Although most respondents did not seem to have known about Cascade Training, it was found to be an effective method in faster dissemination of information and knowledge transfer needed for implementing the changes. Thus, managers should study this method and adopt it in their organizations for more effective institutionalization of change. This study involved respondents from organizations originating from only four countries, namely USA, Singapore, Germany and Japan. However, as the environment is ever changing, more countries are increasing their investment in Singapore and in other countries of Asia. Future research could involve MNCs from more countries and similarities and differences found from this study could then be compound so that a broader conceptual framework could be developed.

Figure 1. Institutionalization of Change Framework

Organization Characteristics
A. Is the intervention aligned with the organization’s goals, management, and design?
B. Is the intervention environment amenable for change?
C. Has the intervention received commitment from key stakeholders?

Intervention Characteristics
A. Do the intervention goals depict the desired state?
B. Is there a process to implement the intervention?
C. Have expectations been stated for individuals, workflows, and groups?
D. Are resources available to implement the intervention?

Institutionalization Processes
- Competence to meet new expectations
- Self-efficacy to carry out the expectations
- Commitment in terms of words and action
- Incentives linked to accomplishments
- Diffusion beyond the immediate setting

Change Management Interventions
- HRD-Training Interventions
  - Cascade training
  - On-the-job training
  - Classroom/Lecture
  - Computer-based
  - Games & simulations
  - Case studies
  - Mentoring/Coaching
  - Self-instructional methods
- Other Interventions
  - Communication
  - Downsizing approach
  - Reward & incentive system
  - Employee involvement
  - Team-building programs
  - Management by objectives
  - Knowledge sharing systems

Institutionalization Outcomes
- Improved job behaviors
- Improved job performance
- Improved Attitudes/Preferences
- Improved organizational norms, values, culture

Cross-Cultural Effects

Empirically Based Recommendations for Training and Development of Supervisory Social Support

Duchduen Bhanthumnavin
National Institute of Development Administration

Based on Interactionism Model, this study investigated the important situational and psychological factors, influencing three types of supervisory social support behavior. Data from 345 supervisors in Thai health centers were analyzed. Results revealed that all 10 factors together could account for the variation of the SSSBs with a range of 25.4% to 50.6% in various subsamples. Findings also revealed three types of supervisors needed to be trained, and also the topic for training and development.

Keywords: Supervisory Social Support Behavior, Training and Development, Interactionism Model

It has long been evident of the important consequences of social support in many social contexts, such as, family (Abbey, Andrews & Halman, 1995; Cobb, Davila, & Bradbury, 2001), and especially at work (Glaser, Tatum, Nebecker, Sorenson, & Aiello, 1999; Geller & Hobfoll, 1994; Pinpradit, 2003). Supervisory Social Support Behavior (SSSB), for that matter, was positively related to group member’s work motivation, such as, job satisfaction (Sorod & Wongwattanamongkol, 1996; Mayfield, Mayfield, & Kopf, 1998), commitment to work (Littrell, Billingsley, & Cross, 1994; Thacker, Fields, & Braclay, 1990) and follower’s work effectiveness (Bhanthumnavin, 2003a). SSSB was further found to have negative relationships with undesirable outcomes, from, job stress (Dormann & Zapf, 2003; Freese, 1999), work – family conflict (Goff, Mount, & Jamison, 1990), to occupational injury (Iverson & Erwin, 1997).

Although many beneficial consequences of receiving supervisory social support in the workplaces have been accumulated in Thailand and abroad, however, there has been inadequate attention to the investigation of predictors of this valuable behavior for the purpose of training and development. Therefore, this study is a response to such an urgent demand.

Research Objectives

This research study has three major objectives. First, to pinpoint the most important antecedents of SSSB in Thai health centers, both situational, as well as psychological factors. Secondly, to compare and contrast the amount of the three types of SSSB among supervisors in health centers, to empirically indicate the more urgent target groups needed for training and development. Finally, deriving from the research results, more definite and reliable recommendations on what need to be trained, in order to obtain more effective and sustainable training outcomes.

Literature Review

Accumulation and content organization in this section will yield three important research directions. First, the operational definitions of the three dimensions of SSSB to be validly and reliably assessed in this study. Secondly, the conceptual framework, using Interactionism Model to indicate the important types of independent variables which was used in this study. Finally, previous research findings are used as bases for hypotheses’ formulation to be tested in this study.

Supervisory Social Support Behavior

Most previous studies have focused on perceived social support of a person from many sources, including that of his or her supervisors (Kaufmann & Beehr, 1986; Niranthewee, 1989). There were also multiple types of support, such as, appraisalal, emotional, esteem, financial, informational, material, services, welfare, and tangible support (House, 1981). Recently, definition of SSSB was reorganized and proposed by Bhanthumnavin (2000) as an interpersonal behavior between supervisor and subordinate in work situation where the supervisor provides subordinate one or more types of the three types of supports, i.e., emotional, informational and material, for the purpose of creating, improving, and/or maintaining work motivation and satisfaction, work performance, and/or effectiveness of the recipient and organization.

Copyright © 2004 Duchduen Bhanthumnavin
Banthumnavin (2003b) suggested that emotional support behavior (ESB) from supervisors to group members should include various types of behaviors, namely, caring for, showing acceptance and respect, and especially showing willingness to help group members to cope with stress or work problems. There are various means for supervisors for showing informational support behavior (ISB), such as giving advice; suggestions, and/or guidance about knowledge and skills related to subordinate's work; passing important work related information including training or work-shop news, techniques; giving appropriate rewards or punishment to appropriate members, and being a good role model at work. Material support behavior (MSB) from supervisor includes providing needed material or instruments, and seeking for financial support or budget arrangement prior to, and/or on request from group members. Many researchers (Fenlason & Beehr, 1994; House, 1981; Sarason, Sarason, & Pierce, 1990), furthermore, suggested that most types of social support behaviors should be viewed as interrelated. In this study, these three types of SSSB in local health centers were separately assessed by self-reported questionnaires, employing summed ratings method which assumed interval scaling.

Conceptual Model of Supervisory Social Support Behavior: An Interactionism Model

This study was based on interactionism model (Magnusson & Endler, 1977) for conceptual framework. At present, the interactionism model has been most widely used for investigating the multiple antecedents of various types of human behaviors, especially work performance in organizational context (Tett & Burnett, 2003). Interactionism model indicates four mainstreams of antecedents of human behavior: situational factors, psychological traits, interaction between the situational factors and psychological traits, and psychological states.

This model requires multiple causes of behavior both intra and extra-individual, and their interactions. In this model extra - or situational factors are those conditions which can facilitate or hinder the behavior in question. In work's context, such situation can be conceptualized into three levels, i.e., individual, work unit, and organization levels (Tett & Burnett, 2003). In this study, three work situations are studied, that is, group atmosphere, organizational support, and member's work success. For intra- or psychological factors, five important psychological traits of the supervisors are expected to play a key role, need for achievement, future orientation and self-control, belief in internal locus of control of reinforcement, religious lifestyle, and social perspective taking are employed. Psychological states of the actor are specified by the Interactionism Model to exert strong influence on one's behavior. In this present study, favorable attitude toward social support behavior and work stress are deemed to have such effects (Figure 1).

Figure 1. Conceptual Framework and Relationships Among Variables in this Study.

Situational Variables and Social Support Behaviors

Many scholars and researchers agree that human behaviors are affected by situational influences. There are many
possible situational factors affecting supervisor’s behaviors including group atmosphere, Organizational support, and member’s work success.

Group atmosphere (GA) has long been accepted as one of the three important group situations affecting leadership effectiveness in Fiedler’s Contingency Theory of leadership effectiveness (1967). GA is also considered as an important component of social capital (Staber, 2003). Thai research findings confirmed that GA was significantly and positively related to leader’s effectiveness (Soonthornvipart, 1989; Sorod, 2003; Surakitbowon, 1989).

Organizational support (OS) in employee’s point of view is called Organizational Support. Eisenberger, Fasolo, and Davis-LasMastro (1990) defined OS as “employee’s perception of being valued and cared about by the organization” (p. 51). OS, was found to be related to several desirable characteristics of employees (Rhoades & Eisenberger, 2002), e.g., prosocial behavior (Lee, 1995; Moorman, 1991), and organizational citizenship behavior (Lynch, Eisenberger, & Armeli, 1999).

Relationship between social support and member’s work success has been reported in many recent studies (Ballentine and Nunns, 1998; Bhanthumnavin, 2003c; Mayfield, et al., 1998). These studies, however, were correlational-comparative studies which assessed social support from supervisor and member’s performance at the same time. Thus, the cause-effect relationship between these two variables could be viewed in two directions. The first direction views member’s work success as a consequence in this phenomenon, the second direction as antecedent of SSSB. Based on this possibility, it is predicted that supervisors of a less successful subordinates have higher SSSB than their opposites. Thus, it expected that at least one of these three situational factors will be among the first three most important predictors of SSSB in this study.

**Psychological Traits and Social Support Behaviors**

Psychological traits have been generally accepted as exerting important influence on human behaviors (Bhanthumnavin, 1983), especially prosocial behavior at work (Brief & Motowidlo, 1986) and being a transformational leader (Bass, 2002; Bhanthumnavin & Bhanthumnavin, in press). At least five psychological characteristics are potentially associated with supportive behavior of an individual, i.e., social perspective taking, internal locus of control, religiousness, need for achievement, and future orientation with self-control.

Many research studies both from Thailand and abroad have recently confirmed that multiple psychological characteristics can account for higher percentages of variation of members’ and leaders’ behaviors and work effectiveness (Bass, 2002; Brief & Motowidlo, 1986; Chaumthong, 1993; Pinpradit, 2003; Sorod, 2003). These psychological traits are nAch, FOSC, Icon, and SPT. Recently, religiousness has come into the picture as an important antecedent of various types of work behaviors of teachers (Na Wanjun1993), nurses (Phosrithong, 1993; Tamavong 2000), policemen (Sopa, 2002), and especially for giving social support to AIDS patients (Chanchamthla, 2001). Thus, it is expected that at least one of these five psychological traits will be among the first three most important predictors of SSSB.

**Psychological States and Social Support Behavior**

Psychological state of an actor is an organismic interaction between one or more situational antecedents with one or more psychological traits of that actor. In this category, work stress and attitude toward SSSB (ATS) were more often found to be strong predictors of work effectiveness, such as, in the study of air force personnel (Thummatophon, 2003), of IPD nurses (Tamavong, 2001), government officials (Sorod & Wongwatthanamongkol, 1996) and Thai bankers (Sorod, 2003).

In addition, it has been found that situational factors and psychological traits mentioned above predict not only behaviors, but also attitude towards behaviors and job satisfaction as well (Pinpradit, 2003; Sorod, 2003; Tamavong, 2001). Thus, it is expected that situational and psychological traits are good predictors of ATS.

**Characteristics of Support Receivers and SSSB**

Social support is usually given to people who seem to need it, such as the young, the poor, sick person, the new comers in organization, and the uninformed or less educated (Vaux, 1985). It is expected that the supervisors in health centers would give more SSSB to young and less educated subordinates than to the opposites.

**Hypotheses of This Study**

Based on the above literature review, two hypotheses were established as follow.
Hypothesis 1  Supervisors of subordinates who are female, or, younger, or less educated, or in less successful group show higher SSSB than supervisors of subordinates who are male, or older, or more educated, or in more successful group.

Hypothesis 2  ATS is the first among the most important predictors of ESB, or ISB, or MSB or OSB supervisors when the total of 10 independent variables are used, and, together with other important predictors, accounts for more than 30% of the variance of ESB, ISB, MSB, and OSB, individually.

Hypothesis 3  When eight independent variables (3 situational factors and 5 psychological traits) are used, the three most important predictors of ATS are from both groups of independent variables, and all important predictors together account for more than 40% of the variance of ATS.

Methods

Sample
Sample of this study was 345 supervisors in health centers in Thailand. The sample consisted of 212 males (41.7%) and 293 females (57.6%) with four unidentified gender. The average age of supervisors was 43.45 (SD = 7.72). The average years of education was 14.92 (SD = 1.10).

Only one health worker in each center was specified by the researcher to be the target of SSSB, consisting of 145 males (42.0%) and 200 females (58.0%), with the average age of 30.48 years (SD = 5.93) and average years of education of 14.89 years (SD = 1.08)

Measures
Summated ratings method was used in all measures written in Thai language. Each item in most questionnaires was accompanied by 6-point Likert Scale ranging from “very true” to “not at all true”. The details of these measures are shown in Table 1.

Data collection and Data Analysis
Data were collected from health center supervisors in 6 provinces in Thailand, employing Stratified-Accidental sampling method (Kerlinger & Lee, 2000). Three approaches were used to obtain data: sending out questionnaire, collecting on-site conference, and collecting on-site of health center supervisors’ monthly local meeting. Three-way Analysis of Variance and Multiple Regression Analysis were used to test the hypotheses.

Results
There are three important research findings (Table 2). First. It was found that supervisor of female subordinates provided more ESB than supervisors of male subordinates. This result was more evident especially in supervisors who worked with young subordinates with high education.

Second, supervisors of young subordinates provided more ESB, ISB, MSB and OSB to their target followers than supervisors of old subordinates. Finally, supervisors of less educated subordinates showed more ESB than supervisors of highly educated subordinates, especially the young ones. Thus, the results mostly support hypothesis 1.

Results from Entered and Stepwise Multiple Regression Analysis showed in Table 3 and 4, revealed that ATS was the first predictor of ESB, ISB, MSB and OSB with beta weight ranges from .45 to .55 in the total sample. ATS together with other predictors could account for the four dependent variables with a range of 30.6% to 44.1% in the total sample. These results fully supported hypothesis 2.

Results in Table 3, furthermore, revealed that all 8 predictors from situational factors and psychological

traits could account for 58.1% of the variance of ATS in total sample. The important predictors of ATS were GA, FOSC, nAch, RL, and MWS. The highest predictive percentage of ATS with 66.4% was found in supervisors who worked with highly educated subordinates. The important predictors of this group were GA, FOSC, nAch, and RL. Percentages of prediction in the subgroups ranges from 52.2% to 63.9%. Thus these results fully supported hypothesis 3.

Discussion

Research on social support behavior suggested that individual's decision for helping others are influenced by many factors including situational, interpersonal, personal and the recipient's characteristics (Cutrona, Cohen, & Igram, 1990; Sarason, Pierce, & Sarason, 1990). However, recent finding did not find the relationship between SSSB and the actor's biosocial characteristics (Bhanthumnavin, 2003c).

Nevertheless, this present study found that the SSSB differed according to the biosocial types of their recipients, especially the recipient's age. The current study clearly revealed that supervisors who worked with older health workers (older than 30 years old) showed less of all three types of SSSB than supervisors of younger subordinates. Furthermore, another study on health workers in Thailand found that older workers' job success was clearly related to receiving more SSSB (Bhanthumnavin, 2001). Therefore, less SSSB for older workers can be detrimental to the organization as well as the workers themselves. The problem of older workers receiving less social support has been signified out in this study which is consonant with one of the most concerned HRD issues (Rocco, Stein, & Lee, 2003).

In addition, this study also identifies other two types of supervisors who provided less support, that is, supervisors who worked with less educated subordinates, and supervisors who worked with young, highly educated, male subordinates. Recommendations for training and development of these three types of supervisors are as follow.

Recommendations for Training and Development

Based on findings from this study, three recommendations for supervisory social support training and development can be made. First, supervisors should be trained on both social support behaviors and psychological characteristics as well as in management for good group atmosphere in order to improve their subordinates' work motivation, performance and effectiveness.

Second, this study has clearly identified three types of supervisors in Thai health centers who are the more urgent target groups for training. These are 1) supervisors who worked with older workers, 2) supervisors who worked with less educated workers, and 3) supervisors who worked with young, highly educated, male workers.

Finally, these three groups of supervisors should be trained on four groups of antecedents of SSSB found in this study. These are 1) ESB, ISB, MSB and OSB, especially of supervisors of older workers, 2) favorable attitude towards SSSB, 3) two psychological characteristics, i.e., nAch and FOSC and for the third group of risky supervisors, RL should be heightened as well, and 4) management for better group atmosphere.

The Value of Critically Reflective Work Behaviour

Marianne van Woerkom
University of Tilburg

This article discusses an investigation into the value of critically reflective work behaviour to a textile-printing factory and a forensic psychiatric clinic. A survey was carried out to measure the critically reflective work behaviour of employees, perceived appreciation of employees by their managers and colleagues, and their feelings of success in their jobs. Interviews with managers and employees were carried out to get insight into their perspectives on the value of critically reflective work behaviour.

Keywords: Critically Reflective Work Behaviour, Work-related Learning, Organisational Learning

Critical reflection can play an important role in organisational learning. By asking critical questions and confronting the basic assumptions underpinning prevailing organisational norms, values, hierarchies, and expectations, workers help prevent stagnation and dysfunctional habits (Argyris and Schön, 1996). The workplace is however not the easiest context for critical reflection. Critical reflection is often considered soft and irrelevant to the results-oriented and bottom-line world of business, and one might also question how critical critical reflection in the workplace can be, because the primary purpose of organisation is productivity (Marsick, 1988). Communities of practice tend to be conservative and reproduce counterproductive patterns, injustices and prejudices. (Wenger, 1998). Communities of practice are also the place for espoused theories, general norms about what works that everybody agrees on (Schön, 1983). Even if espoused theories do not work, people will be afraid to criticise them, for fear of appearing incompetent, or being expelled from their professional group (Schön, 1983). People who dare to criticise espoused theories are perceived as saying ‘the emperor is wearing no clothes’ or as ‘troublemakers’, as the participants in a company for telecommunication expressed it (Brooks, 1999). Although this was not regarded as bad, it was also often brushed aside, leaving the critically reflective worker alone. The ambiguous attitude towards critical reflection also came to the fore in a research into characteristics of good employees (Van Woerkom, 2003). When managers are asked for characteristics of a good employee, many of them stress aspects having to do with critical reflection (Van Woerkom, 2003). They mention the importance of thinking critically about the whys and wherefores, asking questions like “Why are things organised like this? Can the work be done more efficiently? Why do I work like this?” This implies an employee who can distance himself from his work, and reflect on it and on the changes that are taking place, instead of one who does what he is expected to do, and follows changes uncritically. However, some managers only value critical thinking that is ‘positive’, only want employees to reflect critically on themselves, instead of on the organisation, or restrict the importance of critical reflection on the organisation only to higher levels of management. This paper discusses the value of critically reflective work behaviour to organisations. The paper begins with a review of some key issues and themes in the literature on reflection and critical reflection and the operationalisation of critically reflective work behaviour. We then turn to the qualitative and quantitative data that were gathered in a textile-printing factory and a forensic psychiatric clinic. We conclude with discussions of the main findings.

Theoretical Framework

Mezirow (1990) makes a distinction between three levels of reflection, namely reflection, critical reflection and critical self-reflection. Reflection is aimed at the assessment of assumptions implicit in beliefs about how to solve problems. Critical reflection is devoted to problem posing and addresses the question of the justification for the very premises on which problems are posed or defined in the first place. Critical self-reflection is devoted to the emancipation of the individual, in order to make free choices. It means reassessing the way we have posed problems, our own meaning perspectives, and reassessing our own orientation to perceiving, knowing, believing, feeling, and acting. In the literature on reflection and critical reflection in the context of the workplace, we recognise these three levels of reflection. Reflection in the workplace can be an individual activity, aimed at solving the problems one encounters in one’s job. Reflection is important to examine one’s experience, in order to assess its effectiveness and to improve performance.

A very influential theory about reflection in the workplace in the instrumental problem-solving domain is the theory of Schön (1983) about reflection-in-action and reflection-on-action. Reflection in the workplace can also take

Copyright © 2004 Marianne van Woerkom
place in social interaction, aimed at making tacit knowledge explicit (Nonaka and Takeuchi, 1995). When people attempt to conceptualise an image, expressing its essence in language, these expressions are often inadequate, inconsistent, and insufficient. A process of collective reflection and interaction between individuals, results in a creative process leading to the new explicit knowledge. Reflection as a social interaction can also be aimed at problem-solving, as in continuous improvement or quality circles. We recognise critical reflection on the values of the organisation in various appearances. Sometimes, this is approached in a conflict model by one individual challenging groupthink (for example Brooks, 1999). Sometimes, it is approached in a more institutionalised conflict model - that of trade unions and workplace democracy (Brookfield, 1987). And sometimes, this is approached in a harmonious, but very Utopian model as in ‘Model II behaviour’ (Argyris & Schön, 1996). The ‘governing’ variables of Model II are to produce valid information, to make free and informed choices, to develop internal commitment to those choices and constant monitoring of their implementation, and the bilateral protection of others. The pity is, however, that this harmonious model does not exist in practice, as appears from the statement that “we are unlikely to find the new learning system by looking at the world as it presently exists” (Argyris & Schön, 1996, p. 111).

Critical self-reflection in the workplace is aimed at the emancipation of the individual in relation to the organisation. Critical self-reflection refers to learning to participate critically in the communities and social practices of which a person is a member, and creating an identity in relation to this specific social practice. The instrumental approach to learning by reflection cannot be separated from critical self-reflection, because job-related knowledge and skills cannot be separated from the rest of the worker’s life (Marsick, 1988). Through critical self-reflection, people can better see the way in which task-related learning is often embedded in norms that also impact on their personal identity. The three levels of reflection in the workplace cannot be seen as separate dichotomies, they are interrelated, and all touch upon each other. Individual reflection may lead to collective reflection; instrumental reflection may lead to critical reflection, and critical reflection on organisational values may lead to critical reflection on the self.

One dimension thus cannot be seen as more important than another. Since the concept of critical reflection has been developed within the context of theory or practice, rather than research, it has not been developed operationally, and no instrument exists to identify individuals capable of critical reflection (Brooks, 1999). Many definitions of reflection seem to characterise a process, instead of visible behaviour, and many definitions are focused rather on learning or thinking than on working in an organisation. We therefore decided to make an analysis of interviews that were carried out with 32 employees in seven organisations in both services and industries to look for identifiable, concrete, and practical examples of the three levels of reflection identified in the previous section. This analysis resulted in seven dimensions of critically reflective work behaviour. These dimensions are reflection, critical opinion-sharing, asking for feedback, challenging group-think, learning from mistakes, experimentation and career awareness.

In Table 1 we see the seven dimensions of critically reflective work behaviour that we have found ordered by level of reflection. The reflection dimension is a combination of an instrumental function in problem-solving and a function in critical self-reflection with regard to one’s own identity in relation to the job. The career awareness dimension refers to critical self-reflection on the position of the individual in his current job. We can now define critically reflective work behaviour as a set of connected activities carried out individually or in interaction with others, aimed at optimising individual or collective practices, or critically analysing and trying to change organisational or individual values. In order to measure the construct critically reflective work behaviour, each of the dimensions was measured by a scale of five to ten items. The scales were validated in a self-report instrument tested on 742 respondents working in various sectors (Van Woerkom, 2003).
Methodology

We opted to study the value of critically reflective work behaviour by combining quantitative and qualitative approaches in case studies of a textile-printing factory and a forensic psychiatric clinic. The case-study approach enabled us to investigate the perspectives and opinions of management and employees on the value of critically reflective work behaviour to the organisation. Any finding or conclusion in a case study is likely to be much more convincing and accurate if it is based on several different sources of information (Yin, 1994). First, a survey was carried out amongst all the employees of the organisations, using the instrument we developed to measure critically reflective work behaviour. Each of seven dimensions was measured using items we developed ourselves and consisted 5 to 10 items. All items could be scored from 1 to 6 (1=totally disagree, 6=totally agree). Besides the dimensions of critically reflective work behaviour, in the survey we also asked for the perception of the employee of the appreciation of his work by his manager and colleagues, and his own impression of success at work. In the textile-printing factory, 483 valid questionnaires were returned, leading to a response of 77%. In the forensic psychiatric clinic, 104 valid questionnaires were returned, leading to a response of 56%. Second, more qualitative information was gathered by carrying out semi-structured interviews with managers and employees. Literal transcriptions were made of all the interviews.

In the selection of interview respondents, we tried to maximise the variance in the dependent variable, critically reflective work behaviour. The HRD managers in the textile-printing factory and the line managers in the forensic psychiatric clinic were asked to make a selection of five employees whom they expected to score high and five whom they expected to score low on critically reflective work behaviour. The selected employees were asked to participate in an interview, and their permission was requested to include them in the survey research on a nonanonymus basis. If an employee refused, another employee was selected by the procedure described above. In order to get an opinion from the management perspective, in the textile-printing factory, the managing director and three HRD managers were interviewed, while in the forensic psychiatric clinic, the managing director, three line managers, and a staff employee concerned with the organisational climate were interviewed.

In the semi-structured interviews with the respondents, we asked their opinions on the organisational climate and aspects thereof, and on the value of critically reflective work behaviour and its subdimensions to the organisation. The interviews were semi-structured, allowing for the perceptions, attributions, and hypotheses of interviewees. Respondents were encouraged to clarify their statements with examples.

In order to answer the research questions, we made three kinds of analysis. First, based on the interviews with all the respondents, we made a general sketch of the organisational setting in order to gain a better understanding of the context of critically reflective work behaviour. Second, the more direct answers by the interviewees concerning the value of critically reflective work behaviour were described. Third, based on the survey data, Pearson correlations were computed between the self-ratings on critically reflective work behaviour, the perception of the employee of the appreciation of his work by his manager and colleagues, and his own impression of successfulness in his work.

Findings: A Textile Printing Factory

The textile-printing factory is an industrial production organisation, concerned with exotic printing on cotton. Each year, 16 million yards of fabric are produced by 680 employees, 300 of whom are production workers. The production process is rather complicated (batik), since this makes the product so unique and vivid and so popular among African consumers. The factory has been in existence since 1846, and still has in part the character of a Taylorist production organisation. In recent years, much energy has been invested in the delegation of responsibilities to the shop floor - partly in order to increase commitment and thus to reduce the costs of misproduction, and partly to become a more attractive employer, because a relatively large number of its employees are over 50 years old. In general, workers in the textile-printing factory have lifetime contracts of employment and feel very committed to the product and the organisation. Many workers are sceptical about change. During the past few years, there has been a change from a labour-intensive process to a capital-intensive one, which has led to the disappearance of jobs. Further, because of the increasing importance of product quality, the attitude towards the workers has become more businesslike. Workers are tackled about their achievements, and this has resulted in a great amount of tension and uncertainty on the shop floor. The ‘us and them’ culture has become evident, and many workers have developed a defensive attitude, according to the HRD manager. Some workers are dissatisfied about communication from management to the shop floor. They have the feeling that many decisions are taken behind the backs of the workers. According to the HRD manager, workers do not sufficiently take the initiative in preparing for the future. Since the year 2000, much attention has been paid to upgrading team meetings, in order to increase the
participation of the workers. Although this policy is officially propagated, it often fails because of the bosses, who are often still old-fashioned, and do not really know how to deal with it. Many workers still have the feeling they are not being listened to.

The Value of Critically Reflective Work Behaviour According to Interviewees

The importance of critically reflective work behaviour is unanimously acknowledged by management. According to the HRD manager, a change in work behaviour is crucial for the future: “New procedures, new systems, new machines, it’s all very well, but it all has to be carried out, thought up, developed and implemented by the employees we have here. What I see as good work behaviour is being very much aware of what needs to be done, knowing what is required of you, and being able to step back from what you’re doing.” Although he acknowledged the impact of the organisational climate on this behaviour, in his opinion, individuals can also change the organisation by their behaviour. The managing director and an HRD manager put the importance of ‘challenging groupthink’ into perspective. Workers who always say, ‘yes, but...’ are not perceived as very cooperative, and impede the process of change: “Because some people are the only ones to speak their mind, it looks as though they’re also speaking for the rest of the group, whereas that’s often not the case. Then the rest thinks, let him get on with it, I’ve got my own opinion.” The HRD manager valued discussions based on arguments, instead of rousing popular feelings. She emphasised the importance of critical self-reflection: “A lot of people point their finger at others, especially when things go wrong. It’s up to other people to change, I don’t need to.” Asking for feedback is important, but should not be at the expense of independence, was the view of this HRD manager. According to many respondents, experimentation cannot be seen as something entirely positive, because it is in conflict with continuity in the quality of products, which is determined by sticking to the procedures. One line manager saw experimentation as a right that can be earned by performing one’s duties first. If workers prove that they understand the procedures and stick to them, they earn the scope for experimentation. Often experimentation takes place too individually, with too little control. The line manager especially valued critical opinion-sharing: “Many people keep strictly to the rules, make perfect products, but as soon as we start talking about making improvements, they won’t commit themselves. For me, that’s not enough - a good employee is someone who is at least open to change and, preferably, starts to use his own initiative.” According to him, many workers do not have their own objectives when they come to a meeting, and merely listen to the manager. They do not have an agenda for their own development or have the feeling that the organisation is also part of themselves. They feel that the organisation only makes demands of them, but have no clear view about what they want from the organisation. This sometimes gives them the feeling that they are being treated like slaves. The managing director emphasised that shy people will have problems with critical opinion-sharing and that this has to be accepted. Everybody has his strong and his weak sides, so these people probably have other qualities.

The three high-rated respondents also acknowledged the importance of critically reflective work behaviour. One operator felt that, thanks to this behaviour, she was able to get a promotion. She indicated that she often tackled colleagues about their behaviour, but in spite of this, she got along well with everybody. Another high-rated respondent stated: “There are several people among us who just keep quiet when something is wrong. And they say, ‘Well, I’m not going to say anything.’ Then I think, ‘yeah, but things will never improve that way. After all, if you’re trying to get improvements, you’ll have to speak your mind when others are around.’” It is striking that all five of the low-rated respondents do not feel that critically reflective work behaviour is important. Three of them stated that only production is valued in the organisation. An administrative worker: “I see it actually more as character, you see. And I don’t think that management knows what sort of character everyone has. You’re here to work and you just have to do it as well as you can. If you do it on your own, that’s fine; if you need other people’s opinions, then you ask for them. The work simply has to be done as well and efficiently as possible.” One of them stated that it makes no sense to share one’s views, because one does not have a say anyway.

The Relation Between Critically Reflective Work Behaviour and the Perceived Appreciation of Employees by Managers and Colleagues and the Feeling of Successfulness

Table 1 presents the correlations in the survey data between the self-reported score on critically reflective work behaviour and the score on the items “Do you feel appreciated by your manager?”, “Do you feel appreciated by your colleagues?” and “Do you feel successful in your job?” It appears that most of the (Pearson) correlations are not very high, but most of them are significant. Only four of the correlations are not significant, namely the correlation between experimentation and appreciation by both manager and colleagues, the correlation between reflection and appreciation by colleagues, and the correlation between career awareness and appreciation by colleagues. These results converge with the results from the interviews and indicate that managers and workers in general appreciate critically reflective work behaviour, but are less positive about experimentation, because of continuity in the quality of products. The nonsignificant correlation between reflection and appreciation by colleagues can be explained by the individual character of reflection. The nonsignificant correlation between career awareness and appreciation by
colleagues is not surprising, because this activity is more in the interest of the individual and of the employer than in that of colleagues.

Findings: A Forensic Psychiatric Clinic

The forensic psychiatric clinic is a closed clinic for mentally disturbed patients on the border between judiciary and health care. In the clinic, treatment, intensive care, and security are interlinked. This policy is intended to diminish psychiatric problems, prevent delinquent behaviour, and reduce the danger to society. The clinic has over 185 employees and about 60 patients. Most of the employees are directly involved in the treatment, such as psychiatrists, psychologists, psychotherapists, social therapists, and social workers. The clinic has to adjust to ever changing legislation and care insurance procedures, and it is becoming more and more a subject of public and political debate with regard to the punishment versus treatment of delinquents, and the reactions to incidents. Personnel cannot walk freely through the building, but have to stay in their own unit for security reasons and for the privacy of patients. This has caused many workers to focus on their own small working environment and their immediate colleagues. Danger and security are dominant in the culture which made the rules, power and suspicion prevail. There used to be a climate in which workers were made to leave their job whenever they made a mistake, because of the serious consequences this could have for the safety of others. It is hard to break out of this culture. It is hard to strike a balance between a clear hierarchical structure and employee participation. There is a therapeutic climate, where everybody has a say in the many meetings, but it is unclear who is responsible for what. Many workers are dissatisfied with the communication from the top to the floor, and do not feel they are being taken seriously in their professionalism and their participation in decision-making.

The Value of Critically Reflective Work Behaviour According to Interviewees

In general, critically reflective work behaviour is valued as very important in interaction with patients. Since patients are expected to learn to reflect on their own behaviour, it is very important that the workers do so as well. A cluster manager: “Whether you’re a cleaner or a psychiatrist, you serve as an example. You have to behave accordingly and make sure it’s visible too.” It is also very important that workers can reflect on their interaction with the patients, because their own emotions can interfere with the treatment. Critical opinion-sharing is important, although sometimes annoying, according to the managing director: “To those people who think critically, I say: ‘We’ll have to discuss matters, since that always produces a better solution than when you just obediently nod your head because your boss is nodding in agreement too. But it must be rooted in some consensus, otherwise it’ll be utter chaos here.’” However, it is also acknowledged that followers too are needed in a team. With regard to the treatment, the social therapists have to carry out their tasks according to the procedures, and cannot always ask questions. The managing director: “For the routine work, you need people who say, ‘Tell me what to do, that’s when I feel happiest.’” Three managers also felt that critical opinion-sharing often arose more from conservative than progressive arguments and more from negative than positive impulses. A cluster manager said that a large group of employees only spoke up when it was a matter of sticking to the rules and maintaining things as they were, but became silent as soon as development was at issue. Asking for feedback is important, but, on the other hand, it is also vital that workers can react quickly and effectively in the event of serious incidents, and dare to take
independent action. Experimenting is important as long as it happens in contact with others. The organisation has to deal with many procedures. However, some workers interpret these rules too rigidly. A cluster manager mentioned, as an example, a social therapist who threw away some crisps that the parents of a patient had brought along for the whole unit, because visitors are not allowed to bring in things to eat. A cluster manager: ‘I feel there are too many people in this organisation who say, ‘We’ve always done it like this and it’s going to stay that way’. They are the people who think in black-and-white terms in a crisis; they handle that well. There are two ways of thinking that govern the actions of this sort of organisation: on the one hand, they want to control things and make sure that everything remains calm, and that there are no accidents. For this they need the sort of people who believe that orders are orders. On the other hand, they’ll say, ‘No, we are the psychiatric unit, we are the Mental Health Care Service, and we have to evolve.’” Another cluster manager also underlined the ambiguous attitude towards critically reflective work behaviour: “It’s very negative when people won’t lift a finger, or have the attitude of, ‘Let’s just wait and see’. And yet within their teams, they’re often very valuable, because they just get on with their work while others stand chatting, and forget that there are patients who need to be cared for.” He emphasised that both qualities were needed, and stressed the importance of self-reflection and willingness to change: “The most positive people are those who are not just critical about the people around them, but also about themselves, and then look for ways to change things themselves.” The cluster manager of the outpatient clinic felt that experimentation was hampered too much, because of the central position of security “Of course, we’re working among a group of patients where safety and danger are sometimes very much on your mind, you see. Those lousy security bleepers and all that - I can see that they’re necessary, but they’ve almost become the symbols of rules, power, order, and so on. And I sometimes think, just be a bit relaxed, experiment a bit with it, that wouldn’t be such a bad idea.”

The five high-rated respondents stressed the importance of critically reflective work behaviour to their interaction with patients, which should never become routine, and to the development of the treatment. One of them thought management did not care about critically reflective work behaviour, because they were mainly interested in running things smoothly without too many incidents or an overly high absentee rate. Another social therapist stated that one was only allowed to be critically reflective in one’s own ‘backyard’. The five low-rated respondents also stressed the importance of critically reflective work behaviour in their interaction with the patient; however, two of them felt they were so experienced that reflection was no longer necessary. One therapist stated that critical opinion-sharing was just not possible, because of the heavy workload, and the fact that everybody worked on their own. Two others stated that critically reflective work behaviour was too much of a good thing - there were too many meetings that were not very effective, they perceived participation as ‘bread and circuses’. One respondent said that a lot could be learned from the business world, where it’s only the results that count.

The Relation Between the Self-reported Score on Critically Reflective Work Behaviour and Perceived Appreciation by Managers and Colleagues and the Feeling of Successfulness

If we look at the (Pearson) correlations in the survey data between the self-reported score on critically reflective work behaviour and the score on the items “Do you feel appreciated by your manager?”, “Do you feel appreciated by your colleagues?” and “Do you feel successful in your work?”, it appears that only correlations with the employee’s own perceived successfulness are significant (own perceived successfulness and reflection, asking for feedback, experimenting, learning from mistakes, and the total construct of critically reflective work behaviour).
Correlations with perceived appreciation by the manager or by colleagues are very low. Correlations with the aspects of challenging groupthink, critical opinion-sharing and employability awareness are even negative, though not significantly so. It appears that these aspects of critically reflective work behaviour are indeed triggered by negative events (bad relationships with colleagues and manager). The fact that most correlations are not significantly positive indicates that managers and workers, in general, do not really appreciate critically reflective work behaviour. The fact that there is a relatively high positive (though nonsignificant) correlation between appreciation by colleagues and asking for feedback indicates that colleagues appreciate people who ask for feedback.

**Conclusion and Discussion**

In both the organisational settings of our case studies, we have seen that the concept of critically reflective work behaviour is experienced as valuable for the development of the organisation. In the textile factory, it is perceived as valuable for making the shift from a Taylorist to a modern organisation, with participating and self-managing workers. This requires employees to reflect on their own current and future position in the organisation, and to reflect on their own behaviour, instead of blaming others for mistakes. In the forensic psychiatric clinic, critically reflective work behaviour is perceived as valuable for the development of the treatment, in such a way that criminal offences in the future are being prevented. This requires employees to break out of the legalistic climate, dominated by rules and safety, and to contribute to innovations in the treatment. Further, the psychiatric clinic is atypical, in the sense that critically reflective work behaviour is also essential to the primary process - therapeutic interaction with patients. However, in both organisations we have also seen that, for many dimensions of critically reflective work behaviour, there ought to be a balance, for example, between experimentation and standardisation in the factory, and between reflection and action in the clinic. It is acknowledged that there is also a need for ‘followers’ and ‘workers’, who focus on their daily work and not so much on development. There should also be a balance between critical opinion-sharing, self-reflection, and asking for feedback. Sometimes balance within a person is more important, for example, the balance between reflection and action for social therapists. Sometimes, balance within a team is more important, as became apparent by the R&D project worker in the textile-printing factory, who stated that he was not an experimenter, in order to counterbalance his colleagues. The case study in the psychiatric clinic especially has taught us that we should not talk about critically reflective work behaviour in terms of ‘good’ and ‘bad’. This relates to Kirton’s (1994) theory about adaptors and innovators. According to Kirton, these are preferred cognitive styles, and are unrelated to the level of capacity. Adaptors are important for stability and continuity, innovators for the dynamics and development. Thus, the value of critically reflective work behaviour will probably also depend on the historical stage of development of the organisation. It is especially in the dynamic stages that critically reflective work behaviour will be assessed positively. The latitude for innovative role establishment in the job may also play a role in the assessment of critically reflective work behaviour. Jobs vary in the size of the task component and the role component, and the latitude they permit for innovative role establishment (Bandura, 1997). In the textile-printing factory, jobs used to be defined mainly by a task component. With the growing importance of process control and product quality, and the development of the organisation in the direction of self-management, latitude in the role component has increased. In the psychiatric clinic, jobs consist mainly of a role component. This can be illustrated by the remark of a social therapist that every social therapist should have ‘a colour’. Here, however, we see the difference in the assessment of critically reflective work behaviour between the social therapists who opt for the legal aspect of the job (emphasis on rules) and those who prefer the health care aspect (emphasis on development). What we also see is that, although managers think that critical opinion-sharing is important, they feel that it sometimes arises from conservative arguments, or is more based on the rousing of popular feelings than on arguments. It appears that it is not so much the critically reflective work behaviour itself that can be assessed as ‘positive’ or ‘negative’, but more the motivation that lies behind it. The correlations in the survey data from the forensic psychiatric clinic underline the ambiguous attitude with regard to critically reflective work behaviour. Though nonsignificant, the negative correlations in the survey data between challenging groupthink, critical opinion-sharing and employability awareness and the perceived appreciation by manager and colleagues indicate that these aspects of critically reflective work behaviour in the organisation may arise from dissatisfaction. People behave in such a way because they do not feel appreciated in the organisation, or they are not appreciated because they behave in such a way. Our conclusion with regard to the value of critically reflective work behaviour is that the answer to the question of *why* people show this behaviour is more important than the question of *if* people show this behaviour. What motivates people to behave in a certain way? There may be very valid reasons for not behaving in a critically reflective way. However, it is important to make these motivations explicit. Thus, the value of the concept of critically reflective work behaviour lies mainly in the phase of consciousness-raising and making the implicit
interaction between the motivation for behaviour - linked to the organisational environment - and individual behaviour the topic of action research.

**How This Research Contributes to New Knowledge in HRD**

The concept of critical reflection has made us aware that HRD is often approached from the paradigm of adaptive learning. Adaptive learning is necessary for developing routine, expertise, and efficiency. However, when it comes to the development or innovation of existing work practices, this focus on adaptive learning, aimed at ‘how to’ questions about efficiency and effectiveness, is not sufficient. For effective learning that goes beyond the reproduction of existing practices, whether in a formal or informal setting, at an organisational or individual level, learning must not only deal with ‘how to’ questions, but also with ‘why’ questions about individual and organisational values. Adaptive learning and critical reflection build upon each other. Adaptive learning is necessary for critically reflection, because it stimulates a realistic perceived self-efficacy, which on its turn proves to have a major effect on critically reflective work behaviour (Van Woerkom, 2003). HRD should therefore not only play a role in the adaptive learning of competence in relation to given tasks, goals, and conditions, but also in supporting people in critically reflective work behaviour. Critical reflection is not by definition in contradiction with a performance paradigm (Holton, 2000). What is essential is how performance is defined and if this definition includes also performance on the long-term. What is also crucial in the definition of performance is if individual motivations for and perspectives on performance are taken into account, since people cannot be forced to learn. Therefore, HRD should build on employee’s insights and energies, providing support, assistance and strategic direction (Kuchinke, 1998).

Tools and Strategies for Engaging the Supervisor in Technology-Supported Work-Based Learning, Evaluation Research

Manuela Bianco
Betty Collis
University of Twente

This study reports the results of the formative evaluations of two computer-supported tools and the associated strategies for their use. Tools and strategies embedded in web-based courses can increase a supervisor’s involvement in helping employees transfer learning onto the workplace. Issues relating to characteristics of the tools and strategies as well as factors influencing their likelihood of use are identified via summaries of the two evaluation studies.

Keywords: Supervisor Engagement, Tools and Strategies, Work-based Learning

The supervisor, or the supervisory team1, plays an important role both in the formal and informal learning of his or her team members. For formal learning, the supervisor is seen as a facilitator of transfer of training, with roles before, during, and after the training event (Broad & Newstrom, 1992; Nelson & Dufour, 2002). For informal learning the supervisor can have a variety of roles such as monitoring, guiding, enabling sufficient exposure to learning situations, providing help and advice, or encouraging the learner to contact appropriate colleagues (Eraut, Alderton, Coles, & Senker, 1998). However, the supervisor is often the “weak link” in the transfer of training process (Robinson & Robinson, 1989). The supervisor may be reluctant to participate or may lack preparation for how to effectively support learning (Billett, 2002) or lack time or motivation. If the employee is involved in a course using Web-based technology the supervisor may lack insight into how the employee is studying because of the supervisor’s unfamiliarity with the use of such a system. Thus when the course involves a non-traditional pedagogy, such as a new form of workplace learning that combines both formal and informal learning via courses that are centered on work-based activities learning (Bianco, Collis, Cooke, & Margaryan, 2002; Collis & Margaryan, 2003), the needs of the supervisor will be even stronger.

Tools and strategies are needed to help the supervisor in his or her new role (Kessels, 1993). Using the terminology of human performance technology (Stolovich & Keeps, 1992), there is a performance gap between current and desired performance, and to close this performance gap an appropriate intervention needs to be designed and evaluated. If the intervention involves tools or instruments for the supervisor, the supervisor must perceive them as having utility (usefulness) and user-friendliness (usability) before he or she will make use of them. Pilot versions of the tools thus require formative evaluation to improve both their usefulness and usability. In addition, in a multinational corporation, when the target group of supervisors includes individuals with different management styles affected, among other variables, by cultural differences, the adaptability of the tools and strategies for different contexts needs to be considered.

There are many sorts of tools and intervention strategies that could be used to increase the involvement of the supervisor in work-based learning. Some may involve incentives for the supervisor in terms of his own job-performance criteria. Others are under the control of the course-design team and the course facilitators. These can include tools such as messages or other forms of personal contact with the supervisor, informational material about the course directed at the supervisor, or (virtual) meetings or workshops. A learning agreement, or contract, in the form of a document structuring and recording a discussion and agreement between a course participant and his or her supervisor concerning course goals and support for course attendance is a particularly promising example of an intervention. Such an agreement can steer the participation of the learner towards the ways that performance change in the workplace is expected to be seen as a consequence of the course. Another type of intervention is particularly relevant for courses supported in a Web environment as it involves making supplementary material about the course and about how the supervisor can intervene at various times in the course for feedback to and support of the participant directly available to the supervisor via the Web environment. This type of intervention has the benefit of

1 It should be noted that the term supervisor might be replaced by “supervisory team”. The supervisor is defined as the direct superior working with the team member and learner on a daily basis. However, in practice, it might be that others are carrying out aspects of supervision, for example when the supervisor is not an expert in the content that is being learned or “when teamwork is a key component of work practice” (Billett, 2002, p. 184).

Copyright © 2004 Manuela Bianco & Betty Collis
also helping the supervisor to become familiar with the learning environment and types of learning activities in which the participant is involved. If a collection of different types of tools and strategies is integrated together in one electronic environment, this collection can be called an electronic performance support system (EPSS).

**Problem Statement**

Within the Learning & Leadership Development organization of Shell International Exploration and Production (LLD-SIEP) the problem of increasing supervisor involvement in learning is of particular significance because of a new learning strategy that focuses on work-based activities. The overall problem being investigated is: what tools and strategies, used in what conditions, can lead to increased supervisor involvement in technology-supported work-based learning? Through preliminary research (Bianco & Collis, 2003) an intervention has been identified consisting of an electronic performance support system (EPSS) and is in the process of development. Two particular components of the EPSS, a learning agreement and personalized materials added to the Web-based course environments supporting the participants, have been designed and are in the process of various cycles of revisions and formative evaluation. The problems relating to these two types of tools are: Are these types of interventions suitable for supervisors in the LLD-SIEP context? If they are suitable as general types, what features should they have in order to strengthen their likelihood of use by supervisors? Will supervisors perceive the tools as useful to themselves? Will they experience them as easy to use? Will it be advantageous to provide alternative forms of each type of tool, to anticipate differences in the supervisors themselves? The formative evaluations summarized in this paper address these questions.

**Theoretical Framework**

The supervisor’s performance in terms of supporting learning, as with any type of performance, can be affected by appropriately designed interventions. Interventions are combinations of goals, strategies, and instruments (Stolovich & Keeps, 1992). A distinction can be made between instructional interventions such as courses and seminars, and non-instructional interventions (Greenworks Consulting Training Services, 2003). The latter category includes tools such as electronic performance support systems (EPSSs), knowledge management (KM) tools, tools offering just-in-time support, tools supporting the functioning of communities of practice, and job aides and strategies related to corporate culture changes and process re-engineering. When the performance change being focused upon includes working with electronic environments, the support tools typically also have an electronic component. A major category of non-instructional interventions is that of electronic performance support tools. An electronic performance support system can also be described as “any computer software program or component that improves employee performance by reducing the complexity or number of steps required to perform a task, providing the performance information an employee needs to perform a task, or providing a decision support system that enables an employee to identify the action that is appropriate for a particular set of conditions” (http://www.pcd-innovations.com/infosite/whatepss.htm). Leighton (n.d.) indicates that an EPSS typically includes some combination of the components shown in Table 1:

<table>
<thead>
<tr>
<th>Tools</th>
<th>Information Base</th>
<th>Advisor</th>
<th>Learning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Word Processing, Spreadsheet, Database</td>
<td>On-line Documents, Reference Materials</td>
<td>Expert Advice and Coaching</td>
<td>Multimedia CBT and Tutorials</td>
</tr>
<tr>
<td>Templates &amp; Forms</td>
<td>Info Databases, Case History Data</td>
<td>Context-Sensitive On-Line Help</td>
<td>Simulations and Scenarios</td>
</tr>
</tbody>
</table>

The methodology for the design and development of such an electronic intervention relates to human performance technology (Stolovich & Keeps, 1992) and also to software-design research more generally (Reeves, 2000). In the design of an EPSS a number of key issues must be considered. One of these is the content of the EPSS: Which of the types of tools and resources indicated in Table 1 should be included? And once the choice for a type of component is made, how should the component be further realized? The development process of an EPSS and of its component tools and resources involves many iterations of pilot testing with design experts and performance analysts as well as the target users, in order to identify which aspects of the tool will be perceived as having the most
value, or utility, and which aspects will most affect the ease of use, or usability, of the tool in order to increase its likelihood of use in practice (Sweeney, Macquire, & Shakel, 1993).

