, as well as the difficulties and costs of data collection. In most authorities, respondents were pessimistic about ACL under FF expressing concern over reduced funding and increased costs.

Respondents feared the direct impact of FF on WP, attracting hard-to-reach learners and learning for personal interest, especially given the higher costs of WP and outreach work and moves to charge full costs for ‘recreational courses’. There was concern over retention and achievement targets with WP, Basic Skills and learning for personal interest, and the difficulty of maintaining small classes under FF. The move to FF was almost universally seen as forcing choices in the targeting of resources, with a risk of reducing flexibility and damaging high cost provision. Discussions over the impact of FF revealed tensions between the economic and social objectives of Lifelong Learning (LLL), reflected also in differences between vocational learning and learning for personal interest.

**Conclusions and Recommendations**

The complexity of the ACL sector and the different approaches adopted by LEAs to secure ACL provision reflect differences in local socio-economic environments as well as LEA traditions. The fact that different approaches have been adopted by those closest to ACL should be respected and the temptation to prescribe ‘one size fits all’ solutions resisted. The development of national frameworks has brought ACL to centre stage and while this should help maximise the impact of resources, it is important to retain the richness and diversity of provision.

There are advantages and disadvantages with each contracting approach; direct delivery offering better data collection and QA, but outsourcing offering more opportunity to engage with groups closest to the communities of learners being targeted. A mixed approach has the potential to combine the advantages of both but requires good LEA coordination and partnership working. Therefore, direct delivery LEAs should be encouraged to diversify delivery and engage with CVOs, while mixed and outsourcing LEAs should seek to undertake more systematic needs analysis, secure adequate provision and develop more coherence in delivery.

Many LEAs have made enormous progress with ACL. However, to deliver the necessary volume and quality of ACL all LEAs should give this higher priority and secure and commit resources, including SD and capital funding to raise internal competence and establish appropriate venues to offer better provision. The local arms of the LSC have established good communication channels and demonstrated commitment to supporting LEAs in preparing ALPs, introducing Individual Learner Records and moving towards FF. However, the LSC needs to develop more internal competence with ACL and, notwithstanding the need for better information on ACL activity, should seek to streamline procedures.

Patterns of participation in ACL reveal significant variations in the level of provision and uptake of learning opportunities. While geography is an important factor in targeting groups for WP, it is important to focus below LEA level and develop effective mechanisms to support a learner-centred approach. A general lack of accurate data is a problem for the LSC, DfES and the LEAs. This needs to be addressed to provide a picture of the pattern of provision and establish performance parameters. The level of ACL activity recorded in some areas raises questions of the validity of the statistics. In these circumstances it is difficult for the LSC to establish a base figure from which to calculate future performance. The LSC needs more information, and more accurate information, particularly on retention and achievement rates. To this end, LEAs should introduce MIS that are fit for purpose in collaboration with the LSC.

There are variations in the quality of ACL provision both within and between authorities. While many LEAs have made progress towards effective QA systems, more needs to be done, especially in relation to provision that is outsourced. All LEAs need to put in place comprehensive QA systems and develop SD for tutors and others involved in ACL, ideally in collaboration with the LSC. Similarly, the coherence of ACL varies between LEAs and needs to be given higher priority. In the cases studied, where effective LLPs were established there were signs of improvement and these should play an increased role in ACL development to avoid duplication and identify gaps in provision. The work of LLPs would be greatly enhanced by improving the quality of statistical information on ACL and by increasing transparency between providers.

The very groups that are targeted in the WP and social inclusion agenda are those for whom provision is most expensive as a result of outreach and small class sizes. Equally, retention and progression are most problematic with such target groups. If the social inclusion objectives are to be met, it is important that the application of formula funding is sufficiently flexible to promote this vital work. ACL contributes substantial wider benefits of learning,
such as health and social impacts, including active ageing and citizenship. These benefits should be acknowledged irrespective of the extent to which ACL may lead to vocational learning and promote employability.

**Contribution to New Knowledge in HRD**

The research was designed to meet the immediate needs of the DfES, the LSC and the LEAs in England, providing them with early feedback on the effectiveness of the new arrangements for ACL. In so doing, the research contributed to new knowledge in HRD in relation to methodology and, especially, substantive empirical knowledge of relevance to practitioners.

In methodological terms, the research developed a new index of deprivation at LEA level, making it possible to explore the effect of relative prosperity and mode of delivery of ACL on the nature of provision. By combining a comprehensive survey with in-depth case studies, it was possible to obtain an aggregate overview as well as detailed explanations of the perspectives of those closest to ACL.

In empirical terms, this study provides the first comprehensive picture of the emerging ACL sector in England and demonstrates the role of the wider community in developing human resources as well as the nature of the challenge of creating coherence in provision.

Given the importance of social inclusion in the European lifelong learning agenda, and the particular basic skills deficit in the UK, the evidence suggests that HRD practice needs to move beyond the workplace to address the needs of those with low skills, especially when they are currently out of the labour market. To the extent that HRD practitioners engage with this debate and contribute their expertise to provide better ACL, the possibilities for a ‘joined up’ approach to learning and development are immense. The benefits to the unemployed are self evident, since labour market participation is the most important single factor combating poverty and social exclusion. Equally for employers and HRD professionals, developing basic skills among would-be employees offers the benefit of concentrating HRD initiatives in the workplace on intermediate and higher-level skills. Beyond these economic objectives, the benefits of ACL in terms of health of the elderly, for example, also demonstrates the social importance of HRD in the widest possible sense and offers a vision of lifelong learning to develop human potential and foster societal cohesion.

Adult Literacy: Issues and Directions Impacting HRD

Don F. Seaman

Wendy E. A. Ruona  
University of Georgia

Thomas J. Chermack  
University of Minnesota

It is no longer realistic or viable for HRD to be isolated from the broader context of workforce development. Organizations, where HRD has been traditionally situated, have begun to realize the ominous workforce challenge that lies ahead—especially related to ensuring literate and skilled adults in the future. It is very important for HRD professionals to “tune into” these emerging trends because they will affect our roles and responsibilities.

Keywords: Literacy, HRD, Survey

HRD has been defined as “a process of developing and/or unleashing human expertise through organizational development and personnel training and development for the purpose of improving performance” (Swanson, 1995, p. 207). While this may characterize our past, it does not necessarily characterize our future. There are developments afoot in the United States that are beginning to demand a more integrated, coherent system of workforce development. It is no longer realistic or viable for HRD to be so isolated from the larger context of workforce development of which it is an integral part.

Organizations, where HRD has been traditionally situated, have begun to realize the ominous workforce challenge that lies ahead. Despite the recession that dominates our economy currently, the Office for Technical and Adult Education predicts that

a net total of 23 million new jobs will be created in the next 10 years if the trends of the last decade continue. New job growth and retiree replacement together will produce a need for 18 million new baccalaureate degree holders by 2012. At current college and university graduation rates, the available new college degree holders will fall 33% short of demand. (D’Amico, 2002, pg. 2)

If these predictions are realized, it is nearly a guarantee that organizations will have to adopt a more proactive and involved role in ensuring an educated workforce. Like a domino chain, this will also likely affect the roles and responsibilities of HRD professionals as we are asked to respond to the need for qualified workers in areas of high demand.

Furthermore, adult literacy continues to emerge as a major challenge for organizations. Adult literacy is defined in the Workforce Investment Act of 1998 as “an individual’s ability to read, write, speak in English, compute, and solve problems at levels of proficiency necessary to function on the job, in the family…and in society” (Meeder, 2002). The findings of the most recent national survey of adult literacy were published in the early 1990s. That survey found:

40 million American adults (ages 16 and older) functioning at the lowest level of literacy, and 90 million functioning at the two lowest levels. These individuals are not equipped with the skills they need to work effectively in the high-skill jobs that increasingly characterize our economy. (U.S. Department of Education, 2003, pg. 3)

Recent studies have shown that low literacy skills cost business and taxpayers $20 billion in lost wages, profits and productivity annually (Meeder, 2002). Furthermore, companies surveyed in the AMA’s “Corporate Concerns” study ranked developing and improving workforce skills as the 8th most important corporate concern out of a possible 25 issues in 2001 (American Management Association, p.1). Also, 65% of the small business owners surveyed in the "Voices from Main Street: Assessing the State of Small Business Workforce Skills" study said that improving the quality of workforce skills and education was very important (American Express, Small Business Services, p.2).

Thirty eight percent of these small businesses reported that they already participated in local workforce skills improvement programs.
It is very important for HRD professionals to “tune into” these trends that are emerging and that will undoubtedly affect organizations in the coming decade(s). One important part of this effort will be to better understand the issues and challenges facing adult literacy professionals since adults are the primary focus of HRD’s work.

Purpose

The purpose of this manuscript is twofold: 1) it presents a review of the relevant literature regarding the issues and future trends prevalent in the field of Adult Literacy and 2) it presents the results of a survey conducted during Summer, 2001 which sought to elicit what 14 experts in the field of Adult Literacy thought would and will be the most significant challenges as the field moves forward in the 21st century.

Research Question

Thus, the research problem can be summarized in the following research question: what do experts in the field of Adult Literacy presume will be the most significant challenges as the field moves forward?

This paper begins with a literature review of relevant sources concerning general trends in Adult Literacy. This literature review is intended to provide a backdrop given that many HRD professionals may be unfamiliar with the current ideas and debates in the diverse field of Adult Literacy. It is from this backdrop that we, the researchers began to inquire in an exploratory nature what several Literacy experts may suggest are the core challenges on the horizon for the field and its professionals.

Part One: A Review of the Relevant Literature in Adult Literacy

Recent literature around Adult Literacy has included a focus on “information literacy” (Miller & Slater, 2000). Further, technological innovations have made information access the most fluid it’s ever been, although the expertise for making sense of this information and applying it in a useful way are quite another story. It seems that technology will likely be the most obvious driver for change in the realm of Adult Literacy, and for that matter, education in general. While technology will likely have a profound impact on the administration and evaluation of Adult Literacy, it is not the only factor in considering the future of the field. Other driving forces such as changing demographics, cultural issues, accessibility, and economic conditions will all have a direct impact on the ways in which people become literate.

Defining literacy is another sensitive topic. There appear to be two distinct views with regard to the definition of literacy; those pushing for a specific, crisp definition, and those who prefer the lines to remain a little bit blurry around how far the notion of literacy extends. There is one point on which both sides agree: literacy is big – encompassing a wide and increasing variety of contexts (see Barton, 2001 for a discussion of these definitional views).

Changes Since 1990

In earlier years, adult literacy programs focused upon basic reading, writing, and numeric skills, including English-as-a-Second Language (ESL) and preparing for the General Educational Development (GED) test. The decade of the 1990’s began the report from Secretary’s Commission for Achieving Necessary Skills (SCANS, 1991) that stimulated concern about skills that adult literacy programs needed to develop in their students. The report argued that several new basic competencies needed to be included in adult literacy programs, including the ability to process information, understand basic systems found in everyday life, and solve simple problems which adult constantly face. This stimulated changes in adult literacy teaching practices (Murnane and Levy, 1996). However, we are still trying to determine how adults with limited ability to read and write lead their lives in this print-based society, especially when many are not enrolled in literacy programs (Merrifield, Bingman, Hemphill, & deMarrais, 1997).

As the 21st century begins, the residents of the U.S. find themselves living and working in a new, more complicated economy - one built on a foundation of information and communications technology. This new economy provides advantages to people who possess both educational credentials and strong basic skills, where a high school diploma, without further education, no longer leads to a career with a good future (Kasworm, 1990; Sum, Fogg, & Mangum, 2001). The influence of technology cannot be overstated, especially in the adult learning classroom where computer-assisted instruction is believed by some educators to surpass all other forms of instructional methodology (Fletcher-Flinn & Gravatt, 1995).

Everyday living is becoming more complicated. Changes require adults to use their literary and math skills to acquire information for decisions about health care, finances and retirement, to name a few. For example, a recent review of the research literature suggests that a positive correlation exists between literacy skills and good health (Rudd, 1999). More than ever, citizens need strong skills to understand school issues, laws and codes, zoning
regulations, proposed legislation, and the platforms and qualifications of political candidates. They need to know how to gain access to administrators, policy makers and police, to unite and advocate for change, to inform one another, to negotiate among themselves and with those in power, to use their power of votes, and to seek and hold positions of power themselves (Kaplan & Venezky, 1994).

Contemporary Issues

Literature around Adult Literacy suggests five contemporary issues of specific importance, namely, 1) immigration, 2) corrections, 3) special learning needs, 4) volunteers, and 5) learning across cultures. This section examines each of these issues in brief and explores implications for Adult Literacy as a field.

Immigration. Immigrants represent 45 percent of the estimated net increase in the nation’s population in the last decade and immigration has become a determinate factor in population growth (Camorata, 2001). In fact, the U.S. may now be dependant on these immigrants for future increases in the size of its workforce. The rise in the numbers of adults seeking English skills who have enrolled in literacy classes in some states has almost overwhelmed the system and those enrollees dominate program enrollments as well as the lists of those waiting to enroll (Revuelto, 1999). These adults face the task of learning English, while acquiring both educational credentials and high levels of skills to reach income levels adequate for viable family support (Loollock, 2001). There is no reason to believe this trend will decrease anytime in the near future.

Corrections. The need for adult literacy education in the correctional setting has also increased in recent years as the numbers of state prison and county jail populations continue to grow. “It is the problem that most educators do no know about, most politicians do not acknowledge, most corrections officials are unprepared to deal with, and most tax-payers resent having to pay for” (Newman, Lewis, & Beverstock, 1993 [need page number here]). There are efforts to determine what kinds of learning experiences will enable inmates to achieve the learning necessary to be successful outside the incarcerated setting (Batchelder & Rachel, 2000), but data to document achievements are lacking. However, for future planning purposes, one on the greatest issues is the inability of correctional facilities to accurately report the on the number of inmates participating in adult literacy and their progress, especially county jails (Sherman and O’Leary, 1994).

Adults with special learning needs. “The Americans with Disabilities ACT” (ADA) mandates that educational institutions provide academic accommodations, including appropriate educational programs, to persons with disabilities. Although the numbers of adults with special learning needs has begun to increase in recent years, there is some speculation they have always been there, but adequate screening instruments have been sadly lacking (Polson & White, 2000). Some efforts have been made to correct this situation, but more are needed in the future (Mellard, 1998; NIFL, 1998). How to meet the needs of this population should be an important future concern for adult literacy educators.

Volunteers. With tighter budgets and a large population to serve, there has been an increasing emphasis for adult educators to use more volunteers. Even in the 1980’s, volunteers were used extensively in adult literacy programs, especially in school-based and community-based programs (Wu & Carter, 1986). Many tutoring programs in community-based agencies provide excellent services to adults who want to improve their reading and writing proficiencies. It is clear from the literature and from the large number of literacy programs in this country that experts believe basic reading and writing skills are important for survival and success in today’s world. (Ginsburg, 1997). But can volunteers be counted upon to provide the comprehensive services needed in adult literacy education?

Learning across cultures. This concept, the theme of a recent issue of Adult Learning, has become a focus for adult educators. Adult educators have fostered learning in various cultures within the U.S. for many years (Mullins, 1999), but there is now an emphasis to extend even more beyond the borders of this country (Bélanger, 1998). This need was reinforced by the Hamburg Declaration on Adult Learning that advocated developing alliances among nations to share knowledge and other resources in an international effort to promote adult learning at all levels. However, in the future, how will this be done, and by whom?

The Future: How Will Adult Literacy be Perceived?

Planning for the future is always a formidable task. Through the planning process, educational programs are developed, modified and refined, essentially defining the nature of adult education practice (Mills, Cervero, Langore & Wilson, 1995). However, planning should be based upon the reasonable thinking of leaders who have some history and professional experience in the field, and the breadth of knowledge and skills to develop a logical approach to the probability of events occurring that will further shape adult literacy education. This will be difficult when most of those in need of services are not being reached. Some research shows that at present, the adult education and literacy system is serving less than 20 percent of the potential student population (Comings, Sum &
Uvin, 2001). However, attempts must be made to develop a future scenario to guide those who will be planning and implementing adult literacy education programs.

The United States and its many communities need the help and commitment of all their citizens. A lack of basic skills that narrows the range of an individual’s opportunities for social participation and reduces the likelihood of a good income can lead to frustration and anger. People with high level of basic skills are more likely to develop future oriented perspectives that help them invest in constructive activities that can support improvements in the social and political system (Behrman & Stacey, 1997).

Given this brief overview of what is happening in the literature of Adult Literacy, an important additional question involves what is happening in the practice of Adult Literacy. And more specifically, what do some expert practitioners think about the future of Adult Literacy? Considering the amount of uncertainty that has presented itself in the field, a collection of the thoughts and views of prominent Adult Literacy experts presents the opportunity to learn a great deal about the profession and illuminate the areas that are not receiving attention.

Part Two: The Results of a Research Project on the Future of Adult Literacy

The following section of this paper presents the findings from a qualitative research project designed to elicit what 14 experts in the field of Adult Literacy thought would be the most significant challenges as the field of Adult Literacy moves forward in the 21st century. The theoretical framework, methodology, and findings are presented. Then, the paper concludes with a discussion of the findings and some implications for HRD.

Theoretical Framework for this Research

The study was situated in the context of scenario planning. Scenario planning has been defined as “a process of positing several informed, plausible and imagined alternative future environments in which decisions about the future may be played out, for the purpose of changing current thinking, improving decision making, enhancing human and organization learning and improving performance” (Chermack & Lynham, 2002, p. 372).

There are many methods for conducting scenario planning, however, The Centre for Innovative Leadership (1995) identified six steps, which mirror most of the methodologies available publicly today. These are: 1) identification of a strategic organizational agenda, including assumptions and concerns about strategic thinking and vision, 2) challenging of existing assumptions of organizational decision makers by questioning current mental models about the external environment, 3) systematically examining the organizations external environment to improve understanding of the structure of key forces driving change, 4) synthesis of information about possible future events into three or four alternative plots or story lines about possible futures, 5) development of narratives about the story lines to make the stories relevant and compelling to decision makers, and 6) use of stories to help decision makers “re-view” their strategic thinking.

The first step of the scenario planning method is to elicit the strategic insights of leaders in the field. These include tacit and explicit ideas of what is strategically important, what drives (or should drive) the success of the organization, and concerns and anxieties about the future (van der Heijden, 1997). In an effort to surface the strategic agenda, assumptions and vision of those in leadership positions in the field of Adult Literacy, this research elicits the views of people who are actively creating and shaping the profession, thus completing the first step described in the scenario planning process.

Methodology

Fourteen participants were surveyed. These participants were selected purposively as experts in the field of Adult Literacy (Patton, 1990). The participant pool included members of the National Institute for Literacy, the National Center for the Study of Adult Learning and Literacy, the National Center on Adult Literacy, among other important institutions involved in the study and practice of Adult Literacy. This was intended to be a participant pool consisting of people in leadership positions representing the most active groups in Adult Literacy in the United States as measured by prominence in the literature, funding, and program activity.

A verbal agreement and verification of participant e-mail addresses was completed during face-to-face meetings, telephone conversations, or written correspondence prior to the administration of the surveys. Each participant was sent the same survey electronically as an e-mail attachment, and asked to respond within an eight week time period. Participants were asked to answer 10 open-ended questions regarding the nature of the field, factors that may be influencing the field, and their opinions on the potential issues affecting the future directions of the field.

The initial response rate included seven participants out of fourteen. Follow up was conducted with the non-respondents by a reminder e-mail message. The final response rate included all targeted participants. This study reports themes that emerged from the participant responses.

Data Analysis
Data from the surveys was combined and the authors of this chapter inductively analyzed the data to identify emerging themes using a constant-comparative method of data analysis (Guba, 1978). This method included (a) coding the data to identify the large array of potentially important concepts and ideas and then (b) comparing each piece of data with others to generate meaningful themes supported by the data. We enacted Guba’s (1978) method via a rigorous method for analyzing data in Microsoft Word developed by Ruona (in-review).

Guba (1978) suggested noting recurring regularities in the data and sorting them into categories. “Categories should then be judged by two criteria: internal homogeneity and external heterogeneity” (1978, p. 53). Internal homogeneity refers to the extent to which the data that belongs in a certain category hold together, while external homogeneity concerns the extent to which differences among categories are clear (Patton, 1990). The researcher then works back and forth between the data and the categories, verifying the meaningfulness and differentiation of the categories (Guba, 1978).

From this first stage of analysis, common themes began to emerge in participant responses. The themes were captured on 3x5 cards. The project team established internal and external homogeneity (Guba, 1978; Patton, 1990) through an iterative process encompassing data analysis, category creation and lively debate. Originally, an unmanageable number of themes emerged with some themes appearing in more than one category to reflect different perspectives on the same idea. Through an iterative process of cycling between the data and the categories, the researchers refined the meaningfulness of the themes that emerged and made adjustments (collapsed or expanded categories) as was directed by the data (Guba, 1978).

**Emerging Themes**

Several overarching themes appeared through the data analysis that led to the formulation of four major categories. The four categories included: 1) funding, 2) technology, 3) access and 4) fragmentation of the field. Each of these themes will be summarized and supported by comments taken directly from the survey responses, as it was the overall aim of this study to give voice to what several Adult Literacy experts think and feel about the future of the field. It would not be feasible to provide all participant responses related to these four themes. Therefore, the intent of this portion of the paper is to provide some illustrative examples of expert opinions that constitute the themes that have emerged in this study.

**Funding.** Funding was perhaps the most prominent issue revealed in the survey responses and this should not come as any surprise. The issue of funding was closely tied with the first question on the survey. We asked experts what things they would want to know about Adult Literacy over the next 10-15 years.

1) “Is there policy backed up by legislation and funding that supports the lifelong learning approach for adults in this country similar to some European countries who pay for adult to go to training, higher ed with a sabbatical to do it?”

2) “Level of support – not only financial but that, too – for adult literacy from national and state leaders as well as general public and traditional levels of education (i.e., K-12 and higher education).”

3) Several respondents also discussed an overall lack of government funding. In response to the second question on the survey -- what things may lead to the collapse of Adult Literacy as a field of practice, some experts responded:

4) “Lack of adequate funding to provide high quality instruction to adults who, in many cases, have failed in the K-12 system to gain adequate basic skills or who had adequate skills on graduation from high school but have been left behind due to changes in work and community environments”

5) “Too many states fail to provide adequate support to their literacy programs while expecting every higher levels of accomplishment. We then collect performance data that is unsupportable and distribute it as if it was valid and reliable to policy leaders. This is a “house of cards” that is in imminent danger of collapse.”

Funding is not decreasing in its importance to the field of Adult Literacy. With ever-increasing budget cuts in nearly all forms of educational systems, it appears as though Adult Educators of all sorts are not likely to find their funding shortages solved anytime soon. What is clear is that Adult educators are finding more and more ways to stretch their current funding (Ginsburg, 1997), although the time frame through which they will be able to sustain such careful considerations of expenses is unclear.

**Technology.** Technology is re-shaping lives in innumerable ways. Adult Literacy is no exception. While funding shortages provide ever-increasing challenges to the field, technology may be one approach to lessening the burden. We asked experts what things would help the field of Adult Literacy grow and thrive over the next 10-15 years. Some responses included:

1) “Wonderful facilities, accessible to those learners who want to be there in a variety of ways: traditional classrooms, technology, TV, palm pilot, etc.”

2) “Great performance enhancement and virtual reality where the learner can practice skills and move on at his own pace.”

3) “Adult Literacy must learn to use technology to enhance learning and improve achievement.”

4) “The use of technology in adult learning needs to be encouraged. Technology can be a wonderful tool if properly implemented.”

5) “Technology can be a wonderful opportunity if properly put into action and properly trained.”

While the overall lack of funding continues to plague the field, technology may help Adult Educators find innovative solutions to overcoming challenges.
2) “We will have built service delivery systems in which all components essential to student and program success are present and well supported by federal, state and local funding sources.”

3) “Sites that are open year round – basically 24/7”

4) “Learning centers in every community.”

Technology may very well be one major contributor in the event that Adult Literacy thrives over the next several years. By providing the ability to reach more of those in need of Adult Literacy services than ever before, technology allows an increasingly inexpensive outlet and tool for Adult Literacy experts.

Access. Access was frequently mentioned as a core concern about Adult Literacy in participant responses. Particularly relevant to low-income segments of the population, and sections of the United States, access is broadened really only by technology. Therefore, many experts have considered universal access the high standard and goal for the field of Adult Literacy.

1) “Have we succeeded in providing every interested and motivated under-educated and limited English proficient adult with a successful educational experience that equips them for the next round of challenges in their lives – and thereby greatly reduced the number of eligible adults who are not benefiting from our services?”

2) “I think it would be an acceptable option to other equivalent forms of education and integrated into the established system of secondary and postsecondary education. It would also be integrated into workplace education. Therefore, individuals would be able to access literacy skills education in the workplace, community, postsecondary institutions and secondary institutions without feeling stigmatized for being a low-literate learner.”

While technology may aid in providing more access than ever before, it will not solve the access issue in its entirety. Further means for providing access in low-income, or remote locations must be developed and examined.

Fragmentation of the field. Several experts expressed concern about the make-up of the field of Adult Literacy itself. Some urged for some form of professional certification, and others discussed merging with workforce education efforts. The point expressed may also relate to varying ways of defining Adult Literacy. With such a large and inclusive customer base, not only is it difficult to define Adult Literacy, but ambiguity can be confirmed among its practitioners (Barton, 2001). Comments related to the fragmentation of the field seem to indicate a general concern that a lack of cohesiveness and a joint sense of purpose could contribute to increasing difficulties in the pursuit of a fully literate society:

1) “It is difficult to determine an advantage and a competitive position for a field that tries to be all things to all people (for example: religious ed, military ed, adult basic ed, ESL, and workforce training).”

2) “Adult literacy instructors have to understand and be able to apply adult education theory to practice with specific adult populations and from different cultural perspectives.”

3) “I don’t like to think of them as “competitors” since the ultimate goal of providing education is the same, but in a sense the other facets of the education system – especially k-12, which sometimes seems threatened by the adult literacy system’s existence. (If all kids got what they needed in school, our system would not be needed, or so the argument goes... )”

4) “There is a great danger that other education and training systems will develop their own literacy-like systems to meet their particular needs. In fact this is already happening. Perhaps it is the right way to go. If so, the only competency that will distinguish literacy is a specially trained workforce – which it does not really have now. That is, literacy will consist of a body of expertise and a cadre of people produced by colleges and other training centers and applicable to various needs, rather than a distinct service system.”

The reality seems to be that Adult Literacy has a very diverse customer base that changes according to the context in which it is operating. Additionally, the field is inextricably intertwined with other forms of education systems, that a different times, perform some of the same work. Workforce training and education, k-12 education, and adult education in general are all other fields that share some of the same goals as Adult Literacy.

Discussion

This study has attempted to provide some expert views on the future of Adult Literacy. In hopes of prompting further debate and dialogue about the field, these expert views have been presented in the form of four general themes concerning the future of Adult Literacy, namely, 1) funding, 2) technology, 3) access, and 4) fragmentation of the field. These issues are clearly motivated and influenced by social, technological, economical, environmental, and political forces that are far beyond the control of any organization.

Survey participant results suggest five contemporary issues of specific importance, namely, 1) immigration, 2) corrections, 3) special learning needs, 4) volunteers, and 5) learning across cultures. While the expert opinions do
not mirror the prominent issues in the literature, considerable overlap is evident. For example, increased immigration into the United States is clearly affecting technology and access situations. Further, funding affects learning for special needs populations and also those with cultural and linguistic barriers.

While there can be no clear single direction for the future of Adult Literacy, this study has hopefully brought some prevalent issues from the minds of several Adult Literacy experts. A clear, single direction for the future of Adult Literacy is perhaps not a desirable outcome even if it were possible. What is possible is that the field of Adult Literacy and its practitioners and scholars will learn much about themselves through thoughtful reflection and dialogue about the future.

**Implications for HRD**

Clearly the issue of adult literacy is an issue of concern for and challenge to any profession focused on developing human skills and knowledge for the purpose of improving learning and performance, a focus that most definitely includes the HRD profession. In the age in which we live, where access to knowledge and skills are fundamental to social, community, and workplace performance, HRD has no choice but to integrate the issue of adult literacy into its frame of practice and inquiry. Adult literacy may in the past have been labelled as a societal issue beyond the realm of most organizations and therefore that of HRD. Today, however, there is just too much evidence, as suggested in this paper, to support that the issue of adult literacy is an issue of workforce and workplace development.

Horwitz (1999), in an article on the emergence of strategic training and development, highlights the significance of the “transfer of learning, new knowledge and the notion of intellectual capital…” (p. 180) as critical to the competitive success of organizations in the emerging age of a global economy. He further points out, and also highlighted in this paper, that labor markets are becoming increasingly open with the ability to transport skills across country borders, placing even higher demands on competency requirements of the new labor force. Whether a developed or underdeveloped nation, a prerequisite for the development of human capital, and the leveraging of that capital for competitive and societal success, must be a growing level of adult literacy. With the fast pace of change in job knowledge and skill requirements on the rise, the emergence of previously unimagined industries and their demands for completely new labor competencies, the increasing transportability of labor skills across national and international boundaries, the ability of adult workers to re-skill and multi-skill quickly and effectively has become a critical workforce requirement to organizations seeking to remain competitive in a global economy. This increasing gap between demand and supply for skilled and competent workers is clearly being impacted by increasing levels of adult illiteracy and is indeed demanding a more integrated, coherent system of workforce development.

HRD can no longer ignore the challenge of adult literacy to organizations. Nor can it ignore its role in being more proactive in the development of and contribution to the ‘supply’ of an educated workforce to the broader workforce system. Indeed, HRD can expect to be increasingly challenged to extend it theory, research and practice to the address of adult literacy, of adult education and development, in both specific and broader workforce contexts. To do so, though, HRD will need to expand its roles and responsibilities beyond that of the single organization or network of organizations.

Giving Voice to the Factors that Promote and Inhibit Learning in a Community-Based Multicultural Immersion Program: Adult Learner Perspectives – Implications for Research and Practice in HRD

Chaunda L. Scott
Oakland University

This paper presents two elements of a broader set of findings resulting from a qualitative doctoral dissertation. This research gives voice to the learning experiences of 21 diverse adult learners who participated in a community-based multicultural immersion program. Key perspectives of their learning experiences were drawn from two main themes: 1) factors that promoted multicultural immersion learning and 2) factors that inhibited multicultural immersion learning.

Keywords: Multicultural Immersion Program, Community-Based Education, Diversity

Research on the changing demographics in the United States (Johnson & Packer, 1998), along with the rise in racial and sexual discrimination and harassment cases and complaints (Cox, 1993; DeSimone & Harris, 1998; Thomas, 1992), have alerted American communities and organizations to the importance of creating suitable social and work environments for all their members. In responding to this concern, many educational and community organizations have embraced the benefits of human diversity by creating multicultural education programs, which help individuals develop competencies for understanding and respecting human differences in dissimilar cultural settings (Banks, 1981). Moreover, many organizations have responded to this concern by developing diversity training programs, which help individuals become more knowledgeable about and responsive to human diversity in today’s workplace, in an attempt to address environmental inequities such as racism and sexism (DeSimone & Harris, 1998).

Despite these efforts, research as confirmed that numerous problems still confront many minorities and women seeking to fully integrate into today’s communities, organizations, and society (Johnson & Packard, 1987). For example, stories of discrimination, racial harassment, gender discrimination, gender harassment, discomfort, alienation, frustration, and overall lack of success in fully integrating into communities as well as organizations and society still abound (Banks, 1981; Cox, 1993; DeSimone & Harris, 1998; Kanter, 1993; Schraeder, 1999; Thomas, 1992; West, 1993). What is missing from this body of research is the learners’ perspectives on the factors that have promoted and inhibited multicultural education learning and diversity training learning in such programs. In an attempt to build research and improve this practice in the areas of community-based multicultural education programs and similar programs with this focus, I conducted a focused case study of learners’ experiences in a multicultural immersion program (MIP) that will shed light on the aforementioned factors.

Problem Statement and Purpose

Prior to presenting the research problem, I provide definitions for a number of terms and concepts (i.e., multiculturalism, multicultural education, multicultural immersion program (MIP) the research site, community-based education, diversity and diversity training) that are used throughout this study. Recognizing the myriad of ways these terms can be conceptualized, for clarity, this study will adhere to the following working definitions.

Multiculturalism — A philosophical position that stresses that the human diversity of a pluralistic society should be represented in all institutions (especially educational institutions), in such a way that encourages people to retain their individual cultural identities, as well as having equal access to power (Banks & Banks, 1993; Herbst, 1997).

Multicultural Education — A concept with supporting processes intended to help individuals in educational settings develop competencies needed to understanding and respect human differences. Recognizing that equal access does not guarantee fairness for all, multicultural education strives to prepare individuals to work actively towards achieving structural equality in organizations (Banks, 1981; Grant, 1992).

Multicultural Immersion Program — A community-based multicultural education centered program in a Midwestern urban city where seventy-five people spend seven days experiencing food and the culture of five communities of color which include the following cultural groups; European American, African American, Hispanic American, Arab American and Native American discussing issues of concern to those communities (MIP Official Records, 1996).

Copyright © 2004 Chaunda L. Scott
Community-based Education — Education focused on the facilitation of responsive systems designed to take collective action where agencies work collaboratively within the community to address issues such as substance abuse, housing, violence, crime, teen pregnancy, ill literacy, and various kinds of discrimination using a broad range of resources (http://www.ncea.com/2002).

Diversity — A term that captures the many ways in which human beings differ, for example people differ with regard to race, gender, age, class, language, disability, sexual orientation, military experience, personality and so on (Wentling and Palma-Rivas, 1998, p. 241).

Diversity Training — A concept practiced in the form of workshops and seminars designed to help individuals in organizational settings become more knowledgeable about, personally value, manage and generally become more responsive to human diversity in an attempt to address environmental and systemic inequalities such as racism and sexism (Herbst, 1997, p. 70; DeSimone and Harris, 1998).

The problem addressed in this study is that little is known about what factors promote and inhibit learning in community-based multicultural immersion programs in the U.S. from the perspective of adult learners. This lack of knowledge limits the ability of community-based multicultural educators and adult educators working in similar fields in determining what adults have learned in these kinds of programs along with what kinds of skills they take away. Moreover, it limits adult educators’ ability to determine whether they are designing and facilitating multicultural programs that produce multicultural leaders and educators. Without a clear understanding of what has promoted or inhibited past and present learning in community-based multicultural programs from the perspective of adult learners, our current multicultural education practices may be failing to introduce the kind of information adult learners need in order to understand the complex nature of race and ethnicity in America, democratic values, and multicultural awareness, knowledge, understanding, and sensitivity. Therefore, a main purpose of this study was to help community-based multicultural program designers, facilitators, and adult educators working in the areas related to community-based multicultural education proceed from a more informed perspective when developing such programs.

Theoretical Framework

To assist me in understanding and analyzing the learners’ perspective of their learning experiences in the MIP through a theoretical lens, I drew on the work of four distinguished adult education authors, who focused on (a) learning from experience through reflective processes and attending to feelings (Boud & Walker, 1993), (b) learning from experience related to polyrhythmic realities, the intersection of one’s race, gender, class, language, and other cultural factors in the learning environment (Sheared, 1999), (c) learning from experience related to Schon’s (1993) work on reflection in action offers five learning strategies known as framing, reframing, integrating perspectives, experimenting and crossing boundaries that describe learning as the interaction of action and reflection. From these theoretical underpinnings, a conceptual framework for the study emerged and (d) learning form experience related to Kasl, Dechant and Marsick’s (1993) work on group learning in the context of adult progression and growth in learning which describes their experience of learning together as a research team and how this experience enhanced their understanding of their research. The four theories are discussed in more detail in the following paragraphs.

1. Learning From Experience Through Reflective Processes and Attending to Feelings

Boud and Walker (1993) offered a means of analyzing an experience that is relevant to any type of learning experience, including that of adults participating in a community-based MIP. As part of their research, Boud and Walker analyzed a specific shared experience to understand how action and reflection interact; they then created a model of reflection processes in learning from experience (Figure 1).
In this model, Boud and Walker illustrate how learning from experience occurs in nonlinear stages of preparation (the use of strategies and skills focused on promoting learning in the learning environment), experience (using experience as a foundation to stimulate reflection in action), and reevaluation (reflection, integration of experiences, validation of experiences, and appropriation or, in other words, owning experiences). A key component that distinguishes their model from similar work by Kolb (1984) and Cell (1984) is the inclusion of attending to feelings, which enhances or limits one’s opportunity for learning.

2. Learning From Polyrhythmic Realities

Sheared’s (1999) polyrhythmic realities model of learning from experience (see Figure 2) highlights the intersection of the learner’s race, gender, class, language, and other cultural factors (i.e., history, sexual orientation, and religion) in the learning environment as they relate to the learner’s lived cultural experiences. The concept of polyrhythmic realities is relevant to the process of giving voice to cultural factors in a multicultural learning environment. It is “an alternative way to address the effects of race, class, gender, language, and other cultural factors in a classroom environment” (p. 40).

The “YOU” in the center of the model represents the adult learner or the teacher. It is placed in the center to show that race, gender, class, language, and other cultural polyrhythmic realities affect how one may see oneself and how one may be perceived in the learning environment. The polyrhythmic-realities framework acknowledges a different way of knowing that is not grounded in the Western linear tradition.
Sheared’s viewpoint was used in this study to connect the concepts of giving voice to polyrhythmic realities as they related to adult learners’ lived cultural experiences and learning from reflection. A relationship was established between Boud and Walker’s (1993) three-stage model and Sheared’s (1999) concept of polyrhythmic realities. Sheared focused mainly on giving voice to learners’ lived experiences in the learning environment as they intersect with race, gender, class, language, and other cultural factors. These concepts were inserted into Boud and Walker’s model (depicted in Figure 1) and were used to translate the process of giving voice to polyrhythmic realities in the learning environment into a process that draws upon reflection in terms of thinking and action. The resulting new model is shown in Figure 3.

Figure 3. Boud and Walker’s Model of Reflection Processes in Learning from Experience Related to Sheared’s Model of Polyrhythmic Realities

3. Learning from Reflection in Action

Schon’s (1993) work on reflection in action offers five learning strategies known as framing, reframing, integrating perspectives, experimenting and crossing boundaries that describe learning as the interaction of action and reflection. Schon (1983) defines his learning strategies that call for integration of thinking, action and reflection as follows:

- Framing — Framing is an initial perception of an issue, situation, person, or object based on past understanding and present input.
- Reframing — Reframing is a process of transforming that perception into a new understanding or frame.
Integrating Perspectives — Integrating Perspectives are divergent views are synthesized and apparent conflicts resolved, though not through compromise or majority rule.

- Experimenting — Experimenting is action undertaken to test a hypothesis or a move or to discover something new.
- Crossing Boundaries — Crossing Boundaries is when two or more individuals and/or teams communicate, they cross boundaries.

4. Learning from Group Learning in the Context of Adult Progression and Growth in Learning

Kasl, Dechant and Marsick’s (1993) work on group learning in the context of adult progression and growth in learning describes their experience of learning together as a research team and how this experience enhanced their understanding of their research. Below, Kasal, Dechant and Marsick (1993, p. 144) define the four developmental phases of their group learning model as follows:

- Phase one: Contained learning — a group exists, but learning, if any is contained within individual members.
- Phase two: Collected Learning — individuals begin to share information and meaning perspectives. Group knowledge is an aggregate of individual knowledge; there is not yet an experience of having knowledge that is uniquely the group’s own.
- Phase three: Constructed learning — the group creates knowledge of its own. Individuals’ knowledge and meaning perspectives are integrated, not aggregated.
- Phase four: Continuous learning — the group habituates processes of transforming its experience into knowledge.

Schon’s (1987) viewpoint of reflection in action and Kasl, Dechant and Marsick’s (1993) viewpoint of reflection in action and on group learning in the context of adult progression and growth in learning were used in this study to analyze and interpret the findings. The work of Boud and Walker (1993), Sheared (1999), Schon (1987) and Kasl, Dechant and Marsick’s (1993) provided the framework for this study in the context of giving voice to multicultural ways of knowing and being. The framework was useful to this study because it provided a perception of how learning takes place through reflection when giving voice to lived cultural experiences in the learning environment.

Research Question

The study sought to highlight not only what adult learners identified as the factors that promoted and inhibited learning in the MIP, but also how and why they perceived them as such. The following research question was posed to guide the collection of data: (1) What factors were perceived by adult learners to promote and inhibit their learning in the community-based MIP?

Methods and Limitations of the Study

A qualitative interpretive case study research design was employed to explore the factors that promoted and inhibited learning in a Midwestern community-based MIP from the perspective of 21 diverse adult learners. The primary rationale for employing a qualitative, interpretive case study design was linked directly to the core research listed earlier. Denzin and Lincoln (1998) stated that “qualitative research is multi-method in focus, involving an interpretive naturalistic approach to its subject matter” (p. 3). This means that qualitative researchers study phenomena in their natural settings, attempting to make sense of or interpret phenomena in terms of the meanings people bring to them.

I selected a unique community-based, social-action-focused MIP in a Midwestern city for the research site because I have an interest in these type programs and I thought it was an ideal dissertation site to examine community-based education, multicultural immersion education, adult learning and uses of this learning in communities, workplaces and society simultaneously. The MIP was developed in 1996 by a member of the New City Coalition to address the racial tension this Midwestern city often experiences. The goal of this community-based MIP is to develop a network of multicultural leaders and educators who will be prepared to facilitate ongoing dialogue and cross-cultural collaborations aimed at closing the racial divide in their communities, workplaces, and society in general (MIP Official Records, 1996).

People who apply and are accepted to participate in this free 7-month program represent various racial, ethnic, and cultural communities throughout the Midwest and a cross-section of nonprofit organizations, businesses, government agencies, educational institutions, civic groups, and health services. The MIP uses guest lecturers, books, role-play, art, games, music, and food, along with personal sharing, which both the program instructors and learners use to teach the program’s content. The program’s content consists of a multicultural ideology, the history
of racism and ethnicity in America, democratic values in America, and concepts of multicultural awareness, knowledge, understanding, and sensitivity (MIP Official Records, 1996).

The population sample comprised of 455 people who had participated in the MIP over a 7-year period, 1996 through 2002. Out of the population sample, I selected the 21 individuals who participated in this program from the MIP’s master list who had taken part in the program from 1996 through 2002. To gain an understanding of what these 21 adults had learned from the MIP, I then selected three participants from each of those years based on their race and ethnicity, type of work setting (i.e., corporate, nonprofit, educational, government, or other), and availability to take part in the study to make up the sample of 21 participants.

Data were gathered through a demographic questionnaire, in-depth interviews, and official records from the MIP. Member checks and follow-up telephone interviews were also used to increase trustworthiness of this inquiry (Merriam, 1998). The analysis of data consisted of five parts: “organizing the data; generating categories, themes, and patterns; testing the emergent hypothesis against the data; searching for alternative explanations of the data; and writing the report” (Marshall and Rossman 1995 p. 113). The literature review helped in the initial phase of analysis. Using concepts from the readings, I constructed a matrix that helped me organize the data. The data-collection materials for each participant were assigned the same numerical code. This procedure helped to keep the data organized, while ensuring participants’ anonymity. By using more than one source of data, I was able to look for consistencies and inconsistencies in participants’ responses. Triangulation of the data also helped to ensure the validity and reliability of the data (Marshall & Rossman, 1995).

To begin the analysis process, I tabulated and compiled the questionnaire responses. This information allowed for a view of interview responses by participants’ race/ethnicity, gender, age, educational level, occupation, work setting, and years of work experience. Next, I coded the interview transcripts for common themes and patterns, connections, and any discrepancies between interview and questionnaire responses. The responses initially were placed into six categories derived from Boud and Walker’s (1993) work on reflective processes and Sheared’s (1999) work on polyrhythmic realities. This helped me organize and make sense of the data that had been collected. Boud and Walker’s framework helped me understand how action, attending to feelings, and reflection interact with regard to learning experiences. Sheared’s framework on polyrhythmic realities, which focuses on the significance of giving voice to cultural intersecting realities such as race, gender, class, language, and other cultural factors in the learning environment, helped me identify and highlight learners’ perspectives on giving voice to their polyrhythmic intersecting realities in the learning environment within varying sociocultural, educational, political, and historical contexts. Data also were placed in additional categories derived from Schon’s (1993) work on reflection in action and Kasal, Dechant and Marsick’s (1993) work on group learning in the context of adult progression and growth in learning as well as common themes and patterns I discovered during the coding and analysis process.

To establish inter-rater reliability (Merriam, 1998) after preliminary coding and categorizing of the data, I presented my findings to two advanced doctoral students and my advisor, who are experienced in analyzing qualitative data. The data then were placed in categories and matched to all others to determine whether there were any correlations between and among categories. Next, I discussed these categories with my advisor, peers, and colleagues in the field of multicultural education and human resource development, and then compared them to the concepts found in the literature. Last, I examined the various emergent categories and themes in order to synthesize the data and make meaning of it.

Limitations

There were also certain limitations due to the scope of the study and the use of qualitative research methodology. For example, these limitations included the following:

- The study sample was drawn from a volunteer population
- The study lacked a longitudinal perspective
- The constraints of using qualitative instruments such as questionnaires, interviews and follow-up interviews to achieve objectivity and subjective interpretations
- The researcher’s bias as it related to her being committed to promoting racial and cultural awareness for 12 years in her community, workplace and society
- The sample size was small and limited in terms of representing different geographic areas and the many diverse cultures and ethnicities in today’s society and
- The findings were not generalizable to the universe of diverse adult learners participating in similar MIPs in the U.S.
In recognizing these limitations and biases, I made every effort to ensure that I represented the ideas and perceptions of the participants accurately by remaining aware of the above limitations and biases when I analyzed, interpreted and reported the findings.

Results and Findings

The study’s findings revealed that the MIP content increased participants’ understanding of multiculturalism, racism and oppression. The content on democracy however, only confirmed what participants already knew about democracy. In the MIP learning environment participants learned from rules to guide learning and from reflecting on and giving voice to their lived experiences with cultural diversity and intersecting polyrhythmic realities (Sheared, 1999), their race, gender, class, language and other cultural factors. They also learned from meeting and talking with diverse people, visiting cultural sites, eating and making cultural foods, doing cultural dances, and making cultural crafts. Barriers identified by the participants that inhibited learning in the MIP included: inexperienced instructors who lacked knowledge of and experience with multiculturalism, too much Information presented in a short amount of time, lack of time to continue discussions, socialize and network and lack of follow up programs to continue learning about multiculturalism.

Conclusions and Recommendations

The following conclusions emerged from this study.

Conclusion 1. Having ground rule to guide learning in the MIP allowed the participants to tell their story without critique. It also kept them safe from verbal attacks, which made the MIP a safe environment in which to learn in.

Conclusion 2. Allowing participants to giving voice to their past and present experiences with cultural diversity and their polyrhythmic realities, the intersection of race, gender, class and language and other cultural factors in the learning environment introduced them personally to real world multicultural ways of understanding, knowing and being. Participants also had an opportunity to experience aspects of multiculturalism using a hands-on approach (i.e., by doing cultural dances, eating and making cultural food and making cultural crafts).

Conclusion 3. In selecting multicultural instructors, personnel managers should check applicants’ references and access their expertise in the subject matter by observing them in practice, if possible and their competence in making presentations before hiring them.

Conclusion 4. Multicultural immersion education program developers should create a series of follow-up program to continue educating people on multiculturalism. Therefore it should be noted that one multicultural education class, session or workshop does not allow enough time to explore in-depth the many diverse aspects of multiculturalism.

Implication for Research and Practice in Human Resource Development (HRD)

The researcher hopes that this study’s design and findings can make a positive contribution to HRD practitioner’s and adult educators working in the areas of diversity training and multicultural education who wish to integrate concepts as rules to guide learning, hands on experience with multiculturalism and giving voice to polyrhythmic realities (Sheared, 1999) into their current practices. Moreover, the researcher hopes that the results of this study can be used to assist HRD practitioners and adult educators in selecting competent and experienced instructors to facilitate diversity and multicultural learning. Lastly, the researcher believes that this study adds to the literature in HRD and adult education, by expanding our understanding of reflective processes (Boud and Walker, 1993), polyrhythmic realities (Sheared, 1999), reflection-in action (Schon, 1993), and group learning in the context of adult progression and growth in learning (Kasal, Dechant and Marsick, 1993) in that these theoretical frameworks were used as multicultural lenses to examine and make meaning of the learning experiences of 21 diverse adult learners who had participated in a community-based multicultural immersion program. This is significant in this study of giving voice to the factors that promoted and inhibited learning in a community-based multicultural immersion program from the perspective of adults learners because it breaks new diversity training ground and multicultural education ground in all four of these adult education theoretical frameworks.

Neural Network Analysis in Cross-Cultural & Comparative Management Research: Implications for International HRD

Ahad M. Osman-Gani
Nanyang Technological University, Singapore

This paper discusses the application of the neural network analysis in comparative & cross-cultural management research through simulating the information processing in the brain, to identify country clusters based on the perceptions of managers from various countries. Findings from such cluster studies would be useful in developing more effective cross-cultural training programs that might have significant implications for international HRD research.

Keywords: Neural Networks, Cluster Studies, International HRD Research.

The globalization of business has led to an increasing awareness of the cross-cultural environment and its importance for making significant strategic decisions. In the past, the study of differences and similarities among nations and cultures has been the exclusive concern of cultural anthropologists. As a result, corporations paid only limited attention to cultural research. Today comparative management studies have similar goals as anthropology: to understand culture and international management behavior, however, focusing on cultural differences from a business viewpoint rather than from a pure anthropological one. The goal of comparative management is to use the cultural knowledge to design the most effective organizational strategy and structure possible and to make the most effective use of human resources in different cultures.

There are three approaches to comparative management research: the universalist approach, the economic cluster approach, and the cultural cluster approach (Robinson, 1978). The universalist approach contends that few major differences exist among managers across cultures, and that management theories and practices transfer easily from one culture to another. The economic cluster approach emphasizes that the economic similarities and differences among nations, or among groups of nations, will determine management's task. The cultural cluster approach focuses on how behavioral and attitudinal differences among managers and employees from different cultures determine these tasks. All three approaches contribute to the understanding of the management process from a comparative viewpoint.

In the past decade or so, neural network applications have mushroomed in such diverse fields as pattern recognition, identification and control of dynamical systems (Narendra and Parthasarathy, 1990), data and image compression (Daugmann, 1988), speech recognition (Boulard and Morgan, 1994), automatic target recognition (Babri and Farhat, 1992), time series modeling and prediction (Moody and Darken, 1989), improving business effectiveness (Udo, 1992), prediction of bankruptcy (Tarn, 1991), and clustering (Kohonen, 1984; Kamgar-Parsi, Gualtieri, Devaney, and Kamgar-Parsi, 1990), among others. Neural networks have been demonstrated to be exceptionally effective in modeling mappings which contain both regularities and exceptions as illustrated by their application to stock performance modeling (Schoenenburg, 1990; Refenes, Zapranis, and Francis, 1994). In this regard Haykin (1994) provided an excellent comprehensive treatment of the state-of-art technique in artificial neural networks. Apart from non-business (e.g. engineering) applications, neural network has also been used in various business areas, such as: Finance, Marketing, E-commerce, and Travel industries (Lisboa, Edisbury & Vellido, 1994).
2000), but no research could be found that used ANN in human resource or international HRD areas.

This paper is based on the first attempt to introduce the application of neural networks in identifying country clusters based on managers' perceptions/responses to certain organizational management issues in large global organizations such as a multinational enterprise (MNE) (Osman-Gani & Babri, 1995). MNEs and other forms of international organizations employ managers and employees from various different cultural backgrounds. Identification of patterns in their response behavior through cluster studies would provide significant inputs for making important decisions in an effective and efficient manner.

**Review of Literature**

The theoretical framework for such studies could be drawn from an extensive review of literature focusing mainly on three relevant areas: country cluster studies, international management, cross-cultural & comparative management studies. The emerging field of international HRD is being built based on research from these areas.

**Cluster Studies and International Management/HRD Research**

International management research has attempted to establish clusters of countries based on their relative similarity according to relevant organizational variables. These variables are used to group countries or nations (as opposed to cultures), as the unit of analysis. By defining country as the unit of analysis, the clustering of these countries has important implications for managers and academicians. Managers in MNEs can better understand the basis for similarities and differences between countries. With this knowledge, they can more effectively place internal assignees, establish compatible regional units, and predict the results of policies and practices across national boundaries (Ronen and Kraut, 1977). Clusters also help academicians by defining the extent to which results should be generalized to other countries. Clusters also aid the researchers in identifying variables that explain the variance in work goals and managerial attitudes and perceptions (Ronen and Shenkar, 1985). The cluster studies may also provide significant inputs for effective international HRD decisions in developing and implementing appropriate training & development programs for overseas managers in a MNE (Osman-Gani & Jacobs, 1996).

In specifying the significance of cluster studies, Hartigan (1975) contended that clustering allows for a more thorough understanding of macro-environmental factors that are associated with differences in actions and values. According to Hartigan, the principle functions of clustering are to: (a) name, (b) display, (c) summarize, (d) predict, and (e) provide explanation. These functions illustrate the implications of clustering countries according to their work values.

By giving a name to all countries (e.g., Anglo) in the same cluster, the characteristic work values and perceptions of the group are identified. The display of clusters may assist in grouping of business units or country organizations into international combinations (Kraut, 1975; Ronen and Kraut, 1977). The information may also help in deciding overseas assignments and in training personnel for such assignments. Data are summarized by referring to properties of clusters rather than to properties of individual countries. The summary of data helps in enhancing understanding of the interactions among various work values.

Predictive potential, among other reasons is one of the primary benefits of clustering (Ronen and Shenkar, 1985). Hartigan (1975) hypothesized that prediction might take place in two ways. (1) If a group (country) is classified into a given cluster, then information about behaviors of other members of that cluster would serve as predictors of expected behaviors of the classified group (country), and (2) new measures already shown to have cluster affinity would be predictive of the measures that would be expected of other members of a given group (Townsend, Scott, and Markham, 1990). Clustering also may enable better forecasting of problems associated with introduction of organizational policies and practices. Clear-cut clusters require an explanation of their existence and thus promote the development of theories. Of special importance are those clusters that differ from geographic, linguistic, and religious classifications.

So far, nine cross-national (cultural) cluster studies were identified through a literature search on empirical studies in international management. They are: Haire, Ghiselli, and Porter (1966); Sirote and Greenwood (1971); Ronen and Kraut (1977); Hofstede (1976); Redding (1976); Badawy (1979); Griffeth, Horn, Denisi, and Kirchner (1980); Hofstede (1976); and Osman-Gani (1991). Two of the nine studies examined one world region each. Redding (1976) studied eight countries in Southeast Asia, and Badawy (1979) studied six countries in the middle east. Two other studies (Haire et al, 1966; Hofstede, 1984) were published in the form of books rather than papers. One study was done as a part of a doctoral dissertation (Osman-Gani, 1991). Some studies used in-house data collected by an MNE; others collected data designed specifically for the study (Haire et al, 1966).

Ronen and Shenkar (1985) provided an exhaustive review and synthesis of the eight cluster studies. These studies dealt with various variables that can be grouped into four categories: work-goal importance; need deficiency fulfillment, and job satisfaction; managerial and organizational variables; and, work role and interpersonal orientation.
Work-goal importance was surveyed by Haire et al. (1966) through an 11-item scale, later utilized by Redding (1976). Need deficiency fulfillment, and job satisfaction were examined by Haire et al., through the 11-items depicting a modified Maslow need categories. Badawy (1979) used a 13-item instrument based on Porter's (1961) derivation of Maslow's categories. Hofstede (1984) used more than one survey and therefore a different number of items. Griffeth et al. (1980) used an attitude survey to measure satisfaction with nine job facets. Four of the eight studies examined managerial or organizational variables. Haire et al. (1966) and Badawy (1979) used eight items depicting classical versus democratic managerial styles. Griffeth et al. (1980) examined organizational variables; role overload, organizational commitment, organizational climate, and organizational structure. Three studies surveyed work role and interpersonal orientation. Haire et al. (1966) researched cognitive descriptions of the managerial role using a semantic differential technique. Redding (1976) studied relations with subordinates. Hofstede (1976) used the survey of personal values (Gordon, 1967, 1976) to measure practical mindedness, achievement, decisiveness, orderliness, and goal orientation. Osman-Gani (1991) studied managers’ perceptions on transferring and using management technology across countries using ten variables relating to management and human resource development (HRD) issues.

**Cross-Cultural Research Methodologies**

Although methodological issues in cross-cultural areas have been widely discussed by researchers operating in the domains of political science (Ross and Homer, 1976), sociology (Bendix, 1969), anthropology (Naroll, 1968), and social psychology (Berry, 1979), theoretical and methodological reviews of comparative management research up to early 1970s have been somewhat pessimistic in their conclusions (Roberts, 1970; Roberts and Snow, 1973; Triandis, 1972). Some developments, however, made management researchers more sanguine in this regard. Bhagat and McQuaid (1982) and Sekaran and Martin (1982) have pointed out that the cross-cultural literature of the 1970s gave reason for optimism concerning the future of research into organizational behavior. Child (1981) concluded that while macro-level variables (organizational structure and technology) are tending to become more and more similar across various cultures, micro-level variables are tending to maintain their cultural distinctiveness. Negandhi (1973) reached the same conclusion; he suggested that similarities may be explained in terms of industrialization, whereas differences may be explained in terms of cultural variables. Cross-cultural methodology is particularly important in terms of conceptualization, measurement, and interpretation of behavioral context. Sorge (1982) and Jamieson (1980) have argued that there is no culture-free content of organizations; even if the various organizational solutions are similar, they are constructed in a cultural context and may be interpreted as a reaction to a given constraint.

In an attempt to develop a classification scheme for the basic framework of cross-cultural studies, Murdock (1945) started the process by organizing 70 cultural universals which can be used to establish the variables of culture. Negandhi (1983) identified five approaches in this regard: (1) the historical approach looks at the past to determine what standards have been set; (2) the economic approach deals with transfers of technology from developed to underdeveloped countries; (3) the environmental approach looks at external facts to determine operating principles; (4) the behavioral research examines people and organizational structures; and (5) the organizational studies examines cross-cultural transfer effects on formal and informal groups. Barrette and Bass (1973) summarized many surveys in cultural research. They categorized the results around managerial functions such as motivation, organization, and decision making. England (1978) tested cultural research on 2500 managers. The research, supported strong cultural aspects of management principles. Also, young managers were found to have different goals and were less culturally bound than older managers. Hall (1959) developed practical techniques for increasing sensitivity to cultural differences in his message systems and cultural maps. These two dimensional matrices can give direction to communication and management decision making across cultural boundaries.

Adler (1982; 1997) has been instrumental in building methodology for the study of cross-cultural comparative management research. She outlined differences in approach such as parochial, ethnocentric, polycentric, comparative, geocentric, and synergistic. Adler developed the cultural synergy model. This model however did not assume that either part of the cultural integration was the better management principle. It suggested a new synergistic culture different from each of the parts and generally better in its ability to handle and cope with management functions. Given a certain set of environmental variables and cultural backgrounds, a system can be developed to maximize effectiveness and efficiency.

All the previous studies used various types of traditional statistical analysis techniques in the process of clustering countries. The studies that performed worldwide clustering all employed some type of multivariate statistical procedures in their analysis. Haire et al. (1966) used factor analysis to study cognitive descriptions of managerial role through a semantic differential technique. To create country clusters, the authors obtained a correlation matrix on the basis of all three parts of their study. A Q-Factor (inverted) analysis was used by Sirola and Greenwood (1971), Hofstede (1980), and Osman-Gani (1991). They found it as the most robust analysis procedure compared to others considering the nature of their data sets. Some authors found very close similarities among the results of Cluster
analysis and Q-Factor analysis. In his 1976 study Hofstede performed factor analysis within and between groups. He acknowledged trying smallest space analysis with very similar results to factor analysis. Griffeth et al. (1980) used generalized pythagorean distance measure $D''$ to measure profile similarity. Cluster analysis was then applied to the $D''$ scores to create country clusters. The only use of nonmetric multivariate analysis was by Ronen and Kraut (1977), who also employed the technique for reanalysis of two other studies (Haire et al. 1966; Sirotta and Greenwood, 1971). So far, no study was found to have used Neural Network analysis as a technique for clustering countries. This paper attempts to discuss the neurocomputational perspective of grouping countries in general, and then discuss the applications in a hypothetical research setting dealing with cross-national data collected from different countries.

**Brief Technical Overview of Neural Networks**

An artificial neural network (ANN) is an abstraction of a real nervous system which consists of nerve cells or neurons communicating with each other via synaptic connections.

*Figure 1. Schematic Diagram of an Artificial Neuron*

![Schematic Diagram of an Artificial Neuron](image)

The artificial neuron is a simple processing unit whose output is determined by a nonlinear function of the weighted sum of its inputs. Information is stored in the network in the connection strengths between the neurons. These connections can be modified by a learning rule to store new information. The geometry of these neural connections and the learning rule determine the capability of a neural network to solve a given problem. In the following we describe a simple model of a neuron and how it functions in a network of neurons.

Figure 1 shows a schematic diagram of a simple model of the neuron. A neuron $i$'s output $y_i$ is a non-linear function $g(.)$ of the weighted sum of the inputs it receives from other neurons and its internal threshold $\theta_i$. Mathematically, this function is described by:

$$ y_i = g\left(\sum_{j=1}^{N} w_{ij} x_j - \theta_i\right) $$

where $N$ neurons with outputs $x_j; j=1,2,...,N$ are connected to the neuron $i$ through synapses or connection weights $w_{ij}$. The logistic function is defined by:

$$ g(u_i) = \frac{1}{1 + \exp(-\beta u_i)} $$

This is extensively used to model the neuron's response to net input activation $u_i = \sum_j w_{ij} x_j - \theta_i$. Generally, neurons are arranged in layers or levels; the input layer, the output layer and possibly one or more intermediate layers. The geometry of interconnections between neurons allows one to classify neural networks into two broad categories. A network is of strictly feed forward type if all connections are unidirectional, going from the input to the output. A recurrent or feedback network contains at least one connection in the backward and/or lateral direction.
Learning in Neural Networks

Neural networks learn about a problem by gradually encoding information about the problem (e.g. through examples or instances of that problem) in the connections between neurons in the network. Depending on the available information about a problem, neural networks can learn in a supervised or unsupervised manner. In supervised learning, desired classification information on examples of the problem (training data) is available. A learning rule is used to modify the connection weights of the network based on the disparity between the desired classification and the actual classification obtained by the network at a given time instant. The error backpropagation (EBP) rule is the most widely used supervised learning rule (Rumelhart, Hinton, and Williams, 1986).

When desired classifications of training data are not available (e.g. in clustering of multinational data), the network has to learn in an unsupervised manner. In this case learning occurs under some measure of the quality of the representation that the network is required to learn. Connection weights are modified to optimize this measure. Kohonen’s self-organizing feature maps (SOFM) (Kohonen, 1984) and Grossberg’s adaptive resonance theory (ART) (Carpenter & Grossberg, 1988) are well known representatives of unsupervised learning.

Implications for Using ANN in Management/HRD Research

One example of the application of artificial neural networks (ANN) could be illustrated by developing a data matrix of numbers (values) with ‘m’ rows (each row representing a country) and ‘n’ columns (each column representing a management/HRD variable). The numbers (values) in the matrix may represent the mean response scores of managers from ‘m’ countries for each of the ‘n’ management/HRD research variable of interest (representing certain international/cross-cultural management issue). Kohonen’s self-organizing feature map (SOFM) procedure for training ANN could then be performed on the data matrix.

A SOFM network with ‘n’ input neurons and ‘m’ output neurons could be used to observe the topological ordering of ‘m’ country scores based on the similarity contrast measure implemented by the network. An input pattern would be obtained by normalizing the average response scores of managers of a country to values between 0 and 1. Using the procedure described earlier the topological orderings of ‘m’ countries developed by ‘m’ and ‘n’ output neuron networks, after many (e.g. 10000) cycles. During the initial phase (1000 cycles) the learning rate parameter will decrease linearly (e.g. from initial value of 0.91 to 0.01), while the neighborhood radius of a maximally active neuron might be reduced to 0 starting from an initial value. The stability of the topological ordering could then be measured by calculating the average number of shifts in maximally active neurons responding to various countries. A stable map could be developed after about 2000-3000 cycles. As the number of output neurons is reduced below n-number, bigger clusters tend to form and become most consistent in the range of optimum output neurons. Over this range few distinct clusters with consistent topological ordering would emerge. Reducing the number of output neurons below might disturb this ordering. This is an indication that for this m-country set, these clusters represent a near-optimum grouping.

The SOFM neurocomputational approach to forming country clusters results in a hierarchical emergence of clusters as the number of output neurons is reduced. Starting with a relatively large array of output neurons, the countries are topologically ordered on the basis of a similarity-contrast measure implemented by the SOFM through its cooperative-competitive processing mechanism. As the number of output neurons is reduced to a certain number, a consistent ordering and clustering of the countries is observed. Beyond this number, the clusters become softer resulting in movement of some countries of different groupings. Since the developed clusters are also topologically ordered, the similarity (vs. contrast) between clusters that are closer to one another is more (vs. less) than those which are further away.

As far as clustering is concerned, the use of neural processing technique proposed in this paper offers an alternative tool for clustering countries. The emergent country clusters are topologically ordered on a similarity-contrast metric and can offer good insight into important factors that group countries or set them apart.

The SOFM performs topological ordering under symmetric constraints close to the center of the array. However, the probability of distortion in topological ordering increases as one approaches the edges of the open-ended array of output neurons. This can be rectified if the output-array could be closed by making it circular. Further studies should be conducted in this area to confirm the findings of such studies as well as to respond to new issues to be raised in this regard.

Managers’ perceptions on certain phenomena are formed through a complex process involving interplay of a range of factors, which cannot be easily quantified. The neural processing paradigm is ideally suited to processing of information, which results from a rich and complex phenomenon because the structure and knowledge about the problem is obtained by learning from examples representing that phenomenon. In the traditional approaches, certain assumptions (e.g. about the underlying probability distribution of the data samples) provide support for the data.
processing algorithm. The algorithmic approach is powerful when the assumptions meaningfully approximate the underlying data structure. However when this is not the case (e.g. data representing managers' perception), the neural processing approach holds greater promise. As indicated earlier, we may conclude that the neural network analysis can be considered as a potential tool in clustering countries for making significant cross-cultural management decisions, such as in the area of international HRD.

One of the potential use of such cluster studies could be in the design of more effective international/expatriate training programs. It may not be cost effective for large MNEs having thousands of employees in several countries to design and deliver different training and development programs for employees in each of their overseas subsidiaries located in different countries. On the other hand, previous research have established that it will not be effective to offer T&D programs to all the overseas managers/employees at the corporate headquarters (or at one location), which may not contribute to the performance improvement of the expatriate/international employees (Trompenaars, 1998; Osman-Gani, 2000). Therefore, if relevant and robust country/cultural clusters could be identified through the use of ANN paradigms, and appropriate cluster-based HRD programs could be designed and delivered accordingly, then performance of international employees at several overseas locations could be improved significantly. This process may also be more efficient and cost-effective than the traditional systems. Future research may confirm this with empirical evidence from cross-cultural studies.

It is observed that, data in cross-cultural research are hard to acquire. It is an expensive operation and requires the collaboration of researchers in different locations, and it is long in term in nature. So far, only few cross-national studies could be identified through an extensive literature search, and also, they do not provide even a near comprehensive coverage of the nations of the world. All the cross-national studies conducted so far included much of the free market economies of the western world. Many countries from Africa and Asia have not been studied at all; other countries from the middle-east and the far east, have not been studied sufficiently. These gaps in the research make it difficult to draw conclusions about cluster memberships in these parts of the world. Major studies need to be undertaken in which countries from all areas of the world will be included.

As multinational companies increase their foreign direct investment overseas, especially in newly emerging economies as well as in developing and consequently in less studied areas, they will require more in-depth information concerning their local employees in order to implement effective types of interactions between the organization and the host country. The knowledge acquired thus far can help one to understand better work values and attitudes of employees throughout the world. Traditional management theories developed in the USA and other western European countries may work well for those nations. But they are not equally applicable to non-western countries (Ronen and Shenkar, 1985; Hofstede, 1997; Trompenaars, 1998). Therefore, more cross-national cluster research is called for by including more countries from all parts of the globe, and also to cope with the constant changes occurring in the geo-political environment of the contemporary world. Currently, the authors are in the process of conducting comparative analysis among the results of other clustering techniques to identify specific strengths and weaknesses of neural clustering methods over others. This would provide further insights into the nature and type of cluster composition emerging from various techniques. Hopefully, propositions from this paper will trigger more research interests in the use/application of novel and non-traditional research techniques, such as Neural Networks Analysis in the fields of international HRD, comparative, and cross-cultural management in future.

References

The purpose of this study was to translate and validate an Arabic version of the Learning Transfer System Inventory (LTSI) for use in Jordan. The LTSI was administered to 450 employees employed by public and private sector organizations operating in Jordan. Principle axis factoring with oblique rotation was used to uncover the underlying structure of the Arabic version of the LTSI (ALTSI). Results showed a latent factor structure highly consistent with the original LTSI.

Keywords: Learning Transfer, Construct Validation, Jordan

The world has become a globalized economic system, where countries with high levels of technology, finance, and information have more advantages in controlling the sources of human capital, raw materials, and product development and distribution. Jordan, a small but strategic country, plugged into the world economic system by privatizing its economy to attract foreign investments and is pursuing further steps in developing human capital in both private and public sectors (Central Bank of Jordan, 1994). Human Resource Development (HRD) in Jordan leads to the economic development of the whole nation and plays an essential role in the development of the countries surrounding Jordan (Central Bank of Jordan, 1994).

Jordanian organizations, like organizations throughout the Middle East, have invested heavily in the training and development of their employees. For example, organizations in the Middle East spend more than twice on training per employee ($783) than do organizations in Latin America ($311). This level of investment per employee is also substantially higher than the overall world average ($630) (ASTD, 2002). In short, Jordanian organizations - as with US organizations - see investment in training activities as critical for continuously improving individual job performance and overall organizational success.

The challenge of such investments, however, is assuring that the training that occurs can be transferred into on-the-job performance. Although virtually no research has been done on learning transfer in organizations operating Jordan or other Middle Eastern countries, it is likely that these organizations face similar transfer challenges as their Western counterparts. For example, in organizations operating in the US the transfer problem - or the inability of individuals to take what is learned in training and transfer it to improved job performance - is so pervasive that there is rarely a learning-to-performance situation in which such a problem does not exist (Broad & Newstrom, 1992). Although the precise amount of transfer that occurs across training programs has not been empirically determined, the most cited estimate is that only 10 to 15% of learning is ultimately applied on the job.

The transfer problem has generated a good deal of research interest in HRD. Since Baldwin & Ford’s (1988) landmark review of transfer research over a decade ago a good deal of progress has been made in understanding the complex of factors that can influence learning transfer in the workplace. For example, a range of research has been focused on understanding the various dimensions of training design that can influence transfer (e.g., Kraiger, Salas, & Cannon-Bowers, 1995; Goldstein & Muscianite, 1986). Other research has examined a range of individual difference variables that can affect transfer including readiness for training (Tannenbaum & Yukl, 1992), efficacy beliefs (Eden & Kinnar, 1991) and even workplace literacy (Bates & Holton, in press). Another stream of research has examined the influence of work environments focusing on factors such as interpersonal support, (Bates, Holton, Seyler, & Carvalho, 2000), opportunity to transfer (Ford, Quinones, Sego, & Sorra, 1992), and culture (Tracey, Tannenbaum & Kavanagh, 1995). More recently, researchers have concluded that a systems perspective of training transfer is a more useful approach because of the importance of examining a variety of factors that interact together to influence training transfer (Kozlowski & Salas, 1997; Mathieu, Martineau, & Tannenbaum, 1993). For example, Holton, Bates, & Ruona, (2000) conceptualized a model of training transfer, which included a whole set of transfer factors. The conceptual transfer model recognizes that transfer is influenced by a system of factors (the learning transfer system). This system includes factors such as interpersonal support for transfer, reward systems, personal characteristics, motivational influences, and training design elements. Coincident with this has been the recognition
that a fundamental and critical shortcoming of transfer research has been the inability to assess, measure, and
diagnose the complex or system of factors that can influence transfer. To this end, efforts have been made to
develop valid and comprehensive measurement tools for assessing transfer and critical antecedent factors. One such
instrument is the Learning Transfer Systems Inventory (LTSI) (Holton et al., 2000). The LTSI has been widely used
across different organizations and training types to diagnose barriers and catalysts to transfer, and several studies
have provided evidence of the instrument’s construct (Holton et al., 2000; Bookter, 1999) and criterion-related
validity (Bates, 2001; Bates, Holton, Seyler, & Carvalho, 2000). More recent research suggests the LTSI may also
have cross-cultural applicability (e.g., Chen, 2003; Yamnill, 2001). The goal of the present study is to extend to
cross-cultural applicability of the LTSI to organizations operating in Arabic cultures with a specific focus on Jordan.

The Learning Transfer Systems Inventory (LTSI)

The LTSI is currently the only validated instrument available that measures a comprehensive set of learning transfer
system factors. It is based on the theoretical framework of the HRD Research and Evaluation Model (Holton, 1996).
The macro-structure of the model (see Figure 1) views training outcomes as a function of ability, motivation, and
environmental factors (Noe & Schmitt, 1986) at three outcome levels: learning, individual performance, and
organizational performance. Secondary influences such as efficacy beliefs are included and are believed to
influence transfer primarily through their influence on motivation. The LTSI assesses 16 factors that are group to
represent the four factor in the macro structure of the Research and Evaluation Model. These include motivation
elements (motivation to transfer, transfer-effort expectations, and effort-performance expectations), environmental
elements (supervisor support, supervisor sanctions, peer support, personal-outcomes positive, personal-outcomes
negative, and openness to change), ability/enabling elements (content validity, transfer design, opportunity to apply
training, and personal capacity for transfer), and secondary elements (self-efficacy and learner readiness). The first
three categories can directly influence learning transfer whereas secondary influences have indirect influence on
learning transfer through their influences on motivation.

Figure 1. Conceptual Model of the LTSI

Copyright © 1998 E. F. Holton and R. Bates
The LTSI can be used in multiple ways to improve training effectiveness and transfer in organizations. It can be used before training as a diagnostic tool to discover unknown and potential transfer problems and identify leverage points for change. It can be used as an additional evaluative tool following training to obtain additional information about why a training program did or did not work. The LTSI is also valuable as a diagnostic tool for investigating known transfer of training problems; as a means for targeting interventions designed to enhance transfer; as a mechanism for incorporating evaluation of transfer into regular employee assessments; and as an assessment tool to identify knowledge and skills needed by supervisors and trainers to support learning transfer (Holton, 2003).

**Research Question**

For Jordanian organizations, access to instruments such as the LTSI is critical. The capacity to assess transfer and transfer-related factors would not only help provide more complete understanding of training effectiveness in Jordanian organizations, but accurate assessment is a critical first step if organizations are to realize the full benefit from training investments. This research reports on efforts to translate and establish construct validity of an Arabic version of the LTSI for use in Jordanian organizations. The following research question was addressed: *Will construct validation of an Arabic version of the LTSI (the ALTSI) using exploratory factor analysis result in an interpretable factor structure consistent with the original LTSI?*

**Methodology and Research Design**

**Population and Sample**

The population for this study included public and private sector organizations operating in Jordan. The sample was chosen as heterogeneous as possible to ensure organizational mixture. Initial access to the organizations was gained through personal contacts. Because of limited access to subjects in Jordan, both purposive sampling and convenient sampling (Ary, Jacob, & Razavieh, 1996) were used. Specifically, organizations were included in the study if they had provided some type of employee training within six months prior to our initial contact and were willing to participate in the study. Twenty-eight organizations participated and provided an initial sample of 500 employees. Data were collected from 450 subjects for a response rate of 90%.

**Instrumentation**

The LTSI is an 89-item instrument with two sections. The first section contains items measuring 11 constructs representing factors affecting the specific training program that respondents have completed. Respondents are directed “to think about this specific training program” when responding to these items. The constructs in this section are program specific in that they are expected to vary depending on the training program. The second section of the LTSI contains 26 items measuring five constructs that reference factors that reflect respondents’ general experience with training in the organization. Respondents are directed to “think about training in general in your organization” when responding to these items. Since transfer of learning refers to individual behaviors, items in the LTSI were designed to measure individual perceptions of constructs. Respondents are asked to rate the items on a Likert-type scale ranging from 1 = strongly disagree to 5 = strongly agree.

The LTSI was translated into Arabic. To ensure equivalence of meaning of the items and constructs between the Arabic and English versions of the LTSI, a rigorous translation process was used that included forward and backward translation and subjective, objective, and pilot evaluations. The goal of the translation and various evaluation procedures was to produce an Arabic version of the LTSI with items that were equivalent in meaning to the original English version. This last point is important because the goal was an equivalent translation not an identical word-by-word translation. Equivalent translations emphasize functional equivalence or the equivalence of meaning of items across the original and translated instruments. Functional equivalence helps to ensure that the instrument works in the new target culture as well as it does in the original culture because the item-by-item translation is based on achieving equivalence in meaning rather than just the form of the sentence or word-by-word translations. The translation process is summarized below.

*Forward and backward translation.* Two translators bilingual in English and Arabic separately translated the English version of the LTSI into Arabic (forward translation). These translators were instructed to retain both the form (language) and the meaning of the items as close to the original as possible but to give priority to meaning equivalence and they agreed to use common language in the translation. The two translations were then compared to assess the item-by-item consistency. In the case of discrepancies or disagreements, the items were discussed and revised until consensus was reached. When the Arabic translation was finalized, the instrument was then back-translated (from Arabic to English) by two other people bilingual in English and Arabic.
Subjective evaluation. The items in the back-translated English version were then evaluated by one of the original LTSI authors to ensure that the meanings of the LTSI items were equivalent in both the original English versions and the back-translated version. If substantial differences in meaning were found between items, those items were put through the forward and back-translation process again until the author was satisfied there was meaning equivalence.

Objective evaluation. Following the subjective evaluation, a more ‘objective’ approach was used to further establish meaning equivalence. In this evaluation, a group of 19 native English speakers (HRD graduate students and other HRD professionals) rated the equivalence of meaning between the original LTSI items and the back-translated (English) items. A 7-point Likert-type rating scale was used with anchors ranging from 1 (Not at all similar in meaning) to 7 (Very similar in meaning). Items with mean ratings below four were put through the forward and back-translation process until adequate meaning equivalence was established. No items fell below this threshold and therefore no further revisions were made to the translated instrument.

Pilot test. The Arabic version of the LTSI was pilot tested with a group of 12 employees in Jordan to collect feedback on instructions and language in the instrument. This feedback did not lead to any substantive changes.

Data Collection

The ALTSI was administered in Jordan to employees at varying time lengths following an episode of organizational training. Time of administration varied from directly after training to six months after training. When distributed immediately after a training program, either the researchers or the administrator of the training distributed and collected the instruments. In the other cases, the instruments were distributed to trainees through the human resources personnel and then returned to the researchers. Responses were anonymous.

Data Analysis

Exploratory (common) factor analysis was used to identify the latent construct structure of the ALTSI and to provide some evidence of construct validity. Common factor analysis is considered more appropriate than principal component analysis when the objective is identification of latent structures (Nunnally & Bernstein 1994) and more accurate than principal components analysis when the data correspond to the assumptions of the common factor model (Fabrigar, Wegener, MacCallum, & Strahan, 1999). Oblique rotation was employed because of its suitability for latent variable investigation when latent variables may or may not be orthogonal (Hair, Anderson, Tatham, & Black, 1998). The initial criterion used to determine the number of factors to retain was an eigenvalue greater than or equal to one.

Results

Demographic Profile

The 450 respondents were almost equally divided between males and females. The participants in this sample were predominantly age 30 and older (71.4%) and that the majority of the respondents held a bachelor’s degree (69.1%). Forty-two percent of the respondents had work experiences that ranged between four to ten years. Finally, most of the respondents (61.8%) worked in private organizations.

Factor Analysis

The data were screened in several ways to ensure their normality and appropriateness for factor analysis. With respect to normality, visual inspection of the histogram, mean, median, mode, skewness, and kurtosis for each item shows that the data are normally distributed. With regard to the appropriateness of the data for factor analysis, two statistical tests (overall Measure of Sampling Adequacy (MSA) and the Bartlett Test of Sphericity) were conducted. Both of these measures quantify the intercorrelations among variables and provide evidence of the factorability of the data. The results of the MSA (.87) and the Bartlett Test of Sphericity (p < .05) indicated that the data were suitable for factor analysis. The two sections of items in the instrument (training-specific and training-in-general) were factor analyzed separately since each represents a different domain of constructs.

Training-specific domain (63 items). The item-to-respondent ratios for the training-specific section was approximately 7:1, well within the recommended ratio for factor analysis. The MSA for individual items was examined first in order to exclude any that did not meet the minimum recommended value of .60 or higher (Hair et al., 1998). None fell below this value. The overall MSA for the training-specific items was then examined and at .87 it indicated this set of items was appropriate for factor analysis. Exploratory factor analysis procedures were completed for the purpose of identifying the latent constructs underlying the data. The criteria for determining how many factors to extract included eigenvalue greater than one rule, and a visual inspection of both the scree plot (Ary et al., 1996) and several trial solutions. The initial analysis was run without specifying how many factors to retain. This procedure resulted in 16 factors explaining 64.40% of the common variance. However, this factor structure did not appear to be the best representation of the data because of multiple cross-loadings and latent factors.
that were difficult to interpret. The scree plot indicated the extraction of 9 to 13 factors. The final determination of how many factors to retain was made after comparing solutions extracting 13, 12, 11, 10, and 9 factors respectively.

The 12-factor solution for the training-specific items explained 57.23% of the common variance and produced the latent structure that was the best representation of the data. Of those 12 factors, 11 closely matched that the constructs in the original LTSI. However, the 12th factor was dropped because it contained two items that did not have a strong conceptual connection to one another and that cross-loaded (> .20) across multiple factors. The residual correlation matrix was also examined and no meaningful residuals were found, further suggesting that the 12-factor structure was the appropriate and that the extraction of more or fewer factors would not improve the structures representation of the data. Items were retained on factors if they had a minimum loading of .30 and were deleted if they had a cross loading above .20. Using these criteria, 44 items of the original 63 items were retained on the ALTSI and accounted for 55.16% of the total variance. Nineteen items were dropped because of low factor loadings and/or cross-loadings. All but one item loaded on the factor it was associated with in the original LTSI. Factor loadings for items retained in this solution ranged from .34 to .77 with an average loading of .61 on major factor and .05 on the rest of the factors. In short, the 12 factor solution extracted 11 interpretable factors including highly consistent with the following constructs from the original LTSI: learner readiness, motivation to transfer learning, personal outcomes-positive, personal outcomes-negative, personal capacity for transfer, peer support, supervisor/manager support, supervisor/manager sanctions, perceived content validity, transfer design, and opportunity to use training.

In sum, loading of items was characterized by interpretable simple structure, meaning that it has high loadings on one factor and minimum cross-loadings on the rest of the factors. Finally, all factors had an acceptable reliability ranging from .62-.87, with an average alpha of .76, suggesting that this factor structure should be retained. Eight of the 11 scales exceeded Nunnally and Bernstein’s (1994) suggested minimum reliability of at least .70 for instruments in early stages of development.

Training-in-general domain (26 items). The item to variables ratio was approximately 21:1, again well within the recommended ratio for factor analysis. All individual items in the training-in-general domain had an acceptable MSA value above .60 (Hair et al., 1998), and the MSA for the this section as a whole was .85, indicating it was appropriate for factor analysis. The initial examination of the eigenvalues greater than one suggested the presence...
of seven factors, explaining 60.78% of the total variance. However, this factor structure contained multiple cross-loading greater than .20 and at least one scale that was difficult to interpret. In addition, the scree plot indicated the extraction of anywhere from 5 to 7 factors might be appropriate. In an effort to respond to these issues, the final decision of how many factors to extract was made after comparing solutions extracting 7, 6, and 5 factors respectively.

The five-factor solution explained 52.51% of the common variance, it represented the most meaningful solution in terms of interpretable latent factors, and it was highly consistent with the original LTSI (Holton et al., 2000). The residual matrix was also examined for the five-factor solution and very low correlations existed, suggesting that the extraction of additional factors may not be appropriate. After using a cut off value of .30, along with deleting cross-loadings above .20, 22 items of the original 26 items were retained. These factors included transfer of effort-performance expectations, performance-outcomes expectations, resistance/openness to change, performance self-efficacy and feedback/performance coaching. The average loading on major factor was .61 with an average loading of .05 on the rest of the factors. Overall reliabilities were above the minimum level (.70) except for the resistance/openness to change factor which yielded an alpha of .53. Reliabilities ranged from .79 to .86, with an average alpha of .76, indicating that true factors did exist.

Summary of Factor Analysis Results

For both the training-specific and training-in-general analyses (a) factor loadings reflected interpretable simple structures; (b) only items with loading .40 or higher were included in the scales; and (c) average item loading values were greater than .50 on major factors and less than .15 on other factors for all scales. Except for the Openness to Change construct, all the ALTSI constructs showed acceptable levels of internal consistency as measured by Cronbach’s alpha for scales in the early stages of development (.79-.86). For the training-specific domain, 11 factors emerged, explaining 55.16% of the total variance. All items (except for one item) loaded on their respective factors as hypothesized by the original LTSI. Finally, using a cut off for factor loadings of .30, and deleting cross-loading above .20, 44 items were retained for the calculation of scale scores. For the training-in-general domain, five factors were extracted, explaining 52.51% of the variance. Twenty-two items were retained and were highly consistent with that of the original LTSI items.

Discussion

The original LTSI is well-grounded in previous research and theory and has exhibited fairly robust psychometric qualities. Previous research in the U.S. has established the construct validity (Holton et al., 2000), convergent/divergent validity (Bookter, 1999), and criterion-related validity of the instrument (Bates, 2001; Bates et al., 2000; Seyler, Holton, Bates, Burnett, & Carvalho, 1998). In addition, the LTSI has shown evidence of cross-cultural construct validity in both Thailand (Yamnill, 2001) and Taiwan (Chen, 2003). The results of the present factor analysis indicated that 16 latent factors (with 66 items) emerged from the Jordanian data collected with the ALTSI. These factors closely matched the factors found in the original LTSI. Results suggest that the Arabic version of the LTSI can provide reliable and internally consistent measurement for learning transfer system constructs in Jordan. These results are consistent with other cross-cultural instrument validation research done with the LTSI and suggest the constructs assessed by the LTSI may be robust across cultures.
This study proposes new areas for future research. First, the psychometric properties of several ALTSI scales could be improved. For example, there is a need to increase the number of items on several factors. Factors such as performance outcomes-negative, capacity for transfer, content validity, and performance outcomes-expectations had only three items while opportunity to use training had two items. Increasing the number of items on these scales to four or five would enhance their reliability. In addition, the reliability estimate for the openness to change scale was lower than desirable (.53). Several items on this scale may require revision in order to enhance scale reliability.

The second recommendation would be to add more factors to the ALTSI that may specifically pertain to the Jordanian culture. A qualitative effort that includes interviews and focus groups would be helpful in uncovering those factors. For instance, Jordanians are characterized as being a collectivistic society, then organizational commitment and job involvement might play a role in facilitating or hindering learning transfer. Therefore, factors specifically related to theses constructs could be developed.

At the third stage a confirmatory factor analysis (CFA) of the ALTSI would further establish the construct validity of the scales. CFA methodology is necessary to confirm that those items found to belong to a certain factor in the initial exploratory factor analysis actually exist. Once confirmed, the ALTSI can be explored with a different sample to ensure that the factor structure exists in the Jordanian culture. Path modeling and structural equation modeling are other techniques that could be used to demonstrate the predictive relationship and its direction among the ALTSI constructs in the Jordanian culture. These techniques could be used as a first step toward theory development. The fourth stage would be to establish the criterion validity of the ALTSI by establishing its ability to predict other important domains in the field of HRD such as organizational learning (Kaiser, 2000) and training participation (Bates, 2001).

The final stage would involve comparing the responses from the Jordanian culture with those from the American culture after employing invariance testing techniques. Invariance testing allows comparison of results across different sampling parameters to determine how similar or different the results are. This is an important technique in establishing the replicability of results for future research.

**Implications for the Field of HRD**

This research is important because it represents an important effort to disseminate and share HRD tools and expertise across geographic and cultural boundaries. This is critically important given the global nature of business today and the internationalization of the field of HRD. For example, creating an Arabic version of the LTSI will enable HRD practitioners in Jordan to investigate the factors that influence transfer and to more fully evaluate the effectiveness of training. It also has the potential to enable the comparison of transfer systems across geographic and cultural boundaries and to help us learn more about how learning and performance are linked and facilitated. Understanding this linkage may be even more critical in developing economies where effective learning-performance linkages are perhaps not as well understood or pursued but nevertheless have the potential to dramatically improve individual performance and organizational competitiveness. Certainly the study of learning transfer can draw attention to the importance of transfer in the viability of organizations and the economy as a whole in Jordan and spur greater intent and effort in understanding training effectiveness. Moreover, knowing that many international and multinational organizations are expanding overseas, the local and international HRD functions, will gain deeper understanding of the transfer systems that exists in Arabic cultures, develop interventions to enhance learning transfer, and ultimately improve organizational performance.

On the other hand, HRD in the U.S. will have further proofs to the validity and reliability of the LTSI psychometric properties. The LTSI can be used to guide the efforts of the HRD function in enhancing training effectiveness and diagnose early problems with learning transfer. Such effort will have a great benefit to the organization as a whole by contributing to the bottom line results and further may provide further evidence to the credibility of the HRD function.

Validating Constructs of a U.S.-based Transfer Instrument in Taiwan

Hsin-Chih Chen
Elwood F. Holton III
Reid A. Bates
Louisiana State University

Learning Transfer System Inventory (LTSI) is the only research-based instrument of transfer learning in the U.S.A. to be used in diagnosing strengths and weaknesses of organizational transfer systems. This study validated the LTSI for use in Taiwan. The sample contained 583 responses collected from 20 different organizations. The results of exploratory common factor analyses showed that 15 factors were validated for use in Taiwan. Of the 15, fourteen were identical to the original LTSI.

Keywords: Learning Transfer, Instrument Development, Translation Issue

HRD is a relatively new profession but not a new concept in Taiwan. A review of the history of human resource development in Taiwan vividly illustrates that HRD has been embedded in the government’s human resource policy and linked to economic growth since 1953. The Taiwanese government has long perceived that developing highly competent human resources will lead to the nation’s economic growth (Kuo & McLean, 1999).

HRD has been instrumental in Taiwan’s economic miracle in Asia since the 1960s. Taiwan has been perceived as one of the four “little dragons” (i.e., the most rapidly industrialized countries) in East Asia, along with Hong Kong, Singapore, and Korea. Yuen (1994) asserted that Taiwan’s government has created technical training and vocational schools that have dramatically enhanced workers’ skills, knowledge and abilities. This factor has led Taiwan to be one of the most powerful economies in the world. According to the global competitiveness report of the World Economic Forum, published by the Center for International Development at Harvard University, Taiwan was ranked 3rd in economic growth, trailing only the U.S.A. and Finland (Cornelius, 2003). Although other factors such as government financial policies or market forces may influence Taiwan’s economic growth, the government policies that highly value human capital point out the contribution of HRD to Taiwan’s economic growth. Indeed, in a country with limited natural resources such as Taiwan, human capital is a more vital concept than in countries with fruitful natural resources such as the United States or China.

Due to the new era of globalization, organizations in Taiwan have been facing more rigorous competition than ever in recent years. As a result, HRD has received additional attention in both the public and private sectors. In the public sector, Taiwan’s government has embedded the concept of HRD into the government transformation process. Several recent government policies have reflected the intensive need for human development. One of the most dramatic government policies putting the human resource development concept into action has been the legislation called “Civil Servant Life-Long Learning Passport” (CSLLLP), which is approved by the Central Personnel Administration Department, Executive Yuan (CPA 200264 Act, 2001). The vision of the CSLLLP legislation is to build an integrated human resource system by promoting innovation, continual learning, and employee learning initiatives to effectively and efficiently increase civil service to citizens with an ultimate goal of creating a learning government.

In private sectors, training has been a prevalent concern for organization decision makers. A major industrial and business magazine, Common Wealth, conducted a nation-wide study to the top 1000 companies in Taiwan. The top two priorities of those companies were training and development and research and development. As many as 47.8% of the top 1000 organizations perceived that training and development was the highest priority they needed to address (Chuang, 1998).

Problem Statement and Research Question

The priority on training and increasing expenditures on training have warranted that organizations will, sooner or later, want to know if training has led to higher performance and has created better organizational results. However, a study conducted by Lin and Chiu (1997) found that training evaluation practices in Taiwan focus more on levels of reaction and learning than on those of transfer and organizational results. In addition, training is one way to develop human resources, while transfer is an approach to unleash human expertise. It seems clear that both

Copyright © 2004 Hsin-Chih Chen, Elwood F. Holton III, & Reid A. Bates
should be equally important to HRD in Taiwan. Nevertheless, the current HRD practices in Taiwan seem not to pay enough attention to transfer. In order to focus on transfer issues and to get greater results, researchers and practitioners in Taiwan need to assess work environment factors as well as training factors. Although some transfer research has been conducted in Taiwan, none of them focused on developing a generalizable, valid instrument of transfer for use in organizations. Measuring effectiveness of transfer interventions would not be warranted unless a valid instrument could be deployed. Therefore, developing a valid instrument of learning transfer is important because it will help organizations effectively and efficiently manage transfer interventions by diagnosing the strengths and weaknesses of their transfer systems. Without such an instrument, transfer interventions are difficult to compare and the results may vary from one study to another.

The LTSI is a theoretically-based, generalizable instrument to be used in diagnosing an organization’s strengths and weaknesses for learning transfer (Bookter, 1999). It was developed by Holton, Bates, and Ruona (2000) and is the only research-based transfer instrument available in the U.S.A. Therefore, the purpose of this study is to validate, through translation with qualitative, quantitative evaluations and feedback loops, the LTSI for use in Taiwan. The specific research question was “Are the LTSI’s 16 factors valid for use in Taiwan’s organizations?”

Literature Review

Transfer of Learning Overview

The review on transfer of learning in this study was not intended to be comprehensive. Rather, it is to offer fundamental concepts of transfer of learning for later discussions. The term transfer varies from one discipline to another. From the human resource development perspective, the terms “transfer,” “transfer of training,” “training transfer,” “learning transfer,” and “transfer of learning” are generally perceived as interchangeable terms. In general, transfer of training is defined as the extent to which trainees apply what they learned in training, such as knowledge, skills, behaviors, and attitudes, to their jobs.

Transfer of training generally consists of some common elements. These common elements are people, outcomes, applications, and contexts. People involved in transfer of training may include trainees, trainers, supervisors, peers, and subordinates (Broad & Newstrom, 1992; Facteau, Dobbins, Russell, Tadd, & Kudisch, 1995). The outcomes of transfer of training include cognitive, skill-based, and affective outcomes (Kraiger, Ford, & Salas, 1993). The application refers to the degree to which trainees are able to maintain or generalize learned skills to their jobs (Baldwin & Ford, 1988). Finally, the context relates to work environment, such as opportunity to transfer and resource availability (Ford et al., 1992).

Factors affecting transfer of training. Baldwin and Ford (1988) suggested that trainee characteristic, work environment, and transfer design factors could influence transfer. Other research investigating personality traits such as self-efficacy (Tracey et al., 2001) and job attitudes (Noe & Schmitt, 1986) are related to training motivation and transfer. Research focusing on investigating the effect of training design factors to transfer finds that transfer strategies such as relapse prevention (Wexley & Nemeroff, 1975) or matching training content to job utility (Bates et al., 1997) will influence transfer. And, research on work environment factors affecting transfer suggests that transfer climate (Rouiller & Goldstein, 1993) and opportunity to perform (Ford et al., 1992) influence transfer.

Managing transfer interventions. Based on a timeframe that transfer interventions could affect transfer of training, Broad and Newstrom (1992) suggested that transfer interventions or strategies could be applied before, during, and after training. The concepts of the before- and after-training interventions are similar to Tannbaum and Yukl’s (1992) pre-training and post-training interventions. Several studies have tried to establish the relationship of pre-training interventions to training outcomes (e.g., Facteau et al., 1995). Other studies focusing on the relationship between post-training interventions and transfer of training (e.g., Richman-Hirsch, 2001) investigated the relationships among post-training interventions, work environment, and transfer of training. The results indicated that the goal-setting post-training interventions could affect transfer outcomes. Still, some research examined a combination of pre-training and post-training interventions (Werner, O’Leary-Kelly, Baldwin, & Wexley, 1994). Finally, Holton and Baldwin (2000) provided a broader conceptual framework for managing learning transfer systems. The LTSI can be administered to incorporate this framework and help manage transfer interventions.

LTSI Development

A number of studies have been utilizing the LTSI in different settings. Because the focus of this study was to validate the LTSI in Taiwan, only literature that related to the LTSI development was reviewed. The LTSI development was based on Holton’s evaluation model (Holton, 1996; Holton et al., 2000). A summary of the LTSI development can be found in Table 1.

Methodology

Instrument

The LTSI was the instrument used in this study. This version of the LTSI has 89 items, which measure 16 constructs representing two construct domains: Training in Specific (63 items) and Training in General (23 items). Of the eight-nine items, sixty-eight was previously validated (Holton et al., 2000) while 23 were research items that designed to improve relatively low but acceptable reliabilities of five constructs. All of the items used a Likert-type scale ranging from 1 (strongly disagree) to 5 (strongly agree). The LTSI was translated into Mandarin language. Because the quality of translation will ensure the functional equivalence between the two versions of the LTSI, a forward-backward translation with subjective, objective, and pilot evaluations was used to create the Taiwan version of the LTSI (Chen, 2003).

Forward and backward translations. Two bilingual translators (one of whom was the first author) first separately translated the English version of the LTSI to Mandarin. Both translators received HRD graduate degrees. These two translators were attempting to retain the form and the meaning of the items as close to the original as possible, and they agreed to use common language in the translation. Upon completion of the translation, the two forward translators compared their translated instrument item by item to assess the consistency of the translation. Items with disagreement or errors were further discussed and revised until both translators reached a consensus. A first draft version of Taiwan’s LTSI (TLTSI) was then finalized, and this version of LTSI was labeled as the TLTSI-draft. A bilingual backward translator, who has never seen the LTSI before and had strong skills in both languages, then translated the TLTSI-draft back to English.

Subjective evaluation. The backward translation was then evaluated by one of the original LTSI authors by comparing the English version to the English back-translation of the TLTSI. The primary focus in this step was to make sure that the meanings of the LTSI items were equivalent in both English versions. Problematic items were sent back through the entire process: that is, they were re-translated and re-back-translated, and reviewed by the LTSI author. This process continued until no items exhibiting substantial differences could be found by the LTSI author.

Objective evaluation. According to Sperber et al. (1994), in most of the cross-cultural studies, the success of translation is based on the “translator’s satisfaction,” and relatively few have been done through an objective evaluation. As a check on the possible individual bias of the LTSI author, a quantitative approach of evaluation through an objective lens was also conducted in this study. The purpose of this evaluation was to test the quality of the transition by evaluating the two English versions, the original LTSI and the TLTSI-back.

Two measures, comparability of language and similarity of interpretability, were assessed. The former assesses the similarity of words, phrases, and sentences while the later assesses the similarity of an item’s meaning. An instrument using a 7-point Likert-type scales ranging from 1 (extremely comparable/similar) to 7 (Not at all comparable/similar) was developed for this step. The instrument was distributed to a group of HRD graduate students and experts. All of them were English monolingual raters. A total of eighteen individuals received the instrument and fifteen of responses were returned, thirteen of which were useable. A 3.0 criteria was set to determine the effect of the two measures (scores above 3.0 indicated potential problematic items.)

In terms of the comparability of language measure, the results showed that 15 items had mean values greater than 3.0, indicating that the wording was not comparable. However, on the similarity of interpretability measure, the results showed that only eight items had mean values greater than 3.0. The similarity of interpretability measure became the primary focus of the translation because it tackles equivalence of meaning and the Mandarin language forces some sentence forms that appear awkward to English readers when back translated. The eight items with mean values of similarity of interpretability measure greater than 3.0 was further examined. None of them has mean value grater than 4.0. A closer examination of these items suggested that problems with these items were due to differences between the two different languages and no further revision was made (see Discussion section for more information on language differences).

Pilot test. The TLTSI was sent to nine HRD practitioners in Taiwan to collect feedback on whether or not the instrument and its instruction were understandable, and the technical terms in the instrument were interpretable in Taiwan. The comments provided by these HRD practitioners indicated that the instrument seemed appropriate for use in Taiwan except for some concerns about the length and possible repetitive items in the instrument. However, the repetitive items were the research items intended to improve the reliability of some lower reliability scales. Therefore, all of the items were retained and the TLTSI was finalized.

Research Design, Population, Sample, and Implementation

This study was a non-experimental survey design. The target population was employees who attended training programs, either within or outside their organization, provided by trainers in Taiwan. Due to geographical, time, and
resource limitations, a combination of purposive and accidental sampling techniques was used. The sample was collected to be as heterogeneous as possible. The primary author attended international HRD conferences to solicit Taiwan’s HRD practitioners to participate this study. Thirteen HRD practitioners agreed to serve as instrument administrators and help distribute the instrument in their organizations. Each practitioner received an administration guide and 30 to 100 instruments. The number of instrument to be disseminated in an organization depended on the firm size, trainee accessibility, variety of training programs conducted and organizational type. Some instrument administrators who served in public training institutes were able to distribute instruments to participants from more than one organization. The data, through instrument administrators, were collected from trainees either immediately after the training or not later than two weeks after training. There were 712 instruments distributed and 583 responses collected from 20 different organizations for an 82% response rate. The organizations represented public sector (N=77, P=13.3%) and private sectors (N=267, P=46.3%), education institutes (N=59, P=10.2%), public-for-profit (N=63, P=10.9%), and non-profit (N=100, P=17.3%) organizations. These organizations included airline, army, civil service, computer technology, electronic, petroleum, restaurant, retail, shipbuilding, social work, stock investment, telecommunication, transportation, two insurance and five educational organizations.

Results and Findings

Exploratory factor analysis (EFA) was used in this study. Before the EFA was conducted, data was screened in various ways including tests for extreme values, response pattern, visual normality, and factorability. No serious violation was found. The overall Kaiser’s measure of sampling adequacy (MSA) was .932, which means the data was very appropriate for an exploratory factor analysis (EFA). Item to respondent ratios for all of the EFAs described later in this section ranged from 9.2:1 to 22.1:1, supporting factorability of this dataset. An EFA was first conducted using the 68 validated items (Holton, et al., 2000). Following the English language validation procedure, two separate exploratory analyses were run for the two construct domains. In each analysis, common factor analysis with an oblique rotation (Oblimin) was used. A criterion of eigenvalue greater than one was used to determine number of factors to extract. The result showed that 10 out of the 16 LTTSI factors were validated, and six were in need of further investigation (five for Training in Specific and one for Training in General). The six factors included two that did not emerge at all (Personal Capacity for Transfer and Performance Coaching), two that merged to a new factor (Perceived Content Validity and Transfer Design), one that had low reliability (Opportunity to Use Learning), and one that contained only two items (Supervisor Sanction).

Extended Analyses

Cross-cultural instrument validation such as was done in this study is not only involved in cultural issues, but also translation, implementation, and reliability issues. Each issue should be carefully examined before decisions are made about construct validity. Before concluding that the six factors were not valid in Taiwan, the authors decided to conduct additional analyses using the 23 research items (89 items in total) for two reasons. First, the TLTSI conducted in Taiwan included 68 validated items and 23 research items. The 23 research items were being tested to improve the scales with lower reliability in the original LTTSI. These factors included: Personal Outcomes-Positive (.69), Personal Capacity for Transfer (.68), Supervisor Sanction (.63), Opportunity to Use Learning (.70), and Performance Coaching (.70). Interestingly, four of the six factors, which have not been validated in Taiwan in the 68-item analysis, matched these low reliability factors in the English LTTSI. That raised suspicions that something other than cultural issues might be affecting the results. Second, this study was intended not only to validate the current LTTSI in Taiwan, but also to develop the most valid LTSI for use in Taiwan. Because this study was exploratory in nature, to make an instrument useful, it seemed dangerous to conclude that factors such as Personal Capacity for Transfer and Performance Coaching do not exist without careful further examination. Also, it made more sense to develop the best possible instrument for use in Taiwan, which meant examining the research items to see if the troublesome factors could be strengthened. If the troublesome factors remained problematic, then the conclusion that certain constructs do not exist in Taiwan could be made more confidently. On the other hand, if problem factors were strengthened or re-emerged when the research items were included, then it seems likely that the problems may have occurred due to other artifacts and not true cultural differences. This is especially true when one considers that five of the six problem factors had been identified as having some weakness in English also.

The procedures for the extended analysis were the same as ones conducted in the previous section except for having research item included. In the Training in Specific domain, sixty-three items were used. These items included 45 validated items and 18 research items. Although the ratio of respondents to items in this analysis dropped to 9.2:1, it was still an acceptable ratio for factor analysis (Hair et al., 1998). Kaiser’s measure of sampling adequacy in this analysis was .938. Using a .40 cutoff, quite interestingly, the result initially showed an 11-factor structure that was the same as the English version. These 11 factors explained 65 percent of total variance. However, one of the factors
had only two items with loading greater than .40 that was too weak to be considered as a factor, so it was dropped. A new factor emerged which merged items associated with the Transfer Design and Opportunity to Use Learning constructs in the original LTSI. The new factor was labeled Transferability and defined as the extent to which trainees perceive that training is designed to facilitate opportunity to apply what they learn to the job. In the Training in General domain, twenty-six items were used. These items included 23 validated items and three research items. The ratio of respondents to items in this analysis was 22.2:1. Kaiser’s measure of sampling adequacy in this analysis was .933. The results showed a five-factor structure and were consistent with the original LTSI factors. The five factors explained 61.4 percent of the total variance. Overall, reliabilities of the six problematic factors in the 68-item factor analysis all dramatically improved with exception of Opportunity to Use Learning and Transfer Design, which were blended as Transferability in Taiwan’s settings. This result can be found in Table 2.

| Table 2. Factors, Reliabilities, and Items Comparisons of the extended Analyses between the LTSI and the TLTSI |
|-------------------------------------------------|-------------------------------------------------|---|
| **Training in Specific** | **LTSI (11 factors)** | **TLTSI (10 factors)** | **Result** |
| **Validated items** | **Research items** | **Items** | **Items** |
| Learner Readiness | 1, 9, 10, 13 (.73) | 9, 10, 13 (.65) | Validated |
| Motivation to Transfer | 2, 3, 4, 5 (.83) | 2, 3, 4, 5 (.83) | Validated |
| Personal Outcome Positive | 6, 16, 17 (.69) | 7, 8, 15, 18, 22 | Validated |
| Personal Outcome Negative | 14, 21, 23, 24 (.76) | 14, 21, 23, 24 (.79) | Validated |
| Personal Capacity for Transfer | 19, 25, 26, 27 (.68) | 11, 12, 20 | Validated |
| Peer Support | 28, 29, 30, 31 (.83) | 28, 29, 30, 31 (.89) | Validated |

| Supervisor Sanction | 38, 44, 45 (.63) | 34, 35, 36, 41, 42, 46 | Validated |
| Perceived Content Validity | 47, 48, 49, 58, 59 (.84) | 47, 48, 49 (.84) | Validated |
| Transfer Design | 52, 53, 54, 55 (.85) | 53, 54, 55, 56, 57, 58, 59 (.92) | Future investigation |
| Opportunity to Use Learning | 56, 60, 61, 63 (.7) | 50, 51, 57, 62 | Validated as Transferability |
| **Transfer in General** | **LTSI (5 factors)** | **TLTSI (5 factors)** | **Items** |
| **Validated items** | **Research items** | **Items** | **Items** |
| Transfer Effort-Performance | 65, 66, 69, 71 (.81) | 65, 66, 69, 71 (.85) | Validated |
| Expectation | 64, 67, 68, 70, 72 (.83) | 67, 68, 70, 72, 79 (.80) | Validated |
| Performance-Outcome | 73, 74, 75, 76, 77, 78 (.85) | 73, 74, 75, 76, 77, 78 (.80) | Validated |
| Expectation | 82, 83, 84, 85 (.76) | 82, 83, 84, 85 (.86) | Validated |
| Openness to Change | 79, 86, 87, 89 (.7) | 80, 81, 88 | Validated |
| Performance Self-Efficacy | 80, 81, 86, 87, 88, 89 (.88) | Validated | |

Note. (*)=Reliability. A .40 cutoff criterion was used. Bold numbers represent reverse items.

Discussions

As the result showed, fifteen TLTSI factors are validated for use in Taiwan. The differences in the factor structures between Taiwan and the U.S.A. can be looked at from four perspectives: cultural, translation, instrument design, and implementation. From the cultural standpoint, the merger of the two factors could be due to cultural differences in that trainees in Taiwan perceive Transfer Design and Opportunity to Use Learning as one concept. The predominant training method in Taiwan is more lecture-oriented. Relatively few training courses are designed in ways to encourage participation and involvement. In this sense, the concept of Transfer Design in the U.S.A., which encourages participation and involvement, might not be perceived as a unique factor in Taiwan’s culture. Instead, trainees in Taiwan may perceive Transfer Design and Opportunity to Use Learning as a single construct of Transferability. Specifically, trainees in Taiwan may perceive training that they will have an opportunity to use as constituting a good transfer design.

Looking at the translation and instrument design perspectives together, the differences in the factor structures could also be due to either translation errors or the items associated with the lower reliability factors in the original LTSI. However, it is reasonable to think that both of the issues had been reduced somewhat in this study due to the fact subjective and objective evaluations of the translation were conducted. The pilot test with a group of Taiwanese individuals also helped ensure that the translation used common language in Taiwan so the instrument was more understandable. All of these efforts led to a reduction of translation errors and increased the functional equivalence between the instruments in two languages. With regard to instrument design, since the LTSI has strong psychometric qualities and had been validated in the U.S.A, the instrument design was believed to be strong. However, five of the factors that demonstrated problems had a reliability of .70 or lower in the English LTSI. Fortunately, this study was able to use the additional research items to help improve the reliability of the scales. The
results of the 89-item factor analysis show that reliability improved in all of the 5 factors except the Opportunity to Use Learning, which was not present in Taiwan.

From the implementation perspective, the data were collected either immediately after training or two weeks after training in this study. On the other hand, the data for the original LTSI was collected immediately after training only (Holton et al., 2000). The differences in implementation between these two studies could have influenced the factor structures. For example, respondents who returned the instruments immediately after training may have perceived Opportunity to Use Learning differently from those who returned the instrument two weeks after training. The first group of respondents would have reflected on the concept of Opportunity to Use Learning based on their perceptions of what they believed would happen in their work settings, while the latter respondents would have actually experienced whether or not they could apply the training to their jobs. Thus, it is possible that the concepts of Transfer Design and Opportunity to Use Learning may be indistinguishable to participants two weeks after training. In addition, their recall of course activities would be biased by their experience on the job. The author attempted to separate these two groups and to examine the factor structure for each group. Unfortunately, records were not kept of which surveys were returned after training so the analysis could not be completed. However, it is believed that enough were returned after training to possibly have altered the factor structure.

Like any research, this study is not without some limitations. This study began with an assumption that language would be fully translatable. Indeed, this assumption highlights the limitation of the forward-backward translation process. Since the two languages are so different, some translation dilemmas occurred. For example, there is no “tense” in Mandarin. People identify the time a task occurs either by the context of conversations or the modifier (e.g., time adverb) in a sentence. One alternative to eliminate these language limitations is to use the simultaneous instrument development approach. That is, researchers can first generate constructs of interests from both cultures. Once the constructs are identified and determined, researchers can then develop instruments for each language so that language limitations are eliminated. However, this approach also raises issues of cross-cultural comparability of results. In addition, the sampling techniques used limited its generalizability to the greatest extent.

This research also points to some possible revisions in the original LTSI. This study found that the five low reliability factors in the original LTSI are somewhat associated with the factors that did not emerge or continued to have reliability problems in the original LTSI. The same evidence can be found in Yamnill (2001). This implied that the 23 research items are well-developed items that would improve the reliability of the instrument, and further investigation of the 23 research items needs to be done in English to test this assumption. In addition, it is suggested that both the validated and research items be used for future validation of the LTSI in other language and settings so the factors that may exist would not be inappropriately eliminated.

Conclusions

Most of the cross-cultural research that translates instruments from one language to another has been based on direct translation methods (Kinzie & Manson, 1987) and many of the translation processes are completed based solely on a researcher’s satisfaction (Sperber et al., 1994). This study took a more rigorous translation process by using the forward-backward translation approach with subjective, objective, and pilot evaluations of the translation that goes beyond what many cross-cultural studies do and what most of the cross-cultural research in HRD has done (e.g., Lien et al., 2002). The rigorous translation process has enhanced the quality of this research endeavor and reduced the biases that likely would have occurred in the translation process.

The LTSI is basically validated in Taiwan because 14 out of 15 validated TLTSI factors are identical to the original LTSI. The 15 validated factors of the TLTSI are ready for use in Taiwan. In addition, the sample included in this study has increased the generalizability of the LTSI. The results of this study combined with previous results in Thailand (Yamnill, 2001) provide encouragement that the LTSI’s constructs will validate across cultures.

This study has provided an initial attempt to develop a valid, generalizable transfer instrument in Taiwan by validating the LTSI. Future research should focus on investigating additional factors, particularly in Taiwan’s literature and practice, which have not been included in the LTSI. Other directions include, for instance, attempting to confirm the factor structure by using confirmatory factor analysis with different samples or aiming at reducing the size of the instrument to keep it parsimonious while remaining factor structure.

Women’s Socio-economic Development in India: The Role of Non-governmental Organizations

Meena Razvi
Gene L. Roth
Northern Illinois University

Jacobs (2000) and McLean (2000) affirm the need to expand boundaries of HRD to include multiple topics in a variety of contexts. Non-governmental organizations (NGOs) provide possibilities and limitations for the socio-economic development of women in India. The roles of NGOs in serving the socio-economic needs of women provide a broader, non-traditional context for exploring HRD processes and services at a national level.

Keywords: NGOs, Gender, Economic Development

Mainstream HRD literature fails to critically explore how NGOs function within the complex nature of women’s socio-economic development in India. These entities seemingly have the potential to transform the poorest regions of India through economic, educational, and agricultural strategies (Jha & Kumar, 2000). This research explores the strengths, limitations, and possibilities of NGOs to serve the socio-economic needs of poor women in the complex cultural context of India.

India’s present socio-economic situation does not favor poor women. Socio-economic forces (patriarchy, labor, education, and government initiatives) greatly influence NGOs’ priorities for women’s development in India. Each variable affects the complex nature of human development. This paper examines the extent to which these four themes influence the priorities of NGOs, and their effectiveness towards women’s development in India.

A critique of NGOs illuminates their strengths, limitations, and possibilities for women’s development issues. A brief description of the origins of NGOs introduces a discussion of their strengths and challenges to determine the extent to which they support poor women’s socio-economic needs in India. Conflicting views about NGOs present an opportunity for discourse, reflection, and research. Finally, an exploration of recommendations for improvement of NGOs is presented to promote dialogue and action concerning social and economic empowerment of poor women in India.

Conceptual Framework

This study incorporates a literature review to explore the role of Indian NGOs in serving socio-economical needs of poor women. Utilizing a feminist framework, Bierema and Cseh (2003) conducted an analysis of 600 AHRD papers published between 1996-2000 and discovered a minimal six percent of topics that focused on diversity. Such a wide gap in inclusion of multiple frameworks indicates a need to explore non-traditional topics that can inform HRD. This article utilizes a conceptual framework of voluntarism, Gandhian philosophy of non-violent resistance, feminist theory, and HRD to investigate the role of NGOs in India. These disparate pluralities of theoretical and conceptual orientations can serve to expand the parameters of HRD scholars (Roth, 2003). Competing research perspectives and paradigms are healthy for the realm of HRD – they provide scholars access to fresh questions about HRD. The lead author of this article is a female of Indian decent with a strong interest in diversity, feminism, and international human development issues.

The boundaries of HRD scholarship become fuzzier as scholars around the globe search for common ground. Many Western authors focus on processes, systems, and people within organizations. Some Eastern scholars not only consider HRD within organizations, but they broaden HRD to include the political economy. A few authors go beyond workforce issues and encourage HRD scholars to consider the health and well-being of a nation’s people. For example, Pavlish (2002) noted the disparities between the poor countries of the Southern Hemisphere compared to those of the Northern Hemisphere as outlined by the World Health Organization. She urged HRD scholars and practitioners to connect the role of HRD to the disparities of health, education, and knowledge that afflict residents of impoverished communities. With a focus on improving the overall health of the world’s people, Pavlish suggested a human resource model for creating, crafting, collaborating, connecting and contributing knowledge to

construct humane and sustainable social communities. It is within this broad focus on knowledge capital and caring leadership that this research was inspired – an inquiry into the socio-economic conditions of women in poor sectors of India and how these factors influence NGO responses. This perspective is aligned with authors who stress strategies for workforce development that can serve a nation, and note the importance of aligning public and private systems for the betterment of people and organizations within social contexts (Jacobs & Hawley, 2003; Naquin, 2002; Holton & Naquin, 2002; Bates & Redmann, 2002).

Amartya Sen (1999) studied economic reforms in India and found that income enables other capacities, and argues that economic discrimination is a much “broader concept” and includes additional factors (p.108). Factors such as patriarchy, labor, education, and government initiatives emerged as the main underlying factors affecting the socio-economic status of poor women in India.

Culture permeates all aspects of life in India, so this research can contribute to the understanding of the complex nature of economic development. Each micro issue fits into a larger pattern of socio-economic relationships in the complex web of Indian society. Women in poor sectors of India suffer from gender and social discriminations that restrict their access to labor and education, while government initiatives struggle to provide sustainable socio-economic improvements for such marginalized populations. The notion of international HRD infers a world of interconnectedness. This study can inform HRD scholars and practitioners by extending existing literature and providing an understanding of an international perspective from a complex contextual location that should provide insights about leadership in Indian non-profit organizations.

Method

Multiple business and social studies databases were searched to explore the socio-economic status of marginalized women in India such as ABI Inform, ERIC, Wilson SelectPlus, Article First, PsycInfo, Social Sciences Abstracts, Social Services Abstracts, Sociological Abstracts, WorldCat, and Dissertation Abstracts. In addition, Journals and World Wide Web were utilized using a multiple search engine called Dogpile.com. Library books from national and international libraries were recalled on loan and scanned for recurring themes of Indian NGOs, women’s socio-economic status, and women’s development issues. Key descriptors and key words used were: NGOs, women, India, poverty, women’s socio-economic status, and women’s development issues. Searches were limited to India and women’s economic issues.

Origins of NGOs and Socio-economic Focus in India

The role of NGOs enables a broader exploration of a non-traditional context for exploring HRD processes and services at a national level. Although evidence of voluntarism in India dates back to 1500 BC, M.K. Gandhi is most noted for initiating a national effort of “institutionalized and individual or group voluntary actions, for the alleviation of suffering and social and economic development of the poor” (Rai & Tandon, 2000, p.4).

Many early voluntary organizations in India chose to follow either the Gandhian or religious ideology. The famine in Bihar during 1966 and the refugee problem in Bangladesh during 1971 influenced an increase of NGOs resulting in a new professional arena of opportunities for HRD (Rai & Tandon, 2000). Rai & Tandon argue that because human capital investment was not a major goal of many NGOs, economic development has not been adequate. Recently, many organizations in India have attempted to facilitate economic empowerment by providing access to micro-finance. Some organizations focus on policy issues at national levels by intervening on behalf of marginalized populations (Rai & Tandon).

Common NGO characteristics include: Private ownership and control, non-profit (or perhaps not-for-profit) status, legal status; principal function as people-centered development, and not financially self-reliant (Bhat, 2000). Initial conceptual frameworks for voluntary organizations in India were based on ideas of self-help and community service (S. Sen, 1999). In a collective society such as India, voluntary community service dates back to Vedic times. The absence of formal welfare programs prompted families and communities to work collaboratively during times of crisis. One famous voluntary organizer, Mahatma Gandhi, founded a national consciousness movement in India initiating a radical non-violent peace movement called satyagraha. Satyagraha originated from two Sanskrit words, sat (truth), and agraha (firmness) (M. K. Gandhi, 1983). Many Indian NGOs continue to be greatly influenced by this Gandhian philosophy (Mathiot, 1998).

The Gandhian ideology explains why many Indians dislike the Western term “NGO” preferring to use the original term “voluntary agencies” (p. 332). Eventually, community organizations became formalized. Choudhary (2000) defined voluntary organizations as “a group of persons who organise themselves on the basis of voluntary
membership with external and State Control, for the furtherance of some common interests of members” (p. 37). In the Indian context, the government became involved in voluntary groups during the 20th century.

During the 1950s and 1960s India’s government became conspicuously assertive in an attempt to assume the primary role of economic growth. Due to its inability to effectively implement this goal, the government requested NGO assistance with poverty eradication programs (Choudhary, 2000). Gradually as time and experience presented lessons learned, necessary changes became evident. During the 1980s the government focus shifted to socio-economic empowerment although minimal guidelines were provided (Choudhary). The Indian government had lofty economic goals, but did not possess the knowledge or expertise to implement this new ideology. NGOs were sought out as mechanisms to reach these economic goals. Debates continue regarding whether this was an effective tactical strategy.

Socio-economic needs of the Indian population influenced a change in conceptualization for NGOs. In the 1990s women were “discovered” as major participants in the economic arena and influenced NGO priorities (Mathiot, 1998, p. 97). A major sector of the Indian people suffers from dire economic conditions – thirty-six percent (320 million) of India’s population lives in poverty (M. Sen, 2000). Large-scale government programs failed to provide relief for small-scale needs. A recent response to this troubling situation has been the micro-economic strategies of NGOs (Bhat, 2000). A commonly held tenet of NGOs is that micro-finance can make tangible, positive steps toward alleviating poverty (M. Sen, 2000). The supporting logic of this tenet is that low-income women cannot afford to wait for macro developments to take effect – they need micro strategies for their basic survival needs and their pursuit of economic self-reliance. Initial foci of new NGOs appear to support this claim. Many new NGOs initiate their efforts with small relief projects that allow women to gain experience, knowledge, status, and adequate funding. These small successes empower women and serve as a precursor to larger initiatives.

Successful Strategies of NGOs

Improvements of the economic status of women through the actions of NGOs have been well documented: Direct financing became available through banks, financial organizations, donors, private corporations, government programs, and as a result of NGO training programs (Jain, 2000). However, provision of these examples of services are not without contextual barriers. Jha and Kumar (2000) conducted a study of an NGO in a rural region of Bihar. They noted that government officials were reluctant to assist, rely on, or otherwise cooperate with NGOs. NGOs commonly overcome these barriers because locality, diversity, flexibility, and autonomy are their main strengths (Ebrahim, 2001; Kumar, 2000; Madon & Sahay, 2002; Sooryamoorthy & Gangrade, 2001).

NGOs are diverse in their nature, size, missions, goals, and purposes resulting in manifold descriptions and definitions. Viswanath (1991) defines NGOs as “non-governmental, organized collectives with a purpose” (p. 4). Descriptions of NGOs include a number of themes, including indigenous, intermediaries, voluntary organizations, reformist, visionary, transformist, pragmatic, idealistic, participatory, change agent, alternatives, flexible, creative, democratic, and advocacy (Appell, 1996; Das, 2001; Ebrahim, 2001; Madon & Sahay, 2002; A.K. Sen, 1999; Sooryamoorthy & Gangrade, 2001; Viswanath, 1991). This diverse list of descriptions implies that NGOs can function within multiple organizational cultures and sustain autonomy. Whereas slow turning wheels of government bureaucracy can create gaps between policy formulation and implementation, NGOs can find ways to fill these niches (Das, 2001; Madon & Sahay, 2002; Sooryamoorthy & Gangrade, 2001; Viswanath, 1991). NGOs seek to respond quickly with context specific programs whilst government agencies falter, enabling most NGOs to work directly and closely with poor women. As such they possess a greater ability to understand women’s situational needs. Although these needs have always been prevalent in India, funding deficits have historically inhibited NGOs. Several contemporary funding organizations now favor gender equity which has greatly influenced NGO priorities (Mathiot, 1998). Handy, Kassam, & Ranade (2002) noted that most NGOs share a feminist perspective because many work towards women’s empowerment rather than short-term gains that do not transform society. Most NGOs understand and work to eliminate poverty by providing relevant programs and services. Some adopt higher-level missions and aim to raise awareness and empower women but this strategy is not common. Missions, visions, goals, organizational size, staffing, knowledge, expertise, and funding determine the choice of strategies.

One successful Indian NGO is the Self-employed Women’s Association (SEWA). SEWA is both an acronym and an Indian word meaning service (SEWA, 2001). SEWA’s innovative alternative ideas aim to empower women. Because larger Indian banks refused to service poor women with their minimal incomes, SEWA Bank was formed in response to poor women’s demands (Rose, 1992). In its 2001 annual report, SEWA listed two major goals: (1) To organize women for full employment at the household level, and (2) to help them achieve self-reliance. SEWA’s “integrated approach” provides a range of benefits such as banking, credit, savings, and social security services (p. 8). SEWA has received both national and international recognition because of its efforts to assist socio-economic

4-2
development of poor women in India. Poor women with access to credit and savings programs now possess the capacity to increase their income through micro loans that expand their businesses and profits.

Gram-Vikas is a mixed NGO working with both genders. Viswanath (1991) conducted a study of Gram Vikas and another NGO called India Development Service (IDS) to determine their effectiveness in serving the needs of women. Viswanath’s study compared the extent to which each NGO provided sustainable economic gains. Gram Vikas’ strategies were more focused on short-term gains whilst IDS’ strategies were long-term. Although Viswanath recommended that NGOs should adopt the Gram Vikas model, it must be realized that ignorance of long-term needs hinders sustainability and empowerment, and encourages dependency. Education is one approach for sustainability. Lack of education hinders poor women from realizing their rights, and inhibits access to available resources. Some NGOs offer basic literacy education and formal training programs while others provide knowledge and expertise responding to client needs. Whether acting as relief workers, intermediaries, advocates, or change agents, many NGOs offer some form of formal or informal education to their clients. Improved efforts could increase access to education for poor sectors. However, NGOs work within governmental restrictions – some NGOs may be hesitant to delve into national responsibilities such as the provision of education.

NGO conflicts with the Indian government may have resulted from unfamiliarity regarding the different models used by these different parties. The government has adopted western models of development, whilst most NGOs operate within Indian concepts of self-sufficiency, community, and spiritual growth (Mathiot, 1998). NGOs understand that women’s status is a function of socio-cultural discriminations and inept governmental agencies (Mathiot). Working within these two different paradigms can frustrate NGOs, governments, and their clients. NGOs have been known to empathize with client frustrations of government bureaucracy and gain women’s trust by working within the cultural contexts while simultaneously pressuring for legal change when opportunities arise. Because NGOs often criticize the state, the government sometimes retaliates with control over NGOs (S. Sen, 1999). Such a love-hate relationship with the government is an interesting aspect of government-NGO relationships. As most NGOs are locally based within their clients’ contexts, they possess the capacity to maneuver between local needs and government restrictions. NGOs understand the roots of oppression and how local contexts marginalize and exploit women. For example, NGO workers do not criticize religions but become frustrated with “their distortions and abuse” (Mathiot, p. 32).

Most NGOs function with an understanding that social discrimination creates economic instability of poor women. Unlike governmental departments, most NGO workers within the women’s development field are females and reside close to their clients’ geographical locations. These workers speak local languages and understand regional differences. This expertise provides NGOs with an important leverage over governmental programs that are more generic. Workers of NGOs observe, hear, and respond to first hand evidence of the women’s status. Likewise, poor women reach out to NGOs as a source of hope and support knowing they will be heard with respect. Because most poor women request economic assistance, this also influences NGO responses. NGOs can choose to focus on micro, macro or a combination of issues, all of which are essential for women’s socio-economic development. Immediate needs can be satisfied as well as planning for long-term sustainability via training and development while lobbying for change at macro levels of government.

A main disadvantage of Indian governmental agencies is that they are staffed by males; many of whom with patriarchal attitudes. Males are the major decision makers of policies and programs and the main gatekeepers of women’s development in India. Governmental efforts of poverty alleviation are frequently unsuccessful, and a major reason might be the lack of understanding of needs of poor women by bureaucratic men.

A collective look at the factors that influence the success of NGOs in serving the needs of poor women in India would include: Alternative approaches, innovative methods, a focus on women’s issues, committed leadership, motivated staff and volunteers, faster response rates than government, flexibility, access to national and international funds, context specific programs and services, local offices, and innovative strategies.

The Challenges Confronting NGOs

The very factors that allow NGOs to attain success in serving the needs of poor women – diversity and autonomy – may also be their weaknesses. Sooryamoorthy & Gangrade (2001) observed that although NGOs are initially “highly democratic”, as they expand and develop they often drift away from democratic practices (p.152). Sooryamoorthy & Gangrade also noted that institutionalization commonly has detrimental influences on democracy and a spiritual outlook within NGOs. Formal layers of organizational structure can prevent field workers from accessing top leadership (Sooryamoorthy & Gangrade). The proliferation of NGOs in India is no guarantee that they can effectively advocate women’s issues or serve the needs of poor women. Not all NGOs succeed regardless of their size or mission. Inexperienced staff, insufficient funds, lack of committed leadership, government bureaucracy,
Empowerment in India. In due course, most NGOs retreat from each area leaving poor women to fend for ineptitude. NGOs and the Indian government each play important roles in initiating and enhancing women’s participation in development. Despite optimistic possibilities for the future of NGOs, they are not immune to the effects of bureaucratic ineptitude. NGOs to achieve empowerment. (Ebrahim, 2001; P. J. Gandhi, 2000).

Future Directions for NGOs

Recommendations for future priorities of NGOs vary among authors. Some scholars note the need for motivated leadership (Appell, 1996; Mohan, 1973; Viswanath, 1991). Often, strong leadership of NGOs is not sustained when founding leaders retire, or leave the organization without succession plans and strategies solely needed to enable smooth leadership transitions. Some organizations grow too large, lose sight of their democratic goals, and traditions dissipate through growth and affects of time, resulting in a loss of touch with client needs. Rapid growth within an NGO can alter advantages of faster response rates, flexibility, and innovation.

Collaboration among NGOs is a common practice in India. (Manzo, 2000; S. Sen, 1999; Yadama, 1997). Yadama described several advantages of collaboration among NGOs: Increasing the effectiveness of smaller NGOs, helping local NGOs to implement regional level programs, building credibility and trust, facilitating effective sharing of technology and information, increasing the power to deal with government bureaucrats, accessing markets for women, and enhancing effective evaluation by local and national funding organizations. However, contrasting views can be found in the literature regarding the benefits of collaborative work among NGOs.

Consensus differs regarding partnerships and growth of NGOs. Brinkerhoff (2003) noted that some partnerships could be counterproductive. Differing ideologies and missions along with conflicts of power and leadership may cripple joint ventures. Das (2001) suggested that NGOs could initiate pilot projects for new schemes. The smaller NGO can take advantage of its flexibility and rapid reaction time to implement such new ideas. To retain this advantage, Das recommended that NGOs could network and share data of valuable expertise. This may be a good solution for those NGOs that prefer to remain small and autonomous. Regardless of which method is used, it is imperative that NGOs remain focused on client needs. NGOs can achieve better success ratios by involving all stakeholders in decision-making and leadership – not just the privileged few at the higher levels of the organization. Micro-strategies are crucial for improvement of the immediate well-being of poor women and must be continued. Macro-strategies are critical for long-term sustainability in the absence of NGOs or other intermediaries. Elimination of one strategy may result in severe neglect of poor women who are often voiceless in the power structures of India. A balanced approach that utilizes both micro and macro-strategies should be considered. Leadership must continually focus on sustainable development that will release poor women from addiction to NGOs to achieve empowerment. (Ebrahim, 2001; P. J. Gandhi, 2000).

Critics argue that patriarchal attitudes infiltrate NGOs and they cite examples of women workers perpetuating the status quo (Carr, Chen, & Jhabvala, 1996; Mathiot, 1998). Many women centered NGOs do not question gender biases in the home. Although India has deep Vedic roots of equity, many Indians have lost sight of this important piece of their history. Additional research on the processes, strategies, and organizational dynamics of NGOs could serve to embellish the practices of NGOs (Manimekalai, 2000; Manzo, 2000; Prasad & Madaan, 2000).

Despite optimistic possibilities for the future of NGOs, they are not immune to the effects of bureaucratic ineptitude. NGOs and the Indian government each play important roles in initiating and enhancing women’s empowerment in India. In due course, most NGOs retreat from each area leaving poor women to fend for themselves until the next aid program comes along. Sustainable development can help women avoid this cycle of dependency and empower them to make their own decisions plus secure their own resources. Therefore, the most important role of NGOs is to act as important links to available resources by bridging the gap between government officials, institutions, aid agencies, and women. NGOs should incorporate empowerment training and development that can assist women in determining strategies to solve their own problems of patriarchy, labor, education, and government access.

Conclusions and Implications for HRD

Diverse cultural and geographical influences produce complex economic participation of women at work (United Nations, 1997). Sentiments regarding women’s economic status vary because of differing conceptual frameworks and insufficient empirical evidence. Understanding how complex factors affect the global workforce and how
leadership works in various contexts can provide important insights to HRD theorists and practitioners. Multinational corporations and business expatriates conducting business in India need to understand regional work practices in various contexts within India (Templer, 2002). India is a vast continent with many states so it is not within the scope of this study to cover all states. The state of Gujarat has been chosen as the focus of this research because the lead author is an Indian female familiar with the Gujarati culture and language.

NGOs must incorporate women-centered strategies in India to benefit disenfranchised poor sectors. Although the Indian government has recognized the effectiveness of women-centered NGOs, Mathiot cautioned practitioners about the “dangers of cooptation” (p.100). Viswanath (1991) recommended that newer NGOs should plan a gradual and cautious approach of development commencing with small local programs leading to a focus on larger issues and extended geographical regions.

The need for contextual common understandings is a frequent refrain in management literature. Viewing organizations through various cultural lenses has been popular since the 1980s (Hofstede, 1991). Hofstede described it as “the psychological assets of an organization” (p.18). Schein (1992) declared that “ultimately, all organizations’ are sociotechnical systems in which the manner of external adaptation and the solution of internal integration problems are interdependent” (p. 68). An NGO’s capacity to focus beyond “reductionist psychological theories of poverty and development” is its primary asset (Mathiot, 1998, p.96). In practice, however, many NGOs may be undermining their potential impacts by perpetuating patriarchal attitudes.

The proliferation of NGOs in India is no guarantee that they advocate women’s issues or succeed in their efforts. Over 95% of the female Indian workforce still labor in unstable informal sectors without benefits or employment security (Mishra, 1998). The Indian government has made slow progress between 1947-1990s by focusing its five-year plans from early issues of welfare and development to current issues of empowerment (Mishra).

One remedial possibility is motivated leadership (Appell, 1996; Mohan, 1973; Viswanath, 1991) vital for NGO success because it reflects the culture and ideologies of the organization. Viswanath (1991) noted the importance of fostering leadership capacity within clients in addition to organizational staff. Fostering “a collective spirit” involves sacrificing personal benefits (p. 165) and deliberately initiating and implementing this goal. Other authors (Manimekalai, 2000; Manzo, 2000; Prasad & Madan, 2000) recommended research to aid deeper understanding of NGO functions and impacts. Critics disagree about the ideal missions and roles of NGOs. Despite recommendations, NGOs cannot be substitutes for ineffective governmental efforts. Each party is dependent upon the other to initiate and enhance women’s empowerment in India. Interfaces between the public and private organizations are poor (Mishra, 1998). NGOs can aid socio-economic and human capital development by acting as intermediaries on behalf of poor women in India.

Women in Information Technology

Rose Mary Wentling
Steven P. Thomas
University of Illinois at Urbana-Champaign

There is a major concern about the drop of young women entering Computer Science degree programs and a drop in the participation of women in these information technology occupations. In all levels of educational institutions across the nation, girls and women remain under-represented in computer and information science studies and subsequently, the technological workforce. Serious consequences occur not only to women’s overall potential, which is not fully realized, but also to the world’s economy. This literature review focuses on women in information technology by addressing the shortage of women in information technology (IT), the theoretical perspectives of women in IT, barriers to women in IT, and strategies for recruiting and retaining women in the IT workforce.

Keywords: Women, Information Technology, Workforce

The U.S. Department of Commerce projects that by 2006, not only will 50 percent of all U.S. workers be women, but also 44 percent of the U.S. workforce will be employed by industries that are engaged in producing or using information technology products and services (Newton, 2001). Information technology accounted for more than a third of the nation’s real economic growth from 1995 to 1997 (U.S. Department of Commerce, 1999). The U.S. Bureau of Labor Statistics reports that approximately 137,800 new jobs in information technology (IT) occupations have been and will be produced each year from 1996 to 2006 (U.S. Department of Commerce, 1999). In addition, these occupations are experiencing a significant labor market shortage, while at the same time not attracting female participants at the same rate as in earlier decades (Camp, 1997). Female participation in the IT occupations has varied up to a high of approximately 35% in the early 1990s. From 1990 to 1999 the number of people in IT occupations have more than doubled and the female participation has dropped to approximately 27% (Information Technology Forum, 1999). This decline in female participation has caused concern, not only because of the low participation of women in IT occupations, but because there is a significant labor shortage in those occupations and the drop in participation of women further exacerbates the labor shortage (Freeman & Aspray, 1999; Information Technology Forum, 1999).

Information technology-related occupations include many different types of jobs – from data entry and computer operators to systems analysts to computer scientists. There is no generic IT job or IT worker. In the broadest sense, one could dispute that as the economy becomes more digitized, most of our jobs will involve the manufacture, operation, or use of equipment containing a computer chip; hence, all jobs will be IT jobs (Cooke, 2000). However, according to the U.S. Bureau of Labor Statistics (2003) the “core” IT occupations include: computer scientists, computer engineers, systems analysts and computer programmers. Workers in IT occupations design, manufacture, operate, repair, and maintain the IT infrastructure. The job options in the information technology field can be numerous and can lead to different levels of career growth.

Although women currently represent 47% of the total workforce, they comprise only 20% of the technology sector workforce (Catalyst, 2000; U.S Bureau of Labor Statistics, 2003). At present women make up 30% of computer scientists, 32% of computer analysts, 25% of computer programmers, 10% of IT directors, and 18% of IT project leaders (U.S. Bureau of Labor Statistics, 2003). Women have entered the labor market in increasing numbers during the last few decades. Despite impressive gains in employment, women are still under-represented in the IT field. The world of IT is still dominated by men, and the imbalance becomes more striking at the higher rungs of the corporate ladder (Catalyst, 2000). Obstacles and gender differences have created a gender gap that is responsible for the narrowing pipeline of women in IT careers. The shortage of women in IT fields has made it more difficult for them to obtain management positions (Leever, Dunigan, & Turner, 2002). Women hold only 8.1% of executive positions (VP and higher) at major technology companies. One of the reasons for the scarcity of women executives at technology firms is simply that there are fewer women in the technology-management pipeline (Catalyst, 2000).

Recently there has emerged a concern about the drop of young women entering Computer Science degree programs and a drop in the participation of women in these occupations (Camp, 1997). In all levels of educational institutions across the nation, girls and women remain under-represented in computer and information science.
studies and subsequently, the technological workforce (Balcita, Carver, Soffa, 2002). There are serious problems in attracting girls to engineering and computer-related fields and keeping them in the IT employment pipeline (Farmer, 1997). A limited number of studies and observations have been done to determine the cause of why women are deterred from continuing in the computer science pipeline (Farmer, 1997; Margolis & Fisher, 2002; Roberts, Kassianidou, & Irani, 2002). The American Association of University Women (1992) reported that even girls with high aptitude for math and science are less likely to pursue studies in science and technology than their male counterparts. Most women drop out of the engineering/computing pipeline when choosing an undergraduate degree. A 1995 report from the Office of Technology Assessment showed that out of a group of 2,000 students, 280 males and 220 females would have completed the necessary math and science courses to pursue a degree in computer science after high school. However, only 16% of the qualified females chose a degree in computer science, while 50% of the qualified males selected a career in computer science (Levenson & Klawe, 1995). Since the number of women at the bachelor’s level affects the number of women at levels higher in the pipeline and in the job market, these facts are of great concern (Camp, 1997).

This literature review brings about a better understanding of women in information technology by focusing on the shortage of women in information technology (IT), the theoretical perspectives of women in IT, barriers to women in IT, and strategies for recruiting and retaining women in the IT workforce.

The Shortage of Women in Information Technology

The sweep of digital technologies and the transformation to a knowledge-based economy have created robust demand for workers highly skilled in the use of information technology. In the past ten years alone, employment in the U.S. computer and software industries has almost tripled. The demand for workers who can create, apply and use information technology goes beyond these industries, cutting across manufacturing and services, transportation, health care, education and government (Office of Technology Policy, 1997). Having led the world into the Information Age, there is substantial evidence that the United States is having trouble keeping up with the demand for new information technology workers (Office of Technology Policy, 1997). A recent survey of mid- and large-size U.S. companies by the Information Technology Association of America (ITAA) (2003) concluded that there are about 190,000 unfulfilled IT jobs in the United States today due to a shortage of qualified workers. In another study conducted by Coopers and Lybrand (1996), nearly half the CEOs of America’s fastest growing companies reported that they had inadequate numbers of information technology workers to staff their operations.

Evidence suggests that job growth in IT fields now exceeds the production of talent. Between 1994 and 2005, more than a million new computer scientists and engineers, systems analysts, and computer programmers will be required in the United States—an average of 95,000 per year (Office of Technology Policy, 1997). Serious consequences occur not only to women’s overall potential, which is not fully realized, but also to the world’s economy that might have been shaped differently with more involvement from women in the area of technology. The consequences for the U.S. economy are significant (Halweg, 2002). The shortage of technology workers may cost as much as four billion dollars per year in lost production for the United States (Valuing Diversity, 2002). “If we continue to utilize the talents of American women—virtually half the population—at the level we are now, we will not have the workers we need in this country” (n.p.), says Arthur Bienenstock, associate director of science in the White House Office of Science and Technology Policy (Gaudin, 1999).

Unprecedented opportunity exists for IT professionals around the world; the field is experiencing a skills crisis that stems from the shortage of qualified IT professionals. This skills crisis is due, in part, to the fact that certain segments of the population are under-represented in IT. Among those under-represented are women. Despite significant growth in the IT profession in recent years, there remains a gender imbalance. The pipeline shrinkage problem for women in computer science is a well known and documented phenomenon where the ratio of women to men involved in computing shrinks dramatically from early student years to working years (Bryant & Irwin, 2001; Camp, Miller, & Davies, 1999; Camp, 2001; Camp, 2002; Davies & Camp, 2000; Freeman & Aspray, 1999; National Science Foundation, 2001; Thom, 2001). According to the Department of Commerce, only 1.1 percent of undergraduate women choose IT-related disciplines as compared to 3.3 percent of male undergraduates (Freeman & Aspray, 1999).

One of the most obvious patterns is that the percentage of women entering the computer science pipeline and earning the bachelor’s degree in these IT fields has been dropping steadily since 1984. While the number of computer and information science degrees awarded decreased every year between 1986 and 1994, the decrease is occurring at a faster rate proportionately for women (Freeman & Aspray, 1999). This is in contrast to general trends in the graduation figures of U.S. colleges and universities during these same years, when the percentage of bachelor’s degree recipients who were women increased from 50.8 percent to 54.6 percent. It is also in contrast to...
the trends in scientific and engineering disciplines generally. The decrease in bachelor’s degrees awarded to women has also affected the number of women in the graduate degree pipeline, contributing to the decrease in women completing a master’s degree in the computer and information sciences area. The percentages at the doctoral level have stayed somewhat flat, with a reduction in the number of U.S. women apparently offset by an increase in the number of female foreign students entering the system at the graduate level (Freeman & Aspray, 1999).

Research on the career development of women managers in general has referred to the existence of a “glass ceiling” or invisible barrier, which restricts advancement of women to top executive positions (Igbaria & Wormley, 1992). According to the federal government Glass Ceiling Commission (1995), whose mission is to identify barriers to the employment and advancement of women and minorities and encourage companies to build a diverse workforce, fewer than 5% of women are in senior-level management positions. The literature indicates that such a barrier also exists in the IT field (Camp, 1997; Laberis, 1992). If women do decide to pursue management positions in the IT workforce, a glass ceiling exists and they do not have an equal chance to reach these management positions (Leever, Dunigan, & Turner, 2002). Several authors have suggested that proportional presence of women in higher ranks where decision-making takes place will go a long way toward making the workplace conducive to women’s needs, however, women in IT fields are concentrated at the lower and middle levels and are under-represented at the higher levels (Camp, 1997). As of 1997, only 2% of women in IT reached the executive status (Igbaria, 1997).

In one of very few research studies that have focused on women in IT careers, Truman and Baroudi (1994) concluded that the IT field may not be immune to the problems of gender discrimination. They found that women received lower salaries than men even when job level, age, education, and work experience were controlled. They also observed that there were a disproportionately high number of men in the managerial ranks. Furthermore, Igbaria and Baroudi (1995) investigated the impact of gender on job performance evaluations, job performance attributions and career advancement prospects. Although they did not find any significant differences in job performance ratings, they did find that women are perceived to have less favorable chances for promotion than men. Igbaria and Baroudi (1995) request for further research in this area and stated: “future research should explore the potential barriers to promotability among women who have aspirations to IT upper management and executive careers. We need to look at the reasons for the existence of the barriers and possible ways to overcome them” (p. 117).

The increased shortage of women in IT is not confined within the borders of the United States. Other studies, including work by the Stanford Computer Industry Project, document that there is a worldwide shortage of IT workers (Office of Technology Policy, 1997). Recent international studies indicate that in the next four years, women will continue to be massively under-represented in the networking field, despite a major shortage of skilled engineers in Europe that threatens to hamper the industry (Freeman & Aspray, 1999; Mayfield, 2002). At the end of 2001, only 5.6 percent of engineers in Western Europe were female and that number is projected to increase to 7.3 percent by 2004, reaching almost 94,000, and that is only a fraction of the number of people working in the industry, according to a report by International Data Corporation (IDC) for Cisco Systems (CSCO). By the end of 2002, there was a shortfall of approximately 80,000 skilled IT staff, according to IDC. Industries in other countries are facing similar problems, exacerbating the U.S. problem, since the geographic location of such workers is of decreasing importance to the conduct of the work (Office of Technology Policy, 1997). U.S. employers will face tough competition from employers around the world in a tight global IT labor pool. Thus, the United States cannot expect to meet its long-term needs through increased immigration or foreign outsourcing. Instead, the U.S. must rely on retaining and updating the skills of today’s IT workers as well as educating and training new ones. More than ever before, women have a critical place in replenishing the shortage of IT workers.

**Theoretical Perspectives of Women in Information Technology**

According to the National Science Foundation, there is agreement among researchers and scientists that systematic research efforts are needed to address the gender imbalance and under representation of women in IT (National Science Foundation, 2001). There is a documented need to study the gender imbalance in this field, this topic is both under-studied and under-theorized (Trauth, 2002). It is under-studied in so far as there have been minimal published papers in top IT journals on this topic. It is under-theorized in two ways. First, gender is seldom considered a relevant factor in socio-technical studies of IT in context (Wajcman, 2000). Second, gender and IT is under-theorized in so far as most of the published work focuses on data analysis rather than theoretical implications that relate to the existing body of gender, and gender and IT literature (Adam, Howcroft, & Richardson, 2001).

There are two dominant theoretical perspectives that are used to explain the engagement of women in information technology – essentialism and social construction. They offer insights on the issue of the under representation of women in the IT profession. Two dominant viewpoints are reflected in recent literature about
gender and IT. From these perspectives we can develop explanations regarding the participation of women in the IT profession. The essentialist perspective focuses on the presumption of inherent differences between women and men to explain the perception of IT as a male domain. The social construction perspective focuses on the social construction of IT as a male domain, which is interpreted as problematic with respect to the social construction of female identity.

The Essentialist Perspective

Essentialism is the assertion of fixed, unified and opposed female and male natures (Wajcman, 2000). When applied to the IT realm, this viewpoint focuses on inherent differences between men and women to explain the differences in their relationships to IT (and, by inference, the participation of women in the IT profession). In doing so, it reflects an essentialist perspective that observed differences in men and women’s behavior are attributable to inherent, group-level differences that are based upon bio-psychological characteristics (Trauth, 2002). The essentialist perspective has spawned research that views gender as a fixed variable that can be manipulated within a positivist epistemology. An example from the recent IT literature is the work of Venkatesh and Morris (2000) and Venkatesh, Morris, and Ackerman (2000). This research includes gender as a variable in the application of the technology acceptance model (TAM) to understand differences in individual adoption and sustained usage of technology in the workplace. Their findings lead them to suggest that men, as a group, make decisions about using technology based upon different criteria than women, as a group. They conclude that men are influenced by the usefulness of the IT whereas women are influenced by social factors.

Several researchers have employed the psychological literature on gender to guide their interpretations of the empirical data on the adoption and use of IT by the women in their studies (Adam et al., 2001; Tashakkori, 1993; Venkatesh & Morris, 2000; Williams & Best, 1990). Venkatesh and Morris (2000) drew upon a statewide attitudinal survey of California high school students conducted in 1982-1983, to support their conclusion that “women typically display lower computer aptitude…than men” (p. 119). Adam et al. (2001) provided an analysis of this perspective in their critique of research on gender and IT. They noted the perils of ignoring existing gender and technology literature, particularly recent literature in this area. They went on to argue that, “focusing on a background literature of psychology places too much emphasis on individual gender characteristics where a form of ‘essentialism’ may creep in.” They believe that it looks only to psychological explanations of observations without giving attention to the influence of context. They point out that this perspective adopts a determinist stance with respect to gender.

The Social Construction Perspective

An alternative explanation for women’s relationship to information technology (and, by inference, their participation in the IT profession) can be found in societal rather than biological forces. The literatures of gender and technology in general (for example, Cockburn, 1983; Cockburn & Ormrod, 1993; Wajcman, 2000), and that of gender and information technology, in particular (for example, Adam et al., 2001; Balka & Smith, 2000; Spender, 1995; Star, 1995; Webster, 1996) look to social construction theory (Berger & Luckmann, 1966) rather than biological and psychological theories. According to this view, the social shaping of information technology as masculine interacts with the social construction of femininity in such a way as to place IT outside the domain of women. The inference that can be drawn from this perspective about addressing the level of female participation in the IT profession is that the explanation lies in the social construction of the IT profession as “men’s work” (Trauth, 2002, p. 101).

Von Hellens et al. (2001) focused on women who address their “odd girl out” status by developing coping strategies in their attempt to fit into this male domain. However, another school of thought within the social constructivist perspective focuses on the need to reconstruct the world of computing to become more of a “female domain.” Webster (1996) is representative of this approach. Her focus is on the social shaping of female gender identity and the implication for women’s relationship to workplace technologies. At the heart of the issue, she believes, exist structural inequalities between men and women in work and in their relationships to technology. Spender (1995) analyzed the role of women as a social group in cyberspace with the goal of increasing the number of women who employ the Internet. Her argument was that what will follow from increased female presence will be the influx of female values into this new virtual world. She concluded that the same would happen as more women enter the IT profession.

While the timing for increasing women’s participation in information technology fields appears propitious, current literature indicates that the supply of women in IT is alarmingly low. Although there are theories as to why women are under-represented in IT, there are no definitive answers to the problem. Women have made significant strides in several fields—notably in the natural science, however, their participation in engineering, mathematics, and information technology remains persistently low (Fountain, 2000). Based on the unanticipated and strong
societal impact women have had on other disciplines, it seems reasonable to hypothesize that stronger representation of women in IT will have deep influence on technology outcomes and processes (Fountain, 2000).

Barriers to Women in Information Technology

Under-representation of women in the IT workforce cannot be isolated to a single factor or barrier. Factors such as gender bias, lack of role models and mentors, perceptions, stereotyping, difficulty with work/life balance, and lack of corporate commitment all contribute to the under-representation of women in IT (Carver, 2000). These barriers are briefly described below.

Gender bias exists in the workplace for many women who are pursuing careers in IT. A male is more likely to be chosen for a position in a company when competing against an equally qualified female (Panteli, Stack, & Ramsay, 1999). Once in the workforce, many qualified women are assigned to menial tasks such as checking monitors and information retrieval, while men are left to perform the more choice and challenging assignments. Many women in IT also report that they have supervisors assigned to check their work, but men performing similar tasks are left alone to their own discretion. Harassment is also prevalent as women are still often viewed as inferior to men. In 1996, there were more than 15,000 gender bias or harassment suits throughout workplaces across the United States (Leever, Dunigan, & Turner, 2002).

Under-representation of women in IT leads to the inevitable “vicious cycle” or fewer professional role models and mentors for those who wish to enter the IT profession. Therefore, women may tend to view the IT profession as lonely and isolated or may find assimilation into mainstream networks of companies difficult due, in part, to a lack of common interests or a sense of just not belonging (ITAA, 2003). Frequently when women in IT look for support and mentoring through role models and social networks, they come up empty handed. Without the encouragement and guidance of role models and mentors, women in IT are left searching for support and are at a disadvantage (Balcita, Carver, & Soffa, 2002).

Much of the research on recruiting women into IT suggests that perception of the field of IT as unappealing (American Association of University Women (AAUW), 2000; Camp, 2001; Margolis & Fisher, 2002; Halweg, 2002). In a study conducted by the AAUW (2000), girls and young women reported technology-related careers unappealing because they were associated with jobs that were solitary, passive, and sedentary. The unattractive perception of information technology professionals in our culture continues to foster an image of a solitary and antisocial profession, dominated primarily by white males (Camp, 2001). The image of IT as a masculine industry may be causing women to reject IT as a viable career choice (AAUW, 2000)

In addition, to the image challenges that face the IT field, there are also limiting stereotypes that may affect the hiring and promotion of women. Among the negative stereotypes is the belief that women are not proficient in math, technology, and science, consequently this impedes the career progress of women in the IT field (Margolis & Fisher, 2002). Society regards males and females differently and has stereotyped associated traits such as assertiveness, confidence and achievement with men and not women. Employers seeking to fill positions in IT have placed value on masculine traits when seeking to fill positions in IT (Leever, Dunigan, & Turner, 2002).

The IT environment consists of long, irregular work hours as well as fair amounts of volatility. Women with spouses and/or children struggle to keep up with the fast-paced work environment as studies have shown that, unlike, men, they remain primarily responsible for family and home care (Powell, 1999). Long hours and heavy workload are not ideal conditions for women interested in combining work and family. Women constrained by their roles as working mothers may be disadvantaged in the IT work environment and unable to perform to expected time commitments.

Lack of corporate commitment remains a concern in the IT field. Companies lack consistent and proactive approaches to attracting, retaining, and promoting qualified women in IT (ITAA, 2003). Unfortunately, if women do decide to pursue positions in the IT workforce, a glass ceiling still exists (Camp, 1997; Laberis, 1992). Not only do women’s salaries trail those of their male counterparts, most of them do not reach management positions. As of 1997, women in IT only made 83 cents for every dollar that men earned and only 2 percent of women reached executive level positions (Igbaria & Wormley, 1992).

Strategies for Recruiting and Retaining Women in the Information Technology Workforce

Changes in workplace culture are needed to remove the barriers that hinder women in information technology occupations. Bringing about organizational change effectively may be one of the most critical challenges facing organizations today (Kossek & Lobel, 1996; Norton & Fox, 1997). The under-representation of women in IT and those who manage to enter IT, but who are persistently excluded from the top level positions does little to change
the image of the IT culture. Due to the current skill shortage that the IT industry is facing along with the diversification of the IT occupations, there are excellent opportunities for women to enter the IT sector. However, if organizations want to attract and retain talented women into their IT workforce, they must do their part to develop and implement initiatives that will help women overcome the barriers to success that they encounter.

Mentors and role models are of vital importance to women’s advancement in IT. However, women in IT may find it difficult to find mentors through the same informal mechanisms used by men, especially since individuals tend to mentor people who are very much like them and the IT field is predominantly male (Camp, 2001). A study conducted by (Catalyst, 1993) revealed that involvement in a mentor relationship alleviate the stress felt by many professional women by increasing their self-confidence and reducing their sense of isolation and powerlessness in a male-dominated company. Because having a mentor is critical to advancing in IT, especially to management positions, organizational leaders need to create formal mentoring programs that provide structure and help maximize opportunities for all employees, especially women who may otherwise have trouble obtaining a mentor (Enscher & Murphy, 1997).

Women in IT who progress in their careers may be impeded by their having to prove their technical credibility again and again. This may be the result of stereotyping of women’s abilities as well as the perception that promoting women is riskier than promoting men. The perception that the competencies and traits associated with success in IT are male attributes is also prevalent (Mendoza & Johnson, 2000). Changing these perceptions requires long-term vision and is a challenging task, which needs to be implemented gradually with joint efforts from individuals from all levels of the organization (Catalyst, 2001). It necessitates a social and ethical responsibility for these individuals to work together to address these issues that have contributed to forming a male-dominated IT work environment. The change must come from well-established organizational policies and initiatives that encourage and support the recruiting, hiring, retention, and advancement of women in IT (Leever, Dunigan, & Turner, 2002).

Issues of work and family balance are also of paramount concern to women in the workforce. Therefore, organizational policies and benefits such as extended parental leaves, part-time work options, on-site child care facilities, and greater scheduling flexibility are needed. Access to quality, reliable, affordable child care is key to the retention of working women with children (Mendoza & Johnson, 2000). Policies and practices that help women overcome the difficult obstacles to success have a positive impact on the career development of women in IT over the long term (Catalyst, 2001).

Furthermore, rapid changes in technology demand new skills and render existing skills obsolete. Continuous training and development are vital in the IT industry. One way that human resource development (HRD) professional’s can help women in IT achieve is to ensure that training and career development programs are more accessible to them and more adaptable to their needs. For example, training and development programs should be comprehensive enough to incorporate the needs of women employees with family responsibilities. Therefore, they should provide training opportunities for women returning from maternity leave, as well as women who work on a part-time or flexi-time schedule or telecommute (Panteli, Stack, Ramsay, 1999). Technological advancements open up new opportunities to HRD professionals for innovation in their training programs. For example, HRD professionals could provide online training to women who work remotely or from home. As IT is becoming one of the growing job markets, organizations needs to accommodate more effectively women in the workforce by rethinking career development and training programs, and thus building a healthier and more supportive work environment for women (Panteli, Stack, Ramsay, 1999).

Women must overcome the stereotypes presented by society as well as the conceptual role of women as a result of socialization. These obstacles and gender differences have created a gender gap that is responsible for the narrowing pipeline of women in IT careers. The shortage of women in IT fields has made it more difficult for them to obtain management positions. In order to reverse the diminishing number of women in the IT fields, a combination of organizational strategies and changes in perception are required. If these barriers are removed, it is likely that more women will consider careers in the fast-growing and lucrative field of information technology.

Continuing Professional Education and Human Capital Theory

Jasper B. van Loo  
Maastricht University

Tonette S. Rocco  
Florida International University

In this paper, continuing professional education (CPE) is linked to human capital theory. Since human capital theory does not explicitly focus on CPE but does provide important insights on training evaluation, we discuss the differences between CPE and training. We review the main insights on training evaluation and discuss the implications for the evaluation of CPE using human capital theory.

Keywords: Continuing Professional Education, Economics, Human Capital Theory

Continuing Professional Education (CPE) may be defined as “the process of engaging in education pursuits with the goal of becoming up-to-date in the knowledge and skills of one’s profession” (Weingand 1999). Both theory and practice surrounding continuing professional education have been fragmented with providers of CPE identifying with their individual professions and not with the field of adult education (Mott & Daley, 2000) or human resource development (HRD). Yet, CPE has been recognized by adult educators as an important area of study and practice since the 1960s ( Houle, 1980; Cervero, 1988; Queeney, 2000). For instance, adult education graduate programs teach students effective practice in CPE as facilitators, program planners, and administrators (Cervero, 1989).

CPE is a growing concern for both adult education and HRD because of four trends: the amount of CPE offered in workplaces is surpassing CPE offered by other providers, CPE is increasingly being offered by universities through distance education, collaborations between universities and workplaces are expanding, and using CPE to regulate professionals’ practice is increasing (Cervero, 2000). In 1988, Cervero estimated that 25% of the workforce claimed membership in a profession; this estimate could only have increased over the years (Cervero, 2000). As more professionals become corporate employees, CPE has become an important phenomenon in many workplaces making it the responsibility of HRD practitioners to manage and facilitate. As a result, during the last decades, the amount of CPE offered at the workplace has grown more than any other type of education (Cervero, 2001).

Consequently, CPE at work takes resources away from training other classes of workers, the CPE-providers require more education and expertise increasing the costs of securing and retaining trainers, and since CPE is mandated by professional associations the content, timing, and costs to provide it are less controllable by the employer.

Cost benefit analysis and return on investment are terms that are increasingly being used by HRD to support training as a sound investment in human capital (Cascio, 1987; Fitz-enz & Davison, 2002; Swanson, 2001). Human capital has caught the attention of scholars and practitioners outside the economics domain since it is increasingly seen as the “profit lever of a knowledge economy” ( Fitz-Enz 2000). Without a workforce that is constantly increasing its knowledge and skills, organizations cannot remain competitive (Fitz-Enz and Davison 2002). Most theoretical and empirical research has implicitly been concerned with cost-benefit analysis for training at the individual or societal level (Burke 1995). Cost-benefit analysis for CPE for individual organizations or for their customers has been rather scarce in the economic literature.

The field of human capital theory has contributed to research on training while paying little attention to the distinct characteristics of continuing professional education or the differences between training and CPE. This is due to the fact that the estimation of costs and benefits of CPE is not as straightforward as it would seem at first sight. Training and CPE are different in ways that make a simple application of training models to understanding the cost-benefit analysis of CPE, impossible. While standard principles from cost-benefit analysis can be used to determine why, how and how much an organization invests in training, these same principles do not directly apply to CPE.

Problem Statement and Research Questions

The main problem we are addressing in this paper is: how can continuing professional education be evaluated using insights from human capital theory? The purpose of this paper is to explore the factors that make CPE different from training and then to examine the issues that make a human capital theory evaluation of CPE different from the economic evaluation of training. Three research questions are addressed:

5-1
1. What are the main insights from human capital theory?
2. What are the factors that differentiate continuing professional education from training?
3. What issues play a role when continuing professional education is analyzed using human capital theory?

**Human Capital Theory**

Human capital theory is an economic approach to the evaluation of the costs and benefits of the investment in skills and knowledge. While Theodore Schultz coined the term human capital, the foundations of the theory were laid by Gary Becker and Jacob Mincer (Becker, 1962, 1980; Mincer, 1962, 1974). The development of human capital theory began with the recognition that the investment in humans can be analyzed in a similar manner as the investment in physical capital. This implies that the impact of human capital investment (education or training) can be analyzed using economic models of the costs and benefits of investment. Benefits include higher wages, increases in productivity, and a stimulus of research & development and economic growth. Examples of costs are trainees’ time investments, tuition fees, and the cost of the educational system.

In early human capital literature, educational background was considered one of the most important determinants of human capital. As a result, the classic empirical human capital studies focus on the value of additional years of education. One of the assumptions underlying classical human capital theory is that labor markets are competitive and that the wage is an unbiased estimator of individual productivity. Therefore, the empirical work relates human capital to wages using so-called ‘mincerian’ earnings functions.

The notion that various developments render parts of human capital obsolete, attracted attention from human capital theorists later. First, the focus was on “vintage-models”, which take into account the differences in education in various periods and the implications for the variation in human capital and wages with age (Rosen, 1975; Ben-Porath, 1967). When the value of certain vintages of human capital decreases, training as a means of human capital investment becomes essential to keep skills up-to-date. The impact of technological, organizational and competitive developments has resulted in increased attention for training as a determinant for human capital (Baldwin & Johnson, 1995; Barrett & O’Connell, 1998; Bartel, 1991; Blundell, Dearden, & Meghir, 1996).

The analysis of training is full of economic considerations. Firstly, the training need can be related to the demand for and the supply of skills on the labor market. If the demand for a skill increases, for instance due to the introduction of a new technology in the workplace, it may be profitable for organizations and individuals to invest in training. Secondly, training options can be compared on the basis of costs, benefits or both. Cost comparisons are a relatively simple way of comparing different types of training. Organizations may also look at the long term benefits from training when they develop training programs that serve the strategic needs of the organization. Organizations may also compare different types of training by looking at both costs and benefits.

Human capital theory is known for its ability to address training issues in an abstract and quantitative manner. It predicts that rational agents (individuals, organizations, governments) will invest the amount of resources at which the marginal cost of an investment in training equals the marginal benefit. The decisions of whether and how much to invest in training can be analyzed using standard principles from cost-benefit analysis. Cost-benefit analysis is a technique that compares different choices by estimating the associated costs and benefits for each available option. Estimates for training cost and benefits at the individual level have been an area of research which human capital theory has become famous for. At the organizational level, cost-benefit analysis may be applied as well, but it is important to recognize that individual benefits and costs from training may not coincide with organizational benefits and costs. This may cause diverging interests between organizations and their employees. When an organization is unable to reap sufficient benefits from a training program while the trained employees benefit in terms of increased wages, this may lead to an under investment in training from an efficiency point of view.

In the classical human capital literature, the under investment in training has usually been linked to the provision of general training. General training leads to the acquisition of human capital that is applicable in many different contexts. Since organizations run a ‘poaching’ risk of losing the training investment when trained employees are recruited by other organizations that benefit from the training investment without bearing the cost, the incentive to provide general training is reduced. Although the reduced investment in general human capital may be rational from the organizations’ perspective, from society’s point of view, under investment occurs: investments that are potentially profitable are not undertaken since the benefits cannot be secured for those who incur the costs.

**Factors that Differentiate CPE from Training**

A systems view (Senge, 1990) is presented of the factors that influence the cost and benefits of CPE and that make
CPE different than training. This system includes public and private organizations employing professionals who have leadership roles with in the organization and in society and who deliver services that can impact the quality of clients’ lives (Scheneman, 1993). Factors include scope, stakeholders, control, and skill transfer.

First, The Scope of Training is Different from the Scope of CPE

According to Swanson (1995), HRD is a “process of developing and unleashing human expertise through organization development and personnel training and development for the purpose of improving performance” (p. 208). Personnel training is organization- and job-specific, occurs through formal, structured sessions designed to facilitate knowledge acquisition and skill development determined useful by the employer, and whether an internal or external service provider conducts the training the employer decides who should attend and what should be offered. Contrast this to CPE where knowledge and attendance are frequently regulated by an entity external to the organization such as a government or professional association.

Continuing professional education is directed towards the knowledge and skills in the professions. Commonly viewed characteristics of a profession are that preparation is through a distinct pre-professional college curriculum, that formal and informal learning is required throughout the working life, and that the profession is regulated through a set of professional standards or codes, accreditation, and/or licensure. These characteristics are predicated upon the belief that the profession’s knowledge base is continually advancing and to stay current professionals must continue their education (Queeney, 2000). The need for CPE is often based on the desire to protect clients or society from ill informed or poorly prepared professionals. The training received is specific to the profession and not to the firm.

Second, Training has Different Stakeholders than CPE

Stakeholder theory defines stakeholder as “any group or individual who can affect or is affected by the achievement of an organization’s purpose” (Freeman, 1984, p. 53). Taking this a step further a primary task for management is “to influence, or manage, or balance the set of relationships that can affect the achievement of an organization’s purpose” (Freeman & Phillips, 2002). The balancing of competing stakeholder interests is a fundamental concern when considering the growing trend of corporations hiring professionals whose mandated continuing education requirements must be monitored or facilitated by HRD professionals.

Human capital models differentiate between specific training and general training. Specific training is felt to increase productivity in one specific firm while general training more readily goes with the individual (Veum, 1999). In specific training the key stakeholders are the employee and the organization since the benefit of this training is the organization as long as the employee remains. This simplistic model ignores the traditions behind lifelong learning that learning has the potential to enhance intellectual, cognitive, and social growth (Tennant & Pogson, 1995) which would mean the worker’s knowledge, skills, and abilities are enhanced through specific and general training. While in some organizations training is moving away from the banking approach of depositing knowledge and into conceptions of learning organizations and lifelong learning, CPE does not seem to have moved beyond instrumental rationality (Battersby, 1999).

Training of professionals occurs prior to joining the firm and continues beyond any one firm being specific to the profession. For CPE the key stakeholders are society or the state, the professional organization, the professional, and the client. Since we are concerned with CPE when the professional is employed by an organization and not self employed or autonomous the employing organization is also a stakeholder. These five stakeholders— the state, the professional organization, the firm, the professional, and the client—have overlapping interests and concerns. From an economic perspective, each stakeholder makes the decision whether to invest in CPE and the investment intensity is guided by cost-benefit considerations. Most theoretical and empirical research has implicitly been concerned with cost-benefit analysis for CPE at the individual or societal level (Burke 1995). Cost-benefit analysis for CPE for individual organizations or for their customers has been rather scarce in the economic literature. A reason for this is that the estimation of costs and benefits of CPE is not as straightforward as it would seem at first sight.

The state and professional association. The public and the professional association have an interest in professional services being regulated for consistency, to maintain quality, and to ensure the integrity of the professional and the service (Queeney, 2000). Both the professional organization and the state accomplish this through mandating and providing pre-professional education and continuing education content or amount of education measured in units of time often known as continuing education units. In some cases the state requirements and the association’s requirements are coordinated and in other cases what the profession deems competent practice may not coincide with what the state feels is competent practice. In the United States, each state system regulates access to pre-professional education by determining the number and location of subsidized institutions of higher education offering pre-professional education in fields such as nursing, medicine, dentistry, accounting, and law. The location and number of state institutions determines who has access to preprofessional educational
opportunities, limits the number of professionals, increasing the cost of their services, and limiting the access of clients.

The state and or the professional association regulate entrance into the profession after the preprofessional education is completed through exams. The more specialized the pre-professional training and difficult the exams the more expensive the continuing education will be, because it will require well trained professionals from the same field to facilitate CPE.

Professional organizations are accountable to the public (Queeney, 2000) and to members. Public accountability is maintained through credentialing and establishing standards or codes of conduct. The development of standards or codes of conduct become ingrained in the professional culture and in the requirements for membership. This creates another barrier to entrance and can act to increase the prestige of a profession. In order to maintain membership in the professional association CPE is required in terms of content and hours. The professional association also determines content, number of hours, and acceptable CPE delivery systems. The prestige a profession enjoys is often illustrated by the glamorous locations selected for CPE programs.

For these two stakeholders costs are incurred a) by subsidizing CPE, b) during the deliberations that end with decisions about what CPE is needed, and c) in delivering CPE. Benefits are having a skilled professional workforce and when CPE programs offered by the state institutions and professional associations earn a profit.

The employing organization and the professional. Organizations that intentionally employ professionals do so because the organization needs these professionals for instance when an insurance company hires medical personnel or in the retailing of professional services (i.e. Sears Dental Clinics). Organizations also hire professionals because the professional training acts as an indicator of the level of skills and knowledge the worker possesses not because they need for instance someone trained in the law. In either case to maintain membership in the professional association or maintain licensure or certification the organization must allow time off for CPE, to pay for CPE, or to provide CPE. If the organization hired medical personnel specifically for the credential then it makes sense that the organization assumes the cost for the CPE and for the release time and replacement cost of the employee while engaged in CPE.

However, if the organization hired a lawyer because of knowledge and problem solving skills to manage a division and not to practice law the assumption of cost becomes a matter for negotiation and consideration within the organization’s tradition and culture. The professional has a vested interest in maintaining membership in the association because the pre-professional training loses value when the professional is no longer a certified member of the profession. The professional working for an organization in a capacity other than what he or she was trained for has to decide on the value of maintaining the certification as in the example of the lawyer managing a division.

Costs incurred by the employing organization are release time, replacement time, and the cost of the CPE. The benefit is a professional employee in good standing in the field. This might fulfill a legal requirement for the employing organization or the professional’s services might be the product sold by the organization as in the case of law or accounting firms. The professional might have to take vacation time and pay for the CPE.

CPE at the client/customer level. Internal and external clients want and expect competent professionals. Yet “CPE is neither a guarantee of competence nor the sole answer to competence assurance” (Queeney, 2000, p. 375). To ensure competence, evaluation procedures need to be developed that adequately measure the effects of CPE on performance and CPE should be delivered in ways that are practice oriented and context relevant which will increase the costs of CPE. Costs of CPE are passed down to clients through increased fees for service. A good example of this is what an accountant charges versus a certified public accountant.

Third, Training is Controlled by the Organization; CPE is Not

Training is largely controlled by the organization. Organizations determine who is trained, when and how much training the employee receives, and what the content of the training will be. The training content is determined by the upper hierarchy or training department of the firm. In contrast, most organizations only have a limited influence over CPE. CPE is largely controlled by a professional association and often guided if not legislated at the local, state, and federal levels. The association and government regulations dictate the amount and content of education the professional needs to maintain currency in the knowledge base of the field on a time sensitive basis. CPE is treated as a commodity that someone else designs and delivers and that through this process the professional’s worth is increased (Battersby, 1999). The entities that have an impact on the content, the amount and the timing of CPE are summarized in figure 1.

Fourth, There are Differences in the Transferability of Training and CPE

Corporate training is industry and organization specific. Poaching of well-trained employees is a possibility if the prospect can demonstrate that skills are transferable to another organization. Non-professional employees are more mobile than professional employees because they can change industries and career tracks. Corporations run the
risk of training employees whose skills are valued by other firms in the industry and leave or who change careers and leave wasting resources spent training the employee.

Figure 1. Entities Controlling CPE Content, Delivery and Timing

CPE on the other hand is viewed as maintaining the professionals’ currency or advanced knowledge of scientific and practice-specific knowledge and skills, which makes the professional desirable by all organizations that need the expertise of specific professionals. Or that value professional training as a proxy for advanced ability. Professional employees are viewed as knowledge workers with higher order cognitive abilities demonstrated by their professional credentials whose knowledge can go with them across industries. Organizations that require professional workers have no choice but to facilitate CPE for these workers. Even though the knowledge and credentials maintained belong to the professional and not to the organization. It is less likely that professionals will change careers because of the investment already incurred in the pre-professional education, certification and licensure, and competency maintenance.

A Summary of the Factors

These four factors: narrower scope, more stakeholders, less organizational control, and decreased transferability of professional training increase the costs to an organization to provide or facilitate CPE of professional workers. The more specialized the pre-professional training the more costly to hire the specialists to provide CPE.

Issues in an Analysis of CPE using Human Capital Theory

The four identified differences between training and CPE have implications for the way human capital theory should be applied to evaluate investments in CPE. Two aspects that make an analysis of CPE different from an analysis of training investments are discussed in turn.

The Cost-benefit Structure is Different

Training can be seen as the outcome of joint optimization decisions of individuals and organizations regarding the investment in human capital. Although individual professionals and organizations do play a role in who participates in CPE and what is learned, the state has a greater impact by setting professional standards and by regulating the profession. In terms of human capital theory, the assertion that the scope of training is different from the scope of CPE implies that both costs and benefit structures are different. The differences between training and CPE in terms of costs and benefits are laid out in table 1.

The provision of training has costs and benefits at three levels: the individual level, the organizational level and the level of the economy as a whole. Costs at the individual level include direct costs such as tuition and training materials and indirect costs such as time investment and effort. The indirect individual costs are usually opportunity costs, which imply that these costs do not necessarily lead to money outlays but rather represent the value of lost time or income. The individual benefits of training include increases in productivity, wage increases and improved career prospects. At the organizational level, examples of direct costs of training provision are tuition, the cost of materials, trainers' salaries and classroom space required for training activities. Indirect costs include the loss in production when training activities take place. Training requires that some effort or time of employees cannot be used in the production process, which implies that productivity will suffer in the short run. The long term benefit of training could be an increase in productivity. When workers are better trained, it is likely that their productivity will increase following the training period. Another possible benefit of training at the organizational level is that personnel will be more flexible, e.g. in a situation where tasks that are not part of the regular job need to be carried
out. At the level of the economy as a whole, the provision of training implies that resources that could have been used for other purposes have been spent on training. The benefits at the level of society include societies’ economic success factors, such as economic growth, competitiveness and innovation.

The final column in Table 1 displays the additional societal costs and benefits for continuing professional education (CPE). Examples of the additional costs of CPE are the costs of having a preprofessional curriculum, professional organizations, the costs associated with regulating the professions and the enforcement costs. The benefits of CPE are an improved level of product and service quality and a reduction of risks associated with quality variations for clients of products and services. An example of the latter benefit is the guarantee that patients have that a certain level of quality of medical procedures is provided when a system for mandatory CPE for surgeons is in place.

To determine the optimal level of investment in human capital from a society’s perspective, cost-benefit analysis applies the equimarginal principle, which simply means that the level of human capital investment is optimal when the marginal costs of an extra unit of investment (e.g. a training course) equal the marginal benefits. The implication of the additional costs and benefits of CPE is that a cost-benefit analysis for CPE is different from a similar cost-benefit analysis for training.

*CPE Evaluation is Normative*

The discussion has already focused on the different stakeholders involved in CPE. The fact that CPE has more stakeholders than training implies that the determination of the optimal level of investment in human capital needs to take account of many more aspects. If there are conflicting interests between stakeholders, the analysis necessarily becomes *normative* instead of positive. If e.g. a mandatory CPE system acts as a deterrent to individuals that consider entering the profession, the earnings and other benefits of the certified professionals (the ‘insiders’) need to be weighed against the losses of those denied entry into the profession (the ‘outsiders’). It is important to realize that human capital theory is only capable of judging different CPE options in terms of efficiency. The question of what stakeholders should lose or gain from CPE arrangements is a normative issue, which is left for political systems to decide upon. Human capital theory can however play an important role into providing decision makers with options that make sense from an economic point of view.

**Conclusions and Recommendations**

At first sight, an economic analysis of continuing professional education (CPE) has a lot to gain from the existing work on the evaluation of training, which plays a major role in the field of human capital theory. However, this paper has shown that CPE differs in four important aspects from training: The scope is different for training and CPE, CPE typically has more stakeholders, CPE is less controllable by organizations, and decreased transferability of professional training increase the costs to an organization to provide or facilitate CPE of professional workers.
The implications of these differences for a human capital analysis of CPE is that the cost-benefit structures are different for CPE evaluation and that the evaluation is normative since there typically are diverging interests between different CPE stakeholders.

The implications of the analysis in this contribution are both theoretical and practical. From a theoretical viewpoint, including elements from human capital theory, while keeping in mind that ideas and concepts from human capital theory need to be adjusted to reflect the distinct characteristics of CPE, has two advantages. First, it enables us to better explain the patterns and characteristics of the CPE programs that are currently in place. Second, it allows for the design of those CPE systems that benefit society most.

On a practical level, using human capital theory in the evaluations of CPE are important for three reasons. First, it allows CPE professionals to demonstrate the potential benefits of their efforts. Secondly, the professionals and their associations may use the new insights to optimize professional performance. Finally, at the level of governments or states, economic evaluations of CPE may guide the design and implementation of preprofessional curricula and CPE regulation that make sense from an economic point of view.

Future research has an important role to play in putting the ideas brought forward in this paper into practice. A first step could be the development of a cost-benefit analysis methodology, which incorporates the distinct characteristics of CPE. This methodology may subsequently be used in applied research that discusses the value and efficiency of current or future CPE systems.

Contribution to HRD

This study has shown that the combination of insights from human capital theory and human resource development adds to our understanding of the field of continuing professional education. This does not imply that a theoretically sound evaluation of continuing professional education using human capital theory can be achieved by merely applying existing concepts and methodologies. Rather, we have shown that the distinct characteristics of CPE require adjustment of the evaluation methodologies available in human capital theory. Such an approach is useful in expanding and reinforcing the multidisciplinary nature of HRD.

Intellectual Capital: Opportunities and Challenges

Madeleine S. Doran
Barry University

Natural and physical resources are wasted when used; human and intellectual resources are wasted when they are not used. Therein lies the significance of intellectual capital, an underreported and underutilized intangible corporate resource. Intellectual capital is the competitive edge in the twenty-first century, and it offers a plethora of research and career opportunities for HRD scholars and practitioners to unleash its potential, manage its collection and dissemination and explore ways to accurately measure its corporate value.

Keywords: Intellectual Capital, Knowledge Management, Intangible Assets

In the last decade there has been a rapid growth of companies serving industry. These companies rely heavily on the skill and competence of their workforce who depends on a specialized group of suppliers and a loyal following of customers. These service organizations rely on the professional expertise of their employees for their profitability and their greatest asset is knowledge. The term intellectual capital (IC) became a hot topic in the 90’s although the term itself originated in the 1980’s and its origins can be traced back to the 1950’s. It appears, however, that it is not a passing fad. IC is manifested in a myriad of disciplines and is becoming increasingly more important and elusive as the number of knowledge intensive corporations continues not only to flourish but to expand. In this paper, I will review the historical perspectives of IC, describe IC’s conceptual issues and significance to the economy and finally discuss the challenges and implications it presents for practitioners and scholars in the marketplace and in the classroom.

Historical Perspective of Intellectual Capital

The term Intellectual Capital, popularized in the 1990’s, can be traced to the considerable study and emphasis on knowledge in the second half of the twentieth century. In 1962 Frantz Machlup published The Production and Distribution of Knowledge in the United States presenting his premise that knowledge was a major item of production in the United States (Cortada, 1998). While Peter Drucker may have received credit for popularizing the term “knowledge” during the same time period, Machlup was a distinguished economist who studied knowledge creation, distribution and economic significance from 1950 until his death in 1983. (Cortada, 1998). Thomas Stewart’s article, “Brainpower,” in Fortune magazine in 1991, however, was the first time that an article on intellectual capital was published in a national magazine (Sullivan, 2000). Also in 1991, Skandia AFS implemented the first corporate intellectual capital department and named Leif Edvinsson as the world’s first Director of Intellectual Capital, followed in 1993 by Dow Chemical Company who named Gordon Pettrash as Director of Intellectual Assets (Sullivan, 2000). Since that time significant press has been devoted to the subject, particularly among practitioners in management.

There continues to be a dearth of research in the area of IC. Academicians shy away from topics that are frequently found in trade journals and perceived to be just another fad, i.e., emotional intelligence, total quality and quality circles. As a result most of the interest in intellectual capital to date has come from practitioners in the field or scholars who have a management background. The opportunities are limitless to expand IC research as it permeates the disciplines of economics, sociology, communication, accounting, finance and human resource development.

Conceptual Issues of Intellectual Capital

An “asset” is defined by Webster’s Dictionary as (1) “a useful thing or quality” and (2) “a single item of property” (Winter, 1998). Assets are good and positive. Assets can be converted into cash, used to pay debts and used for borrowing money. Assets minus liabilities determine an individual and organization’s net worth. These assets are tangible and typically found in land, buildings and equipment. They are easily quantified. Difficulties arise when an organization’s most valuable assets are not tangible and do not appear in the balance sheet. They are intangible.

Copyright © 2004 Madeleine S. Doran
and, therefore, invisible. What is this invisible asset that created a difference of $63 per share between the book value and market value of the sale of Microsoft stock in 1995. Microsoft’s balance sheet reflected a value of $7 per share while the stock changed hands at $70 per share (Sveiby, 1997). It appears that the invisible assets in today’s knowledge intensive organizations—knowledge, ideas, creativity and innovation— are more valuable than the tangible assets that appear on the company’s financial records. Other companies with high levels of professional expertise reflect a marked difference between their net book value and the stock market value. When approximately 80 percent of today’s corporate business assets consist of intellectual capital and when financial reports reflect only the 20 percent of tangible assets, “one starts to wonder about the accuracy and efficacy of these reports in reflecting the value of the enterprise and its future performance potential” (Al-Ali, 2003, p.53). Hamel and Prahalad (1994) cite ratios of market value to asset value from 2:1, 4:1 and even 10:1 and attribute this not to goodwill, but to core competence—people skills. The numerator in the ratio reflects investors’ beliefs about the firm’s competencies and the potential value gained by exploiting these unique competencies in the marketplace.

When a company changes hands for a value higher than its book value, traditional accounting practices require that the difference be recorded as “goodwill,” which can be depreciated over up to a forty-year period (Sveiby, 1997). A unique difference between the tangible and intellectual assets is that tangible assets depreciate; they are worth less the more they are used. On the other hand, knowledge assets appreciate. The more they are shared and used, the higher the value.

Theoretical Framework

Bontis (2002) cites special challenges facing the field of intellectual capital. “It has no legacy, few world-renowned researchers, and a modest literature” (p.622). Because it overlaps many disciplines, there are a variety of perspectives. “… accountants are interested in how to measure it on the balance sheet; information technologists want to codify it in systems; sociologists want to balance power with it; psychologists want to develop minds because of it; human resource managers want to calculate a return on it; and training and development officers want to make sure that they can build on it” (p. 622).

Clarifying and managing the composition of intellectual capital provides another challenge. Stewart (1997) defines intellectual capital as “the sum of everything everybody in a company knows that gives it a competitive edge. . . . Intellectual capital is intellectual material—knowledge, information, intellectual property, experience—that can be put to use to create wealth. It is collective brainpower” (p. v). Al-Ali presents one of the clearest distinctions between the two types of knowledge, tacit (information/knowledge) and explicit (individual/organizational knowledge). “… explicit knowledge includes all that can be codified or expressed in documents, manuals and databases. Tacit knowledge, on the other hand, encompasses all that cannot be clearly articulated but is the real source of knowledge and the basis of decision making. In addition to experience, skills and competence, tacit knowledge includes intuition and things that the employee ‘just knows.’” (Al-Ali, 2003, p. 84). Since organizations use only 20 percent of the knowledge available to them (Brinker, 2002), extracting and managing the explicit knowledge accumulated in an organization’s databases, routines, culture and practices and the tacit knowledge contained in the heads of the employees to create value is a formidable task.

The sharing of intellectual assets is critical to an organization’s competitive edge. “A basic tenet of communication theory states that a network’s potential benefits grow exponentially as the nodes it can successfully interconnect expand numerically (Quinn, 1998, p. 93). If two employees exchange knowledge, give and receive feedback and then share this knowledge with others, repeating the same process, exponential growth occurs. This growth is enhanced when the process is replicated with customers, specialists and suppliers. However, this mindset appears to be counter competitive; “it explicitly emphasizes cooperation, sharing and egalitarianism, principles that are often considered antithetical to the very idea of competition” (Ozaki, 1991, p. 3). The difficulty arises because many professionals are reluctant to share their knowledge for fear of losing their own competitive edge. This competition inhibits knowledge sharing for fear of not receiving “credit” for ideas. Furthermore, many professionals have little respect for other professionals with different responsibilities in the organization and are reluctant to share ideas even when working toward mutual goals. “The overall organizational climate is also a powerful influence on information politics” (Quinn, 1998, p. 103). Radical changes in the organization’s structure and accountability will be necessary to release employees’ inhibitions and encourage a free flow of information. Modifying the existing employee assessment system to value the employees’ sharing of information and ability to work together, providing peer reviews and other alternative assessments can facilitate an environment that places a premium on information sharing.

Quinn, et. al (1998) describe the successful experiences of some companies who have “inverted” (p. 94) their organizations. They have abandoned the traditional hierarchies and have organized around the professional intellect
that brings value to the company. Novacare, the largest rehabilitation health care provider in the United States, employing over 5,000 specialists, has leveraged its intellectual capital by organizing the work around its therapists. Through sophisticated data systems, the collection and analysis of data is collected in ten-minute blocks and is available to all stakeholders allowing their professionals to have up-to-date, timely information that enables them to be autonomous and provide maximum effective care to their patients. The professionals have authority over line personnel, in effect “inverting” the traditional hierarchy (Quinn, et. al, 1998, p. 95).

Even as the need to share knowledge internally and externally is promoted, there is also a strategic advantage in knowing what not to share. Timing is everything as the race to increase market share intensifies. As intellectual capital was recognized as the key to wealth in the 1980’s, Joel Barker (1992) cautioned that in order for U.S. firms to benefit, the United States must take a strong stand on protecting its intellectual capital. When a product takes years to develop in the United States and a knockoff can be produced overseas and imported back into the United States without penalty or profit to the designer, it is counter productive (Barker, 1992).

There is agreement among many that the greatest challenge of intellectual capital is how to measure it (Al-Ali, 2003; Bonfour, 2003; Bontis, 2002; Chun & Bontis, 2002; Hamel & Prahalad, 1997; Stewart, 1997; von Krogh, et. al, 2000). In a survey of 431 organizations in the United States and Europe that ranked corporate issues by relative importance, “measuring the value and performance of knowledge assets” ranked second after “changing people’s behavior” (Skyrme & Amidon, 1997). Financial accounting practices in the United States are wed to the past and these practices are becoming increasingly more illogical and inaccurate. If investments are made to upgrade the skills and competencies of employees or increase the dollars allocated for research and development, traditional accounting methods reflect this as a cost, but is it a cost or an investment in the future profitability of the firm. What is needed is a system to reflect the true value of an organization, not based on tangible assets, but the value of its marketability, which includes intangibles (Bonfour, 2003). Bonfour (2003) draws an analogy between the current state of financial reporting and the longitude problem in navigation 300 years ago. The British Navy could only navigate with precision in a north-south direction—not east and west. Today’s balance sheet perspectives are vertical, reflecting cost accounting and tangible assets. What is needed is a representation of the value of intangibles—“key persons, networks and relationships, alliances, culture and knowledge”—that reside in the lateral perspective (p.xiv).

If we believe that intangible assets must be accounted for in financial records to reflect an accurate value of an organization’s worth, there are those that believe intellectual capital liabilities should be reflected as well. Double entry accounting principles reflect a negative for every positive and similar consideration should be given to intangible assets. “Microsoft Corporation and its loss in the famous antitrust case in 1999 is a perfect example” (Chun & Bontis, 2002, p. 15). The Exxon Valdez disaster in 1989 is another example of intellectual liability (Caddy, 2000).

After the debacle of Enron and others, public trust in the financial records of organizations and the accounting firms who prepare them is at an all-time low. It is time to overhaul the outmoded accounting principles of the past and include in assets to accurately reflect the true market value of a company’s worth.

Significance to HRD

Swanson and Holton (2001) define Human Resource Development as “a process for developing and unleashing human expertise through organization development and personnel training and development for the purpose of improving performance” (Swanson & Holton, 2002, p. 6). If we are to unleash already existing intellectual capital in the organization, it will require “minimizing mindless tasks, meaningless paperwork, unproductive infighting” (Stewart, 1997, p. 87). It requires that “we have the foresight and courage to let go of the Newtonian clockwork or machine metaphor on which most of our organizations are still founded and embrace . . . the principles of self-organization or unmanagement” (Ehin, 2000, p. 2). It will require visionary leaders who are willing to give up control and provide an environment of self sufficiency to employees, sophisticated data systems that collect and disseminate timely information to professionals and a corporate culture that rewards employees for sharing and collaborating to add value to the organization. HRD professionals have the expertise to develop and unleash human expertise, including classifying, analyzing and managing knowledge, and developing the processes and relationships to create a climate and culture that invites sharing and collaboration.

As researchers in the disciplines of finance and accounting provide a means to measure intellectual assets, funds spent in research and training and development will be viewed as an investment in the future profitability of the organization instead of an expense. When the skills, competencies and creativity of the workforce are officially acknowledged in the financial records and standards are created and enforced that provide all publicly traded companies to disclose the value of intellectual assets, human resource development as a discipline will finally
achieve the recognition it deserves. Human resource development (HRD) professionals’ career opportunities will be enhanced as attention continues to focus on the value of intellectual capital and accurate reporting to substantiate an organization’s worth.

Research is needed to determine how HRD professionals can develop the organization to provide for the exponential growth of existing knowledge and restructure the organization so that the focus is on the professional expertise that adds value. Research is also needed on alternatives to the competitive climate that inhibits information sharing. Only when researchers have results will HRD academicians be able to enhance classroom instruction to create a repertoire of theory and best practices to embrace the opportunity of the wide acceptance and public validation of its most valuable asset, intellectual capital.

Human Capital Theory: A Reflection on Retention of Employees in the Hospitality Industry

Hanna B. Hayes
Meera Alagaraja
Larry M. Dooley
Texas A&M University

This paper examines human capital theory as a strategically implemented human resource development function with reference to retention in the hospitality industry. As noted in this paper, human capital theory demonstrates a need for the inclusion of human resource development within organizations in order to improve organizations’ financial growth via the retention of employees.

Keywords: Human Capital Theory, Retention, Hospitality Industry

According to Navatorov (1997), management and organizational philosophy have begun to shift their focus from financial capital to a focus on human capital. Employers have recognized the need for human resource development and as Paxson (1994) explains, the value of employee commitment can reduce job turnover and increase productivity, which in turn, increases the competitiveness of an organization. As found in a recent study by Lam, Baum and Pine (2003), the average turnover rate in the hotel sector ranged from 27 percent to 41 percent between 1994 and 2000. In an effort to improve their bottom line, as well as their workforces, organizations must understand and implement Human Capital Theory into their organizations’ human resource development framework.

Retention in the hospitality industry is difficult because employee experiences are often negative. “The lack of training is often cited as a main cause of turnover” (Breiter, 1991, p. 44). An increasing trend in human resource development has begun in most hospitality and service organizations. Allen, Shore and Griffeth (2003) suggest that a reason why this trend has begun is due to the fact that supportive human resources practices contribute to the development of perceived organizational support, which in turn, contributes to organizational commitment, thus increasing employee retention.

In today’s high-turnover environment, sales and marketing directors like Tory Parks admit that, “It’s far less expensive to invest in good employees than to continually retrain new hires” (2003, ¶3). Being able to measure and understand the complicated system of organizational development allows hospitality practitioners and professionals to develop more exhaustive human resource training programs, which in effect should lead to employee retention. Thus, there is real pressure on organizations in the hospitality industry to re-examine the role of human capital, as the economic benefit from retention of employees helps to assure both the survival of the company and improvement in the financial bottom line (Pittaway, Carmouche & Chell, 1998). How better to reflect the economic benefit of retention than with the foundational human resource development economic guiding concept of human capital theory.

The pressures that HRD faces in today’s business scenario demands for the inclusion of economics as one of the foundational disciplines. Human capital theory is the economic theory most relevant for HRD. According to Swanson (2001), human capital theory provides a bottom-line orientation to HRD. With the emergence of the knowledge based economy, it is becoming clear that knowledge, skills and attitudes are key factors in for organizations to become economically productive. Therefore human capital theory is foundational to the field of HRD, as it draws its concepts from core theoretical foundations of economics.

Purpose of the Study

The purpose of this paper was to examine the ways in which human capital theory reflects upon retention in the hospitality industry. The researchers’ goal was not to determine the effectiveness of human capital theory on retention; rather, the researchers wanted to uncover the impact that human capital theory has upon organizations’ retention of employees. The central problem statement is: Does the “knowledge, expertise, and skill one accumulates through education and training” (Swanson & Holton, 2001, p. 109) in the hospitality industry lead to return to work intentions? It is the researchers’ intention to add to the relationship model of human capital theory presented by Torraco (2001).

Copyright © 2004 Hanna B. Hayes, Meera Alagaraja, & Larry M. Dooley
Method

The design of this research effort was a conceptual analysis of literature on human capital theory in relation to the field of human resource development and the hospitality industry. This analysis focuses on the impact that education and training have on the retention of employees in the hospitality industry. Sources were located using computer searches using EBSCO, ERIC, and Academic Search Premier. The criteria for searches integrated keywords including: human capital, human capital theory, human resource development, employee, satisfaction, turnover, retention, and hospitality industry. To provide a richer literature source, a manual search for published and unpublished research on employee retention included the Academy of Human Resource Development proceedings, human resource development journals, human resource management journals, hospitality and tourism journals, and economic journals.

Theoretical Framework

Human capital theory, created by Shultz (1961) and Becker (1963) and modeled by Torraco (2001), provided the theoretical framework for this study. Schultz (1961) explains that economists have shied away from including human beings as capital due to conflicting positions regarding slavery and indentured servitude. “To treat human beings as wealth that can be augmented by investment runs counter to deeply held values. It seems to reduce man once again to a mere material component, to something akin to property” (Schultz, 1961, p. 2). Becker (1963) developed his human capital theory model based on the direct and indirect costs of education, especially benefits; moreover, Becker distinguishes between general and specific training. In 1962, Becker prophetically stated that human capital theory was “a development of great and lasting importance”.

According to Torraco (2001) economics is a central element to HRD’s theoretical foundation. Several concepts from economics and the human capital theory have relevant applications for HRD. Some of these concepts have values and principles which add to HRD’s core theory base. The macroeconomic theory concerns itself with fiscal and monetary policy at the systemic level in contrast with microeconomics, which focuses on individual consumers, family or the organization. The supply and demand concepts have application for increasing organizational competitiveness by enhancing the value of the organizational human resources. Concepts of elasticity of demand, opportunity costs, production functions and agency theory are core concepts that help HRD professionals express their work in quantitative terms. Economic or financial measures serve as important indicators of organizational efficiency.

In this paper, the researchers suggest that human capital theory, as applied to the hospitality industry, is missing a foundational source of economic magnitude—employee retention. The main proposition of human capital theory is that human capital is considered a form of capital (Aliaga, 2001). Human capital theory is one of the only economic theories that seemingly explain the return on investment of education and training. Nafuko, Hairston, and Brooks (2003) believe that human capital theory is an economic theory that addresses the macro-economics of production and economic development; however, this study focuses more in depth on the micro-economic effects of employee training on employee retention, which thereby lead to augmented earnings for both the employee and the organization.

Literature Review

“Employee turnover has long been a concern of the hospitality industry, and therefore of researchers who examine industry human-resources concerns” (Hinkin & Tracey, 2000, p.14). Most hospitality organizations underestimate the costs associated with turnover. The costs are substantial even in entry-level positions for relatively simple jobs (Hinkin & Tracey, 2000). Hsu, Jiang and Tang suggest, “HR managers have tried numerous approaches to reduce the turnover rate. They generally focus on methods related to pay structure, including higher than average salaries and staying bonuses” (2002, p.361). Simmons and Hinkin (2001) believe that companies may systematically survey employee attitudes and reward managers for the extent to which they can foster a satisfied and committed workforce. Yet rewarding management does not solve the increasing rate of employee turnover within the hospitality industry.

Wayne, Shore and Liden (1993) suggest that a pattern of reciprocity develops over time between an employee and their employing organization. Those employees who perceive low support may be more prone to leave the organization. “Employee turnover is strongly associated with decreased hotel profits” (Simons & Hinkin, 2001, p.67). In fact, Lam, Zhang and Baum advocate that, “most of the literature on employee turnover suggests that labor
turnover is a “hidden” cost for most organizations. Additional recruitment and training costs must be incurred as well as a resulting decrease in productivity” (2001, p.157).

Hinkin and Tracey (2000) discovered that turnover is more likely to be associated with current job dissatisfaction rather than from an attraction to other job opportunities. In fact, employee commitment and job satisfaction are found to be negatively related to intentions to quit (Allen, et al., 2000). “Turnover is a symptom of underlying problems... caused primarily by poor supervision, a poor work environment, and inadequate compensation” (Hinkin & Tracey, 2000, p.21), not to mention, lack of training and organization dedication (Bowen, Kyriakidou & Warr, 2003). Bigne, Sanchez and Sanchez (2001) suggest, “in order to retain customers, organizations must seek to satisfy them, but a further objective must be to establish a lasting relationship” (p.608; Bigne, 1997).

Bayraktaroglu and Kutanis (2003) believe that the improvement of employees should be supported by the organization, and, as such, a suitable learning atmosphere should be created. This allows employees the opportunity to “contribute effectively to the performance of the organization” (p. 153). “During the past decade, [the workplace] has witnessed an increasing emphasis on learning at work and on the need to integrate learning and work for the good of both individual and organizations” (Ellstrom, 2001, p.421). In fact, according to Rowden, “developing the human resources of a company would seem to be key to increasing production and closing the gap between the level of worker skill and present and future needs” (2002, p.409-410). Allen, et al. (2003) proposes that certain human resource development programs should enhance retention.

Unbeknownst to the hospitality organization, management is utilizing the economic principle known as human capital theory as their guiding principle by incorporating education and training into their workforce. In fact, Parks (2003) suggests that “successful properties have realized that by keeping their employee’s skill level up and knowledge level sharp, they’ll benefit on several fronts” (2003, ¶ 1). Partlow (1996) proposes that quality training provides employees with the tools needed to recognize and solve problems.

However, investing in human beings to educate an organizations’ workforce is not a new process. In fact, the examination of training and development as an investment in human capital was pioneered in the early 1960s through works of important economic scholars like Schultz (1961), Mincer (1962), and Becker (1964) (Nafuko, Hairston, & Brooks, 2003). There are three key relationships in human capital theory. First, an investment in training leads to increased learning. Second, as learning increases, so does production. And third, as productivity increases, both individuals and the organization realize an increase in earnings. The model (figure 1.1) presented by Torraco (2001) incorporates these three ideas.

Figure 1. A Model of Human Capital Theory

As stated above and assumed from Torraco’s (2003) model, when the employees’ skills, productivity and quality of work improve, the organization realizes the benefits of education and training. According to Wang, Dou and Li (2002) “the effect of training on productivity growth is approximately five times as much as would be generated by compensation incentives” (Barron, Berger, & Black, 1993; Bishop, 1991 as cited by Wang, Dou & Li, 2002, pg. 205). Moreover, the return on investment (ROI) of training and education can be realized as “any
In understanding the ROI of human resource development practices, perhaps the organization is realizing an increase in earnings due to the retention of employees as well as increased output. In fact, according to a study conducted by Cox (2001) the “direct cost of turnover is estimated to be $813 million. The opportunity cost of turnover is estimated to be between $4.94 billion and $5.8 billion” (slide 5). Cox (2001) assumes every $1 direct costs equal to $5 of opportunity costs. Cox suggests that turnover exceeds the entire industry’s profit by 41 percent. These research findings propose that the increase an organization realizes by incorporating education and training into their workforce is due to retention rather than increased production.

In the hospitality industry, turnover is one of the leading causes of decreasing profits. In order to slow down decreasing profits, corporations have implemented rewards strategies rather than training strategies. In fact, hospitality organizations do not view training as a benefit, but merely as a cost. When budgets are strained, the training resources is the one of the first strategies of the firm to be put on hold, sometimes for a few weeks, in other instances, forever. Hospitality firms have been focusing on the short term benefits rather than the long term investment. Pollock & Ritchie (1990) posit that although firms seek to augment the skills of industry employees over lasting period of time, they develop a strategy to meet the short term training needs of the industry. According to Pollock & Ritchie (1990), firms implementing job training “have benefited from a useful preparation [of an employee] for an immediate position… [and] often do not perceive [training as] a long term career opportunity” (p.570).

As stated before, “lack of training is often cited as a main cause of turnover” (Breiter, 1991, p. 44). Bowen, Kyriakidou, and Warr (2003) believe that “training demonstrates a commitment to the employee and signals a desire to retain and deploy the individuals and their skills over time” (p.51). Previous research published in tourism management and hospitality journals have dictated that organizational dedication is linked to employee retention. Griffeth, Hom, and Gaertner (2000, p.480) discovered work satisfaction has the highest relationship to turnover; however, their findings also conclude that “organizational commitment predict turnover better than does overall satisfaction.” Moreover, Wright and Davis (2003) believe that job satisfaction has important implications on efficiency. “It is assumed that the benefits [job satisfaction] that employees receive from their organization influence the effort, skill, and creativity that employees are willing to provide their employer” (Wright & David, 2003, p.70).

Theory Building

Theory building has often not been recognized as having an important role in human resource development (HRD). Toracco (1997) states that a theory that is well constructed helps understand complex phenomenon. A simple and elegant theory provides a system for comprehending core ideas and inter-relationships among variables. Theories provide the basis for sound support of practice by helping us anticipate and address issues relevant for organizational performance. Theory building is therefore an invaluable tool for guiding practice in prescribing retention as important issue for increasing investments in human resource development. Incorporating retention to the human capital theory model can be recognized as a method of problem solving relevant to the hospitality industry. The statistics presented by Cox (2001) states that turnover exceeds the entire industry’s profit by 41 percent. This is a clear indication of the significance of retention in adding economic value to the hospitality industry. By addressing retention as the missing link that may dramatically improve overall organizational performance in the hospitality industry, theory building in this case has direct applications for improving the scope of practice.

Incorporating retention into the human capital theory model seems to be a reasonable and well-documented addition. The researchers propose the following revision to Torraco’s (2003) model (figure 1.2). The proposed model utilizes five key relationships that seem to be evident in human capital theory. First, an investment in training leads to increased learning. Second, as learning increases, so does production. Third, as productivity increases, both individuals and the organization realize an increase in earnings. Fourth, an increase in learning leads to augmented retention within the organization. And finally, an increase in retention leads to an increase in output as well as augmented earnings for the employee.
Figure 2. A Model of Human Capital Theory Including Retention

Conclusions and Recommendations

In conclusion, “employees stay with organizations because effective human-resources practices provide a supportive work-environment that affords opportunities to grow and develop” (Hinkin & Tracey, 2000, p.16). Moreover, Rowden suggests “organizations with the greatest harmony between organizational and individual goals are those that are sensitive to individuals and provide them with the resources and opportunities for learning and achievement” (2002, p.411). In the hospitality industry, human capital theory is an important and overlooked component of economics, focusing on education, and training. Perhaps investment in human capital leads to the retention of employees, thus positively or negatively affecting an organization’s financial status.

Swanson and Holton consider human capital theory as the branch of economics most applicable to human resource development (2001, p. 109). Human capital theory suggests that “society needs to invest in people for the sake of a stronger, more productive economy, and also to increase the opportunities and choices open to the individual” (Kagan, 2000, ¶ 8). However, some hospitality organizations view training as a benefit rather than as a standard firm procedure. The influence of human resource development programs on the turnover process has important implications for organizations; however, Allen, et al. (2003) remind managers that not all of the implemented human resource practices will directly affect turnover. Bartlett suggests that “HRD is one component of a complex set of management practices that together influence the attitudes and behaviors of employees” (2001, p. 349).

This paper is specific to the hospitality industry. Future studies need to be conducted that focus on the actual return on investment of training to retention. Moreover, research needs to be performed that depicts the process undergone in economic theory that reveals augmented earnings received from retention. Lastly, it is the researcher’s recommendation that future studies look at the benefits of retention on training and education of new employees within the industry. It is the author’s recommendation that further research regarding other HRD factors that also contribute to augmented earnings for both the employee and organization be studied.
Contribution to New Knowledge in HRD

As organizations recognize the importance of intangible assets and their impact on productivity and growth, few appear to correlate these assets and their measurement with the human resource development function (Cho & McLean, 2000). Previous studies have “recommended retention programs that could reduce turnover and its effects, [including] realistic job previews, job enrichment, workspace characteristics or socialization practices” (Pizam & Ellis, 1999 as cited by Milman, 2003, p. 19). Allen, et al. (2003) proposes that certain human resource development programs should enhance retention and contribute to employee motivation. Bartlett ads that “training and development contributes to desired workplace attitudes, including organizational commitment, which may in turn influence behaviors such as absenteeism and turnover” (2001, p. 349). Human capital theory “breaks down the barriers that now exist between organizational development approaches that attempt to influence climate and quality of work life, employee assistance, and other employee health and safety areas, and the more conventional training and development arena of human resource development” (Swanson & Holton, 2001, pp. 82-83).

This study will provide useful information to management and human resource practitioners within the hospitality industry. Most hospitality firms seek to reduce or manage employee because “employee turnover does more than reduce service quality and damage employee morale—it hits a hotel’s pocketbook” (Hinkin & Tracey, 2000, p. 14). Furthermore, the research will allow for the development of a more extensive human capital theory model to further research findings in the foundational guiding economic theories. This study will further research regarding human resource development and management techniques as related to hospitality organizations, so as to augment employee retention. Lastly, focusing on retention rates, human capital theory may be more quantifiable with regards to the return on investment of employee training practices.

Making Connections: The Link Between HRD Education, Practice, and Research

Lyndsay M. Taylor
Jamie L. Callahan
Texas A&M University

This study addresses the question of whether or not there is a linkage between HRD education, practice and research. By reviewing HRD graduate curriculum, AHRD member research interests, and analyzing the contents of the primary HRD empirical journal, we analyzed three years worth of data. Results indicated that there are many overlaps in the foci of HRD university curriculum to current research interests and publications.

When discussing Human Resource Development (HRD), a variety of debatable issues typically surface. What does HRD mean? (e.g., Lee, 2001; McLean & McLean, 2001; Walton, 2002). Does HRD have different meanings in different countries? (McLean & McLean, 2001). From which theoretical frameworks are HRD derived? (e.g., Swanson, 2001; McGoldrick, Stewart & Watson, 2001). Can we classify HRD as a discipline? (e.g., Kuchinke, 2001). Are there other, better ways to understand the nature of our field? (e.g., Ruona, 2002; Callahan & Dunne de Davila, 2003). Many of these questions are visible in HRD literature, university graduate courses and in the professional association for the field, the Academy of Human Resource Development (AHRD).

As HRD professionals in the United States, we have come to recognize and respect these debates that occur within the field of HRD. However, it is clear that these debates filter through not only the research and publications that inform our field, but also through the graduate programs that prepare researchers and practitioners to enter the field. Responding to calls from senior scholars in the field of HRD, Kuchinke (2002) conducted a study of the curriculum associated with HRD graduate programs in the United States. He noted a lack of alignment between publications in the field of HRD and curriculum in the graduate programs he studied:

When looking at the HRD curriculum, one sees that although much of the writing in the field stresses such topics as organizational learning, strategic HRD, international issues, workforce diversity, change management, distance learning, and the economic impact of HRD, these have not yet been translated universally into core curriculum content of HRD graduate programs (Kuchinke, 2002, p.140).

A lack of alignment between our research and practice could have serious consequences for our search for identity, as Kuchinke points out. Our research can include not only the publications in the core journal of our field, *Human Resource Development Quarterly*, but also the espoused research interests of members of AHRD. Our practice can be equated with the knowledge, skills, and abilities we impart through the educational programs that produce HRD professionals. Knowing more about linkage issues between HRD curriculum, HRD publications, and the research interests of HRD scholars could benefit novices in the field because they would be better informed about the nature of our community of practice. This information would also be beneficial to professionals in the field so that they might recognize if and where gaps exist that are contributing to the identity crises we are currently experiencing in HRD (Ruona, 2002). Thus, the purpose of this paper is to begin to identify both potential overlaps and gaps that currently exist between fundamental information taught to HRD graduate students (novices) and what today’s HRD professionals are researching and writing about.

Research Method

This study consisted of collecting, categorizing and analyzing existing descriptive data from three primary sources. The first source of data was from Kuchinke’s (2002) study of graduate level HRD curricula. From 1999-2001, Kuchinke studied the curriculum of United States – based HRD graduate programs (Kuchinke, 2002). One component of his study compares the HRD graduate course offerings to current HRD publications.

The second source of data was derived from the AHRD membership listings, which are found on CD-ROMs provided to AHRD members at the annual professional conference. In past years, these membership lists included research interests that individuals had provided as part of their professional membership applications. In order to appropriately compare data to Kuchinke’s study, the present research utilizes data from 1999-2001, the same years.
Kuchinke gathered his university curriculum data. However, the AHRD membership interests only appeared on the 2000 CD-ROM; the 1999 and 2001 membership listing did not contain the research interests of AHRD members. Therefore, the results of this study will only show what members were interested in researching during the year of 2000, and will not be representative of the three-year time span.

The third source of data came from a review and analysis of publications in the journal Human Resource Development Quarterly (HRDQ). HRDQ is the primary research publication in the field of HRD. The data used for the present study was derived from the table of contents (TOC) for all issues of HRDQ during 1999, 2000, and 2001; there were four publications each year. This analysis would show the current topics pursued by researchers, as well as what the topics that the editors found to be important for sharing with the HRD community. This review of publication topics may also shed light on current interests within the field of HRD.

To maintain consistency with the first source of data, the assessment of graduate HRD curricula, we attempted to use the same themes when analyzing AHRD member research interests and HRDQ publications. The first author conducted an initial analysis using the constant comparative method (Glaser & Strauss); the second author also conducted an analysis and the results were compared. Using a dialogue approach to clarify assumptions and decisions, the two authors came to agreement upon the themes presented for AHRD member interests and publications.

**HRD in Universities**

“In the absence of a central accrediting body at the program level and institution-level professional organizations, little is known about the total number of [HRD] program[s] in this country” (Kuchinke, 2002, p.129). However, the American Society for Training and Development (ASTD) periodically publishes a list of HRD related graduate programs; this list is composed as a result of information volunteered by U.S. universities (Kuchinke, 2002). Therefore, the list is not fully representative of all U.S. HRD graduate programs.

The names of these HRD related programs are not all always called ‘HRD’. Each program location, title and the required curriculum within the program are representative of the perceptions of what HRD means to that particular university, department and staff. Preparing students to go out into the world as HRD practitioners or leaders is ultimately in the hands of the university a student chooses to attend. Kuchinke’s study, based on the ASTD list of HRD graduate programs, focused on the location, title of, and the core curriculum of U.S. graduate programs:

The fifty-five programs were located in departments or units that were strongly heterogeneous in name, ranging from department of public administration and urban studies to psychology, leadership and organization, management, human services, counseling, curriculum instruction, and many others. In fact, there were no two departments with the same name and only a small number with similar names (those indicating emphasis on counseling, educational leadership, and adult education) (Kuchinke, 2002, p.135-136).

The most frequently mentioned department name with an HRD related graduate program was that of the college of education; “this [location within the university] represented seventy-six percent of HRD programs” (Kuchinke, 2002, p.136).

Does the difference in program names and location within the university necessarily change the curriculum that students are exposed to? Will graduates of these varied programs come out with relatively similar or varied educational experiences? Each university program uses their own process for developing the curriculum they provide to their graduate students. However, ideas advocated by scholars such as McLagan (training competencies) and Swanson (the three legged stool), are generally utilized in HRD graduate curriculum. Therefore, although varied, the core curriculum for HRD related graduate programs are somewhat homogeneous.

Kuchinke found that, “the fifty-five programs addressed a total of 981 content areas, with the average program covering about one-half of all areas identified.” (2002, p.138). The content areas were summarized into thirty-one topical content areas. Seventy-three percent or more of the programs required students to take courses in instructional design, instructional delivery, evaluation, and adult learning theories (Kuchinke, 2002, p.139). While just over fifty percent required courses relating to computer applications in HRD, organizational learning/learning organization, organization theory/behavior, and management of HRD. Forty to forty-five percent of programs required students to learn about communication, facilitation, psychological dimensions, strategic HRD, career development, distance learning, instructional media, diversity/multicultural HRD, and change management. Some less frequent, yet noteworthy, content areas that surfaced were leadership management (36%), international HRD (35%), action learning/research (31%), economic dimensions of HRD (27%), HRD/educational policy studies (22%) and quality management (20%).
We see that these graduate programs generally offer the same types of courses, although each individual program is slightly varied. We know this since there is not one content area that is covered in 100% of the HRD graduate programs. However, this shows us that even though our programs may be found in the management, education or psychology departments – and have different names such as HRD, OD, T&D or industrial psychology, each program offers similar HRD curriculum. For comparison purposes, Table 1 (below) contains an abbreviation of Kuchinke’s table showing the top fifteen university curricula content areas.

\( n = 55 \) (Kuchinke, 2002, p. 139)

Again, Kuchinke offers that his study had the limitation that he has only included fifty-five HRD programs in the US, when there are potentially hundreds more that were not identified in this study. Now that we have learned about the content areas that universities use to prepare their students for a career in HRD, it is time to analyze and compare the research interests of AHRD members. This information on research interests might inform universities of changes or improvements being made in the real world of HRD.

Academy of Human Resource Development (AHRD) Member Interests

AHRD members typically consist of university researchers/professors and HRD university students. While there are certainly other professional associations to which HRD professionals belong (e.g., Academy of Management, Society of Industrial and Organizational Psychology, Institute for Behavioral and Applied Management), AHRD is the only professional association dedicated to the advancement of HRD scholarship. Further, there are members of AHRD who consider themselves to be ‘HRD practitioners’ and are not affiliated with a university. Practitioners tend to participate less often than do university affiliates; this is because AHRD is a research-focused organization, while other professional associations, such as ASTD, Society for Human Resource Management (SHRM), and the International Society for Performance Improvement (ISPI) are more practitioner-focused. Thus, we felt that using the membership of AHRD was a sufficient proxy for capturing the research interests of those who identify themselves as HRD researchers.

On the 2000 AHRD CD-ROM there were a total of 650 members. Five hundred and fifty members were from North America; ninety-five members were from Australia, Hong Kong, Singapore, Switzerland, Korea, or the Netherlands; and five members noted their origin as being either ‘HRD’ or ‘ISPI’ (International Society for Performance Improvement). We did not have access to the specific nationalities of each member, just the country in which they claim residency, for AHRD membership and correspondence records. For analyzing purposes, ‘HRD’ and ‘ISPI’ members will be analyzed as being residents of North America. Each member had the option of reporting his or her top three research interests. Seventy percent of members volunteered to report their primary research interest to be shared with other members. 398 North American members and 65 International members are who made up the research interest population for the year 2000. Therefore, 62.27% of North American members and 65% of International members participated by sharing their research interests.
Because few members reported a secondary research interest and even fewer reported a third, only primary research interests were included in the present study. There were 323 different ‘primary’ research interests given by the 458 total respondents. Since one purpose of this study was to determine whether there was a link between Kuchinke’s curriculum study and the research interests of the HRD community, we began analyzing the primary research list by matching them to the content areas listed in HRD university core curriculum. This matching process enabled us to narrow the 323 different research interests into ninety-three research themes. Many interests were specific and did not fall under the general content areas listed in Table 1, nor did they match the interest of other AHRD members; this prevented further ‘grouping’ of themes. The top fifteen of the ninety-three research interests are reported, according to their frequency, in Table 2.

Because there were 458 individuals with 93 different topical research interests, most research interests accounted for only 0.2 to 1.0 percent of the total population of respondents. The top fifteen interests represent eleven percent or more of the total respondents. Although each member’s interests are important, the purpose of this study was to analyze what AHRD members were most interested in researching, most of these are represented on Table 2. When the research interests were assessed by geographical location, members from North America were most interested in leadership/management development and transfer of training/learning, respectively. International members showed most interest in workplace learning/group learning, followed by training and development.

One interesting finding was that three research interest themes found in the top fifteen of AHRD member interests were not found on Kuchinke’s curriculum content listing as separate, specific courses. Transfer of training/learning, training and development, and workplace learning/group learning are broader interest areas that are likely components of other courses in HRD graduate curriculum. On the other hand, twelve of the top fifteen research interests are being addressed in HRD graduate programs already. Some of the most frequently mentioned research themes are in fact being taught in the university, but are being taught less frequently than other content areas. For example, leadership/management development and international HRD are in the top six research interest of members, but in the university they are only listed as number 26 and 27 (out of 31) as their frequency of being present in university curriculum. Kuchinke’s observation that HRD literature focuses on organizational learning, workforce diversity and international issues would seem to be valid, based on the top fifteen research interests listed in Table 2. These three issues are weighing on the minds of HRD professionals, but are not being taught specifically as core curriculum in our universities. It remains to be seen if the field is actually publishing manuscripts that address espoused research interests of AHRD members and core content of HRD graduate curricula.

HRDQ Publications

*Human Resource Development Quarterly* is the flagship empirical research journal within the field of HRD. The editors of this journal are responsible for making the final decision as to what is and what is not going to be
published in the journal. Therefore, what we read in *HRDQ* is not only representative of what is being submitted to the journal for publication (researcher interests), but also what the editors find worthy of publishing.

Since this study was meant to determine whether there was a linkage between university curricula, to professional interests, and finally to what we are actually publishing to inform the HRD community, *HRDQ* was the publication of choice. The authors obtained the TOC for the years of 1999-2001. Several components were analyzed during this process:

1. Were there themes in the titles of the articles that matched those of Kuchinke and the AHRD membership interests? If so, how many? And what were they?
2. Since there are both peer-reviewed and non peer-reviewed entries in the HRDQ journal, which themes were peer-reviewed, and which were not (which ideas are being published based on more than one HRD person’s perspectives)?

The table of contents in *HRDQ* has five sections: editorial, feature, article, forum, and discussion. The only section in the journal that is peer-reviewed is the articles section. All other sections are included on the judgments of the editors; scholars do not conduct a blind review of the ideas, validity, and quality of articles/papers in the editorial, feature, forum and discussion sections. This component of analysis may or may not show that peer-reviewed articles are more likely to match themes found in the other two areas of this study.

During the three-year time span, there were twelve journals published. There were a total of sixty-seven items published in *HRDQ*. Of these sixty-seven items, thirty-five were peer-reviewed articles, and the remaining thirty-two were not peer-reviewed. The number of peer reviewed versus non-reviewed were nearly equal. Table 3 highlights the top themes found in *HRDQ* manuscripts. Only those themes that appeared more than twice were included in the present study, resulting in only nine reported themes.

*n=67*

Organizational analysis, diversity/multicultural HRD, leadership/management development, facilitation and adult learning theories, were by far the most apparent themes which were published in HRDQ between 1999 and 2001; these themes show us that we are in fact teaching current, real world HRD issues in the university setting. However, there is one content area that is very evident in the HRDQ publications and is reported as being the number two research interest of AHRD members, but is not specifically identified in university curriculum—transfer of training/learning.

**Limitations**

Limitations to this study are present in both our current study, as well as in the Kuchinke study, which is where 1/3 of the data was derived. Kuchinke’s study “does not represent the universe of HRD programs, but a purposefully selected volunteer sample, thus the findings do not generalize beyond the fifty-five programs [studies]” (Kuchinke, 2002, p.141). Also, “even though coding curriculum content areas instead of course names gives a more detailed picture of what is being taught…the information in [his] article is likely to hide additional detail that would be uncovered in a fine-grained study” (Kuchinke, 2002, p.141).

Another limitation in the present study, regarding the AHRD membership interests is that we only had access to research interests reported in the year 2000. The other data analyzed in this study was representative of data reported during the three-year period of 1999 –2001. Therefore, different or additional key research interests could have been available from other sources with which to compare to curriculum and publications. Also, within the 2000 research interests, we focused on the primary research interests rather than all three-research interests reported. There were, by far, more primary research interests available than there were secondary or third research interests.
In researching only AHRD member interests, we may get an accurate picture of what university students and academicians are interested in knowing more about concerning HRD issues; but we would not be representing HRD field practitioners, who are members of professional organizations like ASTD, SHRM, OD Network and other such associations. Had we collected and analyzed research interests of members belonging to these HRD-related organizations, we may have shown different or additional areas of interest. In addition, during this process of analyzing research interests was our goal was to remain neutral, but our perceptions as to what may or may not ‘fit into’ a certain ‘content area’ or category may be different than someone else’s, thus possibly skewing the data.

By reviewing only HRDQ, we have limited ourselves to one journal’s perspective on what is important to publish for the HRD community. Another approach might have been to identify each member of AHRD and to conduct literature review searches for their publications. Interestingly, such an approach would have given us access to what those who claim to be HRD scholars are writing, but, since our identity standard bearer is HRDQ, we would not have been exploring the link we sought. Namely, we wanted to know if what we taught was consistent with our declared interests as HRD scholars and with the portrait of HRD presented by our flagship journal. Again, we used personal judgments in which titles belonged to each ‘theme’; and, although we conducted checks of our respective judgments by independently reviewing each others’ analyses, our mental process in organizing the data may be different than someone else would have done it.

Implications for HRD Research and Practice

While the present study has limitations, the exploratory nature of the study reveals several areas for consideration in strategically positioning HRD as a viable professional and educational field. By reviewing the research (publications and interests) and practice (education) within the field of HRD, we see both overlaps and inconsistencies.

Kuchinke (2002) suggests that our graduate curricula should be updated to meet current research publication topics. While we do agree that the more popular themes in research publications and interests are not well represented in the graduate curriculum of most programs, the present study does suggest that we are on the right track with our HRD graduate education. For the most part, AHRD members express a high level of interest in issues associated with training and learning. This interest in training and learning concepts can also be seen in the major research publication of the field, HRDQ.

This interest is quite consistent with the history of the field. Training and learning have been foundations of the field since Nadler initiated the first HRD graduate program at George Washington University in the 1960s (Ruona, 2000; Callahan, 2003; Swanson & Torraco, 1996). However, the three-way comparison conducted in the present study reveals a potential disconnect between our research and practice. Our graduate programs tend to teach small components of the training process, with in-depth courses on assessment, design, delivery, and evaluation. Themes identified in both the publications and in member research interests suggest that at least two changes in our curriculum could (and should) be made.

First, the issue of transfer is clearly of substantial importance to current researchers. However, there are no specialization courses on this particular aspect of the training process as part of the core curriculum of graduate HRD programs. The curriculum suggests a focus on simply preparing and providing training, without substantive consideration of the impact of that training. This reflects a growing strategic orientation in current research, while current education lags behind. While this is largely due to the bureaucratic nature of large educational institutions, this strategic orientation to training should be reviewed for inclusion in graduate curricula.

However, by focusing only on parts of the training process, we potentially miss the opportunity to strategically identify our real strength as a field. Our strength is our ability to use those constructs of learning and development as a foundation for multiple types of interventions that go well beyond training. Thus, the first change we would advocate is a more mindful consideration of an overview of training and development as a broad approach to applying learning theories to improving people and the organizations in which they work. At the same time, however, we advocate having more detailed coursework on the impact of training transfer. We suggest having both the overview courses that illuminate how all the parts fit together and also the specialization courses that give HRD novices the necessary skills to practice at all levels of the HRD profession (i.e., not just as training designers, but as training directors or HRD directors).

The second major change we would suggest is based on the heavy organizational level focus of both interests and publications. Organizational analysis is one of the most popular interests among HRD scholars. However, HRD coursework does not include required courses from disciplines that focus on the collective. The shifts in research interests and publications toward a better understanding of how learning and training inform the collective suggest that we should require courses from sociology or anthropology. These disciplines are specifically focused on developing knowledge about and understandings of the collective. If we are to take a truly systemic view of HRD
and the way HRD interacts with the systems in which it is embedded, we must better educate ourselves and novices about theories of the collective.

**Conclusion**

The purpose of this paper was to identify both potential overlaps and gaps that exist between fundamental information taught to HRD graduate students and what today’s HRD professionals are researching and writing about. Identifying key content areas in HRD university graduate curriculum, AHRD research interests and HRDQ publications allowed us to find ‘key’ issues in HRD from three different angles. There were many three-way overlaps with foci such as: evaluation, leadership, management/development, OD, diversity/multicultural HRD and needs/performance analysis. So, we would suggest that several aspects of HRD research and practice are in fact linked.

In fact, there appear to be many more overlaps than there are gaps. There are several small gaps, but only two of great concern. The two notable gaps between what we teach novices to what we are facing in the ‘real world’ deal with training: T&D and transfer of training/learning. The desire of HRD professionals to be seen as something beyond ‘trainers’ is understandable. However, training is core to the nature of HRD and can be leveraged to a strategic level if incorporated with principles of learning and performance at the organizational level. Our answer for survival as a distinct field of practice and research is not to abdicate our roles as purveyors of learning in the organization. Instead, our answer is to demonstrate the full range of learning and development constructs that can be used to lead to equifinality of improved individual and organizational performance.

These topics being addressed by HRD professionals and HRD publications are an avenue for us to see where the field of HRD is ‘headed’. With the research presented in this paper, it is evident that our HRD interests have heightened in the areas of T&D, transfer of training, and management development/effectiveness. However, our field appears to be rather stagnant overall. Most frequently reported interests and publications are closely in alignment with our current HRD curriculum. Something to consider, prior to deciding whether we truly have a linkage between HRD education and the real world, would be to analyze HRD practitioners (possibly members of ASTD) in addition to looking solely at the opinions and articles developed by researchers, or academics.

**References**

This paper explored HRD-related job advertisements in the state of Arkansas over a five-year period. This analysis was part of the curriculum revision process for a graduate Workforce Development Program at the state’s “flagship” university. Classified advertisements from newspapers of major cities across the state were examined to determine if changes in recruitment terminology represented the changing needs of business and industry and if the curriculum of the graduate Workforce Development Program reflected those needs.

Keywords: HRD, Human Resources, Recruitment

Arkansas, like other rural states, faces major challenges inherent with increasing economic growth and development while mitigating poverty. Poverty impacts the entire state but is more pronounced within specific regions, such as the agriculturally based and less densely populated south delta. Existing data show that the employable workforce in Arkansas is inadequately educated to meet current and future needs of business and industry. The percentage of adults in Arkansas with a bachelor’s degrees or higher was 16.6 percent — lower than the U.S. average (SREB, 2003).

Research supports the notion that the changing landscape of global economies requires employees to become more knowledgeable and technology-savvy in order to compete for and maintain continuous employment. The economic problems facing Arkansas, especially in the depressed rural areas, require developing a better-trained and educated workforce. The process of planning programs to transform Arkansas’s economy is literally an HRD issue. Higher education plays a crucial role in supplying business and industry with employees that are competent to meet the demands of diverse work environments. In a rapidly changing economy, HRD activities such as training and development assume greater significance to organizations (Bartlett & Porter, 2001; Ulrich & Lake, 1990). Therefore, academic programs that prepare HRD professionals are compelled to ensure that competencies taught are aligned with competencies needed and sought out by business and industry.

To evaluate the alignment of current programmatic content with competencies needed by business and industry, the data from this research functioned as a resource for revising a graduate Workforce Development Program at the state’s “flagship” university. By comparing the HRD skills and positions for which business and industry were soliciting, the curriculum could be revised to better reflect the changing needs of employers within the area. The stakeholder evaluation and environmental scanning are well-established practices in program planning and assessment. Data from a comparison of HRD-focused classified job advertisements could document the need to adjust programmatic content to meet employer needs.

Problem Statement

While empirical evidence exists regarding the increasing role of HRD in organizational transformation, no research in the State of Arkansas currently exists to show the extent to which training, training & development, career development opportunities, and organizational support enhancement opportunities are made explicit in job advertisements. In the last five years, Arkansas has experienced rapid population and economic growth in the Northwest region. This, due in part to the phenomenal growth of Wal-Mart, the largest and most profitable private organization in the world which is headquartered in Northwest Arkansas. To better serve this retail giant, a number of international manufacturers and vendors have established sophisticated “teams” in the area to ensure that the Wal-Mart – supplier relationships flourish and that profits increase. Given that in 2003, Fayetteville Arkansas was rated the top city in the U.S. with respect to growth and diverse, stable economies (Milken Institute, 2003), it seemed reasonable to assume that considering the state’s changing demographics, escalating global penetration of businesses within the state, and its expanding economic development, that the HRD-related skills that employers needed had
also changed. Therefore, the primary objective of this study was to determine the degree to which recruitment advertisements from organizations’ within the State of Arkansas made explicit references to the role of HRD in job descriptions or required skills. Classified job advertisements from 1997 and 2001 were compared to determine if there was an increased number of references to HRD over the five-year period and how those references differed, and possibly identifying trends that will impact the profession and the institutions that prepare HRD professionals.

The data from the study were intended to be used by faculty members at the state’s flagship university to help determine if ongoing curriculum revisions within a graduate Workforce Development Program were aligned with the espoused needs of business and industry within Arkansas. The classified advertisements were one of many data sets used to assess stakeholders’ needs during the curriculum revision process within the university.

Research Question

One primary research question guided the study. This exploratory study analyzed the changes in HRD-related terminology and job descriptions that business and industry solicited in classified advertisements in the years 1997 and 2001. These changes were then analyzed to evaluate the degree to which the current graduate Workforce Development Program at the state’s flagship university was aligned with the espoused needs of business and industry.

Theoretical Framework

Organizations scan the environment in order to understand the external forces of change so that they may develop effective responses which secure or improve their position in the future, to avoid surprises, identify threats and opportunities, gain competitive advantage, and improve long-term and short-term planning (Choo, 2001). Environmental scanning as part of program planning and evaluation is commonplace. Reviewing the changes in job postings associated with HRD-related functions over a period of time is a form of environmental scanning. Choo (2001) states that "Environmental scanning includes both looking at information (viewing) and looking for information (searching)" (p. 1). A number of studies have found environmental scanning linked to organizational performance (Choo & Auster, 1993; Ptaszynski, 1989). In this study, the researchers looked for differences in the way HRD-related jobs were advertised and described in classified advertisements in 1997 and 2001 to identify trends that could assist faculty in curriculum development.

Stakeholder evaluation, the process of analyzing the perceptions and preferences of those that are impacted by a particular service or event, is a response to manage the mercurial nature of customers. Higher education is not immune from this pressure. A recent report by the University of Twente (2001) discusses how institutions of higher education, due in large to the network economy, are forced devise efficient methods to meet the demands of business and industry, the local community and society at large. The report suggests that adaptive organization that monitors its environment, identifies trends and key actors with whom to relate (stakeholders), has sufficient intra-organizational flexibility to respond to need of it stakeholders and constituents is more likely to remain competitive.

While the importance of HRD activities to organizational health is well documented, there is limited research regarding the programs offered by academic institutions to prepare future HRD professionals (Kuchinke, 2001). Abbot (1988) suggests that as the field matures, university degrees and other credentialing programs become critical to preparing HRD professionals. Kuchinke (2001) points out that given the decentralization of education accreditation within the U.S., there is no national body charged with identifying and maintaining the skill standards and professional certification of HRD professionals. While many institutions have used the extensive research of McLagan (1983) to guide the development of curricula skills and competence ties for HRD programs, Baylen, Bailey, and Smardzija (1996) found that programs focused primarily on training roles of HRD practitioners and barely covered the more strategic roles such as budget/cost analyst, strategic planner, manager of change, and performance technologist Kuchinke (2001).

In the spirit of continuous improvement, similar to those used in business and industry, some educational institutions have adopted a multi-rater assessment method to evaluate existing programs and identify trends among stakeholders. Triangulating data sources allows cross-validation of findings from different individuals and groups who have been identified as accurate sources of information (Willis & Kahnweiler 1995; Atwater & Waldman, 1998). Collection and analysis of job recruitment advertisements provide information regarding powerful stakeholders, the potential employers of HRD students. To consider employer needs that are reflected in job announcements is consistent with stakeholder methodology of assessment and evaluation.

Because this study explores HRD-related job advertisements, we must consider the research regarding expectancy theory and motivation. Expectancy theory assumes that motivation is a process of conscious choice and
that people choose to put their effort into activities they believe they can perform (Desimone, Werner, & Harris, 2002). Therefore, the language and descriptors used in job advertisements influence a person’s perception of their ability to perform and could, therefore, influence their inclination to apply for these positions. This is an important antecedent to the psychological contracts and the social exchange theories that Bartlett & Porter, 2001 & Blau, 1964 discuss regarding job advertisements. The degree to which there is a perceived match between the needs and expectations of employers and employees depends on there being a shared meaning of the terminology as it relates to performance and ability. For this to occur, job advertisements should correspond with the expectations of those seeking employment in a given occupation. Whenever a match occurs, there is the expectation for each party to maximize their objectives.

Method

The methodology employed in this study was patterned after a similar study by Bartlett and Porter (2002). In their study entitled: the role of training and development in newspaper recruitment advertisements, Bartlett and Porter explored at a national level if firms were more likely to mention training and development opportunities in their newspaper advertisements. Our study focused on how job advertisements could help in the curriculum reform process of a graduate Workforce Development Program. While macro level studies are important, there is need for micro level studies to shed light on what is happening at state levels. Just like the Bartlett and Porter (2002) study, the researchers in this study thought by including human resource development in recruitment advertisements, business firms in the State of Arkansas would be demonstrating their commitment to the human resource frame of organizations (Bolman & Deal, 1997) and suggesting trends that would be beneficial to the curriculum redesign of an academic program.

Research in the field of human resource development and recruitment advertisements has established that opportunities for career growth have been ranked high among job attributes by job seekers (Bartlett & Porter, 2002, Jurgensen, 1978). This is in line with the human resource frame that focuses on the need to provide opportunities for job growth and advancements as a powerful way of developing human resources in organizations. For instance, Barber and Roehling (1993) established that job postings with more detailed information were more attractive to prospective applicants than those with less details. Redman and Mathews (1995) found that newspaper advertisements had changed over time to reflect the changing job duties of human resource development managers. The only study known to focus on the wording of recruitment advertisements in relation to references of employer provided training and development was conducted by Bartlett and Porter (2002).

Content analysis was the primary method employed to gather data in this study. Data pertaining to frequencies and percentages were collected to establish if references to training and development in newspaper job advertisements in the state of Arkansas occurred more frequently in 2001 than in 1997, a five-year period. The researchers relied on content analysis technique of Kassarjian (1977) and Bartlett and Porter (2002) to examine the exact text in the newspaper recruitment advertisements. Thus, content analysis has been defined as “being a scientific, objective, systematic, quantitative, and generalizable description of communication content” (Kassarjian, p.10). It is also noted “this method of inquiry is well established in marketing, social psychology, political science, and consumer research, yet no evidence exists within the HRD literature” (Bartlett & Porter, 2002, p. 807). In order to establish HRD-related advertisements were more frequent in 2001 than in 1997, a five-year difference, classified job advertisements from newspapers of seven major towns in Arkansas with a population over 30,000 people were examined. The researchers also analyzed the changes in terminology in the job ads from these two years to determine occupational trends within the region. Given the accelerating change within organizations and in the field of HRD, a five-year period was considered adequate to notice increased usage of HRD terminology and analyze changes in terminology in job listings.

Sample

The procedure for selecting the towns to be studied focused on giving every town with over 30,000 people an equal and independent chance of being included in the study. The analysis was limited to the main newspapers from seven major towns in the state of Arkansas. The U.S. census (2000) data were used to identify towns having a population of or greater than 30,000 people. Table 1. shows the main towns studied, populations, region, primary newspapers, and the leading economic activities.

Procedures

The newspaper recruitment advertisements were read and classified by the absence or presence of the following HRD terms: training opportunities, training and development opportunities, development opportunities, career development opportunities, tuition reimbursement policies, and organizational support enhancement opportunities.

Source: U.S. Census Bureau (2000).

Additionally, the recruitment advertisements were examined for the presence of the following key terms associated with HRD: personnel manager, production manager, benefits manager, human resources, content developer, program designer, director of human resources, human resources manager, manager of human relations, chief learning officer, learning and development, performance management, organizational management, director of change, human capital manager, knowledge manager, and chief learning officer. The analyses of these terms was considered important in terms of comparing what business and industry solicits and what our own HRD programs were offering prospective practitioners. The Mullins library at University of Arkansas keeps all the Sunday papers, including job advertisements. With the assistance of the library staff, all the papers for the two years were identified. The relevant pages were all copied and read by the three researchers who subsequently highlighted the relevant recruitment advertisements. A total of 41 job postings fit the research criteria and were included in this study.

Results

An unexpected outcome of this analysis was a decrease in the number of HRD-related classified advertisements in 2001 when compared to 1997. Out of the 41 total number of job postings that fit the criteria of the study, only 10 were from 2001. The remaining postings were from 1997 advertisements. While the scope of this study did not include determining why there was an increase or decrease in HRD-related jobs, there are several possible explanations for this phenomenon. One explanation could be the decline in newspaper subscriptions over the past 30 years. The Baltimore Business Journal citing a recent study indicated that nationwide readership dropped to 54.7 percent in 2000, down from 60.7 percent in 1997 (2002). The Silicon Valley / San Jose Business Journal reported that in 2001, 45.3 percent of those who responded to a media research survey covering 85 markets within the U.S. were not exposed to local daily newspapers and local daily newspapers struggle to keep 45 to 50 percent of adults as readers (2002).

Another explanation for the decrease in the number of HRD-related print job postings in 2001 could be linked to the increasing number of employers that post jobs electronically. Many employers now have links on their own web sites that display employment opportunities and others use independent employment web sites, such as Monster.com. According to a recent article in the Silicon Valley / San Jose Business Journal, those who consistently access newspaper web sites are more inclined to go to Monster.com than to the employment section of the daily newspaper that they regularly access (2002). Results of data analysis for HRD-related job postings for 1997 and 2001 are summarized in the following sections: type of organization soliciting HRD-related job, job titles, primary duties specified in the recruitment advertisements, qualifications, and required work experience.

Types of Organizations Soliciting HRD-related jobs

The types of public and private organizations that used print-based media to solicit job applicants represented: education, health care, information technology, retail, manufacturing, services, and consulting.

Job Titles of HRD-related job postings

The job titles used to advertise these positions included: HR manager, HR generalist, assistant director of HR, personnel supervisor, recruitment manager, project advisor, education liaison, training coordinator, benefits administrator, training supervisor, education manager, services director.

Major Duties of HRD-related jobs

The major duties of these jobs used the following descriptors: occupational and educational development,
program development, training development, training facilitator, benefits administration, compensation development and management, staffing and employee education, coordinate staff education, education advocate, relationship management, labor relations management, policy administration, recruitment development, salary and benefits administration.

**Qualifications**

The following is a summary of the various qualifications that were required for the positions: demonstrated leadership ability, teaching skills, computer skills, goal oriented, clinical administration, management experience, labor relations, highly developed communication skills, assessment development, motivated, self-starter, supervisory experience, business experience, resilience, and bilingual.

**Education / Experience**

Of the 41 advertisements included in this study, only three (3) did not require a college degree. The other 38 required a college degree and six (6) either required or preferred a graduate degree. All 41 job postings required between two (2) and seven (7) years of related experience.

**Changes in Terminology**

When the job postings from 1997 were compared to those from 2001, there was no appreciable change in the terminology used to solicit jobs. Clearly, with only one quarter of the job postings from 2001, no trends were identified that might benefit curriculum development. However, when the entire 41 job postings were considered, there were several indicators that need to be considered when competing program design.

While the data clearly indicate that employers are asking for skills in training, training and development, program development, these skills are not well reflected in our graduate programs. Current workforce development programs within the institution use the language of vocational education and adult education, not training and development and organization development. This study enabled the researchers to see a disconnect between the language of program offerings and the skills and competencies for which business and industry were asking. This analysis lead to the creation of the Task Force on Curriculum Reform within the department to further examine this phenomenon. This task force will focus not only on content, but how we can provide our students with bone fide HR experience as a part of the curriculum. This will involve not only programmatic changes, but necessitate the development of external partners from business and industry who can provide incubators for experience.

**Discussion**

This study raises several areas that need further exploration to explain why job advertisements referring to HRD did not substantially increase over a five-year period. One possible explanation is that a disconnect exists between the vocabulary among business, industry, and academia regarding HRD skills and competencies. For example, having good oral and written skills may signify a person’s ability to lead change in the mind of prospective employers. Business and academia may be speaking languages when it comes to describing HRD skills. Another possible explanation could be that many of the strategic skills that HRD practitioners should cultivate are less quantifiable than those that can be tested or documented. Strategic abilities such as those associated with change agent are less easily demonstrated in the job application process. In other words, metrics to evaluate the level of strategic skills may not be known to the prospective employer. Still another possible explanation is that the majority of businesses within the state are not “high tech” enterprises. While production and service sector businesses certainly have a need to develop human capital, the degree to which they depended on employees for strategy differs from those within the high tech fields that are born and thrive on the fringes of innovation.

While existing literature supports the notion that organizations now recognize the value of providing training opportunities to their employees (Bartlett & Porter, 2002), no advertisements cited in this study mentioned the availability of training opportunities to the prospective employees in their advertisements. What emerges clearly in the job advertisements is the demand for employees with training, training and development and program development skills. This information is important for curriculum design purposes. Implications from the results of this study suggest that HRD scholars should work closely with HRD practitioners, HR managers and recruiters in terms of developing programs that meet the needs of business and industry. It is obvious from the results of this study that training is becoming important among the recruiters.

Work Practice, Learning Worker Characteristics and Informal Learning

Anja J. Doornbos  
University of Nijmegen

This study explores which work practice and learning worker characteristics relate to different kinds of informal learning. Informal learning is viewed as an integrated process consisting of an interaction process between learning workers and interaction partners and an internal psychological process, leading to an outcome. A sample of 279 police officers filled out a questionnaire. Preliminary analysis shows that external input, collegial availability, valuing informal learning, police tenure and hours spend on jobs besides police work predict informal learning.

Keywords: Informal Learning, Work Practice, Learning Worker

Whether and how people learn at work is influenced by how work practices ‘invite’ employees to learn at work (Billett, 2002). The type of workplace activities that individuals are able to engage in and their access to guidance is central to their learning. Both have consequences for the knowledge individuals construct through work. Interest and recognition of the importance of the work practice as learning environment has grown recently in HRD literature (Bolhuis & Simons, 1999; Eraut, 2000; Onstenk, 1997; Simons, Linden van der, & Duffy, 2000), although the body of empirical literature is less profound (Eraut, Alderton, Cole, & Senker, 1998; Kwakman, 1999; Woerkom, 2003). Especially, informal learning that happens without involvement of educational providers in the work practice lacks researcher’s attention and empirical grounding.

The close relationship between working and learning make it difficult to recognise learning separately from working since in most cases working and learning are intertwined (Eraut, 2000). Informal learning may happen by carrying out tasks, following personal interests, setting rather undetermined career goals, solving problems or trying to develop something further. Learning is situated in the activity in which it takes place (Wenger, 1998).

Informal learning is therefore defined as all learning that does not take place within, or follows from a formally organised learning program or event and often happens implicitly through work activities (Eraut, 2000; Marsick & Watkins, 1990). More specifically, we approach the nature of informal learning in this study as an integrated process consisting of an interaction process between learning workers and their interaction partners and an internal psychological process leading to an outcome (adapted from Illeris, 2002). In order to pursuit the goal of the study, the psychological process is operationalized in terms of learning worker’s ‘intentionality’ and the interaction process as ‘developmental relatedness’. We will further elaborate on these concepts of informal learning in order to provide a descriptive typology of informal learning. Finally we select work practice and learning worker characteristics that may predict differences in informal learning. The purpose of this paper is to explore which selected work practice and learning worker characteristics relate to informal learning at work.

Informal Learning: Intentionality and Developmental Relatedness

We apply the concept of intentionality as one part of the integrated process of informal learning, where it refers to whether or not learning workers are consciously and internally initiated engaged in activities pursuing a learning outcome. According to cognitive psychological notions, intentionality refers to whether an act of will, of which the individual is aware, is a necessary condition to put the process in motion: that is to start it (Bargh, 1996). The idea that informal learning may or may not be triggered by intentions is grounded in the work of several authors on learning at work that hold related notions (Bolhuis & Simons, 1999; Coffield, 2000; Eraut, 2000; Marsick & Watkins, 1990; McCauley & Hezlett, 2001; Megginson, 1996).

Learning worker’s intentionality may be spontaneous or deliberate. Spontaneous learning happens in those activities that are performed with another goal in mind than to pursue an opportunity to learn. Learning outcomes emerge or may be unexpected and can be described as by-products, discoveries, coincidences, or (sudden) realizations. Sometimes the learner may remain unaware of the changes, for example when there was no reflection (Marsick & Watkins, 1992). Deliberate learning on the other hand refers to those activities that are performed with the goal in mind to pursue an opportunity to learn. Learning outcomes are planned, sought for and sometimes calculated.
We apply the concept of developmental relatedness as the other part of the integrated process of informal learning, where it refers to whether learning worker outcomes result from direct or indirect social interaction. If there was direct interaction we further distinguish whether learning outcomes were generated for the learning worker solely or for his/her interaction partner(s) as well. From a constructivist perspective, social interaction is at the core of the developmental process and individual cognitive development is a process constructing a personal understanding of relevant structures of meaning derived from action (Fenwick, 2000). In this developmental process interaction partners do not necessarily play an explicit role of being a learner or developer; learning outcomes are a result of interactions while working (Marsick and Watkins, 1990). We discern three different kinds of developmental relatedness: ‘learning individually’, ‘learning in interaction with others’, and ‘learning together’. The first kind of developmental relatedness is when an employee and others indirect social interaction that contributes to learning outcomes through media and artifacts, such as when workers pick up a manual to study a topic. The second kind of developmental relatedness is when workers learn through interaction with other people at work and this contributes to their learning outcomes and not necessarily to the development of their interaction partners. Of course there may be learning outcomes for the interaction partner(s) as well, but they remain outside awareness of the individual learning worker. In that sense there is a one-way developmental relation. The third kind of developmental relatedness is when learning workers and their interaction partner(s) both contribute at the same time to each other’s learning outcomes and therefore both benefit from the interaction (see also D’abate, Eddy, & Tannenbaum, 2003). In that sense there is a two-way or mutual developmental relation. Learning together may happen in a group of people and be task oriented or driven by a shared interest (De Laat & Simons, 2002; Van der Krogt, 1998). Interaction partners fulfill the role of learner and guide in which they offer each other knowledge, e.g. in brainstorming about a work related topic. This sharing and negotiating of knowledge is often implicit but more and more recognized as an important asset for the organization (Senge, 1990; Watkins & Marsick, 1993). Learning together may also happen in an exchange between two colleagues who both have something to give, in which the other is interested.

In learning from others we further distinguish the location and the hierarchical level (Levy, Collins, & Nail, 1999) of the interaction partners (D’abate et al., 2003). The organizational location refers to whether the interaction partner is in the same organization as the learning worker (internal) or in a different organization (external). The hierarchical level refers to the social status of the learning worker in relation to the interaction partner; the status can be lateral (e.g. peers, team mates), downward (e.g. learning worker is at a lower hierarchical level), or upwards (e.g learner is at higher hierarchical level). The reason for doing this, is that it is assumed that learning happens through the possibility to be involved with a variety of interaction partners in different kinds of social networks (Wenger, 1998). People in different positions within the vocational practice provide different potentials in employees zone of proximal development (Vygotsky, 1978).

The combination of intentionality and developmental relatedness provides a descriptive typology of informal learning different kinds of informal learning. We view informal learning on a micro level as a single developmental interaction (D’abate et al., 2003). In Table 1 illustrative examples are listed.

**Work Practice and Learning Worker characteristics for Informal Learning**

It is recognized by many scholars that learning at work is best understood through examining the relationship between work activities, the cultural and social relations of the workplace and the experience and social world of the participants (Evans & Rainbird, 2002). Billett (2002) addresses in this respect that workplace experiences are a product of the historical-cultural practices and situational factors that constitute the particular work practice, which in turn distributes opportunities for participation to individuals or cohorts of individuals. That is, they shape the conduct of work and learning through these practices. Consequently, we question the relations between work practice and individual learning worker characteristics and informal learning. Based on previous work on workplace conditions six characteristics of the work practice were selected that may influence work-related learning and are shown in Figure 1. Managerial support in terms of
encouragement and facilitation of resources stimulate work-related learning as well as the availability of knowledge and knowledgeable colleagues do (Billett, 2002; Eraut et al., 1998; Kwakman, 1999; Onstenk, 1997). Furthermore the kinds of practical work activities people perform in terms of task complexity, variation and autonomy influence learning (Billett, 2002; Ellström, 2001; Kwakman, 1999; Onstenk, 1997; Straka, 2000). Based on previous empirical work, it is assumed that these work practice characteristics stimulate informal learning (Kwakman, 1999; Straka, 2000; Woerkom, 2003), whereas work pace would inhibit informal learning (Kwakman, 1999).

Beyond the opportunities of the work practice is the ‘agency’ of the individual, which determines whether and how individuals learn through work. ‘Ultimately, individuals’ learning may always be in some way unique to their personal histories, which are shaped socially through variations in and complexes of historical, cultural and situational factors encountered throughout life histories’ (Billett, 2002). Individual learning worker characteristics are depicted in Figure 1 and refer to experience of competence, valuing learning at work and experience of social integration with management and colleagues (Deci & Ryan, 1985; Kwakman, 1999; McCauley & Hezlett, 2001; Straka, 2000). This study attempts to find out which selected work practice and learning worker characteristics relate to informal learning at work?

**Methodology**

**Sample**

A sample of 279 Dutch police officers filled out a questionnaire voluntary. Table 2 outlines some of their descriptive characteristics. The police organization was chosen as particularly applicable for their explicit hierarchical levels and their current innovation efforts toward HRD practices in informal learning at work.

**Instrument**

A survey study was supposed to be an appropriate way to address the research questions, because quantities provide a means to capture large amounts of data over a wide range of possibilities. In addition, a standard instrument made it possible to conduct the study in different organizations.

Several attempts have been made to determine the nature and extent of informal workplace learning with help of a questionnaire (Kwakman, 1999; Megginson, 1996; Rowden, 2002; Woerkom, 2003). Some authors examine learning strategies as derived from educational literature and apply this in an organizational context. Others applied a perspective on workplace learning in which learning and working are integrated that is comparable to ours. Megginson (1996) for example introduces emergent and planned learning. Emergent learning represents a strategy, an approach to experience as an ‘unpremeditated exploration’ (p. 417). Emergent learning was measured in a survey by items as, ‘It is important to be open to experience then learning will come’, ‘Most of my new learning emerges
unexpectedly from things that happen’, whereas planned learning was measured in the same survey by items as, I set
goals for my own learning’, ‘I regularly prepare a learning contract, development agreement or continuous
professional development statement outlining my plans.’

In our view, these attempts provide useful inspiration to our specific choice to view learning based on
intentionality and developmental relatedness. A questionnaire was developed based on a previous qualitative study
with police officers by Doornbos, Bolhuis and Denessen (in progress). This study revealed a rich variety of instances
of informal learning. Making every attempt to stay as close as possible to the language and references used by police
officers, a survey was developed to capture informal learning accurately. Once developed the informal learning part
of the ‘Learning from Police Work Questionnaire’, was subjected to critique sessions by content area experts and 25
police officers to ensure validity.

Informal learning at work consisted of 50 items referring to twelve a-priori subscales based on the informal
learning typology (Table 1); ‘spontaneous individually’ (4 items, e.g. in preparing a task I find answers for another
problem) and ‘deliberate individually’ (4 items, e.g. I try out a new application independently) ‘spontaneous from
people outside the police vocation’ (4 items, e.g. people outside the police organization contributed unexpected to
new insights) ‘deliberate from people outside the police vocation’ (4 items, e.g. I discuss a work situation with
friends to find out how they think about it), ‘spontaneous from peers’ (4 items, e.g. In a meeting with a colleague, we
suddenly reached shared insights on something), ‘deliberate from peers’ (4 items, e.g. I deliberately watched a
colleague to follow his/her example), ‘spontaneous from experts’ (5 items, e.g. I spontaneously picked something up
from a conversation with a more experienced colleague), ‘deliberate from experts’ (5 items, e.g. In accomplishing a
task I made use of the knowledge of more experienced colleagues), ‘spontaneous from novices’ (4 items, e.g. I
noticed that I started to think different about a subject by the contribution of a colleague who just started his work at
the police), ‘deliberate from novices’ (4 items, e.g. I talked to a less experiences colleague to generate new ideas),
‘learning deliberately together’ (4 items, e.g. ). All items refer to activities.

Work practice characteristics consisted of 46 items referring to six subscales ‘task variation and chances’ (8
items, e.g. I have variation in my job), ‘task autonomy’ (8 items, e.g. I have freedom in the way I perform my job),
‘external input’ (9 items e.g. I receive constructive feedback on my work from my colleagues), ‘collegial
availability’ (6 items, e.g. my colleagues are available to help me out on something), and ‘managerial support’ (11
items, e.g. My manager encourages me to unfold initiatives).

Learning worker characteristics consisted of 24 items referring to four subscales; ‘social integration with
colleagues’ (5 items, e.g. I feel allied with my colleagues), ‘social integration with manager’ (5 items, e.g. I have a
good understanding with my manager), ‘experience of competence’ (8 items, e.g. I am satisfied with the way I
perform my work) and ‘valuing learning at work’ (6 items, e.g. I believe that I, as a police officer, have to think
about my personal development).

Work practice and learning worker characteristic scales were partially adapted from the Dutch Institute of
Working Conditions (Veldhoven & Broersen, 1999) and were tested in a previous pilot study with 92 police officers.
Responses for informal learning and work practice characteristics were provided on a seven-point Likert-type scale
with the following choices: (0) never, (1) once a year or less, (2) once a month or less, (3) a few times per month, (4)
one a week (5) a few times per week (6) every day. Responses for learning worker characteristics were provided on a
5-point Likert-type scale with the following choices (1) strongly disagree, (2) disagree, (3) donot agree/disagree,
(4) agree, and (5) strongly agree. Reliability analyses of the work practice and learning worker characteristics showed that 3 items would raise Cronbach’s Alpha if deleted from the scale.

Data analysis

Reliability analyses were conducted on the twelve new developed informal learning scales. Cronbach’s Alpha’s
appeared to be rather low. Therefore, exploratory factor analyses were conducted as well. These were conducted in
SPSS using principal component (PC) extraction and Varimax rotation. The selection process for the factor solution
was based on interpretability based on constructs in the typology of informal learning (Table 1) and variance
accounted for. Items that loaded about at least .50 in a factor and maximum .35 in another were included in scales of
informal learning. Scree plots were also used to get an initial indication of the approximate number of factors to
extract. Reliability analyses were conducted for all measures. Pearson’s r was computed as correlations coefficient
between the informal learning scales. Level of significance was set as α = .05. Multiple regression analysis was used
to determine the influence of the work practice and learning worker characteristics on different types of informal
learning. Regression assumptions and multicollinearity were evaluated. The stepwise method was used because of
the exploratory nature of the analyses aimed at determining the relevance of the many independent variables.
Findings

Exploratory factor analysis of the informal learning items showed five factors and were identified as learning in interaction with peers (LP), learning together (LTo), learning individually (LInd), learning in interaction with novices and people outside the vocation (LNO) and learning from experts (LE). Together they explain 56% variance. Table 2 shows the results. The intercorrelations among the five types of informal learning (see Table 3) indicate a positive relationship between all measures.

** Correlation significant at the 0.01 level (2-tailed)

Table 4 shows the distribution and reliabilities of the key measures. Mean scores show that work practice characteristic task variation is perceived to be applicable almost a few times a week, whereas task autonomy and
collegial availability are perceived to be applicable at least once a week. Police officers experience work pace more
than a few times per month. External input and management support are applicable less than a few times per month.
Averagely all respondents agree with statements that refer to valuing learning at work. Responses on the informal
learning scales show that learning from experts, in interaction with peers, together and individually happens between
once a month or less and a few times per month, whereas learning in interaction with novices and outsiders happens
between once a year or less and once a month or less.

</table>

Regression analyses were performed with the five informal learning scales as dependent variables (Table 5). In these
analyses, the following learning worker background variables were included; gender, age, non-police education,
police education, job level, job tenure, police tenure, and hours spend on jobs besides police work. Results show that
all work practice characteristics play a role in predicting informal learning except for work pace. Specifically,
collegial availability is a significant predictor for learning in interaction with people within the vocational practice
(exerts, peers and together). External input is a significant predictor for learning in interaction with peers, novices
and outsiders and individually. The learning worker characteristic valuing informal learning is a significant predictor
for learning in interaction with peers and individually, whereas experience of competence and social integration with
manager are not significant for any of the informal learning scales. Several background variables appear to play an
important role as well, such as police tenure, hours spend on jobs besides police work, and gender, whereas job level
and education do not.

Conclusions

Background variables, work practice and individual characteristics are significant predictors for five types of
informal learning. Negative moderate correlations existed between police tenure and learning from experts, peers and
individually, indicating that police officers with a long history in police work score low on these informal learning
scales whereas police officers with less years of experience in police work score higher on informal learning.
Therefore it is appropriate to recognize its potential influence on the amount of informal learning. Positive moderate
correlations between collegial availability, external input and informal learning indicate that these variables are
important to the amount of informal learning. These findings support the empirical work of others (Billett, 2002;
Eraut et al., 1998; Kwakman, 1999; Onstenk, 1997). Furthermore the positive correlation between hours spend on
other jobs besides police work and learning individually suggests tentative support for the assumption that learning is
supported by a change in the composition of social network, a network that is not part of the primary professional
practice (Vandenabeele & Wildemeersch, 1998). The suggestion that kinds of practical work activities people
perform in terms of task variation and autonomy influence learning (Billett, 2002; Ellström, 2001; Engeström, 1999;
Kwakman, 1999; Onstenk, 1997; Straka, 2000) was supported for respectively learning together and learning in
interaction with novices and outsiders. Furthermore, work pace, experience of competence and social integration with manager did not correlate significantly to any of the informal learning scales. The low correlation between valuing learning at work, social integration with colleagues, management support and informal learning scales confirms that these are important aspects for some types of informal learning. In previous research this relationship was also specific for some kinds of learning activities, such as, ‘participation in innovation and decision making’ (Woerkom, 2003) or interest and emotional dimensions of self-directed learning (Straka, 2000).

Implications and Future Steps

The findings of preliminary analyses of this study contribute to the HRD profession through the presentation and evaluation of a descriptive typology of informal learning grounded in theory and previous research in education, psychology and organizational behavior. An indication of relevant predictors of different kinds of informal learning is presented that may generate ideas for HRD practitioners to optimize informal learning as well as for researchers to consider prevalent factors in affecting the amount of informal learning. The following step in this particular research project will be directed at structural equation modeling.

Contextual Factors and Detractors Shaping Informal Workplace Learning: The Case of ‘Reinventing Itself Company’

Andrea D. Ellinger
University of Illinois at Urbana-Champaign

The majority of learning that occurs in the workplace is informal, however, little is known about how such learning is best supported and nurtured. A qualitative case study was recently conducted to explore the contextual factors that may shape informal workplace learning. Fifteen in-depth interviews were conducted and constant comparative analysis is being used to complete data analysis. Emergent findings derived about informal learning from 10 in-depth interviews are the focus of this paper.

Keywords: Informal Workplace Learning, Organizational Contextual Factors, Incidental Learning Theory

The workplace has always been considered an important setting in which adults learn. However, it has only recently emerged as a setting for the formal study of adult learning (Dirkx, 1999). Workplace learning can take many forms such as formal, institutionally sponsored learning including training and human resource development initiatives, as well as informal and incidental learning (Matthews, 1999; Watkins, 1995). Research, however, has suggested that informal learning takes precedence over formal learning, and comprises the majority of learning that occurs in the workplace (Day, 1998; Leslie, Aring, & Brand, 1998; Lohman, 2000; Watkins & Marsick, 1997).

Informal workplace learning has attracted considerable attention in the literature. The trends toward employees assuming more significant roles in their own learning processes, the importance being placed upon learning as a core competency and lifelong process, and the recognition of learning as a source of sustainable competitive advantage for individuals and organizations alike have also stimulated tremendous interest in informal learning. Additionally, the growing focus on creating organizational environments that promote cultures, policies, and procedures conducive to fostering continuous learning has also influenced the importance of informal learning in the workplace (Dirkx, 1999; Senge, 1990; Watkins & Marsick, 1999).

Despite the prevalence of informal learning in the workplace little is known about “how it can best be supported, encouraged, and developed” (Marsick & Volpe, 1999, p. 3). Further, while the notion of context permeates the informal learning process, the interplay between informal learning and the context in which it occurs has been a largely unexamined area of inquiry (Cseh, 1998; Lohman, 2000). Furthermore, scholars have acknowledged that how learning environments are created and maintained in organizations needs to be research and better understood (Salas & Cannon-Bowers, 2001). Since learning is inherently socially constructed and contextually embedded, exploring the contextual factors that may shape employees’ informal learning is critical to advancing our understanding of how informal learning is facilitated, encouraged, supported and nurtured within the workplace. Therefore, the purpose of the study was to explore how the contextual factors of the workplace setting may shape employees’ informal learning.

Theoretical Framework Guiding the Study

Bolman and Deal’s (1997) organizational frames were integrated into an adaptation of the Marsick and Watkins’ (1990, 1997) model of informal and incidental learning to better understand how aspects of the organization may shape informal learning and the facilitation of informal learning. Bolman and Deal acknowledge that organizational life is complex and offer four perspectives, or frames, which they contend are “both windows on the world and lenses that bring the world into focus” (p. 12). Bolman and Deal’s four organizational frames are: structural, political, symbolic, and human resources. These frames represent different lenses through which to view the organization. These frames are based upon concepts drawn from sociology, social psychology, political science, and anthropology respectively. For the purposes of examining contextual factors, these frames were integrated into the Marsick and Watkins’ model of informal and incidental learning because they represent a consolidation of major schools of organizational thought that can help to make sense of organizations, in this case, how aspects of the organizational context may shape informal learning and its facilitation.

Informal learning in this study refers to learning that results from the natural opportunities that occur in a person’s working life when the person controls his or her own learning (Cseh, Watkins & Marsick, 1999). Informal learning may be planned or unplanned, structured or unstructured, but usually incorporates a degree of

7-2
consciousness about the learning that is taking place. Informal learning in the workplace may be dictated by the needs of the organization and its members, or triggered and influenced by encounters with others, or specific events. The Marsick and Watkins characterize their model of informal and incidental learning as a problem-solving approach that is not straightforward or prescriptive. They contend that the cycle is embedded with sub-surface beliefs, values, and assumptions that guide action at each stage. In this model, informal and incidental learning are influenced by how people frame a situation as a problem that is typically a non-routine problem. As they frame it within their context based upon their beliefs and assumptions that are often unconscious, they consider strategies for solving that problem. Through this process, there is a presence of action and reflection and there are often intended and unintended consequences as a result of the learning process.

Although the Marsick and Watkins model of informal and incidental learning that has been empirically tested in numerous studies that have focused on how individuals learn in organizations, they suggest that their model would be enhanced by additional studies. In particular, while the notion of context is implicit in the model, its pervasive influence on the learning process has not been that evident. Although it has been suggested that context permeates all facets of the learning process, this phenomenon needs to be further examined particularly within organizational settings (Cseh, 1998; Lohman, 2000; Watkins & Cervero, 2000). While “context permeates every phase of the learning process – from how the learner will understand the situation, to what is being learned, what solutions are available and how the existing resources will be used” (Cseh, Watkins & Marsick, 1999, p. 352), this study is being designed to specifically examine what and how aspects of the organizational context shape informal learning and its facilitation.

Accordingly, Figure 1 presents the integration of Bolman and Deal’s four-frame perspective into an adaptation of the Marsick and Watkins model of informal and incidental learning to provide the multiple lenses through which a broader, contextual understanding of informal learning in the workplace can be understood from the perspectives of employees who experience informal learning as well as facilitate it. However, the Bolman and Deal four-frame model is not being empirically tested in this study. Bolman and Deal’s organizational frames are being used as a guide to better understand the complexity of the organizational setting. It is possible that these frames and central concepts within these frames may serve as a point of reference for classification and coding purposes as contextual factors are uncovered, however, this study did not make any assumptions about these frames within the research setting.

**Research Questions**

The study has been designed to address the following research questions:

1. What are the contextual factors that shape employees’ informal learning?
2. How do contextual factors shape employees’ informal learning in the workplace?
Research Design

A qualitative case study approach was selected for this study because it allows for an intensive holistic description and analysis of the contextual factors that shape the phenomenon of employees’ informal learning and their facilitation of informal learning within a specific workplace setting (Merriam, 1997; Merriam & Simpson, 1995).

The rationale for selecting the case for this research was based upon the premise of the learning organization literature. There is a growing interest and emphasis on creating organizational environments that are conducive to fostering learning. Several scholars suggest that these types of learning oriented organizations represent new frontiers for adult learning that occurs in the workplace (Merriam & Caffarella, 1999; Marsick & Watkins, 1999). Yet, despite the importance of the work environment on informal learning, there is not a thorough understanding of how contextual factors within such organizations shape informal learning and the facilitation of informal learning (Karakowsky & McBey, 1999; Lohman, 2000; Marsick & Watkins, 1997).

Therefore, an organization that espouses a philosophy and commitment to employee development, individual, team, and organizational learning by implementing strategies consistent with the learning organization literature has been selected and presents an optimal setting in which to explore the contextual factors that shape informal learning. Contextual factors may be more manifest within such an organization that espouses an orientation to learning. However, it is possible that the espoused philosophy and commitment to learning may be rhetoric. Therefore, the purposeful selection of ‘Reinventing Itself Company,’ a consumer-focused manufacturer located in the Eastern region of the United States represented a unique environment to situate this study. Reinventing Itself Company acknowledges that enriching employee’s lives through learning and development is a fundamental core value. In addition to the documented statement on core values, the selection of the case met the other selection criteria.

The selection of the case was based upon the following criteria: (1) The organization must espouse a philosophy and a commitment to employee development, and attempt to foster individual, team, and organizational learning by implementing strategies consistent with the learning organization literature. Substantial indication of these philosophies must be apparent from the published mission statement, core values, and popular press articles reflecting this commitment to employee development and an overall organizational learning orientation; and, (2) the organization must be geographically located in the Eastern region of the United States to permit accessibility for data collection.

A stratified purposeful sampling strategy was used to identify employees at different levels within the organization representing different functional areas to provide a richer and broader understanding of how the contextual factors shape informal learning and its facilitation within this organization. A total of 15 employees representing senior, mid-level, and lower level employees and various functional areas (such as human resources, information systems, quality and customer service, product development and design, and planning, process improvement, strategy, and manufacturing) were nominated as being exemplary facilitators of learning and committed lifelong learners. The nominator was identified by the Vice President of Human Resources and, based upon the sampling criteria, identified 13 employees at the corporate headquarters and 2 remote employees at two other non-corporate locations that comprised the sample for the study.

An adaptation of the Critical Incident Technique (Ellinger & Watkins, 1998) and semi-structured in-depth interviews were conducted with all 15 employees participating in the study. All participants were asked to identify two informal learning incidents in which he/she had felt he/she learned something important as well as two incidents in which the employee facilitated another person’s learning and believed that he/she made a significant difference to that person’s learning. In addition to these approaches to data collection, the researcher also collected metaphors for the informal learning environment as well as metaphors that reflected the essence of what it means to facilitate learning within the organizational environment. Participants were also asked to participate in an imaginary photography exercise as part of the data collection process. The use of metaphors and imaginary photography not only served as data collection tools, they also represented approaches to triangulate the data collected from the incidents and semi-structured interviews. The interviews were transcribed verbatim and then edited to remove sensitive information, organizational identifiers, names, and confidential material that might put the participant’s confidentiality at risk. The average length of the interview transcripts analyzed thus far exceed 40 pages. Following the editing process for 10 interviews, the entire transcript was then coded and ultimately reduced to a 2 – 4 page individual portrait that captured the essence of the incidents reported, the metaphors, and imaginary photography. In addition emergent themes were identified as they related to the unique portrait. Each participant then received a copy of his/her portrait and complete transcript. Participants were asked to review all materials, make changes as necessary, and comment on the emergent themes. The participants were encouraged to contact the researcher if any of the insights gleaned from the interviews did not reflect the content of the interviews. At present, there have been no requests for modifications and those that have responded have acknowledged that the “this looks good” (Tom), or “this is fine” (Kat), or “I believe you have captured the essence of our interview” (Nicole) and one participant

7-2
thanked the researcher for “sharing her portrait” with her and expressed enthusiasm about learning more from the complete case analysis (Allison). Next, following confirmation of the accuracy of the transcripts and the emergent themes within the portraits, the coded data was then mapped onto the Marsick and Watkins informal learning model and data was also put into a matrix to better understand how the emergent findings may have shaped some of the processes associated with the Watkins and Marsick informal learning model. Using constant comparative analysis, emergent themes related to the contextual factors shaping informal learning from a portion of the dataset (10 of 15 participants) are the focus of this paper.

The Research Setting

The “Reinventing Itself Company” (RIC) is a consumer-focused manufacturer located in the Eastern region of the United States. This organization has been in business for over seventy-five years and has approximately 3,500 employees working at its multiple locations. The corporate headquarters has over 300 employees and represented the primary location for data collection. The organization is a well-respected and reputable company that has had a rich history of invention and innovation. However, as with other companies experiencing the turbulence of the global marketplace, RIC is in the midst of several changes designed to position the organization for longer-term growth and viability. Allison described some of these changes occurring within the industry. She said “[the industry we are in]….the time that [it] really thrived, 40s, 50s, 60s, it was a different culture then; it was more about relationship selling and who knew who even into the 70s, as we entered the late 80s, early 90s, it became more focused on….cost became more of an issue so you had to get at solutions, or creating value for your customer base, not just selling the products you have. There was greater demand that there was supply [then] and now it’s just the reverse so you have to have a different cultural atmosphere within a company to be able to service those different needs” (p. 14). In addition to industry changes, in the past few years, the organization itself has also been engaged in the process of changing from a “traditional, hierarchical, kind of company “ (Tom, p. 23) to one that is “looking at the other direction….all of us have value and you learn from each other in team work….that is where we are literally going….where learning and development is going to be much more critical and that’s been acknowledged….If we move into the new generation and [are going to be successful for another {number of} years], we are going to have to change the way we have done business” (Tom, p. 23-24). As Doug acknowledged, “the company has always been very successful and it’s just not right now and people have to reinvent themselves and reinvent this company in the process….the environment here is one of learning now, one of changing the way we do business” (p. 19). Consequently, over the past few years there has been a shift in leadership as well as movement toward a process-focused organization. The changes that are occurring both externally as driven by the economy, and internally manifest themselves in many of the critical incidents shared. However, as Kat acknowledged, “not everybody is onboard yet, but there [are] more people on board today that there was 2 months ago, and next week there will be more people on board and when I say onboard, I mean in agreement that the company is going this way and in order to do so, that development is required and you’ve got to learn how to do this” (p. 20).

Emergent Findings

Although several themes are emerging within the data set relative to aspects of the organization that shape informal learning and the facilitation of informal learning, as well as themes related to metaphors and the “pictures” obtained from the imaginary photography exercise, the emergent findings that follow focus specifically on those contextual factors that shape informal learning. To provide a framework for the nature of the informal learning that is occurring within RIC, an overview of the emergent catalysts for informal learning, selected learning strategies, and outcomes will be presented followed by the cluster of themes relating to contextual factors.

Catalysts for informal learning. There are two categories of catalysts that seem to be stimulating the need for learning in general, and informal learning in particular. The first category relates to external catalysts. One of the critical driving forces for the need for learning and change in general within RIC stems from a changing industry context in which “the emphasis [is] on cost and being low cost, and we haven’t been very low cost, and we are having to get low cost now” (Tom, p. 25). This low cost emphasis has resulted in the leadership of RIC making “a lot of process improvements….and in order to improve, you’ve got to learn” (Tom, p. 25). As Doug articulated, “….in a weird way, the fact that our business isn’t doing very well helps the learning process” (p. 34). Consequently, the external catalysts for learning and change seem to be highly related to three overarching internal catalysts for learning and change: the influx of new technology within the organization, the influx of new processes within the organization, and most regrettably some degree of downsizing. These three overarching catalysts seemed to be related to a number of themes that emerged as catalysts for informal learning: participating in a cross-functional meeting; seeing a need to change the way things are done; being given a challenging assignment;
addressing current job responsibilities; high priority projects mandated by the CEO; and, implementing high priority projects, a few others were more individually-focused and included: new position and new responsibilities; required performance expectation on development plan; a poor performance evaluation; and just needing help.

Informal learning strategies selected. Employees used a number of learning strategies to learn their way out of their challenges and problems. Specifically, the predominant strategies included: observing others in meetings or in interactions; listening to others in meetings or in interactions; asking questions of others; seeking expertise from knowledgeable colleagues; reflecting on feedback received; hands-on experiences; brainstorming with other colleagues in the company; sitting down with a colleague and going through something step-by-step; trial and error; talking to competitors and suppliers; interviewing consultants; creating an informal virtual community of practice; creating a personal learning notebook documenting how problems were solved; seeking external informal mentoring; seeking a manager for some coaching; e-tutorials; and self-directed learning approaches that included surfing the Internet, reviewing files of other employees’ work, using computerized help menus, and reading books.

Individual and organizational outcomes from informal learning. Several themes emerged regarding the outcomes associated with informal learning both for the learners and the organizations. Learners acknowledged that from their informal learning incidents that they: developed new knowledge and skills; enhanced existing knowledge and skills; learned how to work with others and share knowledge; learned more about other people; learned how to apply acquired key learnings to other situations; completed work tasks; and, received visibility and recognition for newly acquired expertise. For the organization, many of the key learnings that occurred at the individual level also impacted the organization. For example, the themes that emerged related to: helping the organization determine strategy; saving time on tasks; building internal expertise to avoid reliance on external consultants; and, significant cost savings.

Positive organizational contextual factors. At present there seem to be four large overarching contextual factors that positively shape informal learning: learning-committed leadership/management, an internal culture of caring and commitment to learning; work tools and resources, and people that form webs of relationships for learning. While space limits a full discussion of all of these themes, the most predominant theme emerging is learning-committed leadership/management which gets manifested in several ways. Although the majority of employees did not select learning strategies that involved their managers/supervisors, the significant influence of managers/leaders is dominant in several ways throughout the informal learning process: managers/leaders who create informal learning opportunities; managers/leaders who serve as developers (coaches/mentors); managers/leaders who visibly support and make space for learning; managers/leaders who encourage risk-taking; managers/leaders who distill importance of sharing knowledge and developing others; managers/leaders who give positive feedback and recognition; and, managers/leaders who serve as role models.

For example, relating to the first sub-theme, Allison acknowledged, “It was my supervisor bringing me in saying, ‘here would be a good technical resource,’ but also he had in mind giving me exposure to these other things because he saw, or at least he said he saw potential in me down the road, so bring – ‘give you the opportunity to learn and participate and your participation will be on a small level, but you will get exposure to this which I did…’” (p. 4). In terms of the sub-theme, managers/leaders who visibly support and make space for learning, Kat said, “My supervisor…is very adamant on training and development…My learning…It’s just not training the big dogs…it’s training the whole crew to build this company…she supports me….she has pushed me….she is pushing me in a good way – ‘let’s get Kat developed in that area’” (p. 13 and 33). Dale captures the sub-theme about risk-taking. He said, “one of the ways [our company] is changing is for the [CEO] trying to get people to take chances more than past successes that encourage people to rest on their laurels; and, organizational distractions (phone, email, interruptions).

Organizational contextual factors (detractors) negative. At present there seem to be thirteen contextual factors that negatively detract from informal learning: lack of time because of job pressures and responsibilities; unsupportive leaders/managers; micromanagers/microleaders; some budget constraints; physical architectural barriers (structure of building and physical space); a few territorial people who don’t share knowledge; diminished personal communication because of virtual technology; the existence of old guard/old school cynicism; hedging of knowledge because of fear of downsizing; past successes that encourage people to rest on their laurels; not learning from learning; too much change too fast; and, organizational distractions (phone, email, interruptions).

In addition to the organizational contextual factors and shape and detract from informal learning, there were also personal factors that shaped and detracted from informal learning that employees shared. Issues of self-directedness, self-initiation, self-efficacy, and openness to feedback were conceived as factors that shaped informal
learning. Factors that seemed to hinder informal learning at times included limited formal knowledge in some areas, and a range of emotions around learning that included: frustration of not having enough time for learning and knowledge sharing, and resentment toward supervisors who were not supportive of learning.

Discussion

This study seeks to better understand how aspects of an organizational setting shape informal learning and its facilitation. The emergent findings presented thus far regarding the factors that shape and detract from informal learning provide additional empirical insights into how informal learning can “best be supported, encouraged, and developed” (Marsick & Volpe, 1999, p. 3).

Scholars have acknowledged that informal learning often begins with an internal or external jolt (Marsick & Volpe, 1999; Marsick & Watkins, 1997). As evidenced by the emergent overarching external and internal catalysts that are driving learning and change within RIC, and the themes articulating the catalysts for informal learning, there is considerable consistency with existing research on the triggers or catalysts for informal learning. Cseh’s (1999) study on managers’ learning within small Romanian companies characterized triggers as mainly being embedded in the external context of the participating managers’ companies. The findings emerging in this study also support the importance of external catalysts. In other research that has examined triggers or catalysts for informal learning, similar overlap exists among the emerging findings of this study (Dechant, 1989; Mumford, 1993; Ellinger, 2003; Lohman, 2003).

The learning strategies selected by employees that have emerged thus far also mirror those activities through which informal workplace learning has been deemed to occur (Center for Workforce Development, 1998; Cseh, 1998; Marsick & Watkins, 1990, 1997; Watkins & Marsick, 1992). The Center for Workforce Development has acknowledged that “teaming, meetings, customer interactions, supervision, mentoring, shift change, peer-to-communication, cross-training, exploration, on-the-job training, documentation, executive of one’s job, site visits” (p. 53) constitute informal learning activities. Additionally, Watkins and Marsick (1992) have acknowledged that strategies for informal learning include self-directed learning, networking, coaching, mentoring, performance planning systems used for developmental purposes and trial and error. Furthermore, computer-based technology is often used to aid in problem solving and self-directed learning (Marsick & Watkins, 1997). The outcomes associated with informal learning also further confirm Ellinger’s (2003) findings.

In terms of the organizational factors that serve to enhance informal learning or detract from it, some of the emergent findings correspond to research previously conducted by Sambrook and Stewart (2000) on factors that influence learning within learning oriented organizations. Factors deemed to enhance learning were: develop learning culture and senior management support. The absence of these same factors were also deemed as inhibitors. Furthermore, lack of time and resources were identified as being inhibitors of learning, but the presence of these factors also served to enhance learning. While some of the emergent findings reported thus far support those of Sambrook and Stewart (2000), it is hoped that these findings also extend our understanding of how a learning culture can be developed and how senior manager support can be manifested. A key finding of the current study is that an overwhelming influence on informal learning seems to be contingent upon learning-committed leadership/management. This commitment becomes manifest in a variety of ways including: managers/leaders who create informal learning opportunities; managers/leaders who serve as developers (coaches/mentors); managers/leaders who visibly support and make space for learning; managers/leaders who encourage risk-taking; managers/leaders who distill importance of sharing knowledge and developing others; managers/leaders who give positive feedback and recognition; and, managers/leaders who serve as role models. Marsick and Volpe (1999) have also acknowledged that making time and space for learning enhances or improves informal learning and Marsick and Watkins (1997) have suggested that managers and leaders who want to facilitate informal learning can do so by planning for learning, creating mechanisms for learning in teams, and developing an environment conducive to learning. Other scholars have also acknowledged the important roles that managers and leaders play in the process of workplace learning (Beattie, 2002; Ellinger, & Bostrom, 1999; Poell, Van der Krogt, Warmerdam, 1998).

In summary, the emergent findings from the current study lend confirmation to the ways in which other scholars have acknowledged informal learning can be enhanced as well as those that may detract from it. The current study extends our understanding of the manifestations of the importance of leaders and managers in the process of informal learning, and also offers additional insights into the contextual factors that may need to be considered within an organizational setting if an organization wishes to maximize the potential for informal learning.
Limitations of Study

Despite the richness of the data that is emerging relative to contextual factors that shape informal learning and its facilitation, there are several limitations associated with this research. The purposeful selection of the case itself presents a limitation. It is possible that the organization selected, despite claims of being a learning oriented organization, is not, and would not be conceived as one moving in this direction by other researchers and employees within the organization. It is also possible that the purposeful selection of exemplary employees committed to their own lifelong learning and development of others who participated in the study do not reflect the sentiments of all employees within this organization, particularly those who may be resistant to learning and change, although the use of a stratified sampling strategy should help to mitigate this concern. The use of self-report interview data is another limitation as is the recollection of learning incidents from memory. However, integrating multiple sources of data was an attempt to overcome this limitation and allow for triangulation of findings. The qualitative case study approach and the analysis methods used also represent limitations. Additionally, the findings from this case are not intended to be generalizable, however, it is anticipated that findings may be useful to other scholars and practitioners who would like to better understand how aspects of organizational contexts may shape informal learning.

Implications for Research and Practice

The workplace represents a large arena in which adult learning often occurs informally, and employees, as both teachers and learners, are becoming more responsible for their own learning and for facilitating the learning of others. Although there is a large and growing literature base on informal learning, Watkins and Cervero (2000) have suggested that “there is some evidence in the larger field of human resource development that a focus on the learning of individuals is less significant than a focus on the organization as a context for learning” (p. 193). However, a clear understanding of this phenomenon is only beginning to emerge. Many scholars have articulated the importance of context as it relates to informal learning, but contend that considerable research must be undertaken to better understand how organizations inhibit and facilitate such learning (Karakowsky & McBey, 1999; Lohman, 2000; Sambrook & Stewart, 2000; Watkins & Cervero, 2000). The research addresses some of these challenges by focusing on the contextual factors that may shape employees’ informal learning and employees’ facilitation of informal learning. The emergent findings from this study seek to broaden our understanding of the interplay between informal learning and the workplace environment where it occurs which has largely been an unexamined area of inquiry (Cseh, 1998; Lohman, 2000) as well as contribute to a theoretical understanding of the experience of informal learning from the perspective of employees who engage in the process. It is anticipated that when the full case study is complete, the overall findings will contribute to a theoretical understanding of the experience of the facilitation of learning from the perspective of employees who serve as facilitators (Brookfield, 1986; Daloz, 1986; Nesbit, 1998; Robertson, 1996). It is also hoped that this study will stimulate further research on informal learning in the workplace by focusing on different organizational settings such as educational settings as well as integrate the perspectives of employees who may be resistant to this type of learning.

Unanticipated Consequences Among Trainers Delivering S-OJT: The Literature Review

DaeYeon Cho
Ronald L. Jacobs
The Ohio State University

This study reviewed trainers’ actions in the design and delivery of S-OJT and the preparation of S-OJT trainers. Trainers’ behaviors and their preparation of S-OJT trainers tend to create the leaning and developmental opportunity for the trainer through social interactions between the trainer and the trainee/stakeholders. This study discussed possible unanticipated consequences on S-OJT trainers that can be resulted from their behaviors beyond explicit expectations of S-OJT on the trainee. To understand this flow, this study proposed a conceptual framework to depict the relationships between four constructs.

Keywords: Structured On-the-Job Training (S-OJT), Unanticipated Consequences, S-OJT Trainer

A recent primary theme of HRD is the blending between working and learning in the workplace. Furthermore, the necessity of more planned and systematic training approach on the job has been recently highlighted (Poell & Van der Krogt, 2003). S-OJT is good fit on these trends. Some researchers (e.g., Burkett, 2002; Jacobs et al., 1992) have demonstrated the effectiveness of S-OJT on the aspect of both the individual trainee and the organization as a whole.

However, a review of the literature shows that limited attention has been given to the consequences on those employees who serve as a trainer, specifically employees who serve as an S-OJT trainer. The consequences of training have been explained on trainees, not trainers. This emphasis can be expected given that the trainee is the target of the training. But the focus on the consequences on an S-OJT trainer can be expected based upon the unique demands of this job compared to being a trainer using most other training opportunities.

In S-OJT, the experienced employees (e.g., supervisors and frontline employees) are more likely to serve as a trainer (Jacobs, 2003; Johnson & Leach, 2001). The experienced employees are asked to perform another job as a trainer beyond their daily routine work to manufacture products or provide services. Besides, S-OJT means more than just delivering knowledge and skills as planned (Jacobs, 2003). Thus, S-OJT trainers are expected to play multiple roles as coach, master, and tutor as well as deliverer.

S-OJT takes place through the intense level of social contact and social process between a trainer and a trainee because of the one-on-one nature of S-OJT (Jacobs, 2003; Osman-Gani & Zidan, 2001; Semb et al., 1995; Stein, 2001). All events to deliver S-OJT are based on widely mutual interactions between the trainer and the trainee. According to viewing S-OJT as a system, trainers also can be regarded as a subsystem and must interact with other subsystems or systems. As such, to make S-OJT more effective, trainers are expected to build mutual interactions with co-workers, managers, HRD staff, and other S-OJT trainers (Jacobs, 2003; Stein, 2001).

Much of learning takes place through a social process in the workplace. The social process can be facilitated through interactions within networks (Imel & Stein, 2003). If all members within a network share common issues, they would acquire knowledge and skills through mutual interactions (ibid.). Such interactions can be called ‘developmental interactions’ (D’Abate et al., 2003) or ‘learning interactions’ (Kilpatrick, et al., 1999). S-OJT trainers have the authentic learning and development opportunity through social processes and interactions with the trainee and stakeholders within S-OJT.

If there has been a greater recognition of the experienced employees who serve as an S-OJT trainer, if trainers’ behaviors during the design and delivery of S-OJT have been built on mutual interactions within networks consisted of the trainee and stakeholders, and if trainers have had the learning and development opportunity through such interactions, then more needs to be known about the unanticipated consequences of S-OJT on trainers.

The main purpose of this study is to propose a conceptual framework to investigate how the preparation of S-OJT trainers and trainers’ actions in the design and delivery of S-OJT can be connected with possible unanticipated consequences of S-OJT on trainers. Through a review of the literature, this study identified trainers’ behaviors in the design and delivery of S-OJT. This study also found some possible unanticipated consequences of S-OJT on trainers that can be resulted from trainers’ learning and development opportunities through the preparation of S-OJT trainers and their behaviors before and during S-OJT.

Definition of S-OJT

On-the-job training (OJT) is a form of individualized training and can be designed and delivered using two basic approaches: structured OJT and unstructured OJT (Sullivan & Smith, 1996). Structured OJT differs from unstructured OJT in that a systematic planning process is used to design and carry out the training ( Jacobs, 2003; Rothwell & Kazanas, 1994). Unstructured OJT occurs on the worksite but is not logically sequenced. Therefore, learners are expected to learn by watching and doing the work. On the other hand, structured OJT takes place with planned instruction on the job and during the work.

Jacobs (2003) defined S-OJT as “the planned process of developing competence on units of work by having an experienced employee train a novice employee at the work setting or a location that closely resembles the work setting” (p. 28). There are critical characteristics of structured OJT ( Jacobs, 2003): (1) S-OJT achieves training objectives reliably and predictably like other planned training approaches; (2) S-OJT is not about learning to perform an entire job but a subset of the job; (3) it occurs on one-on-one basis (social contact & process); and (4) it occurs in similar work settings beyond the actual work setting.

Participation in the Design of S-OJT

Involving work analysis. The targeted job must be analyzed in depth to identify units of work. Work analysis is very critical step to gather useful information before determining training content and delivering the training. Work analysis refers to “the process of making explicit the behaviors, performance outcomes, prerequisite knowledge, skills, attitudes, and other relevant information to a unit of work” (Jacobs, 2003, p. 83). Work analysis is often performed by occupational, educational, and training specialists in conjunction with subject matter experts (Semb et al., 1995). This phase involves management, training professionals, and line experts working together to produce a needs and a comprehensive implementation plan (Black et al., 1996).

Preparing the module. The information driven from the work analysis uses to prepare the S-OJT modules. The preparation of a S-OJT module refers to “the integration of training content and type of training” (Jacobs, 2003, p. 126). The module guides the trainer during the delivery of the training, and the trainee uses it as a reference during and after the training. Jacobs (2003) strongly suggests that trainers need to be engaged in the stage of developing modules: “it does have at least two advantages. First, having a meaningful context may well help experienced employees become more effective trainers. Second, experienced employees often have greater feeling of ownership since they participate in the development of the training” (p. 106).

Preparing delivery. The trainer should do three basic actions for preparing the delivery of S-OJT: “The training has to be scheduled, training resources has to be secured, and the S-OJT module has to be reviewed. The most of these activities are the responsibility of trainers” (Jacobs, 2003, pp. 133-134). Preparing the delivery of S-OJT is essentially a social activity between the trainer and stakeholders. When trainers decide training location and time, and obtain training resources, the various conflicts often take place between the trainer and stakeholders. Therefore, how to negotiate such complex conflicts should be taken into consideration as a crucial part of preparing the delivery of S-OJT. Success of this stage depends on collaborative interaction and support among training professionals and line management (Black et al., 1996; Jacobs, 2003). More specifically, the work of workplace trainers always includes socio-political aspects when they make decisions regarding where, when, and how to conduct S-OJT in a group and/or an organizational context.

Trainers’ Actions to Deliver S-OJT

Jacobs (2003) identified the five training events to deliver S-OJT as follows:

Prepare the trainee. The main purpose of this event is to prepare trainee to be learned. This event is the trainer’s first action to deliver the training. Like formal classroom training, this event is important to provide an effective introduction to the trainee (Johnson & Leach, 2001).

Present the training. This event requires “the trainer to demonstrate a set of behavioral actions to the trainee” (Jacobs, 2003, p. 148). S-OJT trainers must be aware that their behaviors may be automated and so fast that the trainee cannot follow them (Yang & McLean, 1996). Therefore, the trainer should explain and then show each step at a time (Johnson & Leach, 2001). It is helpful for the trainee to understand and draw a big picture what she or he is learning.

Require a response. During this event, the trainee must participate and respond actively. The trainer prompts the trainee to perform (Semb et al., 1995). For instance, the trainee may have listened the trainer’s explanation about the unit of work, observed the trainer’s demonstration, been asked specific questions to ensure his or her understanding,
and has had an opportunity to ask questions (Johnson & Leach, 2001). The trainer believes that the trainee should have enough confidence to demonstrate what she or he has learned. Therefore, the trainee needs to be encouraged to try units of work and describe as the trainer has performed.

**Provide feedback.** Based on the trainee’s responses, the trainer should try to correct errors. The trainee is not expected to perfectly perform units of work during the first attempt. Therefore, the trainer should give appropriate feedback and encouragement based on “an objective assessment of the adequacy of the trainee’s response” (Jacobs, 2003, p. 156).

**Evaluate performance.** The final event to deliver S-OJT is to evaluate whether the trainee has achieved the training objectives. To do this, the trainer can use the trainee’s self-report, which is the trainee’s own evaluation of his or her learning progress, and objective performance tests, which refers to the trainer’s judgment of the adequacy of the trainee’s responses (Jacobs, 2003). To obtain the trainee’s self-report, the trainee needs to be asked to critically reflect on the training experience in general (Johnson & Leach, 2001) and what he or she has accomplished (Jacobs, 2003).

**Preparation of S-OJT Trainers**

As S-OJT is increasingly used in industry, there is an obvious need of qualified S-OJT trainers. Experienced employees (e.g., supervisors and frontline employees) or expert workers are more likely to serve as an S-OJT trainer (Jacobs, 2003). Johnson & Leach (2001) addressed the use of subject matter experts. However, we cannot assure that expert workers possessing a high level of expertise to perform the job have other competencies required to effectively share his or her knowledge with trainees (Williams, 2001). As such, S-OJT trainers should complete a train-the-trainer course so that they understand good training technique and how to facilitate learning (Filipczak, 1996). Fortunately, today’s many organizations are recognizing the necessities of the formal train-the-trainer program (Jacobs, 2003).

Swanson & Falkman (1997) indicated that most beginning trainers have often prepared informally—by trial and error. Rae (2002) indicated workplace trainers must possess potential to learn to train. Williams (2001) addressed a claim that it is evident that previous training participation and trainer experience become an important factor to be an effective trainer.

On the other hand, trainers’ involvement of networks with other trainers is a means of preparing S-OJT trainers and developing their professional competencies. Harris et al., (2000) indicated informal opportunities where trainers have chances to discuss their work and share problem with other trainers. Jacobs (2003) addressed the importance of learning network with other trainers at different locations in terms of “exchanging training information or generating training information that does not currently exist” (p. 65). For example, “[chat room] discussions could be used to share training ideas, training goals, to discuss barriers to transfer, and to provide positive reinforcement [among members]” (Barnard & Hawley, 2003, p. 117). The participation into networks influences trainers’ perspective of the training and their delivery strategies of S-OJT. In addition, members can be updated with regard to the current initiatives, policy changes or development. Too often trainers are unaware of how critical involvement of learning network with other trainers is to successful S-OJT.

**Unanticipated Consequences of S-OJT on Trainers**

As trainers are deeply engaged in the preparation and delivery of S-OJT, they have the opportunity to learn and develop their new knowledge and skills. For example, Dymock (1999) found that “mentors were learning from the structured mentoring process” (p. 316). Black et al., (1996) also indicated that one of strengths of S-OJT is that there are a great number of developmental opportunities for S-OJT trainers.

**Knowledge and Skill Acquisition**

The authors of this study reviewed three ways for trainers to acquire knowledge and skills in S-OJT as follows.

**Social learning and networks.** From the perspective of social situated learning, much of learning takes place in social interactions with others in the workplace (Stein, 2001). S-OJT is based on social process and social contact through the relationships between a trainer and a trainee (Jacobs, 2003; Semb et al., 1995; Stein, 2001). S-OJT is a special case of one-on-one communication (Osman-Gani & Zidan, 2001). All events used for delivering S-OJT are based on widely mutual interactions between the trainer and trainee (Stein, 2001). Although trainees are novice employees who lack appropriate competence to fully perform their job, they have some degree of rich experience and knowledge derived from their lives (Merriam & Caffarella, 1999). The trainee often lacks context knowledge rather than subject matter expertise in S-OJT (Yang & McLean, 1996). Analytic and reflective conversation between the trainer and the trainee enables them to share what they know and can do each other.
S-OJT trainers have access to and participate in networks in and out of workplace. A primary function of networks is to disseminate knowledge to generate new ideas and new information through interaction of members within the network (Rothwell, 2002). Poell & Van der Krogt (2003) found that networks enable trainers to interact with other trainers and to learn from one another. Barnard & Hawley (2003) indicated that a network built during the workshop for trainers was continued to share and get other ideas beyond its content. Consequently, S-OJT trainers, who have access to networks with other trainers as well as with co-workers in and out of workplace, can tap into learning resources easily and/or engage in learning that may carry over to their roles.

Reflective practice. Reflective practice can be defined as “a mode that integrates or links thought and action with reflection” (Imel, 1992, p. 1). It involves thinking about our practice and critically examines our beliefs and assumptions that lead to our actions. Osterman (1990) summarized some advantages of reflective practice: “it can positively affect professional growth and development […], to the development of new knowledge about practice, and to a broader understanding of the problems” (recited from Imel, 1992, p. 2). Reflective practice is an example of learning to gain new knowledge and improved practice.

S-OJT enhances the trainer’s attention to and reflection upon his or her own works. For instance, the design of S-OJT requires trainers’ reflective practice (Stein, 2001). When trainers participate in developing S-OJT module, they can talk about adding new components to the module and changing events in a different order or through different activities. Such talks may result from the trainer’s reflective practice.

Trainers often possess in-depth knowledge of the work (Jacobs, 2003). However, they may be unable to describe what they do to accomplish an activity because their knowledge has accumulated as a form of tacit knowledge. Tacit knowledge has been characterized as follows: “personal, difficult to articulate fully, experience based, contextualized, job specific, held within, both known and unknown to the holder, transferred through conversation and narrative, and capable of becoming explicit knowledge and vice versa” (Imel, 2003, p. 1). In S-OJT, trainers deliver their tacit knowledge by trying to make explicit knowledge (Stein, 2001). An important role of reflection on practice is to develop the ability to articulate tacit knowledge in order to share professional skills and enhance the body of professional knowledge. Such a process of transition can be viewed as a meaningful learning opportunity for trainers.

The training-the-trainer. Trainers are expected to develop training-related skills, instructor-related skills, and work units related to training content through the train-the-trainer (Johnson & Leach, 2001). Burkett (2002) reported the effectiveness of train-the-trainer programs: ninety percent of respondents indicated an intention to apply S-OJT skills on the job within the first 30 days of completing the workshop. This training has usually been conducted in a classroom setting (Jacobs, 2003). Trainers also believe that formal classroom based training as a form of the train-the-trainer program would be of great benefit (Harris et al., 2001). Such a setting makes it possible for trainers to establish another learning network with other trainers during and after the training. They receive feedback from peers and discuss some issues related to the preparation and delivery of the training and the organizational implications of using S-OJT.

Occupational Commitment

The process through which individuals become committed to their jobs has been interested in the area of work attitudinal research, because it is evident that organizations benefit from occupationally committed employees who continue to invest in their own occupational knowledge, skill and job experience (Heckett, et al., 2001). Blau et al., (1993) defined occupational commitment as “one’s attitude, including affect, belief and behavioral intentions, toward his or her occupation” (p. 311).