Research Setting

The context for this research project is the Learning & Leadership Development organization of Shell International Exploration & Production B.V. (LLD-SIEP). LLD-SIEP supports learning for technical professionals within SIEP worldwide. At the LLD-SIEP a form of technology-supported course is being implemented based on a model of learning that involves different types of work-based activities, predominately carried out in the workplace with the support of the supervisor as well as others with relevant experience (Bianco, Collis, Cooke & Margaryan, 2002). Work-based learning within these courses is supported by web-based course environments that are part of the TeleTOP system, a blend of a course management system and learning content management system (Collis & Moonen, 2001). The work-based assignments involve colleagues and supervisors and are aimed at solving actual challenges that the learner's team is facing in practice.

An important part of a five-year collaborative research project between the LLD-SIEP and the University of Twente focuses on the development of tools and strategies to support this approach to workplace learning. At the LLD-SIEP courses are designed by teams that include subject matter experts and designers. Tools and strategies for supervisor involvement are among the focuses in the design process. This portion of the overall research can be characterized as development research (Reeves, 2000) and has “the dual objectives of developing creative approaches to solving human teaching, learning, and performance problems while at the same time constructing a body of design principles that can guide future development efforts” (Reeves, 2000, p. 7). Figure 1 shows the model for part of the overall research that focuses on supervisor engagement. The dotted lines are taken as assumptions; the focus of the current research is on the vertical arrows relating to supervisor engagement levels and tools and strategies as interventions that can affect this engagement.

Figure 1. A Model to Study Supervisor Engagement in Technology-Supported Work-based Learning: Effect of Tools on Supervisor Engagement and Effect of Supervisor Engagement on Individual Performance.

Within the research represented in Figure 1, a variety of tools and strategies to involve the supervisor are being developed and evaluated in an iterative manner. The two examples whose evaluations are reported in this paper are the “Learning agreement”, an electronic template for a letter of commitment between supervisor and participant; and “Resources and activities embedded in the course Website”, additions to the course web-environment specifically designed for supervisors to encourage their participation. The formative evaluations presented in this paper are part of this portion of research.

Research Questions

This study focused on the following questions:

1. How are the learning agreement and course-addition tools perceived in terms of utility and usability by domain experts, performance-analysis experts, and tool-design experts as well as supervisors and course participants?
2. How are the learning agreement and course-addition tools perceived in terms of utility and usability by the LLD-SIEP course designers?

Example 1: The Learning Agreement

The learning agreement is one of the tools for supervisor engagement being developed within LLD-SIEP. The learning agreement aims at supporting participants in negotiating with their line managers for suitable conditions to complete the work-based course, and understanding what goals are to be achieved by participating in this course and how it is intended to be followed. It consists of an electronic template for a letter of commitment between supervisor and participant that covers goals to be achieved during the course, relation of the course to workplace needs, and resources available to the participants to follow the course. Participants fill in the learning agreement jointly with their supervisor as first activity of a course and submit the agreement in the course web-environment where it remains available for review and for use during the final evaluation.

The learning agreement piloted at LLD-SIEP was structured in five sections. These included: course participant’s details and his or her line manager’s name and email; dates during which learning agreement was valid and persons involved; description of a workplace situation that suggested a business need for the course and how successful completion of the course would impact on it; conditions under which the course participant was following the course, such as where and when he or she intended to study and if time would be made available for learning activities. It is the selection of the workplace activity or problem, which will be the focus of the course that is particularly critical because it is in this that the learning becomes anchored in real workplace needs.

Pilot Test Setting

The Learning Agreement was first designed and piloted in 2002 in a course called Health and Risk Assessment (Bianco, 2003). This course was designed to take practitioners involved at different levels and in different roles in the health- and risk-assessment process to the skill level necessary to carry out an assessment in their own workplaces. Participants worked both for Shell EP Operating Units worldwide and for contractor companies. The course consisted of seven e-modules and a number of activities that extended the concepts in the e-modules and were carried out in the real workplace settings of each participant. Each module consisted of a theoretical portion developed as an e-module and a number of self-assessment questions. After completing each e-module participants were required to carry out assignments that involved the application of what they had learnt in their own workplaces and also regularly required the involvement of the local HRA team. Results of the assignments were submitted via the TeleTOP system. Course participants were expected to finish the course in four weeks, but completion could take up to a maximum of six weeks. The course took place entirely at a distance. The learning agreement was the focus of the first activity of the course. The course did not involve any face-to-face component but was entirely carried out in the workplace, with support of the TeleTOP system.

Method and Respondents

This study employed qualitative methods to explore supervisors’ and participants’ perceptions of the learning agreement as a tool to involve the supervisor in the course HRA. There were 18 participants and 15 supervisors. All completed a learning agreement, and all but one participant indicated his or her supervisor’s email addresses. These sets of participants and supervisors were invited to participate in semi-structured telephone-interviews that were carried out between September and October 2002. Additional documents were also analyzed to provide insight into the interview data. These were the course participants’ descriptions of themselves and their work uploaded in the TeleTOP course-management system and the learning agreements themselves. Both types of documents were submitted as course assignments. The uploading of participant descriptions as an assignment was meant both to familiarize them with the course-management system and to help them to get to know the other course participants.

In addition to being a tool undergoing pilot testing, the learning agreement was also a key tool for data collection as via it participants indicated the names and emails of their supervisors. This means that only supervisors whose names had been indicated in the learning agreement were contacted, thus not all the supervisors whose employees were following the course.

Interviews were recorded and transcribed. The supervisors’ answers were then compared to find emerging patterns. The same procedure occurred for participants’ answers. Then, once preliminary patterns were found, participants’ descriptions and learning agreements were re-analyzed to provide additional insight (Bianco, 2003).

Results

Response rate. Of the supervisors and participants who submitted the learning agreement, only 8 supervisors and 12 participants agreed to be interviewed. In the end, only 4 supervisors and 8 participants were interviewed. Their busy schedules and time-zone difference made it impossible to arrange a suitable time for some of the appointments. This response rate, 28% for the supervisors, was low. However, the course participants’ response rate
was also lower than expected, namely 44% (8 out of the 18 that submitted learning agreements). There appeared to be two reasons for this. Participants’ work descriptions in the course Web environment show that they come from and work all over the world, and so do their supervisors. Thus it was logistically difficult to contact them and arrange a suitable time to interview them (phone connection, time differences). In addition, cultural differences could influence their perceptions of their roles and duties (Wang, Ruona, & Rojewski, 2003) and thus perhaps influenced the response rate. Interestingly, from the analysis of the learning agreements it emerged that participants who did not answer the interview request had a lower level of support from their supervisor that participants who did. Also they were away from their workplace for other job assignments longer.

Participants’ and supervisors’ perceptions of the learning agreement. An interesting contrast between participants and supervisors emerged with respect to the utility of the learning agreements. Except for one, all participants thought the learning agreement was useful in getting their supervisors’ support by clarifying expectations and requirements for course participation and communicating to their supervisors about what they were doing. However, they thought the learning agreement had not helped them in getting appropriate resources (such as computer, or a quiet room to study) to follow the course. The supervisors’ perceptions were less enthusiastic. Two out of three defined the learning agreements as “just more paperwork” and could not see any utility in it. One suggested that the total amount of hours the course participant is expected to spend on the course should be clearly indicated.

Another interesting aspect emerged with respect to the increase in workload for the participants caused both by the course assignments and the fact that they were expected to keep up with their already-overloaded job tasks. This overload seemed to be an acceptable situation in the opinion of the supervisors who did not expect any problems for participants to complete the course. Interestingly, this was true to a certain extent also for the participants: for five participants the course added to an already heavy workload, but only three of them thought they would not be able to meet the deadline.

Current Status

Taking into account the insights gained during the formative evaluation, the learning agreement is currently in use in all TeleTOP-supported courses now being offered to the Shell EP business. Different versions of the learning agreement are currently being developed as part of the ongoing research on tools and strategies. Further evaluation is taking place to codify and analyze the contents of the learning agreements and relate them to the impact of the course in the workplace.

Example 2: Resources and Activities Embedded within the Course Website

For the intervention piloted at LLD-SIEP and reported in this paper, resources and other additions for the supervisor included an introduction to the work-based learning strategy, a description of what is available for the supervisor in the embedded EPSS, a description of the need for a learning agreement, a set of examples of the benefits of the supervisor’s involvement in work-based activities, a reflection moment in the form of a questionnaire, guidelines for a debriefing meeting, a fill-in-form for an action plan to complete with the team member after the course, and a questionnaire to reflect on the team member’s performance improvement and to relate the observed performance to what was planned for in the learning agreement.

All these tools function as a type of embedded EPSS (Sleight, 1993). Parallel to the design of these embedded resources the course design also needs to call for the supervisor’s involvement via suitable activities. The embedded additions to the site specifically for supervisors then encourage the supervisors to know how to participate. The underlying strategy is that supervisors’ access to the course website is first step towards establishing a learning partnership.

Resources and activities are to be included in the course roster. The roster is one of the main features of the TeleTOP system and consists of a matrix-type structure that displays the organization of the course and integrates materials, activities, and feedback (Collis & Moonen, 2001). There are many ways to make such components of an embedded EPSS available to supervisors. In the pilot described next, two sets of alternative ways were developed, presented to the target group, and evaluated. While the learning agreement pilot focused more on the utility of the tool, the embedded EPSS pilot focused more on the usability.

Pilot Test

Two alternative sets of embedded EPSS components were developed to be integrated into two otherwise identical course web environments. The pilot test refers here to the feedback gathered both in the development and evaluation of the first prototype carried out respectively in Q1, 2003 and Q2, 2003 (Tang, 2003). The methods used are described in the next section.
Method

Development method. Resources and additions embedded within the course Website were developed using a rapid-prototyping approach (Reeves, 2000). A first draft of the components of the EPSS based on a preliminary task analysis was prepared. Feedback was collected from different stakeholders at the LLD-SIEP during individual semi-structured face-to-face interviews. Stakeholders included one of the directors of the LLD-SIEP, the senior learning advisor, two instructors, and a marketing expert. Adjustments to the design of the components followed. The modified new draft of the contents was later discussed during a meeting with the senior learning advisor and a business consultant, who agreed on the general design decisions and suggested a number of further specific design decisions. The general design of the components was then worked out in two different styles of language and tone of presentation, based on an analysis of key differences in supervisors from different regions internationally in Shell EP (Tang, 2003). Two versions of the embedded EPSS were then prepared, underwent an expert review, and adjusted once again based on the experts' comments relating to usability and aspects that differentiated one of the versions from the other.

Evaluation method. Data were collected via a questionnaire that included questions about the utility and usability of the tools. Issues about cultural diversity were also included since the two versions of the tools were designed to account for differences between Western and Asian supervisors. The URL of the website where the tools could be viewed was included in the invitation letter for the evaluation, together with a description of the tools and instructions for how to fill out the questionnaire.

Results

Respondents. The questionnaire was sent to 25 persons. Of these, 17 answered, namely 5 LLD-SIEP learning designers, 11 students of Chinese nationality involved in the HRD Masters program at the University of Twente, and one learning expert from the faculty of the university. The Chinese students were included because of their HRD background. Besides based on their experience with managers in China they could comment on the presentation style and the tone of instruction. No actual Shell EP supervisors were directly involved because they had to be first introduced to the TeleTOP system and it was judged not convenient for them at this point in time to view such an early prototype. Each studied the two alternatives of embedded EPSSs and completed the evaluation questionnaire.

Utility. The ideas of resources and activities for supervisors embedded within the course Website were generally well accepted, and thought to be useful and appropriate, as shown in Table 2. However, 35% of the respondents thought the number of activities was too much to expect of the supervisors.

Table 2. Results with Respect to Utility (N=17).

| Idea of using this tool to build communication with supervisors is good (88%) |
| Content is appropriate (82%) |
| Amount of activities is too much (35%) |
| Improves supervisor’s support skills (82%) |
| Encourages supervisor’s involvement (71%) |
| Expects trainee to feel more supported by supervisors that use this tool (71%) |

Usability. Usability aspects need to be further improved, particularly in the wording of several of the sets of instructions. Because of reservations with respect to the clarity of wording of instructions, which were only thought to be attractive and persuasive by 29% of the respondents, the usability of the embedded EPSS was not considered to be high in its current version, as shown in Table 3.

Table 3. Results with Respect to Usability (N=17).

| Supervisors will like the form and layout (47%) |
| Instructions are clear (47%) |
| Instructions are attractive and persuasive (29%) |
| Instructional tone is friendly (41%) |

Current status

After the development of the first prototype the development method for the tools and strategies has evolved. The researcher now works together with course designers and instructors to develop or adapt, implement, and
evaluate the tools as the course itself is being designed and developed and piloted. This is valuable for several reasons. First, both designers and instructors need to feel ownership of the tools they use, and tend not to accept tools that have been developed without their input. Secondly, the course design needs to include features that anticipate the use of the tools by the supervisors during the course so that the supervisors have a structure for intervening in the learning process of their team members.

**Discussion**

The pilot of the learning agreement clearly showed that attention to supervisors’ perceptions of the learning agreement should continue to occur in order to help evolve it into a useful tool. Supervisors’ perceptions of learning and other factors that influence their likelihood to become involved in learning as well as barriers to their involvement should be further investigated. More generally, feedback from the supervisor is of key importance in further developing this type of EPSS tool. Ideally, such tools should be developed jointly. There are several reasons for this: if a supervisor does not see the utility of a tool he or she will not use it, and more positively a supervisor can give suggestions to improve the tool. For example during the pilot, one supervisor suggested that the estimate of amount of total time required for the course should be added. The pilot of the embedded EPSSs show that offering options to the supervisors, in terms of tone and style of approach in the EPSS, needs to be studied further.

Also, courses differ considerably in their design and in the conditions in which they take place. This means that tools need to be adaptable with each course, but also that the researcher needs to understand this complexity in order to develop suitable tools. An approach in which a variety of tools and versions of the tools are developed jointly together with course designers and instructors, piloted, and evaluated involving actual participants and supervisors is seen as appropriate. This will strengthen the further development of a portfolio of tools and strategies and guidelines for how to use them in different situations. It is this portfolio that will be integrated into the overall EPSS for performance support of supervisors that is to be completed in 2005.

**Contribution to HRD Knowledge**

There is not much research that focuses on the role of the supervisor when technology-supported courses focus on work-based activities. The current study contributes to HRD knowledge related to electronic performance support because it identifies tools and strategies that can be used by supervisors when employees are taking web-based courses and also to a new type of partnership involving educational technologists, performance analysts, course designers and supervisors themselves. The methodology used for the design and development work (Reeves, 2000) is well known in fields involving electronic performance and learning support but not often seen in HRD research. This is another contribution to the HRD community.

Organizational Learning Culture, Transfer Climate and Perceived Innovation in Jordan

Reid Bates
Samer Khasawneh
Louisiana State University

This paper examined the relationship between organizational learning culture, learning transfer climate, and organizational innovation. The objective was to test the ability of learning organization culture to account for variance in learning transfer climate and subsequent organizational innovation, and to examine the role of learning transfer climate as a mediator between learning organization culture and innovation. Results showed that organizational learning culture predicted learning transfer climate, and both these factors accounted for significant variance in organizational innovation.

Keywords: Learning Organization, Innovation, Transfer Climate

Technological advancements, dynamic customer demands, increasing globalization, the blurring of organizational boundaries (Arthur & Rousseau, 1996), and increasing competition are all combining to produce organizational environments more turbulent than ever before. Given the uncertain nature of organizational environments it is not surprising that increasing attention in the human resource development (HRD) and organizational development (OD) literature has been paid to learning organizations. A recurring theme in this literature is that the adoption of some all of the features of the learning organization enables organizations to develop more flexible and adaptable systems that improve long-term performance (Guns, 1996; Senge, 1992; Slater & Narver, 1995).

However, the literature addressing the learning organization is largely descriptive and conceptual in nature. For example, many authors have described why a learning organization should work, but there are few specific descriptions about the mechanics of how the learning organization as a strategy works to improve performance (Kaiser, 2000). In an effort to bridge this gap in the learning organization literature, Kaiser and Holton (1998) have identified a number of parallels between the characteristics and recommended procedures in the learning organization literature and the innovation literature. They note that the learning organization and innovation literatures both focus on the facilitating role of the same organizational variables including culture, climate, leadership, management practices, information acquisition, retrieval, and sharing, and organizational structures, systems and environment. Both literatures also focus on strategies that will enhance the adaptability and flexibility of organizations in ways that improve long-term performance. The convergence on a common outcome together with the similarity in influencing variables has been interpreted to suggest that innovation may be a close relative of organizational learning (Kiernan, 1993) and a relationship may exist between the two.

It has been suggested that every organization is to some degree a learning organization but are differentiated by the degree to which they learn better, faster, or more completely (Mai, 1996). This could be revealed through outcomes like innovation and is likely to be facilitated and supported by climates or systems that enhance and support learning application. In other words, the culture of an organizational learning system is all about developing and applying intellectual capital. Learning and the factors that support the transfer (application) of learning are part of that organizational culture that creates and shares knowledge. The purpose of this paper is report on an initial exploratory examination of the relationship between organizational learning culture, learning transfer climate and organizational innovation. The objective was to empirically examine the ability of learning organization culture to account for variance in learning transfer climate and subsequent organizational innovation. Our analysis also seeks to examine the role of learning transfer climate as a mediator between learning organization culture and innovation. The research model shown in Figure 1 depicts a partially mediated model that views learning organization culture as an antecedent that influences learning transfer climate that, in turn, affects organizational innovation.

The Research Model

Organizational Culture and Innovation

One of the outcomes of interest in this study is organizational innovation. For our purposes, innovation will be equated with the adoption and application of new knowledge and practice. This conceptualization is consistent with that of other researchers (Agrell & Gustafson, 1994; Burningham & West, 1995; West & Anderson, 1996) and
emphasizes the importance not only of learning but also the application of that learning. The literature on organizational innovation focuses heavily on the role of culture as a facilitator largely because of the role that organizational culture plays in effective change initiatives (Bluedorn & Lundgren, 1993). In fact, Kotter and Heskett (1992) have identified an adaptive culture – or a culture that fosters and nurtures innovation - as the optimal culture for organizations pursuing long-term superior performance in dynamic environments.

Organizational culture refers to the “shared meanings and manifestations” of organizational behavior (Kopelman, Brief, & Guzzo, 1990, p. 284) and, as such, emphasizes the common beliefs, values and assumptions of organizational members. The learning organization literature also emphasizes that role of organizational culture to the extent it indicates that a consensus has developed among organization members about the value of learning and use of new learning to pursue organizational goals and objectives. In discussing organizational learning, for example, Watkins and Marsick (1993) suggest that a culture that supports the acquisition of information, the distribution and sharing of learning, and provides rewards and recognition for learning is essential. Marquardt (1996) emphasizes the importance of an organizational culture that facilitates and promotes continuous learning and improvement.

An organizational learning culture becomes important in the consideration of innovation to the extent that the culture enables an organization to anticipate and adapt to the dynamics of a changing environment. For example, Bass and Avolio (1990) emphasize the value of innovative and adaptive cultures in their distinction between transformational and transactional cultures. The former support change and innovation while the latter tend toward the maintenance of the status quo. Both innovation and organizational learning are seen as emphasizing the free exchange of information and ideas in ways that facilitate learning and its application. Both focus heavily on the role of culture as a facilitator of creativity. The common threads that emerge from this and other literature underscore the importance of culture in promoting and supporting inquiry, risk-taking, and experimentation.

Organizational Climate and the Culture-Climate Connection

Organizational climate as a general construct can be defined as a psychologically meaningful description of the work environment (James & Jones, 1976; Jones & James, 1979) or, similarly, a individual psychological state affected by organizational conditions like culture, structure, and managerial behavior (Burke & Litwin, 1992). Thus organizational climate is not a fixed environment per se but the way in which people respond to it; it is the ‘perceptual medium’ (Kopelman et al., 1990) through which the work environment affects job-related attitudes and behaviors. Climate has thus been described as a ‘sense of imperative’ that arises from a person’s perceptions of his or her work environment, one that influences how he or she responds (Schneider & Rentsch, 1988). This sense of imperative can be reflected, for example, in perceptions of task-related support (e.g., feedback) for learning transfer or in the cognitive and affective states that ensue from these perceptions.

Organizational culture differs from climate to the extent that culture is based on beliefs that are shared organization-wide while climate is based on what an individual senses in and about the organizational environment (Reichers & Schneider, 1990). This has led to the notion that climate is a surface manifestation of culture to the degree that different beliefs, meanings, and symbols (i.e., culture) give rise to different individual expectations and interpretations of the organizational environment (Denison, 1996). This view is consistent with considerable research into organizational climate that recognizes it as useful multidimensional construct that can be applied to a wide variety of organizational and perceptual variables reflective of organizational-individual interactions (Glick, 1985; Schneider, 1980).
Our research model suggests that organizational learning culture gives rise to task support and cognitive and affective elements indicative of supportive learning transfer climates that, in turn, influence organizational innovation. Our rationale for this sequence is based on several factors. First, these hypothesized relationships are generally consistent with Kopelman et al.'s (1990) model of climate, culture and productivity. Second, to the extent that climate is a surface manifestation of culture it is possible to draw on Schneider’s (1987) attraction-selection-attrition model of organizational development and speculate that an organizational learning culture may, over time, lead to the development of transfer climates conducive to learning and its application. Finally, there is evidence that organizational climates can have an effect on innovation (Abbey & Dickson, 1983; Anderson and West, 1998).

More specifically, the research model suggests the following hypotheses:

H1: After controlling for organizational sector and industry type, learning organization culture will explain a significant amount of variance in innovation

H2: After controlling for organizational sector and industry type, the block of transfer climate variables will explain a significant amount of variance in innovation

H2: Regression results will support the inference of a partially mediated model in which the block of transfer climate indicator variables partially mediate the relationship between learning organization culture and innovation

Methodology

Population and Sample

Data for this study were collected from 450 subjects employed by 28 different organizations in Jordan. Because of limited access to subjects in Jordan, both purposive sampling and convenient sampling (Ary, Jacob, & Razavieh, 1996) were used. Approximately 38% (n = 172) of the respondents were from public sector organizations and about 62% (n = 278) were from the private sector. A little over 25% of the respondents were from public sector educational institutions with the remainder fairly evenly divided between public/governmental organizations and private sector manufacturing, high tech, banking, insurance, retail, and service organizations. A slight majority of the sample was male (54%). Respondents were predominantly 30 or more years old (71.4%) and held a bachelor’s degree or higher (89.1%). Over 60% of the respondents had four or more years of work experience.

Instrumentation

Since all the scales used in this study were developed in English, a rigorous English-to-Arabic translation process was used that included an iterative process of forward translation, backward translation, assessment for clarity and correctness, and subjective and objective evaluation. The goal of the translation and various evaluation procedures was to produce an Arabic version of the items that were equivalent in meaning to the original English versions. This last point is important because our objective was an equivalent translation not an identical word-by-word translation. Equivalent translations emphasize functional equivalence or the equivalence of meaning of the survey items between the original and translated instruments. Functional equivalence helps to ensure that the measures work in the new target culture as well as they did in the original culture because the translation is based on achieving equivalence in meaning rather than just the form of the sentence or word-by-word translations.

Exploratory (common) factor analysis was used to identify the latent construct structure of the survey items and to provide some evidence of construct validity and cross-cultural equivalence. Common factor analysis is considered more appropriate than principal component analysis when the objective is identification of latent structures (Nunnally & Bernstein 1994). Oblique rotation was employed because of its suitability for latent variable investigation when latent variables may or may not be orthogonal (Hair, Anderson, Tatham, & Black, 1998). The initial criterion used to determine the number of factors to retain was an eigenvalue greater than or equal to one. In the analysis (a) factor loadings reflected interpretable simple structures; (b) only items with loading .40 or higher were included in the scales; and (c) average item loading values were greater than .50 on major factors and less than .15 on other factors for all scales.

A five-item scale was used to measure perceived organizational innovation. Scale items were drawn from an assessment tool entitled Assessing Strategic Leverage for the Learning Organization (ASLLO) (Gephart, Marsick, Holton, & Redding, 1996). This scale was designed to measure the perceived ability of an organization to adopt or create new ideas and implement these ideas in the development of new and better products, services, and work processes and procedures (Holton & Kaiser, 1997).

Items for the three scales used to measure organizational learning culture were also drawn from the ASLLO. The knowledge indeterminacy scale was a four-item scale designed to measure the perceived belief that knowledge in organizations is not fixed and that anyone can be a source of learning and knowledge. The learning latitude scale was a four-item scale designed to measure the belief that individuals are free to be independent thinkers and are able...
to freely promote and try new ideas. The organizational unity scale was a five-item scale measuring the belief that all organizational members share a common goal and are all working for the benefit of the organization and its stakeholders. These three scales were summed to yield a single score for organizational learning culture.

The learning transfer climate measures were drawn from the Learning Transfer Systems Inventory (LTSI) developed by Holton and Bates (2002). The LTSI is a diagnostic tool used to assess the factors that influence learning transfer and to assess transfer systems in organizations. It is an 89-item instrument with two sections: the first section contains training-specific constructs that reference a specific training program. This section includes 63 items representing 11 constructs. The second section of the LTSI contains 26 items, measuring five constructs that reference training-in-general in the respondent’s organization.

Because we were concerned with the learning transfer climate in general (as opposed to that generated from a specific training program) the training-in-general measures were used in this study as an indicator of learning transfer climate. The training-in-general measures consist of five scales that reflect perceived task support elements and individual cognitive states that, taken together, comprise a psychologically meaningful ‘sense of imperative’ regarding learning and its application. The two scales reflecting task support elements included performance coaching (six items) and openness to change (four items). Performance coaching measures the extent to which individuals perceive they receive constructive input, assistance, and feedback from people in their work environment when applying new knowledge or trying new ideas to improve work performance. Openness to change measures an individual’s perceptions about his or her work group’s resistance to change, willingness to invest energy to change, and the degree of support provided when trying to use new learning to improve work performance. The three measures reflecting individual cognitive states included performance self-efficacy (PSE), transfer effort-performance expectations (TEPE), and performance-outcome expectations (POE). Performance self-efficacy (four items) assessed the extent to which individuals feel confident and self-assured about applying new learning, ideas, and abilities in their jobs, and can overcome obstacles that hinder the use of new learning. Transfer effort-performance expectations (four items) assessed the extent to which individual believe that applying new learning will improve performance. Performance-outcomes expectations (three items) measured the extent that individuals believe the application of new learning will lead to recognition or rewards they value. All scales used a Likert-type scale ranging from 1 = strongly disagree to 5 = strongly agree.

**Data Collection**

The survey instrument was administered in Jordan to employees at varying time lengths following an episode of organizational training. Time varied from directly after training to six months after training. When distributed at the end of the training program, either the researchers or the administrator of the training distributed and collected the instruments. In the other cases the instruments were distributed to trainees through the human resources personnel and then returned to the researchers.

**Data Analysis**

Bivariate correlations were calculated to examine the direction and magnitude of inter-variable associations. Hierarchical regression analysis was used to determine whether the mediated model provided a reasonable description of the relations among variables. A mediator has been described as a variable “that accounts for the relation between the predictor and the criterion” (Baron & Kenny, 1986, p. 1176). James and Brett (1984) describe two types of mediators, complete and partial. Complete mediation occurs when the mediating variable “transmits all of the influence of the antecedent x to a consequence y, which implies that x and y are indirectly related” (p. 310) and that the relationship between x and y disappears when the mediator z is controlled for. Thus the independent variable significantly affects the mediator; the mediator significantly affects the dependent variable; and controlling for the mediator produces a nonsignificant relationship between the independent and dependent variables. Partial mediation occurs when the independent variable has a direct effect on the dependent variable as well as an indirect effect through the mediator (James & Brett, 1984). Partial mediation is suggested when controlling for the mediator does not attenuate the significant relationship between the independent and dependent variables.

Our research model suggests an partially mediated $x \rightarrow z \rightarrow y$ linkage in which organizational learning culture ($x$) directly influences innovation ($y$) and the block of transfer climate variables ($z$) mediates the relationship between organizational learning culture and innovation. To infer support for partial or completely mediated models using hierarchical regression several statistical conditions must be met (Baron & Kenny, 1986). Specifically, three regression analyses need to be run to determine if learning transfer climate functions as a mediator. A fourth regression analysis provides information about the nature of the mediated relationship (complete or partial mediation). In the first analysis, the predictor block (organizational learning culture) is regressed on the innovation ($x \rightarrow y$). Second, the mediator variable (the learning transfer climate block) is regressed on innovation ($z \rightarrow y$). Third, the predictor block is regressed on the mediator ($x \rightarrow z$). To infer support for a mediated relationship each of
these regression equations must be significant. Finally, to obtain information about the nature of the mediation (partial or complete) a hierarchical regression analysis is performed in which learning transfer climate (the mediator) is regressed on the outcome measure ($z \rightarrow y$) and organizational learning culture ($x$) is added as a second step. If adding $x$ contributes significantly to the variance explained by the regression equation and $z \rightarrow y$ remains significant this suggests the presence of partially mediated relationship (i.e., one in which there are both direct and mediated effects). If adding $x$ does not yield a significant $R^2$ increment, then there is evidence of complete mediation. Finally, to control for the variation in innovation across organizational types and sectors, these variables (organizational sector [public versus private] and industry type [high-tech, manufacturing, service]) were dummy coded and entered as control variables in each regression model.

Results

Descriptive Statistics

Analysis of regression diagnostics following a process described by Bates, Holton, & Burnett (1999) did not reveal any serious violations of regression assumptions, multicollinearity, or the presence of influential observations. The means, standard deviations, intercorrelations, and reliability estimates for all measures are shown in Table 1. Examination of the intercorrelations suggests several noteworthy patterns. First, the one-tailed correlations among variables were generally low to moderate suggesting the measures used in this study were assessing different constructs. Second, organizational learning culture showed significant correlations with all variables except openness to change. Innovation was correlated with all variables except openness to change and performance self-efficacy. Third, all of the associations were in the expected direction except for openness to change. Contrary to expectations, openness to change was negatively correlated with performance outcome expectations, effort performance-outcome expectations, performance self-efficacy, and performance feedback. This was somewhat surprising to the extent it is reasonable to expect that transfer climates that reflect positive reward orientations (i.e., strong values for performance-related expectations and efficacy beliefs) and relatively strong task support for transfer (performance coaching) would also tend to reflect a willingness to change. This finding suggests that Jordanian employees in organizations with learning-oriented cultures and supportive transfer climates perceived relatively little openness to change (despite rating the level of innovation relatively high).

The control variables Sector (public vs. private) and Industry type (e.g., high-tech, manufacturing, and service industry sectors) were dummy coded and therefore are not included in this table.

* p .05

POE (performance-outcomes expectations), TEPE (transfer effort-performance expectations), PSE (performance self-efficacy)

Mediated Model Evaluation

The steps and results of the regression tests for mediation are shown in Table 2. Results from the test of Model 1 show that organizational learning culture was a significant predictor of organizational innovation ($R^2 = .28$, p # .05). Results from the test of Model 2 in which innovation is the dependent showed that, after accounting for the variance explained by the control variables ($R^2 = .04$, p # .05), the learning transfer climate indicators explained a significant amount of variance in perceived organizational innovation ($R^2 = .09$, p # .05). The Model 3 test involved multiple dependent variables (the learning transfer climate indicators) and therefore required the use of multivariate analyses of variance (Manova). In this analysis, after controlling for organizational task and sector, the main effect for organizational learning culture was significant ($F = 9.06$, p # .05). The results from the analysis of these three models support the inference that learning transfer climate as measured by the indicators used in this study mediated the relationship between the organizational learning culture and perceived organizational innovation.
To obtain information about the nature of the mediation, a fourth regression analysis was performed. This model required the use of hierarchical regression in which the learning transfer climate variables were regressed on innovation with organizational learning culture entered as a second step. Results showed that, after entering the control variables, learning transfer climate was a significant predictor of innovation ($R^2 = .09, p \# .05$, and the addition of organizational learning culture significantly increased the variance ($R^2$ change $= .18, p \# .05$). These findings support the inference of a partially mediated model in which organizational learning culture has a direct influence innovation and influences learning transfer climate that in turn influences innovation.

Summary and Discussion

This study took the perspective that a culture of organizational learning is all about developing and applying intellectual capital in ways that make organizations more productive. More specifically, we suggested that learning and its transfer (application) are principle processes in organizational innovation. We speculated that learning initiatives (e.g., training) and the factors that support the transfer of learning are part of an organizational learning culture that values the creation and sharing of knowledge. This paper reported on an initial exploratory examination of the relationship between organizational learning culture, learning transfer climate, and organizational innovation. The objective was to empirically examine the ability of learning organization culture to account for variance in learning transfer climate and subsequent organizational innovation. Our analysis also sought to examine the role of learning transfer climate as a mediator between learning organization culture and innovation. The results supported the hypothesized partially mediated model. Findings indicated that organizational learning culture can predict learning transfer climates, and that both of these factors can account for significant variance in the perceived innovative capacity of an organization. These findings are consistent with the Kopelman et al. (1990) model of culture, climate and productivity in organizations and suggest that organizational learning cultures may, through human resource and other practices, create learning climates and individual cognitive and affective states that enhance and facilitate innovative double-loop learning in organizations.

Limitations

There are several limitations in this study that deserve mention. First, this study relied on self-report and survey data. Although the correlation matrix indicated a relatively wide range of correlations, most generally consistent with expectations, common method variance could have inflated the correlations or affected the observed relationships in other unknown ways. On the other hand, some researchers have suggested that method bias may not
be as serious a problem as has been assumed (Spector, 1987) and that the seriousness of the bias depends on the research question. For instance, when perceptions are the object of empirical interest, method bias may not be a serious issue (Clark, Dobbins, & Ladd, 1993). Although we do not suspect that method bias significantly affected the pattern of results in this study the use of additional data collection strategies or outcome measures would have strengthened the validity of our findings. Second, the cross-sectional nature of the data as well as the analytical technique employed means that the causal relationships between variables in this study can only be inferred. Cultivating more valid insights about the causal antecedents and effects of learning transfer climate, organizational learning culture, and innovation would benefit from future research employing more rigorous research designs (e.g., longitudinal designs) and analytic techniques more suited to testing causal hypotheses (e.g., structural equation modeling). For example, because learning and its application to performance improvement or innovation is not a one-shot kind of experience (it typically requires some trial-and-error and adaptation) it is possible that the learning transfer climate variables would show a stronger relationship with innovation when assessed from a longer-term perspective.

**How This Research Contributes to HRD**

The results of this study are important to HRD for several reasons. First, As Kaiser (2000) has noted, the organizational learning literature is "startling unclear" about how learning organization strategies are improve critical organizational outcomes. This research provides an initial glimpse of what may be a valuable linkage between organizational learning culture, learning transfer climate, and innovation. Second, the study links three constructs that have generated a lot of interest in the HRD and organizational behavior literature. We have in effect expanded the nomothetic networks of organizational learning, innovation, and transfer climate and pointed to potentially important relationships between these constructs. Finally, there has been little if any research that has examined variables related to organizational learning, learning transfer, or innovation variables in Arabic cultures such as that found in Jordan. This paper therefore represents an important first step in this kind of cross-cultural research by showing that organizational learning culture, perceived innovation, and several transfer climate constructs can be fruitfully examined in cultures quite different from that in the U.S.

A Conceptual Exploration of the Antecedents of Organizational Trust

Samuel H. Adams
Albert K. Wiswell
Virginia Polytechnic Institute and State University

Trust is important for organizational learning and performance, but it is often taken for granted or misunderstood by organizations although trust facilitates individual and organizational learning and organizations must continuously learn in order to survive. Developing a better understanding of the antecedent of organizational trust such as adult attachment and emotional self-disclosure (ESD) may provide better understanding of the variance in trust and help leaders to elevate overall levels of trust in their organizations.

Keywords: Organizational Trust, Adult Attachment, Self Disclosure

This paper provides a brief overview of the literature relating to organizational and individual trust and explores the relationships among three constructs: adult attachment, ESD, and organizational trust. The paper opens with a brief introduction to the three constructs and their relationships. It then provides an overview of the literature on organizational trust with an exploration of definitions of trust and a model looking at trust and distrust as separate variables, as well as measurement issues regarding organizational trust.

The paper traces the trust that individuals manifest in organizations to the roots of trusting relationships developed during childhood attachment experience (usually with the mother). The paper then explores ESD and its relationship to organizational trust and adult attachment. The paper concludes with a summary discussion of the three constructs of adult attachment, ESD, and organizational trust, their relationships with each other, and a call for additional research to gain a better understanding of the relationship among the three constructs and especially in the influence of adult attachment and ESD as antecedents or facilitators of organizational trust.

Trust plays a key role in organizational learning and performance (Shaw, 1997), and organizations must learn continuously (Drucker, 1999; Senge, 1990). However, trust is often taken for granted or ignored by organizations, even though organizations have generally declined in their perceived trustworthiness (Tyler & Kramer, 1996). Although trust is important for successful organizational function and distrust is considered deleterious for organizational harmony and performance. Some authors give the impression that little can be done to improve the level of trust among individuals in an organization (Gilley & Maycunich, 1998). For example, Drucker (1999) assumes that trust is present and is important for the exchange of knowledge within organizations and that this exchange is crucial if organizations are to successfully compete and survive (Drucker, 1999). A key part of the discussion of trust that is missing from the management literature is the need to balance the current emphasis on the leader’s role in shaping organizational trust by exploring of the origins of an individual’s trust that can be traced to childhood experience.

John Bowlby, M.D. (1969), an English psychiatrist, is credited with creating attachment theory and contends that childhood attachment to a significant caregiver (usually the mother) is biologically rooted and is crucial for a child to develop trust. Other research confirms the biological basis of attachment (Hinde, 1982). Furthermore, the propensity to trust learned during childhood substantially influences a person’s lifetime relationships (Ainsworth, 1989; Bowlby, 1969, 1988). As a result of her research, Klohnen noted that attachment styles developed in childhood tend to be resilient throughout life (Klohnen & Bera, 1998). In family therapy, attachment theory is often associated with therapy provided to couples that have distressed relationships. The therapist’s grasp of attachment theory provides a basis for understanding the distress experienced by the couple as well as a basis for providing beneficial therapy, such as emotionally focused therapy (Johnson, Makinen, & Millikin, 2001).

Erikson (1997), in describing the stages of human development extending from childhood through adulthood, sees the need to develop trust and avoid distrust as the first developmental hurdle facing the individual. Bowlby focuses on attachment as a prerequisite for secure relationships later in life. Erickson uses slightly different terminology, but his message is the same: Normal human development is based on the ability to trust. He also asserts that individuals who fail to develop trusting relationships will find their personal development stunted because of a lack of trust (Erikson, 1997).
We know from Bowlby’s work as well as the work of other authors that childhood attachment has a profound influence on an individual’s ability to develop trusting relationships, including friendships, throughout life (Klohnen & Bera, 1998). Based on the work of Chelune, Petronio, and Pistole, we know that ESD also facilitates bonding between individuals in a dyadic relationship by helping people to build friendships and that the willingness to self-disclose on a reciprocal basis is based on a feeling of trust in the target of the self-disclosure (Chelune, 1979; Petronio, 2000; Pistole, 1993). Self-disclosure in relationships tends to be reciprocal and to occur progressively over time and helps individuals to form friendships and intimate relationships. These friendships and relationships are formed in part through the process of sharing personal and sensitive information with each other in steps that could be viewed as part of a bonding or attachment process. The amount and content of one’s ESD could be viewed, in part, as a behavioral manifestation of one’s adult attachment.

Based on the work of Erikson and Bowlby, it is clear that the capacity to trust is very important for individual development of satisfying relationships that nurture personal growth, and based on the work of Chelune and others, we know that ESD facilitates bonding between individuals and the formation of friendships and intimate partnerships. Trust is also crucial for organizational learning and performance (Reina & Reina, 1999). However, we do not understand how childhood attachment, ESD, and the individual’s propensity to trust influence an individual’s behavior in organizations, including interpersonal networking and sharing of information, which are crucial for individual as well as organizational learning.

Because there has been a substantial body of qualitative literature developed particularly over the last 10 years, some well-designed quantitative studies similar to the one conducted by Korsgaard may help to advance our understanding of trust and clarify some of these contentious issues (Korsgaard, Broadt, & Whitener, 2002). Before proceeding with a discussion of organizational trust, it would be helpful to examine a definition of trust.

An Overview of the Literature on Trust

There is no agreement among prominent authors on a single definition of individual or organizational trust (Kurstedt, 2002). This lack of agreement on a definition of trust means that different authors not only perceive trust in different ways (often in the context of their academic domains), but also that they discuss different constructs when they speak of trust. This use of multiple definitions of trust contributes to part of the confusion in the literature because authors use the same or similar terms to describe different constructs, rather like the four blind men each with a hold on a different part of the elephant and arguing about the shape of the elephant from his own perspective. One definition of trust developed by Shockley-Zalabak and associates captures a view of organizational trust and provides an introduction to the complexities of defining trust and conducting research on trust. Their view of trust presumes that trust and distrust are opposite ends of a single variable and are inversely related to each other. We will also examine a model of trust and distrust presented by Lewicki, McAllister, and Bies (1998) from the management literature that is based on the contention that trust and distrust are separate but linked dimensions.

The Shockley et al. definition focuses on the willingness to risk becoming appropriately vulnerable in order to achieve commonly held goals and is based on four factors developed by another researcher (Mishra, 1996). The definition connects trust to the accomplishment of individual, group, and organizational goals. Implicit in this definition is the understanding that risk is present and that blindly giving trust may bring harm rather than benefits to the individual (Kramer, 1999). Shockley defines trust as follows:

| The organization’s willingness, based on its culture and communication behaviors in relationships and transactions, to be appropriately vulnerable if it believes that another individual, group or organization is competent, open, and honest, concerned, reliable, and identified with common goals, norms and values.  |
| (Shockley-Zalabak, Ellis, & Cesaria, 2000) (p. 8) |

As a part of their research, Shockley et al. also developed a model consisting of five factors and an instrument consisting of 29 items. The five factors are (a) competence; (b) open and honest communication; (c) concern for employees; (d) reliability; and (e) sharing of common goals, norms, and values. The breach of any one of these factors can damage the individual’s perception of trust. Trust is engendered by shared values, and a perception that teams within an organization do not share similar values can lead to distrust and deteriorating organizational performance (Sitkin & Stickel, 1996).

Although the Shockley-Zalabak et al. instrument appears to be useful in measuring organizational trust, it does have three shortcomings. First, although they used structural equations modeling and path analysis to develop a
model of organizational trust, job satisfaction, and effectiveness, her discussion of the model is brief. It is not clear what the relationship is between the five trust factors she identifies and organizational trust. Second, we found no table showing how the items in their instrument loaded to the factors in their model that would have been helpful for the reader to understand that there were no problems such as cross loadings of the items that could have reduced the reliability of the instrument.

Third, we found no factor analysis in their report that displayed the correlations between the factors that make up trust in her model. There may be correlations between the five factors they identified (e.g., between concern for employees and reliability) that could be strong enough to raise questions as to whether multicollinearity (Allison, 1999) could have influenced the results she reported. Although we requested that the authors provide us a factor loading table and a correlation matrix, we did not receive either of these tables.

Shockley-Zalabak et al. view trust and distrust as opposite extremes of a single variable as do many of the authors of the literature on trust. However, Lewicki et al. present a different view. Their model is based on the assertion that an individual may approach a situation in an organization with both trust and distrust simultaneously and that trust and distrust are separate variables.

A Model of Trust and Distrust (Lewicki, McAllister, & Bies, 1998)

Lewicki et al. state that trust implies risk. They define trust quite differently from Shockley and also links trust to distrust. They define trust as “confident positive expectations regarding another’s conduct,” and they define distrust as “confident negative expectations regarding another’s conduct” (Lewicki et al., 1998) (p. 439). They also provide a model (Table 1) that is useful for examining trust in individuals and organizations and for showing how trust may change over time. They draw the connection between individual trust and the collective trust that constitutes organizational trust and states that trust provides a foundation for social order. Their model demonstrates the interplay of trust and distrust in interpersonal transactions encountered in the workplace. They also focus their model at the interpersonal level consistent with his view that trust is established between individuals. They also explain that trust and distrust are two dimensions that are interconnected, that they exist along indefinite continuums, and that both are often present in interpersonal situations.

The discussion of Lewicki et al. provides important insight into individual’s behavior in organizations that may reflect contextual influences. For example, an individual’s perception of whether he or she could trust a supervisor or upper level manager may be heavily influence by the salience and recency of experience with that person. This is particularly true because trust is fragile and once damaged is difficult to restore (Kurstedt, 2002). Trust can also be influenced by organizational culture which tends to be developed over time and may be particularly shaped by the initial leaders of an organization (Schein, 1996). Specifically, the Lewicki et al. model is useful for developing a better understanding of the behavioral dynamics and ambiguities of trust and distrust in an organizational situation. For example, when high trust and low distrust are present, new initiatives can be undertaken and opportunities pursued (Quadrant 1). Under conditions of high trust and low distrust, individuals tend to perceive each other as partners pursuing common objectives. They are also likely to identify with the values of their partner as well as have positive affect for their partner. Partners within organizations are likely to manifest their support for each other through expressions of appreciation, support, and encouragement and to promote positive interdependence in part by monitoring and acting to repair the trust bond between them. On the other hand, when high distrust and low trust exist between individuals, harmful motives on the part of others are assumed and defensive reactions predominate (Quadrant 4).

The presentation of Lewicki et al. in this table ties to extensive research by other researchers who conclude that many individuals, including managers, in organizations operate in a defensive manner and tend to focus on their own best interests (Argyris, 1993). Argyris also points out that the defensive actions taken by individuals in organizations can contribute to a disparity between espoused values and the values in use in the organization and that defensiveness can also hinder organizational learning. The observation of Lewicki et al. that trust and distrust are often both present at the same time also connects to the observation that it is often wise to be wary in the workplace (Kramer, 2002).

Although the Lewicki et al. model is helpful in understanding trust, it also has three shortcomings. In fairness, they may have considered a discussion of some of these issues to be beyond the scope of his article. First, they do not explain why some individuals have a higher level of trust when approaching a given situation. According to Duffy, some of this propensity to trust could be explained by developing a better understanding of attachment theory (Duffy, Lafferty, & Lafferty, 2001). Second, the model is somewhat simplistic because it places individual reactions into four distinct categories and thereby omits ambivalent reactions that do not fit neatly into one of the four categories. Although Lewicki et al. discuss ambivalence, his model nevertheless provides a general and simple presentation of an individual response that tends to sacrifice accuracy (Weick, 1979). Third, the model is biased...
toward high trust and low distrust as a desirable approach to a situation for an individual. However, this may not be the most prudent approach for an individual to take. Lewicki does not sufficiently discuss when wariness may be advisable for an individual confronting a given situation (Kramer, 2002).

Note: Adapted from Lewicki et al., 1998

Despite its shortfalls, their model does provide important insights regarding the behavior of individuals in an organization. They state that the view commonly expressed in the literature that trust and distrust are opposite ends of the same variable is an incorrect view and asserts that trust and distrust are separate but linked variables. Although the views of Lewicki et al. regarding trust are intriguing, his work is at the theory-building stage of development, and we have not seen any quantitative empirical work that confirms the accuracy of his view of trust and distrust. Although it is intriguing to view trust and distrust consistent with their theory, additional research needs to be done to demonstrate that these are indeed separate variables and that they are not so heavily correlated with each other that they in fact need to be viewed as opposite extremes of a single variable.

*Attachment and the Development of Adult Relationships*

Bartholomew and Horowitz (1991) build on the work of Bowlby and develop a grid (Table 2) to help explain adult behavior based on attachment. They state that individuals who develop secure attachments in early childhood tend to be secure individuals later in life and that their relationships can be characterized by low dependency on others as well as positive regard for others. They further state that these individuals tend to have relationships that are comfortable, with a good balance between intimacy and autonomy. On the other hand, individuals who do not develop secure attachments during early childhood may have relationships characterized by fear of intimacy and avoidance of social contact. They say that the latter group of individuals tends to have relationships marked by a negative view of self and others as well as a high degree of dependency (Bartholomew & Horowitz, 1991). The therapist’s grasp of attachment theory can provide a basis for understanding the distress experienced by the adult couple as well as a foundation for needed therapy (Johnson, 1999). The therapy provided for these couples often focuses on working with each of the partners in the relationship to facilitate open communication of caring feelings to reduce the partners’ sense of hopelessness and pain and to restore trust and affection to the relationship. Just as secure attachment and trust are crucial for healthy and less stressful relationships between individuals, trust is also the glue that helps to hold relationships together in the workplace (Gibb, 1991). In order to more fully understand the implications of attachment for adult relationships, it would be useful to examine Bartholomew’s model that provides insight into adult attachment and into how individuals approach their relationships.