Weaver (2002) found that higher levels of formal education and training are significant predictors of occupational commitment. Amounts of management learning experience for newspaper editors positively affect higher levels of occupational commitment (Sanet, 1992). Jones (1991) found that participants who worked in networks had higher occupational commitment than those who did not. Lowrey (2001) asserted that occupational commitment could be enhanced by creating a social bond.

Individual Performance

There is a belief that employees should maintain and develop appropriate competence to perform better on their job through training and learning activities. Some researchers have explored the effectiveness of training and learning activities on individual performance. The literature suggested that training and learning enable employees to improve their performance through employees’ knowledge and skills acquisition (Farrell & Hakstian, 2001; Roman, 2002). Particularly, Roman et al., (2002) found among various training delivery methods, on-the-job training has positive impact on individual performance as well as in house courses. Some researchers (e.g., Handzic & Tolhurst, 2000; Kasvi & Vartiainen; 2000) have provided empirical evidences that the effect of social interactions on performance exists.
For S-OJT, knowing that trainers take responsibility to deliver appropriate and accurate work content to the trainee motivates them to work harder on the job (Hollister, 2001). For structured mentoring, trainers are often forced to open their eyes about what they have done, reexamine their own performance, and evaluate their outcomes (Schulz, 1995). In the same vein, S-OJT can give trainers a fresh perspective on their work and new insight into their job.

Interpersonal Skills

Stevens & Campion (1994) defined interpersonal skills as the capability of individuals to successfully manage and create friendly interpersonal relations with others. S-OJT allows trainers to strengthen their interpersonal skills by working with trainees from different backgrounds and with different personal types. The preparation and delivery of S-OJT often occurs in the context of actual work structure. However, trainers do not necessarily act completely in line with the existing structures (Poell & Van der Krogt, 2003). To achieve S-OJT objectives, trainers may have to negotiate the use of equipment and tools for S-OJT with managers or other workers. Decision-making regarding where and when to conduct the training sometimes seems to pose problems to managers, supervisors, and trainers. S-OJT trainers should be involved in interpersonal processes, including decision-making, negotiation, conflict resolution, and problem solving (Hellenbeck, et al., 1995). In this situation, those stakeholders should put a collaborative effort to discuss on it and find possible solutions (Jacobs, 2003).

Organizational Commitment

Organizational commitment refers to “an individual’s feelings about the organization as a whole” (Enscher, et al., 2001. p. 56). According to Bartlett (2001), “organizational commitment can be thought of as the level of attachment felt toward the organization in which one is employed” (p. 336). Meyer & Allen (1997) defined organizational commitment as an individual’s dedication and loyalty to an organization.

Researchers have studied which antecedents influence organizational commitment. Particularly, several studies (e.g., Bartlett, 2001; Kontoghiorghes & Bryant, 2001) have focused on a relationship between workplace training and learning and organizational commitment. These studies indicated that individual’s readiness to learn, the participation of training and learning, and social support for training and learning enhance employees’ organizational commitment. Several studies (Heffner & Rentsch, 2001; Kontoghiorghes & Bryant, 2001) have reported a positive relationship between organizational commitment and social interactions with members.

Organizational commitment can be developed through social exchange mechanism as a result of positive work experiences (Bartlett, 2001). Being a S-OJT trainer means that an organization acknowledges the trainer’s level of competence. In addition, S-OJT enables trainers to develop their reputation as a leader and an expert with knowledge and wisdom to share. Consequently, such positive experiences given from organizations are valued by trainers. In turn, they can be committed to the organization that provided these experiences.

Self-Efficacy

The concept of self-efficacy contains an individual’s judgment of what she or he can do. It strongly has to do with an individual’s belief whether or not an employee thinks he or she can perform successfully by using their skills and knowledge (Orpen, 1999). Once employees participate in training programs and/or learning activities, they have the opportunity to put the knowledge and skill they acquired into practice, and to develop their knowledge and skills over time (Washington, 2002). Some empirical studies (e.g., Orpen, 1999; Prieto & Meyers, 1999) have revealed that there is the positive relationship between training or learning activities and self-efficacy belief. Self-efficacy can be increased as a result of learning, experience, and feedback (Washington, 2002). Additionally, Keith (2001) found that individuals’ participation of social interactions and social process has an impact on self-efficacy.

Willingness to Share with Other

Some researchers have reported that pedagogic relationship has occurred among workers in the workplace. For example, Bierema (2002) pointed out that “workplace is the only context where the worker has the opportunity to learn about and develop vocational knowledge” (p. 73). Unwin & Fuller (2003) asserted that when a worker explains a process or procedure to a colleague, they are engaged in a ‘teaching and learning’ relationship and “use a range of skills common to teachers and trainers” (p. 21). In general, trainers prepare for, deliver and review training programs. However, these roles are small part of their overall work. Harris et al., (2000) found the workplace trainer undertakes various functions to help others’ learning beyond their explicit roles within structured training systems such as S-OJT. Therefore, teaching experience as a S-OJT trainer influences his or her willingness to share ideas with others beyond formal training situations in the workplace.

Conclusion and Implications

Trainers’ actions in the design and delivery of S-OJT and the preparation of S-OJT trainers can be built upon mainly social interactions with trainees and stakeholders. Much of learning takes place in such social interactions in the
workplace. As such, there is a high level of possibility to occur mutual learning and development between them. Specifically, trainers have opportunity to learn new or updated knowledge and skills through interactive process and social networks with stakeholders, reflective practice, and the train-the-trainer program. Consequently, these learning and development opportunities take place when trainers perform actions in the design and delivery of S-OJT and when they are prepared to be an S-OJT trainer.

Previous research has conceptually and empirically reported consequences, which can be resulted from such learning and development opportunities. In other words, trainers’ actions in S-OJT and the preparation of the trainer enable trainers to learn and develop their professional competences, and in turn produce unanticipated consequences on trainers, such as knowledge and skills acquisition, occupational commitment, sales performance, interpersonal skills, organizational commitment, self-efficacy, and willingness to share with others. Based on the literature review, complex relationships exist among trainers’ actions in the design and delivery of S-OJT, the preparation of S-OJT trainers, and possible unanticipated consequences on trainers. To understand this, the authors proposed a conceptual framework to depict the relationships in Figure 1 below.

The framework will assist organizations, managers, and HRD researchers to expand their perception about S-OJT on the aspect of the trainer beyond its explicit expectations on the trainee. The conceptual framework indicates additional strengths of S-OJT in terms of creating informal learning opportunity for trainers within a formal training situation. As a result, S-OJT can be viewed as an employee development method for the trainer as well as the trainee. In addition, S-OJT can be regarded as an investment for their experienced employees. As such, managers would recognize the long-term benefits of S-OJT in favor of trainers.

As reviewed above, trainers are engaged in various behaviors in the design and delivery of S-OJT. Using this framework proposed, HRD researchers could investigate which trainers’ certain behaviors can strongly affect certain unanticipated consequences on trainers. Figure 1 introduces possible relationships between the four constructs. Empirical research needs to be conducted to examine the framework.

Higher education today faces formidable challenges that are virtually unparalleled when compared to any other point in its history. Conditions in higher education today suggest that universities have entered an era in which they will undergo significant change. Organization development (OD) is an approach to effecting planned change that is used in the private, public, nonprofit, and volunteer sectors. However, relatively little is known about OD in universities. This session examines issues associated with the use of OD in universities through case studies, discussions, breakout sessions, and opportunities for further research.

Keywords: Organization Development, Higher Education, Change

Universities in the U.S. today confront perhaps the most formidable array of challenges ever faced in higher education. Several forces for change confront universities—financial pressure, rapid growth in technology, public scrutiny, changing student demographics, intense competition for students, changing faculty roles, and the rapid rate of change itself both within and beyond the university. Some feel that the demands for change that universities face have accelerated beyond the contemplative debate, desire for consensus, and collegiality that have long characterized decision making in the university. The significance of these challenges suggests that universities have entered a period in which they are likely to undergo significant change.

Organization development (OD) is an approach to effecting planned change that is used in the private sector and, more recently, in public, nonprofit, and independent (volunteer) organizations. However, relatively little is known about OD in universities. Moreover, few models or frameworks for OD in universities exist. A major purpose of the innovative session is to bring the topic of OD in universities to the attention of scholars and practitioners and to begin exploring the key issues and challenges related to the use of OD in universities.

This session will identify challenges and opportunities related to OD in universities in the U.S. that, heretofore, have been unexplored. Some key questions addressed in the session include: What is known about OD in universities today? Given present conditions in higher education, how can OD help to effect systemic change in universities? How is OD in universities initiated and sustained? What are key, institution-specific issues and challenges associated with OD in universities? These questions about OD in universities will be addressed to gain a better understanding about this important topic. The innovative session will serve as a springboard for continued dialogue on the topic of OD in universities among scholars and practitioners. By drawing attention to the potential opportunities associated with establishing OD initiatives in universities, it is hoped that this session will lead directly to research projects that further explore the use of OD in universities. Specifically, we envision conducting research that proposes and tests hypotheses that lead to more higher education-specific models of OD.

Theoretical Framework

The theoretical framework of the session is grounded in two main sources: (a) theories of organization and culture in higher education and, (b) theories that underlie the philosophy and practice of organization development.

In an early volume on organization development, Warren Bennis (1969, p. 2) defined OD as “a response to change, a complex educational strategy intended to change the beliefs, attitudes, values and structure of organizations so that they can better adapt to new technologies, markets, and challenges, and the dizzying rate of change itself.” OD theorists are currently questioning whether or not, and in what ways, the theory and practice of OD must change to better match changes in organizations, in particular, the move from hierarchical, bureaucratic organizations to decentralized, networked organizations. Warner Burke (2002, p. xiii), in recently updating his thinking on OD in response to the change in the field itself, noted that: “Unlike the situation a few decades ago, the external environment now changes much more rapidly than organizations do. Organizations today are playing catch-up, and certainly this will be true even more so in the future.”

It may not be surprising that much theorizing in OD has not been applied in the world of postsecondary education. Postsecondary institutions have been cushioned from some of the external environmental pressures that businesses encounter, but are also subject to their own unique pressures, both external and internal. But as noted above, the external environment can no longer be ignored because of several critical trends in higher education, including changes in their ultimate markets (the businesses and other institutions that hire their graduates) and changes in technology that have fostered a new way of thinking about the design and delivery of learning services.

In addition to differences in external environments, colleges and universities are using a more consensual model of governance that involves faculty, administrators, trustees, and (sometimes) students, their parents, and the communities served by the university. Birnbaum (1988) captured some of these differences — and their implications for governance and leadership in postsecondary education — in his work on different ways of conceptualizing How Colleges Work. He noted:

Because most institutions of higher education lack a clear and unambiguous mission whose achievement can be assessed through agreed upon quantifiable measures such as “profits,” the processes, structures, and systems for accountability commonly used in business firms are not always sensible for them. Many college and university managers do not exercise primary control over the curriculum, faculty recruitment or promotions, or the methods of teaching, major processes of production that in business firms would be fundamental managerial prerogatives. . . . The authority of various constituencies to participate in or make decisions is often unclear and frequently contested. (pp. 27-28)

OD must take account of these fundamental differences between postsecondary institutions and other kinds of institutions when considering the challenges of entry and change, which are the focus of this session.

Theories of organization and culture in higher education. The dynamics of current and future change in higher education are undoubtedly related to the organization of the academy (Birnbaum, 1988; Duderstadt & Womack, 2003) and to organizational culture in higher education (Tierney, 1998; 1991). Organizational culture is widely viewed as a critical component determining the type, rate, and success of change in organizations. Organizational culture in higher education has its own unique, distinctive features as compared to typical hierarchical, command and control for-profit firms. Moreover, different types of higher education institutions (two-year vs. four-year institutions, research universities vs. liberal arts colleges, and so on) manifest their own cultural nuances, much like the variations in firm cultures across industry, geography, and size. Regardless of the dimension(s) of change that are examined or of the particular higher education institutions studied, the dynamics of the change phenomenon itself will be influenced by organizational culture. Schein (1985) asserts that culture encompasses basic assumptions, values, and norms. Culture is seen as a multi-level concept that includes individual, group/process, and organizational/structural level components. “Culture is critical to guiding behaviors and making choices about organizational design” (Rothwell, Sullivan & McLean, 1995, p. 208). Culture can impact change in higher education in many ways.

Bergquist (1992) proposed four cultural archetypes in an attempt to characterize various institutional cultures in higher education. Bergquist’s intention in creating these archetypes was to hypothesize that “different change strategies would be needed and appropriate within the four different academic culture archetypes that reflect any higher education institution” (Kezar & Eckel, 2002, p. 439). Bergquist’s four academic culture archetypes are each quite different and are intended to reflect culture in any higher education institution. These four cultural archetypes are the collegial culture that arises primarily from the disciplines of the faculty, the managerial culture that focuses on the goals of the institution and that values efficiency, fiscal responsibility, and effective supervision, the developmental culture that is based on the personal and professional growth of all members of the collegiate
environment, and the *negotiating culture* that values the establishment of equitable policies and procedures, mediation, and interest groups. Recent studies have used Bergquist’s cultural archetypes to examine the effects of institutional culture on change in higher education. Kezar and Eckel (2002) examined the effect of institutional culture on change strategies by assessing the degree to which change processes are enhanced by following culturally sensitive change strategies and/or thwarted by violating cultural norms. The authors used an ethnographic approach and a two-tiered cultural framework composed of Bergquist’s (1992) four academic cultures and Tierney’s (1991) individual institutional culture framework to investigate comprehensive change at six institutions—one research university, three doctoral-granting universities, a liberal arts college, and a community college. They found that change strategies seemed to be successful if they were culturally coherent or aligned with the institution’s culture. Institutions that violated their institutional culture during the change process experienced difficulty. The authors recommend that campuses conduct audits of their institutional cultures before engaging in the change process.

Addressing the need for institutional change in higher education, Welsh and Metcalf (2003) examined the chasm between higher education faculty and administrators in their perspectives on effecting change related to institutional effectiveness activities. Faculty support for institutional effectiveness activities was likely to be increased by ensuring that faculty perceive that they are personally involved in institutional effectiveness activities. In addition, faculty support for institutional effectiveness activities is bolstered if the prevailing definition of quality at the institution is based on *outcomes* not on resource *inputs* (italics in original). The authors maintain that administrators are more likely to interact with external stakeholders and, thus, are more likely to be aware of and receptive to external aspirations for higher education. They state, “In sharp contrast to faculty, administrators believe that the institution they serve revolves around a nucleus of external forces that greatly affect the institution’s continued vitality” (p. 447). Faculty tend to have more trust in academic culture than in administrative hierarchy, and they remain committed to their disciplines and the educative mission of their institution.

Other studies of the relationship of institutional culture to change in higher education include a study of the influence of institutional culture, mission, preferred decision-making approaches and collective bargaining status on institutional effectiveness in two-year colleges (Smart, Kuh & Tierney, 1997), a case study of the structural and cultural changes involved in the “chartering” of a university school of education (Wong & Tierney, 2001), and a study of the effects of technology, increased competition for students, and the changing workplace on change in collegiate schools of business (Kemelgor, Johnson & Srinivasan, 2000). As these studies show, the dynamics of current and future change in higher education are undoubtedly related to institutional culture. **The theoretical base of organization development.** Organization development (OD) appears to have originated in about 1957 as an attempt to apply some of the values and principles of learning from laboratory training to the total organization (French, 1969). The theoretical roots of organization development are grounded in human relations training (Bennis, 1963), action research (Lewin, 1951; Kolb, 1960), participative management (Likert, 1967; Mohrman & Ledford, 1985), and strategic change (Jelinek & Litterer, 1988). A dominant influence on the philosophy and methods of OD as it is currently practiced is *action research* (Cummings & Worley, 2001; Rothwell, Sullivan & McLean 1995). We adopt action research as a central element of our theoretical framework along with a comprehensive systems model that incorporates multiple levels (organization, work groups, and individuals) and shows how organizations interact with their external environments. *Action research* and the systems model, the Burke-Litwin model (Burke, 2002), are used to guide our understanding of how OD can be used as an approach to planned change in higher education. **Action research.** Action research is based on the assumption that organizational members themselves should be actively engaged in the process of change (Kolb, 1960). Action research is based on an iterative cycle of problem identification, clarification, data collection/analysis, and action planning for systemic change (French, 1969). Change occurs as new data is collected and used to guide further change, thus insuring that *action* is based on *research*. In the process, the organization develops its capabilities to identify and solve its own problems. In action research, the change process is itself an “outcome.” The organization develops as it improves its capabilities for change management. The *action research model* (ARM) is the eight-phase process of entry, start-up, assessment, action planning, intervention(s), evaluation, adoption, and separation. Several versions of the ARM exist—all variations on a core theme. Those who are responsible for change are all who are involved and/or affected by the change (ideally, the entire system). “Sitting on the sidelines” is discouraged in action research. Collaboration for change occurs among organization members, facilitated by (a) change agent(s), who may be internal to the system, external, or both.

There are many issues and challenges associated with using OD as an approach to planned change in universities. Institutional factors such as a university’s culture, governance structure, size, economics, and other systemic factors heavily influence the perceptions and viability of any initiative to effect planned change in a university. In addition, factors related to the efficacy of the OD strategy itself, such as its ability to obtain
commitment to change and overcome resistance to change, significantly influence how OD is introduced and sustained. Indeed, OD in universities is affected by many other political, socio-cultural, technical, and economic factors that are both external and internal to the university system.

Since relatively little is known about OD in universities to date and the conceptual and methodological issues associated with it are quite broad, the session will focus primarily on how OD gets introduced in higher education. Thus, theoretical grounding and guidance on “entry” and the early stages of OD are needed. The theory base for the session includes the philosophy and practice of organization development primarily as this relates to entry into the system.

The entry stage of organization development. Entry is the process of engaging with an organization or part of an organization that desires change and needs assistance with it. Entry occurs as decisions are made about whether the organizational system and the OD consultant want to engage in a planned change program and commit resources to such a process (Jackson, 1987). Entry occurs in stages as the organization system and the consultant initially explore each other’s needs and interests related to planned change. The organization system (the client) and the consultant(s), who may be internal to the system, external or both, explore the initial stages of OD through a process that frequently follows two general stages; the initial contact and the contracting phase (Lippitt & Lippitt, 1986). The initial contact between the consultant and prospective client, which may be planned or unplanned, is followed by a second phase when the consultant and client meet to develop a contract for the OD intervention (Engdahl, Howe & Cole, 1991). Determining whether the two parties should enter into an OD relationship typically involves clarifying the nature of the organization’s problem, determining the relevant client system for that problem, and assessing the readiness of the client to engage in the OD process (Beer, 1980). Indeed, some of the issues and challenges of entry continue throughout the OD process as the consultant(s) develop psychological contracts with their clients, continue to educate members of client organizations, and cultivate trust in their skills (Rothwell, Sullivan & McLean, 1995).

Burke-Litwin model of organization development. As Birnbaum (1988) noted, higher education functions as a system, even though it does so in a manner that is different from business and other kinds of organizations. A framework that could be adapted to understanding OD in postsecondary institutions is the Burke-Litwin model (Burke, 2002) because it is a comprehensive systems model that incorporates multiple levels (organization, work groups, and individuals) and shows how organizations interact with their external environments. Changes in the external environment trigger change. Change is guided by work on transformational and transactional variables. Transformational variables—mission and strategy, leadership, culture—drive fundamental change, but cannot be effective without corresponding work on transactional variables—structure, management practices, and systems. Both levels of variables affect work unit climate, which in turn, affects individual motivation that is also affected by task requirements and individual skills, abilities, needs and values. Individual and organizational performance is driven by work with the variables in the model through feedback loops between the internal and external environments.

OD initiatives in higher education must take into account the diverse constituencies that affect the setting of mission and strategy, leadership and culture. Yet postsecondary institutions are not typically structured in a way that makes it easy for any of the key players, let alone an OD consultant, to easily influence and work with all critical constituencies. OD change agents may also find themselves operating at the transactional, rather than the transformational level of change. Entry level may make it challenging to reach constituencies that can influence transformational variables.

OD change agents may have to work with parallel systems in effecting change. Change is not achieved because the President, Dean or administrators so decree. Change occurs through negotiation between administrators and faculty, who in turn are influenced by different external environments. Trustees and donors, for example, shape the external environment of higher education, while professional peers shape the leadership provided by key faculty. Burke’s model may be re-constructed for higher education by positing two parallel universes, with potential overlap, at the transformational, transactional, and work climate levels. Brokers may have to work in the white space between the universe of administrators and the universe of faculty to effect change, and in so doing, bring along different stakeholders. OD brokers would have to create vehicles for effective conversation between administrative and faculty cultures to engage multiple constituencies. Ideally, key leaders should partner with both the administrative and faculty sides of the university walls to make this possible. Initiatives could perhaps begin at the transactional level, and remain there, as long as they can function within Departmental silos. But in order to affect the larger university environment, OD would have to engage transformational variables that are co-set by both faculty leaders and Presidents, Deans and their staff.

OD is challenging at best in corporations, more so today because of cultures that are decentralized and networked. Yet at some point, the CEO and his/her key leadership team can make decisions that are carried out at
the risk of loss of job. In higher education, as one panel member has noted, “nothing is a problem or an opportunity until faculty say so!” This observation grew from an informal comparison of the sustainability of OD efforts at MIT, Harvard, and Rutgers University. The OD initiative with the most apparent staying power, at Rutgers University, grew out of leadership by key faculty in partnership with HR. Faculty cannot be fired once they hold tenure, and they co-influence transformational variables such as mission, leadership and culture.

**Overview of the Session**

Since little is currently known about OD in universities, the session will begin by exploring case studies and what is known about the present state of OD in universities. The session will attempt to present a “snapshot” of the current state of OD practice in universities using data gathered prior to the session and at the session itself.

Prior to the session, questions will be posed to human resource professionals in higher education related to OD at their institutions using an e-mail survey. Questions that have been drafted for this purpose include, “If there is/was an internal OD function within your institution, who initiated it?” “What was his/her position?” “What was the impetus/catalyst for OD?” “What was the process?” “How has the OD function changed since its inception?” “How is OD a match/mismatch for the culture of your institution?” “What is the current status of OD within your institution?” Prior to the conference these questions will be sent via e-mail to HR professionals working in higher education. One of the session presenters has access to e-mail lists for this target group.

At the start of the session, we will "prime the pump" by asking participants about their own experiences with OD in universities. As the session begins, participants will be asked to think about OD in universities by answering a limited set of questions that addresses the nature of change in their institutions. In addition, we will ask participants to identify any OD-related initiatives at their universities. These questions will contribute to discussion later in the session on the challenges and opportunities for OD in universities.

The session will begin with the presentation of short case studies of OD in universities. A limited number of cases of OD initiatives in universities have been identified, including those at some of the presenters’ own institutions. Sharing the actual developments associated with the introduction of OD in specific institutions (perhaps four cases) is expected to set a realistic tone about OD in universities for the remainder of the session.

Since the topic of OD in universities potentially can be quite large, the session will focus primarily on how OD gets introduced in higher education (that is, on “entry” and early stages of OD). We will examine the circumstances and forces that catalyze the introduction of OD in universities, as well as factors that might be associated with how OD is sustained. The issues and questions for discussion will focus on this aspect of OD in universities.

We intend for the innovative session to generate a high level of participation and scholarly dialogue on this important topic. Special attention will be given to creating an intellectually stimulating environment conducive to the active involvement of all participants in attendance at the session. Participants will be asked to think about how their own institutions deal with change, how their institutions might respond to an OD initiative, and what key forces and challenges to OD are present in their university environments. Both open discussion forums and small-group breakout sessions will be used to examine specific issues related to OD in universities.

The presentation of case studies early in the session is expected to generate discussion and reactions to the challenges that confront OD in universities. This will lead to open discussion about general issues related to OD in universities, including: What forces for change exist at your institution,? How would you characterize how change occurs at your institution,? Does your institution utilize OD (internal OD function, external consultants, both)? What are key institution-specific issues/challenges related to OD initiatives? and other general questions on this topic.

From a limited number of key issues on the topic, participants will choose an issue of interest to them for more in-depth discussion in small-group breakout sessions. Participants will divide into small groups by topic. Key issues for small-group discussion may include the roles of faculty and staff during the introduction of OD, or how to sustain the OD function after the initial change impetus has been addressed, the relationship of institutional culture to change strategies, relationships that exist between the strategies used to introduce OD into universities and the ultimate viability of OD in universities, and other topics.

**Objectives for the Session**

The session will address the following objectives:

- To raise awareness and understanding of the challenges and opportunities related to OD in universities.
- To begin identifying what is known about the use of OD in universities.
- To explore how OD is introduced in universities.
• To stimulate greater dialogue on this topic among scholars and practitioners.
• To lay the groundwork for future research on OD in universities.

We will ask participants ahead of time about their own experiences and ideas related to OD and change in their institutions. Responses to advance questions and the results of the e-mail survey of HR professionals in higher education will be used to help participants think about OD in universities and to set the tone for the session. The session is tentatively organized around the following agenda:

• Overview of the innovative session and introductions @ approx. 5 minutes
• Presentation of case studies of OD in universities @ approx. 25 minutes
• Pose key questions for open discussion and dialogue @ approx. 5 minutes
• Discussion and breakout sessions in which each person with a case holds a discussion with people around a key issue @ approx. 35 minutes
• Session wrap-up / Identify next steps (research and practice) @ approx. 20 minutes

The Why’s of Bhopal Revisited.

Meera Alagaraja
Sudha Arlikatti
Texas A&M University

The Bhopal tragedy in central India has been relentlessly analyzed and studied across numerous disciplines like engineering, planning, disaster management etc. Drawing on literature and evidence from the case, the paper provides an understanding of the ethical challenges confronting global organizations today. The paper expects to make a meaningful contribution to the growing literature on ethics with implications for HRD.

Keywords: Global Organizations, Ethics, HRD.

The Bhopal tragedy in central India is a catastrophe that has no parallel in the history of chemical industry (Kletz, 2001). In the early morning hours of December 3rd 1984, approximately forty tons of toxic gases leaked out from Union Carbide’s Bhopal plant and spread throughout the city (Morehouse & Subramaniam, 1986; Shrivastava, 1987). The cause was the contamination of Methyl Isocyanate with water carrying catalytic material. The result was a nightmare. Residents awoke to clouds of suffocating gas and began a desperate flight through the dark streets. No warning was sounded and no systematic evacuations were made causing chaos and countless deaths. Controversies regarding the death toll continue to this day. Newspapers placed the total at between 2000 and 2500 while various voluntary organizations, eye witness accounts, information gleaned from scientific experts and circumstantial evidence of death such as shrouds, cremation wood used and missing persons reported put it between 6000 and 15000 (Shrivastava, 1987, Kletz, 2001). It has been referred to as the ‘Hiroshima’ of the chemical industry (Morehouse & Subramaniam, 1986). The Bhopal experience offered a host of possible lessons to industrial societies. It stimulated extensive soul-searching in India and the world over about industrial hazards and the capacity to anticipate and manage them. The consequences of the accident included crisis management responses by the three principal stakeholders - the organization, government, and victims supported by voluntary organizations (Shrivastava, 1987).

“Accident investigation is like peeling an onion... Beneath one layer, of causes and recommendations; there are other, less superficial layers. The outer layers deal with the immediate technical causes while the inner layers are concerned with ways of avoiding the hazards and with the underlying causes, such as weaknesses in the management system. Very often only the outer layers are considered and thus we fail to use all the information for which we have paid the high price of the accident.” (Kletz, T. A., 2001. p.1)

The post disaster crisis management approach dealt only with the ‘technical causes and immediate reactions’ that Kletz (2001) likened to the outer, layers of an onion. The other, less superficial layers concerned with, values and ethics i.e. the ‘peoples’ aspect’, lacked attention. The authors believe this to be the core of the onion and decidedly the core issue at stake. There is a need to know the dynamics of how this core affects different layers, as it is concerned with people involved or affected by the accident in various ways.

Over the years since the tragedy, the Bhopal case has been analyzed by various disciplines like engineering, planning, disaster management, etc. Much of the literature on Bhopal – international and domestic have dwelt on the procedural safety aspects (Morehouse & Subramaniam, 1986; Shrivastava, 1986 & Kletz, 2001). Taking a management perspective, Ice (1991) examined the role of rhetorical strategies in restoring damaged corporate relationships with implications for management communication.

Recently Dutta (2002) studied Union Carbide’s response to the disaster using William Bennoit’s theory of image restoration. It is believed that the Bhopal tragedy, which has never been discussed in HRD, is in fact an ideal case study scenario to study the ethical challenges confronting global organizations today, and their relevance to HRD.
Literature Review

Reviewing the literature on corporations and their social responsibilities one often comes across a common place saying that, “The business of business is to be in business”. For many this view is an accepted matter of fact. A corporation’s primary and perhaps sole purpose is to maximize profits for its stockholders. Milton Friedman is most often associated with this notion of a corporations’ primary purpose. According to Friedman (1970) corporations are owned by stockholders and therefore profits of the corporation belong solely to stockholders. Secondly corporations do not have social responsibilities; it is the people who manage these organizations that have responsibilities. An alternative to Friedman’s analysis of social responsibilities of the organization is to consider those that are affected by the decisions of the organizations, the stakeholders. Much has been written about the obligations of organizations to their stockholders while little has been said about their obligations to the other stakeholders, namely the employees, customers, managers, suppliers and the local community. Freeman’s (1994) stakeholder concept suggests a fine-grained analysis that combines business and ethics to this context.

Increasing concerns for environmental issues and demands for greater product safety, workplace and community well-being have had an impact on the overall performance of companies (Arceleus & Schaeffer, 1982; Fritzche, 1990). There has been an ever growing concern for the role of businesses in society. Managers and professionals are looking for support and guidance as they confront the complexities in a climate of uncertainty and constant change (Velasquez, 2000). Despite the understanding that profits and growth are the priorities of any business venture, there is a need to recognize and acknowledge that actively discharging ethical responsibilities to employees, direct customers, consumers and the community is also in the self-interest of the organization (Harness, 1980). They will increasingly benefit the performance of the organization in the long run. That said, the emphasis of ethics runs contrary to the self-interest of executives who are rewarded for problem solving that is time bound and short term. The literature on business ethics discusses issues of ethics in a variety of contexts – local, national and global. Global business is competitive and has been increasingly so since the 1990’s. Having to operate in different and even inconsistent environments is one of the most important risks facing the global organization (Payne et al., 1997). They discuss the responsibilities of the global organization and suggest that the power and size of the global organization may affect and influence public national policies. Such effects according to them will be more heavily felt in the developing nations than the developed nations. Global organizations have the ability to shift resources across different locations with ease of movement. A global organization can circumvent legal, environmental production standards and other constraints, if it believes that these actions may be beneficial to the bottom line. De George (1993) proposed guidelines, strategies and background conditions that multinationals must adhere to. Jackson (1997) highlighted the need for an organizational code of ethics to work in concert with the prevailing laws and regulations in the host country.

The concept of international ethics is not new, but applicability in a HRD context is only now becoming significant. Swanson (1999) added ethics as the rug supporting the three-legged stool of HRD theories in economics, psychology and general systems. Hatcher (2002) added that HRD should also focus on ethics, as a new addition to the theoretical foundations of HRD apart from the theories mentioned above. The Academy of Human Resource Development (AHRD) has produced Standards on Ethics and Integrity (The Standards) (AHRD 1999). These Standards are meant to provide a common set of values and principles for the profession of HRD. The applicability of the Ethics Standards in international contexts has also been discussed (Garrett & McLean, 2002). Alternative approaches taken with enforcement of ethical standards with implications for AHRD have been examined (Burns, Russ-Eft & Wright, 2001). Emerging literature on the ethical dimensions of HRD has also begun to examine explorations of ethical reasoning and ethical behavior in HRD issues. It is the authors’ beliefs that ethics in HRD needs to be systematically studied to make a difference or influence organizations directly or through the academia. Understanding the need for discussing the applicability of ethics to HRD this paper goes a step further and discusses it in the context of the case study at hand. The primary focus for human resource development (HRD) is defined by its work with people, benefitting individuals and organizations (Ruona, 2000). As a field, HRD is still caught in the conversations of how we define ourselves, whether we are “developing human resources of an organization or resources of the human” (Ruona, 2000, p.11). Relevant to HRD and the case study is the element of ethics, which poses explicit questions as to how we should act individually, organizationally and communally. Ethics, used here in the normative sense, helps in clarifying and outlining the tone and rigor for actions. Ethics plays an important role in putting standards and requirements for acceptable actions in the field. Emerging literature on the ethical dimensions of HRD has begun to examine these issues. The authors’ believe that ethics in HRD needs to be systematically studied to make a difference or influence organizations directly or through the academia.

By the virtue of whom it serves and the context in which it is applied, HRD has many definitions. For the purpose of this paper, HRD is any process or activity that, either initially or over the long term, has the potential to
develop adults’ work-based knowledge, expertise, productivity and satisfaction, whether for personal or group/team gain, or for the benefit of an organization, community, nation or, ultimately, the whole of humanity (McLean & McLean, 2001).

Research Questions

The purpose of this study was to address two research questions.
1. What ethical responsibilities and challenges do global organizations have concerning the issues described in the case study?
2. Given the issues described in the case study, what are the implications for HRD?

The authors would like to state that in revisiting and studying an infamous case facilitates learning through mistakes and serves as a lesson for comparable crises.

Methodology

The case study method “to explain a situation and provide a basis to apply solutions to situations” (Yin, 1994; Dooley, 2002) was adopted. The Bhopal case is a window into the realm of complex issues, faced by global organizations as they operate in different geographic settings, cultures and value based societies. Given the location of the parent and the subsidiary company, the case study brings to fore the dynamics of the first and third world countries and their differing and sometimes competing set of ethics and values. The paper explores strategies to develop an ethical climate for the organization and society with implications for HRD. The researchers investigated the case within its real-life situation using secondary sources of data. Review of literature was drawn from multiple disciplines like industrial management, chemical engineering, disaster management, public policy and law. Other citations and web-based information have been used to gain a better understanding of the ethical contexts in which the Bhopal case operated. The authors recognize that adopting a case study method may not be the best way of exploring appropriate organizational responses to ethical demands made by multiple environments (local, state, national, continental and global). But the case study can serve as a beginning, a quick tool, to understand the dynamics of ethical demands, and to at least prioritize them from the perspectives of the organization, host government and the local community.

The Case

Developing countries confer upon MNC’s a competitive advantage because they offer low cost labor, access to markets, and lower operating costs. Once there, companies have little incentive to minimize environmental and human risks. Lax environmental and safety regulation, inadequate capital investment in safety equipment, and poor communications between companies and governments compound the problem. (Cassels, p.279, 1993).

With encouragement from the Indian government, Union Carbide one of the largest chemical companies in the United States, opened the Bhopal plant in 1977 to manufacture pesticides. India’s post independence urgency in seeking self-sufficiency with the aid of modern agricultural techniques including the use of pesticides, made her waive statutory ownership requirements to obtain the facility. The parent company based in the U.S. held 50.9% of Union Carbide India Limited (UCIL) and the balance stocks were owned by Indian investors (Morehouse & Subramaniam, 1986). In the case of such joint ventures it is important to be clear as to who would be responsible for aspects such as safety in design and operations, information sharing with the public, disaster management plans, implementation or regulation of ethics and codes of conduct. But these were scarcely discussed by the principal stakeholders. While the company sought to increase profits, the Indian government viewed the Bhopal facility as a symbol of development. This scenario was the backdrop to the devastating gas disaster at the Union Carbide plant in Bhopal.

After the Crisis

The preliminary report after the disaster by Morehouse & Subramaniam (1986) pointed out the different and competing ethical values of the home and host country. Ethical issues arose from the lack of safety standards and
maintenance procedures in Bhopal in comparison to the sister plant in Institute, West Virginia, U.S.A. Human life was as precious in Bhopal as it was in Carbide’s U.S subsidiary. But double standards were revealed in protection of human life and well being. There was a demand that Union Carbide face up to the same rigorous standards that it required at home, to anywhere else in the world. Questions arose regarding violation of human rights, the right to information, to participate in decisions affecting the well-being, and safety of workers and the community surrounding hazardous industries. The Bhopal tragedy damaged the reputation of Union Carbide and led to its closure. Subsequently Union Carbide was taken over by Dow Chemicals in 2001. The Bhopal plant remains closed to this day.

Responsibility Analysis

In the case of global organizations, consensus on what constitutes ethical behavior is understandably situational and culture specific. There hasn’t been a disagreement on whether organizations are expected to be ethically responsible. Rather, the determination of what constitutes ethical behavior or not has been the point of contention amongst various stakeholders in the case study. Freeman (1994) provides a wide definition of stakeholders: “those groups who can affect and be affected by the achievement of an organization’s purpose” (p.46). This definition is broad enough to include governments, local community groups and interest groups apart from employees, investors etc. Stakeholders also need to have the ability to access resources and exert influence on organizations to make ethical decisions for protecting their interests. In Bhopal, however, the affected victims were poor and illiterate. They had no choice or voice to object to the unilateral decisions made by the Indian Government and Union Carbide. One of the contentious issues with the Bhopal case has been the ongoing litigation and activism by the victims. The social costs were borne by the local community when Union Carbide closed its operations in Bhopal. The citizen’s groups expected the plant to absorb the social costs and felt that the final settlement reached between Union Carbide and the Indian Government in no way mitigated the harmful environmental effects and the human suffering.

There was enough evidence that Methyl Isocyanate was harmful and quantities in which they were kept were unwarranted (Morehouse & Subramaniam, 1986; Shrivastava, 1986 & Kletz, 2001). When there is some evidence that products, processes and other materials classified as “harmful” in use – managers whether they belong to parent company or the local management may need to openly face the idea of a worst-case scenario as a possibility and be prepared for such an eventuality. Encouraging information sharing with the stakeholders in light of stocking hazardous materials becomes necessary from both safety and ethical point of view. It is believed that the onus of information sharing lies primarily with the parent company, given the hazardous nature of the materials and procedures involved and the potential harm they can bring to the other stakeholders.

Fritzsche (1990) suggests that the host country’s ethical norms standards should be the acceptable minimum. According to him, the global organization has a right to build on the minimum acceptable ethical norms and develop higher standards of its own from this acceptable minimum. According to Kletz (2001), technically, in joint ventures the onus falls on the more sophisticated partner to see that the operating partner is suitably educated and skilled and committed to running the plant in a safe manner. But “for Union Carbide the Bhopal plant was a backwater, making little contribution to profits, in fact losing money and may have received less than its fair share of management resources”(p.117). The host country’s standards were exploited by the global organization to increase its profits – whether it was through cheap labor, low safety standards and ineffective environmental regulations. The case highlights that Fritzsche’s view may be untenable, given the lack of infrastructure in host countries.

Discussion

The Bhopal tragedy made people aware of the global effects and has valuable lessons to demonstrate the effects on individuals, organizations and communities. As is frequently observed, a major accident is the result of a sequence of events; the occurrence of each event in itself is unlikely. Equally no single individual or small group can be held responsible for the disaster. “Organizations have no memory. It is the people, who have memories. There is much that can be done to learn from the experience of those who have been involved in accidents and to keep alive the memory of the past” (Kletz, T. A., 2001. p.313). In many ways Bhopal presaged a new age of ethical awareness, in trying to reconcile the interests of local community, businesses and the host government.

Payne et al. (1997) discuss an ethical behavior continuum addressing five major issues in terms of relationships that the organizations may have with their environment. These issues are organizational relations (with other organizations like competition, strategic alliances etc), economic relations (fiscal policies etc), employee relations, customer relations, industrial (including technology transfer, research and development) and political relations. According to them, global organizations cannot all be expected to have the same standards of ethical behavior for each one of these issues. Even in the context of a single multinational, it is not possible to evince similar ethical
behavior across locations. Differences would arise depending on whether the nations are developed or developing. Asgary and Mitschow (2002) however believe that as businesses expand globally it is essential to develop an international code of ethics despite the difficulties involved. The idea of having an international code of ethics involves complexity of issues and having an international standard may therefore be difficult. However, global organizations need to acknowledge and accept a “defined minimal ethical stance” (Payne et al., 1997, p.1733). The absence of such a code of ethics may mean that the social impacts of globalization are largely glossed over.

Little previous case research views Bhopal as a study tool for students in ethics, HRD and general management. This case study might help global organizations to better understand what constitutes the realm of ethical conduct, and lessons learned can be applied to any global enterprise that is seeking to be ethically responsive and improve the quality of its contribution to society. Quantification of the disaster in terms of financial settlement or number of deaths, affected victims of the tragedy was never on the agenda of the paper.

One cannot confidently say that the lessons after Bhopal have been well learned and that similar crises will be prevented. Given the complexities and legal issues involved there cannot be just one answer or solution, framework or model that will facilitate ethical decision making in such a case, or provide generalizations for other cases. Perceptions about organization’s concern for the common good may influence judgments. It certainly did in the aftermath of Bhopal. The Union Carbide plant remains closed to this day and may never be operational. The community may prevent it from doing so. But is this a signal for organizations to now acknowledge the relationship they have with potentially powerful stakeholder groups in their environments?

Stringent legislations may not be sufficient as stand alone solutions. Enforcement of environmental regulations may run into difficulties given the belief that it may thwart future economic investments in poorer communities. Weaker socio-economic communities may continue to succumb to the financial and infrastructural investment that global organizations promise to bring in the event of opening operations in these communities. At the same time it is extremely important that the people not forget disasters like the Bhopal tragedy and through citizen organizations keep the memory of that fateful day alive, so that they feel spurred to continue to act in unison. In this way they can make the industrial corporations and governments abide by the laws set for the good of the environment and society. Collaboration and the dialogue between the local community groups, multinational companies and governments will serve to improve ethical behavior by global organizations (Lozano & Boni, 2002). It is also imperative that through this dialogue and collaboration, responsibility awareness increases not only for the multinational organizations, but also for the other stakeholders. It is suggested that, organizations that have access to a better understanding of the various demands, prioritize them according to their capabilities for consistent ethical decision making. This will help increase their sensitivity to ethical issues.

**Recommendations**

The case study presents some of the ethical challenges facing global organizations, and underlines the importance of operationalizing them. One possible means of doing so would be to, discuss and include, in standards and ethical codes of practice, notes on the accidents that lead to these recommendations that are essential to prevent other disasters. Creating and employing need based information storage and retrieval systems would enable easier access to reports and recommendations on previous disasters. The recommendations may be feasible if organizations are primed for “disaster readiness rather than disaster recovery” (Greene, R.W., 2000, p.33). Post Bhopal, the legal framework enforced guidelines on the information that organizations need to share with society. But this is only one kind of information, dealing with quantification and or documentation of materials, processes and procedures that may be difficult for a layperson to understand the implications. Creating a hazard management database accessible not only within the organization but to public at large linking public health infrastructure, evacuation routes, shortest routes for entry of relief and rescue, identifying vulnerable populations so as to be best prepared for the disaster scenarios may prime organizations for disaster readiness. Thus improving the transparency and participation in dealing with all the stakeholders may be the key to promoting an ethically sound environment. It is critical for HRD to move beyond descriptive research while we examine ethical dilemmas that challenge global organizations today. As a field, HRD draws from contributions of diverse disciplines. Further contributions to the growing literature of ethics and HRD will provide a useful means to forge links between business and HRD.

Document analysis was the primary source of data collection to provide evidence for the case study. Accident reports were derived from secondary sources of data such as reports commissioned by independent organizations. The literature helped the authors develop a sense of whether the case truly reflected the identified research questions, although we grant that first hand sources of data would have made substantial contributions to address the research questions. Also, comparisons between multiple cases may have lent more credibility to the paper but, for want of similar cases having such far reaching effects as Bhopal was not possible. Both the authors are from the host
country India where this tragedy occurred and they feel this may have unintentionally lent a personal bias to the case study approach.

Conclusions

Revisiting the case has helped in exploring ethical challenges that face organizations. We learn more from failure than from success, another reason that makes the case study unique. The study adds to the growing literature on ethics in global organizations and increasing ethical awareness which is a necessity for HRD professionals.

In the search for a definition that meets the requirements of many countries, Mclean & McLean (2001) dwell on factors that influence HRD. These factors include national and trans-national differences and influences of the economy, government and legislative frameworks. Global organizations also operate under these influences. Also, the intended beneficiaries for global organizations are not different from HRD viz., individuals, teams, organizations, communities and nations. Any learning therefore for HRD that concerns its beneficiaries serves the growing needs of global corporations for balancing its responsibilities and obligations to stakeholders. The reverse is equally true. Hence understanding the ethical challenges facing global organizations also helps broaden our sometimes too narrow view of the content of our field. HRD needs to better understand the true nature of global factors and how they impact different nations. Equipped with this knowledge, better decisions can be made for designing and implementing ethical interventions both at the individual and organizational level. Attention should be focused on changing the organization’s ethical climate through training, based on reward system (Jansen & VonGlinow, 1985), code of ethics (Lazniak & Inderrieden, 1987), need analysis (Delaney & Sockell, 1992), etc. According to Hatcher (2002), setting reasonable ethical expectations and punishing negative ethical behaviors helps build an ethical culture. Interventions that strengthen an organization’s ethical climate may help manage ethical behavior within organizations. A clear framework of HRD policies must form the heart of any management philosophy where ethical values are espoused in practice. Thus HRD scholars and practitioners need to understand that global organizations are not free from societal accountability. A reflection of this accountability of actions can be seen as foundational to the core beliefs of HRD of not tolerating “unethical, amoral or unhealthy human resource practices”(Ruona, 2000).

Socio-economic Development and Gender Inequality in India

Meena Razvi
Gene L. Roth
Northern Illinois University

Gender discrimination in India affects poor women’s socio-economic development. This paper describes and interprets recurrent themes indicating that the Indian government, non-governmental organizations (NGOs), and other international human rights organizations show growing concerns regarding gender inequality in India. As it is not within the scope of this paper to cover India’s vast continent, only certain states will be highlighted.

Keywords: Gender, Poverty, Income

Many attempts have been made in India to increase women’s socio-economic status (United Nations, 1997). Critics argue that income generation alone does not increase the economic equality of women in India (Devi, 1999; Dixon, 1982; Drèze & Sen, 2002; Medhi, 2000; A. K. Sen, 1999). Amartya Sen (1999) argued that economic discrimination is a much “broader concept” (p. 108) than economic status and a complex relationship exists between culture and economic status of poor women in India. Although income generation is just one factor, the India Development Report (Parikh & Radhakrishna, 2002) stressed that economic growth is necessary to alleviate poverty. Socio-economic forces combine to greatly influence the development of poor women in India. Given that culture permeates all aspects of life in India, a critical cultural and feminist perspective may enhance understanding of the complex nature of economic development.

Research Question

The status of poor women in India can be analyzed by identifying underlying themes that affect their socio-economic development. Complex micro issues affect patterns of socio-economic development, so an analysis of how these variables operate is vital to gaining depth of understanding. What are the prominent themes in the literature regarding the position of marginalized women’s socio-economic development in India?

Conceptual Framework

The meaning of HRD has been the topic of debates, opinion pieces, and refereed articles during the ten-year existence of the Academy of Human Resource Development. Swanson’s (2001) position is that HRD has its roots in three areas: psychological, economic, and systems theories. McLean (2000) stressed that HRD has different connotations within countries, that its meaning varies among organizations, that different universities stress different theoretical frameworks, and that it has distinct meanings among individuals.

This paper incorporates gender, economic, and social development as a conceptual framework to explore the status of Indian women. This research is part of a larger study that explores the perceptions of female grassroots leaders in Indian NGOs. A feminist and socio-economic approach is vital if one is to understand the forces affecting marginalized women in India. K.S. Prabhu (2001) conducted research in two states of India (Maharastra and Tamil Nadu) and recommends a focus on structural barriers as well as urban and rural variables that affect social and economic security. The increase of the casual labor force in India and the drop in economic status of women represent small but significant factors in an inter-connected global economy. HRD professionals can expand their horizons by gaining a clearer understanding of the socio-economic conditions of workers in various contexts around the world.

Method

This study utilized literature review to surface factors that influence the position of women’ economic development in India. Multiple business and social studies databases were searched such as ABI Inform, ERIC, Wilson SelectPlus,
Prominent Themes: Poor Women’s Socio-economic Development in India

An exploration of recurrent themes within the literature discerned a multifarious view of the nature of socio-economic development in India. Four popular themes emerged: patriarchy, labor, education, and government initiatives. This does not imply that additional themes do not exist, but merely, that these four themes were the prominent recurring topics of discussion in the area of socio-economic development of poor women in India.

Individuals construct societies that in turn, construct individuals. This implies that a dysfunctioning society can be consciously reshaped into an egalitarian society. At least, it can be altered to include equal opportunities for all women in India. This paper considers males as equal partners as a lens to view women’s economic development in India.

Patriarchy

A common perception about women in India is that their status has always been low compared with women in advanced countries. Contemporary Indian culture reflects a strong connection to its ancient history. India’s past provides insights to the current status of Indian women in society (Masani, 1973). An ancient text from approximately 1,500-1,000 B.C. called the Rigveda, imparted written evidence of the status of Indian women (Khanna & Varghese, 1978; Masani, 1973; Seth, 2001; United Nations, 1997). In addition, archaeological, sculptural, and artistic findings revealed the nature of Indian women’s lives in ancient India (Seth, 2001). The Vedic culture believed that men and women were created as equals.

The word ‘Hindu’ evolves from the name ‘Indus Valley’ in India (Medhi, 2000, p. 31) Hindu means people of the Indus, which indicates Hinduism is a way of life as well as a religion. It is thought that Hinduism originated during the fifth and sixth centuries B.C. (Jayawardena, 1986). Although Hindus worship more than one deity, there are two main beliefs: karma and dharma, which affect the status of many women in India. Karma means that an individual’s actions in their past life affect future lives, while dharma means practice of laws (Jayawardena). The two combine to mean that if one practices good dharma in this life, their karma improves in the next life. This may explain the tendency of poor women to accept their lot in life rather than fight for justice. Vedic men and women were regarded as equals. Women studied the Vedas, astrology, geography, veterinary science, and martial arts. Women scholars such as Ramsha composed seven mantras (hymns) and debated the elevation of women’s buddhi (intelligence) (Seth, 2001). They practiced the right to choose their own husbands, religion, remarry if they became widows, fight in wars, and freedom of movement (Masani, 1973; Medhi, 2000; United Nations, 1997). Women such as Mudgalani who fought in wars indicates that educated women possessed assets, freedom, and talent (Seth, 2001). The Veda describes at least twenty accomplished women (Masani, 1973). Vedic writings do not state preference of boy children nor refer to any sexual differences in rituals (Seth, 2001). However, social and religious taboos affect more women than men in India. Because Hinduism is practiced by the majority (82%) of the population in India (Census of India, 1991), it influences other religions so that customs and practices become commonly shared. Medhi (2000) proclaimed, “India is a sex-segregated traditional society whose deeply entrenched customs and practices are sanctioned by almost all religions” (p. 31).

A significant turning point changed the course of history to subjugate women in India. Another scripture called “Manusmriti” (Laws of Manu) written in Sanskrit between 1500 B.C. and 200 A.D. proved to be a major antecedent (Khanna & Varghese, 1978; Manu, 1967; Medhi, 2000; Seth, 2001). Manu was the author and lawgiver of sacred, societal laws. The Brahmans (highest caste) priests held the Manusmriti in high regard and preached its twelve chapters and 2,684 versus to the general public. Chapter IX clearly discriminates against women in several ways. There were
separate laws for husband and wife where the role of the husband was to “carefully guard his wife, in order to keep his offspring pure” (Manu, p.329). An interesting shift from Vedic times was that “a husband must constantly be worshiped as a god by a faithful wife” (p. 196). Equality for women was no longer in vogue. Patriarchy became so pervasive it suppressed women’s physical and psychological freedoms. Every aspect of a woman’s life was controlled, monitored, and guided. She could not possess any assets of her own, never displease her husband, must be responsible for the housework and children, perform religious duties, prepare all the food, provide male children, subdue her needs, thoughts, and actions, be loyal and obedient, and never remarry if she becomes a widow (Manu). From birth to death a woman’s life is dictated and monitored for many poor women. The marriage age for females was lowered, remarriage was forbidden, and women’s freedoms were severely restricted. Critics of such a hegemonic view include Masani (1973) who asserted that men and women “are products of culturised attitudes, legends, beliefs and values that are socially induced” and that women’s status in Hindu society can be linked to caste and religion (p. 317). This patriarchal view of women continues to dominate and influence Indian society in the 21st century.

Because majority of women in India (74.2%) live in rural areas (Census of India, 1991), they suffer many social and cultural discriminations (Vecchio and Roy, 1998). Traditions are upheld more deeply in rural areas. Vecchio and Roy’s study explored what social and cultural restrictions women would break if there were no community “ridicule or alienation” (p. 91). Women responded by saying they would break early marriage traditions, remove pressures of bearing sons, demand equal work and equal pay, demand access to non-traditional medicine, refuse to neglect girls, and refuse to accept inequality in the family. Although women are consciously aware of their oppression, fear of community retaliation silences their objections. Poor women’s lives are restricted within families also. Pramar (1989) discovered that rural and urban homes resembled the same basic patterns to accommodate social settings. India is a collectivist society where individual needs are sacrificed for the benefit of the group. Joint families from several generations often occupy the same house until it becomes impossible to manage. Caste and class affect the location of each house within the community. The Manusmriti was the harbinger of patriarchy in India. It provides a gender biased philosophical and pragmatic approach to life in India that determines the lives of many women in India. One result is that the female to male ratio in India has been declining. The 1991 census reported the lowest rate at 927 females per 1000 males (Census of India, 1991). The female-male ratios are higher among “disadvantaged castes” and lower castes (Drèze & Sen, 1995, p. 155). Twenty-five percent of female children in India die before the age of fifteen. At least one-sixth of these die because of gender discrimination (Medhi, 2000).

Lack of finances, insufficient nutrition, gender bias and tests that result in abortion of female fetuses are the main causes for girl deaths in India (Medhi, 2000). Dreze and Sen (2002) point out the high rates of “missing women” in India (p. 18). The 21st century has brought additional gender biases. Recent atrocities such as fetus testing, abortions, and dowry deaths not only block women’s chances of survival but also threaten their very rights of birth. Indian society must refer back to its Vedic past to recreate its original egalitarian society.

Education

Between the 1981 and 1991 census, the population increased by 23.85% (Census of India, 1991). Soaring population rates combined with a large proportion of the citizens living in rural areas prohibits access to education for all. A rare commodity like education where demand outweighs supply means it is highly valued. Recommendations range from provision of basic functional literacy to higher level cultural and legal literacy (Bose, Haldar, & Bist, 1996; United Nations, 2000). Literacy rates provide evidence of gender biases. India’s literacy rate is 52.2%, (44.7% in rural areas and 73.1% in urban areas). Males receive more access to education than women as can be seen from their literacy ratios of 64.1% and 39.3% respectively. Rural women suffer most with a literacy rate of only 30.6% compared to 64.1% for urban females. In Gujarat the male literacy rate is 73.1% and female literacy rate is 48.6%. The remaining 23 states also show low rates with the exception of Kerala. Kerala has the highest literacy rate of 89.8% for total population, broken down as 93.6% for males and 86.2% for females (Census of India, 1991).

Vecchio & Roy (1998) argued that education in India is sex and class discriminatory. Medhi (2000) asserted that when education is available, it does not increase the status of women because of the belief in patriarchy. A study of female post-graduate women revealed that 99% continued traditional housewife roles even if they held a job (Medhi). Medhi’s pessimistic proclamation is quite discouraging when she posited that empowerment of women will “take an indefinite period of time” (p. 38). Girls are groomed for marriage, so parents prefer to invest in a boy’s education (Vecchio & Roy, 1998). A common belief is that when girls marry, they belong to their in-laws, so the return on investment for education is too low. For low-income families with limited budgets, education is unaffordable for girls. The type of education a girl receives is often not valuable as Vecchio & Roy (1998) assert that education for economic benefit is not available. Because patriarchal views dominate in poor households, women from lower classes often do not gain access to education. As the ideology is to keep a woman in purdah (covered and secluded), education is not deemed necessary (Vecchio & Roy, 1998). Gender bias also means that any resource requiring funds such as health,
nutrition, and education is denied for poor women (Vecchio & Roy). Due to inadequate education and low assets, a woman suffers greatly if her husband dies or abandons her (United Nations, 2000). She does not possess the capacity to earn an adequate income. Because a girl’s labor is more valuable in the home, mothers prefer to keep them at home. Women bear the highest burdens of household chores (Vecchio & Roy, 1998). This means they wake first, eat last, and sleep late after all chores are completed. Very little time or energy remains for an education. Women in India thus became less valued over time.

While Masani believed that cultural attitudes are difficult to change and may even inflict additional injustices, Vecchio and Roy (1998) accepted that with the help of development programs targeted at women’s needs, this problem can be alleviated. A conflict between reformists and traditionalists contravenes socio-economic expansion. Masani (1973) professes that India is still a new democracy so “the constitution is bound to be rather slow” (p. 331). To her credit Masani wrote that statement during 1973, less than thirty years after India’s independence. Nonetheless, it can be argued that fifty years after independence has brought little progress for poor Indian women. Women must gain equal access to education to increase their awareness of rights and chances of employment (United Nations, 2000). Education can provide “functional literacy and access to training” (p. 104). Literacy can uplift a woman’s self-esteem, confidence and encourage her to use her own voice to demand her rights rather than rely on intermediaries. Illiteracy forms barriers for women faced with paperwork (United Nations). Poor women are at the mercy of officials and employers who cheat them out of their rights because they cannot read. Economic growth requires “educated, healthy and secure people” (Parikh & Radhakrishna, 2002, p. 15). A cycle of poverty pervades as long as women struggle for basic survival while education remains a luxury they cannot afford. As long as they do not gain adequate education, their income remains low. Provision of equal education can increase women’s’ chances of employment and higher income. Secure employment for women can aid socio-economic development as well as nudge India towards an egalitarian society.

**Labor**

“Women are the invisible workforce in India” (United Nations, 1997, p. 8). Without equal access to the job market, women cannot participate in better-paid work so their economic status remains stunted. India has forsaken an untapped human capital resource with high potential. A report by the Ministry of Social Welfare (1987) in India confirmed women’s exploitation in the workplace highlighting women’s low wages, gender biases in the workplace, extended hours, and poor conditions. Technology competes with women workers as machines replace manual work normally performed by unskilled women (Devi, 1999; Dhagamwar, 1995). Issues of employment, skills, training, and low wages adversely affect women’s capacity to work (Devi, 1999, pp. 28-29). Faced with diminishing access to the formal job market, poor women seek other avenues of income. Limited job opportunities compel 90% of women in India to work in informal sectors (Dhagamwar, 1995; United Nations, 1997). The Ministry of Social Welfare (1987) listed three forms of informal labor: Self-employment, contract/wage work, and housework (pp. 74-75). This form of unstable income further reduces the capacity of sustainable development for women. Sub-contractors exploit women (Dhagamwar, 1995) in a chain of corruption that pushes poor women to the bottom of the income ladder. Economic equity in this environment is tenuous. Dhagamwar believed that neither employers, trade unions, nor government policies have taken steps to safeguard women’s jobs.

Amartya Sen (1999) studied economic reforms in India and found that income enables other capacities. Although this may be true for upper class women seeking personal satisfaction, the primary reason why poor women labor outside the home is income generation to pay for basic survival needs. Khanna & Varghese (1978) provided four main reasons for women’s participation in work: Inability of the main earner to provide for the family, family emergency requiring more income, death of the main earner, and the female’s wish for economic independence or raising the standard of living (p. 187). Poor working women form the backbone of India yet their contributions are rarely acknowledged. Patriarchal attitudes shackle women into gender specific job segregations (Drèze & Sen, 2002; Punalekar, 1990; Seth, 2001; Tisdell, 2002; United Nations, 2000). Gender inequalities rob women and hamper their capacity for income and survival (Vecchio & Roy, 1998). Women in purdah are forbidden to work “outside the home” (p. 87). If the male head of the household dies, a woman with limited skills can barely cope. She must rely on...
subsistence work and charity from her family. Gender discriminations feminize women’s labor. In Rajasthan, for example, dhobis (laundurers) will wash but not iron the clothes. In Uttar Pradesh, dhobis demand women do all washing while they do the ironing (Dixon, 1982). In the case of any such inconsistencies, men’s wishes prevail. Although women are the main earners in 35% of Indian families (Vecchio & Roy, 1998), society prefers to view them as housewives.

There is a relationship between gender, caste, class, and income because the majority of poor women come from lower castes. Muslim women work at home because of purdah (Dixon 1982). Upper caste women resist manual labor while lower caste women participate in unclean jobs such as washing, construction work, and sweeping. Caste mobility is almost hopeless because of fate of birth (Dixon, 1982). Studies illuminate that poor households include more wage earning women (United Nations, 1997) yet their status remains low. Poor women remain confined to unstable informal work sectors.

Census of India (1991) reports percentages of “main”, “marginal” and “non-workers”. Census data revealed that 50.9% of men are listed as main workers, compared to only 15.9% of women. Seventy-seven percent of women are listed as non-workers. In Gujarat, only 13.7% of women worked in the main sectors. Majority of women in all three sectors performed unpaid housework in addition to any paid work. Although gender discrimination in work sectors is quite evident, the accuracy of reporting on their status is questionable. Under reporting of women’s work exposes the tendency to undervalue women’s work perpetuating their marginalization and exploitation in the workforce. Critics of census data claim that “most census enumerators are men” with age old patriarchal views that leads to incorrect reporting of women as “housewives” or “non-workers” (Ministry of Social Welfare, 1987). The United Nations report (1997) supported this belief by affirming that census data did not collect accurate information on all working women. The Census of India neglected inclusion of women’s work until 1991 (Devi, 1999; United Nations, 1997). Accurate data were not available until the form of the question changed from “did you work any time at all last year?” to “including unpaid work on farm or family enterprise” (United Nations, 1997, p. 64). Inaccurate reporting of informal sectors permits authorities to rationalize their lack of response. One possible avenue of rectification is research. Research is difficult because a woman may perform multiple roles such as housework, making produce for sale, selling milk, and paid homework etc. (Ministry of Social Welfare, 1987). Women may also work simultaneously in formal and informal sectors creating reporting dilemmas. Majority of poor Indian women work in informal or casual sectors. Breman (1994) provided definitions of formal and informal sectors. Formal sector is defined as “wage labour in permanent employment”, while informal sector includes “anything else” (p. 4). However, lack of consensus results in differences such as The Ministry of Social Welfare’s definition of informal sector as “any enterprise which employs less than 10 workers and does not come under the Factories Act or the Shops and Establishment Act” (1987, p. 3). Diverse definitions and theories prohibit accurate understandings of women’s status.

An imbalance of job supply and demand affects both males and females. The status of casual workers is bleak. Almost 70% of the families in the town of Surat, Gujarat that work in informal sectors, earn no more than a monthly income of 3,000 rupees ($66.00). At least a third live in poverty earning just 1,500 rupees ($33.00) per month. (Desai, 2002). The insecure nature of this mode of income means any emergency situation such as illness or floods can nudge the poor into poverty. India does not provide social security benefits to the unorganized workforce (Desai) leaving workers with very little choice but to compete for whatever work is available. A study on the distribution of incomes in India revealed that 51.2% of men had the power to make decisions compared with only 29% of women (United Nations, 2000). Socio-economical discriminations in India increase female poverty (United Nations). The same study also found an improvement for women in urban areas who have more control of income than women in rural areas. One explanation for this difference could be because urban women have access to more resources and legal protection than rural women. Single, widowed, separated, and divorced women are discriminated in the workplace (United Nations) in India affecting their income levels. Poverty forces women into the workforce where insufficient education, skills, and training results in exploitation by employers who pay women lower wages than men (Devi, 1999; Medhi, 2000; Punalekar, 1990; Tisdell, 2002). Employers consider men to be the main wage earners. Working women are becoming more accepted in India although their status in households remains quite low. Modern couples struggle with a need for double incomes while trying to maintain traditional values. Often the burden of adjustment remains with women whose duties at home rarely change to accommodate their work schedules. Despite economic inequalities, some believe an employed woman is a higher asset to her family and is crucial for their empowerment (Rose, 1992; Seth, 2001; Tisdell, 2002). Without the additional income provided by women, many families suffer famine conditions. In lieu of an egalitarian society, the gap between the rich and poor widens. Poor women in India labor in the dungeons of society while the elite bask in luxurious upper levels.

**Government Initiatives**

After independence in 1947, India used western models of development to plan for industrialization (Jumani,
is a proactive stance and more suited to sustainability. Empowerment is difficult because India exists in a dual system.

Many development efforts focus on reactive strategies of counter-actions to gender discrimination. Empowerment could lead to “political power and leadership” (p. 35). This paper presents a fragmentary glimpse of the field of women’s development because it only focuses on socio-economic empowerment of poor women in India. Policies that are designed to assist women may also work against them. When faced with possible penalties for gender discrimination, employers often refuse to hire females. Women workers in informal work sectors are in critical need of legal protection (Ministry of Social Welfare, 1987). For example, government ration cards are not supplied to poor women living in illegal slums (Punalekar, 1990). Large numbers of slum dwellers are denied access to basic resources and legal protection. Government initiatives can aid socio-economic development by providing and enforcing gender specific policies for all sectors of the Indian population.

Conclusions and Implications for HRD and Workforce Development

This research examines the socio-economic conditions of poor women in select regions of India. The workforce needs and issues of marginalized workers in India are rarely examined in Western mainstream HRD literature. Bierema and Cseh (2003) noted a paucity of research that focused on diversity and feminist approaches in AHRD journals and conference proceedings.

Gender discrimination in India can be traced back to post-Vedic patriarchal attitudes such as the Manusmriti (Laws of Manu). A United Nations report (2000) on economic and social status of poor women concluded that empowerment could lead to “political power and leadership” (p. 35). This paper presents a fragmentary glimpse of the field of women’s development because it only focuses on socio-economic empowerment of poor women in India.

Many development efforts focus on reactive strategies of counter-actions to gender discrimination. Empowerment is a proactive stance and more suited to sustainability. Empowerment is difficult because India exists in a dual system of subsistence (agriculture and industrial economies) (Jumani, 1991). A critical cultural perspective becomes difficult
when presented with multifarious factors such as patriarchy, labor, education, and government initiatives that influence women’s socio-economic development in India. Differing conceptual frameworks and insufficient empirical evidence means presenting general inferences regarding the status of poor women seems inappropriate. However, Indian women oppressed by a patriarchal society share common inequalities. Such a gender-biased ideology hinders women’s socio-economic empowerment. Deconstructing gender-biased realities is critical for empowerment. Income generation alone is not sufficient as it is only one factor in women’s empowerment. An analysis of four recurrent themes (patriarchy, labor, education, government) within the milieu of poor Indian women’s socio-economic development revealed a cycle of gender inequality weaving throughout society.

Without socio-economic equality for women in poor sectors of India, the impacts of efforts at development cannot become fully realized. India must value women as human resource assets and not liabilities. Socio-economic development can both empower women and raise the status of the Indian economy. Women need employment justice. Education, vocational training, and skill improvements would increase the capacity for gainful economic participation of women in India. The needs of women in poor sectors of India should be included in a national approach to workforce development. From a U.S. perspective, Jacobs & Hawley (2003) described workforce development as coordinated policies and programs that collectively “enable individuals the opportunity to realize a sustainable livelihood and organizations to achieve exemplary goals, consistent with the history, culture, and goals of the social context” (p. 1017). Naquin (2002) described workforce development systems as a means of serving needs of organizations, communities, and nations. India is a complex social context – it will require many integrated approaches of private and public systems to serve the pressing needs of women in poor sectors of India.

The Role of HRD in Chinese State-Owned Banks and Implications for Future HRD Policies and Practices

Jie Ke  
Kenneth E. Paprock  
Susan A. Lynham  
Texas A&M University

This paper is to explore the critical role of HRD in the transition of Chinese State-Owned Banks (CSBs) to independent, commercial banks. It is imperative that HRD practitioners realize their role in CSBs during this transition and to implement relevant practices in order to develop and retain the talents needed in the future. Through a literature review and analysis of those reviews this study can contribute to the role and definition of HRD in China

Key words: HRD in China, Chinese State-Owned Banks, International HRD

Introduction

Globalization, privatization and China’s accession into the World Trade Organization (WTO) bring tremendous challenges to Chinese State-Owned Banks (CSBs) along with great opportunities. CSBs will be facing fierce competition from their foreign counterparts not only in the domestic market but also in foreign countries in the process of transformation and expansion to be independent, commercialized and global. The purpose of this paper is to draw the attention of HRD practitioners to their role as professionals in Chinese CSBs and implications for future HRD policies and practices of the Chinese banks inside the country. The article concludes with a discussion of the research limits and suggestions for future research.

Problem Statement and Research Question

Chinese State-Owned Banks have under-performed for a long time due to the economic history and development in China. They are forced to catch up with their foreign counterparts after foreign banks flocked to China after the Chinese economic reform in 1978. However, it takes time to bridge the gap in financial products and services. In the process of transition from state-owned commercial banks to independent commercial banks, the CSBs face continuous challenges. While dealing with the problem of non-performing loans (NPL) from history, CSBs face a big threat brought about by globalization, privatization and China’s entry into the World Trade Organization (WTO), namely, the loss of talented managers and skilled staff.

Given the context described above, one research question was used to drive this study: What is the role of HRD in bringing back and/or retaining precious human resources in Chinese state-owned banks? The focus of this question is an issue that draws much attention from policy makers and administrators in these banks. HRD’s role in addressing this issue will not however be fully appreciated and correctly reflected in policies and practices until the concept of HRD is well defined and widely accepted.

Theoretical Framework

The paper starts with a discussion of the culture and work values in China, and follows with a comparison between Western and Chinese definitions and conceptions of HRD. Next, the paper describes the current state of the Chinese banking industry. After a brief history of Chinese state-owned banks and the present challenges with the country’s entry into the WTO, the practices adopted by the four largest banks in China and their impact on employee loyalty and retention will be presented. Finally, the article will discuss why training has not prevented talent drains and what needs to be done for HRD practitioners in the future.

Methodology and Major Findings

This paper combines a literature review of HRD concepts and their development in China and globally. A

performance analysis of the four largest banks in China, as informed by some relevant statistical data will put in context the issues for HRD practitioners in Chinese banks.

**Chinese Culture and Work Values**

It is important for HRD practitioners to be familiar with work values within the context of different cultures. The workplace can provide a good venue for understanding the employees in a different culture, and for approaches for providing the necessary training and career planning. The Confucian ideology has shaped Chinese culture as it has many other Asian cultures. Understanding this philosophy and the work values of Chinese employees not only helps us to understand the culture, but also to get a sense of the Confucian ideology to help understand many other aspects of Chinese culture. In contrast to workers in Western countries, Chinese employees hold the following distinct work values:

1. Higher power distance. “The power system is high in China, with an unapproachable top stratum, but with distances between middle management, supervisors and workers being somewhat smaller” (Jackson & Bak, 1998, p. 286). The respect for hierarchy and authority may well be rooted in Confucianism, together with a regard for age as a source of authority.
2. High collectivism vs. individualism. “With the main group of reference being the family, collectivism is rooted in both Confucianism and the ancient land system that ensured the farmer and his family were immovable for economic reasons” (Jackson & Bak, 1998, p. 286).
3. Long-term oriented vs. short-term oriented. China is characterized by long-term values (Hofstede, 1991) such as thrift and perseverance (Jackson & Bak, 1998).

The above characteristics of work values, although not exclusive, explain on the one hand why Chinese are traditionally loyal to the group or organization to which they belong and on the other hand put much emphasis on the family.

**Definition of HRD and Its Interpretation in China**

HRD is beginning to establish itself as a separate field of study and application in developed countries like the United States of America. McLean and McLean (2001) offer a global definition of HRD as follows:

*Human Resource Development is any process or activity that, either initially or over the long-term, has the potential to development adults' work-based knowledge, expertise, productivity and satisfaction, whether for personal or group/team gain, or for the benefit of an organization, community, nation, or, ultimately, the whole of humanity.* (p. 322)

HRD in developed countries embraces personal, group, and organization development as well as training, and is commonly framed as a process or an activity.

Unlike HRD in developed countries, HRD in China has been developed from training along with Human Resource Management (HRM) into a main branch of HRM. It started its leeway from HRM in 1997 and has since drawn more and more attention from national HR practitioners. Nevertheless, it is still not an independent field of study in China. In some cases, it includes the whole Human Resource Wheel. (Mclean, 2001; Wright, Mitsuhashi, & Chua, 1998; Swaak, 1995). In other cases, it means on-job-training. (Jackson & Bak, 1998).

A brief look at the evolution of HRD in China might help us to better understand its meanings in China. In the 1950s and 1960s, compulsory primary education and improving the literacy rate were the key national policies (Benson & Zhou, 2002). In the late 1970s, the government has paid particular attention to vocational education, science, and technology. All the efforts at that that time focused on improving the national skills level. In the past two decades, the government has tried to improve labor productivity, product quality and sharpen training and job skills.

In summery, there is a huge gap, in terms of the evolution of HRD and the rest of the developed world, particularly between China and the USA. HRD in China is still in its infancy and has not yet been defined and systematized.

**An Introduction to Chinese State-Owned Banks (CSBs)**

China’s banking system was traditionally dominated by a single central bank: the People’s Bank of China (PBOC). Since 1984, the PBOC has been split into various banking CSBs. They include a restructured People’s Bank of China (PBOC)--transformed to the Bank of China (BOC) in 1997, the Industrial and Commercial Bank of China (ICBC), the China Construction Bank (CCB), and the Agricultural Bank of China (ABC). These four main banks encompass substantial labor and capital resources (see Table 1).

Source: China Year book 2000, 2001 and 2002

Although China is moving from a planned economy towards a market economy, the organizational structure and decision-making processes of the state-owned enterprises, including CSBs, are still highly centralized. Unlike banks in many countries, state-owned banks are not autonomous and still rely on governmental support in its transition.

Besides the challenges in effective implementation of banking reform, such as eliminating non-performance loans, updating financial products and improving services, CSBs are facing other challenges inside and outside the organizations.

Challenges Brought About by Globalization, Privatization and Entry to the WTO

Few can dispute that globalization is a driving force in today's organizations (Rothwell, 1997). China is sixth in overall economic achievement in terms of business volume. For export/import, the growth rate was 13.1 % in 2001. China has attracted the largest amount of Foreign Direct Investment (FDI) of all developing countries, with an increase of 14.9 % in 2001, and the country will improve its production efficiency by utilizing these FDIs. The following challenges have shown the significance of HRD in Chinese banking industry:

1. **Globalization requires more skilled workers in banks.** Four particular HRD influencing factors are emerging from the realities of globalization. In particular these factors include: technological changes, privatization and restructuring, membership in the WTO, and discrepancies between current and future skill needs. Each of these factors are briefly expanded on below.

2. **Technological changes**, especially information technology and telecommunications, and competition in the fast moving competitive global marketplace have changed work organizations and working patterns. The production of goods and services have become flexible and customized instead of being mass produced in long production lines. Fixed automation involving repetitive tasks is being replaced by flexible automation. On-line quality control has replaced end-of-line checking. Instead of fragmentation of tasks, increasing use is made of teams and multi-skilled workers. Decision-making is being decentralized to points of production and sale. The organizational hierarchy is flatter with middle layers of management eliminated. The gap between those in control of institutional leadership and those responsible for production and delivery of products or services is narrowed. As a result of these changes in working patterns, the role of workers has broadened with a consequent need for a wider range of skills. For example, the role a customer service representative (CSR) in First of America Bank in the United States has been widened beyond a series of repetitive tasks of approving checks, answering routine questions and helping customers reconcile account balances. CSRs now also recommend an appropriate mix of products and services of the bank (e.g., mutual funds and annuities) to customers. Employees now need a much wider complement of skills than before.

3. **Privatization and restructuring** started in the late 90s. Private banks are able to finance their expansion by going public on the stock market. This change has resulted in a dramatic increase in the number of branches and agencies, as can be seen in Table 1. On the contrast, CSBs reduced the number of employees and branches by providing early retirement plans, laying off low-skilled employees and streamlining their organizational units. One should not comprehend the opposite trends happened to CSBs and private banks as employee exchanges. The reality is both CSBs and private banks compete over the same group of
employees, who are young but experienced. Unfortunately, CSBs have lost many elite employees to private banks during the past few years due to lack of adequate incentive systems and HRD system.

4. The WTO (World Trade Organization) brings more challenges. Membership in the WTO poses threats as well challenges to Chinese State-Owned Banks (CSBs). The original protections over CSBs will not be available as the WTO banking agreement gradually removes the restrictions on operations of foreign banks in China. The agreement allows foreign banks to conduct foreign currency business for all foreign customers immediately and conduct foreign currency business involving Chinese clients one year after access. It also allows foreign banks to do wholesale RMB business two years later. Five years later, foreign banks will be able to offer individual services to Chinese citizens, and all geographical restrictions will be eliminated. In other words, foreign banks will compete with CSBs equally after 2006. Consequently, more and more foreign banks will be attracted to invest in China. With this trend, a war for local skilled staff and caliber managers between the foreign banks and CSBs is inevitable because to train a large amount of home country employees is extremely expensive and time-consuming per se, not to say dealing with culturally different customers and market. The CSBs will more likely lose the battle if they do not provide attractive remuneration packages and training and development opportunities to the competent employees. With entry into the WTO, China's state-owned enterprises not only face tough foreign competition, but must also compete directly with foreign companies for human resource talent. (Nie, Hopkins, & Hopkins, 2002).

5. The discrepancies between the present skills of employees in banks and skills needed in banking reform, will increase the demand for skilled employees in the future.

In conclusion, to meet the various challenges, CSBs have to manage their people first by attracting and retaining them. To achieve that, training and development becomes critical.

Training practices in CSBs and the Gaps Left to be Closed by HRD.

The focus of training and development in Chinese state-owned banks is on the development of senior executives and high-caliber professionals. Various training programs are provided to those professionals. Take ICBC as an example. In 2002, the personnel department of ICBC and company Head Office sponsored short- or medium-term advanced training programs overseas, MBA, IMBA programs in cooperation with the University of Hong Kong and Fudan University, and overseas internships and distance learning programs with domestic financial institutions and business corporations (ICBC 2002 annual report). Bank of China (BOC) and China Construction Bank (CCB) provide similar training opportunities to the focus group, which is comprised of middle or senior managers. For instance, China Construction Bank (CCB) strengthened training for middle and high-level managers and professional staff through cooperation with leading universities.

From the above example one can see that training and development practices in Chinese banking reflect the hierarchical nature of the Chinese culture and centralized organizational structure. It is an obstacle to be effective. An effective system is to involve the grassroot staff as well as higher level managers in lifelong learning for both individuals and the organization.

Implications for Future HRD Policies and Practice.

Human resource policy should, in general, reflect a desire to inculcate both common work values, and a sense of belonging to the company through Developing effective induction programs which draw the new employee closer to the company by focusing on the following:

1. Developing subsequent training programs that reflect the way things are done in the organization, while taking care not to concentrate too heavily on training for skills that are easily transferable to other enterprises
2. Focusing on developing role models: supervisors who are trained in the way of the company, and can gain standing in the organization by representing the values and practices of the organization
3. Focusing on team working instead of individualistic values, like what most job enrichment programs do, may be more productive
4. Present clear options for career development will be an attractive practice to employees because development is a big chunk of emphasis of HRD. 'Attention should be paid to developing clear career paths as part of human resource planning as well as through a need to develop loyalty, identification with the organization, required work related behavior and intrinsic motivation for the total work experience.' (Jackson & Bak, 1998, pp.297-298):
As far as CSBs are concerned, more policy and practice implications are evident, and they include:

1. **Equal attention**, respect and opportunities should be given to staff without job titles. They comprise the majority of the workforce, representing the banks in vis-à-vis contact with customers. They are analogous to water under the boat if we regard a huge-sized state-owned bank as a colossal boat. As Chinese saying goes: "Water can topple down the boat as well as push the boat to move forward." How to make water move along with the boat should always be kept in mind by HR practitioner in Chinese State banks.

2. **Training programs** must be based on a training-needs analysis that identifies skills gaps at various levels (Swaak, 1995). Group training on a continuous basis can be effective at lower levels. At middle and upper levels, HR practitioners must work with managers and technical support people to map out their individual training and development programs. (Swaak, 1995, P.46)

**Summary and Conclusions**

Although Chinese people are known as loyal and family-oriented, employees in the four largest Chinese State-Owned Banks have not shown their hesitation in leaving the banks. Some think low salaries in CSBs cause the phenomenon, but salaries are only one part of the whole reality. The literature informs us that poor HRD policies will contribute to low morale and retention rates in an organization. HRD, as argued throughout this article, plays a critical role in bringing loyal employees back to Chinese State-Owned banks so that they can confidently face the challenges brought by globalization, privatization and the country’s accession into the WTO in the future.

HRD has begun to establish itself as a separate field of study and application in developing countries, but this is not the case in China. In China HRD is still closely associated with HRM: “for some organizations, HRD includes the whole Human Resource Wheel” (Mclean, 2001, p.64), while for others it only means on-job-training. The four largest Chinese banks are no exception to this. In the 1990s HRD meant essentially training for a specific job position. (Xu & W, 2001). Recently, the State banks have made much progress in terms of training and development. As examples, they are recruiting more employees with more advanced degrees--Bachelor degrees and above, training employees in their own training centers and /or overseas, and providing further learning opportunities, especially management training, to some high-potential employees. Despite these efforts, the past three years have witnessed severe talent drains from these banks. Some reasons for this talent drain are that:

*The concept of HRD* has not been as fully developed in China as it has in most western countries; therefore, its role and function has not been as widely appreciated as it should be. State-owned enterprises, including state-owned banks, are still under centralized management. In other words, the personnel departments at all levels are managed and directed by the personnel department in the Company Head Quarters. As result, HR / HRD functions, especially those of branches and sub-branches, have not yet been developed.

*The centralized* decision making process in allocating training opportunities causes a mismatch between the purpose of training and the training needs. This has resulted in complaints and waste of resources even though training programs are readily available.

*Only a small percent of employees*, mostly middle and higher level managers, are given much attention, due to the hierarchical nature of the Chinese culture, and as demonstrated in the design and allocation of training programs. The rest of the staff has not shared in the ensuing sense of ownership that results from this investment. As a result loyalty and high morale are not developed, which partly explains employee determination to leave the banks when other opportunities for compensation, training and career development arise.

When considering the first point listed above, one can easily understand why CSBs do not have career planning for their employees. HRD, as defined by McLagan (1989), includes career development to improve individual and organizational effectiveness. The price of failing to include these two elements of HRD is unfortunately much higher than what it appears with employees not thinking of the development of the organization in return for this individual investment. Without such an emotional attachment, bank employees will easily and decisively leave the bank when their personal career aspirations can better be achieved through job-hopping.

With the reasons in mind, HR practitioners should not only provide training according to the needs of employees, but design tailored career development plans. The very end of HRD policies and practices in China is to develop loyalty.
Limitations

The methodology used for the article inevitably has some limitations, which are as follows:

The limits of the literatures. The sophisticated nature of Chinese culture and value system has not been elaborated through the limited amount of literature. Further, the literature itself might be less effective in capturing all the main aspects of the Chinese banking industry in the context of an ever-changing world economy. Also, the authors’ limited knowledge of the banking industry might have limited the search and understanding of the literature.

Lack of some detailed information and empirical evidence. Although observation reveals that majority of the present employees in the four largest banks are under 25 or above 45, no statistic data have been found to support the hypothesis that the group aging between 25 and 45 left the CSBs for better opportunities in foreign banks or private commercial banks. This group is the focus of the talent competition since they are young and possess the skills, experiences and / or network that foreign banks and private commercial banks treasure. It will also be recommended to find the data and explore the reasons for their leaving, as the HR practitioner cannot provide them with tailored training and development plans unless they know the characteristics, needs and wants of this group of employees. It will be equally important to pay attention to the remaining groups in these banks. With increasing numbers of college graduates and tough competition among them, the banking job is still sought after by newly graduated students from four-year colleges. It is not too late to address their work morale and retention, which might be another role for HRD to consider in this environment for the future. Again, data on education levels and other characteristics of the remaining workforce is limited in this paper and therefore the potential of this argument needs to be left for future inquiry.

Further Research

This paper has attempted to answer such questions as: What are the roles of HRD in CSBs? What have the banks done to attract and retain skilled staff and able managers? What should the banks do to avoid losing their ground in the “war” with foreign banks and private commercial banks? The paper has found that HRD is critical to CSBs’ development at the age of change, development and globalization; and an effective HRD practice should get employees involved in order to attract, motivate, educate and retain them.

Despite those findings, further research needs to be conducted in order to inform related action plans to address the issues highlighted in this paper. To this end, future research questions might include such issues as: What are the training and development needs and goals of all levels of employees in this banking sector? How would satisfying these personal, group/team needs be to the benefit of the organizations concerned? And if they are to the organizations’ benefit, then what can the banks do to ensure better alignment between these training and development needs and future HRD practices. Furthermore, how can changes to the organization structure be made to better serve the development and job needs of employees? And finally, should the institutional training center be outsourced in order to both cut the costs of, and improve the quality of, training?

The Web-Based Delphi Research Technique as a Method for Content Validation in HRD and Adult Education Research

Sharon Colton
Monterey Peninsula College

Tim Hatcher
North Carolina State University

A Web-based Delphi process can be used to answer difficult questions, compile a body of knowledge from experts, or solve a problem or establish content validity. Because of its more qualitative online discussion environment, a Web-based Delphi procedure has the potential to offer a more rigorous validation of HRD-related content than traditional paper-based Delphi procedures. The method also improves ethics in research by insuring anonymity and confidentiality.

Keywords: Delphi Technique, Validation, Web-based Research

1. To what extent can an instrument be developed by a Delphi expert panel to measure the application of adult learning principles to fully-mediated World Wide Web-based distance education courses?
2. To what extent is there consensus among Delphi panel experts in the fields of adult education and Web-based course development to validate specific instructional methods and techniques that demonstrate the application of adult learning principles to fully-mediated World Wide Web-based distance education courses?
3. The Delphi method, traditionally a paper-pencil technique can be established as a web-based method to validate research measures.

The above propositions were explored in a recent study that used the Delphi research method to develop the Online Adult Learning Inventory (http://www.mpd.edu/sharon_colton), an instrument to apply the principles of adult learning to Web-based instruction and training (Colton, 2002). A pioneering feature of this study was conducting the Delphi process on the Web rather than employing the traditional paper and pencil or computer network Delphi techniques. A Web site was constructed with a threaded discussion forum for discussions related to developing content and validity, Web forms for voting purposes to determine the level of expert consensus, a calendar to keep the panel on task, and as an archive to hold draft versions of the instrument and the text of previous discussions available for review at any time by the expert Delphi panel and researchers. The experts were assigned pennames for anonymity within the group. Ample time was allotted for expert panel members to reflect on the content of the draft instrument and to add additional commentary to the discussion forum any time and from any place.

The purpose of this paper is to highlight the results of an online Delphi research project; in particular the procedures used to establish an online Delphi and to describe a new process of validating HRD-related content and obtaining ‘rich’ and descriptive information using the World Wide Web and current e-learning technologies. The online Delphi was proven to be an excellent tool in establishing content validity. Historically, Delphi technique is an overlooked research method due to its labor-intensive nature. This study illustrated online Delphi as a powerful, effective and efficient research tool for HRD and adult education research.

Most Delphi procedures are paper-based with some previous Delphi’s conducted on a mainframe computer or network (Turoff & Hiltz, 1995). The original purposes in constructing the Delphi Research site on the World Wide Web was (1) convenience, (2) elimination of paperwork and mailings, and (3) an attempt to utilize current technology, a topic of the research, into the research process. The result was the sheer volume of rich discussion and the “anytime, anywhere” give-and-take communications amongst panel members leading to eventual consensus and content validation. Delphi procedures have had some limited qualitative aspects to the otherwise quantitative voting procedures and consensus. This study has demonstrated the potential of the World Wide Web to expand the qualitative aspects of the Delphi procedure to a great extent, resulting in a more in-depth content validation.

Delphi Research Method: A Review of the Literature

Computer-based Delphi procedures have been used since the 1970s on mainframe computers or networks (Turoff &
Hiltz, 1995). Today, however, the technology is available to conduct an anonymous asynchronous threaded discussion easily on the Web “...where the merger of the Delphi process and the computer presents a unique opportunity for dealing with situations of unusual complexity” (Turoff & Hiltz, 1995 p.9). Research indicates this combination opens the possibility for greater performance from the Delphi panel of experts than could be achieved from any individual, something that rarely happens in face-to-face groups (Turoff & Hiltz, 1995, p.11).

Delphi panelists are typically selected, not for demographic representativeness, but for the perceived expertise that they can contribute to the topic. In order to obtain the desired valid results, Scheele (1975) suggested the panel must be selected from stakeholders who will be directly affected, experts with relevant experience, and facilitators in the field under study. Spencer-Cooke (1989) suggested that the composition of the panel relate to the validity of the results of the research.

Delphi panel sizes range from a few to fifty or more participants. In Brockhoff’s study of Delphi performance (1975), he suggested that for forecasting questions, groups with eleven participants were more accurate in their predictions than larger groups. For fact-finding questions as included in this dissertation, groups with seven participants had a higher performance in his controlled study. Other studies have found that error decreases with larger Delphi panels (Linstone & Turoff, 1975). Dalkey (1975), one of the originators of the Delphi research method, commented that, “...under favorable conditions, the group response can be more accurate than any member of the group” (p. 257).

The time requirement for the Delphi process was significant. The process can last for 30 to 45 days (Barnes, 1987) but in this Web-based study, it took several months. For that reason, Scheele (1975) states that attractive and stimulating peers provide the most powerful incentive to participate. Turoff and Hiltz note that, “Motivation for the expert is often lacking because results are often delayed or are not intended to benefit the expert” (1995, p.9). The participants were offered the opportunity to participate in the discussion with other panel members of equal merit, to participate in producing and validating an evaluative knowledge-based tool for others, and to experience a Delphi process. It is also necessary for the panelists to be assured that the facilitator (researcher) has an understanding of the content. The response rates of the experts for paper-based Delphi method dissertations include, 92% overall with less than a ten percent drop-out rate (Dobbins, 1999, Cooter, 1983; DeLap, 1998; Stover, 1997; Jackson, 1998), and similar results with the one Web-based Delphi discussed in this article (Colton, 2002). Participants who responded slowly or not at all to calls for participation were contacted by telephone or sent additional e-mail reminders in order to gain a higher level of participation.

Delphi procedures normally consist of three or more rounds. Each round consists of answering questions posed and is ended by a vote. This typically is conducted with paper and pencil. There is usually a decrease in response rates for the second round of a paper-based Delphi, particularly when using volunteers, as they may lose interest (Jillson, 1975). The author’s Web-based Delphi study had a similar response rate.

Computer-based techniques are far better than paper and pencil in constructing a flexible approach and, in fact, the traditional round structure may disappear, replaced by a continuous feedback process (Linstone & Turoff, 1975). The Delphi method became less structured and permitted greater freedom of discussion after the use of computer conferencing began in 1969. Adding the computer capability allowed for a shorter turn-around time, allowing for more interaction and more material discussed (Price, 1975).

The characteristics or benefits of conducting the Delphi process via computer over a face-to-face discussion as summarized from Price (1975) include:

1. When the communication process must be structured.
2. When the problem is so broad that many more individuals are needed than can interact face-to-face.
3. When severe disagreement among participants occurs, the process must be refereed, and anonymity must be assured within the group of experts.
4. When time is scarce and/or geographic distances are great, limiting group meetings.
5. When an easier more flexible way to access and exchange human experience is required.
6. When increases of the size of the information space to infinity is desirable.
7. When raising the probability of developing latent consensus is desirable.
8. When a written record is desirable.

There are potential problems in the Delphi process and in the contemporary computer-based method. The historical Delphi model follows a sequential, paper-based structure with the facilitator acting to summarize the round. The computer discussion method can prolong the procedure and discussion can assume parallel tracks. Turoff (1991) suggested the timely use of voting to integrate the problem solving process with the group process. Turoff (1991) summarizes the use of computers in the process as, “The merger of Delphi and Computer Mediated Communications offers far more than the sum of the two methods” (p.11), by which he implies that by introducing computer-based discussion into the Delphi process to replace paper and pen, the Delphi process was strengthened.
Turoff, in recommending using the Internet for discussion, emphasizes that the most important criterion to Delphi process design is allowing any panel member to “choose the sequence in which to examine and contribute to the problem solving process” (p. 2).

There are many reasons for the use of anonymity in the Delphi process. The reasons include: an expert making a commitment to a stand then being reluctant to change it, the different academic standings of the participants, not losing face, and elimination of the usual biases found in today’s society such as gender, racial, and age biases. Anonymity of responders allows consensus to take place without the undue influence of rank, power, personality or persuasive speaking which is common to group meetings (Westbrook, 1997). Hiltz, Turoff, and Johnson (1989) suggest the use of pen names when using computer-based communications. A forum or electronic bulletin board enables this technique as e-mail addresses are not used for communications, thus anonymity can be assured amongst the panel members. It is essential that the researcher is the only one who can connect the pen name with the panel member. Pen names, although anonymous, allow for a sense of identification within the community of experts and were used for the present study (Colton, 2002).

Since the results of a Delphi are produced by structured interaction, the final product can be said to constitute a “reality construct for the group” (Scheele, 1975, p. 44). The results of a Delphi can be seen as “the product of a carefully designed and managed interaction and not answers to a set of abstract questions that are obtained by following prescribed methods” (p. 38). “People incorporate each others’ perspective and information into their thinking and arrive at a fairly accurate understanding of the critical issues to consider in their decision making process” (M. T. Corporation, 1983). Panelists may change their previous votes at any time (Turoff & Hiltz, 1995). If consensus was not achieved on an item, that item may be dismissed for the present, subject to a later revision. Brockhoff (1975) states that variance reduction, or consensus, almost always occurs in Delphi groups between the first and fifth rounds but the best results, as a rule, are already known by the third round. Thus, any additional discussion may not be necessary.

**Web-base Delphi Procedures**

The present study used a web based Delphi method to develop and establish content validity of the Online Adult Learning Inventory. Research methods for validity included: (a) a thorough review of the literature to construct an item pool of instructional methods and (b) Delphi expert panel consensus. The mean, mode, standard deviation, interquartile range, and skewness of the data were calculated from the voting procedures for determination of consensus. Evidence of reliability was indicated by the interrater reliability coefficient from a field test. In addition, an informal review of readability was conducted to improve the readability of the instrument and the Gunning Fog Index (1983) for readability was calculated.

The pioneering Web-based Delphi process proved to be a method rich in qualitative data and was an excellent way of bringing together experts to discuss, debate, and organize a body of information in order to develop a validated instrument, reach agreement on an issue, uncover common factors, or forecast trends. This method has potential for use by researchers to build a validated knowledge construct utilizing the resources of the World Wide Web for convenience, ease of use, and depth of discussion. Business and industry personnel may use the Web-based Delphi method to validate instruments or knowledge constructs.

Specific information on constructing a Delphi Web site can be found on Website: [http://www.mpc/sharon_colton](http://www.mpc/sharon_colton). The following is a recommended procedure for online Delphi to develop and establish content validity of an instrument. A visual representation of the procedures used in the present study is illustrated in Figure 1. Web-based Delphi procedures:

1. **Literature review**: Preliminary content collected for the instrument using established quality filters, criteria for selecting the expert panel established, and appropriate and established research methods are selected. In the present study the principles of adult learning were reviewed, as were web-based instructional methods.

2. **Selection of the expert panel**: Selection criteria for panel members must be based on a review of the literature, potential panel members are then selected based on the criteria, and approval of the potential expert panel members was obtained from the studies’ sponsor(s). Human subjects protections should also be established at this time as applicable. Potential panel members are reached by telephone to seek their acceptance. Upon acceptance, a follow-up letter along with any required release forms is faxed or e-mailed to the experts who accepted the invitation to participate. See Table A, Procedure for selection of expert panel members.

3. *Review of readability*: Knowledgeable subject matter experts review the preliminary draft instrument for appropriate wording and ease of understanding. Revision is made to wording based on suggestions.

4. *Set-up of the discussion forum*: The discussion forum is set up on the Web site with the latest revision of the instrument and other data attached to the website. Pen names and passwords are selected for each participant to insure anonymity. Choose gender-neutral pen names for participants.

5. *Round one of the Delphi*: Establishment of instrument content by discussion and vote for possible consensus. In the present study the experts were given a draft instrument with adult learning principles, as derived from the literature, as the structure of the instrument. The main points of consideration were: Is the principle relevant to web-based course development, and, if so, is it worded correctly? They had three weeks to discuss items on this list, suggest changes to the list, collapse any two principles into one, separate one complex principle into two separate principles, alter wording and phrasing, and make additional comments that came to mind. This phase of the Delphi resulted in a depth of discussion not previously obtainable in paper-pencil based Delphi procedures. For example, Mango (penname) asked to soften the language, especially the wording “to cope effectively” as it suggests survival, yet many adults enroll in courses for pleasure. Mango’s suggestion was to re-word the principle as: “Adults become ready to learn those things ... with which they can or wish to relate their real-life experiences.” Celery (penname) agreed that the principle needed to be re-worded and refers to the “primacy” in adult learning, the need to know something becomes of primary importance. Although agreeing with the above experts, Broccoli (penname) stated that adults are motivated by life events “to pursue formal educational opportunities and to conduct informal learning projects.” Tomato (penname) related that, “we design instruction to solve a problem.” Kiwi (penname) offered, “Web-based learning systems can and should connect learning to the learner's life experiences” as an alternative re-wording. Kiwi commented that “the concept, premise, principle applies to all learners, but might be more relevant or pertinent to adult learners.”

Experts then had another two weeks to vote on the list. Prior to voting, the list of adult learning principles was revised based on suggestions by the expert panel. Voting ended the round. Results of round one were displayed on the discussion forum. Mean, median, mode, standard deviation, and interquartile range were calculated. Based on the suggestions and a statistical analysis of the vote, the instrument and its structure of adult learning principles were revised again.

6. *Round two of the Delphi*: Round two consists of establishing and sorting of an item pool completed by a vote. Consensus is typically not expected at this point. Expert panel members in the present study were asked to list one or more instructional methods that applied an agreed-upon adult learning principle to Web instruction or training for adults. Because of the opportunity for discussion and debate that a threaded discussion forum afforded, there was expected to be some negotiation toward consensus during the dialogue. Results of the listing of instructional methods were displayed on the
discussion forum. One week was given to the expert panel for reflection on the draft instrument as again revised with the list of instructional methods included. Then, a vote was conducted on the large item pool or list of instructional methods, which applied the various adult learning principles to Web courses, using a Likert scale. Descriptive statistics were calculated to indicate consensus. Edits were made by the researchers to the list of instructional methods based on the results of the vote, comments on the voting ballot, correspondence, and references from the literature where necessary. Items receiving weak consensus (mean of 3.0 or higher and an interquartile range of 2 or greater) were retained for a re-vote for the third round to allow panel members to consider changing their vote.

7. Round three of the Delphi: Follow up discussion was available and a second vote was performed on the revised list of instructional items either to include in the instrument or consider for elimination. Statistics were calculated as before. Items not having reached consensus to be included in the instrument were considered for elimination from the final instrument. Edits were made to the list of instructional methods based on the results of the vote, comments on the voting ballot, correspondence, and references from the literature where necessary.

8. Field test for indication of reliability: A field test was conducted using fourteen university or community college faculty or staff who had knowledge of Web course development and/or evaluation. Participants first participated in an overview of adult learning principles, then used the draft instrument to conduct an evaluation of one pre-chosen instructional Web course. Comments by the participants related to the draft instrument were recorded. Results of the Web courses review were analyzed for an indication of inter-rater reliability using standard correlation procedures for estimating agreement corrected for chance. The inter-rater reliability statistic gives an indication of the reliability and consistency of the instrument. Participant comments and results of the analysis were used for the final revisions of the instrument. The Gunning FOG Index (1983) was also computed for final reading level.

Conclusions and Implications for HRD Research and Practice

The Web-based Delphi process used for this study is new to the field of research design. This study demonstrated the power of technology in enhancing a classic and ethical Delphi research process, in facilitating discussion among participants separated by time and place, and providing a venue for voting, all while preserving the anonymity of the participants. It yielded rich qualitative and rigorous quantitative data resulting in a content validated instrument, possibly resulting in a more in-depth content validation, applicable to educational, business, industrial, and government research as well as bringing the tenets of andragogy into the 21st century. The procedures used in this study can also be applicable to HRD practice in that with the ubiquitous nature of the technologies used in the study it makes replication of the process feasible for practitioners and others seeking to develop valid tools to measure HRD and adult education related content.

Finally, this process insured anonymity of participants and confidentiality of data throughout the process as well as addressing issues around power and rank inherent in expert-based research. Anonymity of responders allowed consensus to take place without the undue influence of rank, power, personality or persuasive speaking which is common to group meetings (Westbrook, 1997). Required anonymity in the Delphi process is based on: an expert making a commitment to a stand then being reluctant to change it, the different academic and reputation standings of the participants, not losing face, and elimination of the usual biases found in today’s society such as gender, racial, and age biases.

Competencies and Training Needs of Financial Aid Administrators

James F. Lane, Jr.
University of Houston

The purpose of this research was to: 1) identify the competencies considered essential for entry-level administrators of financial aid at four-year universities, and 2) determine what method of training leads to these competencies according to financial aid directors. A Computer-based Delphi process was implemented because of its flexibility and adaptability.

Keywords: Competencies, Delphi technique, Professional Development

Problem Statement

The financial aid profession is in a continuous state of evolution due to advances in technology and changes in legislation. Consequently, as more and more programs and technological advances are introduced to student financial aid administration, there is greater demand for effective, efficient and skilled professionals to administer and develop successful financial aid programs. There is also an overwhelming need for advanced and limited training opportunities as shown in a search of the relevant literature. Currently, there is no consensus concerning the competencies that financial aid administrators need or the preferred method of obtaining those skills.

The creation of identifiable competency requirements gains importance as the career expectations of the financial aid administrator increase. The continually evolving financial aid arena is a direct result in changing laws, developing regulations and the introduction of new aid programs. Therefore, research needs to be conducted to establish which competencies are considered appropriate and the most appropriate form of training to develop these competencies.

Theoretical Framework

The creation of the National Defense Education Act in the late 1950’s brought about a national commitment to a higher educational system that could service a growing technologically advancing society. Certain developments such as the G.I. Bill in 1944 spurred student aid policy during the national economy era from the end of World War II to the mid 1960’s. Significant increases in Federal expenditures for student aid began in 1972, again making the role of the institutional aid administrator even more important than it had been in the past (National Association of Student Financial Aid Administrators [NASFAA]), 1978. A NASFAA commissioned report in 1977 had its findings published in 1978 under the title Characteristics and Attitudes of the Financial Aid Administrator, became the groundwork study identifying early characteristics or competencies of administrators of student financial aid. This report surveyed financial aid directors with the purpose of analyzing staff background, academic achievement, job orientation, professional competence, degree of professionalism, needed professional development and aid office characteristics.

Utilizing this foundational study in the financial aid arena as a basis for research, answers to the question of competencies of the financial aid administrator can be sought. Parry (1996) describes competency as “a cluster of related knowledge, skills and attitudes that affects a major part of one’s job (a role or responsibility), that correlates with performance on the job, that can be measured against well-accepted standards, and that can be improved via training and development.” (p.50).

Prerequisite to the establishment of any form of meaningful training, there is a need to identify the competencies required and their corresponding level of importance for financial aid administrators. In their presentation to the 1979 ASTD National Conference, Ashely and Stump stated that:

“A variety of skills and abilities developed through both work and non-work experiences are needed by workers in order to enter and progress in a rapidly changing world or work. Additionally, individuals need to develop their occupational adaptability and flexibility to enable them to deal effectively with the increasing number of career and job changes that are characteristic of the current labor force” (p. 71).

Copyright © 2004 James F. Lane, Jr.
In a paper presented to the Academy of Human Resource Development Conference in 2002, Charlotte Nitardy and Gary McLean state that competencies are commonly considered by organizations to help guide human resource development and in making human resource decisions. They built this conclusion from several existing definitions of competence. Ayer and Duncan were cited for their 1998 expansion of the definition of competency as a specific, observable behavior or characteristic that leads to superior performance. Finally, personal competencies are people interaction skills. McLagan (1996) indicated that a competency model could be used as a decision tool to describe the key capabilities for performing a specific job. They are more reliable than job descriptions, more valid than skill lists, and more on target than gut feelings. Utilizing the results of the previously stated literature as a basis, a more coherent and comprehensive understanding of specific competencies required of an administrator in the field of financial aid can be developed.

In the infancy of the financial aid profession, authors have documented the need for increased professionalism among the aid administrators. The National Association of Student Financial Aid Administrators (NASFAA) established in 1974 the professional standards of practice, which laid the foundation for the standards that are followed today. Additional research was conducted to identify the general competencies for financial aid practice (Moore, 1975, p.10) and the activities and professional characteristics of aid administrators (Morris, 1976, p.25, Flippin, 1979, p.143, Schiesz, 1974, p.30). Some of the first studies to identify professional development needs were conducted by Flippin (1979) and Willingham (1970). They queried directors of financial aid and concluded that the professional development needs included attendance at state and regional professional organization meetings, availability of professional journals, a code of ethical standards and increased availability of training opportunities.

The Journal of Student Financial Aid reported in 1988 that as a conclusion of the study conducted by Robbins and Phillipe, there was noticeable role ambiguity and conflict within financial aid administrators in the execution of their duties. Their findings indicated that there was a significant difference between the actual and desired role of the financial aid administrator for the twenty-two role functions included in the study. Student recruitment, personnel evaluation and administration of state financial aid programs were the functions that had the highest level of concern by the respondents. They suggested that a study should be conducted to determine courses or workshops that could be instituted to lessen the gap between actual and desired role functions. McDougal (1983) added that there is an increasing need for student financial aid personnel at all levels to be more aware of and familiar with sound counseling techniques and the advising role. The financial aid administrator is required to go beyond needs analysis, administrative trivia and paperwork to focus attention on an important issue- the student.

Taylor and Shelley (1992) suggest that by identifying important tasks required of the entering financial aid administrator an institution can save valuable time and money when selecting the candidate with the best fit for the position. They proposed that the new administrator possess seven key skills; counseling, communication, computer expertise, management (programs, people, and operations), packaging (as in “experience with packaging and awarding aid”), counseling (advising students and parents) and communications (speak, write and listening).

The changing environment of student aid has some technological implications to the financial aid administrator. Craig Cornell (2000) emphasized that the financial aid industry must adjust for the technology surge at the Department of Education, increased use of internet technology in the business sector, increasingly sophisticated mainframe systems and enrollment management paradigms (p.38). As a result of these changes he suggests that to ensure competitiveness the financial aid office should develop hiring and training programs by examining staffing patterns and considering staff reorganization.

Vali Heist stated in his 2002 NASFAA Student Aid Transcript article what he considered to be the top ten “in-demand” job skills for a financial aid administrator and they are as follows:

1. Problem solving or critical thinking
2. Human relations to include interpersonal skills, communication skills and people skills
3. Computer programming and software utilization
4. Teaching and training skills
5. Information management skills
6. Money management skills
7. Business management skills
8. Science and math skill
9. Foreign language
10. Vocational and technical skills

Methodology

Invitations to participate in this study were initially sent to the 23 committee chairs and board members of the Southwestern Association of Student Financial Aid Administrators (SWASFAA) that represented universities. These invitees were considered to be experts with extensive experience and knowledge in the area of financial aid.
The credentials of the panel support Moore’s (1987) criteria for an expert panel member. He states that an expert is an “individual who possesses the knowledge or experience necessary to participate in a Delphi” (p.51). The membership of the Delphi expert panel was subsequently formed from the 18 SWASFAA leaders who accepted the invitation to participate and was considered well within the recommendations of Murray and Hammonds (1995) where they indicated that the panel should be comprised of at least 10 members. Wilhelm (2001) also believes that a panel of this size is appropriate by supporting Linstone and Turoff’s (1975) early observations of Delphi panels in which they suggest a panel of 10-15 members.

The Delphi technique was selected as the preferred methodology for this study. The Delphi distinguishes itself from other group interaction methods such as the Nominal Group Technique by three important characteristics. Those features are (1) anonymous group interaction and responses, (2) multiple iterations or rounds of questionnaires or other means of data collection with researcher controlled statistical group responses and feedback and (3) presentation of statistical group responses (Murray and Hammons, 1995, p. 424). Olaf Helmer and Norman Dalkey developed this procedure in the early 1950’s as researchers with the Rand Corporation. The initial purpose of this process was to gather expert opinion and develop consensus in forecasting war scenarios and as explained by Helmer (1983) is “to make the best use of a group of experts in obtaining answers to questions requiring reliance, at least in part, on the informed intuitive opinions of specialist in the area of inquiry”(p. 134). Murry and Hammonds (1995) believe that the:

“Delphi method rests on two assumptions. One is the assumption that group decisions are usually more valid than decision made by a single person. Further, decisions are more valid if the group is comprised of experts in the field (Brooks 1971; Langford 1972; Martino 1983). A second assumption is that, while group decision making can be more reliable, numerous problems can arise when group members meet face to face” (p.426).

In Round One an electronically mailed questionnaire was sent to the expert panelists with the dual purpose of surveying the preferred method of training and soliciting ten competencies deemed essential for an entry level financial aid administrator. Somers, Baker and Isbell (1984) state “the first round is designed to elicit individual judgments or opinions from each of the panel of experts” (p.28). Utilizing the recommendations and designs of Dillman (2000), the electronic surveys were considered to be similar to other acceptable forms of surveying. An advantage noted by Thach (1995, p.31) in the utilization of electronic notifications was that respondents may provide more candid results due to the isolation of their answers. In response to the initial questionnaire, the panelists submitted 180 essential competencies which were condensed because of duplication to 84 essential competencies. These competencies were then categorized into seven defined areas. The categories were developed using the constant comparison method which was developed by Barney Glasser and Anselm Strauss (Strauss & Corbin, 1990). Each Round One competency response was written on a note card with no reference to the contributing respondent. The competencies were then separated into stacks of like responses and information considered useless or redundant was deleted. Competencies were compared until emergent categories were solidly identified. The meaning of each category was clarified until sharp distinctions were determined and the most important categories were established for the study (Gall, et al, 1996). The final result was 84 competencies organized in seven categories. The identified categories were: Leadership, Fiscal Management, Personnel Management, Communication, Professional Development, Technical Processes and Assessment, and Student Contact/Customer Service. The 84 competencies once organized by category, were presented to the expert panel on an electronic questionnaire in Round Two.

In Round Two, panelists were instructed to rate each essential competency on a four point Likert scale from 4 (Strongly Agree) to 1 (Strongly Disagree). Those not wishing to rate the competency were afforded the opportunity to select the rating of “Undecided” which had a value of 0. Respondents were provided sections to submit comments to support or clarify their ratings. Round Two results were electronically stored and later tabulated to assist in the production of statistical and narrative data utilized in the development of Round Three. Seventy of the original eighty-four competencies achieved a mean rating of greater than or equal to 3 (Agree) and were retained in the development of Round Three. The fourteen competencies that had a mean rating of less than 3 were removed from the study.

Round Three allowed the panelists to review and possibly re-rate the seventy remaining essential competencies presented from Round Two. The electronic survey in Round Three provided the results of the Round Two analysis which included the panel’s Interquartile Range (IQR) for each competency, the individual respondents rating and comments for each section. Panelists were instructed that they could reevaluate their rating in light of the new data and any comments or let their previous rating stand. They were also directed to provide comments concerning their rating, particularly if this rating was outside the IQR.
Each essential competency identified by the Delphi panel was graphically displayed on a Summary Analysis Sheet. This analysis consists of the essential competency, identified by the category, for Rounds Two and Three, there is a graphic display of the frequency of distribution, the means and the IQR. The data generated by the rounds also included the experience and education level of each respondent, other sources of financial aid training used in the development of financial aid skills and knowledge, competencies required for the field, method of training delivery and importance of identified competencies.

Results and Findings

The essential competencies of an entry level financial aid administrator were identified utilizing a computer-based Delphi process. There were 84 essential competencies initially identified in response to Research Question One: What are the professional competencies are required for an entry level financial aid administrator to possess or obtain during the first year of employment?

Data analysis of the responses to the first question indicated that at the conclusion of Round Three, 67 of the essential competencies were rated as 4 (Strongly Agree) or 3 (Agree) by at least 75 percent of the Delphi panel. Category I or Leadership consisted of essential competencies that provide a basis for leadership or followership. These skills encompass decision-making, time management, planning, quality of work and organizational behavior. The panel indicated that the most significant competency for this category was the ability to assume responsibility with a ranking of number 4. This reflects the need in the financial aid industry to identify young professionals that will be accountable for their actions. The ability to multi-task was also ranked among the top 10 competencies at number 8. Considering the complexity of the financial aid industry, the entry level professional must be able to manage many projects at the same time. It is very common for the financial aid professional to be involved in personal advising of a student and family, sit on a board or committee for a professional organization, be a member of an institutional functional group and oversee the completion of financial aid applications and files. A sense of humor, a sense of urgency, the ability to prioritize work loads, flexibility in a changing environment and the ability to set priorities were all considered by the panel to be of equal rank at 12 and were within the top 20 competencies. These competencies are an indication that the well rounded employee is extremely desirable. The Directors indicated that they desire an employee that is pleasant to work with and can be trusted to complete all projects assigned and within prescribed deadlines.

Fiscal Management or Category II was comprised of competencies required in the operations of financial aid awards and cash management. The competencies for Fiscal Management received ratings that were considered very low and as a result none were within the top 20. One competency, possess basic mathematical competency, was ranked at 28. This indicates that the respondents did have some value for this competency but did not consider it to be among the most important traits for an entry level employee. The basic understanding of Federal, State and local cash management regulations concerning financial aid was ranked at the bottom at 64th. This would indicate that the respondents believe this to be a higher level skill and necessary only for the advanced financial aid administrator. Generally, this competency is not required of financial aid administrators until they have reached the senior administrator or director level.

Category III or Personnel Management includes competencies required in promoting cooperative working relationships with staff, students and faculty. There were no traits in this category that were rated within the top 10. However, there were six competencies ranked between 21 and 28 in significance. These competencies included sensitivity to others needs, willing to accept constructive criticism, discretion with personal matters, ability to seek assistance, ability to work with peers and the ability to work with a diverse population.

The next category, Communication (Category IV) focuses on those skills and competencies required for the transfer of information. The communications category received only three competencies considered significant by the expert panel in Round One. The possession of listening skills was considered extremely significant by the panel as indicted by the ranking at number 4. Considering the counseling demands on the new financial aid administrator when working with faculty, staff, students and parents, this trait is critical in the awarding of accurate and timely financial aid. Financial aid administrators, in their first year of employment, will be engaged daily in listening to students and parents with their special circumstances and how those circumstances affect student aid eligibility. The possession of writing skills was ranked number 21. This mid level ranking would indicate that the panel believes this to be a significant trait but one that should be developed after the initial competencies have been refined.

The competencies required for the development and retooling of skills to effect continued professional growth and productivity were listed in Category V or Professional Development. Integrity and ethics were the number 1 and 2 competencies ranked by the expert panel in this study. This ranking is a significant indication that directors must be able to trust entry level financial aid administrators as they work autonomously. Considering the high
demands of the office and sometimes minimal staffing levels, entry level financial aid administrators are allowed to work independently within two to three months after employment. Directors must have a level of confidence in their employees that they will perform their duties with integrity and ethically and minimal supervision. The competency of patience, assumption of responsibility for action and the projection of a positive image for the department were ranked number 12.

Category VI or Technological Processes and Assessment consists of those competencies that cover the ability of the administrator to apply new technology into the financial aid process, to evaluate and analyze programs and processes, and to seek solutions. The panel indicated that the ability to ask questions was a significant trait and ranked it number 2. The financial aid industry is a very complex, regulation and policy driven industry and an entry level employee must be inquisitive enough to seek answers for any questions that may arise. It is imperative that the new professional know their limitations and ask questions of the more seasoned staff and government officials. The utilization of technological solutions was considered by the panel to be of low priority for the new employee and ranked those competencies number 50 to 59. This is considered a skill that the administrator would obtain as they progress in responsibilities and as their management duties increase.

The final category, Student Contact/Customer Service, Category VII contains the competencies required for the effective interaction with individuals seeking the services of the financial aid office. Entry level financial aid administrators are the “front line of defense” in the operations of the financial aid office. They are the employees that will have the maximum contact with the customers of the office and as such must have developed people skills. This category received high rankings by the panel as indicated by five of the eleven competencies receiving a ranking in the top 10. The experts believe that a new employee must enjoy working with people and should be able to listen to them and care about their circumstances. This belief is so strong that they ranked both of these competencies were ranked number 4. The panel also indicated that it is important for the new administrator to be able to maintain concern for the student and have a realistic academic expectation for the student to fulfill. This competency was ranked number 4 along with the ability to understand the concepts of customer service and to treat every customer as an individual. These rankings are indicative of the nature of the financial aid industry and its roots in the student affairs field, concern for the student and a true desire for student success by the school administrator.

The 67 essential competencies of financial aid administrators met the definition of consensus as prescribed in the study. Therefore, these competencies can be considered a representation of essential competencies required for an entry-level financial aid administrator to possess upon employment or to obtain within the first year of employment. The most significant of these competencies are integrity, ethics, ability to ask questions, enjoys working with people, the ability to listen and care, assuming responsibility, possessing listening skills, concern for the student’s success, ability to multi-task, understands customer service concepts and treats every customer as an individual.

The expert panel also provided in Round One the answer to Research Question Two, which was: What type of pre-service and/or in-service training do directors of financial aid consider useful for developing these competencies? Panelists were instructed to select five sources of training or instruction from the list provided on the instrument. Analyses of the top 5 responses are as follows:

1. The panelists unanimously selected on the job training in a financial aid position.
2. “Financial Aid Officer Workshops” presented by state or regional professional organizations was selected by 94.4% of the panel.
3. Mentoring from key organizational leaders received two-thirds or 66.7% of the panelist votes.
4. Decentralized training provided by the National Association of Student Financial Aid Administrators was indicated by 10 of the panelists, or 55.5%, as a top five method of information delivery.
5. Self-Study utilizing programs such as SFA Coach, the web-site LearnFinancialAid.org and pre-conference training seminars received equal votes at 8 or 44.4% each. Self-study programs are relatively new programs delivered by CD or by web-site and have not been widely promoted.

Conclusion and Recommendations

The unanimous selection of “On the job training” by the panel is an indication that practice and tenure is considered the best method of preparation for entry-level financial aid administrators. As reported by Baier, this conclusion by the panel supports the dissertation results reported in 1977 by Patricia Eileen. Her study concluded that on-the-job
experience was one of the desired methods of development. Ferguson (1981) also supports these findings by stating that there was a need for in-service training for financial aid staff. Baier’s 1985 report also supported these finding by indicating that there was support for on-the-job experiences in developing new professionals.

The following twelve competencies, listed in descending order, were judged significant by the expert panel and had a mean value greater than 3.5.

1. Possesses high degree of integrity
2. Maintains ethical behavior in all activities
3. Asks questions
4. Assumes responsibility
5. Possesses listening skills
6. Enjoys helping people
7. Able to listen and care
8. Able to multi-task
9. Maintains a concern for the students and a realistic expectation for the student to fulfill
10. Understands the concepts of customer service
11. Treats every customer as an individual

From this list it can be determined that financial aid directors believe the most important competency or trait was “Possess high degree of integrity”. Delworth and Yarris (1978) stated in their foundational study of student affairs that one of the four categories of competencies required of new student affairs professionals was ethical concerns. The findings are also supported by Osruth’s 1981 study of competencies for entry level student affairs administrators, which included the appreciation and internalization of professional standards and ethics. Similarly, the indication of integrity and ethics is supported in part by the executive-level model presented by Alldredge and Nilan (2000, p.139) in which the number 1 competency listed in their study was a combination of ethics and integrity. Glenn and Engle (1993) support the training of integrity and ethics with their suggestion that there is minimal material on the human aspect of financial aid. Finally, Lovell and Kosten (2000) synthesized 30 years of research relating to successful student affairs administration and concluded that the administrator should possess the traits of personal integrity and cooperation among others.

The panel indicated that asking questions, the ability to multi-task, enjoys helping people and has concern for the students were significant competencies. These findings are supported by Taylor and Shelley (1992) who indicated that the entering financial aid administrator should possess seven key skills which included counseling, communications, and the management of programs, people and operations.

The expert panel came to the conclusion that listening was a desirable trait. This is support in part by Carpenter, Guido-DiBrito and Kelley (1981) when they stated that in the field of student affairs communications was a valuable talent. The findings of the panel also support the significance of communicating effectively as reported by Winston and Miller (1991). Taylor and Shelley (1992) suggested that the ability to speak, write and listen (communications) was one of seven key skills required of a potential candidate. The competencies identified by this study are elements that can be utilized to develop an individualized training program as recommended by McDade (1990).

As a result of this research it is recommended that the competencies identified in this study should be incorporated in the recruitment, selection and training of entry-level financial aid administrators. Hiring supervisors should develop from this list appropriate competency requirements, as they relate to their institution, for the position being filled. Upon employment, the new administrator should be placed in a personalized basic training program to develop the competencies not yet obtained. The competencies identified should also be utilized in the design and implementation personalized training programs for financial aid administrators currently in the industry. This training program would be utilized to develop more competent administrators and should be factored into the annual performance. Credentialing of financial aid professionals should also be examined with the goal of establishing required competencies and experience levels required for professional designation. Considering the current absence of consensus concerning the competencies that a financial aid administrator should possess, the competencies identified should be utilized to conduct presentations and training at State, Regional and National professional conferences with the target audience being the supervisors and managers of entry-level financial aid administrators. Such training should include the development and awareness of integrity, ethics, communication, student development and customer service. It is recommended that future financial aid training programs and courses incorporate the competencies in this study in the curriculum along with technical and regulatory subjects. The establishment of financial aid internships should be promoted due to the high percentage placed on “on-the-job training” by the Delphi panel. It is also recommended that current web-based training programs should be modified to implement the identified competencies not already included in the curriculum.

Development and Change Through Scenario Planning

Thomas J. Chermack
University of Minnesota

John S. Walton
London Guildhall University

This paper examines the role of scenario planning as a development and change intervention. To do so, this article provides an overview of scenario planning and an overview of development and change in organizations. The article then builds on the philosophical orientations of development and change through scenario planning introducing the concepts of autopoiesis and requisite variety. The article concludes with implications for HRD professionals.

Keywords: Development and Change, Scenarios, Teleology

Purposes of the Paper

The purposes of this paper are 1) to provide an overview of scenario planning and its key concepts, 2) to use Van de Ven and Poole’s (1995) classifications of development and change in organizations to assess scenario planning as a change intervention, 3) to expand on that classification by introducing the concepts of requisite variety and autopoiesis and 4) to discuss the implications of scenario planning as a change intervention for HRD professionals.

Scenario Planning -- Overview and Key Concepts

In essence scenarios are possible futures or contingencies. A set of techniques covered under the umbrella notion of scenario planning can be of significant value in helping an organisation determine its future direction and develop contingency plans in the event of a disastrous occurrence. The facilitation of scenario planning workshops and associated activities should be within the armoury of an accomplished HRD practitioner.

A scenario can be defined literally as the script for a play. In management terms it is “a tool for ordering one's perceptions about alternative future environments in which decisions might be played out” (Schwartz 1991, p. 21). Hermann Kahn, who founded the future-oriented Hudson Institute in the mid 1960s, and pioneered the technique of future-now thinking whilst previously working for the RAND Corporation after World War II, was one of the first to adopt the term and develop the concept. He particularly liked the emphasis it gave on creating a story or myth which helped people break out of their mental sets and consider the “unthinkable”. “Future-now” thinking encouraged people to write a report that drew upon their imagination as well as detailed analysis, as though they were living at some point of time in the future.

The process of scenario planning generally involves the development of three or four diverse plots and associated narratives, each of which illustrates the possible playing out of major forces driving change within a system, the interrelationship of these driving forces, and critical uncertainties in the environment (Wack 1985).

Shell is the organisation most associated with scenarios. In 1973, the world's biggest oil crisis to date was caused by the Organisation of Petroleum Exporting Countries (OPEC) collectively agreeing to a strategy that tripled the price of oil. The oil companies, with the exception of Shell, were totally taken by surprise. The prevailing mental set was that the companies making up OPEC were so disparate that they would never reach agreement on a collective price raising or production reducing strategy. It was 'thinking the unthinkable'.

Shell, however, had been caught out in the past by relying on conventional forecasting techniques whereby they judged the future through extrapolating from the trends of the past. Experience had taught the company that they were dealing with an increasingly turbulent environment and could be caught out by discontinuities, step-changes, cataclysmic events happening 'out there'. In particular they had not anticipated events in Mexico in the 1960s where the government nationalised the oil wells without compensation. As one of the biggest operators in Mexico, Shell suffered far more than its competitors. It concluded that its previous approach of relying on business projections based on past performance and extrapolated forward in time by regression statistics were totally
inadequate. They concluded, as had Peter Drucker some years previously, “the greatest danger in times of turbulence is not the turbulence - it is to act with yesterday's logic” (1964. P. 14).

Accordingly it incorporated scenarios into its strategic forecasting ideology, anticipated the possibility of a co-ordinated OPEC strategy, and planned the future as though that was a likely happening. But, as subsequent events impacting on Shell have shown, scenario planning is not a panacea. Shell had its blind spots on the environmental front, as demonstrated by the Greenpeace protests that prevented its disposal of the Brent Spar vessel in 1995?

A Group-Based Approach to Scenario Planning

Scenarios can be remarkably simple. One very effective approach is to divide a group into 3. One sub group is asked to visualise an environmentally friendly world 20 years into the future in which the green party is predominant. Ask them to reflect on a typical working day. What do they see when they wake up in the morning? What do they eat for breakfast? Where do they go to work? What transport do they take? What do they note about the physical working environment? And so on.

A second group goes through the same process; only they imagine themselves to be in a world dominated by a political party whose priority is high technology.

A third group are given a free hand to visualise the world assuming that it is the culmination of the trends they are experiencing at the present? What world do they envisage?

After having been given a period of time to give free rein to their creative ideas, a specific question is put to each group by the facilitator in the capacity of a consultant. For example: Your client organisation is considering investing in a large open learning training centre. Is this a good idea? What form should it take? Then finally, their collective ideas are pooled and 'presented' to the client.

The problem with scenarios is that they can still contain blind spots in what Shell have called ‘the gentle art of re-perceiving’. Pierre Wack of Shell Oil, who has been one of the most influential figures in developing scenario planning as an accepted management tool, realised that managers' mental models would have to change if scenarios were to have any real impact:

Every manager has a mental model of the world in which he or she acts, based on experience and knowledge. When a manager must make a decision, he or she thinks of behaviour alternatives within this mental model....From the moment of this realisation, we no longer saw our task (in scenario planning) as producing a documented view of the future.....Our real target was the mental models of our decision makers; unless we influenced the mental image, the picture of reality held by critical decision makers, our scenarios would be like water on a stone (Wack 1985, p. 13)

Midpoint Scenarios

Beckhard and Harris (1987) referred to the value of midpoint scenarios in thinking through and refining the desired outcomes of a change process. The technique involves writing a scenario of what the organisation should look like at an intermediate point of the change effort. It should be detailed, and behaviourally oriented in focus and describe what one would expect to see, hear, even feel in the projected situation at the mid point of six months.

They give by way of example a proposed merger between two business sub units with a target for successful implementation in 12 months time. The process entails asking managers involved in the implementation process to imagine themselves in a helicopter, photographing several days of action with a camera that has a very wide-angle lens. Record the detail that the camera would see. Where would the business sub units be in 6 months time? Who would be managing which parts of the work? What would be the information flow? Who would be responsible for which decisions and why?

The approach should not be viewed as an invitation to fantasise problems away. It represents part of a personalised description of what those responsible for the change process are committed to achieving. The task of constructing the midpoint scenario cannot therefore be delegated. The way they describe scenario preparation is akin to structured visioning.

Disaster Scenarios

Many scenarios have been created to enable strategic contingency plans to be developed by bodies such as civil defence and local authorities in the event of possible disasters. Many large organisations have used them to evaluate the likely effects of such eventualities as flood, earthquake and tempest.

Defensive Scenarios

Some organisations use scenarios as part of a visionary way of perceiving the future. Others use them as checking mechanisms on threats to the current organisational steady state or as constraints to proposed courses of action. Shell, for example, have set up a think tank to include those opposed to its policies, who are invited to suggest environmentally friendly solutions to potential issues they might have to face in this area.
A Stepped Approach to Developing Scenarios

Kleiner (1994) proposed the following stepped approach to developing scenarios

1. Refining a Sense of Purpose

Scenarios become no more than an academic exercise unless they address genuine concerns. These should be compelling, shared by the entire group (ideally of between 8-20 people) and beset with uncertainty. Examples of concerns could be ‘Should we move towards overseas markets?’; ‘What sort of career should we prepare graduate trainees for?’ Articulating the focus is deceptively complicated, especially since participants, although sharing a common interest should have diverse backgrounds. As with visioning, it is important to move beyond the concerns that people think they have to those which truly engage them.

2. Understanding Driving Forces

Scenario building entails an understanding of two different types of driving force. Predetermined forces are relatively predictable. Barring some unforeseen calamity we can predict with reasonable accuracy the number of forty year olds existing in a given country twenty-five years from now. But the vast majority of forces at play contain considerable uncertainties. Will consumers continue to regularly want new media products? Will the tiger economies continue to invest heavily in Western economies? Although it is not possible to know all of the answers one can become far more aware of why events may move in one particular direction, and the implications of such a movement.

The predetermined elements provide the boundaries within which scenarios are constructed; the act of isolating key uncertainties helps identify the key ramifications of the decision. In practice the process can entail members of the group engaging in independent external research.

3. Scenario Plots

Developing scenarios involves creating “classic stories” based on what would happen if some future event or occurrence impacted on the current situation. You create several stories of your own, trying to make each be internally consistent and evocative of a future that takes you out of your prevailing preconceptions. Each story can then be enriched and embellished with accounts of what might plausibly happen. Kleiner referred to scenarios at New York University dealing with the future of global information networks. One possible future in which information flows were dominated by large corporations was called the “keiretsu world”, named after the Japanese industrial consortia. An alternative “virtual world” depicted a situation in which large companies were no longer necessary, and information flows were devolved.

4. Strategy, Rehearsal and Conversation

Having developed a small number of scenario plots, consider each in turn. What strategies would be effective assuming that the proposed futures came to pass? What would it feel like to live in those worlds? Insights can be gained by rehearsing the scenarios as though each was a piece of improvised theatre, with each participant in their creation taking the part of a different key player. It also helps to recount the scenarios to others, and draw upon their response to make the world-view richer. The criteria that test the completeness of the process include;

1) Will this strategy stand up in, say, a keiretsu world?
2) If a virtual world comes to pass, will the organisation be prepared?

Delphi Technique

Over the years a number of techniques have been used to help forecast and gain some degree of insight into a given organisation’s future. One well-known approach is called the Delphi technique and it is commonly included in the scenario generation process. It is based on the Ancient Greek tradition of going to the oracle at Delphi for advice. In general terms it entails presenting a given problem to a number of experts or gurus, and independently soliciting their advice on the likely future. Individually they are then presented with the views of the others and given the opportunity to refine their views.

The Delphi method is widely used as a technique to identify technology futures drawing upon a range of experts. It is held to be more at the “certain” end of the future forecasting spectrum compared to the use of scenarios (Ringland 1998). Nevertheless scenario planning, although structured in a somewhat different way, has affinities with the Delphi technique and many approaches to scenario planning similarly draw upon a range of experts. Where it differs from the Delphi technique is the reliance on stories about the future.
An Example of Scenario Planning and Delphi in Practice

In 1993, the UK government initiated a “Technology Foresight Programme” through the auspices of the Office of Science and Technology (OST), the lead agency for government funding of the science base through the universities and research councils, with an annual budget of £1.3 billion. The specific objectives of the Programme are to bring together business people, engineers, scientists and government in networks which identify emerging and longer-term opportunities in markets and technologies. At an early stage panels of experts were set up to conduct foresight analysis for each of 15 designated economic sectors. Panels were invited to consult as widely as possible with other people in their sector across the country, to form links with other panels where possible, and in the process to consider the following questions

1) What are the likely social, economic, environmental and market trends over the next 10-20 years?
2) Which areas of R&D and underpinning science, engineering and technology best address those future trends?
3) How best can public funds be used to sustain an innovative science base to support future national prosperity and quality of life?
4) To what extent should regulation, skills, educational facilities, and other factors be taken into account?

When the panels began their work, the OST organised a series of Delphi surveys seeking views from over 3,000 experts on topics concerning the future of the technologies in the 15 sectors. The results of the first round of questionnaires were analysed and sent back to the original respondents to see if they wished to revise their judgements in the light of the findings. This helped to develop better mutual understanding and consensus on priority topics.

The way the Delphi survey was orchestrated was not successful in this case. There were too many questions; and the postal survey method was alienating and missed out on the face-to-face contact necessary if one is to encourage a dynamic and creative debate. The process might have been more effective had a one-stage questionnaire survey been undertaken that was highly focused on key issues, and then the results been presented for interpretation and debate at a series of interactive workshops. (Anderson 1997)

Development and Change in Organizations

Scenario planning can be classified as an organization development and change intervention. Perhaps the most unique aspect of scenario planning is its inclusion of the individual, group process, and organization levels as its targeted domains of improved performance (Chermack & Lynham, 2002). That is, scenario planning aims to alter the ways in which individuals and groups perceive their world such that seeing the world anew leads to different ways of acting and includes a direct impact on the organization level. Relatively few works have centered on scenario planning as a change intervention, however, scenario planning is more frequently being coupled with traditional strategic planning processes and therefore can be included as a portion of strategic interventions (Cummings & Worley, 2001).

Van de Ven and Poole (1995) provided an assessment and classification of four core approaches to development and change in organizations, namely, 1) life-cycle, 2) teleological, 3) dialectical and 4) evolutionary. Each of these has utility in classifying change in organizations and scholars often integrate varying aspects of these typologies to explain change events.

Life-Cycle Approach

The life-cycle approach to organizational change suggests that change follows a set of phases. Van de Ven and Poole (1995) stated: “According to life-cycle theory, change is imminent: that is, the developing entity has within it an underlying form, logic, program, or code that regulates the process of change and moves the entity from a given point of departure toward a subsequent end that is prefigured in the present state” (p. 515).

Teleological Approach

Teleology is a philosophical doctrine that promotes the idea that a goal or purpose is what guides the alteration of any entity. That is, any entity moves toward a goal or purposeful end state. Most models of strategic planning centered on this approach to change -- specifying the goal or desired future state and then implementing and developing plans to achieve it. “Proponents of this theory view development as a repetitive sequence of goal formulation, implementation, evaluation, and modification of goals based on what was learned or intended by the entity” (Van de Ven & Poole, 1995, p. 516).
**Dialectical Approach**

Based on the distribution of power, the dialectical approach to change suggests “the organizational entity exists in a pluralistic world of colliding events, forces, or contradictory values that compete with each other for domination and control” (Van de Ven & Poole, 1995, p. 517). Dialectical theory is based on Hegel’s philosophical work. At its essence, Hegel’s view suggested that for every thesis, there exists an anti-thesis, and that synthesis finds some balance or alternative between the two. Organizational change from this perspective requires “two distinct entities that embody these oppositions to confront and engage one another in conflict” (Van de Ven & Poole, 1995, p. 517).

**Evolutionary Approach**

In the evolutionary approach, change proceeds “through a continuous cycle of variation, selection, and retention” (Van de Ven & Poole, 1995, p. 518). That is, selection happens in industry and organizations according to scarce resources, environmental factors, and competition. While there are a variety of specific viewpoints regarding evolution, its application in the context of organizational change simply promotes the idea of some continuous process of novelty, choice, and then competition to replicate it.

Scenario planning appears to include characteristics of more than one of these fundamental orientations toward development and change in organizations. Thus the remainder of this article will focus on the orientations and characteristics of scenario planning as a development and change intervention, and the implications for HRD professionals.

**Scenario Planning as an Approach to Development and Change**

Scenario planning exhibits characteristics of the dialectic and teleological approaches to development and change. While the bulk of these characteristics fall into the teleological approach, the core method of operation for scenario planning is through dialogue. While it does not appear that scenario planning requires conflict and opposition, dialogue is the primary means through which mental models and assumptions are revealed, shared and ultimately changed.

Scenario planning most prominently exhibits characteristics of the teleological approach to development and change in organizations. All of the available methods for conducting scenario planning center on a focal issue or goal. Some works have linked scenario planning and system theory on a conceptual level (Ward & Schriefer, 1999), and seem to support the notion that scenario planning follows a teleological approach to organization change. That is, scenario planning begins with some assumptions about development, namely, that organizations strive toward goals and core purposes commonly stated in corporation missions and visions.

Recent developments in system theory pertaining to teleology include the notion of teleogenesis. That is, while it is certainly appropriate to assert that organizations strive to reach goals and accomplish purposes, it is equally appropriate to assert that organizations can generate and create their own purposes.

A teleogenic or purpose generating system is a system that seeks a set of related goals for which it was created (Banathy, 1993). Mechanistic and organic systems can be purposeful, meaning that they serve some purpose but they do not generate purpose. Teleogenic systems incorporate and build upon the concepts of autopoiesis, and requisite variety. Scenarios and scenario planning incorporate these concepts and are attempts to develop purpose-seeking systems by providing and constructing a vision for the future.

Telegenic systems can incorporate several other modes of systems: mechanistic, organic and telegenic (Banathy, 1993, Harkins & Kubic, 2000). For example, the pilot of a sailboat is dealing with several mechanistic systems in the operation of the sailboat, several organic systems in computer navigation and weather systems, and is functioning as the integrative telegenic system that brings the others together and provides purpose and intent. Telegenic systems are most effectively and appropriately applied to human systems, because, as Von Bertalanffy (1969) stated, “True purposiveness is characteristic of human behavior, and it is connected with the evolution of the symbolism of language and concepts” (p. 79).
An exciting idea in teleogenic systems is the notion that there are too many options to plan for any one set of circumstances and the implication is that instead of choosing, and understanding of teleogenic systems will allow humans to create their own futures (Banathy, 1993). Thus, scenarios and scenario planning allow decision makers within human systems to design custom systems that devise and constantly revise their own purposes and seek new areas of advantage within their own environments. To this end, teleogenic systems develop what has been referred to as autopoiesis and generate requisite variety. These concepts will be explained and described as they apply to organizations and scenarios.

**Autopoiesis**

Maturana & Varela (1973) based their system theory work on 4 fundamental assumptions about the nature of systems, namely, (1) that systems are autonomous (2) the behavior of the whole is generated by the components and their interactions with neighboring elements (3) observers can perceive both systems and their environments and how they interact and (4) the observation of function can only be made by an observer who can interact with both the components and the whole. Maturana & Varela considered two key questions in the analysis of what differentiates organic system from mechanistic system:

1) What is it that a system produces?
2) What is it that produces the system?

Maturana & Varela used a cell as an example of a system. Consider for a moment what it is that a cell produces. Cells produce their own components, which therefore produce the cell itself in a cyclical and ongoing process. “A cell produces, and is produced by, nothing other than itself” (Mingers, 1995, p. 11). This is the core of autopoiesis. The word means, literally, self-producing, which is exactly what a cell does. (Figure 1 displays the circular processes of production).

*Figure 2. Circular processes of production (Mingers, 1995)*

![Circular processes of production](image)

The organization of a system demonstrates the properties of the system as a whole and occurs on a conceptual and abstract level. Organization is found in concrete examples in reality, while structure often refers to the generality lying behind such examples (Mingers, 1995). The distinction between organization and structure is, therefore, in the distinction between the whole and its parts. In these terms, organization refers to the events (often empirically detectable) and structure refers to the underlying assumptions.

In other words, autopoietic networks must continually regenerate themselves in order to maintain organization. Autopoiesis is not confined to the physical world (Mingers, 1995; Martuana & Varela, 1973) thus leaving open the possibility for communication, social systems, or a set of concepts to also be defined as autopoietic systems. A concern around the concept of autopoiesis is in its application to these other systems. Human systems become extremely complex, which makes the origins of autopoiesis within them, something mysterious. Human systems become more abstract because of their complexity. For example, one cannot observe a business organization in the same way that one can observe a cell under a microscope. Thus, a common problem in the application of system concepts is a failure to make the switch in perspective. Looking for characteristics of autopoiesis in human system from the mechanistic perspective will not yield very powerful results. The key to autopoiesis in human system is in the relationships among components.
Autopoiesis is evident in human systems and organizations and can be considered by first asking the same questions posed by Martuana & Varela, which are both critical questions in scenario planning (Schwartz, 1991; van der Heijden, 1997):

The use of heuristics often provides an answer to the first question. For example, the business idea (van der Heijden, 1997) is designed to articulate the key products and processes without which the organization would not exist. The second question is more difficult to answer. The organization system is sustained by the continuous input and output of resources. In today’s world, the primary resource of concern is a financial one. If an organization is not financially viable, it will not be in business for long. Thus, business organization systems can be described as autopoietic because they naturally strive to regenerate themselves through the perpetual flow of inputs, processes and outputs and because they must regenerate their resources to sustain themselves.

Scenarios as autopoietic systems. The actual stories generated in the scenario planning process can also be viewed as autopoietic systems. van der Heijden (1997) referred to the notion of the “strategic conversation” (p. 46) which is an example of autopoiesis in the scenario itself. A strategic conversation occurs when individuals participate together, share ideas about patterns, reflect together, build a common course of action, and act together. The strategic conversation is the collective consideration, deliberation, planning, and action of members of an organization. In this context “the learning loop works as a positive feedback loop” (van der Heijden, 1997, p. 47). The assumptions of the strategic conversation are that organization structure exists in action and interaction, and that action and interaction take place through conversation or dialogue.

Requisite Variety

Key to the notion of teleogenic systems is the concept of system anticipation or preparedness. In systems, this is accomplished through the development of requisite variety. The law of requisite variety states that “the larger the variety of actions available to a control system, the larger the variety of perturbations it is able to compensate” (Ashby, 1956, p. 206). Where requisite refers to “required” (Webster’s New World Dictionary, p. 529), this type of variety is that which is required in the environment.

Ashby (1956) used the simple example of a press photographer to demonstrate the concept of requisite variety: “A press photographer would deal with twenty subjects that are (for exposure and distance) distinct, then his camera must obviously be capable of at least twenty distinct settings if all the negatives are to be brought to a uniform density and sharpness” (p. 212-213). This example is simple but the law of requisite variety can also be applied to large, more complex systems.

Requisite variety in scenarios. One function of scenario planning is to provide organizations with the required or requisite variety to cope with the external forces of the business environment. These forces can be multiple and from differing domains, for example, societal, technological, economic, environmental, and political are all environmental domains that contain interrelated forces influencing organizations (Mintzberg, 1994). Scenarios can then be used to “windtunnel” (van der Heijden, 1997, p. 57) the organization itself, and consider possible actions in a considerable number of plausible yet challenging situations. An organization with requisite variety is an organization that has considered many plausible futures and how it might adapt and change to cope with each different environment. An organization with requisite variety is an organization that is relatively prepared for a number of plausible options.

Scenarios allow organization decision makers to think through decisions they might make in the future and consider their possible implications. Because of the imaginary capacity of the stories themselves, an aim of the stories is to provoke managers and executives to think what is considered unthinkable, and to explore the events thought not possible (Wack, 1985). In short, scenario stories help organizations develop preparedness for a variety of plausible future environments, thus expanding the adaptability of the organization.

Implications for HRD Professionals

This article has 3 key implications for HRD professionals. First, this article provides a summary of key scenario planning concepts for HRD professionals. Second, it identifies scenario planning as a development and change intervention. The implications of this include the requirement for HRD professionals to be familiar with and knowledgeable about scenario planning practices. Finally, this article has examined the theoretical and conceptual foundations of scenario planning as a change intervention. Based on Van de Ven and Poole’s (1995) work, this article has illustrated a teleological set of assumptions that underpin scenario planning interventions and introduced the further concepts of autopoiesis and requisite variety. Conceptually, the case has been made illustrating how scenarios can generate these concepts. However, these concepts are on an abstract level and are difficult to research. Therefore, the object of this article has been to describe the fundamental assumptions that often precede and accompany an engagement in scenario exercises.
While few concrete conclusions can be made at this point, it seems that an important one can: by virtue of its positioning as a development and change intervention and also by its apparent foundation in system theory, scenario planning is within the domain of HRD professionals and therefore HRD professionals should be developing their knowledge and expertise about the phenomenon. Further, an opportunity exists for HRD professionals to research and develop their role in a strategic process that is of increasing importance in today’s organizations.

Online and Face-to-Face Training: A Cost Matrix

Sharon Jeffcoat Bartley
Jennifer H. Golek
The University of Tennessee

Online instruction gains an increasing presence due to associated benefits, including the ability to disregard geographical and time constraints, and the belief that online training is more cost efficient. This paper provides a discussion of issues to be faced by HRD professionals who intend to move the training environment online in response to current business and academic environments, and provides a matrix to compare costs of online training with traditional training mediums.

Keywords: Online training, Face-to-face Training, Cost Matrix

The advent of the Internet and the widespread adoption of advanced technological measures have led to a new emphasis on online education both in the academic and business worlds by providing unique alternatives for reaching larger audiences than ever before possible. In the academic world, universities now have the ability to provide distance learning opportunities through online classes for students—traditional or non-traditional, full-time or part-time, and international—who perhaps have had limited access to advanced educational opportunities. Online education is especially valuable to those students who juggle demanding work, familial and social schedules that necessitate access to learning in special forms. The idea of online training becomes valuable to the business world as well as trainers also face situations with adult learners who may experience similar constraints especially those of time and geographical distance.

Statement of Problem

The current academic and business environments in the global economy view the implementation of online education and training programs as a necessary avenue for training and implementing programs across the global network. However, the rapid adoption of online education and training has created a void in the literature. Those few studies published to date primarily compare online training to tradition training rather than evaluating the ability of an online training course to meet its predetermined goals (Newton et al, 2002). A study completed by Aragon et al (2002) evaluated learning in the online and “traditional” classroom, and found no significant differences between the methodologies. Given the lack of conclusive research concerning the effectiveness of online training, cost comparison factors may serve as the primary criterion to determine which methodology to use. The question to the academician and to the HRD business professional however becomes how to determine the cost effectiveness of training programs offered online when compared piecewise to the traditional training medium. The cost matrix (see Figure 1) provided in this paper offers the HRD professional a tool or mechanism to compare the costs of training offered online to that of training offered face-to-face in a more traditional setting.

Theoretical Framework

History of Distance Learning

Using distance learning to further educational goals is not a new concept. Late in the nineteenth century, the American public became involved with correspondence education through the postal system. Distance learning eventually evolved with technology through the introduction of radio programming, then local television such as PBS, and eventually to telephone- and video-based courses. In recent years, the availability of Internet access and widespread adoption of affordable personal computers has made online training the largest sector of distance learning (Evans & Haase, 2001). In the early nineteen-nineties, online learning was limited to a small number of expensive electronic classrooms owned and operated by large universities and businesses, but today the technology is pervasive and available to large sections of the public (Kilby, 2001).

The advent of the Internet has had a profound effect on business, forcing the evolution of everything from ordering systems to selling platforms. A similar impact is expected for distance learning. E-businesses are discovering that e-learning has great growth potential, and that this directly equates to increased profits (Kilby,
These impending changes require a reconceptualization of how training courses are designed (Lairson, 1999). The evolution of training had begun, but much still needs to be considered as attitudes and technologies continue to change. These developments are further necessitated as the clientele for training changes. An increased emphasis on globalisation, development of increasingly sophisticated communication systems, the need for lifelong learning, and the growth of the earner-learner environment drives these changes. In fact, Price Waterhouse Coopers estimates that approximately seventy percent of large companies cite the lack of trained employees as a major barrier for future growth (Clarke & Hermens, 2001).

The technological infrastructure necessary for online learning is firmly established through recent rapid improvements in bandwidth, the pervasiveness of computers in the household, improved technological standards, the permeation of computers into schools and businesses, and the adaptive nature of technology (Clarke & Hermens, 2001). The majority of moderate and large sized corporations have extensive information technology groups to manage and develop their systems; therefore, adequate resources should exist to form project development groups for extended online training systems. However, if businesses and their HRD professionals fail to recognize the large potential commitment of time and resources to the development, updating and maintenance of these systems, a significant financial and resource drain could be placed on the organization.

Business trainers are primarily faced with training adults who come with many familial and social commitments, and who need the ability to learn without geographic boundaries. Further, these older learners are different from the traditional student in that they are continuous, informal, adaptive, and motivated learners who seek the ability to stay competitive in their lives and also for career advancement (Evans & Haase, 2001).

Models of Online Learning

The face-to-face classroom environment has many established models for optimizing the learning process, but online training currently lacks models upon which to structure its processes. Typically, a common misconception in the application of existing pedagogies occurs when traditional classroom models are merely adapted into the online medium (Shaw, 2001). The main barriers associated with the online learning environment lie not with the technologies currently available, but with the pedagogical assumptions and conceptions underlying their use. The development of innovative and effective methods made possible by advanced technologies are constricted by the narrow perspective of online training held by many who think only of static online tutorials and online books (Kilby, 2001). This greatly hampers the development of innovative and effective methods for completing training online. Given the wide availability of technology in the marketplace, both at learners’ residences and workplaces, the options are innumerable. Many practitioners fail to reframe their conceptions of learning and teaching in the online environment, leading to extremely damaging consequences for the students involved in the training. Another problem is the common juxtaposition of pedagogy and technology. Although the natural tendency is to separate them, pedagogy and technology should be considered simultaneously as one designs and develops the online learning experience (Jackson & Anagnostopoulou, 2001).

Online learning is a subset of a collection of learning tools collectively referred to as flexible learning. To date two primary pedagogies have been associated with these learning environments: student-centered learning and experiential learning. Student-centered involves negotiation between the learner and the instructor as to how learning proceeds in the “classroom.” Experiential learning allows the learner to exhibit a degree of control over the situation and determines the degree by which he or she becomes involved. Further, experiential learning has a degree of correspondence between the learning environment and the real environment where daily work is conducted (Thorpe, 2000).

The ILDIC model (Integration Learning Design in Multimedia CD-ROM) identifies many required components of e-pedagogy and suggests that the e-learning pedagogue needs to include conventional pedagogy, online awareness, the ability to plan and manage events online, comprehension of the current and future potential of technology, and the ability to interweave technology into the training design (Good, 2001). Taylor (2002) asserts that the following ideas also need to be considered in the implementation of online programs: using online learning efficiently, team-based efforts, additions to existing classroom presentations, both synchronous and asynchronous programs, the trainer learning curve, cost, using multimedia to augment presentations, reaching distance learners, assessing learner needs, ability to access course material, ability to distribute course information, ability to give and receive feedback, class management techniques, techniques to measure results, and procedures to update material. In order to successfully meet these requirements, one needs to devise an infrastructure to support distance learning needs and to orient distance learning programs to traditional programs (Evans & Haase, 2001).

Wild et al (2002) discusses the development of an e-learning value chain within organizations which includes the following steps: assessing and preparing organizational readiness; designing appropriate content; designing appropriate presentations; implementing e-learning. Reducing the training process to a logical value chain provides additional methodologies that may help in the justification of training programs. Presentation of a well thought out
and documented plan is far more likely to gain support than less structured ideas. Further, these steps combined with one of the currently accepted models can constitute a comprehensive and effective e-learning program. The currently accepted models include CBT on the Web (popular for occupational training), synchronous learning and the electronic classroom (Whitlock, 2001).

Issues for Consideration in Comparisons of Online Training with Face-to-Face Training

Benefits of Online Training

The many benefits associated with online training are well discussed in the literature. First and foremost is the current economic situation, which necessitates the need for companies to economize. With more than fifty million workers to re-train, any discovery leading to decreased expenses is extremely well received, and distance training programs have already proved their ability to save millions of dollars each year (Evan & Haase, 2001). In today’s rapidly changing work environment, the need for just-in-time training, similar to the many other just-in-time functions such as production, is essential (Wild, 2002). Economic and time benefits achieved from training are essential in the current environment; therefore the creation strategic alliances for the training function have become extremely popular. Businesses and educational institutions have begun to join together to share in the responsibility of building a globally competitive work force (Vincent & Ross, 2001). Firms seek to position themselves to be the most competitive in the new international marketplace, and e-learning is a way to empower such a workforce with the skills and knowledge necessary to create those advantages (Wild, 2002). In order to actually achieve these goals, companies must revise their perception of training as an unredeemable cost to the company and view expenditures to develop human potential as an investment with unlimited potential returns (Vincent & Ross, 2001).

The returns of training, whether traditional or online, include improved performance and attitudes from employees necessary to achieve organizational growth (Kilby, 2001). Online training allows learners to work at their own pace to complete required technical and work related training or complete full degree or certification programs (Taylor, 2002). Online training and education allows learners who would be otherwise denied the opportunity to increase their personal knowledge and abilities, the ability to reach the tools to empower themselves (Furnell, 1998). Further, the use of online and distance training has removed the need to travel in order to join together to learn and study (Cornford & Pollock, 2003). This results in both significant cost reduction and also reduction in lost time and opportunity from having employees away from their responsibilities for extended periods of time.

Evans and Haase (2001) discuss ten benefits of online training that are readily available to companies upon the implementation of these new and innovative programs. These benefits include increases in the impact of the money invested in training programs, significantly reduced employee travel cost and time, the ability to train more people, more frequently and in shorter sessions that are easier to coordinate and schedule. Further, online training is scaleable because it offers the ability to add instructors and students as needed, with fewer changes and re-developments. Trainers now have the ability to deliver programs with a consistent message in a way that can quickly be disseminated company wide, with real-time updates and information access. With online training, the concepts for group learning and collaborative problem solving can be delivered to networked sites, including the employee’s home.

Online training is learner-centered, which allows learners more control with course pacing, sequencing and styles. The benefits of online training can be achieved through the development of corporate universities or through the use of strategic alliances between technology and media companies, learning and research universities and newly formed and developed e-learning companies (Clarke & Hermens, 2001).

Negatives Associated with Online Training

The integration of online training can have a large impact on the learning and performance of the employees involved in the company processes. Although online learning is becoming mainstream in many organizations, many doubt that it is adequately meeting the needs of either the learner or the organization (Kilby, 2001). There is a continued idea that the online training outputs should only be compared to those that have been achieved previously by the “traditional” training functions. The focus should be shifted to include the evaluation of whether or not online training is meeting the goals that were set out during the planning stage of the training (Jackson & Anagnostopoulou, 2001).

In the HRD function, the important factors focus on the evaluation of learning and performance achieved by these programs. Without such evaluation, one faces the very real possibility that the company will cease to place support in favor of training programs (Jakupec, 2000). Further difficulties encountered in the use of online training programs are faced in the evaluation stage of the program. To date, there has been the inclusion of some assessment, but few formal training evaluation processes have been implemented (Kilby, 2001). In order to justify the results of the training programs, better tools are needed to evaluate the results of training.
Little discussion can be found in the literature about the financial constraints of the online training medium. Although Swanson (2001) discussed assessment of financial benefits of the HRD function as well as proposed how to show the cost and benefit of a training program, others have focused little attention on the comparison of costs between different program options. Phillips (1997) proposed that costing methods should determine “fully loaded costs” – all costs identified and linked to design, development and implementation of a specific program. A case study presented by Phillips (1997) provided a cost matrix for a fully loaded program, but again the tool stopped short of comparison between different programs.

Some people fear that too much emphasis is placed on the technology of online courses, often at the expense of the learning and design process. The experience that a learner has in the online classroom is determined largely by the way new learning technologies are presented. The technology must be able to deal with a multitude of learning theories and learning styles (Whitlock, 2001). Vincent and Ross (2001) discuss the directed use of learning styles in the online classroom. They suggest allowing the students to determine their learning styles individually using many readily available online tools. The results of these exercises can be presented to the trainer and used to assist in assessing and meeting the unique needs of the adult learner. Vincent and Ross (2001) present a variety of Internet sites where tools for evaluating learning styles, personality types and multiple intelligences are freely available.

Design Issues concerning Online Training

Although instructional design has always been an important aspect of the HRD job function, the implementation of online learning programs necessitates the need for particular attention to be paid to the design process. A more global view of design must be adopted if online training is to achieve its potential to be adaptable to a multitude of learning environments (multi-national, multi-lingual and international collaborations), reduce travel time, and reduce overall cost to the learning organization (Kilby, 2001). Design methods ensure that a variety of resources and activities are included in the course and that the amount of technology used is not overwhelming to the student (Shaw, 2001). An equitable match should exist between the materials and medium being used in the online training environment, and assurances made that all of the technology is readily available to the learners (Evans & Haase, 2001). Instructional designers must have a concrete understanding of the theory behind their learning models in order to be effective in the online environment (Good, 2001). In the development of online courses the majority of the focus seems to be given to the concrete aspect of the course, with little thought given to the complete integration of e-mail, discussion groups and chat functions. Without the complete integration of such functions, the learner in the online environment can become lost in the virtual world, without recourse in times of need (Kilby, 2001).

Companies reaching the time where employee skills require constant updating to meet changing demands may rush to implement online training courses without the required degree of planning and research jeopardizing the many benefits associated with adequately planned online training (Newton et al, 2002). A dull, unrewarding course taught in the classroom environment becomes even duller and less rewarding in the online environment (Kilby, 2001). Just like in the “traditional” training environment, the users of online learning seek a satisfying learning experience and the perception that they have gained knowledge and skills. By its nature, online training occurs without extensive interaction between members of the class and the trainer, which can lead to an anti-social environment where learners feel isolated (Kilby, 2001). Swanson and Holton (2001) discuss the importance of social learning as part of the learning process in learning organizations. The new online courses must be developed from a learner-centered model, with instruction that begins at the learner’s level of current understanding with his/her needs driving the training process.

In order to design effective online training programs, HRD professionals must negotiate the social, economic and political policies that govern and influence the training procedures in place at the company. The HRD professional must effectively and efficiently provide appropriate learning materials to the learners as well as provide for practice for realistic work situations (simulations, for example). A usable mechanism to answer questions and foster discussions among learners must be available as well as an assessment tool(s) to assess learning both effectively and accurately. Trainers and learners must have the ability to access quick and accurate technical support services. Many of these design and learning considerations can be achieved through the use of simple chat and e-mail functions that are readily available with appropriate technology. As an example, even with very limited programming skills, one can create interactive applets that reside on the Internet or on one’s personal computer to facilitate the learning of new ideas. However these innovation elements must be incorporated during the design phase, not added as an afterthought.

Another new aspect of instructional design to be implemented is the aspect of online security. To date, significant consideration has not been given to the use of security features for adequate securing of private information. Furnell et al (1998) discuss the security framework that should be considered in the development of these new courses. They consider the online course as a five-stage model: enrollment, study, suspension, completion, and termination. Each of these stages has its own idiosyncrasies and poses potential problems that need
to be clearly evaluated prior to the distribution of online modules for many reasons, but primarily for the protection of proprietary information. The issue of security in the online environment must remain a primary concern of the HRD professional as the necessary learning materials are developed and distributed.

How This Research Contributes to New Knowledge in HRD

This discussion has evaluated issues to be faced by the HRD professional who intends to move the training environment online in response to the current business and academic environments. Corporations are in precarious economic positions at the current time with high emphasis placed on cost reductions in any manner possible. For this reason, the prospect of online training becomes a lucrative option, given that it does not require extensive travel costs or time by large numbers of employees. It is especially effective for those employees in small, remote office locations (Taylor, 2002). Online training has the benefits of scalability, easy access and timeliness, all of which are extremely desirable in today's economic climate (Clarke & Hermens, 2001). Centralization of the training options creates new demands for modules that can affect the interests of learners in many different geographic locations and diverse international areas, requiring new forms of collaboration between the stakeholders in the training process and new ways for those in diverse geographic locations to share this information (Jakupec, 2000). The challenge is to transform a simple printed lesson transmitted via computer technology into an exciting online classroom with powerful interactive features for the learner. The HRD professional should recognize the opportunity afforded by online instruction to implement these new technologies so that the online environment is a rich and value-added teaching methodology.

Online instruction is gaining an increasing presence because of its reported benefits, its ability to consolidate training across geographical and time constraints, and the claim by many that online training is cost efficient. The HRD professional needs a tool with which to justify the development costs of online training. The following metric may prove helpful for making such determinations. This tool is intended to aid the HRD professional in many different ways. First, if those responsible for training wish to proceed with the implementation of online training systems, they will likely need a tool with which to justify the potential costs associated with such a program. Secondly, if those responsible for training are under pressure to implement new online training programs, this tool may also provide an avenue to argue the point for necessary resources. Overall, the need for the financial justification of the conversion to online training programs is necessary. The cost matrix below (Figure 1) provides a methodology to make cost comparisons between online and face-to-face training programs, allowing HRD professionals to begin discussion regarding costs associated with online training programs in their organizations.

Designing an Assessment Model for Implementing a Quality Online Degree Program

Rita L. Dobbs
W. Clayton Allen
The University of Texas at Tyler

This paper will include critical information for administrators and faculty in higher education for developing an assessment model for an online degree program. Determining the assessment process for the program before offering courses will ensure a smooth transition into the online environment so that faculty and administrators will know that the outcomes for the program are being addressed and evaluated.

Keywords: Assessment, Evaluation, Online degrees and Value-added

The purpose of this paper is to provide an assessment model that has been designed and applied to a higher education online degree program. Too many times courses and/or programs are introduced into the online format without formal evaluation plans outlined to determine if the program reflects the aims and purposes of the higher education institution or the department. To be successful, the outcomes of the program, and the process for collecting them, must be established before the first course is offered. Without the assessment model in place, “knee-jerk” reactions will drive the program. Without the outcomes clearly delineated before the program is put in place, quality results cannot be obtained.

Problem Statement

The problem in this study was to develop an assessment model that could be utilized in an online degree in higher education.

Theoretical Framework

Accountability is the norm for all areas of work and education today, and this is especially true for higher education. However, designing an effective accountability system that will truly measure what needs to be measured so that reliable results will be provided is often times difficult to execute. Assessment projects are often times handicapped because the person, institution or entity does not have a clear picture of what truly needs to be assessed (Astin, 1993). Many times organizations keep performing the same kinds of assessments even though the rationale for the assessment has never been established, validated, or evaluated.

When establishing an online degree program, it is imperative that the department and the faculty identify the outcomes, or core values, that a student must obtain as a result of completing the required curriculum. It is not enough to simply give lip service to “outcome assessments” (Astin, 1993). Bothel (2002) identified that “one of the most significant challenges in online course delivery is the testing and assessment component” (p. 99). He further said that the effectiveness of the assessment process is challenged by the unrealistic appraisal of the potential of online education. He stated that distance education skills bias and the limitations of online media also contribute to faulty evaluation methods for online courses. (Bothel, 2002). To ensure that learning outcomes are appropriate to the rigor and breadth of the degree or certificate awarded and that faculty and support staff are appropriately selected and properly utilized, administrators must identify exactly what assessment procedures will be used, how the program will be evaluated, and how the curriculum will be evaluated.

Offering online courses and evaluating them is only one of the pieces to a quality online degree program. A vehicle must be in place to provide the support services that are critical for student success in the online environment. The University of Texas System created the University of Texas Telecampus (UTTC) to provide the support services for students, faculty, and the components that comprise the UT System. The goal of the UT TeleCampus in placing programs online was the creation of collaborative degrees, utilizing the best resources in faculty expertise from all campuses (UT TeleCampus).

The Department of Technology at The University of Texas at Tyler (UTT) followed this model when creating the Master of Science Degree in Technology/HRD option UTTC offers support to the components of the UT System in instructional design and course development, as well as faculty training in bringing courses from the...
lecture-based classroom to the Web-based classroom. Technological support, policy, marketing research and external communications are among the other essential support services provided to the campus from UTTC; however, the assessment of the program and/or courses is left to the discretion of the component awarding the degree (UT TeleCampus).

**Research Questions**

This study addressed three research questions:

1. What comprises an assessment model to evaluate a degree program as perceived by faculty and the HRD Academic Advisory Council?
2. How do students rate the quality of the course?
3. How do students assess the services and technical components of the course?

**Overview**

The Department of Technology, in support of the mission of UTT, is a student-centered department committed to conducting multi-option programs pertinent to today's changing workforce needs. With the creation of the on-campus Master of Science in Technology/HRD option four years ago, the explosion of the enrollment in this newly created program indicated the need to provide the same degree in the online environment. In the spring of 2002, the Department submitted a proposal to UTTC to develop the degree for the online environment over a three-year period. In the proposed third year of the phase-in program, additional courses that enhance the HRD option would allow students to complete the State Board of Educator Certification (SBEC) Trade and Industrial (T & I) alternative teacher certification to help address the critical shortage of teachers in this discipline.

The Trade and Industrial certification prepares Texas teachers to instruct at the secondary level in Texas public schools, to prepare young people to manage the dual roles of family member and wage earner, to enable them to gain entry-level employment in a high-skill, high-wage job and/or to continue their education. T&I certified teachers can teach in the areas of communications and media, construction maintenance, electronics, industrial and manufacturing, metal technology, personal and protective service, transportation, and career preparation systems. The T&I certification can be part of the MS in Technology/HRD degree or students can elect to only pursue the certification. The coursework necessary for the certification process also provides valuable teaching methodologies that can prove beneficial to any person desiring to go into the training and development field.

The online program will be assessed throughout the three-year period through formative and summative measures. Astin’s model for assessment, I-E-O, (1993) served as the basis for the assessment model that was to serve in the ongoing evaluation of the courses and the degree program. The Chair and the faculty of the Department identified the targeted outcomes for the program after the proposal for the online degree program was accepted by UTTC. Once the outcomes were decided, the HRD Academic Advisory Council was created to provide a framework for implementing the degree program and then for closing the assessment loop at the end of each year of course offerings by reviewing the faculty and student course assessments and support service assessments. The HRD Academic Advisory Council will determine recommendations for improvements based upon first year assessment data when it meets in the spring of 2004. Recommendations will also be entertained from the Departmental Advisory Committee based upon its end-of-year curriculum review. These recommendations will also feed into the HRD Academic Advisory Council for review and program changes/modifications. The model takes into consideration all aspects of the on campus program and the online program (See Figure 1).

Summary of Program

The Master of Science degree in Technology with the Human Resource Development (HRD) non-thesis option is a 36 semester credit hour degree program requiring two three semester credit hour core courses, Research Techniques and History and Philosophy of Technology/HRD, 18 semester hours in the area of concentration of HRD and 12 semester hours of support courses, which can be taken from the other UT components or may include the T&I certification courses. During the last semester of the program, the candidate must successfully complete a written and/or oral comprehensive examination on the coursework of the degree plan.

Students must meet the admission requirements of the UTT graduate school as outlined in the current catalog. Students completing the certification courses must meet the requirements of the State Board of Educator Certification for T&I teachers. Current guidelines for this program can be accessed at the web site of http://www.sbec.state.tx.us/certreq/certreq.htm

The online Master of Science in Technology/HRD option utilizes the resources of UTT, other component institutions, and UTTC. The Department of Technology developed three courses in year one of the online program, three courses in year two of the program and will develop three courses in the final year of the program. UTT utilizes existing component online UTTC courses to round out the degree requirements in the major and support areas.

Assessment of Program

The program is administered by The Department of Technology, and UTT is the degree granting institution as authorized by the Texas Higher Education Coordinating Board. To determine the success of the program and to ascertain if the students exiting the program feel that their education has been value-added, it was necessary for the Department to develop a formal assessment model for the program. Carneval (2001) asserted that administrators do not rely on assessment models to evaluate their online programs. Bothel (2002) stated that online education continues to grow without adequate assessment programs in place.
Because the research is limited in the area of online program assessment, the Department was committed to developing an assessment model that could be administered throughout the three year phase-in process for the degree program and that could be effectively used in an ongoing basis after the program was fully operational. “In essence, the outcomes refer to those aspects of the students’ development that the institution either does influence or attempts to influence through its education or practice” (Bothel, 2002, p. 38). In order to develop the assessment model and to determine the formative and summative evaluations, the following areas were identified:

**Input**

- Program assessment and improvement is based upon the recommendations of the HRD Academic Advisory Council which consists of the faculty members from the Department of Technology developing and teaching courses for the online environment, members from UTTC, and faculty members from the other disciplines on campus who have online degree programs. Currently, the Council consists of 12 individuals.

- Each course that is developed for the online program is sent to an independent evaluator prior to implementation who checks the course for rigorous content, resources, and links to outside information. If the evaluator finds a problem with the course, the faculty member makes the recommended changes before the course is ever placed in the online environment.

- At the annual Advisory meeting, recommendations based upon faculty assessment, student assessment, student service assessment, and Departmental Advisory Committee input will be presented. Decisions for program and course improvement will be determined at that time.

**Environment**

*Course Assessment:*

- When the course is first taught, the faculty member developing and teaching the course, conducts a continuous evaluation of course content, comprehension, and logistics problems that occur.

- Standardized course assessment results will be reviewed. This provides consistency in evaluation of all the courses being offered for the degree.

- Assessment of student evaluation regarding the quality of the course will be conducted.

- An assessment of support services provided through the UTTC will be conducted to determine if students are being provided the services that they need to be successful in the online environment.

**Outcomes**

- Statistical analysis will be conducted to determine the outcomes of the faculty course assessment, the student course assessment, and the student support services assessment.

- Recommendations from the Departmental Advisory Committee, based upon the Departmental Assessment Model, will be reviewed to keep the on-campus program consistent with the online program. These recommendations will be submitted to the HRD Academic Advisory Council.

**Conclusions and Contributions to HRD:**

The purpose of this paper was to provide an assessment model that can be used to provide formative and summative evaluations of an online degree program. Too many times online courses are introduced without formal evaluation studies conducted to determine if the courses are successful or if students leave the institution with value-added to their education. However, designing an effective accountability system that will truly measure what needs to be measured so that reliable results will be provided is often times difficult to perform. Assessment projects are often
times handicapped because the person, institution or entity does not have a clear picture of what truly needs to be assessed (Astin, 1993).

Based upon the faculty evaluation process, the three faculty members who developed courses will be making their recommendations for changes/improvements to the HRD Academic Advisory Council in the spring of 2004. Those changes, when approved by the Council, will become part of the revision process before the courses are offered for the second time in the spring of 2005. Based upon student course evaluations, 84% of the students strongly agreed that they would recommend this online course to their peers. 90% agreed that the courses were well organized and clearly presented. These results will also be tabulated into table format and presented to the Advisory Council for their recommendations. 89% of the students provided positive comments on the student support services questionnaire. 84% indicated that the course navigation was simple and user-friendly. 71% reported that they believed the online course to be comparable or better than the on campus courses and 84% stated that their overall experience with online education was positive.

With the formative assessment process in place for the first three courses, the faculty and Chair of the Department of Technology will have quantitative results to share with the HRD Academic Advisory Council when it meets in the spring semester of 2004. Based upon the faculty evaluations, the student course evaluations, and the student support services evaluation, and considering the recommendations for curriculum improvement from the Technology Advisory Committee, the assessment model is in place and functioning to provide constructive improvement and refinement for the MS in Technology/HRD option.

The Department of Technology has developed a model for assessing an online degree program based upon the model published and validated by Astin (1993). The assessments for the first three courses are currently being analyzed and the results will be reported to the HRD Academic Advisory Council in the spring of 2005.

Organizational Politics and Culture: An Essential Attribute of the Mentoring Experience for Women Faculty

Sharon K. Gibson
University of St. Thomas

This paper reports on the results of a study on the experiences of being mentored for women faculty that identified the political climate of the organization as an essential attribute influencing their mentoring experiences. The findings identified various aspects of organizational culture and work-life considerations that affected the mentoring that was provided to women faculty. Increased involvement of HRD in the academic organizational context is suggested.

Keywords: Mentoring, Organizational Culture, Women Faculty

Human Resource Development (HRD) is engaged in unleashing human expertise for the purpose of improving individual and organizational performance. Its role in facilitating culture change in organizations is well-documented (Cummings & Worley, 2000; Swanson & Holton, 2001). In the academic environment, however, there have been reports of continued marginalization of women faculty and the culture of academia has been described as less than hospitable to women as they attempt to navigate the various aspects of their positions and environments (Glazer-Raymo, 1999; Hamrick, 1998; Hopkins, 1999). Women faculty frequently view themselves as ‘outsiders’, feeling both isolated and constrained by the existing structure of academia or due to outside responsibilities. There is often no one readily available to assist women faculty in gaining access to the informational networks and organizational systems that are required for success (Watkins, Gillaspie, & Bullard, 1996).

In addition, junior women believe that family-work conflicts are likely to have an impact on their careers (Aisenberg & Harrington, 1988; “A Study on the Status of Women Faculty”, 1999). University work-life programs are described as lagging those in business and industry, which are seen as having a role in supporting the objectives of the organization (Rios & Longnion, 2000). “In sum, cultural, attitudinal, and structural constraints inhibit women’s progress” (Glazer-Raymo, 1999, p. 198).

One intervention that has been suggested to enhance socialization, orientation, and career progress of faculty as well as equity for women faculty is the establishment of mentoring relationships (Brennan, 2000; Jackson & Simpson, 1994; Smith, Smith, & Markham, 2000). In addition, it has been proposed that, since women’s learning and development may be more rooted in relationships (Gilligan, 1982), mentoring is more beneficial for women, as they have the capacities to use these relationships to better advantage (Johnsrud, 1991). This paper reports on the results of a phenomenological study of the experiences of being mentored for women faculty that identified the political climate of the organization as an essential attribute influencing the mentoring experience. Implications for human resource developers working in academic environments are explored.

Theoretical Framework

Phenomenological inquiry requires that pre-understandings held by the researcher about the phenomenon under investigation be bracketed (i.e., brought into conscious awareness and then set aside), so that the researcher can be fully present to the phenomenon as it reveals itself. Therefore, recognizing that social learning theory informed my understanding of the mentoring phenomenon, I needed to explicitly bracket this prior knowledge and understanding when I embarked on this study. However, it is important to note that the lens of this theory is one that I have found relevant and useful in studying and understanding this phenomenon.

Social learning (cognitive) theory identifies learning as a reciprocal interplay between the person, the environment, and behavior (Bandura, 1977, 1986). Bandura (1986) represented this model as a triangle with each factor bi-directionally influencing the others. “In this model of reciprocal determinism … behavior, cognitive and other personal factors, and environmental influences all operate interactively as determinants of each other” (p. 23). However, reciprocality does not imply symmetry in the influences that the various factors have on each other. As Bandura asserts, “The relative influence exerted by the three sets of interacting factors will vary for different activities, different individuals, and different circumstances. When environmental conditions exercise powerful constraints on behavior, they emerge as the overriding determinants” (1986, p. 24).
In social learning theory, learning is viewed as being firmly situated in its social context. Indeed, environmental factors are noted to be key determinants of learning and behavior. In addition, Bandura’s (1977, 1986) description of the components of observational learning highlights the processes necessary for modeling, and as such, provides insights into the factors that influence mentoring.

Description of Methodology

Phenomenology is an interpretive research methodology that is aimed at gaining an in-depth understanding of the nature and meaning of lived experience (van Manen, 1997). Four major philosophical concepts of phenomenology, as founded by Edmund Husserl (1959-1938) are important in phenomenology as a research methodology—intentionality, lifeworld, intersubjectivity, and embodied consciousness (for a description of these philosophical concepts, see Gibson & Hanes, 2003).

In applying the philosophical concepts of phenomenology to research, investigators must go to the lifeworld (the natural world) and study the way in which humans, who are in their natural attitude, experience particular phenomena. In conducting this study, I employed the lifeworld research concepts of openness, encounter, immediacy, uniqueness, and meaning (Dahlberg & Drew, 1997), in an attempt to remain as open as possible to the phenomenon of mentoring from the perspective of the participants who had experienced being mentored. Openness is defined as a “perspective free of unexamined assumptions” (Dalhberg & Drew, 1997, p. 305). Throughout the research process, phenomenologists continually strive for openness in order to allow the phenomenon to present itself as it is. In this methodology, the researcher's role is critical in uncovering the essences of a particular phenomenon. It is through actions taken by the researcher to ensure openness that objectivity is gained in phenomenological research (Dahlberg & Drew, 1997).

Methods

The results reported here are part of a broader phenomenological study that looked overall at the experience of being mentored for women faculty across the variety of mentoring that they had experienced in their academic careers—formal or informal, with a faculty member or administrator, and with male or female mentors at the same or varying ranks—in an attempt to gain an in-depth understanding of the essential nature of this experience. Nine women faculty members who stated that they had been mentored were selected for this study. The key criterion in the choice of these participants was their assertion that they had been or were currently being mentored as a faculty member. A description of the participants is listed in Table 1.

* Pseudonyms were used to ensure confidentiality of responses

The research question for this study was as follows: What is the experience of being mentored like for women faculty? In-depth conversational interviewing was the primary method used to gather the rich descriptions of mentoring from each faculty member. Each interview lasted from 90 to 120 minutes. Questions were generated that focused specifically on the faculty members’ concrete experiences of being mentored, staying as close as possible to the experience as it was lived by the participants.

As noted earlier, phenomenological research methodology requires that the researcher employ a number of strategies to remain truly open to the phenomenon being explored and to bring to conscious awareness any
assumptions or biases and setting them aside (‘bracketing’) so as to allow the phenomenon to present itself. This was done both through a journaling process and by applying lifeworld research paradigm concepts designed to facilitate openness throughout the research process. The tapes of the interviews with each participant were transcribed and these transcripts served as the text for the theme analysis. The text was analyzed using the selective reading approach (van Manen, 1997), which involved looking for phrases or statements that seemed to be essential or revealing about the phenomenon being described. A tripartite structure of analysis—moving from the whole to the parts and back to the whole of the interview text—was employed to ensure full understanding. The identification and revision of themes continued through many iterations with each successive iteration being supported by the actual words of the participants.

This research process led to the identification of five essential themes of the experience of being mentored for women faculty: (1) Having someone who truly cares and acts in one’s best interest; (2) A feeling of connection; (3) Being affirmed of one’s worth; (4) Not being alone; and (5) Politics are part of one’s experience. This article specifically discusses the theme “Politics are part of one’s experience” which explicates one of the essential attributes of the mentoring experience for women faculty. Two sub-themes, “A culture committed to one’s success fostered mentoring” and “A gap was seen in addressing issues specific to women in academia”, are described that assist in explicating this essential theme. Following the description of findings, implications for human resource developers are discussed.

Politics are Part of One’s Experience

A Culture Committed to One’s Success Fostered Mentoring

Women faculty described political and departmental cultures that affected how mentoring was provided for themselves and others. These women faculty had experiences in a variety of academic environments, which ranged from being unsupportive and, in some cases, detrimental to the woman faculty member’s success to, at the other end of the spectrum, being described as a mentoring culture where senior faculty were committed to the success of junior faculty. These various departmental cultures had a large impact on both the mentoring that was available to protégés and on what protégés saw as the possibilities for achievement within their academic environments. Ellen described feeling very lucky to be in a department that had what she saw as a mentoring culture.

It is essentially stated by faculty, if not the department head, that we’re here to support these people and if we don’t do a good job in the mentoring committee, how else are they going to know what they have to do? So that was very much part of the department culture and perhaps brought on by that policy of having a mentor committee who’s responsible for them….We want to show this person’s very best side to the Dean and to the rest of the community….it’s the department’s responsibility to lay that stuff all out and give context. I’ve just been so lucky. I’ll tell you. Really lucky. {Ellen}

She described how a mentor committee was assigned to each faculty member, to assist them in achieving the next position level. This mentor committee assisted in her promotion to full professor.

In our department ... we have a mentor committee. And that mentor committee meets with you, sometimes twice a year, reviews your vitae, your annual report, your goals, whatever you ask them to review and they mentor you….So, to help me gain my promotion to full professor, I had three full professors, two in the department and one outside the department….And I met with them probably once a year to figure out if I’m on track. {Ellen}

Lillian also identified a mentoring culture in her department, in that her colleagues were very supportive when she decided to begin a family.

I think that there’s some acknowledgement that as an assistant professor who has a young child or is about to have a young child, there are some things that they’re able to do to help out….So there’s sort of this general acknowledgement that we can work some things out….It was an issue of how are we going to do this, not whether we were going to do it. {Lillian}

She further described the overall tenor of the department in terms of dealing with these types of work-life issues.

I guess it just seemed to me to be a way to try to help me get to where I needed to be in both my academic career and in my personal life and so the mentoring thing, I think, in my mind, is in both of those arenas. And it’s not simply a career mentoring kind of process because at least for me with having now two kids, trying to figure out how to juggle those things is always a struggle and thinking about well, how do I
approach my career so that I have some time for home and how do I approach things going on at home so I still have time for my career and the willingness of this individual in particular to help me out with those kinds of things...And I just see that as a way for me to try to maintain both some kind of academic momentum and some kind of family momentum...I see those things as going together. And so that kind of mentoring has been in more of a generic, sort of, family-career arena. {Lillian}.

Lillian also discussed benefiting from having other women in the department who had been there a long time and had paved the way. These women’s experiences and their influence on the department made a substantial difference in her experience as a woman in that department.

*I think that their [senior women colleagues] experiences and their influence in the department had a fair amount to do with that feeling that I had, that this was a place that felt like it would be supportive or at least acknowledge the kinds of difficulties that you have as a person on the tenure track and with small kids. {Lillian}*

Nancy described a mentoring environment at her university that encouraged the establishment of a mentoring group for junior women faculty.

*We actually have the [specific name] club, where all the junior faculty get together ... and then they have senior faculty come in. So it’s like a little club where we have guest mentors...But I think if the environment wasn’t like that she [the woman who started it] might not have done it. If there wasn’t a mentoring environment type of thing. {Nancy}*

She also noted that the following message of support was communicated to her during her interviews for the faculty position:

*It was kind of like you’re going to be here, you’re going to be successful, we’re going to help you be successful...and all the people that I interacted with through the process, it was, we’re committed to you....We are committed to your success. {Nancy}*

Ellen described the difference between an environment in which informal mentoring occurred and one with a formal mentoring culture.

*At [name of university], I was brand-new to teaching, [I was] junior faculty. And I just simply believe that [mentor’s name] saw that as her role. That was her role. And there were four senior ... women who’d been there, full professors who’d been there several years and they were all mentors...And it was a very informal process. Here, however, it really started out as a formal process and the environment required it ...faculty are advocates for non-tenured, tenure-track faculty. That’s the difference. There is an advocacy relationship between the non-tenured and the tenured faculty. And it is our responsibility to get those tenure-track people tenured. {Ellen}*

A bad department head or a detrimental departmental culture significantly affected women faculty’s experience. Wendy recounted her experience of being assigned a ‘mentor’, whom she did not perceive as performing a mentoring role.

*That particular mentor had been given to me by my departmental head, who had issues with me even before I was hired and he was basically a conduit for him. And once the other faculty figured it out, they realized that that had to be stopped. This whole thing had to be more positive and so I got a second mentor who was very good. {Wendy}*

Ellen expressed her horror at the tenure committee process in her former institution, which reflected a culture that was not supportive, that did not work to ensure others’ success.

*So I sat in on the tenure committees there and I was just horrified at the raking over the coals; you know, “Well, she doesn’t, look at here. In this class she only got a 4.5 out of 5. And all the rest are 4.7s or 4.8s. Oh, there’s a problem there!” Holy mackerel. I mean, it’s just rip them apart and tear them up and spit them out. There was no sense of camaraderie and pretty soon you kind of get caught up in it and, “I’d better find something wrong with this person.” Because you want to show that you’re just as critical as the rest of them. Oh, what a terrible, terrible place to be. {Ellen}*

Wendy further noted that, “Politics can ruin mentoring. So people can take the mentoring system and use it as a way to get information on you.” People can be called mentors but not provide mentoring. As stated by Wendy:
I think you can subjugate the mentoring system to a spy system, an informational transfer system, where somebody isn’t truly your mentor to help you but does give information back to powers in the department. And I got myself in a situation like that. {Wendy}

Protégés perceived that, in some departments, the effort of mentoring does not get rewarded, so people then tend to focus on other priorities of the job that are recognized. As stated by Laura, “I think that the effort also gets not recognized and that’s what puts people off from trying to help in those ways, too.” Sue described that a change in department heads, who had different priorities about the importance of being mentored, may have been what triggered her being assigned different mentors.

We got a new department head in who taught this process and obviously thought about it differently to the way the department head previously had. And so he thought this was important and so thought we had to do this, and this is what needs to get done and at that point he assigned two faculty members. {Sue}

In discussing one of her mentors, Nancy noted that her mentor’s decision to set up a formal mentorship for her and other junior faculty was based on his concern that, “We’d be swimming with sharks.” She stated the following: “If you really care about the junior faculty, you tend to set it up to where there’s, if it’s not formal, at least there’s some mentor system in place” {Nancy}.

A Gap Was Seen in Addressing Issues Specific to Women in Academia

The women faculty who had been mentored described a number of gaps in areas specific to being a woman in academia, that were not addressed through an academic mentoring relationship. In some cases, male mentors were not seen as people with whom female faculty could address certain issues. The relatively low numbers of women in senior faculty positions was seen to contribute to this gap in available mentoring. Barb noted that her mentor, while being highly supportive of her career, was also aware of and acknowledged that she might have some specific concerns that were unique to her as a woman. “I think he was sensitive to issues that I might have, and some of them are, when am I going to have these babies?” {Barb}. Although Lillian felt supported by her department in her decision to have children, she was aware that this could be an issue and that other women faculty did not feel the same in other areas of the university.

Some of that decision to have children probably was influenced by the fact that I felt like I could probably do it here. Without incurring too much, I don’t know, wrath of the gods or something. Yeah, I did remember talking to this one woman who is an assistant professor in one of the engineering departments here, at a women’s faculty dinner, and one of the issues that came up at this dinner was women saying that they were basically afraid to stop the tenure clock for a year because it would signal to their male colleagues that they weren’t serious about their jobs. And that’s what this woman said, that was her impression. And I had never gotten that impression from colleagues in my department.... And so I thought, well, this is something that’s very different. {Lillian}

Although also viewing her mentor as supportive, Barb noted a gap in her mentor’s understanding of certain issues facing women in academia.

I felt there are certain areas where either he or I would’ve felt that he wasn’t the best advisor. Like where is it better, which department is more compatible for a woman. That’s hard to know, for I think you have to experience it as a woman to really know. And, he might have been concerned about some departments that had a generally bad reputation. But there were certain people in the field he would’ve thought, they’d be such wonderful colleagues, and I would think to myself, yeah if you’re a man they’d be wonderful colleagues. Not so good, maybe, if you’re not a man. And there were certain things he was unaware of. I knew of issues within a department in this campus, where I knew women who had had bad experiences, but he would have been oblivious to that.... So I didn’t get into issues like that. {Barb}

Sue expressed that she did not see the mentoring relationship as helping her to address work-life balance issues, as the formal mentorship that was established for her was predominantly focused on her work goals.

It didn’t help me balance my life the way I feel like I probably should have and that’s something that, I’m not sure where I’d get help doing that from. Maybe that doesn’t come from a mentoring relationship.... The mentoring relationship was more within the work world and what I was doing and how I get this particular goal achieved. But the kind of larger life question, like how do I balance home and work and those things together is a much harder question and I’m not sure where you go for that. {Sue}
Barb spoke of women faculty who would approach her on issues about which they felt less comfortable approaching a male mentor.

And I think particularly this happens with women in a position like mine, because there are so few women and they come in here to talk about, you know, agonizing over some decision of whether to try to have a baby or not before you get tenure or whatever. I mean these issues that they don’t want to talk to their mentor about, because their mentor’s a man and wouldn’t know what the deep issue is about this. Most men wouldn’t, anyway. And so occasionally I have mentoring roles with younger women faculty who aren’t really my own students but who come for particular issues related to being a female faculty member who’s got to make important life decisions, often about children. That’s a tough one. And there’s no great solution. {Barb}

Linda noted both the lack of women in her profession as well as the political reality that men were better networked.

I found that males in my profession are just generally better connected. It’s just a fact of life so it’s nice having [a male mentor], I guess just from a practical matter. Because you’re more plugged in. It’s terrible, but it’s true. I mean there are small numbers of women in [my field] that are in academics and especially that are active in research....Especially at the full professor level, the numbers are just quite staggeringly low. They really are. {Linda}

As a senior faculty member, Barb lamented the lack of women mentors, also noting that, at present, men were in a better position to mentor as there were still simply more of them in academia.

And one thing that I’ve not found that I think is due to scarcity more than anything else, is I’ve not had much experience with women mentors because there aren’t many women in senior levels in my field. It’s not uncommon for me to go to a meeting, like a national small group meeting, getting together people to work on some issue or something and be one of one or two women sitting there at a table of eight or ten people. I mean the further along you get, the more scarce women get! And I have certainly known successful women, but I don’t think many of them are in a position to mentor, because there are too few of them to really be helpful to all the women who might be interested in learning from them....I think men were in a better position [to mentor] and there are a lot more of them. {Barb}

Issues of balance for women in academia are seen as continuing to be of concern to women entering the field. Barb continued as follows:

And I worry about the young faculty coming up or young graduate students. Some of the issues are still here of, a lot of young women are worried that, they’re looking at us as role models and thinking, who needs this? This is like, impossible! Balancing your family life and your career here and we’re not attracting as many people as I’d like into academics right now, because it doesn’t look that attractive. And particularly young women I think we’re doing a disservice to....And it seems to affect the women. {Barb}

Summary: Politics are Part of One’s Experience

The results of this study on the experience of being mentored for women faculty identified that organizational politics and culture had a profound impact on protégés’ experiences with mentoring in academia. Women faculty found that different political environments and cultures affected their mentoring experiences. These climates varied significantly across the different academic organizations experienced by these participants. Some cultures were viewed as being mentoring ones, where senior faculty were committed to the success of junior faculty. In other instances, an individual designated by a department as a mentor did not fulfill a mentoring role. Other cultures were actually detrimental to the provision of true mentoring. There was recognition that the nature of the mentoring experience was affected by the political climate in which the protégé found herself. The culture of the department affected the faculty member’s perceptions as to her possibilities for academic success.

In addition, women faculty were aware that there were issues specific to being a woman in academia that were not always addressed through a mentoring relationship. There were some issues for which male mentors were not seen as being able to provide support. There were limited numbers of women in some fields of academia and they were not present in sufficient numbers to be able to mentor all the women who might have benefited. Mentoring occurred in the context of an academic institution; the awareness of the political realities of this environment was always with the protégé.
Implications for Human Resource Development

The historic and continuing function of HRD has been to maximize employee potential to contribute to overall organizational strength. This role clearly justifies involvement in women’s career progress and interest in the ramifications of inadequate support for women in organizations. (McDonald & Hite, 1998, p. 54)

This study supports the notion that the perceived effectiveness of mentoring initiatives for women faculty in higher education is influenced by the culture of the protégé’s department and/or institution. A department committed to the success of faculty members facilitated the provision of mentoring and fostered the protégé’s belief that she could be successful in the academic environment. In addition, several women protégés identified the critical role played by the department head, either as mentor or in ensuring that mentoring occurred for new faculty.

The women faculty in this study also expressed an awareness of issues relating to work-life balance. Women faculty made decisions based on work-life considerations; their decisions took into account their current stage of life. The findings indicated an inconsistent message of support for assisting women in dealing with work-life issues. Often university work-life programs were seen as nice perks that “keep the women on campus happy” but not as integral components of the mission of the institution (Rios & Longnion, 2000, p. 8). The difficulty that women experience in balancing work-life concerns in an academic environment may be a contributing factor to their lower rate of success in academia than that of men (Bentley & Blackburn, 1992; Glaser-Raymo, 1999; Hensel 1991).

These findings indicate that there is high potential for HRD to be engaged in a number of structural, leadership, and development initiatives to support the career advancement of academic women. These initiatives are described below:

1. Selecting department heads who are committed to the provision of mentoring should be considered as one means of increasing the likelihood that mentoring will be promoted in that environment. Responsibility for ensuring that mentoring occurs should also be included as part of the department head’s responsibilities.

2. A particular type of formal mentoring relationship that was emphasized by the participants in this study was the establishment of mentoring committees to assist each faculty member in attaining the next position level. The establishment of a formal mentoring committee coincided with the perception of a mentoring culture in the department; a culture committed to the success of all faculty members.

3. The establishment of mentoring programs that cross institutions should be considered as a means to avoid some of the political challenges that face faculty. Protégés would be able to seek input on issues that they might not necessarily be comfortable asking in their current institutions. The establishment of broad-based mentoring programs across institutions would help alleviate the discomfort some women experience in addressing traditionally female issues in their current institutions.

4. Mentoring of others should be a component of faculty evaluation for tenure or promotion. This would enable those with a desire to mentor to be better able to allocate time for this important task.

The findings of this study provide support for the recommendations on improving campus climate and the status of women in higher education as identified by the National Initiative for Women in Higher Education. These recommendations included both encouraging and rewarding mentoring and service work with appropriate credit and developing orientation programs for women faculty on such topics as mentoring and networking, negotiating the institution, tenure and promotion, grant-writing, professional development, and understanding institutional politics (Rios & Longnion, 2000). The establishment of these types of institutional structures has the potential for transforming the academy in ways that could have a long-term impact on the experiences of women who choose academia as their career path. As expressed by Lynn Gangone, Executive Director of the National Association for Women in Education:

We need to really move from incremental changes and adding equity and diversity as add-ons somehow to really transforming the academy and looking at what are the structural changes that we need to really make a difference, so that when we talk about excellence in education, equity and diversity are part and parcel of that, not just an addition. (Rios & Longnion, 2000, p. 5)

This study supports the provision of mentoring as an important component of campus climate improvement initiatives for women in the academic environment and points toward the establishment of a new model of academic leadership that is committed to the success of the more diverse population of faculty members that is now present in academic institutions.

These findings make a compelling case for HRD to become more involved in issues related to women in academic organizations. HRD has expertise in aligning cultural interventions to support the development of individuals, which translate into organizational performance. HRD professionals also have expertise in personal development strategies and leadership development, as well as organizational transformation. The needs identified
by this study merit more focus and attention by HRD professionals, as they have skills in and knowledge of change management, systems level interventions, and developmental strategies that will be required for interventions to be effectively implemented in this environment.

The findings of this study on the experiences of being mentored suggests that transforming the academy will require interventions at the individual (mentoring relationships), group (mentoring committees), and organizational (mentoring culture) level. The facilitation of mentoring—individually, departmentally and culturally—is one way to foster this transformation and change in academic institutions. HRD’s involvement is both needed and required to make this a reality.

Do Formal Mentoring Programs Matter?:
A Longitudinal Randomized Experimental Study of Women Healthcare Workers

Toby Marshall Egan
Manda H. Rosser
Texas A & M University

We report results from a pretest-posttest randomized experimental study comparing the impact of high versus low facilitation of formal mentoring programs on female healthcare workers’ performance and attitudes. Results indicated increases in job performance, job satisfaction, and organizational commitment for mentoring program participants from both groups with larger gains made by the high facilitated group. These results suggest that facilitated HRD interventions have positive effects on the outcomes of mentoring programs for women employees.

Keywords: Mentoring, Performance, Job Satisfaction

Mentoring relationships and formal mentoring programs have received increasing attention in HRD and related literature over the past several years. Studies examining mentoring involvement have indicated that up to two-thirds of employees have engaged in some type of mentoring relationship and that mentoring functions may be especially beneficial for women employees because of the greater barriers they often face as compared to their male counterparts (Chao et al., 1992). Involvement in formal mentoring programs has a variety of benefits for participants (Noe et al., 2002; Wanberg et al., 2003). Two of the most emphasized developmental benefits have been psychosocial and career advancement (Kram, 1985). Despite increasing activity, few empirical studies have been performed examining outcomes of formal mentoring programs (Wanberg et al., 2003). Because of the considerable investment of time and energy on the part of organizations and mentoring participants, a better understanding of the presence or absence of formal mentoring program benefits would be an important contribution (Ragins et al., 2000). No study identified compared women participating in different types of formal mentoring programs or used control groups in the study of females’ experiences with mentoring and few studies have examined the impact of formal mentoring participation for women employees. Additionally, clarification regarding the impact of various approaches to the facilitation of formal mentoring programs would be helpful in determining which HRD practices may positively influence mentoring program results.

Purpose of the Study and Research Question

Despite the increase in organizational investment over the past decade or more, there is little research on formal mentoring programs. The handful of well implemented studies has largely failed to distinguish formal mentoring programs in terms of quality and content (Wanberg et al. 2003). Many studies combine formal mentoring programs facilitated by organizations for comparison regardless of whether the mentoring programs are similar in approach. Those conscientiously assembled programs may be compared to other mentoring programs involving a poorly planned arrangement between mentors and protégés without attention to detail or opportunities to support mentoring relationship development. The purpose of the current study is to answer the general question: do formal mentoring programs matter to the development of female healthcare workers? We test a series of hypotheses (clarified below) to evaluate the effectiveness of high versus low facilitated mentoring programs on the development of female employees and whether there are differences between female participants and non-participants in mentoring programs regarding job performance and job related attitudes.

Significance of the Study

Recent comprehensive reviews of the literature by Noe et al. (2002) and Wanberg et al. (2003) identified 192 total mentoring studies, 24 on formal mentoring, 28 on women in mentoring relationships, and 4 comparing mentored versus non-mentored employees and managers. In addition to being one of only a handful of studies to make a systematic comparison between mentor versus no mentor female employees, this study is the first mentoring study of female protégés known to use a randomized participant selection processes, and the first identified to explore specific differences in facilitation approaches between formal mentoring programs for women.

11-2
Review of the Literature

The use of mentoring relationships aimed at employee development is rapidly increasing in organizations (Noe et al., 2002). Some benefits of mentoring relationships include career mobility and advancement (Scandura, 1992), career satisfaction (Chao et al., 1992), career commitment, and career advancement (Scandura et al., 1996), more promotions and higher compensation (Chao et al., 1992) and higher retention (Viator & Scandura, 1991). Although beneficial to personal and professional development, only a portion of the current literature examines mentoring relationships that are situated at work or in job related contexts. It is necessary to better understand how to utilize mentoring in order to enhance the growth of individuals in organizations.

Women in Mentoring Relationships

Because of demographic trends and glass ceiling realities in many organizations, there are typically few women holding upper management positions to serve as mentors (Noe et al., 2002). Mentoring relationships help women integrate and advance in frequently male dominated organizational cultures (Stewart & Gudykunst, 1982). Women who report having a mentor generally identify having greater job satisfaction, career success, greater self-confidence, and a stronger support base than women who do not have a mentor (Noe, et al., 2002). “Mentoring may help women to develop career plans and to acquire a self-identity” (Noe, 1988, p. 462).

Women are more likely than men to report the need for a mentor (Ragins & Cotton, 1991). However, the availability of women in upper management to mentor young female professionals has long been identified as a major challenge for most organizations. This demographic imbalance creates a supply problem for those seeking to be mentored by women executives (Noe, et al., 2002). These gender imbalances necessitate cross-gender mentoring in order to provide women with mentors. If an effective cross-gender relationship can be achieved, the experience can be very beneficial for both the mentor and protégé because they can learn from two different perspectives (Clawson & Kram, 1984). Nelson and Quick (1985) suggest male mentors may be less able to fully appreciate the unique work-related stress and work-family conflicts faced by females.

Although cross-gender mentoring relationships have been found to be effective, research indicates that women who are mentored by women gain unique benefits (Noe et al., 2002). “Based on available research, female mentors may be best suited to prepare their female protégés for the unique sources of stress that women face in the workplace, such as discrimination, social isolation, and coping with work-family conflict” (Noe et al., 2002, p. 164). Female protégés more often report their female mentors provide more role modeling than male mentors (Sosik & Godshalk, 2000). Additionally, female mentors may provide more social support and more strategies for work-life balance to their protégés (Ragins & McFarlin, 1990). Because women are in need of productive and meaningful mentoring relationships, more research needs to be conducted in order to better understand the needs of female professionals seeking development opportunities and how those needs can be met in the context of mentoring (Noe et al., 2002).

Formal Mentoring

Comparisons between formal and informal mentoring relationships have been key themes in recent literature. Informal mentoring relationships are most frequently defined as cooperative and ongoing connections between protégé and mentor instigated and maintained voluntarily (Ragins & Cotton, 1999). Informal mentoring relationships develop naturally without external intervention or planning. On the other hand, an organizational representative typically initiates formal mentoring relationships. Employees or managers are typically invited to participate in externally matched mentor-protégé pairings. HRD practitioners, who shape goals and expectations for participation, facilitate formal mentoring relationships. Parameters for participation may include mandatory introductory sessions or ongoing training, a required number of meeting times, specific discussion topics, and mentor-protégé goal setting.

Expectations for the length of commitment for formal mentoring programs vary; the typical minimum expectation for formal mentoring programs is six to twelve months (Single & Muller, 2001). Similar to formal mentoring practices examined in this study, organizations may use mentoring programs in the retention and promotion of women and minorities and the socialization of new hires (Noe et al., 2002). Because formal mentoring relationships do not emerge naturally, mentor and protégé motivation may be lower than in informal mentoring relationships (Ragins & Cotton, 1999). A formal protégé-mentor relationship may lead to number of circumstances such as: (1) pairing individuals with very different backgrounds and experiences; (2) pairing individuals from different parts of the organization; (3) matching individuals having different expectations; or (4) the relationship may be impeded by low communication abilities on the part of one or both individuals. Given these potential challenges, the mentor-protégé pairing may not be as effective as naturally occurring dyads.

A recent comprehensive review of the literature by Wanberg et al. (2003) identified a significant gap in HRD–related research on formal mentoring. Of the twenty-four studies identified that focused on formal mentoring
program outcomes, only thirteen were determined to be well designed studies. The review found only four studies that explored protégé outcomes in comparison with employees not involved in mentoring. The four published studies identified significant positive results from formal mentoring program participation as compared nonparticipants including: increased career commitment, compensation, job satisfaction, organizational commitment, organizational socialization, promotion, and self-esteem (Ragins et al., 2000). Although the study by Ragins and Cotton (1999) failed to report results reflecting positively on formal mentoring, the outcomes examined were narrowly focused. Additionally, the aforementioned study focused on protégés, from numerous organizations did not control for variation in formal mentoring quality and protocols. Another Ragins and Cotton (1999) study did not describe the manner in which the mentoring programs were formulated and implemented. The current study improves on all other available studies by using randomized experimental design to compare the effectiveness of mentoring programs with different facilitation levels (e.g., high facilitated vs. low facilitated). By comparing formal mentoring programs to a nonparticipating control we may develop more confidence about the potential for a causal linkage between the mentoring participation and mentoring outcomes.

Outcomes Associated with Formal Mentoring

Our study explores the impact of high and low facilitation of formal mentoring programs on three outcomes: job satisfaction, organizational commitment, and job performance we explore the concepts in relationship to mentoring in the following sections.

Job Satisfaction

This study explores whether facilitated mentoring relationships will have a positive effect on job satisfaction for women protégés. Job satisfaction is characteristically defined as an employee’s affective reactions to a job based on comparing espoused outcomes with actual outcomes (Cranney et al., 1992). Job satisfaction is commonly acknowledged as a multifaceted construct involving both intrinsic and extrinsic job elements (Howard & Frick, 1996). Porter and Steers (1973) argued that employees anticipate that their jobs will provide a blend of aspects (e.g., pay, promotion, or autonomy) to which the employee assigns preferences. The ranking of these preferences differ across individuals, but if expectations go unmet for an extended period, satisfaction is diminished and the probability for withdrawal behavior increases (Pearson, 1991). Some who study job satisfaction focus on its influence on employee commitment, absenteeism, intentions to quit, and actual turnover (Agho et al., 1993).

There are apparently few studies exploring associations between job satisfaction and mentoring and only four studies that compare employee participants in facilitated mentoring programs to employees reporting they have no mentor. In their meta-analysis focusing mentoring outcomes, Allen, Eby et al. (2002) identified ten mentoring studies utilizing job satisfaction as a dependent variable. These studies identified positive relationships between mentoring and job satisfaction. According to Ragins (1999), men and women do not differ in their increased job satisfaction reactions in association to mentoring experiences. However, comparisons between groups of employees with formal mentors to those without mentors, found no difference between groups with regard to job satisfaction (Chao et al., 1992). It is important to note that the findings in both of the aforementioned studies combined and compared groups from different organizations where the designs and quality of the programs are not described, but are assumed to be similar. Ragins et al. (2000) were unable to identify differences between protégés in formal and informal mentoring relationships in relation to their job satisfaction. In one of only four studies examining an employee-protégé group participating in a formal mentoring program with employees in the same organization without a mentor, increases in job satisfaction were identified in a group participating in formal mentoring relationships over the non-mentored group (Siebert, 1999).

Based on previous findings about the relationship between mentoring and job satisfaction, we proposed in the study a hypothesis associated with this relationship:

HYPOTHESIS 1a. Women participating in high and low facilitated mentoring programs will, on average, have higher job satisfaction than those not in a program.

A formal mentoring program with more facilitation is intended to provide a stronger and more positive impact on protégés’ than the mentoring program with less facilitation, therefore, we proposed that:

HYPOTHESIS 1b. For women participating in a high facilitated formal mentoring program, the level of job satisfaction will be higher than those participating in the low facilitated formal mentoring program.

Organizational Commitment

According to Meyer and Allen (1997), employee organizational commitment has been defined in a number of ways including as a process by which the goals of the organization and those of the individual become congruent, an attitude or an orientation that links the identity of the person to the organization, the costs associated with leaving an organization, the perceived rewards associated with continued involvement with an organization, and normative

11-2
pressures to behave in a manner consistent with organizational goals. Overall, three major elements are most prevalent the organizational commitment literature: a moral obligation to remain with the organization, commitment reflecting an affective identification with the organization, and recognition of costs associated with leaving the organization.

Research is fairly consistent in finding an association between being a protégé and favorable outcomes (Wanberg, et al, 2003). In a comparison of those individuals who had mentors and those that did not, the individuals with mentors often have more positive subjective outcomes including career satisfaction, job satisfaction, career commitment, and intention to stay at their organization (Allen, Eby, et al., 2002). Donaldson, et al., (2000) found that high quality mentoring relationship correlated with organizational commitment.

In two separate studies, Ragins and Cotton (1999; 2000) found evidence of increased organization commitment associated with mentoring. In the earlier study, it was found that individuals with satisfying formal mentoring relationship had higher levels of organization commitment than those without mentors. In the next, study both informal and formal mentoring relationships were addressed. No difference in organization commitment between protégés in an informal or formal mentoring program were identified. In addition, the study found that levels of organization commitment were higher in both groups compared with those individuals who did not have a mentor.

Few studies have examined organizational commitment as an outcome variable for formal mentoring programs or mentoring relationships. Donaldson et al. (2000) found high quality mentoring relationships to be associated with organizational commitment and self-reported levels of organizational citizenship behaviors. Ragins and Cotton (1999) found individuals with satisfying formal mentoring relationships had higher levels of organizational commitment than those without mentors. Ragins and Cotton (2000) found no differences between satisfied protégés in formal or informal mentoring relationships and their levels of organizational commitment, but found higher levels for both groups as compared to those without mentors. Two hypotheses associated with organizational commitment were forwarded in this study:

HYPOTHESIS 2a. Women participating in the high and low facilitated formal mentoring program will have greater organizational commitment than those not in the program at the time of the posttest.

HYPOTHESIS 2b. Women participating in the high facilitated formal mentoring program will have greater organizational commitment than those in the low facilitated mentoring group.

Job Performance

Despite this identified need for exploration of performance results in the HRD literature (Holton, 2002), few studies have focused on direct measures of job performance in relation to mentoring participation and no studies have been identified which use managerial or organizational reported measures of protégé performance. Wanberg et al. (2003) emphasize that the “well-established linkages between ability, conscientiousness, motivation, and job performance (Schmidt & Hunter, 1998) and between ability, motivation, and objective career success (Tharenou, 1997) support the need for research that carefully examines the association of mentoring to career success outcomes above and beyond protégé ability, motivation, and other individual.” (p. 14).

Wanberg et al. (2003) found only one study focusing on mentoring performance outcomes. Green and Bauer (1995) identified a significant zero-order correlation between production of published work and participation in informal mentoring, but these results were not significant in a multivariate context in which protégé ability and commitment were controlled. Job performance was used as a control by Day and Allen (2002) who explored mediating effects of career motivation and self-efficacy between mentoring provided and protégé outcomes. Career motivation was found to mediate fully the relationship between self-reported performance effectiveness and involvement in mentoring. Because of the absence of studies exploring the impact of mentoring on performance, this study has the potential to make an initial contribution in the exploration of performance and mentoring interactions.

We proposed two hypotheses associated with performance ratings in this study:

HYPOTHESIS 3a. Women participating in the high and low facilitated formal mentoring program will have performance ratings from their managers greater than those not in the program.

HYPOTHESIS 3b. Women participating in the high facilitated formal mentoring program will have higher performance ratings at the posttest than those in the low facilitated mentoring group.

Method

The following section details the specifics of the study such as: research setting and participants, the facilitated mentoring program, research design and procedure, and the measures used.

Research Setting and Participants

This study was conducted within a large metropolitan hospital in the central US. Those who qualified to be included in the mentoring program were 121 employees who worked with the organization for at least six months,
but no more than 24 months. Among these 121 individuals, 109 filled out both pretest and posttest surveys (90% completion rate). The following analyses were based on these 109 participants. The average age of the sample was 28.3 years old (SD=2.83) and average previous work experience was 7.1 years (SD=3.02). 8.6 percent of the study participants had associate degrees, 88.5 percent has Bachelor’s degrees and the remaining had attained Master’s degrees. In the report of demographics, 76.1 percent reported themselves as Caucasian, 10.5 as African American, 7.3 as Latino, 4.4 as Asian and 1.6 as Native American. One hundred percent of the sample was female.

The Facilitated Formal Mentoring Program

The facilitated formal mentor program was part of a larger effort to increase employee satisfaction and organizational commitment while reducing turnover. Mentors internal to the organization were recruited to participate in the program. Following the identification of 121 prospective participants, protégé participation was strongly encouraged and based largely on the commitment by top management in combination with support for participation by prospective protégés’ managers. Because of a limited number of mentors, all employees eligible and interested in participation were not provided an opportunity to be paired with a mentor during the six-month period identified for the implementation of the mentoring efforts under study.

Employees were sorted and randomly assigned to one of two groups—high facilitated or low facilitated. Those unable to participate or whose program participation was postponed due to a limited number of mentors became the control group for the study. Protégés assigned to participate in a high or low facilitated mentoring program were assigned to a mentor based on a matching process facilitated by internal HRD practitioners. Before the beginning of the program, all mentors and protégés were informed regarding the expectation that mentors and protégés meet regularly over a six-month period (no specific number of expected meetings was identified). Mentors and protégés were not expected to commit to any interaction beyond the six-month period. The program appeared to be well supported, designed and implemented including: upper level managerial support for the program, clearly defined and communicated objectives, experienced mentors with solid performance records, and clear expectations communicated to mentors and protégés (Kram & Bragar, 1992). Subsequent program evaluations were positive and several measures supported the overall effectiveness of the program. 84.2 percent of protégés reported meeting with their mentors once or more than once per month. Protégés reported that they were, on average, “satisfied” or “very satisfied” (mean = 4.37 SD = 0.71 on a five-point scale) with the mentor-protégé relationships.

The major differences between the high and low facilitated mentoring groups involved different participation expectations and actions by the protégés in the high facilitated mentoring group versus the low facilitated group. Both groups participated in a program kickoff meeting where they were mentor-protégé pairs were introduced and were given time to get to know one another. Similarly, both groups participated in an end of program gathering where they were asked to again meet in pairs to discuss the challenges and growth that occurred during the six-month long program. Although both groups were provided written information regarding mentoring and goal setting, the high facilitated group of protégés was asked to meet for one hour once per month during the program to have a “brown bag lunch discussion.” Facilitated by an HRD practitioner, this meeting included approximately fifteen minutes of structured discussion about the printed information provided to all protégés on mentoring and goal setting, and an unstructured discussion focused on how the protégé relationships were going with their mentors.

Research Design and Procedure

This study uses a version of a randomly assigned pretest–posttest nonequivalent control group design. One hundred twenty-one employees were randomly assigned to one of three groups of high facilitated mentoring, low facilitated mentoring, and the control group. Twelve of 121 participants later dropped from the study. The final numbers of participants in the high facilitated mentoring group, low facilitated mentoring group, and the control group were 38, 43, and 28 respectively. Questionnaires were administered prior to program participation and immediately following the official termination of the formal mentoring programs six months later. Data on the demographic, control, and outcome variables were collected from all study participants on the time 1 questionnaire. Data on the control and outcome variables was collected again at time 2 from all study participants.

Questionnaire packets were provided to mentoring program participants in intraorganizational mail. Each packet included a letter and study questionnaire emphasizing that participant data would remain anonymous and that respondents would be making a contribution to the organization’s understanding of new employee development needs. Participants were asked to bring survey responses to the mentoring program “kickoff” meeting. Those failing to bring the survey were provided one at the meeting. A very few non-attendees sent their surveys into the organization’s human resource office via internal organizational mail. Control group members received a similar packet through intraorganizational mail and returned it through the same means within the same timeframe as the participant groups. The time two protocol occurred in the same manner in correspondence with the six-month large group program completion meetings occurring on consecutive days during the same return timeframe as the control group return dates.
Measures

Job satisfaction was measured using the three item overall job satisfaction measure developed by Cammann, Fichman et al., (1983). Responses were obtained on a seven point Likert-type scale (1 = strongly disagree and 7 = strongly agree). A sample item is “in general, I like working here.” In the current study, the Cronbach alpha coefficient values for the measure were .83 and .87 at the pretest and posttest respectively.

Organizational commitment was measured using affiliation commitment items from the organizational commitment scale (OCS) developed by Balfour and Wechsler (1996). Responses were obtained on a seven-point Likert-type scale (1 = strongly disagree and 7 = strongly agree). An example item is “I feel a strong sense of belonging to this organization.” The coefficient alphas values were .85 and .88 at the pretest and posttest.

The job performance measures were evaluated by the managers of each protégé and were part of the numerical performance rating utilized by internal human resources. The three items used in this study focused on employee productivity and performance and were rated by each protégé’s manager on a 5-point Likert type scale (5 = exceptional to 1 = unacceptable). The reliability coefficients were .84 and .86 at the pretest and posttest.

Five demographic variables were included to assess equivalence between groups. Respondents were asked to report their age in years, years of previous work experience, and number of months with the company, on the blanks provided. They were asked to mark the appropriate category to indicate their level of educational attainment (high school through doctoral degree), and race.

Results

Table 1 provides matrix of intercorrelations for all measured variables at both pretest and posttest. The group differences of measures at pretest were assessed by multivariate analysis of variance (MANOVA). No significant multivariate effect was detected (the Wilks’ multivariate F(6, 296) = .24, p=.93). Multiple comparison Bonferroni tests for each variable also showed that time 1 values were not significantly different across three groups. These tests provide evidences to support that three groups were equivalent at the pretest.

To assess the effects of mentoring, we used the multivariate analysis of covariance (MANCOVA), with the posttest measures as the dependent variables, mentoring group status as independent variable, and pretest measures as the covariates. Significant multivariate effects were detected for the covariates, Wilks’ multivariate F(12, 443.39) = 158.27, p<.01. A significant group effect was also obtained, Wilks’ multivariate F (6, 283) = 8.77, p<.01.

To evaluate the effect of the mentoring group on individual outcome variable, we conducted a series of univariate analyses of covariance (ANCOVA) controlling pretest measure. Significant effects emerged for all three dependent measures. More specifically, F(2, 151) =24.03, p < .01 for job satisfaction; F(2, 151) = 26.51, p < .01 for organizational commitment; F(2, 151) = 17.33, p < .01 for person-organization fit; F(2, 151) = 13.86, p < .01 for manager’s performance rating.

Based on the above ANCOVA models, Bonferroni tests with adjusted marginal means were conducted to simultaneously compare outcome measures for three groups, controlling for the pretest measures. For the job satisfaction, employees in high facilitated group demonstrated higher values than the low facilitated group, and both two groups had higher values than the control group: (adjusted mean=16.82, 15.46, and 14.79, respectively, all ps<.01). Employees who received high facilitated mentoring demonstrated higher organizational commitment than the low facilitated mentoring, and both mentoring group ratings were higher than the control group: (adjusted mean=14.44, 12.16, and 11.43, respectively, all ps<.01). Thus, hypotheses 1a, 1b, 2a, and 2b were fully supported. For the manager’s performance rating, employees who received high facilitated mentoring demonstrated higher ratings than the low facilitated mentoring and the control group (adjusted mean=11.84, 10.88, and 10.43,
respectively, both ps<.01), which provide support for the hypothesis 3b, but the low facilitated mentoring was not significantly different from the control group, thus the hypothesis 3a was only partially supported.

Discussion

This study was the first known randomized longitudinal comparison of the effectiveness of high versus low facilitated mentoring programs on female protégés in a field setting. The results identified significant differences between groups associated with job satisfaction and organizational commitment. Six months following the parallel launch of high and low facilitated programs, women who participated in the high facilitated mentoring program reported greater levels of job satisfaction organizational commitment, and manager performance ratings than the low facilitated group, and both mentoring groups were higher than their non mentored counterparts on the measures of job satisfaction and organizational commitment.

These findings are consistent with previous correlational research demonstrating positive outcomes of mentoring on satisfaction and organizational commitment (Chao, 1997; Chao et al., 1992) and for the first time demonstrated the significant difference in performance ratings for high facilitated formal female mentoring participants and those without formal mentoring. Our results advance the study of the impact of formal mentoring programs because it does not share the threats to internal validity suffered by the majority of the mentoring literature, which uses non-experimental and non-randomized designs. The current study supports the conclusion that the positive effects of mentoring on protégé job satisfaction, organizational commitment, and performance, is likely a characteristic outcome of formal mentoring, and not the result of an implicit selection process on the part of the mentors or protégés. Additionally, support was provided for the notion that formal mentoring designs that engage mentoring program participants beyond the initial pairing and mentor-protégé introductions enhance desired program outcomes, in this case job satisfaction, organizational commitment, and performance.

Contributions to HRD

The relationship between mentoring and HRD can be found in the functions of mentoring and how they link to the three realms of HRD. From an organization development standpoint, mentoring can serve as a function of planned change used to improve employee effectiveness (Hegstad, 2002). Mentoring can serve as a form of on-the-job training to develop key competencies enhancing employees’ abilities to perform their job functions, the defining component of training and development (DeSimone & Harris, 1998). In terms of career development, mentoring can be used as a strategy allowing employees to shape and perform their work to better achieve their professional goal (Cummings & Worley, 2001).

This study not only fills a gap in the literature on mentoring relationships, it improves upon the current literature available particularly in the area of women in mentoring. The design of this study is also important in improving the current literature in that few studies have an experimental design. The findings of this study will be effective in developing a better understanding of performance, organization commitment, and job satisfaction as it relates to mentoring relationships. By better understanding this perspective, HRD practitioners can utilize mentoring to improve the development and performance of professionals, particularly female professionals.

Creating Consumer Resistance through *Adbusters*: Managing Emotion Beyond Organizational Boundaries

Jennifer A. Sandlin  
Jamie L. Callahan  
Texas A &M University

*We explore how the social movement collective *Adbusters* manages consumer emotion to create critical awareness of the negative cultural, social and environmental effects of consumption and bring activists together for social change. Through tactics such as “culture jamming” and “subvertisements,” *Adbusters* seeks to create a “detournement,” or emotional jarring among those who come into contact with its work. By re-interpreting well-established cultural images in sometimes funny, sometimes disturbing ways, *Adbusters* engages in emotional deviance to facilitate social change. We argue that a deeper understanding of the way *Adbusters* works as an organization and the way it manages emotions can help HRD professionals better understand issues of egalitarian leadership and organizational commitment, identity and development.*

Keywords: Consumer Education, Emotion Management, Cultural Analysis

In a recent editorial in Academy of Management Review, Brief and Bazerman (2003) call for organizational researchers to focus their attention on “the consumer.” They believe that “researchers can and should play a part in shaping a world that rewards the creation of goods and services that make the world a better place and that punishes the creation of harmful ones” (p. 187). They call for researchers to “adopt a consumer orientation to the study of management and organizations” (p. 187) and urge them to ask questions like, “Why do some organizations consistently create beneficial products, whereas others create products that inflict great harm upon an unacceptable number of consumers?” (p. 187). To address the “management myopia” they see in current organizational research, they propose adopting a “consumer orientation”. Brief and Bazerman (2003) admit to being “not at all sure” what this type of orientation would look like, but do give an example using the magazine *Consumer Reports*. They argue that “many questions about the organizations, people, and decision processes that produce products and services of superior quality at low prices have yet to be posed” (p. 188) and suggest this is one area a “consumer orientation” to research could start. Other questions they suggest as research starting points include, “How do organizations get away with selling inferior products? Why don’t consumers learn? Why do organizations offer inferior products in their retirement plans? Why is the move toward better products so slow?” (p. 188). They also include as potential objects of study “deceptive advertising, high-pressure credit sales tactics, racial and sexual discrimination against customers, and the production and marketing of unsafe products” (p. 188). In sum, they state that “addressing the why behind firm practices that enhance or harm consumer welfare is bound to benefit our field intellectually as well as morally” (p. 188). We believe that consumer-focused research is also relevant to HRD and has been missing from our research and practice, as well. We hope to begin creating a space for this type of inquiry within HRD.

This current project is a result of the coming together of two of our research interests. Jenny has been interested in consumer education and how to create a more critically-focused consumer education for adults. She has been recently focusing on alternative sites of consumer education, and has been exploring these informal sites of consumer education as social movements. Jamie has been interested in emotion management and the reciprocal influence between the experience and expression of emotion and the social systems that structure our daily lives. These two interests came together when we started discussing the social movement organization *Adbusters*. In this paper we will explore *Adbusters* as a social movement organization that manages consumer emotion to create critical awareness of the negative cultural, social and environmental effects of consumption and brings activists together for social change. This paper thus brings together ideas from consumer education, cultural studies, and emotion management to give insight into how consumer groups are organizing themselves to fight the culture of consumerism within North America.

**Traditional Consumer Education**

Because we see *Adbusters* as a form of critical, nonformal consumer education, we will begin by presenting an
overview of how consumer education has traditionally been defined, and then discuss how a critical framework positions *Adbusters* differently. In doing so we hope to set the context for our discussion of *Adbusters* as a social movement organization. The term “consumer education” conjures up images of learning how to perform price comparisons, make budgets, balance a checking account, and calculate interest on a mortgage. Consumer education has been defined as the “process of gaining knowledge and skills to manage personal resources and to participate in social, political, and economic decisions that affect individual well being and the public good” (Bannister, 1996, p. 1). Throughout the history of consumer education, practitioners have been concerned with improving the “economic level of living for all citizens” (Bannister, 1996, p. 5), and have focused on three broad areas of education: consumer choice and decision making, personal resource management, and citizen participation (Bannister & Monsma, 1980). More recently, the National Institute for Consumer Education, or NICE, (1996), outlined a new “blueprint” for consumer education and called for a renewed consumer education effort in the United States. In this blueprint, NICE argues that because consumers today operate within an increasingly complex marketplace characterized by massive amounts of information to process, more product choices, and more opportunity for fraud, they require a wider range of skills and knowledge than ever before. NICE posits that consumer education can create knowledgeable consumers who are better equipped to participate effectively in the modern marketplace. NICE (1996) describes what life could be like after consumer education:

> Individuals and families able to handle the complex financial decisions of daily life experience an enhanced quality of life. They have the personal satisfaction of being in control of their lives and are more likely to be satisfied with their social and economic environment. They are less likely to need government assistance such as consumer protection (p. 7).

Learners involved in “traditional” consumer education are thus taught more informed ways to navigate the consumer world and “better” ways of making consumer decisions. This kind of consumer is the goal of traditional consumer education (Ozanne & Murray, 1995, p. 519).

**The View from Cultural Studies**

If one examines consumer education through a different lens – that of cultural studies – one sees a very different purpose of consumer education. Sardar and Von Loon (1999) provide the following characteristics of cultural studies: First, they state that “cultural studies aims to examine its subject matter in terms of cultural practices and their relation to power.” Its constant goal is to expose power relationships and examine how these relationships influence and shape cultural practices” (p. 9). Using this point of view, we see consumer education as focusing on consumption as a cultural practice. We also see resistance to consumerism as happening within the cultural realm, as we will show in our analysis of *Adbusters*, one site of consumer resistance. Second, “cultural studies is not simply the study of culture as though it was a discrete entity divorced from its social or political context. Its objective is to understand culture in all its complex forms and to analyze the social and political context within which it manifests itself” (p. 9). That is, culture is not neutral, it is political and exists within a particular historical and social time. The consumer culture that has been created in North America acts in many ways to oppress; resistance to this same consumer culture works to counteract this oppression. Three, “culture in cultural studies always performs two functions: it is both the object of study and the location of political criticism and action. Cultural studies aims to be both an intellectual and a pragmatic enterprise” (p. 9). Raymond Williams, often considered one of the intellectual fathers of cultural studies argued, after Gramsci, another major intellectual influence on cultural studies, that “the rule of capital is inherently contradictory” (Rojek, 2003, p. 105). Rojek (2003) goes on to explain this position, arguing that “because hegemony is never universal, its contradictions cannot be entirely assuaged or masked by bourgeois organic intellectuals or spin doctors. In as much as this is so, hegemony has to be understood as a matter of perpetual struggle between contending forces.” (p. 105). Finally, Sardar and Von Loon (1999) posit that “cultural studies is committed to a moral evaluation of modern society and to a radical line of political action. The tradition of cultural studies is not of value-free scholarship but one committed to social reconstruction by critical political involvement. Thus cultural studies aims to understand and change the structures of dominance everywhere, but in industrial capitalist societies in particular” (p. 9). Towards this end, we take a stand against the all-pervasive consumer capitalism that has created harsh material existences for so many, and we are interested in how consumer education/activist groups like *Adbusters* actually go about confronting consumer culture.

Using the theoretical framework of cultural studies helps us to see consumer education differently. Whereas in traditional consumer education, consumption refers to the “acquisition, use, and divestment of goods and services” (Denzin, 2001, p. 325), within the framework of cultural studies consumption “represents a site where power, ideology, gender, and social class circulate and shape one another. Consumption involves the study of particular
moments, negotiations, representational formats, and rituals in the social life of a commodity. The consumption of cultural objects by consumers can empower, demean, disenfranchise, liberate, essentialize, and stereotype” (Denzin, 2001, p. 325). Within this framework, people do not consume to satisfy utilitarian needs. Rather, consumption is viewed as “a social activity that integrates consumers into a specific social system and commits them to a particular social vision. In other words, consumption does not stem from the realm of nature... but from the realm of culture” (Ozanne & Murray, 1995, p. 522). Cultural studies also regards culture as inherently political, seeing culture as “a terrain of conflict and contestation. It is seen as a key site for the production and reproduction of the social relations of everyday life” (Storey, 1996, pp. 2). From a cultural studies framework, consumer education can thus be viewed as a site where adults learn about consumption. If consumption is inherently cultural, and culture is inherently political, consumer education can be reframed as a political site where adults learn particular ways of relating to consumer culture and consumer capitalism—a site where consumers are constructed to have particular reactions to consumption and consumerism.

From a cultural studies point of view, then, consumer education helps create particular types of consumers, crafting certain types of dispositions, relationships with consumer capitalism, and ways to “read” consumer culture. While there are many different reactions to consumer culture, depending on the kind of consumer education one is engaged in, including embracing consumption and individually questioning consumption, we are interested in a type of response we are calling “collectively politicizing and fighting consumption.” Similar reactions to consumer culture have been called “participatory consumerism” (McGregor, 2001) and “reflectionally defiant consumers” (Ozanne & Murray, 1995).

This reaction is found in some informal sites of consumer education which seek to fight against the hegemony of consumerism. They seek to craft “anti-consumers” who recognize that the “hegemonic cultural logic of consumerism systematically permeates public, discursive, and psychic spaces, dictating that our lived experiences are increasingly shaped and monitored by marketers” (Rumbo, 2002, p. 134). This arena of consumer education seeks to problematize the naturalization of consumer culture. Consumers operating within this realm of consumer education form a “different relationship to the marketplace in which they identify unquestioned assumptions and challenge the status of existing structures as natural” (Ozanne & Murray, 1995, p. 522). This arena of consumer education often takes the form of social movements, made up of activists focusing on issues such as the environment, fair labor practices, corporate globalization, and global capitalism. Most participants range ideologically from the political left to radical anarchism. Some examples of groups in this very broadly defined movement include the labor activist group Students against Sweatshops, the explicitly anti-consumption festival Burning Man, and the anarchist anti-consumption group L’Ombre Noire. These anti-consumers have dropped the natural attitude “toward the existing order and, instead, question economic, political, and social structures” (Ozanne & Murray, 1995, p. 516). These groups see culture as a site of resistance, and use subversive tactics to “jam” consumer culture using the very signs (such as advertising) that constitute that culture. Culture jamming involves fighting against the corporatization and branding of America through interrupting the normal, everyday, taken-for-granted flow of life (Lasn, 1999).

Adbusters

One of the more well-known loose collectives of such activists are those that create, read, and participate in activities inspired by the Adbusters Media Foundation, which publishes Adbusters magazine. Based in Vancouver, British Columbia, Adbusters describes themselves as “a global network of artists, activists, writers, pranksters, students, educators and entrepreneurs who want to advance the new social activist movement of the information age. Our aim is to topple existing power structures and forge a major shift in the way we will live in the 21st century” (from the website www.Adbusters.org). Adusters magazine is a reader-supported, not-for profit magazine with an international circulation of 85,000 and contains reader-supplied letters and articles, commentaries by activists from around the world, and photographs and stories highlighting readers’ social dissent. Adusters also hosts a website (www.Adbusters.org/) where activists can read about new anti-consumption campaigns, download toolkits, posters, stickers, and flyers for distribution, post information about their own activist resistance, and read about others’ acts of resistance. Some of the ongoing campaigns sponsored by Adusters include “Buy Nothing Day,” “TV Turnoff Week,” “Reclaiming Urban Space” (a “placejamming” project, wherein public spaces are reclaimed and nature is reintroduced to urban places), and “Commercial Free Schools.”

Adusters states that ultimately, it is “an ecological magazine, dedicated to examining the relationship between human beings and their physical and mental environment. We want a world in which the economy and ecology resonate in balance. We try to coax people from spectator to participant in this quest. We want folks to get mad about corporate disinformation, injustices in the global economy, and any industry that pollutes our physical or mental commons” (from www.Adbusters.org). We see Adusters as a form of informal, critical consumer education that seeks to create consumer resistance and raise awareness of corporate wrong-doing.
In the next section of this paper we will discuss how Adbusters goes about creating anti-consumptive resistance. What all of these modes of activism/education discussed below have in common is that they ultimately work on an emotional or non-rational level to create a particular feeling in the learner/viewer/activist. Through its magazine and website, Adbusters works through visual art to elicit this response, and encourages its readers and participants to create art—both visual and performance art—to be used as cultural resistance. Thus Adbusters works within the realm of culture to bring about gut-level reactions which they hope will ultimately lead to a new vision and practice of a less consumer-driven society.

**Culture Jamming**

Anti-consumerism activism goes well beyond reading Adbusters magazine. Adbusters advocates direct forms of activism they call “culture jamming.” Culture jamming involves fighting against the corporatization and branding of America through interrupting the normal, everyday, taken-for-granted flow of life (Lasn, 1999). Lasn (1999) sees culture jamming as being a social movement with great power to transform society:

> We believe culture jamming will become to our era what civil rights was to the ‘60s, what feminism was to the ‘70s, what environmental activism was to the ‘80s. It will alter the way we live and think. It will change the way information flows, the way institutions wield power, the way TV stations are run, the way the food, fashion, automobile, sports, music and culture industries set their agendas. Above all, it will change the way we interact with the mass media and the way in which meaning is produced in our society. (p. xi)

Culture jammers resist and rebel against consumerism through a variety of activities including organizing and participating in the campaigns listed above, producing cyber petitions, virtual sit-ins and virtual protests using the internet, and producing “subvertisements” (discussed below) and placing them in public spaces. In one example of culture jamming, activists targeted a Gap store, where they pasted anti-Gap “subvertisements” in dressing rooms. During this campaign other activists dressed up like Gap employees and infiltrated the store while trying to educate would-be shoppers about the labor rights abuses of the Gap corporation and urging them to buy nothing or to shop at the local thrift store. The Adbusters website helps to educate activists and future activists about the latest campaigns, and provides space for culture jammers to share their activities with and learn from others. Activists also learn together as they participate in rallies and actions in public spaces.

**Subvertisements and “Uncommercials”**

One way to jam culture is through subvertising, for which Adbusters magazine is perhaps most famous. These subvertisements are akin to anti-advertisements against large corporations, and have targeted such brands as the Gap, McDonald’s, and Absolut vodka. Through subvertising, Adbusters seeks to raise the critical consciousness of consumers about the power and impact (cultural, environmental, psychological, social) of advertising and the corporations that create and plaster our culture with advertisements. What makes these subvertisements so effective, so memorable and attention-grabbing, is that they mimic “the look and feel of the target ad, prompting the classic double take as viewers realize what they’re seeing is in fact the very opposite of what they expected. Subvertising is potent mustard” (Lasn, p. 131). Bordwell (2002) explains that

> to spread critical awareness about advertising’s power, Adbusters fights fire with fire. Rather than launch highbrow missives or scholarly analyses, Adbusters critiques marketing by co-opting the slick, visually appealing techniques of marketing itself. This signature rhetorical strategy lampoons specific name brands – Camel, Marlboro, Benetton, Calvin Klein – but also, and more important, throws into question the entire advertising industry. (p. 238)

Put more succinctly, Adbusters “confronts consumption by targeting the purveyors of excess consumption and challenging them on their own turf. It promotes access to the media as engaged citizens, not passive consumers” (Bordwell, p. 239). Thus through these subvertisements Adbusters seeks to create consumers who are critical of the consumer world and the tools used to create adherence to that world.

**Meme Warfare**

Subvertisements work because they play with and give new meaning to the “memes” of our culture. Memes have been defined as “media viruses that spread throughout the population. Think of urban legends, fleeting fashions, and idiotic ad slogans that work their way into everyday conversations; these are memes” (Duncombe, p. 369). Culture jammers take advantage of the power of memes that have already been created and that are already part of most consumers’ consciousness. Subvertisements work on an emotional or subconscious level in a way that rational critique of advertising or of corporations fail to do. Boyd (2002) argues that “culture jamming can stick where rational discourse slides off” (p. 376). Subvertisements operate ‘much like a ‘meme vaccine’, interrupting our consumer trance and redirecting our attention. Culture jamming fights virus with virus. Over the last decade it has itself become a virulent meme, spreading far and wide and encompassing a myriad of new sub-cultural forms” (Boyd, 2002, pp. 376-77). Indeed, Adbusters believes that the important battle of our time is over the “mental
environment,” including memes. Herein lies the potential for social change: “Potent memes can change minds, alter behavior, catalyze collective mindshifts and transform cultures. . . Whoever has the memes has the power” (Lasn, p. 123).

**Detournement**

When subvertising, culture jamming, and meme warfare are effective, *Adbusters* founder Kalle Lasn (1999) argues that they bring about a certain new way of looking at the world, which he calls “detournement.” Detournement is “a perspective-jarring turnabout in your everyday life” (p. xvii). Lasn takes this idea from a European anarchist group active in the 1950s called the “Situationists” who were led by Guy Debord. Members of this group were committed to living “a life of permanent novelty” and fought against “bureaucracies and hierarchies and ideologies that stifled spontaneity and free will,” including consumer capitalism (Lasn, p. 100). The Situationists argued that

You are—everyone is—a creator of situations, a performance artist, and the performance, of course, is your life, lived in your own way. Various stunts were concocted to foster spontaneous living. Situationist members suggested knocking down churches to make space for children to play, and putting switches on the street lamps so lighting would be under public control. The Situationists believed that many times a day, each of us comes to a little fork in the path. We can then do one of two things: act the way we normally, reflexively act, or do something a little risky and wild, but genuine. We can choose live our life as ‘a moral, poetic, erotic, and almost spiritual refusal’ to cooperate with the demands of consumer culture. (Lasn, p. 100)

The Situationists argued that the spontaneity of everyday life had been stolen or eroded away by the ‘spectacle’ of modern life—which included everything from advertising to radio to television—in short, “modern society’s ‘spectacular’ level of commodity consumption and hype” (Lasn, p. 100). Whereas humans used to experience life directly, that real kind of living “had been replaced by prepackaged experiences and media-centered events” (Lasn, p. 100). Through spontaneous acts, people can bring about a detournement (a “turning around”), wherein the spectacle of modern life is rejected and replaced with a more authentic experience. Detournement “involved rerouting spectacular images, environments, ambiances and events to reverse or subvert their meanings, thus reclaiming them” (Lasn, p. 103).

**The Management, or Manipulation, of Emotion**

Like most other organizations in the Western world, *Adbusters* focuses on cognition as the battleground for social change. Indeed, this preference for rationality to the exclusion of emotionality is in keeping with the primary thrust of critical theory, as well (Callahan, In Press). However, while the detournement advocated by *Adbusters* aims to fundamentally alter the experience of modern life, it seeks to accomplish this aim by using emotion as the catalyst to turn around popular mindsets. Ironically, the manner in which *Adbusters* uses emotion turns around the common conceptions of the role of emotion in consumerism. Further, the latent focus on the manipulation of emotion to achieve change aligns with the power perspective of understanding emotion (Callahan & McCollum, 2002); most research and practice in organizational contexts has aligned with a more functional orientation (Burrell & Morgan, 1979). Thus the ‘turning around’ of detournement in *Adbusters* occurs on multiple levels.

The sociological literature on consumerism openly acknowledges the manipulation of consumer emotion (Boden & Williams, 2002). However, this manipulation is typically viewed from the perspective of capitalistic control of consumer desires to further instrumental organizational or political ends (e.g., Cranny-Francis, 1994). Typically, even emotionally-oriented consumer research has focused on the instrumental purpose of encouraging consumerism. This is done, for example, by identifying what consumers like or dislike, by determining environmental factors (such as music) that encourage purchases, or by detailing the specific emotions and contexts that salespersons can create to maximize profit (Howard & Gengler, 2001).

We interpret the emotion management pursued by *Adbusters* as fundamentally distinct from earlier accounts of consumption and emotion. *Adbusters* takes postemotional (Meštrović, 1998) consumer appeals and transforms them from ‘nice’ to shocking (see Figure 1). An example of how *Adbusters* does this can be demonstrated through the “subvertisement” below. Upon first glance, the viewer sees (or thinks she sees) an advertisement for Nike shoes. This subvertisement is based on the Nike “Why do I run?” campaign from the 1990s, which featured photos of runners with inspirational text explaining why they run—for instance, one Nike ad read, “Why do I run? They said I was the best high school runner in the last 20 years. Then they said I was washed up and burned out. Finished. I know what I was. I know what I am. You know what they’re saying now? Me neither.” A viewer familiar with the Nike memes would, at first glance, think this subvertisement shows a picture of an passionate runner and would think the text contains inspirational phrases about being dedicated to the art and sport of running. In what can be
described as a double-take, however, the viewer sees what is really featured in this ad – an Indonesian shoe factory worker who is running (barefoot, without the Nike shoes that she makes but cannot afford to buy) to escape the harsh working conditions she must endure to earn a tiny bit of money by making the expensive shoes sold to consumers much like the one reading the ad. If the reaction works “right,” according to what Adbusters is trying to elicit, the reader begins to experience “detournement.” The viewer feels off-balance because the expectations for and the reality of the ad are at such odds. This realization produces a variety of emotions in the viewer – outrage at the unfair labor practices and guilt over buying (perhaps, even at that moment wearing) Nike products – and hopefully shocks the reader into viewing the Nike company in a different light, and to changing his or her consumption practices with regard to Nike. Lasn (1999) captures the emotional response detournement brings about:

What does the perceptual shift feel like when it comes? Imagine a desperately down-and-out soul who suddenly finds God. Now try to imagine the opposite of that process. This moment of reckoning is not so much like suddenly seeing heaven in a world you thought was hell as it is suddenly seeing hell in a world you thought was heaven. That world is the world of summer blockbusters and $5 lattes and Super Bowls in which a thirty-second ad slot sells for $1.5 million – the spectacular world of the American dream, a world you were raised to believe was the best of all worlds, but a world that collapses under scrutiny. If you stare at your reflection in the mirror long enough, your face becomes a monster’s face, with enormous sunken gargoyle eyes. (p. 107)

Figure 1. A Nike “subvertisement”

The tactic of using disturbing imagery to shock the viewer is clearly associated with the literature that explores the manipulation of others’ emotions (e.g., Thoits, 1996; Lively, 2000); however, there is a difference. Earlier research and theory development in the study of power aspects of emotion focused on specific interpersonal interactions within the context of a bounded organization (Turnbull, 2002; Fineman, 2001). Adbusters extends this phenomenon to an attempt to manipulate emotions of a broader culture in order to facilitate broad scale change. By doing so, they consciously engage in emotional deviance by breaking the established feeling rules of society; the purpose of this deviation from cultural norms is to facilitate change.
Implications for HRD Research and Practice

A deeper understanding of the organization *Adbusters* and their practice of emotional manipulation can help the field of HRD and the professionals working within the function of HRD. Our examination of *Adbusters* informs core components of HRD, especially the core component of organization development.

At the very least, the anti-consumerist tactics employed by *Adbusters* are part of a highly effective educational program that uses a critical theory perspective to promote social change. The program of detournement is specifically designed to shock consumers out of a Pollyanna fog. The premise is that consumer reactions to the subvertisements will result in reflection. In turn, this reflection would lead to a reconstruction of self-narrative such that consumers make a conscious change in their consumption behavior. However, research in consumer decision making processes suggests that our choices for action are rarely so rational. Nevertheless, research does indicate that emotional valences attached to consumer goods will influence behavior. Of course, the previous research was conducted with regard to positive emotion in an attempt to foster consumerism. Even if consumers do not engage in the desired reflection, the negative implicit bias toward targeted corporations may still effect social change.

Moving from HRD-related adult learning implications, the lessons learned from *Adbusters* are relevant to organization development in several ways. First, *Adbusters* can be seen as a non-profit loosely coupled system (Orton & Weick, 1990). As such, it represents an excellent case for studying the nature of organizational commitment and egalitarian leadership structures. It is a virtual organization in that its membership is widely dispersed and its objectives are accomplished through distance media such as the internet, magazines, and television. Second, *Adbusters*’ emotion-laden tactics are innovative mechanisms to shape organizational image and identity (Hatch & Schultz, 1997). Each time a subvertisement is issued the strength of the organizational image is emphasized in the larger social context. In turn, this strengthens the collective identity of those loosely affiliated with the activist organization.

Perhaps one of the most important lessons offered by *Adbusters* is that every good idea contains the seeds of its own demise. Einstein once noted this paradox and *Adbusters* capitalizes on the notion. Corporations spend a great deal of time, money, and effort to craft advertising campaigns that will appeal to consumers. *Adbusters* takes these good ideas and uses them against the very organizations that disseminate the marketing idea. Marketing identity, image, product, and service is inherently emotional. In some respects, *Adbusters* is no different than the major corporations who attempt to appeal to the emotional-decision making of consumers. What makes the organization different, however, and what makes the organization a useful ground for HRD inquiry, is the manner in which they co-opt or subvert the available tools and resources of competitors to turn the tide of competition and, eventually, the nature of consumer culture.

Identity Consistency: The Role of Emotion Management Across Contexts

Aubrie Horrocks
Jamie L. Callahan
Texas A&M University

This research study reveals the tensions that exist between expressing our emotions and maintaining an acceptable image within organizations, and the way individuals find a balance through storytelling. Narratives are our tools for clarifying the uncertainty of the past, understanding and managing the emotion of the present, and creating a functional identity from which to act in the future.

Keywords: Identity, Emotion, Narrative

There is extensive literature expanding and developing theories of identity creation, spanning a wide variety of disciplines, relating to a vast range of topics. In the beginning, the conceptualization of identity evolved from individual thought (i.e., Descartes’s ‘I think, therefore I am), to an amalgamated construction of interpersonal interaction (Holstein & Gubrium, 2000, Volger, 2000). Currently, research within the social sciences is building on the concept of identity as a process (Eisenburg, 2001). Some studies report that individuals maintain multiple identities, where specific selves are developed to advance interaction within particular spaces/environments, and among a variety of people (Eisenburg, 2001, Holstein & Gubrium, 2000, & Raggatt, 2002).

While the search for a sense of self, or a way of conceptualizing and framing life experiences, has produced a variety of theories in postmodernism, interpretivism, and criticism, some theorists continue to find that this abstract concept still slips through our fingers as we force it into a dimension of reality. There is truth in every perspective that has been previously produced, and common ground is realized with the notion that identity is a building process that creates a multiplicity of results. However, the process of constructing identity[ies] assumes an end through open communication and a journey of self-discovery, negating the fact that the future always remains uncertain (Eisenberg, 2001).

We suggest that the process of creating narratives about daily activities is a means to construct a tangible identity (or identities). Narratives capture fragments of identity as it is communicated through representational stories, created from experiences, and reflected from individual perspectives (Eisenberg, 2001, & Gilbert, 2002). They are a biased depiction of our lives, articulated from a angle that only we can see, yet provide a foundation from which to function (2002). Shaping our sense of identity, “….stories provide structure…and that which we perceive to be reality. At the same time, our lives and our perception of reality establish a structure for our stories. We create our stories and then see our world and ourselves through [them]” (Gilbert, p. 225).

Narratives, full of emotion, serve as a window to identity. Individual experiences of emotion and the choices about the expression of these emotions reflect an individual’s sense of self. As a result, we get a tangible picture of identity across contexts. This research study reveals the tensions that exist between expressing our emotions and maintaining an acceptable image within organizations, and the way individuals find a balance through storytelling. Thus, the purpose of the present study is to map both oral and written narratives associated with emotion to the displayed identities of eight professional women. The conceptual framework for this study incorporates the constructs of identity, emotion management, and narrative. We suggest that the process of identity development and maintenance can be observed through the emotion management patterns revealed in oral and written narratives.

Identity

From a theoretical perspective, there continues to be a gap in identity research explaining the relationship between our personal perspective of self and how that identity is enacted or communicated within a cultural society. Riessman stated that, “In the telling, there is an inevitable gap between the experience as I lived it and any communication about it” (1993, p. 9).

Obtaining a secure sense of identity among obscure experiences continues be an unsettling challenge because the morphing task is to continually understand who we are becoming, and our role in an ambiguously unstable world. Each life experience shapes a story in our minds, creating boundaries and rules for prospective interaction. From this blueprint of narratives, we’ve learned to interact as capable individuals by applying familiar behaviors to
unfamiliar encounters that constantly arise in the future. This way of reducing uncertainty through passive observation or active interaction produces a sense of reality and an understanding of individual identity. Realistically, however, each moment of thought and interaction has the potential to alter our current way of knowing. Eisenberg states that, “The quest of understanding oneself is an aspect in achieving mental and emotional security…[and]…How we respond to the fundamental uncertainty of life shapes everything we do and is driven in part by how we think about our place in the world, our sense of identity” (Eisenberg, 2001, p.534).

This being the case, there is no single truth, until we chose to construct a definition or accept a way of knowing, find the resources to live it, and reinforce that particular understanding through experience and storytelling. In an article on progression through significant life experiences, Gough (1999) stated that, “The purpose of inquiry is not to dispel the difficulties, risks, and ambiguities of life but to live and speak from within them” (p.414). Identity is an emotional process that is understood through personal reflection and enactment with others. The multiple results are unique to each individual and every situation. Telling stories gives meaning to our thoughts and experiences, and in turn, builds our community.

Emotions

The study of emotion, how it is individually managed, and how it shapes interactions within society continues to be a novel field of research in the academic community. New approaches and theories are constantly being explored within an array of fields, yet further research produces more questions and conclusions to be studied. Emotions are apart of daily life, embedded in every thought, interaction, and outcome. Defining emotion, and understanding how it affects us all, is crucial to success for both individuals and for society as a whole. Emotions have been defined, referring to the way an individual feels, their general mood, or disposition (Callahan & McCollum, 2002). Most research sustains the notion that emotions are a sense, or component of expression resulting from internal stimulation (Hochschild, 1983), or as “…the culturally-based interpretation of a physiological state which enables an individual to act,” (2002, p. 6).

The importance of emotion within the process of identity creation is apparent when concepts are specifically applied to a variety of social contexts and structures. Since the role of the individual is learned, we seek to manage our emotions, only publicly expressing the feelings that are socially constructed as appropriate. Positive and negative outcomes, resulting from trial and error efforts, not only teach us which emotions to feel and manage, but also with whom and where we can communicate those emotions (Kramer & Hess, 2002). Identities are created and maintained through communication and interaction, resulting in a structure that allows individuals to feel comfortable, confident, and safe in sharing their thoughts and experiences, while substantiating functionality and productivity. Through expression, we are valued and respected in both the public and private arenas of our lives. The ability to shift and change in accordance to various needs produces new expectations and recreates a structure from which to function and progress. While emotions are rooted within individual exchanges, the expression of feelings can transform and negotiate typical patterns of functioning.

In understanding the definition of emotion as an objective, evolving force, it is apparent that social structures influence personal feelings during social interactions (Callahan & McCollum, 2002).

Narratives

The study of narrative is not a new form of research, and has, in fact, facilitated understanding and theory in fields such as communication, psychology, sociology, and anthropology (Rosenwald & Ochberg, 1992). This method has become increasingly more popular for the reason that it provides rich data to understand interpersonal interaction, individual bias, social expectations, and cultural values (Smith & Keyton, 2001). We are constantly required to both interact with others and reflect upon our own thoughts, and telling stories is the fundamental way for us to interpret situations and understand experiences (Gough, 1999, & Riessman, 1993).

More recently, however, narrative research has extended beyond the insight of a particular experience, and stories are now read for the description of “…the process, product, and consequences of reportage itself” (Rosenwald & Ochberg, 1992, p. 2). The story becomes a predominant channel for communication, revealing the interplay of interactions and emotions that develop the foundation from which we choose to function. By focusing on the way an individual rationalizes the events throughout their life, we can understand the importance of negotiating between tensions of emotion management and identity management to produce functionality within reality. “Stories are emotionally and symbolically charged narratives; they do not present information or facts about events, but they enrich, enhance and infuse facts with meaning” (Gabriel, 1998, p.136, cited in Smith & Keyton, 2001).
Used as a means of conveying both history and understanding (Riessman, 1993) narratives are sense-making tools that not only clarify, “...past actions but [also] how individuals understand those actions...”(1993, p. 19). Because personal histories are subjectively constructed, the experiences retold are constrained by the individual’s own interpretation. “[P]eople lie sometimes, forget a lot, exaggerate, become confused, and get things wrong. Yet they are revealing truths. These truths don’t reveal the past as it actually was, aspiring to a standard of objectivity. They give us instead the truths of our experiences” (Personal Narratives Group, p. 261, cited in Riessman, 1993, p. 22). The story encourages security in a constructed reality, producing personal awareness rather than generalizability, ultimately providing external events significance by provoking changes in how we live (Gough, 1999, & Rosenwald & Ochberg, 1992).

**Written Narratives**

Written narratives encompass similar characteristics as spoken stories, in that they disclose experiences that negotiate emotions while constructing identity. However, the alternate form of communication produces an avenue for a different expression that is otherwise typically constrained, the most obvious constraints being social limitations and mandatory coherency.

As interaction constructs social rules and expectations that guide further communication, over time, acceptance and resistance of these social standards, “…offers a way of identifying what is assumed to be a normative experience” (Andrews, 2002, p. 1). The encounters that deviate from the norm, or stories that are too difficult to tell, often create an emotional reaction of denial, suppression, and silence. However, the expression of such a narrative is necessary to for us gain security and establish rationality (Riessman, 1993). Journaling provides that safe place for expression. Private constructions do not always mix with the imposed order in society, but are important for the individual to realize in order to better understand themselves, “…claim[ing] identities and construct[ing] lives” (1993, p. 2).

Writing offers time for reflection, allowing lingering thoughts to develop, free from the pressures of a listening audience. Journaling is a private experience where the author is the audience, and coherency is dependent merely on memory and imagination, rather than social expectations. Writing rationalizes abstract experiences, creating “…a sense of continuity and self-contained individualism…” which might never be realized through oral expression (Raggatt, 2002). It is a two-dimensional way to freeze time, forcing the experience into reality where it can be emotionally expressed, and accepted as truth. This world of reality is built from abstract experiences that are continually retold for the purpose of managing our emotions and creating a functional identity. “How individuals recount their histories—what they emphasize and omit, their stance as protagonists or victims, the relationship the story establishes between teller and audience—all shape what individuals can claim of their own lives.” (Rosenwald & Ochberg, 1992, p. 1).

**Dynamic Interplay of Emotion and Identity**

As reflected in the review of the literature, over time, we begin to construct a general sense of who we are through public and private experiences. Interactions influence our thoughts, and likewise, our thoughts influence our behavior. It is this cyclical process, influenced by emotion, which builds an impressionable identity. The conflict arises with the concept of emotion, and how it can be communicated, in order to support an individual’s sense of identity. Hochschild (1983) refers to this concept as authenticity, maintaining that as a society we value “…spontaneous, natural feeling” (1983, p.190); yet require the management of emotions. She claims that, “…we find ourselves speaking of emotion as if it had a location or residence...as having some sort of continuous identity...[which] is sometimes the case and sometimes not” (Hochschild, 1983, p. 203-4). Emotion influences our identity, and reciprocally identity influences our emotions, creating a dynamic interplay. Because life is not structured and straightforward, this study, and previous research, shows that functionality is produced through balancing emotion management with identity management, maintaining it all through storytelling. The way we communicate our emotions builds a history of identity, and we can rely on this history of experience to determine an individualize balance of authentic expression. Without a personalized balance the outcomes are negative, resulting in a false sense of self, or an overly emotional experience.

In the case of a false sense of identity, an individual’s narrative management is most focused on maintaining a particular image, above expressing true feelings. This may, or may not, be a conscious effort because while it seems that society has placed more value on the expression of emotions, the freedom to authentically convey feeling is restricted by social expectation (Irvine, 1997). Hochschild refers to these situations as an “estrangement...from feeling” and a “hazard” (Hochschild, 1983, p.189). At times, preserving identity over emotional expression is important, however, continual surface acting creates a binding identity that is established through manipulation, resulting in less sincerity and dissatisfaction. The decision to disguise felt emotion, has been shown to affect future
expectations and interaction, creating dissonance in our sense of identity, leading to personal disharmony, depression, and even demise (Clark, 2001, & Krone, Chen, Sloan, & Gallant, 1997).

On the other extreme, when an individual is too emotionally expressive, identity is sacrificed, producing incoherent experiences and instability. Having intense expressions for every experience is exciting and dramatic, it is also psychologically draining, and emotionally overwhelming. Although passion is important, picking your battles is crucial for survival and coherency. Reinforcing this notion, Hochschild states that, “Emotional dues can be costly to the self” (1983, p. 219). Relating to others is an important aspect in this dynamic, and a pattern of highly charged experiences eliminates outlets for future communication as others become too drained, emotionally numb, or nervous about the consequences of a drama. By not having a secure outlet, instability forces melodramatic individuals to continually search for others who can momentarily handle their excessive energy.

While emotion is a sense that guides our way of knowing, and identity is an ever-evolving process, we use narratives to create reality of these complete abstract notions. Understanding this dynamic can provide not only social progression within organizations, but also internal satisfaction for every individual.

**Method**

This phenomenological study explored the emotion management experiences of eight women enrolled in a graduate seminar on emotion in organizations. All of the women were working adults who ranged in age from early 20s to mid-50s. Six of the women were European American, one was Latina, and one was from Thailand. In order to protect the participants, all names have been altered. Data collection methods included: journaling, participant observation, and written reflection of the journal entries. Each week, participants submitted a journal entry that chronicled an emotion management experience that occurred during the week. The number of submitted journal entries ranged from three to fifteen entries with a total of 87 entries that averaged 2-3 single spaced pages. These written narratives were then compared to the oral narratives constructed during seminar interactions.

Both authors simultaneously conducted the data analysis using open coding (Strauss, 1987). For the present study, we were first looking for general themes associated with identity and emotion management across the journals of the eight participants and the observations made by each author in her capacity as participant observer. Then, the data was grouped into three categories of, intense examples of emotion management, identity management, or moderate balance between the two. We then conducted bi-weekly meetings to discuss coding progress, data interpretations, and literature support. Any disagreements in our interpretations were resolved through dialogue and re-assessment of the data. Interestingly, the data was triangulated through written narration, observed interaction, and oral reflections.

It is important to note that the researchers were both European American women. This cultural background served as our lens to viewing the emotion management narratives occurring in the study. We recognize that our cross-cultural interpretations of the Thai and Latina emotion narratives are influenced by the rational-cognitive cultural preference of Americans.

**Findings**

In the analysis of the journal entries, it became apparent that our participants’ felt they were managing emotions well within their perspective organizations. While they may have displayed appropriate behaviors, it is interesting to find that many communicated in ways to maintain a particular identity, above expressing true feelings.

The balanced category is where most of the participants functioned. Participants used a variety of strategies to manage the stresses within the work environment and maintain cohesive identities as both employee and individual. All faced a variety of challenges including deaths of loved ones, sexual harassment, pregnancy, role confusion, overworking, and more; these challenges gave them the opportunity to become extremely emotional. Many also found themselves in leadership positions of administration and teaching, requiring professionalism and emotion management. The balance that these participants negotiated, allowed them to feel productive and successful, find social support, and/or reframe the situations. Those who did not have this same level of balance displayed more extreme levels of either emotional expression or identity maintenance.

The participants who wrote of consistently disguising felt emotions to display positive feelings, were considered to be managing identity through surface acting and masking strategies. On the other extreme, those who appeared to be particularly expressive with their emotions, yet wrote of displaying controlled behaviors, were categorized as melodramatic expressers who lacked identity stability and coherency. The study presented a few individuals within these extreme groups, while most of the participants used more moderate strategies of both emotion and identity.
management. Those in this moderate group still tended to lean to a particular style, either emotional expression or identity management.

Focus on Identity

Surfacing acting. Hochschild (1983) describe surface acting as displaying the appropriate responses to a situation, while honestly feeling something different or nothing at all. Some of the participants were excellent at displaying exactly what the organization wanted. Through this acting, they felt as if they were being the perfect employee, maintaining an ideal identity, even if they truly had different feelings.

Janis’s organization was facing a budget crisis, and consequently was downsizing. Many people were losing jobs, or experiencing pay cuts. Janis expressed concern for her position, due to family obligations.

“I was being extra careful to be a model employee…I did always try to display the emotion of being a satisfied and helpful employee just in case something did happen to my grant and I needed someone else to pick up my funding…I am having to sit in my office and act like everything is fine when I really want to jump up and down and scream about how wrong this all is” (Janis).

In another situation, a different participant experienced a change in her emotions due to the surface acting that she felt required to constantly display. Often, her co-workers would stop to talk with her because she “was a good listener,” yet this became frustrating as she worked to complete all of her tasks, projects, and assignments. The following excerpt is a statement following an interruption and long conversation with a new employee.

“I’d like to say that I pretended to enjoy the conversation. But I didn’t really pretend. I did enjoy it. But other feelings (i.e., stressed and angry) coexisted. However, I didn’t show them though” (Somsri).

Masking. Sometimes, the need to present a specific identity only requires a momentary disguise in our true emotions. At this point, masking the sincere feelings was a strategy for some of the participants. After an emotional conflict with a subordinate employee, who was also a personal friend, Janis struggled to maintain professionalism and stay objective. She writes of being extremely disappointed, yet said nothing to the employee of her true concerns, in order to preserve the friendship.

“Overall, I am pleased at how the meeting turned out. I was happy with the way I was able to manage my emotions regarding the situation and keep the meeting objective” (Janis).

Another situation of disappointment for Janis was after the news of budget/job cuts, when the manager hired a family member, rather than preserving current jobs. She felt that it was an unethical hire, but masked her discontent to safeguard her position.

“I don’t think she realizes how much what she did hurt my feelings on both a personal and professional level. I don’t think she thought twice about it honestly. I still don’t really know how to deal with it all” (Janis).

Cultural Reasoning. While some participants maintained an organizational identity for personal gains and successes, one participant seemed more culturally constrained to mask emotions, due to her native Thailand traditions. Somsri often had lunch with office friends, although she would rather work. During lunch, many began to gossip about a new hire, and Somsri restrained her opposing concerns, sitting quietly instead.

“I wish I could say what I really felt about her and the whole situation. But that’s probably politically incorrect…I pretended to be calm and attentive. I looked into her eyes, but my mind was somewhere else. Sometimes, I looked away. I was quiet” (Somsri).

Focus on Emotion

While some control emotion to maintain socially acceptable identities, others struggle to balance their intense emotional expressions. In this case, Hochschild (1983) also reported costly consequences of lack of support, physically impairment, and depression. One participant faced a trying time, struggling to actively participate in this study, manage her job and home life, and function as a graduate student. In summarizing her minimal journal entries she reflects on always being stressed, continually dealing with personal issues, and fighting to control her emotions at work. In reflecting on her job, she states:

“In all honesty there have been times when I wished I would get into a car accident, just so that I wouldn’t have to go to work. It’s pretty bad when I jump in front of the car in the walkway that I will be hit” (Maria).

Another participant struggled to create a fulfilling work experience, facing challenges that emotionally disrupted her employment as well as her health and self-esteem. Although she seemed to mask many emotions at work, her journal entries were packed with emotional experiences, turmoil, and frustrations. While she vented a lot to her spouse, the diary seemed to be the only other outlet for emotional support.

“I try to block out and ignore all the stupid things my boss says. When he is in the throws of belittling and ridiculing me, I try to remind myself that I have friends and family who love me, and that this job is only
temporary...I will move on from this job. I also think about how I could take Cody’s walking boot and use it as a club to hit my boss. That makes me feel a little better, if only for a moment.” (Darlene).

After receiving her evaluations for the year, Darlene was more enraged with her working situation than ever, and upon reflection of the journal entries, Darlene actually became motivated to find a different job.

“I felt anger, frustration, embarrassment, outrage, disbelief, and self-consciousness all at the same time… I felt physically tired when I was finished reading it. My body and my fists were so tense and my jaw was clinched so tightly that I had that tired, overused feeling when I finished reading it… Usually, when I am that angry I will tremble and cry out of frustration…I would have laughed…but the amused disbelief quickly returned to rage” (Darlene).

Finally, Maria seems to articulate her extreme emotional cycle, reflecting feelings of being trapped in an unending cycle of events, with no notion of how to resolve the problem, and feeling isolated and helpless. She says: “When I am angry…it is starting to show. I lose my temper quicker. I let my frustration show… My emotions are affecting others. For example, the second my voice shows any amount of frustrations-the other person becomes very defensive. When the person becomes defensive, I am quick to put up my walls. It’s a horrible spiral that causes the situation to get even worse. Because of all the things going on in my life, this spiral causes my emotions to remain negative even to next person. I become very secluded and alone” (Maria).

**Moderate Identity**

The moderate category is where most of the participants functioned. Many times using a variety of strategies to manage the stresses within the work environment and maintain an identity as an employee and person. All faced a variety of challenges, i.e. death, sexual harassment, pregnancy, role confusion, overworking, and more, giving them the opportunity to become extremely emotional. Many also found themselves in leadership positions of administration and teaching, requiring professionalism and emotion management. The balance that these participants negotiated allowed them to feel productive, find social support, and/or reframe the situations.

One participant experienced a death in her family, while also being overloaded with tasks and projects at work. Although emotional, Terry commented on the impossibility of controlling everything, and was grateful for “caring people” with which she worked. When being given extra work by her supervisor, Terry said:

“…this just caused my stress level to get really high because I was wondering how in the world I would be able to get everything finished. So, I let him know up front what I already had waiting on my desk and asked the priority of these projects... this did provide some relief to me” (Terry).

Showing a balance more toward the identity maintenance, Susan was an administrator of a middle school who worked to unite her faculty, insure the safety and well-being of the students, and mentor teachers. She used many communicative strategies to negotiate needs for the school, and diffuse arguments, dually showing leadership skills and compassion. While working with a teacher who had received poor reviews, Susan says:

“I was trying to be supportive yet honest about the condition of his classroom. He has extremely poor classroom management skills… I think I displayed a positive outlook and was supportive. I did not let him know how frustrated I was or how disappointed I am that he is not able to take responsibility for his classroom. I like the teacher, in spite of his lack of teaching skills, and would like to help him, but he is not admitting that he needs help.” (Susan)

**HRD Implications**

These findings lend support to earlier works that call for balance in emotion management (Callahan, 2000), that caution about the consequences of too much emotion management (e.g., Hochschild, 1983; Turnbull, 2002), and that encourage the use of narrative in identity formation (Eisenberg, 2001). Perhaps the most significant finding of this study is the impact of written narratives in the identity development process. Journaling can be used as a vehicle for helping people explore the meaningfulness of work. As a tangible self-narrative, past journal entries can help employees reflect upon their experiences within the larger picture of the workplace. Even if people do not reach to the deeper sense of the meaningfulness of their work, journals can, at the very least, help them clarify the ambiguity within difficult issues. Employees could be encouraged to journal, helping to articulate and crystallize the way they describe or discuss difficult issues. This would enable them to potentially raise the issue to co-workers or superiors for resolution. Or, they may find resolve through reframing, finding social support, or creating emotional harmony.
In this way, journals can serve as a means for healthy resolution of identity conflict. Narratives in general may facilitate this effort. To encourage oral narratives, HRD professionals could create backstage spaces (Goffman, 1959) as neutral zones for expressing narratives. They could also offer therapeutic sessions (Schein, 2000; Van de Loo, 2000) for verbally confronting presenting problems and seeking constructive solutions to those problems.

This study also reiterates the importance of balance in identity and emotion management. Those who exhibited a balanced identity typically selected healthy strategies for dealing with emotional upheaval. Those who exhibited extremes of either melodrama or identity management posed potential dangers to themselves or others. However, the emotional nature of these individuals may facilitate warning signs or cries for help. HRD professionals should be aware of, and open to, receiving such signals. Further, they should be able to refer employees to trained counsel, or to be trained themselves in counseling techniques. Excess suppression could result in physiological pathologies (Levenson, 1994). Further, the news media is replete with headlines of the ‘perfect’ mother, neighbor, or employee who suddenly snaps and unleashes death and destruction on unsuspecting others. Even if we believe our interest as HRD professionals is confined to instrumental organizational purposes, our role would still include providing for the development of employees to preclude such devastating incidents.

While most implications are employee-focused, this research also shows the importance of open communication within organizations to facilitate healthy working environments, reduce employee turnover, and improve overall production. The journals show strategies that individuals use to maintain power, promote relationships, facilitate decision-making, and reduce uncertainty. Understanding these tactics further allows management to produce more fulfilling training and socialization orientations, fast-track and promote productive employees, and improveizational negotiation techniques. By clarifying experiences and emotions, a positive identity of the organization can be better maintained. Finally, the implications of this study move organizations in a direction for understanding the inseparable interplay of rationality and emotionality, showing how it can be conceptualized, and produce continued development for the benefit of all.

Conclusion

Narratives can, indeed, help individuals make more tangible the identities they construct in multiple social contexts. This study reveals insight about narratives, emotion management patterns, and identities. However, this initial glimpse raises additional questions for further research. For example, would free-writing or critical incident journaling reveal different aspects of emotion management? Also, women are noted for being more aware of their emotions than men (Gallois, 1993). In what ways would all-male, or mixed gender, samples result in similar or different findings? Finally, are there any cases where participants suppressed oral communication because the writing created an expressive outlet, diffusing the situation?

By using oral and written narratives of emotional experiences as a means to uncover identity development, this study begins to fill the gap in existing identity literature. Narratives help provide individuals with an anchor that can serve to stabilize a developing identity. While Eisenberg (2001) suggests that a coherent, stable identity is forever elusive, we suggest that the act of written narration can be an identifiable mechanism for understanding the uncertainty of the past, managing the emotions of the present, while creating and maintaining a cohesive identity across future contexts.

Developing the Creative Class: A Role of Human Resource Development Programs

Consuelo L. Waight
Shirley Ezell
Katy Greenwood
University of Houston

This paper looks at human resource development (HRD) programs’ role in cultivating creativity. This paper will first briefly discuss what fuels creativity within business and industry. Second, a review of the changing workforce structure and its relationship with creativity will be provided. Lastly, a creativity model that could be used by HRD programs in cultivating creativity will be explored.

Keywords: Creativity Model, Human Resource Development Programs, Creative Class

The unremitting competitive challenges in the global marketplace, pace of change, globalization, knowledge economy, and technology among other trends have fueled a dire need for creativity in all fields and jobs. Human resource development (HRD) as a field relating to the development of individual, group and organization performance is closely related to creativity because of the expected roles and outputs. McLagan (1996) for example, identified HR strategic advisor as one of the roles of HRD. In specific this role requires HRD professionals to consult strategic decision makers on HRD issues that directly affect the articulation of organization strategies and performance goals. To be able to affect the articulation of an organization’s strategies and performance goals, HRD professionals will need to employ their creativity. Another salient HRD role identified by McLagan and which underlines the creative element is organization change agent. To be able to implement interventions such as work teams, quality management, mergers and acquisitions, for example, HRD professionals will need to employ creativity in their problem-solving and decision making processes. While creativity is a core competence in the workplace, the impact of the knowledge economy on our lives, extends the need to be creative in our homes and communities. Thus, introspection, analysis and transformation of the environments and methods used to develop creative competence among the human capital are critical.

Florida (2002) states that human creativity is multifaceted and multidimensional and it is not limited to technological innovation or new business models. Creativity can be generated by employees in any job and at any level of the organization, not just in jobs that are traditionally viewed as necessitating creativity (Madjar, Oldham, Pratt, 2002). Florida states that creativity involves distinct kinds of thinking and habits that must be cultivated both in the individual and surrounding societies. This paper looks at human resource development (HRD) programs as learning communities and explores the importance of cultivating creativity. This paper will first discuss what fuels creativity within business and industry. Second, a review of the changing workforce structure and its relationship with creativity will be provided. Lastly, a creativity model, that specifically looks at problem solving as a core element of creative competence, and which could be applied to HRD programs within academia will be explored. It must be noted that the word problem is conceived broadly as any task that an individual seeks to accomplish (Lubart, 2000-2001).

Creativity in Business & Industry

When looking at corporations as societies, much has been researched on how to foster and cultivate creativity, which makes an important contribution to organizational innovation, effectiveness, and survival (Amabile, 1996). Watkins et al (1999) in their study on understanding support for innovation found that innovation is contingent on managers’ belief that innovation is consistent with the their role as managers of change, and their potential to derive benefit in terms of enhanced power in the organization and control over the innovation itself. Boeker (1997) also found that managers with experience are crucial to promoting product innovation because through their expertise they can influence creative occurrence in organizations. Sta Maria (2003) in her study on innovation and organizational learning culture found that embedded systems, leadership, continuous learning, and team learning better explained the variance in the use of innovation. Hailey (2001) in her study on innovation as a strategy for corporate renewal recognized that investment in time, resources and energy is important to trigger the transformation. Bessant and Buckingham, (1993) in their study of innovation and organizational learning, and Hatch & Mowery, (1998) in their

Copyright © 2004 Consuelo L. Waight, Shirley Ezell, & Katy Greenwood
study on process innovation and learning agreed with Hailey that developing new learning capabilities was not an automatic emergence; rather conscious and sustained effort was necessary. Steve Kerr, chief learning officer, of Goldman Sachs, for example, has been publicized as an effective idea practitioner. Kerr sees leadership being inclusive of breaking down boundaries to penetrate the outside walls with ideas (Davenport, Prusak & Wilson, 2003).

Tierney & Farmer (2002) study on creative self-efficacy and its potential for creative performance found that both personal and contextual factors come into play when employees formulate work-related self-efficacy judgments. The study found that job self-efficacy was the strongest predictor of creative self-efficacy. Tierney and Farmer added that this finding highlighted the importance of managers providing the training and experience opportunities necessary for employees to develop the sense of general job mastery, a foundation for subsequent creative work. Similarly, Madjar, Oldhan and Pratt (2002) found that explicit support for creativity from work (supervisors and co-workers) and non-work (family/friends) and others made independent contributions to employees’ creative performance. Rao and Drazin (2002) in their study on product innovation by recruiting talent augment the role of managers with innovation in the finding that recruitment of managers may be an important method by which new and poorly connected firms reduce resource constraints on innovation and use recruited talent to introduce new products.

While these studies are only a fraction of what has been found about creativity in business and industry, they highlight the importance of resources and conducive environments. These studies also highlight the necessity and responsibility that business and industry have in valuing and promoting creativity. These studies, however, also tell us that researchers and educators are looking at external environments, other than their internal environments, to understand and foster creativity. External view of creativity, however, cannot continue because the changing workforce structure heightens the role HRD professionals play in enabling creativity within workplaces. HRD professionals in turn are dependent on HRD programs as their cornerstone for creativity competence.

The Changing Workforce Structure

By the year 2005, the national workforce will number 151 million. Minority groups will comprise 27% and women will make up 48% of the total workforce (US Department of Labor). Of the twenty-five million people who entered the workforce during the 1990s, 85 percent were women and people of color. More than 50 percent of the American workforce is over age 40 (US Department of Labor). About 11 million Americans are self-employed; this number is expected to increase by 15 million by the year 2010 (US Department of Labor). Cetron and Davies (2003) focused on self-employment trend by looking at the workforce generation. Generation X, now in their 30s, and especially of generation dot-com, now in their 20s, have more in common with their peers throughout the world than with their parent’s generation—they are more entrepreneurial. Generation X are starting new businesses throughout the world at an unprecedented rate. Florida (2002), on the other hand, looked at workforce structure through the lenses of economies. The creative, working, and service classes were outcomes of social groupings and common identities based principally on economic function. Figure 1 describes the changing class structure.

Figure 1. The Changing Class Structure (Adapted from The Rise of The Creative Class, 2002).

- The Creative Class now includes some 38.3 million Americans, roughly 30 percent of the entire U.S. workforce. It has grown from roughly 3 million workers in the 1900, an increase of more than tenfold. At the turn of the twentieth century, the Creative Class made up just 10 percent of the workforce, where it hovered until 1950 when it began a slow rise; it held steady around 20 percent in the 1970s and 1980s. Since that time, this new class has virtually exploded, increasing from less than 20 million to its current total, reaching 25 percent of the working population in 1991 before climbing to 30 percent by 1999.
- At the heart of the Creative Class is the Super-Creative Core, comprising 15 million workers, or 12 percent of the workforce. It is made up of people who work in science and engineering, computers and mathematics, education, and the arts, design and entertainment, people who work in directly creative activity, as we have seen. Over the past century, this segment rose from less than 1 million workers in 1900 to 2.5 million in the 1950 before crossing 10 million in 1991. In doing so, it increased its share of workforce from 2.5 percent in 1900 to
5 percent in 1960, 8 percent in 1980 and 9 percent in 1990, before reaching 12 percent by 1999.

- The traditional Working Class has today 33 million workers, or a quarter of the U.S. workforce. It consists of people in production operations, transportation and materials moving, repairs and maintenance and construction work. The percentage of the workforce in working-class occupations peaked at 40 percent in 1920, where it hovered until 1950, before slipping to 36 percent in 1970, and then declining sharply over the past two decades.

- The Service Class includes 55.2 million workers or 43 percent of the U.S. workforce, making it the largest group of all. It includes workers in lower-wage, lower autonomy service occupations such as healthcare, food preparation, personal care, clerical work and other lower-end office work. Alongside the decline of Working Class, the past century has seen a tremendous rise in the Service Class, from 5 million workers in 1900 to its current total of more than ten times that amount.

While there are three categories, Florida pointed out that as the creative content of other lines of work increases – as the relevant body of knowledge becomes more complex, and people are more valued for their ingenuity in applying it – some now in the working class or service class may move into the creative class and even the super creative class. Krogh, Ichijo and Nonaka (2000) captured the creative transition in saying, “…knowledge workers can be anything from a lawyer to a systems analyst to a corporate planner; the point is not the specific type of professional work but the multiple talents this new worker must have. He or she needs to be a thinker, team player, team leader, a critic, an autonomous decision maker …”. This mobility of the working and service classes to the creative class will be outcomes of companies who have realized that their employees are, as Reich (1998) described, about building a business that can outlive its first good idea, continuous learning, and building a career that allows them to grow into new responsibilities. In essence companies will need to be in synch, more than ever, with the values of their workforce.

Florida (2002) identified individuality, meritocracy and diversity and openness as values of the creative class. Individuality refers to strong preference for individuality and self-statement. The creative class seeks to create individualistic identities that reflect their creativity. The creative class has a propensity for goal setting and achievement, they want to get ahead because they are good at what they do – meritocracy is important. Lastly, the creative class values diversity in all its manifestations. Talented people defy classification based on race, ethnicity, gender, sexual preference or appearance (Florida, 2002). Cetron and Davies (2003) also added that generations X and dot-com thrive on challenge, opportunity, training and lifelong learning – whatever will prepare them for their next career move. Employers, say Cetron and Davis, will have to adjust virtually all of their policies and practices to the values of these new and different generations, including new ways to motivate and reward them. If these are the implications for companies now, what will be the implications for not only companies but also HRD programs based on future generations?

A Model for Enabling Creativity in HRD Programs

The changing workforce generations heighten the need for HRD programs to assess and adjust to how they will best serve their future clients. If indeed generation X and dot-com are entrepreneurial, HRD programs, presently and in the future, need to assess their values and actions towards creativity. Creativity, now and in the future, will have to be a conscious-to-non conscious competence among all involved in HRD programs. While there are professors that are presently focused on developing creativity – in specific, problem solving within their courses, the concerted effort of all involved in HRD programs will be important. HRD programs cannot ‘talk the walk’, experiential learning and constructivism are now more than ever necessary to foster learning and enable creativity. Constructivism, which grew from the early work of people like John Dewey, Lev Vygotsky, Jean Piaget and Jerome Bruner, will be eminent. The methods of constructivism emphasis the learner’s ability to solve real-life problems. Often, in a constructivist enterprise, the learner works collaboratively or cooperatively with others, rather than individually to solve practical problems. The time, then, where the workplace, for example, remained a topic of discussion will be unacceptable. Students will need to experience real workplace problems – and explore in concert
with their colleagues and companies the best solutions. HRD programs will need a balance between the ‘walking and talking’ – a balance between concepts, theories, research and incubator experiences.

Creativity has been the focus of several theories and models. Though creativity goes back to Promethesus and the Stone Age, the foci of creativity definitions and models are varied (Amabile, 1990; Albert, 1990; Gardner, 1993; Bundy, 2002). These definitions can be reflective of the process, product, individual and/or environment. Amabile (1996) defined creativity as the production of ideas, products, procedures that are (1) novel or original and (2) potentially useful to the employing organization. Gardner (1993) described the human being, the object or project and other individuals as the foundation of creativity. Gardner further described the interaction of the adult mind with the worldview of the child as the first of three fundamental elements to understanding the superstructure that promotes creative activity. Gardner stated that the relationship of the individual to the work in which he or she is engaged and how that domain is altered as a consequence was the second fundamental element to creative activity. Lastly, Gardner stated that the interaction of the individual and others in the immediate or related domains was critical. Gardner, like Csikszentmihayli (1990), saw creativity as a dialectical or interactive process among all three elements (Bundy, 2002). Feldhusen & Goh (1995) in their review of creativity definitions concluded that the within the individual there is a complex system of cognitive skills, abilities, personality factors and motivations, as well as styles, strategies and meta-cognitive skills that work together to produce adaptive or creative behaviors. Bundy (2002) in describing conclusions of Cohen’s book on creativity, stated that if creativity is to flourish, social conditions elicit an attractive environment. Bundy goes on to state, “Plato was most incisive in his statement, “What is honored in a country will be cultivated there”. More importantly, however, in today’s knowledge economy, creativity, as Florida (2002) and Madjar, Oldham, and Pratt, (2002) related, is multifaceted and multidimensional and it is not limited to technological innovation or new business models. Creativity can be generated by employees in any job and at any level of the organization, not just in jobs that are traditionally viewed as necessitating creativity.

In reviewing creativity models that could be applicable to HRD programs, the industrial creativity model, which is not only applicable to business and industry but also academe (Bundy, 2002) was selected to identify a conceptual approach to integrating creativity in HRD programs. The original design of the industrial creativity model was the work of Helmholtz in 1891 (Bundy, 2002). Jules Henri Poincare, a French mathematician, and Wayne Bundy, have modified this model. While Bundy’s model has five stages, the model will be revised to 4 stages, in specific the third and fourth stages are combined. In addition, some of the content within this model will be modified to reflect the field of HRD. Thus, figure 2 provides a description of schematic for promoting creativity in HRD programs.

Figure 2. A Schematic for Promoting Creativity in HRD Programs

![A Schematic for Promoting Creativity in HRD Programs](image-url)
Knowledge gain the first stage of the creativity process is important as a broad range of knowledge and extensive knowledge interactions are the basic nutrients that fuel discovery and creativity (Bundy, 2002). Bundy goes on to state that by virtue of gaining abundant knowledge about a subject, interest in that subject is stimulated. While knowledge about HRD is important, the process of understanding knowledge patterns, logical and critical thinking must also be cultivated through knowledge gain. Bundy (2002) stated that basic research, external stimuli and specialized thought processes can also be stimuli for creativity.

Basic research in addition to being indispensable to the generation of new knowledge is a stimulant for the generation of new thought patterns. Bundy identified empirical, literature, dialectical, and hypothetical research as forms that can be used to stimulate thought patterns. Anomalies and humor in research were also described as the sources of serendipity. External stimuli focus on opportunities for discussion that exist out of one’s organization such as conferences, and worldwide travel. Specialized thought processes, such as common sense, conventional and unconventional, on the other hand, were seen as the trigger for the underlying genius of those who discover (Bundy, 2002). Bundy stated that while conventional thinking, such as deduction, induction and abduction, was indispensable to good science and technology, unconventional thinking such as lateral, visual-spatial, and hemispherical, for example, become the main channel for creative illumination. Bundy concluded that to think with as much clarity and depth as possible and to carry out the best possible research, it is important to have a good working knowledge of as many viable thought processes as possible and to employ diversion and flexibility in the process of discovering the paths to solutions. Feldhusen and Goh (1995) stated that creative thinking and creative problem solving are aspects of human cognition and behavior that probably can be accessed through training programs that focus on cognitive skills and methods, personality factors, motivation, cognitive styles and meta-cognitive skills. Thus, HRD educators will need to focus on the developing the critical thinking paradigm directly and indirectly through the activities they provide to students to enable knowledge interaction. Bundy (2002) concludes that knowledge gain is one’s conceptual base is expanded continually, not only within one’s discipline but in related fields as well. Bundy states that this can be accomplished through diverse research projects and by the interaction of different knowledge patterns as much possible. This heightens the solutions to many problems and is important for the second stage, preparation, to be successful. While the highlighted knowledge areas are not exclusive, they provide a point of departure to understanding the conceptual and skill foundations students will need to be creative in HRD programs.

Preparation, the second stage is specific in comparison to the first stage, knowledge gain. This stage focuses on the problem study. Problem study requires that students are able to use the knowledge gained in various ways. Usage of knowledge gain can be done through holistic thinking which involves the interaction of many different knowledge patterns associated with the problem (Bundy, 2002). Higgins (1994) in discussing how to create creativity identified analogies, metaphors, association and mind mapping as techniques to explore problems. Bundy identified the following five steps to problem study:

1. Problem definition and opportunities
2. Characterization of key in-house knowledge re the problem
3. Delineation and prioritization of research needed to enhance problem solving
4. Derivation of direct approaches to problem solving
5. Promotion of maximum interaction of groups’ collective knowledge, creativity and wisdom.

In addition to Bundy’s list, the preparation phase could also include enabling the conscious mindset on problem solving process and styles. Bundy (2002) states that learning to use the conscious mind to overcome mindsets and habits, contrary to human nature, is a pathway to intellectual growth. Given that the third phase is where students can move to the non-conscious process, it will be critical for HRD students to know more about the problem solving process and their preferred problem solving style. Prathner & Gundry (1995) identified the adaptive and innovative problem solving styles. Adaptive problem solving reflects people who will use creativity to make any system better, faster, cheaper and more efficient. Innovative problem solving, on the other hand, is about people who challenge and choose to change the system they are in by installing a new system. These people will do research, create new products, and anticipate unarticulated customer needs. These people seek novelty. Prathner and Gundry’s description of these two problem-solving styles heightens the change management process – a core competence for HRD professionals.

Incubation/ Stimulation, the third stage, is where creativity can be nurtured. Bundy described the incubation stage as the stage for moving from conscious to non-conscious competency in order to enable creativity. Amabile et al., (1996) related that individuals who have access to a variety of alternatives, example solutions, or any potentially relevant ideas are more likely to make connections that could lead to creativity. The variety of alternatives such as research, external stimuli and specialized thought processes, as discussed in the knowledge gain stage, can stimulate
the creativity process – and thus should be targeted during the incubation period. Relating the incubation stage to HRD, here is where the real workplace problems discussed in the preparation stage could be dissected by HRD students who have gotten formal training in conventional and unconventional thought processes. This is the stage where all experiences are brought to work through a conscious to non-conscious continuum. Diverse teams (Payne, 1990), supportive leaderships, ample resources (Tierney, Farmer & Graen, 1999), environments that promote autonomy and risk taking and external competition (Gilson & Blum, 2000) the social network (Perry-Smith & Shalley (2003), and external stimuli such as real workplace problems, real project managers, and real face time with companies can be only some of the mitigating factors for promoting creativity among students in HRD programs. Other avenues for fostering creativity could be solving case studies, theory building, consulting projects, knowledge sharing, or creative centers in which companies could bring their human and organizational problems to get solution paths. These creative centers could become sources of short and long term problem solving and creative relationships between academia and business and industry. In the past these partnerships were primarily with engineering departments, today, however, creativity is a competence for survival with all individuals, groups and organizations. Davenport, Prusak & Wilson (2003) for example, relate that several important business ideas of the 1990s were created or refined in a vehicle specifically designed for creating contact between researchers/consultants and companies – the so called multi-client research programs. In, my ‘Design and management of e-Learning’ course, for example, students are internal consultants to a company on an e-Learning project. The students identified their expertise and formed content, instructional design, usability and technology teams all of which are working together to develop an e-Learning module. Creativity resides with each team as they are now applying their knowledge on teamwork, project management, consulting, communication, accountability, problem solving, research, instructional design, technology for example. This incubation experience enables students to transition to workplaces and immediately have impact on decision making as they can readily assess e-Learning solutions and create changes to impact results.

The final stage, illumination relates to the realization that a discovery has been found – that a solution path has been identified. Bundy (2002) describes the illumination stage as the ‘aha’ which could be the discovery of a new fragment of knowledge, a viable combination of ideas or patterns of knowledge, the discovery of something that always existed, or the creation of something that never existed or serendipity. For HRD students, the illumination phase could be the implementation of a solution in a company, a research project, a paper presentation at a conference, working in a company, a new HRD theory, an organization development model, for example. The illumination stage represents the time where HRD students can reflect on their knowledge gained, their experiences and what they have been able to create as a result of their supportive creative environment.

Overall, the creativity model provides a general view of what can be done to facilitate creativity in HRD programs. While most HRD programs provide environments for rigorous research, conference presentations, journal publications and solving of case studies and while these activities are critical for fostering creativity; HRD programs must also connect with the just-in-time need for problem-solving. Providing students with opportunities and environments at school to become idea practitioners is necessary in the knowledge economy. In essence all the good research, conference presentations and publications, for example, must be leverage in creative ways to make impacts in real organizations. A closer connection between HRD programs and business and industry need to be established. HRD programs with creative centers that are seen as places to get ideas and solutions could lead to a generation of HRD gurus which as Davenport, Prusak and Wilson (2003) relate are people who are boundary spanners. Their exposure to both theory and practice-oriented ideas makes them uniquely suited to develop new business ideas. Torraco and Swanson (1997), and Gilley and Maycunich (1998) have all highlighted the strategic nature of HRD; for HRD professionals to truly be strategic business partners in organizations, their creative problem-solving and decision making skills need to be at the fore-front, having those skills developed and applied in real environments while at school not only gives HRD programs a good name, but also gives students a readiness for success and impact – a critical competence for HRD professionals in today’s fast pace organizations.

In conclusion, this is a preliminary discussion on how HRD programs can become creative at cultivating creativity. From this basic discussion, several recommendations can be deducted. First, HRD programs need to assess how and to what extent they are promoting creativity and problem solving in their programs. Second, HRD programs need to identify a strategic form of introducing and integrating core creativity and problem solving conceptual and skill foundations and opportunities that are tied with business and industry. Lastly, HRD programs need to be at the forefront of the creativity agenda. National Science Foundation this year, for example, had funding resources for research in creativity. Academic environments that not only conduct research but which apply their research in creativity could become leaders in attracting funding and providing best practices and ideas to public and private, for profit and non for profit organizations on how to develop and value creativity among the emerging creative class.

Practise In and Perceptions of HRD: Do we Need an Aesthetic Perspective?

Stephen Gibb
University of Strathclyde

If an aesthetic perspective on practise in and perceptions of HRD is possible what form that might take? The concepts of IAV and EAV are introduced to expand upon this. What can be termed a utilitarian aesthetic is dominant in informing the IAV of practise in and perceptions of HRD. Both challenging this, and developing an EAV perspective on HRD. The implications of these for HRD are considered.

Keywords: Aesthetics, Creativity, Imagination

HRD may be seen to connected with aesthetics, rather than being an ‘aesthetics free’ subject. This can involve connecting practise in and perceptions of HRD with ideas about creativity drawing on personal and cultural judgements on style and appearance, ideas of the beautiful. It extends more broadly to connecting aesthetics based analyses and understanding of people, as agents possessing mind-body-sensibility complexes. In either sense there can be connections between aesthetics and HRD. The concepts of IAV (IAV) and EAV (EAV) are introduced to expand upon this. IAV is defined by identifying the general, ideal properties involved in creating pleasing and delightful experiences; this approach seeks a universalistic template of what is of value aesthetically. EAV is defined, in contrast, by reference to ‘fit’; what is of value aesthetically is to be determined in terms of theories, not a single universal standard. It can be argued that what can be termed a utilitarian aesthetic is dominant in informing the IAV of practise in and perceptions of HRD. There are possibilities in both challenging this, and in the development of in an EAV perspective on HRD. The implications of these for understanding practise in and perceptions of HRD are considered in conclusion.

First, what is meant by practise in and perceptions of HRD depends what HRD is taken to be. HRD can be defined in multiple ways. In narrow terms it may be defined as being concerned with practise in and perceptions of the education, training and development of people in the employment context. Or it can be defined in broader terms as practise in and perceptions of a discipline which is the product of the union of organisational analysis and theory on the one side and Human Resource Management (HRM) on the other. In a narrow sense the concerns of HRD may be seen as theorising and practising around adult learning and development. In a broader sense the concerns of HRD may be seen as an integral part of organising and the management of employment. It is assumed here that both these definitions have a role to play, and each can be considered in relation to aesthetics.

HRD in either these senses can be understood from various perspectives. The psychological, the economic, systems thinking and ethics are all understood to be and accepted to be prominent perspectives (Swanson & Holton 2001). As HRD evolves as a subject other possible perspectives which may be additional to these are encountered (McGoldrick et al 2002). Is a concern with the ‘strategic’ or the ‘international’ or ‘knowledge management’ an additional perspective on HRD, or just a mixture of these primary perspectives in a special context? Should there be an anthropology perspective on HRD, a social psychological perspective on HRD, a ‘critical’ perspective on HRD? These seem to be developments which are being encountered as the subject evolves. These may be developments which are welcomed as part of a burgeoning discipline, or treated with scepticism as intrusions upon the coherence, identity, and boundaries of the subject.

I have some sympathy with each position. If an additional perspective is to be embraced it needs to contribute to the identity of the subject in a distinctive way, and be connected with the core concerns of the subject. Among the developments which may provide an additional, distinctive and connected perspective I would identify what can be termed the aesthetic perspective.

There are two ways in which the term aesthetics is commonly defined. In a narrow sense aesthetics has been concerned with matters of style and beauty, and the processes of delighting the senses (Beardsley 1966). This is most commonly associated with the creation and appreciation of art works and the creation of pleasing objects and environments; and, of course, our creation and appreciation of our selves as human beings. There are some already existing connections with aesthetics in these senses. A concern with design in the development of courses or organisations is, conceptually at least, embedded in HRD. And the concept of aesthetic labour, for example, has generated some debate about how our creation and appreciation of our selves is intimately connected with employment in certain jobs and sectors of employment.

Copyright © 2004 Stephen Gibb
In a broader sense aesthetics involves understanding and exploring the complex of mind, body and sensibility (Howard 1992, Mellander 2001) which people possess and use to make sense of reality. In this sense analysing aesthetics is not confined to understanding the discrete and special experiences of appreciating art, or the dynamics of how style and look matters for specific kinds of people such as employees in certain jobs. It is a perspective on understanding human consciousness and behaviour. It contrasts with rational-logical perspectives (Cazeaux 2000). In the narrow sense then to explore aesthetics is to encounter the processes and challenges involved in delighting the senses; a concern primarily associated with art and design. In the broader sense to explore aesthetics is to encounter debates and challenges about human nature, consciousness and morality; a concern primarily associated with philosophy.

Aesthetics in either of these senses may be relevant to HRD. Is delighting the senses, being like an artist, relevant to HRD? Is understanding the mind, body and sensibility complex, as a philosopher might, relevant in HRD? Some will answer positively; that it is at least relevant in some ways on some occasions. Design permeates all aspects of human endeavour (Lawson 1997, Norman 2001, Farmelo 2002) and HRD is not exempt (Strati & Guillot de Monthou 2002, Shani & Docherty 2003, Bredeson 2003). Others would answer negatively; that HRD is a domain founded on scientific theory and professional practise, and aesthetics are not an essential or integral part of that (Phillips & Soltis 1998, Piskurich et al 2000, Schram 2002).

Figure 1 outlines the different domains in which connections between HRD and aesthetics may be possible. To establish the relevance of aesthetics as a perspective, or dismiss it as outside the domain of HRD, these are the territories of contest. Rather than dealing with each set of connections separately this territory as a whole will be further explored here by addressing three inter-related questions;

- Can practise in and perceptions of HRD be free of aesthetics?
- If practise in and perceptions of HRD are to be informed by aesthetics how is IAV to be understood and analysed?
- What are the theoretical and practical consequences of applying the concept of analysing the external aesthetic value to HRD?

**Can Practise In and Perceptions of HRD be Free of Aesthetics?**

Aesthetics is a concept which is not a normal part of the HRD lexicon. It is not in common use in business and management to discuss practise in and perceptions of HRD and it does not appear in the indices of major HRD textbooks. As such it would seem that practise in and perceptions of HRD are free of aesthetics. For all that trainers and teachers may think of themselves as performers, or that organising may be viewed as like staging a performance, these are just fanciful ways of reflecting on what are essentially non-aesthetic activities. However, if the question is re-phrased to be ‘is HRD theory and practise free of creativity, innovation and imagination?’, then the response may be different (Earl 1987). These concepts have a role and a significance in the context of
adult learning and organising; though again they are absent from the indices of major HRD texts. An aesthetic perspective is just a systematic and methodical way of considering the nature and role of creativity, innovation and imagination in HRD.

The concept of aesthetics was briefly defined above in a narrow and a broad sense. This can be expanded upon. In its most basic sense aesthetics refers to the style and appearance of everyday objects, and the ‘beauty’ of works of art such as poetry, music or painting; and the perception of ourselves. It may also refer more broadly to the experience, the feeling, of a unity and simultaneous engagement of mind, body and sensibility.

Such feelings might be found in nature or the man made; a walk through a garden or an appealing urban landscape. These kinds of experience as well as art appreciation raise matters of aesthetics. In this broader sense human experience is never free from aesthetics. Aesthetics are an essential and integral part of consciousness.

We inhabit a natural and a constructed environment in which the people, objects and experiences we encounter have an aesthetic value. People appreciate a positive aesthetic value in the gardens or urban landscapes or people they encounter. If there is a negative aesthetic value they will feel differently about the garden, urban landscape or person. They may even judge them, in the extreme, to be ugly, offensive, or disgusting. Escaping the influence of aesthetics in this sense, and finding all of equal aesthetic value, is as hard to imagine as is a world in which there is no up or down, no right or wrong, no truth or illusion. What matters is that often there is contest over different judgements about aesthetic value; the same object or landscape or person being of great aesthetic value to one person or group but not of any value to others.

This is the problem of standards. This is manifest in particular around the concept of beauty, and the implications of having standards of beauty which influence our perceptions not just of landscapes and cityscapes but our perceptions of people. For on the one hand are those who seek to define and promote defined and certain standards of beauty. The beauty industry embodies and reflects these concerns, some would argue fixations, with such ideals. On the other hand there are those who seek to deconstruct these ‘myths’ of beauty and challenge their ideological origins and consequences. Underlying this is an argument that things may be perceived and judged aesthetically, but people should not be. Attractive or plain, stylish or casual, young or old, thin or large, tall or short; it should be immaterial, as this is all only skin deep and what matters is under the skin. What is very evident, whether the beauty industry or its opponents are embraced, accepted in parts, or opposed, is that there are no absolute single standard of aesthetic value, of beauty. There is instead variety of personal and cultural tastes. Beauty is in the eye of the beholder, and beholders vary individually and culturally.

For proponents of an aesthetic perspective HRD is not free of these issues. Practise in and perceptions of HRD are enmeshed in aesthetic value. The aesthetic valuing which people engage in, their perceptions of beauty and their combined mind/body/sensibility natures is not switched off when they engage with HRD; they bring this with them to HRD. They bring this with them as practitioners and as users; whether the practitioners are organisation designers, trainers or teachers and whether the users are managers and employees in an organisation, learners or students. One explicit illustration of this is Earl’s (op cit) text on the art and craft of course design. For learning experiences to be effective, valued, liked and efficient it is necessary to give time and attention in the design process to rational analysis of needs and methods, but also to creativity. Earl argues that design needs to combine intuition, creativity and logical thinking. He provides a series of ideas and models about how to realise creative design thinking, and analyses issues in translating designs from the drawing board into practise. Unless attention is given to this the likelihood is that learning will be ineffective, not valued, disliked and inefficient. He offers a list of common flaws in design. Among these are:

- The absence of a special organising anchor at the heart of a course, which provides a simple but holistic point of reference for the whole experience.
- The missing ‘melody’; all kinds of learning experience should have a ‘melody’, with different ‘notes’ which learners expect to be combined if the course is to be ‘in tune’
- The non-integration problem; the bits of a course don’t fit together, as the sequence is faulty
- There is neglect of some of the four different kinds of human need in the course; the physical, intellectual, emotional, spiritual

For proponents of the aesthetic while this is important in itself the really critical point is that such intuition and creativity occurs within a cultures wider system of aesthetic valuing. The standards of aesthetic value in use at large will shape what creativity in HRD can be and will be. That is to say that there is no independent creativity in HRD set apart from the standards of style and beauty in the general culture. The implication is that addition to understanding rational analysis factors such as analysing needs, knowing learning styles, having functional expertise in a subject, and so on, there is an aesthetic factor. There is a process of aesthetic valuing which will inform, for example, course design, and can impact upon learners. This suggests that it is possible to think of HRD outcomes which are satisfying or not satisfying, and ineffective or effective, because of their aesthetic value. These do not have to be absolute aesthetic standards. They may be more a matter of ‘fit’. Where
there is a fit between the aesthetics of a designer and the users of HRD the HRD is more likely to be experienced as satisfying and effective. Where there is a mismatch between the aesthetics of a designer and users of HRD the HRD is more likely to be experienced as dis-satisfying and ineffective. Even if, for example, the HRD designer is a subject expert, who has sought to accommodate learning styles, and has a clear map of needs, the HRD may fail.