Note: Adapted from Bartholomew and Horowitz (1991)

The model of Bartholomew and Horowitz is quite helpful in providing a framework for understanding how individuals tend to approach intimate relationships. It does, however, have two primary weaknesses. First, it is limited in its representation of complex human behaviors. Their model provides simplified categories for understanding behaviors, but it does not address ambivalent responses that fall between the categories. For example, what cell does an individual fit into who has not had a secure childhood attachment and is preoccupied with relationships (consistent with Cell II) but who still relishes the intimacy and autonomy offered by a stable marriage (consistent with Cell I)? General and simple explanations are more easily grasped, but they sacrifice accuracy because they are overly simplistic (Weick, 1979). Second, their model and discussion do not explain how someone can repair weak attachment bonds developed during childhood in order to achieve the secure attachments they crave in intimate and autonomous relationships. In fairness, however, they may have felt that exploring this issue was outside the scope of their article. Nevertheless, the thrust of their model is consistent with the findings of other researchers who observe that a secure person tends to approach relationships in the workplace in an open and friendly manner and that this approach helps to provide the basis for a virtuous cycle of trust (Kurstedt, 2002). This open and friendly approach also makes possible the networking between individuals and the formation of bonds of trust that facilitate individual learning as well as organizational learning (Senge, 1990).

The Connections of Adult Attachment, ESD, and Trust

Some connections between adult attachment, ESD, and organizational trust have been made in the literature. For example, secure attachment may lead to increased prosocial behaviors by employees and reduced turnover (O’Reilly III & Chatman, 1986), however, O’Reilly and Chatman do not explore the connection to attachment theory. However, other researchers do connect attachment and ESD in his research and have found that the securely attached are better able to emotionally self-disclose in an appropriate way that facilitates the development of friendships (Mikulincer & Nachshon, 1991). Other researchers have also made the connection between the propensity to trust that is developed during childhood and the propensity to engage in ESD (Vangelisti & Banski, 1993).

Although there is a basis for connecting the constructs of attachment and ESD in order to better understand organizational trust, the limited discussion of the constructs in the literature, and these discussions are usually focused within particular academic domains, and as a result we have a limited understanding of the antecedents of organizational trust. For example, authors in family systems focus on attachment theory for its value in understanding the disturbed attachment between partners in a couple (Johnson & Sims, 2000) or in order to understand the emotional needs of those seeking therapy (Pistole, 1999). An exception has been the work of two researchers, who noted, based on their study, that there was a “modest linear relationship between individual trust and various dimensions of self-disclosure” (Wheeless & Grotz, 1977) (p. 250). As a part of a body of work on the connections between ESD and trust, Wheeler develops instruments for measuring the solidarity between individuals, ESD, and a generalized ESD that he calls disclosiveness (DS) (Wheeless, 1978). However, as a part of his work, Wheless does not explore the connections between individual trust and trust in organizations.

There has been considerable interest in ESD in the fields of communications and social and personal relations, but little has been written about ESD in the field of management science. Some management literature has been focused on the commercial advantages that can accrue from ESD, for example, on how insurance agents can use ESD as a way of cementing long-term relationships with clients (Jacobs, Hyman, & McQuitty, 2001). The article explores the commercial advantages of self-disclosure from the perspective of self-presentation and relationship...
manipulation rather than focusing on emotional benefits that may accrue to the agent as a result of forming a friendship bond with a client. If the target of the ESD detects the attempt at manipulation, the target could feel a diminished level of trust in the individual who is disclosing. Other authors have noted that there are organizational benefits that can be attained from ESD such as information sharing, teamwork, and productivity (Baird, 1977; Rawlins, 1992). Hossack also explores ESD by leaders in an organization that presents the perspective that leaders who are willing to self-disclose tend to be more certain of themselves and more self-confident than those leaders who avoid self-disclosure (Hossack, 1993). In his article, Hossack notes that in order to be willing to emotionally self-disclose, the leader had to be willing to risk vulnerability. Unfortunately, the article is very brief and does not provide information regarding the responses of 150 Canadian leaders to the author’s questionnaire or any of the details from his interviews with 15 leaders of private sector companies. Hossack also does not explore the potential negative consequences that can arise as a result of the inappropriate disclosure of sensitive information (Ubel et al., 1995). Although trust is often associated with the willingness to risk vulnerability through ESD, Hossack does not directly discuss individual trust in the article. Rather he focuses on the connection between the leaders’ self-disclosure and their relatively high levels of self-confidence.

A Proposed Research Agenda

Future research on trust needs to concentrate on three specific areas. First, after the extensive and dispersed theory building of the past 10 to 15 years, the study of organizational trust would benefit from researchers making an effort to arrive at a common conceptual understanding of the construct of organizational trust and to develop a commonly shared framework for exploring organizational trust.

Second, researchers need to build on the work of their colleagues in the field of organizational trust. For example, there are now three instruments for measuring organizational trust that are identified as the OTI. Three different researchers developed instruments since 1995 and have given their different instrument the same acronym. Not only did they not build on each other’s research work in developing and refining an instrument for measuring organizational trust, they also added to confusion in the field by labeling their instrument as the OTI.

Third, the bulk of the research on organizational trust has focused on individual demographic characteristics and the characteristics of organizations rather than exploring underlying individual dimensions such as adult attachment and the propensity to self-disclose. More attention is paid to overall measures than to explaining the variance observed within organizations. Future research on organizational trust would benefit from an interdisciplinary review of the antecedents of trust that would increase our understanding of the propensity to trust that individuals bring with them to the workplace. This understanding could facilitate interventions in organizations and increase trust levels thereby contributing to increased productivity and the achievement of organization’s strategic goals. Specifically, the authors of this paper propose to focus a study on the question: What portion of the variance in employee’s perception of organizational trust is explained by employee’s adult attachment and disclosiveness (general self-disclosure)?

In order to explore the relationships between the three constructs of adult attachment, generalized self-disclosure, and organizational trust, the authors will use valid and reliable instruments to gather data from two Washington, D.C. metro area organizations, one commercial contractor and one trade organization. Participants from the respective organizations will all be volunteers and the samples will be convenience samples. The data collected will be analyzed using statistical techniques including hierarchical multiple regression. This research study is currently underway and data collection is complete.

Conclusion

Trust is multifaceted and complex. Based on the work of Erikson and Bowlby, we know that the capacity to trust is very important for individual development of satisfying relationships that nurture personal growth. Additionally, based on the work of Chelune and Petronio, we know that ESD facilitates bonding between individuals by helping people to build friendships and that the willingness to self-disclose is based on a feeling of trust in the target of the self-disclosure (Chelune, 1979; Petronio, 2000). Self-disclosure in relationships tends to occur progressively over time and helps individuals to form friendships and intimate relationships based in part on the process of sharing personal and sensitive information with each other in progressive steps that could be viewed as a part of a bonding or attachment process.

Trust is also crucial for the sharing of information and networking in the workplace and is one of the keys for individual learning as well as for organizational learning (Reina & Reina, 1999). However, we have an incomplete
understanding of the nexus between adult attachment, ESD, and organizational trust. There are real consequences to our limited understanding. Based on the work of Lewicki, Kurstedt, Senge, and other authors, it is clear that trust is crucial for individual learning, the sharing of information, and the development of productive team relationships. At least on an intuitive level, there appears to be a connection among these constructs of adult attachment, ESD, and organizational trust. However, in the literature, the discussion appears to have been largely confined to particular academic domains, and few authors have ventured into a broader discussion so that the scholarly community could benefit from a more comprehensive understanding of the connections among these constructs. Our research project that is currently underway may help to clarify how much of the variance in organizational trust is explained by key antecedents, adult attachment and ESD.

Diagnosing the Learning Capacity of a Financial Services Institution

Wayne Connell
Dana Papke
Robert Stanton
Susan Wise
The George Washington University

The Organizational Learning Systems Model (OLSM) is a dynamic model for understanding the various forces that contribute to an organization’s ability to learn and sustain itself over time. This study shows that by combining organizational diagnostic tools with the unifying lens of the OLSM, it is possible to uncover an organization’s learning capacity.

Keywords: Organizational Learning, Organizational Diagnosis, Organizational Culture

Why does one organization thrive and survive beyond its faltering peer when both organizations compete in the same industry using similar resources and access to similar information? Does one simply outperform the other? Does one have a special capacity to learn faster and hence change more quickly than the other? Is competitive advantage just a matter of developing superior products?

Most organizations tend to direct their energies toward improving performance in an effort to sustain and even expand their position in the marketplace. In the case of the client studied, encroaching competition during the mid-1990s threatened the market position and forced the client to mount a massive cultural transformation. They sought to change their traditional service into a high-performing sales organization in order to compete more aggressively. Over the course of a four-year span, the institution dedicated most of its resources to create a change in performance. This study will judge the effectiveness of the change effort with a different lens. Instead of examining performance, learning capacity is assessed using a variety of organizational learning tools and methods.

Specifically, this study articulates the key questions to be addressed, clarifies client expectations, reviews relevant literature, identifies the approach and methods conducive to the diagnosis, gathers data through multiple vehicles, organizes and interprets the data, establishes learning capacity, provides feedback and options to the client, makes specific recommendations, and suggests strategies for implementation.

Research Question

To effectively assess learning capacity, it is important to first understand the industry and the environment in which the client operated. By the late 1990s, “[the industry] was no longer going to do a reasonable amount of business because [locations] were on the busiest corner or had the prettiest sign” (Sullivan, 1997). The industry realized that a “shift in focus [was] needed because increasing competition …[was] making them realize they [had] to take initiative to bring in new customers” (Sullivan, 1997). This realization created the “sales culture movement,” an effort for both large and small organizations to “stay in the game for the longer term” (Kimelman, 1999). Because of the thriving economy throughout the 1990s, it is difficult to attribute successes directly to these cultural transitions. What is certain is that the primary emphasis of the industry was on reshaping performance. The focus was on performance measures—volume, referrals, and product sales, for instance—as the tools to gauge the success of their change efforts.

This institution adopted a similar approach to culture change. Due to encroaching competition, the client followed in the footsteps of many of its peers by introducing a sales culture. Such a transformation meant changing the focus of customer interactions from exclusively service to a more balanced approach of both sales and service. Associates were asked to identify needs and recommend additional products and services in an effort to reduce the likelihood that customers would take their business to competitors. Similar to others in the industry, the focus was on performance emphasizing measures such as the cross-sell ratio, product volume, and referral numbers to gauge the success of the change.

Using this initiative as a backdrop, this diagnosis answers the question: What was the learning capacity of the client during its transition to a sales culture? The study examines trends and patterns during a four-year period beginning with the launch of the change effort in 1999 and continuing through year-end 2002.

Client Expectations

As a dominant market shareholder, the client’s sole purpose in undertaking a cultural change effort was to quell
The impact of encroaching competition while preserving its market dominance and its overall market success. These issues are at the core of the expectations regarding a post-hoc analysis of the transformation from a traditional service into a high-performing sales organization. The client wanted to determine whether its efforts over the course of the change were enough to create lasting, sustained results.

During the four years studied, the leadership remained fully committed to supporting its cultural transformation. However, questions remained regarding the adaptability of the staff to the change effort and the cultural change’s impact on the long-term competitive position. In order to penetrate these issues, a post-hoc analysis was conducted. From this analysis, the client hoped to garner insight into the feasibility of maintaining its long-term competitive edge by assessing the organization’s overall learning capacity relative to its change into a high-performance sales culture.

Theoretical Framework

Beginning in the late 1970s, the concepts of “organizational learning” and “the learning organization” became increasingly influential as ways of examining and prescribing how organizations might respond to contemporary economic and social conditions (Marsick & Watkins, 1999). These conditions are ones where the rate of change faced by organizations is increased through the advent of globalization, information technology, and the importance of knowledge as the source of competitive advantage.

Organizations must continually learn and adapt in order to survive and prosper and it is in this context that the field of organizational learning has developed. Daft and Weick’s (1984) Model of Organizations as Interpretation Systems uses two central variables to differentiate types of organizations based on their interpretation patterns: “(1) management’s beliefs about the analyzability of the external environment and (2) the extent to which the organization intrudes into the environment to understand it” (p. 287). Using these variables, the model provides a means to describe the different ways organizations obtain knowledge about the environment. Thus, organizations can be categorized according to their interpretation modes. Through the interpretation process, organizations develop specific ways to scan their environment, in turn influencing organizational outcomes such as strategy and decision-making.

Fiol and Lyles (1985) expanded the field’s body of knowledge by defining organizational learning as “the process of improving actions through better knowledge and understanding” (p. 803). The authors distinguish between organizations that respond to their environments based on a reflective understanding of past actions versus those that simply engage in unreflective, reactionary changes. Fiol and Lyles also argue for the need to build cohesion around key terms such as learning, adaptation, and change if the field is to progress. The core of their model centers around four contextual factors impacting the probability that organizational learning will occur: culture, strategy, structure, and the environment. These factors provide a framework for addressing the health of an organization’s learning system.

Senge provided some of the cohesion called for by Fiol and Lyles. Senge proposed that the only sustainable source of competitive advantage for an organization is its ability to learn faster than its competition. He draws a blueprint for organizations where individuals expand their capacity to create results and collective aspiration is set free through the development of five key disciplines: personal mastery, mental models, shared vision, team learning, and systems thinking (1990).

In the aftermath of Senge’s contributions, many theorists built on his work, including Huber who related four constructs to organizational learning (knowledge acquisition, information distribution, information interpretation, and organizational memory) and Kim who developed an integrated model of organizational learning by linking it to individual learning and the pervasive impact of mental models (1991, 1993). The models developed throughout the 1980s and 1990s were largely descriptive, however, focusing more on what to do and why it should be done than on how to actually do it. To compound matters, the field lacked cohesion among its many disparate elements. Schwandt and Marquardt finally addressed these gaps in the field through the development of a cohesive, dynamic model that contained the necessary complexity to address organizations’ complex adaptive capacities—the Organizational Learning Systems Model (OLSM) (see Figure 1) (2000).

Based on Parsonian social action theory, the OLSM reveals that organizations must adapt to their environments, achieve their goals, integrate their various functions, and maintain those behaviors essential to their survival and prosperity. Schwandt and Marquardt built on Parson’s premise by delineating these elements into four subsystems that comprise an organization’s learning system: the Environmental Interface (EI) subsystem (the adaptation function), the Action/Reflection (AR) subsystem (the goal attainment function), the Dissemination and Diffusion (D&D) subsystem (the integration function), and the Meaning and Memory (M&M) subsystem (the pattern maintenance function). Each of these subsystems produces a critical output, or interchange medium—new
information, goal reference knowledge, structuring, and sensemaking, respectively— which in turn interact with, inform, and impact the other three subsystems in a dynamic, non-linear way. The interdependent relationships between the subsystems form the basis of the first holistic model in the field of organizational learning.

Figure 1

D.R. Schwandt & M. J. Marquardt (2000)

Method of Analysis

Despite the OLSM’s capacity to analyze organizational complexity, developing a robust understanding of the client’s learning capacity required two additional tools. First, Lewin’s Force Field Analysis was utilized to uncover those factors working both for and against the success of the change. Second, Daft and Weick’s Model for Organizations as Interpretation Systems was used to understand how the client perceived and interacted with its environment. In both of these analyses, the focus of the diagnosis was on the first year of the change, 1999. Special emphasis was placed on this first year in an effort to gain greater insight into the learning capacity at the outset of the change, as well as create a baseline against which to measure the evolution of its learning capacity over the course of the four-year change effort. Finally, the four subsystems of the OLSM were employed to organize the data and interpret the interchange media collected throughout the four-year transformation.

Because this study was post hoc, avenues for gathering data were limited to those involved throughout the change and existing secondary data. As a result, data were gathered through two primary means. The first was one-on-one phone interviews with senior leaders and managers integral to the change effort’s implementation. The following questions were asked: (a) at the outset of the change, what driving forces supported movement from an order-taking/operational culture to a sales-and-service culture, (b) at the outset of the change, what forces impeded or restrained movement from an order-taking/operational culture to a sales-and-service culture, (c) to what extent were you aware of the forces at work—both for and against the change effort—at the outset of the initiative, and finally, (d) how did you overcome the forces working against the change effort?

Second, an analysis of comprehensive secondary data was conducted to capture the progression of the change effort during the four-year period. Extant data included project criteria and obstacles, progress reviews, internal communications and updates, reports to and from external consultants, training design and content, workshop evaluations, field results and measurements, focus group reports, expense tracking, and meeting minutes. Variables were assessed quantitatively by tallying data into themes, as well as qualitatively by considering the relative significance or strength of each theme that emerged. These data afforded a glimpse at both the formal and informal workings of the organization.

Findings

Force Field Analysis Findings

In the force field analysis, three major forces emerged as drivers toward the new culture. First, in the mid-1990s the industry shifted from a traditional service culture to a sales-focused, high performance culture. Second, as a result of the shift, larger, more aggressive, national competitors expanded their operations. Lastly, a change in the senior leadership team was a central driving force fueling the shift from a day-to-day operations focus to a sales focus. This new leadership team possessed extensive experience in sales-driven processes, understood their value, and knew how to develop them in an organization. In addition to these primary driving forces, two lesser forces surfaced during the interviews. These lesser forces included the training organization’s decision to partner with line
managers throughout the change effort and a decision to contract with an external vendor to provide expertise in moving to a sales culture.

Two major forces impeded movement to the organization’s desired state. First, the mindset of long-tenured employees (10-20 years) was a significant impediment to the success of the initiative. Managers were hired to oversee daily operations, not sell products and services using an integrated, deliberate method. Throughout the organization, managers and employees resisted the new emphasis on sales growth and performance. Second, employees lacked the necessary sales, product knowledge, and coaching skills to implement the change. Two lesser restraining forces were also identified. Participants cited movement from one cultural extreme to another, i.e., shifting from a total operations mindset to a total sales and numbers focus. Additionally, previous failed attempts to institute a sales culture reinforced employees’ hesitancy to embrace this change. Figure 2 depicts the driving and restraining forces affecting the change effort.

Figure 2. Force Field Analysis Diagram

Organizations as Interpretation Systems Findings

Secondary data from the first year of the change were analyzed using Daft and Weick’s Model of Organizations as Interpretation Systems. Seven variables were analyzed: (1) where the organization acquired its information (Data Source); (2) how the organization acquired its information (Acquisition); (3) to what extent the organization attempted to reduce the lack of clarity in its environment (Equivocality Reduction); (4) how many procedures were created to process information about its environment (Assembly Rules); (5) how frequently the organization reviewed and re-processed new information (Cycles); (6) what type of strategy the organization used to interact with its environment (Strategy Formulation); and, (7) what primary factors influenced the organization’s ability to make decisions (Decision-Making) (Daft & Weick, 1984).

With regard to scanning characteristics, 22 instances of Data Source were discovered, all of which were clear examples of “internal impersonal” information in that they were written documents collected and funneled to senior management for review. These included executive overviews, quarterly sales reports, and course evaluations. Fourteen examples of Acquisition were found, 10 of which were characterized by “separate departments, special studies, and extensive information,” while four examples were more characteristic of having “no [special] department, regular record-keeping, and routine information” (Daft & Weick, p. 290, 1984). Most examples here included progress tracking and reviews, financial reports, and course evaluations, while the remaining four included more routine data extrapolated from the HRIS and requests to automate certain reports for regular inquiry.

With regard to the interpretation process, seven instances of Equivocality Reduction were revealed in the data as evidenced by senior leaders’ frequent discussions regarding the change and benefits to the company. Thirty examples of Assembly Rules illustrated a focus on establishing procedures and guidelines to navigate through the
change effort, and included program success criteria, guidelines for implementation, precise instructional designs, and customer interaction tools and forms. Twenty instances of Cycles were found, including frequent project reviews that often discussed or re-processed topics and decisions from previous meetings.

With regard to interpretive actions, six examples of Strategy Formulation were found, four of which illustrated the Analyzer strategy and two examples resembled the Defender strategy. Analyzer examples included a focus on becoming the provider of choice in the region and how its portfolio management process would support this strategy, while maintenance of traditional markets and a focus on internal efficiency exemplified the Defender strategy. Finally, three instances of Decision-Making were found, including the methodology for selecting a training vendor and how it processed recommendations for improving the quality of the training later in the change effort.

**OLSM Findings**

By combining information obtained through interviews and secondary data, interchangeable media variables from the four OLSM subsystems were coded to determine strengths and uncover patterns and prevalent themes. Five prominent themes emerged in EI. Externally, shifts in the industry, the use of consultants, and a heightened emphasis on connecting with the customer were prevalent forces in this subsystem. All interview participants stressed the changing tide of the industry in the 1990s. “Competition and the business…changed the entire landscape of the…industry in the early 90s” according to one training manager. Consultants were referenced continually throughout the change effort, with the client relying heavily on one consulting firm for direction. Customer connections occurred through the external promotion of products, including outbound calling, business development, and direct mail. Internally, key variables included regular reporting mechanisms and employee feedback instruments. Routine progress reports were systematically captured into notebooks and distributed to senior management. Employees’ input was collected through multiple means, including focus groups, surveys, site visits, and meeting and training evaluations. Within EI, data that were not apparent became some of the most important to the analysis. In the secondary data, there was no reference to competition, despite explicit interview statements from the force field analysis that competitive forces necessitated this change.

In AR, four themes surfaced. First, decision-making manifested through key choices in external consulting partnerships, evaluation systems, and campaign identification. Second, the use of extensive pilot studies comprised the experimentation theme. Third, a multitude of performance measures such as the cross-sell ratio, individual sales productivity, and account retention represented the evaluation theme. Finally, the reflective capacity was demonstrated through the training supervisor’s comment, “We were just bringing in numbers, not profitability—we were opening accounts to meet sales goals but the accounts had only pennies in them.”

Within D&D, five themes prevailed: leadership, training, roles, policies, and reward systems. Abundant pattern clusters supporting each theme were found in D&D compared to the other subsystems, given its concrete and observable nature. Leadership examples included the addition of new senior leaders, coaching associates in the field, and the discipline to stay the course throughout the initiative. Training encompassed many elements, the largest of which emphasized sales skills and product mastery. Roles were redefined throughout the organization, with special attention paid to manager and associate responsibilities through scripting, practice sessions, and daily focus sessions. Policies were also fundamentally reshaped to reflect the organization’s evolving culture, including the creation of a customer profile tool, tracking sheets, program guides, and “results coaching” guidelines. The client leveraged and sustained reward systems from the outset of the change in an effort to incent associates. These incentive plans included “Club” status, travel awards, and gift certificates.

In spite of the challenges inherent in studying M&M, four primary themes emerged. First, ingrained values and basic assumptions regarding the client’s mission and role surfaced throughout the data. “I was not hired to sell” was cited as the most frequent response of managers to the new sales initiative. Second, organizational memory played a significant role during the change. Because many senior leaders were new to the organization, a collective understanding had to be established. Likewise, long-tenured employees (10-20 years) held unforgiving views regarding the merits of the change. This widespread resistance embedded in the organization’s memory also served as a driving force for the change through heavy attrition. “All managers were hired to administer daily operations and were very skilled in that arena. Suddenly, they were asked to expand their operations focus to include sales goals. Many refused and left,” according to the vice president tasked with implementing the culture shift. Additionally the organizational memory served as an impetus for action. “By the mid-90s, [the industry was] beginning to bounce back and we did not want to make the same mistakes again,” stated a vice president of training. Also prevalent in the data was a clash in weltanschauung, or worldview (Kim, 1993). New senior leaders, having been steeped in the value of high-performance sales cultures, did not anticipate any resistance at the outset of the change. “That the senior leadership changed mid-stream also worked against us. There was no established alignment within the management team. We built understanding of the different perspectives as we developed this initiative,”
said one executive. Lastly, language and symbols became increasingly prominent as the change effort progressed through the creation of new language, logos, newsletters, and a variety of materials created to reinforce the change.

Synthesis

In keeping with the spirit of the OLSM, once information has been collected, knowledge and meaning can be extrapolated through analysis and reflection. Schwandt and Marquardt provide a framework for understanding the strengths and challenges an organization may face in increasing its learning capacity (2000). The subsequent sections synthesize the findings by revealing how effectively the client met the challenges of each subsystem.

Environment Interface Subsystem

Three challenges are common to this subsystem and the generation of new information: inappropriate screening, lack of variety of environmental interface actions, and lack of understanding of the role of management cognition. With respect to inappropriate screening, the client’s perception that they understood and could control their environment encouraged them to ignore or dilute new information entering the organization. The use of one consultant as the primary source of external information diminished the quality of new information available, thereby affecting the capacity to learn. Later in the initiative, the institution successfully expanded its EI actions by consistently interfacing with key stakeholders, including employees and customers. They accomplished this through focus groups, surveys, business development, and outbound calls. The senior leadership team failed dismally in understanding how their own cognitive schema could influence scanning outcomes. Through exclusive pursuit of one correct answer, the executive team ignored strategies that could have imported a more robust spectrum of options. This is consistent with Daft and Weick’s model that emphasizes the impact of interpretation on environmental scanning strategies (1984).

Action/Reflection Subsystem

This subsystem also includes three challenges to producing goal reference knowledge: lack of organizational reflection, resistance to the dual nature of knowledge, and lack of readiness to confront assumptions. Here, the client reflected on “how” to accomplish the change as consistently as it passed over opportunities to reflect on “why.” Frequent evaluations and course corrections to performance and implementation processes demonstrated the strength in managing the “how” of the change. Conversely, the executive team’s singular mental model regarding sales transformations coupled with the consultant’s synchronous approach impeded the organization’s sensemaking function. Senior leaders never questioned “why.” Likewise, this mental model acted as a barrier to embracing the dual nature of knowledge resulting in diminished dialogue and diversity during deliberations. The organization did, however, transform tacit knowledge into explicit knowledge by leveraging the consultant throughout implementation. With respect to their willingness to confront underlying assumptions, the senior leadership team failed in several respects. One example was their inability to assimilate the true impact of a 30% turnover outlined at the outset of the change. As a result, opportunities to stem talent loss through sharing the benefits and rationale of the changed were missed.

Dissemination and Diffusion Subsystem

Inherent to D&D are two challenges intrinsic to the facilitation of structuring: lack of information movement and inappropriate alignment of roles. In the aggregate, the client excelled in the process of effective structuring. While many organizations struggle with moving information throughout their myriad functions, this organization incorporated a variety of methods to share information at various levels throughout its system including comprehensive training, daily focus sessions, special events, and regular newsletters. Roles can be difficult to define and refine even under stable conditions. The client managed to redefine roles at all levels during a period of heightened change. For example, in addition to developing a coaching strategy for managers, senior leaders began holding themselves accountable to a higher standard with regard to moving from “good coach to great coach” according to one executive. Concurrently, senior leadership implemented incentive reward programs designed to reinforce the new roles throughout the organization. Because of the client’s strength in this subsystem, the organization was able to effectively integrate the many disparate elements of this initiative into a cohesive whole.

Memory and Meaning Subsystem

Two challenges can affect this subsystem: lack of alignment in multiple organizational memories and lack of a cultural profile through surfacing basic assumptions. Long-tenured employees held deeply ingrained beliefs regarding the nature of their roles and the purpose of services offered. These schema clashed with the senior leaders’ prevalent mental model. The organization also lacked the insight to surface the level of resistance embedded in the culture at the outset of the change. As the initiative evolved, however, more frequent assessments were conducted along with evaluations of understanding and receptivity.
Establishing the Client’s Learning Capacity

When considering the whole of this study, we return to our original research question: What was the learning capacity of the client during its transition to a sales culture? Similar to the early organizational learning models that focused on why, rather than on how, to become a learning organization, the client began its transition knowing only that it should change, with no clear roadmap of how to construct its vision. After four years of continuous efforts to inculcate a new culture, the client began to learn how to become a learning organization.

To fully understand the client’s learning capacity, Parsonian social action theory—the basis of the OLSM—must be considered. Parsons proposes that any human action system must adapt, attain its goals, integrate its various functions, and maintain select patterns of behavior. In applying this framework, it becomes evident that the client’s adaptation function was weak. Biologically, the organization was slow to adapt to its rapidly changing environment. Psychologically, goals evolved with the influx of new leadership. Sociologically, the integration function was its greatest strength. The client successfully integrated new roles and transported information through its myriad functions. Anthropologically, the pattern maintenance function remained almost immovable at the outset of the change. Only by introducing employee assessments and multiple feedback instruments was the organization able to achieve a level of support sufficient to sustain the change.

Key to gaining insight into learning capacity is M&M. The strength of this subsystem proved to be more than the senior leaders bargained for. The prevalence of a shared mental model inhibited their ability to proactively manage the magnitude of the culture’s resistance. Only through consistent structuring sustained over the long term were senior leaders able to overcome these obstacles.

Implications and Recommendations for HRD

To sustain long-term learning capacity, HRD professionals can use two approaches: a generative and a reductionist strategy.

Recommendation 1- Generative Approach

A generative approach focuses on sustaining the momentum already created throughout an organization by enhancing and building upon strengths. As referenced above, many successful strategies on the part of the client demonstrate a propensity for cultivating a learning environment. Therefore, in concert with generative thinking, the client would focus its attention on enhancing the prominent strengths found within each OLSM subsystem.

Within EI, the organization would continue to interface with key stakeholders including its employees and customers. New information could move into the remaining subsystems more effectively if senior leaders looked beyond their shared mental model to the need for incorporating a variety of environmental interface actions. Strengths to be augmented from AR include reflection on accomplishing change consistently through the use of frequent evaluations and periodic course corrections. If the senior leadership team had allowed for diverse opinions during deliberations, the client would have produced more well-rounded goal reference knowledge. This approach calls for sustaining effective D&D activities by continuing to incorporate a variety of methods to share information. By leveraging its integration strengths to disseminate the benefits and rationale for the change, the client could continue to build on the support already established over the course of the initiative.

Having recognized the importance of organizational memory and culture, the client could adopt a generative approach within M&M by managing any resistance to change through continued frequent assessments of understanding and receptivity. If the senior leadership team had shared the benefits and rationale for the change at the outset, they could have more effectively addressed the intense resistance present in the existing culture.

Recommendation 2- Reductionist Approach

A reductionist approach focuses on eliminating those factors that contradict and restrict the attainment of an organization’s desired goals. Additionally, this approach encourages the detection of factors that may be potential barriers. In adopting a reductionist strategy, the client would direct its strategic focus toward correcting weaknesses found within the OLSM subsystems.

Within EI, a reductionist approach requires more complete consideration of information before limiting its entry into the subsystem. Additionally, expanded methods of interaction with the environment need to be developed to reduce the reliance upon the consulting firm as the primary source of external information. Finally, this approach necessitates that senior leaders carefully examine and surface their own knowledge structures and shared mental models.

A reductionist approach to overcoming barriers found within AR would call for movement towards a higher level of thinking and learning by considering the “why” of the change and not simply implementing the “how.” Additionally, the organization must engage employees at all levels in dialogue to increase diversity in deliberations.
Finally, senior leaders must confront underlying assumptions, including their own, that unduly inhibit learning and attainment of goals.

While D&D is a strength for the organization, it must be leveraged to effectively influence M&M. The client must focus on deeply ingrained cultural phenomena and their effects on the remaining subsystems by actively questioning perceptions, norms, and values. This questioning process would increase information sharing and dialogue throughout the organization.

Because each subsystem requires the input of interchange media from the other three, focusing on one alone will hinder the development of the organization’s overall learning capacity. Similarly, because the variables within each subsystem are related, focusing only on those that remove barriers or only on improving those that are already strong cannot improve the learning system over time. For this reason, it is recommended that the client integrate both generative and reductionist approaches to improve its learning and long-term adaptive capacity.

This balanced approach includes the need to sustain and build upon what is working well while reducing barriers by addressing the most compelling of each. By eliminating barriers while simultaneously building upon strengths, synergies can be created to more effectively achieve goals. The combined approach would call for identification of the most compelling of the aforementioned options within each of the subsystems and implement a plan of action.

Conclusion

The results of this analysis bring some clarity to the dynamics of organizational learning capacity. Just as the descriptive, linear models of early organizational learning theory proved to be inadequate tools for diagnosing learning capacity, so too does using only one approach when assessing an organization’s ability to learn over time. The combination of several methods and approaches resulted in a deeper, more robust understanding of the client’s learning capacity in this study, with the dynamic lens of the OLSM serving as the unifying element.

Certain limitations in this study do exist, however. When examining D&D, diffusion activities are inherently informal in nature, and the design of this study did not allow for this kind of detection. Likewise, the abstract nature of M&M does not lend itself to discovery. M&M also poses a particular challenge to any organization attempting to increase its learning capacity: the belief that only one subsystem can be enhanced at any given time. Because this study focused on a single initiative in assessing the client’s capacity to learn, the design prevented the collection of meaningful data around the client’s ability to implement changes to multiple subsystems simultaneously.

In spite of these limitations, the most salient issues related to the client’s learning capacity have been surfaced. In the final analysis, balance is the key to unlocking the client’s full capacity to learn and sustain itself over time. By balancing generative and reductionist strategies, improvement options from each subsystem, short-term performance and long-term learning, senior leadership support, and employee involvement, the client organization can learn to apply these lessons to a variety of change efforts.

Customizing Learning Programs to the Organization and its Employees:
How HRD Practitioners Create Tailored Learning Programs

Rob F. Poell
Tilburg University

Ferd J. Van der Krogt
University of Nijmegen

This study investigates how HRD practitioners customize learning programs, that is, tailor them to take into account the demands set by organization and participants. A theoretical account of the relations between learning programs and organizational/individual characteristics is provided. Results from an action-research project involving thirteen learning programs conducted in healthcare institutions are presented. The main conclusion of the study is that the seven HRD practitioners in our sample used few strategies to customize learning programs.

Keywords: Customization, Learning Programs, Action Research

There is a lot of learning going on in organizations. Mostly this learning occurs informally, with colleagues and supervisors, during the preparation and execution of work (Eraut, 2000). One could call this employees’ every-day learning, although organizational practice rarely refers to these processes as ‘learning’. Notions of a learning organization also have such ideas at their core: employees learn while they do their work and improve upon it, they learn while developing the organization (Swieringa & Wierdsma, 1995). From the moment, however, that the learning is organized more systematically, a learning program is in the making. A learning program refers to a coherent set of learning activities conducted by a group of employees around a core theme that is relevant to their work, supported by an HRD practitioner (Poell & Van der Krogt, 2002, 2003). The central idea is that organizing a learning program brings new impetus to employees’ every-day learning, improving the organizational learning system at the same time.

HRD practitioners who set up a learning program, which can comprise training activities besides workplace learning, (have to) take into account both the situation in the organization and the characteristics of the participating employees. Learning program are influenced by the organizational situation in two ways. In the first place, it affects the learning program content, the core theme studied in the program. Current work problems and expected developments can lead to learning initiatives. Second, the make-up of the learning program will be influenced by the learning opportunities offered by the organization, for example, the available learning facilities. Besides organizational characteristics, the participants also place their mark on a learning program, for instance, through their existing competencies, their ideas about learning, and their learning styles.

This paper deals with the question in which ways HRD practitioners tailor-make learning programs, that is, take into account the demands set by the organization and the participants. We start out by providing a theoretical account of the relations between learning programs, on the one hand, and organizational and individual learner characteristics, on the other hand. We then continue by presenting results from thirteen learning programs carried out in several care institutions. It is concluded that there is a considerable theory-practice divide when it comes to customizing learning programs. Finally, implications for theory building and organizational practice are discussed.

Learning Programs and Customization: A Theoretical Exploration

The learning-network theory (Van der Krogt, 1998; Poell, 1998) stipulates there are several ways to organize employee learning and there are probably certain relationships between an organization and its learning system. The core idea is that organizational dynamics are expressed also in the way employees learn. Differences among organizations lead to different ways of organizing employee learning. Assuming relations between organizations and learning programs enables the formulation of hypotheses concerning customization.

Organizing Learning Programs as Projects

Employees learn a lot simply by working in an organizational context. Doing their job, informally improving it, or attending training sessions are common ways of learning for them. Such learning may be conducted more systematically and explicitly when several employees team up with an HRD practitioner as facilitator to form a team.
Organizing learning programs can be done using project-based work methods, provided the special nature of learning programs is specifically taken into account. Poell & Van der Krogt (2002, 2003) developed a typology of project-based learning programs to this end (also referred to as learning projects). The typology comprises three phases that are elaborated upon to describe four ideal types of learning programs. The three phases are orientation, learning and optimizing, and continuation. The four types are the contractual, individual-oriented learning program (liberal type), the regulated, task-oriented learning program (vertical type), the organic, problem-oriented learning program (horizontal type), and the collegial, profession-oriented learning program (external type). For limitations of space, these are not further elaborated upon here (please refer to Poell & Van der Krogt, 2002, 2003).

### Learning Programs in Organizations: The Impact of Work and Employees

Above, we have indicated that learning programs can be organized in a variety of different ways. The actual structure and phasing of the program, however, depend on the characteristics of the organization and its workforce.

**Types of organization and learning programs.** The literature provides two arguments to expect relationships between learning programs and the organization in which they take place: first, the way work is organized impacts upon learning programs; second, they are affected by the existing learning structure and culture in the organization.

**Work and learning programs:** When it comes to the organization of work, oftentimes the differences between mechanical, bureaucratic organizations and organic, team-based organizations are mentioned (Ellström, 200x; Onstenk, 1997; Doorewaard & De Nijs, 1998). Machine-type organizations with extensive task differentiation are likely to feature highly standardized, formalized learning programs, whereas in team-based organizations more organic learning programs are expected to take place. The learning-network theory (Van der Krogt, 1998) draws on the work of Mintzberg (1989) to bring two more types of organization into play: entrepreneurial and professional organizations (cf. Weggeman, 1997). Table 1 shows which learning programs are expected to occur in the four different types of organization and work.

### Learning structure / culture and learning programs

The second argument to expect relationships between organization and learning programs emphasizes the impact of the existing learning structure and culture in the organization. These have come into being over time, usually rather implicitly as a result of the concrete learning activities that take place. For instance, when organizational changes are implemented training courses are often provided, or employees participate in educational programs to further their careers. In doing so, procedures and task divisions concerning training and learning gradually take shape and organizational members’ beliefs about education and development become clear. It is expected that organizations differ in their learning structures and cultures, which affects the actual learning programs that are conducted (Baars-Van Moorsel, 2003).

**Employees and learning programs:** Besides existing work and learning structures, the employees who participate leave their mark on learning programs in the organization. First of all, their learning capabilities and beliefs about learning are relevant in this respect. Second, employees’ prior knowledge, skills, and attitudes also influence the learning activities they undertake.

No general hypotheses can be stated concerning the impact of employee characteristics on learning programs. It is possible, however, to come up with expectations about the roles to be played by employees in different types of learning program. The liberal type gives individual participants a very active role, in that, they have to form a picture of their own learning needs and opportunities as well as mobilize others to support them. In a horizontal learning program, ability to be a team player and to learn together with others by solving complex work problems is crucial. The vertical type expects employees to follow a training program designed for them by HRD practitioners and management. In the external learning program, colleagues within the professional community set the stage and an externally oriented, professional attitude is needed.

### Customization Strategies of HRD Practitioners

Learning activities and programs are strongly affected by the existing work and learning structure in the organization, as well as by the employees who participate. In creating learning programs, HRD practitioners have to
take into account the specific characteristics of organization and employees. Two general customization strategies of HRD Practitioners can be distinguished: differentiating in the program structure and individualizing during program execution.

**Differentiation in the program structure.** In designing a learning program, the HRD practitioner can build in options in order to adapt to the specific situation in an organization and to differences among participants. This strategy is clearly visible in regulated, task-oriented learning programs. The key question here is how the program designer takes into account the organizational context and participant characteristics in the program structure and planning.

**Individualization during program execution.** Both the HRD practitioner and the participants can adjust the program during execution in order to fit better with organizational and employee characteristics. The core issue in this strategy is, as all parties together realize learning activities, how does the HRD practitioner make room for unexpected developments and newly acquired insights during program execution. Three types of learning program feature this strategy, be it each with a different emphasis. In the contractual, individual-oriented type individual participants are responsible for customizing the program to their needs as it unfolds. The organic, problem-oriented learning program places the responsibility for progress and participation with the learning group as a team. In the collegial, profession-oriented type, a strong emphasis is put on the externally directed, professional bond within the learning group.

**Research Questions**

Although customization is a term often used in HRD practice, little is known about the exact way in which HRD practitioners (can) deliver tailored learning programs. The main question in this study, therefore, is how HRD practitioners customize learning programs. The investigation is targeted at their activities in creating work-related learning programs. Two research questions need to be answered:

1. How do HRD practitioners tailor learning programs to individual learners?
2. How do HRD practitioners tailor learning programs to the organization where they take place?

**Research Methods**

**Research Design**

The study was set up as an action-research project in a collaboration of researchers with HRD practitioners from the healthcare sector. Its explicit aim was to use joint reflection on the practices of the HRD professionals to improve their self-understanding and to broaden the researchers’ insight into the customization strategies employed by HRD practitioners, in a continuous mutual exchange process. The Dutch healthcare sector was chosen because the broad nature of its primary processes yields a possibly wide range of learning-program types. In order to facilitate comparisons, participant selection focused as much as possible on the primary work process of the organization as opposed to its management layers. In selecting learning programs for the study, the emphasis lay on those with participants around the higher vocational education level. Two learning-program cases were selected for each HRD practitioner, in order to establish whether the customization strategies were bound more to their person or to their situation.

The analysis of separate cases focused on the characteristics of the learning programs designed by all HRD practitioners and on the elements of their customization strategies, as far as they could isolate the latter in a reflection session held afterwards. An analysis across cases was performed to relate characteristics of work and learning programs to the customization strategies that the HRD practitioners employed.

**An Action-Research Project in Four Phases**

The action-research project with the HRD practitioners took place in four phases: selection, description, analysis, and reflection.

1. **Selecting the participants and learning programs.** Two learning groups were established consisting of HRD practitioners. Snowball sampling was used to find HRD practitioners from the Dutch healthcare sector who worked with employees at least at the secondary vocational education level. Potential participants were asked to take part in an action-research project-cum-learning program about customization strategies. Eventually a useful and complete data set was acquired from seven participants, among them six men. They worked as HRD practitioners in or for large (psychiatric) hospitals, and in or for medium-sized nursing homes and institutes for home care or for mentally handicapped people. Most participants were very well informed within the healthcare sector and had extensive experience with educational consultancy and training. Two introduction sessions were held with the participants at the start of the study in order to familiarize them with theory about learning programs and customization.
2. Describing the learning programs conducted. An especially developed checklist (“Customized Learning-Programs Checklist”: CLPC, see below) was used to interview each participant twice about two different recent learning programs that they had organized. Useful learning programs had a core theme to do with the quality of care or service and lasted at least a month with two plenary sessions. One participant had only one useful learning program, accounting for a total number of thirteen cases on which the analysis was based. In total five researchers were involved in doing the interviews, including an initial analysis, operating in ever changing pairs. Table 2 contains a general overview of the cases.

3. Analyzing the learning programs described. During the interviews the researchers summarized the answers of the participants at the end of each separate section of the CLPC in order to check whether their interpretations fitted with the intentions of the participants. Tape recordings, full transcripts, interview notes, and the CLPC as completed during the interview were used to make a four to six-page summary of each interview. This was sent to the participants for verification and additions, together with the version of the CLPC that was completed during the interview. All thirteen summarized case descriptions were returned to the researchers with corrections. These corrected versions were used for the initial case analyses, which were carried out by different pairs of researchers for each learning-program case using the N-Vivo software package for qualitative analysis. An interpretation and diagnosis were made of each learning program in terms of the typology presented above. All thirteen case analyses were discussed and commented on by the other three researchers in two or three rounds, leading to a number of changes in the interpretation of some cases. The analysis was aimed at gathering information about pre-selected categories, although an effort was made as well to find ‘new’ customization strategies beyond the ones already singled out. At the end of this phase, the individual case analyses were used as input for a learning program with the HRD practitioners and for a comparative multiple case analysis that was discussed with the participants during the last meeting of said program.

4. Reflection on the learning programs and case analyses. The descriptive and analytic phases of this action-research project contained some activities that could also encourage HRD practitioners’ learning about the organization of learning programs. In the final reflection phase, their learning was intensified by forming two learning groups. The action-learning project in this phase consisted of four workshops and reflective discussions about the backgrounds to the choices made by the HRD practitioners in their respective cases. The researchers and other participants gave individual HRD practitioners suggestions to improve the way they organize learning programs. The action-learning project ended after the participants had used the CLPC to improve an existing learning program, or design a completely new one, from their own work practice. Participants were invited to think about how to continue the action-learning project individually in their own organization. A final meeting was held with all HRD practitioners to evaluate the action-learning project for learning effects and impact on their work situation.

The Customized Learning-Programs Checklist (CLPC)

Before the action-research project took place, the typology of learning-programs presented above was used to design a draft Customized Learning-Programs Checklist. This draft was tried out for interpretive power in interviews with six HRD practitioners (not the same group) and adapted accordingly. During the action-research project the CLPC was employed to guide the interviews, but using it has yielded many concrete ideas for customizing learning programs as well (see Poell & Van der Krogt, in preparation). HRD practitioners can draw upon these to determine to what extent and how they operationalize the vast array of possible customization
activities. It also provides them with a range of alternative ways to tailor their learning programs to the organization and its employees.

As an interview guide, the CLPC contains 52 open questions spread across five categories. First, there are fourteen questions about the organizational context where the learning program took place. The core of the interview is about the activities of the HRD practitioner and the learning-program participants in the orientation (thirteen questions), learning and optimizing (thirteen questions), and continuation phase (eight questions). The final category comprises four questions about the customization strategy of the HRD practitioner. Time for completion in the thirteen cases ranged from an hour and a half to two-and-a-half hours. Half this time was usually needed to get a general picture of the learning program in its organizational context, the other half to complete the CLPC on the basis of the information provided with some specific additional questions.

Results

This section has two main parts. First, the structure of the thirteen learning-program cases is discussed in relationship to the type of work in which they were conducted (cf. Table 1). After that, some illustrations from the reflection sessions are provided of how these HRD practitioners customized their learning programs and which problems they ran into.

Learning Programs and the Organization of Work

The main results from the analysis of the thirteen cases are presented in Table 4. The most striking result is that all learning programs had at least a vertical component, meaning that they were to a large extent pre-structured by the HRD practitioner and mainly task oriented. The majority of cases (nos. 1, 4, 5, 8, 9, 10, and 13) even had vertical characteristics only. Four of the remaining cases showed a vertical-horizontal hybrid structure (2, 6, 11, and 12) with some organic, problem-oriented elements within the pre-structured, task-oriented framework. There is one vertical-liberal case (no. 7) with some unstructured and individual-oriented elements, and one vertical-liberal-external hybrid (no. 3) with a number of collegial, profession-oriented elements also.

Note: Legend for work type and learning-program type: X = characteristic in case, X = dominant type for case, -X = characteristic in case, however unsystematic. Legend for customization: blanc = none, o = very little, oo = to some extent, ooo = extensive customization.

The work in all thirteen cases was predominantly task based, that is, much shop floor activity was directed from the top with relatively little employee autonomy. Jobs were often rather narrow, split up into sub-tasks, and subject to standard protocols. Incidentally, in three cases this type of work was not functioning very systemically, in the sense that key work procedures were not well executed. Four cases (9, 10, 12, and 13) were characterized purely by task work, the other nine were hybrid forms in several combinations. Elements of professional work were found in five cases (1, 3, 4, 5, and 7), individual work in five as well (1, 3, 4, 6, and 8), and group work in three organizations (2, 7, and 11).

Without performing a statistical analysis, comparing the respective columns in Table 4 makes rather clear that a relationship exists between types of learning program and work. To illustrate this point, all cases contain the main elements of regulated, task-oriented (vertical) learning programs as well as key features of task work. However, no
one-on-one relationship was found, in that, relatively fewer external and liberal elements were found in learning programs than could be expected had there been a direct relation with the professional and individual work types.

**Reflection on Customization by HRD Practitioners in Learning Programs**

The final phase of the action-learning project consisted of two reflection sessions with HRD practitioners and focused, besides on discussing the analyses of the learning programs in their work context, on further analysis of the customization strategies in use. The main result of this exercise was that HRD practitioners make little explicit use of customization strategies (see two rightmost columns in Table 4). Although they do have implicit images of the characteristics of work and learners in mind, these are scarcely taken into account in organizing learning programs.

Although differentiation in the design of the program structure occurred in ten of the thirteen cases, this happened to a limited extent only. Individualization during the execution of the learning program is a more rarely, occurring as it does in six cases to a limited extent only. The only case where explicit and extensive attention is paid to customization (no. 12) is a learning program targeted at first-line managers, where the work has rather different characteristics compared to the shop floor. All in all, the repertoire of customization strategies used by these seven HRD practitioners turns out to be quite limited.

To illustrate the customization strategies that were surfaced a number of examples from the interviews follow. **Differentiation** in the design of the program structure occurred, first, through learning needs and task analyses (e.g., analyzing a work problem with the participants, then discuss with them what they should learn as a result). A second strategy in this connection was taking into account the learning styles of participants (e.g., “Nurses are clearly doers, they have a very practical orientation,” therefore use real-life cases and emphasize action throughout the learning program). Third, differentiation upfront was achieved through a flexible program design (e.g., use parallel groups meeting at different days of the week, so that individual participants can attend when they please). A fourth strategy related to transfer enhancing measures (e.g., encourage several people from one department to take part, the head also; pay attention to management processes besides shop-floor learning).

Three main categories of individualization during the execution of the learning program were found. First, being flexible during the program (e.g., open a help-desk telephone for specific questions from individual participants at a moment when they need an answer). The second strategy was facilitating self-directed learning (e.g., encourage participants to attend a national conference about the same topic, so that they can keep up). Finally, HRD practitioners mentioned examples of the individualization strategy continuous adaptation of the learning program (e.g., by establishing a meeting’s first assignment only, leaving further proceedings dependent on the group and the situation at hand).

There is no scope in this article for an elaborate account of all customization activities employed by the seven HRD practitioners, besides these examples. A full overview will appear in Poell & Van der Krogt (in preparation). Although some examples of customization strategies were found among these seven HRD practitioners, their repertoire in this area was far from extensive. Paying explicit attention to the characteristics of the organization and the participants in organizing learning programs happened in only few cases. The final section of this paper deals with the implications of these findings.

**Conclusions and Perspectives**

This study has presented an action-research project conducted with seven HRD practitioners, which was aimed at investigating how they take into account the characteristics of work and learners in organizing learning programs. These HRD practitioners were found to pay a reasonable amount of attention to differentiation in the design of the learning program for the participants. This mostly took the shape of taking into account transfer enhancing measures and different learning styles. Different types of learning program emerged as a result of this, also based on the particular beliefs about learning that differed from one HRD practitioner to the next. Despite such diversity, the pre-structured task-oriented (vertical) learning program was a rather dominant type in most cases. The HRD practitioners in our sample seemed to employ very few individualization strategies during the execution of their programs, for example, continuous adaptation and facilitating self-directed employee learning. The programs were rarely adjusted along the way on the basis of progressive insight. All in all, these HRD practitioners used few explicit customization strategies. In view of the attention paid to customization in literature, it has to be concluded that there is a considerable theory-practice divide in this area.

The HRD practitioners all tended to use their own individual method to organize a learning program, an idiosyncratic system that usually remains implicit unless there are action researchers around. Nevertheless, most individual approaches seemed to be based on an underlying means-end rationality that has been rather dominant in HRD literature to legitimize training efforts (Robinson & Robinson, 1989; Jacobs & Jones, 1995; Swanson & Holton, 2000). Clearly, the HRD practitioners in our sample initially embraced the assignment and problem definition of management, leading to a quite vertical, top-down approach. Within that framework, they then tried to
processes. Perhaps we should accept that training and learning cannot easily be subjected to traditional conceptions

sector. On the other hand, the action-research project at the core of the study was very intensive and well suited for strategies in organizing learning programs. Obviously, the limitations of the present study have to be taken well into account. Its empirical base was restricted to thirteen cases and seven participants, all working in the healthcare sector. On the other hand, the action-research project at the core of the study was very intensive and well suited for an in-depth investigation of the customization strategies employed by HRD practitioners. Also, the findings of the present study are in line with a number of other studies that dealt with systematic learning efforts in organizations. For example, Overduin, Kwakman, & Metz (2002) concluded that HRD departments in organizations used few of the systematic practices propagated by the performance approach. Similarly, Sels, Huys, & Van Hootegem (2001) found that very few of the elaborate methods for training design from the HRD literature were used in practice. Weggeman (2000) came to the conclusion that few organizations managed knowledge systematically. In a longitudinal study, Kieft & Nijhof (2000) found that promising notions like, for example, learning organizations were hardly encountered in organizational practice. Instead, HRD practitioners still seemed to devote most of their time to training delivery, with their own particular beliefs and insights directing such efforts. In organizational practice, a systematic approach to organizing learning programs that goes beyond the individual action repertoire of the HRD practitioner appears to be far from widespread as yet.

Where to go next for promising research avenues? Three general remarks must be made before this question can be answered. First, a rather constant finding in empirical HRD research is that theoretical concepts find limited resonance in practice. The theory-practice gap in HRD seems rather wide. Much of the thinking in the field offers little assistance for practitioners to express their everyday actions in words, let alone to give these some more direction. A second observation is that organizations pay far less explicit attention to training and learning than assumed in HRD literature. This call for modesty should be a crucial starting point from which only small steps away can be taken. In this connection, it should be clear that employees and managers oftentimes are unwilling to invest as much in training and learning as many HRD practitioners desire. Moreover, their views and interests in the arena of training and learning can vary widely. Third, explicit and systematic attempts to organize learning programs seem rather rare, thus severely limiting the possibilities of studying the underlying dynamics and processes. Perhaps we should accept that training and learning cannot easily be subjected to traditional conceptions of organizing and controlling.

The above considerations raise the question of what value there is at all in looking at the notion of learning programs. Everyday learning is everywhere and probably always will be, but its further systematization gets scant attention from employees, managers, and even, as the present study suggests, from HRD practitioners. The latter seem to fall back on their implicit action repertoire, which is usually strongly biased by traditional training-design approaches. Although many in HRD underwrite the importance of alternative approaches to learning, including workplace learning and the integration of work and learning, much is unclear as yet about the ways to fully realize their potential. From an effectiveness perspective this is problematic, in that, as witnessed in many of our cases, the impact of learning programs is small as a result of the apparent lack of optimizing and continuation during execution.

The question arises if the movement from training to learning that characterized much of the HRD literature over the last decade has been very successful. Besides the current study, other studies too have had to conclude that the impact of the HRD practitioner is very limited (e.g., Nijhof, 2000; Tjepkema, Sambrook, Stewart, Mulder, Ter Horst, & Scheerens, 2002). Managers and employees are far powerful actors when it comes to learning in organizational and work contexts (cf. Van der Krogt, 2002). HRD practitioners can attempt to create a coherent set of learning activities within the boundaries of a pre-designed program. It seems illusionary, however, to also want to change the work and organizational context, which appears to be restricted to managers and employees.

If HRD practitioners have little impact in practice on employee learning and on the work context where everyday learning takes place, their challenge is to create learning programs that take into account that context to the best possible extent. They can try and find out about the normal ways in which these core actors learn (implicitly) from work and build upon that in a tailored learning program. This involves not only differentiation in the design of the program structure, but also leaving room along the way for adjustment, employee self-direction, and flexibility in program execution.

Although the latter customization strategies did not feature often in the present study, their illustrations show that there is a range of possible ways to bring some more system and customization to the interventions of HRD practitioners (cf. De Caluwé & Vermaak, 1999): through needs and work analyses (Swanson, 1994), by taking into account different employee learning styles (Riding & Sadler-Smith, 1997), through transfer enhancing measures (Robinson & Robinson, 1989; Simons, 1990; Holton, Bates, & Ruona, 2000), by applying flexible design methods and leaving room for adjustment along the way (De Corte, Geerligs, Lagerweij, Peters, & Vandenberghhe, 1986), by
facilitating self-directed learning (Brookfield, 1986), and through continuous adaptation of the learning program during its execution (De Lange-Ros, 1999). Poell & Van der Krogt (in preparation) give a full overview with concrete illustrations of all customization strategies.

The framework employed in the present study to analyze learning programs offers HRD practitioners and other learning actors (e.g., employees and managers) a diverse range of context-sensitive action possibilities. Straight or hybrid forms of contractual individual-oriented, regulated task-oriented, organic problem-oriented, and collegial profession-oriented learning programs can be experimented with in organizational practice. Those who want to offer tailored learning programs can use such models to both determine their own strategy and better understand other actors’ strategies in use.

Constructing a Theoretical Model of Human Resource Development Knowledge Innovation in Corporate Settings

Yu-Shu Chen (Jason)
National Chung Cheng University

The purpose of this study is to construct a theoretical model of Human Resource Development (HRD) knowledge innovation. To achieve the purpose, grounded theory was chosen as the research methodology. This research design included a sampling of nine benchmarking companies in Taiwan. Five theoretical categories were grouped as follows: (a) knowledge generation, (b) building archetypes of innovation, (c) knowledge distribution, (d) knowledge utilization, and (e) factors leading to knowledge innovation success.

Keywords: Knowledge Innovation, Grounded Theory, Theory Building

In the era of knowledge-based economy, companies depend on knowledge innovation to help gain a competitive edge. Organizations dealing with an uncertain environment cannot get ahead merely through passive adaptation; they need to actively interact with that business climate. Organizations that wish to cope dynamically with the changing environment need effective innovative knowledge. Furthermore, the organizational members must not be passive but must rather be active agents of innovation (Nonaka & Takeuchi, 1995). In order to transform knowledge into a valuable organizational asset, knowledge must be generated, distributed, and utilized. Knowledge innovation is considered a key part of the strategy in using knowledge to create a sustainable competitive advantage in today's business environment (Beckman, 1999). How to generate new knowledge and utilize it to improve performance become more and more important in corporate settings.

The purpose of HRD is to improve employees’ and organizations’ performance (Swanson & Holton, 2001). Therefore, new HRD knowledge generation and utilization is vital for companies. However, there is little literature related to HRD knowledge innovation in corporate settings, let alone HRD knowledge innovation theory construction. Therefore, this study was conducted to fill the knowledge gap in the HRD domain. The purpose of this study is: (a) to explore the concepts of corporate HRD knowledge innovation, (b) to explore the relationships among those concepts, and (c) to construct a corporate HRD knowledge innovation theoretical model.

Problem Statement

HRD knowledge innovation is the process of managing organizational HRD knowledge for creating business value and sustaining competitive advantage through the creation, acquisition, sharing, and application of knowledge to maximize organizational growth and value (Tiwana, 2001). In a knowledge-based economy, a business’ intangible assets carry more weight than its income statement. Therefore HRD knowledge innovation, one of the critical factors in producing intangible assets, is more important than ever. However, HRD knowledge innovation has been overlooked and neglected for years by many companies as a key component of human resource strategy. The primary thrust of strategic thinking and planning has centered on how to cut the personnel cost. Of course, reducing costs is an important piece but knowledge innovation brings far more potential power to reach human resource strategic goals (Kuczynski, 1996). In reviewing the literature, there is a lack of available information on how HRD knowledge innovation happens. The focus of previous research has been on HRD with little attention paid to knowledge innovation. The phenomenon of HRD knowledge innovation has not been well understood in the past.

Theoretical Framework

“An innovation is an idea, practice, or object that is perceived as new by an individual or other unit of adoption” (Rogers, 1995, p. 11). In this study, HRD knowledge innovation is not objectively new since its first use or discovery. The perceived newness of knowledge for the company determines its reaction to it. If the knowledge seems new to the company, it is a knowledge innovation.

Many authors have proposed models for knowledge innovation, such as linear models of innovation, the simultaneous coupling model (Trott, 1998), interactive model of innovation (Rothwell & Zegveld, 1985), five-phase model of the organizational knowledge-creation process (Nonaka & Takeuchi, 1995), a model for best

Copyright © 2004 Yu-Shu Chen (Jason)
practice transfer (O’Dell & Grayson, 1998). However, the purpose of this study is to build theory that is faithful to and illuminates the HRD knowledge innovation phenomenon. Therefore, grounded theory was chosen as the research methodology. The grounded researcher uses a systematic set of procedures to develop an inductively derived grounded theory about a phenomenon without previous theoretical framework. A grounded theory orientation allows theoretical categories to emerge from the data that explain how HRD practitioners continually process and respond to knowledge innovation phenomenon (Brott & Myers, 2002). One does not begin with a theory and then prove it (Strauss & Corbin, 1990).

Research Questions

The research question was developed to elicit the process of knowledge innovation for HRD practitioners. This question evolved from a review of the literature and dialogue with experts in HRD and grounded theory research design. Several iterations and revisions of the question were developed and discussed resulting in the following research question: “To what extent does knowledge innovation in HRD reflect the generic knowledge innovation models?”

Methodology and Research Design

To achieve the above objectives, grounded theory was chosen as the research methodology. The research design included a sampling of nine benchmarking companies in Taiwan. Seventeen HRD practitioners participated in this study. Data collection was through qualitative interviews using an open-ended approach. Each interview lasted approximately one to three hours. Interviews were tape-recorded with prior consent of the participants. Verbatim transcriptions were produced for data analysis. A set of rigorous coding procedures guided the analysis to develop theoretical interpretations of the data. Data analysis progressed through the stages of open, axial, and selective coding.

Methodology

A grounded theory is inductively derived from the study of the phenomenon it represents. It is discovered, developed, and verified through systematic data collection and analysis. Conducting grounded theory research, the researcher does not begin with a theory; rather he or she begins with an area of study, and what is relevant to that area is allowed to emerge (Strauss & Corbin, 1990). The purpose of this research is to explore the process and factors, which influence HRD knowledge innovation in corporate settings in order to build a theoretical framework. Therefore, the grounded theory was chosen as the research methodology. The research begins with field data collection and lets the HRD knowledge innovation emerge from the substantive area.

Sampling and Data Collection

The research design included a sampling of HRD practitioners who worked in companies with a good reputation in knowledge innovation. A purposeful sampling approach was used to generate information-rich events that illuminated the study and elucidated variation as well as significant common patterns within that variation.

Data collection was through structured interviews using an open-ended approach with an interview guide. The interviews lasted approximately one hour for each participant. Most of the interviews were completed at the HRD practitioners’ respective work site. The question included in the interview guide focused on HRD knowledge innovation activities and processes. The interviews were tape-recorded with prior consent of the participants, and verbatim transcriptions were produced for data analysis. Each HRD practitioner who participated also was asked to complete a form about his or her demographic information.

The researcher, as an active participant in the data collection, was intent on understanding in detail how HRD knowledge innovation happens. The interview guide provided the topic within which the researcher explored, probed, and asked questions to elucidate and illuminate the subject area. Therefore, the researcher remained free to build a conversation within a particular subject area and establish a conversational style. In addition to interviews and descriptive data, the researcher observed some participants in their respective working settings. A narrative that was a composite of the transcriptions and participant observations provided a portrait of the HRD practitioners who participated in the study.

Participants

Because the research purpose is to build a theoretical model of HRD knowledge innovation, the participants had to work for those companies whose HRD knowledge innovation is active. The researcher sifted research companies carefully. Most of them have a good reputation for HRD knowledge innovation in Taiwan. Some of them even obtained an award for human resource innovation, which is given by the Human Resource Development Association.
of the Republic of China. After a recruiting, there were 16 HRD practitioners from 9 companies who participated in this study. Fifteen HRD practitioners have more than three years’ working experience in corporate HRD practice.

One of the concerns is the possible selection of participants by the researcher that might reflect preexisting biases and the unique perception of HRD practitioners that would lead them to respond in particular ways to the research questions. The selection of participants was intentional and thus provided sufficient variety in experience to overcome the possibility of selection bias. The unique perceptions and experiences of the HRD practitioners were strength of the study rather than a limitation because their uniqueness contributed to the variety of perspectives, and thus categories, which emerged in the data analysis.

The Researcher

The researcher is an assistant professor, who teaches HRD classes at the Department of Adult and Continuing Education in National Chung Cheng University in Taiwan. He earned his Ph.D. degree from University of Minnesota and came back to Taiwan to teach HRD classes in university settings since 2001. The researcher has devoted him to the HRD field.

Any researchers will encounter the same problem when conducting qualitative research. There are several possible biases that can result from the research process. The researchers’ biases can affect the findings. Therefore, the researcher invited several faculties to participate in reviews of the data, and interpretations were intended to minimize researcher expectations as a possible source of error.

Data Analysis

A set of rigorous coding procedures guided the analysis to develop theoretically informed interpretations of the data. Data analysis progressed through the stages of open, axial, and selective coding. Open coding identified and developed concepts and then grouped concepts into categories, and further, the researchers explored the properties and dimensions of categories. Axial coding put the data together in new ways by making connections between a category and its subcategories to develop several main categories. Finally, selective coding integrated the categories to form a grounded theory for the development of HRD knowledge innovation.

Open coding. The naming and categorizing of phenomena through a close examination of the data is referred to as open coding (Strauss & Corbin, 1990). In taking apart a description by a line, a sentence, or a paragraph of transcription, each discrete incident, idea, or event was given a name or code word that represented the concept underlying the observation. Concepts were selected by the researcher to elicit new insights from the data. Examples of concepts identified in this study included assessing, learning, supporting. A total of 200 concepts were identified in this study.

Grouping the concepts in the data is called categorizing, which reduces the number of concepts with which to work. The creative aspect of the data analysis was incorporated with the researcher naming categories as a basis of innovative theoretical formulations. For example, “rental,” “hiring,” and “purchasing” were grouped around the category named knowledge acquisition. A total of 36 categories were identified through open coding in the study.

Axial coding. Whereas open coding fractured the data, axial coding put the data back together in new ways by making connections between a category and its subcategories to develop several main categories (Strauss & Corbin, 1990). The resulting model denotes causal and intervening conditions, phenomena, and contexts.

Selective coding. The selective coding process integrates the categories to form a substantive theory (Strauss & Corbin, 1990). This theory describes an interrelated set of categories that emerge from the data through a constant comparative coding and analysis procedure. The identification of a core category, one that accounts for most of the variation in a pattern of HRD knowledge innovation phenomenon, was essential for the development of the theory. After the core category was identified, the remaining categories were related to the core category as the conditions that led to the occurrence of the phenomenon and as the phases that represented the phenomenon.

Results and Findings

The results of the coding procedures reflect the theoretical categories that explain how research companies continually process the knowledge innovation. These categories form the basis for a substantive theory, which describes an interrelated set of categories grounded in the data that emerged from the constant comparative coding and analysis procedures. Five main theoretical categories emerged through the axial coding process that explained how the research companies continually processed the knowledge innovation. The five theoretical categories included: (a) knowledge generation, (b) building archetypes of innovation, (c) knowledge distribution, (d) knowledge utilization, (e) factors leading to knowledge innovation success. Using selective coding, the core category was identified as a dynamic interaction process. The core category and major theoretical categories were linked through conditions that described how research companies process the knowledge innovation.
Proposition 2. Factors leading to knowledge innovation success have a positive relationship to building generation.

Proposition 1. Factors leading to knowledge innovation success have a positive relationship to knowledge HRD knowledge innovation stated, we can assert the following formal propositions about the theoretical model:

Concepts were generated from the data and systematically related. The conceptual linkages were presented as phases (that is, strategies and activities of the process).

Categories was related to the core category as conditions (that is, events or incidents that led to the phenomenon) or the core category was entitled "dynamic interaction." Using selective coding, each of the remaining theoretical categories was related to the core category as conditions (that is, events or incidents that led to the phenomenon) or phases (that is, strategies and activities of the process).

Factors leading to knowledge innovation success. There are several factors influencing HRD knowledge innovation in organizations such as culture and senior management support. Culture was one of the most important factors leading to the success of knowledge innovation in this study. In a positive culture of knowledge innovation, employees are willing and free to explore and do not fear that sharing knowledge will cost them their jobs. Like almost every other type of change project, knowledge innovation projects benefit from senior management support. Strong support from executives was critical for knowledge innovation projects.

Building archetypes. The new HRD knowledge is converted into an archetype, which can take the form of a prototype, in the case of training and development products such as training programs, or an operating mechanism, in the case of organizational development projects such as a new corporate value, or innovative organizational structure.

Knowledge distribution. The distribution of knowledge within an organization is a vital precondition for turning isolated new knowledge into something, which the whole organization can use. Knowledge distribution is the process of sharing and spreading knowledge, which is already present within the organization (Probst, Raub, & Romhardt, 2000). Knowledge distribution consists of several subcategories such as diffusion and sharing. Diffusion is the process by which new knowledge is communicated through certain channels over time among the members of a social system (Rogers, 1995). Sharing reflects what individuals tell others about their innovation, including related ideas, problems, and plans (Hall & Hord, 2001).

Knowledge utilization. Just because a company has first-rate processes for generating and distributing knowledge don't mean it will succeed in knowledge innovation; if it does not apply its new knowledge, no benefit is achieved (Probst, Raub, & Romhardt, 2000). Countless HRD projects have failed because of the mistaken belief that designing better infrastructures automatically leads to mastery of the knowledge innovation process. All the generated new knowledge must be directed towards efficient use in order to reach the company's goals. In this study, knowledge utilization comes almost at the end of the cycle of knowledge innovation. However, the whole process could be turned around.

Factors leading to knowledge innovation success. There are several factors influencing HRD knowledge innovation in organizations such as culture and senior management support. Culture was one of the most important factors leading to the success of knowledge innovation in this study. In a positive culture of knowledge innovation, employees are willing and free to explore and do not fear that sharing knowledge will cost them their jobs. Like almost every other type of change project, knowledge innovation projects benefit from senior management support. Strong support from executives was critical for knowledge innovation projects.

Theoretical Model of HRD Knowledge Innovation

The results of the coding procedures reflect the emergence of theoretical categories that explain how the participants continually processed the phenomenon. These categories form the basis for a substantive theory, which describes an interrelated set of categories grounded in the data that emerged from the constant comparative coding and analysis procedures (see figure 1). As revealed in reviewing each story, HRD knowledge innovation was faced with multiple influences, and HRD practitioners found a way to intertwine or blend these influences. As a process, the core category was entitled "dynamic interaction." Using selective coding, each of the remaining theoretical categories was related to the core category as conditions (that is, events or incidents that led to the phenomenon) or phases (that is, strategies and activities of the process).

Proposition 1. Factors leading to knowledge innovation success have a positive relationship to knowledge generation.

Proposition 2. Factors leading to knowledge innovation success have a positive relationship to building
archetype.

Proposition 3. Factors leading to knowledge innovation success have a positive relationship to knowledge distribution.

Proposition 4. Factors leading to knowledge innovation success have a positive relationship to knowledge utilization.

Proposition 5. Knowledge generation has a positive relationship to building archetype.

Proposition 6. Knowledge generation has a positive relationship to knowledge distribution.

Proposition 7. Knowledge generation has a positive relationship to knowledge utilization.

Proposition 8. Knowledge distribution has a positive relationship to knowledge utilization.

Proposition 9. Knowledge distribution has a positive relationship to building archetype.

Proposition 10. Building archetype has a positive relationship to knowledge utilization.

Figure 1. Theoretical Model of HRD Knowledge Innovation

Conclusions and Recommendations

This study discovered that there were five main categories among the phenomenon of HRD knowledge innovation as occurring in the corporate context. The process of knowledge innovation was identified as a dynamic interaction process. The core category and the major theoretical categories were linked and described how HRD knowledge innovation occurred. The relationships of categories that comprise the process for HRD knowledge innovation were presented (see figure 1). There are 10 theoretical propositions comprising the HRD knowledge innovation theory.

The present set of propositions is premised on existing knowledge about HRD knowledge innovation. The findings are limited by current methods used to describe knowledge innovation. HRD knowledge innovation is very complex. Additional research findings and improved methods may suggest other propositions. Further exploration and conceptualization of this theory through quantitative methods would be advantageous. Further research would be focused on testing and refining the theory through examining relationships within the theory, collecting data from multiple corporate settings.

Contribution to New Knowledge in HRD

The purpose of this study was to generate a grounded theory of HRD knowledge innovation in corporate settings. It is useful to have a theoretical framework to organize and evaluate social phenomenon, to provide direction for future research, and to stimulate new ideas and concepts. The total set of propositions suggests research hypotheses that may be tested to determine the usefulness of the theory in understanding HRD knowledge innovation. This study
focused on the development a theoretical model of HRD knowledge innovation that is useful in explaining and predicting the phenomenon of knowledge acquisition, diffusion, and utilization in the corporate setting. The implications have relevance for the practice of HRD. By understanding the concepts and the relationships of concepts of knowledge innovation, HRD practitioners may be in a better position to improve their organizational innovation performance.

Relationship Between Learning Style and Learning Modality of Employees of a Health Care Organization

Geri McArdle
Paul VanBuskirk
Barry University
Nancy Edwards
Florida Gulf Coast University

When training and certifying a large number of employees at various levels, there is a need to determine the most effective and efficient training methodology. One way of becoming more effective in training individuals could be to determine the preferred learning style of the learners, and deliver training that is conducive to these preferred styles. This study explores the relationship between learning styles and preferred learning modalities.

Keywords: E-learning, Learning Styles, Learning Modalities

Medical centers are faced with the challenge of maintaining a competent workforce in an era of rapidly changing technologies and increasingly complex healthcare needs. In addition, they must meet standards for accreditation that stress quality of care, as well as provide mandated training required by state regulatory agencies. This challenge becomes more complicated when the medical center includes several facilities that are separated geographically. Added to this is a workforce that has no time to attend scheduled sessions, and a limited education staff. This is the dilemma currently facing a large medical center, with three hospitals, several physician office buildings, a home health agency, and other medical services. Therefore, there is a need to find the most productive training delivery modality that impacts the greatest number of learners.

Theoretical Framework

Learning and Learning Style

Learning is an interactive process. Learning can only take place when students feel confident that they can learn, and possess the skills to facilitate their learning (Kirkpatrick, 1998). Furthermore, learners learn differently (Price, 1977). Each learner has a distinct and consistent learning preference to organize and retain information (Keefe, 1987).

A learning style is both a student characteristic and an instructional strategy. As a student characteristic, learning style is an indicator of how a student learns and likes to learn. As an instructional strategy, it informs the cognition, context, and content of the learning (Keefe, 1991). Learners can identify their own learning style when exposed to a teaching style that matches their own learning style (Dunn and Dunn, 1987).

During the past two decades, a great deal of research has focused on learning styles. Claxton and Murrell (1988) concluded that learning styles consist of four elements: (1) personality, (2) information processing, (3) social interaction, and (4) instructional methods. A previous study conducted by Kirby (1979) and often cited in the literature suggests that learning styles can be classified using only two fundamental categories or orientations: the “splitters,” and the “lumpers.” Learners who are “splitters” tend to analyze content and break down the information into smaller parts, while “lumpers,” tend to watch for patterns and relationship between the parts.

Learning Styles, Preferences and Modalities

Learning occurs using the sensory channels of seeing, feeling and/or hearing. These three communication channels are considered in the literature to be the prime media that is used by an individual to give, receive and store information (Reiff, 1992). When an individual uses channels of communication, they establish a preference for learning, and these channels establish the three learning styles (Eiszler, 1983). The three learning style categories consist of the kinesthetic/feeling type learner, who has a need to touch, feel or try something out.

Copyright © 2004 Geri McArdle, Nancy Edwards, & Paul VanBuskirk
Numerous studies have focused on the learning process in order to “catalog” the range of learning styles. There are many different ways to classify learning styles including: perceptual modalities that define biologically based reactions; information processing that distinguish between the way one senses, thinks, solves problems and remembers information; and personality patterns that focus one’s attention, emotion, and values.

There are many ways to measure learning styles. David Kolb (1985) has written extensively on learning styles and theorized that learning styles develop as a result of life experiences, both past and present, and hereditary influences. To help individuals identify their learning style, Kolb developed a self-descriptive questionnaire called the Learning Style Inventory (LSI). Kolb asserted that his theory and the LSI could help HRD professionals, supervisors, and employees identify and appreciate a number of different approaches to learning. Further research on the Kolb model took place at the University of Colorado at Colorado Springs. Here they developed a prototype of a computer-based tutoring system that could assess an individual’s learning style (Eurich, 1990). Although these studies focused on various aspects of learning styles, the research did reflect a common agreement that learning, learning modalities and learning strengths may be classified as sensory (Learning Style Inventory modality), perceptual (Hemispheric Dominance), Cognitive information processing (Kolb’s Learning Styles model and Learning Style Inventory), personality type (Myers Briggs Type Inventory and Kersley Temperament Sorter II), and personal or situational (The Multiple Intelligence Inventory; Using Multiple Intelligence; Gardner’s Seven Types of Intelligence and Seven Styles of Learning).

A popular learning style inventory used in distance learning research is the Kolb Learning Style Inventory (LSI) (Kolb, 1986). Kolb’s LSI measures student learning preference from two perspectives: the preference for either concrete experiences or a preference for engaging in abstract or conceptual analysis. Dille and Mezack (1991) used Kolb’s LSI to identify predictors of high risk among community college telecourse students. The results indicated that the successful students had lower scores on their preferences for concrete experiences than did the non-successful students. Gee (1990) administered the Canfield Learning Styles Inventory (CLSI) (Canfield, 1980) to students to study the impact of learning style variables in a live teleconference distance education class. His findings suggested that students in the distance learning class who possessed a more independent and conceptual learning style had the highest average scores in all of the student achievement areas. Gee (1990) also developed an inventory designed to assess the impact of different social dynamics on the learning preferences of students. Of the different learning style instruments, the Grasha-Reichmann Student Learning, (GRSLSS), according to Hruska-Reichmann & Crasha, (1982), is one of the few instruments designed to address the distinguishing features of a distance learning class, including the relative absence of social interaction between instructor and student and student/student.

Online learning defined by Steiner (1997) is a program that uses media tools to deliver instruction. Educational programs come in a variety of formats, including audio, computer-assisted programming of modules, lessons or whole curricula (Sherry, 1996). Yet, little empirical research exists that explores the potential strategic success factors that make one online program successful over another (Merisotis and Phipps, 1999). Using knowledge of student learning preference could provide a bridge to course success in a online mode, however, instructors must be willing to recognize and appreciate the variety of student learning styles, and to adjust their teaching strategies and techniques (Sarasin, 1998).
Learning Style and Training Transfer

The focus of this study is to determine if a relationship exists between an individual’s learning style and a preference for a specific learning modality. The learning style inventory chosen for this study was the Felder Soloman’s Index of Learning Styles (ILS). This inventory is based on the learning styles model developed by Richard Felder and Linda Silverman (Felder 1993; Felder and Silverman, 1988) and incorporates five dimensions, two of which replicate aspects of the Myers-Briggs and Kolb models. Specifically, the five dimensions include: the Perception dimension (sensing/intuitive), which is analogous to the Perception dimension of both Myers-Briggs and Kolb; the Processing dimension (active/reflective) which is also found in Kolb’s model; Input (visual/verbal); Organization (inductive/deductive); and Understanding (sequential/global).

In a recent white paper, Donzelli (2000) asserted that e-learning would revolutionize training similar to the way airplanes revolutionized transportation. E-learning, according to the author, has potential to drive knowledge closer to meaningful organizational results as people within organizations share the best practices and knowledge, and apply the expert thinking to their own duties. Developing and providing e-learning is fast becoming a mainstream practice in the field of HRD, due to geographical and time constraints of traditional training. Many organizations are utilizing online training and investing tremendous amount of resources in developing e-learning programs (Park & Wentling, 2003).

Important changes have occurred during the past 20 years in the area of understanding the nature of effective learning (Briggs, 1996). Specifically, Briggs asserted that learning involved passive transmission of knowledge from teacher to student. A recent study conducted by Boekaerts (1997) found that encouraging students to take responsibility for their learning led to more effective learning, and that student responsibility made a difference. A year later, Vermunt (1998) proposed an integrated learning model as a means of studying learning styles. His model suggested that although there is an implicit assumption that one approach to learning is more desirable than another, different methods of assessment may promote or discourage different styles of learning.

There is some evidence, according to Smith (2001) that individuals can generally do better in tasks, which are developed around their preferred method of processing information. Researchers in the United States such as Brown, Collins and Duguid (1989), Lave and Wenger (1991), and Resnick (1987), asserted that learning should be situated in a context of practice, and that workplace learning can be supported through the effective use of more flexible learning methods.

Research Hypothesis

Does a correlation relationship exist between a learning style and preferred learning modality?

Method

Participants

Forty staff members were randomly selected from a total population of 90 employees that had participated in three instructional delivery methods used at the medical center to deliver training. The employees were staff from the Patient Management departments from three different campuses. The three types of training delivery systems were: classroom-based, online modules, and videotaped learning programs. Each of the study participants received a package from the medical center’s Office of Training that included an introductory letter from the researchers explaining the purpose of the research study, instructions on how to complete the two survey questionnaires, instructions for signing the research participant’s consent form, and instructions as to returning the packet back to the Office of Training.

Instrumentation

The first survey questionnaire that the participants were asked to complete was the Index of Learning Styles Questionnaire, which consists of 40 multiple choice question statements. The second questionnaire was designed by the researchers to elicit the participant’s preference for one of the three instructional delivery methods (classroom-based, online modules or videotape programs), currently used at the medical center. The questionnaire used a Likert 5-point Scale using a “5” for most highly preferred to a “1” indicating a least preferred instructional method. This questionnaire was constructed with the help of the staff in the Office of Training at the medical center and reflected the actual training delivery that each participant had attended. A pilot test was conducted with seven doctoral students to test the instrument prior to surveying the healthcare group.
Experimental Design

The design for this study was a correlation testing of a continuous independent variable (the learning style) and continuous dependent variable (the preferred learning modality). The first statistical test was used to explore the relationship or association between each independent variable and each dependent variable as a bivariate analysis. A correlation matrix was designed to illustrate the degree of association between the independent and dependent variables.

Scatterplots were produced to analyze the association between the independent and dependent variables. These graphic illustrations provided the opportunity to analyze the patterns’ associations between variables.

Finally, a statistical test of multiple regression for predicting, a statistical procedure used to examine the combined relationship of multiple independent variables and a single dependent variable, was run. The variation in the dependent variable is explained by the variance of each independent variable. Predictive scores of an outcome can be generated using the equation form multiple regression.

Procedure

Forty employees were selected from the employees at the medical center, using a table of random numbers. The research participants were given the Felder and Soloman Index of Learning Styles Questionnaire, a 40-item survey that measures learning styles. Next, they completed the Learning Preference Survey. This survey asked for the participant’s preference for each of the three learning delivery methods (classroom-based, online modules or videotape production programs) presently used at the medical center to deliver training.

Preliminary Results

An analysis of the means from 19 of the 40 participants revealed the group of healthcare employees favored the online learning modality, followed by the classroom-based modality, and video learning. A bivariate analysis of the visual learning style and online learning modality resulted in a \( r = .327 \) and a \( p = .080 \).

Multiple regression was conducted to evaluate how well the learning styles correlated with learning modalities. The visual, verbal, intuitive, active and global learning styles were tested as predictors to predict the preference of online learning modality. The preliminary results were \( R^2 = .699 \); \( F (5,14) = 6.497 \); \( p = .003 \). These preliminary results indicate that these learning styles in linear combination could be significantly related to the online learning modality.

Preliminary runs of learning style predictors of predicted preference for classroom-based and videotape learning modalities resulted in high \( R^2 \), but were not statistically significant.

The Felder and Soloman Index of Learning Styles instrument is designed to pair opposite learning styles. A bivariate correlation analysis of the paired learning styles yielded the following results: active and reflective learners \( r = -.996 \) \( p = .000 \); sensing and intuitive learners \( r = -.991 \) \( p = .000 \); sequential and global learners \( r = -.981 \) \( p = .000 \). These results verify the reliability of the Felder Soloman Index of Learning Styles instrument.

Preliminary Conclusions, Limitations, and Recommendations

The preliminary analysis of testing multiple regression in which the correlated learning styles as predictors to predict preferences for learning modality yielded a high \( R^2 \). However, as the sample size increases for similar correlation coefficients, the \( R \) values yield \( p \) values that could meet the test of statistical significance.

It is anticipated that final results will demonstrate that learning styles may be predictors of online and video learning modalities. However, it is doubtful if learning styles will be a predictor of preference for the classroom-based modality for this healthcare group. Correlation and regression analysis addressed the predictive relationship between variables and not the causal nature of the relationship.

The small sample size is one limitation of this study since the findings cannot be generalized for a larger population. It is recommended that further studies be conducted using a larger sample size. Since this study involved employees with post-secondary degrees who worked in similar job capacities, future research needs to include employees with broader educational backgrounds and more diverse job responsibilities.
Contributions to the Field

The results will allow HRD practitioners to be able to optimize their limited resources by determining the most effective learning modality for training, retraining and certification in rapidly changing technologies and increasing complex health care needs. The return on investment in training will be justified by using the modality that is most effective and provide the trainee with the learning environment in which they are most productive.

Preliminary results for this sample indicated that there is a preference for online learning and not classroom-based modalities, regardless of learning style. This finding, if it continues to bear out in future studies, will provide further justification for the use of e-learning modalities for training purposes.

Applications of Psychology-based Theoretical Approaches to Executive Coaching: 
A Summary and Exploration of Potential Utility

Brandi Lyn Plunkett
Toby Marshall Egan
Texas A&M University

We focus on the fast growing human resource development (HRD) role of Executive Coaching and the psychological frameworks influencing coaching practice. Theories and applications underlying current practices in executive coaching are outlined and explored. Assumptions, roles, strategies, strengths, and weaknesses of a variety of coaching-related theoretical frameworks—from psychoanalytic to athletic coaching—are detailed and compared.

Keywords: Coaching, Individual Development, Psychology-based Theory

Although the concept of coaching is not new, executive coaching is quickly becoming the development approach of choice for many professionals (Bennet & Martin, 2001; Bobkin, 2002; Deane, 2001; Filipczak, 1998; Fulmer, 1997; Hall, Otazo, & Hollenbeck, 1999; Maher, 2001; Morris, B., 2000; Morris, T., 2000; Peterson & Hicks, 1999; Smither, London, Flautt, Vargas, & Kucine, 2003). Some scholars have attempted to explain this increased demand for executive coaches by pointing out that traditional executive development programs (usually involving some form of classroom or workshop instruction) do not meet the unique needs of executives in today’s fast-paced business world (Conger, 1993; Edelstein & Armstrong, 1993; Filipczak, 1998; Zenger, Ulrich, & Smallwood, 2000). While executive development programs are often created and implemented based on sound learning theory, many executive coaching methods are not. Methods are often based on the executive coach’s experience or isolated training rather than any kind of theory. Current scholarship and practice literature examines executive coaching from the standpoint of counseling or clinical psychology (e.g., psychodynamic theory or psychotherapy or behavioral modification), and rely on case studies or vignettes as illustrations or sources of evidence (Corey, 1991). However, despite a handful of articles that examine core approaches associated with executive coaching, there appear to be a very limited number of articles exploring the underlying theories associated with executive coaching interventions.

Purpose of the Paper and Research Questions

The purpose of this paper is to take the first step toward addressing the disconnect between theory and practice by exploring the breadth of theories, most of which originate from psychology, that are likely to influence underlying assumptions and overt practices chosen by executive coaches. We explore the practice of executive coaching with particular emphasis on applied and theoretical frameworks. The research questions include: 1) What are the theories influencing coaching practice? 2) What are the goals associated with each theory? 3) What are some of the strengths and weaknesses of the identified theories? 4) What are the implications for these theories in coaching and HRD practice? By identifying and analyzing the theories that may influence coaching practice, we create the conditions whereby HRD scholars and practitioners can make more informed contributions to the field of executive coaching.

Overview of Executive Coaching: Review of Current Literature

The following section reviews the available popular literature on coaching, outlines the current gaps in the literature, explores executive development, and the transferability of coaching skills to manager roles. Literature was selected through an extensive search of Ebsco and Proquest databases (key words: executive coaching, executive development, managerial coaching, management development) and through reviewing reference lists from a variety of published doctoral dissertations.

Coaching Overview

The notion of coaching employees in an organization can be found in the management literature as far back as the 1950’s (Evered & Selman, 1989). The next two decades found business writers attempting to make connections between executive and sports coaching. However, several scholars and researchers find athletic coaching to be
lacking specific consideration of complex and unpredictable issues unique to working in an organizational setting (Evered & Selman, 1989; McLean & Kuo, 2000). Currently, we find terms such as executive coaching, managerial coaching, executive development, and several other derivations of the term to mean generally one of two types of relationships; a one-on-one relationship with a high level executive, frequently involving an external coach, or a relationship involving a manager and his or her subordinate (Peltier, 2001). There are a number of other fields that use the term coach including: psychology, management training, industrial/organizational psychology, counseling, adult education and more (McLean & Kuo, 2000).

“Executive coaching is an outgrowth of executive development programs.” (Judge & Cowell, 1997, p. 71). One of the differences, however, is that executive coaching includes ongoing support, frequent checkups, and feedback (Judge & Cowell, 1997). Executive coaching is a development-oriented approach designed to focus on specific contexts where executives can identify and understand problem behaviors, adopt new and better behaviors, and maintain sustained change; with the goal always being improved business results (Bobkin, 2002; Deane, 2001; Koonce, 1994). According to Witherspoon and White (1996), coaching leads to: clearer goals and roles, better self-awareness, better support for performance improvement, shared goals for success, better discovery of developmental needs, and better support for continuous development. These outcomes could be linked to a variety of psychological foundations. The analysis of frameworks and theoretical approaches described in this paper will make such linkages possible.

Gaps in the Current Research

Although the popularity of coaching as an applied field is experiencing growth, research and scholarly writing on the subject is sorely lacking (Ellinger & Bostrom, 2002; Ellinger, Ellinger, & Keller, 2003; Kilburg, 2000; McCall, 1988; McLean and Kuo, 2000; Smither, London, Flaauitt, Vargas, & Kucine, 2003). The International Coaching Federation (ICF), the primary organization recognized for coaching certification, coaching resources, and where standards for the field were established (Bennett & Martin, 2001), experienced an increase in membership in 2001 to 2,400 members and estimated the number of practicing coaches in the United States to be in the neighborhood of 10,000, with the growth rate doubling each year (Maher, 2001; Deane, 2001; Morris, 2000). Yet, a study conducted in 1999 by Personnel Decisions International (PDI) showed that less than 10 percent of organizations using executive coaches were actually calculating the return on investment (ROI) (Peterson & Hicks, 1999). Finally, in 2001 Manchester, Inc. conducted what is believed to be the first major study to evaluate the impact of executive coaching and found the ROI to be almost six times the amount initially invested by corporations (Business Wire, 2001). While this study, and the popularity of coaching, speak the perceived value of executive coaching, there is no available evidence that organizations are asking questions about why it works, if it works consistently in a variety of situations, what individual coaches are doing to address long-term development, or if managers as coaches are able to achieve an overall success. Again, there is no discussion of any kind of theoretical underpinning of executive coaching methods or approaches. Some of the literature attempted to explain the lack of research on coaching by pointing out the confidential nature of the coaching relationship and the fact that the nature of the executive position precludes the executive from openly discussing developmental issues with colleagues, but this explanation does not address the lack of scholarly inquiry that would lead us to the creation of informed frameworks for coaching based on theory. It is clear that more scholarly research is needed to inform human resource development professionals regarding related theories, effective practices, and outcomes associated with the phenomenon of coaching (Ellinger, Ellinger, & Keller, 2003; Kilburg, 2000; McCall, 1988; McLean & Kuo, 2000; Smither, London, Flaauitt, Vargas, & Kucine, 2003).

Defining Executive Coaching and Executive Coach

There is no single agreed upon definition of coaching, how it works, or what it is intended to do (Morris, T., 2000). However, the ICF does offer their definition of coaching as, “…an ongoing relationship that focuses on clients taking action toward the realization of their visions, goals, or desires.” (Bennet & Martin, 2001, p. 6). Coaching can take on many different forms. “Some executives use coaching to learn specific skills, others to improve performance on the job or to prepare for advancement in business or professional life, and still others to support broader purposes, such as an executive’s agenda for major organizational change.” (Smither, et.al., 2003, p. 24). Overall, the literature suggests that executive coaching is a short-term, confidential, one-on-one development strategy with many possible goals (depending on the needs of the “coachee”) including helping executives or managers overcome problems, increase confidence, solidify new behaviors, increase motivation, and link individual performance with organizational goals for the primary purpose of achieving better business results (Bobkin, 2002; Ellinger, Ellinger, & Keller, 2003; Hall, Otazo, Hollenbeck, 1999; Judge & Cowell, 1997; Koonce, 1994; McLean & Kuo, 2000; Mellema, 2001; O’Brien, 1997; Witherspoon & White, 1996). However, these definitions and explanations do not include discussion of theoretical underpinnings of coaching and its various approaches. While it
is acceptable for there to be no single agreed upon definition or strategy, executive coaching must know what its foundations are for practice if it is to be an informed field rather than a passing business trend.

For the purposes of this paper, executive coaching will be defined as processes and interventions facilitated by qualified consultants utilizing psychology and other HRD-related knowledge, skills, and techniques to assist positional leaders in the improvement of individual effectiveness, learning, and performance. An executive coach is defined as a trained HRD specialist who utilizes knowledge, skills, and techniques from psychology and HRD-related fields in the design, development, and implementation of individually focused change efforts aimed at improving executives’ effectiveness, learning, and performance.

Theoretical Frameworks and Approaches

The following section outlines theoretical frameworks and approaches associated with executive coaching.

Specific Theoretical Frameworks Influencing Executive Coaching

Although clarification of appropriate steps in the coaching process is an important element of effective coaching, the nature of the relationship implies that the coach will, in fact must, have underlying assumptions regarding individual development.

Table 1. Differences in Practices: Coaching versus Therapy

Influenced by Sperry (1996) and Peltier (2001)

The field of psychology has long been working toward approaches aimed at increasing individual well-being and capacity. Some executive coaches have identified psychology as a major contributor to their approaches to client interventions (Peltier, 2001). Whether or not an executive coach’s background has included professional training regarding psychology paradigms and the implementation of various approaches to client intervention, assumptions regarding the nature of the coaching relationship and assumptions about human development in general are inherent in any coaching relationship. Ultimately, an executive coach will utilize some framework for working with a client(s). This section explores current perspectives from applied psychology and their interactions with executive coaching.