The obvious concern then is ‘what constitutes the personal and cultural tastes that shape and inform people’s aesthetic valuing?’ This raises the question of IAV; what is it that an object, experience or person needs to have to be deemed of aesthetic value? Just as the beauty industry or the art world need to track, and create, changing fashions, HRD theorists and practitioners may be enmeshed in a similar dynamic. Instead of a gradual and growing accumulation of knowledge informing practise that leads to a settled and certain understanding of HRD there is rather a need to keep up with changes in aesthetic value, in fashions. Are high performance work organisation still fashionable, or has a newer concept appeared? Is the learning organisation part of this spring’s collection? What are we going to do with e-learning this year?

Another primary domain of aesthetics, and perhaps the one that most people think of, is that associated with art appreciation. Here aesthetics is a special area of concern among those who make up the ‘artworld’. The artworld is made up of the artists, institutions, critics and consumers of art in the contemporary world. In a culture where what counts as art is no longer plain and certain, they are concerned with defining what is and what is not art. For them aesthetics provides a language for defining what is and what is not art. This is a specialised, and many would argue elitist, process. While connections with practise in and perceptions of HRD can be made, this is a difficult site of connection. What makes one pile of bricks ‘art’ and another pile of bricks ‘not art’, raises questions about definitions of art and its function in the modern world, but how the aesthetics of this may be coupled with HRD is not immediately evident. This sense of the external valuing of aesthetics will be returned to, as it is relevant.

The brief analysis above establishes an entry point to addressing the question about the role for aesthetics in HRD. There are immediate points of contact with HRD that can be made. HRD is not aesthetics free. However, the concern here is going beyond the analysis of these separate points of connection, to consider if there are deeper and stronger connections underlying these apparent links. This can be done by further exploring how the concepts, theory and philosophy of IAV and EAV can be applied in HRD.

Intrinsic Aesthetic Value (IAV)

First consider the idea of an IAV; that is, what are the properties that an object, experience or person needs to have to be deemed of aesthetic value? In the main practise in and perceptions of HRD are framed, it seems, in largely utilitarian, functional and vocational terms (Wood 1995, Winch 1998). This is perhaps so commonplace as to seem a non-aesthetic way of understanding HRD. But it is indeed, and exactly, a form of aesthetic understanding. HRD conceived of and discussed in the languages of the utilitarian, functional and instrumental. It is utilitarian as practise in and perceptions of HRD should be informed by the plain, the simple and the austere rather than the extravagant, the ornate and the gorgeous; the aesthetics of the classical portico not the Gaudi house. It is functional as practise in and perceptions of HRD should be informed by the neutral, the mechanical, and the standardised rather than the colourful, the organic and the unique; the aesthetics of the plate glass not stained glass. It is rational as practise in and perceptions of HRD should be based on the straight line, columns of data, and the logical rather than the curved, the harmonies of fuzzy thinking and the intuitive; the aesthetics of the weather forecast not singing in the rain.

The appearance of this understanding of practise in and perceptions of HRD, the classical, plate glass, columns of data, as being non-aesthetic is attributable to the long dominance of an established paradigm for aesthetic value. The origins of this are to be found in the late 19th century. Then the focus of social and organizational development was on transforming institutions. In that period the institutions of concern were diverse and mixed, not just multi-national businesses; hospitals, prisons, schools, police forces, armed forces, government as well as factories and offices were all perceived to need transformation. This transformation from old institutional forms and norms to the new was a process occurring as various ideas which prevailed at the time were mixed and cohered in various ways. Three of the most influential were the idea of bureaucracy, the idea of efficiency and the idea of social positivism. Much has been written about these ideas and their impact on organisation and management. The focus here is only on HRD. Practise in and perceptions of HRD as it evolved in this environment were influenced by these; HRD to fit in had to be more bureaucratic, to be more efficient and to be imbued with social positivism.

One neglected feature of these is their apparent anti-aesthetic influence. For some being bureaucratic, efficient and socially positive combined to produce a way of working not just a form of aesthetics but actually anti-aesthetic. That is to say that matters of style and beauty, of engaging human sensibility, seem not just to be neglected but positively excluded. Arguably it was, and still is, the idea of social positivism which had most impact. The mix and coherence of ideas about bureaucracy and efficiency have changed over time, but social
positivism abides. Social positivism requires and embodies high minded and logical thinking about society and organization. The impact on HRD is that it is to be pursued as a means to the end of progress and improvement. It is to be energetically pursued, and with great ‘seriousness’. An all pervading ‘ameliorative intent’ is the moving spirit. It is impossible to read HRD journals, talk to HRD professionals and academics, and hear papers at conferences without this spirit being very evident.

The purpose and goal of improvement is not lightly conceived or carried. Whether the practitioner is an organisation designer or trainer, or the academic using quantitative or qualitative methods, they share this ameliorative intent. In its early forms, and since, social positivism is welcomed as a robust force for good. It was indeed part of making changes for the good. Through making investment in and support for education, training and development central, and for taking human development seriously, we have much to be grateful as we can enter an era of human capital standing on the shoulders of the giants who made this possible. However, an unintended side effect was the domination of a utilitarian, functional, rational aesthetic. Other conceptions of the task of helping human learning, growth and change as involving different kinds of style, beauty and engaging the sensibilities were not consonant with this package, and remained marginal. Those who thought otherwise were isolated voices, innovating in places but excluded from the mainstream and the normal. An aesthetic of rigour, order, uniformity, discipline, austerity, and seriousness fits with the ameliorative intent. As this has prevailed for so long it appears ‘normal’, and even non-aesthetic. But it is not free of aesthetics. It is a form of intrinsic aesthetic value (see below). The structure, relations and ‘normal’ experiences associated with HRD, from identifying needs to evaluating learning, have been, and still are, shaped by this aesthetic.

Utilitarian, Functional, Rational IAV

- Rigour and order
- Uniformity
- Austere
- Discipline
- Seriousness
- Rational

To appreciate how these ideas about IAV can inform HRD an illustration of what happens if they are challenged can be given. The Scottish Ensemble Orchestra (SEO) is a twelve member orchestra. They are seeking to diversify their income generating activities by acting as trainers for team building in organisations. They plan to do this by offering a full day event on team building. The thinking behind this is that this is a world class team, which forms and learns many times a year, without a conductor. Effective communication in rehearsals is the basis of the world class team. The team is able to attain world class standards with less rehearsal time than others; so they must be really effective as a team. The day event they offer is is based on the following elements;

- They perform a piece for the trainees to demonstrate their abilities
- They then rehearse a new piece in front of the audience
- The trainees then discuss rehearsal in small groups
- They discuss their observations with the whole ensemble
- They then form groups to make their own music
- Things are modified and changed during the composing
- The groups perform their pieces
- Learning about teams is discussed

They offered potential clients a ‘taster’ session, to showcase what they could do, and I attended this. This involved experiencing the early part of the day outlined above and seeing video footage of the latter part of the day as experienced by a group they had practiced the whole event with. The ensemble offering clearly represents a creative and imaginative approach to learning. It is an entertaining means to a serious end. Hearing, seeing, and playing music, being in the presence of world class musicians, is indeed a great pleasure, for music lovers especially. Using this as a means of learning and developing workplace skills related to teams, communication and speed, is a version of the same kind of design found in the adoption of ‘outdoors activity’ based training, and other arts based training, such as working with creators of improvisational comedy or drama. This is fun, and play, but with a purpose.

Observing these artists promoting their creative based training is immensely pleasurable, and satisfying. But who wants creative based training and development? What is the value? Why the interest? How can it be evaluated? By the norms of the discipline of HRD this event broke the aesthetic rules (see below). I found
myself afterwards critiquing this event as failing to fit these norms; and trying to develop analytical solutions to help them take an approach to being trainers that would fit with dominant conceptions of HRD as they are most usually framed. How do arts and business connect in terms of organizational strategy, work performance, professional practise, the credibility of HRD? But this is to miss the point, I then realised. Even as someone who approached this experience in sympathy with their goals I found myself thinking about their performance in utilitarian, functional and rational terms. The point is though that they do not, and cannot, fit with that sense of IAV.

Utilitarian, functional, rational

IAVs

- Rigour and order
- Uniformity
- Aesthetic
- Discipline
- Seriousness
- Rational

SEO; Breaking the rules

The ‘chaos’ of a rehearsal session

Musicians not trainers facilitating

Using the joy and language of music

Participating in experiment and fun

Playing and enjoying

Evaluating the impact of this on teams?

Extrinsic Aesthetic Value (EAV)

Alternatives to the intrinsic aesthetics of the utilitarian as a distinct perspective on matters of human development can exist. They can be seen to have evolved through various analytical movements in the 20th Century. These movements provide a variety of frameworks for the theoretical analysis of the aesthetic and, subsequently, can contribute to explaining and understanding the problems and challenges of human relations and interactions in socio-technical systems of work. These analytical movements include German aesthetics, phenomenology and hermeneutics, Marxism, modernism and postmodernism, and psychoanalysis. There is a case for considering each of these, but that would require another article in itself. Instead the essence of what they offer collectively can be considered.

Vickery (2003) provides a summary of what these seem to offer for reconsidering question of aesthetic value in the contemporary context. The key contribution for Vickery is precisely that they define, and justify, the analysis of aesthetic value in all areas of human concern in opposition to perspectives which adopt an instrumental rationality view of human beings and human nature. These instrumental and rational ways of seeing and thinking have come to dominate the contemporary scene not just in HRD but at large. We inhabit a world dominated by instrumental rationality, where economic value is uppermost and people feel themselves to be managing a constellation of roles that orbit around their economic value; at work or as consumers. Many seem to feel split and fragmented, alienated and bereft, whether they are affluent or not. They seek and attempt to find consolations for this, through forms of therapy and healing which help them attain or affirm a feeling of being a ‘whole’ human rather than a unit of economic value. In the past, Vickery argues, art and high culture functioned as one such consolation, a sanctuary for the alienated soul. Special experiences with some properties of IAV, such as art, music, tourism and the like, compensated for the absence of IAV in the fabric of peoples working and private lives. In relation to the art world, for a work to be art it once had to have IAV.

IAVs Offered via Experiences of Art

- Reflective, contemplative
- Subjective and individual
- Community and shared values
- Authentic expression

The connection with HRD would then be that a alternative to utilitarian aesthetics might be founded upon these properties. HRD that was influenced by these aesthetics would, in contrast to the utilitarian influence, would be reflective and contemplative, subjective and individual, communal and based on shared values, and involve authentic expression (Lieberman 1997, Egan 1992). The contributions of those such as the Scottish Ensemble Orchestra for team building would not then look and feel strange; they would not be seen to be breaking the rules. They would seem entirely plausible and natural, as it would be consistent with these aesthetics. To progress aesthetic connections with HRD might then seem to lead to exploring and validating such an alternative aesthetic. But this too is changing. These old sanctuaries are themselves under siege, and challenging the whole concept of IAV is at the heart of that.
Vickery notes that the other major consequence of these movements, aside from challenging instrumental and rational perspectives on humanity, has been to question the idea of absolute IAV. The attempt to define common properties that embody aesthetic value has been superseded. It is the hermeneutics of reception that matters now, not the defined qualities of a work and their embodiment of IAV. What this means is that a conscious process of interpretation is needed to determine what is and is not art, as this cannot be defined by the qualities of an object in itself. This has the effect of making the determination of aesthetics a matter of EAV. The external factor is most often the institutional endorsement of a work as significant as art. That institutional endorsement is based on an art theory discourse about what counts as art, not the inherent features of the object. Another way of putting this is to say that the esoteric values exoteric values are relevant. Esoteric values are those of the elite, only likely to be understood by those with a specialised interest. Exoteric values are those likely to be understood by the general public. The difference between a Brillo box and a work of art made of Brillo boxes is the endorsement of those with esoteric values. To possess, and believe, and share those values is to then see the art. To neither have, nor believe, nor share those values is to see just a Brillo box. Instead then of providing a sanctuary for the alienated art becomes a forum in which contests about extrinsic aesthetic valuing are encountered. What is of aesthetic value HRD and what is not of aesthetic value in HRD cannot be determined by any defined qualities in an activity. It depends on what those who interpret it, according to their esoteric or exoteric values think and feel.

This gives rise to a whole new framework for understanding aesthetics; as a contest over ‘cultural capital’ among those with esoteric values and their relations with the general public and their exoteric values. What are the implications for HRD? The main implications are that there can be no single substitute for the utilitarian aesthetic. For aesthetic value is only ever constructed within a complex of seemingly arbitrary relationships among an elite, often in contest with general beliefs. Are there parallels with this and the ‘HRD world’?

Conclusions

This review of an aesthetic perspective takes place in circumstances where the primary HRD dialogue is fixed around strategy, performance and major government policy reform. There seems to be little room for the ‘philosophical’ and ‘academic’ language of aesthetics to be adopted here. Yet everywhere else, from the grand scale of the physical environment we inhabit, the buildings and homes, the furniture and products we use, to the detail of the food we require for nourishment everything is now much more consciously and explicitly informed by aesthetics. The concern with the aesthetic challenge is real, and part of progress elsewhere. Why not HRD?

Objections to an aesthetic perspective, and the lines of inquiry associated with it, can be identified. These include objecting to the ‘superficiality’ of concerns with style, the negative or ideological aspects of dealing in constructs of beauty, and the objection that effective HRD is to based on the ‘success’ of psychological models of learning which do not require an understanding of the nebulous unities of mind, body and sensibility. Overall the objection is that engaging with the problems of ‘continental philosophy’ in which the contemporary study of aesthetic is seen to be entangled (Eagleton 1990), is a diversion from the real tasks faced.

Yet the issues raised in the course of considering the nature of aesthetics can be seen to matter for practise in and perceptions of HRD, as either minor or major matters. In a minor sense they suggest a need for creativity, innovation and imagination to be taken more to heart in the world of HRD; there ought to be some discussion of them in major HRD texts, for example. The case for a major role would require seeing the aesthetic perspective as part of confronting in the broadest context concerns with the failing infrastructure of instrumental, functional and rational HRD. The physical, cultural and pedagogic facilities, relations and institutions that embody design methodologies and approaches to education, training and development, or managing and organising, can be perceived to be inadequate in the learning societies, knowledge economies and global culture we are currently seeking to construct. Once again, just as when the instrumental and rational aesthetic came to the fore, there is a requirement for transformational change rather limited reform. The infrastructure we have inherited needs to be questioned, and an aesthetic perspective offers one way of doing that. Is the existing infrastructure up to the job, is it in the right physical and cultural places and is it a socio-technical system allowing us to do the right things? At least some commentators worry that it is not; that the whole edifice of the infrastructure, the buildings, professions, technologies, systems and processes of education, training and development are part of the problem (Laurillard, 2002).

But Gaudi houses, stained glass windows, and rainbows? The team building methods of an ensemble orchestra? Do these parts of an aesthetic analysis add up to a case for an aesthetic perspective or not? This is an initial exploration of the idea of aesthetic value, to help clarify the potential relevance of an aesthetic perspective. Addressing this in full entails exploring and understanding a range of ideas. These stretch back to what Plato had to say on the role of the arts in society and up to current controversies over what ‘art’ is. It raises and involves matters ranging from the morality of censorship to the cultural conditions of effective knowledge creation. These are the kinds of matters opened up for discussion by seeing aesthetics as relevant.
Or is this evidently an indulgence in philosophy which amounts to a distraction from the real tasks of HRD. There are important themes and issues raised; matters of style and appearance, ideas of the beautiful, unity of mind, body and sensibility, and the debates of analytical movements concerned with the aesthetic. These can be interpreted in relation to the concepts and debates of intrinsic and EAV, and this can be applied to thinking about HRD. For individuals, organizations and communities the aesthetic connections with HRD that have been ‘invisible’ are increasingly being seen. The model presented in Figure 1 above is designed to open up the relationship of aesthetics to HRD and issues in HRD as a contribution to that. I would expect there to be some ambiguity still. I do not believe that can be resolved, but rather it may motivate useful thinking about and practise in HRD.

The legitimacy, or otherwise, of exploring these connections depends on seeing HRD as involving an aesthetic, as well as a scientific, enterprise. But suggesting that understanding aesthetic value is central to HRD, in the senses cited above, rather than either materialistic questions associated with ‘economic models’ of human capital or phenomenological questions about constructing better learning organisations, raises further questions. Better understanding aesthetic value can be a means to desired ends, more people involved in better HRD. And it is an end whose pursuit in itself can make overcoming trials and troubles, the vicissitudes, easier rather than harder. Certainly once the associations between human development and aesthetic value are glimpsed it is difficult to ignore the implications these have for all education, training and development, including that in the work and organisation context. Practise in and perceptions of HRD are limited only by one thing; our imagination.

Building Web based Communities: Factors Supporting Collaborative Knowledge-Building

Jennifer Calvin
David S. Stein
Joe E. Wheaton
The Ohio State University

Web based training is utilized by many organizations, yet trainers rate this method of training comparatively low in meeting training objectives. Many trainers indicate that collaboration and communities of practice are key elements in transferring learning to improved productivity. This study examined the role of the development, maintenance and use of Web based communities to increase satisfaction with knowledge gained in college courses. The results indicate that interaction and collaboration, appropriately structured into courses, can foster learning in communities. The study has implications for the development and use of communities of practice to foster continual learning and improved performance in organizations.

Keywords: Collaboration, Community, Knowledge Building

The World Wide Web has the potential to change the way that training and education are provided. Three out of four organizations employing over 100 workers have used the Web to provide training (Galvin, 2001; Kaupins, 2002). In spite of widespread use, trainers continue to rate Web based training methods comparatively low on meeting training and learning objectives (Kaupins, 1997; Kaupins, 1998; Kaupins, 2002; Newstrom, 1980; and Noe, 1999). Among the reasons given are the inability of the web to provide opportunities for collaboration and problem solving skill development. Collaboration in learning and the building of communities of practice in the workplace is now seen as vital in the development of knowledge workers and in the development of a workforce that is able to continually learn and improve performance (Newman & Smith, 1999; and Smith, P.J. 2003), yet trainers do not see Web based training allowing for collaboration and community building.

Other research indicates that Web based learning has the potential to change the dynamics of traditional training. Rather than the instructor solely establishing the conditions for learning, the learner has the opportunity through listservs, chat rooms, and threaded discussions to influence the social, emotional, and instructional environment (Burch, 2001; Jones & Martinez, 2001; Newman & Smith 1999). These researchers believe this influence can be used to create learning communities. A key factor cited in creating and maintaining an online learning community is interaction with both the social and content dimensions of the course (Palloff & Pratt, 1999; Grubb & Hines, 2000; Carabajal, LaPointe, & Gunawardena, 2003).

If trainers are not convinced that web based training can lead to collaboration and the development of communities and if higher education researchers suggest that learning communities can assist in knowledge development then the factors that might encourage the development of collaboration and learning communities need to be identified. This notion of allowing the learners to influence the conditions of learning, through the development of Web based learning communities or Web based communities of practice, may offer a way to reconcile organizations’ desire to utilize the Web for training, the need for the development of communities of practice and trainers’ beliefs that Web based training cannot meet learning objectives.

While this study was set in a large midwestern university, the results have implications for trainers who want to promote communities of practice within their organizations and for the development of collaborative problem solving skills. The study focused on several research questions, which were investigated through both quantitative and qualitative methods. The quantitative methods included logistic regression and chi square tests of independence, while the qualitative methods used semi-structured in-depth interviews and focus groups.

The research questions specifically addressed in the study were: (1) To what extent do structure, interaction, degree of distance, or characteristics of the learner affect satisfaction with learning in a distance environment? (2) In what way is learning orientation related to degrees of distance or educational philosophy? (3) How do learners create, maintain, and use a learning community to foster individual and collective learning? The findings for question three have the most implications for trainers and web based training. Consequently, the findings for the first two questions will be presented briefly while the majority of this paper will focus on question three.

Moore’s theory of transactional distance provided a framework for analyzing the development of online communities and satisfaction with knowledge gained during the learning experience. Moore’s theory describes the transaction of education or learning as being comprised of dialogue and structure, the levels of which vary from course to course (Moore & Kearsley, 1996). Dialogue is a particular type of interaction that advances learning, while structure reflects the flexibility of the course design in accommodating individual learners’ needs (Moore, 1993; Moore, 1991).

Methods

This mixed methods study included 201 undergraduate and graduate students in nine intact classes at three Ohio universities. Courses were of different length, content, and percentage of online versus face-to-face interaction (variable ‘degree of distance’ in the study). With the exception of one course, students had no choice as to the degree of distance. Four instruments were administered to collect the quantitative data. They were: (a) Satisfaction Questionnaire, (b) Demographics Questionnaire, (c) Learning Orientation Questionnaire (Martinez, 1996), and (d) the Philosophy of Adult Education Inventory (Zinn, 1983). Both the satisfaction and demographics questionnaires were researcher developed. Participants in the quantitative portion of the study consisted of anonymous volunteers from the nine courses. Consequently, the number of responses to any given survey varied from a low of 69 (response rate of 34.3%) on the satisfaction survey, to a high of 154 (76.6% responding) on the Learning Orientation Questionnaire (LOQ). The Philosophy of Adult Education Inventory had a slightly lower response rate (142; 70.6%), as did the demographic survey (133; 66.1%).

Question 3 (How do learners create, maintain, and use a learning community to foster individual and collective learning?) was answered through qualitative analyses, which consisted of theory driven open coding of comments from 29 learners who volunteered to participate in semi-structured individual or focus group interviews. Coding of the interview transcripts identified nine themes: (a) dialogue, (b) structure, (c) distance, (d) learning, (e) participation, (f) barriers, (g) community, (h) communication, and (i) reasons to enroll/not enroll in online courses. The results were used to link the quantitative and qualitative results in the following ways:

1. The themes of dialog, participation, and communication were used to connect the quantitative data on interaction.
2. The theme of structure was used to connect the quantitative data on course structure.
3. The themes of distance and barriers were used to explain the lack of statistical significance found in the degree of distance and use of technology.

All data for the study were collected between September 2001 and June 2002.

Results

In examining research question 1 (Do structure, interaction, degree of distance, characteristics of the learner, or the expectations of instructors affect satisfaction with learning in a distance environment?) logistic regression with forward stepwise entry was employed. The dependent variable, satisfaction with knowledge gained, consisted of two categories – high satisfaction or low satisfaction. Structure was found to be highly related to satisfaction with knowledge gained. Interaction was also related, although much less so than structure. None of the other variables (age, sex, level of computer experience, previous web based course experience, learning orientation, educational philosophy, level of education, or degree of distance) were statistically significant. (See Table 1). In other words, if the participants were satisfied with the structure of the course, they were very likely to be satisfied with their learning in the course, and if they were satisfied with the level and type of interaction in the course, they were more likely to be satisfied with their learning in the course.

Correlations examined to answer research question 2 (In what way is learning orientation related to degrees of distance or educational philosophy?) were not statistically significant (Cramer’s V = .15 for learning orientation and .18 for educational philosophy). The qualitative data again supported this finding as learners reported reasons for choosing level of distance that had nothing to do with their learning orientation or educational philosophy.

Research question 3 (How do learners create, maintain, and use a learning community to foster individual and collective learning?) was answered through the qualitative data collected. Learners provided both a definition of community and a description of how these communities developed and were used to aid in their learning. Becoming a member of a learning community provided a sense of social presence and learners seemed to feel this way across all degrees of distance.

**Defining Community**

Respondents indicated that a learning community had for them, the following elements - shared learning goals, a free flow of ideas, and help solving problems from all members of the community. An element of interpersonal connection or trust was also identified as important in attaining a feeling of community.

**Creating a Learning Community**

When asked how they went from being individuals to feeling part of the group or team, the most common response can be summed up by one of the interviewees who said, “We had to!” Most of the learners felt that although they were placed into groups, it was the assignments given within the courses, and the process of working together to complete them that were the keys to becoming a cohesive group, and subsequently feeling that they were part of a learning community. In examining responses from interviewees who felt that community did develop in their course, we found this was true across all degrees of distance.

Not all agreed, however, that the course or the group to which they were assigned created a learning community. For those learners who did not feel that their group became a learning community, it often appeared that the individual was unwilling to socialize or did not have an interest in participation in the course.

I just felt like an independent student. I didn’t try to get to know anybody except for reading their student intros and also with the teacher. [When the student was asked if she felt like she was alone, she responded:] Yes.

**Structure and community creation.** The learners participating in this study concur with Moore’s theory that interaction and appropriate structure aid in learning, and with the notion that social construction of knowledge aids in the formation of learning communities. When the structure of the course requires learners to work together, communities were created and learning was enhanced.

But, that format where you produced a result of your group discussion and compared it with other groups in one way or another I thought improved your learning [she nods]

On the other hand, when learners were not satisfied with the level of structure, learners indicated that there were problems with learning.

They [were] just…not at all structured. There’s no set way, no definite… I’m never sure what they want, so when I sit down to do my work, I’m not sure what I should be doing or what they want me to do or if I’m doing it right…Like I said, I like more structure and only one of them (one of the 14 web based courses this learner took) really had…enough (structure) to make it work.

Whether the learners were working together face-to-face or via the web did not seem to make a difference in whether a learning community was created, however learners who had taken both face-to-face and Web based courses believed face-to-face communities developed more quickly.

**Maintaining a Learning Community**

Some learners felt that the process of community building began with social interaction and shared goals. Trust that others in the group would do their part and provide assistance if needed was identified as a key element in the continuation of a learning community. Working on the assignments allowed some learners to develop a feeling of trust in their community members. For others, working together on a project or assignment was not sufficient to develop and maintain a learning community.

Communication problems were reported as one reason that learning communities did not develop or were derailed after development began. As evidenced by the following comment, it appears that one sure way to erode
trust among the group is to communicate in ways that would be unlikely in a face-to-face course. Basic courtesy seemed to be lacking from some group members.

I found people to be somewhat impolite, more so than I would expect face-to-face. More challenging in an impolite way than I would expect face-to-face. And that’s turned me off. As a matter of fact, the last time I was with my group face-to-face, I said, “I’d like for us to be careful about this as we continue, particularly around the final exam that we’re all starting to do as a discussion chat group,” because it made me uncomfortable.

Good communication and ongoing interactions were identified as factors that maintained the learning communities that were created.

Using Learning Communities

The interviews provided evidence that the learning communities that developed and were maintained throughout the courses played an important role both in students’ learning and in lessening their feelings of distance from each other. Becoming a member of a learning community provided a sense of social presence. Again, learners seemed to feel this way across all levels of distance. One of the learners in a Web enhanced course summed up the use of a learning community rather well:

It’s gotten me more involved. I think just the back and forth between the people – it’s kind of funny because when we go to class we don’t know anybody’s names. On the Internet, during the week when we are having these discussions over the e-mail, we all know everybody’s names and there are like little jokes going back and forth but when you get to class you have no idea who you had these jokes with. I think having them (group interactions) online and having everybody post their opinion or their experience has really furthered it (learning), because everybody in that class has some kind of different experience so, therefore, when they do respond to different discussion postings they give further information. They’re like, oh well this society deals with this or this society deals with this and if you go to this web page - or this is a great book that concerns that - it gives you a lot more things that are not particularly required for the course, things that I may not actually go and do right now but maybe over the summer when I have time I’ll say, oh hey, I remember this guy was talking about this and I need to go look that up and find out more about it. I think that has really fostered more outside learning like without having required it.

These students used their learning communities to enhance their learning. They saw the community as an opportunity to share ideas. Finally, learning communities seem to lower the feeling of isolation for some students.

Interaction and the use of community. For the learners reporting that learning communities formed and that they relied on the community for the construction of knowledge, interactions were deep and meaningful. These meaningful interactions also seemed to help maintain the community throughout the course.

I think they (chat, discussions, and group assignments) added value to the learning experience and helped us be connected.

It gives you different notions too, because otherwise you’re your own compass unless you get other peoples’ feedback, so my experience would have been totally through tunnel vision unless I had inputs coming along the way.

I found it [group interactions] to be very good. We got so much in-depth....

However in some situations, the interaction never reached the depth required to aid learning.

Some people are using it [the discussion board] more as a chat line... than I think for depth of thought issues....

Some of those postings, I ask “what does that have to do with anything we’re reading?”
Overall, the learners interviewed felt that the interaction had at least the potential to aid in their learning and to support the development, maintenance and use of learning communities. In addition, they felt that when a learning community did develop through interactions, their learning was enhanced.

Conclusions and Implications

This study began with three questions. These questions were based on research that indicated that given a choice, learning orientation and educational philosophy would make distance education courses more attractive to some students than to others, that structure and the amount of interaction would be related to student satisfaction with the amount of knowledge gained in a course, and that given the opportunity, students would develop and use learning communities.

The first question (To what extent do structure, interaction, degree of distance, or characteristics of the learner affect satisfaction with learning in a distance environment?) offered mixed results. That is, structure and adequate interaction do lead to greater learning, and it is structure that is the most important, while degree of distance and learner characteristics were not related at a significant level. Why interaction was less important than structure to learning may be related to the more limited experiences of both faculty and students with online instruction. On the one hand, faculty (both in general and in this study) typically have more experience designing courses (i.e., creating structure) than at facilitating interaction in the newer, online environment. On the other hand, the students remarked in the interviews that they had some technical and organizational difficulties in the distance environment. Online assignments are more demanding of the student because they must be opened, read, and then (sometimes) responded to. These steps are more time intensive than listening and commenting in class and require at least some technical skill to accomplish. Combining the logistic regression results with the interviews and focus group comments supports the proposition that student experience with online interaction was more varied and that some students had difficulty adapting to the new environment. These difficulties would account for the smaller effect of interaction on satisfaction with knowledge gained.

The data for question 2, (In what way is learning orientation related to degrees of distance or educational philosophy?), were not statistically significant for at least two reasons. First, except for one course, students were not given a choice in how much of the course was online. Thus, nearly all students in this study were taking courses with at least some distance component, regardless of learning orientation or educational philosophy. Second, regardless of learning orientation or educational philosophy, students appear to be flexible and to have eventually adapted well to the online environment. In summary, the results of the quantitative tests indicate that neither learning orientation or educational philosophy, nor whether the course was taught online or face-to-face is related to satisfaction with the amount of knowledge a student gained. What does emerge, however, is that the structure of the course and the quality of interaction is highly related to self-reported student satisfaction with learning.

The third research question investigated how learning communities developed in face-to-face, Web enhanced or Web based courses and whether the formation and use of these communities was instrumental in a learner’s knowledge development in the course. We had theorized that interaction would be the most important element in both the development of communities and in the learning that occurred as a result. Surprisingly, structure appeared to be more important to these learners. Without clear guidance, and without adequate explanation of what the interactions were to accomplish and how they were to be used, learners did not find the interactions themselves to be useful as an aid to learning or in the development of a learning community. Even in courses we had categorized as highly structured, there were instances where lack of structure interfered with both the development of community and with learning.

The importance of structure in this group of students’ satisfaction with their learning reaffirms the need for instructors to develop clear guidelines and to communicate the purpose of interactions in courses, whether face-to-face or on-line. Specifically, as instructors we need to be clear about what is expected of the student, provide continued support and clarifications throughout the course, and to continue to facilitate the interactions structured into the course. Through these steps we can encourage the creation, maintenance and use of communities as learners engage in the hard work of learning.

The learners developed definitions of community through their own experience with the formation and use of communities that reflect much of the research and the definitions found in the literature. They recognized when the course required them to become a community and when the course got in the way of the development of a community. For those learners in courses where communities developed - and were not derailed by lack of trust, poor communication or lack of guidance by the instructor - this group of learners indicated that the interactions and sharing in the community led to better understanding and fostered further learning outside the course. Chance encounters with two of the interviewees indicate that nearly two years later, these former students are still in contact.
with the community that developed during their courses, and are using the other community members as resources in their work.

This study included courses that were 6-10 weeks in length which may be similar to some training programs. We found that communities could and did develop in this short amount of time when there was adequate structure and facilitation by the instructor. Simply asking learners to discuss topics is not adequate. As instructors, we must explain reasons for the interactions and what learners should expect to gain from them. These learner to learner interactions must be monitored by instructors and the instructor must ensure that group interactions remain cordial and constructive. With regard to learning, members of communities told us that learning was deeper when they were involved in a community. These learners explored subject areas further than the course required on their own, related it to their own work and study situations, and discovered more connections to other areas of work or study than learners who did not feel they were part of a community. This depth of understanding and collaborative knowledge building came from dialogue (interactions) among the members and with the instructor, especially when communications were directed more toward community members than to the instructor. In fact, some of these members still meet and use each other as resources. Once developed these communities, or parts of the communities, do continue and members continue to help each other learn and solve problems. It is this aspect of learning communities that leads to what HRD calls communities of practice – a goal of many training programs. The development of these communities then may reduce the need for additional training and reduce costs associated with formal programs. The development of collaborative communities may also increase the non formal learning that goes on within an organization. Dialogue does seem to foster collaboration and problem solving skills.

This study offers some preliminary findings regarding the development and maintenance of online learning communities. Further research is needed to determine the levels and type of structure required for learners of various abilities. In addition, we need to investigate how online interaction might best be facilitated if on-line communities are to be created maintained and used to aid learning. The types of interaction that best assist learners as well as the factors that interfere with the creation and maintenance of on-line communities also require further study.

The findings of this study suggest that Web based communities can be developed and maintained if learners are encouraged to work together and the support for that collaboration is provided. It is through this support that communities of practice can evolve and assist in translating learning into improved performance on the job.

There Is No “We” in Team: Learning to Learn Across Difference in Problem-based Teams

John M. Dirkx
Michigan State University

Regina O. Smith
Portland State University

Increased emphasis is being placed on working and learning through teams, especially online. While technical aspects of this process have largely been the focus of researchers and practitioners, the emotional dynamics of online teams has received considerably less attention. In this study of online, problem-based learning teams, membership evoked a powerful sense of ambivalence and emotion revolving around difference, authority, and intimacy. Learning to learn across difference involved a re-working of one’s identity as a team member and learner.

Keywords: Teamwork, Group Learning, Learning to Learn

In one educational organization, members of a three-person team charged with developing a new curricular approach for their educational program were excited about the insightful and innovative ideas reflected in the proposal they had constructed. Eager to share their thinking with colleagues, a meeting was called of the larger group of six instructors to outline this new perspective. Shortly after they began to present these ideas, the room filled with tension and several of the other instructors began to aggressively challenge the ideas being presented. At first the team members attempted to defend their proposal, but as the others intensified their criticism, they backed away in resignation and defeat. The proposal was shelved without careful exploration or analysis by the larger group. The team members left the meeting emotionally upset, feeling personally attacked and with little interest in continuing the work.

This anecdotal story underscores the power of emotional dynamics that often permeate workplace teams and groups. Recent organizational literature has been drawing attention to the importance of emotional dynamics in the workplace and workplace learning (Cherniss & Goleman, 2001; Goleman, 1995, 1996; Hochschild, 1983). In a preliminary report of a study of incidents of problem-solving among front-line manufacturing workers, Brockman (2003) found that her study participants often described “problems” that involved relationships and communications with fellow workers, team members, supervisors, and managers. Expecting stories of technical difficulties that arose within the manufacturing processes, she instead heard a number of participants recall incidents that seem to revolve around interpersonal interactions more than they involved technical breakdowns. Their stories suggest that, within the manufacturing process, the technical challenges are often the easiest to resolve. But they are frequently complicated and even exacerbated by the complexity of the human relations issues in which they are embedded.

At the dawn of the twenty-first century, the experiences of these workers reflect a growing reality - life in organizations feels like “permanent white water” (Vaill, 1996), where change is the only constant. As a result, more emphasis is now placed on lifelong learning. Some scholars suggest we recognize the workplace as a primary location for adult learning and development (Welton, 1991), a notion reflected in the idea of the “educative workplace” (Dirkx, 1996). Specific methods used to realize this notion include the learning organization (Senge, 1990) learning communities (Stein & Imel, 2002), communities of practice (Wenger, 1998), and action learning (York, O’Niel, & Marsick, 1999). In one form or another they all stress the importance of group inquiry and emphasize relationships and the development of interdependence in the workplace. Attention to these particular forms of learning in the workplace recognizes the inherently social, collaborative, and constructivist nature of learning (Steffe & Gale, 1995).

Underdeveloped in this view of workplace learning, however, is the role that emotional issues and dynamics play in the overall work and learning of the group or organization, particularly around issues of difference. Work on emotional intelligence (Goleman, 1995; 1998; Cherniss & Goleman, 2001) has helped increase attention to the importance of emotional dynamics within the workplace. This approach, however, individualizes emotions through processes of self-awareness and self-management, and suggests that emotions can be controlled and managed (Hochschild, 1983). Furthermore, this literature provides little explanation as to why emotions arise within
Our interest in this paper is on this problem of difference in online team learning. In our study, we focused on more complex human existence (p. 10). Because of the virtual nature of online teams, this problem of difference becomes even more complex. As Sidorkin (1999) suggests, the difference among teams and individuals is “a central defining condition of human existence” (p. 10). Because of the virtual nature of online teams, this problem of difference becomes even more complex.

Our interest in this paper is on this problem of difference in online team learning. In our study, we focused on developing a better understanding of how difference is manifest and managed by online teams, the emotional dynamics associated with its expression, and the various strategies that teams develop to address difference.

**Theoretical Perspective**

To help make sense of and better understand the problem of difference in teams and their struggles with learning to work across these differences, we drew from dialogical perspectives (Baxter & Montgomery, 1996; Sidorkin, 1999) and psychodynamic group theory (Smith & Berg, 1987). Based on the work of Bakhtin (1984) and Buber (1987), Sidorkin argues that difference is a “central, defining condition of human existence” (p. 10). It is in and through dialogue with others that we realize who we are, our identity as persons. Sidorkin suggests that “the very fact of human existence is contingent upon engagement in dialogical relations…we are truly human only when we are in a dialogical relation with another.” (p. 11). Dialogue connotes “the capacity to deeply receive the other and the capacity to receive oneself; to allow the other a voice and to allow the self voice” (Watkins, 2000, p. 184). According to Sidorkin, “Dialogue is not an activity in a sense that it is not directed toward anything. Dialogue is an end itself; the very essence of human existence” (p. 14). Harris and Saedghi (1987) assert that “‘You’ and ‘I’ are not distinct units but rather part/wholes in the process of creating who ‘we’ are.” If a person is denied recognition as a member of a group, important consequences may result for that person’s sense of identity.

The critical importance of dialogue to group process is reflected in the paradoxical theory of group life (Smith & Berg, 1987). Paradoxical theory helps us better understand “those forces that draw us into repeated oscillations between enchantment and despair over groups” (p. 4). Grounded in a psychodynamic view of human nature and object relations theory, this perspective is concerned with the emotional and psychological processes that exist relatively independent of the tasks that teams face. Group formation and development involves the paradoxical movements of the group taking in the individual member, and the individual member seeking to assert his or autonomy. The individual seeks to become a member but such membership represents a threat to his or her identity. To the extent members perceive this identity as less than fully actualized, development of the team suffers which, in turn, further constrains dialogue and relationships within the team. Life as a team member often has this “damned if you do and damned if you don’t” feel to it. Membership simultaneously evokes fears and hopes among those who participate. According to Smith and Berg, development and change in small groups are characterized by this dialectical, paradoxical movement. But this sense of paradox is also a primary source of feeling stuck, of going nowhere, of spinning one’s wheels. The way through the paradox is to honor the dialectic within the paradox, to stay in dialogue with the conflict, the team as a whole, and its individual members.

This study focused on the following questions: 1) How is difference within online problem-based learning teams manifest? 2) What are the emotional dynamics associated with the expression of these differences? and 3) What strategies do online teams adopt to manage these differences and their associated emotionalities?

**Methods**

In this study, we selected teams of learners participating in an online graduate course in a postsecondary educational leadership development program within a large, Midwestern research university. This setting was selected because the team membership remained stable over a 16 week period, allowing for clear expression of developmental movement and dynamics. Furthermore, a significant dimension of the teams’ work involved collaborative study and decision by consensus. The course allowed for access to eight online teams participating in the same course, controlling for variability that might be associated with different tasks, content, or instructors. While ideally we advocate the study of work teams within their natural environments, numbers and problems of access often make research in these settings somewhat problematic. For this reason, we chose to focus on teams that were confronted
with real-world problems but in a “simulated” context. Because this course is offered for credit and is an integral part of their graduate program, there were aspects of this experience that felt very real to the participants.

The course was designed and implemented using a problem-based format (Bridges & Hallinger, 1995), in which small, heterogeneous teams work to understand and resolve highly ill-structured situations. Participants were purposively assigned by the instructor to teams of three to four learners and the teams stayed intact for the entire semester. Guided by the principles of consensus group work (Bruffee, 1999), these teams were required to collaboratively construct the meaning of the case, what research was relevant to the case, and an appropriate resolution to the perceived problems of the case. The problems were derived from real-world contexts of professional practice, including community college, continuing professional development, and business and industry. Members within a given team shared in the grade for the product, but also received credit and grades for other individual work in the class.

Twenty-five of the twenty-six enrolled learners agreed to participate, consisting of a mix of masters and doctoral level students. Of the study participants, 64% were European-American, 24% were people of color with American citizenship, 12% were International students, and 64% were women. A qualitative methodology informed by a phenomenological perspective was used to guide the overall design, data collection, and analysis. Data sources included a background questionnaire, in-depth participant interviews conducted near or after the conclusion of the course, debriefing papers for each problem written by individual team members, reflective journals maintained by each team member, and archives from team discussion boards and chat rooms. Interview transcripts were analyzed using constant comparative methods. Participants’ papers and journals, as well as archival material were analyzed for evidence that were either positive or negative examples of themes derived from the interviews.

**Findings**

Viewed through the dialogical perspective and psychodynamic group theory, our findings illuminate the emotional complexity involved in fostering the educative workplace through collaborative teamwork. Because the nature of the differences reflected in the data and their associated emotional dynamics are intimately bound up with each other, we report the findings in a more narrative form, reflected in the notion of “lessons”. These lessons suggest the struggle that participants experience in attempting to integrate the voice of the other with the voice of oneself. Learning to work across difference involves recognizing and giving voice to these differences. Giving voice to difference, however, reflects only part of the process. In working across difference, team members must be willing to allow one’s sense of identity as a team member to be reworked and renegotiated through the process.

**Lesson One – Ambivalence as Inherent to Learning in Teams**

Perception of difference within teams creates a profound sense of ambivalence among its members. They want to honor difference but they also see it as an obstacle to achieving common goals. They both desire and fear participation in authentic dialogue. Participants in this study wanted to be able to express who they were as a team member, and to be able to listen to others. Ann explained that an affinity for language “allows [the group members] to assure each other that what one person is saying is being heard generally the same by the rest of the members of the group,” creating a “confidence in exploring, challenging, looking for alternatives, [and] developing consensus.”

In reflecting on their process, Ginger suggested, “Each of us comes from distinctly different backgrounds. Each of us saw the problems from a different angle. In the learning process, that helps a great deal. I appreciate diversity of minds. In the workplace, I have found it critical to have different perspectives on a given problem.” India noted: “Different opinions are exciting because verbally the team members came from different places and they all agreed.”

Reflecting the sentiment of many others, however, Sophia voiced her frustration associated with the presence of difference: “It’s hard to see how things work together and don’t work together, especially when we all have different agendas when we come to the table. How does a paper get written when each person disagrees?” India remarked, “We don’t really write as a group. The group is so diverse that it can be quite challenging to get things done.” In a sense, learners both desire to learn within a group and loathe the group process. This deep sense of ambivalence seems associated with the struggle for individual voice and authority within a growing sense of the group entity.

**Lesson Two – Share Voice as “First Discourse”**

Because of this profound sense of ambivalence, getting much beyond a shared sense of voice in task-oriented teams is exceedingly difficult to accomplish. Sidorkin (1999) refers to this sense of shared voice as “first discourse,” providing “a common text, a shared experience…., a common set of references, a shared language” (p. 75). But in the development of authentic dialogue it is followed by “second discourse,” a level of interaction in which “a word is half ours and half someone else’s” (p. 77). For the most part the teams in this study did not engage one another in the deep, challenging conversations that characterize authentic dialogue or Sidorkin’s notion of second discourse. According to Scarlett, everyone listens but “I don’t think people are willing to challenge points of view.”

14-2
This lack of challenge is prompted in part by a desire to include all voices, regardless of its perceived relevance to the team’s work. Scarlett recalled a time when one of her team members’ contributions to the final product did not seem to fit but she said, “One person can’t decide that one piece doesn’t work, because it is what they contributed. You just can’t throw something out. I mean, you can’t do it even though you know that it doesn’t seem to connect with what the rest of the group has done… It doesn’t seem to be fair. So we were left with just having to put it in.”

In a photographic journal entry, Anne portrays the process of putting together their team’s product. Sheets of 8 ½ x 11 paper with print on them are cut to varying lengths and spread out over a five square foot area of the floor, representing contributions from different team members. Using color markers to code the various parts, the photo portrayed her attempt to assemble these parts into the team’s final report.

Unwillingness to engage one another in authentic dialogue was fueled by the fear that this level of interaction risked raising personal and interpersonal issues that participants were clearly unwilling to engage. Scarlett observed, “Not very many people are comfortable with conflict. I think what happens quite a lot and it seemed to me in our small group was that if there was disagreement, then often times it was just avoided.” This stance created a seemingly no-win situation, in which team members sought authentic dialogue but resisted the self-disclosure necessary for this form of dialogue to occur. Several members perceived their teams as dancing around key issues, rather than confronting them directly and authentically. Such perceptions prompted these members to psychologically withdraw from the teams, further contributing to dissatisfaction in the team and furthering more withdrawal. David, a White-American master’s student, explained that the two female doctoral members of his team, an African-American and a White-American were constantly disagreeing with one another. He comments, “I just sat there and watched the two of them disagree…I did not want to take sides in a three person group.”

Lesson Three – Developing Strategies to Address Emerging Differences

Teams must develop specific strategies to address the differences represented in the establishment of common text. Either they learn to work across these differences, engaging in the difficult but intrinsically meaningful processes of authentic dialogue, or they develop strategies to get around the need to confront and deal directly with their differences. How teams learn to manage their differences holds critical consequences for their future welfare and vitality. At the core of dialogical capacity and working across difference is the ability to allow the voice of the other while maintaining “one’s own voice amidst the fray of relationship” (Watkins, 2000, p. 182). Learning to work across differences involves team members developing a reflexive stance toward the apparent conflict or paradox in which they feel themselves immersed (Smith & Berg, 1987). These members are able to step back from their identification with the conflict and recognize the various ways in which the conflict simultaneously evokes both their desire to engage and fear of what it may involve. In holding opposing truths in consciousness at the same time, they are often able to redefine the issues involved and move through the paradox to new levels of consciousness within the team.

Participants clearly identified and named important differences among their members. Many of these differences identified seemed emotionally-laden, reflecting conflict over participants’ interests, values, or goals. Although they expressed a desire to honor and give voice to these differences, they were unable to effectively work across these differences to break through to a more authentic form of interaction and discourse. As with Autumn, they perceived themselves to be stuck, unable to move through or out of what seemed like a no-win situation: “I have begun to feel like a motorboat that is in gear but can’t move forward across the lake very easily because there is this giant anchor there pulling me backwards. It just doesn’t seem like we are picking up any momentum…I was most ticked this week about how little progress we have made.”

Rather than learning to work across difference, participants developed strategies to get around the problem of difference, further increasing the difficulty of achieving authentic dialogue. One strategy was to psychologically withdraw, evident when members simply didn’t care about the overall team product. They simply wanted it done and over with, an attitude which contributed to a sense of lifelessness in the team. Annie commented: “We were just trying to get through the motions of it rather than the deeper learning that was supposed to come.” This strategy often results in psychological death of the team, if not its literal dissolution. Other teams sought more authoritarian interventions to get them out of their sense of stuckness. In this strategy, members often invited or welcomed a team member or even an outside authority (e.g., a teacher) to step in and take charge, often telling them what needs to be done and relegating team members to a subservient role. Chris, a master’s student noted how she and Ginger, a master’s student, began to depend upon Nard, a doctoral student. “She took the bull by the horns and just went with it and we totally appreciated that…Nard always knew her…content…She’s going for a Ph.D. and so she has been taking classes longer… that was really helpful… having another person in our team who could kind of make it flow for us.”
Discussion

Fostering of the educative workplace, through the use of such approaches as the learning organization, action learning, learning communities and communities of practice, places the self in potential dialogical relationship with the “other.” In so doing, we surface difference and create the need among the learning team to learn to work across these differences, “to differentiate and integrate the self’s and the other’s point of view” (Watkins, 2000, p. 180). These findings suggest the difficulty involved in creating conditions of authentic dialogue in learning teams and learning to work across difference. These difficulties derive from the very reasons that make dialogue so meaningful and important. The process is emotionally laden and intimately bound up with an evolving sense of self-other relationships within the team. It evokes powerful feelings of uncertainty, ambiguity, and ambivalence among team members, who seem to both desire and loath team membership. Despite their best intentions to honor difference and to hold these within a dialogical frame, team members seem vulnerable to paralyzing feelings of despair, alienation, or helplessness.

But such emotions are not negative in the sense of unwanted or undesirable. Although they may feel quite painful, they represent messengers from the team’s depth (Dirkx, 1997), letting members know about aspects of its life unattended. They help us keep in mind the multiple and conflicting truths that make up any given social context. Such messengers remind us that conflict in team life is something to be lived and embraced, rather than something to be “resolved” through appeal to authorities external to the team, by withdrawing, or by “fixing” the problem through more effective communication skills. It is only through authentic dialogue with an “other” that we are able to fully realize who we are as persons, our sense of identity within that particular social context. Yet, it is this very possibility of openly confronting and working on our sense of self that engenders fear within team members and makes such relationships and interactions so difficult. Learning to live amidst and within difference is to learn to be human (Sidorkin, 1999). To avoid difference or run from it is to ultimately run from the self. As Watkins (2000) suggests, “the dialogues of social interaction are both creative of the self and liberating of the self” (p.185). Engaging in an authentic process of creating who we are “is unfortunately a responsibility which many of us are unprepared to bear in times of interpersonal conflict” (Harris & Saedghi, 1987).

Conclusion

Difference gives voice to the fundamentally paradoxical, emotional nature of group life. To fully enter into dialogue with these paradoxes makes problematic one’s sense of identity as a group member, creating ambivalence towards the group, others, and towards oneself. It is within this relationship of difference that team members are challenged to learn and to grow. It is through a recognition and appreciation of difference that members experience a sense of newness or novelty (Mahoney, 1991) and are encouraged towards change and development. This sense of newness, however, is only fully grasped when team members learn to hold and work through the tension of the opposites that characterize the sense of paradox in which they find themselves (Smith & Berg, 1987).

The difficulties experienced by the members of these online teams in learning to work across difference reflect the emotional dynamics encountered by the face-to-face curriculum team in the opening anecdotal story. While the virtual context adds levels of complexity not readily apparent in face-to-face contexts, the difficulty of constructively entering into and addressing the powerful emotionality associated with the teams’ processes seems equally apparent in either context. Effective team processes are intimately bound up with self processes. To be truly effective and to engage in second level discourse, individual members need to, paradoxically, be willing and able to let go of preconceived notions of their own sense of identity in order to truly find their individual identity as a group member. This claim holds profound implications for organizations as they seek to construct the educative workplace. The face-to-face and online teams that constitute the contexts for organizational learning will only thrive in environments that fully support authentic engagement of both one’s self and the other. Anything else, as the saying goes, seems like rearranging the deck chairs on the Titanic.

Teaching the Ins and Outs of Evaluation in Organizations

Hallie Preskill
University of New Mexico

Darlene Russ-Eft
Oregon State University

This session examines evaluation within a theoretical framework based on evaluation theory and practice, organizational learning, and systems thinking. It will present these concepts, along with a practical five-phase approach to evaluation. The session will engage participants in two experiential and interactive activities that convey these concepts within an education or training setting. We will conclude with a discussion on methods for incorporating experiential and interactive methods to promote learning about evaluation in organizations.

Keywords: Evaluation, Systems Model, Teaching

The purpose of the session is for participants to consider alternative ways of teaching evaluation to HRD students and practitioners. This will be accomplished by engaging participants in two teaching/learning activities. Implications of using these activities will also be discussed.

Goals

The goals for the session are for participants to:

• Learn about a framework for teaching evaluation.
• Understand the importance of using experiential and interactive approaches when teaching evaluation.
• Experience two different activities that could be used to teach evaluation.
• Discuss interactive approaches to teaching and learning.

Session Content

Organizations are increasingly asking their employees to evaluate the processes and outcomes of their training, organization development, organizational learning, performance improvement, and instructional technology efforts. As a result, graduate education programs in HRD, Adult Education, and Organizational Learning, in particular, are offering courses on evaluation. In addition, HRD professionals are seeking workshops on the topic of evaluation in order to implement evaluations within their organizations.

Evaluation, as we understand and practice it, is a process for enhancing knowledge and decision-making within organizations and communities. It involves answering questions and/or addressing issues through the collection and analysis of data about programs, systems, processes, procedures, products, and services. As such, it is best implemented as a systematic process that is planned and purposeful, and with a clear intention of using the evaluation findings.

An evaluation system is comprised of several components (Preskill & Russ-Eft, 2002). Our framework for evaluation is based on the theory and practice of evaluation, organizational learning, and systems thinking. (Argyris & Schon, 1996; Finger & Brand, 1999; Fiol & Lyles, 1985; Katz & Kahn, 1978; Patton, 1997; Preskill & Torres, 1999; Senge, 1990; Wheatley 1992). The evaluation framework suggests that evaluations occur in five distinct phases, and is influenced by three components of an organization’s context.

In the Focusing phase, the evaluator and stakeholders determine: (a) the background and history of the evaluand (that which is being evaluated), (b) identify other stakeholders who might be interested in using the evaluation’s results, and (c) develop the questions the evaluation will seek to answer. This process is fundamental to ensuring that the evaluation addresses various individuals’ and groups’ concerns and issues. The second phase involves determining the evaluation’s design, methods of data collection, and means for implementation. Here, the evaluator determines which data collection methods (e.g., surveys, tests, interviews, observation, document reviews) will most effectively answer the evaluation questions. The third phase focuses on analyzing the data collected, as well as

Copyright © 2004 Hallie Preskill & Darlene Russ-Eft
interpreting and assigning meaning to the data. The fourth phase of the evaluation process is communicating and reporting the evaluation findings to the stakeholders and other identified audiences. Developing project management plans constitutes the fifth phase, though it often begins before or is concurrent with the other phases. Evaluators may develop several different plans including a time-line, a roles and responsibilities plan, a communicating and reporting plan, a plan of options in case obstacles are encountered during the evaluation’s implementation, and a budget (Russ-Eft & Preskill, 2001). Finally, the five phases of the evaluation process are situated within an organizational context that includes three components: 1) Evaluator Characteristics, 2) Political Context, and 3) Intended Use of Findings. This context may significantly affect an evaluation’s commissioning, design, implementation, and reporting of findings.

The teaching of evaluation to HRD graduate students and other professionals requires some experience and knowledge about the field of evaluation. Yet, there are few evaluation resources for instructors and trainers on this topic in the field of HRD (though there is a great deal of this information in the evaluation field).

**Format and Timetable**

In this session, we will introduce participants to a systems model of evaluation. We will then engage participants in two teaching and learning activities that illustrate innovative and practical ways for teaching evaluation to HRD students and practitioners (Preskill & Russ-Eft, in press).

The first activity, called “Images and Purposes of Evaluation” is related to the Focusing phase of the evaluation process. This activity helps participants articulate their current perceptions of evaluation; what it is, why it is done, how it is performed, and the impact it has on individuals and organizations. The activity provides a means for the facilitator to discuss various definitions of evaluation, the concepts of formative and summative evaluation, the differences between quantitative and qualitative data, and how others perceive evaluation. This activity will enable participants to: a) Reflect on their assumptions and experiences regarding evaluation, b) observe how different people perceive the value of evaluation, and c) understand the various definitions, purposes and types of evaluation.

The second activity, titled “Ethical Dilemmas and Debates,” is related to the Political Context of the evaluation. This activity introduces participants to several resources on ethical issues in evaluation, specifically Michael Morris’ column in the American Journal of Evaluation, the Guiding Principles for Evaluators from the American Evaluation Association (Shadish, Newman, Sheirer, & Wye, 1995) and The Program Evaluation Standards (Joint Committee on Standards for Educational Evaluation, 1994). This activity will enable participants to (a) examine an ethical dilemma faced by an evaluator, (b) identify possible actions to resolve the dilemma, and (c) potentially debate with other groups the action choice.

It is hoped that this session will increase participants’ interest in finding alternative ways of teaching evaluation, and will stimulate their interest in learning more about how to teach or train others about HRD evaluation. The format for this session is experiential and interactive.

Context beyond Culture: Implications for Human Resource Development

David Ripley
Irene Hudson
The University of Canterbury

This exploratory study examines employee perceptions of work environment issues in 17 work settings in seven Asia-Pacific countries. Site data were compared using coefficients of concordance (Gibbons 1971). Differences and similarities were not as one would expect to find based on research concerning cultural differences in those same countries (Hofstede, 1980, 2001; Hall, 1976), indicating that relying exclusively on national cultural differences would not be a sufficient guide for determining HRD policies and practices.

Keywords: Cross-national, Context, Culture

Cross-national similarities and differences in employee perceptions of issues in the work environment in 17 organizational work settings were examined for seven Asia-Pacific countries; Australia, Malaysia, New Zealand, Singapore, South Korea, Taiwan, and the United States. Employees at these 17 sites completed the Performance Environment Perception Scale (Ripley, 2003), which asks respondents to indicate their degree of agreement with statements about work environment issues. Site data were compared using coefficients of concordance as described by Gibbons (1971) at three levels of analysis; sites within countries, groups of countries, and all sites. Data were analyzed to determine if the differences and similarities in responses found reflected those one would expect to find based on previous well-known research concerning cultural differences in those same countries (Hofstede, 1980, 2001; Hall, 1976). Results indicated that differences and similarities were not as one would expect to find based on national cultural differences. Therefore, we suggest that for these sites, relying exclusively on national cultural differences would not be a sufficient guide for determining human resource development (HRD) policies and practices. We believe this has important implications for practical application because determining the appropriate HRD practices for various locations can help determine organizational performance (Bernardin, 1989; Gilbert, 1996; Thompson, 1993).

Problem and Importance of the Study

While our purpose was exploratory, we did expect that study results would tend to reflect the cultural groupings of countries suggested by the work of Hofstede and Hall. Our rationale was that employees' perceptions about conditions in the work environment would reflect what their organizations and management groups were attending to. Further, we expected that these organizations and management groups would be attending to those things that are considered important in that culture and that attention would be reflected in these organizations' practices. Therefore, we expected that employee perceptions of work environments would tend to be more similar intra-nationally and among countries that tended to group naturally in Hofstede and Hall's work and would tend to be more different inter-nationally and among countries that did not group naturally in Hofstede and Hall's work. The study was designed to determine the extent to which the differences and similarities we find reflect those one would expect to find based only on culture. This has important implications for HRD practitioners. To the extent similarities and differences are surfaced that are not in keeping with expectations based on national culture, directions for further research are suggested and important questions are raised concerning the extent to which the determination of HRD practices for local work sites in various national settings can or should be based on cultural considerations without due regard for other contextual aspects.

Conceptual Framework

Employees work in organizations that pursue their aims in contextual settings that go beyond culture (Cheng, 1989). Whether a country has several distinct cultures or one dominant culture, organizations in that country must operate in a context that also includes the economic system, the political system, and the legal system. Further, employees in different regions of the country (e.g. urban vs. rural regions) or with differing demographic characteristics may have different concerns. Brewster (1999) has noted, in relation to the contextual approach to strategic human resource management, that the strategy literature in Europe is arguing for a careful understanding of complete

Copyright © 2004 David Ripley & Irene Hudson
national contexts while recognizing that local areas may have differences. In regard to HRD, Kuchinke (2003) has asked “How, for example, might the implementation of organizational learning ideas differ in large and small organizations? In urban and rural areas? In the health care sector and the mining industry?” (p. 295). Small and large, urban and rural, different industries – all these occur within the same national cultures. McKenna (1998), in discussing global corporations’ attempts to develop global behaviors, noted that “It may be more useful for such professionals to develop local approaches that take into account the realities and perceptions of the ‘local world’” (p. 113). In fact, the idea of distinct national cultures is not accepted by all as a given. Myers and Tan (2002) have pointed out that the concept of national culture may be problematic to begin with, since “ethnic and cultural groups can exist across many nations” (p. 24). They take issue with the idea that cultural differences are in some way aligned with the boundaries of the nation-state.

However, many articles from the popular HR literature, a primary source of guidance for many seeking to implement HRD programs, appear to focus on national cultural differences as a basis for the development of human resource practices, without due regard for other aspects of context (Addison & Wittkhun, 2001; Hao, 1999; Ketku, 1999; New Arthur Anderson, 2000; Milliman, J., Taylor, S., & Czaplewski, A., 2002; Poe, 2000; and Roberts, 2000). This emphasis on culture has also been seen in the HRD literature (Civelli, 1997; McGuire, et al. 2002). We suggest that context beyond what is perceived as national culture, particularly at site-specific level, is a significant concern for those involved with HRD in any part of the world.

The Cultural Dimensions of Hofstede and Hall

We selected the work of Hofstede and Hall because it is very well known and has provided the basis for subsequent studies by many other scholars. Sivakumar and Nakata (2001) tell us that between 1981 and the first half of 1998, 134 conceptual and empirical studies had made use of Hofstede's framework and further, that Hofstede's *Culture's Consequences* was cited 1,101 times in the Social Sciences Citations Index from 1987 to 1997. Hall, while not as frequently cited as Hofstede, is very well known for the high-context vs. low-context paradigm in national cultures (1976) and is still cited extensively as a key source in articles related to cross-cultural communication (Singh et al. 2003; Downing et al. 2003; Kersten et al. 2002; La Ferle et al. 2002; Koshiba & Parker, 2001; Babcock & Du-Babcock, 2001; Du-Babcock & Babcock, 1996). His work is particularly relevant to the Asia-Pacific region we study because of the significant degree of contact between high- and low-context cultures (e.g. as western businesses move into Asian Pacific Rim countries and vice versa). There are of course, many other scholars who have done significant work on culture (Trompenaars & Hampden-Turner, 1998; Laurent, 1983, 1986; Haire, Ghiselli, & Porter, 1963). However, the exploratory study was our primary focus and it was not our intent to compare the study results to all possible cross-cultural paradigms. Hofstede and Hall were considered sufficient for our purposes.

Determining the Country Groupings

Hofstede published extensively on differences in national cultures in the early 1980s (1980, 1983a, 1983b, 1983c, 1983d). The initial study used an existing data bank covering matched populations of employees in national subsidiaries of IBM in 64 countries, although only the data from 53 countries was found to be statistically useable (Hofstede, et al., 1990). Hofstede's initial work (1980) indicated that national culture consisted of four dimensions; power distance, uncertainty avoidance, individualism vs. collectivism, and masculinity vs. femininity. According to Hofstede, power distance deals with the acceptance of unequal power in organizations; uncertainty avoidance has to do with the extent to which people feel threatened by ambiguous situations; individualism refers to the tendency of people to fend for themselves and their families; and masculinity deals with the degree to which values such as aggressiveness and materialism are found versus such values as concern for relationships and quality of life. In the more recent edition (2001) of *Culture's Consequences*, he added a fifth dimension, long-term vs. short-term orientation. Hofstede (2001, p. 354-355) points out that this is the same dimension that Bond has called Confucian work dynamism (Hofstede & Bond, 1988, Bond & Mai, 1989), but suggests that this name can be misleading since some non-Confucian cultures score fairly high in this dimension and since some Confucian values are found in both poles of the dimension. What Hofstede calls long term orientation contains values such as persistence, ordering relationships by status (and observing this order), thrift, and having a sense of shame. What Hofstede calls short-term orientation includes values such as personal steadiness and stability, protecting your “face”, respect for tradition, and reciprocation of greetings, favors, and gifts.

Reviewing Hofstede's data on his original four dimensions in *Culture's Consequences* (2001), we find that our study countries fall into two groupings on three of the four -- power distance, individualism, and masculinity. The first group is Malaysia, Singapore, South Korea, and Taiwan, and the second group is Australia, New Zealand, and the United States. The same cannot be said for the uncertainty avoidance index however, where South Korea and Taiwan rank above Australia, New Zealand, and the United States, while Malaysia and Singapore rank below those three countries. In the more recent long-term orientation index, Singapore, South Korea, and Taiwan group together,
as do Australia, New Zealand, and the United States. Data is not available for Malaysia since the data for the long-term orientation dimension came from a later study involving students from 23 countries (Hofstede, 1997, p.166). With the exception in the uncertainty avoidance dimension, we can generally say that, using Hofstede's dimensions, we would expect in this study to find that Malaysia, Singapore, South Korea, and Taiwan would tend to group together and that Australia, New Zealand, and the United States would tend to group together, since those groupings hold true for four of the five dimensions.

Hall’s work (1976, 1989) suggests that in a high-context culture, much of the important information is not found in the words of actual transmitted communication, but is found in the context in which those words are used. On the other hand, in a low-context situation, the major part of the important information is in the actual transmitted communication -- the words themselves are much more significant (Gudykunst, 1997). As Hall put (1989), "A high-context (HC) transaction or message is one in which most of the information is either in the physical context or internalized in the person, while very little is in the coded, explicit, transmitted part of the message. A low-context (LC) message is just the opposite; i.e., the mass of the information is vested in the explicit code" (p. 91). Generally speaking, certain cultures, such as those in Asia and the Middle East, tend to be high-context. Other cultures, such as those in North America and other English cultures, tend to be low-context (Munter, 1993). When viewed from this perspective, Malaysia, Singapore, South Korea, and Taiwan group together as countries with high-context cultures, and Australia, New Zealand, and the United States group together as countries with low-context cultures.

The data relating to Hofstede’s cultural dimensions and Hall’s high-context, low-context categorization as it applies to the countries under discussion are summarized in Table 1. The numbers in the cells in Table 1 are the scores on the indices used by Hofstede for each of his cultural dimensions. Hall’s high-context, low-context categorization is shown in the last column on the right.

Method

Samples and Sites

Participating scholars collected data from samples taken from the general staff employee populations of 17 universities in the seven countries -- Australia, Malaysia, New Zealand, Singapore, South Korea, Taiwan, and the USA. These seven countries were selected specifically to provide two sets of countries that grouped naturally using Hofstede's (2001) five dimensions of culture and Hall's (1976) high context-low context differences, as discussed previously. In addition, Malaysia, Singapore, South Korea, and Taiwan are all in the group of countries that have been termed the little tigers or little dragons economic groups (Lee, 1998; Nieh, 2002; Park, 1998) as opposed to either the larger economies such as the Peoples Republic of China and Japan or the smaller Asia-Pacific economies.

Separate university settings were selected to eliminate the potential impact of a common organizational culture, such as might be present in a multi-national corporation. General staff employees were selected as the category of university employees considered to be most representative of the culture of the specific site of the university, and to provide vocational commonality among the samples. Samples were purposive insofar as the selection of the general staff category of employees, but accidental in terms of the actual participating employees, since participation was voluntary and anonymous. Across the 17 sites, 2,961 employees agreed to participate. Sample size ranged from a low of 44 employees to a high of 514 employees. For convenience, we labeled South Korea, Malaysia, Singapore, and Taiwan as the East group, and labeled Australia, New Zealand, and the USA as the West group. The participating universities are shown in Table 2.

The sample of 2,961 employees is 61% female (94% of the sample provided this information). This is more the case in the West group countries (66%) than in the East group countries (52%), and is the general pattern in all countries with the exception of South Korea, where the country sample is 60% male. One South Korean site had a male proportion of 75% and the other a male proportion of 49%. The sample population of the East group was generally younger than that of the West. A rough approximate age was calculated by applying sample decade percentages to the midpoints of the age range data collected. This would indicate about an average age difference of about seven years; age 36 for the East group and age 43 for the West group.

Five of the nine eastern sites indicated private ownership. All of the western sites indicated public ownership. However, discussion with participating scholars suggests that this data needs to be treated with a degree of caution. Governments are significantly involved in the funding of many ostensibly private institutions and exert a significant degree of influence on their operations. The West group of sites is generally larger than the East group. While both groups have three sites in the >20K category, four of the five remaining West sites are in the 10-20K category. Of the remaining six East sites, three are in the 5-10K category and three are in the <5K category. The West group of sites is generally older than the East group. Five of the eight West sites are over 100 years old, while only one East site approaches that category – Korea University at 98 years old. Seven of the East group sites range from 3 to 22 years old, while the three newest West sites range from 27 to 65 years old.

As one would expect, there is a relationship between site size and site age. We assigned values to the size ranges approximating their relative size (>20K = 50, 10-20K = 40, 5-10K = 20, <5K = 10) and compared these values to site age. In the East group, size is strongly and positively correlated (0.79) with the age of the site. The West group also has a positive, but less robust correlation (0.29). However, the age of two of the newer West group sites (Edith Cowan in Australia and Penn State – Harrisburg in the USA) may be understated for our purposes. Both institutions have educational history that precedes their official designation by these names.

**Instrument**

Participating employees completed the Performance Environment Perception Scale, which asks employees to indicate their degree of agreement with 60 statements about items in the work environments, each of which has been shown by previous research to impact upon employee performance (Ripley 2003). For three countries (South Korea, Malaysia, and Taiwan), the instrument was translated under the direction of the participating scholars, using appropriate procedures to ensure that original meanings of statements were retained. The participating scholar in Singapore elected to use the USA English version. Minor wording changes from the USA version were made for New Zealand and Australia to reflect the usage of English more common to these countries. The instrument, and the research it is based on, can fairly be said to have a western bias. However, no changes to reflect uniquely eastern issues were made in the instrument for employees from South Korea, Malaysia, Singapore, and Taiwan. Thus employees in all samples responded to the same instrument, which allowed comparison of results, as was considered appropriate for exploratory research.
Procedures and Results

We first examined the similarities and differences in the exploratory results and then compared those results to what we would expect to find based on Hofstede’s cultural dimensions and Hall’s high-context low-context paradigm. This involved comparisons of participant responses, using coefficients of concordance (Gibbons, 1971). Kendall’s coefficient of concordance reflects the degree of agreement, or concordance, among sets of data and allowed us to compare samples of different sizes. The concordance procedure was also selected because it was appropriate given that some of our samples were relatively small ($n < 100$). We made comparisons at three levels, or hierarchies, of analysis; namely the various sites within the individual countries, the two groups of countries (East and West), and all sites taken together. For each level of analysis, we compared lower quartile, median, and upper quartile responses. Due to length limitations for this paper, detailed results cannot be provided here.

Summary of Results

While our primary purpose was exploratory, we did expect that study results would tend to reflect the clusters of countries based on national cultures as represented by the East and West groups. The findings of our study do not appear to support these apriori expectations.

Our first level of analysis, sites within countries, showed mixed results. In the West group, all sites were internally concordant within their country. In the East group however, Singapore was not concordant internally when using the lower quartile values, and both Singapore and Korea were not concordant internally when using the median and upper quartile values. However, the degree of concordancy for sites was not uniquely aligned with the cultural grouping (that is, East group or West group) of countries within which the site was situated, as was evident from the site-to-site comparisons of coefficients of concordance. For example, many East group sites were concordant with West group sites, particularly at the lower quartile and median value levels. So the proposition that sites would tend to be more different internationally is not strongly supported. The proposition that sites would be more similar intra-nationally, while generally holding for the West group, is likewise not strongly supported, given the lack of concordancy between sites in the East group.

At the second level of analysis, looking at the two groups of countries, there are also mixed results. In the West group, all countries were concordant at the lower, median, and upper quartile values. However, in the East group, this is not the case, and some interesting results emerge. Both Malaysia and Taiwan, for example, are concordant with each of the individual West group countries (and each other) -- at all levels -- except with Australia at the upper quartile level. However, Malaysia and Taiwan are not concordant with the Singapore and Korean sites in most cases. It seems clear that we cannot strongly support the proposition that groups of countries will tend to be similar along the lines of national cultural groupings. While that case can be made for the West group, it cannot be made for the East group.

Our third level of analysis was to look at all sites and countries together. This was done first by a simple comparison across all sites. We found significant concordance across all sites at the lower, median, and upper quartiles. The significant degree of concordance across sites and countries would tend to reinforce what we found at the second level of analysis; namely that we cannot strongly support the proposition that these countries will all tend to be similar along national cultural lines and so separate into two clearly defined yet distinct groups.

There are also a number of points that can be discussed in connection with the participants’ age and gender, as well as site characteristic data. There is a difference in age between the East and West groups. Had we found significant lack of concordance between the two groups, this age difference could have been a contributor. It should be noted, however, that some of the dissimilarity could be due to the relatively high percentage of participants at the Malaysian sites (29%) who chose not to indicate their age range when completing the instrument. Since these Malaysian sites are relatively new and somewhat technologically focused, one can speculate that older employees might have been reluctant to provide their age, perhaps perceiving they were in a youth-oriented organizational culture, and not wanting to advertise their difference. As the instrument was completed anonymously, the participating scholar for these sites could not retrieve participants’ age.

Gender data is also quite interesting. The West group generally had a higher percentage of females responding at their sites. In the East group, K1 was the only site with a male majority responding. One can speculate that this could have a bearing on K1’s lack of concordance with many other sites. Malaysia is interesting in that one site has a 50/50 gender split while the other has only a 55/45 female majority; yet Malaysian sites exhibited considerable concordance with Taiwanese sites, and Taiwan had a 70/30 female majority. As with age, there were a high number of Malaysian participants (24%) who opted not to provide gender information.

There are differences between the East and West Groups in all three characteristic of the sites that we examined – public or private ownership, size of the site, and age of the site. However, since concordance results
indicated there were no significant differences between the East and West groups when all sites were examined together, we cannot say these differences were significant to the study at the group comparison level of analysis. Nevertheless, site size and site age could partially explain some of the lack of concordance within the East group, particularly at the median and upper quartile. For example, site K1 differs significantly from both Malaysian sites in site age and site size, and is not concordant with Malaysia at the median or upper quartiles.

Conclusions and Implications

The results suggest to us that HRD practitioners should consider context beyond culture in developing human resource development practices for the sites examined in this study. Our initial expectations -- that employee perceptions of work environments would tend to be more similar intra-nationally and among countries that tended to group naturally in Hofstede and Hall's work and would tend to be more different inter-nationally and among countries that did not group naturally in Hofstede and Hall's work -- were not strongly supported. Results suggest that as one moves to a finer level of analysis -- in this case from an overall look at all sites to a site-by-site comparison -- more and more differences begin to emerge. For example, the two South Korean sites are not consistently concordant, and the results certainly give us opportunity to consider possible reasons. One site is in Seoul, the capital of the country and the other in Pusan, a more regional location; one is private while the other is public; one site is approximately 40 years older than the other; and finally, the demographic characteristics of the respondents differ. It seems to us that it would defy logic if the two groups of employees did not view the work environment somewhat differently. We consider such differences to be important, and the sort of beyond-culture type aspects we should be taking into account in the development of HRD policies and practices. Doing so could have an impact on the success of HRD efforts; employers who respond to these aspects may find they have enhanced the effectiveness of their programs.

We add that we do not conclude from this study that national culture is not important and can be ignored. For example, Newman and Nollen (1996) found that work unit performance within a multi-national organization was higher when management practices were congruent with Hofstede’s dimensions (although only partly so in the case of uncertainty avoidance). This would support the proposition that practices from one country will not automatically be effective in another, and we agree. But beyond this, our study suggests that intra-country levels of differences in work groups means that one should not base HRD practices only on national culture when moving into other countries, but should take other contextual issues into account as well, particularly at the site level.

Future Research

Since the samples in this study were not random, we cannot attempt to generalize the results for all university general staff, or to other industries and locations. However, our exploratory results raise some interesting questions and we hope others will see fit to continue research in this area of the broader, beyond-culture context of work environments as it relates to effectiveness in HRD programs. We felt a number of issues from this study could bear further investigation. For example, while all sites taken together are concordant at all levels, the number of site-to-site comparisons indicating a lack of concordance increases as one moves from the lower to the median to the upper quartile comparisons. What is the reason for this? Would this pattern hold true in another study? Further, would West group sites continue to be concordant while East sites were not? Are there in fact sub-groups as the data indicated was possible? Would selecting sites from a single organization make a difference, as the impact of organizational culture was felt? Are there implications for HRD of the answers to these questions? Finally, could there be a basis not only for different HRD practices for employee groups at sites with different demographics, but even different practices for different sub-groups of employees at a single site?

The data related to age and gender influences on employee reaction to and perception of the work environment that surfaced in this study were quite interesting and will be the subject of another paper. We suspect there are significant implications for HRD in this area as well.

Intercultural Training for Business Expatriates: Cultural-Specific Training Needs of US Business Expatriates on Assignment to Taiwan

Tien-Chen Chien
Gary N. McLean
University of Minnesota

US companies’ expansion across political boundaries requires personnel to work in foreign facilities with vastly different local cultures. Intercultural training facilitates adjustment to the foreign environment and improved interaction with host country nationals. This study assessed US expatriates and their Taiwanese colleagues and identified knowledge and skills needed for assignment in Taiwan. The study focused on knowledge of the host country, relationship building, interpersonal communication, business protocol, legal, and living issues.

Keywords: Expatriates, Intercultural Training, Culture-Specific Training

Continually improving information and communication technologies are accelerating business globalization. Globalization has become an inevitable trend in today’s business world (McLean, 2001). As businesses expand into global marketplaces, the number of expatriate employees grows. The success of employees who accept foreign assignments is becoming more important to the headquarters in their home countries. To cope with global competition, businesses are in need of employees who are able to work effectively with people from a diversity of countries and cultures.

As the first little dragon to emerge from Asia, Taiwan took advantage of its close strategic ties with the United States to become one of its major trading partners (Vogel, 1991). That economic relationship was expected to grow even further following Taiwan’s (Republic of China, or ROC) entry into the WTO (World Trade Organization) in 2002. Therefore, business encounters between US Americans and Taiwanese are likely to occur more often than before in the international business arena.

Researchers have found significant differences between the Chinese culture and Western cultures (Blackman, 1997; Bond, 1991; Hofstede, 1993, 2001; Williams & Bent, 1996). Business interactions between people from different countries often fail due to cultural differences. In particular, expatriates sent by US multinational companies have a much higher failure rate than those of European or Japanese multinational companies (Tung, 1988). The cost of failed international negotiations and failed expatriate assignments is high (Latham, 1988). To prevent problems in this area, it is necessary for US companies to provide effective intercultural training for their expatriate employees.

Statement of the Problem

Despite the rapidly increasing business contacts between the United States and Taiwan, limited research has addressed the specific training needs for expatriates in Taiwan. This study intended to discover cultural-specific training needs of US business expatriates on assignments to Taiwan. The study assessed Taiwan culture training needs of US business expatriates from the perspectives of both US expatriates and their Taiwanese colleagues and compared the perceived importance of these intercultural training needs between these two groups.

Theoretical Framework

Today, Western businesspeople visiting Taiwan’s major cities, such as Taipei or Kaohsiung, may find few differences between these modern cities and those in the West. On the surface, people who work in the commercial centers of Eastern or Western countries dress the same, commute the same, and occupy similar office buildings. However, how people conduct business is embedded in their traditions and cultural norms.

Cultural Dimensions

Culture is “the customs, worldviews, language, kinship systems, social organization, and other taken-for-granted day-to-day practices of a people which set that group apart as a distinctive group” (Scollon & Scollon, 2001, p. 139). From this perspective, culture has a significant impact on the development of individuals’ values, beliefs,

Copyright © 2004 Tien-Chen Chien & Gary N. McLean
and worldviews. It further influences their behavior and activities in everyday life. Many anthropologists and social scientists have studied culture. Some of them have attempted to classify culture. In Hall’s (1959) *The Silent Language*, culture was considered as a form of communication. Hall and Hall (1990) identified four dimensions of cultural differences based on communication patterns: (1) high-context/low-context, (2) space, (3) time, and (4) information flow.

In his book, *Culture’s Consequences*, Hofstede (2001) stated, “culture is to a human collectivity what personality is to an individual” (p. 10). He defined culture as “the collective programming of the mind that distinguishes the members of one group or category of people from another” (p. 8). Hofstede (2001) studied IBM employees in over 50 countries in the 1960’s and developed five main dimensions of cultural differences: (1) power distance, (2) uncertainty avoidance, (3) individualism and collectivism, (4) masculinity and femininity, and (5) long-term versus short-term orientation. In Hofstede’s (2001) study, Taiwan was found to have larger power distance than the United States. Taiwan had stronger uncertainty avoidance than the United States. The United States had a higher score in masculinity than Taiwan. The United States ranked the highest on individualism, while Taiwan scored low on this dimension. The United States ranked low on long-term orientation. In contrast, Taiwan was found to be highly long-term oriented.

Trompenaars (1998) described culture as “a shared definition of a situation by a group” (p. 20). Culture can be observed through “social interaction, or meaningful communication, presupposes common ways of processing information among the people interacting” (p. 20). Culture is to human as water is to fish. People need it; however, they are usually not aware of it until they are no longer in it (Trompenaars, 1998). According to Trompenaars (1993), culture can be examined through five dimensions: (1) universalism versus particularism (relationships and rules), (2) collectivism versus individualism (the group and the individual), (3) neutral versus emotional (the degree to which feelings are expressed), (4) specific versus diffuse (how much people get involved), and (5) achievement versus ascription (how people achieve status).

Gannon (2001) analyzed cultures of 23 countries and categorized them into groups. He used American football as a cultural metaphor to describe the U.S. American culture and the Chinese family altar to describe the Chinese culture. According to Gannon (2001), countries can be grouped into four types of cultures: (1) authority-ranking national cultures (collectivism with high power distance), (2) equality-matching national cultures (individualism with high power distance), (3) market-pricing national cultures (individualism with low power distance), and (4) community-sharing national cultures (collectivism with low power distance). The United States falls into the category of market pricing. In market-pricing cultures, individualism is emphasized. Countries with this type of culture are also market-dominated. Since it is free market, inequality resulting from this operation is acceptable (Gannon, 2001). Gannon (2001) stated that some cultures should be analyzed beyond the boundary of nations. The Chinese are considered to be an ethnic group, regardless of the nation in which they reside. Chinese tradition is deeply influenced by Confucianism (Gannon, 2001). The Chinese highly respect their ancestors. They are very family-oriented. “The family is the basic social unit through which all are united in a relation-based system” (Gannon, 2001, p. 435). Characteristics of Chinese culture can be symbolized by the Chinese family altar (Gannon, 2001).

Apparently there is a gap between the US and Chinese cultures. Coping with this issue, many US multinational companies hire Chinese Americans as middle people to bridge the gap between East and West (Blackman, 1997; Lam, 2000). These Chinese Americans have the experience of living in mainland China, Taiwan, or Hong Kong, and are hired by US companies to work in these areas. They are then expected to deal with two different legal, social, and political systems, two negotiation styles, two languages, and two sets of expectations (Lam, 2000). Simply relying on Chinese Americans to function in the middle should not be a long-term solution to this personnel problem. Multinational companies need to pay more attention to the training and development of their expatriate employees (Lam, 2000). In addition, the experience of working overseas is very helpful to the development of global leadership (Oddou & Mendenhall, 2000). Business expatriates can become important human resources to companies, especially those with international or multinational operations (Mendenhall, 2001).

**Intercultural Training**

Intercultural training helps expatriates understand culture differences, provides information and knowledge of a specific culture, and helps reduce emotional challenges (Brislin & Yoshida, 1994). Effective intercultural training can help expatriates adjust to the host culture and enhance job performance (Black & Mendenhall, 1990). Researchers have found that intercultural training in general is effective (Black & Mendenhall, 1990; Deshpande & Viswesvaran, 1992; Morris & Ribie, 2001).

Since intercultural training has broad goals and objectives, it is difficult to determine what exactly should be taught in training. Goodman (1994) proposed a list of knowledge areas that intercultural training should provide for international executives that included both culture-general and culture-specific training. First, international
executives need to understand the role that culture plays in international business. Then they need to know the history and geography of the host country; the social, demographic, and business trends of the country; and the country’s politics and economics. They should understand that there are different communication styles between cultures and should know about the verbal and written communication, as well as the nonverbal communication of the culture with which they are dealing. International executives need to learn introductions, greetings, and proper use of people’s titles. They also need to know about entertainment and gift-giving in the foreign country. Other than the above, international executives should know the cultural differences in marketing, sales, quality, packaging, decision making, negotiations, and managing (Goodman, 1994).

Brislin and Yoshida (1994) recommended that intercultural training programs should cover four areas: (1) awareness of culture and culture differences; (2) knowledge of a target culture or facts that are accepted within a culture, as they are necessary for adjustment; (3) emotional challenges that trainees will encounter and how to cope with anxiety and stress when they are in a different cultural environment; and (4) acquiring skills and adopting appropriate behaviors of a specific culture. Brislin and Yoshida (1994) also stated that culture-specific training was to provide learners with the knowledge of a specific culture. They concluded with several themes of culture-specific knowledge: “(a) work, (b) time and space, (c) language, (d) roles, (e) importance of the group and importance of the individual, (f) rituals and superstitions, (g) hierarchies: class and status, and (h) values” (p. 45).

Smith (1993) interviewed 10 US business executives who had the experience of working in Taiwan and found that it was necessary for US business expatriates to acquire knowledge and skills in the following areas: (1) building relationships and trust with their Taiwanese counterparts; (2) understanding the history of Taiwan and the political issues between Taiwan and the United States, mainland China, Hong Kong, and Japan; (3) being familiar with communication patterns of their Taiwanese counterparts and being able to deal with communication problems; (4) understanding Taiwan’s business protocol and how business is conducted in Taiwan; (5) knowing about the Taiwan market, sales opportunities in Taiwan, and Taiwan’s marketing strategies; and (6) understanding behaviors and attitudes of their Taiwanese counterparts in order to know how to perceive them, feel about them, and respond to them.

Research Questions

The study attempted to find answers to the following questions:

1. To what extent are specific intercultural knowledge and skills perceived to be needed by US business expatriates in Taiwan?

2. Do differences exist between US expatriates and their Taiwanese colleagues in terms of the perceived importance of these intercultural training needs?

Research Methods

Participants

This study used the survey method to assess the opinions of US business expatriates and their Taiwanese colleagues. However, it was impossible to identify and locate all US businesspeople who were in Taiwan at the time the study was conducted. To determine the population of US business expatriates in Taiwan, a membership directory was obtained from the American Chamber of Commerce in Taiwan. Approximately 1,000 individuals who represented 600 corporations were listed in the 2001-2002 AmCham Membership Directory. It was assumed that Chinese Americans and US citizens who had Chinese ethnicity in their background had been influenced previously by Chinese culture. Therefore, members with Chinese names were eliminated from the list. US subjects who responded that they had Chinese ethnicity in their background were excluded from the study as well. This study also excluded US government agents because they were not business expatriates. Those who had addresses that were not in Taiwan were also eliminated. The final total was 283 individuals from the AmCham in Taiwan who became the target population of the study. Since the number of the population was small, there was no need to sample the population. All 283 people were surveyed.

To determine the Taiwanese subjects, each US subject was asked to recommend two of his or her Taiwanese colleagues to participate in this study. However, between the two Taiwanese subjects, only one was to be used for this study. This was done to avoid giving the subjects a sense of obligation to participate. It was also used to increase the response rate of Taiwanese subjects. US subjects who responded to the survey but whose Taiwanese colleagues did not were not used in this study. The same decision rule was used for those Taiwanese subjects who responded to the survey but whose US colleagues did not. For US subjects who responded to the survey, if both of their Taiwanese colleagues returned the survey, a random selection was used to decide which one to use in the study.
In the first mailing, 283 surveys were sent to US subjects. Thirty-seven surveys were returned because of bad addresses. Among the new total of 246 surveys, 67 US participants and 81 Taiwanese participants returned the questionnaire. These were matched as 64 pairs. An additional 182 surveys were sent as follow up. After the second mailing, 14 additional US participants and 16 additional Taiwanese participants returned the questionnaire. There were 14 additional pairs matched. Therefore, a total of 81 US subjects returned the questionnaire for a response rate of 32.9%. A total of 97 Taiwanese subjects returned the questionnaire for a response rate of 19.7%. Seventy-eight pairs were matched, for a paired response rate of 31.7%. Table 1 lists responses after the first mailing and follow-up, total responses, and total response rates.

Among the 78 US subjects, 82.1% were male and 17.9% were female. All held US citizenship, and none had Chinese ethnicity in their background. Of the US subjects, 73.1% had a spouse or significant other with them in Taiwan, and 39.7% had a child with them in Taiwan; 48.7% of the US respondents had more than 10 years of international work experience, and 33.3% had 1-3 years of work experience in Taiwan. Among the 78 Taiwanese subjects, 50% were male and 50% were female. All held ROC (Taiwan) citizenship, and all had Chinese ethnicity in their background. Most of them (44.9%) had the experience of working with a US expatriate for at least 10 years.

**Instrumentation**

A survey questionnaire was developed for the study to assess subjects’ opinions on the intercultural training needs of US business expatriates in Taiwan. Twenty-six items were identified as knowledge/skill needed for US business expatriates in Taiwan. They were grouped into six categories: (1) knowledge of the nation, (2) relationship building, (3) interpersonal communication, (4) business protocol, (5) legal issues, and (6) living in Taiwan. The scale ranged from 1 to 5 (1 = not needed; 2 = little need; 3 = some need; 4 = much need; 5 = extremely necessary) to measure the extent to which each item is needed by US business expatriates in Taiwan. The questionnaire also contained questions to collect subjects’ demographic information. Open-ended questions and space were provided for comments and suggestions.

To develop the questionnaire, the researcher created a draft questionnaire based upon Smith’s (1993) findings. After the draft was created, ten people were requested to review the questionnaire to ensure its validity. They included five US expatriates with experience working in Taiwan and five Taiwanese with the experience of working with US expatriates. Changes were then made in accordance with their suggestions.

A Chinese version of the questionnaire was created by the researcher and was reviewed by a Taiwanese who is fluent in both Chinese and English. Then, a US American who has Chinese language training back translated the Chinese questionnaire into English. The back-translated questionnaire was then compared with the original English version of the questionnaire to ensure that the questions in the two languages delivered the same meanings. Revisions in the translated version were made until it was deemed that the two questionnaires were asking for the same information. In the questionnaire for the Taiwanese subjects, each item was written in English (for those who preferred to work in English), immediately followed by its Chinese translation.

After the questionnaire was developed, a pilot study was conducted. Four US businesspeople who had experience working in Taiwan and four Taiwanese who had experience working with US business expatriates participated. The results of the pilot study suggested that there were no obvious problems in the questionnaire.

Reliability of the instrument was established based on actual questionnaire results. The Cronbach’s alphas were .76, .90, .66, .85, .83, and .88 for categories 1 through 6, respectively. The overall alpha was .90.

**Procedures**

Before the questionnaire was mailed to the US subjects, a pre-notice letter was sent to inform them of the survey. Then, the survey was sent to the US subjects by airmail from the United States. Each envelope contained one copy of the questionnaire for the US subjects, two copies of the questionnaire for distribution to their Taiwanese colleagues, a cover letter to US subjects, two cover letters (with Chinese translation) to Taiwanese subjects, and three addressed return envelopes. In the cover letter, all US subjects were asked to give the Chinese questionnaires to two of their Taiwanese colleagues. Each questionnaire was assigned a code number. For each questionnaire sent to the US subjects, there was a number that matched the one assigned to their Taiwanese colleagues. This was
intended to help the researcher pair US participants with Taiwanese participants. These numbers also served as an identification code to protect the respondents’ anonymity. A follow-up contact was made to the US subjects at about four weeks after the first mailing.

**Limitations**

This study surveyed US business expatriates and their Taiwanese colleagues. However, only 246 US Americans in the American Chamber of Commerce in Taiwan were surveyed. Since the scope of the study was small, generalizability of study findings is limited to this target population. Moreover, a 31.7% return rate is low. Many subjects who received surveys did not return them. The response rate among the Taiwanese subjects (19.7%) was much lower than the US subjects (32.9%). Because this study asked US expatriates to distribute the questionnaire to Taiwanese subjects, the IRB only approved one follow-up to US subjects. Therefore, a non-respondent investigation was not appropriate due to the anonymity of participants. It is not known if a 100% return rate would have resulted in different findings.

**Results**

**To What Extent Are Specific Intercultural Knowledge and Skills Perceived to Be Needed by US Business Expatriates in Taiwan?**

Among the 26 items rated by the US subjects, “the relationship between Taiwan and mainland China” has the highest mean, followed by three items with the same mean: “business ethical standards in Taiwan,” “the way business is usually conducted in Taiwan,” and “the negotiation strategies used by Taiwanese business people.” The top 3 items with the highest means rated by the Taiwanese subjects were “the way business is usually conducted in Taiwan,” “how to deal with situations when communication problems occur between them and their Taiwanese associates,” and “how to build social relationships with their Taiwanese associates.” Both US and Taiwanese subjects perceived “how to communicate with Taiwanese people in Taiwanese” as the least needed for US business expatriates in Taiwan.

**Do Differences Exist between US Expatriates and Their Taiwanese Colleagues in Terms of the Perceived Importance of These Intercultural Training Needs?**

Data collected from 78 US subjects and 78 Taiwanese subjects were analyzed using matched pairs t-tests. Between-group differences for the overall 26 items and each category were examined. Results from matched pairs t-tests indicate that there is a significant difference between the US subjects and Taiwanese subjects in the perceived importance of the overall items, t(2027) = 4.597, p < .01. While the US subjects perceived the items, overall, to be needed more than the Taiwanese subjects did, the difference is quite small (.11). The results of the matched pairs t-test of all items are shown in Table 2. Matched pairs t-tests were also calculated for each category. The results indicate that there is a significant difference between the US and Taiwanese subjects in categories 1, 2, 4, and 5 (see Table 3). US subjects generally perceived “knowledge of the nation,” “relationship building,” “business protocol,” and “legal issues” as more important than Taiwanese subjects did. There were no significant differences between the US and Taiwanese subjects in category 3, “interpersonal communication,” and category 6, “living in Taiwan.”

Discussion

This study found that both US expatriates and their Taiwanese colleagues believed that it is necessary for US expatriates to acquire knowledge and skills in all the six areas of the survey. US subjects generally believed that the overall items are needed more than their Taiwanese colleagues did. They particularly perceived more need in categories “knowledge of the nation,” “relationship building,” “business protocol,” and “legal issue.” This can be explained perhaps by the fact that, since the US subjects themselves are business expatriates, naturally they experience a strong need to acquire cross-cultural knowledge and skills, particularly in those four areas.

Knowledge of the Nation

The study agrees with Brislin and Yoshida (1994) that intercultural training should provide knowledge or facts of a target culture. This also supports Goodman’s (1994) suggestion that cultural-specific training include the history, geography, and politics of the host country. Both groups in this study suggested that it is important to know the people in Taiwan. This item was not listed on the questionnaire; it should be considered for inclusion in future research. This study also confirmed Smith’s (1993) finding that US business expatriates need to understand the relationship between Taiwan and mainland China, and the role of the United States in Taiwan-China relations.

Relationship Building

The Taiwanese have a longer-term view of business than US Americans (Hofstede, 2001). Since good relations and friends are important to the Taiwanese, they generally put more time into relationship building before doing business (Smith, 1993). Results of the study are congruent with Smith’s (1993) conclusion that it is critical for US expatriates to know how to build relationships and trust with their Taiwanese counterparts. This study found knowledge/skills in “relationship building” and “interpersonal communication” to be important learning needs for US expatriates. This indicates that adjustment to interacting with host-country nationals is essential to expatriate adjustment (Black, Gegersen & Mendenhall, 1992).

Interpersonal Communication

Previous literature reported that business expatriates should be aware of different communication styles between cultures (Goodman, 1994). They need to learn the verbal and non-verbal languages of the host country (Brislin & Yoshida, 1994; Goodman, 1994). This study found that it is important for US expatriates to understand different communication patterns across cultures and learn how to deal with situations when communication problems occur. In terms of language training, since many US expatriates communicate with their Taiwanese associates in English, it is not critical for US expatriates to learn Mandarin or Taiwanese. US expatriates need to learn how to communicate in Mandarin if they are on an extended assignment; however, if they plan to stay in Taiwan for a short time (less than 2 years), they can get by with only English. This study found low importance from both groups for US expatriates to acquire Taiwanese language skill despite the fact that it is a major dialect in Taiwan. Although it is not a necessity, some respondents suggested that US expatriates will find it helpful if they can communicate with Taiwanese people in Taiwanese.

Business Protocol

Smith (1993) found that one theme for US business expatriates success in Taiwan was to know Taiwan’s business protocol. The current study provides evidence of the importance of understanding Taiwan’s business protocol for US expatriates. Items grouped in “business protocol” and “legal issue” are learning needs related to work. This indicates that work adjustment is an important dimension of expatriate adjustment (Black et al., 1992).

Legal Issue

When doing business, Taiwanese tend to believe in the importance of good relationships, while US Americans tend to emphasize rules and laws (Kenn & Lacy, 1994; William & Bent, 1996). Taiwan’s legal system is quite different from that of the United States. Smith (1993) stated that legal issues were recognized as learning needs, but they were not considered as a critical factor to US business expatriates’ success in Taiwan. Findings of the current study show that both US expatriates and their Taiwanese colleagues perceived legal issues to be important learning needs for US expatriates in Taiwan. This does not contradict Smith’s findings. It may not be critical, but it is important for US expatriates to know legal issues in Taiwan.

Living in Taiwan

In the three-dimensional model of expatriate adjustment proposed by Black et al. (1992), besides work adjustment and interaction adjustment, the third dimension was environment adjustment. In this study, items in “living in Taiwan” were learning needs related to adjustment to the general non-work environment. They were found to be important learning needs for US expatriates in Taiwan.

Another noteworthy finding is that some Taiwanese participants stated that US expatriates were too arrogant. They seemed to believe that they were superior to Taiwanese and did not respect them or their culture. Even some US participants pointed out that US expatriates needed to be aware of cultural differences and learn to respect a
different culture. This indicates that there is a lack of cultural-general sensitivity, perhaps arising from a lack of training, among US expatriates.

Conclusions

This study found that both US expatriates and their Taiwanese colleagues believed that US expatriates need to acquire knowledge and skills in: (1) knowledge of the nation, (2) relationship building, (3) interpersonal communication, (4) business protocol, (5) legal issues, and (6) living in Taiwan. US expatriates believed that they had a need for more knowledge overall and in four of the areas than did their Taiwanese colleagues: knowledge of the nation, relationship building, business protocol, and legal issue. The study also found that US expatriates are in need of intercultural training; however, their companies have not paid enough attention to this area. Not only is cultural-specific training needed, but there is also a lack of cultural-general training among US expatriates in Taiwan.

Recommendations for HRD Practice and Research

The following suggestions are recommended for practitioners when developing and implementing intercultural training for US business expatriates going on assignment to Taiwan.

1. The training should include the general knowledge or facts about Taiwan. US expatriates need to know the history, geography, and politics of Taiwan. They need to know the different groups of people in Taiwan, as well as regional cultural differences of Taiwan. It is particularly important for US expatriates to know the relationship between Taiwan and mainland China, Taiwan and the United States, and the role of the United States in Taiwan-China relations.

2. The training should provide US expatriates with the knowledge and skills in building relationships with their Taiwan associates. US expatriates need to understand the importance of family and friends to the Taiwanese. They need to know the role of social relationships in business and learn how to build and maintain good relationships with their Taiwanese associates.

3. The training should include the knowledge and skills in interpersonal communication. US expatriates need to understand that there are different communication styles between cultures and know the communication patterns of Taiwanese people. It is very important for them to know how to deal with situations when communication problems occur between them and their Taiwanese associates.

4. The training should include Taiwan’s business protocol. This includes the way business is usually conducted in Taiwan, how business meetings are usually conducted, and the negotiation strategies used by Taiwanese business people.

5. The training should include legal issues related to doing business in Taiwan. US expatriates need to know about Taiwan’s legal system, the use of contracts in Taiwan, business ethical standards in Taiwan, and Taiwan’s government regulations for business.

6. The training should provide US expatriates with information about living in Taiwan. This includes the life styles of people in Taiwan, the food and dining conditions, the commuting conditions, the housing conditions, and the schooling conditions in Taiwan. The training should provide information about the social support available to US expatriates in Taiwan and how to access it. The training also should inform US expatriates about how to cope with natural disasters, such as typhoons and earthquakes.

7. US business expatriates need intercultural training. Companies working across country borders should pay more attention to this training. In addition to cultural-specific training, companies should provide cultural-general training for their expatriates.

There is a need to study a broader group of US expatriates in Taiwan. This will add validity and expand generalizability of these findings. Future research should expand the questionnaire used to include the items that surfaced in this study in response to the open-ended questions. Second, a model for Taiwan culture training should be developed and its effectiveness should be evaluated. Future studies can focus on the development and refinement of the model. Another suggestion is that although there has been an abundance of literature on intercultural training, rarely has research been done on Taiwan cultural-specific training. More studies need to be done in this area. For instance, future research can investigate the intercultural training needs of US expatriates in different occupations. Future research also can examine the relationship between intercultural training and gender. Finally, there is a lack of theory developed in the literature on intercultural training. More research needs to be done to generate knowledge that can contribute to theory building in intercultural training, especially in Taiwan cultural-specific training.

Connecting Cross-Cultural Training Transfer with Performance

Anne Wang Drewry
Wal-Mart Stores, Inc.

Vickie J. Stout
University of Tennessee

Brian Walker
Wal-Mart Stores, Inc.

Based on existing frameworks and supported by empirical data, the paper suggests a positive relationship between individual factor, self-efficacy, the transfer of the cross-cultural training (CCT) process, and expatriate performance. The research builds upon and extends previous transfer of training literature, which only focused on domestic settings and concentrated on non-cultural contexts. The reported study linked training transfer theories with CCT studies and yielded invaluable insights that contribute to new knowledge in human resource development.

Keywords: Cross-cultural Training, Transfer of Training, Self-efficacy

As corporate education and training continues to grow into a multi-billion industry, U.S. businesses keep investing heavily in training their workforces. While the training industry appears to be blooming in the domestic markets, cross-cultural training (hereafter referred to as CCT) for expatriates also seems to be receiving more attention. A recent survey showed that overall expatriation rates are climbing, although some areas are seeing less international assignees (Windham International, 1999). A more recent national Global Relocation Trends Survey (2001) reported that even though there was a slowdown in the growth of expatriate population in the U.S. due to the impact of the terrorist attacks on September 11, 2001, the vast majority of the participants (96%) did not plan to change their global relocation programs. Morris and Robie (2001) also reported in the Global Best in Class Study: Summary Report (Cuthill, 1997) of 32 Fortune 500 companies identified as Best of Class, 94% of these multinational firms offered at least a language training program for international assignees, and 69% offered some additional form of cross-cultural training. An Industry Report of 2002 showed that U.S. firms project spending $54.2 billion on training in 2002 (Galvin, 2002), yet other studies showed that only 15% of the companies measured training transfer, which was defined as the effective and continued application to trainee jobs of the knowledge and skills gained in training (Garavaglia, 1993). How much of the training has been transferred and what was the return on the investment have become the key questions companies ask.

According to Ford and Weissbein (1997), previous transfer literature was based upon various types of training. Training content or tasks included specific technical training such as card sorting (Crafts, 1935), hitting a target button with a rotor (Digman, 1959), human behavior training such as behavior modeling of assertiveness skills (Baldwin, 1987), coaching and handling employee complaints (Decker, 1982), and meeting, negotiation, team, and communication skills (Brinkerhoff & Montesino, 1995). None of the training transfer literature recorded training pertaining cross-cultural content. Yet, “transfer of training is particularly meaningful for the organization that invests heavily in an expatriate” (Morris & Robie, 2001). An urgent need persists for bridging the gap between transfer of training and cross-cultural training.

Despite the neediness for the cross-cultural training, the previous CCT literature primarily focused on the effectiveness of alternative instructional approaches (Gannon & Poon, 1997; Black & Mendenhall, 1990). Other cross-cultural research has targeted intercultural adjustment and personality variables such as self-efficacy and self-monitoring (Harrison, Chadwick & Scales, 1996). In their rather comprehensive assessment of the cross-cultural literature, Kealey and Protheroe (1996) itemized several criteria for reliable empirical research on the effectiveness of CCT, and pointed out the strengths and weaknesses of the major studies to date on the issue. Morris and Robie's study (2001) was one of the few which tied CCT with performance and adjustment, although their study still did not take the viewpoint of training transfer. They pointed out that even though progress had been made in bettering training design, there were no specific strategies for improving the performance of expatriate managers, and that transfer of training was particularly critical for organizations that invested heavily in expatriates.

Problem Statement

While the majority of previously conducted transfer of training studies concentrated on the transfer of training in domestic settings, it was evident that study of transfer in the area of cross-cultural training for U.S. expatriates has been ignored, in spite of the growing importance on this type of training. The absence of examining the transfer of training in the cross-cultural area has made it difficult for organizations to measure how much of the training has been transferred to real job performance, thus resulting in inadequate and inefficient use of CCT, and therefore affecting the success of multinational corporations’ overseas operations.

This study focused on the perception of expatriates receiving cross-cultural training with an emphasis on self-efficacy. The researcher studied the influence of self-efficacy and other selected demographic variables on the transfer of cross-cultural training and in relation to performance.

Research Questions Hypotheses

The researcher’s empirical investigation of the linkages between self-efficacy, CCT, and performance adds to the literature of two adjacent fields of study—transfer of training and cross-cultural training. Using the expatriate perceptions of the transfer of cross-cultural training as the foundation for the survey used in this study, the researcher attempted to answer the following questions:

1. Does the expatriate’s perceived level of self-efficacy increase the transfer of the cross-cultural training?
2. Do demographic characteristics such as expatriate tenure, level of education, gender, age, marital status, level of foreign language competency, and level of formal cross-cultural experience affect the transfer of the training in the cross-cultural context?
3. Does self-efficacy affect performance as perceived by the expatriate?

The hypotheses formulated for this study were:

1. The expatriate’s perceived level of self-efficacy affects the transfer of the cross-cultural training.
2. Demographic characteristics such as expatriate tenure, level of education, gender, age, marital status, level of foreign language competency, and level of formal cross-cultural experience affect the transfer of the cross-cultural training.
3. Self-efficacy affects expatriate’s perceived performance.

Theoretical Frameworks

Two distinctive kinds of theoretical frameworks were researched for this study; namely, transfer of training frameworks and CCT and self-efficacy frameworks.

Transfer of Training Frameworks

One of the most cited frameworks for examining training transfer was developed by Baldwin and Ford in 1988. By using that framework, the researchers critically reviewed the literature that was focused on training transfer to the date. According to Baldwin and Ford, examination of training transfer requires “clear understanding of what is meant by transfer as well as the identification of factors that affect transfer” (1988). The framework they used to describe the transfer process in terms of training input factors, training outcomes, and conditions of transfer, in which the transfer condition was consisted both (1) generalization of material learned in training to the job context and (2) maintenance of the learned material over a period of time on the job. Training outcomes were defined as the process of the original learning material that transpired during the training program and the retention of the same material after the training was completed. Training input factors consisted trainee characteristic, training design, and work environment predictors, in which trainee characteristic included ability or skill, motivation, and personality factors. Work environment characteristics contained climatic factors such as peer or supervisory support, and constraints or opportunities to perform learned behaviors on the job.

The third limitation cited by Baldwin and Ford (1988) was the lack of theoretical frameworks to guide research on trainee characteristics. The updated review (Ford & Weissbein, 1997) analyzed a few studies that developed lines of theoretical frameworks. Facteau et al. (1995) adapted a conceptual framework from the career development literature and the motivational perspective of expectancy theory to develop a theoretical model of pre-training factors that could influence the learning and training. These factors contained such characteristics as career exploration, career planning, motivation to learn, and the potential for obtaining intrinsic/extrinsic incentives. Another line of theoretical framework adapted social learning concepts such as self-efficacy to examine the impact of trainees confidence in his/her ability to transfer the acquired skills from training to job performance (Ford et al.,
1992; Gist et al., 1991; Warr & Bunce, 1995). These studies improved our understanding of the training transfer in terms of motivational factors that involved in the transfer process, though still not enough attention had paid to personality factors and prior experience, and only a small amount of studies examined the issues such as tenure, age, and managerial experience (Warr & Bunce, 1995); locus of control (Ford et al., 1992). Much more of the impact of individual difference factors needed to be investigated.

More recently, Cheng and Ho conducted a study on the transfer of training (2001). In this extensive review of transfer of training literature, they studied major empirical researches that were conducted in the past decade (1989-1998). These reviewed studies focused their investigations on the effects of individual, motivational and environmental factors on the process of transfer of training. In this study, Cheng and Ho developed a conceptual framework to better present the “popular” constructs that had been tested empirically. This framework derived from Kirkpatrick’s (1987) views on training evaluation together with Tannenbaum et al.’s (1991) proposal on training effectiveness. Combining these two models it contained four stages of the transfer process: pre-training motivation, learning, training performance and transfer outcomes, by which they claimed to represent what would happen in a transfer process. Nine most commonly examined independent factors were identified and included in this new combined model. These nine factors were categorized as “individual (locus of control, self-efficacy), motivational (career/job attitudes, organizational commitment, decision/reaction to training, posttraining interventions), and environmental (supports in organization, continuous learning culture, task constraints) variables (Cheng & Ho, 2001).

CCT and Self-efficacy Frameworks

As scholars (Mendenhall et al. in press) concluded in their extensive evaluation review of the effectiveness of cross-cultural training that while some studies indeed attempted to base their work on theory, overall, the literature in this area could be marked as atheoretical. Scholars (Church, 1982; David, 1976) had long advocated the potential of Social Learning Theory (SLT) to facilitate the understanding of the theoretical relationship between CCT training and CCT performance. Based on the central variable of “modeling process” in SLT, Black and Mendenhall (1989) developed models exploring (a) the relationships among the modeling process, rigor, and training methods; (b) the integration of CCT rigor and main contingency factors. More recently, Black and Mendenhall (1990) presented a theoretical framework, based on SLT, that linked cross-cultural training with variables such as individual differences (include Locus of Control, Efficacy Expectations, Outcome Expectations), motivation, incentive, attention, retention, reproduction, skill development (Self Dimension, Relational, Perceptual), adjustment and performance.

Since then, Black, Mendenhall, and Oddou (1991) included self-efficacy in another framework of international adjustment as one of the three individual factors effect expatriate overseas adjustment, but no empirical test was done on self-efficacy in that study. Later, Parker and McEvoy (1993) included self-efficacy in a model of intercultural adjustment. Still, no attention had been paid on it in that study. Only Harrison, Chadwick and Scales (1996) empirically tested self-efficacy among 99 American expatriates based in Europe. Expatriates with high general self-efficacy were found having significantly greater degrees of general, interaction, and work adjustment than those with low general self-efficacy. Prior to the present study, no empirical investigation had been done on the relationship between self-efficacy and performance as the result of the transfer of CCT.

Based on the literature of both transfer of training and CCT studies, the reported study intended to fill a void in the literature pertaining to CCT transfer by examining expatriates’ perceptions of the transfer effectiveness based on self-efficacy. What the researcher attempted within the model of cross-cultural training and social learning theory involved exploration of whether trainees’ perceived self-efficacy affects their performance, as a result of transfer of the cross-cultural training.

Research Design and Procedure

This study stemmed from both transfer of training and cross-cultural training literature. Although a number of theoretical frameworks have been used to describe the process of transfer of training (Facteau, Dobbins, Russell, Ladd, & Kudisch, 1995), the social learning theory (SLT) was most influential among the literature of both transfer of training (Noe, 1986; Gist & Mitchell, 1992) as well as in cross-cultural training literature (Black & Mendenhall, 1989, 1990; Harrison, Chadwick, & Scales, 1996) and brought the two fields to a common ground.

Based on SLT, Black and Mendenhall (1990) developed a model that included the CCT, motivational factors (e.g. locus of control, efficacy expectations, and outcome expectations), and incentives that affect expatriates’ adjustment and performance. They proposed that the higher the person’s self-efficacy, the more likely the person is to execute the learned behavior and to persist in executing the behavior. They also concluded that within the SLT framework, CCT would increase an individual’s efficacy and resulting expectations as well as greater proficiency, which in turn would facilitate more effective execution of job performance (Black & Mendenhall, 1990).
Developed from Black and Mendenhall’s (1990) model, this study employed a quantitative design by which the researcher examined the effects of self-efficacy on the transfer of CCT in relation to performance on a triangular linkage (see Figure 1).

A newly developed instrument contained four parts: Part I: demographic characteristics of the subjects included (a) expatriate tenure, (b) level of education, (c) gender, (d) age, (e) marital status, (f) level of foreign language competency, (g) level of formal cross-cultural experience. Part II: the self-efficacy scale was partially adapted from Sherer, et al. (1982), which included only 12 items under General Self-efficacy measure and 4 items under Social Self-efficacy measure. Part III: CCT Transfer Survey included 8 items which assessed the first two levels of training transfer, knowledge and behavior transfer. Part IV: Expatriates’ Self-rating included 17 items, which measured the subjects’ perceptions of their performance level, partially adapted from Caligiuri (1997). As reported in the below table, the reliability analyses were satisfactory for all the scales except the Social Self-efficacy Subscale. Thus, this subscale was excluded from the instrument being used.

The Expatriates employed by Wal-Mart Stores, Inc. in fall 2002 were targeted as potential participants. Due to (a) the complexity of how the company categorizes its expatriates and (b) the constant movement of expatriates around the world, only 162 employees were identified as potential expatriate participants. While 162 expatriates from 14 countries/regions were originally thought to be the total number of potential participants, the researcher learned that 18 expatriates from China encountered Internet firewall blocks that prohibited them from sending their completed surveys via the Internet. Only one of these expatriates attempted to fax the manually completed survey back to Wal-Mart’s headquarter office in the States, and then the data were entered into the survey from the campus of the University. Consequently, the total of potential participants was changed from 162 to 144. With the collection of surveys from 43 expatriates, a response rate of 29.9% was achieved.

To ensure the rigor of measurement of transfer of training, the original design of the present study included supervisors of expatriates rating their expatriates’ performance, in addition to the expatriates rating themselves with regard to their performance after receiving CCT. Because potential participating companies’ feedback involving expatriate’s supervisors was problematic and cumbersome, the researcher faced attrition, thus the present study’s design was altered to exclude surveying supervisors about expatriate performance. Although the researcher initially invited multiple large multinational companies, only one company, Wal-Mart Stores, Inc. sustained its agreement to participate in this study.

Results

The results of the research are as follows.

Relationship Between Self-efficacy and CCT Transfer

In answering research question 1, Does the expatriate’s perceived level of self-efficacy increase the transfer of the cross-cultural training?, a Pearson Correlation test using the sum of the means of the two variables showed that the answer was YES, there was a significant correlation (r=.368, p=.038) between General Self-efficacy and overall CCT transfer. In addition, four items concerning transfer of learned knowledge and learned behavior were also found positively correlate with General Self-efficacy. Thus Hypothesis 1 was supported.

GENSE = General Self-efficacy subscale  
SOCSE = Social Self-efficacy subscale  
CCTT = Cross-Cultural Training Transfer scale  
ESPP = Expatriates’ Self-rated Perceived Performance scale

### Relationship Between Demographic Variables and CCT Transfer

An Univariate Analysis of Variance (UNIANOVA) test based on the 26 responses from those who received CCT previously showed no significant correlation between any of the demographic variables and CCT transfer of training. Therefore, the answer to research question 2, *Do demographic characteristics such as expatriate tenure, level of education, gender, age, marital status, level of foreign language competency, and level of formal cross-cultural experience affect the transfer of the training in the cross-cultural context?* was NO. As a result, Hypothesis 2 was refuted by the data.

### Relationship Between Self-efficacy and Performance

The investigation pertaining Research Question 3, *Does self-efficacy affect expatriate’s perceived performance?* contained a Pearson Correlations test between their overall means. Not only General Self-efficacy had a significant correlation ($r=.361, p=.022$) with Expatriate Performance, but also Overall Self-efficacy had a significant correlation ($r=.352, p=.026$) with Expatriate Performance. On an item-by-item break down, self-efficacy was found to have significant correlations with 6 out 17 performance items. Self-efficacy, both General and Overall, was found to affect expatriate effectiveness in (a) maintaining good working relationships with host nationals; (b) communicating and keeping others in work unit informed; (c) supervising and developing host national subordinates; (d) transforming information across strategic units; (e) communicating, developing, and maintaining good relationship among host national customers, suppliers, colleagues, government officials; and (f) communicating technical concepts among leaders, teammates, and direct reports across boarders. Therefore, the answer to Research Question 3 was YES. In turn, Hypothesis 3 was strongly supported.

### Relationship Between CCT Transfer and Performance

Although not originally raised as a formal research question, the researcher was interested in learning the linkage between CCT transfer and performance, whether the transfer of CCT affects expatriate performance. No significant correlation was found between the CCT transfer and expatriate performance ($r=.272, p=.138$). To further understand whether there was any CCT item that correlated with performance, a Pearson’s Correlation was run again between each items of CCT transfer and expatriate performance. Only *How much of the knowledge learned from the Cross-Cultural Training have you used to perform your expatriate job?* was found highly correlated with Overall Self-efficacy ($r=.440, p=.013$). In further ascertaining whether CCT, indeed, has an impact on expatriate job performance, a Univariate Analysis of Variance was conducted. The result showed that whether or not an expatriate received CCT was insignificant in affecting performance.

### Conclusions and Recommendations

A series of conclusions were reached based on the results. However, due to the limitations of this study, especially the fact that the response rate is only 29.9% and only one participating company, the researchers would caution the readers with the conclusions and recommendations for generalization ability reasons. First, as hypothesized, General Self-efficacy DOES have an effect on the transfer of CCT, especially on the transfer of learned knowledge and behavior. Specifically, General Self-efficacy influences the expatriate’s overall perception of how the knowledge learned from CCT helps job performance. General Self-efficacy also affects the expatriate’s perceptions of how much of the learned knowledge is used in job performance. Moreover, General Self-efficacy affects the expatriate’s overall perceptions of (a) how the behavior learned from CCT helps job performance, and (b) how confident he/she is in executing the learned behavior in job performance.

Second, demographic characteristics such as expatriate tenure, level of education, gender, age, marital status, level of foreign language competency, and level of formal cross-cultural experience DO NOT affect the transfer of the cross-cultural training. The confirmation of insignificant correlations between demographics and transfer of CCT, (especially the insignificance between tenure, age, and prior experience), however, fills a void previously pointed
out by Warr and Bunce (1995), who suggested a need existed for examination of the relationships between these variables and transfer of training.

Third, as expected, self-efficacy (both overall and general) DOES affect expatriate performance in various dimensions. In particular, self-efficacy influences expatriate effectiveness in (a) maintaining good working relationships with host nationals; (b) communicating and keeping others informed; (c) supervising, and developing host national subordinates; (d) transferring information across strategic units (e.g., from the host country to headquarters); (e) communicating, developing, and maintaining good relationships among host national customers, suppliers, colleagues, government officials, etc.; and (f) communicating technical concepts among leaders, teammates, and direct reports across boarders.

Fourth, marital status appears to influence expatriate level of perceived self-efficacy. Finally, although overall CCT transfer does not correlate with expatriate performance, expatriate perceptions of how much of the knowledge learned from CCT is used in job performance do strongly influence expatriate perceptions of his/her overall job performance. And whether or not CCT is received does not impact expatriate performance.

Supportive findings from Hypothesis 1 and Hypothesis 3 substantiated the linkage between self-efficacy and CCT transfer, as well as the linkage between self-efficacy and performance. The investigation of the these linkages within the proposed model supports Black and Mendenhall’s (1990) theory that CCT increase a person’s efficacy and results in higher expectations and greater proficiency, which, in turn, facilitates more effective execution of job performance. This fulfilled the need suggested by Morris and Robie (2001) to develop a theoretical model of the relationship between CCT and performance.

However, there wasn’t enough evidence found to support the linkage between CCT transfer and performance on this model. Although expatriate perceptions of how much of the knowledge learned from CCT is used in job performance was found to correlate significantly with expatriate performance, CCT transfer, as an overall scale, was found insignificant in relation to performance. Thus, this linkage remained unproven and was, therefore, presented by only a dotted line.

The salient findings of the study led the researcher to make the following recommendations for future research in HRD. First, while the muddiness remains, it is the researcher’s belief that had the study been conducted on a larger scale and had a higher response rate, potential more solid evidence would have emerged in the relationship between CCT transfer and performance. Thus, to increase the validity of the conclusion based on the same model, as well as other established transfer of training models and theories, future research needs to be done among more organizations with more diversified industrial backgrounds. Meanwhile, to increase rigor, similar research is still needed to include multiple ratings (e.g., supervisor and peer ratings including home and host country nationals) and to improve the certainty of the relationships between self-efficacy and expatriate job performance.

Second, in order to better evaluate the transfer of CCT, more rigorous empirical studies need to include longitudinal outcome measures such as how much attitude or behavior changes/transfers to job performance, in comparison to attitude and behavior before the training, at the end of training, and a few months after training.

Third, more research needs to be conducted in order to further explore the relationships between demographic variables and CCT transfer in relation to expatriate level of performance. These relationships are complex and require thorough research that builds upon previous performance studies and CCT studies as well as transfer studies in order to come up with more accurate questions to be included in the survey instruments. Finally, future research may further explore the CCT transfer by examining higher levels of CCT transfer.

**Contributions to New Knowledge in HRD**

As a result of what the researcher learned from this study, several implications emerged that contribute to new knowledge for HRD practitioners and global organizations. This research contributes in six distinctive ways.

First, it bridges the field of training transfer with the field of cross-cultural training by examining training transfer variable, self-efficacy, in cross-cultural context. Using real organizational personnel rather than college students as the subjects for the study better reflects what really happens in the training transfer process in real work places. By testing the training transfer in cross-cultural context, it extends the generalization of the results and findings from the existing training transfer research.

Second, it provides HRD professionals with a solidly-based framework for transfer of CCT and expatriate performance. The investigation of the linkages between CCT transfer and performance fulfilled the need suggested by Morris and Robie (2000) to develop a theoretical model of the relationship between CCT and performance.

Third, it provides empirically based insights about one of the individual characteristics, self-efficacy, in a cross-cultural context and connected it with performance. These insights unfold in two ways. Finding that higher self-efficacy increases the transfer of CCT confirms Bandura’s (1977) SLT in the training transfer literature and
empirically supports Black and Mendenhall’s (1990) model of CCT and SLT. Thus, it substantiates self-efficacy’ role in assessing the transfer of CCT. Self-efficacy is identified as an important variable that strongly influences various dimensions of expatriate performance and transfer of CCT training, which coincides with previous studies concerning self-efficacy’s association with job performance in domestic settings (Barling & Beattie, 1983; Gist, Stevens, & Bavetta, 1991; Gist, & Mitchell, 1992) and with expatriate’s cross-cultural adjustment (Harrison, Chadwick, & Scales, 1996).

Fourth, the confirmation of insignificant correlations between demographics and transfer of CCT, especially the insignificance between tenure, age, and prior experience, fills a void previously pointed out by Warr and Bunce (1995).

Fifth, despite technological advances in data collection using digital surveys and the Internet, the present study documents that (a) challenges persist in obtaining multiple ratings which include supervisor feedback about transfer of CCT to expatriate performance, and (b) the presence and use of firewalls within companies pose a double-edged challenge—granted confidentiality of company information is protected but firewall protection also restricts access to and participation in meaningful, value-adding communication pertaining to human capital development.

Finally, this research alerts future researchers to the need for adapting to emerging and maturing technologies in implementing research design, e.g. using digital data collection tools in a web-based environment.

The Emotional Reaction of HRD Professional to the Decision to Outsource HRD

Nicola Simons
Jean Woodall
Stephen Gourlay
Kingston Business School

This paper seeks to explore the emotional consequences of the decision to outsource HRD for those employed in the HRD function of a large UK public sector agency. It adopts a case study research design, and interview data drawn from a purposive sample of HRD professionals is discussed within the context of the growing literature on emotion in organisations, organisational change, and the costs and benefits of outsourcing.

Keywords: Emotional Labour, Outsourcing, Human Resource Development

Problem Statement

The preoccupation with achieving a strategic focus in HRD has led many organisations to question whether the delivery of HRD should be wholly managed from within the organisation. While a large part of training and development activity in large organisations has always been sub-contracted to external providers, explicit use of a systematic rationale for outsourcing a broader range of HRD, has only really been adopted by US and UK firms since the mid 1980s. Until very recently (Ravishankar, L, 1998; Woodall, Gourlay and Short, 2002; Woodall, Gourlay and Lad, 2003) there has been little systematic research into the reasons for and scope of HRD outsourcing among UK organisations. In any case, there has been a tendency to approach the strategic decision on whether or not to outsource in a very clinical manner, in terms of a ‘rational’ calculation of the benefits and costs to the organisation as a whole, and to potential internal customers for outsourced services.

While it is now commonplace to speak of the importance of taking into account the human impact of change interventions, (Carnall, 1999; Balogun and Hope-Hailey, 1999; Thornhill et al, 2000), the issue of the emotional impact of change tends to be considered from a managerialist perspective: how to manage 'resistance', 'personal transition', or the 'survivor-syndrome', and the rebuilding of ‘commitment’ or 'trust' etc. The feelings of those who are on the receiving end of change are seldom explored. Only Turnbull’s (1999) study of the impact of emotional labour on middle managers undergoing a corporate culture change programme goes some way towards addressing this gap. She argues ‘..for organisations engaging in the various forms of normative culture programme, the suppression of emotion at middle management level has been shown, nevertheless, to have strong negative effects on communication channels, and in the long term, on motivation ‘ (Turnbull, 1999: 141). She suggests that this is significant for the long term impact of corporate culture change programmes, as well as for the impact on individual emotional and mental well-being.

This paper focuses upon a specific type of organisational change: outsourcing, a process which involves an organisation in the explicit evaluation of whether to 'make or buy' a specific business function. While the subcontracting of various training and development activity has long been an option for the delivery of HRD, large scale outsourcing of HRD to a third party is a phenomenon of only recent origin (Ravashankar, 1998; Woodall, Gourlay and Short, 2002). While there is some evidence that the model of outsourcing adopted has retreated from a whole-scale hand-over to a third party, towards partnership and 'shared service' solutions (Reilly, 2000; Woodall et al, 2003), there has been little consideration of what this means for the strategic management of HRD, and particularly for the career paths, organisational commitment and, above all, personal feelings of those HRD professionals affected.

This paper seeks to explore the emotional consequences for those employed in HRD by means of a case study research design based upon a public sector agency that was contemplating the introduction of outsourcing for the delivery of its HRD service between 1999 and 2001. The paper places this case study within the context of the debate around outsourcing (especially the advantages and disadvantages of outsourcing), and the growing literature on emotion in organisations. The paper reports on the findings clustered around a number of themes: outsourcing as an enduring emotional issue; the gender dimensions of feeling and emotional expression; the emotional labour experienced by HRD professionals; and the emotional effects that the threat of outsourcing has had on both professional and personal lives.

Theoretical Framework

i) What is Outsourcing, and What are the Perceived Advantages and Disadvantages?

There is surprisingly, no single definition of outsourcing, and the range of views has been summarised in Woodall, Gourlay and Short (2002). Perceptions can vary from the long-term transfer of all activities and assets from the user to the vendor, to only partial transfer for a fixed time period. Various forms of outsourcing can be classified into a taxonomy either by placing them along a continuum or within the context of a ‘stage’ theory. The general assumption is that an outsourced service or function is selected because it is a vital but not core part of the business. In the 1980s and 1990s, outsourcing became a popular strategy for businesses recovering from recession and undergoing restructuring: it offered savings in time and money when the need to do ‘more for less’ became a general assumption. An outsourced service or function is selected because it is a vital but not core part of the business.

The theoretical framework for outsourcing of HR in general, and HRD in particular has taken place with little theoretical attention. Theoretical frameworks to date has been largely confined to the application of the theories of human resource management, psychology and organisational behaviour relating to change management, than the average general manager, management consultant or scholars in other fields of management. These have been limited. In the UK, the most recent large scale survey on employment practice, the Employment Relations Survey, classified into a taxonomy either by placing them along a continuum or within the context of a ‘stage’ theory. The theoretical framework has been summarised in Woodall et al (2002), and Ravishankar (1998) have conducted a survey questionnaire of the reasons for outsourcing of HRD. The main reasons for outsourcing were seen to include enhanced cost-efficiency (Atkinson, 1999; Laabs, 1993); enabling a focus on core HR activities and therefore a more effective demonstration of value-added (Adams, 1991); facilitating devolution of HR responsibility to the line (Adams, 1991); improved quality (Atkinson, 1999); reduction of risk by hiring experts with credible experience, and an increase in competitive advantage through access to external ‘state-of-the-art’ expertise (Lever, 1997); and thereby access to ‘objective’ views (Switser, 1997). However, Woodall et al (2002) found that the main benefit reported was the improvement in HRD knowledge and quality following on from greater access to external expertise.

By contrast, fewer disadvantages have been reported, although earlier models of Transaction Cost Economics had predicted high costs where the outsourcing transaction was complex, or where the service very specific to the organisation, or where there was the threat of opportunism resulting from client ‘capture’ (Spee, 1993; Finlay and King, 1999). This was echoed in the survey findings of Woodall et al (2002), where the increase in units costs, the greater risk of organisation dependence upon contractors, and the decline in organisation specific content in externally delivered programmes were seen as the major disadvantages.

However, the discussion on outsourcing of HR in general, and HRD in particular has taken place with little theoretical attention. Shaw and Fairhurst (1997) have remarked upon how the people, cultural and communication issues have been overlooked, and Lever (1997) also felt that outsourcing could generate problems of morale and uncertainty that would have an effect upon productivity. This is somewhat surprising, if it is considered that both HR professionals and scholars are more likely to be well-versed in theories of human psychology and organisational behaviour relating to change management, than the average general manager, management consultant or scholars in other fields of management. It thus seems strange that the issues of the human consequences and the potential human costs of outsourcing HR have not been factored into the calculation of costs.
and benefits. However, to appreciate the significance of this requires some prior reflection on the theoretical debate and empirical evidence for the significance of emotion and emotional labour within organisations.

ii) Emotion and Emotional Labour within Organisations

There has been a slow growth in research evidence over the last twenty years showing that emotion is an inextricable part of organisational life. This started in the 1970s from a position that emphasised the potential dysfunctional nature of everyday emotion to the rational operation of ‘effective’ organisations. In a major review of the developing literature on emotions and organisating (Fineman, 1999) has argued that the emotional challenge to rationality comes from three directions: that emotions will interfere with rationality, that emotional processes can serve rationality; and that emotions and cognitions are inextricably intertwined.

Much of the debate on emotion in organisations has tended to foster a belief that emotion is the antithesis of rationality, and thereby polarises what are related facets of everyday working life (Mumby and Putnam, 1992; Ashforth and Humphrey, 1995). To the contrary, emotions are essential components of everyday organisational behaviour (Domagalski, 1999). They have been shown to be key elements in motivation, job satisfaction, leadership and group dynamics (Ashforth and Humphrey, 1995; Fineman 1996) as well as learning (Vince, 2001; Turnbull, 2002), and creativity (Mumby and Putnam, 1992). So, strong motivation and psychological involvement in work are not possible without connection to the work or work context; and much leadership involves the practice of symbolic management by means of orchestrating, summarising, and elaborating symbols to evoke emotion. Similarly 'emotional contagion' (the tendency for individuals to affect the emotions of others) within group dynamics can be a powerful force with both constructive and destructive consequences (Domagalski, 1999). Vince (2001) has also argued that emotion and politics are key components in organisational learning. In more recent work Turnbull has attempted to integrate the treatment of emotion in organisations with socio-cultural theories of learning (2002).

However, as Fineman (1999) has shown, the concern with emotion in organisations can be traced as far back as the early 1930s studies on workplace relations. It was rather the reaction against this that led to the swing in the 1970s towards an exclusive emphasis upon the cognitive and rational explanations of human behaviour. This was followed in the 1980s by a ‘rediscovery’ of the importance of feeling and emotion in organisational life.

In particular, the concept of emotional labour (Hochschild, 1983) has provided a very influential framework for explaining how emotion becomes an essential component in the successful operation of customer focused organisations. Here the common expectations concerning the appropriate emotional stance of service providers give rise to ‘feeling rules’ (silent rules or expectations often built into the culture of an organisation) that specify the range, intensity, duration and object of private emotions that should be experienced. However, this regulation of the experience and expression of emotion is perceived as exploitative in that it encourages the expression of inauthentic emotion and a dragging of emotion into the public realm. Hochschild showed that each individual reacts differently to emotional labour. The intensity of the effects of emotional labour depends upon the level of effort required to perform it, and the resulting ‘emotional dissonance’. Some employees may identify with organisational expectations and perform the emotional labour required of them. A very few are able to adopt a healthy detachment from what is expected of them, and consequently, experience minimal stress. The remaining individuals find it impossible to conduct emotional labour: they become estranged from the expectations and fail to comply.

Turnbull (1999) has also argued that the increased salience of emotional labour can be traced to the trend since the early 1980s towards more ‘normative’ organisations demanding moral psychological contracts with their managers. She also sees middle managers as more susceptible to emotional manipulation and therefore more stress prone than the ‘frontline’ service workers studied by Hochschild. So, while organisations expect emotional labour in the interest of profit and productivity, there are limitations to the effectiveness of compliance with ‘feeling rules’ in the workplace. Thus it is equally possible that the requirement to perform emotional labour can be more damaging than it is productive to the achievement of organisational goals.

There is still ground for arguing that the concept of emotional labour ultimately polarises feeling and 'dispassion', and ignores many insights from the psychotherapeutic tradition that stress the ubiquity of emotion in all human transactions, and not just organisational life. However, the implications are that any evaluation of organisational change should consider the emotional dimension more fully from the experience of the individual human subjects involved, and not solely from the managerialist agenda.

Research Questions

The above discussion of the research literature on outsourcing and emotion has raised a number of important issues about why the human and emotional dimension is not considered by organisations contemplating outsourcing, and the nature of the emotional states that individuals experience. In consequence, this paper will address the following research questions:
1. What emotional issues surface, and for whom, and at what stage?
2. What is the emotional impact of outsourcing on the professional lives of HRD staff?
3. What is the emotional impact upon their private lives?
4. What are the implications of these emotional responses and reactions for the organisation in which they work, especially the management of the process of outsourcing HRD?

Research Design

It would appear that the influence and manifestation of emotion in organisational life is complex. Also, how it is manifested during a period of radical change, such as that involved in the decision to outsource HRD, requires an exploratory method of investigation that will take into account the complexity of situational factors. For this reason, a case study research design was selected.

At the time this research was conducted, the principal researcher was working on a short-term assignment with the HRD function within the organisation. The HRD manager had requested an investigation into the experiences of HRD staff within the organisation to determine how the proposed outsourcing had affected individual personal and professional lives, and particularly emotional well-being. The principal researcher thus had exceptionally good quality access to research participants, and also to other documentary evidence, such as reports, business plans, and electronic databases. This information was clarified and supplemented through informal discussions with staff members and with management. Furthermore, the interpretive nature of the research design, and the highly sensitive and confidential nature of the subject matter, meant that the data needed to be collected by individual interview. While thirty three HRD professionals were potentially affected by the proposal to outsource HRD, a purposive sample of 12 individuals was selected. These included 5 trainers who were currently employed, 1 new recruit, and 3 former trainers who had left the department or the organisation, and finally, 3 current HRD managers, including two who had been assigned the role of Efficiency Review Project Managers. The interview data were collected by means of semi-structured interviews and critical incident technique. They took place about 18 months after the proposal to outsource HRD.

However, because of the very sensitive nature of the subject matter, considerable care was taken to ensure that respondents could decline to participate without adverse personal consequences, and that the anonymity and confidentiality of respondent and non-respondent alike would be assured. Similar care was taken with the construction and pre-testing of the interview schedule to ensure that the questions were valid and were neither leading, nor misleading. The interviews were recorded and transcripts were prepared, and the dangers of bias were addressed by subsequently confirming responses with participants. The text was then subjected to detailed analysis using the ‘framework’ method (Ritchie and Spencer, 1994) to identify key themes. The co-researchers scrutinised this analysis to ensure the validity of the final outcome. The obvious limitations of a case study research design are acknowledged, and in particular, the difficulty of generalisation to other contexts. However, the findings do provide the opportunity for theoretical generalisation by means of analytic induction based on future similar case studies.

As acknowledged above, it is important to provide some detail of organisational context. At the time of the data collection, Public Service Agency (PSA) was a UK central government agency formed as a result of a merger between two government offices in the mid 1990s. With 3,000 employees it operated in five locations across the UK, and retained a hierarchical organisational structure, and work was organised into six business areas. By 1999 the hitherto separate HRD and Personnel functions had merged, reporting as one of the divisions into the Administration and Services Department of PSA. It was typical of many other agencies that emerged at that time in consequence of a political drive for efficiency in central government services. The need to increase the accuracy and quality of the service they provided, and in particular, to rebuild a strong reputation for the organisation, clearly required additional funds. However, as these were not forthcoming from Central Government, the PSA recognised the potential to make savings in some areas of the business. In 1998-9 PSA called in a major management consultancy to carry out an efficiency review that would outline recommendations leading to substantial savings of approximately £20 million over a period of 5 years. The recommendations were accepted and incorporated into the PSA business plan for 1999-2002. One recommendation focused upon methods of reducing costs through driving down overheads and seeking partnership opportunities. HRD and Personnel were a key target. The management consultancy identified a possible saving of £1.8 million per annum on HRD and Personnel. Specifically their recommendations involved merging the HRD and Personnel functions; using private providers for some training delivery; reducing the volume of in-house training, and thus the number of development staff; and in the light of this, consideration of whether to outsource this function completely. However, by the summer of 2000 when this
case study was undertaken, the only recommendation to have been implemented was the merger of the HRD and Personnel functions. An Efficiency Review Team was established to oversee the rest of the process.

Despite some very well-intentioned proposals from the Communications Manager for managing the outsourcing process in a human-centred way, it was clear that this did not take place. During 1999 and 2000 it became apparent that staff morale was badly affected by developments at PSA, and was evident in problems of employee motivation and staff turnover.

**Main Findings**

*Outsourcing is an Enduring Emotional Issue*

Despite the considerable lapse of time since the announcement of the proposal to outsource HRD, the interviews were deeply charged with emotion. Bitterness, anger, resentment, anxiety and fear were just some of the many emotions conveyed by respondents. It quickly became apparent, through their willingness to be interviewed and to express their innermost thoughts and feelings that many respondents felt compelled to talk about their experiences. Some emotional disclosure was expected. However, the researcher and the sponsoring organisation believed at the outset that individuals would have become detached from any previous feelings as the decision to outsource HRD made 18 months previously. This was certainly not the case. Despite no action to implement this policy, it was clear that the emotions originally aroused among the HRD professionals had persisted and were still keenly felt.

“It was very distressing watching people leave…it wasn’t nice, because the team I’m part of, I have been part of from the outset…” (trainer 7)

“People were leaving and there were new faces around the office…the working atmosphere was never the same…” (trainer 5)

*Emotion is a Gender Issue*

A gender dimension to emotion also emerged as a significant, but unexpected theme. It may well relate to the ‘masculine’ organisational culture (see below), and gender stereotyping (Shields, 2000) but the wider range of potential causal factors was not explored. Shields argues that although men and women experience the same emotions the difference lies in the intensity with which women feel them, and their ability to identify and express them. This was upheld in the findings relating to the female respondents. However, male respondents tended to be less open or comfortable when discussing their feelings. In general they tended to adopt a more ‘rational’ outlook on the outsourcing of HRD, displaying an appreciation of the positive as well as the negative aspects, and reporting on their decisions as to how to manage the situation in the best possible way. For most men, managing the personal emotional consequences of outsourcing was not something for which they looked to the organisation for support. By contrast, the female respondents appeared to take the problems they encountered as a result of the decision to outsource HRD much more personally, and were far more concerned with the negative aspects. They also wanted more support from the organisation than their male colleagues did. Men had a greater tendency to want to discuss the emotions and feelings of others rather than themselves. This is illustrated in the following quotations:

“I was more realistic. You may call it negative: you may call it realistic. I was more inclined to say this is extremely likely to happen. You might think realistically and look for other opportunities if you aren’t happy with it…” (trainer 9: male)

“If the worst does come to the worst, and they do outsource my post, to be quite honest I’m not that bothered, as long as I can continue training…” (trainer 1: male)

“If I go around saying this is terrible, we won’t have anyone left. I don’t want to risk exposing too much about how I feel, so I am putting on a brave face, in order to give them all the reassurance they need to ease their concerns....” (trainer 2: female)

“No one wanted to hear what we had to say, how it was having an effect on me…” (trainer 5: female)

This can be interpreted in several ways. On the one hand, women’s ‘lack of control’ of their emotions might be interpreted as rendering them unable to manage major organisational change. On the other hand it could mean that
the organisation failed to recognise the importance of emotion in the effective management of employee relations with female colleagues, and also may indeed be underestimating the hidden emotional needs of male employees.

*The Emotional Labor Involved in 'Business as Usual'*

The policy announcement that HRD was to be outsourced, followed by inaction created an atmosphere of uncertainty and insecurity among HRD professionals. This was exacerbated by a ‘masculine’ organisational culture stressing rational behaviour and ‘business as usual’. Many individuals felt compelled to suppress their emotions and to continue to perform as before.

“*I personally feel that they are expecting us to do everything as we normally would, even under the increased pressure, but they don’t seem to be giving us any motivation...we are giving 110% and they are only giving 25%...*” (trainer 1)

“*Going into a meeting, hearing awful news, and just carrying on...it's very draining and you really can’t cope...*” (trainer 4)

“*You feel as though you are being taken over. They want you to behave the way they behave rather than the way you are.*” (trainer 5)

The dissonance engendered two main effects. The first was increased personal stress resulting in a negative impact upon performance, and ultimately the ability to continue with ‘business as usual’. All respondents reported experiencing some form of stress, but curiously the most stress was experienced in the office environment where HRD professionals interacted with each other and other members of management, rather than in the training room with programme participants. Indeed, conducting training sessions was perceived as a source of respite where HRD professionals could behave authentically. In the office environment, however, they were carrying out emotional labour either by working harder to prove the added value of HRD to the organisation, or by experiencing the stress involved in suppressing true feelings. The second outcome of the emotional labour performed was a breakdown in the employment relationship as HRD professionals ‘switched off’ and became alienated from the organisation. Typically respondents reported reduced commitment and productivity, and greater ‘presenteeism’. Thus the evidence indicated that there was a limit to the emotional labour that the organisation could expect from its employees. The findings have shown that in the long run, emotional labour did not benefit either party.

*Outsourcing Has Implications for HRD Professional Life*

The consequences of performing emotional labour had a number of implications for the professional life and careers of these HRD specialists. In extreme cases some individuals made massive professional compromises and changed career direction to escape the pressure. Other individuals experienced ‘burnout’ or offered resistance to what was happening. This had implications for their careers as they no longer had the same drive and enthusiasm, and also felt they were therefore less attractive as employees.

“*My enthusiasm went, which is really important, as I need to care about what I am producing, but I didn’t feel as thought the effort was worthwhile...*” (trainer 5)

“I am afraid my motivation would simply be that I’ve got to do it, because you pay my wage. But I have no enthusiasm for the job whatsoever.” (trainer 1)

*Outsourcing Has Effects Upon the Private Lives of HRD Professionals*

Respondents reported two main effects. The first concerned personal health and well-being. The most frequently cited problems included depression (mentioned by 4 out of 9 trainers) and insomnia (mentioned by 5 out of 9), although more frequent bouts of physical sickness, and increased use of alcohol were also mentioned.

“I was feeling intimidated and unhappy about the process to the extent that I was on anti-depressants” (trainer 2)

“I was finding myself feeling sick, and I wasn’t eating properly. I was certainly drinking more than I should have been. Eventually, I cut down on the alcohol but started smoking heavily....” (trainer 1)

Secondly, self-esteem was greatly affected where individuals felt they and their role were no longer valued. A general feeling of life being ‘out of control’ also affected self-confidence.
Conclusions and Recommendations

This case study has provided the opportunity to reflect upon the adequacy of a rationale for outsourcing that disregards the emotional and human consequences for employees. The literature on outsourcing is silent on these aspects, and indeed, the emotional and human consequences of the decision to outsource HRD at PSA were never seriously considered at the outset (despite the warnings from the PSA Communications Manager). Yet it was quite clear that emotional issues were very important to the respondents and were the trigger for potential major costs to be borne by the HRD function. These included absenteeism, increased labour turnover, loss of intellectual capital and experience, and reduced productivity amongst those ‘left behind’, with consequences for overall performance. No organisation can afford to ignore the cost of the potential emotional burnout, stress, high labour turnover, and waning performance and commitment associated with outsourcing if it is to maintain a well-run business, with good customer service and a high reputation. But if this case study is typical, then it is clear that organisations do precisely this!

Furthermore, this case study provides another example illustrating the saliency of the emotional aspects of change management. While most studies of emotional labour have been researched only in the context of day to day job activities, only Turnbull (1999) has shown how it is manifested in the course of large scale organisational change. The emotional labour required of individuals when their personal and professional lives have been severely affected as a result of a major organisational change, such as a culture change or outsourcing, is of a different magnitude to the daily emotional labour required such as smiling at a difficult customer. This was recognised by Turnbull (1999) who saw middle managers had little choice but to accept the ‘ever changing rhetorics’ of an organisation undergoing a culture change programme. The same effects that she observed in relation to culture change can also be seen in this study of HRD outsourcing. Thus major change is likely to engender the demand for high amounts of emotional labour from key managers and professionals.

Finally, while most discussion of emotion in the context of change management tends to see it as something to be contained and managed (Carnall, 1999), maybe now is the time to reframe emotion as something which is an enabler of change? This could lead to a review of those models of rational organisation, which underpin the case for outsourcing. In addition to the suggestion that negative emotions and their implications can be harmful to business, there is growing evidence that creativity and innovation are only possible when people are psychologically healthy. Thus it could therefore be suggested that emotions are vital to the smooth management of such a process. Positive emotion may determine whether or not an individual will cooperate with the organisation and accept change. Thus, while the extent to which management can control emotions may be very limited, it is important to distinguish between manipulation and management. The latter implies that emotions need to be understood, appreciated, and empathised with in order to gain employee commitment.

Contribution to New Knowledge in HRD

This paper draws attention to major changes taking place in the way in which HRD is managed and delivered in large organisations. It also draws attention to the hidden human costs when a decision to outsource HRD is taken, both for the professional and personal lives of the individual HRD specialists, and for the organisation.

Testing a Model of Employee Selection: A Contextual Approach

Kiyoe Harada
HRD Research

Jeffry S. Bowman
Bowling Green State University

The study examined selection practices applied to education. The selected contextual factors were tested to see whether school administrators took consideration of person-organization fit (POF) factors when they select applicants during the selection process. The results showed that POF factors affected selection when school size was under consideration and person-job fit factors affected selection when socio-economic status was under consideration.

Keywords: Selection Model, Contextual Approach, Model Testing

Selection has three critical functions for the organization; (1) supplying human resources, based on human resource planning, (2) allocating human resources to specific divisions, departments, and/or assignments, and (3) identifying and selecting high performers for future business leaders (Okubayashi, 2003). In other words, it pertains to supply, allocation, and utilization of human resources for the purpose of attaining organizational goals and objectives. Therefore, having productive human resources is imperative to any organization for overall performance. Consequently, selection focuses on how accurately one can select a potential high performer. One of the challenges that an organization faces today is a rapidly changing work environment, due to technological advancement, pressures under knowledge economy, and global competition. Therefore, keeping up with a changing work context and identifying desirable high potential performers in the organization has been of great interest (Kehoe, 2000).

Problem Statement

In selection, organizations are interested in high potential performers, who are expected to make significant contributions. In contrast, job applicants focus on working for excellent organizations where they can stay long and have opportunities to grow. Both parties have to come to mutual decisions; hiring and entering, to attain different goals. One of the selection issues relates to criteria and instruments: what to look for and measure in order to identify a potential high performer. The organizations focus heavily on job-related criteria that help separate those who meet job requirements and those who do not. This is known as person-job fit (PJF). However, as the work environment changes, work becomes more complex and demanding (Kehoe, 2000). For instance, information technology and knowledge-based work require employees to have highly specialized knowledge, and to increase their learning ability as well as adaptability to changes. In addition, flexibility and agility are constantly required of an organization and its employees (Pearlman & Barney, 2000). These work context pressures could influence selection criteria. Consequently, focusing heavily only on the job-related criteria may not be sufficient.

A study shows that as the selection process advances, human resource managers become more interested in how well job applicants fit to the existing work context, which is influenced by changes from inside and outside of the organizations (Rynes & Gerhart, 1990). Job applicants are also interested in how well they can fit to the existing organizational context. This is known as person-organization fit (POF), concerning matching between organizational and individual attributes. Those attributes are not directly related to selection criteria; however, these factors might influence any decisions during the selection process (Harada & Bowman, 2003). More importantly, POF factors tend to take on a significant role before and after employment. For instance, before employment, job applicants use attributes to make their selection decision (Bowen, Ledford, & Richman, 2000; Chatman, 1989; Lyon, 2001). However, if a mutual selection decision by both an organization and a job applicant is not made, due to a lack of congruence in POF factors, the organization might lose high potentials. After employment, when employees find inconsistency in attributes between the employees and the organization, issues of work motivation, retention and job satisfaction could become major concerns for the organization. These issues influence individual performance in a short run; however, they will undermine organizational performance in a long run. Therefore, it is very critical to make the case where both an organization and a job applicant make a mutual selection decision. In this respect, work
context, which might relate to PJF factors, should be given more attention in order to identify the most promising high potential performers. However, the work context that is influenced by changes inside and outside organizations may not be given enough attention, in terms of how the work context and POF factors might influence selection. Therefore, it is important to investigate the work context and POF factors to select high potential performers.

**Purpose and Research Questions**

The purpose of this study was to test the proposed model of employee selection to see whether POF factors are taken into consideration in the selection process by focusing on contextual factors. Specifically, the study focused on selection criteria for K-12 educators where PJF factors are applied rigidly by school administrators who are responsible for the selection of teachers. The selected contextual factors include: (a) size of school, (b) characteristics of the district, and (c) socioeconomic status. These factors were included in research questions as indicated below.