It is important to note that most of the applied psychological frameworks that can be associated with coaching originated in psychotherapeutic practices. Despite some overlap between therapeutic and coaching relationships, there are many differentiating factors between the two. Table 1 demonstrates the differences between therapy and coaching. The theoretical frameworks explored in this paper are identified and explored in Table 2 below:
<table>
<thead>
<tr>
<th>Theoretical Approach</th>
<th>Foundational Assumptions</th>
<th>Goals of Coaching Relationship</th>
<th>Techniques</th>
<th>Strengths</th>
<th>Limitations</th>
</tr>
</thead>
</table>
| Psychoanalytic       | - Early experiences and personal development and current levels of mental energy are essential in understanding current behavior  
- Present behavior is strongly influenced by unconscious motives and conflicts  
- Irrational, aggressive and sexual impulses strongly influence behavior | - To make unconscious attitudes, behaviors, and their roots conscious  
- To review the relationship between previous work and life experiences and current situations leading to insight regarding root causes of behavior  
- To expand intellectual awareness  
- To develop “work around” strategies for dealing with identified limitations | - Utilizes dream interpretation, free association, analysis of resistance and analysis of transference.  
- Assists clients with self-awareness and minimizing self-defeating behaviors through dialogue and case history techniques | - The techniques used to explore clients personal limitations and strengths have influenced coaching practices  
- Emphasis on self-awareness as a critical element in the personal change process  
- Assumes connections between work and personal life shaping the breadth of reflection explored by client | - Is based on an in-depth approach that requires lengthy training  
- Social, cultural, and interpersonal factors are often overlooked in exchange for emphasis on personal factors.  
- It is difficult to transfer the in-depth therapeutic perspectives into the coaching context as client expectations for coaching are inconsistent with the demands of this approach |
| Adlerian              | - Human nature is viewed as essentially positive  
- Individuals typically create a unique approach or life style which remains relatively constant throughout the lifespan  
- Core human motivations are social interest, goal orientation, and a focus on critical life tasks  
- People control their fate and are not victims of it | - To challenge the basic premises and goals of clients  
- To provide support to clients in their development of socially useful goals.  
- To support change in faulty motivation and empower clients | Paraphrasing, providing encouragement, confrontation, interpretation, gathering life history (family constellation, early recollections), coaching contracts, and homework assignments | - Is humanistic, unified, and goal oriented and places emphasis on social and psychological factors  
- Approach is relatively easy for clients to understand and to transfer to different contexts beyond the coaching relationship  
- Because it is a “growth model” it is ideally suited for a broad range of contexts including individuals and organizations | - Weak in terms of precision, testability, and empirical validity.  
- Few attempts have been made to validate the basic concepts used in this approach to coaching  
- Tends to oversimplify some complex human problems and is based heavily on “common sense” |
| Jungian               | - Human nature is both positive and negative and is better understood when including broad historical and cultural human perspectives  
- Humans have cognitive preferences that can be organized into psychological types  
- The unconscious plays an important role in human behavior  
- The potential for increasing development or awareness is not limited by age | - To introduce the notion of individual preferences and psychological types in support of exploration of self and others.  
- To work with clients in the development of their understandings of the ways their faulty assumptions or complexes create barriers to their success  
- To support the notion of growing throughout the lifespan  
- To introduce the shadow concept as it relates to interactions and decision making | Use of Myers-Briggs Type Indicator, exploring psychological type theory from individual and interactive perspective, exploring life history, assumptions, association techniques, dreams and imagery considered, journaling, and reflection | - The Myers-Briggs Type Indicator has been found to have questionable psychometric validity and reliability  
- The approach is demanding on individuals not used to thinking about the “big picture” of their lives, workplace, and decisions  
- It is difficult to transfer the in-depth therapeutic perspectives into workplace interactions  
- The emphasis on paying attention to symbolism can be helpful in the development imagination and interpretation of workplace interactions | - The Myers-Briggs Type Indicator is humanistic, unified, and goal oriented and places emphasis on social and psychological factors  
- Approach is relatively easy for clients to understand and to transfer to different contexts beyond the coaching relationship  
- Because it is a “growth model” it is ideally suited for a broad range of contexts including individuals and organizations |
| Person-Centered       | - Human nature trends toward full functionality and positive outcomes  
- Increased awareness is developed through accessing feelings and insight not previously acknowledged  
- Developmental foci lead to actualization of potential, increased awareness, self-directedness, and increased self-esteem | - To provide a climate for growth to clients in support of self-exploration  
- To challenge distorted notions of self or previous experiences  
- To enable openness and greater trust in self, in life as an ongoing process and to increased spontaneity and aliveness | - Stresses the attitudes of the coach more than specific techniques.  
- Emphasizes active listening, hearing, paraphrasing, clarifying, and being fully present. This approach does not involve probing questions, or exploration of past issues | - Client takes and active stance and assumes responsibility for coaching relationship  
- Training for coaches to utilize this method is relatively easy and accessible  
- Basic concepts easy to understand and apply  
- Excellent for building trust | - Due to extensive active listening emphasized in this approach, the coach may be perceived as not providing enough advice  
- Those in crisis may need more direction from coach  
- Lacks specific or rigorous techniques |
<table>
<thead>
<tr>
<th>Approach</th>
<th>Foundational Assumptions</th>
<th>Goals of Coaching Relationship</th>
<th>Techniques</th>
<th>Strengths</th>
<th>Limitations</th>
</tr>
</thead>
</table>
| Existential | - Humans should be viewed holistically and subjectively  
- Humans have the capacity for self-awareness, responsibility, freedom of choice, determination of one’s own fate, the search for unique meaning and anxiety  
- It is important that individuals develop philosophically regarding what it means to be human | - To help clients to become aware of new possibilities and the current freedom that they are overlooking  
- To challenge clients to take responsibility for their actions and the events that occur in their lives  
- To help clients to identify barriers that block their senses of freedom | Although this approach can be very confrontational and can borrow techniques from other approaches, there are no standard techniques | - Emphasizes the importance of a subjective approach to understanding the client  
- Asks clients to clarify a personal philosophy and approach to implementing it  
- Emphasizes the importance of a mutually respectful relationship between client and coach | - The general framework used in this approach can be overly general  
- Has limited applicability to clients who are not verbal  
- Is limited in its ability to provide specific direction to clients (instead wants clients to develop their independent approach) |
| Behavioral | - Humans are both product and producer of the environment  
- Behavior is a product of learning which is didactic and directive  
- Assessment, evaluation, and goal setting are important to success | - To apply the principles of learning theory  
- To eliminate unproductive and maladaptive behaviors  
- To learn more effective behaviors  
- To determine factors contributing to current behavior and what action can be taken to address the problematic behavior | The main techniques used are systematic desensitization, relaxation techniques, modeling, cognitive restructuring, assertion and social skills training, self-management programs, behavioral rehearsal, and coaching of client regarding behavior and decision-making | - Emphasis on assessment and evaluation techniques provide basis for accountable practice  
- Specific problems and goals are identified and monitored  
- Has demonstrated effectiveness in a broad array of contexts including coaching | - Although client behavior may change, their feelings or reactions may not, creating problems for long-term behavior change  
- Coach has predominant role in the relationship  
- Hard to assess outcomes because environmental variables cannot be controlled |
| Cognitive  | Human beings are born with the potential to think rationally, but also with tendencies to think irrationally  
- Human beings tend to socialize themselves to organize their lives around irrational beliefs  
- Coaching is a process of reeducation which is didactic and directive  
- Coaching is organized around client cognition, behavior, and action and stresses thinking, judging, analyzing, doing, and redirecting | - To eliminate clients’ self-defeating outlook  
- To assist clients in the development of a more rational and tolerant view of life.  
- To assist clients in applying the scientific method to solve emotional and behavior problems throughout life | - Disputing irrational beliefs, homework, and changing one’s thinking and behavior patterns.  
- Use of emotive techniques include role-playing, imagery, listening to tapes, keeping records on behavior, and shame attacking exercises | - Uses an approach for limiting irrational thinking  
- Uses a variety of techniques that provide opportunities for people with various learning styles  
- Openness to incorporating techniques from other theoretical approaches | - Coach may be perceived as too forceful, direct, or confrontational  
- Feelings may be left behind in place of a more thinking focus  
- Coaches must be careful not to be overly forceful with clients in ways that could be harmful |
| Systems   | - The old paradigm associated with linear causality is replaced  
- Coaching is focused on the relationship between the client and the workplace system  
- Coaching is a process so of shifting client perceptions from individual to context, from content to process, and from linear causality to circular determinism  
- By definition, coaches are inside of the system in which they are working with clients | - Coaching questions shift from “why,” “how,” and “what is wrong with this person” to “how does this person’s behavior make sense in to the organizational context?”  
- To focus clients on the present rather than the past  
- To focus on process over content identifying what is and the interactions that occur, not focusing on explanations for why they are that way  
- To avoid scapegoating by removing the focus on problem individuals to how the system perpetuates as individual behavior  
- Work toward structural change | - Family role identification—reflecting regarding the dynamics of the group or organization and the roles individuals play that are similar to family roles.  
- Exploring systems characteristics—myths, rules, roles, and norms.  
- Process observation by client or coach, skills training, and reflecting on the “miracle question” as to what would it be like if in the ideal new context. | - The approach changes the way in which the client is considered—from individual to individual-environment interchange  
- Understanding the ways individual executive action can have system-wide impact  
- Reframing interactions between parts of a system and the client’s parts in the system  
- Extending the way in which clients consider their situations | - Too much focus on system can remove responsibility from individuals/clients for their actions or related outcomes  
- Perceived locus of control can be blurred making it difficult for the client to focus on immediate needs  
- System dynamics are complex and demand client attention in order that they might be better understood  
- Some clients may feel overwhelmed by complexity of systems |
<table>
<thead>
<tr>
<th>Approach</th>
<th>Foundational Assumptions</th>
<th>Goals of Coaching Relationship</th>
<th>Techniques</th>
<th>Strengths</th>
<th>Limitations</th>

</thead>
</table>
| Athletic       | - Coaching is aimed at specific performance strategies in the context of well-defined parameters  
                 - Approaches to fostering and improving athletic and team performance are transferable to other individual and organizational contexts  
                 - Cooperation and an orientation toward “innocence” aimed at give and take interactions is important to organizational success  
                 - Practice the precise development of fundamentals | - Work toward the development of specific and realistic performance goals  
                 - Establish agreed upon principles and clear contracts related to client’s contexts, abilities, skills, and goals  
                 - To develop expertise in the execution of fundamentals associated with client’s performance goals  
                 - The coach serves as catalyst for client development | - Reflection on motivation and desire; using videotape to review behavior and actions; visualization techniques; reflection on defeat; establish contracts and principles for coaching relationship and for client’s other situations needing clarification.  
                 - Uses sports literature, metaphor and genre. | - Is clearly goal oriented  
                 - Supports the practice of establishing clear relationships between coach and client  
                 - Emphasizes the unique treatment of each client and the focus on their strengths  
                 - Is comfortable with the notion that client-coach relationships can be fun  
                 - Utilizes visual tools, audio, and video techniques to provide specific client feedback  
                 - Can provide memorable sayings or metaphors that stay with clients | - Is based on sports and motivation approaches that can often be oversimplified  
                 - Often places the coach in place of authority versus mutual connection  
                 - Theoretical underpinnings not well developed  
                 - Depends on observable and obviously measurable outcomes to determine success in achieving goals |
| Feminist       | - Society is generally male dominated and unconscious regarding the effects of patriarchy  
                 - Women’s often unique preferences for working and living in community may be overlooked or subsumed by the larger environment  
                 - Women can develop strategies for greater growth and independence through awareness, strategizing, and support from allies | - To develop awareness regarding the male dominated system and its aversive impact  
                 - To develop client strategies for managing the male dominated system on an individual basis  
                 - To help clients figure out unwritten rules and gender codes  
                 - Assist client in developing support, where possible, for reinforcing awareness of male dynamics and persistence regarding goals | - Reading of feminist/women’s perspectives  
                 - Dialogues with other women aimed at reflection and self-awareness  
                 - Utilizes social networks as catalysts for growth and development  
                 - Often encourages the utilization of experienced women who “have been there” and who are willing to help. | - Focuses on systems-level analysis in analyzing clients’ situations  
                 - Use of extended network including the coaching relationship can help in achieving desired goals  
                 - Clients learn to see how some of their negative self-perceptions are connected to gender issues and can learn to reframe them  
                 - Creates overall awareness of the potential impacts of gender on relationships and interactions | - Can be overly general in defining gender roles, social structures, and individual perceptions  
                 - Previously unaware client may become overwhelmed by insights regarding negative experiences with men/male dominated systems  
                 - Outward discussion of concerns about gender issues in the workplace can lead to isolation for those who discuss them |
Although in some cases overlapping, these perspectives have unique orientations to the framing of both the client-coach relationship and the underlying assumptions about the nature of human development. Some perspectives, such as the psychodynamic, Adlerian, and Jungian approaches assume underlying issues such as personal history, family history, or psychological type influence present behavior. Utilizing these perspectives in coaching implies that there is a need to support the client in the development of a basic framework for understanding the interaction between personal underlying orientations and workplace interactions. Unlike the therapeutic approach from which these frameworks emerge, coaching applications influenced by these theories involve much less emphasis on client self-disclosure and more on assessment techniques that will support the client’s understanding of some of the underlying issues that could be considered in workplace interaction and decision-making.

Although coaching is generally more present than past focused, some approaches such as person-centered or existential view the present with much more emphasis than three approaches identified previously. Similarities between person-centered and existential approaches are the focus on personal perspectives and individual responsibility for challenges being faced by the client. These two approaches often position the coach as an active listener but more passive talker than other approaches to working with clients.

Cognitive and behavioral approaches overlap in their more directive focus on the part of the coach and their focus on observable behavioral outcomes as a key indicator for goal setting and measured progress. Behavioral approaches focus more on the actions of clients in the context of their consistency or inconsistency with desired outcomes while the cognitive approach explores the manner in which the client has supported or inhibited belief systems that are either desirable or undesirable. In recent years, cognitive and behavioral approaches have been combined to cognitive-behaviorist approaches to coaching. These frameworks attempt to provide support and action planning for behavioral modification or reinforcement while paying attention to self-image, learning, and client use of the scientific method to solve problems.

Because of their focus on large scale impacts on individual functioning, we placed systems and feminist perspectives next to each other on Table 2. Both perspectives insert an assumption involving interconnectedness of the parts of an organization or system and the potential for those parts to influence individual understanding, perspectives, and outcomes. Both perspectives see events and assumptions of system stakeholders to be influenced by interchanges between various elements leading to the need to take a nonlinear approach to engaging a specific problem or issue in an organizational context. The departure between systems and feminist approach is at the point of causality, as feminist perspectives have a more narrowly defined set of explanations for the manner in which a system operates and by which outcomes occur. In theory, systems perspectives are more neutral regarding the underlying assumptions driving a particular system dynamic.

Finally, athletic coaching is likely what influenced the term “executive coaching” (Peltier, 2001). Of the theories identified, athletic coaching is the least well formulated. However, in practice, athletic coaching is the most frequently practiced development approach of all the areas identified in this study. Some key themes identified by Peltier include: 1) focus on individual drive; 2) focus on the development and use of fundamentals; 3) utilizing individualized approaches involving flexibility and ingenuity; 4) setting goals relevant to individual progress versus “top status” or “becoming the best.”; 5) using visualization; 6) accessing video feedback when possible; 7) learning from defeat; and 8) focusing on communication, trust, and integrity. Until recently, insights regarding athletic coaching has been communicated in popular literature and has lacked coherence and scholarly organization. However, academics in kinesiology, sports psychology, sports education, and sports management, and in business schools have begun to assemble more coherent discussions and research associated with theoretical and applied dimensions associated with athletic coaching. This literature may provide more specific conceptualizations of the influences of athletic coaching approaches to theory and practice in other realms of human development.

Summary

The purpose of this paper was to explore the practice of executive coaching with particular emphasis on applied and theoretical frameworks associated with coaching. The psychology-based theories identified provide some insight into the types of assumptions that may be chosen and likely influence current executive coaching practice. It is important to note that although all of the theories identified are likely influencing current coaching practice the overt goal orientations underlying behavioral and cognitive approaches likely make it most attractive in task-focused business environments. This is due largely to the utilitarian approach taken by clients who have specific performance or outcome related expectations.

Psychologists sometimes get stuck in their primary theoretical point of view. This is professionally acceptable in the practice of psychotherapy, in part because it is part of theoretical integrity. But this is counterproductive in
executive coaching. Unlike many psychotherapy patients, coaching clients will quit the relationship when they aren’t getting results (Peltier, 2001, p. 175).

Perhaps most important from a scholarly perspective is the need for HRD professionals to more closely examine the implications of various approaches. Similarly, it is important to note that the numbers of therapists or coaches dedicated to a single theoretical framework pales in comparison to those who use a combined or eclectic approach (Corey, 2000; Peltier, 2001). Therefore, understanding the breadth of psychology-based theoretical orientations can assist executive coaches not only to be more informed practitioners, but may influence their interpretations of client situations and the extend the range of possibilities for interventions with clients.

An Investigation of CEOs’ Learning Experiences: Implications for Leadership Training

Margot B. Weinstein
Kingston Group Inc.

This study explored the learning experiences of CEOs in organizations for profit throughout the United States. Malcolm Knowles theory of Andragogy was used as the framework of the inquiry. While the CEO’s position is considered unique from other executive positions, it is has not been the focus of many studies. The findings suggest how CEOs learn and how the implications of this research can be used to improve leadership development programs in HRD.

Keywords: CEOs, Leadership Development, Adult Learning

Today’s organizations worldwide are faced with many new challenges in business. Leaders must learn new strategies, competencies and skills in order to lead organizations successfully in this new age (Collins & Holton III, 2003; Kotter, 1988; Sherlock 2002; Bennis & Nanus, 1985; Senge, 1990). Even though the literature asserts that the Chief Executive Officer (CEO) plays a key role in the success of the organization, few studies have concentrated on understanding how the CEOs learn (Sherlock, 2002; Bennis & Nanus, 1985). Many studies have focused on how senior executives learn, but few studies have focused exclusively on how the Chief Executive Officers learns (CEO) (Collins and Holton III, 2003; Sherlock, 2002). “This lack of understanding of how CEOs learn has negative workplace implications for both CEOs and the organizations they serve. It produces an information void for both the CEO seeking self-development, as well as executive development practitioners who seek to facilitate CEO development in both current CEOs and potential successors” (Sherlock, 2002, p. 632).

The purpose of this paper is to explore how CEOs’ learn, and relate the information to expand the literature on leadership training in organizations. The research study used Andragogy by Malcolm Knowles as the lens to examine the topic because the framework of Andragogy with its core adult learning principles works well when it is adapted to fit the uniqueness of the learners and the learning situation (Knowles, Holton, & Swanson, 1998). This paper first defines the terms and theoretical framework. Then, the paper provides a summation of how qualitative research methods were used as a lens to examine the learning experiences of 33 CEOs’ from real estate companies throughout the United States. Last, the paper relates the conclusions and implications of the research to add to the literature for developing leadership training and education programs in HRD.

Definition of Terms and Theoretical Framework

Professional Context

“Professional Context” was operationalized in this study to mean CEOs of large real estate companies who operated for profit in the United States. Serving as CEO is a unique context, because he/she has the highest level of staff accountability for achieving organizational goals and power dynamics between 1) The CEO and the staff reporting to him/her, and 2) The CEO and the Board of Directors to whom the CEO reports (Sherlock, 2002).

The CEO is recognized as a unique position that allows the person to occupy a position of unique influence in the firm” (Mintzberg, 1983). The result of the degree of power that the CEO has, and his/her role and responsibilities, the literature states that that this creates a unique “professional context” that is unlike others who are in an executive capacity (Sherlock, 2002).

Leadership

The definition of leaders and leadership is an elusive concept, although written about often, the concept has been vague and ambiguous. The definition of leaders in this study was operationalized to as that defined by James MacGregor Burns (1978) in his book Leadership: “Leadership is leaders inducing followers to act for certain goals that represent the values and the motivations—the wants and needs, the aspirations and expectations—of both leaders and followers. And the genius of leadership lies in the manner in which leaders see and act on their own and their followers= values and motivations” (p.3).

Andragogy.

This qualitative research study used the concept of Andragogy by Malcolm Knowles as the framework of inquiry to explore the learning phenomenon of how CEOs perceive and describe their learning from an adult learning perspective. The concept of Andragogy by Malcolm Knowles is defined as “the art and science of helping adults learn” (Knowles, 1980, p. 43). Andragogy transformed the study of adult learning. A review of the literature acknowledged that the following concept has been used to examine on how adults learn in organizations (Knowles, 1995; Gilley and Eggland, 1989). Additionally, Andragogy is a unique concept that focuses on the internal process of how adults learn.

Malcolm Knowles (1980, 1995) concept of Andragogy, adult learning theory is based on the assumption that learning is an internal process of which the locus of control resides with the learner. Five key assumptions form the tenets of Andragogy by Knowles (1980; 1995):

Self-concept of the learner. Adults have a deep psychological need to be self-directing. As adults, they have a deep psychological need to be perceived by others and treated by others as able to take responsibility for themselves (Knowles, 1995). Adults do not want to find themselves in situations where they feel that others are imposing their will on them without their participation in making decisions that affect them. When this happens, adults feel resentment and resistant. As a result, the Andragogical process assumes that adults should enter in the design process of a program.

Role of experience. Adults bring with them a rich background of experiences that is a valuable resource for their own learning and that of other students. Adults come to situations with a depth and breadth of experience than can be used as a resource for theirs and other learning (Knowles, 1980, 1995).

Readiness to learn. Adults learn more effectively when adults see that the information is relevant to their lives. It assumes that the facilitators need to help adults see how the training programs or courses can help them perform more effectively in their jobs.

Orientation to learn. Adults enter into educational or training activities to acquire prescribed subject-matter. Educational activities need to help adults in the process of acquiring content in organized units, sequenced according to logic of the subject matter.

Motivation to learn. “Each person is unique and brings with his/her own goals and internal motivators; it assumes that learning plans and strategies must be highly individualized” (Knowles, 1995, pp. 1-3). The Andragogical Model acknowledges that adults will respond to external motivators such as a promotion, a change of jobs or a change in technology; it assumes that the most powerful motivators are internal (i.e. self-esteem, recognition by peers, better quality of life, greater self-confidence, self-actualization), and that program announcements should emphasize these benefits (Knowles, 1995).

Research Questions

The following research questions guided this study:
1. How did the leaders describe and perceive their learning?
2. What were the common learning strategies the leaders used to learn?
3. How can these strategies be utilized to improve leadership training programs in organizations?

Methodology

The study used phenomenological research design to explore how CEOs perceived and described their learning in this context. In phenomenology, an interview has a unique potential to provide an understanding of the lived experiences of participants that helps to explicate the meaning of the phenomena (Van Manen, 1990). There are various approaches and methods used with phenomenology, but all of them contain certain common characteristics (Lincoln and Guba, 1985). This methodology allowed the researcher to explore the subject through formal and informal interviews, and gain new insights from the themes that emerged (Denzin & Lincoln, 1994). Qualitative research methodology was used for the research because an intensive description and analysis of the phenomenon would uncover the interplay of significant factors that are characteristic of the phenomenon (Merriam & Simpson, 1995). A key goal for HRD practitioners is to strive for insight into the human experience and provide a new level of understanding that strengthens current knowledge in the area (Van Manen, 1990).

Participants

By means accorded in the methodology (Lincoln & Guba, 1995), 33 CEOs of real estate companies throughout the United States were purposely selected because they represented successful business organizations for profit in the United States in the field. The researcher’s knowledge of and work experience in the field was helpful in gaining
research access to 33 CEOs. The sample was limited to individuals who were considered exemplar executives in the field based on characteristics of top professional in the membership profile of the National Association of REALTORS® (1996). Participants characteristics were: (a) 27 were men and six were women. (b) The ages of the respondents ranged from mid-40s to 70 years old. (c) The respondents had practiced a minimum of 10 years in the business, and (d) had been CEO for a minimum of five years. (e) had completed a minimum of a bachelor’s degree, and (d) all took CPE regularly to increase knowledge.

**Procedure**

The researcher studied the respondents and their companies for two years. Standardization was obtained by taping one formal interview with each respondent using questions that were designed in advance, and all respondents were asked the questions in exactly the same sequence and manner (Lincoln and Guba, 1995). In addition to the 33 formal taped interviews with each CEO, additional informal interviews, both face-to-face and telephone were taped with consent of the participants to clarify answers or gather additional information. The researcher used structured, open-ended questions to explore participants’ perceptions regarding the subject matter. The characteristics that emerged from the interviews were validated through documents, journals, a literature review and discussions with other CEOs and educators in the field.

After the completion of the data analysis process, another phase of data analysis, a search for themes, was begun. The process used "concept mapping" (Smith & Associates, 1990) as a diagnostic tool. "A concept map depicts in a diagrammatic form, ideas, examples, relationships, and implications about a particular concept. The center or core idea is placed at the center or top of the page, and radiating from it are a number of spokes or lines leading to other concepts related to, or indicated of the central idea" (Smith et al., p. 49). Concept mapping enabled the researchers to group similar examples of large concepts together, and smaller concepts were set aside until they could be integrated into the larger themes; this process allowed the dominant themes to emerge from the data.

In order to examine the data from the formal interviews, tables were designed to display the data, and quotations from respondents and further explanation were presented by the researcher as needed to explain the data. The characteristics that emerged from these in-depth interviews were validated through review of tapes, transcriptions, and field notes of the interviews. The researcher contacted the respondents several times during this study as well as reviewed all published information about their companies and themselves in order to obtain accurate information. The respondents also received copies of the final transcribed tapes and edited any personal information that they did not want in the final case study. The information was further validated through documents, journals, literature review, and discussions with other CEOs and educators in the field.

The similarity of the process of the information gained in the research made possible the rich, descriptive data needed to interpret the phenomenon being investigated as explained by Merriam and Simpson (1995).

**Limitations**

Since this qualitative study was based on a small sample of 33 CEOs in real estate, the study can not attempt to predict how CEOs learn in all contexts. Although qualitative studies can lead to deeper insights into the area of the study, findings from qualitative studies cannot be generalized in the same way as the findings from random samples. In addition, although the researcher spent considerable face-to-face time to establishing rapport and trust with the CEOs, the study is also limited by the willingness of the participants to discuss their personal learning experience. For these reasons, this study should be the first step to lead to further research on the subject.

**Results and Findings**

The results provided information and data that led to deeper understanding on all three research questions. This section presents the themes that emerged from the interviews with the participants that describe how they learn using adult learning principles of Andragogy. The 33 CEOs in this study presented similar stories that led to consistency of the 12 themes presented in this section.

**Themes That Emerged**

**Theme 1. Be lifelong learners.** The Andragogical Model supports that adults will respond to some external motivators for example, a chance for promotion, a change of jobs, or a change in technology. The Model proposes that the more potent motivators are internal-such as self-esteem, recognition by peers, better quality of life, great self-confidence, self-actualization. The CEOs recognized that success in their job requires a dedication to be lifelong learner to deal with the changes and challenges in business. The CEOs believed that utilizing opportunities for continual learning was one of the most important reasons they chose and were successful in business. They used phrases such as "being on the top of the heap," "being innovative," "learning faster than competitors," and "being a quick study," which expressed what made these CEOs’ love the field. Respondents explained that with the
development of newer technologies, new laws, and constant restructuring of companies they must continue to adapt and learn in order to remain successful in the business. CEOs often described how they had entered into training programs or educational activities that were offered at the organization to obtain valuable information. They felt that they learned better when learning activities are designed in a logical order for the material. They always felt that they are short on time, and they do not want to attend learning activities in which the material is not organized in a way for them to learn it easily.

Theme 2. Use entrepreneurial characteristics. Knowles (1995) asserts that adults learn from their life experiences, and they are motivated to learn for personal change and career advancement. CEOs stated the CEO is a unique position, and that they succeed because they concentrate on learning and thinking in new ways which they believe centers on learning by using the characteristics of entrepreneurs as they have read the literature by several authors (McClelland, 1965; Meyers, 1986; Peters, 1994). CEOs state that they embraced qualities of entrepreneurship by being: 1) Creative; 2) Innovative; 3) Risk takers; 4) Possess interest in concrete knowledge of the result of decision (i.e., money as a measure of success); 5) They have need for achievement; and 6. Take personal responsibility for their learning. (McClelland, 1965, p. 389).

Throughout the interviews, CEOs continually conveyed the importance of being able to use information in creative and innovative ways to succeed. Their statements affirmed writings by Roberts (1994) that people who are innovative create their future. Roberts stated, "You learn rapidly from experience, and continually improve your ability to take effective action and produce results" (p. 228). CEOs repeatedly explained that their position demands that they think like an entrepreneur and are self-directed learners who take responsibility for knowing how to investigate situations using a variety of strategies to propose innovative solutions.

Theme 3. Develop interpersonal skills. The Andragogical Model assumes that adults enter into an educational activity with a greater volume and a different quality of experience than youths. The greater volume is obvious in regard to the interpersonal skills of the CEOs. CEOs said that they had developed outstanding interpersonal skills. CEOs explained that business was a "people business" and successful leaders must be able to utilize interpersonal skills to interact with customers, CEOs, experts, the public and members of the board of directors.

Although 33 CEOs believe in practicing an "open-door" policy that encourages effective communication with everyone who is important to their organizations, the six women CEOs attributed the formation of their interpersonal skills to being a women in American society. They believed that women, more than men, are encouraged from childhood to learn how to communicate effectively with family members and friends. Young girls are able to express ideas openly, share information, and receive feedback. The women emphasized the ability to listen is an important skill CEOs need to learn in the business. They also stressed that the ability to deal with nonverbal signs of communication is also critical skills for leaders to serve diverse workforces, publics and populations.

Theme 4. Value expertise. The Andragogical Model assumes that adults benefit from former rich life experiences. As in the Andragogical Model, the CEOs in this study have been in their role for over five years, and as such have had vast life experiences and different quality of experiences the non-CEOs in their companies. The respondents felt that they had gained knowledge through experience and practice that had enabled them to become experts in their area of the business similar to literature on expertise (Benner; 1994; Smith, 1982, 1990; Weinstein, 1998; 1999). The respondents frequently explained that they valued expertise, and they constantly seek other experts. They described two types of experts who they sought to keep learning in the business: 1) Other people who were experts in their business, and 2) were experts who practiced in other fields. For example, they sought out lawyers, bankers, accountants who could keep them abreast of important new changes in the business.

Theme 5. Recognize and value diversity. The Andragogical Model assumes that adults enter into activities with a different quality of experience from the different roles adults perform, and they value a climate where people feel that they are being treated as human beings. The CEOs’ described the importance of respecting and valuing other people. CEOs stated that their employees and customers are becoming increasingly diverse. They work with employees and customers of all ages, sexes, ethnicities, disabilities and differences. CEOs embraced ideas expressed in the words by Work (1996): In the final analysis, true leadership brings people of diverse backgrounds and interests together in ways that provide fair and equitable opportunities to contribute their best, achieve personal goals, and realize their full potential (p. 79). CEOs recognize the importance of learning of others and creating an organization in which learning is encouraged throughout the organization.

Theme 6. Be problem solvers. The Andragogical Model acknowledges that adults are motivated to learn after they experience a need to know, and they enter into an activity with a life-task and are problem-centered. The Andragogical process assumes that people tend to feel committed to any decision in proportion to the extent to which they have participated in making it, and they tend to feel uncommitted to any decision that they feel others are making for or imposing on them (Knowles, 1995). The CEOs explained that they had developed an ability to define difficult
problems, find solutions and achieve their goals. CEOs often work with others to solve intricate business problems. They described problems that are often complex solved over time through cycles and iterations that is similar to ideas explained in literature (Argyris and Schon, 1974, 1978). During the continuous process of problem-solving, CEOs said that they work with employees individually as well as in groups to resolve problems. They demonstrated the ability to trust their employees and delegate jobs and responsibility effectively to solve problems to reach organizational goals.

Theme 7. Importance of networking. Knowles Model assumes that although there is competition and adults enter into learning activities with rivalry toward fellow learners, the Model also recognizes that peers are often the richest resources for learning. CEOs understood that Networking is a way to gather useful information, build a pool of professional contacts, and position themselves for new opportunities in the long term. The CEOs explained that they were constantly networking to find people who could provide them with the answers to problems. They believed that networking enables them to build relationships, and they do this both at different business functions and in their personal lives (i.e. professional associations, PTA meetings, family functions, and community functions). The respondents also remarked that they believed that in the future, the Internet and E-mail will provide them with another valuable way to network.

Theme 8. Support teamwork and collaboration. The Model assumes that not only do adults learn from peers, but it assumes that people learn more from those they trust and respect rather than from those that they are not sure they can trust. CEOs stated that a climate of mutual trust, support and openness is necessary for optimum learning to take place. They said that they have developed their ability to learn in groups in a variety of situations (e.g., with employees, in courses, in lectures, at conventions, in teaching or training sessions, etc.). Respondents stated that leaders must possess the skills necessary to work in groups effectively, because of demands in business. They explained that such collaborative learning requires communication skills, observation and reflection skills, and planning and consensus skills and developing an organization where people feel comfortable sharing information to work together effectively.

Theme 9. Value the mentoring relationship. The Andragogical Model asserts that adults can be induced to learn by exposing them to role Models and experiences to assess the gaps between where they are now and where they want and need to be in terms of this personal competencies. CEOs described mentors who had been essential in enabling them to become successful CEOs. The respondents stated that teachers were mentors in their early schooling, and throughout their careers they have had many mentors, and as a result, they believe in mentoring others.

Theme 10. Be trainers and teachers. The Andragogical Model asserts that adults experience a need to know or to be able to do something to perform more effectively in some aspect of their lives. Among the chief sources of readiness are the developmental tasks associated with moving from one state to another, or any change, such in job, activities can induce readiness by providing learners with a diagnostic experiences to assess the gaps between where they know, and where they want and need to be in terms of their personal competencies. Respondents claimed that it was essential to learning new material and gaining insight on solving problems for them to train and teach in the business. The old adages “good leaders are good teachers” and don’t know what you know until you teach it applied to these CEOs. They discussed how they learned how to teach through the process of training employees and teaching courses, and through constantly taking training and educational programs throughout their careers. They also gained valuable information through assessments forms and feedback from their employees and students. They affirmed that in a training or teaching session, adults must: be involved, receive content that relates to their specific work setting and expertise, and have an atmosphere or setting that is comfortable. Teachers should use overheads, computer technology, lectures, and cases studies and involve learners through dialogs, questions, and group discussions.

Theme 11. Value integrity and honesty. The Andragogical Model assumes that adults learn best in a setting where people are treated fairly and honestly. CEOs understood that they needed to treat their employees and customers fairly in order to be successful. They explained that their role as CEO creates intense feelings of responsibility and accountability, especially with new laws, lawsuits, etc., in business. CEOs were critically aware of how important their ethical behavior was in their leadership role and to the success of the organization, and they continue to learn to create an environment where people are treated fairly.

Theme 12. Create an open learning environment. The Andragogical Model assumes that adults learn from each other, and when they work well together, learning increases for everyone. Knowles (1995) suggested that although there is rivalry with adults in learning experiences, they work to create open supportive atmospheres that can increase learning and sharing ideas throughout the organization. CEOs recognized the power dynamics of their position as well as their need to transcend that dynamics in order for everyone to work together effectively. With constant changes in the business and the competition, CEOs believe that they must work to build an environment where employees can learn from each other through the organization to remain profitable. CEOs’ understood the power dynamics of their
position, and that the dynamics is important in shaping “what” and “how” they learn. CEOs’ recognized that his/her role was to transcend the power dynamics in the organization so that they could help employees work together, collaborate, and learn from each other to stay ahead of the competition from other organizations.

Conclusions and Recommendations

This study used the framework of Andragogy to uncover and describe the 12 competencies that these CEOs use in their learning process. This section discusses the major conclusions of the research:

The assumptions of the Andragogy appear to provide an excellent Model to explore how CEOs’ learn, and the Model could be used in further research studies with CEOs. Adult learning theories have been used in several studies as a framework of inquiry to explore the leadership phenomena (Sherlock, 2002). And the competencies cited in this study are similar to ones discovered in other research studies on leaders of organizations (Sherlock, 2002; Collins and Holton III, 2003; Senge, 1990; Peters, 1994; Weinstein, 1999; 1998). Knowles (1995) discussed in Designs for Adult Learning, how the practical resources, exercises and course outlines he designed in the book could inform employees in the workplace. This study supports the ideas expressed in his Model, and offer many suggestions for incorporating the results of this study into leadership development programs.

Second, the research supports literature on the overall importance for CEOs to be self-directed learners who know how they learn and how to foster continual learning throughout the organization. The CEOs in this study sought out learning opportunities through formal and informal learning activities, and they suggested several activities and programs whereby training programs could incorporate these ideas. Leadership training programs could be designed by utilizing the 12 themes and information discussed in this study. The twelve themes that were cited in this study as key to leadership are consistent with other studies (Collins and Holton III, 2003; Leeamornsiri and Schwintd, 2002.).

A third implication was that CEOs’ understood the power dynamics of their position, and that the dynamics is important in shaping “what” and “how” they learn. The Andragogical Model assumes that adults have a deep psychological need to bee self-directing, and the CEOs supported this theme by providing learning opportunities and personal growth throughout their organizations. CEOs’ recognized that his/her role was to transcend the power dynamics in the organization so that they could help employees work together, collaborate, and learn from each other to stay ahead of the competition from other organizations. Further research could examine in detail how the competencies CEOs’ used to learn in this context could be utilized in training programs.

Fourth, although of the 33 CEOs, only six were women, the women described how being a woman in the United States contributed to their development of learning strategies that will be important to successful CEOs in the future. The Andragogical Model assumes that adults bring with them a rich background of experiences that is valuable resource for their own learning and that of other students. The women CEOs attributed the formation of their excellent interpersonal skills, working well in teams and in collaboration from being a woman in American society. They believed that women, more than men, are encouraged from childhood to learn how to communicate effectively with family members and friends, as a result, they are able to express ideas openly, share information, and receive feedback.

Future studies should examine how women CEOs’ perhaps possess skills that help them learn effectively that could be applied in leadership training programs.

Last, with the amount of money spent on leadership development and training programs, further research should examine how CEOs learn. Both qualitative and quantitative research should be conducted to examine this topic. Since most of the research has been conducted on leadership training programs with senior management people instead of CEOs, perhaps, there are different qualities or strategies that should be used to develop training programs for CEOs because of their senior position in the company. The lack of understanding of how CEOs’ learn has negative workplace implications for both CEOs and the organizations they serve, and more research could add to the literature in the field.

Implications for HRD Research and Practice

Organizations spend millions each year on leadership training. As we enter the millennium, visionary leadership is needed in HRD to succeed in competitive and changing workplaces (Noe, 2001; Knowles, 1980, 1995; Gilley and Eggland, 1989; Senge, 1990). With increasing global competitiveness, continuous restructuring activities, demographic changes in the workforce, customer demands, and rapid technological changes, CEOs are in a unique professional context to help organizations compete successful today. The CEOs in this study acknowledged that
learning was essential to their success as well as to the organization’s profitability. However, most research studies focus on managers and non-CEO learning, even though literature supports that executive learning research provides little insight on the learning of CEOs (Sherlock, 2002). While learning remains a focus of leadership development programs and interventions (Sherlock, 2002; Collins & Holton III, 2003), there is a need to do more research specifically with CEOs to understand how they learn in order to design better-quality programs for future CEOs. Since this study was limited to CEOs in the real estate business, perhaps the all the themes that emerged would not be supported by CEOs in other industries.

With the tremendous costs spent on training each year, both human and financial, it is important to constantly add to the research and literature to create more effective leadership programs in HRD. Malcolm Knowles concept of “Andragogy,” provides a framework to examine this topic as well as exercises and course outlines that could be explored for use in developing leadership training programs in HRD in the future.

In Support of Coaching Models of Management and Leadership: A Comparative Study of Empirically Derived Managerial Coaching/Facilitating Learning Behaviors

Bob Hamlin
University of Wolverhampton

Andrea D. Ellinger
University of Illinois at Urbana-Champaign

Rona S. Beattie
Glasgow Caledonian University

The concept of managers assuming developmental roles such as coaches and learning facilitators has gained considerable attention in recent years as organizations seek to leverage learning by creating infrastructures that foster employee learning and development. Despite the increased focus on coaching, the literature base remains atheoretical. Accordingly, the purpose of this study was to compare the empirical findings from three separate studies to derive a comprehensive understanding of coaching models of management and leadership.

Keywords: Coaching Behavior, Facilitator of Learning, Managerial and Leadership Effectiveness

Increasingly organizations are beginning to embrace a new management paradigm based on empowerment rather than a traditional command, control, and compliance paradigm of management which “cannot bring about the conditions and competence necessary to successfully meet the challenges [of endless innovation; relentless downsizing, re-engineering, and multicultural working] holistically (Flaherty, 1999, p. 2-3). Therefore, this new paradigm of management calls for new facilitative behaviors that focus on empowerment and employee development (Beattie, 2002; Ellinger, 2003; McGill & Slocum, 1998). Accordingly, coaching has been conceived as the essence of the new management paradigm (Evered & Selman, 1989) and the notion of leaders and managers serving as coaches has gained tremendous currency in the literature (Ellinger, 2003). Several scholars believe coaching is an essential role that most managers and leaders need to develop (Antonioni, 2000; Bianco-Mathis, et. al., 2002; Hunt & Weintraub, 2002; Kraines, 2001; Piasecko, 2000; Ragsdale, 2000). However, not all managers adopt a facilitative coaching role. Some may find it challenging to switch from a prescriptive to an empowering style and may lack the requisite skills to coach effectively (deJong et. al., 1999; Keep & Rainbird, 2000). However, based upon the growing number of books and practitioner-focused articles, it is clear there is a significant body of expert opinion that believes coaching is an essential core activity of everyday management and leadership, and that managers and leaders need to become fully competent as proactive facilitators of learning and development if they are to be truly effective and successful in today’s and tomorrow’s world.

Current HRD practice has been criticized for lacking a sound and sufficient empirical base (see for example, Mumford, 1997; Hamlin & Stewart, 1998; Hamlin, 2002) and similar criticisms have been leveled at most current coaching practice within the context of HRD (Grant, 2003) and about the devolution of HRD responsibilities to line managers (deJong et. al., 1999). Whilst there is an extensive literature on developmental roles that managers may play, such as mentor and coach, much of this literature is prescriptive and there are relatively few examples of substantive research and empirical studies (Beattie, 2002; Ellinger, 2003; Graham, Wedman & Garvin-Kester, 1993, 1994; Marsh, 1992; Popper & Lipshitz, 1992). According to Horowitz (1999), “the HRD literature is somewhat normative and rhetorical in exhorting line managers to take responsibility for training and development” (p. 187). This should not be surprising. Even in the field of management and leadership where there has been a plethora of empirical research, major concerns have been expressed recently about its practical relevance and utility for determining and distinguishing between ‘good’ and ‘bad’ management practice. Furthermore, there is still little agreement about what constitutes and what is meant by managerial and leadership effectiveness (See Cammock, Nikalant & Dakin, 1995; Conger, 1998; Kim & Yukl, 1995; Willcocks, 1997). In terms of coaching, “while there has been consensus amongst professional trainers and developers about what good coaching looks like, little published research exists that identifies specific coaching behaviors, shows that preferred models of coaching have any relationship to improved performance, or demonstrates what differentiates a ‘good’ coach from a ‘poor’ coach”
Accordingly, the present study endeavors to address this lack of a sound and sufficient empirical base with regard to the “manager as coach” phenomenon in the management and leadership and coaching literature bases by presenting and comparing three distinct empirical studies that have examined this concept in the context of the UK and USA.

**Research Method**

The current study was designed to compare and contrast the findings that were empirically derived in three separate studies conducted within the UK and the US that examined effective manager/leader coaching and facilitating learning behaviors using the Critical Incident Technique (CIT) as originated by Flanagan (1954). These previously conducted studies include, respectively, the UK based ‘managerial/leadership effectiveness’ studies of Hamlin (2003a, 2003b) and the ‘managerial facilitative behaviors’ study of Beattie (2002), and the US based ‘managerial coaching behaviors in learning organizations’ study of Ellinger (1997) and Ellinger and Bostrom (1999). The following research questions guided this comparative meta-level analysis:

1. How are effective coaching/facilitating behaviors of managers manifested within the featured studies of Hamlin, (2003a, 2003b; Beattie (2002), and Ellinger (1997; Ellinger & Bostrom, 1999) respectively?

2. What behaviors are held in common and generalized to each other?

3. To what extent are the empirically derived effective coaching/facilitating learning behaviors resulting from questions 1 and 2 held in common with the prescribed behaviors associated with the notions of the ‘facilitative leader’ and ‘coaching manager/leader’ as reported recently in the management literature?

*The Hamlin ‘generic model of managerial and leadership effectiveness.* Hamlin’s (2003a, 2003b) model was derived from several meta level analyses of the respective sets of criteria of managerial/leadership effectiveness identified by three previous empirical studies carried out within three different types of UK public sector organizations: schools, customs and excise, hospitals. In each case a qualitative approach based on CIT using a grounded theory mind-set was adopted for the initial data collection, and a quantitative approach, namely factor analysis, was used for reducing and classifying the CIT data and identifying behavioral categories/criteria of effectiveness. In all three studies critical incidents were obtained from the perspectives of subordinates, peers and superiors. Managers were required to offer examples of critical incidents based on their personal observations of other managers, and not on their own management practice. Meta-level analyses were carried out on the various sets of managerial/leadership effectiveness criteria obtained from the three studies. These revealed very high degrees of sameness, similarity, coincidence and congruence of meaning. The findings led to the creation of an eleven (11) factor ‘Generic Model of Managerial and Leadership Effectiveness.’ This comprised six (6) positive criteria comprising 48 behavioral items indicative of effective management/leadership [including coaching, mentoring and other facilitating learning behaviors], plus five (5) negative criteria comprising 49 behavioral items indicative of ineffective management/leadership [typical of traditional manager/leader behavior] (See Hamlin, 2003a). The six positive behavioral categories are the focus of the current study.

The Beattie ‘managerial facilitative behaviors framework’. The coaching behaviors comprising the Beattie (2002) ‘Managerial Facilitative Behaviour Framework’ were derived empirically by studying the behaviors used by voluntary sector senior and first line managers when facilitating employee learning in the workplace. Similarly using the CIT, Beattie (2002) obtained from 60 respondents, representing senior line managers, first line managers, employees and key informants, critical incidents offered by the respondents as examples of effective or ineffective managerial behavior in facilitating, or conversely inhibiting learning in the workplace respectively. The analytical strategy adopted was based on a grounded theory approach. The fist stage of analysis involved developing profiles for each managers. This involved collating data collected on them from their own interview, the interviews with their staff, and where appropriate, the interview with their senior line manager. Each profile was then analyzed several times to identify actions within critical incidents which contained words and phrases that provided examples of behaviors that facilitated or inhibited learning. These clustered with similar examples from other managers. The examples were not reduced to data sets of single words or short phrases as this was viewed to be overly reductionist and may have resulted in the loss of significant data by removing them from their context. On completion of this process of analytical refinement, 22 facilitative behaviors were identified and were then allocated to one of nine
behavioral categories. Nine categories of inhibitory behaviors were identified, incorporating 13 descriptions of negative behaviors. The nine facilitative behavioral categories are the focus of the current study.

| Caring – support, encouragement, approachable, reassurance, commitment/involvement, empathy- | Thinking – reflective or prospective thinking, clarification- |
| Supporting by giving aid or courage; Encouraging by inspiring or instilling confidence; approachable by being easy to approach; giving reassurance to relieve anxiety; commitment and involvement by giving time (to staff); empathy by showing understanding of another's situation. | Reflective or prospective thinking through the process of taking time to consider what has happened in the past or may happen in the future. |

| Informing – sharing knowledge - | Empowering – delegation, trust- |
| Sharing knowledge through the transmission of information. | Delegation by giving duties and responsibilities to others; trust and having confidence in someone. |

| Being professional –role model, standard-setting, planning and preparation - | Developing Others – developing developers - |
| Role model by behaving in a manner that people respect and wish to emulate; standard setting by outlining or encouraging an acceptable level of performance or quality; planning and preparation in terms of organizing and structuring learning. | Developing developers by stimulating the acquisition of skills & knowledge by employees to develop others. |

| Advising – instruction, coaching, guidance, counseling - | Challenging – challenging- |
| Instruction by directing an individual in a specific task; coaching through discussion and guided activity; guidance by providing advice; counseling by helping others take control of their own behavior and solve problems. | Challenging by stimulating people to stretch themselves. |

| Assessing – feedback and recognition, identifying developmental needs. | |

The Ellinger (1997) and Ellinger & Bostrom (1999) ‘managerial coaching behaviors in learning organizations framework’. The Ellinger (1997) and Ellinger and Bostrom (1999) model comprising managerial coaching behaviors were empirically derived using CIT and semi-structured interviews as the primary methods of data collection. Content analysis and thematic open coding were subsequently used to cluster, classify, and categorize the behavioral critical incident data. Fifty six effective and ineffective critical incidents were obtained from twelve (12) managers employed within four organizations considered to be learning organizations. These managers, who were deemed through a process of expert nomination to be exemplary coaches/facilitators of learning within their respective organizations, were asked to describe an average of 4.6 critical incidents that reflected effective and ineffective behaviors associated with facilitating their employees’ learning. This study also examined the catalysts for facilitating learning, the outcomes associated with such informal learning episodes, and the belief systems of exemplary managers who serve as coaches/learning facilitators. Thirteen (13) themes emerged from the rigorous open and thematic coding processes and were further categorized into two distinct clusters of behavior sets: empowering behavior sets and facilitating behavior sets.

</table>

The current study. The present study comprised a comparative meta-level analysis of the three respective empirical model/frameworks. This involved a detailed comparison of the respective behavioral categories and their specific underpinning behaviors. The purpose was to search for evidence of sameness, similarity, coincidence, and congruence of meaning, and thereby identify the existence or otherwise of a relationship between coaching/facilitating learning behaviors and the determinants of managerial/leadership effectiveness. To enhance the reliability and validity of the meta-level analysis, the authors compared and contrasted their respective model/frameworks independently of each other. Overall, there was general agreement regarding their respective judgments and perceptions of what was held in common and when minor discrepancies and inconsistencies occurred, these were resolved through discussion and critical examination to reach a consensus. This rigorous approach helped to establish reliability in the findings.

Findings

Due to the limitations of space, Table 1 presents the findings from this meta-level comparison. As can clearly be seen in Table 1, the vast majority of the Hamlin (2003a, 2003b), Beattie (2002) and Ellinger (1997) and Ellinger and Bostrom (1999) categories/behaviors align closely with each other. Most of the behaviors comprising Ellinger and Ellinger and Bostrom coaching/learning facilitation behavior categories appear to be very similar, or equivalent in type, to a majority of the managerial behaviors comprising one or more of all of the criteria of managerial/leadership effectiveness criteria comprising Hamlin’s generic model, and were nearly identical or very similar or equivalent to the Beattie model. In the case of the Beattie framework, the behaviors associated with managerial facilitative behavior categories are near identical, or very similar to equivalent behaviors comprising the Hamlin and Ellinger and Bostrom behavioral constructs. Overall, the degree of alignment, overlap, similarity and congruence of meaning between the categories/criteria of the three model/frameworks is extremely high.

- Empowerment and delegation  - Question framing to encourage employees to think through issues  - Thinking
- Effective organization and planning/proactive management  - Being a resource – removing obstacles  - Informing
- Empowerment and delegation  - Transferring ownership to employees  - Empowering
- Empowerment and delegation  - Holding back – not providing the answers  - Thinking and/or Empowering
- Participative and supportive leadership/proactive team leadership  - Providing feedback to employees  - Assessing
- Effective organization and planning/proactive management  - Soliciting feedback from employees  - Assessing
- Participative and supportive leadership/proactive team leadership  - Working it out together – talking it through  - Informing and/or Thinking
- Participative and supportive leadership/proactive team leadership  - Creating and promoting a learning environment  - Advising  - Assessing  - Develop developers
- Effective organization and planning/proactive management  - Setting and communicating expectations – fitting into the big picture  - Being professional
- Genuine concern for people/Looks after the interests and development needs of staff  - Stepping into other to shift perspectives  - Caring
- Empowerment and delegation  - Broadening employees’ perspectives – getting them to see things differently  - Thinking
- Participative and supportive leadership/proactive team leadership  - Using analogies, scenarios, and examples  - Advising  - Developing developers
- Participative and supportive leadership/proactive team leadership  - Engaging others to facilitate learning  - Developing developers
- Communicates and consults widely/keeps people informed  - Setting and communicating expectations – fitting into the big picture  - Being professional
- Participative and supportive leadership/proactive team leadership  - Using analogies, scenarios, and examples  - Advising  - Developing developers
- Participative and supportive leadership/proactive team leadership  - Engaging others to facilitate learning  - Developing developers

Discussion

It is quite evident from the results of the meta-level analysis that there is considerable overlap between the Hamlin (2003a, 2003b) Ellinger (1997) and Ellinger and Bostrom (1999) and Beattie (2002) models. All three models are comprised of the type of managerial behaviors that managers and leaders need to exhibit if they are to be perceived and judged by their superiors, peers, and subordinates to be effective (See Hamlin 2003a; 2003b). The findings from the present study provide further empirical support for the soundness, validity and generalizability of the Hamlin (2003a, 2003b), Ellinger (1997) and Ellinger and Bostrom (1999), and Beattie (2002) models and suggest
truly effective managers/leaders are those who embed effective coaching and learning facilitation into the heart of their management practice.

The findings also support the conceptual notions articulated by scholars who believe that coaching is an essential core activity of management and leadership (Burdett, 1998; Bianco-Mathis et. al., 2002; Evered & Selman, 1989; Flaherty, 1999; Hunt & Weintraub, 2002). The common managerial coaching/facilitating learning behaviors resulting from the present study are consistent with the range of coaching behaviors identified by these scholars.

Limitations of the Study

This study has several limitations that should be addressed with regard to methods and sampling. Although the CIT was used according to the procedures outlined by Flanagan (1954) in all three studies, it is possible that the richness and depth of the critical incident data collected may vary within each of the three studies. It is also possible that data from interviews, observations, and documents also aided in the analyses and informed each of the three respective models. Another limitation in performing this meta-level comparison is that the original samples of managers for each of the three studies also varied to some extent. The Hamlin (2003a, 2003b) model was generated based upon the collection of critical incident data from large and homogenous groups of middle and first line managers within six public sector organizations with the intent to examine manager and leader behavior in general. In slight contrast, Ellinger (1997) and Ellinger and Bostrom’s (1999) sample was comprised of mid-level and senior level exemplars who were nominated as being excellent learning facilitators within four consumer goods and manufacturing organizations deemed to be learning organizations. Similarly, Beattie’s (2002) sample was comprised of line managers, senior line managers and employees in social service organizations. Both the Ellinger (1997) and Beattie (2002) studies were designed to specifically examine coaching/facilitating learning behaviors. Despite these limitations, it appears that the findings across all three studies are robust and the meta-level comparisons provide a rich portrait of critical managerial coaching behaviors.

Conclusions and Implications for HRD

The results of the meta-level comparative analysis carried out on the three empirical studies referenced above have mutually validated the respective fundamental soundness of each of these behavioral constructs. Furthermore, the results of this study lend empirical support for the conceptual notions of the ‘facilitative leader,’ the ‘coaching manager,’ and the ‘coaching leader’ as advocated (Bianco-Mathis, et. al, 2002; Hunt & Weintraub, 2001). However, more empirical evidence is required before a generic model of coaching and learning facilitation can be offered. It is recommended that a range of studies should be carried out specifically to identify concrete examples of effective and ineffective coaching behaviors, as manifested in a wide range of private and public sector organizations within the UK, USA, and other countries. However, these should be replica studies using a common research design and method, including critical incident technique, with some form of central control to ensure consistency in the research process. Such research needs to be conducted if the coaching/facilitating components of everyday management/leadership practice are to be deemed research-informed/evidence-based as opposed currently to being ‘guru’ led. From a practical perspective, the behaviors that emerged within these three empirical studies may provide managers and leaders with diagnostic tools to examine their own coaching and facilitative behaviors. Although coaching has been deemed to be a powerful tool in organizations to develop employees, and has been linked with job satisfaction and performance improvement, Goleman (2000) contends that the coaching manager is still a rare species. Perhaps these findings will stimulate appropriate management and leadership development programs that seek to make coaching a managerial way of being.

Diversity Training in the Heartland: An Exploratory Study of Small and Mid-size Organizations

Linda M. Hite
Kimberly S. McDonald
Indiana University-Purdue University Fort Wayne

This qualitative, exploratory study investigated the development and implementation of diversity training in small and mid-size organizations in a midwestern region. The results indicate these organizations are implementing diversity awareness programs that recognize diversity as a business imperative. Common themes found in the diversity literature are supported in this study.

Keywords: Workforce Diversity, Diversity Training

The topic of diversity has become increasingly important to organizations since the early 1990’s as changing workforce demographics and increased global competition have become reality (Cox, 2001; Weiner, 1997). This interest has prompted a proliferation of diversity training programs throughout the United States. The most recent industry report conducted by Training indicates that 72% of the companies responding to that survey offered some form of diversity and/or cultural awareness training (Galvin, 2002).

At the same time, a variety of diversity initiatives have begun to take shape on college campuses across the country (Hurtado, Milem, Clayton-Pedersen & Allen, 1999). Included in these initiatives have been efforts to infuse diversity into the college curricula. As faculty in a leadership program, we have struggled with how to best integrate diversity issues into our curriculum to prepare our students to work in a multicultural society. Currently, we require majors to take a course that focuses on diversity issues as they relate to organizations and leadership.

A segment of that course focuses on organization-based diversity initiatives. Students study the theory and practice of designing and implementing diversity endeavors. Many of the available examples involve large multinational companies with sufficient resources to apply to diversity programs. While the students find this interesting in theory, it inevitably prompts questions of what can be done in smaller companies, like the small or mid-size organizations where they are employed. They live in a mid-size midwestern city and commute to a regional campus for their education. True to adult learning principles, they typically are most engaged in the learning process when they see the relevance to their own lives. This is particularly critical when teaching a diversity course. Chan and Treacy (1996) recommend making “the issues relevant to students’ own experiences and lives” (p. 220). Since the majority of our students will stay and work in this community after graduation, they want to know how diversity initiatives are being designed and implemented in companies in the vicinity.

This research project developed for two major reasons. First, to investigate local organizations’ training practices to better inform our students. Second, to build on the current research examining diversity training programs. Very little empirical research has been conducted on diversity training, and most of the existing studies focus on large, multinational organizations. This exploratory research project examines the diversity training efforts of six organizations located in a mid-size midwestern city.

Theoretical Framework

While the most successful organizational diversity endeavors include multiple system wide initiatives, one of the most visible and potentially viable features of a many diversity programs is training (Arredondo, 1996; Wentling, 2002; Wentling & Palma-Rivas, 1998). Richard & Johnson (2001) argue that training and development is one of four human resource practices that are needed for an organization to have a “diversity orientation” (p. 181). Arredondo (1996) writes:

Education and training have often been considered the essence of a diversity initiative. In some organizations, they are viewed as key to changing attitudes and behavior; others view them as a way to build awareness about valuing differences (p. 125).

Several diversity experts have identified important characteristics of effective diversity training programs. For example, Ferdman & Brody (1996) provide three major reasons organizations develop diversity training: 1. to comply with moral standards, 2. to respond to legal and social pressures, and 3. to succeed in business and remain competitive.
competitive (p. 284). Often all three of these reasons are important motivations for diversity training. Common objectives of diversity training programs include: developing awareness of diversity issues and one’s feelings about diversity, disseminating information about diversity/legal issues and policies, developing skills for a diverse work environment, and applying those skills to improve or change the organizational culture (Ferdman & Brody, 1996; Holvino, Ferdman, & Merrill-Sands, 2004; Wentling & Palma-Rivas, 1998). While the content of diversity training will vary based on need, topics commonly covered include: definitions of diversity and key terms; information regarding equal opportunity laws and sexual harassment policies; explanations of prejudice, stereotyping, acculturation, and cultural differences; and obtaining “diversity-interaction skills” (Ferdman & Brody, 1996, p. 293). It is important to note that the majority of training conducted in organizations has focused on increasing employees’ awareness of diversity issues.

Various prescriptions for diversity training have been offered as well. Recommendations include: developing something customized for the organization rather than using a “canned” program, ensuring that content and learning objectives are complementary, allowing sufficient time for learning to occur, using a variety of instructional methods, selecting highly skilled individuals to facilitate the training, and carefully considering the composition of the training groups (Arredondo, 1996; Cox, 2001). Other suggestions (Cox, 2001; Koonce, 2001) include getting leadership support, conducting a needs assessment, and benchmarking effective programs.

Wentling and Palma-Rivas (1998) interviewed twelve diversity experts to gather information regarding diversity issues and initiatives. One area of inquiry included the components of effective diversity training programs. The factors mentioned most frequently included: gaining commitment from upper management, including diversity training initiatives in the strategic plan, identifying training needs before development, “using qualified trainers,” and combining the training with other diversity initiatives (pp. 244-245). Fifty percent of the experts interviewed also advocated making attendance at diversity training mandatory and evaluating the effectiveness of the training.

While several scholars have provided recommendations regarding essential components of diversity training, relatively little empirical work has been done examining how training is implemented in organizations, what evaluation methods are being used, and whether the training is effective. A few studies have investigated effectiveness issues. For example, some research has focused on the impact of training group composition on diversity training effectiveness (Roberson, Kulik, & Pepper, 2001) and the influence of environment factors on the transfer of training (Hanover & Cellar, 1998). In the latter study, Hanover and Cellar (1998) found that diversity training positively affected participants’ perceptions of management practices related to diversity.

In addition, Wentling (2000, 2002) conducted interviews with diversity managers/directors at eight multinational companies to identify their diversity initiative evaluation processes (2000) and to investigate their perceptions of “factors that assist and barriers that hinder the success of diversity initiatives” (2002, p. 42). While these studies do provide useful information regarding how diversity training is being conducted and evaluated, most of the research has been done examining practices in large organizations. Wentling (2000) notes that all of the corporations in her study had received public recognition for their diversity practices. However, very little is known about the diversity training practices in smaller organizations.

Research Questions

Reflecting previous work by Cox (2001), Arredondo (1996), and Wentling and Palma Rivas (1998), interview questions focused on three major areas: 1) organizational definition of diversity, 2) diversity program structure (training goal and level, availability and requirements, need establishment and trainer selection), and 3) program evaluation (evaluation methods, training program strengths and limitations, and connection to other diversity initiatives). Our initial expectations were that we would find limited resources devoted to diversity training and that although diversity might be acknowledged, it would not be perceived as a pressing concern, except for legal compliance.

Methodology

This was an exploratory study. Data were gathered through semi-structured interviews with six individuals representing a variety of organizations. All of the study participants were involved in a significant way with diversity training in their organizations.

A total of fifteen companies were contacted to be included in the study. Companies were selected for two primary reasons: 1. the organization might have a diversity training program or 2. the organization represented one of the sectors of business we hoped to include in the research. Of the companies contacted, only seven indicated
that they currently had a diversity training program in place. Six of the seven agreed to be interviewed. Obviously a limitation of this study is the small sample. However, the organizations included in the research represent several types of industries: manufacturing, insurance, military, healthcare, government, and non-profit. The organizations range in size from approximately 3,650 employees to 154 FTEs. Two of the companies are divisions of large, multinational companies. The non-profit organization is affiliated with a national office.

All interviews were conducted face-to-face. Both researchers were present for each interview; one conducted the interview, while the other took notes. Each interview was conducted on-site at the interviewee’s office. The interviews were one-two hours in length and based on fifteen pre-planned questions. Examples of questions asked of each interviewee included: How does this organization define diversity? How does the organization determine the need for diversity training? What instructional methods are used in the training? Who conducts the training? What are the strengths of the diversity training offered in this organization? Follow-up questions and/or probes were included as needed. Three of the interviews were tape-recorded and transcripts were prepared. Three interviewees did not consent to tape-recording the interviews. In these cases, notes were compiled and sent to the interviewees to verify their accuracy and completeness. No differences were perceived between the taped and non-taped interviews in regard to the openness, thoroughness, and clarity of the interviewee responses.

Five of the interviewees are female; one is male. Most of them are affiliated with the human resource function in their organizations. The exception is at the non-profit agency where we interviewed the director of the organization. One interviewee is from the corporate office of a multinational company. The HR manager of the division requested that we interview her because she, along with local facilitators, conducts all of the diversity training for the division. Two of the interviewees actually conduct most of the diversity training for their organizations. The rest of them serve as administrators of the programs.

The interview data were content analyzed by each researcher independently. Each question response was analyzed across interviews to determine patterns and themes related to the specific question. After this analysis was completed, general themes that emerged across interviews and throughout the interviews were noted as well (Creswell, 1994). The researchers then shared their findings and found no major discrepancies. Additionally, all notes and transcripts were read and analyzed by an independent researcher, not associated with this project, to control for potential bias in interpretation (Marshall & Rossmann, 1989).

Results and Findings

Definition

All of the interviewees acknowledged a broad-based definition of diversity that includes multiple aspects of difference (i.e. gender, race, ethnicity, age, etc.) with two noting specifically that diversity included both differences and similarities. There was a variation however in how those differences were perceived. One participant clearly noted that of all aspects, they choose to focus on racism, because it is difficult to address and if people understand that, they will understand the others. She later noted that sometimes people want to put attention on types of difference that are not as difficult to deal with, but that makes the concept of diversity too soft. In contrast, another interviewee readily included geographic location and profession in listing types of differences the company recognizes, factors that many consider secondary in terms of impact on self (Loden & Rosener, 1991).

Program Structure

Goals and levels. When questioned about goals for the diversity training, participants gave multifaceted responses that reflected both pragmatic and humanitarian reasons for this endeavor, as described by Ferdman & Brody (1996). Four cited the business case as an important goal for the training, positioning the organization for success in a multicultural society. One phased this succinctly as keeping the organization “open, competitive, and viable.” Another said, “It’s a customer service issue all the way around.” Two interviewees included protection from liability as another goal for diversity training. Three also indicated that culture change or a better work environment is an additional goal. Several of the participants specifically indicated that enhancing awareness and understanding of diversity is a goal of their diversity training. One said, people “need to understand their own lack of awareness, to realize how ethnocentric we are and to develop methods to get out of that.” However, she like the others in this study, admitted that at present, their training is limited to the awareness level rather than expanding into increased knowledge and skill building.

Availability and requirements. There is a wide variation in the amount of training available across the organizations studied. The shortest time allotment is one hour (much to the chagrin of the trainer), which limits the content to a basic introduction to diversity and why it is important to the organization. The longest is approximately eight hours, but this varied because one system measures training time in credits and while eight credits was reported as the target, there is not a credit per hour ratio established, and the other that cited a program designed for
eight hours noted that it recently has been shortened to four hours to meet scheduling demands. Other interviewees indicated four hours was a common time allotment. Just as experts vary on the wisdom of mandating diversity training for all (see for example, Wentling & Palma Rivas, 1996, Joplin & Daus, 1997), these organizations vary on requiring diversity training. Two were emphatic about mandatory training; two indicated that although diversity training is not mandatory, it is strongly encouraged and the goal is to have all employees attend; two others noted that training participation is left to the discretion of the person in charge of each work unit. The two interviewees that described their training as not mandated, but expected, represent the only organizations in this study affiliated with large multinational corporations.

Need establishment and trainer selection. When asked about how the need for diversity training was established, only one participant cited use of a formal needs assessment. One indicated it was in response to immediate needs and concerns in the system. Four of the organizations represented were prompted to implement training upon the directive of a senior staff member, illustrating the importance of leadership support to diversity initiatives (Cox, 2001).

Variations were evident regarding diversity trainers. One organization developed the program, but has it delivered by outside trainers, while another had their program designed by an outside firm, but it is facilitated by people within the organization. Two organizations use a mix of in-house trainers/facilitators and outside presenters and two rely on staff within the system for all of the training. Participants indicated that selection was based on expertise and interest in and understanding of diversity issues.

Program Evaluation

Evaluation methods. While participants acknowledged the value of training evaluation in determining the progress of diversity initiatives, they indicated that to date, their organizations had done little to quantify the value of training. Most described using participant satisfaction forms that focus primarily on trainer delivery and perceived usefulness of the session. The two representatives from multinational affiliates also outlined plans to implement additional levels of evaluation. One will be based on comparing performance data and feedback with previously collected baseline information. The other will focus on managerial perceptions of training application. Another interviewee noted that the primary metric is numbers trained, but that the system also monitors recruitment and retention data in comparison with the demographics of the community. The one organization that does not conduct any type of evaluation at this time readily indicated that is a weakness and that they are exploring ways to gather meaningful evaluative data.

Training program strengths and limitations. A common strength cited among most of the programs studied was that the training has a good reputation among recipients, often surprising them with an unexpected approach, the scope of the topics covered, and the usefulness of the information (in other words, it is a better experience than what potential trainees expect it will be). It is so well received in one organization that the representative affirmed, “It’s become embedded in the organization’s fabric.” Two interviewees also cited the increased awareness that the training has fostered, a plus since most organizations indicated that was a training goal.

Limitations cited fell into three main categories: level, time, and support. Three interviewees acknowledged that while their current programs are well received, it is time to offer something more advanced to build beyond the awareness level and to keep employees engaged in applying what they are learning. Time concerns focused on the challenge of scheduling to accommodate other work priorities, the limited amount of time allotted for diversity training, and time to further develop the diversity curriculum. Concerns about support included lack of firm commitment from the senior staff of the organization, cited by two interviewees; as well as comments about limited staffing and money to further develop and conduct diversity training.

Connection to other initiatives. Responses varied widely regarding about how diversity training supports other initiatives in the organization. One cited programs that are only peripherally connected with diversity. Another stated that the organizational lack of support is evident in that diversity training is not included in the strategic plan or given resources to grow. At the other end of the continuum, one interviewee made the connection between diversity and the organization’s leadership standards and described several human resources initiatives that are analyzed from a diversity perspective (i.e. developmental opportunities, succession plans and compensation), and another cited the racial justice aspect of diversity as being a driver in the organization. The two other participants indicated that the goal is to make diversity so much a part of the culture that it is simply embedded in the system.

Conclusions and Recommendations

As noted previously, this is a small, exploratory study. Therefore the sample size is too small for generalization of these results, but the findings reaffirm previous studies on diversity training and prepare the way for future research. Conclusions from these data suggest several interconnecting patterns. The small and mid-sized organizations
included in this study are recognizing the potential of diversity as a business imperative, even those who also cited liability protection as a secondary factor. This indicates that they have moved further along the continuum of diversity perspectives from seeing diversity as simply a legal compliance issue to recognizing it as a benefit to the organization (Dass & Parker, 1999; Joplin & Daus, 1997). The diversity training in each of the organizations remains in the awareness stage of learning, although several interviewees recognized the need to move to the next level so that trainees not only understand differences but also have sufficient knowledge and skills to apply that understanding (Cox, 2001).

The importance of leadership support for diversity initiatives (Cox, 2001) was reinforced at several points. For example, a trainer described the impact of having a senior staff member address every training session to talk about their own and the company’s commitment to diversity and a non-profit director acknowledged setting the mandatory training requirements for her organization. In contrast was the trainer who fights for training time and sees no commitment from senior staff and the organization representative who noted the training had been a high priority with the previous leadership but has slipped in importance and visibility since new management has taken over. This support plays out in time and resources allotted for diversity training and in how much people are urged, if not required, to attend.

One way to reinforce the value of any endeavor is to evaluate its effectiveness. Unlike the large companies Wentling (2000) describes that use multiple methods to measure the impact of diversity training, most of the organizations in this study currently limit their evaluation to participant satisfaction forms. However, two interviewees described specific plans for performance-based measures to determine how training affects performance and two others expressed interest in developing a more meaningful way to assess the effect of diversity training on the organization. The connection between organizational commitment to diversity and measurement of results (Arredondo, 1996; Cox, 2001) reinforces the importance of devoting time and attention to evaluation efforts of diversity training if programs are going to not simply survive but evolve and expand into greater depths of learning.

While all of the persons interviewed for this study expressed interest in diversity and clearly recognized the value of diversity training in making their organizations more viable, a difference in personal styles and investment in the topic was evident. Three of the participants can best be described as being passionate about diversity, readily acknowledging that it is of great importance to them personally and as an integral part of who they are and how they approach their work. They interjected personal anecdotes into their responses to questions and readily disclosed their feelings about diversity and their own commitment to helping people “get it.” One in particular talked about progress that has been made in the organization, but followed that with the telling statement, “I’m never satisfied with what we do, we never do enough.” Each touched on the importance of engaging the individual as well as clarifying the business case at an organizational level, and made comments like “how do you engage the soul?” of trainees so they truly understand what this is about. One expressed her concern that some diversity training is too soft, that is does not challenge people to address the really difficult issues, like racism, for example, because trainers want the training to be palatable to the audience. This is in contrast with another interviewee who described the organization’s efforts to use a “balanced, tempered approach” so that trainees feel good about diversity and the training session when they leave.

Certainly, one of the purposes of an exploratory study is to suggest additional avenues for research. This study indicates that there is much more to learn about diversity training in small and mid-sized organizations that recognize the moral and business implications of a global society and shifting demographics but that may lack the resources of larger companies. It is not uncommon for the biggest organizations to pioneer new organizational initiatives and set precedents for others to benchmark, but it is important to consider how those endeavors can be adapted to organizational systems that operate on a small scale. Studies that will assist smaller firms both to move beyond the awareness stage of training and to formulate more meaningful measurements for evaluating the performance value of diversity training are needed. Questions to be explored include: How to connect diversity initiatives more directly with organizational goals? How to evaluate the value added of diversity training to organizational productivity? What types of diversity training will help organizations move beyond the awareness stage into more advanced levels of implementation? How do organizational systems reinforce or hinder transfer of diversity training?

Implications for HRD

This study taps into some of the traditional struggles of the human resource development function. Training programs often are given tacit approval by upper management, but not supported with strong leadership commitment or with the resources needed to foster growth. Like some of the diversity training endeavors cited in
this study, training initiatives frequently are seen as set aside programs that are not linked with the mission or the strategic plan of the organization, leaving them vulnerable to changes in leadership and complicating efforts to foster transfer of training and to evaluate organizational impact. One of the interviewees likened the current interest in diversity initiatives to earlier efforts to adopt a quality mindset, noting it is high profile and provided with resources at first, then it either becomes embedded into the culture or it is abandoned. Projections strongly indicate that the forces prompting globalization and demographic changes will continue for the foreseeable future (Judy & D’Amico, 1997). Diversity is therefore an inevitable part of HRD’s future.

An additional implication for AHRD stems from the one of the initial reasons for this study, preparing students to work in a multicultural society and providing them with information about the workplace that is current, accurate, and applicable. The results of this study reinforce the viability of diversity initiatives in an area that is just beginning to experience demographic changes in its workforce and customer base. Further, they reveal that these small to mid-sized organizations use models for diversity training similar to those employed in larger systems. Certainly, students can learn from case studies about Fortune 500 firms, but the most powerful reference typically brings the real world into the classroom in a more personal way. Theory, no matter how well documented, makes more of an impression when students can envision it applied in their own lives. Just as the interviewees in this study and diversity researchers (Arredondo, 1996; Wentling & Palma-Rivas, 1998) cite the importance of customizing training programs to their employees and responding to their needs, applying diversity theory into small and mid-sized firms that students recognize reinforces the value of their learning and gives them a realistic job preview.

HRD in Community Development: A U.S. Case Study of Diverse Community Development

Mesut Akdere
University of Minnesota

The notion that HRD can also function as an agent of societal and international development as well as organization development has brought a new dimension to the field. One of the ways to achieve this is to study the potential contributions and implications of HRD to community development. In addition to the tremendous growth of diverse populations in our neighborhoods, administrative policy changes have pushed community leaders to approach organizational engagement with diversity more comprehensively.

Keywords: Community Development, HRD, Diversity

Human Resource Development (HRD) is a very large field of practice and a relatively young academic discipline. Furthermore, HRD is deeply concerned about the dynamic issues of individual and organizational change. Thus, the field of HRD is in continuous growth and change. A current definition of HRD brought a new approach to the way we understand the field. According to McLean & McLean (2001) “HRD is any process or activity that, either initially or over the long term, has the potential to develop adults’ work-based knowledge, expertise, productivity, and satisfaction, whether for personal or group/team gain, or for the benefit of an organization, community, nation, or ultimately, the whole humanity.” Thus, the definition indicates the levels that HRD can contribute to community development. This study is conducted using case study research. The umbrella strategy of case study research is extremely useful to HRD in which case studies are one of the most prevalent formats for conducting research and they are often a combination of qualitative and quantitative inquiry (Marsick & Watkins, 1997).

The Cultural Diversity Council (CDC) is a rural community-based nonprofit organization, serving the Upper Minnesota River, formerly the Hispanic Outreach Task Force. It was organized in 1999 to strengthen the network of intercultural human relationships and thereby to achieve welcoming, peaceful, trusting, and respectful communities. The Council strives to maintain a multicultural commitment to peacefully built communities that embrace the gifts of every member of the community it serves. The CDC serves the counties of Chippewa, Lac qui Parle, and Yellow Medicine in the Western Central Minnesota. According to the U.S. Census Bureau (2000), the total population of these three counties is 32,235 with a total minority population of 1,151, which constitutes approximately 3.57% of the total population (2000). The breakdown of the minority population for each county is as follows: Chippewa County 4.1%; Lac qui Parle County 1.3%; and Yellow Medicine County 4.6%. The census results also indicate that in these three counties the largest groups of minorities include the Hispanic/Latino (467) and Native American (375) groups. Additionally, in recent years (after the 2000 Census) there has been an increasing migration of the Somalian population to the region from the larger metropolitan areas such as the Twin Cities.

These statistics indicate an increase in the number of diverse populations in the area and the trend is likely to continue implying more culturally diverse people will be migrating into the communities in these counties (Diaz, 2001). As such, there are increasing issues about housing, education, health care, banking and credit, socialization, recreation, language assistance, citizenship, legal advocacy, food, and spiritual issues. However, at present, there are not adequate infrastructures to properly address these issues. Thus, the study attempts to develop an understanding of the realities of people of color in these counties. The study further attempts to develop an understanding of the interactions of these diverse individuals and the community at large. The results of the study will also enable the CDC to better understand: a) the social structures within the community in these counties; b) how the CDC can work with other community service providers and networks to better promote and utilize the strengths of the residents and support their goals; and c) respond to the needs and issues that most concern them. This report will be instrumental in determining the utility of the current services and programs by the CDC; the demand to these services; how to recruit volunteers to assist with the CDC’s efforts; and the appropriate community development and skill building opportunities for the members of the community. Consequently, the purpose of this study is to understand the ways HRD can contribute to community development.

Research Process

This study is based on the case study methodology, an empirical inquiry that investigates a contemporary phenomenon within its real-life context, especially when the boundaries between the phenomenon and context are

Copyright © 2004 Mesut Akdere

28-2
not clearly evident; and in which multiple sources of evidence are used (Yin, 1984, p. 33). Thus, the researcher is neither interested in a specific phenomenon and wishes to understand it completely, not by controlling variables but rather by observing all of the variables and their interacting relationships (Dooley, 2002, p. 336). As such, case study research has the ability to utilize multiple cases, to analyze quantitative and qualitative data, and to implement multiple research paradigms in which the conduct of case study research can be expanded to engage multiple studies using multiple research paradigms. In this study, the participants are identified upon the suggestions of the CDC. The participants are selected using convenient sampling method. They are individually invited to the focus group interview sessions via phone by the CDC. The advantages of the case study method are its applicability to real-life, contemporary, human situations and its public accessibility through written reports (p. 344).

Case study results relate directly to the common reader’s everyday experience and facilitate an understanding of complex real-life situations (Soy, 1996). Furthermore, the major point about case studies to keep in mind is that they are richly descriptive in order to afford the reader the vicarious experience of having been there (Merriam, 2001, p. 238).

Among the data collection processes that case study research employs are participant observation, document analysis, surveys, questionnaires, interviews, and Delphi processes (Dooley, 2002, p. 338). For the purposes of this study, the data collection processes include document analysis from of the U.S. Census Bureau records to quantify the minority groups living in the region; focus group interviews with three largest minority groups; and phone interviews with the community service providers in the area. The power of case study research is the ability to utilize all methodologies within the data collection process and to compare within case and across case for research validity (p. 338). As such, the study utilizes a number of methods to compare and analyze for research validity. Studying the government records to find out the factual figures about these groups; conducting focus groups to obtain intensive descriptions and analyses of a single unit or bounded system (Smith, 1978); and conducting phone interviews with community service providers to understand the issues from their perspective may be adequately achieved with multiple techniques that only case study research enables. Case study research enables the researcher to study the observations of a single unit or subject, or contextual case, as the focal point of a study, along with its plurality as a research method (Dooley, 2002, p. 338). Thus, it is a process of scholarly inquiry and exploration whose underlying purpose is to create new knowledge (Herling, Weinberger & Harris, 2000). For the purposes of this study, case study research is considered as a research strategy in which a contemporary phenomenon and the associated contexts that are not clearly evident are examined to achieve methodological rigor, validity, and reliability (Dooley, 2002, p. 338).

Consequently, this study includes the following six steps:

1. Determine and define the research questions.
2. Select the cases and determine data gathering and analysis techniques.
3. Prepare to collect data.
4. Collect data in the field.
5. Evaluate and analyze the data.
6. Prepare the report.

**Determine and Define the Research Questions**

The first step in case study research involves establishing the focus or the intent of the project. The focus or intent is established once a complete literature review has been completed and the problems have been well identified which should be something that the research can refer to as grounding during the process of the study (p. 339). Although the focus and intent of this study have been pre-determined by the CDC, in light of the literature review, the research questions, the focus and intent of this study, thus, have been modified. Objects—organizations, groups or teams, and individuals—involves in case study research are usually associated with political, social, historical, and personal issues, making the case much more complicated than at first glance (p. 339). Thus, the objects of this study are the organizations such as the agencies under which the community service providers serve, and the individuals from the minority groups. This further helps to refine the research questions and to also discover if past research has been done that will add to the study (p. 339), which also adds face validity to the project.

**Select the Cases and Determine Data Gathering and Analysis Techniques**

About selecting the cases and determining data gathering and analysis techniques, Dooley (pp. 339-340) suggests that:

This is a very important phase and sets the tone for the rest of the study. The researcher must select single or multiple cases that reflect the research questions in step 1. Moreover, this step also involves selecting the instruments and other data gathering strategies that will be used... The researcher must also decide how to select the cases; will they cover similar or different geographic regions, will they be the same size or different... A major strength of case study research is the ability to use multiple sources and techniques.
Tools used in this type of data collection are usually surveys, interviews, document analysis and observation, although standard quantitative measures such as questionnaires are also used.

Thus, the cases selected for this study are diversity, community development, and immigration. The data gathering techniques include focus groups with the members from the minority population; phone interviews with the community service providers in the community; and governmental documents. The data analysis techniques are bracketing, which describes the act of suspending one’s various beliefs in the reality of the natural world in order to study the essential natural structures of the world; determining the themes which are essential qualities that make a phenomenon what it is and without which the phenomenon cannot be what it is; and consequently, imaginative variation, which is the process for determining which themes are essential and which are incidental to a phenomenon and in which the theme has to be looked at from several directions and be considered in different ways to discern whether or not it is essential to the phenomenon.

Prepare to Collect the Data

Dooley suggests that case study researchers will typically begin a study using only one method of data collection and will add others as the situation warrants it (p. 340). In this case, the first method of data collection is government documents to analyze the population demographics. Due to the nature of case study research, the researcher generates large amounts of data from multiple sources (p. 341). Consequently, larger and more in-depth data are generated from the focus groups and phone interviews in regarding to the phenomenon under study. Brief comments by the researcher about his or her background and experiences relevant to the case study may facilitate data collection and the reader’s ability to better understand the findings (Gall, Borg, & Gall, 1996). In this regard, the researcher possesses adequate first-hand experience as a minority as well as substantial knowledge and scholarly research experience in the content area.

Collect Data in the Field

Dooley (2002, pp. 341-342) states that:

Data collection is emergent in case study research. That means what the researcher learns from the data collected at one point in time often is used to determine subsequent data collection. The researcher therefore must collect and store multiple sources of data, in a systematic manner. The storing of the data is critical so as to allow for patterns and themes to emerge. One must always keep the original object in mind and observe causal factors associated with the observed phenomenon. It is important to make formative evaluation checks so arrangements can be made in the event that factors arise causing the manner in which the case is evaluated to change. Case study research is flexible, but when changes are made, they must be documented systematically. Field notes document this process; they record feelings, hunches, pose questions and document the work of the case.

Taken this into account, the researcher collects the data from a variety of resources as indicated earlier. The government documents collected for this study are not only statistically significant and valid but also instrumental in determining the minority groups to include in the study. The focus groups have been established through collaboration with the CDC and the minority community leaders. Every effort has been made to accommodate the needs of the participants during the process. Due to the regulations of the Institutional Review Board at the University of Minnesota, each participant is asked to complete a consent form before the process is initiated. They are further explained about the nature and the purpose of the study as well as how the study is to benefit their community. Since all of the groups decline to be taped the data collection is conducted in the form of note taking.

Initially, two largest minority groups were identified to participate in the study, the Hispanic/Latino and the Native American communities. However, the literature review indicates a new trend of Somalian workforce migration to the region from the Twin Cities metropolitan area. As such, a third focus group is established to study these new comers. An interpreter from the community has been present for the focus groups with the Hispanic/Latino and the Somalian groups. The consent forms are also translated into their native languages so as to ensure an effective communication and authentic agreement. The participants for the focus groups were equally represented in terms of age and gender. Such balance of demographics among the participants is important to achieve validity and reliability in case study research.

Community service providers, on the other hand, are contacted via telephone. They are explained the nature of the study and the value of their voluntarily participation to the study. Over seventy service providers from the three counties are contacted and forty-six of them agreed to participate in the study. Such large percentage of participation does not only increase the validity and reliability of the study but also allows a large spectrum of professionals from all serving agencies to express their concerns and problems about these minority groups from their own perspective.
Evaluate and Analyze the Data

Dooley (p. 342) describes this stage as:

The researcher now evaluates the data using an array of interpretations in order to find any and all relationships that may exist with reference to the research questions. The discovery of constructs in qualitative data can be a significant outcome to a case study. The case study method, with its many different data collection and analyzing techniques, allows researchers opportunities to triangulate data in order to strengthen the findings.

The following section includes the evaluation and analyses of the interviews with these three focus groups and the phone interviews with the community service providers. Each group is evaluated separately to allow individualized analysis and prevent any possible exclusion of findings due to generalization.

Focus Groups

The Hispanic Community

The majority of the focus group participants have only been in the area for the past two years, which may be interpreted as the majority of the Hispanic/Latino population is new to the area. As such, there are some concerns related to socialization, which is described as to adapt to social needs and uses or to participate actively in a social group (American Heritage Dictionary, 2003). Consequently, programs and policies should be adapted to enhance the socialization process of this group.

Among the problems they face are the bureaucracy that immigrants have to go through; lack of adequate utilization of information pertaining to immigrants; lack of bilingual staff in many governmental agencies, especially in healthcare organization; lack of equal access opportunities to public services; lack of sufficient food shelves; lack of public transportation; lack of bilingual manuals, descriptions, and directories for public services; lack of awareness towards Hispanic students in schools; and general stereotypes among the residents. Such issues and concerns need to be addressed by the CDC since one of its primary missions is to help immigrants with their problems and concerns and their transition to become members of the community.

The participants indicate that the CDC can help the Hispanic/Latino community by informing the community about the services available to the Hispanic/Latino population; providing more individualized services; developing more programs for the community at large to help increase awareness for Hispanic culture; recruiting bilingual employees to public services; attracting more interpreters to the area; offering more English as a Second Language courses; and lobbying for equal access opportunities to education. They further state that in order to create a community that welcomes new people from diverse backgrounds the CDC can help in the establishment of a center with a full-time bilingual employee to offer aid with their problems, in providing food shelter and more job opportunities, and increasing opportunities for public housing. The CDC can also establish a data bank through a general membership to help tracking the members and also to offer a sense of belonging to its members.

The participants indicate a larger participation from the Hispanic/Latino population to the community events will definitely help achieving a diverse community. To achieve this, a connection between the CDC and the Hispanic/Latino community must be established so that people will become more familiar with the CDC and its programs and services. Thus, they can contribute to the CDC through their human and social capital such as their bilingualism, advertising the events and programs, and helping out with the preparations. There is no doubt that the Hispanic/Latino community has a lot to offer to the CDC. However, due to a lack of community-based partnership, this is not adequately achieved. The CDC can recruit more Hispanic/Latino members to develop and foster such networks.

The Native American Community

One of the problems that the Native American community faces is the ignorance and lack of awareness within the larger community about the Native American history and culture. They suggest that this can be overcome through various programs and curriculum change in schools. Another problem that the Native American community faces is gambling, alcohol, and drug addiction. More social services are needed in this area to help with the treatment processes. In addition, the CDC can initiate a taskforce with the Leadership Council of the Upper Sioux Board of Trustees, which can help the CDC to offer programs and services focused towards this population. Furthermore, such networking will increase participation and involvement in the CDC’s programs and services within the Native American community. The Council should utilize such opportunities by active encouragement, collaboration, and involvement.
The Somalian Community

The majority of the Somalian community migrated to the region for the job opportunities, nice neighborhood, and the English as a Second Language (ESL) support that they receive in the workplace. They suggest that the CDC can help for more ESL programs, electricity and gas aid programs, affordable housing, and translators for public services. This group has expressed a need for a new service—electricity and gas aid programs. The CDC can lobby for such programs at local, state, and federal level.

Phone Interviews with the Community Service Providers

Part of this project included conducting phone interviews with the community service providers who serve in the region. The CDC provided a list of seventy community service providers from the agencies in education, health care, nonprofit organizations, federal and state agencies, social work, law enforcement, and spiritual institutions. Among these seventy community service providers forty-six of them are participated included in the study. Among the responses are:

- It is a rural setting and the location is geographically widespread.
- Although there is an increasing diverse population, this is not reflected on the numbers of the community service providers.
- There is a need for further educational programs on compulsive gambling.
- School attendance and retention ratio of the minority students are low and there is a need to address this issue.
- There is a great need for affordable housing.
- There is a lack of farming employment.
- Acceptance of the people with diverse backgrounds within the community at large is a challenge achieving a diverse community.
- Economy and employment in parallel to that are also great concerns.
- Funding for social services is also decreasing.
- Public transportation is much needed especially in the remote areas of the region.
- There is a lack of sufficient services and interpreters available to the minority groups.

These responses, in fact, are almost identical with the responses those of the minority groups. This is an indication that these problems are equally observed, recognized, and experienced by both the minority groups and the community service providers.

All of the participating community service providers further indicate that a good relationship exist between their organizations and the minority groups. Most of them indicated that an interpreter usually solves many problems, without which otherwise would have become more complex and complicated to resolve. A positive relationship between the community service providers and the minority groups is an indication of future collaborations and larger participations.

The participants state that both governmental and nongovernmental organizations can reach out and serve minority communities by providing funding to educational programs and services and training the minority groups in basic skills required for many entry-level job positions. They also indicate that minority groups require more individualized service, though this may be difficult. Another suggestion is that the Housing Authority can assist the minority groups with issues related to housing. The local business can also address the unemployment by providing new job opportunities. English and Spanish language classes can be offered both to the immigrants and the locals. Another suggestion is to develop broader based task forces in form of more specific committees. Legislators can address these needs at political settings. More grants may be offered to organizations to offer programs to the minority groups.

They characterize the strengths and assets of their organizations in respect to serving the minority groups as being well aware of the needs of the minority groups; having access to bilingual staff; welcoming diverse groups; and reflecting the multicultural aspect of the community in their organizational policies. The participants also express a desire for the growth of minority population and a culturally diverse community, which welcomes people with all different backgrounds. To achieve this, some local policies should be changed and some new laws have to be made. Furthermore, the business should provide not only new job opportunities but also offer programs for professional and personal development.
Prepare the Report

Dooley (p. 343) suggests that:

- The goal of the report is to present the conclusions to the questions posed by the researcher in a way so that the reader can understand. Two types of reports are popular for case study researchers. Reflective reporting, where the writer will use literary devices to bring the case alive for the reader and the strong presence of the researcher’s voice is apparent; and analytic reporting which notes an objective writing style (the researcher’s voice is either silent or subdued).

In the analytic style, the report generally has a conventional organization: introduction, review of the literature, methodology, results, and discussion (Gall, Borg, & Gall 1996). Thus, this report is written in the analytic style, as it is more appropriate to achieve the goals and the purpose of the study.

Conclusion

Using case study research model, this study examines the potential for building community-based partnerships among a community center, community service providers in the area, people of color, and the community at large. The paper identifies current problems and issues as well as potential barriers to successful partnership, and provides instrumental findings as to how these problems and barriers can be overcome. The paper offers possible ways and methods for building community-based partnerships and increasing cultural diversity awareness to other communities facing similar challenges around the world.

Studies of this nature require a multiple implementation of research methodologies. Case study research has undoubtedly provided the study with such modes of inquiry to better understand the phenomena under study. This study is intended to provide an understanding about the cultural and social backgrounds of the minority groups as well as their needs, the problems and issues that they face within the community.

As a country of immigrants, the U.S. will, undoubtedly, continue to attract new immigrants from other parts of the world. The notion that U.S. is a ‘melting pot’ has diminished long ago, and the concept of diversity, where individuals are encouraged to express their cultural, ethnic, and religious heritage in everyday life, is on the rise. Studies that examine immigrant populations and analyze the challenges, issues, and problems that immigrants are facing are not only necessary to better understand them but also vital for scientific and sound approaches to help them in their transition phases to their new environment.

Two major capitals that the CDC needs to address and utilize are human capital and social capital, which are equally critical in community development. Human capital is defined as the knowledge and skills (physical and intellectual) that an individual possesses that make that individual a productive worker (Besanko, Dranove, & Stanley, 1996, p. 641). Social capital, on the other hand, is defined as any aspect of social structure that creates value and facilitates the actions of the individuals within that social structure (Coleman, 1990).

Community development is a new and dynamic field of study to which HRD can greatly contribute. A community is composed of individuals, groups, and organizations. As such, HRD can help address issues and challenges in community development at individual, group, and community levels. In this aspect, community may be viewed as the organization that needs to be developed. It is recommended that future studies in community development can adequately utilize HRD in responding to a rapidly changing environment; dealing with some of the most significant human issues of poverty, inequity, diversity, discrimination; determining individual learning styles and responding to them; and dealing with the ambiguities of life (Azevedo & McLean, 2002).

Diversity and Human Resource Development

Rose Mary Wentling
University of Illinois at Urbana - Champaign

An important factor in diversity and Human Resource Development (HRD) is understanding how the changes in society are affecting the workforce. This literature review brings about an understanding of the complexity and breadth of workplace diversity issues and provides information that can be used to enhance the role of HRD professionals in organizational change and diversity. The information provided in this paper can be used by HRD professionals to develop new and unique diversity initiatives for their organizations.

Keywords: Diversity, Human Resource Development, Organizational Change

It is common knowledge that the American workforce doesn’t look like the workforce of the past. Today’s workforce is significantly different in that the working population is aging, more women are working, ethnic diversity is growing, more people with disabilities are employed, an increasing gap exists between highly educated persons and the large number of people who cannot read and write well enough to hold simple jobs, and employees have a greater mix of values and attitudes (Jamieson & O’Mara, 1991; Judy & D’Amico, 1997; Naylor, 1997). These demographic changes are dramatic, important and a reality in today’s workplace. People from many diverse groups will be working together to keep business running competitively (Baytos, 1995; Fernandez, 1993; Gasorek, 1998; Hayles & Russell, 1997).

It is expected that the extent to which these workforce demographics are effectively and efficiently managed will have important impact on the competitive and economic outcome for organizations (Lynch, 1997; Morosini, 1998; Schell & Solomon, 1997; Thomas, 1992). Organizations that recognize that they need to fully develop all members of their workforce to remain competitive are responding by implementing a variety of different approaches to manage diversity (Brimm & Arora, 2001; Cavanaugh, 1997; Martino, 1999).

Diversity has received increasing attention in recent years, on account of demographic as well as attitudinal shifts. Within the field of human resource development, the interest in diversity is primarily focused on improving individual, group, and organizational effectiveness (Rothwell, Sanders, & Soper, 1999). This focus is critical as workplaces throughout the world evolve within the global economy. While the last decade have seen an increase in valuing and managing diversity in the workplace, the role of human resource development in diversity remains vague. Once a workplace becomes diverse what needs to change? Whose responsibility is it to make sure that the goal of a more inclusive workplace becomes a reality? The focus of HRD puts HRD professionals in a unique position to help organizations redefine the way they do business, especially around issues of organizational change and diversity.

This literature review brings about an understanding of the complexity and breadth of workplace diversity issues as they relate to defining diversity, diversity in the workplace, managing diversity in the workplace, strategies for managing diversity in the workplace, and the role of HRD professionals in organizational change and diversity. To accomplish this, workforce diversity issues and the key points from research studies, books, reports, and journal articles written for business and human resource professionals on diversity in the workforce were reviewed.

Diversity Defined

There are numerous ways in which different individuals have defined diversity. Definitions of the term range from narrow to very broad. Narrow definitions tend to reflect Equal Employment Opportunity (EEO) law, and define diversity in terms of race, gender, ethnicity, age, national origin, religion and disability (Hayles & Russell, 1997; Wheeler, 1996). Broad definitions may also include sexual/affectional orientation, values, personality characteristics, education, language, physical appearance, marital status, life-style, beliefs, and background characteristics such as geographic origin, tenure with the organization, and economic status (Thomas, 1992; Triandis & Bhawuk, 1994; Wheeler, 1996).

Morrison (1992) categorized diversity in terms of four levels: (a) diversity as racial/ethnic/sexual balance, (b) diversity as understanding other cultures, (c) diversity as culturally divergent values, and (d) diversity as broadly

Copyright © 2004 Rose Mary Wentling
inclusive (cultural, subcultural, and individual). Griggs (1995) classified diversity into primary and secondary dimensions. Primary dimensions of diversity are those human differences that inborn and/or that exert an important impact on our early socialization and have an ongoing impact throughout our lives. The six primary dimensions include: (a) age, (b) ethnicity, (c) gender, (d) physical abilities/qualities, (e) race, and (f) sexual/affectional orientation. According to Griggs, people cannot change these primary dimensions. They shape our basic self-image and have great influence on how we view the world. The secondary dimensions of diversity are those that can be changed and include, but are not limited to: (a) educational background, (b) geographic location, (c) income, (d) marital status, (e) military experience, (f) parental status, (g) religious beliefs, and (h) work experience.

Thomas (1996) contends that diversity needs to be expanded much further than race and gender. He claims that diversity needs to be expanded beyond the single arena labeled human resources into the entire spectrum of strategic issues that modern corporations face. Thomas believes that by restricting the word, “diversity” only to “people” issues we overlook a powerful, versatile idea and a new tool that can contribute significantly to many problems facing organizations today. He states that diversity can be used as a tool for strategic management in issues such as globalism, acquisitions and mergers, teaming, work/family, teaming, and managing change.

For the purpose of this literature review, diversity is defined as all the ways in which people differ, and it encompasses all the different characteristics that make one individual or group different from another. It is all-inclusive and recognizes everyone and every group as part of the diversity that should be valued (Kossek & Lobel, 1996).

**Diversity in the Workplace**

The demographic composition of the U.S. society and the workforce has changed considerably and is expected to continue undergoing dramatic changes in the near future (Jamieson & O’Mara, 1991; Johnston & Packer, 1987; Judy & D’Amico, 1997). The demographic trends will most certainly affect the makeup of the U.S. labor force. Through 2020, people of color, white women, and immigrants will account for 85 percent of the net growth in the U.S. labor force (Judy & D’Amico, 1997). In 1980, women made up 43 percent of the total workforce. By the year 2010, they will account for more that 47.6 percent of the total workforce, and 65 percent of all American women will be employed. Also, in 1980, blacks made up ten percent of the total workforce and Hispanics accounted for six percent. By 2010, black will make up 12 percent of the total labor force. Hispanics will account for ten percent and Asians another four percent (U.S. Bureau of Labor Statistics, 2000).