**Research question #1.** Do school administrators take consideration of POF factors in teacher selection?

**Research question #2.** Do school administrators take consideration of POF factors and PJF factors differently when school size, characteristics of districts, and socioeconomic status are under consideration?

**Research question #3.** Under what levels of the contextual factors do school administrators take consideration of POF factors and PJF factors differently in selection?

**Research Framework**

The concept of “fit” has been used in selection research. It is concerned with the fit between job requirements and organizational attributes, as they apply to job applicants. Selection studies using the fit concept have indicated the improvement of employee attitudes and job performance (Kristof-Brown, 2000). Person-job fit (PJF) refers to matching an applicant’s knowledge, skills, and abilities (KSAs) and the requirements of a specific job. Person-organization fit (POF) refers to matching an applicant’s personal attributes and broader organizational attributes, which evaluate how well a person fits with existing organizational members and the overall culture of the organization (Kristof-Brown, 2000; Rynes & Gerhart, 1990). The assumption is that factors in PJF and POF play important roles in identifying and selecting good employees. It implies that both types of “fit” help employees maintain high performance and produce quality work. Therefore, the PJF and POF factors are very important to take into consideration during the selection process. However, the recent nature of work has been changing and it requires employees to perform more knowledge work and a new type of work collaboration, such as within and outside networking and project teams (Kopp, 2003; Morishima, 2002). As a result, human resource managers look for more than matching job requirements and applicants (Rynes & Gerhart, 1990). Business organizations are often first interested in PJF to see if job applicants can meet the job requirements. If the applicants meet the job requirements, the managers then become interested in how well the job applicants fit into the culture of the company and the existing members with whom they will be working. In other words, while managers use the job-related criteria, they also use non-job-related factors to evaluate potential employees.

A model of employee selection was proposed (Figure 1), derived from the fit concepts, which have been applied to a series of selection studies (Bowman & Harada, 2003). The assumption of the proposed employee selection model is based on mutual selection decisions made by both an organization and a job applicant. It is a premise that mutual decisions are important to bring high potential performers into an organization. When mutual selection decisions are made, the organization obtains high potential performers, while the high potential employees will produce quality work through increased work motivation, commitment, and job satisfaction. In order to reach mutual selection decisions, the organization takes consideration of both job-related factors and non-job-related factors to see how PJF and POF can be attained. Therefore, factors relating to POF should be given more consideration in the selection process, to obtain promising high potential performers.

**Fit concepts and School Administration**

Studies in employee selection focus on business organizations rather than non-business-related organizations. However, a school can be seen as one form of an organization where their product is educational services. Like business organizations, they have multiple customers, such as students, parents, business organizations and industries. In this regard, in order to provide high quality services, schools rely on teachers who are responsible for educating students. Therefore, selecting high potential performance educators is very critical for schools to provide quality education. However, K-12 education has faced tremendous pressures from parents and society due to lower student educational attainment and a lack of reliability in their education (Gross, 1999; National Center for Education Statistics, 1996; National Center for Excellence in Education, 1983). At the same time, the environment surrounding K-12 school administration has become increasingly demanding. For instance, budgets do not to increase as much as needed. Consequently, school administrations face a lack of educational resources available for educators, and insufficient support from the community. These problems, associated with the context of school
administration, create other problems, such as difficulty in attracting and retaining potential high performance educators, lower job satisfaction and commitment, and increased job stress (Abel & Sewell, 1999; Hirsch, 1999). Due, in part, to these reasons, potential high performance teachers tend to leave (Corwin, 2001) and fewer people want to become educators. In this regard, it is very important to focus on the administrative role in the selection system, where job-related criteria have been rigidly applied in education.

In education, while job-related criteria have been rigidly applied in teacher selection, a continuing problem has been associated with personal factors entering decision-making. Personal factors include sharing similarities, such as educational backgrounds, personal values and belief in education, interests in life, job experiences and qualifications. At the early stage in the selection process, school administrators focus heavily on PJF factors to separate those applicants who meet job requirements and those who don’t. However, as the selection process advances, administrators are interested in how well their applicants can merge to an exiting school environment. At that time, if school administrators perceive similarities in job applicants, they feel close to the applicants. Such similarity might interfere with selection decisions (Baron & Byrne, 1984; Young & McMurry, 1986). School administrators also deal with other factors, which are not immediately related to a teaching job, such as schools’ goals and objectives, beliefs and norms of the community and administrators’ educational policies. These factors can be thought of as non-job-related and they relate to person-organization fit (POF). In addition, there are other factors, contextual factors that relate to where education is taking place. The contextual factors can be overall characteristics of schools or districts where educational communities are located. These contextual factors relate to the educational needs of students and to the overall characteristics of educational communities and the needs for educational resources. Therefore, the contextual factors may be taken into consideration in the selection process.

**Selected Contextual Factors and Hypotheses Development**

POF factors include not only personal values and individual personality traits, but also a job applicant’s needs and expectations for a job, strategic needs, norms, and characteristics of workplaces (Adkins, Ravlin, & Meglino, 1996; Adkins, Russell & Werbel, 1994; Bowman & Harada, 2003). This is based on the notion of changing workplace context and issues in management of human resources (e.g., retention, job satisfaction and commitment). The contexts of a teaching job vary, depending on the overall characteristics of the workplaces. This paper focuses on selected contextual factors; (a) school size, (b) characteristics of districts, and (c) socioeconomic status. These factors are used to: (1) discuss how contextual factors are related to PJF and POF in selection and (b) test each contextual factor by setting up each hypothesis.

**Size of Schools**

The size of an organization affects various aspects of the organization, such as resource availability, ways of getting work done, communication, values, policies and strategic plans. In other words, these factors could affect business operation and practices, which in turn are also related to school operation and practices. In this regard, it is assumed that school administrators might take consideration of factors associated with their school size during the
selection process. The size of a school in this study is defined by the number of students in the school. It is categorized into three levels; large, medium, and small. The size of school could relate to working conditions. A study by Lee, Alfeld-Liro and Smerdon (2000) showed that face-to-face communication is required more often in small schools than in large schools. Consequently, working conditions in a small school require employees to work closely with each other and to be merged into the existing teaching community. Therefore, commitment to interpersonal relationship building may be expected more in small schools than as is required in large schools. Furthermore, school administrators with small size schools might effect to build a desirable school atmosphere, based on their educational values and beliefs and use less rigorous policies and rules. On the other hand, administrators in large size schools deal with a large numbers of teachers. Consequently, building a desirable school atmosphere and keeping it coherent would be challenging for school administrators. School size also relates to availability of administrative resources. Educational resources in small schools may be limited due, in part, to a limited amount of monetary resources. If this is the case, educators are sometimes asked to perform additional work with less administrative assistance. In this regard, school administrators should be aware of the educational needs, required of newcomers. As a result, the size of schools could affect the condition of the workplace for educators. If the working conditions are under taken consideration when administrators select high potential educators, they may need to consider the school size factor in the selection process. Based on this notion, a hypothesis is stated below:

**Hypothesis 1.** School administrators take consideration of POF factors and PJF factors differently, depending on the different sizes of schools.

**Characteristics of District**

Characteristics of school districts have not been defined in the selection literature. It depends on how characteristics can be operationalized in a particular study. For instance, socioeconomic status, size, and locations of schools have been used as definitions (Abel & Sewell, 1999; Alspaugh, 1998; Sommers, 1997). In this study, characteristics of school districts are defined as (1) location, categorized into three areas; (a) urban, (b) rural, and (c) suburban and (2) socioeconomic status; (a) high, (b) medium, and (c) low.

**Locations.** According to Alspaugh (1998) and Esposito (1999), the locations can have an impact on educational needs. For instance, a study found that rural areas tended to be lower in the number of dropouts than urban areas (Alspaugh, 1998). School districts in urban areas tend to deal more frequently with behavioral problems, such as drugs, violence, and teenage gangs (Alspaugh, 1998; Esposito, 1999). These problems require teachers to have disciplinary skills and interpersonal communication skills when they deal with problematic students. As a result, there would be additional educational needs and efforts that are required of teachers. In this regard, teachers have to give a great amount of attention to these students with family backgrounds, to respond to their educational needs. The teachers in an urban area often face challenges in classroom management and lower learning motivation. All of these issues describe demanding working conditions. If this is the case, school administrators want to have teachers who are willing to put in additional efforts and to have higher work motivation. At the same time, school administrators may need to set educational goals and plans aiming from the bottom up to a certain level of educational attainment. In this regard, they might focus on contextual factors of the school and the educational needs. To discipline students, administrators might reinforce the use of rules and principles. If this is the case, school administrators are interested in how well job applicants would agree with these policies and educational plans. Characteristics of suburban areas tend to be relatively moderate, in terms of students’ behavioral problems and school dropouts. Parents would be interested in education and its quality; therefore, they tend to be willing to take part in school activities. If this is the case, school administrators would be interested in factors relating to PJF throughout selection. Based on such notions, a hypothesis is stated below:

**Hypothesis 2.** School administrators take consideration of POF factors and PJF factors differently, depending on locations of school districts.

**Socioeconomic status.** Socioeconomic status (SES) is one of the significant factors differentiating characteristics of school districts. It relates to the overall level of lifestyle and financial resources of communities. SES in this study is defined at three levels: high, medium, and low. The level of SES relative to education often relates to educational achievement (Alspaugh, 1998; Esposito, 1999; Griffith, 1998). For instance, schools in high SES areas focus more on the quality of education given to their children. Those parents often have higher educational attainment. They have high expectations of their children and support educational attainment. Consequently, parents expect schools to provide quality in various aspects of education. Therefore, school administrators in wealthy districts would be interested in improving the level of educational achievement. In this regard, establishing schools’ missions and values that call for higher educational attainment would be responding to parents and the community expectations. As such, they would focus more on how well applicants meet job requirements and the degree of congruence with applicants’ beliefs in high educational attainment. At the same time, teachers are expected to have a certain level of subject matter expertise. As a result, PJF factors, including experience, qualifications, training, and specialty in
teaching are stressed in these situations (USA Today, 2002). Characteristics of medium SES districts could be similar to the high SES areas, in terms of parental interest in education and student achievement. In this regard, school administrators tend to focus on PJF factors to see how well an applicant fits the job requirements. In contrast, schools in the low SES areas often have lower student achievement. Parents tend to be interested in their own daily lives rather than their children’s educational attainment (Griffith, 1998). At the same time, these working class parents may not have enough time to provide parental support. In this regard, school administrators would like to have those teachers who believe in and have values in the potential ability of students and understand the importance of education. Another issue relative to schools in the low SES areas is limited financial resources. Those schools most likely may not have adequate educational resources (e.g., teaching materials, facilities, equipment, etc). Like schools in the urban area, low SES school districts also tend to have community problems, such as violence, teenage gangs, and drugs (Alspaugh, 1998; Esposito, 1999). These problems require teachers to respond supportively and to provide additional help for their students. Responding to such educational needs, they may focus on goals and objectives as a way of keeping school operation as cooperative and coherent, as it can be by using rules and policies. In this regard, selection criteria for teachers might apply differently. The following hypothesis is stated below:

Hypothesis 3. School administrators take consideration of POF factors and PJF factors differently, depending on the socioeconomic status of the school districts.

Methodology

The research design was casual-comparative with three independent variables; (a) school size, (b) location of district, and (c) socioeconomic status. Each variable has three levels; large, medium, and small and/or high medium and low. The two dependent variables were summed scores on PJF and POF.

Sample

The population for this study was all public school administrators, who were superintendents and principals, in a large Midwestern state. Systematic random sampling was used to select school and school district administrators, which were listed in a statewide school district phone directory. The sample size, based on a power analysis with medium effect size (.80) and an alpha level of .05 was calculated (Cohen, 1988). The final sample size was 100 school administrators. Regarding response rates, a total of 200 questionnaires were sent. Of these, final response rate was 53%.

Instrument

The instrument was developed, based on several fit concept studies (Chatman, 1989; Kristof-Brown, 2000), by the researcher. It was designed to measure perceptions of both PJF and POF. PJF factors were derived from studies dealing with teacher selection (Hopkins, 2003; Kansas State University, 2003) and from interviews with school administrators. Items included communication skills, planning skills, motivation, goal orientation, etc. POF factors were taken from the Teacher Perceiver Interview (Clifton & Hill, 1952; Delli, 2000; Warner, 1969; Winesman, 1969), a commercially available selection process, and contain 11 items, including policies, goals, strategic plans, etc. Contextual factors included: school size (Small, Medium, Large) and district location (Urban, Rural, Suburban). In addition, from median family income data furnished by the State Department of Education, a district socioeconomic contextual factor was also created (Low, Medium, High) for each participant. A pilot study (Cronbach’s Alpha = .92) was conducted. A total of 28 items were included in the questionnaire, which asked the level of consideration given each item during the teacher selection process, and were measured on a four-point Likert-type scale. Participants were asked to mark their responses on a four-point Likert Scale, which was anchored at: “1 = Never,” “2 = Infrequently,” “3 = Frequently,” and “4 = Always”.

Descriptive statistics were used to provide overall information for the demographic data. To test the hypotheses, multiple analyses of variance (MANOVAs), were performed on the contextual factors (school size, district location, socioeconomic status), to determine whether PJF and POF consideration differed on each of the contextual factors. One-way analyses of variances (ANOVARs) were performed to answer Research Question #3.

Results

The final usable data was 105 responses (53%). The average age of the participants is 49.7 years old (S.D =7.4) and average years of experience is 15.9 years (S.D. =7.3). Overall average school size is 468 students (S.D. = 240), showing high variability. The median income for the districts is $32,544 (S.D. =6,689). Research Question #1 asked about school administrators taking consideration of POF factors in teacher selection. The results of the MANOVAs, show that school administrators took consideration of POF factors when school size is under consideration (F (2, 102)=4.470, p<.05). However, school administrators did not indicate use of POF, regarding the
characteristics of district and socioeconomic status POF factors (See Table 1)

Research Question #2 asked whether school administrators take consideration of POF factors and PJF factors differently when school size, characteristics of districts, and socioeconomic status are under consideration. To respond to this question, three hypotheses were developed and statistical tests were performed. Hypothesis 1 tested whether school administrators took consideration of POF factors and PJF factors, differently, depending on a different size of schools. The three size of schools were operationalized as: large size school (n=6) with > 850 students, medium size school (n=46) with 441-849 students, and small size school (n=53) with < 440 students. The result shows that factors in POF have a significant effect on teacher selection (F (2, 102)=4.470, p<.05) when school administrators take consideration of their school size. Hypothesis 2 tested whether school administrators took consideration of POF factors and PJF factors differently, depending on locations of school districts. The locations were categorized into three levels: urban (n=13), rural (n=44), and suburban (n=48). The result shows there are no differences in POF factors and PJF factors when the school location is under consideration in teacher selection.

</tr>
</tbody>
</table>

Note: Values enclosed in parentheses represent mean square errors. 
S = subjects. *p< .05 (The values for p are based on Wilkes Lambda)

Hypothesis 3 tested whether school administrators took consideration of POF factors and PJF factors differently, depending on SES, based on income. High SES (n=16) was more than $40,000, medium SES (n=75) was between $25,001 and $40,000, and low SES (n=3) was less than $25,000. The result (Table 2) shows that Socioeconomic Status (SES) has a significant affect on administrator consideration of PJF factors in teacher selection (F (2, 102)=3.928, p<.05). Based on these findings, it can be said that school administrators take consideration of POF factors differently from PJF factors when SES is under the consideration. Research Question #3 asks about under what levels of the contextual factors do school administrators take consideration of POF factors and PJF factors differently in selection. To answer this question, One-way ANOVAs were performed on each contextual factor. Using Tukey’s HSD post-hoc test, it was found that the significant difference found in the level of consideration of PJF factors relating to SES, was due to the influence of wealthy districts. The result also shows that a significant difference is found in the consideration of POF factors with a large size school.

**Discussions and Implications**

The purpose of the study was to test a proposed model of employee selection, based on the fit concept. The study focused on selected contextual factors. Specifically, the proposed model applied to teacher selection where
job-related criteria have been rigidly applied. The assumption of this model is that when a mutual selection decision is made, an organization is able to obtain high potential performers. One way to do so is not only matching between job requirements of PJF factors and job applicants’ KSAs, but also by matching between school attributes as the POF factors and individual attributes that are important. The study results show that POF factors can have a significant impact in teacher selection. Based on these notions, school administrators with large schools should pay attention to matching between their POF factors and individual applicants’ factors relating to POF. In other words, prior to advertising a vacant position in their schools, it would be better if they take consideration of the characteristics of their POF factors. They should use these factors in identifying desirable characteristics of individual applicants they are interested in for their schools. The applicants’ POF factors should be in congruence with their POF factors. At the same time, administrators in high SES districts should pay the same type of attention to matching their PJF factors and individual applicants’ PJF factors. In business organizations, human resource managers are first concerned about matching job requirements with a job applicant’s KSAs and work experience, which could be done during the recruitment and screening phases. Once those applicants who meet the requirements are identified, they are invited for an interview during the final selection decision phase. Like selection processes used among business organizations, at the initial phase, school administrators have a certain picture of desirable applicants, and they can provide a series of interview questions to see how well PJF or POF factors can be congruent with those of job applicants. In this regard, selection of high potential educators would be most likely made while the applicants also self-select their schools.

Contributions to Knowledge in HRD

Most selection studies focus on PJF factors, such as job-related factors rather than POF factors. In contrast, this study focused on POF factors and treated them as contextual factors as they apply to selection of high potential educators. Based on the findings of this study, the proposed employee selection model can be useful in identifying and selecting such educators when school principals are in large schools and school administrators, including school principals and superintendents are in high socioeconomic status areas. In addition, a practical implication based on this study will help individual performance among school administrators by improving their knowledge and awareness of the importance of POF factors when they practice teacher selection. Regarding research contributions, a selection study is a relatively new area for HRD. Consequently, the study expands the HRD research domain to show broad HRD perspectives. Potential HRD research areas include not only individual performance improvement of school administrators, but also the selection process and the fit concept used in educational settings. Based on the proposed employee selection model, individuals who are responsible for selection can improve the human resource system through identifying and selecting high potential performers, based on the human resource planning of the organization. Reliable high potential employees can be allocated, according to needs and requests of departments in the organization. Finally, the most promising high potential performers who have the abilities to become future business leaders can be selected.

An Integrated Approach to Planning in Organizations

Thomas J. Chermack
University of Minnesota

This manuscript attempts to integrate a varied body of planning approaches into a simple heuristic. In so doing, this article argues for a systems approach to planning and strategy in organizations rather than the current view of planning as a single process. After establishing this heuristic and systems view of planning, the article provides examples of integrated planning in organizations and speculates about the implications for HRD practice, research and theory.

Keywords: Planning, Strategy, HRD

The bulk of the planning and strategy literature assumes that organizational planning is a process (Mintzberg, 1999, Porter, 1985). At its essence, the argument made in this manuscript is that planning should be viewed as a system within the organization and thus might better be approached from a more integrative perspective than current practices promote. While this distinction may seem trite, its implications have a considerable influence on the nature of planning and strategy in organizations. Further, viewing planning as a system allows strategists a greater amount of flexibility in their efforts to obtain glimpses of the future.

Problem Statement and Theoretical Framework

The problem is that viewing planning as a process is too restrictive in light of the complexity facing today’s organizations (Micklethwait & Woolridge, 1995; Hitt, Hoskisson & Ireland1990). A more modular, flexible, and integrative approach is required. To build the case for viewing strategy as a system, this article considers the current view of planning as a process and then suggests a general account of planning as an integrated system. The article then reviews several “schools” of planning as advocated by Mintzberg & Lampel (1995) in the context of three “paradigms in strategy” as advocated by van der Heijden (1997) to illustrate the utility of viewing planning as a system. A planning heuristic is constructed by combining the paradigms and schools. The use of this heuristic provides an integrated view of planning and a framework for discussing strategy as a system itself.

To accomplish its goal of a conceptual shift in how planning is viewed and approached, this article has three core sub-objectives: 1) to generally describe the current view of strategy as a process, 2) to generally describe a view of strategy as a system and 3) to illustrate the utility of viewing planning as an integrated system by describing and combining some views in the planning literature (Mintzberg & Lampel’s schools of strategy and van der Heijden’s strategy paradigms). Finally, this article examines the implications of an integrated approach to planning for HRD practice, research and theory given a tenuous link between planning and HRD in today’s organizations.

Planning as a Process

Planning is generally viewed as a single process (a series of steps) to be conducted within an organization (Miller & Cardinal, 1994). The availability of countless guides to organizational planning and strategy serves as testament to the fact that there are as many different sets of steps for planning as there are consultants to help organizations through them. Indeed, planning is largely thought of as a single process in organizations with little concern for the nature of the engagement in strategy or its ultimate outcomes (Micklethwait & Woolridge, 1995). The problem posed in this situation is that by selecting a single process for approaching strategy, organizational planners limit their approach to strategy. That is, most strategic planning processes are not compatible and do not interface with other strategic planning processes. Thus, the problem is that most approaches to planning promote a single view of strategy throughout the entire strategy making event, while the strategy phenomenon is extremely complex, multifaceted, an may require more than a single approach.

Planning as a System

With the popularity of publications like The Fifth Discipline, there is no need to engage in a detailed discussion of
system theory and how it applies in an organizational context. However, the basic definition of a system requires a set of inputs, a process (or multiple processes) and a set of outputs, all of which occur in some contextual environment (Senge, 1990; von Bertalanffy, 1969; Morecroft, 1995).

Swanson (1994) used the diagram in Figure 1 to denote a view of organizations as simple systems. This simple figure allows the components of a system to be seen simply and logically. This article advocates for the conception of planning in the same way. Following the logic employed by the system diagram and the view of planning as a system, planning itself requires a series of inputs processes and outputs (Swanson, Lynham, Ruona & Provo, 1998).

Figure 1. An Organization as a Simple System (Swanson, 1994)

A discussion of planning as a system involves the same components: inputs, processes, and outputs in some kind of environment. Inputs to the planning system involve the need for planning, or some organizational problem for which planning is suggested as a possible solution. The processes involve the sets of steps as discussed earlier in brief. Planning processes can be any of the popular methods or consulting perspectives commonly used for strategy interventions.

It is further argued here that strategic planning generally consists of two distinct processes -- option generation, and decision formulation (Swanson, Lynham, Ruona & Provo, 1998). Figure 2 depicts planning as a system with two distinct processes.

Figure 2. A General Planning System
The implications of Figure 2 are that a variety of approaches to developing strategic options exist, as well as a variety of approaches to decision formulation. Thus, approaching planning as a system requires the ability to accommodate a variety of perspectives for each of these strategy components.

Paradigms in Strategy

Thinking on strategy within the last few decades has revealed the development of schools of thought in strategic perspectives. In order to place planning in context, it is important to consider the backgrounds of each of these views. Van der Heijden (1997) identified three overarching paradigms of strategic management and planning. They are the rationalist, evolutionist and processual.

The Rationalist Paradigm

The rationalist paradigm features a tacit and underlying assumption that there is indeed one best solution. The job of the strategist becomes one of producing that one best solution, or the closest possible thing to it. Classic rationalists include Igor Ansoff, Alfred Chandler, Frederick Taylor and Alfred Sloan (Micklethwait & Wooldridge, 1997). The rationalist approach to strategy dictates that an elite few of the organizations top managers convene, approximately once each year, and formulate a strategic plan. Mintzberg (1990) listed other assumptions underlying the rationalist school:

1) Predictability, no interference from outside
2) Clear intentions
3) Implementation follows formulation
4) Full understanding throughout the organization
5) Reasonable people will do reasonable things

The majority of practitioners and available literature on strategy is of the rationalist perspective (van der Heijden, 1997). Although it is becoming clear that this view is limited and though the belief in one correct solution wanes, the rationalist perspective is still currently the most common approach to planning found in organizations today.

The Evolutionary Paradigm

With an emphasis on the complex nature of organizational behavior, the evolutionary paradigm suggests that a winning strategy can only be articulated in retrospect (Mintzberg, 1990). In this context it is believed that systems can develop a memory of successful previous strategies. In this case, strategy is thought to be a “process of random experimentation and filtering out of the unsuccessful” (van der Heijden, 1997, p. 24). The issue with this perspective is that it is of little value when considering alternative futures. This view also reduces organization members to characters of chance, influenced by random circumstances (van der Heijden, 1997).

The Processual Paradigm

The processual paradigm asserts that although it is not possible to deliver optimal strategies through rational thinking alone, organization members can instill and create processes within organizations that make it a more adaptive, whole system, capable of learning from its mistakes (van der Heijden, 1997; 2000). Incorporating change management concepts to influence processes, the processual school supports that successful evolutionary behavior can be analyzed and used to create alternative futures. van der Heijden (1997; 2000) offered the following examples of metaphors for explaining the three strategic schools:

1) The rationalistic paradigm suggests a machine metaphor for the organization
2) The evolutionary school suggests an ecology
3) The processual school suggests a living organism

Because van der Heijden viewed scenarios as a tool for organizational learning, he advocated the integration of these three strategic perspectives. “Organizational learning represents a way in which we can integrate these three perspectives, all three playing a key role in describing reality, and therefore demanding consideration” (van der Heijden, 1997, p. 49). It is widely accepted that effective scenario building incorporates all three of these perspectives (Ringland, 1998; Gerogantzas & Acar, 1995; Schwartz, 1991).

Planning Schools

Mintzberg & Lampel (1999) provided an overview of 10 “schools” of strategy. In an attempt to summarize the vast literature around strategy and planning, the authors devised ten schools according to ten different views regarding the intent and nature of strategy and planning. While their classification is helpful in analyzing planning practices, Mintzberg and Lampel (1999) did not offer a precise description of a truly integrative approach to planning. Thus a
core intent of this article is to provide the rationale that successful planning may incorporate several, if not all of the schools proposed by Mintzberg & Lampel. That is, varying approaches to option generation can be coupled with varying approaches to decision formulation in an overall planning system (Swanson, Lynham, Ruona, & Provo, 1998). To illustrate this link, the ten schools of planning proposed by Mintzberg & Lampel are summarized.

The Design School

The Design school suggests that fit between the organization and its environment is the most important factor in implementing and considering strategy. By analyzing strengths, weaknesses, opportunities and threats, organizational leaders attempt to achieve a maximum fit with the environment through a “deliberate process of conscious thought” (Mintzberg & Lampel, 1999, p. 22). The design school is based on a relatively predictive model and aspects of it have been incorporated into many of the other schools (Mintzberg & Lampel, 1999).

The Planning School

The planning school has grown primarily out of Ansoff’s (1965) work and dominated the conception of strategy through the 1960’s. “Ansoff’s book reflects most of the design school’s assumptions except a rather significant one: that the process is not just cerebral but formal, decomposable into distinct steps, delineated by checklists, and supported by techniques (especially with regard to objectives, budgets, programs, and operating plans)” (Mintzberg & Lampel, 1999, p. 22).

The Positioning School

The positioning school was the dominant view in the 1980’s and was given much support and influence by Porter (1980) and consulting firms such as Boston Consulting Group, and McKinsey & Company. “In this view, strategy reduces to generic positions selected through formalized analyses of industry situations. Hence, the planners become analysts” (Mintzberg & Lampel, 1999, p. 23). Drawing on roots in military strategy, the positioning school focused on data and the articulation of strategy as a science.

The Entrepreneurial School

The entrepreneurial school focuses on the chief executive as the primary strategist. With a much smaller stream of literature and practice, the environmental school “centered the process on the chief executive; but unlike the design school and opposite from the planning school, it rooted that process in the mysteries of intuition” (Mintzberg & Lampel, 1999, p. 23). Thus, strategy was a more vague, metaphorical endeavor driven by the knowledge, skill, and perceptions of an individual.

The Cognitive School

Focusing on creating models of reality for executive teams to test strategies, the cognitive school suggests that strategy is a mental process. Cognitive maps, mental representations, mental models and other terms have been used to communicate the importance of understanding those mental processes. “Particularly in the 1980s and continuing today, research has grown steadily on cognitive biases in strategy making and on cognition as information processing, knowledge structure mapping, and concept attainment” (Mintzberg & Lampel, 1999, p. 24).

The Learning School

The learning school has emphasized planning as a learning activity, completely abandoning the notion that the future can be predicted. “Dating back to Lindblom’s early work on disjointed incrementalism and running through Quinn's logical incrementalism, Bower's and Burgelman's notions of venturing, Mintzberg et al.'s ideas about emergent strategy, and Weick's notion of retrospective sense making, a model of strategy making as learning developed that differed from the earlier schools” (Mintzberg & Lampel, 1999, p. 24). This view also sees strategy as an emergent phenomenon and incorporates a cross-section of the organization into the planning process.

The Power School

The Power school has been divided into two perspectives: Micro power and Macro power. “Micro power sees the development of strategies within the organization as essentially political - a process involving bargaining, persuasion, and confrontation among actors who divide the power. Macro power views the organization as an entity that uses its power over others and among its partners in alliances, joint ventures, and other network relationships” (Mintzberg & Lampel, 1999, p. 25). Ultimately, the power school suggests that people in powerful positions devise strategies.

The Culture School

The culture school is the opposite of the power school. In the cultural view, strategies are devised by collective thought and contribution to the strategy process. The cultural school “focuses on common interest and integration - strategy formation as a social process rooted in culture” (Mintzberg & Lampel, 1999, p. 25). This view was popularized in the United States after Japanese management styles were observed at the height of their effectiveness in the 1980’s.

16-3
The Environmental School

“In this category, we include so-called "contingency theory" that considers which responses are expected of organizations facing particular environmental conditions and "population ecology" writings that claim severe limits to strategic choice” (Mintzberg & Lampel, 1999, p. 25). The environmental school suggests that the goal of strategic planning is to prepare for as many environmental situations as possible. With a focus on contingency plans and preparedness, the environmental school represents a constantly reactionary stance to environmental conditions.

The Configuration School

The configuration school suggests the use and combination of multiple methods and views as an appropriate approach to strategy. “This school, more academic and descriptive, sees organization as configuration - coherent clusters of characteristics and behaviors - and integrates the claims of the other schools - each configuration, in effect, in its own place” (Mintzberg & Lampel, 1999, p. 26).

The ten schools proposed by Mintzberg & Lampel are intended to provide a means by which the diverse, complex and varied nature of the literature around strategy and strategic planning can be summarized. Some conceptual work has linked scenarios to strategic planning (Swanson, Lynham, Ruona & Provo, 1999) and this research intends to build on that work.

A unique perspective is achieved when the strategy paradigms and planning schools are combined in a matrix. Based on Mintzberg & Lampel (1999), the planning schools can be classified into strategy paradigms generally as depicted in Figure 3. The matrix provided in Table 1 allows the strategist to further assess or include a variety of approaches to strategy.

The heuristic offered in Table 1 represents the potential for a variety of approaches to planning based on a modular combination of summative planning literature. The heuristic is useful to practitioners and academics in four important ways. First, it offers a parsimonious summary of theories and approaches to planning. Second, the heuristic serves an assessment function. That is, it could be used to classify existing approaches to planning in an organization for a consultant. Third, the heuristic encourages academics to conduct research that verifies the validity of not only the schools and paradigms that constitute the heuristic, but also the cells within it. Finally, the heuristic provides a perspective of planning that has not been explored.

Having established this integrative view of planning, we may now turn to some examples of planning as a system using these integrative concepts. With the considerable complexity facing today’s organizations, it seems logical to assert that none of these perspectives is adequate on its own. For example, it is inadequate to think of planning from a strictly rational perspective, and it is inappropriate to consider that the learning school includes the only applicable ways of thinking about planning. Strategy and planning are simply too complex to be addressed by a single set of assumptions.
Examples of Integrated Planning in Organizations

There are examples of planning in organizations that illustrate a division in the strategy system. This section offers some brief descriptions of planning in organizations that suffered problems and evolved toward a more integrative approach. While none of the examples reviewed have used the specific heuristic that is the basis of this article, several have exhibited characteristics suggesting problems with and then an integration of many of the perspectives found in Mintzberg & Lampel’s and van der Heijden’s thinking on planning. Further, as scenario planning has gained increased recognition as a key mode for generating options, it is becoming widely adopted in organizations as a precursor to more traditional planning. Therefore, many of the examples described here involve the addition of scenario planning at the outset of the strategy system.

The planners at Royal Dutch/Shell Oil had several insights as they pioneered the scenario planning technique. After becoming masters at designing technically magnificent scenarios they realized that by focusing on the scenarios themselves, they were overlooking the core purpose of their work -- to alter the mental models of the management teams for whom they were developing plans (Senge, 1994). So, once they became proficient at designing challenging scenarios, there was a looming question of “now what?” Using the scenarios to formulate better decisions required a different kind of expertise, thus efforts to combine scenario planning and other forms of strategic planning began.

Argyris & Schon (1996) provided a case study of planning in which the orientation of the executive team contradicted the values of the majority of others involved in the planning system. What might have been assessed as a conflict between the design school and the culture school (Mintzberg & Lampel, 1999) was solved by incorporating both approaches to the planning system at different times as required by the intended outputs of the planning effort.

In 1997, Daimler-Chrysler integrated scenario planning with their more traditional planning process. In so doing, the planning team consisted of multiple smaller teams, each working with a different approach to the problems presented by recent mergers and growth (Tessun, 1997). Tessun (1997) reported that this was the first attempt at explicitly breaking planning into two distinct phases at Daimler-Chrysler; one of exploring options, and one of assessing and making decisions based on consideration of the options and their implications.

Hitt, Hoskisson, and Ireland (1990) have argued that bureaucratic features of large firms undermine strategic planning efforts. In their attempts to understand what factors tend to support the influence of planning and firm performance, Hitt, Hoskisson and Ireland concluded that generally, small firms have an advantage because much bureaucracy is removed from planning. Conversely, Miller and Cardinal (1994) argued that large firms have an advantage in planning because of their capital intensity. To reconcile what appeared to be conflicting conclusions, the authors suggested that firm size is another factor that drastically affects the approach to planning in organizations. Proceeding to case studies of companies that adjusted their approaches to planning based on these factors and showed marked improvement in firm performance provides some confirmation that an integrated approach to planning might be useful.

Implications for Human Resource Development

There is no clear view of the link between HRD and planning processes in organizations. Some HRD scholars have argued passionately for the link between expertise and strategy, implying a role for HRD given its function in the development of expertise (Swanson, 1994; Herling, 2000). It is perhaps wishful thinking to assume that HRD is a valued partner in planning and strategy as the reality in many organizations does not support this assumption. However, there are organizations that do value the HRD function and that do incorporate HRD input into their planning system. These organizations are prime places to begin making the case that HRD can contribute to strategy in ways that increase an organization’s advantage and their numbers seem to be growing (citation, 19xx). Planning has not been the primary domain of HRD, although the growth of the field seems to indicate a trend toward an increasing role in strategy for HRD professionals.

Implications for Human Resource Development Practice

The practice of HRD in strategic contexts varies. Perhaps this practice varies according to Swanson’s (1994) views of HRD in organizations, or perhaps other. Either way, HRD professionals face a variety of challenges concerning their role in the planning system. Practitioners in organizations that value HRD as a contributor to the planning system, might use the heuristic offered in this article as a means for assessing and modifying current planning practices in their organizations. Further, examples of shifts in planning practices such as those described here may provide the enough incentive for managers to discuss the potential for changes in their current planning
practices. However, it should be noted that these examples are anecdotal at best and that further research is required to investigate any potential hypotheses concerning improved planning as a result of a more integrative perspective.

**Implications for Human Resource Development Research**

Aside from a few case studies, there is no body of research concerning HRD’s contribution to strategy and planning. Further, there is minimal research that clarifies the link (if any) between integrated approaches to planning and improved organization performance. While this can be viewed as a weakness, it can also be viewed as a tremendous opportunity. Minimal research exists that clarifies the validity of Mintzberg & Lampel’s (1995) schools of strategy, therefore, simple descriptive research, surveys, or even further case studies that lend credit to the classifications offered by Mintzberg & Lampel would be helpful. Thus a key next step in the research domain might be a simple survey examining perceptions of planning practices in organizations. In addition, and as has already been mentioned, the link between HRD and planning is not clear. Therefore, any research, (be it in the form of descriptive research, case studies or other) that helps to establish or further this link can be considered invaluable to the profession.

**Implications for Human Resource Development Theory**

There is no shortage of theories about strategy. In fact, it can be argued that the vast majority of work concerning planning in organizations has been conceptual (Mintzberg, 1990). As planning becomes a more prominent area of practice for HRD professionals, the value of theories that explain what happens in practice will increase. The heuristic provided in this article is useful in that it provides a relatively parsimonious summary of the varied planning theories. Further, complex organization planning practices can be analyzed across this summary in an integrative view. Such an analysis makes it possible to assess what particular approaches to planning have in common with others, and what is unique about each. Finally, the heuristic may lead to conversations about best practices in planning given an integrative approach that allows such commonalities and unique nesses to be determined.

**Conclusions**

This article has introduced a heuristic for assessing and integrating approaches to planning and strategy in organizations. The heuristic is based on the conceptual and summative works of Mintzberg & Lampel (1995) and van der Heijden (1997) respectively. It has been argued that planning has been and is currently largely approached from a process perspective, indicating a limited number of options for engaging in planning, and this article has further advocated a systems approach to planning by introducing the integrative heuristic.

While it is unclear what role exists for HRD to play in the formulation and implementation of planning and strategy in organizations, there are clear opportunities for HRD professionals (academics or practitioners) to demonstrate and develop expertise in this area. It appears that there will be an increasing demand for HRD professionals with such expertise.

Transformational Learning and Human Resource Development: Advances Toward a Knowledge Based Society through Humor

Joanne Parke
Northern Illinois University

A common thread within a growing globalism is the creation of an emerging knowledge-based workforce. This paper will discuss a message supported by adult education theory that is beginning to manifest itself in human resource development and the growing globalism that steeped in communication and information. Theoretical implications are reviewed that capitalize on transforming workers to learners whose world views are dramatically altered through the appropriate utility of humor that may lead to transformation.

Keywords: Human Resource Development, Transformational Learning, Humor

Much has been said about human resource development, the learning organization (Senge, 1994) and organizational development. The ultimate goal of learning is change in knowledge, behavior, and ultimately world view. Expanding Senge’s learning organization creates opportunities for a learning society. Therein lie implications for strong knowledge based societies that live, work, and learn in an engaging concentration and scope. However, individual learning is seminal to creating a knowledge based worker, organization, and society. Human resource developers must incorporate an overriding view that is infused with individual learner contexts and concepts of learning beyond job, career, and professional development. In order to achieve this evolutionary view, it is possible that enhancements to individual development would entail learning at a broader, deeper level. To instructively breathe transformative learning into human resource development, it could be that the learning itself must be transformational in capacity. Furthermore, human resource developers can foster learning that is both creatively expressed and can offer access to learners that matches their individualized, epistemological foundations. The creativity of HRD professionals must include a variety of potential learning strategies that facilitate change and prepare worker learners for insights beyond the job learning contexts, curriculums, and learned outcomes. The changes that may advance transformative learning involve HRD professionals at every level of societal transformation involves pragmatic methods of instruction. Yet, the utility of the methods can translate to transformation in the growing knowledge based organizations and societies around the world. The questions that surround the concepts and processes are as follows: How can meaning perspectives arise from a depth of learning that results in the knowledge of a new world view? How can HRD professionals begin to comprehend the diverse nature and culture bound understandings of cross cultural learning that will enhance learning, and develop the individual professionally? This paper explores aspects of humor, transformative learning, and human resource development within the context of adult learning theories. This investigation of humor theories links learning strategy and perspective transformation that is prevalent in adult learning literature. This discussion offers a literature review that investigates the theoretical insights of adult learning expert Jack Mezirow. Previews of how linkages between humor and perspective transformation can open new pathways to improve worker learner trust, esteem, communication, and altered world views are examined.

Adult Learning: Theoretical Perspectives

Lindeman (1961), Knowles (1980), and Mezirow (1990,2000), are considered forefathers in adult education. Foundational adult learning theories indicate adults undergo broadened orientations of their worldview from accumulated life experiences. Social and contextual references and experiences during adult life contribute to learning in an ongoing proliferation of knowing. A growing adult learning literature base stipulates that despite similarities in adult roles and responsibilities, the sum of each person’s experiences makes for specific learned meanings created from their unique awareness. Even though the broadening and accumulation of meaning is qualitatively and quantitatively different from person to person and situation to situation, it is the individual’s perspective that drives specific types of reflection and critical responses. Meaning making shapes the new learning that occurs from reflective processes. According to adult learning theorists, an ongoing learning process stimulates a conceptual worldview that accumulates experiences, precipitates meaning making, and creates the purpose for learning in other new encounters.

Copyright © 2004 Joanne Parke
Perspective Transformation

A key adult learning theory developed in late 1978 by Jack Mezirow focused on adult perspectives. Mezirow (1990, 2000) states that adults’ meaning making is situated in a specific cultural context. Within a specific cultural context, the meaning making of identity and beliefs, are habitually intertwined. New perspectives are transformed or altered by new learning. By converting various cultural and contextual points of view, adults develop changing values and increasing clarity. The results are reframed perspectives that are altered from those that were previously anchored in more stabilized frames of reference. Consequently, a new contextual understanding comes from bridging what is recently experienced to a developing, contour of fresh assumptions. Ultimately, the new learning leads to an alternative, broadened worldview known as learning transformation theory.

The Transformative Process & Critical Reflection

In his book *Learning as Transformation*, Mezirow (2000) notes that stipulations of transformation theory are that adults continually assess contextual understanding in their learning. Adults may criticize and reflect on assumptions to validate personal meaning. The core learning result is that a point of view may be changed. The change may take place over a long period of time or in smaller incremental stages. Altered views entering established mental frames of reference formulate new phases of meaning.

Critical reflection challenges current assumptions, and contributes to broadened concepts and ideas. Perspective transformation refers to taking a problematic frame and transposes it into current adult meaning perspectives that generate different opinions and interpretations after critical reflection.

The progression of perspective transformation has been scrutinized among adult learning literature. Some critical perspectives of the theory are noted in research by Brookfield (1986), Gould (1978), Houle (1992), Taylor (1998), and others. Yet, Mezirow’s the work stands alone as seminal work in adult education.

Learning that fosters transformed perspectives are most prominent when new ideas challenge hegemonic assumptions. It is a definitive aspect of transformative learning according to Brookfield (1986). Critical reflection that fosters becoming aware of power dynamics is a major component of the mindful, self-reflective process of transformation. Having a broadened reordering of how power is formulated and understood infuses critical assumptions with old mindsets. Critical assessments create the environment for establishing other different views. Taylor’s (1998) discussion of transformative learning recognizes that a discontent in withholding old views, self-examination, and critical assessment can create a forceful shift in perspectives brought about by unresolved questions and concerns. As a result, there is a new social, contextual perseverance that accompanies relating old and early decisions. The knowledge-based society will require human resource developers to transform learning at work to examine critical assumptions that foster transformative learning. The links that build competence and self-confidence ultimately reintegrates into newly created mental frames of reference, and thus may create a new worldview and may make way for a knowledge-based society.

Humor Theories

The literature base and theories of combining humor and adult learning are not as prevalent as transformative learning and adult learning literature. However, the effects of humor are well documented. The foundational research regarding the physiological and psychological effects of laughter is most prevalent. Physiological and psychological advantageous effects of laughter and humor is more customarily written about and discussed among nursing and counseling professions. Volumes of literature on humor from theoretical composites are disconnected and lack unifying topics. The theoretical foundations of humor are recognized in several areas. Primary theory development has centered on three prominent assumptions.

Incongruity humor theory indicates that humor is facilitated by unexpected, illogical, or surprisingly contrasting comments in cartoons, jokes or behaviors. Explanations of humor have evolved from contextual circumstances that indicate surprisingly abnormal outcomes that form absurdities are incongruous and humorous or funny. Social and cultural stipulations surround incongruity theory, and create a variable and unidentifiable theoretical base.

Relief theory primarily connects physiological and psychological releases. The physiological neural firing released by laughter impacts psychological outcomes and the effects are intimately linked to positive outcomes. The
recent proliferation of the healing effects of humor and laughter relies on the scientific research that indicates endorphin released during laughter or humorous encounters produces increased neural firing and stimulates the body’s immune system. (Fry, 1992; Frances, 2001; Sultanoff, 1995).

Other initial psychological theories arose from Sigmund Freud. Freud (1960) theorized pent up sexual and aggressive impulses were more socially acceptable in expressions of humor and laughter. Release from anxiety, anger, and other tension producing feelings is the central focus of relief theory. More current research indicates the effects of humor in many cases includes reducing stress, building confidence and increased motivation from a psychological point of view (Endlich, 1993; Goodman 1992; Lefcourt, 2001, 1995, McGhee, 1983; Pease, 1991; Sherman, 1998; Smith, 1971; Struthers, 1993; Watson, 1988; Ziegler, 1998).

Superiority theory is the oldest humor theory, dating back to the height of the Greek and Roman eras. It is steeped in the premise that laughing and humor through disparagement, teasing, or ridicule provokes one person or group to feel superior to another. This theory is the oldest primary explanation for humor. The superiority theory supposes amusement heightens the self-esteem of those thought of as superior. Humor that negatively promotes one individual or group over another and precipitates negative, ego-inflationary results for the dominant group are inappropriate. At the same time, it supposes that amusement and humor diminishes the self-esteem of the less dominant individual or group. It is presumed that humor is perpetuated through laughter, and so is the hegemonic view of the superior group. The viability of anti-social or inappropriate humor can confirm superiority and foster aggression at the expense of others. The results can at the least widen gaps that discourage acceptance of cultural differences and negate cultural inclusion. The worst use of superiority humor can perpetuate oppression of minority groups. It is clear that human resource developers recognize that links to the knowledge society can be defeated within the theoretical humor superiority contexts.

The three key theories of humor that pervade some general assumptions of why humor exists are in all likelihood assimilated into complex and various rationales. Each theory results in different psychological processes. Despite the constricting notions of these theories, they force examination of social and broadened interests and contexts. Unfortunately, the research from a qualitative basis has been quantitatively systematic and forced, leaving questions about the combining of theories as the ultimate theoretical basis.

Offensive Humor and Critical Thinking

Humor tailored in a learning context can enhance adult learning. From that framework, the transformative creation of a sociologically improved worldview may have vast possibilities. However, inappropriate workforce learning and personal development that uses inappropriate humor can have significant negative effects when used under the ancient superiority theory. The perpetuation of verbal inaccuracies regarding gender, race, and dominance of a hegemonic culture may create an offensive and undesirable learning environment. The most serious issue of respect is primarily one of the most important in using humor in adult learning. Offensive humor is the wrong tool or strategy that can perpetuate a range of negative behaviors that may include humiliation, distrust, and feelings of insensitivity. Superiority theories may enhance humor for the dominant group, but perpetuate existing stereotypes and insensitive topics regarding the oppressed group. Most inappropriate humor is negatively impacting to the developing adult learners’ views of cultural acceptance. Instructional effectiveness and relation to the educational message is most prominent in the research done by Bryant, Comisky, Crane, and Zillmann (1980). That research concluded that negative effects of hostile or sexually hostile humor resulted in low ratings of instructors by students across all dimensions. Furthermore, their research indicated that educational facilitators should use caution in their use of humor (p.113-116). Most especially, Berk (1998) states there is a risk in spontaneous humor, and the pitfalls to inappropriate humor, even when used as an instructional tool to improve communication, presents a negative consequence of offensive impropriety. Superiority theories manifest themselves in Berk’s list of 10 offensive areas to avoid. He emphasizes avoid at all costs: 1) Put-downs of any individual including a popular entertainment of political personality 2) put downs of any group based on race, ethnicity, gender, religion, or sexual orientation3) sarcasm and ridicule 4) Sexual content and innuendo, 5) profanity and vulgarity, 6) humor about physical disabilities 7) humor about extremely sensitive issues (e.g., AIDS, abortion, divorce, personal tragedies) (45). The culturally diverse workforce that is knowledge based and global in scope, can certainly utilize appropriate humor to build bridges that perpetuate individual transformation and social inclusion. However, special attention must be taken to avoid offensive humor that has the reverse affect.

Aligning Non-Transformational Adult Learning and Humor

Problems exist with aligning humor and adult learning. Offensive humor can perpetuate superiority that underlies hegemony. In addition, humor often is sporadic and unprompted and can cause the greatest problem of misconception. The literature on how humor enhances learning is coming forward. There is scattered, discrepant
literature describing the cognitive implications of humor in the classroom. Some literature states retention and comprehension are improved. Yet, other research by Kaplan and Pascoe (1977) indicated that previous studies were inconclusive because they lacked evidence of humor as a strategy for comprehension. They claimed additional explanations are needed to demonstrate that retention and a significant difference in comprehension is achieved by using humor in the classroom (1977).

Incongruity lays the foundation for cognition and humor. Recent research suggests a cognitive shift is an explanation of incongruity theory. Accordingly Latta, states, “The basic humor process hinges on a cognitive shift, which entails that every episode of humor hinges on one essentiality, he states is “the ultimate cognitive-shift…” (1999, p. 49). Latta goes on to investigate definitions of incongruity and the judgments associated with humor. In summary, Latta (1999), states that incongruity theory is “indecisive and inconclusive” (p. 124) due to the wide ambiguity of the meaning of the word.

However, humor can help develop higher order cognition through incongruity. Goodman’s (1992) theories indicate that humor plays a key role in problem solving, creativity, and a heightened awareness that can foster the free, exploration of options regarding new roles, relationships, and actions. Furthermore, an exaggeration of the out-of-context components of humor may be revered by cognitive complexities (Berk, 1998, Bryant, 1980 et al, 1980, Kaplan & Pascoe, 1977, Fry, 1984, Powell & Andersen, 1985, Smith et al, 1971, Watson & Emerson, 1988).

An excellent example of the humor relief theory is noted by Boverie (et al 1994) in her article, *Humor in Human Resource Development*. In that article she states that humor may enable individuals to change their views of life events from their epistemological threatened perspectives to challenged, broadened views. According to Boverie, being able to laugh at difficult situations indicates a powerful shift from identifying a crisis to handling crisis in a significant way. Additionally, interpersonal reasons for humor, such as gaining support of others in difficult times may also result in desired, supportive outcomes. (p.76). Even though these identifications may be affectively steeped in psychological underpinnings, a cognitive switch may take place before during of after the difficult situation.

**Beneficial Applications of Humor in Adult Learning**

Humor literature reveals a relationship between giftedness and creativity. Bridging new awareness and humor aligns purposeful learning with a twist. Divergent thought is incorporated in the physiological, psychological, social, and contextual aspects of humor and can be linked to adult learning. An exaggeration emphasized by out-of-context components of humor cognitively stimulates interest and increases motivation. Sharing humor and laughter about critical or difficult learning helps to facilitate the credible assumptions that link adult learning and humor. This point is supported by both humor theories of incongruity and relief. When a funny line is delivered at the right time to an understanding listener or viewer, the attitude toward the subject is enhanced. Satisfaction and comprehension with the subject is improved. (Ber, 1998, Bryant, 1980 et al, 1980, Kaplan & Pascoe, 1977, Fry, 1984, Powell & Andersen, 1985, Smith et al, 1971, Watson & Emerson, 1988).

A limited humor literature base states topic related humor in the classroom environment can greatly contribute to the point of the learning session. (Ber, 998, Hudson, 2001, Johnson, 1990). Well-developed skills in humor delivery are also key to invigorating learning. The right touch of relevant humor at the right time can perk up or illustrate important points in learning. Funny cartoons, quotes, observations, letters, and personal anecdotes and stories that convey humor in strategically important segments of learning, can add zest and relevance to learning. When used as a strategic application to learning enhancements, practiced appropriate humor can be essential to instructional effectiveness. All strategies apply to the positive aspects of incongruity and relief theory.

The possibilities are endless in applications of humor in adult learning. Yet, the foundational support and respect basic to the nature of learning must be provided through cohesive, nurturing and communication. Further appropriate humor may provide the links to the transformative learning process when used in context and strategically. Adult education through humor can provide a link to learning. As with humor, there are educational benefits linked with adult education from the psychological, physiological and sociological perspectives. Mezirow (1991) states: “The essence of adult education is to help learners construe experience in a way that allows them to understand more clearly the reasons for their problems and the action options open to them so that they can improve the quality of decision making. (p.203).

The basic fundamental guide for HRD professionals in fostering critical reflection is to allow empowerment through equal discourse and dialog. Through the application of humor, dialog and discourse can be stimulated in an interesting and promising way. Participation in adult learning work environments that foster validation and self-reflection of new learning can create ideal conditions for the fundamental components of transformation to occur. Understanding the learner’s involvement in life long learning experiences that is demonstrated through dialog and
discourse fosters adult learners’ inquiry. Further, including humor stimulates discussion and nurtures equal participation that is critical to the formulation of new roles and ideas outlined in Mezirow’s perspective transformation. Humor when used in appropriate contexts can decrease impending, overwhelming uncertainties and promote clarity and promise about developing perspectives. Humor can provoke and facilitate an interesting learning environment.

According to Patricia Cranton (1994), “Fostering learner empowerment also involves setting the stage for critical self-reflection” (p. 159). She indicated that by offering strategies for adult educators that create and enhanced learning environment, cultivates less divergence between learner experiences and new or conflicting information. She states: “[Providing] provocative readings, unusual events, outrageous statements, and unexpected activities can all help create and environment in which differences are not only acceptable but encouraged. This kind of atmosphere leads one to examine long-held assumptions or values” (1994, p. 159)

Popular humor can provide unusual events and outrageous statements. New frames of reference can be cultivated when presented in a humorous context. Popular humor can also perpetuate stereotypes and reinforce cultural values. Therefore, in creating a climate of acceptance as Cranton (1994) suggests, the environment will guide adults into the skills fundamental to critical thinking and reflective practice. Humor that causes a cognitive shift can facilitate meaning formulations for adult learners’ and allow individual differences in non-threatening, non-judgmental environments to coexist. Yet, these formulations are some of the key challenges that face human resource developers in fostering the critical reflection process.

**Operationalized Humor in Adult Transformative Learning**

The critical reflection process is fundamental to transformative learning. Furthermore, motives for gaining insights can be indefinably individualized and unique. Beginning a learning session by using appropriate humor in context can provide the outrageous attention-getting strategy that can foster learning empowerment. Providing a funny story, joke, or riddle can diminish the introversion some adults may feel about certain upcoming learning activities. By applying humor to the broad contexts of work, human resource developers can use humor to express truth even when truth is repressed or feared. The median approach, somewhere between perpetuating hegemonic values and transformative regeneration of life experiences, is a pragmatic utility of humor that can impact learning simply because it adds an element of fun. Humor can help us cope with problems. Humor often succeeds when other methods have failed. By offering humor HRD professionals can offer an improved psychological, physiological and sociological setting to learn, explore and grow.

Sociological views of humor suggests that meaning and relationships can be facilitated through humor, laughter, and the common meaning and knowing that comes from communication. Human resource development that is challenging, yet fundamentally known and understood by worker learners can expand by using humor infused with existing knowledge about group camaraderie and playfulness. By supporting and challenging learning among adults, Daloz, (1986) and Boyd (1989) claim adult learners’ growth can be promoted by developing group building exercises. Ultimately skilled human resource developers can build supportive relationships among groups over a short period of time. By beginning and interjecting appropriate humor, tensions can be lessened, and openness and support can be modeled. Group building can be stressed throughout the dynamic group learning processes, and fostered through contextual humor that is appropriately timed. Fostering and building on feelings of unity in groups can be enhanced through humor and laughter. Physiological, psychological, and sociological theories support the positive aspects of using humor in groups.

**Humor as a Social Corrective**

A general superiority statement that substantiates the triumph of one person or group of persons over another can facilitate amusement and hegemony at the same time. Humor may link attitudes and values that can mark transformative perspectives, especially in the instances of emotional turmoil and pain. Consequently, the inappropriate use of humor can backfire and adversely effect perspective transformation. Consider for example an oppressively dominant group egged on in a heightened negative awareness of their perceived superiority. By ridiculing an oppressed group, it is presumed the sociological implications of humor can bind the superior group’s relations and can be used as a tool for developing solidarity, where their oppressive views are magnified. Herbert states in his article *Humor in the Classroom: Theories, Functions, and Guidelines*, “The more intense the negative disposition toward the disparaged person or thing, the more viable the use of humor becomes in elevating the magnitude of laughter” (p. 10). Further self-examination, self-reflection and critical assessment by the worker learner can be established about the inappropriately offensive, oppressive humor that was used. In those contexts, the heightened awareness can make new meanings of hegemony and oppression. Critical reflection can bring evaluation that bridges disconnections with previous frames of references, and fosters dawning of new assumptions.
The triggering humorous hegemonic event that jars established mental frames of references can foster perspective transformation.

Conclusions That Lead to Further Research

The social, contextual, and relational critical points of view lead to sharing, questioning, debating, and updating of the dominant cultural values of individuals. Critical reflection is a natural outcome of that process. The objective and subjective reframing that involve critical reflection, substantially permeates transformative learning, in relational ways that can initiate a substantial change and plan of action. I have reviewed that by applying the superiority theory of humor in a workforce learning context, the wrong views are endorsed. Using humor in the worst-case scenarios fosters superiority theory that can defy the foundational aspects of transformative learning such as understanding individual differences and the role of support in adult educational settings. The sensitivity of appropriate humor and awareness of classroom demographics are essential to avoiding offensive humor that undermines learning.

In this decade human resource developers are poised to attract and retain excellent workers, by training and educating workers in profound, and life changing ways. Central to adult learning and significant professional development is transformative learning. Humor is one tool that can advance attitudes of group camaraderie and interaction. Learning in groups potentially expands learning perspectives. Examining psychological perspectives, Gestalt theorists would agree changes the meaning of the whole to a cognitive factor, and accordingly could be the reason for adding a great punch line.

Berk (1998) states that adding humor throughout the learning process, adds unique interactions in the classroom can “…provide a powerful instructional package for our students” (p. 85). He goes on to list ten examples of techniques to operationalize and integrate humorous material into the learning environment. They are 1) Humorous material on the syllabus 2) Descriptors, cautions and warnings on handouts 3) Opening jokes 4) Skits and dramatizations 5) Spontaneous humor 6) Humorous questions 7) Humorous examples 8) Humorous problem sets 9) Jeopardy! type of reviews for exams, and 10) Humorous material on exams” (p.87). Using these techniques can incorporate appropriately used humor that may advance human resource development goals to a higher personal, professional, and organizational development through humor.

Yet, further research should be conducted to discover how life changing does it have to be before learners experience humor in appropriate contexts? What types of humor perpetuates perspective transformation? Where are the sociological boundaries that transform hegemonic views into the creative phenomena needed to perpetuate new altered worldviews that pave the way for the knowledge-based society? What are the links between essential elements of adult learning, human resource development, transformative learning and humor that can be beneficial?

Creativity and new ideas that facilitate the explorations of optional new roles, relationships, and actions can be enhanced through appropriate humor. The seeking of new functions and roles integrates plans for new actions that are central to transformational learning. Humor can build competence and self-confidence in assuming new roles. The trial and error process often developed in a reintegration of new perspectives originated in appropriate humorous contexts can enhance new phases of meaning. Altered views through humorous venues can facilitate the progression of group and individually related experiences. Furthermore, the acquisition of a new proficiency of knowledge, based on new meanings, is crucial to transformative learning. The relevance of this work is the review and infusion of the cornerstone of adult education, transformative learning and human resource development. The change that perpetuates the meaning of learning and work can advance engaged worker learners that can dramatically alter their individual meaning perspectives. It can foster cross-cultural demarcations and facilitate a knowledge-based society.

Future developments in this field may expand avenues to a knowledge based workforce that has implications toward a knowledge based, global society. Furthermore, humor can add links to the acquisition of new proficiency and new meanings that is crucial to adult transformational learning. The variance of human resource development that bridges workforce training and organizational development to creating the knowledge-based society relies on individualized transformative adult education. The growing interest offers hope for an advanced global workforce and a key role for the field of human resource development.

Escaping the Tyranny of Belief

Albert K. Wiswell
C. Leanne Wells
Virginia Tech

This study describes an action research case study through which the dynamics of identifying and changing strongly held assumptions illustrate the differences between experiences that serve to strengthen beliefs from those that lead to learning. Theoretical considerations are presented linking cognitive schema, action science, attribution theory, and learned helplessness in relation to interventions that may be effective in addressing error in informal learning.

Keywords: Learning, Attribution, Mental Models

Under pressure from legislative bodies and tax paying citizens to have increased accountability, many school districts are implementing a merit pay system in which monetary rewards are based, in part, upon performance evaluations of actual classroom teaching behavior. New dynamics of interactions among teachers and administrators result from these programs and may require some additional interpersonal skills. Described here is a case study illustrating some aspects of these dynamics and how they were resolved through more careful communication aided by the application of a model of informal experiential learning and belief.

The purpose of this research was to develop an understanding and offer an explanation of how certain dynamics of experience interact, specifically in reference to these questions:

1. From a conceptual perspective of experiential learning, how do beliefs develop and persist?
2. Why are beliefs so difficult to change, even when based on incorrect or incomplete information and interpretations?
3. How might learning error be reduced through various ways of testing experience?

Changing Role of Performance Evaluation

Without a direct and quantifiable tie to monetary rewards, performance evaluations have been used by teachers as a feedback mechanism to monitor and document their professional development and to improve their professional practice. With a change to tie these evaluations to direct monetary reward, the importance may shift from that of a feedback mechanism to a mechanism for supplementing an arguably less than adequate salary and demonstrating a credible professional status.

The role of the evaluator may also change, being under some constraints in performing the evaluation. Awarding each teacher the highest rating would inflate the overall ratings, as well as call into question the principal’s ability and expertise to discriminate quality in teaching. So there is pressure to impose variance in the ratings, even if little exists. Also, the system results in teachers competing with each other, at least in terms of how they are perceived by the evaluator. In addition, the evaluator may develop a tendency to look for any signs of easily documentable weaknesses on the part of the teacher and perhaps overlook strengths that are not easily translatable into behavioral descriptors.

Action Research Case Study

A public school teacher was involved in a performance evaluation in a school district with performance-based merit pay. A direct cash bonus is paid at the end of the academic year if the total evaluation is above 3.0 on a 4 point scale. Since this was a newly instituted program, many issues had surfaced, at least in minds of teachers that had not previously been of great concern with respect to the evaluation process. These included questions about the qualifications of the evaluator in subject content and in teaching effectiveness as well as questions about the evaluation instrument and the teaching model it was based on. There was concern about the validity of the instrument as well as how objective the process would be in relation to subjective judgments of the evaluator. These underlying issues framed the specific experience for this particular teacher.

This particular teacher was due for an unannounced class observation that focused a large part of the total evaluation. The principal was to be the observer for this component and was also responsible for the ratings on the rest of the evaluation. The evaluation is based on clearly observable behavioral data, and, as such, the content of the evaluation is not a valid grievance, and this is stipulated by state law. The final date was approaching when the principal was to have all evaluation completed for all the staff, and this teacher had not yet been evaluated by the unannounced class observation. In fact, it was the last week before evaluations were due, and she was getting somewhat nervous about it in anticipation.

One day, during that week, the teacher had a behavior problem with a disruptive student in the class just before lunch. The student became emotionally and behaviorally unable to function in the classroom and had to be removed physically and taken to the office. The parents had to be called to take the student from the school. The lunch period that followed this class was spent by the teacher filling out report forms, calling the parents, and consulting with the principal about this incident. While an incident such as this is not out of the realm of experiences for teachers, it was (in this case) not a typical or normal occurrence. As such, the teacher was, to a degree, distraught and emotionally drained from this experience. Also, because of all these activities, she did not have time to eat lunch. In fact, she just barely had time to get back to the next class, arriving just as the bell was ringing.

Then, who should walk in about thirty minutes later but the principal, ready to do the unannounced class observation/evaluation. As might be predicted, the teacher was not at her best during this class, but conducted it in a satisfactory, albeit not brilliant, manner. Her overall rating was 2.7 out of 4.0, which was not bad but was under the 3.0 cut off for the merit pay adjustment. The behavior observations that impacted most negatively on the evaluation included accompanying comments such as, “was disorganized at the beginning of class, assignment was not written on board, students not in seats,” etc.

The teacher received a copy of the evaluation the next day and was initially incensed. There was a three day time limit in which she could respond to any of the aspects of the evaluation that were in error, but she was not inclined to do so, knowing that the descriptions of the class were behaviorally accurate, and she was attributing that the principal had “set her up,” so to speak. That is, that the principal had deliberately chosen to observe her at her worst in order to give her a mediocre evaluation since she did not feel she was one of those teachers in the “inner circle” who received more tacit support from the principal. She used this occurrence to attribute negative motives to the principal and then looked for other evidence to support that. That additional evidence included her awareness that, of all the classes she taught, that course had the least structured curriculum in the sense that it was at a higher level than others and more difficult to describe in observable behavioral objectives. Thus, she felt that, additionally, the principal had chosen this class because it would be easier for the principal to observe that the objectives were not clear and question whether they were met.

Other evidence that came to her mind was that other teachers in her department had been evaluated in their lowest level, highest-structured classes, in which objectives and outcomes are more easily described. Also, they had been observed several weeks earlier so presumably had not had to remain apprehensive about the process as long. Moreover, the principal having been involved with her in the immediately previous student incident knew full well what the teacher had been going through and must have been aware that she was somewhat distraught due to extenuating circumstances. Therefore, the fact that the unannounced observation was done at that time was deliberate maneuver to catch her at her worst.

Part of the evaluation procedure allowed for the teacher to provide a written response to the evaluation within three days of receiving a copy. The teacher did this, explaining in writing that she felt that the incident prior to class negatively affected the class performance and the evaluation and that that should be taken into consideration or the observation should be done again. The principal responded back with a note stating that he was aware of the circumstances, had made allowances for them in the ratings, and the evaluation would stand as it was. This was particularly distressing for the teacher since several of the relevant categories had been rated zero, and she at this point felt helpless about changing the situation.

All of this was confirming evidence of the hypothesis that the principal had “set her up” for a negative evaluation. There was no evidence to the contrary to disconfirm the hypothesis. This, then, became her view of the state of nature of this incident. The principal had a malevolent character, at least the motives toward her were negative, and this interpretation led to specific plans for her future behavior.

She then proceeded to formulate the following plans:

1. to file a grievance through the personnel office claiming unfair treatment,
2. to write a letter to the superintendent complaining about the principal’s actions, and
3. to resign her position.
These actions made sense, given the validity of her hypothesis. If the principal was that sinister in conducting the evaluation and had generally negative motives in relation to her, then the employment future was not favorable in terms of professional and career development.

**Action Research Intervention**

At this point, the first author had an opportunity to work with the teacher in the capacity of consulting with her about her experience and her intended plans. The primary intervention, besides pointing out the ultimate futility of the intended plans, was to raise the possibility that the original hypothesis was not valid, that the interpretation was faulty. Raising this as a possibility, the teacher was encouraged to further test the hypothesis and the accompanying supporting evidence. This took the form of viewing some of the evidence as continuing hypotheses or questions, namely:

- Was the principal aware of the effect of the class description on the performance of the teacher during the following period?
- Was the principal aware that the observed class was the least structured of all the classes she taught?
- Did the principal have ulterior motives in conducting the evaluation in the manner in which it was done?

It should be noted that a direct testing of someone’s motives is somewhat difficult unless there is a fairly solid personal relationship.

**Experiential Model of Learning and Belief**

A synthesis of multiple learning and belief theories, the model in Figure 1 captures the cognitive – perhaps emotional – processes as an individual assimilates a new experience into an existing mental model of life’s experiences. The individual builds life experiences by making meaning of each new experience, perhaps testing understanding of the new experience, then augmenting or strengthening an internal belief system through new or reinforced learning. We’ll first examine application of the model to the case study example, then conclude with highlights of the theoretical underpinnings of the model.

*Figure 1. An Experiential Model of Learning and Belief*
**Application of Model to Case Study**

Little is revealed regarding the teacher’s existing mental models of life’s experiences. However, we do know that she did not feel a part of the “inner circle” of teachers who received tacit support from the principal. Given the new experience of receiving the negative evaluation, she makes meaning (attribution) of this experience by formulating an hypothesis that the principal has sinister motives: essentially that he “set her up, choosing to observe her at her worst.” She bases this hypothesis on the “evidence” that the principal chose to observe her in her least structured, highest level class, one for which learning outcomes are most ambiguous and, further, a deviation from the experience of other teachers who were observed in their most structured, lowest level classes.

Additional “evidence” includes that the principal waited until “the last minute” to complete the observation and chose to do so during a time when he was aware that she had just experienced an uncommon, problematic, stressful incidence.

Following this meaning making process, the model acknowledges a forced-choice event: either the individual tests understanding of the meaning making or proceeds without testing. The teacher, confident in her beliefs as bolstered by her “evidence,” does not actively test understanding. Clearly for her, the “evidence” serves to strengthen her beliefs that the principal is sinister. Her learning about “how things work” is reinforced and this new experience is assimilated into her mental model of life’s experiences. Indeed, her learning is so strongly assimilated that she commits to a series of actions, including filing a grievance through the personnel office, writing a letter to the superintendent to complain about the principal’s actions, and resigning her teaching position.

But what if she is wrong? And by wrong we mean what if the teacher’s attributions – her meaning making – is faulty and has led to incorrect experiential learning? How would she know if her hypothesis was right or wrong? One way to correct incorrect learning is to test understanding, an interactive process that may lead to disconfirming prior experience or to confirming prior experience.

Returning to the “evidence,” the principal elected to complete the evaluation during the teacher’s least structured, highest level class and immediately following an uncommon, problematic, stressful incidence experienced by the teacher. The teacher’s attribution: He wanted to catch me at my worst. The following scenarios are the actual outcomes that occurred when the teacher tested her attributions and understanding of this experience.

Test 1: (Teacher) “Did you know that was my least structured class, with the most ambiguous learning outcomes?” (Principal) “No, I didn’t know it mattered what class I observed.”

Test 2: (Teacher) “Were you aware that I was stressed by the earlier discipline incident?” (Principal) “No, interacting with you during that incident reminded me that I hadn’t completed your evaluation.”

Without testing, the teacher’s determined course of action as based on her meaning making would have been disastrous. Admittedly, the testing of understanding may either support or fail to support the preceding meaning making. Additionally, the model stipulates learning error regardless of the outcome of the testing process. It is an imperfect process.

**Theoretical Underpinnings**

As acknowledged earlier in this paper, the proposed model of experiential learning and belief is a convergence of established constructs, theories, and frameworks – specifically, cognitive schemas, attribution theory, learned helplessness and learned optimism, and action science. We will highlight each of these in turn and relayed in the model sequence.

**Cognitive Schemas**

Developing from “simple networks into more complex structures” (Scholl, 2002, ¶ 5) psychology’s cognitive schemas are how we organize knowledge about ourselves, others, events, and social roles. These schemas are classically viewed as the “product of one's internal mental apparatus … [as well as] an emergent property of the constant interaction with the environment” (Szokolszky, 1998). Representing the totality of experiences, as well as temperaments and personality, the mental models create the frame and filters for understanding and interpreting all new experiences. As such, these mental models are equivalent to frames of reference and cognitive schemas and possess a developmental aspect, relating to cognitive development and various adult learning concepts, such as transformational learning. Reflecting on the proposed model, individuals with more rigid schemas tend to make quicker, more assumed meaning of new experiences and bypass testing understanding. Alternately, individuals with flexible schemas more freely question the meaning of and openly test understanding of new experiences.
**Attribution Theory**

One way individuals make meaning of new experiences is through an attributional process. Attribution is a natural human response to behavior and events: an “answer” that assigns causality in an intrinsic need to know “why” – a fundamental need to understand in an effort to explain, even to anticipate, predict or control our world. It is a survivalist’s strategy for maneuvering and thriving in spite of adverse odds or events (Heider, 1958). In a given situation, an observer, who may or may not be directly involved in the event, observes an actor’s behavior, making interpretations and drawing conclusions. Attribution theory addresses this process of how the observer selects and combines information to make causal judgments (Fiske, 1991; Heider; Jones & Davis, 1965; Kelley, 1972). In essence, it is how an individual makes sense of behavior and events and constructs a reality of the world.

Typically, the observer considers and weighs situational factors, which are environmental and external to the actor, along with dispositional factors that are internal to the actor and often labeled as stable, unyielding, even permanent to the actor’s personality. Streamlining the complexities of the theory, the most common applications are those of the four attributional dimensions. In weighing the situational and dispositional factors, the observer considers the actor’s behavior in terms of locus of causality (internal, external), stability (fixed, variable), controllability (controllable-uncontrollable), intentionality (intentional, unintentional), and globality (global, specific). The observer’s internal or external locus of causality influences whether a dispositional or situational perspective of the situation. When an observer weighs the actor’s behavior more dispositional, attribution is made in terms of fixed, intentional, and global factors. In essence, the behavior “is what it is” and likely what it has and will continue to be. Conversely, when an observer more strongly weighs dispositional factors, the attribution signifies more credibility for variable, unintentional, and specific environmental influences.

Within the proposed learning and belief model, this attributional, meaning-making process leads the individual to pursue or abandon testing. The individual’s sense of internal or external locus frames the existing mental model. Assigning internal control of the new experience, the individual, less fearful of questioning existing learning and beliefs, is more likely to assume situational attributions that question and test the new experience against the existing mental model. Thus, while dispositional attributions limit qualities such as objectivity, curiosity, and inquiry that are essential for catalyzing testing understanding of the new experience, situational attributions position the individual to more freely accept and pursue testing.

**Learned Helplessness and Learned Optimism**

Rooted in behaviorism and avoidance learning, the learned helplessness phenomenon acknowledges an independence between action and reaction. – meaning the individual assumes an external locus of control and, therefore, does not take action to influence an event. It is a “giving up reaction” (Seligman, 1990) to life’s experiences. Such learning “interferes with subsequent formation of associations [and] undermines motivation” (Maier, Peterson, & Schwartz, 2000). As the theory of learned helplessness evolved, attributional qualities were incorporated to portray an individual’s tendency to explain causality of bad events (Peterson & Seligman, 1984). The emergence of explanatory or attributional style opened the door to presuppose individuals who act in logical, rational ways to interpret experiences and, as such, laid the groundwork for the theory of learned optimism (Schulman, 1999). In terms of the attributional dimensions, learned helplessness assumes pessimistic expectations and the individual assesses the situation as internal, changeable, and global; learned optimism dictates positive expectations for an individual who views the situation as external, stable, and specific. Here, interpretation of the internal/external dimension is in terms of locus of causality rather than locus of control.

Essentially, learned helplessness and learned optimism further clarify the attributional process demonstrated in the proposed learning and belief model. Following a learned helplessness course of action, the individual will make meaning for negative experiences as internal, stable, and global, abandoning testing understanding as a futile effort. Learned optimism leads the individual to interpret negative experiences as external, unstable, and specific, demonstrating a belief that negative experiences are more exceptions rather than the way the world works. Learned optimism positions the individual as less vulnerable, more resilient to negative experiences and less unafraid to test understanding of this event within existing mental models.

**Action Science**

Testing understanding is an active, interactive process that questions the validity of the attributions, inferences, and evaluations made during the meaning-making process. As imagined, this is not always an easy or welcomed process for individuals, as it demands that the observer share – perhaps even “lose” – control of the situation (Argyris, 1982). Under the premises of action science, the attributional observer morphs into participant with public testing of the attributions (Riordan, 1995), which may produce feelings of exposure and vulnerability.

What encourages or dissuades the observer to shed a self-protective cloak and risk the public testing process? Wedged between the meaning-making process and the decision to “test or not to test” you will likely discover the
individual’s theory-in-use, as learned and developed through lifelong socialization processes (Putnam, 1999). Theories-in-use, which are theories of practice, contrast with espoused theories, which are the theories of action that individuals claim to hold and that do not always translate into practice, especially in difficult, unexpected, or threatening situations (Argyris, 1982).

Argyris (1982, 1995; also Argyris, Putnam, & Smith, 1985) proposed two models, which serve as frameworks for the individual’s preferred and employed action strategies, which are under-girded by a set of governing values. Table 1 depicts the two models’ governing values and action strategies.

Table 1. Argyris Theory-in-Use Models

Interwoven in the public testing process are the same risks and control vulnerabilities also discussed in the attribution, learned helplessness, and learned optimism literature. Returning to the proposed learning and belief model, a Model I Theory-in-Use characterizes an individual who is likely to forego testing and experience a reinforcement of existing learning and strengthening of beliefs. In terms of action science, the individual experiences single-loop learning and self-fulfilling, self-sealing processes. Alternatively, the individual who engages in Model II Theory-in-Use practices embraces public testing and reaps the rewards of double-loop learning and reduced self-fulfilling, self-sealing processes.

Thus, an individual enters the model with an established cognitive schema, which serves as the mental model for processing the new experience. During the meaning-making process, the individual attributes causality to the new experience in terms of the locus of causality, stability, controllability, intentionality, and globality. Also active in the meaning-making phase are elements of learned helplessness and learned optimism. Individuals evidencing learned optimism are more likely to assign situational attributions to the new experience and are more likely to engage in testing. However, individuals evidencing learned helplessness typically assign dispositional attributions and move from meaning-making to reinforced learning, without testing understanding of the new experience against the existing mental model. The testing process itself is indicative of action science principles and is a demonstration of public testing of the attributions.

Conclusions

This action research case study describing the dynamics of identifying and changing strongly held assumptions illustrates the differences between experiences that serve to strengthen beliefs from those that lead to learning. Theoretical considerations linking cognitive schema, action science, attribution theory and learned helplessness / optimism can inform practice in relation to learning and intervention.

So what potential conclusions may we reach? First, hypotheses are easier to accept than reject. Acceptance is a cleaner fit with our current state of life experience, requiring less cognitive, emotional, and interpersonal commitment and risk. Second, the power of a test decreases the likelihood of error – the more powerful the test, the greater the likelihood of correctly rejecting the hypothesis. Third, hypotheses that are no longer subject to testing become entrenched beliefs. Finally, positive interpretations lead to greater effectiveness than negative ones.
This research informs particular processes and constructs that are highly relevant for the human resource development field. Coaching behavior, conflict resolution and mediation, performance appraisal, and decision making, as well as interpersonal skills training, are examples of processes that can benefit from additional theoretical integration. Constructs such as self-efficacy, job satisfaction, commitment, and trust are potentially elucidated through examination of the dynamics that affect them.

Asking The Right Questions, Looking In All The Right Places: Embedding Knowledge Construction in Professional Education

Suzanne J. Gallagher
Florida International University

The yearning for spirituality and social responsibility in HRD illuminates the need for reflective practice in professional education to be transformed by multiple sources of information and praxis questions. Theological reflection, a form of reflective practice, is contextualized by praxis questions, spirituality, and social analysis. An alternative model of reflective practice is proposed which addresses the need for spirituality and socially responsive learning at work.

Keywords: Reflective Practice, Spirituality, Social Responsibility

Human resource developers are seeking ways to integrate spirituality and social responsibility through knowledge construction processes (Dirkx, 1997; Hatcher, 2000). Current models of reflective practice do not respond sufficiently to learners’ need for spiritual integration (English, Fenwick, & Parsons, 2003) or connection to social issues (Hayes & Wilson, 2000). Theological reflection, a form of reflective practice in ministry, provides a model of reflective practice which embeds the problem solving process using spiritual information in a social context. The purpose of this paper is to illustrate an alternative model of reflective practice embedded in a spiritual and socially responsible framework.

HRD’s Quest for Spirituality and Social Responsibility

The desire for spirituality and social responsibility in human resource development points toward the need to incorporate a holistic set of experiences and questions of social responsibility into models of reflective practice. Human resource development theory is extending its discussion about learning and performance to include spirituality, values, and meaning (Bates, Hatcher, Holton III, & Chalofsky, 2001) and social justice and responsibility (Hatcher, 2000). The search for spirituality, values, and meaning in HRD goes beyond adding these facets to theory to transforming theory in light of these dimensions (Dirkx, 1997). Transforming theory and practice is a process of constructing knowledge with additional sources of information and praxis questions (Fenwick, 2000; Lee, 1994). Sources of information are the types of data we use to make decisions. The data includes cognitive, affective, spiritual, political, and communal experiences. Praxis questions are questions designed to evoke a vision of the common good or socially responsible outcomes. Praxis is understood as doing for the purpose of creating the common good. Integrating spiritual information and being socially responsible are points of development in human resource development.

Spiritual Integration

Bates, Hatcher, Holton III, & Chalofsky (2001) proposed a statement of purpose for human resource development that seeks to integrate learning, performance, and spirituality perspectives. The underlying assumption of the purpose statement was that the integration of the three perspectives was desirable and could enhance the field. The effort to include the spiritual dimension of individuals points to the need to integrate spiritual information in professional education. Spirituality was defined in the purpose statement as “human potential” or “the latent capabilities in humans for growth and development” (Bates, et. al, 2001, p. 9-1). The definition, while avoiding some of the ambiguity and diversity of the term, spirituality, limits the ability to conceptualize the interconnection with larger contexts (i.e., social justice, ecological issues) thereby limiting our ability to imagine more complex, interdependent outcomes (i.e., socially responsible outcomes). Potential was defined primarily in terms of the individual rather than the social. The statement of purpose pointed to the need to include spiritual information in human resource development processes.

The ongoing discussion on spirituality at work validates the need for alternative sources of information in constructing knowledge for learning and performance. Chalofsky (1997) identifies giving to others and bringing your whole self (mind, body, emotion, and spirit) to work as primary components of meaningful work. He argues for the inclusion of mental, emotional, physical, and spiritual information in learning and performing. Spirituality is understood as the construction of knowledge through symbolic and unconscious events (Tisdell, 2003) and is ever...
present in the learning process (Dirkx, 1997). Spiritual information may include meaning, practices, or rituals that express an individual’s “awareness of something greater than ourselves” (English & Gillen, 2000, p. 1). Tapping into this information during reflective practice is one way to incorporate this source of information.

While the statement of purpose highlighted the need to include spiritual information in knowledge construction, a limitation of the statement was its inability to include questions of social responsibility. The search for spirituality is connected to the search for social responsibility through awareness of human interconnectedness (English, Fenwick, & Parsons, 2003).

**Social Responsibility**

Human resource development models based on productivity, profit, and performance are being challenged for narrowly defining outcomes and processes (Bates, et al., 2001). The economic theory underlying human resource development is expanding from an exclusive focus on the financial bottom line to include other indicators of success. These indicators include the impact on social communities and the environment. Models for performance improvement are beginning to include socially responsive outcomes (Hatcher, 2000). “Performance therefore is defined as outcomes of a systematic approach to positive and desired changes in the individual, processes, organization, community, society, and the environment” (p. 27-3). At the organizational level, models are available to support socially responsible performance.

No models at the individual level are available to support socially responsible learning in the workplace. A primary model for learning used in professional education is reflective practice. Learning is necessary when novel problems arise, requiring new solutions. Learning at the individual level uses models of reflective practice that solve the problem without consideration of the social and environmental contexts. An alternative model of reflective practice is needed to systematically incorporate social responsibility in knowledge construction processes. Reflecting on social responsibility acknowledges our human interconnectedness and is further developed with the use of spiritual information.

Spirituality and social responsibility, or the search for a common good, are intertwined (English, Fenwick, & Parsons, 2003). Spirituality brings individuals’ meaning and practices to the work of creating the common good from within the team and organizational context. A model of reflective practice is needed that affirms the relationship between spirituality and social responsibility and supports learning within the workplace. The yearning for a spiritually integrated and socially responsible reflective practice also draws insight from the paradigm shift in knowledge construction.

**New Ways of Constructing Knowledge**

The paradigm shift in knowledge construction reveals important questions for the use of reflective practice. Knowledge construction is the creation of new knowledge in specific and concrete situations. Knowledge construction is a phrase that emerged during the second half of the 20th century to reveal the political and historically situated reality of learning (Habermas, 1971). The idea of knowledge construction critiques learning as the process of acquiring knowledge and expands learning to include the social construction of what we know. Knowledge construction has undergone a paradigm shift in the 20th century resulting in the movement from the transmission of knowledge to the transformation of learning processes and outcomes as summarized in Table 1. The table shows the shift in knowledge construction along various dimensions of learning.

Prior to the late 20th century, the dominant model of knowledge construction in professional education was described as the transmission model (Schon, 1983). The steps of transmitting knowledge included: a) generating knowledge by the experts (academics), b) teaching the knowledge to the professionals, and c) professionals applying the knowledge in their practice. The linear, unreflective application of theory did not provide the knowledge required to solve new problems. Theory and academics, or experts who taught the theory, were the authoritative sources for learning and education. This often resulted in the insufficient relevancy of knowledge for practitioners (Schon, 1987).

In the transformation model, the learner is actively engaged in creating knowledge by reflecting on practice and making connections to pre-existing knowledge (Lee, 1995; Schon, 1983, 1987). The transformation model affirms affective experience, community involvement, and the authority of the practitioner’s experiences (Lee, 1995; Schon, 1987). As practitioners’ experience increases in value and authority, expert practitioners become authoritative sources (Schon, 1987). In reflective practice, practitioners’ experience has authority in the construction of knowledge (Schon, 1983). Reflective practice has only shifted slightly by embracing the active, authoritative role of the practitioner. Reflective practice has not evolved far enough to integrate spirituality and social transformation.

Social transformation is based on the realization that knowledge construction is not a neutral process and social and political interests are at stake in the process (Deshe & Grudens-Schuck, 2000). Complex processes are required to discern the social and political interests involved in constructing knowledge. The complex processes include accounting for the perspectives of various stakeholders, assessing the impact on social and environmental communities, and designing a vision of the common good. The paradigm shift unveils these processes and poses questions to help build systems of learning that explicitly account for the various interests.

The paradigm shift in knowledge construction illuminates three questions for professional education relevant to the use of reflective practice (Lee, 1994, Mott, 2000, Schon, 1983, Whitehead & Whitehead, 1980, 1995). The first question shaping professional education is what practical end(s) does knowledge construction serve? Habermas (1973) and Lee (1994) distinguish between the “practical” ends or praxis questions of what we should do and the “technical” means of how we should do things. Praxis questions ask “what kind of world do we want to make” and “what is the common good?” By focusing on the technical means to problem solving, professional education has missed the opportunity to define a vision of the common good and to work towards that end by addressing the praxis questions (Lee, 1994). Questions about the purpose and intent of professional education shape its development. If the purpose of professional education is to efficiently and effectively solve problems, then curriculum will be designed to achieve this end. If the purpose of education is to create a world we want to make for future generations, the curriculum will include the development of values and meaning to shape the use of technical knowledge.

The second question is what sources of information will be engaged in knowledge construction processes? Will affective, communal, spiritual, and environmental sensory data or information be brought into the construction of knowledge or will it rely strictly on rational data? Massumi (2002) argues that rational “information is a bit player in the project of inducing a global transformation” and that sensation provides the greater possibilities of change (p. 124). Sensation includes feelings, symbols, and images. Professional education programs vary in the degree of diversifying sources of information used in knowledge construction processes (Fenwick, 2000). Developing meaning and value requires the inclusion of multiple sources of information such as emotional, physical, social, political, environmental, and spiritual experiences.

The third question is how do models of knowledge construction used in professional education address the first two questions? Models are representations of processes. With exceptions (Hatcher, 2000; Kaufman, 2000), models of knowledge construction do not include a component for answering the praxis question but focus only on solving problems encountered by professionals (Schon, 1983). Is the opportunity for envisioning socially responsible actions accounted for in models of reflective practice and theological reflection? Are alternative sources of information accounted for in the models or do they only reflect rational processes? These knowledge construction questions point to areas needing development in professional education and its use of reflective practice.

**Reflective Practice**

Reflective practice grew out of the realization that technical rationality or the application of theory to practice was insufficient for the unique and surprising challenges faced by professionals (Schon, 1983). The primary architects of reflective practice in adult education are Schon (1983, 1987) and Boud, Keouagh, and Walker (1985). Schon’s (1983) original model of reflective practice is complemented by Boud et al’s (1985) use of affective information. Models of reflective practice are dynamic and evolve with new sources of information and new challenges.
Professionals, or practitioners, as Schon called them, engaged in reflection-in-action to meet the challenges of new situations that did not meet the requirements of accepted theory. Reflecting in action is the ability to think about what one is doing and to change one’s actions simultaneously (Schon, 1983). The ability to reflect on and learn from professional activity to determine appropriate ways to behave in the future is the keystone idea of Schon’s reflective practice model.

Schon (1983) identifies four primary movements in reflective practice. These movements include reframing the problem, drawing on a repertoire or familiar exemplars, formulating a new hypothesis, and testing the hypothesis. The testing does not occur as a formal experiment but in the broad sense of confirming or refuting a hypothesis. Boud, et.al (1985) present another model of reflection for professionals that affirms the role of affective experience.

Boud, et.al(1985) identify three primary factors in turning experience into learning. The first factor is to return to the experience in a descriptive way, without evaluation or judgment. The second factor is to attend to feelings surrounding the experience to allow supportive feelings to move the process forward and to work through obstructive feelings. The third factor involves re-evaluating the experience. Re-evaluation includes linking the experience with prior knowledge (association), integrating the experience with prior knowledge (integration), testing it in some way (validation), and taking ownership of the new learning (appropriation). Boud et. al’s (1985) model of reflective practice expands Schon’s model by incorporating the affective dimension of experience.

While the linear, problem oriented models of reflective practice advanced by Schon (1983) and Boud, et.al (1985) affirm the creative, affective role of the practitioner, they do not incorporate spiritual information or a vision of social responsibility. The models do affirm the importance of the practitioner’s experience and feelings. The models need further development to integrate spirituality, social responsibility, and the full paradigm shift in knowledge construction. By examining theological reflection, a model of reflective practice used in ministry education, insights illuminate a potential path of further development for reflective practice.

Theological Reflection

Theological reflection, a form of reflective practice in ministry, is a knowledge construction process that incorporates spirituality and social responsibility and reflects the paradigm shift in knowledge construction. Ministry is a profession with particular knowledge and skills including theological reflection. By examining a model of theological reflection used in graduate education in ministry, possibilities emerge for an alternative model of reflective practice in human resource development.

Lee (1994) claimed that graduate education in ministry is the most progressive form of professional education. Theological reflection provides professional education with models that incorporate questions about the common good and multiple sources of information that push the evolution of professional education programs, including human resource development. The praxis questions, sources of information, and models of theological reflection differ from reflective practice due to its grounding in the literature on practical theology (Lee, 1995; Whitehead & Whitehead, 1980, 1995). Practical theology brings together theory, praxis, and technical or instrumental knowledge in response “to a major paradigm shift within Western culture” (Lee, 1994, 25). The shift in knowledge construction involves the move from seeking truth in right belief (orthodoxy) to finding truth in right action (orthopraxy) (Lee, 1994). The focus in practical theology has moved from theory and metaphysics to informed action or praxis. Technical or instrumental knowledge serves praxis rather than being applied theory. These dimensions place informed action at the center of the learning endeavor rather than intellectual affirmations.

Theological reflection is the process of correlating experience and tradition (Kinast, 2000). Theological reflection is a conversation between individual and communal experience and the wisdom of a religious tradition to seek the vision of the common good and meaning in life (Killen & de Beer, 1994). The tradition component provides inspiration for praxis, cultural information includes social analysis, and personal experience incorporates cognitive, affective, and spiritual information (see Figure 1). The search to resolve ministerial concerns is embedded in the conversation between tradition, cultural information, and personal experience.

For example, a minister is presented with the problem of the lack of participation of women in the church’s pastoral board. Engaging the model of theological reflection, the minister attends to information from her own personal experience, cultural information, and information from the spiritual tradition of the church. From her own experience, she may remember her own struggles with church hierarchy and feel anger and discouragement. She may also tell the story of her spiritual journey for strength and encouragement. A spiritual journey is evolution of the meaning, images, and feelings in the individual’s relationship with the Ultimate over time. The cultural or social analysis reveals the historically submissive and private role women played in religion as well as successful strategies for empowerment and assertiveness. Analysis of the tradition may include reading scripture and feminist theologians that lift up positive models for women in church leadership.
By attending to information in all three areas; personal, cultural, and tradition, the minister decides and implements an approach to affirm the leadership role of women in the church and secure their participation on the board. The systematic construction of knowledge in theological reflection incorporates multiple sources of information (mental, emotional, social, and spiritual) (Killen and de Beer, 1994). Spiritual information is elicited from the reflection on personal experience. The analysis in the cultural and tradition areas reveals social injustice (i.e., history of women’s oppression) and a vision of socially responsible outcomes (i.e., women in church leadership). Theological reflection brings together spirituality and social engagement in a transformative manner (Holland & Henriot, 2002). Theological reflection embodies the paradigm shift of knowledge construction and serves as model for reflective practice in human resource development by incorporating questions about the common good and multiple sources of information.

**Alternative Model of Reflective Practice**

The system of reflection begins with asking the right question and looking in the right places for the answers. The right question goes beyond “how do we solve the problem” and “how do we improve performance” to “what type of world do we want?” In practical theology, this is called the praxis question. The praxis question is the foundation for curriculum development and evaluation of professional education. Imagine the impact of centralizing this question in the professional education of human resource developers. The questions of learning and performance will occur naturally within an explicit context of meaning, value, and vision.

Answering the praxis question requires diverse dimensions of knowledge. Cognitive, empirical information is one source for constructing knowledge about our world. The yearning for spirituality tells us that it is not enough. We are feeling, imagining, symbolic, and communal beings who envision a world with all our senses and capacities. Constructing knowledge needs to include the full spectrum of cognitive, affective, biological, spiritual, political, and communal information to adequately answer the praxis question. This complexifies our models, processes, and experience of knowledge construction and raises issues of multi-modal research and theory development. By embedding the problem within the praxis questions and multiple sources of information, human resource developers may find satisfaction for spiritual and social justice yearnings (see Figure 2.).

Figure 2 uses an embedded model rather than the triangulated model used in theological reflection to illustrate the relationships between the praxis questions, sources of information, and problem solving. Embeddedness shows the enhanced context of problem solving activity — within a vision of the common good generated by responses to the praxis questions and within data generated from multiple sources of information. The sources of information are embedded within the praxis questions because the responses to the questions or vision validate the sources used in solving the problem. If the vision is narrowly defined as profit, the social, affective, and spiritual experience of individuals is not validated. The cognitive and technical information will be sufficient to address the problem. The embedded model parallels the economist, Karl Polanyi’s, vision of re-embedding economic theory in a vision of the social good (Dalton, 1986). The vision should drive the economy, not the economy drive the vision.

For example, a manager is faced with low customer satisfaction ratings from his employees. Using the traditional model of reflective practice, the manager will reframe the problem (e.g., employees are not trained properly), draw on repertoire of exemplars (e.g., identify successful training modules), formulate a new hypothesis.
(e.g., better trained employees will yield higher customer satisfaction ratings), and test hypothesis (e.g., measure satisfaction ratings after training).

Using the embedded model of reflective practice, the manager seeks the resolution of the problem by asking praxis questions in the outer circle. The praxis questions may include: a) what is the desired outcome for the customer, b) what is the desired quality of work life for the employees, and c) what knowledge and skills are needed for life-affirming relationships. The answers to the praxis questions paint a vision of the common good and social responsibility. Within this vision, the manager seeks information from multiple sources to insure a holistic context. Using cognitive information (e.g., draw on literature regarding customer satisfaction), affective information (e.g., how the employees feeling about their relationships with customers), spiritual information (e.g., what meaning do his employees ascribe to their work and interactions), and social information (e.g., what is the overall work environment contributing or inhibiting to the desired outcomes), the manager now has a context to address the problem of low customer satisfaction ratings.

Figure 2. Embedded Model of Reflective Practice

Image of embedded model with circles for praxis questions, sources of information, and problem solving.

Using the vision generated by the praxis questions and the data from cognitive, affective, and spiritual sources, the manager engages the problem. Schon’s 4 step reflective practice model may be engaged at this point or another problem solving technique using the information from the two outlying circles. The manager may have discovered that the employees do not feel connected to the organizational mission and the spiritual meaning of their work. Resolving the problem in the embedded context results in workshops for the employees to connect their personal and team experience with the organizational mission. The embedded model of reflective practice generates multifaceted, spiritual, and socially responsive solutions to work problems.

Implications for Human Resource Development

Reflective practice plays an important role in knowledge construction in the workplace. Professional education programs teach models of reflective practice and need to move beyond the rationalistic, problem oriented use. The yearning for spirituality and socially responsive human resource development and the shift in constructing knowledge require more complex models of reflection. The alternative model proposed in this paper is a starting point for complexifying models of reflective practice. Further research is needed to describe the use (or non-use) of praxis questions and multiple sources of information in professional education programs. Curriculum development in professional education will be impacted by integrating spirituality and including questions of social responsibility. Program evaluation will need to include an assessment of the use of multiple sources of information including spirituality and socially responsive outcomes.
As human resource developers who value the spiritual dimension of individuals and the need for socially responsible outcomes, the development of complex models of reflection is essential for fulfilling our values. If we do not acknowledge spirituality and the common good in the models used by professionals to solve problems and construct knowledge in their field, then it is highly unlikely that the solutions will be integrated and responsive. Our yearning for spirituality and social justice demands that we ask the right questions and look in all the right places for answers.

A Summary Analysis And Prescriptions For Mentoring In Multicultural Organizations

Ray K. Haynes
University of Louisville

This review examines mentoring outcomes for women and minorities in contemporary organizations from a policy-in-experience perspective. The history of organizational mentoring and its formal and informal distinctions are addressed. Extant empirical research addressing mentoring outcomes for women and minorities is reviewed. A gender and ethnicity mentoring typology is presented along with 6 prescriptions for developing equitable formal mentoring programs.

Keywords: Mentoring, Multicultural Organizations, Career-benefit Outcomes

This paper critically examines the practice of mentoring as an organizationally sanctioned strategy for socializing newcomers into organizations. In addition, it offers several prescriptions to increase the effectiveness of organizational mentoring. Historical accounts (Cameron, 1978; Dalton, Thompson, & Price, 1977; Fagenson, 1988; Kram, 1983; Kram and Isabella, 1985; Levinson, Darrow, Klein, Levinson & McKee, 1978; Spilerman, 1977) and relatively recent research identified mentoring as an essential mechanism in fostering career development for employees in organizations (Burke, McKeen & McKenna, 1993; Gaskill, 1993; Pollock, 1995; Reid, 1994). Some of these articles addressed a number of important issues (type, outcomes, and obstacles) relevant to the mentoring phenomenon. Although many of these articles made substantive contributions to our understanding of mentoring, what is most noteworthy is the proliferation of mentoring programs in organizations. This prevailing trend towards using mentoring as a career development and socializing tool in today’s organizations must be examined for its practical and theoretical significance in the domain of Human Resource Development. Moreover, it is useful to examine the efficacy of mentoring in socializing newcomers.

The purpose of this paper is to review and analyze the empirical studies that addressed mentoring outcomes for women and minorities as compared to their White organizational counterparts in similar mentoring relationships. According to Caldwell and Carter (1993), business organizations experienced profound changes within the last decade of the past century. These changes stem from global, societal, economic and demographic trends that permanently changed the workforce and the ways in which it is developed (Caldwell & Carter, 1993; Galpin, 1996; Harvey & Brown, 1996). Contemporary organizations are different from those of the past because there is less time and opportunity for developmental relationships (Gaskill, 1993; Kram & Bragar, 1991; Murray & Owen, 1991; Zey, 1988). In response to these constraints, contemporary organizations appear to rely less on informal developmental relationships such as informal mentoring (Caldwell & Carter, 1993; Kram & Bragar, 1991, Murray & Owen, 1991; Zey, 1988). Ironically, these organizations seem to have prematurely adopted the use of formal mentoring as a socializing tool based upon the popular literature and a paucity of scholarly articles advocating the virtues and effectiveness of informal mentoring as a socializing tool (Douglas, 1997; Merriam, 1983). For definitional purposes, informal mentoring is a naturally occurring relationship based on attributes, attraction and, similar interests, where experienced organizational members provide career and psychosocial support to lesser-experienced organizational members. Formal mentoring is a program designed and developed by the organization to facilitate structured mentoring relationships where experienced organizational members provide career and psychosocial development to lesser-experienced organizational members.

Statement of the Problem

Despite a lack of sound empirical support for mentoring (formal and informal), formal mentoring programs continue to proliferate overtly, and informal mentoring still manifests itself covertly in organizations. The problem on a macro-level standpoint is that much of what we know about mentoring is anecdotal and may be anachronistic given the changes described by Caldwell & Carter (1993). Unlike organizations of the past, contemporary organizations are no longer stable and are more multicultural. The problem at a micro level, and more germane to the focus of this paper, is the fact that organizations faced with renewal must replace their old and departing members with new and younger members who will be selected from contemporary workforce that is increasingly more multi-ethnic and multicultural (Finkelstein, Seal & Schuster, 1998; Rubow & Jansen, 1990). Moreover, it is predicted that minorities
will account for 62% of the U.S. workforce by year 2005 (U. S. Department of Labor, 1995). According to Forsythe (2003) by the year 2050, 85% of new entrants to the workforce will be the women and minorities who are now collectively considered minorities but will become the new majority in the workforce. This reality portends difficulty for the traditional practice of mentoring (formal and informal) in contemporary organizations. In the past, mentoring was a relatively simple process. Older or veteran members of an organization would simply guide younger and newer members of the organization with little or no self-reflection. Wellington (1999), cogently describes mentoring of the past in this manner “if the “new boy” has a life history and life circumstances that are just like those of the “old boy,” then all the “old boy” has to do is to remember what private or secret information was useful and important for him to know and then pass that information on to the “new boy” (p.xi). In today’s more multicultural organizations, the mentoring custom is now even more complicated; and new entrant socialization is less than automatic. Because of this reality, the “new boy” may not look like the “old boy”, and may also have a different cultural background (Wellington, 1999). As a consequence, the reliance upon age-old customs and knowledge may no longer be sufficient for mentoring women and minorities.

Theoretical Framework

It should be noted that this paper uses Social Learning Theory as the broad explanatory base to address mentoring phenomenon. Merriam and Caffarella (1991) stated, “Social learning theories contribute to adult learning by highlighting the importance of social context and explicating the process of modeling and mentoring” (p.139). This paper does not focus on the mentoring construct itself or the specific operational nuances of mentoring programs. For a discussion of the mentoring construct, see Kram (1983), Kram (1986). For a discussion of the history and operational nuances of mentoring in organizational settings, see Murray and Owen (1991), and Phillips-Jones (1982). A significant amount of research has been conducted on various aspects of the mentoring phenomenon. Specifically, research on mentoring in organizations has succeeded in understanding key characteristics of the mentoring phenomenon. The phases of mentoring have been established (Kram, 1983). The role of the mentor has been sufficiently defined (Levinson et al., 1978; Noe, 1988; Tack & Tack, 1986) and several studies have established the outcomes of mentoring (Fagenson, 1988, 1989; Hunt & Michael, 1983; Whitely et al, 1991).

Despite significant research progress and efforts aimed at understanding the organizational mentoring phenomenon, few studies have attempted to understand the policy implications of using mentoring as a socializing tool for women and minorities in contemporary multicultural organizations. According to Smith, Smith, and Markham (2000) very little is known about cross-race and cross-gender mentoring including their impact and outcomes. This is a policy analytic study examining the experiences of women and minorities who engage in organizational mentoring programs. It uses Guba’s (1984) policy framework. The policy to be examined is the use of mentoring (formal and informal) as a socializing strategy in multicultural organizations.

Policy Questions

Three policy questions are proffered in order to examine the mentoring outcomes for women and minority (women and people of color) protégés who engage in mentoring programs at their respective organizations.

1. Do minority protégés and White protégés of the same organization have different mentoring outcomes as a result of participating in a mentoring relationship?
2. Do same-race and cross-race mentoring relationships produce different mentoring outcomes?
3. Do same-gender and cross-gender mentoring relationships produce different mentoring outcomes?

These three questions rest squarely in the definitional domain of policy as it is experienced.

Review of the Literature

The review of the literature relevant to this policy examination is divided into three sections. First, the history and evolution of mentoring is addressed. Second, mentoring’s conceptualizations, definitions, and distinctions are addressed. Third, and finally, extant empirical research on the mentoring phenomenon as it relates the experiences of women and people of color are addressed. The empirical research reviewed was selected through keyword searches within business, educational and psychological databases containing journal and peer reviewed articles on mentoring women and minorities. The reviewer only selected published articles germane to the mentoring experiences of women and minorities for this review.

History of Mentoring

History offers us many examples of mentoring relationships (Carden, 1990; Murray & Owen, 1991; Phillips-Jones 1983). According to Murray and Owen (1991) Homer’s account of the Mentor Telemachus relationship in the Odyssey illustrates one of the first attempts to facilitate mentoring. Moreover, it was a relatively sophisticated
same-race relationships provided significantly more psychosocial support than cross-race relationships.

More inclined to form relationships outside the formal lines of authority and outside their departments. Moreover, form sixty-three percent of their developmental relationships with whites. This study also found that blacks were rarely had developmental relationships with persons of another race. On the other hand, black protégés appeared to formation of developmental relationships among black and white managers. Thomas found that white protégés about women.

These barriers include tokenism, cross-gender relationship taboos, and persistent negative attitudes and stereotypes minorities received more mentoring than whites. Overall mentoring was associated with higher levels of job satisfaction and lower levels of work alienation. These studies are significant because they establish the efficacy of mentoring in producing career-benefit outcomes.

Two schools of thought govern the existence of mentoring in business and industry. The first school of thought relies on the belief that mentoring can be designed and created. The second school of thought rests on the assumption that mentoring can only occur naturally (Murray & Owen, 1991). The distinction between the first school of thought and the second is simply a distinction between formal mentoring and informal mentoring. Mentoring, as it has evolved through the ages, has suffered from conceptual and definitional problems (Carmin, 1988; Carruthers, 1993; Chao et al., 1992; Merriam, 1983). An examination of mentoring’s conceptualizations in organizational settings suggest a wide degree of variance in the concept prompting numerous definitions. In a critical review of the literature, Merriam (1983) said that “Mentoring appears to mean one thing to developmental psychologists, another thing to business people and, a third thing to those in academic settings” (p.169). Despite this wide degree of variance for the mentoring concept, most mentoring conceptualizations fall into one of two outcome categories: 1) those that stress professional development and protection, and 2) those that emphasize both professional and personal development of the mentee (Carruthers, 1993).

Two scholars in particular, seem to have been pivotal in creating the two distinct conceptual categories as outlined by Carruthers. Kanter (1977) suggests that the mentor is a person of significant power who helps the protégée climb the organizational ladder through patronage. The mentor according to this conceptualization fights for the protégé and provides assistance to the protégé. In many instances the protégé gains indirect power by being associated with the mentor (Kanter, 1977). Kanter’s mentoring conceptualization focuses on the professional development of the protégé. At the other end of the mentoring continuum is the more elaborate mentoring conceptualization offered by Levinson et al. (1978) that not only includes professional development but personal development as well. In this conceptualization, the mentor takes on a series of roles such as teacher, advisor, and sponsor in a work setting.

Mentoring Outcomes and Empirical Examinations of the Experiences of Women and Minorities

This section first addresses the establishment of mentoring outcomes. Second, it addresses the significant empirical studies examining mentoring outcomes for women and minorities.

Fagenson (1989) examined mentoring’s effect on several career-benefit outcomes (job satisfaction, career mobility/opportunity, recognition, security, and promotion). Fagenson found that mentored employees reported more satisfaction, career mobility/opportunity, recognition and higher promotion rates than non-mentored employees.

In another study, Dreher and Ash (1990) investigated linkages between mentoring experiences and the outcome variables of income, promotion, and perceptions of satisfaction with compensation. Their findings suggest that individuals involved with extensive mentoring relationships obtained more promotions, higher incomes, and perceived being more satisfied with the salary and benefits than individuals who were not.

Koberg, Boss, Chappell, & Ringer (1994) studied the correlates and outcomes of mentoring among professional and managerial employees. Significant findings of this study were that men received more mentoring than women; minorities received more mentoring than whites. Overall mentoring was associated with higher levels of job satisfaction and lower levels of work alienation. These studies are significant because they establish the efficacy of mentoring in producing career-benefit outcomes.

The next set of studies discussed directly addresses the policy analytic questions posed in this paper. These studies although few, are significant because they deal directly with the experiences of women and minority protégés involved in organizational mentoring. Noe (1988) in a review of the literature on women and mentoring suggest that women may face a number of barriers that retard equal access to organizational mentoring relationships. These barriers include tokenism, cross-gender relationship taboos, and persistent negative attitudes and stereotypes about women.

Thomas (1990) conducted a study examining the influence of race on protégés experiences with respect to the formation of developmental relationships among black and white managers. Thomas found that white protégés rarely had developmental relationships with persons of another race. On the other hand, black protégés appeared to form sixty-three percent of their developmental relationships with whites. This study also found that blacks were more inclined to form relationships outside the formal lines of authority and outside their departments. Moreover, same-race relationships provided significantly more psychosocial support than cross-race relationships.
McGuire (1999) used a structuralist approach to examine the effects of employees’ race and sex in accessing help from their mentors. Data were collected regarding employees’ informal networks and their mentoring relationships. McGuire found that male protégés received significantly more instrumental help from their mentors than did female protégés. Female protégés received significantly more psychosocial or socioemotional help than male protégés. McGuire also found that men received more instrumental help (getting one’s work recognized) than women. McGuire’s findings with respect to race suggest that white employees obtained significantly more instrumental help from their mentors than did minority employees. Additionally, minority protégés received significantly more socioemotional help than did white employees. Data obtained from the sex composition of mentor-protégé relationships indicated that both male and female protégés received significantly more instrumental help from their male mentors than from their female mentors. Conversely, both male and female protégés received significantly more socioemotional help from their female mentors than from their male mentors.

Smith, Smith & Markham (2000) conducted a study exploring the nature and impact of diversified mentoring relationships among university faculty. Their study spanned three specific areas common to the mentoring phenomenon. (A) mentoring across diverse groups, (B) mentoring functions and (C) mentoring outcomes. The findings for this study suggest that women reported being in more mentoring relationships than men. Minorities are not successful in acquiring mentors even though they attempt to find mentors inside and outside their organizations; moreover their opportunities are even fewer if they desire a same race mentoring relationship. With respect to mentoring functions, it was found that there was no significant difference in the levels of career and psychosocial support behaviors for diversified mentoring dyads as compared to homogeneous mentoring dyads. In regards to mentoring outcomes, whites reported that mentoring produced higher affective commitment and lower intent to turnover. Minorities reported no significant impact in their levels of affective commitment and intent to turnover based on an increase in mentoring.

Discussion

The findings relevant to the three policy questions in this review suggests that minorities (women and people of color) and whites of the same organization have different mentoring experiences. White protégés only have White mentors. Minority protégés generally have white mentors, rarely have minority mentors and often have to seek mentoring relationships outside of their functional areas. Same race mentoring dyads wherein both mentor and protégé are White produced significantly more instrumental help than same race mentoring dyads where the mentor and protégé were both minority. Generally, these minority mentoring dyads produced more psychosocial help for the protégés. In regards to gender, both male and female protégés received more instrumental help from male mentors than from female mentors. Female mentors offered significantly more psychosocial help to both male and female protégés than did male mentors. Additionally, female mentors offered more instrumental help to their male protégés than their female protégés. Based upon these findings, it appears as though mentoring outcomes are linked to the variables of race and gender. If the protégé is White and male instrumental help is virtually assured. If the protégé is female and/or a minority, (s)he will likely receive psychosocial help but not instrumental help.

The policy of organizational mentoring in its present form(s), in effect, produces disparate treatment for women and minority protégés as compared to their White male counterparts. As a consequence organizational mentoring is ineffective and contributes to the status quo. The status quo is that women and minorities are yet to achieve a critical mass within organizational settings. According to McGuie (1999), the workplace is segregated by race and gender. This means that White males occupy most positions of power within organizational settings and are therefore in positions to offer instrumental help to their protégés who are invariably white and male. In stark terms, women and minorities appear to receive little or no instrumental help from their mentoring experiences yet instrumental help is what is most needed to vertically integrate women and minorities into organizational settings. Instrumental help for women and minority protégés will create a critical mass that hopefully will render the need for specialized programs geared towards integrating women and minorities into organizational settings unnecessary.

Given the demographic trends which suggest that women and minorities will comprise a significant portion of the 21st century workforce, organizations should ask why are there disparate outcomes for women and minorities as compared to majority males engaged in organizational mentoring. The structuralist approach offer a broad understanding of the outcomes associated with organizational mentoring. According to McGuire (1999) structuralists examine how individuals’ positions within a social system provide opportunities for action as well as constrain behavior--- this is known as the opportunity context. If one were to look at the opportunity context with respect to mentoring for women and minorities, one might readily understand why mentoring benefits for women and minorities manifest in the form of psychosocial and socioemotional help but not instrumental help. From the mentoring opportunity contest standpoint, women and minorities are relatively new
entrants into organizational settings. As a consequence, they are yet to be fully vertically integrated into the organizations. In other words, the opportunity context for women and minorities is yet to mature where women and minorities can engage in mentoring relationships where not only psychosocial help is offered but instrumental help as well. Ragins (1997) highlights the importance of considering race and gender in mentoring relationship. These biographic categories appear to affect mentoring behaviors and ultimately mentoring outcomes.

Before concluding this section, it is necessary to address the distinctions between psychosocial help and instrumental help. It is not the intent of this paper to endorse one form mentoring help over the other. It is asserted that in most instances the protégé may view either form of help as being valuable based upon their situational context. For example, since women and minorities generally occupy low-level positions within organizational settings and; the ones who attain high-level positions within organizational settings are often in token and/or isolated positions. It is plausible to suggest that this token or isolated status may cause women and minority mentors and protégés to suffer from a latent sense of loneliness, insecurity and performance anxiety. As a consequence, minority mentors and protégés dealing with this set of circumstances may be more inclined to give and seek psychosocial rather than instrumental help.

Prescriptions for Contemporary Organizational Mentoring

Shapiro, Haseltine, and Rowe (1978) developed a gender-based mentoring typology that reflected the growing presence of women in organizations. Ragins (1997) examined the linkages between diversity and organizational mentoring using a power perspective. I propose that to truly reflect the diversity present in contemporary organizations, there should be an extension of the gender-based typology of mentor-protégé relationships to include a race and ethnicity. (see Figure 1 below).

Figure 1. Gender and Race Based Typology of Mentor Protégé Relationships

Organizations using mentoring as a socialization process for its employees should first recognize that this mentoring dyad typology represents the full range of mentoring possibilities within contemporary multicultural organizations. This new typology represents a fundamental base form which one can recognize the breadth and depth of diversity present in contemporary organizations. Gender, race and ethnicity are biographic categories that can augment our understanding of other aspects of diversity such as cultural characteristics and individual differences. Recognizing these characteristics as fundamental ways in which we differ will serve as a gateway towards building global perspective within organizations.

To improve the experiences and career outcomes for women and minorities involved in organizational mentoring programs, I proffer the following six suggestions that are intended to provide a framework for the development of formal mentoring programs that produce equitable rather than disparate mentoring results.

Suggestion # 1: Provide everyone in the organization with access to the mentoring program. Formal mentoring programs have been marginalized and stigmatized as programs aimed at helping women and minorities. Formal
mentoring should be promoted as an organizational mandate where every employee is encouraged to take part. Nonrestrictive access will lessen the stigmatization associated with restrictive forms of mentoring.

Suggestion # 2: Enlarge the role and responsibilities of all managers and individual contributors who are stellar employees to include that of mentor. These individuals with high performing competencies are the best resource for socializing and instilling protégés with the right attitudes, skills and abilities.

Suggestion # 3: Use the proposed gender and ethnicity typology as a basis for informing and training all employees of the organization on the mentoring dyad possibilities and their nuances. The gender and ethnicity typology is simply a starting point from which one might learn, and develop fundamental cultural and behavioral understanding that transcends gender and ethnicity.

Suggestion # 4: Encourage mentors and protégés to develop a primary mentoring relationship with the requirement that mentors and protégés establish multiple secondary mentoring relationships that span the mentoring gender and ethnicity typology. This requirement simply promotes global perspective.

Suggestion # 5: Hold mentors and protégés accountable (through performance planning) for development. This suggestion addresses mentoring outcomes directly. Mentors and protégés must understand that they will be held accountable for producing effective and equitable mentoring outcomes that contribute to the renewal of the organization.

Suggestion #6: Create cross-functional mentoring forums where mentors and protégés can provide progress reports on the protégé’s development. These organization-wide, cross-functional mentoring forums are designed to anchor mentoring squarely in organizational culture. By engaging in these open forums, mentoring best practices can be shared, and mentors and protégés can gain cross-functional exposure based upon their developmental accomplishments. These forums also enable organizational leaders to gain first-hand experience of the human capital within their organizations.

Conclusion

Organizational mentoring can be a useful tool in facilitating the socialization of employees to their organizations. However, the ongoing increase of women and minorities in the workforce has created significant challenges for organizational mentoring. Mentoring in contemporary organizations must now evolve to meet these challenges. Presently, the experiences of women and minorities engaged in organizational mentoring are not the same as majority males. These differences and disparate outcomes associated with organizational mentoring portend renewal and competitive difficulties for organizations. How organizations socialize and integrate new entrants into the workforce will directly affect their renewal and competitive survival. Policy using mentoring as a socializing tool must evolve to create mentoring programs that produce equitable outcomes for all employees regardless of gender and ethnicity.

The Advantages of Reporting to Your Mentor:
A Comparison of Managers with Supervisory and Non-Supervisory Mentors

Sarah A. Hezlett
University of Illinois at Urbana-Champaign

Theory suggests that protégé and mentor characteristics influence the development and process of mentoring relationships. This study investigates the role of one variable that is a joint function of protégé and mentor characteristics: the nature of the reporting relationship between protégés and their mentors. Results suggest managers who report to their mentors have higher organizational commitment and career satisfaction than those without mentors. However, other variables were not associated with the nature of the reporting relationship.

Keywords: Mentoring, Development, Career Success

Problem Statement

Over the past fifteen years, a noteworthy amount of research has been devoted to understanding mentoring in the workplace. The growth in this literature is highlighted by the recent appearance of several reviews on mentoring (Allen, Eby, Poteet, Lentz, & Lima, in press; Noe, Greenberger, & Wang, 2002; Wanberg, Welsh, & Hezlett, 2003). Despite this progress, research on mentoring is still relatively young (Wanberg et al., 2003). More research is needed to clarify our understanding of mentoring relationships.

Relatively little attention has been directed towards examining how mentoring relationships are affected by the combined characteristics of mentors and their protégés. The current study helps address this gap in the literature by examining whether or not the nature of the reporting relationship between a mentor and a protégé is associated with differences on other variables identified as pertinent to mentoring. The individual characteristics, development activities, manager support, proximal affective outcomes, and career success of four groups are compared: managers who report directly to their mentors; managers who have mentors in the organization but do not report to them; managers who have mentoring relationships both with their direct supervisors and with others in the organization; and managers without mentors in their own organizations.

Theoretical Framework

This research is grounded in the dynamic process model of mentoring recently proposed by Wanberg and her colleagues (Wanberg et al., 2003). Although this model focuses on formal, or arranged, mentoring relationships, the authors acknowledge that many aspects of this model are applicable to mentoring relationships in general. According to this model (Wanberg et al., 2003), mentoring relationships yield two broad classes of outcomes for protégés: proximal and distal. The proximal outcomes include four potential areas of protégé change: cognitive learning, skill-based learning, affective-related learning, and the development of social networks. Proximal outcomes are predicted to partially mediate the relationship between the receipt of mentoring and distal outcomes. Distal outcomes include extrinsic and intrinsic career success. Extrinsic career success can be characterized as the observable rewards individuals receive for their accomplishments, such as compensation and promotions. Intrinsic career success refers to employees’ reactions to their accomplishments. Examples are career and life satisfaction.

Past research, recently summarized in a meta-analysis, supports the proposition that receipt of mentoring is associated with proximal affective outcomes (e.g., job satisfaction and organizational commitment) and with both intrinsic and extrinsic career success (Allen et al., in press). Few empirical studies, however, have examined other proximal protégé outcomes. One study by Lankau and Scandura (2002) found that the assistance provided by mentors (i.e., mentoring functions) was associated with learning about work relationships and interpersonal skill development. Clearly, more research on how mentoring influences cognitive and skill-based learning is needed.

Self-directed learning represents one of the major approaches to studying learning and development in the workplace (McCauley & Hezlett, 2001). Within this body of research, a number of studies have been devoted to understanding the antecedents of participation in development activities (e.g., Noe & Wilk, 1993; Maurer & Tarulli, 1994; Maurer, Weiss, & Barbeite, 2003). Of the antecedents that have been examined, manager support for...
development is one that has been consistently associated with participation in development activities (McCauley & Hezlett, 2001). Given that mentoring relationships are directed towards enhancing the professional development of protégés, it seems likely that receipt of mentoring also is related to participation in development activities. This proposition is not explicitly part of the dynamic process model of mentoring (Wanberg et al., 2003), but is consistent with the model’s thesis that mentoring leads to protégé change. Therefore, development activities are examined in this study, along with proximal affective outcomes and distal outcomes.

Most prior research on participation in development activities has focused on employees’ completion of new learning activities that stretch their knowledge and skills (e.g., reading books, job rotation), but theory suggests additional classes of behaviors are likely to be critical to development (McCauley & Hezlett, 2001). These include behaviors related to assessing one’s development needs and establishing development goals (development planning), as well as behaviors involving reflection on what has been experienced or learned (development review). Therefore, development planning, learning activities, and development review are all included in this study.

According to the dynamic process model of mentoring (Wanberg et al., 2003), mentoring relationships have several kinds of antecedents. Protégé characteristics, mentor characteristics, and the combination of protégé and mentor characteristics are hypothesized to influence the nature of mentoring received. That is, the characteristics of the participants in a mentoring relationship will influence the support mentors provide and protégés receive. This support, in turn, drives the outcomes experienced by the protégé. The current study focuses on one combination of mentor and protégé characteristics: the nature of their formal work relationships.

Researchers have disagreed about whether the nature of the formal work relationship between individuals constrains the possibility of them having a mentoring relationship. Some have argued that certain formal relationships, such as a supervisor-subordinate relationship, interfere with the types of assistance the more experienced person can provide to the less experienced one, making it impossible for a true mentoring relationship to develop (e.g., Ostroff and Kozlowski, 1993). In contrast, others have proposed that employees benefit from receiving mentor-like support from clusters or constellations of developmental relationships that may involve more experienced people both within and outside the employees’ work organization (Higgins & Kram, 2001). Although some studies (Baugh & Scandura, 1999; Fagan & Walter, 1982) have suggested that there are costs associated with having more than one developmental relationship (burnout, role conflict), several have concluded that having multiple mentors is associated with more favorable outcomes (Higgins, 2000; Peluchette & Jeanquart, 2000).

Considering these arguments and the research evidence in light of the dynamic process model of mentoring (Wanberg et al., 2003), it seems reasonable to expect that differences in the formal work relationships between mentors and protégés will lead to differences in the support provided by mentors, and, consequently, the proximal and distal outcomes experienced by protégés. Therefore, different kinds of reporting relationships between protégés and their mentors are likely to be associated with different proximal and distal outcomes.

Research Question and Propositions

The fundamental question addressed by this study is: How do work-related experiences differ for managers and professionals who report to their mentors, who do not report to their mentors, who have both supervisory and non-supervisory mentors, and who do not have mentors in their organizations? The experiences examined include manager’s development activities (development planning, learning activities, and development review), proximal affective outcomes (job involvement, job satisfaction, and organizational commitment), intrinsic career success (career and life satisfaction) and extrinsic career success (total compensation, salary changes, and promotions). In addition, differences between the groups on their individual attributes (i.e., demographic characteristics, personality traits, and cognitive abilities) and the support they report receiving from their managers are investigated.

Consistent with the concept of constellations of developmental relationships (Higgins & Kram, 2001), it is expected that managers who have both supervisory and non-supervisory mentors will have the most favorable work experiences. That is, they will participate in more development activities, have more positive work attitudes, and experience the most intrinsic and extrinsic career success. Managers who report to their mentors (i.e., who have only supervisory mentors) are predicted to have the next most favorable experiences. This is because supervisory mentors are likely to have a greater ability to interact with and influence their protégés on a regular basis than non-supervisory mentors. Managers who have non-supervisory mentors are expected to have more favorable experiences than managers who do not have mentors within their organizations.

One limitation of many prior studies on mentoring is their failure to take into consideration the antecedents of mentoring relationships when examining the outcomes of mentoring relationships (Wanberg et al., 2003). As a result, it is not clear whether outcomes attributed to the receipt of mentoring are due to the relationship or protégé
attributes. The current study includes a number of demographic attributes and individual difference variables, permitting both their substantive investigation and an evaluation of their potentially confounding role in the results. Hypotheses regarding these variables are not specified. Although the dynamic process model of mentoring (Wanberg et al., 2003) identifies protégé characteristics as an important antecedent of receiving mentoring, research has found few employee attributes that consistently relate to the receipt of mentoring. Following a recommendation made by Wanberg et al., the current study extends previous research by examining the major traits represented in the five-factor, or “Big Five” model of personality (Hough & Schneider, 1996).

Managers’ perceptions of how much support they receive from the managers they report to are expected to vary according to the status of their reporting relationship with their mentor(s). The two groups of managers who report to their mentors (i.e., those with supervisory mentors and those with both supervisory and non-supervisory mentors) are expected to report receiving more support from their managers than participants who have non-supervisory mentors or those who do not have mentors within their organizations.

Method

Procedures and Participants

Participants were recruited for a research project jointly sponsored by a consulting firm and a large research university. Managers and professionals who participated in services offered by the firm were invited to participate in the study after the delivery of the professional services was completed. Those invited to participate had taken part in either selection services or activities related to development or promotion (e.g., assessment centers).

Individuals who agreed to participate in the study were asked to complete a paper survey on their own time. Completed surveys were returned to the research university. For some participants, data also were available from demographic surveys, personality inventories, and cognitive tests that were completed as part of the professional services. Approximately two years after the first survey, follow-up surveys were sent to the 82 individuals who returned the initial survey. Time 2 surveys were completed by roughly half of the original participants (n = 40).

Some of the participants in the study responded to demographic questions. Their average age when the initial survey was completed was 40 (SD = 6.9, n = 62). Two-thirds of those providing information about their gender (n = 72) were male. Of those reporting their ethnic backgrounds (n = 62), most indicated they were Caucasian (92%). More than three-quarters (77%) of those who provided data about their education (n=62) had earned at least a bachelor’s degree. Fifty-five of the participants indicated they had managerial responsibility. Of these, 31% were executives, 51% were middle managers, and 18% were supervisors or first-line managers. Eight participants reported they did not have management responsibility. Participants worked in a variety of industries, including financial services, transportation, retail, technology, shipping, and communications.

Comparisons of participants who completed the Time 2 survey with those who did not revealed only one difference. Non-responders reported receiving more total compensation at Time 1 [t = 2.08, df = 47.8 (unequal variances assumed), p = .043]. Overall, the groups appear fairly similar.

At Time 1, 81 of the survey respondents provided sufficient information to classify them into four groups reflecting their reporting relationships to their mentors. The first group (n =15) includes employees who consider their manager as their mentor and also report having another mentor in the organization. Study participants in the second group (n = 17) perceive that the only mentor they have in their organization is their manager. The third group (n = 21) is composed of respondents who do not view their manager as a mentor, but have a mentor elsewhere in their organization. Individuals in the fourth group (n=28) do not have mentors in their organization.

Measures

The current study utilizes items on the two surveys assessing manager support, development activities, proximal outcomes, and distal outcomes. Some measures from the original survey were omitted from the follow-up survey in the hopes of maximizing the response rate by decreasing the length of the instrument. Therefore, some variables were only assessed at Time 1. Internal consistency reliabilities (Cronbach’s alpha) for measures at Time 1 and Time 2 are shown in Tables 1 and 2, respectively.

Manager support. At Time 1, participants were asked to rate the extent to which they felt their managers supported them. Sixteen items were rated on a five-point, Likert-type scale with anchors ranging from “Not at All” to “To a Very Great Extent.” Sample items are: “My manager has coached me in specific areas,” “My manager has conveyed feelings of respect for me as an individual,” and “I have tried to model my behavior after my manager.”

Development activity. Three kinds of development activity were measured. Development planning was measured by asking participants to review a list of seven behaviors and check all they had performed in the past six months. Examples of the behaviors listed are: “Evaluated your own strengths and development needs” and “Targeted specific skill areas to develop.” Learning activity was assessed by asking participants to indicate how
frequently they had performed certain activities in the past six months. The anchors for the five-point response scale ranged from “Never” (coded zero) to “Over 6” (coded six). Twelve items were included in the final scale. Sample items include “Read books or articles to update my skills” and “Practiced skills on-the-job while handling my regular responsibilities.” To measure Development Review, participants were asked to indicate how often they performed three behaviors. Anchors on the six-point response scale ranged from “Never” (coded zero) to “Daily” (coded 5). One sample item is “Reflected on what I have learned.”

Proximal outcomes. The same five-point response scale was used in measuring all three proximal, affective outcomes examined in the study. The anchors on the scale ranged from “strongly disagree” to “strongly agree.” Job Involvement was assessed with ten items, two of which were negatively worded and, consequently, reverse-scored when scale scores were computed. An example of one item from the job involvement measure is “I consider my job to be central to my existence.” Five items were used to measure Job Satisfaction, two of which were reverse-scored. A sample item is: “I find real enjoyment in my work.” Organization Commitment was measured with 15 items, one of which was “I really care about the fate of this organization.”

Distal outcomes. Two indices of intrinsic career success were used in the study. Career Satisfaction was measured with nine items. Responses were made on a five-point scale with anchors ranging from “not at all satisfied” to “extremely satisfied.” One of the items was “How satisfied are you with the success you have achieved in your career?” Life Satisfaction was evaluated with five items using the same response scale used in measuring the proximal affective outcomes. A sample item is: “I am satisfied with my life.” At Time 1, fill-in-the-blank questions were used to assess two indicators of extrinsic career success: total compensation and change in base salary in the past year. Participants also were asked whether or not they had received a promotion in job level in the past year.

Individual differences. For most participants, data regarding personality and general cognitive ability were available. The “Big Five” personality dimensions (Extraversion, Neuroticism, Conscientiousness, Agreeableness, and Openness to Experience) were assessed with the Global Personality Inventory (GPI). This 300-item instrument was developed with input from psychologists in 14 countries in Europe, Asia, North America, and South America and refined using data collected in the U.S., China, and Spain. Items are rated on a five-point, Likert-type scale with anchors ranging from “strongly agree” to “strongly disagree.” Thirty of the GPI’s 37 scales measure facets of the “Big Five.” Reported internal consistencies of most scales are adequate and criterion-related validity data are promising (Schmit, Kihm, & Robie, 2000). To create more homogenous scales for the present study, items pertaining to achievement orientation and initiative were omitted from the Extraversion scale. Conscientiousness was separated into two sub-dimensions: Need for Achievement and Dependability. This scoring is consistent with research supporting the differential validity of these traits (Hough & Schneider, 1996). General cognitive ability was measured with a composite of participants’ scores on the Watson-Glaser Critical Thinking Appraisal (Watson & Glaser, 1980) and the verbal reasoning section of the Wesman Personnel Classification Test (Wesman, 1965).

Limitations

This study has some limitations that should be kept in mind when considering the results. First, the sample is primarily comprised of managers and, consequently, the findings may not generalize to people in other occupations. Second, participants were not assigned to different mentoring “treatments.” As is typical in studies on mentoring, participants were asked to provide information about mentoring relationships that had occurred without researchers’ intervention. The lack of random assignment calls into question the assumption of the equivalence of the different groups. In fact, theories of mentoring suggest that protégés’ attributes should affect their mentoring relationships, yielding groups that differ on more than their mentoring experiences. Comparison of the groups on a number of demographic and individual differences permits the evaluation of some potential differences between the groups. However, it is possible that observed differences between the groups on any outcomes may be due to unmeasured variables, rather than differences in mentor-protégé reporting relationships. Finally, the internal consistency reliabilities of most measures used in this study are adequate. Exceptions to this trend involve the measures of development planning and review. Conclusions pertaining to these scales must be considered tentative.

Results

To evaluate the comparability of the four groups in terms of their demographic backgrounds and individual differences, a series of tests were performed. ANOVAs were conducted for variables that were continuous (age, tenure with current organization, personality traits, and cognitive ability), while non-parametric tests were performed on categorical variables (gender, management level, and education). No differences were observed, suggesting that biographic data, personality traits, and cognitive ability do not differentiate among those with supervisory mentors, with non-supervisory mentors, with both kinds of mentors, and without mentors.
Next, ANOVA was utilized to compare the four groups in terms of their perceptions of the support they received from their managers. As can be seen in Table 1, substantial differences were observed. Post hoc tests (Tukey’s honestly significant differences) indicated that both groups who view their managers as their mentors rate

*p < .05, **p < .01, *** p < .001
them as providing more support than the two groups who don’t view their managers as their mentors. There were no differences between study participants who only had supervisory mentors and those who had both a supervisory mentor and another mentor, nor were there differences between study participants who only had a non-supervisory mentor and those without mentors. This pattern of results was expected.

Results for development activities, proximal outcomes, and distal outcomes at Time 1 also are shown in Table 1. Significant differences were observed for only one proximal outcome (Organizational Commitment) and one distal outcome (Career Satisfaction). Post hoc tests (Tukey’s honestly significant differences) indicate that managers and professionals with only supervisory mentors have significantly higher organizational commitment than those without mentors in the organization. Those without mentors in their organization had marginally less career satisfaction than those with both supervisory and non-supervisory mentors (p = .072) and those with only non-supervisory mentors (p = .060).

Results for outcomes reported at Time 2 are shown in Table 2. Many of the participants who completed both surveys experienced changes in the nature of their reporting relationship to their mentor (mentor status) between Times 1 and 2. Consequently, two sets of ANOVAs were conducted. The first set examined the relationship between mentor status at Time 1 and outcomes at Time 2; the second investigated the relationship between mentor status at Time 2 and outcomes during the same time period. Mentor status at Time 1 was not related to outcomes at Time 2. However, mentor status at Time 2 was significantly associated with organizational commitment. Post hoc tests indicated that study participants who only viewed their manager as their mentors at Time 2 had significantly higher organizational commitment than those without mentors in the organization. There also was a marginally significant effect of mentor status at Time 2 on career satisfaction at Time 2 (p = .08). Note that all results involving Time 2 outcomes must be interpreted cautiously due to the modest overall sample size (N = 40) and the small number of cases in certain groups.

Discussion

Three findings stand out in the present study. First, no differences were observed between those with supervisory mentors, those with non-supervisory mentors, those with both kinds of mentors, and those without mentors in their organizations on any of the background characteristics or individual differences variables examined. These results are counterintuitive and appear contradictory to the dynamic process model on which the current study is based. However, these findings are not inconsistent with previous research in which few protégé characteristics have consistently differentiated those with and without mentors. Additional research is needed to clarify which protégé and mentor characteristics affect mentoring relationships and thus, should be included in theories of mentoring.

Second, the nature of the formal reporting relationship between managers and their mentors was not related to the managers’ development activity, job involvement, job satisfaction, life satisfaction or extrinsic career success. These results diverge from prior research indicating individuals with mentors have more favorable work-related attitudes than those without. One possible explanation for this finding is that managers in this sample who did not have mentors within their organizations were protégés to people outside their organization. Additional research is needed to evaluate whether protégés with mentors who work for the same organization have different experiences than protégés with mentors who work elsewhere. Given past research indicating participation in development activities is associated with manager support, the lack of differences between groups on development activity also was unexpected. For learning activities, the pattern of results is consistent with the idea that those with more developmental relationships will engage in more development. Further research with larger samples is needed to determine if this trend is significant. Note that the same pattern does not appear to hold for development planning or review. This may be a sign that support does not influence these developmental steps, but more reliable measures of planning and review must be created before definitive conclusions can be drawn.

Third, meaningful differences were found between groups on organizational commitment and, to a lesser extent, career satisfaction. Managers with supervisory mentors had greater organizational commitment and were more satisfied with their careers than managers who did not have mentors within their organization. Past research has attributed differences in organizational commitment between those with and without mentors to the presence (or absence) of mentoring. However, in some studies, as much as 85% of participants report that their mentor is their manager. It may be the case that differences in organizational commitment are not due to differences in the receipt of mentoring, but the quality of support employees receive from their managers. Additional research with larger samples is needed to tease out whether there are small, but meaningful differences, in organizational commitment among employees with non-supervisory mentors, both supervisory and non-supervisory mentors, and those without mentors in their organization. Failure to find such differences would suggest leadership, rather than mentoring, drives organizational commitment.

Contributions to HRD

This study has broken new ground by systematically examining whether the work-related attributes and experiences of managers vary based on the nature of their formal reporting relationship with their mentors. Drawing on models of mentoring relationships, developmental relationships, and development activities, several hypotheses were proposed and tested. This study also extended prior research by incorporating two new sets of variables into an investigation of mentoring: protégés’ scores on all five of the “Big 5” personality traits and three kinds of development activities. In several ways, the results diverged from expectations, provoking ideas for new research. Overall, it appears that some work-related experiences and outcomes are not restricted to employees with a particular kind of reporting relationship with their mentors.

These results have implications for HRD practitioners. First, they suggest that when designing mentoring programs, there is room for flexibility in the nature of reporting relationships between managers and protégés. Second, HRD practitioners who are interested in enhancing employees’ commitment to their organizations may wish to focus on improving supervisor-subordinate relationships.

A Systems Approach to Mentoring: A Review of Literature

Jeeyon Paek
The Ohio State University

Numerous studies about mentoring have been conducted, and this paper reviews current studies on mentoring programs from a systems approach. To understand current studies about mentoring, the paper identified three major research questions and reviewed how those questions have been examined in each area: mentoring input, mentoring process, and mentoring outcome. The paper also identified two emerging questions, which are not answered but need to be studied in each area.

Keywords: Mentoring, Systems Approach, Training and Development

A number of individuals and organizations have participated in mentoring programs, and numerous impacts of mentoring relationships have been perceived. The impacts of mentoring programs are varied, but forms of mentoring are also becoming diversified. Mentoring programs vary in their purpose, approach, ideology, and philosophy. The attitude and level of the individual, the organization’s commitment, and advanced information technology contribute to this diversity. While mentoring programs have been implemented in numerous ways, there have been also numerous studies conducted about mentoring. These studies have focused on topics such as what is mentoring, how mentoring can be successfully utilized, and what benefits mentoring brings to the workplace.

However, how can HRD practitioners be confident in considering all factors related to mentoring program planning, implementation, and evaluation? How do HRD scholars identify research questions, which are significant but have not been answered? This paper reviews current studies on mentoring programs from a systems approach—input, process, and outcome—to understand current studies about mentoring and to identify future research needs. Most of the literature does not cover a single area among input, process, and outcome. Instead, it discusses relationships between areas such as input and outcome or relationships between process and outcome. Consequently, literature on mentoring cannot be clearly divided into three categories in a systems approach. However, since a systems approach allows HRD scholars and practitioners to view one training program from a comprehensive perspective covering all aspects and relationships between factors, this paper provides an understanding of current studies and insights related to potential future areas of further study. By analyzing current studies from the systems prospective, this paper identifies emerging research questions to be studied in mentoring input, mentoring process, and mentoring outcome.

The paper is based on a literature review, most of which was published in the last decade, and a critical assessment of the literature. The databases searched are Business Source Premier, Educational Resources Information Center (ERIC), and Proquest. ERIC was used to gain education and training perspectives. Business Source Premier was used to gain individual performance, business, and organizational perspectives. Proquest resources provided additional information regarding application and perspectives various fields’ such as military, teacher’s development, healthcare industry, and community.

Mentoring Input

Participant’s Characteristics

A number of studies have examined the influence of both the mentor’s and protégé’s characteristics on the satisfaction of mentoring relationships. The characteristics examined included demographic information such as race, gender, age, and position; and cognitive tendency such as learning style and transformational leadership style. Some studies illustrated that mentor’s recognition of the protégé’s learning style increases the protégé’s development (Koberg et al., 1998). Another study conducted with 53 mentor-protégé dyads examined the effects of the cognitive style of mentors and protégés. This study found that mentors who are more analytic enhance the quality of the mentoring relationship (Armstrong et al., 2002). Clutterbuck and Megginson (1999) illustrated the difference in mentoring relationships by studying the role of positions using 21 cases of mentoring executives and directors.

Ragins and Scandura (1994) conducted a study of 80 male and 80 female executives to see if any difference existed between genders in the costs and benefits of mentoring. To measure costs and benefits of being a mentor, the authors developed a survey instruments using a seven-point Likert-type scales after pilot a test with 110 executives and upper-ranking managers. The results showed that female executives were as likely to be willing to serve as

Copyright © 2004 Jeeyon Paek
The benefits of peer mentoring are recognized in that there is more open communication (not hierarchical) supported from various disciplines such as social network theory, organizational behavior, and feminist studies. Mentorship differs from conventional mentorship, and by Rymer (2002)'s paper, the concept of "co-mentoring" can examine the role of gender in mentoring. In this study, the composition of the relationship was categorized with four kinds of dyads: (1) mentor who is in the majority group and protégé who is in the minority group and a different gender, (2) mentor who is in the minority group and protégé who is in the majority group and a different gender, (3) both mentor and protégé are the same gender and in the same majority group, and (4) both mentor and protégé are the same gender and in the same minority group. The results indicated that female mentors with either female protégés or male protégés provided more role modeling and psychosocial support than male mentors. However, male mentors provided more career development than female mentors, and male mentors supported female protégés with more career development than any other combination of mentoring relationships.

**Experience Level**

The mentor's experience has been considered an important input to mentoring program. However, in contrast from the conventional mentor's experience level, co-mentoring, or so-called peer mentoring, was recently studied in terms of its impact as an alternative mentoring form. Equality replaces hierarchy in the relationship as peer-mentorship differs from conventional mentorship, and by Rymer's paper, the concept of "co-mentoring" can be supported from various disciplines such as social network theory, organizational behavior, and feminist studies. The benefits of peer mentoring are recognized in that there is more open communication (not hierarchical).
communication), mutual support and feedback, and cooperative learning efforts (Woodd, 1997; Knouse & Webb, 2000; and Rymer, 2002).

Allen, Russell, and Maetzke (1997) described factors related to a protégé’s satisfaction and willingness to serve as a mentor by surveying first-year MBA students as part of an evaluation of a formal, peer, team mentoring program. Protégés were a first-year, five-MBA student team, while mentors were one or two second-year MBA student(s). However, it could be argued that the mentors were not exactly peers since they were in the second year. Measures included time with mentor, satisfaction with current mentor, willingness to serve others as a mentor in the future, satisfaction with previous mentoring relationships, and demographic information. Based on the hierarchical multiple regression analysis, the results showed that higher protégé’s satisfaction level from the mentoring relationship, the resulted in better performance in career and psychosocial functions. The more time they spent together, the more satisfied protégés were regarding the mentoring relationship. The results also indicated that protégés who were highly satisfied with the current mentoring relationship were more willingly to mentor others in the future.

**Mentoring Process**

Just as inputs greatly affect outcomes of mentoring programs, the process also significantly influences outcomes. Mentoring has been implemented in various ways. Mentoring is similar to management, as it can be implemented in a variety of styles and with varying degrees of skill, and is very dependent on the beliefs and values of the day (Woodd, 1997). This paper also found that recent studies presented alternative forms of mentoring compared with classical mentoring. Alternative forms of mentoring discussed consisted of one-to-one, face-to-face relationships between more a experienced person and a less experienced person as a means of implementation. Although the purpose of mentoring—development of person who receives mentoring—might not change, implementation of mentoring has changed and expanded its boundaries as table 1 presents.

**Formality**

Formal and informal mentoring relationships differ in many ways. While the purpose of a formal mentoring relationship is assigned by the organization (usually a short-term career goal like skill improvement), the purpose of an informal one is often driven by developmental needs, which is a much longer-term career goal. The duration of formal mentoring is relatively short and forms are structured, while informal mentoring lasts relatively longer and forms are constructed freely. It is believed that informal mentoring is more effective for a protégé’s development than formal mentoring, but recently because organizations are attempting to implement more mentoring program as part of their HRD strategy, studies have examined how formal mentoring programs could adopt more characteristics of informal mentoring (Rosser & Egan, 2003). Several researchers studied differences between formal and informal mentoring relationships (Armstrong et al., 2002; Ragins & Cotton, 1999; Chao et al., 1992).

Chao, Walz, and Gardner (1992) performed a longitudinal study of 549 individuals from nine graduating classes of a large Midwestern university and a small private institute to examine mentoring outcomes by types of mentorship participation—212 formal protégés, 53 informal protégés, and 284 non-mentored individuals. All three groups were compared in terms of three outcome measures—organizational socialization, job satisfaction, and salary. The findings indicated that protégés participating in informal mentorship had slightly more career related support than those in formal mentorship. However, there was no significant difference in receiving psychosocial support between formal and informal mentorship. Chao, Walz, and Gardner interpreted that psychosocial supports such as counseling, confirmation, and acceptance roles could be performed easily by a supervisor or coworker so those are not unique functions of mentoring; however, the career related roles such as coaching, visibility, exposure, and sponsorship required a more intimate relationship like informal mentorship. Significant differences were found between informal protégés and non-mentored individuals in terms of all scales of organizational socialization, job satisfaction, and salary. Thus, they concluded that organizations should support more mentoring relationships within an organization and should support the transformation from formal mentoring to informal mentoring relationships.

However, individuals who reported not having either formal or informal mentoring relationships, might had have someone who tried to be at least informal mentors. Those individuals may have had a tendency toward low
interest in their professional or career development and refused to have mentors. Additionally, they might have low progress in their professional career life as well, not because they had no mentors, but because they originally had low interest in their professional development.

**Team/Group Mentoring**

Another attempt of expended implementation of mentoring is team or group mentoring rather than one-to-one mentoring. From the 1993 study (Gibb & Megginson, 1993) conducted to describe the current status of mentoring programs in the practical world, there were no instances of group mentoring. One of the first studies about group mentoring was published in mid of 1990s (Dansky, 1996). Dansky (1996) describes benefits of group mentoring as opportunities offered through group participation that may complement or serve as a substitute for individual mentors. Knous and Webb (2000) also describe benefits of team mentoring and professional group mentoring by presenting several military mentoring types to apply to the complex business world with mixed populations on competitive task environment. They illustrated that “team mentoring can provide a sense of identity that can enhance the self-esteem of individual team members. Team members can also provide insight into training needs and the ongoing learning processes of individuals and the team as a whole. In addition, they can provide perspectives on diagnosing process shortcomings, solving problems, finding scarce resources, and dealing with difficult customers” (p. 50). They also stated that group mentoring from professional organizations can provide role modeling for career development, networking, and psychosocial aspect such as belonging for support.

Dansky (1996) described the impact of group mentoring on two career outcomes—salary and job title—by surveying 88 management and supervisory staff from home health agencies, 86% of whom were women. Dansky defined group mentoring as, “a group influence that emerges from the social norms and roles that are characteristic of a specific group and results in the career enhancement of an individual member” (p. 7). She first identified four types of group mentoring: role modeling, inclusion/belonging, networking, and psychosocial support. The results showed that there was a significant positive relationship between group behavior of feelings of inclusion and job title after controlling for the effects of individual mentoring. The study also found that role modeling group behavior was a significant predictor of salary. From this study, though it cannot be concluded definitely that group mentoring promotes job title and increased salary. It may be there was a positive relationship between group mentoring and an individual’s career outcomes. It may be more valid if the study examined non-group mentored management and supervisory staff from home health agencies.

**Virtual Mentoring**

As virtual communication increased, a way of virtual mentoring, so called e-mentoring, emerged in conventional face-to-face mentoring as an alternative method of communication. The notion of the boundaryless career creates the possibility of the virtual mentor—one who is outside the organization of the protégé and who only rarely encounters the protégé face to face (Megginson, 2000). Hamilton and Scandura (2003) stated that e-mentoring may not be a substitute for traditional, face-to-face mentoring, but it can supplement learning and development by providing timely needed advice and coaching. E-mentoring creates a larger pool of mentors and protégés who may face difficulties in commuting time, geographic barrier, and other commitments. In the case of pure online mentoring programs, most online mentoring programs match mentors and protégés who can communicate through a central site for security, privacy, and monitoring or filtering inappropriate communication (Field, 2003). There seems to be many e-mentoring approaches conducted, but few of empirical studies have been published.

**Roles of Mentor**

Much of the literature on mentoring describes the functions mentors performed to provide benefits to protégés. Many researchers explained the roles of the mentor and described mentor’s functions. For example, Clutterbuck (1991) outlined five key roles played by the mentor, namely, coach, coordinator, supporter, monitor, and organizer. Overseer, teacher, counselor, provider of psychological support, promoter and sponsor were roles outlined by Zey (Zey, 1984). Fisher reported that mentors perform the roles of advocate, expert, trainer, alternatives identifier, collaborator, learning process specialist, fact finder, and partner (Fisher, 1994). Clutterback and Kram found that confidant, coach, networker, facilitator and challenger described the mentors they evaluated (Clutterback, 1991; Kram, 1983). Other researchers described mentors as a monitor, problem solver, and assessor (McIntyre et al., 1993); and role model, advisor, and motivator (Knouse & Webb, 2000). Since one of the classical studies in mentoring identified two mentor functions from an in-depth interview with 15 managers (Kram, 1983), most identified roles are belong to those two functions—career-related and psychosocial functions.

Mullen (1998) studied the relationship of roles of the mentor with the mentor’s characteristics. Mullen studied the characteristics of mentors who serve both vocational and psychosocial mentoring functions by surveying 160 mentors and 140 protégés in seventeen Midwestern organizations. The author used hierarchical multiple regression of three steps. In the first step, she tested age, educational level, and gender. In the second set of relationship characteristics, she tested hierarchical distance between mentor and protégé, who initiated the relationship, and the
amount of time spent together. In the third set of mentor attitude and perceptions, she tested how much a protégé influenced the mentor, how well the mentor perceived the protégé's competence, and the mentor's organizational-based self-esteem (OBSE). The results showed that mentors who initiated the relationship, who had high OBSE, who had their protégé influence them, who perceived their protégés as competence, and who spent more time with their protégés were identified as serving both functions at the greatest level. The results also indicated that older mentors performed both combined functions more than younger mentors.