The significant increase in minority populations also affects marketplace demands. According to the Population Reference Bureau, African Americans, Asians, and Hispanics currently make up about 21 percent of the U.S. consumer base and they are expected to reach 25 percent by the year 2010. Pollar and González (1994) noted that organizations benefit from diversity by tapping into the tremendous purchasing power that minorities have. They provided two examples: (a) older Americans spend over $ 800 billion annually; and (b) minority markets buy more goods and services than any country that trades with the United States (p. 22). To market products and serve a variety of diverse customers effectively, organizations will have to employ a diverse workforce (Brimm & Arora, 2001; Schell& Solomon, 1997).

The American workforce will continue to mature and there will be increase in the racial and ethnic diversity within the elderly population as well (U.S. Department of Commerce & U.S. Department of Health, 1998). The average age of the workforce is expected to increase, from 36 in 1986 to age 45 by the year 2010. Those in the 35-54 age group will increase by more than 25 million—from 38 percent of the workforce in 1985 to 55 percent by the year 2010. The combination of changes in the age distribution of employees and new flatter organization structures mean that several generations of workers can find themselves working side by side (Norton & Fox, 1997). Even if employees from these different generations were all white Americans, they would differ fundamentally in their values and attitudes about work, physical and mental functioning, as well as the everyday concerns that reflect their age group. There will be increasing differences within each generation, gender, and cultural group (Carnevale & Stone, 1995; Carr-Ruffino, 1996).

People with disabilities is another group that is becoming increasingly part of the workforce. Workers with disabilities have to be integrated in the labor force by law. They have been historically stereotyped and discriminated against because of their disabilities. "Such individuals are generally viewed as not being capable employees" (Henderson, 1994 p. 105). However, the American with Disabilities Act of 1990 has been a major piece of legislation that has tried to reverse this situation for workers with disabilities. Due to the American with Disabilities Act of 1990, people with disabilities benefit, as well as, society because supported employment helps decrease government subsidies and increases tax revenues and productivity.
When taking into consideration the changes in society and the workplace, it is easy to understand the significant role that diversity will play in the future competitive and organizational success. Regardless of whether one looks at diversity as a societal, workplace, strategic management, or a consumer marketing issue, these demographic changes cannot be disregarded (Carnevale & Stone, 1995; Jackson & Alvarez, 1992). The character of society and the workforce is changing and is expected to change significantly in the future. All these changes have directed many organizations to explore the business implications and have provided a strong rationale for managing diversity in the workplace.

Managing Diversity in the Workplace

Triandis, Kurowski, and Gelfand (1994) defined managing diversity very broadly, from the cultural perspective. For them “managing diversity means changing the culture—-that is, the standard operating procedures. It requires, data, experimentation, and the discovery of the procedures that work best for each group. It is more complex than conventional management but can result in more effective organizations” (p. 773). Thomas (1992) relates it to employees. For him managing diversity is to empower or enable employees. Managing diversity prescribes approaches that are philosophically broad enough to encompass all dimensions of diversity (p. 315). Henderson (1994) relates managing diversity to the accomplishment of the organization's goals. For him managing diversity also emphasizes managerial skills and policies needed to optimize and emphasize every employee's contribution to the organizational goals.

There are important fields that have shaped and continue shaping diversity (Simons, 1992). Simons identified the pioneering organizations in valuing diversity. International business has been one of the pioneer fields in valuing diversity. Diversity, in this case, has emerged as a need for survival and success. Multinational corporations are forced to develop and implement strategies that could lead them to capture and retain diverse customer bases not only nationally but also throughout the world. They are also required to recruit and retain a diverse workforce that mirror its market (Cox, 2001; Kossek & Lobel, 1996; Fernandez, 1993; Talbott, 2001).

Sports/athletic organizations is another group that has had the need to effectively manage diversity. Sports/athletic organizations include group dynamics, behavioral processes, social interaction, socialization, and subcultures. Sports have become more institutionalized, especially at the highest levels of amateur and professional athletic events and have come to reflect the corporate/commodity model, which make sports more like work than play (Frey & Eitzen, 1991). An athletic team’s win-loss record many times is used to measure its effectiveness. Similarly, a business organization’s profit-loss record is used to measure its efficiency. Comparable to organizations, an athletic team designs policies and procedures to recruit, socialize, train, and promote its team members. These policies and procedures are strategically utilized to make the team more effective, so they can compete and win (Guttmann, 1988).

In many professional athletic teams, players come from all parts of the world, different cultures, speak different languages, eat different foods, have different levels of education, and different values. To win and be competitive the team members need to understand and appreciate each other’s differences and work toward an overall team goal. Murrell and Gaertner (1992) conducted an experimental study that examined team interaction and performance outcomes in teams. They found that there was a significant difference between members of winning versus losing teams involving issues of team unity and cooperation, and interpersonal conflict. Players who were members of winning teams rated team unity and cooperation as more important, and interpersonal conflict as less favorable than players on teams with losing records.

Many companies trace their diversity initiatives to the Workforce 2000 report (Johnston & Packer, 1987), which greatly intensified concern for the effective utilization of an increasing diverse workforce. However, many believe that the concern for managing diversity started with Equal Employment Opportunity/Affirmative Action (EEO/AA). Traditionally, EEO/AA requirements have been based upon social, moral, and legal obligations. While many companies are still obligated to comply with EEO/AA policies today, they are convinced that programs and processes for managing diversity go beyond compliance with EEO/AA policies because they are directly connected to bottom-line business issues (Fernandez, 1993; Morrison, 1992; Norton & Fox, 1997; Thomas, 1999). According to Gottfredson (1992), “our nation must work harder to help all workers develop themselves to their fullest and that such efforts are required not only in the interest of social justice, but also to maintain competitiveness in the global marketplace” (p. 279).

Cox (1993) noted that companies that learn how to manage diversity acquire a competitive advantage over companies that do not know how to deal with diversity. They found that sound management of diversity affects cost savings, employee selection, creativity, problem solving, flexibility, marketing, and resource acquisition. Triandis, Kurowski, and Gelfand (1994) reported that those companies that “manage diversity well are more likely to gain
competitive advantages, attain increased productivity from available human resources, and reduce the intergroup conflict cost" (p. 775).

Managing and valuing diversity is a bottom line issue for organizations (Harris & Moran, 2001). Possibly, the simplest and the strongest rationale for managing diversity stems from the potential to increase productivity among all workers, especially among those groups of workers that have historically been underrepresented and underutilized (Miller & Katz, 2002). Examples of these groups include women, people of color, people with physical disabilities, older workers, and gay or lesbian employees (Carnevale & Stone, 1995; Hayles & Russell, 1997; Morrison, 1992). It is not legally required that organizations manage diversity, instead it is in the best interest of American corporations to develop and utilize the talents and energies of all their workforce. Managing diversity’s goal is to develop an environment that takes into consideration all dimensions of diversity and works for all employees at all levels in the organization (Griggs, 1995; Loden, 1996).

Strategies for Managing Diversity in the Workplace

During the last decade, many organizations have responded to the increase in diversity with programs designed to manage diversity in the workplace (Arredondo, 1996; Baytos, 1995; Carnevale & Stone, 1995; Cox, 2001; Fernandez, 1993; Gottfredson, 1992; Griggs, 1995; Thomas, 1996; Wheeler, 1996). Cox (1993) reported on about 42 American corporations' specific diversity activities. Examples of such programs included nontraditional work arrangements, such as flextime and home work stations; education and training programs intended to reduce stereotyping, increase cultural sensitivity, and develop skills for working in multicultural environments; career management programs designed to promote constructive feedback to employees, mentoring relationships, and access to informal networks; and new employee benefits, such as parental leave and dependent-care assistance.

Wheeler (1995) conducted a study for the Conference Board. He surveyed and interviewed 69 diversity managers, consultants and academicians and found seven innovative diversity initiatives. Those practices were: (a) incorporation of diversity into mission statement; (b) diversity action plans; (c) accountability in business objectives; (d) employee involvement from all levels and functions; (e) career development and planning; (f) community involvement and outreach; and (g) long-term initiatives directed at overall culture change.

Although there are a wide range of approaches and strategies for managing diversity, there is no single approach or strategy that can be recommended for all organizational situations. Even though there is no method that contains all the necessary ingredients for success in managing diversity, several individuals have developed steps and/or procedures that can assist organizations in successfully managing diversity. Morrison (1992) cited five major steps involved in the process of putting diversity into action. The first step is to identify the diversity problems in the organization by collecting relevant information. The second step is strengthening top management commitment by getting them involved in the diversity effort. Third, select practices that fit the organizations needs and problems and develop a balanced diversity strategy. Fourth, measure the specific results of the diversity efforts. Fifth, establish a process that ensures ongoing successful diversity efforts.

Louw (1995) identified five phases in the overall process of managing diversity. (a) needs analysis---answer the questions why, what, how, when, where, and who of the managing diversity strategy; (b) diversity strategy design---develop goals, objectives, methods, dimensions, management, actions, priorities, and resources of plan; (c) development---form specific interventions and initiatives related to diversity; (d) implementation--develop a plan that answers who, when, where, and how the diversity interventions and initiatives will be accomplished; (e) maintenance---evaluate and monitor diversity efforts to ensure ongoing improvement. In addition, Louw (1995) identified the following eight principles required for managing diversity successfully: Use a holistic, integrated approach; obtain top management commitment and accountability; consciously work to integrate diversity values into the broader organizational values; integrate responsibility for diversity initiatives into other management functions and initiatives; integrate diversity efforts with existing strategic objectives and programs; expect resistance to change, and take steps to minimize it; use a participative management approach; and be instrumental or facilitative rather than charismatic or autocratic in leading diversity initiatives.

Leadership commitment and revising policies and benefits so that they support diverse needs are elements that are essential to building diversity (Cross, 2000; Carnevale & Stone, 1995). Before diversity can be valued and properly managed in any organization, the organization’s leadership must be committed to it. Leaders/managers need to get directly involved in making things happen. Leaders need to lead by example, and also hold others accountable. They warn that proceeding without leadership commitment diversity initiatives will have little impact if employees view management as not supportive of diversity efforts. When people are engaged in diversity initiatives and leadership commitment is lacking, it is important to stop and design a strategy to get it. Commitment takes time to develop and leaders/managers need to understand the benefits and process involved in managing
diversity (Arrien & Gorbachev, 2001). Many organizations use accountability as a key component to ensuring commitment to diversity from their managers (p. 27). Some organizations have managers develop their own diversity goals and specific ways to demonstrate their support for diversity. Other organizations connect performance-appraisal ratings, compensation, and even annual bonuses to the achievement of diversity goals (Weiss, 2001). Morrison (1992) found through her research that companies are beginning to attach consequences to diversity-related performance. According to Morrison, leaders competent in developing and capitalizing on diversity are essential to the success or American organizations. Further, Loden (1996) stated that to set the stage for changing the organizational culture, company leaders must take an influential and visible role from the very beginning. Specifically, their role must focus on: Acknowledging the fundamental difference between equal employment opportunity and valuing diversity; endorsing the value of diversity and communicating this throughout the organization; and articulating a pluralistic vision (p. 197).

Organizations are undertaking a number of diversity initiatives. However, no single strategy or activity, used in isolation, is likely to constitute an adequate approach for managing diversity. What is needed is a careful selection of initiatives adapted to organizational needs, tied to business aims, and used strategically in an ongoing manner. Clearly issues of managing diversity need to work their way through the strategic planning process of the organization. Diversity initiatives should not be fixed and should be modified over time, as an organization needs change.

The Role of HRD Professionals in Organizational Change and Diversity

Bringing about organizational change effectively may be one of the most critical challenges facing human resource development professionals today (Kossek & Lobel, 1996; Norton & Fox, 1997; Weiss, 2001). A survey of the nation’s top human resource professionals at American’s Fortune 100 companies found that their number one concern was managing change (Laabs, 1996). Any change process needs to recognize the issues of workforce diversity in relation to organizational change, especially as it relates to buy-in and the eventual success of the diversity initiatives (Henderson, 1994; Norton & Fox, 1997; Triandis, 1998; Weiss, 2001). By viewing every diversity initiative as having a critical change element that will either drive or restrain the initiative, HRD professionals can more effectively tap all of the organization’s human capital. HRD professionals today need to develop diversity initiatives that take the changing needs of all their workforce into consideration. In order to respond to such needs, HRD professionals need an understanding of the culture of the organization and a broad-base definition of diversity.

The ideal intend of diversity initiatives is to maximize the utilization of all available talent in the organization, in order to accomplish the organization’s goals and objectives (Davidson & Fielden, 2003; Martino, 1999; Schell & Solomon, 1997; Thomas, 1996). In addition, effective diversity initiatives assist in removing barriers related to gender, race, ethnicity, family responsibilities, level of education, religion, personal beliefs, and so on (Morrison, 1992). The organizational culture can be either a driving force or a restraining force for diversity initiatives (Miller & Katz, 2002; Norton & Fox, 1997).

For HRD professionals to implement diversity initiatives they must enlist the support and commitment of top management. Before an organization can change top level leaders must agree that change is necessary (Cross, 2000). They must buy-in to the idea that a change is needed and believe that the proposed diversity initiatives will bring about the desired change (Carnevale & Stone, 1995; Loden, 1996). To obtain the support of top management HRD professionals need to make clear the purpose of the diversity initiatives (e.g., improve productivity, increase new markets, decrease employee conflict, improve employee moral) by providing them with relevant education (e.g., information, statistics, documentation). The primary purpose is to obtain the commitment of appropriate stakeholders (those individuals with a stake in the welfare of the organization) by helping them to understand the positive organizational change that will take place because of successful diversity efforts (Baytos, 1995; Hayles & Russell, 1997; Norton & Fox, 1997). HRD professional whenever possible need to make a link between the organization’s goals and the achievement of these goals through the implementation of the diversity initiatives.

Once HRD professionals have obtained the support and commitment of the organizational leadership and they are fully behind the proposed diversity initiatives, the organization’s readiness for change needs to be assessed. The purpose is to develop a clear understanding of the driving and restraining forces present in the organization and using the information effectively in determining the possible outcomes of the diversity initiatives (Arredondo, 1996, Loden, 1996). Resistance may be found from members of management, individual employees, and in even from individuals outside the organization such, as customers and suppliers (Thomas, 1999). HRD professionals can conduct a cultural assessment to obtain a better understanding of the organization’s culture and how it may affect the desired outcomes of the diversity initiatives. During a cultural assessment data can be collected about the
organizational culture; organizational structure; management systems, policies and practices; individual/team roles and responsibilities; work relationship skill, and so forth (Gardenswartz & Rowe, 1998; Greer, Plunkett, & Plunkett, 2003; Norton & Fox, 1997). Cultural assessment data can provide a comprehensive analysis of the issues that could affect the implementation of diversity initiatives in the organization (Loden, 1996).

Next the HRD professionals must develop specific plans for overcoming possible barriers and implementing the desired diversity initiatives (Baytos, 1995; Prasad & Mills, 1997; Thomas, 1999). In planning the organizational diversity initiatives the HRD professionals need to work closely with organizational leaders and employees representatives from different groups and levels. The purpose is to develop a planning process for the diversity initiatives from beginning to end in order to maximize the potential for success (Arredondo, 1996; Hayles & Russell, 1997). The HRD professionals need to decide on the specific strategic objectives that the diversity initiatives are intended to achieve and make sure that these are reflected in the mission and goals of the organization. In addition, outcomes of the objectives need to be identified, as well as the systems, policies, and practices needing to be changed to achieve these outcomes. During planning it is important for HRD professionals to identify other corporate initiatives that can be linked to the diversity initiatives. Plans for linking different change initiatives may allow an organization to increase its competitive advantage by coordinating and combining efforts and resources wherever possible (Norton & Fox, 1997; Wheeler, 1996).

Next, HRD professional need to assist in the implementation of the diversity initiatives that were planned by embedding them into the systems and functions of the organization and consequently changing the organizational culture (Arredondo, 1996; Baytos, 1995). The expected outcomes is for the diversity initiatives to be integrated into the organizational culture; for the systems, practices, and policies to be re-engineered to support the diversity initiatives where necessary; and for employees to acquire the knowledge, skills, and experience they will need to ensure their success (Hayles & Russell, 1997; Wheeler, 1996). Diversity initiatives of any type can result in backlash or increased inter-group conflict when the initiative is poorly implemented. HRD professionals can identify specific skill deficits and help determine the appropriate education and training (Carnevale & Stone, 1995; Clements & Jones, 2002; Prasad & Mills, 1997). For example, it may be that cross-cultural sensitivity training is needed to increase awareness and understanding of differences reflected in different cultures. Similarly, employees may need to learn to communicate better in order to work together more effectively, or learn to negotiate disagreement more productively, or learn how to perform better as a group, and so on (Gardenswartz & Rowe, 1994; Norton & Fox, 1997). Many diversity experts recommend that all training related to diversity initiatives be customized. They believe that training should be customized to fit the realities and needs of each organization (Carnevale & Stone, 1995; Cox, 1993; Griggs, 1995; Thomas, 1996; Loden, 1996).

After the diversity initiatives have been fully implemented and integrated into the organization, (which may take several months or several years, depending on the types of initiatives) and a new organizational culture has been created, it is important to assess the diversity initiatives with emphasis toward future changes or directions that should be established (Baytos, 1995; Norton & Fox, 1997). HRD professionals can measure outcomes with a combination of hard data (attrition rates, productivity indexes, promotional patterns, employee-satisfaction ratings, customer feedback, etc) and more subjective data generated by focus groups (town meetings of both internal and external consumers and workers, etc.). Outcomes assessment data can provide valuable insights into what improvements can be made for the future related organizational diversity initiatives (Arredondo, 1996; Gardenswartz & Rowe, 1994). Organizations today must continuously plan for the future. Frequently diversity initiatives are implemented and then the change process comes to an end. To ensure that the diversity initiatives that have been implemented continue to have the desired effect and more important to plan for the future, HRD professionals need to establish a monitoring system with continuous feedback, so that problems can be noted early on and strategies for future action can be identified (Arredondo, 1996; Baytos, 1995; Henderson, 1994; Norton & Fox, 1997).

The human resource development (HRD) approach to diversity focuses on the interplay between people and the organization, and recognizes that diversity includes every employee (Davidson & Fielden, 2003; Henderson, 1994). This perspective starts with the principle that people are the most important resource in an organization. The challenge is to successfully apply and optimize every employee’s contribution to make an organization better. To effectively manage diversity, it is important for HRD professionals to understand the beliefs and values of the employees in the organization. These beliefs and values come together to create an environment that employees perceive as supportive or not supportive of diversity. Within all organizations there are diversity supportive and non-supportive people, policies, and informal structures. This is referred to as the organizational culture. The process to change an organization’s culture requires the implementation of effective diversity initiatives by HRD professionals. The integration of diversity issues into all systems and functions of an organization means eliminating
barriers to the full utilization of all organizational employees. The aim is to see that all employees are empowered to contribute to their fullest potential in achieving professional and organizational goals.

This proposal for an Innovative Session at the AHRD Annual Conference is intended to assist new and experienced research scholars in publishing their research work. This session will consist of the Editorial Board of a leading HRD journal and a panel of published scholars providing guidance and suggestions to authors interested in getting their materials published. The session will include tips on the most significant factors that cause manuscripts to be accepted and rejected.

Keywords: Journal Publication, Refereed Process, Editorial Review

Theoretical Framework

Success in publishing is an uncertain business. Authors must be systematic, persistent and willing to accept total rejection. Huff (1999) offers some wise words when advising authors, “Don’t fall in love with anything you have written. Be willing to cut, revise and reorganize every word and every draft” (p. 120).

Getting a manuscript published can be a game of chance. It depends on many factors that may be within the author’s control or completely outside of the author’s control. Successful publication can be enhanced, however, if authors take opportunities to learn tips and skills that will increase the probability of acceptance. For many authors, publishing becomes easier and more effective when they follow the suggestions and counsel of other scholars who have successfully published or been involved in the Editorial Review process (Henson, 2001). Authors armed with knowledge of the publication process and editorial expectations and guidelines can gain greater control of the fate of their manuscript, and subsequently their career.

Scholars have a responsibility to contribute to their professions by increasing the knowledge base of their particular field, enhancing the professional literature and sharing their knowledge with others at professional meetings (Staudt, Dulmus, & Bennet, 2003). Scholars also have an obligation to model scholarly writing in their

work. A scholar’s livelihood and future can very well depend on their ability to publish on a regular basis. This “publish or perish” (McConnell, 1999, p. 73) expectation creates a scenario in which an author must avail themselves of, as well as develop, particular writing habits and methods that will significantly increase the opportunity for acceptance. Writing quality is critical to successful scholarly publication. A key to this success is keen familiarity with the publication and/or Editorial Review process (Thompson, 1995).

According to Smaby and Crews (1998), every author seeking publication should “make writing their top priority, set writing achievement goals, spend time matching their project to a relevant journal, develop an outline for each paper, maintain a coherent focus within the manuscript and follow journal submission guidelines” (p. 2). Authors should practice their writing by “submitting different types of papers for publication such as book reviews, practitioner-oriented pieces and non-refereed articles” (Dorn, 1985, p. 512). Writing for these types of publications will give an author confidence, expose the author to various publication processes and allow the author to make contacts within their scholarly field. Another outcome will be that the author will receive appropriate feedback to assess and redefine writing problems and behaviors. The author can then establish a writing program for change by setting short- and long-term goals for eventual publication in a scholarly journal (Smaby, Crews, & Downing, 1999).

Specific strategies for attaining this level of writing experience and mastery and ultimately publishing scholarly research result can be obtained by affiliating with other published scholars in one’s field of expertise. By creating networks of contacts and mentors, scholars can increase the likelihood that their publications will be of the quality accepted by scholarly journals. An elevated understanding of the publication and Editorial Review process can help the author “identify writing goals” (Henson, 2001, p. 765); “attend to the details” of writing a research manuscript (Thompson, 1995, p. 343); “accept constructive feedback” from the peer-reviewers and editors (Thompson, 1995, p. 343); focus on “complying with revision requests” of editors (Thompson, 1995, p. 344); “follow the submission and style guidelines” requested by a particular journal or publication (Henson, 2002, p. 766); “have colleagues judge a manuscript prior to submission” (Henson, 2001, p. 765); and “choose the right journal for their manuscript” (Miracle, 2003, p. 31).

Authors must remain ethical with regard to “authorship, simultaneous submissions, integrity of research information and conflict of interest” (Erlen, 2002, p. 68). Research-based scholarly writing encompasses a wide array of issues that must be addressed in order for publication to occur. An author’s ability to access publication resource information to not only improve their writing quality, but to be aware of specific guidelines for publication will determine that authors publication success and potential future research and publication opportunities.

Erlen (2002) suggests that in order to “improve their writing and help them establish good habits when developing papers, authors need to identify resources such as mentors or colleagues who can assist them as they prepare a manuscript” (p. 68). As authors focus their energies on improving the quality of their writing and work habits, the publications will naturally follow. Subsequently, authors will not only gain personal and professional acknowledgment, but also learn respect for the work of others through honoring the scholarly pursuit of publishing.

Session Description

The proposed Innovative Session will help guide both novice and experienced researchers to learn more about the Editorial Review and publication process. The authors will receive tips, suggestions and strategies from published scholars on how to get published and increase publications. The authors will obtain insights about the peer review process and gain greater understanding of why and how a manuscript gets accepted or rejected. This session will provide a unique opportunity for authors to network with one another, collaborate and share ideas within their fields of expertise, and hear direct feedback from their peers who have published.

Authors will also work in small groups with published scholars and members of an Editorial Board, discussing relevant issues in publishing and the profession. It will not be a review course for how to write a manuscript. It will give potential authors the chance to voice questions, ideas and concerns of their own as well as obtain insights from an established group of authors about the publication process. It will offer counsel into why a manuscript gets accepted or rejected, the dilemmas of accepting feedback, how to make suggested revisions and handling editorial rejections. While the session does not guarantee publication in any journal, it does offer an opportunity for researchers to find out particular guidelines that will assist them in gaining confidence to publish their manuscript. The session will also provide authors the opportunity to hear what an Editorial Board looks for in manuscript submissions.
Presenters and Panelists

A five member Editorial team of a leading Human Resource Development journal will lead the innovative session, with one who will act as the moderator and facilitator. All members will actively participate in the session with each bringing their particular views and experiences into the discussion. The Qualitative and Quantitative Editors will offer suggestions of how to design the methodology and results sections as well as offer their insight and comments for the overall manuscript. The Editor and Associate Editor will elaborate on their own publication experiences, review the guidelines for journal submissions and the differences between a manuscript that is accepted and one that has been rejected. The Managing Editor will give some tips on how to submit a manuscript for publication including style guidelines and what to send and what not to send with the manuscript. Finally, the invited panelists will participate in small group sessions on publication issues as well as offer their scholarly advice and answer any questions participants may have.

Purpose

The purpose of the Innovative Session is to assist new and experienced researchers with improving their scholarly writing to achieve publication of their manuscripts in peer-reviewed journals. This innovative session is structured so an author can get a better understanding of what combination of scholarly activity, writing style, personal dedication, and professional expertise go into preparing a publication-worthy manuscript. This session is not a guarantee of publication in a journal. It will, however, provide tips and hints on how authors can make their scholarly work more attractive to an Editorial Board. This session will utilize the expertise of published HRD professionals to guide other authors in their efforts to publish scholarly work in the field of HRD. The authors’ backgrounds differ in such a manner that this session will address both the qualitative and quantitative aspects of scholarly writing and go in depth with regard to specific publication guidelines and tips. The session will also provide time and opportunity for authors to ask specific questions of the panelists regarding publishing in a scholarly HRD journal. The breakout session and small groups will lend to individual attention and focus to particular publication questions and concerns of authors.

Goals

To assist researchers in preparing their manuscripts for submission to journals, the proposed Innovative Session will provide a ‘developmental’ discussion followed by a question and answer period. By the end of the session, each author should have a clearer understanding of what components are involved to successfully write a manuscript suitable for consideration by a scholarly HRD journal for publication. This session is intended to enlighten authors regarding the essential features and strategies to get published in any HRD scholarly journal, not any particular one. The panelists have published in a wide variety of scholarly HRD journals and can thus provide significant feedback on common themes, processes, and expectations. The authors will learn about the content and organization of a manuscript that is ready for publication (American Psychological Association [APA], 2001). The session will achieve this by completing the following goals:

- Differentiating between quality scholarly-based research and practitioner-based work.
- Exploring the essential elements of research-based manuscripts and what must be included.
- Discussing the essential nature of focusing the research on new and developing areas of interest in scholarly fields, thus making a strong case for the importance of the work to the field or other implications.
- Elaborating on the importance of presenting relevant findings and making connections to existing literature.
- Rationalizing reducing the method section to the key elements as well as identifying what elements to keep and what to leave out.
- Providing the basic information for submitting a manuscript to a journal.
- Staying encouraged and not discouraged in the publication process.
- Tips of the trade by the Editors of a leading HRD journal including a list of Tips for Authors and a copy of Information to Contributors.

Discussion and Timetable (90 minutes)

- Introduction of the panel members, what each person brings to the session, review of goals and objectives (15 minutes).
b. Explanation of what differs between an accepted and rejected manuscript (10 minutes).
c. Break out into small groups led by the panelists to explain their own personal writing strategies, successes and failures as well as their perspectives on the process of publication and peer-review. These discussions will include insights on 1) focusing the manuscript on research area studied, hypothesis or research question; 2) adequately and succinctly providing a review of literature; 3) streamlining the methodology used and presenting the findings in a succinct manner; 4) allowing for complete discussion of limitations of study, recommendations for future research and logical conclusions (40 minutes).
d. Re-convene and report back from small groups with a discussion period and an open question and answer period (20 minutes).
e. Wrap-up and address any additional items (5 minutes).
f. Adjourn.

The Innovative Session is planned so each participant can gain a better understanding of how to write and report their scholarly findings in a manuscript that is ready for review and possible publication by a journal. While it does not guarantee publication in any journal, it does offer a unique opportunity to discuss with the Editorial Board of a leading HRD journal and leading scholars the requirements of a potentially successful manuscript submission. The format has been designed to thoroughly present the pertinent material and to allow for adequate discussion between the panel and the audience.

Tips for Authors

- Follow exactly the submission and style guidelines established by the journal.
- Proof-read your manuscript and ask a colleague or peer to proof-read prior to submission.
- Remove any identifying features within the manuscript.
- Work with others and learn from their experience and expertise.
- Use all available resources that will help the manuscript get published. Become intimately familiar with spell check, thesaurus and your word processor.
- Be patient! The peer review process can take up to six months or longer depending on the journal.
- Don’t take recommendations or rejections personally. Feedback, even rejection, can be an excellent learning tool.
- Follow ethical behavior. Let editors know if the paper was a previous conference proceeding, poster session, or submitted elsewhere. Don’t submit manuscript to more than one journal at a time.
- Be resilient and persistent. Accept suggestions for improvement, knowing this information will help get closer to publication. Comply with revisions requests of editors, and do it in a timely manner, as this means the paper is being considered for publication.
- Start small. Editorials, case studies, book reviews and practitioner pieces are good ways to build confidence and skill in writing.
- Develop your writing skills. Make writing a habit and a regular part of your personal and professional life. Set aside time to write and improve your thinking and writing behaviors.
- Remember that a successful publication is a work in progress that can take more than once to complete. Don’t ever give up!

Information to Contributors: Guide To Preparing Manuscripts

A. Importance of Topic
1. Theoretical Importance
   - Is theoretically important
   - Can take field in new directions of change future research
   - Justifies claims of importance
2. Practical Importance
   - Is practically important
   - Links theory and practice
3. Appropriateness
   - Is appropriate to the journal and readership
   - Is a new, emerging, or under-researched area
   - Is timely in terms of current trends
B. Literature Review  
   1. Linkage to most important literature  
      - References cite key studies  
      - Considers recent literature  
      - Recognizes all relevant aspects of literature  
   2. Framing the Problem  
      - Uses literature to develop arguments, not just a review  
      - Fits the study into a logical development of the area  
      - Justifies direction taken by the study  
   3. Thoroughness and Accuracy  
      - Demonstrates understanding of the literature  
      - Draws proper inferences without overstating, misinterpreting, or selectively reporting  
      - Identifies the major issues and themes relevant to the study  
      - Reviews the literature critically, pointing out limitations, conflicts, and constraints  
      - Recognizes seminal works and minimizes non-scholarly citations  
      - Integrates other literature bases when appropriate  
      - Clarifies narrowly defined terms  

C. Problem Statement  
   1. Adequacy of scope and complexity  
      - Focuses on most critical variables that may influence situation  
      - Level of abstraction appropriate for the study  
   2. Presenting the Research Problem  
      - Explains the principal proposition in some depth  
      - Presents how the interacting proposition contradicts the principal proposition  
      - Explains how the speculative proposition provides a consequence for the interacting proposition  
      - Presents the explicative statement to propose a purpose for the study  
   3. Clarity and Logical Coherence  
      - Defines constructs and variables clearly and differentiates them  
      - Uses theory and arguments that are internally consistent  
      - Reaches logical and clear deductions about the theory or conceptual development  
      - Constructs statements in a way to be understood by a wide range of readers  

D. Methodology  
   1. Appropriateness of Sample and Setting  
      - Uses a sample that is appropriate for the research questions  
      - Uses a setting that is appropriate for the research questions  
      - Uses a context that is relevant to the human resource development field  
   2. Appropriateness of Method or Paradigm  
      - Justifies use of methodology based on research problem and questions  
      - Describes methodology adequately to ensure replication  
      - Describes trade-offs in selecting one method or paradigm over another  
   3. Appropriateness of Data Gathering  
      - Provides information about how instruments were developed  
      - Provides information about the reliability of instruments  
      - Provides information about the validity of instruments  
      - Provides statements about the limitations of the instruments  
      - Provides information about how interview or observational protocols were developed  
      - Provides information about the use of audits and other techniques  
      - Provides statements about the limitations of the protocols  

E. Research Design  
   1. Appropriateness  
      - Uses appropriate design  
      - Matches research questions, questions, or issues that are amenable for the design  
      - Addresses issues of control, influence, causation, relevance vs. rigor, internal and external validity
2. Technical Accuracy
   • Uses statistical techniques accurately
   • Addresses issues related to statistical techniques
   • Uses qualitative techniques accurately
   • Addresses issues related to analyzing qualitative data
   • Describes all procedures clearly to ensure possible replication
   • Describes any procedural issues that might be of interest to other researchers

F. Data Analysis, Results, and Conclusions
   1. Appropriateness of the Reporting
      • Reports both descriptive and inferential statistics
      • Reports analyses in logical order
      • Reports significance levels
      • Reports complete tables to ensure replication
      • Reports sample qualitative data to support results and conclusions
   2. Appropriateness of the Results
      • Links research questions and data analyses
      • Does not over-interpret or under-interpret results and conclusions
      • Minimizes discussion of tangential results
   3. Appropriateness of the Conclusions
      • Links results to conclusions
      • Does not go beyond results in the conclusions
      • Derives theoretical implications from the results
      • Derives practical implications from the results
      • Places results in larger context
      • Suggests new and innovative directions for future research
      • Considers both limitations and constraints in the study
      • Does not overlook results that contradict or suggest alternative explanations

G. Presentation
   1. Quality of the Writing
      • Presents analyses clearly
      • Presents ideas in a logical and orderly manner
      • Shows intentional organization
      • Is impartial, objective, and professional in the treatment of the subject
      • Tells an integrated, consistent story
   2. Conformance to Publication Requirements
      • Conforms to publication guidelines
      • Presents citations correctly
      • Follows journal style and format requirements

H. Contribution of the Manuscript
   1. Overall contribution
      • Makes a theoretical contribution
      • Makes a practical contribution
      • Makes a methodological contribution
      • Provides a constructive replication
   2. Contribution to Current Knowledge
      • Fills gaps in current knowledge
      • Goes beyond literature
      • Has the potential to stimulate future research
   3. Creativity and Scope
      • Addresses the “so what” question
      • Is innovative in some respects
      • Reports new information not found elsewhere

From the Editors
Call for Papers – AHRD 2005 Conference
AHRD 2004 Conference Overview

Pre-Conferences
Wednesday and Thursday, March 3 – 4

Bridging HRD Research and Practice: Motivating, Collaborating, and Communicating through Awards, Partnerships, and Translations
Chris Squillaci, Darren Short, Ghazala Ovaice, Marijke Kehrhahn, Martin Kormanik, Nancy Berger, Philip Graham, and Jamie Callahan (PC-1 No Description)

International Adult and Continuing Education: Expanding the Horizons (in Conjunction with the Induction of the 2004 Class of the IACE Hall of Fame)
Richard Swanson (PC-5 No Description)

Factor Analysis: Exploratory and Confirmatory - Advanced Faculty Professional Development Seminar on Quantitative Research Methodology Tools
Bruce Thompson (PC-6 No Description)

E-learning in Human Resource Development
Theo Bastaens and Rob Martens

OD Consulting Engagements Gone Wrong: A New Framework for Analyzing and Learning from Our Mistakes
Joanne Provo, Monica M. Danielson, Gregory M. Henderson, Terrence Gray, Kshanika Anthony

Continuing Professional Education: Linking CPE and Workplace Learning
Tonette Rocco and Jasper van Loo

Conference Papers

Friday, March 5 • 10:30 AM – 12:00 PM

Symposium 1: HRD with International and Multinational Groups

Corporate Universities v Traditional Universities: Comparison Through Published Organisation Documentation
John S. Walton and Michele Martin

Current Status of Executive Coaching Interventions as Identified by Selected Consultants to Multinational Organizations
Brandi L. Plunkett, Toby Marshall Egan, and Marco Garza

An Evaluation Case Study of an International Student Services Office: Assessing Satisfaction and Productivity
Laura Hammons, Yi-Hsuan Lee, Ralitsa Akins, Usha V Somasundaram, and Toby Marshall Egan

Symposium 2: Learning in Communities

Adult and Community Learning in England: A New Era for HRD in the Community?
Jonathan Winterton

Adult Literacy: Issues and Directions Impacting HRD
Don Seaman, Susan A. Lynham, Thomas Chermack, and Wendy Ruona

Giving Voice to the Factors that Promote and Inhibit Learning in a Community- Based Multicultural Immersion Program: Adult Learner Perspectives Implications for Research and Practice in HRD
Chaunda Scott
Symposium 3: Learning Measurement and International HRD
Neural Network Analysis in Cross-Cultural and Comparative Management Research: Implications for International HRD
Aahad M. Osman-Gani
3-1
Construct Validation of an Arabic Version of the Learning Transfer System Inventory (LTSI) for Use in Jordan
Samer Khasawneh, Reid A. Bates, and Elwood F. Holton, III
3-2
Validating Constructs of a U.S.-Based Transfer Instrument in Taiwan
Hsin-Chih Chen, Elwood F. Holton, III, and Reid A. Bates
3-3

Symposium 4: Gender in HRD
Women's Socio-economic Development in India: The Role of Non-governmental Organizations - Research and Theory
Meena Razvi and Gene L. Roth
4-1
Women in Information Technology
Rose Mary Wentling and Steven Thomas
4-2

Symposium 5: Intellectual Capital and Human Capital Theory
Continuing Professional Education and Human Capital Theory
Jasper B. van Loo and Tonette S. Rocco
5-1
Intellectual Capital: Opportunities and Challenges
Madeleine Doran
5-2
Human Capital Theory: A Reflection on Retention of Employees in the Hospitality Industry
Hanna B. Hayes, Meera Alagaraja, and Larry M. Dooley
5-3

Symposium 6: Connecting Education and Practice
Making Connections: The Link between HRD Education, Practice, and Research
Lindsay M. Taylor and Jamie L. Callahan
6-1
Kit Brooks, Fredrick M. Nafukho, and Mary Herrington
6-2

Symposium 7: Formal and Informal on-the-job Learning
Work Practice, Learning Worker Characteristics and Informal Learning
Anja J. Doornbos
7-1
Contextual Factors and Detractors Shaping Informal Workplace Learning and Its Facilitation: The Case of 'Reinventing Itself Company'
Andrea D. Ellinger
7-2
Unanticipated Effects on Trainers Using Structured OJT: The Literature Review
Dae Yeon Cho and Ronald L. Jacobs
7-3

Innovative Session 1
Organizational Development in Universities
1-1

Friday, March 5 • 1:30 PM – 3:00 PM

Symposium 8: International Human Resource Development
The Why's of Bhopal Revisited
Meera Alagaraja and Sudha Arlikatti
8-1
Socio-economic Status of Women in India
Meena Razvi and Gene L. Roth
8-2
The Role of HRD in Chinese State-owned Banks and Implications for Future HRD Policies and Practices
Jie Ke, Kenneth E. Paprock, and Susan A. Lynham
8-3
Symposium 9: HRD Methods and Tools
The Web-based Delphi Research Technique as a Method for Content Validation in HRD and Adult Education Research
Sharon Colton and Tim Hatcher
Competencies and Training Needs of Financial Aid Administrators
James F. Lane, Jr.
Development and Change through Scenario Planning
Thomas J. Chemack and John S. Walton

Symposium 10: Considerations for Distance Education
Online and Face-to-face Training: A Cost Matrix
Sharon J. Bartley and Jennifer H. Golek
Designing an Assessment Model for Implementing a Quality Online Degree Program
Rita L. Dobbs and W. Clayton Allen

Symposium 11: Gender and Mentoring
Organizational Politics and Culture: An Essential Attribute of the Mentoring Experience for Women Faculty
Sharon K. Gibson
Do Formal Mentoring Programs Matter? : A Longitudinal Randomized Experimental Study of Women Healthcare Workers
Toby Marshall Egan and Manda H. Rosser

Symposium 12: Emotions in Organizations
Creating Consumer Resistance through Adbusters: Managing Emotion beyond Organizational Boundaries
Jennifer A. Sandlin and Jamie L. Callahan
Identity Consistency: The Role of Emotion Management across Contexts
Aubrie Horrocks and Jamie L. Callahan

Symposium 13: Creativity and Aesthetics
Developing the Creative Class: A Role of Human Resource Development Programs
Consuelo L. Waight, Shirley Ezell, and Katy Greenwood
Practise In and Perceptions of HRD: Do we Need an Aesthetic Perspective?
Stephen Gibb

Symposium 14: Collaboration
Building Web-based Communities: Factors Supporting Collaborative Knowledge-building
Jennifer Calvin, David S. Stein, and Joe E. Wheaton
There is No "We" in Team: Learning to Learn across Difference in Problem-based Teams
John M. Dirkx and Regina O. Smith

Innovative Session 2
Teaching the Ins and Outs of Evaluation in Organizations
Hallie Preskill and Darlene F. Russ-Eft

Friday, March 5 • 3:30 PM – 5:00 PM
Symposium 15: Cross Cultural Training
Context beyond Culture: Implications for Human Resource Development?
David Ripley and Irene Hudson
Intercultural Training for Business Expatriates: Cultural-specific Training Needs of US Business Expatriates on Assignment to Taiwan
Tien-Chen Chien and Gary N. McLean
Connecting Cross-cultural Training Transfer with Performance
Anne W. Drewry, Vickie Johnson Stout, and Brian Walker
Symposium 16: Strategic Human Resource Development
The Emotional Reactions of HRD Professionals to the Decision to Outsource HRD
Nicole Simons, Jean Woodall, and Stephen Gourlay
Testing a Model of Employee Selection: A Contextual Approach
Kiyoe Harada and Jeffry S. Bowman
An Integrated Approach to Planning in Organizations
Thomas J. Chermack

Symposium 17: Learning
Transformational Learning and Human Resource Development: Advances Toward a Knowledge Based Society through Humor
Joanne Parke
Escaping the Tyranny of Belief
Albert K. Wiswell and C. Leanne Wells
Asking the Right Questions, Looking in All the Right Places: Re-embedding Knowledge Construction in Professional Education
Suzanne J. Gallagher

Symposium 18: Mentoring
A Summary Analysis and Prescriptions for Mentoring in Multicultural Organizations
Ray K. Haynes
The Advantages of Reporting to Your Mentor: A Comparison of Managers with Supervisory and Non-supervisory Mentors
Sarah A. Hezlett
A Systems Approach to Mentoring: A Review of Literature
Jeeyon Paek

Symposium 19: Organizational Commitment
Voluntary Organizations: Commitment, Leadership, and Organizational Effectiveness
Terry P. Ekeland
Training and Organizational Commitment among Nurses in New Zealand and United States
Kenneth R. Bartlett and Dae-seok Kang
Commitment Elements Reframed (Antecedents and Consequences) for Organizational Effectiveness
Sandra L. Fornes and Tonette S. Rocco

Symposium 20: Knowledge Management
Knowledge Sharing in Organizations: An Analysis of Motivators and Inhibitors
Minu Ipe
Knowledge Management Leadership: Exploring the Role of the Chief Knowledge Officer
Tina M. Chindgren
A Critique of Selected Knowledge Management Models
Baiyin Yang, Wei Zhen, and Chris Viere

Symposium 21: Defining Human Resource Development
Human and Organization Studies: The Discipline of HRD
Neal Chalofsky
A Survey of Current and Former Members of the Academy of Human Resource Development
Fredrick M. Nafukho and Barbara E. Hinton
Bridging the Great Divide: Exploring Resistance to HRD in Adult Education
Laura Bierema, Wendy Ruona, Maria Cseh, Andrea D. Ellinger, and Karen Watkins
## Innovative Session 3
Behaviorally Anchored Competencies as Assessment Tools
*Kim E. Dooley, James R. Lindner, Larry M. Dooley, Meera Alagaraja, Gary Jedynak, and Elaine Patterson*

### Saturday, March 6 • 10:30 AM – 12:00 PM

### Symposium 22: Exploring International Human Resource Development

- **Grounding Our HRD Practice in the Challenges of Management Development: A Case of China**
  *Jia Wang and Wendy Ruona*
- **A Review of HRD Research in Three Areas of East Asia: Mainland China, Japan, and Taiwan**
  *Yi-Hsuan lee, Jie Lin, Susan A. Lynham, Kenneth E. Paprock and Jie (Jessica) Li*
- **HRD in Latin America: An Exploratory Review of the Literature**
  *Michael G. Hasler, Monica D. Thompson, Susan A. Lynham, and Kenneth E. Paprock*

### Symposium 23: Change in International Human Resource Development

- **The Change Agent in the Global Environment: An Exploration of a Role in Transition**
  *Toni Powell*
- **Managing Effectively as a Global Manager in Thailand**
  *Boon-Anan Phinaitrup*
- **Institutionalization of Organizational Change: A Study of HRD Interventions in Singaporean, US, Japanese, and German Companies**
  *AAhad M. Osman-Gani and Ronald L. Jacobs*

### Symposium 24: Supervisory Social Support

- **Empirically Based Recommendations for Training and Development of Supervisory Social Support**
  *Duchduen Bhanthumnavin*
- **The Value of Critically Reflective Work Behaviour**
  *Marianne van Woerkom*
- **Tools and Strategies for Engaging the Supervisor in Technology-supported Work-based Learning**
  *Manuela Bianco and Betty Collis*

### Symposium 25: Organizational Learning and Culture

- **Organizational Learning Culture, Transfer Climate and Perceived Innovation in Jordan**
  *Reid A. Bates and Samer Khasawneh*
- **A Conceptual Exploration of the Antecedents of Organizational Trust**
  *Sam Adams and Albert K. Wiswell*
- **Diagnosing the Learning Capacity of a Financial Services Institution**
  *Wayne Connell, Dana Papke, Robert Stanton, and Sue Wise*

### Symposium 26: Education Customization

- **Customizing Learning Programs to the Organization and Its Employees: How HRD Practitioners Create Tailored Learning Programs**
  *Rob F. Poell and Ferd J. Van der Krogt*
- **Constructing a Theoretical Model of Human Resource Development Knowledge Innovation in Corporate Settings**
  *Yu-Shu Chen*
- **Relationship between Learning Style Learning and Learning Modality of Employees of a Healthcare Organization**
  *Geri McArdle, Paul VanBuskirk, and Nancy Edwards*
Symposium 27: Executive Training and Development
Applications of Psychology-based Theoretical Approaches to Executive Coaching: A Summary and Exploration of Potential Utility
Brandi L. Plunkett and Toby Marshall Egan

An Investigation of CEO's Learning Experiences: Implications for Leadership Training
Margot B. Weinstein

In Support of Coaching Models of Management and Leadership: A Comparative Study of Empirically Derived Managerial Coaching/Facilitating Learning Behaviors
Bob Hamlin, Andrea D. Ellinger, Rona S. Beattie

Symposium 28: Diversity Programs and Initiatives
Diversity Training in the Heartland: An Exploratory Study of Small and Mid-size Organizations
Linda M. Hite and Kimberly S. McDonald

HRD in Community Development: A U.S. Case Study of Diverse Community Development
Mesut Akdere

Diversity and Human Resource Development
Rose Mary Wentling

Innovative Session 4
Publication Tips and Strategies: A Scholar's Perspective on How to Get Published
Laura Boehme, Darlene Russ-Eft, Tim Hatcher, Tonette Rocco, and Baiyan Yang
Volume 2

AHRD 2004 Conference Overview

Conference Papers

Saturday, March 6 • 1:30 PM – 3:00 PM

**Symposium 29: Learning Assessment**
Implementation of a Learning-oriented Evaluation for HRD Programs 29-1
Youngsook Song
The Constructivist Learning Environment Scorecard: A Tool to Characterize Online Learning 29-2
Barbara J. Helland
Organisational Factors Influencing the Assessment of Formal and Informal Learning 29-3
Nicholas R. Clarke

**Symposium 30: Culture and Organizational Socialization**
Development of a Theory of Continuous Socialization for Organizational Renewal 30-1
Monica M. Danielson
Coworker Relationships, Acculturation and Socialization-related Job Knowledge 30-2
Thomas G. Reio, Jr. and Mike A Boyle
Cultural Effects on Medical Residents Evaluations of Interpersonal Skills and Professionalism 30-3
Carol Packard

**Symposium 31: Theoretical Frameworks of Performance and Human Resource Development**
Toward a Meta-theory of Learning and Performance 31-1
Darlene Russ-Eft
Taking Hope to Work--Extending Hope Theory to Include Performance Communication 31-2
Vickie Johnson Stout, Kristye Yvette Raby, and Michael L. Morris
A Rationale for HRD-Ethics and its Inclusion as a Theoretical Foundation 31-3
Tim Hatcher

**Symposium 32: Human Resource Development in Law Enforcement**
Vicarious Traumatization: The Role of the Human Resource Development Practitioner 32-1
Lynn A. Tovar
Understanding the Formation of Prejudice Attitudes of Police Officers 32-2
Lisa M. Snow and Rose Mary Wentling
Symposium 33: Motivation
Motivating Employees During Lean Times: A Review of the Employee Participation Literature
Murray D. MacTavish
An Exploratory Examination of Selected Growth Theories of Individual Motivation and How They Inform Performance in Organizations
Melissa A. Noggle and Susan A. Lynham
Taking on the Teacher Supply and Retention Challenge: A Performance Focused Model for School-University Partnerships
Dorian Martin, William E. Reeves, Eric Wilson, Lisa O'Dell, and Toby Marshall Egan

Symposium 34: Human Resource Development Policy in Asia
State-led Policy in Human Resource Development: Korea Case
Hae-young Lee
Needs Assessment for Career Development Programs in the Taiwan Power Company (TPC): A Factor Analysis of Employees’ Career Development Needs for Their Present and Future Positions
Yi-Hsuan Lee and Walter Stenning
National Human Resource Development in the People’s Republic of China
Baiyin Yang, De Zhang, and Mian Zhang

Symposium 35: Diversity’s Impact on Change and Learning
Leveraging Diversity—Strategic Learning Capabilities for Breakthrough Performance
Terrence E. Maltbia
Viewing Older Workers' Social and Human Capital Capacity Development to Evolve an Adaptive Future Workplace
Donald L. Venneberg, Vida D. Wilkinson, and Gary D. Geroy
The Relationship between an Individual’s Margin in Life and Readiness for Change
Susan R. Madsen, Cameron John, Duane Miller, and Emily Warren

Innovative Session 5
Cross-Cultural Multi-Theory Perspectives in Research: Dialogue Based on Theory and Data from the US and Netherlands on Action Learning Programs
Rob F. Poell, Lyle Yorks, Victoria J. Marsick, and Jean Woodall

Saturday, March 6 • 3:30 PM – 5:00 PM

Symposium 36: The Future of Career Development
Career Development within HRD: Foundations or Fad?
Marieke S. van Kijk
Career Development Challenges for the 21st Century Workplace: A Review of the Literature
Thomas J. Conlon
Perceived Effectiveness and Application of Organizational Career Development Practices
Carroll M. Graham and Fredrick M. Nafukho

Symposium 37: Organizations and Change
Involvement in the Investigative Phase of a Merger and Acquisition: Perceptions of HRD Professionals
Consuelo L. Waight
Organizational Identity and Its Implication on Organization Development
Yueh-Ysen Lin
Change and Higher Education: A Multi-disciplinary Approach
Julia Storberg-Walker and Richard Torraco
Symposium 38: Theorizing Human Resource Development
Conceptualizing a Theory of Scenario Planning  
*Thomas J. Chermack*  
Agency Theory: Implications for Human Resource Development  
*Mesut Akdere and Ross E. Azevedo*  
Neoclassical and Institutional Economics as Foundations for HRD Theory  
*Greg Wang and Elwood F. Holton, III*

Symposium 39: Adult Learning Theory and Defining Training and Development
A Critical Evaluation of Adult Learning Theories and Implications for Human Resource Development  
*Baiyin Yang*  
Training and Development: An Examination of Definitions and Dependent Variables  
*Usha V. Somasundaram and Toby Marshall Egan*  
The Realities of Clarifying and Redefining the Trainer Role  
*Geri McArdle and Nancy Edwards*

Symposium 40: E-learning and Culture
Cross Cultural Differences in Online Learning Motivation  
*Doo H. Lim*  
The Relationship between National Culture and the Usability of an E-learning System  
*Steve Downy, Rose Mary Wentling, Tim Wentling, and Andrew Wadsworth*

Expatriate Practices in Taiwan's Multinational Companies  
*Chi-jung Fu and Hui-chin Chu*  
Training Evaluation: A Case Study of Taiwanese Benchmark Companies  
*Bella Y. Lien and Richard Y. Y. Hung*  
Devolving HRM and HRD to Line Managers: The Case of Hilton International's UK Hotels  
*Gillian A. Maxwell and Sandra Watson*

Symposium 42: Performance Appraisal
Seeking Symmetry between Supervisory Ratings and Self-ratings of Employee Problem-solving Skill  
*Margaret C. Lohman*  
Preferences of Training Performance Measurement: A Comparative Study of Training Professionals and Non-training Managers  
*Diane D. Chapman*  
Using Behaviorally Anchored Self-assessment Instruments to Evaluate Employee Performance  
*James R. Lindner, James A. Buford, Jr., Kim E. Dooley, Gary Jedynak, Elaine Patterson, and Larry M. Dooley*

Innovative Session 6
Playing with Perspective: Emotions in Organizations  
*Jamie L. Callahan, Aubrey Horrocks, Carrie Machala, Rose Opengart, Sharon Turnbull, and Darren Short*
### Sunday, March 7 • 9:00 AM – 10:30 AM

#### Symposium 43: Perceptions of Online Education
- Distance Learning Roles and Competencies: Exploring Similarities and Differences between Professional and Student Perspectives
  - **Toby Marshall Egan and Mesut Akdere**
- The Competitive Advantage of Online Versus Traditional Education
  - **Jillian A. Peat and Katherine R. Helland**
- Adult Students' Perceptions of Web and Interactive Video Classes
  - **Dale E. Thompson, Cecelia Thompson, Buddy Lyle, and Betsy Orr**

#### Symposium 44: Learning Transfer and Human Resource Development Effectiveness
- Reconceptualizing the Learning transfer Conceptual Framework: Empirical Validation of a New Systemic Model
  - **Constantine Kontoghiorghes**
- A Theoretical Framework for Addressing Training Needs Associated with Sexual Harassment Prevention Programs

From the Editors

It is with great pleasure that we welcome you to Austin and the celebration of our eleventh Annual Academy of Human Resource Development Conference! This year’s AHRD 2004 Conference Proceedings once again reflect a rich collection of scholarly voices committed to the ongoing challenge of leading our evolving discipline through research.