**Mentoring Outcome**

**Benefits to Protégé**

Because the purpose of mentoring is to develop protégés, most of the literature on mentoring outcomes has been examining the benefits and impact to a protégé rather than discussing the benefits to the mentor or organization. Benefits to the protégé have been identified in mainly both career and psychosocial development areas, but increasing individual performance is also one of the biggest beneficial areas, which can be linked to organizational performance (Jacobs & Washington, 2003).

Benefits related to a protégé’s professional development are found as protégé’s increase learning (Sullivan, 2000; Summer-Ewing, 1994; Joinson, 2001), teamwork (Messmer, 2003), and mobility (Scandura, 1992). Benefits from the protégé’s professional/career performance perspective are promotion (Scandura & Schriesheim, 1994; Kram, 1986; Ragins et al., 2000), recognition (Aryee et al., 1996), increasing income (Chao et al., 1992), higher career satisfaction (Ragins et al., 2000; Aryee et al., 1996), career development (Rosser & Egan, 2003; Kram, 1986), and career commitment and higher retention (Ragins et al., 2000; Verdejo, 2002). Benefits related to the protégé’s psychosocial development are self-esteem (Ragins et al., 2000), greater intimacy, strength of interpersonal bond, confidence, identity (Mullen, 1998; Verdejo, 2002; Summer-Ewing, 1994), and socialization (Mullen, 1998).

Scandura and Schriesheim (1994) conducted a study of 183 supervisor-subordinate dyads in a large, high-technology Midwestern manufacturing firm to integrate research of the leader-member exchange approach with research on mentoring. Based on the authors’ review of literature, the leader-member exchange model is a transactional leadership approach that “describes how leaders use their position power [organizational resources] to develop different exchange relationships with different subordinates” (p.1590). On the other hand, the career mentoring model is a transformational leadership approach in which “leaders get followers to act as they desire by transforming or changing the followers” (p. 1588), and by devoting personal resources such as time, knowledge, and experiences. The authors examined the relationship between individual development and leader-member exchange model/career mentoring. The dependent variables were promotion rate, salary growth, and supervisor ratings of performance improvement. The results indicated that the leader-member exchange model had a positive relationship with increased supervisor ratings of performance but not for salary and advancement rate, while career mentoring had a positive relationship with salary and advancement but not performance.

Aryee, Wyatt, and Stone (1996) surveyed graduate employees working full-time in Hong Kong to examine the effect of career-oriented mentoring on their career success. The measure of career success included salary, number of promotions, and career satisfaction. The results showed that while there was no significant relationship between career-oriented mentoring and compensation increasing, the mentoring was significantly related to the number of promotions received and career satisfaction that protégés perceived.

**Quality of Relationship**

Several mentoring scholars attempted to the study relationship between the quality of the mentoring relationship and its impact on mentoring outcomes. Although quality can be operationally defined in various ways, in this instance, it means how much protégés are satisfied in mentoring relationships. While other factors such as mentor’s characteristics and type of mentoring relationship are mentoring input or process, the quality of relationship is another outcome of mentoring. Thus, in this area, scholars tried to examine whether one outcome can be explained or predicted by another.

Ragins, Cotton, and Miller (2000) conducted a national survey of 1,162 employees, using mailing lists of professional associations representing social workers, engineers, and journalists in order to examine the effects of mentor presence, type of mentor, quality of relationship, and program design on work and career attitudes. To measure career and work attitude, seven items were used, “career commitment, job satisfaction, satisfaction for promotion, organizational commitment, procedural justice, organization-based self-esteem, and intentions to quit” (p.1182). The authors defined marginal mentors as those who provide limited functions of a mentor so they might disappoint the protégé or might not be helpful to the protégé’s individual development. The results indicated that protégés who had high satisfaction in a mentoring relationship reported a more positive attitude than non-mentored individuals, but protégés who had marginal mentors reported equivalent attitudes with non-mentored individuals.
individuals. In addition, the results showed that the degree of satisfaction in a mentoring relationship was a more a result of work and career attitudes than the type of mentor. Thus, the authors concluded that the mentoring outcomes may depend on the quality of the mentoring relationship rather than the presence of a mentor or the design of the mentoring program.

Benefits to Mentor

Mentors also gain benefits as a consequence of mentoring programs. Not many studies have examined the impact on a mentor, but the need to study this area has increased since a mentor’s willingness and attitude toward participating are believed to be significant for improving the overall quality of the program, whether it is formal or informal mentoring. By recognizing the benefits for the mentors, the mentor’s participatory level can be intensified, and an organization is able to recognize more benefits through a mentoring program—not only to develop novices but also to develop experts. In addition, recognizing both the protégé’s and mentor’s benefits enables organizations to make strategic HRD plans by actively utilizing expected outcomes from both participants (Hegstad, 1999).

Mentor’s benefits from mentoring relationships are found to be related to professional identity and psychosocial aspect, while some are related to the development of leadership and communication skills. Mentor’s benefits are professional identity along with respect and organizational power (Hegstad, 1999); building leadership, supervisory, and training ability (Messmer, 2003); networking opportunity and performance improvement (Scandura & Schriesheim, 1994); and job satisfaction and retention (Messmer, 2003). Mentors not only gain loyal followers, but also earn the respect and admiration of peers (Ragins & Scandura, 1994).

Benefits to Organization

Historically, the research of mentoring has been studied at the individual level of development and education. As some HRD scholars asserted, to examine the linkage between individual development and organizational performance (Jacobs & Washington, 2003), the outcome of mentoring relates to the organizational level of outcome. As economic competition becomes more intense in the global economy, knowledge and learning is very significant to an organization’s performance. One of the major organizational impacts from implementing a mentoring program is the transfer of learning and knowledge (O’Reilly, 2001; Swap et al., 2001). Mentoring stimulates organizational learning by providing indirect and direct information flow among organizational members. Mentoring is also found to intensify organizational commitment (Ragins et al., 2000) and employees’ retention and motivation (Hegstad, 1999). One study showed that mentoring has a significant impact on expatriate’s training, job satisfaction, and creates a bridge between the parent company and local company, particularly for international or multination firms (Downes et al., 2002). Although it is believed that mentoring brings organizational impact, there are few studies, in particular empirical studies, found that examined mentoring outcome at the organizational level.

Conclusion and Suggestion for Future Research

In the practical world, a greater number of organizations are implementing mentoring programs as its benefits become more recognized. Academically, numerous studies have been conducted about mentoring in various fields of study. However, this research found that most studies have focused on the impact at the individual level, while few studies have been conducted from the organizational view. An analysis of the current literature from a systems approach identified three major research questions that have been studied and two emerging questions to be studied in each area: mentoring input, mentoring process, and mentoring outcome. Table 2 illustrates those questions.

From this respect, this analysis contributes to the enrichment of HRD research and the improvement of HRD practice. It helps HRD researchers and practitioners understand mentoring programs from the comprehensive perspective based on a systems approach. It also provides emerging questions for future research, and research about those questions will ultimately help HRD practitioners implement mentoring programs in a more organizationally effective way.

</tr>
<tr>
<td>Research question 3.</td>
<td>Does mentor’s experience level influence mentoring?</td>
<td>Does mentoring change when conducted in a group setting?</td>
</tr>
</tbody>
</table>
Emerging question 1. Does cross-cultural or cross-national influence mentoring relationship?

Emerging question 2. What is the importance of mentor training?

In the area of mentoring input, researchers conducted studies about participants’ characteristics, match and mismatch in gender and race, and mentor’s experience level. However, there are few mentoring studies about cross-national and cross-cultural issues, which should be studied as environmental input to mentoring programs since organizations increasingly operate on a multinational basis (Higgins & Kram, 2001). Training issues about mentoring (Cox, 2000) should be examined, as well whether a trained mentor is more effective than an untrained mentor. Additionally what aspects of training are the most effective should also be researched.

In the area of mentoring process, formal and informal mentoring, career functions and psychosocial functions, and mentoring in group and team settings have been studied. Although virtual mentoring has been widely implemented, it also lacks empirical study about the impact of pure virtual mentoring compared with classical mentoring. In addition, since currently many mentoring relationships depend on virtual communication, it also needs to be studied how virtual mentoring enhances cross-national mentor and protégé relationships.

In terms of mentoring outcome, more empirical studies are necessary in proving organizational benefits from mentoring, and unanticipated effects of mentoring outcome such as negative impact or impact of failed mentoring relationships. HRD scholars believe that mentoring supports career development (Gilley & Egland, 1994) rather than employee development (training and development) or organizational development. However, due to its diversified programs and perceived impacts, some recent studies show that mentoring programs support not only career development, but also training and development functions, and even support organizational development (Hegstad, 1999). As the impact of mentoring programs on organizations, becomes more widespread, it is critical to link the role of mentoring to HRD areas such as organizational development and training (Hegstad, 1999).

**Voluntary Organizations: Commitment, Leadership, and Organizational Effectiveness**

*Terry P. Ekeland  
Texas A&M University*

Voluntary organizations offer a unique opportunity to interpret participant relationships, leadership influences, and organizational effectiveness unencumbered by employment relationships. Regardless of organizational structure or purpose, all organizations are affected to some degree by their leadership and their membership. Based on the literature reviewed, effective voluntary organizations achieve their stated objectives through committed members united under a common purpose, exercising shared responsibility in a collaborative leadership process, and informed through regular communication and interaction.

Keywords: Commitment, Leadership, Organizational Effectiveness

Considerable research has been focused on the effectiveness of formal business and government organizations. However, voluntary organizations have received far less attention. What is effective for business and government organizations may not be effective for the voluntary organization. Regardless of organizational structure or purpose, all organizations are affected to some degree by their leadership and their membership.

This paper examines the nature of voluntary organizations in terms of the tripartite relationship between individual participation and commitment, appropriate leadership styles, and ultimately organizational effectiveness. Comparatively little data addresses the role of commitment and leadership in voluntary organizations. Catano, Pond, and Kelloway (2001) contend that voluntary organizations represent an ideal context in which to study the subject—a context where no employment relationship exists.

The following questions will be addressed: What distinguishes voluntary organizations from other organizational types? Why do people freely associate with these organizations? What relationships are created within and between voluntary organizations? What leadership methods are appropriate for voluntary organizations? What determines their organizational effectiveness? And finally, what is the relationship between leadership in voluntary organizations, organizational commitment, and organizational effectiveness? At first analysis, commitment implies individual alignment with the shared purpose and beliefs of the organization; organizational effectiveness implies effective leadership around achievement of objectives built from core beliefs; and effective leadership implies the presence of followers united under a shared purpose and committed to the achievement of organizational objectives. A review of relevant literature will be conducted to answer these questions and assess the analysis.

**Theoretical Framework**

Many factors can be observed that influence how voluntary organizations function, including participant motivation, commitment, leadership, and peer relationships. In the areas of leadership style, the relationship between leaders and non-leaders is heavily influenced by the voluntary nature of the organization. In fact, the dominant relationship in all organizations is the leader-follower relationship. Organizational effectiveness is dependent not only on these influences, but also on how one defines the concept of effectiveness. Factors impacting the implementation of appropriate leadership and management processes within the voluntary organization context are also explored.

Voluntary Organizations

It is necessary to draw a distinction between voluntary organizations and organizations of volunteers. Dartington (1996) suggests that the defining characteristic of voluntary organizations, both structurally and psychologically, is the presence of a voluntary governance process through boards or committees. Voluntary organizations are distinctively group systems; decisions are made by consensus or majority vote and leadership is emergent, subject to the will of the majority, and often rotating (Wilderom & Miner, 1991). Given this group structure, it becomes necessary to determine the factors contributing to the individual decision to associate with, participate in, and commit to, a voluntary organization.

Motivation to associate and participate. Motivation can be generally classified as either extrinsic—doing something for an expectation of compensation, or intrinsic—doing something for the sake of the activity or the outcome. Farmer and Fedor (1999) note the lack of rigorous empirical research exploring the management of volunteers and suggest as a reason the lack of a coherent, well-established framework for understanding volunteer

*Copyright © 2004 Terry P. Ekeland*
behavior, particularly in the areas of participation and withdrawal. They suggest that psychological contract theory may be used to explain volunteer behavior and performance. Even though volunteers do not expect financial gain from their services, they do expect other considerations from the organizations for which they work (Farmer & Fedor, 1999). The results of their research supported the idea that psychological contract fulfillment (or violation) affected the level of volunteer participation. Farmer and Fedor (1999) drew four conclusions:

1. People select themselves into their volunteer work situations;
2. Psychological contracts in volunteers are much more likely to be relational than transactional;
3. Perceived breaches in the psychological contract may have serious consequences concerning level of participation in the organization, due to the combination of relational contracts and difficulties in mandating volunteer behavior; and
4. Fulfillment of psychological contracts may rest on more than just expectations.

Allison, Okun, and Dutridge (2002) conducted a study to determine the motives of volunteers given the choices of career, esteem, protective, social, understanding, and value. Participants in the study rated the value motive as their most important motive for volunteering followed by esteem and understanding motives. Post hoc analysis of their data also revealed three additional motives for volunteering: enjoyment, religiosity, and team building. Basically, individuals join voluntary organizations because of the compatibility of their beliefs with the values of the organization.

Organizational commitment. Given the above motives for initial voluntary association, there is a need to look at continued voluntary association, or organizational commitment. Organizational commitment may be generally defined as a strong belief in and acceptance of organizational goals and values, a willingness to exert effort on behalf of the organization, and a desire to maintain organizational membership (Porter, Steers, Mowday, & Boulian, 1974). Catano et al. (2001) contend that commitment to voluntary organizations may be moderated by several factors: some people may join to make social contacts, some because of professional pressure to do so, or even some due to perceived job requirements. Additionally, McPherson (1983) found that behavioral commitment to an organization is constrained less by attitudinal disposition and more by broad social, geographic and institutional factors. For example, people are more likely to retain their memberships in voluntary organizations when their employment relationships reinforce that membership.

Meyer and Allen (1991) developed a model of organizational commitment consisting of three distinct components: affective commitment, continuance commitment, and normative commitment. Under this model, affective commitment denotes an emotional attachment to, identification with, and involvement in the organization; continuance commitment denotes the perceived costs associated with leaving the organization; and normative commitment denotes the perceived obligation to remain in the organization. A meta-analysis conducted by Meyer, Stanley, Herscovitch, and Topolnytsky (2002) found strong correlation between affective commitment and overall job satisfaction, occupational commitment, organizational justice, and transformational leadership. While the research reviewed in the meta-analysis appears to come from organizations where an employment relationship exits, the influences of organizational commitment, justice, and leadership are equally applicable in voluntary organizations. Regarding continuance commitment, positive correlation was found among employees who believed their skills and education would not easily transfer to other organizations, and negative correlation was found when employees perceived the availability of alternatives (Meyer et al., 2002). From the perspective of a voluntary organization, this would seem to be consistent with the factors influencing participant motivation discussed earlier.

Partnership relationships. Taking the relationships of voluntary organization one step further, voluntary partnerships between organizations reveal many similarities. Present within these organizational partnership relationships are the same individual dynamics present within a voluntary organization of individuals. According to Lasker, Weiss, and Miller (2001), the voluntary nature of partnerships can make recruitment and retention of partners challenging. This raises organizational association, commitment, and leadership issues similar to those discussed above under voluntary organizations. Mohr and Spekman (1994) define partnerships as purposive strategic relationships between independent organizations, sharing compatible goals, striving for mutual benefit, and acknowledging a high level of mutual interdependence. Partnerships form to accomplish goals that either party could not easily attain on their own. Farrell and Scotchmer (1988) define partnership as a coalition that divides output equally. Additionally, the equal sharing of output should occur even when partners contribute unequal amounts. Under this economic model, partnership size is controlled by the ability of the individuals involved, where the equal sharing constraint limits the size of the partnership. Partnerships of people and/or organizations with differing ability are smaller than those comprised of similar levels of ability (Farrell & Scotchmer, 1988).

An ideal partnership may be described as a dynamic relationship among diverse actors, based on mutually agreed objectives, pursued through a shared understanding of the division of labor (Brinkerhoff, 2002). Partnerships in this definition must have a careful balance between synergy and respective autonomy, incorporating mutual
respects, equal participation in decision making, mutual accountability, and transparency of operation. Brinkerhoff (2002) proposes a partnership model consisting of two dimensions: mutuality and organizational identity. Mutuality refers to the interdependence or horizontal relationships between partners, including shared purpose and values, mutual trust, and respects. Organizational identity refers to that which is distinctive and enduring in an organization. This view is consistent with the previously discussed research of Farmer & Fedor (1999) regarding the presence of psychological contracts underlying participant motivation.

Assessing partnership organizations as high or low in each of the two dimensions produces four quadrants of inter-organizational relationships. Brinkerhoff (2002) defines the four quadrants as partnership, contracting, extension, and co-optation. Partnership exists in the quadrant where mutuality and organizational identity are maximized. If organizational identity is high but mutuality is low, then contracting describes the inter-organizational relationship. When organizational identity and mutuality are both low, the dominant organization defines the relationship and the following organizations are viewed as extensions of the dominant organization. Co-optation occurs when mutuality is high and organizational identity is low. The less dominant organization will follow the more dominant organization’s lead, leading to co-optation of purpose and potentially long-term loss of organizational identity and gradual absorption. Arino and de la Torre (1998) found that in such asymmetrical partnership relationships, conflict resolution mechanisms were critical in promoting positive renegotiation loops, enhancing relationship quality, and rewarding collaborative behavior. Mutuality can reinforce organizational identity, but it is not guaranteed. Brinkerhoff (2002) suggests that by participating and influencing equally, each organization can protect its organizational identity and hence the efficiency, effectiveness and synergistic rewards of the partnership. Additionally, by maintaining organizational identity, it is possible for organizations to be involved in more than one partnership.

Partnership remains an evolving concept and practice (Brinkerhoff, 2002). In fact, Miller and Ahmad (2000) found the term partnership to be much abused, even used to describe traditional contract relationships. Many organizations enter into partnership-style activities without giving much thought to the underlying organizational and interpersonal relationship issues. These hasty decisions may ultimately lead to an increase in interpersonal and/or inter-organizational conflict, participant withdrawal, and even organizational ineffectiveness.

Leadership

The impact of differing leadership styles on volunteers and the organization processes in general can be critical for organizational success. The characteristic of shared governance found in voluntary organizations is different from that found in a typical employment-based organization, and reveals a need for effective application of appropriate leadership styles.

Leadership relationships. Two levels of membership are found within the voluntary organization: leaders and non-leaders (Heidrich, 1990). The nature of the relationship between leaders and non-leaders is especially important in voluntary organizations, since the member has the ultimate option of withdrawing from the organization (Catano et al., 2001). Active participation by both leaders and non-leaders is necessary for the organization to complete its goals and missions (Catano et al., 2001). Further aggravating the relationship between leaders and non-leaders is the recurring problem of building a shared understanding of the common good (Firestone and Fisler, 2002). Without this shared understanding, it would be easy for an organization to lose focus and direction, becoming ineffective and impacting volunteer recruitment and ongoing commitment.

A common failing of voluntary organizations is that leaders can become so directly involved in project accomplishment that they don’t leave time to cultivate their subordinate leaders (O’Connell, 1976). According to Dartington (1996), the struggle for authority in voluntary organizations often has the characteristics of an Oedipal conflict, involving the need to usurp or remove past leadership in order to create a new relationship with the original (or perhaps a new) vision of the organization. Those who manage voluntary organizations often subvert the accountability of the characteristic shared governance model to accomplish singularly beneficial objectives. As such, the voluntary organization needs to have ways to maintain its integrity and sense of purpose against the threats of individual ambition (Dartington, 1996).

Lord, Brown, and Freiberg (1999) advocate a self-oriented approach to leadership, where the self-concept of the subordinate determines the appropriate leadership activity. Three component views of self-concept are explored: the individual, interpersonal, and collective. Leadership activities will be most successful when matched to the predominant self-concept of those being led (Lord et al., 1999). For example, transactional leadership fits better with individual-level self-identities, but transformational leadership is more consistent with the collective-level identities. Leadership activities that overemphasize the individual-level identities of subordinates may actually interfere with the development of a group identity (Lord et al., 1999). Instead, when collective-level relational identities are used to build group identity, such as in a voluntary organization, a transformational leadership approach is more likely to be successful.
Transformational leadership. Transformational leaders link task goals to self-regulatory systems, emphasizing higher level self-relevant constructs such as personal projects, self-identities, and underlying values (Lord et al., 1999). They also emphasize a connection between possible selves and collective identities as determinants of specific task goals.

Bass (1985) characterized transformational leadership as the ability to elicit support and participation from followers through personal qualities. This is in contrast to transactional leadership, where support and participation is typically elicited through reward and punishment. Firestone and Fisler (2002) contend that transformational leadership goes beyond mere exchange or transaction to modify the underlying purposes of the work, and suggest specific transformational leadership activities, including “providing idealized influence, inspirational motivation, intellectual stimulation, and individualized consideration” (p. 485). Transformational leadership should promote a sense of professional community. As noted earlier, this shared sense of identity is indicative of a voluntary organization.

Shared leadership. Shared leadership is a management model common to voluntary organizations, and is based on the philosophy of shared governance. Shared governance is a structural model that provides a framework for ensuring the processes of empowerment operate effectively (Porter-O’Grady & Krueger-Wilson, 1995). It is not a democracy, but an accountability-based approach with a clear expectation that all members participate. White (2001) describes governance as a process through which coordination is achieved.

Coluccio and Havlick (1998) provide four characteristics to describe shared leadership: a decentralized organizational structure; a balance of staff autonomy, managerial guidance, collaborative decision making, and individual accountability; an environment ensuring excellence and dignity; and a shared vision within the organization. Within Calucchio and Havlick’s model, Jackson (2000) describes four constructs vital to the understanding of shared leadership: accountability, partnership, equity, and ownership. Accountability is the intrinsic responsibility of organization members within a specific role. Partnership is the collaborative relationship among individuals striving toward a common goal. Equity is respect for others’ individual contributions to the organization. Ownership exists when individuals are committed to the mission and outcomes of the organization.

Under shared leadership, problems are approached by collaborative means, focusing on the work itself instead of who has authority. Shared leadership is directive, not dictatorial – those in leadership positions must find ways to be accountable without being controlling (Jackson, 2000). People who feel valued and have a shared sense of ownership bring greater energy and commitment to their work.

Collaborative leadership. Chrislip and Larson (1994) define collaborative leadership as a process to initiate, facilitate, and sustain collaborative initiatives among stakeholders. Collaborative leaders are those who have the right credibility and initiative to involve the right individuals and organizations in creating visions, solving problems, and reaching agreements (Hartman, Hofman, and Stafford, 1999). According to Chrislip and Larson (1994), collaborative leaders must focus on process rather than outcomes, further reinforcing the need for a transformational approach.

Collaboration can be defined as a process through which involved parties constructively explore their differences and search for solutions beyond their own limited vision of what is possible (Gray, 1989). Collaboration develops most easily when parties have a pattern of repeated and frequent interaction, but this interaction itself does not assure collaboration (McCaffrey, Faerman, & Hart, 1995). Residual conflicts affect the establishment of organizational trust and may make collaboration difficult. According to Hartman et al. (1999), collaboration can present significant challenges as it progresses from independent or adversarial parties to more tightly connected interrelationships characterized by coordinated decision-making.

A primary factor influencing the nature of collaboration is the existence of a shared vision (Gray, 1989). It is this shared vision that defines the voluntary organization’s reason for existence and serves as the foundation for selecting a collective course of action. Lasker et al. (2001) identify synergy as the outcome that gives collaboration its unique advantage. As viewed through a synergistic process, collaboration can foster creative, comprehensive, practical, and transformative thinking (Lasker et al., 2001). The changes that result from this synergistic thinking can produce comprehensive actions and solutions that address problems at many levels.

In terms of social and political systems, collaboration is more likely when individual power is balanced and the number of parties involved is small enough to develop favorable relationships. McCaffrey et al. (1995) contend that the arguments supporting collaboration are so strong that it is easy to forget that an organization’s members generally care about other things besides their collective identity and organizational effectiveness. Case studies indicate that leadership affects the outcomes of collaborative efforts (McCaffrey et al., 1995). In fact, both successful and unsuccessful implementations noted the impact of leadership on the final outcome.
Organizational Effectiveness

While a mutually acceptable definition of organizational effectiveness may not be possible, voluntary organizations may be examined under the existing frameworks of organizational control (leadership), defining organizational characteristics, and the available variables for predicting success.

Organizational control. Tannenbaum (1961) defined organizational effectiveness as the extent to which an organization fulfills its stated objectives and preserves its means and resources. A descriptive model called the “control graph” can be used to characterize the pattern of control in formal organizations, with the horizontal axis representing the hierarchical levels of the organization and the vertical axis representing the amount of control exercised by those at each hierarchical level (Tannenbaum, 1961). The resulting graph allows for four prototypic models of organizational control: autocratic (or oligarchic), democratic, laissez-faire (or anarchic), and polyarchic. Tannenbaum suggests that voluntary organizations will be more effective under democratic control than autocratic control for two reasons. First, members with a say in determining policies and actions of their organization will satisfy the needs of a broader segment rather than just the leaders. Second, there is likely to be greater acceptance of jointly made decisions as well as an increased sense of responsibility and motivation to further the goals and purposes of the organization. Tannenbaum’s suggestions are consistent with previously presented information on individual association, organizational commitment, and shared leadership. An individual who exercises control gives more of himself/herself to the organization, and is likely to be more identified with, more loyal to, and more active on behalf of the organization (Tannenbaum, 1962).

According to Tannenbaum (1962), increasing and distributing the exercise of control more broadly within an organization helps distribute an important sense of organizational involvement. However, the process of translating the expressed desire of organizational members for greater control into the actual exercise of that control may lead to several problem conditions (Tannenbaum, 1961). Some of these conditions may lead to a more autocratic environment, such as leaders making decisions themselves rather than begin a more cumbersome and time-consuming decision-making process. Or leaders may fail to, or choose not to, communicate the information necessary for proper decision-making. Some leaders may not have a clear understanding of what decisions are appropriate for them and which should be made jointly. Other problem conditions may lead to a more laissez-faire environment, such as ill-defined responsibilities causing decisions to fall between organization roles. The lack of mutual understanding regarding appropriate decision-making may lead to conflict in which efforts of some are canceled out by the efforts of others, resulting in a situation where neither group exercises much control. This implies the importance of communication and interaction between organization members to permit the development of shared understanding, vision, and purpose, which are essential for organizational effectiveness and long-term success.

Organizational characteristics. Webb (1974) developed a general model of organizational effectiveness in terms of four organizational characteristics: cohesion, efficiency, adaptability, and support. While this model emerged from a study of religious organizations, many parallels exist with other forms of voluntary organizations. Cohesion refers to the presence of a positive working relationship (Webb, 1974). Indicators of cohesion would be commonality of interests, activities, values, and a strong identification with the organization. Efficiency refers to producing a desired result with a minimum of wasted time, effort, or expense (Webb, 1974). While voluntary organizations may often operate inefficiently, with duplication of effort and expense by non-experts, business organizations would not tolerate such a situation. Adaptability is a measure of readiness to accept change and respond effectively (Webb, 1974). Since the nature of volunteerism seems to be rotational leadership, it is important for organizations to be adaptive to changes from the internal as well as external environment. Support refers to the degree to which individuals stand behind their leader (Webb, 1974). This is of course a two-way street; individuals need to feel valued and appreciated within their organization and by those in leadership positions.

Ashmos, Duchon, McDaniel, & Huonker (2002) propose a simple managerial rule to improve organizational effectiveness: use participative decision-making. Participation in this context is defined as joint decision making or influence sharing, not delegation. When done appropriately, participative decision making reduces the manager’s capacity to establish and maintain control, but also reduces the need to know everything and to coordinate and organize everything (Ashmos et al., 2002). Participation is a social process, and creates an environment where self-organizing becomes an expression of organizational learning and sense making (Ashmos et al., 2002). While not without difficulty, participative processes reinforce interdependence within organization members, providing a connection to a larger system. According to Ashmos et al. (2002), the connections generated through participation allow the organization to self-organize, re-energize, and co-evolve in ways that are more likely to lead to organizational success.

Organizational success predictors. Mohr and Spekman (1994) found the following variables significant in predicting partnership success: coordination, commitment, trust, communication quality, information sharing,
participation, joint problem solving, and avoiding problem avoidance behaviors. Interestingly, interdependence and persuasive tactics to resolve conflict were not found to be predictors of partnership success. According to Miller and Ahmad (2000), partnerships may have a better chance of success when they are built around specific and limited objectives. Great ambitions are often controversial and more likely to generate fundamental conflict of interests.

An effective system of governance requires balance between three purposes: developing a strategy, mission and/or policy; managing the setting; and being accountable to the people represented by the governing organization (White, 2001). This balance may prove hard to achieve. Additionally, participative management practices must balance the involvement of managers and their subordinates in the processing of information, decision-making, and/or problem-solving (Wagner, 1994).

A study conducted by Kim (2002) found a positive correlation between a manager’s use of participative management and high levels of job satisfaction. In addition, the study demonstrated that a participative strategic planning process has a positive effect on employee job satisfaction. These findings also suggest that employee participation in strategic planning contributes to organizational effectiveness. Kim (2002) suggests that the transformational leadership practices of learning, change, and renewal would be required to facilitate implementation of the participative management processes necessary for increased job satisfaction and organizational effectiveness. While job satisfaction may not seem immediately relevant to the voluntary organization, it does exhibit a positive correlation to affective commitment (Meyer et al., 2002), which is arguably necessary for voluntary organization survival.

**Implementing Collaborative Leadership**

According to Burke (1982), change does not occur without the exercise of power, where “power is the capacity to influence, and leadership is the process or act of influencing” (p. 129). Implementing collaborative leadership would then require the combined influence of all parties involved. Jackson (2000) cites several potential obstacles to the implementation of shared or collaborative leadership. These include team attitudes, turf battles, individual career goals, management versus leadership issues, the organization’s culture, the organization’s readiness to change, current and future performance, and the current and future external environment. Firestone and Fisler (2002) also speak about the dark side of collaborative, shared, or distributed leadership, noting that it can easily become dispersed leadership, with the chaos, isolation or conflict that logically follows. Many of these barriers are directly influenced by the attitudes of the individuals involved. In fact, the survival of an organization when changing to a shared leadership model may hinge on the ability to incorporate new information into individual mental models (Jackson, 2000), reinforcing the need for a transformative approach. Transformational leadership offers a positive strategy for coordinating these multiple sources of influence without dictatorship or major organizational redesign (Firestone & Fisler, 2002).

Factors that may aid, or even drive, the transition to shared leadership include continuing education, strong organizational and administrative commitment, strong lines of communication, and the ability to define and promote outcomes for shared leadership (Jackson, 2000). For the successful implementation of a shared leadership model, Jackson (2000) recommends a program of concentrated education of the general concepts, specifically accountability, to promote the model. Additionally, all levels of the organization should visibly support the concepts of shared leadership.

McCaffrey et al. (1995) identify four conditions that contribute to the implementation and success of participative systems: prior organizational disposition toward collaboration; social and political organization; nature of incentives, issues, and values; and leadership capacity and style. Ashmos et al. (2002) suggest that implementation of participative processes must be tempered by an organization’s predisposition and sensitivity to its environment, essentially their willingness and ability to respond to changes in the environment. Organizations may be predisposed for or against participation based on factors such as past performance, reliance on rules, and rigidity of roles.

**Implications for HRD Research**

One practical implication of research conducted by Catano, Pond, and Kelloway (2001) on voluntary organizations is the need for a greater emphasis on developing transformational leaders to improve member involvement, commitment, and participation. According to Mohr and Spekman (1994), effort must be dedicated to the formation and implementation of management strategies that promote and encourage continued growth and maintenance of the partnership relationship. As presented here, voluntary organizations require a different leadership approach, and it is quite possible that a different developmental approach is also necessary. Leadership development is an important role for HRD professionals, and as such, differing methods and techniques must be thoroughly researched to identify appropriate and effective processes. Day (2001) suggests that leader development takes a human capital approach
whereas leadership development takes a social capital approach. How do these two approaches impact leadership in voluntary organizations? Additionally, participants in voluntary organizations bring with them knowledge, skills, and abilities from other areas of work and social experience. Research is needed to determine if these prior external leadership experiences translate into effective leadership in the voluntary organization.

According to French and Bell (1999), increasing participation and empowerment are central goals and fundamental values of the field of organization development. As such, interventions are often deliberately designed to increase the involvement and participation of organization leaders and members. What intervention approach should be used with voluntary organizations? Since the consulting skills of HRD professionals are called upon to conduct these participative interventions, research into appropriate and effective methods will always be needed.

According to McCaffrey et al. (1995), studies of perceptions of organizational effectiveness show a higher correlation between participation and effectiveness than studies that look at actual operational indicators of effectiveness. In other words, individuals in participative systems may believe their organization to be more effective than it really is. Does this perception of effectiveness influence individual motivation to associate with a voluntary organization? Since HRD professionals often work with organizations desiring to improving their effectiveness, research is needed to address the apparent difference in perceived versus actual effectiveness.

Conclusions

The review of literature revealed the following tri-partite relationship: organizational commitment arises from individual alignment with the shared purpose and beliefs of the organization; organizational effectiveness depends on effective leadership around achievement of objectives built from core beliefs; and effective leadership is determined by the presence of followers united under a shared purpose and committed to the achievement of organizational objectives. The leader-follower relationship is central. According to White (2001), the top-down governance model of organizational leadership is being replaced by an autonomous, self-referential, and self-organizing model. The view now being adopted is that self-organization is a condition for self-renewal. A transformative leadership and learning process seems to be necessary and evident as interrelationships and connections are rearranged and revised to keep organizations effective at meeting desired outcomes. To be effective, the process of shared governance and leadership must allow this emergence to take place.

Managers and other leaders are drawn to participative systems because they seem to offer solutions to real problems (McCaffrey et al., 1995). However, the implementation of a participative system frequently reveals problems often associated with collective action, including dispositions against cooperating with former adversaries, the perceived costs of collaborating in complex social systems, the difficulties of engaging deep conflict, and the leadership incentives favoring control (McCaffrey et al., 1995). Firestone and Fisler (2002) contend that distribution of leadership may be especially important in partnerships, where no one individual has authority over the full range of participants.

Obviously, the implementation of a collaborative leadership process in a voluntary organization is not to be taken lightly. However, when effectively managed, it can lead to increased member participation and greater organizational effectiveness. An important consideration is that the process of implementing shared leadership is “a dynamic, ever-changing, never-ending journey, rather than a destination” (Jackson, 2000, p. 170).

Training and Organizational Commitment among Nurses in New Zealand and United States Public Hospitals Experiencing Industry and Organizational Change

Kenneth Bartlett
Dae-seok Kang
University of Minnesota

This study examines the relationship between employee attitudes towards training and organizational commitment among a sample of nurses in New Zealand and the United States. Results show that perceived access to training, training frequency, motivation to learn from training, benefits of training, and supervisory support for training were positively related to the affective and normative components of commitment. Significant differences were found between training and organizational commitment variables between New Zealand and the US.

Keywords: Training, Organizational Commitment, Organizational Change

HRD is recognized as being able to foster and contribute to desired workplace attitudes and behaviors of employees during and after periods of both industry and organizational restructuring. Management of employees’ commitment has also become a key management concern as intellectual and human capital become increasingly important to organizational functioning and service provision. Organizational commitment is an increasingly valued work-related attitude, especially in health care settings where retention, job performance, response to change, and organizational restructuring demand the attention of management. In recent years both New Zealand and the United States have undergone changes in their health care systems to different extents with ongoing restructuring and reorganization occurring. This provided an opportunity to explore relationships between training and organizational commitment within the entire sample as well as to examine differences between the two countries. The purpose of this research study was to explore the relationship between a number of training related variables and organizational commitment and to identify differences in a sample of New Zealand and U.S. registered nurses.

Problem Statement and Theoretical Framework

It is widely acknowledged that personnel training is the cornerstone in most organizations’ HRD systems (Nordhaug, 1989). Training contributes to gains in competitive advantage (Schuler & MacMillan, 1984) with some suggesting that improvements in productivity and organizational performance have become the most dominant argument for justifying training (Scott & Meyer, 1991). During times of externally driven change many organizations alter their policies and procedures related to training. This may have implications for employee work-related attitudes and behavior.

Of the many work-related attitudes frequently examined for their relationship to the management of employee behavior, organizational commitment is increasingly valued as a predictor of work behaviors and behavioral intentions (Jaros, Jermier, Koehler, & Sincich, 1993). In general terms, organizational commitment can be thought of as a type of mind-set or psychological tie that describes the level of attachment felt by an employee towards the organization in which he or she works.

Early research considered organizational commitment to be a construct with a single dimension; however, it is now widely accepted as being multi-dimensional (Meyer & Allen, 1997). In other words, more than one form of attachment exists to describe the nature of this psychological tie or mind-set. Meyer and Allen (1991) developed a three-component model to capture the different forms of underlying mind-sets that reflect attachment to an organization. They defined the three constructs of organizational commitment as follows: ‘Affective commitment refers to the psychological attachment to the organization, continuance commitment refers to the costs associated with leaving the organization, and normative commitment refers to a perceived obligation to remain with the organization’ (p.1). An individual employee may have one or more of these mind-sets and report variations across all three.

Recent studies of human resource practices, including training, have been shown to influence employee commitment (Meyer & Smith, 2000; Iles, Mabey, & Robertson, 1990; Whitener, 2001). These findings support a larger body of commitment literature that explores various outcomes measures associated with organizational commitment.

commitment. In their review of commitment research Meyer and Herscovitch (2001) noted that accepted correlations exist between all three components of commitment and turnover, turnover intention, absenteeism, job performance, and organizational citizenship behaviors. A recent meta-analysis of the antecedents, correlates, and consequences of organizational commitment highlighted that the strongest and most established consequence investigated is the negative correlation between organizational commitment and turnover intention followed by the negative correlation with actual turnover (Meyer, Stanley, Herscovitch, & Topolnytsky, 2002). Affective, normative, and continuance commitment are negatively related to both turnover intention and actual turnover, although the relationship with actual turnover is not as strong as that with turnover intention. In both cases the affective form of commitment produces the strongest negative relationship followed by normative and continuance commitment. Affective commitment also correlates negatively with self-reported stress and work-family conflict. With other outcomes measures affective commitment again provides the strongest correlations with positive relationships found between coming to work on time, job effort, job performance, and extra-role performance or organizational citizenship behaviors (Leong, Randall, & Cote, 1994; Meyer et al., 2002; Randall, 1990).

During times of industry restructuring and organizational change when performance is carefully monitored the importance of organizational commitment is perhaps most strongly emphasized. Furthermore, during these times absenteeism and turnover can be particularly disruptive for continued change efforts and can negatively affect the attitudes of other employees. A recent study of the effects of organizational change on employee commitment among bank staff in the United Kingdom and the Republic of Ireland highlighted the resulting reduced levels of affective commitment following both structural and cultural change (Bennett & Durkin, 2000). In a study of hospital restructuring Burke and Greenglass (2001) found that nurses in Canada who reported greater workloads and perceived future threats in the workplace from restructuring also reported greater work-family conflict and lower levels of job satisfaction. Low levels of organizational commitment have been found to influence burnout in hospital employees (Kalliath, O’Driscoll, & Gillespie, 1998). However, potential cross-national differences in attitudes towards training and organizational commitment resulting from organizational and industry driven change are yet to be explored. This study addresses this research need.

Research Questions

The two over arching questions for this research were; Do relationships exist between perceived access to training, training frequency, motivation to learning from training, benefits of training, supervisory support for training, and organizational commitment? And, do significant differences exist between New Zealand and the United States in perceptions of access to training, training frequency, motivation to learning from training, benefits of training, supervisory support for training, and organizational commitment? To explore these questions five research hypotheses were tested.

The relationships between perceived access to training, training frequency, and organizational commitment has only recently attracted research attention. A recently published qualitative study found that nursing staff believed that opportunities for learning were more important in explaining individual levels of organizational commitment than monetary benefits, job satisfaction, relationship with co-workers, or job security (McNeese-Smith, 2001). Furthermore, perceptions of access to training opportunities and self-report rates of training participation were both found to be positively related to all three forms of organizational commitment (Bartlett, 2001). However, the current study setting of nurses from hospitals outside of major metropolitan areas suggests that a different result could be expected, especially in relation to the continuance form of commitment. More specifically, we believe that, in non-metropolitan areas nurses are likely to have fewer opportunities for employment compared to those in large cities with many hospitals. Consequently, the form of commitment based on attachment driven by the perceived high costs of lost income, time, effort, and stress of leaving the job suggests that continuance commitment may relate in a different way to the affective and normative components.

Hypothesis 1a. There will be a positive relationship between perceived access to training, training frequency, and affective organizational commitment.

Hypothesis 1b. There will be a negative relationship between perceived access to training, training frequency, and continuance organizational commitment.

Hypothesis 1c. There will be a positive relationship between perceived access to training, training frequency, and normative organizational commitment.

Motivation to learn is a key variable linked to actual participation in training (Tharenou, 2001). It is noted that as HRD becomes increasingly vital for organizations it is equally essential that employees who participate in development activities see their participation as rewarding (Nordhaug, 1989). It is likely that employees with a strong affective attachment to their organization will recognize the need for on-going participation in training
activities to enhance their skills, knowledge, and abilities in the achievement of organizational goals. Therefore, we would expect a positive relationship between motivation to learn from training and affective commitment. Continuance commitment describes an attachment based on recognition of the cost associated with leaving. An employee who is high in this form of commitment is perhaps a reluctant learner and a less than enthusiastic training participant and, therefore, may be characterized with lower levels of motivation to learn. An employee with high normative commitment is bound to the organization with a sense of obligation to remain. This sense of obligation may also create an awareness of the need for ongoing training, which may result in higher levels of motivation to learn. We therefore predict a positive relationship between motivation to learn from training and the normative form of commitment.

Hypothesis 2. There will be a positive relationship between motivation to learn from training and affective and normative commitment, and a negative relationship with continuance commitment.

Employees who believe that positive outcomes result from participation in training and development events have been found to be more motivated to seek opportunities for training (Dubin, 1990; Tharenou, 2001). Nordhaug (1989) identified three different types of reward functions or benefits that employees obtain from participation in training: job, career, and personal related benefits. Job related benefits reflect individuals’ perception that training will allow a performance improvement in their current position, whereas, career related benefits will likely assist in the development of skills for a future job. Personal related benefits of training reflect psychological, political, and social outcomes that may or may not be related to the work setting. Because continuance commitment reflects attachment based on the perceived high costs of leaving we would anticipate a negative relationship with all three types of training benefits. In contrast, we would predict that all three categories of perceived training benefits would be positively related to the forms of affective and normative forms of commitment as they represent attachment based on emotional ties and personal values.

Hypothesis 3. There will be a positive relationship between perceived job, career, and personal benefits of training and both the affective and normative forms of organizational commitment and a negative relationship with continuance commitment.

Support for training from an employee’s supervisor and senior staff members influences decisions to participate in training and development activities (Kozlowski & Hults, 1987; Noe & Wilk, 1993). A recent meta-analysis of training motivation places manager support for participation in training as a key situational characteristic influencing individual behavior towards training (Colquitt, LePine, & Noe, 2000). Birdi, Allan, and Warr (1997) found that managerial support was related to increased on-the-job learning, increased development, and increased career planning. Given these findings we believe that social support from senior staff and supervisors towards training participation is also likely to be related to employee perceptions of training access. Furthermore, supervisor support for training is also thought to relate to feelings of attachment to the employing organization in that employees may feel more attached to the organization if they are receiving support for training from their supervisors. In this situation employees may view training as a means to improve job performance and future career opportunities. Therefore, employees who receive support for training were thought to be more committed, hence hypothesis 4a and 4b propose:

Hypothesis 4a. There will be a positive relationship between supervisory support for training, and perceived access to training.

Hypothesis 4b. There will be a positive relationship between supervisory support for training, and all three forms of organizational commitment.

Given the magnitude of recent changes in the public healthcare system in New Zealand we anticipated that significant differences between perceived access to training, training frequency, training motivation, benefits of training, supervisory support for training, and organizational commitment would be found between the two countries. As noted above, the radical changes in New Zealand’s national healthcare policy have brought many impacts to individual hospital boards forced to focus on cost reduction efforts. Kearns and Joseph (1997) noted that the effects of health-care restructuring have been more severe in New Zealand’s rural communities. Despite recommendations to the contrary it appears that New Zealand healthcare administrators are viewing human resources as an area for cost reduction (Ashton, 2000). This would appear to suggest that individual hospital boards maybe viewing training and development activities as a cost rather than as an investment.

While reports of the impacts of healthcare restructuring at both the national policy level and at individual hospitals result in a temptation to predict that New Zealand would have lower scores on our training and commitment variables, there is insufficient research evidence to develop such a claim. Therefore, given the exploratory nature of this study we confine our hypothesis to a non-directional examination to determine whether significant differences in training and organizational commitment levels exist between the two countries.
Hypothesis 5. Significant differences will be found between New Zealand and the United States in perceived access to training, training frequency, motivation to learn from training, perceived benefits of training, supervisory support for training, and all three forms of organizational commitment.

Method

This section reports on the sample, procedures, variables, and data analysis used in this study.

Sample

The population for this study was registered nurses (RNs) employed in public hospitals in New Zealand and the United States. Three public hospitals located outside of large metropolitan areas were selected from the State Directory of Public Hospitals in one mid-western U.S. state. Then one similar sized public hospital was selected from the North Island of New Zealand. The four hospitals are somewhat similar in that they are located away from large metropolitan areas with each located in a small city or large town serving both the local population and surrounding rural districts. The smallest hospital was a 40-bed facility serving a population of 15,000 staffed by 70 full-time nurses and the largest a 140-bed facility serving a population of 45,000 staffed by 158 full-time nurses.

Procedures

A self-administered written questionnaire was used to collect individual-level data on the relationship between our training related variables and organizational commitment. The survey was developed and pilot tested in the same US state in which the data were collected with assistance of a group of four HRD trainers/educators with nursing backgrounds. The instrument was also examined by the head nurse and a training manager at the New Zealand hospital used for data collection. Surveys were distributed to all full-time nurses at each hospital (a total of 543 RNs) through the internal mail system with responses returned directly to the lead researcher. A single follow-up was done approximately two-weeks after initial delivery. The initial distribution and the follow-up resulted in a total of 198 completed and useable surveys representing 117 from the three US hospitals and 81 surveys from New Zealand (30% response rate from US; 51% New Zealand; 36% overall). As could be expected from a female-dominated profession, the majority (94%) of respondents were women.

Variables

The variables under investigation were divided into two broad categories related to training and organizational commitment. Training was divided into five operational variables to assess perceived access to training, training frequency, motivation to learn from training, perceived benefits resulting from training, and supervisory support for training. Perceived access to training was measured with a three-item scale used in a previous study of organizational commitment and training (Bartlett, 2001). Coefficient alpha was .77. Training frequency was measured using three items to assess the number of different types of training events employees had participated in during the past twelve months. These items, developed by Tharenou and Conroy (1994), should be thought of as three discrete questions to determine frequency of participation rather than as a scale. A sum of these questions produces a total number of training events participated in during the past year. Motivation to learn from training was measured using the 11-item motivation to learn from training scale developed by Noe and Schmitt (1986). Coefficient alpha was .85. Benefits resulting from training were measured with the 14-item perceived benefits of training scale (Noe & Wilk, 1993). Alpha coefficient was .80. This scale is an adaptation of Nordhaug’s (1989) scale composed of three sub scales to measure, job, career, and personal related benefits. The reliability coefficients of these three subscales were .76 for job related benefits, .68 for career related, and .62 for personal related benefits of training. Finally, supervisory support for training was measured using the 16-item senior staff support for training sub scale from the Noe and Wilk (1993) perceived support for training instrument. Coefficient alpha was .96. The Affective, Continuance, and Normative Commitment Scales (ACNCS) of Allen and Meyer (1990) were used to measure organizational commitment (α = .86, .79, .89 respectively).

Data Analysis

There were very few instances of missing data (less than 4% missing for any single item). Data analysis employed bivariate correlations to explore hypotheses 1-4. Possible differences between RNs in New Zealand and the United States were explored using t-tests for mean differences.

Results

Table 1 presents the mean scores, standard deviations, and correlations for the variables under investigation. Hypothesis 1 explored relationships between access to training, training frequency, and the three forms of organizational commitment. Access to training produced a positive and significant relationship with the affective and normative forms of commitment. Training participation based on frequency was also found to be positively and
significantly related to affective and normative commitment. All predictions in hypotheses 1a and 1c were supported. Hypothesis 1b predicted a negative correlation between both access to training and training frequency and continuance commitment. The result in terms of access to training was not supported (r = .02 n.s.) whereas the predicted negative relationship between training frequency and continuance commitment produced a negative but non-significant relationship (r = -.09).

Hypothesis 2 examined the relationship between motivation to learn from training and organizational commitment. As predicted, we found a positive and significant relationship between motivation to learn from training and the both the affective and normative forms of commitment (r = .20, p < .01 for both relationships). The predicted negative relationship with continuance commitment was non-significant (r = -.13). This partially supports our hypothesis that motivation to learn from training is related to commitment; however, the ordering and magnitude of this relationship in explaining organizational commitment requires further analysis.

The relationships between job, career, and personal related benefits from training, and affective commitment were positive and significant, as predicted in hypothesis 3. In other words, those employees who believe that training participation brings rewards or benefits to their job, career, or personal life are more likely to report higher levels of the affective form of organizational commitment. Likewise, a positive and significant relationship was found between job, career, and personal related benefits of training with normative commitment. Hypothesis 3 also predicted a negative relationship between the three types of training benefits and continuance commitment. Negative but non-significant relationships between career and personal related benefits of training and continuance commitment were found. However, a positive and significant relationship (r = .18, p < .05) between job related benefits and continuance commitment was found. Additional research on training benefits and organizational commitment would help in understanding this finding.

The relationship between supervisory support for training and access to training was moderately strong and significant (r = .50, p < .01) supporting hypothesis 4a. Hypothesis 4b predicted a positive relationship between supervisory for training and all three forms of organizational commitment. This was supported but only the relationships with the affective (r = .47, p < .01) and normative (r = .44, p < .01) forms of commitment were significant. Our final hypothesis considered possible differences between RNs in New Zealand and United States. As shown in Table 3, many significant differences were found between the New Zealand and U.S. samples in mean scores for our training and commitment variables. New Zealand nurses reported lower mean scores compared to the U.S. nurses on all variables with 10 of the 12 comparisons producing a significant difference. A high level of significance in the difference between mean score for the following variables was found; perceived access to training, training frequency, supervisory support for training, as well as the affective and normative forms of organizational commitment.

**Conclusions and Recommendations**

This study examined relationships between employee attitudes related to training and feelings of organizational commitment, and compared these variables in a sample of nurses from New Zealand and the United States. The following conclusions can be made based on the results of this study. First, the affective and normative components of organizational commitment are related to participation in training with perceived access to training producing a stronger relationship than self-report measures of training frequency. Second, the affective and normative components organizational commitment is also related to motivation to learn from training, perceived benefits of training, and perceived supervisory support for training. This suggests a need for organizations to have supervisors and managers be active supporters of training. Third, a number of significant differences in the attitudes towards training and the level of commitment were found between the New Zealand and U.S. samples. A number of potential explanations could be offered for this cross-national difference. While differences in culture, formal educational pathways, hospital management structures, and so on no doubt play a role we also believe that the lower scores from the New Zealand nurses may highlight their frustration and concern following the reorganization of the nation's public healthcare system. The findings potentially support statements that attribute the general low morale of New Zealand nurses compared to those in other industrialized nations as resulting from the past two decades of major health care reform efforts (Coney, 1996). While not suggesting that the industry and organizational changes in New Zealand hospitals by themselves explain the significantly lower scores related to many training and commitment variables, these findings do point toward the need for additional research to determine potential cultural, organizational, and individual level constructs that may offer further insight.

The implications of the findings from this study apply to both managers and administrators in the healthcare field as well as to trainers, HRD practitioners, and researchers. Given that well-established relationships are known between organizational commitment and outcomes that influence performance, such as low absenteeism, reduced turnover, and increased levels of organizational citizenship behaviors (Meyer, Stanley, Herscovitch, & Topolnytsky, 2002), managers could adopt a view towards training that recognizes its relationship to organizational commitment. Health-care managers could perhaps acknowledge that key performance related indicators such as patient welfare, employee stress levels, and turnover are potentially connected to the relationship between attitudes towards training and organizational commitment. However, while managers should not focus solely on organizational commitment, it is important to recognize how management practices, employee responses to change, and additional stress brought on by industry-wide restructuring may impact the type and strength of commitment and consequent behaviors. This is especially true for examining retention, which has long been an issue of concern. A number of the variables investigated in this study can be influenced by supervisors and managers. For example, employee perceptions of training benefits can be enhanced by communication from supervisors and training providers. This could also
potentially contribute to positive perceptions of access to training, as shown by the positive relationships between access and benefits in this study, and encourage additional research into training results.

The findings related to the three separate constructs of organizational commitment examined in this study support a growing body of literature that indicates that employee attachment is multi-faceted. This has practical implications as different management actions related to training and development may have different impacts on affective, normative, and continuance commitment. However, as is supported in existing studies, the affective form of commitment appears to be the focus of most management interest. Recent research has suggested that public personnel administrators increasingly recognize the need to increase affective organizational commitment among public sector employees (Nyhan, 1999). Such recognition among health care administrators may also benefit the public health care field.

Researchers continue to explore which variables are related to and influence organizational commitment. This is resulting in increasingly complex models to understand the nature of organizational commitment and the variety of antecedent and consequent variables. To date, HRD researchers have not played a major role in this line of inquiry despite the potential to make major contributions. As employment practices shift to support management that fosters organizational commitment rather than management by control, additional studies are needed to determine whether changes are actually occurring in the type and strength of employees' feelings of attachment. Such studies are needed, particularly in settings experiencing significant industry and organizational change.

Commitment Elements Reframed (Antecedents & Consequences) for Organizational Effectiveness

Sandra L. Fornes  
Tonette S. Rocco  
Florida International University

This structured literature review of commitment in the workplace provides a new way to look at commitment through levels, elements, antecedents and consequences of organizational and individual commitment.

Keywords: Organizational Commitment, Workplace Commitment, Commitment Antecedents

Performance improvement in an organization goes beyond the commonly accepted principles of good management and effective leadership by engaging the emotional commitment of the employee (Katzenbach, 2000) Commitment is the differentiating factor between top performing companies and those of average performance (Katzenbach, 2000). Emotionally engaged employees are more productive and more customer-focused. High-levels of employee commitment are positively correlated with superior financial performance in organizations demonstrated by significant increases in operating and net profit margin (International Survey Research, 2001; Gallup, 2002; Watson Wyatt Global Consulting, 2003). Individuals and teams that are committed to the values and goals of an organization have a higher morale and lower turnover, increased job satisfaction, and increased productivity (Cohen, 2003; Meyer & Allen, 1997; Mowday, Porter, & Steers, 1982).

Gallup (2002) estimates that actively disengaged workers cost the U.S. economy up to $350 billion per year. Even though employee commitment has a positive impact on organizational and individual performance and job satisfaction, low levels of commitment exist in most industries. More than a third of employees worldwide admit to having low levels of commitment to the job and the company and instead are more committed to their careers (TNS Worldwide, 2002). Only one in twelve (8%) are 'company-oriented' employees, predominantly committed to their company (TNS Worldwide, 2002). Levels of employee commitment in the USA are significantly lower than half of the world’s other major economies, placing USA companies at a disadvantage when competing in the global marketplace (International Survey Research, 2001).

Problem Statement

By understanding when and how commitments develop and how they shape attitude and behavior, organizations will be in a better position to anticipate the impact that change will have and to manage it more effectively (Meyer & Allen, 1997). By knowing what drives the commitment of employees, a positive environment can be created to deliver tangible results quickly. The purpose of this paper is to identify theories of commitment in the workplace to develop a framework that helps the field create higher levels of commitment, productivity, and satisfaction. The paper is organized into five main sections: the method, commitment in the workplace, mapping workplace commitment, and the implications for HRD and future research.

Method

A structured literature review was conducted. Educational Resources Information Center (ERIC), PsycInfo and ABI Inform and were selected with the assistance of a reference librarian as most representative of education, psychology and business. We started with 1980 because early in the 1980s organizational downsizing and restructuring became a trend ending with 2003. Databases were searched for the following descriptors: workplace commitment, organizational commitment, affective commitment, employee emotional commitment, career, profession and occupational commitment, job commitment, work group and team commitment. Each term was searched individually. In addition, organizational and workplace commitment, career and job commitment were each paired with commitment antecedents and consequences. Each descriptor set produced a list of records that were reviewed for relevancy. The search resulted in 3985 articles of which 567 addressed workplace issues, not general societal trends such as societal commitment or familial commitment. Articles, non-specific to the workplace, were
eliminated as were duplicate articles. Articles were then examined for the antecedents or consequences of commitment in the workplace resulting in 125 articles to analyze.

A content analysis was conducted. Abstracts were read and categorized by (a) elements of commitment (b) antecedents to commitment (c) consequences of commitment. Tables were created to organize themes and patterns that emerged as the elements, antecedents and consequences of commitment in the workplace. Cognitive mapping was used to create a mental model of the overall meaning of the text. A graphic map depicts the relationships between concepts. Cognitive mapping lends itself to the comparison of semantic connections across texts and attempt to represent the relationship(s) between ideas, beliefs, attitudes, and information available to an author within a text. These relationships can be represented as logical, inferential, causal, sequential, and/or mathematical relationships (Palmquist, Carley, & Dale, 1997).

**Commitment in the Workplace**

Commitment has been defined as the degree of pledging or binding of the individual to a set of behaviors and motivates one to act (Kiesler, 1971). Once identification with the organization begins, individuals are likely to become concerned with the broader interests of the organization including its reputation, survival, and continued success, that generates activity and resource exchange (reflecting enhanced concern between firm and employee) fostering further identification (Rousseau, 1998). Katzenbach (2000) describes an energized workforce as high performance (those that perform better than industry norms) and whose emotional commitment enables them to make and deliver products or services that constitute a sustainable competitive advantage.

Commitment in the workplace or understanding how people become committed to an organization is multifaceted (Meyer & Allen, 1997) consisting of the elements, antecedents and consequences, and forms such as organizational (affective), job, career, team, and supervisory commitment. Sufficient discriminate validity (reduction in concept redundancy) exists among organizational commitment, job commitment, career commitment (Bashaw & Grant, 1994; Carson & Bedeian, 1994; Chang, 1999; Morrow & Wirth, 1989; Morrow & Goetz, 1998), and group (team) commitment (Ellemers, de Gilder, & van den Heuvel, 1998) to consider these as independent forms of commitment in the workplace. Considering this, these independent forms of workplace commitment are reframed into two distinct levels – organizational commitment (organization and supervisor) and individual commitment (job, career, and team) and will be discussed following the elements of commitment in the workplace, the antecedents and consequences.

*Levels of Commitment - Forms of Commitment*

Commitment affects the organization and the person, making two levels. (a) Organizational commitment which is directed by organization attributes and defined as the psychological and emotional attachment of employees to their organizations (Morrow, 1993; Meyer & Allen, 1991; Mathieu & Zajac, 1990). (b) Individual employee commitment, guided by attributes that directly affect the person and is defined as the psychological and emotional attachment of individuals to their jobs, careers, work groups or teams, peers and supervisors (Cohen, 2003).

**Organizational commitment.** Organizational commitment is the measure of strength of the employee’s identification with the goals and values of the organization (Mowday et al., 1982) and supervisor. Individuals committed to the organization exert extra effort, desire organizational membership (Morrow, 1993), protect company assets, and share company goals and values (Meyer & Allen, 1997). Supervisory commitment is defined as the strength of identification with supervisor and internalization of supervisor’s values. Identification occurs when the subordinate admires certain attributes of the supervisor, such as attitudes, behavior, and accomplishments. Internalization occurs when the subordinate adopts the attitudes and behaviors of the supervisor because the supervisor's attitudes and behaviors are congruent with the subordinate’s value systems (Becker, 1992; Gregersen & Black, 1993). Commitment to organization is related positively to a variety of desirable work outcomes including employee job satisfaction, motivation and performance, and related negatively to absenteeism and turnover (Mathieu & Zajac, 1990). Organizational commitment can be measured as either attitudinal or calculative. Atitudinal, referred to as affective (Meyer, Allen, & Smith 1993), or internalization and identification (O’Reilly & Chatman, 1986) is the employee’s emotional attachment and identification with the organization (Meyer & Allen, 1997; Mowday et al., 1982; Cohen, 2003; Porter et al 1974). Employees continue with the organization because they want to do so (Meyer & Allen, 1997; Mowday et al, 1982) and feel proud to be part of the organization, respecting its values and accomplishments (O’Reilly & Chatman, 1986). The calculative or “side-bet” (Becker, 1960), also referred to as continuance (Meyer & Allen, 1997) and compliance (O’Reilly & Chatman, 1986), signifies the extent to which employees feel committed to their organization by virtue of the cost that they feel is associated with leaving it and their need to remain with the organization (Becker,1992; Meyer & Allen, 1997).
The affective (attitudinal) commitment approach provides a clearer and more focused scale of organizational commitment (Jaros, 1997) because the correlation between antecedents and attitudinal (affective) measures are stronger than those measures of the calculated or continuance approach (Hrebiniak & Alutto, 1972; O’Reilly & Chatman, 1986; Meyer & Allen, 1997). In addition, many existing measures of organizational commitment are attitudinal (Ko, Price & Mueller, 1997; McGee & Ford, 1987), and the construct validity of affective (attitudinal) commitment is supported (Ko et al., 1997), while the construct validity of continuance and compliance commitment is questionable (Ko et al., 1997).

Individual employee commitment. Individual commitment is the measure of strength of the employee’s identification with the values of other individuals and peers within the organization (team commitment), and their work (job commitment) and careers (career commitment) and encourages individuals to exert extra organizational citizenship behavior as active positive contributions to colleagues and avoid engaging in harmful behaviors. Team commitment is an individual’s identification and sense of cohesiveness with other members of a group. The importance of team commitment is its enhancement of social involvement that reinforces the social ties that the individual forms with the organization (Randall & Cote, 1991).

Job commitment is the degree to which a person identifies psychologically with his/her work and is the internalization of the values and the importance of work for the person’s worth and the degree to which one’s work performance affects one’s self-esteem and self-image (Lodhal & Kejner, 1965; Rabinowitz & Hall, 1977). Career commitment (professional and occupational commitment) focuses on the employee’s career and the devotion to a craft or occupation (Blau, 1995; Morrow, 1983). Career commitment is defined as the magnitude of an individual’s motivation, attitude, affects, belief and behavioral intentions toward an occupation or vocation (Blau, 1995; Hall, 1971) or the degree of centrality of one’s career for one’s identity (Gould, 1979).

Antecedents to Commitment in the Workplace

Antecedents of commitment are actions or elements that cause commitment to occur. Congruency, interesting work, clarity of purpose, feedback, equity/fairness, empowerment, and autonomy are antecedent elements linked to organizational commitment that produces psychological states that lead to positive consequences for the organization and individual. The antecedents that lead to individual employee commitment are congruency, interesting work, feedback, and autonomy.

Congruency is the quality of agreement that exists between the employee’s values and interests and those of the organization. If congruency exists between a person’s interests, preferences, abilities (Holland, 1985) and values (Katzenbach, 2000), and organizational factors in the work environment, employees become more emotionally committed to the organization leading to improved performance (Holland, 1985; Katzenbach, 2000). Congruency or “fit” between the individual and his or her job/career increases commitment to the career and/or job (O’Reilly, Chatman, & Cadwell, 1991).

Interesting work holds the individual’s attention, is challenging and rewarding, is significant to the organization, and allows utilization of a variety of skills and knowledge. Job characteristics such as job challenge, skill variety (different activities and talents the job requires), task identity (doing a job from beginning to end with visible results), task significance (the job’s impact on the lives of workers and the organization), degree of autonomy (freedom, independence and discretion in scheduling work and determining procedures) all improve commitment to the organization (Mathew & Zajac, 1990; Nelson, 1999), to the job (Hackman & Oldham, 1976; Varona, 2002), and one’s career (Person, 1997). The more important a task or job component (job significance) is, the greater the level of job commitment and job satisfaction, motivation and job performance (Hackman & Oldham, 1976). Organizations that ensure interesting work will improve employee commitment to the organization and the job itself.

Clarity of purpose provides a clear identification of the intentions, ideas, goals and plans of the organization allowing employees to be informed, ask questions, share information, provide a clear sense of direction. Lack of clarity, about purpose, lies at the core of organizational ineffectiveness and inefficiency (Kaufman, 2000; Katzenbach, 2000). Organizations that provide a clear sense of direction (Greenberg, 1994), adequate explanation of new policy (Rhodes & Steers, 1981; DeCotiis & Summers, 1987) and purposereport high levels of organizational commitment (Mathieu & Zajac, 1990), workgroup commitment (Konovsky & Cropanzano, 1991) and individual commitment (Varona, 2002).

Equity and fairness maintains a balance between and within the organization and its employees. Affective commitment and commitment between peers and supervisor is strengthened when employees’ perceptions are of a fair, trusting, and equitable environment (Konovsky & Cropanzano, 1991; Kim & Mauborgne, 1993; Rhodes & Steers, 1981). Feedback is the degree to which employees receive information that reveals how well they are performing on the job. Feedback that promotes continuous improvement and constant communication with employees leads to the development of organizational commitment (Luthans, 1998) and enhanced performance (Katzenbach, 2000; Nelson, 1999; Varona, 2002).
Empowerment gives authority to the employees to make decisions about their work. Organizational commitment is stronger among employees who are allowed to participate in decision-making and empowered to carry out their work (Rhodes & Steers, 1981; DeCotiis & Summers, 1987; Meyers & Allen, 1997). Empowerment, autonomy, and mutual accountability focus employees on doing a job well and encourage them to lend a hand to a co-worker or department that needs help (Katzenbach, 2000). Giving people latitude, flexibility, and empowerment to make decisions increases the chance that they will perform as desired bringing additional initiative, ideas, and energy to their jobs (Nelson, 1999). Autonomy is the degree of freedom, independence and discretion an employee is allowed in scheduling work and determining procedures. Increased autonomy strengthens organizational commitment (Mathew & Zajac, 1990), increases job satisfaction (Fried & Ferris, 1987), and contributes to job commitment (Person, 1997; Hackman & Oldham, 1975).

Consequences of Workplace Commitment

The consequences of workplace commitment are the effects and outcomes that result from organizational and individual employee commitment. Employees with strong organizational affective commitment are emotionally attached to the organization having a greater desire to contribute meaningfully to the organization, choose to be absent less, work harder (Mathieu & Zajac, 1990), improving production (Randall & Cote, 1994) and overall performance on the job (Meyer & Allen, 1997). Managers with strong affective commitment report higher levels of compliance with strategic decisions and avoidance of budgetary slack in financial planning (Kim & Mauborgne, 1993; DeCotiis & Summers, 1987), are more willing to engage in organizational citizenship (Nouri, 1994) or extra-role performance (Meyer et al, 1993). The willingness to go above and beyond the call of duty (extra-role performance) include things such as providing extra help to coworkers, volunteering for special work activities, being particularly considerate of coworkers and customers, arrive early to work and/or leave late, and make suggestions when problems arise (Meyer & Allen, 1997). Affective commitment leads to increased competitiveness, accountability and the desire to improve overall performance of the job (Konovsky & Cropanzano, 1991).

Affective organizational commitment is beneficial to the employee as well. Employees that have high levels of affective commitment, experience lower stress levels even though they work longer and harder than those not committed. Affective commitment encourages motivation (Meyer & Allen, 1997) and lower psychological physical, work-related stress (Reilly & Orsak, 1991), less emotional exhaustions and depersonalization (Jamal, 1990). Employees committed to the organization, their jobs and careers appear happier, and are able to exert more quality time to their families and hobbies (Reilly & Orsak, 1991).

Individual employee commitment and commitment to work groups improves team performance, pro-social behavior and group cohesion enhancing individual job performance and satisfaction (Bishop and Scott, 1997). Those committed to their jobs and/or careers are absent less and have lower intentions to quit (Bishop & Scott, 1997), increased job satisfaction, and increased intrinsic motivation (Hackman & Oldham, 1976). Job characteristics or interesting work such as task identity, skill variety, task significance and autonomy increases motivation, job satisfaction and job performance (Hackman & Oldham, 1976). Career commitment and job involvement affect professionals' job satisfaction, turnover intention, role stress, productivity, and job migration (Aranya & Ferris, 1984; Gunz & Gunz, 1994).

Figure 1. Commitment Mapped

"Job Satisfaction"
"Motivation"
"Improved Performance"
"Improved Production"
"Absenteeism"
"Turnover"
"Work related stress"
"Self-esteem/Self image"
Cognitive mapping was used to create a model of the relationships between the elements, antecedents, and consequences of workplace commitment, which lead to organizational commitment and/or individual employee commitment (See Figure 1). The antecedents to organizational commitment (clarity of purpose, equity & fairness, empowerment, congruency, feedback & recognition, autonomy and interesting work) lead to an employee’s perception of organizational and supervisory support creating an emotional attachment to the organization (organizational commitment). The antecedents to individual commitment (congruency, feedback & recognition, autonomy and interesting work) lead to meaningfulness of work, career, peers, and self, creating an attachment to ones job, career, and work teams (individual commitment). Organizational and individual commitment results in positive outcomes and implications for the organization and the individual (consequences of commitment).

Commitment in the Workplace Reframed and Performance Implications

If commitment behavior is not transferred from individuals and subgroups to the total organization, dysfunctional behavior can exist among individual employees whose goals are in conflict with the goals of the total organization (Cohen, 2003; Vandenberg & Scarpello, 1994). One example of this is the possible inverse relationship between career commitment and organizational commitment. If the organization is not in line with the employee’s career goals, it may cause the employee to be more committed to his or her career rather to the organization, which would have an inverse effect on organizational performance (Cohen, 2003). Commitment in the workplace reframed (See Figure 2) illustrates this issue of conflict which is explained by the extent to which organizations engaging in activities (antecedents) that enhance both organizational commitment (committed to the organization and supervisor) and individual employee commitment (committed to their jobs, careers, work groups) consequences will occur, leading to outcomes of maximization of organizational and individual performance. When the employee is committed at all levels, optimal organizational and individual performance occurs as well as individual employee satisfaction. In organizations where employees are neither committed to the organization nor to their job, careers, and/or work groups, or the organization, distress within the organization may occur leading to organizational performance problems and low performing workers.

Organizations where employees may either be committed to the organization, but not committed at the individual level (i.e. to their jobs or careers) or committed at the individual level, but not committed to the organizational level may experience conflict between organizational values and goals of the employee leading to a status quo performance situation or performance lower then expected.

Implications for HRD and Future Research

Lower levels of commitment may indicate a lack of coherent strategies linking human resource development interventions to increasing commitment in the workplace. Human Resource Development’s (HRD) principle purpose is to improve organizational performance through increased productivity, efficient work processes, and individual contributions (Swanson & Arnold, 1996). One trend effecting modern HRD practices is greater expectation of meaningful work and employee involvement (McLagan, 1989). A major focus of HRD interventions is an effort to change employee behavior to enhance performance. Commitment of organizations and individuals to each other, the process and the product, is vital to increased productivity and efficiency.
Potential spill over into other areas such as commitment to one’s family and nation may provide affects on society at large (Cohen, 2003). If the quality of an employee’s attachment to work organizations were low, this would carry certain implications for the basic fabrication of society (Cohen, 2003). Without employee commitment, individuals would lose one very basic source of identity and belonging. When quality of membership status linkages is low in a number of work organizations, the level of productivity and the quality of products and service would be affected (Cohen, 2003, Mowday et al., 1982). The identification of people with the organization can create a larger whole that is often a driving force behind a firm’s performance, and its employees’ well being (Meyer & Herscovitch, 2001).

Knowledge Sharing in Organizations: An Analysis of Motivators and Inhibitors

Minu Ipe
University of Minnesota

Knowledge sharing has been identified as critical to the management of knowledge in organizations. However, in practice, problems with knowledge sharing have proved to be a major barrier to the effective management of knowledge. This paper reports on research that identified four motivators and five inhibitors of knowledge sharing within one organizational context.

Keywords: Knowledge, Knowledge Sharing, Motivators of Knowledge Sharing

Knowledge is increasingly perceived as being commercially valuable and its ownership is being recognized by individuals and the organizations in which they work (Brown & Woodland, 1999; Weiss, 1999) and therefore, knowledge sharing has been identified as critical to the management of knowledge in organizations. Knowledge sharing connects individuals with the organization by transferring knowledge that resides with individuals to the organizational level where it is converted into economic and competitive value for the organization (Hendriks, 1999). However, knowledge sharing is not an activity that takes place seamlessly within organizations. In practice, problems with knowledge sharing have been identified as a major barrier to the effective management of knowledge in organizations (Hendriks, 1999). This paper reports on factors that function as motivators and inhibitors of knowledge sharing from a larger study on knowledge and knowledge sharing in organizations.

Problem Statement

There is enough evidence to suggest that knowledge sharing is critical to organizations (e.g. Davenport & Prusak, 1998; Hendriks, 1999). However, the dominant idea in the literature related to knowledge sharing is that individuals do not readily share knowledge (Brown & Woodland, 1999; Davenport & Prusak, 1998); and that individuals are motivated to share what they know primarily through financial inducements (Gupta & Govindarajan, 2000; Quinn, Anderson & Finklestein.). These assertions, while they appear to be intuitive, are not based on sufficient in-depth research in multiple organizational settings. This study addressed the need for a comprehensive investigation of knowledge and knowledge sharing in organizations through an in-depth examination of these issues within an organizational setting.

Theoretical Framework

The following sections summarize some key ideas about knowledge sharing and factors that function as motivators and inhibitors of this process in organizations. The objective here is not to provide an exhaustive review of the literature but to give an overview of the prominent ideas in this area that serve as the theoretical framework for this study.

Knowledge sharing between individuals. Knowledge sharing is the process by which individuals make their knowledge available to others. Davenport (1997) defined it as voluntary and distinguished it from reporting. While reporting involves the exchange of information based on some routines or structured formats, sharing implies a voluntary act by an individual who participates in the knowledge exchange even though there is no compulsion to do so. According to Hendriks (1999), knowledge sharing suggests a relationship between at least two parties—one that possesses the knowledge and the other that acquires the knowledge. Individuals in organizations have always created and shared knowledge and therefore knowledge sharing was considered to be an activity that took place automatically. Today, there is growing realization that this is not the case. Knowledge sharing is a dynamic process mediated by complex factors that exist at the organizational, group, and individual levels (Andrews & Delahaye, 2000; Davenport & Prusak, 1998). Despite the importance of the role of individual knowledge and the need for this knowledge to be shared effectively, relatively little empirical research sheds light on how individuals share what they know within their work settings.

Dominant ideas about knowledge sharing. Among the factors considered a significant inhibitor of knowledge sharing in organizations is power politics. The phrase knowledge is power is used frequently in the context of organizations. Empirical evidence suggests that knowledge is used at the individual level for both control and defense (Brown & Woodland, 1999), and that if individuals perceive that power comes from the knowledge they possess, it is more likely to lead to knowledge hoarding instead of knowledge sharing (Gupta & Govindarajan, 2000). Withholding information from those perceived to be competitors is often considered useful in attaining one’s goals in a competitive environment (Pfeffer, 1980). Research further indicates that professionals zealously guard their knowledge, as they perceive that their own value to the firm is a product of the knowledge they possess (Empson, 2001; Weiss, 1999). Issues of power that mediate the relationships between individuals involved in knowledge exchanges is also thought to influence knowledge sharing behavior (Huber, 1982). However, it must be noted that many of these studies were conducted in situations involving organizational restructuring, mergers, and other highly volatile environments.

Equating knowledge with power has fuelled the notion that knowledge is not easily shared within organizations and sufficient incentives need to be provided in order to prompt individuals to share what they know with others within the organization. O'Reilly and Pondy (1980) indicated that there is a positive relationship between rewards and knowledge sharing behavior among individuals. The relationship between knowledge sharing and incentives was further supported by case studies (Gupta & Govindarajan, 2000; Quinn et al., 1996) which found that significant changes had to be made in the incentive system to encourage individuals to share their knowledge, particularly through technology based networks in the organizations. Yet there appear to be inconsistencies in the literature regarding the role of tangible rewards as means to enhance knowledge sharing in organizations. While there are those who perceive rewards and incentives to be indispensable to knowledge sharing, others argued that the only reason that professionals participate in knowledge sharing activities is the intrinsic reward that comes from the work itself (Tissen, Andriessen, Deprez, 1998). There is also some evidence for knowledge sharing that was not motivated by any tangible rewards (e.g. Constant, Sproull, & Kiesler, 1996). Yet others who argued against the use of incentives to share knowledge claim that in the long run, unless knowledge sharing activities help employees meet their own goals, rewards will not help to sustain the system (O'Dell & Grayson, 1998).

Culture is another factor that has proved to have a significant influence on knowledge sharing behavior in organizations. Regardless of how strong an organization’s commitment is to knowledge management, it has been found that the influences of the organization’s culture are much stronger (O'Dell & Grayson, 1998). Due to the very complex nature and influence of culture, organizational culture is increasingly being considered a major barrier to effective knowledge sharing in organizations (DeLong & Fahey, 2000; Leonard-Barton, 1995). Empirical evidence of the relationship between culture and knowledge sharing was found among other by Leonard-Barton, 1995, and Pan and Scarborough (1999).

Other motivators and inhibitors of knowledge sharing. Other factors that have been identified as influencing knowledge sharing behavior are sensitivity of knowledge (Weiss, 1999), friction (Szulanski, 2000; von Hippel, 1994), reciprocity (Nahapiet & Ghoshal, 1998) and trust (Andrews & Delahaye, 2000; Ghoshal and Bartlett, 1994). The importance of having shared language to facilitate knowledge sharing was identified by several authors (e.g., Blackler, et al., 1998; Nonaka and Takeuchi, 1995; Nahapiet and Ghoshal, 1998; Orr, 1990). While several factors have surfaced from the literature as having an influence on knowledge sharing behavior, empirical evidence for the existence and influence of these factors is sketchy and fragmented. Individual factors that have been identified from different settings and different contexts do not offer a complete understanding of the dynamics that influence knowledge sharing behavior within organizations. This study attempts to address this void by doing an in-depth analysis of motivators and inhibitors within one organizational setting.

Research Questions

The purpose of this study was to understand the factors that motivate and inhibit individuals to share knowledge with others within the context of their work environments. The primary research questions were:
1. What are the individual level factors that motivate and/or inhibit knowledge sharing?
2. What are the motivators and inhibitors that come from organizational policies and formal practices?
3. What are the motivators and inhibitors that are influenced by the culture of the work environment and informal practices?
Method

The focus of this study was on trying to understand knowledge sharing from the point of view of the individuals who worked on the project that was selected as the case of interest for this inquiry. This study was exploring a current phenomenon within a real life setting, making the case study an appropriate research method (Yin, 1994). This study assumes that knowledge and knowledge sharing behavior arise out of and are influenced by the context in which it exists. Therefore it was important to isolate a setting with clearly defined boundaries with a clear context within which to conduct this study. Merriam (1998) further supports the use of the qualitative case study as an appropriate method when the researcher is interested in “insight, discovery, and interpretation rather than hypothesis testing” (p.10).

The case. The primary unit of analysis was a project from a Midwest based division of an Information Technology (IT) Services company. Members of the project team were involved in designing, developing, and implementing a new technology based system that would significantly improve the services provided by the company. This particular project was selected for this study because (a) it was an active project involving a cross-functional team, (b) all members of the project team were professionals who would be considered knowledge workers as each of their areas was knowledge intensive, (c) the progress of the project and its ultimate success was fully dependent on how individuals with different backgrounds and areas of expertise shared their knowledge with one another, and (d) it provided the researcher with adequate access to collect data. This project also allowed the researcher to focus on one specific group of people who worked together, providing both a clear context and clear boundaries. The project team had just begun the implementation phase when the active data collection process began for this study.

Sources of data. An advantage of the case study method is that it allows for multiple sources of data, providing for data triangulation and validation of findings (Yin, 1993). Four sources of data were collected for this study. (1) Observation of 13 team meetings, (2) a sample of 40 e-mails exchanged by team members related to the project, (3) key documents related to the project (4) interviews with 22 members of the team.

Data collection process. Data was collected over a period of five months from June to October, 2002. The data collection instruments used in this study drew their focus from the theoretical framework that was created prior to data collection. Observational data was collected by the researcher who attended project meetings as a non-participant observer. All the project team members were informed about the objectives of the study as well as the researcher’s objectives as an observer at the meetings. Key project documents and a sample of project related e-mails were obtained from project members. Interviews were conducted with 22 team members, each lasting about an hour and a half. All interviews were transcribed with the permission of the participants and sent back to them for verification. The interview schedules used for the study were designed by the researcher and pilot tested with two individuals from the same organization. An expert in the area of qualitative research also reviewed the interview schedules.

Data analysis. Data analysis focussed on uncovering the factors that functioned as motivators and inhibitors of knowledge sharing within the project team. Thematic analysis of data was conducted using the qualitative data analysis tool, Nvivo. Each data source was analyzed independently to begin with using sentences as the primary unit of analysis. Guba’s (1978) steps for analysis of qualitative data—convergence and divergence, guided the process of data analysis. Convergence involved creating a classification system for the data to identify the things that fit together. Divergence refers to the process of developing the patterns that emerge from the data. All the findings that emerged from the study were shared with the participants and their feedback and verification was sought. The findings were also validated by methods triangulation (Patton, 1990), checking the consistency of findings across the different sources.

Results

Four motivators and five inhibitors of knowledge sharing were identified in this study. The four motivators of knowledge sharing were (a) a feeling of being valued, (b) informal relationships with team members, (c) commitment to the project, and (d) a sharing climate within the team.

A feeling of being valued. There was clear recognition among individuals of the knowledge they brought to the team and therefore the value they were able to add to the project. The most important motivator to sharing knowledge within this group was an individual’s perception of being valued by others in the group as well as in the organization. This feeling of being valued was manifested through several means: (a) being recognized by peers for
contributions made to the team, (b) having ones opinions and knowledge solicited by team members, (c) having ones expertise in a specific area acknowledged by team members, and (d) the perception of being treated with respect during interpersonal interactions. The example below illustrates what recognition of an individual’s expertise by team members mean to them and how it resulted in their willingness to share more with others.

I guess it gives you more confidence inside that says, If I say something to people they’ll listen and they’ll believe me. They won’t question or doubt what I’m saying.

Soliciting someone’s knowledge while recognizing their expertise proved to be a very positive factor for knowledge sharing within the project team. As one individual said:

There were times when I would go and specifically say, “I know that you’re very good at this, you know. And can you help me understand what this means or can you help me understand what you do.” …To let them know that I know “I’m not the expert in your area and I’m not trying to be the expert in your area. So why don’t you help me?” …“I respect what you are doing on this project because I know you are good at what you do” and that seemed to help.

Informal relationships with team members. Having informal relationships with team members outside of their roles within the project was another factor that motivated individuals to share knowledge. Informal relationships allowed individuals to seek out other members of the team either to share their inputs or seek clarifications on things that they were not clear about. Such relationships also facilitated the sharing of knowledge in social settings outside of work. In fact, opportunities to socialize outside of work strengthened informal relationships, which in turn facilitated the knowledge sharing process. One team member described how this worked:

You know, I guess from my perspective, I’ve always tried to connect on a personal level, because I think when people feel like they’re connected that way, they tend to share more then in their business meetings as well. Informal relationships with team members also created awareness of other individuals’ skills, abilities, and strengthened the social web within the organization. Individuals who knew the skills and knowledge sets of their team members proved vital to the efficacy of knowledge sharing within the team. As one participant described:

I would say my knowledge was greater in pointing to other people’s knowledge. Like I knew enough people, and I knew what their skill sets were, and I knew the different areas that they’ve worked in. A lot of times I think I was a bigger asset on, “Why don’t you go talk to such-and-such because I know that they’ve worked on, you know, X, Y and Z before and this is very similar.”

Commitment to the project. A key motivating factor to share knowledge on this project was individuals’ commitment to the project—a desire to contribute meaningfully to the project and ensure its success. Most individuals on the team had worked on the project since its inception and were therefore committed to seeing it through. Many individuals were selected for this important project because the organization valued them. So it was also a matter of professional pride for them to ensure that this project was completed successfully. Commitment to the project was manifested in individuals by (a) wanting the project to be successful, (b) valuing commitment in team members, and (c) valuing individual and group learning. One individual described how commitment to the project was a key motivator of knowledge sharing.

…I want this to be good…. So that I think is what keeps me going and knowing that what I'm doing is providing value to the team.

Most team members agreed that they tended to share more with those who demonstrated a high degree of commitment to the project. As one individual explained:

People that I tend to share with are people that do care about the project. They are not just doing their job, but they are looking out for improvements that we can make. They are helping me do my job. If there are issues, if there are questions they are ready to roll up their sleeves too.

Sharing climate within the team. Most of the participants talked about the openness within the team and how that facilitated knowledge sharing throughout the project. Since team members had been working on this project for a long time, they had opportunities to get to know most of the others on the team and many had built strong informal relationships with each other. One individual described the working climate within the team:

I think this is a pretty good group. I think we've evolved. It seems like there is a lot of snags here, but as far as communicating amongst the team and working with the team, it's been pretty good. Everyone's willing to share what they know and pull their weight, do their end of the project.

Valuing expertise in others not only functioned as a direct motivator of knowledge sharing; it also enhanced the sharing climate within the team. One individual described how the group was receptive to the knowledge that experts brought to the team.

It was a good group of people to work with and they were very open to having data administration involvement to help them come up with the terminology and to come up with how made it sense to organize this data. So it
Another participant said:

Lack of shared contexts inhibited knowledge sharing. Members, and (d) there was a lack of absorptive capacity in recipients. The following examples illustrate how the knowledge among team members, (c) there was a lack of a common language for communication among team members, and (b) there was a lack of common industry training but also of tenure in the company and the industry. Lack of shared contexts influenced knowledge sharing most significantly in the initial stages of the project when the requirements were being identified. Shared contexts continued to evolve through the life of the project. The lack of shared contexts inhibited knowledge sharing because (a) individuals from different backgrounds had different perspectives, (b) there was a lack of common industry knowledge among team members, (c) there was a lack of a common language for communication among team members, and (d) there was a lack of absorptive capacity in recipients. The following examples illustrate how the lack of shared contexts inhibited knowledge sharing.

I think when it comes to the technical side, the development side, sometimes it's hard to ask them about how things work from a technical standpoint when you're very non-technical. So say a customer comes to me or for part of this project I need to understand something technical and I maybe write an e-mail to [a developer] or [the chief designer] and their response will not be at all what I was expecting. Like they did not understand where I was coming from so I have to rephrase it or stop by and just try to explain. It's like pulling teeth sometimes. So it is challenging, it's just a matter of prying and prodding and re-wording and trying to get what you need... because it's just a different world. Their understanding of the system is the code behind it and to me it's the screens, its what the user puts into it. That's the challenging part.

Another participant said:

In this project I felt that on a really higher level you can share, but as you go down deeper it's not possible because it's so varied and the things that people work on are so varied. We cannot share it with everybody, but with only a certain number of people.

Tacit nature of knowledge. Individuals carry knowledge in both tacit and explicit forms. Much of the knowledge that individuals possess tends to be tacit in nature, especially as individuals move up the ladder from novices to experts. Since many of the individuals selected to be part of the project team were those considered experts in their areas, it was clear that they were bringing with them a significant amount of tacit knowledge based on their experiences in their areas of specialization. This tacitness of knowledge negatively influenced individuals' abilities to share what they knew with others. One individual described how hard it was to document a process that was part of the knowledge base of another individual who had expertise in that area.

So that was one of the times when it was very intense where we would sit down and I would document how--what a score model consists of and then how its processed. Step by step. It was very tedious and very difficult because he knew it very well but he had a hard time communicating it. Because it is just in his head. You know, its just one of those things where “I don’t how we do it, we just do it”. And that’s really difficult to work with.

When you’re trying to ask these questions and starting from ground zero.

Another individual pointed out that tacit knowledge, since it is not easily captured in any tangible format, is not easily shared between individuals.

I think that’s an issue because people retain all this information in their head instead of in a document someplace so that its not easily exchanged on to the next person.

Dependence on individuals’ abilities to manage the sharing process. In situations where individuals lacking shared contexts had to come together to share specialized knowledge, much of the success of the sharing effort depended on the abilities of individuals to communicate with team members. These abilities related to structuring and sharing knowledge in a manner that was easily absorbed by others within the team. Most of the participants talked about the conscious effort involved in assessing the knowledge needs of other team members and the effort and time spent in structuring their communication so that it was effective. Effective sharing of knowledge involved the ability to adapt to and develop multiple strategies of sharing to ensure that everyone on the team had a basic understanding of critical issues related to the project. One participant spoke about the importance of making a conscious effort to share the same knowledge differently with individuals from different backgrounds.
...it goes back to that breaking it down into plain English as best you can...I would say I've got the ability to take technical information and translate it into a form that different groups can understand. So, yeah, you'd have to make that conscious effort to switch gears so to speak when you're going between two different groups.

Another individual explained how finding a medium of sharing that worked for most members helped the sharing of knowledge that would otherwise be challenging.

...And I realized quickly with this team that most of the people were visually oriented. And I find that drawing pictures helps [the team] gain some perspective on complex situations.

Cost of sharing. The primary costs involved in knowledge sharing were time and effort. Individuals on this project were conscious of the costs of sharing and wherever possible were keen to minimize these costs for themselves. Individuals were particularly conscious of the high cost of sharing in those situations related to (a) the perceived utility of shared knowledge:

Like someone coming and asking me--asks me to explain stuff to him or her at a microscopic level. It doesn't make sense. You don't even care. You are not going to work on it or anything like that at that level. It's my job. And I'm wasting my time explaining to him because I know that it's completely useless to him and explaining this to him is completely useless to me.

(b) cost of sharing with individuals who should already have known it:

The only time I get frustrated is when you share it once and you're expected to share again with that same person. That's kind of frustrating. Granted people don't always remember everything, I mean, I tell you something once. You go away. You come back. I tell you something again. That's okay still, but the third and fourth time is when it's like, "Okay, how many times do I have to explain this to you?"

Project setup process and structure. While the openness within the team and the relationships shared by individuals were motivators of knowledge sharing, some aspects of the structure of the process obstructed the smooth flow of knowledge at times. Some issues with the project structure included the setup processes involved in the initial stages of the project, and project practices that developed over the project life cycle. Issues with the project setup process and structure was manifested in three areas: (a) not knowing all team members, (b) not having clarity on roles and responsibilities, and (c) lack of awareness of developments on the project. One individual described how early on in the project, not knowledge all team members resulted in ineffective knowledge sharing that resulted in a lot of rework for the team.

Initially when [one group] were building the strategies and all that, things used to go haywire. And we did not know what was happening and the communication was really, really bad. It was like basically nobody knew what was happening and nobody knew who was on the team. I think that one of the reasons was because we were at two different locations and we never had any face to face meetings or anything like that. We did not have any track of what was happening and there were too many gaps. We had to redo a lot of stuff because of those gaps.

During the early stages of the project, developments on the project were often not shared with the whole team and this resulted in some individuals feeling like they could have contributed more of what they knew if they had been given a chance to do so.

I and the rest of the consultants didn’t get a whole lot of input on it. You know, we have ideas that maybe [the business owner] didn’t have or the programmers or anyone else... So maybe we should have been brought in and like said ““ are we on track? Here’s what we’ve done so far”. Kinda run it by different groups and get their feedback. And do that periodically.

Discussion and Conclusion

The findings of this study revealed some new factors that have not been identified in the literature so far while confirming some other well known motivators and inhibitors of knowledge sharing. The literature in this area overwhelmingly favors the knowledge as power notion, suggesting that individuals who recognize the value of their knowledge are not very likely to share it with others around them. In contrast, this study found that while individuals within the project group were aware of the knowledge and expertise they brought to the project team and the value of their knowledge, this awareness did not result in knowledge hoarding. It was found that individuals were motivated to share their knowledge with others so long as others in the team recognized them and the contribution they were making to the team. The willingness of individuals to share what they knew with others despite empirical evidence supporting knowledge hoarding and the need for monetary rewards indicates that the process of knowledge sharing is far more complex than it is generally thought to be. This finding points to the need for HRD professionals to consider designing recognition and reward systems linked to knowledge sharing that are not focussed only on tangible reinforcements. However, it must be noted that the results of this study cannot be generalized to a wider
population due to the research method. More research is required to verify if the results of this study are consistent with motivators and inhibitors of knowledge sharing in different organizational settings.

An important issue in the literature regarding knowledge intensive work and knowledge workers is the commitment of knowledge workers to their work vis-a-vis their organizations. Several authors have suggested that knowledge workers are more likely to be committed to their professional groups than to the organization in which they are employed (e.g., Quinn, et al, 1996; Zuboff, 1988). This study provides some empirical evidence regarding the commitment of knowledge workers to their organizations and the impact of this commitment on knowledge related behaviors in organizations. More research is required to verify these findings in multiple organizational settings.

The results of this study reinforce the importance of organizational cultures and sub-cultures in maintaining and nurturing an environment that supports knowledge sharing. It also pointed to the fact that informal relationships between individuals who work together not only create a social web within the organization but also has a direct impact on knowledge sharing behaviors of individuals within work teams. The field of HRD has an important role to play in nurturing and managing organizational cultures that facilitate knowledge sharing. While more research is required to tease out those elements that directly influence knowledge sharing, practitioners can focus on building initiatives that support the creation of strong social webs within organizations based on what is already known in this area.

The influence of individuals’ abilities on the sharing process within the team is an important finding. The influence of individuals’ abilities on the effectiveness of the knowledge sharing process reinforces the importance of the role of individuals in knowledge-related activities and initiatives in organizations. Bonner (2000) suggested that HRD could exert more strategic influence within the firm through involvement with knowledge related initiatives. HRD’s traditional role of developing human expertise and advancing organizational learning can be extended to the management of knowledge in organizations by maximizing motivators while controlling or trying to work around inhibitors of knowledge sharing.

Knowledge Management Leadership:
Exploring the Role of the Chief Knowledge Officer

Tina M. Chindgren
Perkins Learning Solutions

The chief knowledge officer (CKO) provides leadership as a technologist and as a shaper of organizational culture and information exchange. Through a review of the literature, the CKO role is explored by comparing and contrasting five sources. As more and more organizations use competency models to select, evaluate and develop their knowledge manager, this presentation of CKO roles may be used as a starting point for discussion and a building block for identifying CKO competencies.

Keywords: Knowledge Management, Chief Knowledge Officer, Competencies

“In today’s service-oriented, information-intensive economy, intellectual capital is a critical resource that can help [organizations] forge sustainable, renewable, competitive advantage. Like financial capital, it must be accumulated, cultivated, and managed in an active and thoughtful way. But unlike financial capital, it is routinely squandered by even the most competent [organizations]” (Pemberton, 1997, p. 67). Pemberton (1997) is one of many who believe that knowledge has become intellectual capital, a manageable resource (Earl & Scott, 1999; Rifkin, Fineman, & Ruhnke, 1999; St. Leon, 2002). As more and more organizations formalize a leadership role to oversee their intellectual capital or knowledge resources, the chief knowledge officer (CKO) position has appeared. The CKO provides leadership as a technologist, understanding which technologies can contribute to capturing, storing, exploring, and sharing knowledge, while also creating social and environmental conditions that stimulate and facilitate deliberate knowledge creation and exchange (Earl & Scott, 1999).

My original research interest was to identify CKO competencies, but there was very limited information in the literature that provided a comprehensive and validated CKO competency model. Furthermore, there was no consensus in the literature about CKO roles – a necessary building block for a CKO competency model. As a result, my research focus moved to defining the CKO roles in contemporary organizations, recognizing that environmental (e.g., global competition, information explosion, budget fluctuations) and organizational (e.g., trust among units, type of industry, support from stakeholders) factors will customize role descriptions. To this end, I have compared and contrasted five sources that identify key roles for the CKO. The paper also provides an overview of the evolution of knowledge management and highlights the theme of leadership (i.e., the CKO) in the current evolutionary phase. Finally, the paper introduces a definition of a competency as a springboard for future research in CKO competency models.

Knowledge Management

von Krogh (Keursten & van der Klink, 2003) believes there have been three main stages in the evolution of knowledge management. In the beginning, there was a strong emphasis on technology. The technology facilitated “locating and capturing knowledge and making knowledge explicit” (p. 119). According to Williams and Bukowitz (1997, p. 77) organizations used technology to “create a database” to respond to an organizational problem. Yet, databases resulted in additional problems such as, “Which database is the information in?...What does [the] document mean anyway?...Why has it taken me three hours to find it?” (p. 77). Users often concluded that picking up the telephone and talking to someone would provide a quicker response.

Williams and Bukowitz (1997, p. 77) report that despite the promises of information technology, “people will continue to be the key to delivering the right information to the right place at the right time.” During the second stage of the knowledge management evolution, organizations promoted sharing of knowledge among individuals and between teams. von Krogh (Keursten & van der Klink, 2003) illustrated this stage by citing the rise in popularity of cross-functional teams to work on common issues and the development of communities of practices to promote discussion across work groups.

In the third and current stage, von Krogh (Keursten & van der Klink, 2003, p. 120) believes that organizations need to be entrepreneurial and innovative, “focus[ing] on developing new knowledge quickly: from using best practices to developing new practices.” Since the emphasis is placed on knowledge creation, organizations must pay
more attention to how their culture enables the development of knowledge. This stage is more than managing knowledge, but rather, creating the cultural conditions to foster its development.

**Leadership: The Chief Knowledge Officer Role**

As the evolution of knowledge management moves from technology to structure to culture, delegating a leader to manage the strategy, processes, and cultural transformation would support organizations in meeting their service or product goals. As more organizations recognize that people—not information technology (IT)—are at the center of their knowledge systems, an increasing number of organizations have created a new position, the knowledge manager, to lead their efforts (Bonner, 2000; Earl & Scott, 1999).

A review of the literature provides a range of knowledge manager position titles including knowledge activist, director of intellectual capital, strategic knowledge manager, director of knowledge transfer, and global director of intellectual asset/intellectual capital management (Davenport & Prusak, 2000; Duffy, 2001; Nonaka & Konno, 1998). In many organizations, the knowledge manager is better known as the chief knowledge officer (CKO) (Earl, 1999). Davenport & Prusak (2000) report that instead of CKO, some organizations have created chief learning officers (CLO), a related role that entails both knowledge management and organizational learning. Bonner (2000) compiled eighteen cases about organizations who are using a knowledge manager and she groups the CKO and CLO positions together when discussing roles, responsibilities, and daily activities.

Pemberton (1997) distinguishes the CKO role from the chief information officer (CIO) by referring to McGee (1996, p. 94) cited in Information Week, “while the CIO...is typically interested in data, the CKO...must identify what corporate knowledge needs to [be] retained and built on.” The CIO is more interested in the how of information distribution (i.e., the process, such as via technology) whereas the CKO is focused more on the what (i.e., content) and who (i.e., needs access to the content). The CKO, however, must understand the use of technology in order to combine content and process effectively. Earl and Scott (1999) add that although there is often a CIO where there is a CKO, the reverse is not always true. Tiwana (2002) describes the CIO as providing general IT oversight, managing the development of systems, connectivity, and IT support. He believes the CIO may not be entrepreneurially oriented, but the CKO must be. Individuals who serve in CKO positions provide subject matter experience from such diverse fields as academia, new product development, information science, records management, IT, human resources, finance, marketing, journalism, research and learning (Pemberton, 1997; Tiwana, 2002; Williams & Bukowitz, 1997).

Many factors influence how the CKO role is used and valued within an organization. Factors include the size of organization, product or service orientation, availability of technology resources, trust among staff members, and leadership’s support. In addition, there are some private sector organizations that have been more strategic in tying knowledge management to their bottom line (i.e., profit) during the past decade than others (Bonner, 2000). In addition, there are some Federal agencies that have a history of capturing, codifying, and storing information, even if it was not considered “knowledge management.” For instance, the primary product of the Central Intelligence Agency (CIA) is knowledge that is used by the President and policymakers. Today, the CIA has an active CKO role (Bonner, 2000). Perhaps as Kurtzman (1996, p. 20) asserts, “organizations which manage knowledge best are those whose survival and prosperity depend upon it.”

**Comparison of CKO Role Descriptions**

In reviewing the literature about CKO-related role descriptions, it was apparent that there is little consistency in how role is defined. For instance, Davenport and Prusak (2000) cited tasks (e.g., provide critical input to the process of knowledge creation) and Bonner (2000) identified CKO activities (e.g., align or integrate diverse functions or groups). Others cited characteristics (e.g., comfort with the primary operational processes of the business) needed by CKOs. In addition to the challenge of distinguishing among tasks, activities, and characteristics, some roles were broadly defined (e.g., provide leadership and strategy), while others where more narrowly defined (e.g., evangelize the nature and value potential of knowledge). Lastly, there were few CKO role descriptions that used the same words or descriptors, so it was necessary to analyze the descriptions for similarities. Most CKO role descriptions are generic and apply to most knowledge managers, regardless of position title or type of organization. The array of CKO role descriptions is likely because the role is so new that the individuals who fill these roles generally are in the process of building their job, “and they often do so without blueprints or models” (Bonner, 2000, p. 12). For the purpose of this paper, role is defined as the “expected-perceived-enacted behavior patterns attributed to a particular job or position” (Kissler, 1991, p. 261).
Using Kissler’s definition of role, I selected five sources and compiled a list of role descriptions. I selected these sources to review and compare for three reasons. First, I wanted to include both academic and industry/practitioner perspectives about knowledge management in the public and private sectors. Second, I included the Federal Knowledge Management Group (Federal KM Group) because their research focused on the roles in a public sector organization. (The Federal arena is the context I am most interested in.) This group appears to be the first to capture and share the framework of knowledge management in the government, addressing Federal organization’s structures, systems, and cultures. Because it is the most comprehensive presentation of CKO roles, the Federal KM Group research provides the benchmark that the other four sources are compared against. Third, all five sources attempted to document CKO roles by exploring tasks, activities, and characteristics. Although none of the five individually provide a comprehensive picture of what a CKO does, each researcher’s snapshot contributes to a richer image of a CKO in the workplace today. Table 1, Summary of CKO Roles, presents the list of CKO roles identified by the Federal KM Group (2000) (industry literature), Davenport and Prusak (2000) (academic and industry literature), Earl and Scott (1999) (academic and industry literature), Pemberton (1997) (academic and industry literature), and Bonner (2000) (industry literature).

Results & Findings

The CKO role entails a combination of technological, psychological, and business responsibilities. To illustrate this combination, Table 1, Summary of CKO Roles, reflects the actual words used in the literature to describe the role. The columns represent the five literature sources. Each row reflects an aspect or component of the CKO role. Blank rows indicate that the literature did not explicitly address the aspect or component of the role.

| 3. Create and use taxonomy (common language) | • Design and implement a firm’s knowledge codification approaches | • Capture, codify, store, protect knowledge | • Knowledge-content activities (contributed to or managed the capture, share, and retention activities) |
| 4. Champion education | • Manage the organization’s professional knowledge managers, giving them a sense of community, establishing professional standards, and managing their careers | • Advocate learning and knowledge development | |
| 5. Provides tools and technology | • Design, implement, and oversee a firm’s knowledge infrastructure | • Use technology and physical space to facilitate explicit and tacit knowledge exchange | • Design, implement, and oversee a firm’s knowledge infrastructure |
| 6. Use incentives and rewards | • Build a knowledge culture | | |
| 7. Champion communities of practice | • Build a knowledge culture | • Promote and manage the construction of social interaction, reflection, and conversations | • Leverage corporate-wide learning and/or knowledge • Align or integrate diverse functions or groups |
| 8. Create knowledge-sharing culture | • Build a knowledge culture | • Promote and manage the construction of social interaction, reflection, and conversations | • Work to break down the natural reluctance to share information and foster an environment in which collaboration and teaming can thrive • Development of culture for acceptance of the following: organizational learning, continuous learning, or KM |
| 9. Promote “best” practices | | | • Best practices or benchmarking |
In reviewing the preceding table, the reader will notice that although CKO roles differ in the literature, there are several common themes. First, the CKO is a technologist. Second, the CKO organizes a broad range of material so that it will be meaningful to users (e.g., codifying knowledge). Third, the CKO fosters knowledge sharing and community of practice development by providing resources and structures that help people communicate. Davenport and Prusak (2000, p. 115) articulate what is illustrated by the table, “that of all the CKO responsibilities, three are particularly critical: building a knowledge culture, creating a knowledge management infrastructure, and making it all pay off economically.”

Since viewing knowledge management as a conscious practice is relatively new, these responsibilities suggest the need for change management. Change management can address the power and political dynamics of the organization and communicate the need for change that will result in a culture that fosters knowledge management (Burke, 1992). Although the Federal KM Group provided the most comprehensive list of CKO roles, they did not include change management as a part of the CKO role. In fact, out of the five sources, only Bonner (2000) identifies it as a core CKO role. Although some organizations have an organizational development (OD) manager who is responsible for planning and implementing change, the CKO must still be concerned about change management.

Much like Tiwana (2002), Davenport and Prusak (2000) emphasize the CKO’s role in improving infrastructure and processes. For Davenport and Prusak (2000), building a knowledge culture incorporated several aspects or components of the CKO role identified by the Federal KM Group: creating a knowledge-sharing culture, using incentives and rewards, and championing communities of practice, in addition to championing education.

Bonner (2000) examines eighteen CKOs and the table reflects the roles that all or almost all of the CKOs demonstrated. Her research (2000) yields two additional roles that were not identified by the other researchers: provide a customer service orientation and identify critical areas for improvement or conducting needs analysis (as distinct from measuring outcomes or results). These aspects may be indirectly included in the CKO roles, but are not explicitly cited by the other researchers.

For Earl and Scott (1999), a significant component of the CKO role is providing leadership. They believe that a CKO must identify and interact with four types of managers: those who are excited about a particular knowledge management project (knowledge champions), those who will publicly comment positively about knowledge management (knowledge sponsors), those who are hostile to knowledge management and/or the appointment of a CKO (knowledge skeptics), and those who are allies in knowledge management implementation (knowledge partners).

Conclusion & Recommendations

Table 1, Summary of CKO Roles, reflects that much of the CKO role is a leadership role. Clearly, the CKO must demonstrate unique, role-specific responsibilities (e.g., knowledge management strategy development, knowledge codification, knowledge infrastructure and technologies). Yet, much of what a CKO does is leadership, regardless of the role-specific responsibilities. Chindgren and Callahan (2002) describe leadership as a role that leads towards goal achievement, involves interaction and influence, and usually results in some form of changed structure or
behavior of groups, organizations, or communities. Strength of personality and ability to persuade or effect compliance are critical variables in the effectiveness of leaders, but their relative influence depends on time and circumstance. This leadership definition intersects with what is currently being identified as leadership competencies in the workplace.

Intellectual capital represents an element of organizational wealth within this knowledge-based society (St. Leon, 2002). King, Fowler, and Zeithaml (2001) believe the most fundamental strategic resources in any organization are the competencies the employees have developed over time. These competencies combine skills and abilities grown by experience in occupational units or roles, with explicit and tacit knowledge. In order to respond to organizational challenges such as evolving technology, information explosion, and budget fluctuations, competencies are gaining more importance in employee development (Berge, de Verneil, Berge, Davis, & Smith, 2002; Davenport & Prusak, 2000; Keursten & van der Klink, 2003; van der Klink & Boon, 2002). Today, competencies provide a richer picture of what professionals do when performing their work, as compared to traditional job descriptions which identify knowledge, skills, or abilities and classify jobs as a bundle of strictly definable tasks.

Just as there are many definitions of roles, there are many definitions of competencies, with definitions dependent on how the concept is used. McLagan (1996) identified six approaches to defining competency: (1) job tasks, (2) results of work efforts, (3) outputs, (4), knowledge, skills, and attitude, (5) qualities of superior performance, and, (6) bundles of attributes. The definition of a competency that I use is synthesized from the suggestions of several hundred HRD specialists who attended a conference on the subject of competencies in Johannesburg, South Africa, in October, 1995: A cluster of related knowledge, skills, and attributes that affects a major part of one’s job (a role or responsibility), that correlates with performance on the job, that can be measured against well-accepted standards, and that can be improved via training and development.

Parry (1996) examines the individual components of the definition as follows: A cluster of related knowledge, skills, and attributes illustrates that competencies take cognitive (knowing), affective (feeling), and psychomotor (doing) into account. Affects a major part of one’s job signifies that competencies focus on underlying skills or generic competencies that are transferable to a number of tasks. Many tasks are situational and specific, such as linking the knowledge management strategy with the business strategy, but require underlying skills, or generic competencies, such as organizational agility and business acumen. Correlated with performance on the job recognizes that given unique job responsibilities, competencies may be as job related as possible if they will be used as a basis of human resource activities such as training, career development, and compensation. Can be measured against well-accepted standard denotes that as with the correlation to job performance, competencies should be measured as the ability to set behavioral objectives. Can be improved via training and development means that competencies require that knowledge, skills, and attributes can be measurable and teachable. In short, competency descriptions provide an observable, measurable pattern of knowledge, skills and attributes that an individual needs to perform work roles or occupational functions successfully in any profession.

As organizations pay more attention to how their culture enables the development of knowledge, creating the cultural conditions to foster its development will require leadership (Keursten & van der Klink, 2003). Just as behavioral scientists helped us to understand leadership as a set of behaviors, viewing the CKO role from the behavioral perspective complements the focus of competencies which emphasizes how a CKO creates value and what is actually accomplished. As organizations implement knowledge management, the foundation for the effort is the knowledge manager competency model.

Contributions to the HRD Community

King, Fowler, and Zeithaml (2001) report that organizations frequently claim that their people – intellectual capital or knowledge-based resources – are their source of competitive advantage. However, they also believe that “many organizations are vaguely aware of the value of their competencies or the important competencies that they lack”

1 Perhaps “regaining” is more accurate, as competency-based training was popular in the 1970s, although the focus was on developing isolated competencies, and there was limited interest in integrating the competencies for improved performance.

2 Rifkin, Fineman, and Ruhnke (1999) distinguish between attributes, knowledge and skills. Attributes are fairly fixed and immutable in adults, such as creativity and persistence, and are of little use in designing developmental programs. Knowledge and skills provide the best basis for training and development programs. This is because competencies can be concretely defined, broken down in teachable elements, and measurably demonstrated by learners.
Yet, better understanding and awareness of CKO competencies can provide a couple of benefits: First, the knowledge manager community that agrees on its occupation’s most valuable competencies is more likely to be consistent in developing those competencies. Second, identifying competency gaps can help organizations identify areas where improvements are required in order to facilitate organizational advantage. King, Fowler, and Zeithaml (2001, p. 96) believe that, in general, organizations “that invest the time and effort to assess their competencies can expect to have better information to support strategic decision making.”

This paper briefly reviewed the evolution of knowledge management as a backdrop to the CKO role in contemporary organizations. Five sources provided different perspectives on the CKO role and will provide the foundation for building a CKO competency model. As more and more organizations use competency models to select, evaluate and develop their knowledge manager (Rifkin, Fineman, & Ruhnke, 1999), this presentation of CKO roles may be used as a starting point for discussion and a building block for identifying CKO competencies.

A Critique of Selected Knowledge Management Models

Baiyin Yang
Wei Zheng
Chris Viere
University of Minnesota

Based on a newly developed holistic theory of knowledge and learning, this paper critically evaluates selected models of knowledge management (KM). Most existing KM models tend to narrowly define knowledge from technical and practical perspectives and fail to recognize critical knowledge such as values and visions. Furthermore, most models view KM as a linear or cycle process and thus fail to identify the multidimensional nature of knowledge dynamics between individuals and organizations.

Keywords: Holistic Theory, Knowledge Management, Organizational Learning

Knowledge management (KM) and related terms such as organizational learning and learning organization have become buzzwords in business practice and popular research topics in the field of human resource development (HRD). However, little consensus can be identified what the real meanings of these concepts are. At the same time, numerous conceptual frameworks and models have been proposed in the literature to explain new organizational phenomena in this emerging knowledge economy. Even the term Knowledge economy itself is another term related to the concept of knowledge that has been used frequently in popular media and scholarly writings. A central concept in these terms is knowledge, which has received inadequate attention in the literature in terms of its clear definition and implications comparing to its wide usage. Tsoukas and Vladimirou (2001) contended that “Organizational knowledge is much talked about but little understood” (p. 973).

Although distinctions among data, information, and knowledge have often been made in the literature (Boisot, 1995; Choo, 1998; Davenport & Prusak, 1998; Nonaka & Takeuchi, 1995), no consensus is reached for the definition of knowledge. Tsoukas and Vladimirou (2001) concluded that “[w]hat differentiates knowledge from information, …, is that knowledge presupposes values and beliefs, and is closely connected with action” (p. 976). Bell (1999) maintained that data is an ordered sequence of given items and events, information is a context–based arrangement of items whereby relations between them are shown, and that knowledge is the judgment of the significance of events and items that comes from a particular context and/or theory. Tsoukas and Vladimirou (2001) differentiated individual knowledge and organizational knowledge. Individual knowledge is defined as “the individual capability to draw distinctions, within a domain of action, based on an appreciation of context or theory, or both” (p. 979). And organizational knowledge is “the capability members of an organization have developed to draw distinctions in the process of carrying out their work, in particular concrete contexts, by enacting sets of generalizations whose application depends on historically evolved collective understandings and experiences” (p. 983). While the above definitions of knowledge tend to acknowledge the tacit dimension of knowledge, not all authors recognize the complexity of knowledge. Some authors maintain that knowledge resides in one’s cognitive domain. For example, Boisot (1998) believes that knowledge is essentially a set of patterns stored in memory that helps us make sense of the world. Further more, most authors of organizational learning have examined how individuals learn in organizational contexts or explored how individual learning theories could be applied at the organizational level (Cook & Yanow, 1996). Consequently, there is a need to critically examine the existing conceptual frameworks of KM and OL so as to identify commonalities and differences for the purpose of better understanding of related concepts and proposed models.

There is an increasing body of literature on KM, LO and OL. Argote, McEvily and Reagans (2003) suggested an integrative framework for organizing the literature on KM. This framework consists of two dimensions, KM contexts and outcomes. Knowledge creation, retention, and transfer represent the KM outcomes. The KM contexts are reflected in units (individual, group, organization), relationship between units and the nature of knowledge itself (tacit vs. explicit). It has been observed that existing theoretical frameworks of KM can be categorized into one of the three contexts. Some frameworks emphasize the properties of the units themselves (Cohen & Levinthal, 1990), some recognize the importance of the relationships between units (Crossan, Lane & White, 1999), and yet others call attention to the nature of knowledge such as tacitness (Nonaka & Takeuchi, 1995). This is probably one of the most comprehensive models of KM that appeared in the literature. However, this model has not yet been fully

Copyright @ 2004 Baiyin Yang, Wei Zheng, & Chris Viere
developed because the interactions between its key components are not identified nor described. Furthermore, the authors of this integrative model have used the model to identify points of integration across many studies reported in a special issue on KM. No effort was made to critically examine the major KM models in the literature from an integrative perspective.

Research Questions

The purpose of this study is to critically examine the major models of KM in the literature from an integrative and holistic perspective. This paper has two related tasks. First is to demonstrate the utility and application of a newly developed holistic theory toward an integrative perspective of KM. Second, the paper is to critically examine major models of knowledge management. The following research questions were used to guide the study:

1. What is organizational knowledge from a holistic perspective?
2. What are the key assumptions of major KM models in the literature?
3. What are the merits and limitations of major KM models from the perspective of a holistic learning theory?
4. What are the implications of a holistic approach to KM for HRD theory, research and practice?

Methods

Two major research methods were used in this study, literature review and conceptual analysis. First of all, the researchers identified major KM models. Conceptual analysis was then used to critically examine the major KM models. The analysis was based on two integrative frameworks of knowledge and knowledge management.

The first conceptual framework that guided this study was the one proposed by Yang (2003). Yang (2003) suggested that knowledge has three facets and layers and that it is the interactions among them that determine learning. Yang also distinguished individual and organizational knowledge and proposed an interactive model of learning. The second conceptual model was the one suggested by Argote, McEvily and Reagans (2003).

Theoretical Foundation

The theoretical foundation of this paper is based on a newly developed holistic theory of knowledge and learning (Yang, 2003). The holistic theory defines knowledge as a social construct with three distinctive and interrelated facets—explicit, implicit, and emancipatory knowledge. Knowledge is viewed as human beings’ understanding about the reality through mental correspondence, personal experience, and emotional affection with outside objects and situations. The explicit facet consists of the cognitive component of knowledge that represents one’s understandings of the reality. Explicit knowledge refers to clear and certain mental apprehension that is transmittable in formal and systematic format. It is the codified knowledge that identifies true from false in the reality. It is part of the technical knowledge that reflects one’s intentional and conscious effort to understand reality to meet his/her individual needs. Theories, models, and formulas in textbooks are examples of explicit knowledge.

The implicit facet is the behavioral component of knowledge that denotes the learning that is not openly expressed or stated. In most cases we know more than we think know (Polanyi, 1967). Implicit knowledge is personal and context-specific familiarity. It is either something hard to formalize and communicate implicit knowledge, or the familiarity that has yet to be articulated. It indicates something works in the reality based upon direct observation or involvement. Implicit knowledge usually comes from and exists in one’s behavior, action, and accumulated experiences.

The emancipatory facet is the affective component of knowledge and is reflected in affective reactions to the outside world. Emancipatory knowledge is one’s understanding based on emotional affection and thus it is value-laden. It is indicated by feelings and emotions people have toward the objects and situations around them. Emancipatory knowledge defines one’s view of what the world ought to be, and it is the product of seeking freedom from natural and social restraints. It reflects one’s internal affective and motivational states.

A Dialectic Perspective of Three Knowledge Facets

Yang (2003) posits that all of the three facets are present in all learning processes, even though not all of them need to experience a change. Furthermore, the holistic theory calls for a dialectical perspective of the three knowledge facets. On one hand, we need to acknowledge some intrinsically different characteristics of the three knowledge facets. If we examine each of the three knowledge facets at a time, they tend to be different and contradictory. The results will be like observing different faces of a coin. On the other hand, we should understand the complementary nature of these three knowledge facets. They are interacting with each other and indivisible when we take a holistic perspective. They occur by default whether we recognize them or not. All of the three facets are necessary components of the whole.

The holistic learning theory asserts that the construct of knowledge consists not only of the three facets but also of three knowledge layers (Yang, 2003). The knowledge layers include: foundation, manifestation, and orientation.
The first layer is a stratum of foundation or premise, which serves as the basis for our knowing and determines the boundary of explicit knowledge. Foundation includes those tacit assumptions that have been taken for granted and are not normally requiring proof. We have to accept certain assumptions in order to know and act. This layer indicates our epistemological beliefs. The second layer is manifestation that represents the outcomes of our knowing. The third layer is the orientation of our knowing which defines the direction and tendency of knowing action. So the third layer indicates the driving forces of our learning process.

Learning as Dynamic Interactions among Knowledge Facets

The holistic learning theory not only identifies characteristics of three knowledge facets and layers, but also points out that it is learning that unifies different facets. Each of the three facets of knowledge provides a support needed for the other facets to exist. Explicit knowledge will exist only as meaningless facts, figures or bytes of information without the support of other facets (i.e., when two other facets are disconnected). We normally use “body of knowledge” to denote theories, models, and empirical findings but fail to realize that these things only represent explicit facet of knowledge. From the perspective of the holistic theory, theories and models themselves are not knowledge per se. They are carriers or indicators of explicit knowledge and they become simply available information when human factors are detached or removed. It should be noted that information itself is not knowledge. Thus the term “knowledge base” is a better term to represent explicit knowledge such as theories and models in textbooks. By the same token, learning is also influenced by emancipatory knowledge that defines the objectives and missions that guide our actions. Implicit knowledge also connects with the two other facets. It will appear as random, idiosyncratic, and isolated practical experiences without the support from two other facets. Similarly, emancipatory knowledge will be simply emotion or affection when the explicit and implicit facets are removed in learning process. In sum, the holistic theory contends that knowledge exist in a dynamic dialectic interactions among all three facets.

The holistic theory suggests that knowledge is created and transformed through the interactions among explicit, implicit, and emancipatory knowledge (Yang, 2003). These relations are reflected by nine modes of learning: participation, conceptualization, contextualization, systematization, validation, legitimization, transformation, interpretation, and materialization. It is suggested that learning occurs as a result of interactions within each of and among the three knowledge facets. Learning can start in any of the three knowledge facets and in different forms. Learning may involve one, two, or all of the three knowledge facets. “Learning is defined as the process whereby knowledge is created, acquired, transformed, converted, or utilized in different context from its origin” (p. 117). Knowledge creation is a learning process where new understanding (in either of the three facets) about reality is formed. For example, theory building is a knowledge creation process that normally results in a new format of explicit knowledge. Knowledge acquisition such as attending a lecture is also a learning process where a learner gains knowledge from another source in the original form. Knowledge transformation refers to a process where the learning outcome is a new format of knowledge. For instance, research seminars and symposiums are sometimes very powerful in transforming the participants’ knowledge to a greater understanding on the topic. Knowledge conversion refers to the exchange from one knowledge facet to another and the following paragraphs will discuss different forms of knowledge conversion in detail. Finally, knowledge utilization can also be viewed as learning when a learner applies knowledge in a different context from its original and gains new understanding about the problem facing him/her. In sum, learning involves all of three knowledge facets and appears in different forms.

The holistic theory suggests a total of nine modes of learning in the dynamic interactions among three knowledge facets (Yang, 2003). Participation is a process of learning from practice and thereby creating implicit knowledge from experiences. Conceptualization is a process of articulating implicit knowledge into explicit concepts. It converts familiarities into tangible explanations by proposing new concepts or theories. Contextualization is a process of embodying explicit knowledge into implicit knowledge. It is the process of utilizing concepts, models, formulas, principles, and propositions in a specific context. Systematization is a process of systematizing explicit conceptions into a system with logic and reasoning. This learning mode generally involves combining different bodies of explicit knowledge in a consistent format. Validation is a process of examining and possibly modifying underlying values, desires, judgments, perceived importance and worth, and other kinds of fundamental learning based on explicit knowledge (which is believed to be true under a rational perspective). Legitimization is a process of justifying explicit knowledge based upon emancipatory knowledge. Transformation is a process of converting an old meaning scheme (i.e., values, feelings, ethics, etc.) into another form. Materialization is a process of transferring emancipatory knowledge into tacit knowledge. Those who utilize what has been learned from participatory action research to improve the quality of their daily life are in the process of materialization. Interpretation is process of making a meaning scheme from tacit learning and direct experiences.

Learning as Social Activity and Organizational Knowledge

The holistic theory further suggests that learning is not only an individual activity but also as social phenomenon as well (Yang, 2003). An individual learner has to interact with his or her immediate social group or
organization within certain social/cultural contexts. The holistic theory posits that a group or organization has to have three major components—critical knowledge, technical knowledge, and practical knowledge. Similar to individual knowledge, group and organizational knowledge can be viewed as a social construct with three facets and each of them has three layers. Table 1 lists three layers of group and organizational knowledge in three domains. The first facet of group and organizational knowledge is technical knowledge, which is carried by formal system and structure. Technical knowledge is institutionalized explicit knowledge of individual members (Crossan, Lane & White, 1999). Technical knowledge is manifested by those establishments such as formal rules, regulations, policies, standard operation procedures, technical specifications, formal communication channels and formats. The orientation of technical knowledge is efficiency and optimum, which is one the major driving forces of organizations. In other words, the main function of technical knowledge of an organization is to produce maximum products and services with efficient utilization of available resources for a clearly defined mission. Once technical knowledge is acquired and established in a group or in an organization, it has influences on an individual employee’s behavior mainly through the rational driving force within the domain of explicit knowledge.

The second facet of group and organizational knowledge is practical knowledge, which can normally be identified in organizational process and practice. Practical knowledge is manifested by the implicit knowledge that has not been (or cannot be) incorporated into formal organizational system. Examples of practical knowledge include social norms, customs, conventions, shared understandings, intuitions, insights, routines, and technical know-hows. Practical knowledge also includes individual employees’ knowledge that has not been incorporated into the formal system such as their awareness of market changes. Group and organizational learning of practical knowledge can be facilitated by those action-oriented activities such as socialization, conversation and dialogue, and some interactive systems (Crossan, Lane & White, 1999). Practical knowledge is oriented toward effectiveness and flexibility, one of the driving forces for a group or organization to function. A group or organization’s practical knowledge is a collection of its members’ knowledge that has been proven to be workable in practice; it thus interacts directly with an individual’s realistic driving force within the domain of implicit knowledge.

The third facet of group and organizational knowledge is critical knowledge, which is based on the foundation of organizational value and vision. Critical knowledge can be defined as the dominant emancipatory knowledge of its members. Because individuals tend to have diverse values and visions for their own and have different understandings about the organizational issues, the formation and change of the critical knowledge generally involve organizational power and politics. It also activates and defines individual and organizational interests and ethics. Critical knowledge is manifested by those less stable but vital elements such as formal mission statements, managerial philosophies, perceived social responsibilities, morale, ethical and moral standards, and spirituality in workplace. Critical knowledge is largely determined of the sense of social responsibility and it interacts directly with individual employees’ emancipatory knowledge.

Further more, the holistic theory defines group/organizational learning as a process of change in the dimensions of collective beliefs (i.e., shared technical knowledge), social norms (i.e., prevalent practical knowledge), and shared values (i.e., dominant critical knowledge) among group members. In other words, organizational knowledge is viewed as collective understandings among members through their technical, practical, and emancipatory facets of knowledge. Organizational learning involves changes of technical, social, and political dimensions of the organization. Figure 1 depicts the dynamic interactions among three knowledge facets at individual and group/organizational level.
A Critique of Selected Knowledge Management Models

Knowledge Creation Model

Nonaka and Takeuchi (1995) proposed a knowledge creation model that likely has more influence than any other model in practice. The theory as a whole presents a model for describing the creation and dissemination of knowledge throughout an organization as embodied within “products, services and systems” (Nonaka & Takeuchi, 1995, p. 3). According to the theory, knowledge moves on two ontological dimensions (individuals to organizational) and on two epistemological dimensions (tacit and explicit). Tacit knowledge is distinguished as more difficult to formalize and communicate because it is often intimately tied to action and experience. Explicit knowledge is the knowledge that can be put into words, written down, modeled and relatively easily transferred. The modes of knowledge conversion include socialization (from tacit to tacit knowledge), externalization (from tacit to explicit knowledge), combination (from explicit to explicit knowledge), and internalization (from explicit to tacit knowledge). The progression on the ontological dimension ranges from the individual at one end of the range and moves to team, group, organization, and beyond in a spiral-like fashion “when the interaction between tacit and explicit knowledge is elevated dynamically from a lower ontological level to higher levels” (Nonaka & Takeuchi, 1995, p. 57). The knowledge creating process for this model contains five steps- sharing tacit knowledge, creating concepts, justifying concepts building an archetype, and cross-leveling knowledge (Nonaka & Takeuchi, 1995; von Krogh et al, 2000). Enabling knowledge creation organizationally is promoted by examining barriers, establishing conditions by creating an enabling context, and by establishing organizational enablers (von Krogh et al, 2000).

The knowledge creation model recognizes the potential nature of tacitness of the knowledge and provides useful concepts of the dynamic interactions between explicit and tacit knowledge. However, there are several limitations associated with this model. First, despite its illustration of the knowledge creation process between individuals and organizations, this model does not differentiate individual and organizational knowledge. Therefore, it fails to acknowledge the characteristics of knowledge at different organizational levels. Second, this model suggests knowledge creation is spiral process and implies that all types of knowledge have to go through tacit-explicit process. In fact, much tacit knowledge cannot be externalized and the learners have to participate in a community of practice to gain such knowledge. Therefore, the limitation of externalization should be recognized. For example, most professional schools require their student to fulfill practicum (i.e., to gain tacit knowledge) in addition to formal schooling (i.e., for the purpose of acquiring explicit knowledge). Third, this model fails to recognize a third facet of knowledge, emancipatory knowledge. Learning and knowledge creation should not be isolated from emotion, motivation, and perceived needs.

4I Framework of Organizational Learning

Crossan, Lane and White (1999) observed that despite a growing popularity, little convergence among
organizational learning theories had advanced. As a major step towards an integrated organizational learning theory, they proposed one of the most comprehensive frameworks of organizational learning to date (Yang, 2003). Their model, also referred to as the 4I framework, contains four process stages of organizational learning that consist of intuiting, interpreting, integrating, and institutionalizing. Each of the 4I process stages are conceptualized into the individual, group, and organization levels. Together, the stages and levels and their interactions are explicated to improve organizational learning for the underlying purpose of strategic renewal in organizations.

In Crossan et al. (1999) model, the central proposition states that the 4I’s (intuiting, interpreting, integrating, and institutionalizing) are related in “feed-forward and feedback processes across the [organization] level.” (p. 523). For the framework, intuiting and interpreting occur at the individual level. Intuiting refers to subconscious recognition of the pattern and/or possibilities that are implicit to a personal experience that leads to the development of tacit knowledge. For Crossan et al, interpreting is largely a cognitive act and progressively conscious act of explaining, through words and/or actions, a cognitive map with insight or idea to one’s self and to others as change from previous understanding and/or actions. As learning progresses from individual learning towards assimilation in to group member, a process of integration begins to occur. Crossan et al. (1999) refer to the process of integrating as developing shared understanding among individuals and with the outcome taking shared and coordinated action through mutual adjustment. Institutionalizing refers to the process of ensuring that routinized actions occur as an organization strives to leverage the knowledge created by individuals or informal communities.

Crossan et al. (1999) provided a systematic and dynamic model of organizational learning that includes process and level dimensions. By integrating disparate theories and language on how organizational knowledge is created, Crossan et al. have provided scholars and practitioners with a model on internal and interpersonal process on flow of knowledge from implicit to explicit, and from individual to group that has served fruitful purpose.

Under the perspective of Yang’s (2003) holistic theory, the foundation or premise generally represents, in part, an epistemological belief system. The holistic theory defines knowledge as a social construct with three distinctive and interrelated facets—explicit, implicit, and emancipatory knowledge. The knowledge facets provide visibility into an epistemological basis for the holistic theory that calls for acknowledging a dynamic interplay in the creation of knowledge between empirical-analytic, interpretive, and critical epistemologies (Yang, 2003). Crossan et al.’s (1999) 4I framework, does not fully explicate the foundations of framework with respect to highlighting epistemologies or knowledge facets. The framework does begin to illustrate the roles the of explicit and implicit knowledge, but stops short of acknowledging an emanciptaory facet.

Both frameworks, however, advance propositions related learning processes. Crossan’s et al. (1999) intuiting process is closely related to gaining implicit knowledge at the individual level. Interpreting in the framework represents developing cognitive maps and is similar to conceptualization included in the holistic theory. However, the interpreting process centers around the cognitive domain and role of the affective domain and emancipatory knowledge equivalent is not defined or mentioned. Integrating in Crossan et al.’s (1999) framework refers to shared understanding by group members that results in coherent, collective actions. This learning process reflects the dynamic relationships between individual and group. However, the holistic theory suggests that integrating individual knowledge does not always occur in the cognitive and explicit knowledge, but can also integrate individuals’ implicit knowledge such as knowledge hard to be express in formal language and symbols, and emancipatory knowledge into its values and consequently change its critical knowledge. Likewise, both models incorporate the concepts embodied by Crossan et al. (1999) notion of Institutionalizing process, but differ moving beyond explicit, in the continued interplay implicit and emancipatory knowledge.

The major shortcoming of 4I model is its failure to recognize the nature of knowledge. Because 4I framework does not distinguish the three facets of knowledge and clarify the epistemological knowledge basis, it fails to capture some of the key organizational learning activities. For example, the holistic theory suggests that changing an organization’s values and visions is a vital learning process and that it is critical knowledge that interacts with individual shared values and critical knowledge. Rules and procedures can be institutionalized but cannot guarantee the desired change and the coherence of individual values.

Information-Space Model

Boisot (1998) proposed that individual knowledge is the sum of our mental models and through these mental models we process data and information in order to bring about action and change. He believed that knowledge is essentially a set of patterns stored in memory that helps us make sense of the world (1998). He further categorized knowledge along three dimensions, codification, abstraction, and diffusion. These three dimensions make up the I-space for capturing the distribution of knowledge in organizations. In terms of codification, knowledge is either codified or uncodified. Codified knowledge refers to the knowledge that is represented by language or other systems. Codified knowledge is easily transmittable from one human agent to another. On the contrary, uncodified knowledge is highly dependent on the implicit expertise of the human agent. The second dimension, abstraction,
describes the extent to which knowledge is abstracted from the concrete and observable information. Knowledge with higher abstraction is believed to be constructed through building relationships of less abstract knowledge (Boisot, 1998). The third dimension is diffusion. This refers to the extent to which knowledge is available among human agents.

Boisot’s three dimensional Information-Space (I-Space) bears similarities with the holistic model. The codification dimension is similar to our distinction between explicit and implicit knowledge, because it can be argued that knowledge becomes explicit when it is codified by language or other systems and can be transmitted from one agent to another. On the other hand, implicit knowledge is usually not verbalized or codified through other means. As regard to diffusion dimension, the holistic model elucidates three levels along this dimension, individual, group, and organization.

The holistic model proposes three dimensions of knowledge, explicit, implicit, and emancipatory. Boisot’s (1998) model considers the explicit (codified) and implicit (uncodified) categories, but does not consider the emancipatory dimension. Elements of emancipatory factor is recognized in his model as the perceptual and conceptual filters that affect what data and information human agents turn into knowledge. However, Boisot (1998) failed to accommodate these filters into his model of knowledge. The holistic model takes into consideration these filters, and offers a third category of knowledge — emancipatory knowledge. This emancipatory knowledge is defined as the objectives and missions that guide our actions. In Boisot’s model, the perceptual and conceptual filters are such knowledge that dictates what knowledge human agents take in and spread, as well as the direction of human actions. The holistic model absorbs this emancipatory knowledge into the nature of knowledge, contrary to Boisot’s model that externalizes these filters. The reason for internalizing the filters into the arena of knowledge is consistent with Boisot’s definition of knowledge — a set of patterns stored in memory that helps us make sense of the world (1998). These filters as conceptualized by Boisot are previous patterns that exist in the human mind in understanding the world.

Learning with Knowledge Cycle Model

A large portion of the past literature focused on knowledge management processes. Demerest (1997) built a KM model which consists of four stages, knowledge construction, knowledge dissemination, knowledge use, and knowledge embodiment. Soliman and Spooner (2000) modified this model and proposed a five-stage knowledge management chain. Their five stages are: create knowledge, capture knowledge, organize knowledge, access knowledge, and capture knowledge. Based on their models, Rowley (2001) suggested a model Learning with Knowledge Cycle (LK cycle) that consists of knowledge articulation, knowledge repository updating, knowledge access, knowledge use, and knowledge revision. According to Rowley (2001), the cycle applies to both explicit and implicit knowledge, which means that these stages are equally applicable to both explicit and implicit knowledge.

These knowledge management process models contribute to the conceptualization of the development of knowledge from individual level to organizational level, but they only offer a macro picture of knowledge management. While they are useful in grouping different organizational activities into different knowledge management processes, these models do not account for the dynamic relationship and interaction of the components of knowledge. Nor does it describe how knowledge moves from one stage to another. In practice, the interrelations among people or units often affect the learning process. The rigid segregation of a flow of actions and events into static stages is inadequate to direct practice effectively.

Rowley (2001) included explicit knowledge and implicit knowledge in the LK model. However, she posited that both explicit and implicit knowledge go through the processes discussed in the model. This proposition puts an indiscriminat face on explicit and implicit aspects of knowledge. As implicit knowledge is either something hard to formalize and communicate, or the familiarity that has yet to be articulated. It is hard, if not at all, to make a convincing case that the evaluation, dissemination, use, and revision of such unarticulated knowledge can be done the same way for explicit knowledge. How can some unarticulated, unverbalized, and shapeless knowledge be measured and weighed?

Another inadequacy is similar to that of Boisot’s model. The emancipatory aspect of knowledge is not given sufficient attention. Rowley (2001) claims that the LK cycle model embraces the social construction of knowledge, but it actually follows a mechanical approach of disregarding the value orientation of individuals or interrelations of people which is in the realm of emancipatory aspect of knowledge.

Conclusion

This paper examined milestone knowledge management models from the holistic perspective. Most the models reviewed in the paper touch upon but do not incorporate an important aspect of knowledge — emancipatory knowledge. Most models do recognize the importance of organizational culture, relations among people or units,
and other emotional factors, which demonstrate their agreement that this emancipatory facet of knowledge is not dispensable because it describes people’s or organization’s values, assumptions, and other knowledge that dictates their direction of action. However, they do not integrate this facet into their model of knowledge, and so fail to make a holistic account of what is happening and what ought to be.

Implications for Research and Practice

The holistic model of knowledge management highlights the equal importance of the three facets of knowledge, explicit, implicit, and emancipatory. Explicit and implicit knowledge are given abundant consideration in past research, but the emancipatory knowledge is either totally neglected or externalized to be an environmental factor instead of something innate to a person or an organization’s knowledge base. The practical implication of this view is that personal values or organizational culture is dealt with separately from rules, regulations, or experiences. However, in real life, personal values go hand in hand with a person’s knowledge as a whole, and an organizational culture permeates every aspect of the organization’s repertoire of knowledge. The artificial separation of emancipatory knowledge from others would lead to partial organizational solutions.

The holistic model of knowledge management combines the emancipatory aspect with the explicit and implicit aspects of knowledge, and so offers a complete picture for practitioners when dealing with organizational problems. For example, when solving a problem communication inadequacy in a certain department, technological (explicit), contextual (implicit), and motivational (emancipatory) aspects will be considered at the same time.

Human and Organization Studies: The Discipline of HRD

Neal Chalofsky
The George Washington University

Human resource development (HRD) has long been considered a field with an interdisciplinary foundation. Unfortunately, there has never been a consensus on the composition of the disciplinary base of HRD. We may have a sense of the purpose of the field; but it still does not lead easily to a sense of the discipline of the field. And it may be that we are thinking of the discipline and the profession of HRD in the same mindset, when there is an alternative perspective. It is proposed that the body of knowledge and teaching that HRD practitioners study to learn about or advance in the field be known by a different label than HRD. Human and Organization Studies (HOS) is described as it exists at one university and a discussion is presented about the need to begin the dialogue about the discipline of HRD.

Keywords: Discipline of HRD, Human and Organization Studies, Theory and Research

Human resource development (HRD) has long been considered a field with an interdisciplinary foundation. Pat Galagan (March, 1986), then editor of Training & Development, referred to this issue in an editorial when she described the field:

. . . as an omnivorous discipline, incorporating over the years almost any theory or practice that would serve the goal of learning in the context of work. Like an amoeba, it has ingested and taken nourishment from whatever it deemed expedient in the social and behavioral sciences, in learning theory, and business”. Indeed, it is a field that has borrowed heavily over the years from other disciplines, and will continue to do so in order to apply the best of approaches to the learning needs of the workplace (p.4).

Jacobs (Spring, 1990) stated that:

HRD is both an area of professional practice and an emerging interdisciplinary body of academic knowledge. The interrelatedness of these two aspects makes HRD similar to most other applied professions, most of which have emerged to meet some important social or organizational need. After practice is established, the need arises to formalize the knowledge gained in practice into some logical structure. Such activity helps legitimize the profession and increases the reliability of practice (p.66).

Every new occupation seeking professional status has sought to delineate its foundation in terms of its unique body of knowledge. (Jarvis, 1987). HRD, like adult education (which most professionals consider at least a closely related field), has developed a unique body of knowledge suited to its purposes though two methods;

1) Experiences gained from coping with problems of practice lead to the formulation of principles or generalizations which provide guides for future practice.
2) Knowledge that has been developed by other disciplines is borrowed and reformulated for use in HRD (Jensen, 1964). HRD, again like adult education, is a practical discipline. “Its primary objective is coping effectively with some unsatisfactory state of affairs or problem of everyday life” (Jensen, 1964).

HRD as a Discipline

Unfortunately, there has never been a consensus on the composition of the disciplinary base of HRD (Swanson, 2001; Kuchinke, 2002). The one agreement that seems to exist is that the foundation of the field is multidisciplinary. After that is noted, there is considerable disagreement as to the disciplines that inform and support HRD. This is largely due to the field’s inability to define the concept of HRD.

Recent attempts to define the concept of Human Resource Development (HRD) by academics, researchers, and practitioners are proving frustrating, elusive, and confusing. This suggests that HRD has not established a distinctive conceptual or theoretical identity. The process of defining HRD is frustrated by the apparent lack of boundaries and parameters, elusiveness is created through the lack of depth of empirical evidence of some conceptual aspect of HRD. Confusion also arises over the philosophy, purpose, location, and language of HRD. The [different] epistemological and ontological perspectives of individuals in the HRD area further complicate this (McGoldrick, Stewart, & Watson, 2002, 19).

Copyright © 2004 Neal Chalofsky
For quite a while, the scholarly literature and presentations at academic conferences have reflected three different perspectives that can be characterized as learning, performance, and humanistic. The debate among these different perspectives has at times been heated but has done little to move the field forward in terms of a definition, or philosophy. It is, as Ruona and Lynham (1999, have pointed out,

... a conversation having us – that is, ... a conversation that is ongoing and becomes the prominent focus such that little else actually happens except the having of the conversation. Very few new thoughts are generated, positions are defended, tradition weighs heavy, and very little progress is made in understanding and creating new meaning (p. 215).

The former editor of HRDI, (Lee, 2001), made the plea for not defining HRD because the act of defining itself is mechanistic/scientific. Instead, she argued that we should seek to establish what HRD should become as it evolves. In actuality, a small group of HRD scholars and practitioners at the 2000 Academy of HRD conference began to analyze the tension and gulf between the perspectives noted above. The goal was to clarify the fundamental values about what HRD should be and to explore if and how these values could be woven together. Once the group started to share what was common among the three perspectives, they were able to articulate a new statement of purpose for HRD that the group believed reflected the synergy of the learning, performance, and humanistic viewpoints: “The purpose of HRD is to enhance learning, human potential, and high performance in work-related system” (p. 205).

Watkins (2000), in outlining her key beliefs about HRD, said that, “The aims of HRD are to bring learning and change in an organizational context” (p. 54).

It could be that these conversations, and others, are closer to a unified position then we have been willing to admit. And it could be that this position of purpose can give us a basis for a dialogue on the discipline of HRD. But I believe we have been mistakenly talking about the discipline and the profession of HRD in the same mindset, when there is an alternative perspective. Someone who desires to be a management consultant studies the various organization behavior and management disciplines, or one studying to be a group therapist learns about group dynamics and psychology. We do not refer to the discipline of consulting or therapy, they are fields of practice. A discipline, as defined by the American Heritage dictionary, is a branch of knowledge or teaching. I am proposing that the body of knowledge and teaching that HRD practitioners study to learn about or advance in the field be known by a different label than HRD.

Human and Organization Studies

A number of years ago in the HRD program at The George Washington University, we began to realize a significant number of people were applying to our doctoral programs who were not HRD/training/adult learning professionals, nor did they have an interest in becoming one. In researching doctoral programs in business, psychology, and education, they felt that the description of our programs gave them the development they needed, which was to learn about “people management”. We began to revise and evolve our curriculum to meet the needs of these students, while still holding fast to the purpose of developing professionals in the HRD field, especially at the masters’ level. Then, at a faculty retreat several years ago, we decided to tackle the issue of our program focus. This led us to the decision that the program should rest on three constructs; people, learning, and organizations (refer to figure 1). While this may seem simplistic, it reflects our commitment to a balance between these areas (as opposed to programs that may lean towards any one area). More recently, we decided that this represented more than a program focus; it represented a discipline, a field of study, and we are in the process of changing the name of our program to represent the discipline; Human and Organization Studies (HOS).
People are the critical resources of any workplace, more so now than ever before. The need for knowledge workers in judgment-based positions that are equipped to provide high quality service to their customers requires a workplace that is supportive and an organizational culture that is empowering. “Organizations don’t change, people change. And then people change organizations.” (Richards, 1996). Students of the discipline need to understand how people work and interact in social systems at individual, group and organizational levels.

Learning needs to be embedded in the culture of the workplace so that the development and growth of management and staff is continually enhanced. Interventions need to be designed to improve effectiveness through systemic change processes and consideration for alternative perspectives. Students of the discipline need to understand learning and change constructs and models that can be applied at individual, group and organizational levels.

Organizations need to be adaptable, humanistic, and ethical. Leadership should be transformational. Structure and work processes should be designed to meet both employees’ and customers’ needs. Students of the discipline need to understand the complexities of organizations as systems and their impact on stakeholders, the community, and the economy, both nationally and globally.

(Note that the concept of change is embedded in all three constructs.)

These constructs are all interrelated, yet the study of them can involve examining them individually, in pairs, and/or all together. The discipline is multi- and/or inter-disciplinary. It has been and continues to be informed by other related disciplines. These include:

- Sociology (e.g. social systems)
- Anthropology (e.g. culture)
- Psychology (e.g. motivation and behavior)
- Management (e.g. leadership, strategy and structure)
- Education (e.g. learning theory)
- Economics (e.g. human capital)
- Physical Sciences (e.g. systems theory, chaos theory)

Many academic programs include the study of some, all, and/or additional subjects within their curriculum. What is different with our program is that we are proposing that the discipline is a more encompassing concept than the profession, which in turn is a more encompassing concept than the practice (refer to figure 2).
Anyone with a need or desire to understand the complex interactions between people, learning, and organizations can come and study the discipline, not just those individuals that are interested in being HRD professionals.

In the 1990’s, many academic programs base their curriculums on the role and competency study conducted by the American Society for Training & Development (ASTD) (McLagen, 1989). The results of this study represented both practice and borrowed theory and knowledge, which is sometimes hard to distinguish because of the mingling of the two over the years. It is important to note that the data collection technique used to arrive at the results was to poll approximately 300 “experts” (as identified by a committee of practitioners and academics) as to what they perceived to be the critical roles and competencies for the HRD field in five years (from the time of the study). This may have been a legitimate form of inquiry for a field in its infancy, but it does not translate into a full-fledged body of knowledge for a professional discipline. There have been little, if any, research to test the experts’ perceptions; few attempts to develop theoretical constructs from the data; and almost no scholarly critique and debate of the value of the study beyond its immediate applications (Chalofsky, 1996).

More recently, most programs have based their curriculums on the needs of the local market (employers of HRD professionals) or on the disciplinary base of their “parent” programs (e.g. vocational education or adult education). Kuchinke (2002) studied the curricula of 55 HRD related graduate programs and found that over 75% of the programs covered what I would label practice or professional subjects; instructional design, instructional delivery, and evaluation. (Adult) learning theories was covered by 73%; the next disciplinary subject on the list, organization theory/organization behavior, was covered by only 55%. Only 40% covered psychological dimensions of HRD and only 27% covered economic dimensions of HRD. What this tells me is that the body of knowledge most graduate programs are covering is still based on professional practice. Since the practice of HRD is accepted as a necessity in most organizations, and there is an increasing number of training and consulting firms serving organizations, the focus of most graduate programs has been on preparing professionals to meet the needs of the marketplace.

Since our field is still primarily practice-driven, the body of knowledge studied in most HRD graduate programs has been informed by “reflective theory building” (Mott, 1996). There is nothing wrong with practitioners engaging in reflective theory building that results in expert knowledge for use in practice. And there is nothing wrong with graduate students studying expert knowledge as part of their programs of study. The danger is both what is “expert” knowledge and whether what may work in one context will work equally well in another context (Chalofsky, 1996). Most of what is practiced in the field is still, at best, educated trial and error, and, at least, “the fad of the month”. Few organizations or HRD consulting firms conduct research to test new approaches. And the academic research being conducted is still too new to be readily translated into practice. The state of research and
theory building has not had outlets for dissemination until the establishment of the Human Resource Development Quarterly and the Performance Improvement Quarterly journals. In addition, an association for HRD academics (the HRD Professors Network of ASTD) was established in 1981 but did not seriously begin to promote scholarly work until the Academy for Human Resource Development was formed in 1993. Thus, HRD has not had its own research and theory building guiding and informing best practice; which, in turn, would be guiding and informing day-to-day practice. Instead, we have had practitioners’ and consultants’ educated opinions and ideas cloaked as new theories and/or approaches driving practice.

In essence, the very HRD doctoral programs that are producing the new research and theory that will inform the field should also be anchored with a foundation of seminal theories in related disciplines. This will insure that we are building on what is already known, rather than reinventing the wheel. It also means we will be practicing what we preach; that doctoral students should know the seminal theories and research in their respective specialties within HRD. In addition, research and theory should also be linked with expert knowledge wherever possible in the curriculum.

Conclusion

While our program faculty would advocate this disciplinary framework for all HRD graduate programs, I primarily want to start the dialogue about the basis for a discipline for our field. Eventually, our Academy is going to have to deal with questions of quality control and accreditation. Should the academy have an agreed upon core set of theories for the discipline? Should there be specialty areas within the discipline? Should quality be evaluated on a program’s adherence to and coverage of the core theories? These and other questions need to be addressed in the academy at some point in the near future.

A Survey of Current and Former Members of the Academy of Human Resource Development

Fredrick Mayia Nafukho
Barbara E. Hinton
University of Arkansas

The primary purposes of the study were to: determine the overall satisfaction of current and former members with the AHRD professional activities; establish the members’ perception regarding the resources provided by the academy and the additional resources that need to be provided; establish the members’ perceived importance of the academy’s selected professional activities; and determine the reasons for leaving the Academy by former members. Seminal findings regarding the professionalization process of AHRD were established.

Keywords: Professional Organizations, Professional Development, Academy of HRD

(The findings from this study have been analyzed by the authors and do not necessarily represent the opinion of the AHRD Board of Directors.)

The Academy of Human Resource Development (AHRD) began in 1993 in the United States of America and “today, AHRD is a vital professional organization with membership worldwide” (McLean, 2003, p.157). The academy focuses on a new and evolving discipline of Human Resource Development (HRD). As noted, “HRD is an evolving discipline that is in the process of creating and validating knowledge” (Bierema & Cseh, 2003, p.5). The vision of AHRD is “leading Human Resource Development profession through research.” This vision is not static and is ever evolving. In addition to North America, AHRD has chapters in Africa, Asia, and Europe. To show the dynamic nature of AHRD, it holds annual research conferences in the US, Asia and Europe. The academy also sponsors or co-sponsors four scholarly journals: Advances in Human Resources, Human Resource Development International, Human Resource Development Quarterly and Human Resource Development Review. It also publishes annually a 1000 plus page refereed conference proceedings. Mclean (2003, p. 1) observed, “the success and vitality of the organization today reflect many of the forces, events, and people behind the formation of the Academy of Human Resource Development.”

Since the establishment of AHRD, several studies have been conducted related to its vision and mission. For instance, Arnold (1996) looked at the 1994 and 1995 proceedings of the Academy of Human Resource Development conference proceedings according to the type of research and tools used to discuss findings, Van Hooff and Mulder (1997) examined the contents of research appearing in the 1996 AHRD conference proceedings, and Chermack and Lynham (2002) examined the highest procedures of scholarship in human resource development. Bieriema and Cseh (2003) evaluated over 600 AHRD Proceedings papers from 1996 to 2000 according to a feminist research framework. While these studies advance the professionalization of AHRD, limited research has addressed the issue of customer (member) satisfaction within the Academy of Human Resource Development.

Research Problem and Purpose of the Study

Empirical research shows that AHRD is a dynamic professional association with a vision to lead the HRD profession through research. The academy “is already filled with a rich and meaningful past” (Mclean, 2003, p.155). While the Academy is making tremendous progress, members must continuously aim for excellence. Empirical research shows that “96% of customers/members who experience poor customer service never complain to someone in the organization, an unhappy customer/member will tell 9 to 15 other people/members about their experience and it takes 12 positive experiences to make up for one negative customer service experience” (Epsilon Pi Tau Inc., 2002, p.5). Thus, one customer receiving poor service experience normally gets exaggerated more than expected. Therefore, AHRD must continuously examine itself. While there is much to be researched and written about the Academy, the primary purpose of this paper was to determine the overall satisfaction of AHRD current and former members with the professionalization of the Academy. The research questions that guided this study were: What is
the background information of AHRD members? (Country of residence, state of residence for US members, primary area of responsibility, membership in other professional associations and reasons for joining the Academy). How satisfied are the current members with the AHRD’s professional services? What are the current members’ perceptions regarding the resources provided by the academy? What additional new resources should be introduced? How important are the various professional activities provided by the Academy? And what reasons do the former members provide for leaving the Academy?

Significance of the Problem

AHRD has become a major professional association for both researchers and practitioners in the field of HRD. Members of the academy have made significant contribution by writing outstanding books such as “Principles of Human Resource Development” by Gilley, Eggland and Gilley, “Ethics and HRD: A New Approach to Leading Responsible Organizations” by Hatcher, “The Workplace Learner: How to Align Training Initiatives with Individual Learning Competencies” by Rothwell, “Strategic Human Resource Development” by Walton, and “Foundations of Human Resource Development” by Swanson and Holton. Several Members of the academy are professors, respected practitioners and leading international consultants in organizations world over. It is important that the association sets the best example by valuing her own members – their diversity, their unique contribution to the association, their nationality, their cultures, and their views regarding the professional growth and performance of the Academy. What AHRD has become today, its vision, its mission, its ethical values, its growth and recognition, can all be attributed to the members of the association. The authors hope that this paper will provide some insight on how to best serve the members of the Academy and make AHRD a leading world professional association in the field of HRD. Regarding the Academy and the globalization agenda, one of the founding members of the association noted: “Again in contrast with last year, only two of the ten papers had at least one author who is obviously not a U.S. citizen. This is an interesting observation for me as the Academy struggles with defining what it means to become a global organization. … The results from this year raise questions about whether we are, indeed, making consistent movement in the direction of attracting the best of HRD research that is being conducted outside of the U.S” (McLean, 2001, p. 1). While we totally agree with these sentiments, more views from AHRD membership should help the organization re-examine its vision, mission, and organizational services.

Theoretical Framework

The conceptual framework for this study is derived from Gilley and Egglands (1989) overall marketing strategies for HRD departments. In their model, Gilley and Eggland developed a 2 by 2 matrix for marketing HRD programs. The Academy could adapt this model for the purpose of marketing its services to existing and new markets. The model argues that existing HRD programs need to penetrate existing markets while at the same time develop new markets. The organization needs to develop new programs by developing new products through diversification. Application of this model to AHRD as a profession requires continuing offering the existing services to both current markets and to new markets. In addition, the Academy must design new services and provide additional resources to its exiting members and to new members. The Gilley and Eggland model, as adapted for AHRD, is illustrated in Figure 1.

Figure 1. Overall Marketing Strategies for AHRD

Blake (1995) and Mclean (2003) noted that HRD is a relatively young profession that was born out of sagacity rather than sentient action by its founders. AHRD as a young professional association needs to appropriately market itself. An understanding of member’s choice in decision-making is therefore critical in designing of unique professional services for the members. This understanding is in line with investment in customer-capital (Nafukho & Burnett, 2002). Human Resource Development professionals as marketers should use their marketing skills to research the issue of member satisfaction and perception of the professionalization process of the Academy. The AHRD’s strong and competent leadership should provide customer-capital services to the members by helping in
designing effective marketing strategies. The Academy as a professional association dedicated to serving its members has an obligation to the members to help them grow professionally. This can only be achieved by knowing what the members want through research.

Marketing as applied to education is a concept that allows decision makers to think systematically and sequentially about the mission of the organization, the services it offers, the markets it currently serves, and the extent to which these same markets and possibly new ones may demand its services in the future (Ihlanfeldt, 1980). HRD researchers and practitioners, in particular, deal with an intangible product that is more of a service than a commodity. There is always some difficulty when it comes to quantifying intangible services such as providing quality journals to members. Marketing can, however, enable AHRD leadership and professionals to determine whether their vision and mission match member interests. Kotler (1975) defines marketing as the “analysis, planning, implementation, and control of carefully formulated programs designed to bring about voluntary exchange of values with target markets for the purpose of achieving organizational objectives” (p.5). Marketing relies heavily on designing the “organization’s offering in terms of the target market’s needs and desires and on using effective pricing, communication and distribution to inform, motivate and service the markets. Rothwell and Sredl (1992) noted that marketing is important to HRD field since people (members) cannot benefit from products or services that are unsuitable or those they know nothing about. Therefore, when the Academy markets its products, resources and services, it must tailor these services, resources and products to suit the needs of the customers (members) and to continuously inform members of the products, resources and services that are offered.

Professional Associations and their Roles

While it is obvious that AHRD as a profession needs strategies for marketing itself, it is important to look at what professional organizations are and why they need members. It has been noted that professions must “ (1) involve intellectual operations (2) derive their material from science (3) involve definite and practical ends (4) possess an educationally communicable technique (5) tend to self-organization, and (6) be altruistic” (Cervero, 1988, p.6). When a profession is looked at in this way, Cervero calls it a static approach of defining a profession (Merriam & Brockett, 1997, p. 218). The second approach of defining a profession is known as the process approach. In this approach, “emphasis is placed on the circumstances by which an occupation professionalizes (Merriam & Brockett, 1997, p. 219). Houle (1980) observed that the professionalization process has the following core characteristics: Clarifying the functions of the profession, mastery of theoretical knowledge, capacity to solve problems, use of practical knowledge, self-enhancement, formal training, credentialing, creation of a subculture, legal reinforcement, public acceptance, ethical practice, penalties, relations to other professions, and relations to users of the service (customers/members). The fourteen characteristics identified by Houle (1980) define a profession from the process approach. This perspective differs from the static approach in that it defines a profession by the extent to which the criteria is met and not from specific objectives and standards. Merriam and Brockett, (1997, p. 219) provide a third definition of a profession as a socioeconomic approach which views a profession as “a folk concept, in that an occupation is a profession only to the degree to which it is regarded by the general public.” This approach relates to the tenth characteristic of a profession – public acceptance, and has social, political and cultural implications for the developing profession such as AHRD.

The professionalization process of AHRD is in line with a number of the characteristics identified above. While professions that have existed for many years may be easy to market, new and emerging professions like HRD face tough challenges. The profession of HRD faces challenges related to its definition (Lee, 2001). Although several studies have looked at vision and mission of AHRD, gender issues in the Academy, quality of research conducted, philosophical beliefs of the founders of AHRD (Arnold, 1996; Beriema & Cseh, 2003; Chermack & Lynham; 2002; Hooff & Mulder, 1997), no study has looked at members’ perception regarding the professionalization of the Academy. This study was therefore designed to fill this gap.

Method

Sample. The sampling frame for this study consisted of 522 current members (fully paid up members in 2002) and 473 former members (members who had not renewed their membership in 2002). Respondents participated in the study via a Web-based survey. The AHRD professionals that participated in the study were identified through their affiliation with the Academy headquarters based at Bowling Green State University, College of Technology. The researchers sought permission to contact the Academy members from the AHRD Executive Board and Institutional Review Board (IRB) at the University of Arkansas. All current and former members (995) received e-mails from the Academy office directing them to the University of Arkansas server where the research instruments were hosted. Participation was voluntary and
totally anonymous. The software used in the design of the research instrument enabled the researchers to receive the e-mail feedback anonymously. In total, 157 (16%) current and former members responded to the instruments posted on the web.

**Instrumentation.** A web-based instrument designed using the Perseus software was developed for both the current and former members. Several research experts who are members of the Academy examined the instrument for its content validity before it was posted on the web site. Respondents were asked to rate their level of satisfaction with professional activities on a five point Likert-type of scale (Extremely Satisfied, Mostly Satisfied, Neither, Mostly Dissatisfied, and Extremely Dissatisfied). The respondents’ perception on need for additional services was sought by requesting them to indicate whether new resources were required or not. An open-ended item on the instrument required members to specify ways to improve the Academy. Respondents were also asked to rate the professionalization activities of the Academy on a five-point Likert-type of scale (Strongly Agree, Somewhat Agree, No Opinion, Somewhat Disagree and Strongly Disagree). In addition, respondents were asked to provide background information such as country of residence, state of residence for U.S. members, primary area of responsibility, membership in other professional associations and reasons for joining the Academy. The former members were asked to provide reasons for leaving the Academy.

**Results and Findings**

**Research Question 1: What Was the Background Information of AHRD Members?**

Of the 97 current members who responded to the online survey, the majority (73.2%) came from the U.S., 5.2% from UK, 4.1% from Netherlands, 2.1% Kenya, while Afghanistan, Australia, Belgium, Finland, Hungary, Ireland, Jamaica, Japan, South Korea, and Taiwan had 1% of respondents each. The remaining 5.1% did not indicate their country of residence. In the case of former members, of the 60 members who responded to the online survey, 76.7% were from the U.S., 3.3% from India, while Afghanistan, UK, Ireland, Italy, South Korea, Thailand, and Hungary, had 1.7% of the respondents each. The remaining 8.3% did not indicate their country of residence. Regarding the state of residence for U.S. current members, the majority (16.5%) was from Minnesota. This was followed by the states of Arkansas and Illinois, with 6.2%, Georgia and Pennsylvania had 5.2% each, Florida had 4.1%, Virginia, Texas, Ohio, and Michigan had 3.1% each, Tennessee and Maryland had 2.1% each, while 17 other states had 1.0% of the respondents each. The remaining 22.7% did not indicate their state of residence. In the case of former members, the majority (13.3%) were from Minnesota, this was followed by Oklahoma with 8.3%, Texas and Virginia with 6.7% each, Georgia, Louisiana and Tennessee with 5.0% each, Illinois, Indiana, Michigan, with 3.3%, while 13 other states had 1.7% each. The remaining (18.3%) of the former members who responded to the online survey did not indicate their state of residence.

Regarding primary area of responsibility, 46.4% of the current members surveyed were faculty members, 17.0% were practitioners employed in business, non-profit or government organizations, 14.4% were consultants, while 11.3% were students. The remaining 10.3% filled “other” as their main occupation. When compared to the former members’ primary area of responsibility, approximately 23% were students, 12.4% were faculty, and 33% worked as practitioners in business, non-profit, government or consultants. The former members’ major reasons for joining the Academy were to: gain intellectual stimulation from HRD scholars, learn the latest research, gain visibility relative to career moves, present research, and network 86%, while 6% joined the Academy to look for a job. Of the current members, 93% reported that they would recommend the Academy to others. Of the former members, 80% had belonged to the Academy for a period ranging from 1-6 years.

**Research Question 2: How Satisfied are the Members with the Professional Services Provided?**

When current members were asked to rate their overall satisfaction with AHRD activities, 50.5% were extremely satisfied, 25.8% were mostly satisfied, 14.4% indicated neither, 3.1% were mostly dissatisfied, none were extremely dissatisfied, while 6.2% did not respond to this item. Table 1 shows the satisfaction level of the current members with the peer-reviewed journals published by the Academy. As shown in Table 1, 86.6% of the current members who completed the online survey were satisfied with the HRDQ; this was followed by ADHR and HRDR with 72.2% each. Regarding the ARHD annual research conference, 69% of the members were satisfied with the way the conference was being organized and another 69% of the members were satisfied with the cost of AHRD membership, while 39% of the current members were satisfied with the research to practice activities of the Academy.

The current members were asked to indicate whether the resource provided was useful as is or if the resource needed improvement. Data in Table 2 show that 72.2% of the respondents reported that the AHRD print resources were useful in their present forms. This was followed by print proceedings of the AHRD Annual Conference, 65%. The resource that urgently needed improvement as rated by the respondents was the AHRD web site with 46.4% of the respondents rating it, as “resource needs improvement.”

Research Question 3: What Are the Current Members’ Perceptions Regarding the Additional Resources that should be Provided by the Academy?

Given the many resources now existing, current members were asked to suggest some of the additional resources that should be provided by the Academy. The following resources were recommended as being needed: Articles in AHRD electronic publications such as HRDQ, HRDI, HRDR and ADHR for members (20%), reading lists for relevant articles delivered online (26%), compilation of relevant information delivered online to members (26%), list serve online discussions (25%), and web seminars/meetings (25%).

Research Question 4: What is the Current Members’ Perception of the Professionalization Process of the Academy?

The professionalization process of such a vibrant organization such as AHRD is ongoing and not static. As shown in Table 3, 63% of the current members who completed the online survey agreed that the Academy’s activities helped members in their research mission, 60% agreed that the Academy provided opportunities for participation in leadership positions, 52% agreed that the Academy’s leadership was responsive to individual input and members’ concerns, while only 38% agreed that Academy sought inclusion to new membership on editorial boards or journals.

Research Question 5: How Important are the Various Professional Activities Provided by the Academy?

Data in Table 4 show the current members’ perceptions regarding the importance of various AHRD activities. Research opportunities, publishing opportunities and development seminars were rated as being important by 86.6%, 83.56% and 81.4%, respectively, while leadership development programs had 70.1% and E-modules, 76.2%. In addition, 64.9% of respondents rated mentoring and 69.1% rated pre-conferences.

Research Question 6: What Reasons do the Former Members Provide for Leaving the Academy?

To help AHRD grow and attain international recognition among its members world over, it was found necessary to establish reasons for leaving the association from former members. The highest percentage (17.39%) of the members found AHRD not relevant to their needs, another (13.04%), reported that dues were expensive, (13.04%), found the journals not being relevant, (12.17%) were cutting back on membership while (12.17%) quit because of poor service.

Conclusions

Current members are satisfied, to some degree, with the four Academy journals, the cost of membership, and the annual research conference. HRDI and HRDQ are the oldest AHRD publications, and, perhaps, are most familiar to current membership. The two newest publications, ADHR and HRDR were also reported as satisfactory by a majority of the respondents. Equally important, none of the publications were reported as being unsatisfactory by more than 5.1% of current members. Cost of membership does not appear to be a major concern with current members. Over two-thirds indicated some degree of satisfaction with membership cost. The annual research conference appears to be meeting the needs of a majority of the current members. Research to Practice Linkages need to be increased and improved. They are not perceived as being satisfactory by a majority of the members. Clearly, this is an activity that needs attention. Print resources are regarded as useful, according to a majority (72.2%) of respondents. There was no clear preference for print over electronic form of the AHRD Conference proceedings. Many of the AHRD electronic resources may not be well known or utilized by current membership. There should be an effort made to either make the resources available and known to the membership or to improve the existing resources. The AHRD Website needs improvement. Responses concerning the website had a spread of 27.8% (useful), 46.4% (needs improvement), and 34% (no response). Clearly, those responding “the resource needs improvement” signals a need for immediate attention to the web pages. AHRD pre-conference sessions are perceived as useful by almost half of the respondents (43.3%). However, with 33% of current members not responding to this item, perhaps the pre-conference sessions may not be fully utilized by membership. The same pattern is evident in the Forum General Question resource, with 42.3% indicating it is useful, but 39.2% not responding.

AHRD Committees need to become more effective and membership participation increased. Many members may believe they either are not useful or are unaware of their functions. Overall, the current members who responded view the professionalization process in AHRD as positive. Over two-thirds of respondents felt that leadership is responsive to member needs, that activities help members in their research and teaching missions, and that opportunities for participation in leadership positions are provided. They agreed that there are adequate opportunities for members to contribute to book chapters and to serve as reviewers of manuscripts; they also perceive the Academy as encouraging international membership. The AHRD Office is not perceived as providing timely information by almost a third of the respondents (29.9%). Although 48.5% agree that they receive timely service, with a third of the membership being dissatisfied, the Office should establish procedures that respond in a timely manner. Clearly, the office relocation has not been easy; however, the level of dissatisfaction calls for critical analysis. Research to Practice efforts need to be expanded. A third of respondents did not agree that AHRD “activities help members apply research to practice.” As with the issue above, there is a perceived need for more or better support of research to practice. Opportunities for members to contribute book chapters/serve on editorial or journal boards should be expanded. Current members identified most of the activities of the organization as being important. Research opportunities, publishing opportunities, and development seminars are clearly valued by current membership. Leadership development programs and E-modules are activities that should be further developed. In addition, mentoring, networking, and pre-conferences should continue to be emphasized. Post-conference activities

21-2
should not be pursued at this time. Less than half of respondents (46.4%) rated post conference activities as being important. Former members seem to have left for three major reasons: Academy and journals were not relevant to their needs; expense of dues and cutting back on membership; and poor service. The relatively small number of people mentioning other reasons suggests that AHRD should focus on the top three.

Limitations

The data were purely descriptive; no relationships between variables were studied. The small sample could raise questions about the generalizability of the findings. Additional research involving larger samples is necessary to insure more generalization to AHRD membership.

Implications for HRD

The findings of this study show that AHRD leadership needs to communicate and clarify the Academy’s vision and mission. The Academy must refine its activities and services to meet the greatest needs of the target audience. There is a need to strengthen the research to practice component. This calls for further collaboration between ASTD and AHRD to bridge the gap and clarify the application of AHRD research. Leadership should focus efforts on the things that the Academy is doing right. Process issues need to be addressed. Further qualitative inquiry is needed.

Bridging the Great Divide: Exploring Resistance to HRD in Adult Education

Laura Bierema

Andrea Ellinger
University of Illinois

Keywords: HRD on the Margins, Adult Education, Foundational Issues

This paper examines the debates and critiques surrounding HRD by uncloaking myths about HRD philosophy and practice that seem to commonly held by professionals in the field of Adult Education. We argue that the HRD field is “marginalized” in adult education and reflect on both the problems this situation creates and the increasing need to bridge these two fields.

During a recent Adult Education conference, participants were asked to identify metaphors for how they viewed both the fields of HRD and adult education. Several slogans emerged. These slogans included, “Learn and Earn,” “The Buck Starts Here,” “Cheerleaders for Management,” and “Corporate-centered, rigid, and individualistic.” The Adult Education slogans were characterized as being “learner-centered, flexible, collaborative,” “A Journey of Learning,” and “Education for Life.” These slogans tend to embody the views adult education holds toward HRD. These rather narrow views sometimes function to marginalize a growing field.

The study of marginality and commitment to eroding it are hallmarks of adult education theory and practice. Adult education’s interest in marginality, however, seems to be selective where HRD is concerned. There is little space on the agenda for HRD at adult education research conferences. Conversations about HRD tend to be less constructive than combative. Expressing an interest in HRD can be risky as it opens one up for unsolicited, often inaccurate critique. Because of these unwelcoming dynamics, many adult educators who are interested in HRD have moved to circles that are more hospitable and allow them a voice, and in the process, the voice of adult educators and their influence on HRD is being increasingly lost.

It is ironic that adult education marginalizes HRD since this behavior defies both the philosophy and practice of adult education. Although HRD is often accused of embracing money and management motives, the truth is that the HRD function is significantly marginalized in organizations. Furthermore, the majority of HRD professionals are women. Adult Education’s marginalization of HRD does little to help students who find themselves in the “trenches” striving to address the difficult process of organizational learning and development. HRD also straddles often competing interests between employees and management.

While we are not asking that adult education embrace every tenet of HRD, we feel that critical reflection on the profession’s behavior toward and treatment of HRD is imperative. By silencing this increasingly important aspect of adult education, we are doing a disservice to the profession, students, and most importantly stakeholders in the educational process. Seemingly, the HRD field is like unwelcome guests at dinner. Although they have a place at the table, they are merely tolerated, offered insincere niceties, and talked about in unsavory terms when they depart.

The purpose of this paper is to examine some of the commonly held myths that may portray HRD professionals as being behaviorally and performance focused, potentially irresponsible and non-reflective, economically focused on the bottom-line, exploitative, and possibly of questionable ethical practice. Following and examination of these myths, we will explore the possibilities of how some of these philosophical and practice-based differences between HRD and adult education can be bridged.

HRD Myths

According to The New Shorter Oxford English Dictionary (1993), a myth is:

Copyright © 2004 Bierema, Ruona, Cseh, Ellinger, & Watkins
Our goal is to identify myths that negatively portray or characterize HRD and HRD practice. These myths are either explicitly discussed in Adult Education literature or seem to be commonly held although not explicated. Whether explicit or not, these myths ultimately position HRD on the margins of adult education.

**Myth # 1: HRD Professionals are Capitalist Sympathizers who Abuse Behaviorist and Humanistic Practices to Exploit Workers**

Some adult educators assume that adherents of HRD profess unconditional allegiance to the human capital theory perspective (Cunningham, 1993; 2000; Scheid, Carter & Howell, 2001; Welton, 19xx). For instance, Schied, Carter, Preston, and Howell (1997) suggest that the HRD profession is prisoner to its history and view human capital theory perspective (Cunningham, 1993; 2000; Scheid, Carter & Howell, 2001; Welton, 19xx). For instance, Schied, Carter, Preston, and Howell (1997) suggest that the HRD profession is prisoner to its history and view human capital and human relations theories as the key influence in HRD with their claim that “Embedded within human capital theory, in some quarters HRD has become synonymous with workplace learning” (p. 404).

There are several problems with the assertion that HRD is synonymous with capitalism and human capital theory exclusively. First, it is reckless to lump an entire field under one label. HRD is a complex multi-disciplinary field that is constantly changing in response to multiple stakeholders. Stereotyping the philosophical orientation of the many HRD scholars and practitioners is discourteous, and no more accurate than doing so for the profession of Adult Education. In fact, in a recent analysis of the philosophical underpinnings of HRD, Gilley, Dean, and Bierema (2001) illustrate how philosophical perspectives ranging from human capital to radicalism are represented in the scholarship and practice of the field.

Another flaw in the belief that HRD professionals are capitalist sympathizers is centered on the unit of analysis for critique. Seemingly, HRD is categorized as such because of its work with organizations. However, this is flawed for a few reasons. First, there is an underlying assumption that HRD only happens between the walls of corporations. This perspective ignores the important HRD work that is happening in non-profit organizations, governments and communities. What many critics of the human capital influence on HRD assert is that it is futile to work within the system to change it. We disagree. Second, this myth simply does not hold up when it is recognized that HRD is one of the few professions in organizations that most deeply cares and works for groups and individuals. One of the tenets of HRD is to work both from within and outside organizational systems to promote change that is beneficial to all stakeholders. Indeed to do that requires a constant balancing act and many struggles to find “win-win-win.” It also demands that HRD professionals cultivate a true systems perspective. HRD is often wrongly critiqued by people who focus largely on HRD roles in training processes, and yet this too ignores the systemic and broader issues that HRD must face. HRD is not only concerned with training, but also career development and organization development.

Finally, while human capital theory may be one theoretical lens to utilized in HRD, Swanson (1998) has acknowledged that there is no universal view or agreement on the theory or multiple theories that support HRD as a discipline. In fact, it is generally acknowledged that HRD is a discipline that draws upon many theories and is informed by several disciplines. Willis also suggests that “there is considerable agreement that adult education; instructional design and performance technology; psychology; business and economics; sociology; cultural anthropology; organization theory and communications; philosophy; axiology; and human relations theories, principles, and practices have all become a visible part of the HRD milieu” (p. 32). Still, there is often the tendency for critics to focus exclusively on human capital theory, or to narrowly conceive of HRD practice in highly economic and behavioristic terms. Accordingly, the images of HRD professionals as “capitalist pigs” and “Pavlovian trainers” are often construed.

**Myth # 2: HRD Professionals Embrace Exploitation**

Amplifying the myth that all HRD professionals embody an exploitative, capitalist perspective is the myth that they also seek to control employees through training and conditioning, or through humanistic initiatives that coax employees into participative or employee empowerment programs. Gee, Hull, and Lankshear (1996) charge that work in the old capitalism was alienating and characterized by workers being forced to sell their labor, with little mental, emotional, or social investment in the business. Today, they view management’s expectation for employees to invest their hearts, minds and bodies fully in work while at the same time thinking and acting critically, reflectively, and creatively. The authors acknowledge that this “new work” offers a less alienating view of work and labor in practice, but they suggest that it can also amount to a form of mind control and high-tech, but indirect coercion. The authors suggest that this high tech, kinder, gentler coercion happens through training. Schied, Carter,
Burns, Hatcher and Russ-Eft (2000) addressed the need for a casebook on ethics and integrity, and the “Academy of Human Resource Development Standards on Ethics and Integrity” was formed in 1998 to develop a code anchored in principles but lends itself to discussion and interpretation over time (p. 91). The AHRD Standing Committee on Ethics and Integrity was formed to develop a code on ethics and integrity that is solidly anchored in principles but lends itself to discussion and interpretation over time (p. 91). The AHRD Standing Committee on Ethics and Integrity was formed in 1998 to develop a code on ethics and integrity, and the “Academy of Human Resource Development Standards on Ethics and Integrity” was published in 1999. Burns, Hatcher and Russ-Eft (2000) addressed the need for a code on ethics and integrity to raise the awareness of HRD professionals of the ethical standards of the profession and to help them examine how ethical standards apply to specific situations. The publication of the AHRD Standards on Ethics and Integrity (Academy of Human Resource Development Standing Committee on Ethics and Integrity, 1999) and a special issue of Advances in Developing Human Resources on Ethics and integrity in HRD: Case studies in research and practice (Aragon & Hatcher, 2001) shows the deep commitment of HRD professionals to an ethical profession.

While both the fields of HRD and organization development have established, published codes of ethics, ironically, the field of adult education has none. That is not to say that there are not ethical principles that the field is based upon, but that the field has not made identifying a unifying code of conduct a priority.

**Myth #3: HRD Has No Ethics?!**

One of the contentious topics that often fuels the scholarly debate triggered by the tenuous relationship between adult education and HRD is that of ethics in HRD (Bierema, 2000; Cunningham, 1993; Dirkx, 1996; Kuchinke, 1999; Swanson, 1996; Willis, 1996). The question under scrutiny is “Are HRD professionals guided by ethical standards in their practice?”

HRD professionals have been actively engaged in discussion of the ethical issues involved in their profession (Dean, 1993; DeVogel, Sullivan, McLean, & Rothwell, 1995; Hatcher, 2002; Paige & Martin, 1996) for at least 10 years. During the 1996 Academy of Human Resource Development (AHRD) conference, Marsick (1996) and Jacobs (1996) started a discussion on the need for a code of ethics that continued at the 1997 and 1998 AHRD conferences. In her reflections after the 1996 AHRD conference, Marsick (1997) called for a code that “should be a living entity that is solidly anchored in enduring principles but lends itself to discussion and interpretation over time” (p. 91). The AHRD Standing Committee on Ethics and Integrity was formed in 1998 to develop a code on ethics and integrity, and the “Academy of Human Resource Development Standards on Ethics and Integrity” was published in 1999. Burns, Hatcher and Russ-Eft (2000) addressed the need for a code on ethics and integrity to raise the awareness of HRD professionals of the ethical standards of the profession and to help them examine how ethical standards apply to specific situations. The publication of the AHRD Standards on Ethics and Integrity (Academy of Human Resource Development Standing Committee on Ethics and Integrity, 1999) and a special issue of Advances in Developing Human Resources on Ethics and integrity in HRD: Case studies in research and practice (Aragon & Hatcher, 2001) shows the deep commitment of HRD professionals to an ethical profession.

**Myth #4: HRD Professionals do not Deeply Reflect on Practice, Theory, or Philosophy**

Another myth surrounding the growing profession of HRD is that the profession does not deeply reflect on its practice, theory, or core beliefs. The last 10 years, however, demonstrate steadily increasing attention to philosophical issues. There has been a consistent call for work in this area from many of HRD’s leading scholars. Chalofsky (1992) called for the conceptualization of the core of the profession comprised of philosophy and mission, theory and concepts, and roles and competencies. In a later writing, he stated that “the essence of why HRD exists as a profession—its purpose, values, and ethics—provides the foundation for professional practice of the field” (Chalofsky, 1998, p. 180). This call has been echoed by many others throughout the last 10 years, including Marsick (1990), Watkins (1991), Ellinger (1998), and Barrie and Pace (1998) who stated that “we may need to discover the foundational principles, as opposed to commonsense descriptors, that give HRD its philosophical base” (p. 39). Kuchinke (1996) described, compared, and contrasted different goals of HRD and their underlying ideologies, focusing solely on the concept of human development to elucidate alternative philosophies of HRD. In 1998 Barrie and Pace conducted a philosophical analysis, framed within a liberal education mode, to approach and describe the field of HRD. They argued that the key concepts of “learning” and “performance” could be elucidated in much the same way that differences between education and training were explained as part of analyses of philosophy of education. The utility of this kind of analysis, they argued, was that making some progress in analyzing these concepts would ultimately make a preferred model of HRD clearer. Recently a monograph entitled, *Philosophical Foundations of Human Resource Development* (Ruona & Roth, 2000) was introduced. In it Ruona (2000) shares the findings of a research study that sought to uncover core beliefs underlying HRD by exploring assumptions and beliefs of 10 scholarly leaders in the field.

**Myth #5: Poor Practice is Representative of the Majority of HRD Practice**

HRD has received sometimes-deserved critique, but unfortunately the profession is often condemned by its worst performers. What is never mentioned in many of the critiques is that often the program being evaluated is flawed and one that no responsible HRD professional would support. We must be critical of the critiques noting the type of intervention reported and analysis. Much of the critique assumes that HRD is synonymous with training. This view is laden with its own problems indicating that researchers are quick to critique HRD before they are even fully cognizant of what the process entails (For instance, Gee, Hull and Lankshear (1996) use an abhorrent training
examples to discuss “the new work order”). Until HRD efforts that are of high integrity and systemic are objectively evaluated, the critiques will lack credibility or useful information for improving HRD practice.

**Myth #6: HRD Cannot Influence the System**

The information age, the power of knowledge, and recognition of people’s role in gaining competitive advantage brought the HRD field out from its traditional role of offering individual training to that of supporting individual learning, the integration of learning into the workplace, the development of learning teams and organizations and facilitation of organizational development and change. As organizations have to change more frequently and sometimes radically in order to maintain their competitiveness on the global market, HRD professionals are seen more often in the role of strategic business partners in the change process.

The theory and practice of aligning HRD as a major organizational process having strategic business contributions has been the topic of many books published in the last decade (Chalofsky & Reinhart, 1988; Hendry & Newton, 1993; Brinkerhoff & Gill, 1994; Pfeffer, 1994; Rothwell & Kazanas, 1994; Phillips & Rothwell, 1998; Rothwell, 1998; Price & Walker, 1999; Walton, 1999). Their purpose was to describe the strategic roles of human resource development in organizations and strategic planning, to develop the ability of HRD professionals to think strategically and holistically about the organization and the environment within which it is situated and gain understanding on how to influence change. Continuous inquiry in understanding the challenges facing “change agent” HRD professionals (Kalata & Wentling, 1999; Leimbach & Ceh, 1999; Anthony, Jeris & Johnson, 2000; Watkins, Marsick, Honold & O’Neil, 2000) give a glimpse on how HRD professionals influence the system and present lessons learned for better practices.

**Myth #7: HRD Lacks an International Perspective**

Some have charged HRD for lacking an international perspective and discipline. Once again, there is ample evidence to the contrary. The interdisciplinary nature of HRD described so metaphorically by Willis (1996). The open space created by the intensive globalization of the world economy, triggered by the development of science and technology, has offered people the opportunity to migrate across national boundaries in search of the “ideal” employment opportunity or political environment. This raises continuous challenges for HRD professionals whom work in organizations that are increasingly becoming globalized and multi-national. More and more professionals “fly off to learn from each other” in an attempt to understand each others’ issues. Seeking this understanding is even more important in the light of literature (Rijk, Mulder and Nijhof, 1994; McLean & McLean, 2001; Odenthal & Nijhof, 1996, Valkeavaara, 1998) that has shown the culture-bound nature of HRD.

For example, in Finland and other Scandinavian countries human resource development is seen as a special area of adult education which is closely related to working life and new ideas in the HRD field are quickly followed and adopted into local HRD needs and practices (Valkeavaara and Vaherva, 1998). Valkeavaara and Vaherva also acknowledge the changing role of HRD practitioners from deliverers of training to facilitators of change and lifelong learning in organizations. HRD is called to adopt a proactive role towards the change in society and in the work organizations.

**Myth #8: The Primary Role of HRD Professionals is Training and Educating Adults**

There have been at least 20 definitions of HRD forwarded and analyzed (Weinberger 1998) and most of them do indeed describe a role/responsibility related to training and adult education. In 1989, Nadler and Nadler defined HRD as “organized learning experiences provided by employers within a specified period of time to bring about the possibility of performance improvement and/or personal growth” (p. 6). However, 1989 also revealed a very different truth for the people who were actually practicing in the field of HRD. McLagan’s (1989) study of practitioners explained that the three key roles HRD professionals were working in could be classified as (1) training and development, (2) organization development, and (3) career development. This is an important marker in HRD’s history, because since 1989 and the explosion of the knowledge economy, those roles have multiplied and diversified rather than being refocused back to only training. Watkins (1998) discusses the more complex reality in which HRD professionals exist: “Actual titles for human resource development practitioners vary enormously, and job responsibilities are more often combinations of one or more of these three roles with other assigned personnel roles such as organization designer, personnel specialist, or employee assistance counselor” (pg. 58).

HRD has not taken the technical-rational paradigm of separating practice from theory (Schön, 1983). HRD is an applied field, and to serve its practitioners well, HRD must tune-in to the real-world roles they are being asked to fill. It has and will continue to help them prepare for those roles by developing the proper diverse skill sets, and building an interdisciplinary knowledgebase that will serve the profession well.

**Myth #9: HRD Exploits the Disenfranchised According to Race, Gender and Class**

HRD has been accused of exploiting people based on race, gender and class. In fact, there is a growing recognition among several HRD scholars of the importance of critically evaluating HRD practice and scholarship (Bierema and Cseh, 2000, 2003). While we acknowledge that any educational endeavor, including HRD, can be
exploitative, HRD in and of itself is not. There may be practitioners and organizations that engage in questionable practices, but the field as a whole cannot and should not be labeled as an exploitative undertaking. The difficult work of making HRD more accountable and inclusive is underway. Considering that HRD is a younger field than adult education, it is to be expected that much of the research to date has focused on methods, evaluation and philosophical foundations. The field is entering a new phase of evaluating its purpose and impact as described elsewhere in this paper, and we believe that there will be even more critique and change in the future.

**Myth #10: HRD is a sub-set of Adult Education**

Throughout the years we have engaged in many a debate about HRD’s heritage. Typically the discussion revolves around whether HRD is a sub-set of various academic disciplines. For instance, a common question is whether HRD grew out of a more established discipline such as Adult Education? The quick and obvious answer is that “yes, it has.” However, that same answer can just as readily be stated by other strong and rich disciplines such as Vocational Education, Human Resource Management, and Industrial-Organization Psychology. Willis (1997) lists well over 20 “information files” that HRD practitioners use to support their work and states that “HRD practitioners and theorists will take from whatever disciplinary resources they need at any given time” (p. 666).

**Epilogue: Bridging Adult Education and HRD**

As we ponder the question of how to bridge the values chasm that now divides adult education and HRD, we are struck by Mark Twain’s comment when told that the transcontinental lines were completed that would enable Maine to wire California. Twain replied, “But does Maine have anything to say to California?” In fact, over the years that we have been in adult education and human resource development, we see the chasm widening. Adult education increasingly speaks of inclusiveness—meaning including people who are different—but still within the value frame of adult education. HRD has become more and more distinctive in its own right, now a major academic entity in multiple disciplinary homes and yet has little allegiance to any one of them. Theory development in adult education has moved more to a post-modern critique and human resource development theory development continues with a few bursts of post-modernism but is still dominated by the modernists. So perhaps we have reached that point in a marriage of irreconcilable differences? Often this conversation ends with ponderings of whether HRD should “divorce” its spouse.

On the other hand, what would be different were we to seek marriage counseling? It would seem that we would need to renegotiate our relationship. As is so often the case, that renegotiation would likely have to do with power (in issues, for instance, such as who decides what HRD curriculum will be). We have built separate programs within our Universities because we could not come to a meeting of the minds. We have increased the distance between the two areas by creating and attending different “churches” (in this case academic or research conferences). Those of us who attend both churches already are boundary spanners, bridges between the two worlds. It has been left to those few boundary spanners to literally be bicultural. One of us recently described to a colleague what it was like to “be HRD” within adult education and yet “be adult education” in HRD”—she was amused at the realization that HRD was marginalized in both places! Frankly, it is not really all that funny if you’re living it.

Real bridging would ask more of us to span the boundaries of both fields. We would incorporate both kinds of courses in our curriculums. We would create a culture of safety and acceptance for students with interests in literacy, social action, AND organizational training and development. We would problematize both corporate oppression and the oppression of post-modern critiques of organizations. In short, we would entertain multiple realities, and multiple truths.

But real bridging is hard. It may be that our values frames have already solidified and we are already looking around for a new life partner. If we do decide to get a divorce, it will be interesting to see who gets what property. Will adult education get to own theory about how adults learn and develop---or has psychology already taken that? What about program development? Will that stay with adult education or migrate to instructional design? What about theories of educational and organizational change? Will adult education retain any of that or let it go with HRD? What about issues of multiculturalism, race, class, and gender? Will HRD leave the best of what adult education has to offer behind? What of the students who do HRD work in government, hospital, non-profit, and corporate settings? Will adult education have a strong student base when these students are gone? Will HRD students want to leave adult education?

In other venues we have argued that, for the sake of HRD professionals, we need to be connected. We believe that we are a fate-sharing group and both HRD and adult education are enhanced by our connections. Perhaps it is time to challenge that assumption. Perhaps HRD professionals are worse off caught in the crossfire of our differing assumptions and values. In this article we have raised a number of issues about the myths that adult educators hold about HRD and attempted to illustrate that these are indeed myths. Yet, the prevalence of these views suggests to us
that we are like a voice in the wilderness. While the little interest in bridging between these two areas of study is coming from those of us who already bridge them, it would seem obvious that the time of reckoning has already come and we were simply unaware. A common statement of recently divorced people is, “I was living alone and didn’t know it.” Perhaps HRD is already living alone?

On the other hand, Short (2000) asserts that the metaphor of marriage and divorce is all together wrong and that continuing to think of HRD as a marriage between disciplines may fundamentally impede its progress. Perhaps, instead, it would be better to acknowledge HRD as a child of a diverse set of parents. In so doing, the child would be expected to learn about its heritage and be grateful for all of it—including the parts from the “other” parent’s family. The child would be expected to deeply hold and integrate core values of each parent, rather than compromise the “other” parent’s set of values and beliefs. Willis’s (1997) assertion is that HRD will use whatever resources it needs to thrive and succeed. Perhaps that fittingly characterizes the teenager that HRD is now—a teenager that is passionately open and focused on the possibilities and the needs of the world and, yet at the same time, still struggling to figure out its own capacities, belief systems, foundations, and how it will fit in the world. Developmental theory would recognize this as a healthy and normal stage for a teenager and encourage this interdisciplinary odyssey. These disciplines together have produced a multitude of HRD scholars and practitioners who are rich in their diversity, and have given HRD a strong interdisciplinary heritage on which to grow. This metaphor of child also, of course, has implications for the parent. As a recognized “parent” of HRD, Adult Education must reflect on its role. Does a parent's job ever stop? What are the duties of this position we call a "parent”? How does a parent effectively use its influence as the child matures? How does a parent nurture the growth of an independent and successful child?

Behaviorally Anchored Competencies as Assessment Tools

Kim E. Dooley
James R. Lindner
Larry M. Dooley
Meera Algaraja
Texas A&M University

Gary Jedynak
Elaine Pattison
Summerhill Associates, LLC

This session will address the use of behaviorally anchored competencies as assessment tools to measure employee performance and learning in formal educational settings. Practitioners from private industry and higher education will discuss and provide self assessment instruments and authentication measures that promote dialog and continuous improvement for both the employee/learner and the supervisor/instructor. Challenges and solutions for human resource professionals will be discussed, with a focus on implementation of innovative approaches to measure performance based upon competencies.

Keywords: Behaviorally Anchored Competencies, Behaviorally Anchored Self-Assessment, Strongly Inferential Anchors

Introduction

Many businesses and educational institutions face numerous challenges in determining appropriate assessment tools to measure knowledge, skills, and abilities (competencies). One innovative solution is the use of behaviorally anchored scales to measure competence for performance appraisal and to measure learning/growth as a result of training/formal education. According to Klink and Boon (2002), current uncertainty in employment contracts necessitate that employees have a “clear insight into their competencies and into the possibilities of maintaining or improving their professional competencies” (p. 1). Employers on the other hand are seeking multi-skilled employees flexible enough to keep up with the pace of change and growth taking place in the workplace. Organizations therefore provide training so that individuals become more competent for effective performance in their jobs. In this scenario, the concept of competency is gaining more and more importance (Barnett, 1994). This is also the case in higher education (Dooley & Lindner, 2002; Dooley, Lindner, & Dooley, 2002; Lindner & Dooley, 2002). From experience based on this system, the authors have seen significant practical, economic, and legal advantages in comparison with other performance review systems. Innovative work in progress is application of this system to software development worker performance appraisals. Key to the long term observed success of this behaviorally anchored self-assessment system is a one page, simple self-assessment document. This document is kept very compact by using strongly inferential anchors.

Theoretical Framework

Competency based training has emerged as an important human resource development tool. Professionals have used competency models to “clarify organization-specific competencies to improve human performance and unify individual capabilities with organizational core competencies” (Rothwell & Lindhom, 1999, p. 104). A competency model is a validated decision tool, correlated to a specific group of activities that describes key knowledge, skills, and abilities for performing those activities (Buford & Lindner, 2002). Competency models can be used as a recruitment and selection tool; as an assessment tool; as a tool to develop curricula and other training material; as a coaching, counseling, and mentoring tool; as a career development tool; and as a behavioral requirement benchmarking tool (Yeung, Woolcock & Sullivan, 1996).

Copyright © 2004 Kim E. Dooley, James R. Lindner, Larry M. Dooley, Meera Algaraja, Gary Jedynak, & Elaine Pattison
Competency based education primarily is a training program that is individualized and focused on the outcomes. It has flexible pathways for realizing the outcomes. According to Watson (1990) competency based education is an approach to education that ensures that the competencies taught are those that are required on the job. The goal of any competency based education is to ensure transfer of learning on the job.

Transfer of learning and the ability to measure learning outcomes as a result of a training program have been major issues in training and development (Antonacopoulou, 1999; Kellie, 1999; Smith, 1999). “Currently, the individual’s perspective is relatively under-researched, thus much remains unclear about the way individuals perceive the association between training and learning and more significantly whether individuals actually learn from training” (Antonacopoulou, 1999, p.14).

**Description of Innovative Session Format**

Consider the conventional methods of performance review and formal education assessment. Employees are judged by supervisors who circle or check boxes to give “grades” (Halbert, 2000). College classrooms include primarily lectures with exams, also giving “grades.” Is there a better way to measure learning and performance?

This innovative session proposes the use of a practitioner forum to discuss challenges and opportunities while using behaviorally-anchored competency assessment tools to measure job performance and learning in formal educational settings. The practitioners will include consultants whose work conceptualized and implemented an innovative system of behaviorally anchored self-assessment and performance appraisal as workers progress from “novice” to “expert.” This system is empowering to employees because they have the opportunity to assess their own skill levels and receive feedback from their supervisors. Both are asked to identify “long-term personal objectives,” including “skills and knowledge required and/or future positions desired,” and the “skills and capabilities you have that could be better utilized in your present job or in the future” (Halbert, 2000, p. 41). It was noted by the consultants that this system puts an emphasis on what people actually know and provides a forum for conversation about what a person can do.

Another component of this practitioner forum will be a discussion from researchers who have implemented behaviorally anchored assessments in short-term training programs and graduate coursework in the university setting. Competency-based behavioral models have been used to help adult learners understand their core competencies, and may subsequently increase satisfaction, motivation, learning, and ultimately success in educational programs (Drawbaugh, 1972). Use of anchors to authenticate results overcomes limitations of self-administered rating scales that are typically used to measure perceptions of competencies. A model will be shared in the session that can serve as an additional tool for HRD managers to measure the quality of training and address public and political pressure to explain learning.
Agenda

1. Creating an Assessment Toolkit: Introductions and Overview of Session (5 minutes)
2. Hammer It In! Demonstration of Behaviorally Anchored Self-Assessment in Everyday Life (10 minutes)
3. Nuts and Bolts: A 7 Year Success Story in Manufacturing (15 minutes)
   a. Overview of Competency-Based Self-Assessment for Performance Appraisal
   b. Commercial Application in Collaborative Software Development
      BASA: How do you determine the expertise of the design team?
4. Taking Measurements: (15 minutes)
   a. Training and Education Overview of Competency-Based Self-Assessment for Documenting Learning
   b. Exercise on Distance Education – Technology Knowledge and Skills
5. Structure Building: (30 minutes)
   a. Small Group Discussion and Reports: Challenges in Developing and Using Behaviorally-Anchored Competencies as Assessment Tools
   b. Closing and Complete Self-Assessment Instrument

Grounding our HRD Practice in the Challenges of Management Development: A Case of China

Jia Wang
Wendy E. A. Ruona
University of Georgia

In the context of on-going economic reforms in the People’s Republic of China, the paucity of management resources is widely recognized as a major obstacle to the country’s endeavor toward modernization. This review of the literature explores pressing issues facing Chinese managers and current solutions being provided at the national, organizational and individual levels. Implications for management development are drawn and specific directions for future HRD research are presented.

Keywords: Management Development, International HRD, China

China’s economic reforms since 1978 have ignited the transformation of many Chinese state-owned enterprises (SOEs) from a centrally planned government allocation system to a free market oriented shareholding system (Blayney, 2001). As a result, cadres of managers have shifted from being bureaucratic administrators to becoming strategic decision-makers (Branine, 1996). China’s open-door policies and recent entry into the World Trade Organization (WTO) have further exposed Chinese managers to tougher global competition and higher standards of performance. In light of these changes, attracting and developing qualified managers has become a pressing issue for many Chinese organizations (Wang, 2002). Management development has been prompted speedily during the past two decades in response to the enormous and urgent demand for competent managers, however there is still a critical shortage of experienced and well-trained managerial personnel. In fact, it is widely recognized today that the paucity of management resources is a major obstacle to China’s endeavor toward modernization (Frazer, 1999; Newell, 1999, Wang 2002).

China’s economic transition has called for not only high quality managers but also professionalization of organizational management. How to transform so-called “civil servants” (gong pu) of SOEs into professional managers under the market economy has become a major issue in SOEs reforms (Li, 2003). Consequently, China is witnessing an emerging market of professional managers whose management experiences, talents, and skills are being recognized as valuable yet scare resources.

All of these challenges continue to emerge, and yet there is strikingly little information available that helps us to really understand the day-to-day challenges that Chinese managers experience. The limited volume of literature on management and management development in China reflects the formative state of research in these areas (Lau & Roffey, 2002). Even the information that is available is not effectively synthesized to allow the typical HRD professional to get a grasp of how to best design and implement HRD interventions that will be most helpful during this transitional time. HRD professionals working with Chinese managers need a clearer and richer understanding of the unique and complicated managerial and organizational issues facing Chinese managers. If HRD professionals are to facilitate the development of people and systems in organizations, they must be more fluent in these issues and ground their HRD practice in the challenges of the stakeholders they serve.

Purpose and Methodology

The purpose of this literature review is to assess the management and management development literature related to two questions. First, what pressing issues are facing Chinese managers in a transitional economy? Second, what solutions for these issues are being discussed in the Chinese management literature?

This paper presents the results of a review of the literature. Searches of both Western and Chinese literature were conducted at two different phases. For the Western literature, a thorough search via five American databases was conducted in areas of business/economics and education: ABI/Inform Complete at ProQuest, ERIC at EBSCOhost, PsychInfo, Academic Search Premier, and Business Search Premier. The following key words were used either alone or combined to generate as many publications as possible: “organization management,” “business management,” “Chinese managers,” “professional managers,” “human resource management/development,” “management education,” “organization development,” “management development,” and “China”. This search was

Pressing Issues Facing Chinese Managers in a Transitional Economy

The following themes must be understood in the context of five major transitions that have resulted from China’s change initiatives: (a) transition of the economy from being rigid planned to becoming market oriented, (b) transition of the country from being rural and agricultural to becoming urban and industrialized (Zhang, Yang & Zhang, 2002), (c) transition of the society from being closely self-contained to becoming more actively involved in the global community (Zhang et al), (d) transition of enterprises from being state-owned allocation system to representing private or collective forms of ownership (Blayney, 2001; Lau, 2002), and (e) transition of culture from being Confucian dominant to be more diverse with emerging socialism and capitalism (Yang, 2002). These five transitions have had a huge impact on managers. Fan (1998) likened this impact as “a non-swimmer being suddenly plunged into the ‘sea of market’ by the force of reform” (p. 203). In this section, we present three pressing issues facing managers during this transitional time.

Challenge of Changing the Managerial Role and Practice

China’s economic transition has shifted millions of Chinese managers from being bureaucratic administrators to becoming strategic decision-makers (Branie, 1996). For example, managers under the market-oriented economy have been charged with sufficient autonomy and responsibilities to set production quotas and make decisions while they were left with little room to do so under the centrally planned economy because production quotas were pre-established by central and local governments (Krone, Chen, & Xia, 1997). Hiring is another example. In the planned economy, hiring was based on state assignment of jobs while in the market economy the state has gradually removed itself from this administrative responsibility and managers increasingly make hiring decisions independent of state control (Guthrie, 1999). Further, the practice of organizations providing employees with guaranteed lifetime employment (iron rice bowl) and generous benefits (e.g., free medical care, housing) is being replaced by time-specific employment contracts (Wang, Ruona, & Rojewski, 2003).

While managers are forced to re-adjust their thinking and practice in the light of a market-driven economy that emphasizes performance and individual accountability (Branie, 1996), they are still found to make compensation or bonus decisions and evaluate subordinates based more upon relationships than work performance (Zhou & Martocchio, 2002). This kind of resistance to change has historical and cultural roots. Historically, China has been a rural, agricultural and self-contained society isolated from the outside world for many years. Culturally, China has been dominated by the Confucian ideology (Wang et al., 2003). It was not until the country’s recent opening to the outside that managers were exposed to different cultural norms and beliefs, different political and social systems, and different managerial mindset and conduct. Nevertheless, the strong cultural orientations of Chinese managers have often constrained them from understanding and accepting business and social practices that differ from their own, and these problems then “generate other human resource and strategic management problems, in job design, leadership, motivation, performance and productivity improvement, and organizational development” (Lau et al., 2002, pp. 3-4). Therefore, it is not surprising that even with a shift in managerial values, Chinese managers are more likely than their Western counterparts to engage in “informal” (what may be regarded in the West as illegal) business activities (Whitcomb, Erdenei, & Li, 1998). Further, the co-existence of traditional and reformed economic, institutional and cultural systems in China have caused more challenges for managers. For instance, despite the government’s continued effort in promoting the market-oriented labor contract system since the mid-1980s, a considerable number of employees in SOEs still hold the mentality of relying on the government or state agency to assign jobs rather than actively participating in the labor market (Zhang et al., 2002).

Challenge of Developing Management Competencies

This issue can be understood in two respects. First, periodic changes in China have made managers’ previous know-how increasingly inadequate and obsolete (Newell, 1999). Many managers have realized that skills they
acquired a decade ago are no longer sufficient for them to cope with changing business issues. In this regard, competencies such as problem-solving, strategic decision-making based upon a realistic understanding of market competition, and business English are most desired by employers (Shi, 2000). However, the majority of Chinese managers holds no education beyond high schools (Lau & Roffey, 2002) and have been promoted from workers or appointed because of their political and military background. The formal training they have received from organizations has tended to be in areas such as production and finance, even though there is a serious need for managers with knowledge in HRD, marketing, and organizational analysis (Branine, 1996).

Second, China’s global development initiatives (e.g., open-door policy, WTO membership) have exposed Chinese managers to higher international standards for competencies. A recent research conducted using the Managerial Proficiency Assessment studied 70000 global managers from 17 different countries and found that the 7000 Chinese managers under investigation scored much lower in relevant managerial skills including listening and Managerial Proficiency Assessment studied 7000 global managers from 17 different countries and found that the 7000 Chinese managers under investigation scored much lower in relevant managerial skills including listening and analysis (Branine, 1996). A reasonable conclusion can be reached that Chinese managers are not yet fully on track with the international world (yu guoji jiegui) (Guthrie, 1999) as the Chinese government has anticipated.

Challenge of Professionalizing and Standardizing Managerial Conduct

Related to the issue above, Chinese managers are facing the increasing pressure of professionalizing their conduct. This is confirmed by a survey of 300 middle-level Chinese managers in which 86% of them agreed that it has become imperative for organizations’ leaders and managers to professionalize their practices (Li, 2003a). Unfortunately, Chinese managers have continuously reported their struggles in the process of professionalization largely due to the lack of established government policies, effective market mechanism and sufficient organizational support. For example, in a recent study on the income of managers of 40 large Chinese enterprises directly under the jurisdiction of the central government, the Department of Labor and Social Security found that on average Chinese managers receive much lower pay than their western counterparts and in many cases the annual income of a Chinese CEO is only 1.5 times of that of an ordinary employee (Anonymous, 2002). Another recent survey on Chinese managers in Beijing, Shanghai, Guangzhou, and Shenzhen (the four most economically advanced cities in China) disclosed six areas that managers felt most frustrated about: (a) objectives being too ambitious to achieve, (b) unclear directions of organizational development, (c) high turnover of human talents, (d) unbalance between heavy workload and little compensation, (e) unfair competition in the labor market, and (f) lack of credit from organizations (Li, 2003b). The results of this survey partly reflect the current situation of Chinese managers. Further, inadequacies in both laws and enforcement have weakened professional morality and social responsibility in China (Wright, Szeto, & Cheng, 2002). It is predicted that it will take at least another 8-10 years before the market of professional managers in China reaches maturity.

Current Solutions for Management Development in China

China now faces the daunting task of developing more than seven million Chinese administrators. To accomplish this huge task, many strategies have been adopted at the national, organizational, and individual levels.

National Level

The central government has made substantial efforts in addressing issues facing Chinese managers. First, the central government has stipulated adequate national laws and policies as a reaction to the critical shortage of managerial resources in reformed China. These include, for instance, the Law of Labor, the Law of Professional Education, and the Law of Enterprise. A series of training policies have also been formulated to provide specific guidance for developing management staff in large and medium enterprises. The Guidelines for Training National Enterprise Managerial Personnel during the Ninth Five-Year Plan explicitly regulate that during the planned five-year period of 1996-2000 all the enterprise managers must attend a three-month training on business administration which consists of 12 subjects such as Corporate Finance, Marketing, International Business, Economics, and Human Resources Development. Meanwhile, they must also complete a minimum of seven-days training on newly formulated laws, policies, and pressing issues during enterprise reforms. However, no literature has been found to assess whether or how well these government policies have been implemented in reality.

Second, in an effort to establish effective professional management systems within enterprises, a series of strategies have been adopted by the central government. A typical example is the 2002 establishment of China Professional Managers Research Center (CPMRC) and the China Institute for International Professional Managers (CIIPM) under the administration of the China Economy and Trade Commission. These organizations are charged with central tasks such as conducting professional management related research, providing accreditation for managers, and promoting life-long learning among managers (Wen, 2003). The government has also proposed specific strategies to build effective professional management systems including (a) continuing research on
profession to deal with challenges day to day. However, it is apparent that Chinese managers are increasingly few studies have been found in the current management literature exploring how Chinese managers prepare themselves for the need for Chinese management personnel (Qu & Zeck, 2001).

Third, the central government has played a key role in management education by actively seeking the international assistance, especially from Western countries. A typical example is the development of Western-style MBA (Master of Business Administration) programs. Since the central government views MBA programs as an effective way to improve the quality of managerial personnel, the planning and implementation of MBA programs in Chinese universities are closely monitored by the Ministry of Education and the Academic Degree Committee (ADC, the highly ranked government authority supervising the award of academic degrees by universities in China) (Shi, 2000). In addition, the Ministry of Education and the ADC have also set up the National Guidance Committee for MBA Degree to supervise academic standards and evaluate the teaching quality of MBA programs offered by universities at different levels. At the same time, China has imported MBA programs from the United States, Canada, Australia and European countries. However, despite the government’s effort in quality control, a number of researchers and scholars have reported problems associated with both domestic and imported management programs. Included among these problems are cultural discrepancy (Fan, 1998; Lau & Roffey, 2002; Newell, 1999) and unqualified management educators (Frazer, 1999; Shi, 2000; Zhang et al., 2002) which are widely accepted as major obstacles to the transfer of learning. Compared to developed countries, management development in China appears to have a less coherent strategy (Zhang, et al,) and has a long way to go to meet international standard and the need for Chinese management personnel (Qui & Zeck, 2001).

Finally, the Chinese government has also made a special effort in developing Chinese managers into WTO experts. A result of this effort is a 2002 national training project launched by China Enterprise Management Training Center and the University of International Business and Economics. It is expected that within next two years about 6500 high-level Chinese managers will attend this program which mainly offer training courses on WTO rules and market economy knowledge (China Trade World, 2002).

Organizational Level
China’s SOEs reform during the past two decades has led to many fundamental changes in organization management. These continuous transformations are evidenced by organizations’ effort in restructuring, technological upgrading, and human resource development (Yiu, Wu, & Saner, 2000). The gradual reduction of organizational hierarchy and bureaucracy requires managers to understand the market economy, have major accountability to their stakeholders, and retain more autonomy in decision making. The selection of managers has shifted from governmental appointment to public competition which adds new pressures for organizations to develop their selection systems.

In addition, formal management training and development programs have been given top priority and have been adopted Chinese organizations as a core strategy for the organizations’ growth (Branine, 1996; Wang, 1999). The Chinese training market has witnessed rapid expansion in recent years. The domestic training expenses in 2001 were ¥ 30 billion (approximately US$3.8 billion) and amounted to ¥ 40 billion (approximately US$4.8 billion) in 2002 (Qu, 2003). Training has taken a variety of forms. For example, Frazer (1999) identified five training options for companies in China, including in-house training, the use of regional training centers, local outsourcing training, overseas work and study programs, and the local MBA programs. Similarly, Wang (1999) highlighted on-the-job technical training programs, formal management development programs (e.g., academic programs in economics and management), MBA programs, and management personnel on-the-job training programs. Although training has been given great importance, to what extent such an intervention has been sufficient and effective remains unclear. Branine (1996) characterized the process of introducing and implementing training programs in China as a great emphasis on quantitative rather than qualitative knowledge and as a poor appreciation of training priorities. He further critiqued the Chinese approach to management training and development for not being selective because training priorities are not clearly defined at the outset and being over-ambitious given the fact that the majority of managers have no education beyond high school and their management knowledge and skills are limited to the strict socialist central planning economy model.

Individual Level
Few studies have been found in the current management literature exploring how Chinese managers prepare themselves to deal with challenges day to day. However, it is apparent that Chinese managers are increasingly

22-1
committed to lifelong learning in both formal and informal settings. There is ample evidence that MBA education has gained and is increasingly gaining prominence among Chinese managers (Newell, 1999; Wang, 2003). Other means of learning include attending on-the-job training and management development programs and experiential learning - i.e. learning from personal experiences and mistakes, learning from the media, networking with other managers, and joining management associations, etc.

Implications

This analysis of the literature points to a few key themes for HRD professionals to consider. We organize them around two areas: management development in China (especially as is relevant for those practicing HRD in China) and future HRD research.

Implications for Management Development in China

First, it is evident from our discussion above that training has been adopted as a primary means to address the need for quality managers in China. This intervention is supposed to equip Chinese managers with adequate competences that will ultimately result in more effective managerial performance in the changing Chinese and global environments. However, both Western and Chinese management researchers and scholars have continuously reported problems associated with training programs-and these are increasingly being encountered in China. For example, Frazer (1999) stated that developing a quality in-house training program is one of the most difficult tasks for HR professionals in China. Shi (2000) found that the lack of qualified teaching staff, inappropriate teaching materials, and ineffective teaching methods are three major problems associated with MBA education in China. For Chinese management education as a whole, there is still a long way to go to meet the international standard (Qui & Zeck, 2001). Yiu et al. (2000) even went further by cautioning us that there is little evidence that training actually leads to better managerial and organizational performance. Thus the need to ensure adequate talent pools of middle and top managers in the coming decades continues to grow unabated even though China has invested extensive resources in training and upgrading its managerial talents. Two implications can be inferred here. First, HRD professionals working in China must be very critical when adopting training as an intervention, especially when managers’ issues are beyond what can be effectively addressed via training. Hence, conducting an in-depth organization and training needs analysis should always be on the agenda of HRD professionals. Second, HRD professionals should strive to find means to warrant the quality of training programs whenever they decide to use training as an intervention. In fact, a few scholars have already taken actions in this direction. For instance, Wang (1999) identified the following three approaches that are approved to be useful in management development in China particularly in international joint ventures: (a) process skills, teamwork, and context learning, (b) action learning and experiential development, and (c) cross-cultural management learning and strategic distributive training. However, many more actions must be taken.

Second, our analysis also revealed that organizations do not have effective systems to support the development of professional managers. It is widely accepted in China that an effective management development system must incorporate four areas of practice: selecting, motivating, monitoring, and performance evaluating. Yet it is found that none of these four systems has proved adequate within Chinese organizations (Anonymous, 2003a). Take the selection procedures as an example. It is not uncommon for a manager in a shareholding enterprise to be designated by his/her superior authority rather than being selected by the board of directors from the managerial talent pool. In other words, the selection of a manager is not guided by the principle of openness, equality, and fairness as it is supposed to be. Concerning the motivation system there is currently no significant difference in pay between a manager and his subordinate, nor adequate monetary or non-monetary incentives. Further, performance evaluation in Chinese organizations still reflects the old practice under the planned economy which is to base performance reviews on personal attributions (Hempel, 2001; Huo & von Glinow, 1995) rather than work performance. The lack of effective management support systems has resulted in the increased turnover of Chinese managers (Anonymous, 2003a). A huge task for HRD professionals is to help organizations build more market-oriented selection, reward, monitoring, and appraisal systems that will not only develop but also retain management talents.

Third, Western management techniques are being uncritically adopted in Chinese management programs primarily through the channel of imported management education and development programs such as MBA. While there is extensive demand in China for Western MBA degrees, there is also a strong agreement that these degrees are inadequate in addressing the values, needs, and expectations of both Chinese managers and the organizational environment in China (Lau & Roffey, 2002). This is largely due to cultural discrepancy in these imported programs and a clear gap between what Western programs offer and what modern-day Chinese organizations demand (Wang, 2003). Newell (1999) made this point well with the following statement.

The manager in China faces a very different set of problems from his/her Western counterpart … and has a
very different set of underlying assumptions and values. Recognising the importance of developing a new cadre of managers, but relying on transferring explicit management knowledge from the West, may ironically impede economic development, by over-emphasising simple mechanistic tools, which bear little relation to reality and will not really help to solve the organizational problems in China. (p. 291)

HRD professionals must work harder to understand the demands on managers and how the Chinese and Western ways of working relate to each other. In addition, the cultural context plays a critical role in facilitating the transfer of learning. An uncritical adoption of Western management theories and techniques without recognition of unique Chinese environments is unlikely to resolve Chinese problems (Wang et al., 2003).

Fourth, as mentioned earlier, the professionalization of management is a result of the development of the market economy. Therefore, management competencies are not natural or in-born skills but are acquired and developed through long-term training and developmental experiences (Anonymous, 2003a). It is HRD professionals’ responsibility to promote learning at both the individual manager and organizational levels. Further, given that the need for professionalizing management practices was not felt until the late 1980s (Anonymous, 2003b), China is witnessing the burgeoning of the market of Chinese professional managers, and guidelines for professional conducts are yet to be established. This presents a large area that HRD professionals can take a lead in helping organizations improve the quality of Chinese managers.

Implications for Future HRD Research

In light of the foregoing discussion, the following research areas seem likely to make an important contribution in helping HRD professionals to facilitate further management and organization development in China.

Building a management competency model with Chinese characteristics. Managerial competencies should be defined by focusing on various Chinese organizations’ critical success factors and the particular challenges that are likely to face Chinese managers over the next decade and beyond. For example, state enterprises will need people to manage international competition and global expansion. Government ministries and agencies will need people to formulate effective policies to deal with constant political-socio-economic-cultural changes confronted by a technologically advanced society. Political organizations will need people who know how to manage the governance infrastructure in an interconnected global community, while social organizations will need people who can strengthen the functioning of the civil society. Whatever the nature of these organizations, they all require people who can manage change, rejuvenation, and growth. The task for HRD professionals is to develop multiple sets of managerial competency models that can guide management development more coherently.

Identifying the development paths of successful managers. It is widely believed that managerial and leadership skills can be taught through training and development. However, there is still little evidence that management training actually leads to better organizational performance (Yiu et al., 2000). This lack of transfer is particularly predictable when training programs are disconnected with the performance needs and/or strategic orientation of the organization. However, on-the-job learning seems to be formative for managerial success. Therefore, it would be useful for HRD professionals to conduct research to document the effectiveness and impact of management development so we have more evidence of if/how it affects managers and organizations.

Developing a profile of Chinese managers. Given the dearth of Chinese management theories and the minimal empirical research in China over the past fifty years, little is known about Chinese managers—their changing management values, styles, practices, etc. Some effort has been made in studying Chinese managers. For example, Ralston, Egri, Stewart, Terpstra, and Yu (1999) developed a profile of the new generation of Chinese managers based on measures of individual values (individualism, collectivism, and Confucianism). However, it would be extremely helpful if HRD professionals can further and more deeply understand modern Chinese managers. This will help in many ways including to begin to reveal the strengths and weaknesses of the existing managerial pool. The results of such an endeavor could then serve as a guide not only for Western organizations who plan to engage in business in China, but more importantly, for HRD professionals when designing OD interventions and training programs that will develop, enhance, or supplement existing managerial competencies.

Identifying situational factors that affect managerial and subsequently organizational performance. Research in this direction is particularly meaningful given the dramatic changes which have taken place in China in the past twenty years. Data needs to be collected concerning the contextual factors which impact both individual and organizational performance. This data will provide HRD professionals with a better insight into the dynamic interplay between managers and their working environments.

Assessing current interventions for management development. Few studies have been forwarded in the literature we reviewed, yet we see an increasing number of scholars moving toward this direction. For example, Zhang, Zhang, and Yang (2002) empirically examined the applicability of the learning organization intervention in Chinese SOEs and found that the Chinese version of the Dimensions of Learning Organization Questionnaire demonstrated acceptable psychometric property. Newell (1999) conceptually explored the transferability of Western management
knowledge to China and suggested that a community model, rather than the cognitive model of knowledge
development could be a good fit with Chinese culture. Effort in this area will be extremely worthwhile because it
provides HRD professionals with a solid base that can enable them to make the best decision.

In sum, HRD professionals must continue to build a firm understanding of organizational and managerial issues
in the coming decades. They must take a more proactive role and make more conscious attempts so that they can
discover more effective ways of developing managers and maximizing their managerial capacity.

Conclusion and Contributions to HRD

This paper has explored a critical area of concern among Chinese organizations and managers. Although this
exploration has been a rather broad brushstroke at the conceptual level, it has intended to provide insightful
information for HRD professionals. In this paper, three pressing issues facing Chinese managers were identified and
strategies to address them were also discussed at the national, organizational, and individual levels. Current
management development issues in China have been tackled, but not entirely and with mixed results.

Given China’s phenomenal economic expansion, corresponding social and administrative complexities, and
their continuing effort to globalize, it is imperative that Chinese organizations ensure better equipped talent pools of
middle and top managers in the coming decades. The need to groom future managers who can oversee operations at
various hierarchical levels with various types of organizations will remain a huge challenge for HRD professionals.
Another issue that deserves reiterating is the emerging trend of professionalizing management in China. What is
garnering the most passion and concern among Chinese managers today is how to professionalize and standardize
their conduct so that they are in a better position to compete against their international counterparts. This is certainly
an issue most Chinese organizations are grappling with, and HRD professionals are in a unique position to discover
more effective ways of unleashing and maximizing managers’ capacity.

This paper contributes to HRD in four ways. First, focusing on a developing country like China where radical
changes have taken place in the last two decades, this paper presents more details about a case in which HRD
professionals practice in an unstable environment full of high ambiguity and uncertainty. Given that most conceptual
and empirical studies in the field of management training and human resource development are conducted in
developed countries, this literature review provides a needed perspective and expands our current understanding. Second,
this paper adds knowledge to management development by outlining the critical concerns of Chinese
managers and by synthesizing findings that could inform the development of management resources in China. Third,
by analyzing the unique issues facing managers in the Chinese context, this paper increases the cultural awareness of
HRD professionals and situates them in a better position to develop culture-sensitive HR/OD interventions that will
be most appropriate to the Chinese situation. Lastly, for HRD scholars who are interested in Chinese management
studies, this paper provides specific areas for future research.

A Review of HRD Research in Three Areas of East Asia: Mainland China, Taiwan, and Japan

Yi-Hsuan Lee
Jie Lin
Kenneth. E. Paprock
Susan A. Lynham
Jie (Jessica) Li
Texas A&M University

Recent research focusing on Human Resource Development (HRD) in East Asia is attracting increasing attention. The purpose of the study is to explore the definition and practice of HRD, together with influencing cultural factors, in Mainland China, Taiwan, and Japan. The results indicate a difference in the definition and implementation of HRD among these three areas, and that the nature and role of HRD are influenced by cultural factors specific to each region examined.

Keywords: HRD in Mainland China, HRD in Taiwan, HRD in Japan

Organizations increasingly operate within a global context. It challenges both HRD practitioners and researchers to examine the definition, implementation and function of HRD in multinational environments. A common problem in defining the field of HRD lies in the majority of studies being limited to a North American perspective (Ruona, 2000). Singh (Peterson, 1997) argued that HRD, as defined in the United States, may not be an appropriate definition for other regions. Similarly, McLean and McLean (2001) commented that a US perspective alone does not represent the entire field of HRD. “It appears that the definition of HRD terms varies from one country to another, and the national differences are a crucial factor in determining the way in which HRD professionals work”. (Hillion and McLean, 1997, p. 695) Maclachlan (1993) offered similar conclusions, namely, that HRD practitioners from different countries use culturally based perceptions and attitudes to define their work and its effectiveness that may differ from American-based HRD definitions. Furthermore, that the social cultural factors affecting the thinking and learning styles and local perceptions of HRD effectiveness lead to differences in the mission and means of the developmental aspects of HRD (Hansen & Brooks, 1994). Therefore, it is important, especially for international HRD researchers and practitioners to explore the difference in which cross-cultural and cross-national enterprises formulate and apply their HRD frameworks.

Purpose of Study

We focused our research interest among Mainland China, Taiwan, and Japan. The reason for this focus was due to authors’ preference, interest, and cultural familiarities with these three regions. In reviewing the literature, we discovered that even through there were studies of the HRD field available for these three regions, however, there is no single research that summarizes the similarities and differences in the definition, practice, and cultural influence of HRD within and among these three regions. Given the importance of cross cultural and cross national difference in HRD research and practice, this paper attempts to address the gap and does so in the following three specific ways:

1. How is HRD defined in these three East Asian areas?
2. What constitutes HRD practice in these three East Asian areas?
3. How does the cultural influence the HRD practice in these three East Asian areas?

By doing so, the authors intend to provide references for international HRD researchers and practitioners who are interested in these areas or working in these areas when making critical HRD decisions.

Methodology and Limitations

The methodology used for this paper was one of conceptual review, analysis, and synthesis of related scholarly literature. The predominantly available literature came from relevant refereed publications, including conference
proceedings and secondary materials on human resource development (HRD) strategies in Mainland China, Taiwan, and Japan, and the role of these strategies in the economic development of these regions and countries. A keyword search of HRD and various related terms conducted through several large search engines at a major university in the United States yielded several sources. The analysis of the data consisted of two steps. First, the results of the literature review were reviewed and compared several times for individual research questions. Following, conclusions were synthesized and summarized from the outcomes of step one, and used to inform recommendations for future related studies.

It is important to acknowledge that this exploratory study has at least three limitations. First, all studies reviewed were limited to available English-language literature. As McLean and McLean (2001) suggested, the literature readily available in the United States tends to focus on a US perspective. The limitation of this tendency in accessible literature is evident in this study. Due to language limitation, research material in Japanese are not readily available in the United States tends to focus on a US perspective. The limitation of this tendency in accessible literature is evident in this study. Due to language limitation, research material in Japanese are not reviewed. In addition, online resources about HRD in China are limited and most material available was focusing on HR practice in general. Second, few synthetic data studies addressing HRD definition and practice and the influence of culture in these three regions were found. This lack of synthetic data within these three regions points to a gap in the literature and underscores the need for more studies. Third, it is recognized that for the development of a broader understanding of HRD in East Asia, more countries need to be included in this study, a limitation that is currently being attended to by the authors, and will attract further attention of other researchers.

In spite of these limitations, the research resources on HRD that were available and accessible to us enabled a fairly thorough analysis of HRD in the three regions. In addition, among the authors, there were years of practical HRD experiences in these three regions which should allow first-hand analysis of HRD practices to be included in this study. The authors are confident that the insights gained as a result of this study should be able to add to the development of HRD in East Asia as well international HRD as a whole.

Theoretical Framework

The majority of the research studies consulted related to HRD definitions and practices in East Asia, specifically at the national and local levels. As previously pointed out, synthetic research studies that contrast and integrate HRD among different nations are hard to come by, a finding consistent with the experience of this study. In order to better understand the nature and role of HRD in East Asia, researchers have explored and interpreted how economic success has influenced the practice of HRD in these regions (Lee & Stead, 1998; Niemi & Owens, 1995; McLean & McLean, 2001).

Outcomes of the analysis of the literature reviewed clearly points to the existence of regional and cultural differences in the way the term HRD are formulated and interpreted (Hillion & McLean, 1997; Maclachlan, 1993; McLean & McLean, 2001; Peterson, 1997). As pointed out by McLean and McLean (2001), and in a 2001 special issue of the Human Resource Development International (HRDI) journal, HRD practitioners use different terms to identify and describe the construct of HRD in different nations. Clearly the term, HRD, has different meanings in different countries. Similarly, the findings of this exploratory study indicate clear differences in tasks and means of training, organizational, and career development systems among the three East Asian regions considered. Furthermore, these differences are shaped by economic status, employee development, and governmental policies.

As for the practice of HRD in Asia, many studies that explored HRD activities in different countries implied that, although the majority of HRD principles applied internationally originated in the U.S., the nature and purpose of HRD activities differ in each country (Harada, 1998; Hillion & McLean, 1997; Kuo & McLean, 1999; Wee-Liang-Tan, 1998; Yan & Mclean, 1997). For example, in the transition from a planned economy to a free-market economy in Mainland China, HRD is shaping up differently in difficult sectors of the economy and in general it is not well distinguished from human resources (HR) practices. The definition and understanding of HRD among the four major sectors of the economy, the state-owned enterprises, private-owned companies, Joint-Ventures, and foreign-owned companies, could reveal totally different understanding and practices in the field of HRD.

Although cross-cultural HRD was paid increasing attention in the literature (Bennett, Aston, & Colquhoun, 2000; Black & Mendenhall, 1990; Osman-Gani, 1996), there still is a surprisingly limited amount of literature that addresses HRD professionals working cross-culturally (Black & Mendenhall, 1990). Most of the writings on cross-cultural and international HRD strongly suggest that HRD practitioners must pay attention to socio-cultural factors. Black and Mendenhall (1989) indicate that the HRD models of many countries vary significantly from those common to the USA. They also suggest that interpretation and definition of HRD is a function of both local culture and social history.

In summary, and specific to the East Asian region that is the broader focus of this study, there is a lack of synthetic data relating how what makes for HRD in different countries and regions, and how this definition is
influenced by local perception, practice, and culture. This absence of synthetic HRD literature is not only an obstacle to understanding the role and nature of HRD in various regions and countries of the world, but also to that of the general construct of what makes for international HRD.

Research Findings

The review of the literature revealed a number of themes. Next, these themes are presented and discussed against the three research questions posed in this paper, namely: How is HRD defined in these three East Asian areas?, What constitutes HRD practice in these three East Asian areas?, and How does the cultural influence HRD in these three East Asian areas?

Definition of HRD

Currently, HRD literature and practices in the USA and throughout the world have been strongly affected by the definition of the American Society for Training and Development (ASTD) proposed by McLagan in 1989 (Paprock, 2003, p.1): “Human resource development is the integrated use of training and development, career development, and organizational development to improve individual, group and organizational effectiveness.” Although researchers suggest that most countries have used this USA definition of HRD, it was changed in each of Japan, Mainland China, and Taiwan because of the influence of some variables, like economy, governmental legislation, and national context, and culture, on the construct (McLean & McLean, 2001), and as indicated in the discussion following.

Japan. According to Harada (1999, p. 357) the concept of human resource development can be identified by three terms. The first is that of “Noryoku kaihatu” meaning “development of individual abilities”. The second is “Jinzai keisei” meaning “formation of a masterly level of human resources through the work system and training”. And the third is the term “jinzai ikusei” meaning “fostering the development of human resources through management of the human resource process”.

Harada (1999, 1998a, 1998b) further suggests that an outcome and process perspective can be used to describe HRD in Japan. The outcome perspective of HRD includes “the development of desirable human resources, characterized by employees who acquire corporate knowledge and a high level of job competencies to use in the improvement of products or services” (1999, p. 357). The process perspective of HRD involves learning activities and opportunities designed to grow employee job competencies by developing potential human capabilities through their job experiences.

Taiwan. The concept of HRD in Taiwan is still confused with that of human resource management (HRM), involving personnel, training, manpower planning, and industrial relations. HRM is therefore considered to be more significant than HRD in Taiwan. Nevertheless, some researchers (Kuo & McLean, 1999; Lee & Chen, 1998; Lien & McLean, 2001) have begun to identify the role, policy histories and current practices of HRD in Taiwan. According to Lee & Chen (1998), HRD in Taiwan is defined as “the systemic education, training and development which employers provided for their employees to promote career development for employees and organizational development for corporations” (p.3). Kuo and McLean (1999), by reviewing the literature related to the field of HRD in Taiwan, defined HRD in Taiwan as “a systematic, intentional, innovative, and long-term committed process of developing an individual’s work-related learning capability through education and training with an aim to contribute to individual, organizational, and national growth” (p.448).

Mainland China. HRD is a relative new concept in China. Under the socialist planned economy, the meaning of HRD is placement, social ware fare, record keeping and move up among the ranks solely by party assessment. With the economic reform in the past twenty four years, China has been experiencing double digits growth and comes with it were the influence from the western world and other Asian countries and regions. HRD was the first noticed in China as an important field of study in mid 1990th. Even though, a comprehensive definition of HRD for Mainland China was not easily available from the literature, however definitions for both individual training and development, and organization development are readily available (Yan & McLean, 1997). McLean and McLean (2001) contacted the China Training Center for Senior Civil Servants (1997) and obtained a preliminary definition of HRD, namely, “A planned and organized education and learning process provided by organizations to improve employees’ knowledge and skills as well as change their job attitudes and behaviors. The process helps unleash the employees’ expertise for the purpose of enhancing individual performance and achieving effective organizational functions”. As further indicated by McLean and McLean, “In many ways, there is no distinction at present between HR, HRD and personnel in Mainland China” (p. 316).

Practice of HRD

Japan. In Japan HRD receives strong support from all levels with Japanese companies (Weber, 1984). Japanese employers are very concerned with recruiting and training, and most organizations develop their own strategies,
plans and training programs and other approaches to employee capability development (Frank, 1988).

Harada (1998; 1999) conducted a comprehensive study regarding the HRD function in Japan. According to him, individual development (ID), career development (CD), and organizational development (OD) are the three major practical components to HRD in Japan. Individual development, including On-The-Job training (OJT), Off-The-Job training (Off-JT), and self-development programs, focus on obtaining higher levels of job mastery and competencies. The ID activities among Japanese companies that include OJT were categorized as the acquisition of job-related procedural know-how learned at the office, job-related information gained from various sources and customer/client-related knowledge learned from customer interactions. Off-JT provided by Japanese companies was found to be based on: (1) levels of managerial rank, (2) orientation program, (3) job classification, and (4) levels of job competency. In addition, self-development program were found to be focused on personal development including acquisition of job-related and non-job-related certifications through workshops, correspondence programs and higher education degrees.

Highlighted in Harada’s study, career development in Japanese companies is comprised of job rotation and assignments, and Job Qualification Competency (JQC) rankings. Through the JQC system, employees are able to increase their knowledge, skills and abilities (KSAs) which are required for a particular qualification rank in the job. Through job rotations and assignments, employees can obtain necessary KSAs at each rank and accumulate job experience required for promotion. Generalists and specialist constitute two major career paths within Japanese companies. Through the experience of job rotation, transfers, and assignments, generalists can become managers. Specialists, on the other hand, are reported to be limited to horizontal career paths provided by the company.

Harada (1998; 1999) pointed out that OD methods developed by Japanese people largely consist of the group activities of Total Quality Control (TQC), Just-in Time, and Quality Control Circles (QCCs). OD methods are integrated into the work process in Japanese companies. Hence, these methods assist the work system to make continuous changes in work processes and environments. A variety of learning activities, which focus on the overall human system, are incorporated into the OD system to bring about changes for the operational improvement of the organization.

Additionally, it is worth mention that “Japanese management practices provide an overall frame for HRD while the work system indicates actual HRD activities” (Harada, 1998, p.93). HRD activities are therefore clearly practiced in most Japanese firms. Many large organizations have their own technical institutes to support in-plant training. Small and medium enterprises, which cannot afford the expense of their own technical institute, can utilize training facilities provided by government or facilities of larger companies if they belong to the same company grouping or have close relationships with them.

Although it is admitted by Japanese HRD professionals that the HRD system in Japan is frequently adopted from the West, the HRD system in Japan is more comprehensive than in other countries in Asia (Weber, 1984). Nevertheless, it is reported that lifetime employment and the work system is undergoing substantial changes and that a new HRD system is currently emerging in Japan (Harada, 1998; 1999). More investigations into the operation of this emerging HRD system are expected in the future.

Taiwan. The current status of HRD in Taiwan was explored by Jean (1993). After investigating 1000 large-scale enterprises and small and medium enterprises, Jean concluded that: 1) training in large-scale enterprises is mainly focused on in-service specialized training, orientation for new employees, and leadership training for potential heads, while orientation for new employees in small and medium size enterprises constitute the major element of training, followed by safety and hygiene training and on-the-job specialized training; 2) more than half of the large enterprises investigated had organized training departments, however, training departments were seldom found in small and medium size enterprises; 3) in terms of training instructors, most of enterprises were found to rely on insiders, while professional experts were brought in from outside the organization; and 4) a lack of enthusiasm among employees, a lack of qualified training personnel, and insufficient support from policy-makers were the major difficulties encountered by the enterprises. Furthermore, high employee turnover rates, lack of personnel conducting training and a shortage of funds were the given reasons for why employers in small and medium size enterprises were reluctant to conduct training activities.

It can therefore be concluded from Jean’s study that HRD receives more emphasis in large-scale Taiwanese enterprises. The shortage of training professionals and the low level of interest and satisfaction with training activities among policy-makers, employers and employees are essential challenges that need to be overcome (Lee & Chen, 1998). Furthermore, HRD in small and medium-size enterprises appear to be still restricted by their inherent limitations.

Lien and McLean (2001) conducted an interpretive study to describe the experiences of Taiwanese Human Resource (HR) practitioners who are performing Human Resource Development (HRD) tasks. Seven participants were interviewed about their daily work experiences as HR practitioners. Three major themes were produced from
the data analysis: “(a) HRD is one aspect of HRM, (b) HRD is equated with training in Taiwan, and (c) HRD success relies on the vision and support of top management” (p. 66). The researchers concluded that organizations neither regarded HRD as a separate profession and nor distinguish HRD activities from those of HRM. Furthermore, HRD practitioners appeared to seldom recognize their role as change agents within the organization in Taiwan. Instead, HRD practitioners tended to be recognized as training specialists because the majority of their responsibility was to deliver training. The Taiwanese organizations investigated were found to see HRD as associated with training rather than a broader scope of activities, or even training and development. Supported by Jeans’ (1993) study, the researchers also indicated that many HR activities in Taiwan do not succeed without top management commitment. In other words, HR practitioners are able to do more meaningful work if the leader of the company has a clear vision and supports training and other HRD-related activities.

Kuo and McLean (1999), by reviewing the history of HRD in Taiwan from 1949 to 1999, indicated that most of HRD policies in Taiwan aimed to promote economic growth. Furthermore, three functions core to Taiwan’s HRD system emerged from the strategies and policies adopted by the Taiwanese government. First, HRD assists in increasing the employability of the laborers, thereby decreasing unemployment, and enhancing economic growth. Second, HRD helps handicapped people to develop needed job skills. And finally, HRD improves employee skills levels, upgrades technological levels, increases job mobility, and lessens structural unemployment (Kuo & McLean, 1999). Thus, from their point of view, vocational education and employee training seem to constitute the major roles of HRD in Taiwan, with the primary purpose of HRD being to improve the national economy and reducing unemployment rates.

Although career development and organization development are significant components of HRD in Taiwan, there are still only a limited amount of studies exploring these two aspects. Hence, more studies regarding career development and organization development as components of HRD are required in this East Asian area.

Mainland China. In a 1992 study undertaken by Xu and Ma on HRD in China, it was found that the whole HRD profession was under-developed. This under-developed state of HRD was considered partly caused by such problems as the limited number of people receiving higher education in China (Yan & McLean, 1997). A shortage of skilled workers is a common problem faced by Chinese organizations. Furthermore, employers do not feel that the education system is addressing the necessary skills needed (Venter, 2003). Although China’s frame of HRD does not appear include career development, increasing attention has been paid to HRD during the early and mid ninetieth to organization development and employee training (Yan & McLean, 1997). Benson and Zhu (2002) also believed that, in spite of the underdevelopment of HRD, there is potential development of the HRD system in China by, for example, increasing pre-employment vocational education, employment training centers, and expanding higher education.

China has gradually recognized the important of as Nieml and Owens commented that “the Chinese government recognizes the importance of HRD in an enterprise, as a process that would involve workers in new learning” (1995, p. 19). Xie and Wu (2001) also stated that HRD problems are gaining national attention now in China, because scholars and policy-makers realized that HRD is not only the key to economic development, but also would be one solution to employment and population aging problems. In terms of organization development, Yan & McLean (1997) suggest that in the past few years China has insisted on implementing different policies to reform and build new functions in government, institutions, and enterprises. They believe that the Chinese government in recent years has focused increasingly on organization development and human resource development, with organization development not being considered a component of HRD.

Strongly influenced by the HRD practices brought in by foreign investments and joint-venture companies, and the emphasis from the government for HRD, we could see major changes in the HRD field in China in the past seven or eight years. Based on authors first hand experience in the field of HRD in China, the changes can be summarized into the following areas. First of all, the state-owned enterprises started investment in HRD, companies like TCL, Hair and Future Wave has formed their own HRD practices which combine the western theory with Chinese culture and believes. Some private owned companies began invest in people, even thought still in very small numbers. Joint ventures and foreign owned companies started to pay attention to customize and adapt their home countries HRD practices to better fit Chinese environment. Additionally, HRD as an academic discipline has emerged in Mainland China. In 1996, the first two HRD program were established in Beijing University and Nankai University.

Culture Factors Influencing HRD

Culture can be defined as “shared reality that individuals and groups value and accept as a guide for organizing their lives” (Ramsey, 1996, p. 9). Most authors agree that particular cultures and traditions have significant influence and impact on HRD definition and practice. Hansen and Brooks (1994) suggest that cultural frames which affect business are multidimensional in that employee beliefs are shaped by national-societal values. From a summary of
findings on cultural influences on the HRD system, Peterson commented that “what is know is this: culture plays a role in understanding international organization and international HRD”, but that “technology and industrialization have had a leveling effect on some cultural distinctions” (Peterson, 1997). Marquardt and Engel (1993) also refer to the importance of understanding cultural factors in HRD thought and practice: “…global HRD programs cannot succeed if cultural factors are ignored” and that “diagnosing and understanding trainee’s cultural values are as important as recognizing their training need” (p. 16). McLean and McLean (2001) point out that differences in national culture, in particular a country’s value system, are reflected in the definitions collected from around the world. They also mention that HRD roles, competencies, and scope of activities are influenced by national culture.

Swaak (1995) suggests that in East Asia, especially in Japan, Mainland China, and Taiwan, many values reflected in the behavior of workers today originated with Confucius, a renowned educator and thinker who lived in the Fifth Century B.C. He explains that Confucianism emphasizes the importance of the family, a favoring of order, and a stable hierarchy. Confucianism therefore informs the basic national and individual code of conduct, informing the avoidance of friction and disharmony in working or social relationships. Swaak further argues that given this cultural framework, it is no wonder that East Asia reflects a particular perspective of the business environment and of HRD practices.

The literature reviewed supports Swaaks’ point of view. For instance, Black & Mendenhall (1990) comment that according to the finding of Hayes, Anderson, and Fonda, training in the United States is intended to develop richness and diversity in job performance. However, in Japan it is attaining perfection and increasing the ability to learn. Austin (1990) concludes that Japan and China reportedly share certain group decision-making practices because of their group-oriented culture. Especially in China, negotiators place great emphasis on friendship and personal relationship, and this derives from their concept of guanxi, a relationship between individuals that allows them to make unlimited demands on each other. This concept provides further impetus to Swaaks’ point, namely, that East Asian workers pay so close attention to their work groups. What’s more, Weber (1984) conducted cultural comparisons and reviewed training programs in Japan. He reported that training program were supported from various levels within companies, and attributed this support to the paternalistic orientation of most large Japanese companies.

With the rapid economic growth, culture and value system in Mainland China has changed largely during the past decade. The co-existence of Western and Eastern values results in the turbulence of value system in China society today (Matthews, 2000). These changes have many impacts on the HRD practices in China. For example, loyalty was considered a main attribute of a good manager in China, a claim supported by an investigation by Liu in 1988 (as cited in Yan & McLean, 1997) that reported that 60.7% of Chinese people never change their jobs in their lifetime. However, Chinese people has become more mobile, especially the young and well educated in recent years. The government has also relaxed in regulation policies to support the mobility of these people. HRD practitioners are called to create retention programs to attracted and retain the highly desirable employees. For instance, Motorola sent 100 Chinese employees to the United States for about a year to train them with technology skills, which cost up to $3 million annually (Pacific Bridge, 2001). Nokia created a retention program in 1999 to provide the top 50 employees with unique training opportunities for over a two year period. The loyalty to people and company may have been substituted by the loyalty to development opportunities which rooted in the Chinese tradition value for a good education.

**Implications to Future Study in HRD**

Professional organizations are becoming increasingly globally operated, both in practice and academic. As McLean and McLean stated, “If we are to create a body of knowledge that is relevant to academicians and practitioners around the world, the definitions we use must be inclusive of the range of contexts that exist in the multitude of nations which we live and work” (p. 322). Currently, most theories and operational actions concerning HRD were generated in the West. There is a large need for more comprehensive perspectives involving the interpretation and implementation of HRD in a global context.

This paper explored and synthesized the definition, practice, and cultural influencing factors of HRD in three East Asian areas. It should offer practical applications for HRD researcher and practitioner in these regions or in international HRD field to examine and study. Through this study, reader can clear identify how culture and policy can influence a practical field of HRD and same goes to the economy development. It calls HRD practitioners and researchers to pay special attention to culture, policy, and economic status when enter an unfamiliar culture or country to practice or conduct HRD research.

Although most studies examined are limited to English literatures, the authors believe that this review still provides a new synthetic perspective to help understand the transferability of the framework of the HRD system to
multinational circumstances, and suggests that more synthetic inquires be conducted which focus on theory and application of HRD among the different East Asian regions.

Conclusions

In terms of definition of HRD, a difference in what constitutes HRD among the three areas of focus emerged from a review of related and relevant literatures. The definition of HRD in Japan is more comprehensive than that in Taiwan and Mainland China, and more close to the HRD system in the West. Although Taiwan practiced HRD earlier than Mainland China, both of them reflect a lack of distinction in definition between HRD with HRM, emphasizing personnel training, and manpower planning in both areas. Especially in Mainland China, the officially and scholarly defined HRD is under construction.

In Japan, HRD activities are often incorporated with HRM activities. However, in Taiwan, the implementation of HRD relies on HRM practices, and government and its policies play an important role in shaping HRD practices, mainly through implementing the HRD policies and education of HRD practitioners. Further, the success of implementation of HRD depends on the support from top management. Most HRD activities in Taiwan are conducted by large-scale enterprises. Because of a high turnover rate and a scarcity of funding, the small and medium scale companies seldom engage in HRD activities. The practices of HRD in Mainland China are mostly through the contribution of multinational enterprises with most training programs being limited to inside these foreign-owned corporations.

As for the influence of cultural factors on HRD, we can draw a number of conclusions from the findings that emerged from the literature review, namely: that what makes for the roles of HRD are influenced by cultural factors; and that the nature of the East Asian culture, together with an operating philosophy that originated from Confucius, seem to significantly influence the behavior of HRD practitioners.

References

Differences in global contexts clearly influence and change what makes for HRD, making it important to study and understand HRD from these different contexts (McLean & McLean, 2001). Interested in what and how international contextual factors change and influence the definition and practice of HRD, this paper explores HRD in the economic region of Latin America, and forms part of a larger study of HRD in different economic regions of the world.

Keywords: Latin America, International Human Resource Development, Training and Development

Human Resource Development (HRD) has long been concerned with processes of developing and unleashing human expertise for the purpose of improving learning and performance (Swanson, 1995; Texas A&M University, 2001). In the context of the United States of America, HRD has largely been confined to and studied within the context of the organization, and largely for-profit organizations at that. However, in an emerging global economy, “…the transfer of learning, new knowledge and the notion of intellectual capital has become important to leveraging competitive success and does [have] sensitivity to local conditions” (Horwitz, 1999, p. 180). As McLean and McLean (2001) and a special issue of the Human Resource Development International Journal (HRDI) in 2001 pointed out in their inquiry into the definition of HRD in various parts of the world, what makes for HRD, both in terms of process and intended outcome, is significantly influenced by the local (national) and regional (continental) context in which it is studied and practiced.

This paper represents an initial exploration of the construct of HRD as it is thought about and practiced in Latin America and is presented in a number of parts. First, the problem statement, theoretical framework, and research questions that direct and inform the study are made explicit. Second, a brief description of the study methodology is provided. Next, an overview of contextual factors driving and shaping HRD practice and outcomes of HRD in Latin America are presented, together with implications of these findings for future HRD research and practice.
Informed by the purpose of the broader study of how HRD thought and practice vary among different world economic regions, and how these differences inform the construct of international HRD, this study considers HRD from a Latin American perspective. Three primary questions were used to construct this study:

- What key contextual factors (e.g., social, economic, political, and cultural) drive and influence HRD in the Latin American region?
- What is the necessary purpose of HRD in the Latin American region?
- What are possible implications of these factors and purpose for HRD research and practice in the Latin American region?

Methodology

The three research questions posed by this study were addressed by way of a review, analysis, and synthesis of related and available literature. Electronic databases were used to identify and locate empirical studies reported between 1998 and 2003 that provided data about Latin America, and HRD in Latin America, which included the Caribbean, Central America, Mexico and South America. Most of the studies found in the search were of a regional rather than a national nature—that is, fewer studies found were on HRD in specific Latin American countries, than on HRD in the Latin American region as a whole. While we searched multiple journal databases and online indexes in the conduct of this exploratory study, and even though these databases yielded an abundance of results, less than a hundred studies met the keyword topics we finally selected to guide the search.

The keyword topics used to inform the literature selected for inclusion in this study tended to cluster around four HRD-related subject areas: (1) regional contextual factors, including historical, cultural, economic and social issues; (2) frequently perceived components of HRD, including training and development, career development and organization development; and finally (3) studies that explored the topics of literacy, bilingual training, adult education, workforce development and job training. The difficulty of finding and accessing information written in English is a recognized current limitation to this study. This limitation will be addressed in the next phase of the study by including a researcher native to the Latin American region in the conduct of the study.

Findings

The findings of the study so far can be divided into two sections. The first describes the broader political, social, and economic context of the Latin American region. The second, explains specific HRD research and practice within this context. Also supported by the findings is a dual, micro-macro, nature to the focus of HRD activities in Latin America. The details of these findings are considered next.

The Broader Context

The Latin American region studied is comprised of the Caribbean, Central America, Mexico and South America. Specifically, this region includes the following countries: Antigua and Barbuda, Argentina, Belize, Bolivia, Brazil, Chile, Colombia, Costa Rica, Dominica, Dominican Republic, Ecuador, El Salvador, Grenada, Guatemala, Guyana, Haiti, Honduras, Jamaica, Mexico, Nicaragua, Organization of the Eastern Caribbean States (OECS), Panama, Paraguay, Peru, St. Kitts and Nevis, St. Lucia, St. Vincent and the Grenadines, Suriname, Trinidad and Tobago, Uruguay, and Venezuela (The World Bank Group, 2003). This section of the paper will first provide descriptive information on Latin American’s society including economic, political, and cultural issues. Next, the economic status and gross domestic product (GDP) of Latin America will be considered. The authors’ research points to these contextual factors as direct influences on HRD in Latin America (McLean & McLean, 2001).

The political and cultural context. The Latin American region is one of staggering diversity, with 524 million people who speak Spanish, Portuguese, English, French and some 400 indigenous languages (The World Bank Group, 2003). Its topography and ecosystems range from those of tropical islands to high sierras and altiplanos, rainforests, deserts and sprawling plains. Latin America is the most urbanized region in the developing world, with three-quarters of its people living in and around cities, but natural resources and agriculture are important to many of its economies (The World Bank Group, 2003). Despite immense resources and dynamic societies, deep inequalities of wealth persist in most of these countries, with almost one-third of the region's people living in poverty. Life expectancy is 71 years, and infant mortality is 28 per thousand births (The World Bank Group, 2003).

Gender is also an important dimension of many of the pressing socioeconomic issues confronting Latin American and Caribbean countries today, including: high rates of maternal mortality, teenage pregnancy, and child labor; the transmission of HIV/AIDS; and the lack of job and income opportunities for young adults (The World Bank Group, 2003).
These issues are critical in the fight against poverty as they undermine the capacity of the poor to make use of available economic opportunities. Furthermore, socially ascribed gender roles result in expectations imposed on men and women due to their sex, or which are negotiated through social interaction, gender relations, and power relations between men and women, and play a pivotal role in some of the region's most pressing development challenges (The World Bank Group, 2003). For example, in the Latin American countries researched by the authors it was found that there are very few women in leadership in large corporations. The probability of finding women in positions of leadership appears to diminish with the climb up the corporate ladder. Overall, the higher the level of a female executive, the more important “chauvinism” and the “national ideology” becomes as barriers to further advancement (Zabludovsky, 2001, p. 8). The political overview for most of the Latin American countries is that they can all be characterized as unstable and they share similar obstacles as a result of government corruption and lack of economic and political freedom (The Latin Chronicle, 2003).

The economic context. Latin America's economies have been growing the past decade. As of 2001, the combined GDP of Latin America and the Caribbean stood at $1.9 trillion, according to World Bank data for 19 countries in the region. Latin America's economy ranks behind the United States, the European Union and East Asia and Pacific, but ahead of regions like the Middle East and North Africa, South Asia and Sub-Saharan Africa. Mexico became Latin America's largest economy in 2001, measured in both current prices and constant prices. Mexico's GDP reached $617.9 billion in 2001 in current prices, which was 22.5 percent more than the economy of Brazil, which has long had the largest economy in the region. Despite a dramatic decline, Argentina remained the third-largest economy in the Latin America region.

Despite the impressive size, there are huge differences between individual countries. The top three economies - Mexico, Brazil, and Argentina - accounted for a whopping 75 percent of the region's GDP. Mexico's economy is 237.6 times larger than Nicaragua, the region's poorest economy (The World Bank Group, 2003). Shown in Table 1, the GDP size ranking generally follows the ranking of population. Among the poor examples - both figuratively and literally - are countries like Haiti, Nicaragua and Honduras, which have larger populations than countries like Panama and Costa Rica, yet considerably smaller economies. Haiti and Nicaragua have suffered from political instability and unique factors, while Honduras has suffered from a lack of sufficient development (The World Bank Group, 2003).

The context of Latin American culture, politics and economy has a direct impact on how HRD is defined and practiced in the region (McLean & McLean, 2001). While most HRD activities in Europe and the USA are focused on learning and performance in the organizational context, those in an environment of political instability and widespread illiteracy (as seen in Latin America), should include learning and performance at the community, national and regional levels. This implies that HRD that focuses only on the organization is insufficient in developing regions.

**HRD in Latin America**

The literature review revealed a very clear set of contextual factors and drivers that have implications for defining and prioritizing ongoing HRD activities in the region. During the synthesis of the information from the variety of sources consulted in the study, a format for clarifying, organizing, and relating key issues pertaining to the questions of the study emerged. The resulting information was organized by type (macro and micro), level (regional, national, organizational, and individual), drivers (e.g., cultural, economic), and implications for HRD thought and practice in the region (e.g., literacy training, leadership development, training in civic participation). Table 2 presents a summary of the contextual framework that emerged from the synthesis of the study. While the synthesis shows drivers and implications at all four levels of study, the levels can be grouped into two types, macro and micro, for analysis. Likewise, there is almost certainly overlap between some of the types, levels, and drivers depending on their specific context and definitions, for example, multinational corporations can exert both national and regional influence.

From the review of the current literature on HRD in Latin America, the purpose of HRD falls clearly into two areas, namely, labor force development within the corporate setting, and human and community development. The area that most closely resonates with the current definitions of HRD, as described in the USA, is that of labor force development within the corporate setting. This area includes career development, functional training (i.e., total quality management, quality circles, machining skills), and management training (Luchi & Paladino, 2000; Nelson, 1998; Dooley, Paprock, Shim, & Gonzalez, 2001). In this study the individual and organization focus of HRD is defined as a micro analysis. The second HRD-related area evident in the literature is that of human and community development. This approach manifests itself in literacy training, development of skills for civic participation, and bilingual education (King, 1998). The Inter-American Foundation (2000) defines HRD as “Activities that generally focus on building the skills of disadvantaged people and/or personnel in organizations that partner with the poor” (p. 15). The concept of multiple definitions of the role and purpose of HRD was explored by McLean and McLean (2001). They found that the role and purpose of HRD varies throughout the world, and is affected significantly by
the context of national culture and economic development. The current literature relating to Latin America clearly supports this contention. For the purposes of this study, HRD-related activities at the national and regional levels are described as macro analysis.

**Micro analysis.** HRD within the Latin American corporate environment appears to be focused heavily on Multinational Corporations (MNCs) with headquarters in North America or Europe and satellite operations in Latin America. The vast majority of literature addresses development efforts by MNCs in Latin America with very little found that speaks to Latin American-based companies. The assumption is that this development exists, but is not well represented in the English-language literature. Harzing (2001) notes that “organization development is not a goal of international transfers as such, but is rather the result of knowledge transfer, management development and the creation of a common organizational culture and effective informal information network” (p. 3). In their study of the automobile sector in Argentina, Luchi and Paladino (2000) reviewed efforts by Fiat, Mercedes Benz, Ford, and GM to develop green field auto assembly plants along with the local firms that make up the value chain of supplier companies. The efforts of these large MNCs included activities focused on training supplier personnel, their own employees, and dealer personnel throughout the value chain. Topics included quality training, management principles, and high technology skills.

MNC participation in the Latin American economy often takes the form of substantial foreign direct investment (FDI). As Schuler and Brown (1999) note, “MNCs face substantial risks in deciding where to locate their FDI. MNCs must assess factors such as social cultural differences, local supply-and-demand structures, exchange rates, and organizational structures and processes” (p. 2). Schuler and Brown (1999) use Costa Rica as an example of the decision-making process used by various North American companies to locate facilities in Latin America. The practice of HRD in Costa Rica played a significant role in the decision-making process, as well as the ongoing execution of strategy once the facilities were operational. For example, “Intel invested in a labor supply that was inexpensive but not necessarily the cheapest in the world” (p. 8). From this perspective Intel’s interest was not in a ready-made, fully-trained workforce, but rather a workforce that was able to be trained. The training used by Intel included technical skills, semiconductor manufacturing skills, and both English and Spanish language training (Schuler & Brown, 1999).

The current literature also revealed a significant focus on cultural and social training, both for MNC expatriate employees and native employees. Several authors noted training and development efforts concerning women in management in Latin America. The general assessment of the impact of cultural training in organizational development has a similar theme, that is, the role of women in management and technical positions requires awareness and training on part of both MNC expatriates as well as employees from the host country. (Harzing, 2001; Head, Haug, Krabbenhoft, & Ma, 2000; Nelson, 1998; Osland, De Franco, & Osland, 1999; Zabludovsky, 2001) Likewise, training and development on the individual level resides primarily in the MNC community, according to the current literature reviewed (Zabludovsky, 2001; Osland, et. al., 1999).

**Macro analysis.** There is a parallel effort in human (resource) development evident within the literature. In the Latin American region, a significant effort has been underway for decades in developing the economic and political infrastructures of the various countries. Much of this effort centers on literacy and bilingual education in order to provide a trained workforce for MNC direct investment (Schuler & Brown, 1999). Several studies subsidized by the United Nations on a country-by-country basis show that adult literacy and bilingual training is being prioritized by Latin American countries for reasons that go beyond the standard economic development efforts. In the UN study, authors (King, 1998; Gleich, 1998) note that much of the literacy efforts taking place in Latin American are being used to bolster the use of a national common language among indigenous peoples. Given the presence of indigenous peoples, each with their own language, Latin American countries have found literacy and common language education to be a critical factor in the level of participation in civic affairs at levels beyond the immediate community. While many indigenous peoples can survive and thrive at the community level, the presence of a common national language, in most cases Spanish, is necessary for the group to participate in the civic affairs of the nation. Ushina (1998) found that Ecuador had at least eleven indigenous peoples, each with their own language. In order for Ecuador to have an active democratic society, these eleven groups needed a common language in order to participate in the most basic activities of citizenship. Ecuador began an effort to provide literacy training in Spanish speaking and writing skills that initially met with resistance, particularly from more senior members of the various communities. Likewise, participation in language training for indigenous peoples was not always supported with enthusiasm by the more entrenched sectors of the existing power structure, as literacy gave the formerly illiterate communities more power in the democratic process.

Gleich (1998) noted that the legal implications of rights for indigenous peoples affected many aspects of life within the country and the targeted communities. Efforts to legislate action on behalf of distinct communities and cultures have resulted in “language laws” and laws to protect the rights of indigenous peoples. This direction toward
a legislative solution has been met with a mixed response as the people that these laws were intended to help have often resisted participation in the training mandated by national legislation. As Cruz (1998) observed in Mexico, the skills desired by the targeted communities were those that led to community self-sufficiency, not civic participation. The communities were interested in skills training for farming, carpentry, and ironworking (blacksmithing) skills. The need for literacy was perceived as something being done in the national interest, not the interest of the individual or the self-sufficient indigenous community. This view was supported by reports from the Inter-American Foundation (2000) and United Nations Educational, Scientific, and Cultural Organization (1999) and applies to several other countries in the region.

Conclusions and Implications

This study set out to address three questions:

- What key contextual factors (e.g., social, economic, political, and cultural) drive and influence HRD in the Latin American region?
- What is the necessary purpose of HRD in the Latin American region?
- What are possible implications of these factors and purpose for HRD research and practice in the Latin American region?

The literature review and subsequent analysis allows us to answer these questions.

In response to the first research question on the contextual factors driving HRD, we found that problems common to several developing nations throughout the world are, predictably, also present in Latin America. These include: low levels of adult literacy, lack of a common language among the population, significant differences in the concentration of economic resources, and lack of technical skills normally associated with participation in the global economy. Several authors highlighted the illiteracy and lack of common language skills as critical to citizen participation in the civic activities of the various countries (Cruz, 1998; Gleich, 1998; King, 1998; Ushina, 1998).

The review of current literature reveals a distinct two-tiered view of HRD in Latin America, and helps to answer the second research question on the necessary purpose of HRD in the region. The classic USA view of HRD, namely, development of individual skills and capabilities to improve organizational effectiveness, is evident in corporate activities of MNCs with operations in Latin America. The corresponding activities found in literature included: workforce training, total quality management concepts, technical training, career development, and leadership development. However, investigation reveals a body of literature noting the need for development of the human capital of most of the countries in the Latin American region. It is the role of HRD professionals to help in the development of the basic human resource infrastructure that presents the main topic for discussion about the appropriate area of focus in the coming years; however, it is beyond the present scope of this study to define that focus. We hope to address this in more detail in the next phase of this study.

These conclusions present several, sometimes conflicting, implications for HRD research and practice. While HRD activities in organizations tend to mesh closely with current USA definitions of HRD, the English-language literature highlights efforts in MNCs and Non-Governmental Organizations (NGOs) from Europe and North America rather than Latin American-based firms. Those local firms that are mentioned become involved in HRD activities because they are members of the value chain (suppliers or local dealers) of MNCs and have been encouraged to participate. The opportunities to participate in the growth of HRD research and practice in Latin America by allying with MNCs and NGOs appear to be many and consistent with current popular USA views of HRD. Most of the current definitions of the HRD discipline appear to leave literacy and language skills in the domain of adult education professionals. However, without a serious investment of effort and resources in the most basic development activities of the populations in the Latin American region, there appears to be little need to be concerned with growth of the HRD discipline in organizations. Unless the population has the ability to participate in civic affairs outside the immediate community, there will be very little need for development efforts at the organizational or individual level, since there will not be sufficient economic development through MNCs or other commercial organizations. The level of HRD activity should reflect the context of the region, nation, and community within which it is operating.

Contribution to New Knowledge in HRD

The current USA definitions of HRD focus primarily on development of the individual and groups of individuals within the context of an organization in order to improve the learning and performance effectiveness of that organization. In the context of a region of the world that has significant gaps in the level of political and economic development, professionals in the field of HRD may be required to look beyond the current USA definitions.
Participation in less developed regions requires the field of HRD to expand its definitions to include human development at the community, national, and indeed, regional level. This expansion of definitions will lead the field to align more closely with professionals in the fields of adult education, literacy training, social development, and political science in order to bring about positive change.

The Change Agent In the Global Environment: An Exploration of a Role in Transition

Toni Powell
Barry University

This paper explores some of the effects of the global organization on communities and the role of HRD change agents in developing the social responsibility of corporate leaders. The paper then suggests, as an alternative workplace for effecting social change, employee-owned organizations, where HRD could exert more influence in supporting long-term sustainability than in the global organization.

Keywords: Change Agents, Social Responsibility, Global Organizations

For several years, there has been growing interest in the role of HRD professionals as social consciences for the corporate world (Brooks, 2003; Chalofsky, 2003; Hatcher, 1997; Hatcher, 2003; Hatcher & Brooks, 2000; Kuchinke, 2003; Lee, 2003.) Hatcher and Reio (2003) urge practitioners to take an activist role in increasing the accountability of organizations. In arguing for a global HRD code of ethics, Russ-Eft and Hatcher (2003) pose some of the ethical questions the profession should address in the global era. “Should the HRD professional “stand for increased efficiency, reduced labor costs, and increased profitability alone? Should he or she speak out to prevent gender discrimination? To lobby for retraining of U.S. workers? To mitigate the effects of family dislocation?” (p.298). Marquardt & Berger (2003) have suggested three relatively new areas in which HRD should focus, one of which is social responsibility. Russ-Eft and Hatcher (2003) place great emphasis on social responsibility. “If we as HRD professionals continue to assume a subordinate role in organizations that are unethical and socially irresponsible, then we are complicit” (p.302). Kuchinke (2003), who suggests we frame assumptions grounding the discussion of professional roles for HRD within a radical humanist perspective, argues that HRD has the opportunity to “address issues of power and domination in organizations, of justice and fairness, or equality and access for all. This role is in contrast to the subservient role often adopted by the profession and a role that has the potential to strengthen the organization as a whole” (p. 487). One might reasonably ask, however, how likely it is that HRD practitioners, either as full-time employees or, externally, as outsourcing consultants, have the power or influence to effectively raise the social conscience of global organizations to the extent that corporate executives and stockholders become more accountable to employees and local communities.

The purpose of this paper is to critically examine some of the current assumptions underlying the role of change agents in global organizations and to suggest an alternative workplace culture in which HRD scholars and practitioners could more easily and effectively implement social change through influencing organizations to strive for long-term sustainability. To this purpose, the paper draws upon the work of economists, philosophers, and psychologists to discuss some of the effects, in particular powerlessness, of the global organization on employees and the community. Next, the paper focuses on the HRD professional as organizational empowerer (Watkins, 1989) whose key contribution is to “assist people and organizations in critically reflecting on what is oppressing them and how their organizations can free them to create new worlds and to design organizations not for control but for adaptability” (p.168). Finally, the paper examines the climate of some of the smaller employee-owned organizations where employees are more likely to hold greater power over their own work, and suggests that HRD might more easily and effectively develop policies and procedures that would assist them in supporting the organization to engage in social responsibility. The paper asks the following questions: Can HRD change agents significantly influence organizations to become socially responsible to individuals and communities? Are there corporate workplaces that are more open to inviting long-term sustainability than others?

Conceptual Framework

This paper links the conceptual arguments of ecological economists and other sociopolitical writers that point to a limitless power and flexibility held by organizations through globalization. To combat the power of global organizations, HRD scholars such as Hatcher and Reio (2003) suggest “an ecocentric view of HRD” (p. 634) which they define as focusing on enhancing learning that contributes to “sustainable human and environmental development” (p.634). One might ask, at this point, what kind of corporate environment most readily allows and encourages HRD professionals to provide for and support sustainable development? One such environment might
be one proposed by Aktouf (1992) who envisions a “humanized firm, where the organization would become a place for partnership and dialogue” (p.419) and a culture of synergy and collaboration that would empower employees to participate in shared values. After reviewing the literature of economists who describe the limitless power unleashed through globalization, this author makes the assumption that the global organization, as a means for retaining unlimited power, is not likely to fit Aktouf’s definition of the humanized firm, nor is it likely to support efforts by employees or management to encourage sustainable development, defined by Hatcher (2003) as “meeting our present needs without compromising the needs of the future” (p.486).

Globalization, Power, and Morality

Globalization, by definition, means that one company in one country owns, or operates, another company or companies in different countries (McPhail, 2001). Marquardt and Berger (2003) note that globalization combines factors such as a worldwide increasing flow of information sharing, connections and links to people in every continent. However, many economists (Aktouf, 2001; Andrews, 2001; Korten, 1995; Mander,1996; Nader,1996; Townley, 1993) and, more recently, business leaders such as Drucker (1993) and Senge, (1997) point to the immense power inherent in the global organization, and the impact such power can have on human societies. Workers around the world view this power with, at best, ambivalence, worrying that unchecked power will increase the growing disparity between rich and poor by threatening employment and living standards and setting up barriers to social progress (Marquardt and Berger, 2003). Mander (1996) reminds us that, for several reasons, an organization has its own rules of corporate behavior. The corporate structure is operated by rules that are not subject to human control. These rules dictate that profit and growth are the primary motivators. If individuals working within an organization attempt to change these rules or even re-prioritize them, the corporation dismisses them and replaces them with other individuals who would abide by the rules. Mander concludes: “Form determines content. Corporations are machines.” (p. 310). Global corporations are not directly accountable to stockholders and are, for the most part, independent of the states in which they operate (Barnett and Finnemore, 1999). Mander (1996) adds that when a global organization damages a community so outrageously that the situation becomes newsworthy, or when employees begin to rebel against unsafe working conditions, the corporation simply disappears, then reappears somewhere else where it can continue to acquire profit and grow. As McPhail (2001) points out, the further individuals are removed from the consequences of their actions and the individuals affected by those actions, the easier it is to take the actions.

Certainly there are managers and executives who feel shame or anger at some of the consequences of their corporations’ actions. However, individuals are constrained in publicly expressing anger or reproach about their organizations’ actions; corporate law mandates that managers are legally obligated to support the corporations’ position on community welfare issues (Mander, 1996). In the case where an ethical and humane chief executive is selected to take the reins of an organization with an historically unethical and inhumane corporate culture, the CEO can have some power over the behaviors and decision making of the executive staff, managers and supervisors, primarily through the rewards system, where moral and ethical behaviors can be rewarded and immoral behaviors can be punished. However, as decentralization occurs and the organization’s sub-systems are spread throughout the world, the CEO loses control over the enforcement of new policies. The more distance between the main offices and regional offices, the more disparate the cultures and countries are, the harder it becomes for the CEO to impose moral values and practices (Andrews, 2001).

Aktouf (1992) argues that as the power and the profits of the organizations increase, the rights and decision-making powers of its employees have decreased. During the 80s and 90s, when down-sizing and decentralization began to significantly reduce the number of middle managers, organization theorists envisioned a new culture where employees would participate in shared values, shared profits, increased autonomy and greater satisfaction. With few exceptions, however, employees have not been the recipients of enhanced autonomy. Aktouf maintains that the current management trend emphasizing the concerns of the employees through increased interest in human capital and knowledge management, denotes, in fact, a “false and stunted humanism” (p.412), and the increased concern for employees masks a new culture that “is bestowed, organized, and remote-controlled by a throng of leaders, visionaries, cheerleaders, and entrepreneurs” (p.412). Aktouf argues that earlier management gurus such as Peters (1986), Waterman (1987) and Mintzberg (1989), while calling for a revolution, actually suppressed this dehumanizing process by not challenging basic premises which degraded people and disregarded the reality of unilateral power and corporate monopolizing.
**Ecocentric HRD**

HRD primarily serves the organization; its purpose is to improve employee performance. As global organizations acquire more power over the world’s economic, social and political arenas, some HRD theorists are suggesting that the field focus more on building socially and politically responsive individuals and organizations (Hatcher & Reio, 2003). Hatcher (1997) argues that HRD should focus not only on creating humane workplaces for employees, but on extending corporate responsibility to building a sustainable environment. However, HRD has traditionally taken on a reactive, rather than proactive role, finding solutions to problems that are defined by corporate leaders. In our traditional stance, the professional appears to avoid accountability which, according to Dalla Costa, (1998) “renders us isolated and anonymous. It heightens our longing for community and personal context but also allows us an invisibility from which it is easy, and often self-advancing, to avoid obligations and cut corners” (p. 20). In the global organization, as with earlier corporate cultures, this role creates a dilemma. As Lee (2003) notes, HRD practitioners train and coach employees to “espouse, promulgate and enact ideals within a system that by its very through the interaction between trainer and trainee, mentor and mentee, coach and employee. One might ask, then, they have pledged their commitment to the corporate mission which, in the case of the global organization, is to expand “beyond its reach and powers, and to spread the consumer life-style around the globe” (Mander, 1996, p.310)

In addition to Hatcher and Reio (2003), Marquardt and Berger (2003) have also proposed a proactive model as a means for HRD to address ethical and environmental concerns arising from globalization. The authors cite seven areas in which HRD should impact global power, one of which is environment sustainability. The authors list specific steps to take, including developing governmental policies to strengthen the position of HRD in persuading global organizations to cooperate in improving the environment and empower employees. Through the lobbying efforts of professional organizations such as ASTD and SHRM, the field could encourage policies that “encourage country integration into the global economy while putting in place measures to help those adversely affected by the change” (p.286). Clearly HRD must form partnerships with other groups to effectively impact the powerful forces of global organizations. Other recommendations made by Marquardt and Berger include building global teams, developing cross-cultural communication skills, strengthening vocational training programs in the areas of environmental and development programs, and encouraging more mentoring and communication networks. The authors warn that “to retain their relevance and leadership, HRD professionals will need to play an increasingly strong role in the development of global and multicultural competencies throughout organizations”(p.293).

**An Alternative to the Global Organization**

The recommendations made by Russ-Eft and Hatcher (2003) and Marquardt and Berger(2003) call for counteracting HRD’s reactive stance within the global environment and strengthening its role as change agent to become, in the words of Watkins (1989) an organizational empowerer. This paper suggests that as an alternative to the global workplace, HRD change agents consider the small, employee-owned company as a more conducive environment for taking on such a role. Employee ownership provides a structure that aligns a corporation’s private self interest with public goals such as distributing wealth and providing retirement benefits. Such an alignment promotes ethical conduct. Berg and Kalish (1997) employed a model of business ethics that focused on the organization, rather than the individual employee or employer. The authors cite Drucker (1993) who rejected the popular corporate view of ethics that holds that businesses don’t need to consciously seek the public good since economic self-interest will create public benefit. Drucker argues that “in a good, a moral, a lasting society the public good must always rest on private virtue...It is management’s public responsibility to make whatever is genuinely in the public good become the enterprise’s own self interest (pp.390-391). Berg and Kalish (1997) choose the organizational model to describe the advantages an employee-owned company has in developing trust, which the authors define as “anticipated cooperation” (p.214). Employee ownership has existed, in one form or another since the 1920s. It wasn’t until 1950, however, that an investment banker argued that with one percent of the population owning over fifty percent of the privately owned stock, the country would incur serious economic and social problems. By 1974, there were 300 Employee Stock Ownership Plans (ESOP), retirement plans with tax incentives that encourage companies to borrow money so that, as the debt is being repaid, the stock being financed will be
owned by employees. Employees then have equity ownership. ESOPs are now much more common and there is growing evidence that employee ownership companies that actually ask for and implement employee input substantially outperform their competitors. Recent studies examining financial data of employee owned companies (EOPs) have found that employee ownership does, with some exceptions, result in returns to employees (Beatty & Schacter, 2002). Of five companies experiencing severe financial problems prior to their shift to employee ownership, only one failed during the seven-year period in which the companies were examined. Berg and Kalish (1997) point to one of larger and more successful EOPs – Amsted Industries, which formed employee stock ownership in 1986; by 1998, the company had become 100% owned by the ESOP trustee corporate structure. Participants in the ESOP include all employment levels, from clerical and nonunion factory workers to top management. In 1985, Amstead endured a leveraged buy-out (LBO), which significantly altered the company’s finances. This was a situation that required enormous trust between Amstead and its shareholders. Employee shareholders placed their trusts in the company even when they were faced with the termination of their pension plans and only promises from management that they would benefit in the end. They responded by remaining loyal to Amstead and supporting the LBO transaction. The authors conclude that Amsted and the employee/shareholders had a knowledge-based trust relationship built up over many dealings. As a result, Amsted was able to pay off the entire LBO debt much earlier than scheduled. Berg and Kalish (1999) conclude that employee ownership aligns a corporation’s self interest with public goals. This alignment then promotes business ethics. In a recent study (Kuvaas, 2003) examined the relationship between the preferences of employees for an ongoing share ownership plan and their organizational commitment, The findings support the idea that employee ownership has intrinsic motivating efforts on employees’ affective commitment toward their work and their environment. With the evidence from a number of studies pointing to the high degree of trust, commitment, involvement and feelings of empowerment and profitability enjoyed by workers in employee owned companies, this paper suggests that an EOP offers a work environment that seems an attractive alternative to the global corporation. In an employee-owned organization, certain assumptions can be made—that employees can be trusted to be effective decision-makers; that when employees are expected to be trustworthy, they are trustworthy. In return, when individuals work in organizations where they are treated as partners and co-managers, and where there is tolerance of human error and an open-book policy on information, including financial information, (Aktouf, 1992), they become employees who perform far beyond expectations because they take ownership of their work.

**Conclusions**

This paper suggests that as a result of the empowerment they find in their EOP experience, employee-owners could more easily perceive and feel their connectedness with the bigger world. Another conclusion reached by the author of this paper is that employee-owners will be more willing to commit to the social, economic, and environmental development of the community than would employees of large global organizations. Employees that take ownership of their workplace have roots in the community; the extent to which the community is healthy and vital is the extent to which they and their families remain healthy and vital. A sustainable, empowering workplace creates a model for a sustainable, empowered community environment.

**Implications for HRD**

This paper is proposing an alternative to the global workplace for HRD change agents who wish to exert more influence in promoting long-term sustainability. In an employee-owned company, HRD professionals could serve as organizational empowering, while developing cross-cultural communication skills and building capabilities in knowledge management and technology systems (Marquardt and Berger, 2003). An employee-owned organization has greater potential than a global organization for developing an empowering environment, one that encourages employees and HRD professionals to work together as problem-solving teams. Together, employees and HRD change agents could use action research models to gather data and determine what the major barriers to a sustainable environment are. In this organizational culture, such needs and concerns would not be perceived as extraneous to the “bottom line.” Instead, they could be seen as critical, superceding the traditional corporate profit margins as the bottom line. Aktouf (1992) warns that “although the pursuit of profit is a legitimate objective, it must not become the only factor to be considered for the sole benefit of managers and shareholders. Instead, profit should be regarded as the result of collective efforts of all parties, and it should be administered accordingly” (p. 426).

Managing Effectively as a Global Manager in Thailand

Boon-Anan Phinaitrup  
National Institute of Development Administration, Bangkok.

Global management is an important issue these days because of the growing number of multinational companies in Thailand. This article will explain the main characteristics of a global manager and how higher education in Thailand can help prepare people to be global managers. The main characteristics of a global manager are 1) to have received training in global management, 2) to have the ability to manage political, economic, and foreign environments, 3) to be strongly interested in adapting to other cultures, and 4) to be proactive in global business. The research methodology employed for this study is documentary research.

Keywords: Global Management, Manager, Education

Thailand is trying to encourage more international companies to invest and operate within its borders. There are many international companies in Thailand such as Colgate-Palmolive, Pepsi-Cola, Johnson & Johnson, Uniliver, Toyota, Ahold, and Effem. These companies have increased the demand for people who can manage effectively in international companies. In addition, the Thai government is trying to persuade Thai companies to set up businesses in foreign countries. These Thai companies also need people who can be global managers. This study is justified by the fact that there are relatively few research studies on the qualifications for people who work in these types of positions.

Purpose of study

This study aims to identify the characteristics of a successful global manager. For this paper, literature was reviewed on the characteristics of global managers, leadership of global managers, and the impact of global managers on business opportunities.

Literature Review

The literature indicates that the global manager’s role is particularly challenging. In addition, there is a literature review on Thai education to determine how educational curricula prepare Thai people to work as global managers in international companies. Therefore, the literature review is divided into two parts; the first part on global managers and the second part on the role of Thai higher education.

Role of Global Manager

Several studies have tried to explain the role of the global manager that impact the management of multinational company. Geber (1992) stated that many multinational companies are concerned about global managers who have an impact on the company’s marketing or competitiveness. In this article, the author said that global managers have a strong interest in, and tolerance for, other cultures and an understanding of the decision-making processes of their host culture. Yet at issue is how such understanding can be created. Many multinational companies are spending so much time on what attributes produce the kind of employees who can succeed in another culture. There are some surveys among US and non-US companies about key success factors that enable a global manager to do their job efficiently. There are three key success factors: 1) knowledge of the business, 2) a high degree of tolerance and flexibility, and 3) the ability to work with other people. McBride (1992) examines the global organization and its development needs. Global managers must be able to cross national and cultural boundaries with a high quality of service. It is proposed that global managers manage multicultural micro cultures that have their own ecology-relationship, attitudes, beliefs, and behavior. This microworld is proposed by Peter Senge as a context for learning. It is constructed to reflect real organizational dynamics and to combine meaningful business issues with meaningful interpersonal. A management development program is proposed that prepares managers not only for crafting strategy, but also for crafting a strategic culture worldwide.

It is also consistent with Ioannou (1994) said that midsize multinationals may not have played the global game as well as their larger competitors, but many are proving remarkably skilled, especially when it comes to the crucial task of creating efficient, responsive international interactive workforces. They realize human assets will play at least as large a role as advanced technology and economies of scale when it comes to competing in the new world order. These surprising findings emerge from a survey of 1,200 American multinationals with annual sales of 1 billion dollars or less conducted by International Business Magazine and the human resources
firm of Drake Beam Morin Inc. The world being a complex place, this joint study shows many cross currents roiling the global personnel pond, including: 1) management compensation costs are rising faster outside the US than inside, but still fall well short of the total package required to establish a senior US manager abroad. 2) Most American companies now try to fill senior positions abroad with locals, importing US experts only for such specific projects as technology transfer. Katz and Seifer (1996) mentioned that internationalization has increased the demand for individuals who can manage effectively in a foreign environment. Historically, multinational firms have been plagued with the problem of expatriate managers returning home prematurely due to their inability to adapt to the culture of the host country. This study integrates models of national culture thus providing a framework for the prediction of the appropriate types of cross cultural training and socialization necessary for an expatriate manager prior to the foreign assignment, as well as the methods and goals of socialization to be used within the organization upon his/her arrival. The discussion leads to specific HR guidelines and implications for the proper socialization of expatriate managers, more use of performance appraisal systems, and heightened motivation, culminating in management styles that more closely correspond to the cultural expectations of host countries and result in higher overall managerial success.

During the past few years, other authors have response to the diversity in the management of multinational. As stated by Buhler (1999) said that many managers do indeed recognize globalization and see its impact on their daily work. In reality, the globalization of business has effected every sector of business and in many cases causes changes in work performance. In some cases, the changes are subtle. It is therefore important to the manager and the organization that care is taken to ensure the trends are monitored. Managers must be proactive in their global business. Saner, Yin, and Sondergaard (2000) said that global managers don’t need to know how to manage non-business stakeholders in all the countries where they work. However, they do need to be able to manage complex organizational environments. To do this they must develop diplomatic strategies for handling internal structures and conflict. Failure in this diplomatic function can easily lead to crisis, open conflict, or missed business opportunities. In order to succeed in business, many global companies should show competence in managing multiple stakeholders at home and abroad. While it is of key importance to have the right price and time, global companies might not be able to deal successfully with obstacles outside their direct sphere of control. Facing such challenges, global companies require business competencies in which most managers have no background or training. The competencies needed to deal with foreign country interests, multiple domestic and foreign pressure groups, or international conflict demand that global companies acquire organizational competency in business diplomacy management. This competency can build bridges between core businesses. In fact, many of the attributes of a business diplomacy manager are comparable to those of a political diplomat.

Caligiuri and Di Santo (2001) said that multinational companies need globally competent managers to drive business successfully. To address this human resource need, many strategic human resource departments have initiated global leadership development programs to groom future leaders. There are two inherent assumptions in all global leadership programs. First that “global competence” can be defined in terms of a developmental dimension and, second, that once defined, this dimension can be developed through global experience.

**Role of Education**

At present, Thai society is confronting many changes - economic, political, and educational. These changes come both from within and from its interconnectedness with a complex and rapidly changing world. For some time, Thai society has been based on a system of relationships and the code of conduct of small communities. Within a short period, it has changed radically into a complex society with a modern economic system, new information technology, new reform politics and changes in education. Many people have learned to cope with the changes through education which has been used as a tool to prepare Thai people for the new business environment which is more and more involved with global business. In addition, since education is very important in enabling people to work in a global environment and as a bridge to sustainable social and business development, there are many international seminars and joint study shows many cross currents conducted in Thailand in order to broaden perspectives or renew curricula, create new student characteristics for international business, and create an international network. For example, the First International Forum on Education Reform: Key factors in effect implementation (July 2001); and the Second International Forum on Education Reform: Experiences in selected countries (February 2002). There is also an annual seminar on “The Educated Man in the 21st Century: Guidelines for Thai education reform, as well as international links between ASEAN, Asian Development Bank, Asia-Pacific Economic Cooperation, IMF, ILO, the World Bank Group, WTO, and the United Nations Industrial Development Organization.

As Thailand is trying to bring itself up to international standards, it is very important to utilize education as a tool for preparing Thai people for international organizations. To do this, universities must perform a new role as follows (www.inter.mua.go.th): The role of universities toward the whole education system including basic education. Universities can only have a limited contributive role in the overall education system because of certain barriers, particularly those relating to the continuity between basic and higher education systems and the inflexibility of the teaching-learning system. It is therefore advisable that higher education institutions and other
institutions cooperate and allow schools, universities and the community to join forces in enhancing educational research, academic services and the preservation of art and culture. Secondly, universities should provide increased educational opportunities for the community through diversified systems such as providing courses for second degrees. In addition, they should take a more active part in providing non-formal and informal education. Transfer of credits and learning experiences acquired from non-formal to formal systems should also be allowed. Government support should also be provided to universities in order to enable them to provide education to disadvantaged groups and the disabled. Thirdly, Universities should give equal importance to internationalization and national identity based upon proper adaptation and assimilation. Comprehensive education, in the world community and national identity should be specified as desirable attributes of graduates in the 21st century. The international dimension should be integrated into curriculums, extra curricula activities, the academic environment, as well as management systems and academic services. Attention should also be given to harmony, local wisdom and local culture. Fourthly, universities should make the best use of the information and data available in the business and industry sector to develop and revise the curriculum.

From the above, it is apparent that education needs to be reformed. Every university must take steps to create a curriculum that incorporates world affairs. This can be achieved through such activities as apprenticeships/internships in multinational companies or American, European, or Asian studies programs. These programs can contain courses of an international nature, often focusing on questions of foreign policy or current events. The programs may be designed to prepare students for the Foreign Service. Many specialized courses are devoted to helping students strengthen competence in their chosen fields such as business or industry. Universities need to relate their international programs to the community.

It is very important to confirm that this new approach to educational curricula is being developed. Further, that curricula options and majors are being created to give students alternative course sequences to follow; that international dimensions are being infused into national courses, and that there is increased opportunity to travel.

Research Methodology

The author conducted a literature review of empirical and research based articles to understand the theoretical and conceptual aspects of global manager characteristics. The study provides definitions and current knowledge in the area. It is limited to a literature review and would benefit anyone who is interested in building competency as a global manager.

Data collection was document analysis. Documents related to multinational companies were collected from primary and secondary sources. Documents were solicited from corporations and from standard literature sources such as journals, magazines, the world-wide-web, newspaper articles, and research reports. Data obtained these documents provides insightful and enriched information that was used to confirm and verify the information provided through literature review.

Findings

This article tries to show the importance of global managers and the role that education must play in preparing students for global business. The discussion section will be divided into three parts. The first part summarizes the findings from the literature review on the role of global managers. The second part shows how selected companies prepare their people to be global managers, and the last part encourages educational institutions to do more and be involved more in the development of educational curricula for world business.

According to the literature review, global managers need to have a few basic characteristics. These can be summarized as follows: 1) to have received training in global management, 2) to be able to manage political, economic, and foreign environments, 3) to be strongly interested in adapting to other cultures, and 4) to be proactive in global business. Therefore, it is essential to train global managers to develop these competencies. These competencies provide opportunities for people to perform the role of global manager with a shared set of beliefs, attitudes, and values.

Furthermore, in many cases, in order for multinational companies to succeed, they need managers who can handle diplomatic assignments as part of their job portfolio. Global companies must participate in environment conflict, communicate effectively with nonbusiness interests and pressure groups, influence decisions of foreign government constituencies, and negotiate on behalf of the company in foreign countries with nonbusiness groups. Therefore, global companies need to be able to forecast, plan, and manage international issues, cope with multiple crises, influence and work with intergovernmental organizations, and operate appropriately within diverse cultural and social environments.

Following are examples of how multinational companies prepare global managers:. A Dutch company pairs a key overseas manager with a manager at its US headquarters. Top management monitors the foreign manager’s progress and helps the manager stay in tune with what is going on back at the source of power. This
mentoring can provide vital input into management succession strategy (Ioannou, 1994). Nordson Corporation, a producer of industrial paint with sales in Europe and Japan, recruits young talent directly from the American Graduate School of International Management in Arizona, Columbia, and South Carolina. Since 1988, Nordson has hired 18 graduates and assigned them to such jobs as regional marketing manager and business group head in Germany and other key markets (Clark and Arbel, 1993) In addition, Beckman Instruments Inc. of Fullerton, California, exports the “leadership process”, a three day course on the company’s management philosophy and global mission. All senior and mid-level executives in Europe and Asia and the Pacific Rim are required to attend. Other companies turn to human resource consulting firms that provide three-week programs including language studies, courses on cultural adaptation, and business and social practices in foreign countries. The Food Corp International simulation was specifically developed to simulate the activities of a firm in need of a strategic review of its worldwide activities. Developed by McBride and other associates of the Management Simulation Project Group at New York University, Food Corp International was designed to provide multicultural managers with a micro culture which must be managed strategically. It highlights the complexity of developing a culture, which can support a global strategy and can be exported worldwide. Food Corp also allows managers to wrestle with the inconsistencies of a culture in transition (McBride, 1992)

Warner Lambert’s Global Leadership Associate Program (GLAP) is an international rotational program designed to yield business managers with a global perspective. The goal of GLAP is to provide managers with international assignments early in their career and expose them to the diversified business of Warner-Lambert. Through GLAP, it is believed that participants will gain the skills necessary to successfully manage and lead anywhere in the world (Caliguuri and Di Santo, 2001)

Finally, the role of higher education needs to be reformed. Every sector of the educational community must cooperate and design curricula that can produce students who can work in multinational companies since there is an increased number of multinational companies around the world. New curricula should help prepare students in terms of language and an understanding of the culture, beliefs, and values in the environments in which they may work.

Future Research

The purpose of this literature review was to examine the characteristics of global managers. There are several recommendations and questions for future research. More emphasis needs to be given to strategic partnerships as these help to reduce the complexity of operating in the global arena. Focus more on the development of global managers in order to prepare them to be ready for the job.

Institutionalization of Organizational Change: A Study of HRD Interventions in Singaporean, US, Japanese, and German Companies

AAhad M. Osman-Gani
Nanyang Technological University

Ronald L. Jacobs
The Ohio State University

Institutionalizing organizational change has emerged as an issue among organization researchers and managers alike. Institutionalization of change is derived from change management theory in its emphasis on understanding the roots of organizational success and failure. The field of HRD appears particularly poised to help organizations institutionalize change. The purpose of this study was to identify what HRD interventions are being used to institutionalize organizational change in multinational corporations (MNCs). This paper presents empirical findings on the use of Cascade Training along with other methods, and the nature of significant differences found among companies from the four countries in their use of the HRD interventions.

Keywords: Institutionalizing change, Cascade Training, MNCs, Singapore

The purpose of this study was to identify what HRD interventions are being used to institutionalize organizational change in multinational corporations (MNCs) from four countries. Institutionalizing organizational change has emerged as an issue among organization researchers and managers alike (Kearney, 1999). Institutionalizing organizational change appears the best way to describe the relative perseverance of planned change efforts (Jacobs, 2002; Cummings & Worley, 1997). Perseverance means that the change effort has received sufficient acceptance by individuals and groups over a period of time to achieve the intended goals (Beer, Eisenstat, & Spector, 1990; Mirvis & Berg, 1977). Of concern here is whether the desired change becomes part of the organization’s ongoing activities to replace what existed beforehand. Institutionalizing change is derived from change management theory in its emphasis on understanding the roots of organizational success and failure.

The field of human resource development appears particularly poised to help organizations institutionalize change. As shown in Figure 1, Jacobs (2003) introduced a framework for institutionalizing organizational change, adapted from the one presented by Cummings and Worley (1997). The framework presents how organization characteristics influence intervention characteristics and each of them in turn influences institutionalization processes, resulting in the desired institutionalization outcomes. The outcomes show the extent to which the change has taken hold and can, presumably, be sustained over a length of time. The framework, based on a systems theory perspective, suggests that the failure of change can occur because of inadequate or incomplete attention to any one or a combination of the organization characteristics, the intervention characteristics, or the institutionalization processes.

Following Cummings and Worley (1997), the framework posits that institutionalization processes infer a dependency relationship among employee competence, self-efficacy, commitment, incentives, and behavior modeling. More specifically, employees should first have the competence to meet the new expectations that, in turn, is dependent on employees having the self-efficacy to carry out the change. Self-efficacy is prerequisite for expressing the commitment behaviors, both words and actions, related to the change. Over time, commitment depends on the allocation of financial and non-financial incentives. Finally, institutionalization processes depend on individuals to model the change behaviors for others to observe and repeat (Washington, 2002; Klein, Wesson, Hollenbeck, & DeShon, 2001, Klein & Wright, 1994).

Research Problem

Institutionalization of organizational change has become an issue of increasing interest among organization researchers and managers alike. HRD has the potential to be useful in helping organizations implement planned change, primarily because institutionalization processes focus on key HRD concerns: employee competence, self-efficacy, commitment, incentives, and behavior modeling. These processes help determine the extent to which...
institutionalization outcomes will be achieved. However, a review of the literature shows that few if any studies have been conducted to understand how HRD has actually been used to institutionalize organizational change. If HRD has potential for ensuring the institutionalization of change, and if few studies have been done to understand current practices that would help guide future practices, then more needs to be known about current institutionalization practices. Also, no empirical research could be identified that investigated this phenomenon so far. In addition, previous research suggests the importance of considering national culture in the study of management practices (Osman Gani, 2000; Hofstede, 1997).

The specific research questions of the study were the following:

1. What HRD interventions are being used to institutionalize organizational change?
2. Is Cascade Training being used as a specific means to implement institutionalization process?
3. Are there country-based differences in the ways multinational companies (MNCs) implement institutionalization practices?
4. Are there differences in the perceived effectiveness of the training methods used across countries?

Methodology

This study adopted an exploratory research design since no previous study on the issue of institutionalization of organizational change could be identified. The research was carried out in two phases in Singapore, where MNCs from various countries are operating for a long time as regional headquarters and are involved in making such decisions. First, interviews were carried out with human resource managers and general managers of twelve local Singaporean and multinational companies. In the second phase of the research, a questionnaire was administered to a sample of human resource managers and general managers. Managers from a total of 127 local and multinational companies (MNCs) from four countries participated in the study: Singapore, the United States, Japan, and Germany. The business sectors represented were: manufacturing, construction, finance and business, transportation, communication, commerce and information technology.

The sampling frame of the study was the “Singapore 1000” (2001/2002 edition), in which the top 1000 companies operating in Singapore with the highest sales turnover for the time period specified are listed in the annual publication. A sample of 411 companies from the four countries was selected from this sampling frame by using a proportionate stratified random sampling method.

The main source of data was from a survey conducted using a structured questionnaire, designed to solicit the opinion of HR or general managers from local as well as multinational corporations. The questionnaire method was chosen to enable a standardized format of collecting the necessary data required for this study. The questionnaire was designed based on literature reviews and the interviews with the managers. To ensure validity and reliability of the questionnaire, a pilot test was carried with ten of the 12 managers interviewed. The questionnaire was organized into four parts: Part I aimed to gather information about the general characteristics of the participating companies; Part II outlined the process of institutionalization of organizational change and is divided into six parts; and, Parts III and IV of the questionnaire respectively solicit job-specific as well as demographic information of the respondents. In order to test for reliability, a test-retest method was used, and reliability coefficients (alpha) were computed for various section of questionnaire. There is relatively high level of internal consistency for most of the variables as shown by the alpha values ranging from 0.65 to 0.88.

A panel of experts consisting of the professors from Nanyang Business School, NTU, and HR and general managers of companies were consulted to test for content and face validity of the research instrument. Feedback from this panel was incorporated in finalizing the questionnaire before the final administration. In order to test for construct validity, factor analysis was conducted. Eigenvalue of more than one was used to identify the constructs consisting of the items with highest factor loadings and the items not loading properly in relevant construct were removed from the analysis.

A combination of mail, fax, and E-mail administration methods were used for distributing the questionnaires. The research team called up each company and explained to the managers, the purpose of the study and requested for completing the questionnaire. A majority of the questionnaires were administered using mail administration, a procedure that holds advantages over others in terms of coverage, cost and confidentiality issues. A two-week deadline for the return of the questionnaires was set and return-envelopes were enclosed to encourage participation and thus, a higher response rate. Follow-up phone calls were made to non-returnees one week and two weeks after the deadline to serve as reminders. Due to initial low response rate, the research team followed a personal administration method after the two sets of follow-up calls. A total of 127 questionnaires were collected giving an overall response rate of 26.8%.
Results

The following are the results for each of the research questions of the study:

What HRD interventions are being used to institutionalize organizational change? Table 1 presents different types of training programs adopted by companies in dealing with organizational changes. It can be seen that the top five training programs most commonly adopted by companies are job-skills training, management training, IT training, certified technical training, and team-building courses.

Table 2 presents the training methods to deliver information about the organizational change. The most commonly used training methods are on-the-job-training (OJT), conference/seminar/workshop, classroom/lecture, mentoring, and computer-based training. Table 2 also presents the distribution of the effectiveness of the training methods, where OJT was found to be more effective than others.

Is Cascade Training being used as a specific means to implement institutionalization process? (For this study, Cascade Training has been defined as the process of providing critical change-related information that will flow through the organization in a planned way to facilitate subsequent parts of the institutionalization process.) The results generally showed that most respondents are not aware of cascade training as a method of change management. About 78% of the respondents indicated that they have not heard of the term although some organizations practiced it unknowingly. Table 3 shows a breakdown of the responses according to company ownership. A cross-tabulation of the results showed that the largest number of respondents who have heard of cascade training came from middle-level managers. An analysis by business sector showed that the manufacturing sector had most respondents who have heard of cascade training. Analyses by functions showed that the human resources function had the most number of respondents who have heard of cascade training, followed by general management. Finally, a cross-tabulation on awareness by country showed that USA and German managers at 25 percent, while Japan and Singapore managers were 15.2 percent and 23.1 percent respectively.

The results also showed that 65.2 percent of the respondents who have knowledge of cascade training expressed interest in using this intervention. The results also showed that managers from USA and Singapore organizations were the most interested in adopting cascade training, once they understood the concept. Singapore, Japan and German managers rate the factor, “Top management support” the most important factor that would influence their decision to adopt cascade training. On the other hand, respondents from the USA rate the factor “Tested and proven successful” as the highest. Finally, the results showed that potential influences in adopting cascade training included the need for “faster dissemination of information” and “reinforce one’s learning”.

Are there country-based differences in the ways multinational companies (MNCs) implement institutionalization practices? Table 4 presents the factors considered important to implement cascade training by organizations from different country of ownership. The results showed that organizations from Singapore, Japan and Germany rated the factor, “Top management support” significantly higher in terms of influencing their decision to adopt cascade training. On the other hand, organizations from the USA rated the factor “tested and proven successful” significantly higher.

Table 5 presents the perceived effectiveness of initiatives having different country ownership. The results showed that “Communication” was rated significantly by respondents from all countries. However, only companies from Singapore and Germany rated “Education” as being significant and companies from USA rated “Participation and involvement” as being significant.

Table 6 presents the training methods used most frequently to implement change by country of ownership. The results showed that “On-the-job training”, “Classroom”, and “Seminar/Workshop” were rated significantly by respondents from the four countries. On-the-job training had the highest mean across all four countries of ownership.

Table 7 presents the strategies used by country of ownership. The results showed that countries differed across all approaches presented to respondents. The results showed that “Communication” was the highest rated approach across all respondents.

Are there differences in the perceived effectiveness of the training methods used across countries? Table 8 presents the perceived effectiveness of differing training methods across countries. The results showed that on-the-job training was significantly rated as the most effective training approach across all four countries. Self-instructional training was significantly rated the lowest among three of the four countries. Significant differences were also found in the degree of effectiveness for all the training methods used across the four countries.
Summary and Discussion

In general, the results showed that in the institutionalization process, communication and training initiatives play more significant roles over other change management strategies. With regards to the new concept of cascade training, a general lack of awareness was found, although many companies are using it in various ways. Socio-cultural issues have also been shown to have significant influences on several aspects of the change management process. In determining the effectiveness of the institutionalization of change, several types of training programs were found to play significant roles. This study provides insights into the different strategies of institutionalizing changes; the potential of using cascade training as a means of institutionalizing change, as well as the influence of various cultural, organizational and demographical factors on the institutionalization process. In this study, respondents were exposed to a wider range of strategies and initiatives available to effectively manage changes in their organizations, and were asked to identify important influencing factors, and cultural differences were found to play significant role in this regard. The differences in the degree of effectiveness of the training programs can also be explained by the cultural factors of the four contrasting socio-cultural environments.

Overall, training interventions seems to be more effective in institutionalization of organizational changes compared to non-training interventions. This signifies the role of HRD in organizations from all national cultural background. Organizations are using a wide range of strategies and training methods to institutionalize changes, however, they have yet to explore the other areas of HRD from strategic perspective (such as career development, organizational learning). Organizations should review existing strategies and explore the ways to make HRD strategies more integrated with other organizational functions to ensure better success in institutionalization of change.