The collection of research in the over 160 papers and conference sessions contained in these Proceedings celebrate the work and effort of authors from five continents. The papers cover a wide array of topics, methods, and contexts of enquiry and represent a growing consciousness and worldwide recognition of the importance of developing and unleashing human skills and expertise, and of celebrating and recognizing the greatness within every human being. As reflected in these papers, HRD continues to contribute to and influence thoughtful dialogue, discovery of new knowledge, and improved practice in HRD, and in so doing, have increasing impact in multiple contexts and domains of learning and performance.

Using the Proceedings

1. This year’s Proceedings are divided into two volumes, reflecting the Conference Program. Volume One covers all symposia through Saturday morning, while Volume Two covers the remainder of Saturday and whole of Sunday symposia.
2. The Table of Contents, provided at the beginning of each Volume of the Proceedings, covers the contents for both Volumes. The comprehensive Author Index and Keyword Index are included at the end of each Volume.
3. A Program Overview is included in both Volumes of the Proceedings. The full version of the Conference Program is printed as a separate document.
4. Papers are grouped by symposium number. Symposium numbers are used in the Author and Keyword indices.
5. As in past years, we also have a CD-Rom version of the Proceeding. Instructions for use of the CD-Rom are provided in digital text.

Our most sincere thanks to all of the authors featured in these Proceedings — without YOU this celebration of HRD scholarship would not be possible.

Our very best wishes to each of you for an enjoyable, engaging, and energetic conference in Austin! May you leave the Conference having had fun, made new friends, found new opportunities for collaboration and enquiry, and reenergized to continue to demonstrate and pursue our important professional mission of “Leading HRD through Research.” Yeeh-Hawh!!

Toby Marshall Egan, Editor                              Texas A & M University
Michael Lane Morris, Associate Editor                  University of Tennessee
Vinod Inbakumar, Managing Editor                      Texas A & M University
Dear HRD Professional:

The Academy of Human Resource Development strives toward a vision of “Leading Human Resource Development Through Research.” A key component in achieving this vision is our annual research conference, which convenes scholars, students, and reflective practitioners from business, government, non-profits, the military, the academic sector, and any other setting to discuss research and forge relationships that foster cooperation and collaboration. As the world grows increasingly smaller, we are particularly interested in extending that cooperation and collaboration to the international community. Accordingly, we extend a special invitation to international scholars, students, and reflective practitioners to submit manuscripts and attend the conference.

We urge every HRD scholar and professional to give the call for papers the widest possible dissemination. In addition to giving the hard copy of the call for papers to an interested associate, you may refer those interested to the EVENTS AND CONFERENCES section of the AHRD website http://www.ahrd.org or ask them to contact the AHRD office.

We are also interested in expanding the number and quality of innovative and poster sessions and, towards that end, have provided additional information on various formats, submission requirements, and acceptance criteria as part of this call for papers. Finally, in an effort to expand and refresh our preconference offerings, we have gone to a proposal format for those sessions, also. We urge you to be creative and innovative in putting together either half-day or full-day sessions that would attract the interest of the HRD community.

We look forward to receiving a wide variety of submissions and proposals from the worldwide HRD community and making this 11th annual research conference the best we have had. Thank you for sharing our vision, and I look forward to seeing you in Estes Park, Colorado, Feb 24 – 27, 2005.

Best Regards,

Gene L. Roth

Conference Hosted by:
Colorado State University

Questions about Papers:
Direct all questions regarding submissions to Lane Morris, Program Chair: AHRDsubmit@utk.edu

The Academy of Human Resource Development, an international organization having the mission of encouraging the systematic study of human resource development theories, processes, and practices, encourages you to submit manuscripts for the 2005 International Research Conference.

All scholars interested in HRD are invited to submit manuscripts for consideration. The conference is attended by researchers and students from the areas of HRD, business, psychology, education, economics, sociology, technology, and communication. In addition, HRD researchers and reflective practitioners from business, industry, and government participate fully in the conference. Manuscripts may be submitted in five categories: Research and Theory Symposium, Poster, Research in Progress, Innovative Session, and Pre-conference. Research and Theory, Poster, and Innovative Session manuscripts will be blind reviewed and should be of new unpublished research. Research in Progress manuscripts will be blind reviewed but will not be published in the proceedings. Pre-conference proposals will not be blind reviewed but will be published in the proceedings. Manuscripts accepted for the conference program will be published in the conference proceedings and may be published elsewhere following the conference.

At least one author for each submission must register for the conference by January 10, 2005, in order for the submission to be included in the program and proceedings. The registration form will be available at www.AHRD.org.

Submission Deadlines
Manuscripts Due: 5 PM (Eastern) Monday, September 20, 2004
Decision Notification: October 25 – November 1, 2004
Camera-ready Papers: Friday, December 3, 2004

Online Submission Address: http://hrd.utk.edu/AHRDsubmit
AHRD International Research Conference 2005
Submission and Formatting Requirements

- Manuscripts must not exceed 8 pages in length (10 point font), including everything except the cover sheet (all figures, graphs, references, and tables must be included in the 8 pages). Submissions must be made via the online submission site (http://hrd.utk.edu/AHRDsubmit). The online submission form will not accept more text than what is stated in this document, so ensure your paper fits the requirements before trying to submit the paper. The deadlines are firm. The submission site will be disabled at 5:01 PM (Eastern) Monday, September 20, 2004. Exceptions to this deadline will be made only for true emergencies or extraordinary circumstances, so please submit your paper early. If you have problems or issues when submitting your paper, then immediately send an email to AHRDsubmit@utk.edu for assistance.

- Upon successful submission and completion of the submission process, authors will receive a confirmation message via email.

- Manuscripts must be blind review ready upon submission. The cover sheet will be the only page with any identifying information. This information will be required during completion of the online submission form. The header, footer, and the body of the manuscript as well as the file properties must not contain any author names or identifying information. The cover sheet must include the following:
  1. Each author’s full name, academic or business affiliation, complete address, work phone, fax, and e-mail address. All communications with authors will be via e-mail, so addresses are required for each author.
  2. Abstract (no more than 75 words)
  3. Category of the manuscript: Research and Theory Symposium, Poster, Research in Progress, Innovative Session, and Pre-conference
  4. Primary research methodology: Quantitative, Qualitative, Theory, Literature Review, etc.
  5. Three keywords – choose from those made available on the submission site.

- Manuscripts should be camera-ready upon submission. Formatting requirements for all manuscripts include the following:
  1. First page includes the abstract (75 words maximum), three descriptive keywords, and the primary research methodology immediately below the manuscript title.
  2. Margins of 1.0” (left, right, top, and bottom)
  3. Times New Roman font, 10 point
  4. Single line spacing
  5. The first line of each paragraph should be indented 0.25” from the left, except for the first line under a major heading.
  6. Full justification throughout
  7. Do not start references on a new page. Follow APA (5th edition) throughout except when specified otherwise in this Call for Papers.
  8. Embed tables and figures into the document.

- You and/or your co-author(s) must be available to present at any time throughout the duration of the conference. As soon as the conference program has been finalized, you will be notified about the assigned date and time of your presentation.
AHRD International Research Conference 2005
Category Requirements

Research and Theory
Full manuscripts of 8 pages are required for this category. Submissions must be new and unpublished research and theory. Research papers, as appropriate to the methodology used, should contain the following elements:

1. Title
2. Problem statement
3. Theoretical framework
4. Research questions or propositions
5. Methodology and/or research design with limitations
6. Results and findings
7. Conclusions and recommendations
8. How this research contributes to new knowledge in HRD

Research and theory papers will be combined according to the three keywords submitted by the authors and presented orally in symposium format with at least one other paper. AHRD also welcomes manuscripts presenting methodologies including new scholarly theory, models, conceptual analyses, literature reviews, and case studies. While these papers may not yet offer results (#6 above), they must otherwise follow the above requirements.

Poster
Manuscripts with a maximum of 8 pages (including the poster miniatures) are required for submission. Visual representations of the posters can enhance the clarity of the research and help us view the field of HRD in new and different ways. Posters are not a substitute for a scholarly paper. Posters will remain up throughout the conference, and a session will be scheduled to allow interaction between the author(s) and conference participants.

The following criteria MUST be included in the manuscript:
1. Title
2. Theoretical Framework
3. Substantive contribution to HRD knowledge
4. Reduced copies of the posters
5. Accepted posters will have no more than two, professional appearing, 2’ x 3’ poster boards that must be readable from a distance of six feet.

Research in Progress
Research in progress manuscripts have the same requirements as Research and Theory papers. While these papers may not yet offer results, they must otherwise follow the stated requirements. Furthermore, by the conference date, it is anticipated that the presenters be able to share preliminary results, conclusions, and recommendations.
Innovative Session

Proposals up to 8 pages in length may be submitted for this category. An innovative session is designed to present new and innovative HRD work through creative, interactive presentation formats that do not fit within the research and theory symposium process.

The formats described below are offered as suggestions only. The intent of these examples is to be useful to those considering alternatives to the standard paper and symposium session formats. Preference will be given to proposals with a research or theoretical basis.

Debate. The debate format can be an effective way to present two opposing views about a topic. One structure for a debate is to have a moderator and two, two-person teams. The debate begins with the moderator stating a position. One team then presents arguments that affirm the proposition and the other team presents arguments against the proposition. Each team member has a fixed amount of time (e.g., 10 minutes) to present arguments. Time for rebuttal can be incorporated into the session and/or a discussant can sum up the main points of the session. When submitting a debate proposal, be sure to include a statement of the proposition to be debated and descriptions of the major points likely to be argued by each side.

Panel Discussion. In a panel discussion, the chairperson plays a very active role, serving as a moderator who asks questions of the panelists and ensures that all panelists (three to six people) have the opportunity to speak. Diversity among panelists is important to the success of the session. Further, all panel discussion members must recognize the need for advance preparation. Panelists and chair do not prepare papers. They make brief introductory remarks before engaging in ad hoc give and take for which they may have prepared themselves but which cannot be predicted or entirely controlled (a chair skilled in discussion management is essential). Panel discussions should generate spontaneous interaction among participants and between participants and the audience. A panel discussion proposal should describe the questions that will be addressed by the panel, the underlying issues or themes to be discussed, and the structure or format of the session.

Practitioner Forum. A Practitioner Forum provides an opportunity for HRD professionals to discuss challenges in the work environment and innovative solutions that are linked to HRD research issues. Each forum is devoted to a single topic. A chair introduces the session, three or four presenters take approximately 10 minutes each to discuss applied research and practice issues, and audience members spend the remaining time interacting with presenters and each other, offering their own ideas about applied research and practice. Practitioner Forum topics are welcome on any "cutting edge" topic. Special effort should be made to link theory and practice.

The following criteria MUST be addressed in the proposal:

1. Title
2. Session Description
3. Presenters/Panelists (name, affiliation, and contact information for each person)
4. Purpose
5. Goals
6. Content of session with evidence that it is new, is innovative, addresses research or scholarship, and makes a substantive contribution to HRD knowledge. The content section should include a theoretical framework.
7. Description of format, style, and an agenda for the presentation that is to be innovative, intellectually stimulating, generative of a high level of scholarly dialogue, and participative by both presenters and audience.
**AHRD International Research Conference 2005**

**Category Requirements**

**Pre-Conference**

The AHRD Conference Planning Committee seeks dynamic learning experiences that would be of significant interest to HRD researchers and reflective practitioners. Pre-conference sessions may be problem oriented, professional-development oriented, focus on knowledge transmission, address recent methodological and substantive developments in HRD research, or serve as organizing sessions for special interest groups exploring an HRD related subtopic in depth. AHRD welcomes sessions that extend beyond traditional research paradigms and methods and especially encourages offerings that merge research and practice.

- Full-day sessions and half-day seminars (4-hour) are available. Pre-conferences will run on Wednesday and Thursday before the annual conference.

- The following criteria must be addressed in the proposal:
  1. Cover page with each author’s full identification and contact information as required for all submissions
  2. Title
  3. Committee or Panel Members with affiliations and contact information
  4. Purpose including a statement about how the session advances the mission and vision of the Academy
  5. Constituency or target audience
  6. Specific goals
  7. Draft agenda

- Pre-conference proposals will not be blind reviewed but will be judged on their contribution to advancing the vision of the Academy. The Conference CEO will make the final decisions on pre-conference proposals. Pre-conference manuscripts will be included in the proceedings.

- An example proposal can be found on the AHRD website <www.ahrd.org> under EVENTS AND CONFERENCES.

- No budgets are allocated by AHRD for pre-conferences, except for refreshment breaks.

- All pre-conference attendees are expected to pay the fee including invited speakers.

- No pre-conference is guaranteed approval from one year to the next.

- As with the other types of submissions, the pre-conference proposals must be submitted online at http://hrd.utk.edu/AHRDSubmit. All deadlines are firm. Exceptions will be made only for true emergencies or extraordinary circumstances.
Call for Papers

Academy of Human Resource Development, International
Jointly with the
Korea Academy of Human Resource Development (KAHRD), Korea

Announces the

Third Asian Conference of the Academy of HRD

November 21 - November 23, 2004
(Pre-conference Workshops: November 20-21)

Venue:
Seoul Olympic Parktel, Seoul, Korea

Host Institution:
Korea Academy of Human Resource Development (KAHRD), Korea

Conference Theme:
Human Resource Development in Asia:
Harmony and Partnership
The Asian Chapter of the Academy of HRD (the top global scholarly organization in the field of HRD), in cooperation with the Korea Academy of Human Resource Development (KAHRD), invites scholarly papers (empirical or conceptual) for its third Asian Regional conference. The conference will bring together researchers and practitioners in the field of HRD coming from various disciplines and fields of study (HRD and HRM, business management, education, IT, economics, psychology, sociology and others). It will also be an effective forum for networking and professional interactions among leading HRD researchers and practitioners from around the world who have interests in HRD in Asia. From throughout Asia, attendance is expected from Japan to New Zealand, from Vietnam to Saudi Arabia, as well as participants from the USA and Europe.

The Korea Academy of Human Resource Development (KAHRD), established in 2003, aims at a center for scholars’ and practitioners’ community who have interests in the field of HRD. It holds forums, seminars and other conferences designed to share and discuss HRD related ideas, research, practices, and programs in both corporate and not-for-profit settings and national policy areas.

The Academy of HRD, headquartered in the USA, is supported by four international publications: Human Resource Development Quarterly (HRDQ), Human Resource Development International (HRDI), Advances in Developing Human Resources, and the new Human Resource Development Review. All of these journals are published quarterly by reputed publishing houses in the USA and the UK. Papers from this conference may be submitted for publication consideration in these journals.

Possible Topics or Issues to be Covered in the Conference (not an exhaustive list):

Harmony and Partnership in HRD
- Labor-management cooperative HRD, partnership building of HRD, partnership and alignment between government and business, and partnerships among academia, industries, and research institutes.

HRD in Policy Areas
- HRD at the National/Strategic Level (national policy initiatives, national innovation system, various strategies used, focus and interpretations of HRD in different countries, regional HRD, regional innovation system)
- Lifelong Education & Learning Policy and Practice (trends in research and practice, adult education & learning, international comparison of lifelong education and learning, future of lifelong education & learning)

Training and Development in Corporate Sector
- HRD in the Business or Corporate Sector (recent trends, leadership development, competency mapping research, roles and responsibilities of HRD staff, performance management systems, HRD Audit, career planning, coaching and mentoring and their effectiveness.)

HRD in Non-Government Sector/Non-Profit Sector
- HRD in the Not-for-Profit Sector (NGO, national & local development, social infrastructure, health, education, services sectors, community development)

HRD Concept, Model, Tools, Techniques and Theory
- HRD Theory, Concepts, Frameworks, Systems (relevance and application to Asian context)
- HRD Tools, Techniques, and Innovations (instructional technology, performance technology, performance management systems, adult learning & teaching methodology, assessment centers.)
- HRD Professionals and HRD Roles (emerging roles of HRD professionals, new competencies, new knowledge & skills, academics & consultants)
Diagnosis and Evaluation in HRD
- Measuring and Managing the Impact of HRD (HRD audit, HRD measurement & evaluation, implementation research, assessment centers)
- HRD and Information Technology Driven Change (role of IT in HRD, role of HRD in change management, particularly in technological changes, such as SAP, ERP)

Organizational Development
- Organization Development and Learning Organization (OD and change management, organizational survey feedback, team-building & development, group dynamics, inter-departmental cooperation, organizational learning & learning organization, action research case studies, appreciative inquiry, action learning)

Career Development and Change
- Career Assessment, Change, Development, and Planning (Career development theory and practices, CD and HRM, Career change and transition, Career coaching & counseling, Assessment of career interests and career seeking behaviors)

Global HRD
- International/global HRD (International flow of human resource: studying abroad, employment, immigration & emigration and its impact, cultural influences on HRD practice, cross-cultural differences, comparative analyses, culture change and change management)
- HRD Interventions Based on Indigenous Culture and Values
- HRD Research in Asia (potentials, problems, strategies used, partnerships among academia and industry)

[In all cases, please keep in mind that the list above is suggestive only. Any paper that forwards our scholarly understanding of the HRD field is eligible for review and consideration. While an Asian focus is desirable, it is not essential for acceptance.]

Guidelines for Submission of Papers

- Please send a summary of less than 200 words as an e-mail attachment in MS Word file. All summary will be accepted with no feedback. After you submit a full paper by August 15, 2004, you will receive feedback on whether your paper is acceptable.
- Please e-mail summary and full paper to: kahrd@plaza.snu.ac.kr.
- For the full paper, follow the same guidelines as for the annual AHRD Conference submissions. The guidelines are available from the web site, www.ahrd.org. All papers are to be in English and must be complete at the time of submission. If English is not your native language, please have the paper edited before submission.

- Deadline for sending 200 words summary : May 30, 2004
- Deadline for submission of full papers: August 10, 2004
- Information on the acceptance of papers: September 15, 2004
- Submission of final revised papers: September 30, 2004

Pre-conference Workshops and Skillshops

Interested professionals and institutions (research institutes, companies, consulting agencies, etc) are requested to offer pre-conference workshops on any related themes. The following research themes are being considered at present:

- Partnership in HRD
- Leadership Development
- Ethical Dimensions in HRD
- National HRD
- Cultural Dimensions in HRD
- Return on Investment of HRD
- HRD for Managing Change
- Other proposals will be considered

Each theme will be for one half/full day duration. The pre-conference workshop will be led by one person or a group of persons and should be designed for professional development. Those who desire to offer such workshops may send details of the workshop to pre-conference coordinator Dr. Young-sik Ahn at Fax: 82-51-890-1209, Tel: 82-51-890-2184, or e-mail: ays@deu.ac.kr.

The details should include the purpose and objectives of the workshop, coverage, time schedule, prerequisites, if any, for participation, and the presenter’s qualifications. One conference registration will be waived for offering a half-day workshop; if there are two presenters for a full-day workshop, both presenters will have their conference registrations waived.

Registration

Conference registration fee (payments received by September 20, 2004): For members of AHRD International: US $150 (covers opening cocktail dinner on November 21, conference materials, proceedings, and coffee breaks on November 22 and 23, and the concluding dinner on November 23); For non-members, US $200.

After September 20, the fee will be $185 and $235, respectively. (Student discount of US$75 will be provided upon recommendation from his/her advisor/supervisor).

Registration fee for each pre-conference workshop: US $30 per half-day and $55 for each one-day workshop or two half-day workshops. Registrants for a full-day pre-conference workshop or two half-day workshops on the same day will be provided with lunch as part of their workshop registration fees. Details of the pre-conferences will be mailed to all registrants as soon as possible.

To register: please mail, fax, or e-mail completed Registration Form to a conference organizer:

Contact person: Ms. Mihwa Lee

Mailing Address: Department of Education, Seoul National University
San 56-1 Sillim-dong, Gwanak-gu, Seoul, 151-742 Korea
E-mail: polk0070@empal.com
Tel: 82-11-9838-3790  Fax: 82-2-880-7635

For credit card payment: Please fill up the credit card payment information on the Registration Form. Be sure to include full name on credit card, type of credit card (acceptable cards are: Visa, MasterCard, Discover, American Express), credit card account number, and expiration date.

For wire transfer payment, and for local Korea delegates: Please remit the appropriate registration fees (including pre-conference) to bank account as follows. And please fax remittance slip to Fax: 82-2-880-7635. Be sure to indicate your full name and university or company on the remittance slip, as well as the amount submitted. Confirmation will be sent to you by e-mail upon receipt of payment.

Account Name: Mihwa Lee
Account No: Saving Account No. 079-12-665093 (same as Control Number)
Bank Name: National Agricultural Cooperative Federation (Swift Code: NACFKRSEXXX)
Bank Address: National Agricultural Cooperative Federation Seoul National University Branch
San 56-1 Sillim-dong, Gwanak-gu, Seoul, 151-742 Korea

Conference Venue

Seoul is the capital of Korea with over 600 years of history. It is the heart of Korea’s culture and education as well as politics and economy. Seoul is unique in that historical sites such as grand royal palaces and modern cultural facilities coexist in harmony. Seoul is a world-class city with numerous amenities and shopping districts such as Myeong-dong, Apgujeong-dong, and Itaewon Special Tourist Zone.
Travel from Incheon International Airport to the conference venue at Seoul Olympic Parktel is easy. The best-recommended way is by airport limousine bus #606 (bus stop 5B, 12A at airport, 5:40 AM- 10:50 PM). It takes about 90 minutes to the conference venue. The best way to explore Seoul at a low cost is by subway. The public bus is also available at a low cost but not recommended for first timers to Seoul. Seoul map will be available in the conference package upon arrival.

Accommodation

For your convenience, hotel accommodation is available at the conference venue, the Seoul Olympic Parktel, located approximately one and half hours from Incheon International Airport. Seoul Olympic Parktel agreed to offer great discount rates for AHRD participants.

Single or double rooms are available at 119,000 Korean won (inclusive of tax and service charge) per room per night inclusive of morning buffet breakfast (which is about US $100 per room per night at current exchange rate of Korean won 1,200 per US$).

Advance booking before November 1, 2004 is strongly recommended. For room reservation, please e-mail, or fax to Ms. Jeong Eun Kim at Seoul Olympic Parktel. E-mail: parktel@sosfo.or.kr, or Fax: 82-2-410-2100. Tel: 82-2-410-2514 or 82-17-290-1180.

Credit card information, your full name, and address are required for hotel room reservation. Please clearly indicate period of stay, bedding preference (SGL or DBL), arrival & departure flight detail, in your e-mail or fax for making reservations. Hotel confirmation will be sent to you by e-mail.

Sightseeing and Excursions

Delegates may plan for pre & post conference sightseeing excursions in Seoul and throughout Korea. Half-day and full day excursions in Seoul and its vicinities are available at special discount rates for conference delegates. Some are the must-visits: Royal Grand Palace(Gyeongbokgung Palace, Deoksugung Palace) Insa-dong, Itaewon Special Tourist Zone, Dongdaemun and Namdeamun Market, and Korea House. To explore more of Korea through full day excursions, recommendations are: Yongin Folk Village, City of Gyeongju (designated as a World Heritage by UNESCO, capital of the Silla Kingdom for almost a thousand years), or DMZ(Demilitarized Zone).

Advance reservation is recommended. A Tour Table will be set up at the venue for your convenience. For more details, inquiries, questions, and concerns regarding accommodation, excursions, package tours, and general information, please feel free to contact Ms. Yoonmi Choi. E-mail: ymchoi03@snu.ac.kr or Fax: 82-2-880-7635. Tel: 82-11-9749-8409.

Conference Schedule (Details will be announced later)

- Seoul city tour in the afternoon of November 19. Please make reservations with Ms. Yoonmi Choi (ymchoi03@snu.ac.kr ). (Also, the city tour is available everyday if there are more than six persons per trip.)
- Pre-conference workshops will be held at the conference venue on November 20 and 21.
- Get Acquainted icebreaker on November 21 starting at 5:30 PM.
- This will be followed by a plenary session at 6.00 PM with introduction of the Conference and first Keynote speech.
- Opening Dinner will follow the first plenary session at the conference venue on November 21.
- AHRD conference parallel sessions will be on November 22 and 23 from 9:00 AM onwards.
- Conference will close on November 23 at 4:30 PM after the final plenary session.
- Cultural evening and Closing Dinner at Seoul Olympic Parktel on the evening of November 23 at 7:00 PM.
Conference Chairs and Committee Members

Conference CEO and AHRD Asia Chapter Coordinator:
Dr. AAhad M. Osman-Gani
Professor of HRD and International Business
Nanyang Business School (S3-B3A-27)
Nanyang Technological University, Singapore 639798
Tel: (65) 6790-4982 Fax: (65) 6791-8377
E-mail: aahad@ntu.edu.sg

Conference Co-Chair and Site Coordinator:
Dr. Shinil Kim
President of Korean Academy of Human Resource Development
Professor at Department of Education, Seoul National University
San 56-1 Shillim-dong, Gwanak-gu, Seoul, Korea, 151-742.
Tel: 82-2-880-7643 Fax: 82-2-884-8542.
E-mail: kshinil@snu.ac.kr

Advisor:
Dr. Gene L. Roth, AHRD International Board Liaison and Past-President
Professor and Director of Office of HRD and Workforce Preparation,
Northern Illinois University, Dekalb, Illinois 60115-2854 USA
Tel: 1-815-753-1306 Fax: 1-815-753-9309
E-mail: groth@niu.edu

Conference Site Co-Chairs:
Dr. AAhad Osman-Gani and
Dr. Yonglin Moon
Professor at Department of Education, Seoul National University
San 56-1 Shillim-dong, Gwanak-gu, Seoul, Korea, 151-742.
Tel: 82-2-880-7648 Fax: 82-2-880-7635.
E-mail: moonyl@snu.ac.kr

Program Associate Chairs:
Dr. T.V. Rao, India: tvraoad1@sancharnet.in
Dr. Baiyin Yang, China: yinyang@umn.edu
Dr. Kiyoe Harada, Japan: HRDharada@aol.com
Dr. Jamilah Othman, Malaysia: jamilah@ace.upm.edu.my
Dr. Bella Ya-Hui Lien, Taiwan: bmayhl@ccunix.ccu.edu.tw
Dr. Ahmad A. Ajarimah, Middle-East & Gulf: ajarimaa@aramco.com.sa
Dr. David Ripley, NewZealand and Australia: d.ripley@mang.canterbury.ac.nz
Dr. Hunseok Oh, Korea: ohhs@snu.ac.kr

Financial Committee Chair
Dr. Jongcheol Yang: jcylife@kornet.net

Program Committee Chair:
Dr. Eunsang Cho: aquinascho@hanmail.net

Conference Proceedings Editors:
Dr. Yonglin Moon, Dr. AAhad M. Osman-Gani, Dr. Gene Roth,
Dr. Hunseok Oh, & Dr. Eunsang Cho
E-mail: kahrd@plaza.snu.ac.kr / Papers and Summaries to be sent at kahrd@plaza.snu.ac.kr
Academy of Human Resource Development

VISION
To Lead Human Resource Development through Research

MISSION
The Academy was formed to encourage systematic study of human resource development theories, processes, and practices, to disseminate information about HRD, to encourage the application of HRD research findings, and to provide opportunities for social interaction among individuals with scholarly and professional interests in HRD from multiple disciplines and from across the globe.

PUBLICATIONS
AHRD in cooperation with our publishing partners, provides a full range of scholarly and professional publications:
- *Human Resource Development Quarterly*, our research journal
- *Human Resource Development International*, our new international journal
- *Advances in Developing Human Resources*, a quarterly monograph series
- *Human Resource Development Review*, a quarterly theory journal
- *AHRD Standards on Ethics and Integrity* in Human Resource Development
- *Human Resource Development Research Handbook*, a book for both researchers and practitioners
- Blind Refereed Annual Conference Proceedings published annually in conjunction with the annual research conference

MEMBERSHIP
AHRD membership includes the following

1. Being a member of the only global organization dedicated to advancing the HRD profession through research
2. Subscription to all four AHRD sponsored scholarly journals:
   - *Human Resource Development Quarterly*
   - *Human Resource Development International*
   - *Advances in Developing Human Resources*
   - *Human Resource Development Review*
3. Copy of *AHRD Standards on Ethics and Integrity*
4. Subscription to the *Forum*, the Academy newsletter
5. Subscription to the Academy Listserv, for timely professional and career information annual
6. Discount on annual conference participation
7. Research conference with full proceedings of research papers (1200+) pages
8. Research partnering, funding, and publishing opportunities

ANNUAL RESEARCH CONFERENCE
AHRD holds an annual research conference in the early spring of each year. The 2005 conference will be held in Estes Park, Colorado. The conference will be hosted by Colorado State University

AWARDS PROGRAM
AHRD recognizes professional excellence in the HRD profession through its awards program, including:
- HRD Scholar Hall of Fame
- Outstanding HRD Scholar Award
- Richard A. Swanson Research Excellence Award
- Outstanding Human Resource Development International Article
- Malcolm S. Knowles Dissertation Award
- HRD Book of the Year Award
- AHRD Outstanding Academic Program
- “Cutting Edge” Top Ten Conference Proceedings Papers
Editor-in-Chief: Jean Woodall, Kingston Business School, Kingston University, UK
Editors: Allan Hixson Church PhD, Director, Organization and Management Development, Pepsico, USA
Rob Poell University of Nijmegen, The Netherlands
Reviews Editor: Darren Short, Office for National Statistics
Reviews Sub-Editor: Reid Bates, Louisiana State University, USA
Special note: Jean Woodall will be Editor-in-Chief for the journal from January 2003, and as of August 1, 2002 all new submissions should be sent to the new editorial office: Penny Macoustra, Editorial Assistant, HRDI, Kingston Business School, Kingston University Kingston Hill, Kingston Upon Thames, Surrey, KT2 7LB.
Monica Lee, in consultation with Jean Woodall, will continue to handle all manuscripts already under consideration by HRDI. All files, regardless of decision status will be transferred to Jean Woodall at the end of 2002.

Publication Details:
Volume 6, 2003, 4 issues per year
ISSN 1367-8868

*A preferential rate is available to accredited members of the Academy of Human Resource Development (AHRD) and the Univeristy Forum for Human Resource Development (UFHRD)
Submission Guidelines

Advances in Developing Human Resources provides a central focus for the reporting on sound theory and practice within topical areas of interest to the profession. Members of the profession are encouraged to submit issue proposals and should contact the editor-in-chief for current proposal guidelines. The Advances editorial board utilizes a two-tier blind review process. The first tier is the review of proposals for individual issues; the second tier is the review of completed manuscripts. Issue proposals are reviewed for (1) relevance to the HRD profession, (2) potential in advancing the theory in HRD, and (3) potential in advancing the practice in HRD. Complete manuscripts are reviewed for (1) completeness of the ideas, (2) quality of the writing, (3) advancement of HRD theory, and (4) advancement of HRD practice.
Human Resource Development Review

Elwood F. Holton III, Editor
Louisiana State University
Richard J. Torraco, Associate Editor
University of Nebraska

A quarterly refereed journal from the Academy of Human Resource Development
Published by Sage Publications

Human Resource Development Review is a theory journal for scholars of human resource development and related disciplines. **Human Resource Development Review** publishes articles that make theoretical contributions in papers devoted to theory development, foundations of HRD, theory building methods, and integrative reviews of the literature.

The journal provides new theoretical insights that can advance our understanding of human resource development, including:

- Syntheses of existing bodies of theory
- New substantive theories
- Exploratory conceptual models
- Taxonomies and typologies developed as foundations for theory
- Treatises in formal theory construction

Send manuscripts to:
Dr. Elwood F. Holton, III, Editor
Electronic submission (preferred) to eholton2@lsu.edu.
**Human Resource Development Review**
School of Human Resource Education and Workforce Development
Louisiana State University
142 Old Forestry Building
Baton Rouge, LA 70803, U.S.A.
Human Resource Development Quarterly

Sponsored by the

Darlene Russ-Eft, Editor

Human Resource Development Quarterly is the first scholarly journal focused directly on the evolving field of human resource development (HRD). HRDQ has become the national forum for interdisciplinary exchange on the subject of HRD. Sponsored by the American Society for Training and Development and the Academy of Human Resource Development.

INFORMATION FOR AUTHORS AND CONTRIBUTORS

Human Resource Development Quarterly is a publication sponsored by the Academy of Human Resource Development and the Research Committee of the American Society for Training and Development (ASTD). It provides a central focus for research on HRD issues, as well as the means for disseminating such research. HRDQ recognizes the interdisciplinary nature of the HRD field and brings together relevant research from related fields, such as economics, concerned solely with the practice of HRD are not within the scope of this journal, but may be more appropriate for practitioner-oriented publications such as Human Resource Development International or Training and Development Magazine.

Authors may contribute to HRDQ by submitting three types of manuscripts:

· Peer Review
· nonrefereed Forum Section
· nonrefereed Review Section

Submit forum manuscripts to Darlene Russ-Eft, Edition, HRDQ, 1791 Arastradero Road, Palo Alto, CA 94304

Development of Learning-Oriented Evaluation for HRD Programs

Youngsook Song  
University of Illinois at Urbana-Champaign

This study examines key theoretical principles of learning-oriented evaluation for HRD programs. Practical guidelines for the implementation of learning-oriented evaluation are also developed based on the related literature. This study suggests that evaluation should be a learning process in which information and knowledge are socially constructed and used for individual, group, and organizational learning.

Keywords: Learning-Oriented Evaluation, Evaluation Use, Organizational Learning

There has been growing attention on evaluation of Human Resource Development (HRD) programs in organizations. As the importance of optimizing human potential in the competitive business environment has been increasing, organization leaders need to learn more about how HRD programs operate and can be improved. Accordingly, HRD practitioners have paid more attention to evaluation of HRD programs and its impacts on the organization. On the other hand, HRD scholars have grown skeptical about the effectiveness of Kirkpatrick (1998)’s evaluation approach that has dominated training evaluation over the last forty years. This has resulted in an increasing number of studies that aim to enhance HRD evaluation theory and practice and search for an alternative evaluation approach to HRD programs.

Despite this growing attention, evaluation of HRD programs in organizations, especially in the private sector, is still problematic. First, evaluation has not been widely implemented (Swanson & Holton, 2001). Russ-raft and Preskill (2001) explain ten reasons why evaluation is ignored in organizations. Among the reasons, the top reason is organization members’ misunderstanding of evaluation purpose and role. The second reason is organization members’ fear of the impact of evaluation findings. In general, evaluation is negatively perceived by organization members. This makes evaluation difficult to implement.

Second, evaluation approaches to HRD programs are very limited. Most of them are based on or are variations of Kirkpatrick (1998)’s four level evaluation approach. In spite of its strengths, such as simplicity, flexibility, and popularity, Kirkpatrick’s approach has not provided a comprehensive information and understanding of how HRD programs work and influence organizational members. As Holton (1996) indicates, Kirkpatrick’s approach is not grounded in a philosophy or theory of evaluation. In addition, the majority of evaluations based on his four-level approach have been conducted only at level one (reaction) or level two (learning) (Dixon, 1987)

Third, there is a significant lack of evaluation use. Preskill and Caracelli (1997) conduct a survey asking American Evaluation Association (AEA) members about various conceptions of evaluation use. Although their study does not target evaluation of HRD programs, its result shows that nonuse and misuse of evaluation are critical issues. In fact, many HRD scholars and practitioners have focused only on instrumental use of evaluation results and the evaluation results are not actually used (Russ-Eft, Atwood, & Egherman, 2002). Some researchers emphasize use of evaluation to justify the bottom line impact of HRD programs (Philips, 1997; Swanson, 1998). Yet, there is lack of research and discussion on conceptual use of evaluation and the link between evaluation and organizational learning.

I believe that these problems are driven from critical misconceptions about evaluation of HRD programs, such as evaluation is bad and unnecessary, evaluation means a smile sheet, and evaluation use is not important. The future of HRD evaluation will be shaped depending on the extent to which we can overcome the problems. The success of HRD evaluation relies on whether we can change these misunderstandings. In this regard, academic efforts for developing new evaluation approaches to HRD programs are asked in order to improve the existing HRD evaluation theory as well practice. New approaches should be more responsive to organization members and their needs and be more systemic and comprehensive in investigating the quality of HRD programs. In addition, they ought to contribute to increase the usability of evaluation in the private sector.

The purpose of this paper is to investigate the development of learning-oriented evaluation for HRD programs. In order to achieve this, I first define the notion of evaluation as learning process. Key theoretical principles
Underlying learning-oriented evaluation are also examined based on the related literature. Further, I develop practical guidelines for successful implementation of learning-oriented evaluation. Learning-oriented evaluation, which aims at fostering different types and levels of learning through evaluation, can change negative conceptions of evaluation to a learning opportunity. Evaluators as well as stakeholders can have opportunities to broaden and deepen their knowledge and understanding of HRD programs from this kind of evaluation approach. Learning-oriented evaluation also can help organizational members consider evaluation as ongoing learning experiences rather than as a one-time event. Moreover, it can produce useful and comprehensive information of the program being evaluated. So, evaluators and stakeholders can develop diverse ways to enhance evaluation use and to improve HRD programs. Evaluation should be an opportunity and catalyst to learning in organizations.

**Evaluation as Learning Process**

Several evaluation researchers, such as Lee Cronbach, Gretchen Rossi, John Owen, Hallie Preskill, and Rosalie Torres, have emphasized evaluation as a process of fostering learning. Although there are variations in explaining the learning dimension of evaluation among them, their major focus is on helping evaluators as well as stakeholders learn from evaluation, so they can deepen their understanding, obtain new insights, take visible actions, and improve quality of an evaluand – product, program or process being evaluated.

Cronbach and his colleagues contend that “evaluation is a process by which society learns about itself” (Cronbach et al., 1981, p.2). According to them, evaluation should be a learning opportunity that enables stakeholders to know better about the program, understand multiple perspectives, and thus make wise choices for the program improvement. In doing this, an evaluator need to play a role as an educator that facilitates sharing as well as providing information. Although their main concern is to help members of the “policy-shaping community”, their contention provides at least two important points of view for evaluation of HRD programs. First, they suggest a different view on the role of an evaluator from the traditional one. According to them, it is not an evaluator’s task to decide whether the program is good enough. Instead, the evaluator provides information which stakeholders may want to take into account in forming their judgments. Second, Cronbach et al. (1981) believe that things can be changed because of stakeholders’ learning through evaluation. Evaluation can directly or indirectly change stakeholders’ understanding and behavior, whether it is intended or unintended, throughout evaluation. Accumulations of these changes can affect procedure and culture of the program and other parts of organization processes, so in the long run, the organization can be changed.

The concept of evaluation as learning process is further explained by Preskill and Torres (1999), who suggest the notion of *evaluative inquiry* as a new form of evaluation for learning. Since organizations have experiencing continuous and dramatic changes due to advanced technology, workforce diversity, and globalization, continuous learning and development becomes the key for organizations to survive (Dixon, 1992; Ruona, Lynham, & Chermack, 2003). Under consideration of this feature, Preskill and Torres (1999) emphasize that evaluation should be integrated into daily work practice in organizations and thus it ought to be an ongoing inquiry for learning. In this sense, they introduce *evaluative inquiry*, which encourages organization members to have chances of exploring, reflecting, questioning and discussing critical organization issues based on the evaluation logic and process. They believe that this will bring out enhanced organization capacity for continuous learning as well as personal and professional development of organization members.

Learning through evaluation can occur at individual, group, and organizational level. Individual learning can occur when individuals are able to alter their perceptions and knowledge of the program from the evaluation process and findings, achieve new insights, and take actions based on the insights (Rossman & Rallis, 2000). Learning from evaluation at the group level can take place when individuals share their experiences, knowledge, and insights through dialogue and participate in collaborative learning situations. Since evaluation involves, in most cases, different groups of stakeholders, it is important to provide chances of communicating across the groups and understanding diverse perspectives of the program that will increase the potential of stakeholders for learning. Organizational learning from evaluation can occur when individuals and groups disseminate their learning and knowledge obtained from evaluation throughout the organization. This will lead to organizational change and development.

**Key Theoretical Bases of Learning-Oriented Evaluation**

Learning-oriented evaluation is concerned with developing the potential of stakeholders as well as evaluators by providing opportunities to learn and stimulating social interactions among stakeholders and evaluators in a given
context. In this section, I examine theoretical assumptions of learning-oriented evaluation in terms of its claims on knowledge construction, evaluation use, and organizational influence.

Knowledge Construction

Most researchers who advocate learning-oriented evaluation emphasize participation and ownership of stakeholders in creating information and knowledge useful. This assertion is based on the belief that knowledge and values are socially constructed and transited rather than exist independently from the social world waiting to be revealed by technically expert evaluators. Therefore, stakeholders should be active participants in construction of knowledge through evaluation and use of the knowledge in their work. In fact, HRD programs involve adult learners in the workplace. Compared to children, adults are more self-directed and learn from their experiences. They tend to have their own willingness, motivation, intention, and styles for learning. These characteristics of adult learners enable learning-oriented evaluation of HRD programs to be a platform for stakeholders to construct and use their own knowledge.

From the constructivist view, learning is also a process of meaning making (Preskill & Torres, 2000; Rossmann & Rallis, 2000). Individuals and groups learn by understanding and making meanings of their experiences. In this sense, learning from evaluation is socially situated and is mediated through stakeholders’ previous knowledge and experiences. Constructions of meanings are influenced by specific historical, political, geographical, and cultural practice and discourses in a given context (Greene, 2000). These constructions are multiple, contingent, and contextual. It is, therefore, important through learning-oriented evaluation to involve and discover multiple constituencies each representing different perspectives.

Evaluation Use

Although the concept of evaluation use is still diverging and expanding (Shulha & Cousins, 1997), there are mainly three different kinds of evaluation use based on the purposes they serve. They are instrumental, conceptual, and symbolic use (Weiss, 1998). Learning-oriented evaluation can be employed for instrumental, conceptual, and/or symbolic purpose.

Instrumental use of evaluation aims at providing information for decision makers. Evaluation findings and recommendations are used to give feedback into decision making processes for the program. According to Weiss (1998), this kind of use is fairly common under three conditions. First, the application of evaluation findings is relatively non-controversial. Second, the change that occurs as a result of evaluation is relatively small-scale. Lastly, internal and external environments of the program are relatively stable without dramatic change in leadership, fund, and stakeholders. If evaluators and stakeholders learn from findings of learning-oriented evaluation and make informed decisions regarding operation, continuation, or improvement of the program, this evaluation is instrumentally used to produce information for decision-making.

Conceptual use of evaluation is concerned with changing and developing, through evaluation, stakeholders’ understanding of what the program is and does. Many aspects of learning-oriented evaluation are connected to this kind of use, because learning-oriented evaluation focuses primarily on the evaluation process and conceptual change (learning) of the people who are involved in evaluation. In fact, stakeholders can obtain new ideas and insights about the program from evaluation findings. However, they can learn even more about merits and limitations of the program and possible directions for action by engaging in the evaluation process. The notion of Patton (1997)’s process use is similar to this kind of use. Patton (1997) highlights evaluators as well as stakeholders’ changes as participating in the evaluation process.

Process use refers to and is indicated by individual changes in thinking and behavior, and program or organizational changes in procedures and culture, that occur among those involved in evaluation as a result of the learning that occurs during the evaluation process. (p. 90)

Preskill and Torres (2000) describe this kind of use as a form of individual, team, and organizational learning. They suggest that when individuals participate in the evaluation process that is collaborative and guided by dialogue, reflection, and critical inquiry, learning occurs not only at the individual level but also at the group and organizational level.

Symbolic or political use of evaluation is intended to strengthen one’s positive or negative opinions about the program (Marra, 2003). For example, program managers know what is not working and how problems can be solved. Thus, they use evaluation to legitimize their position and gain supports from other members. Moreover, the very existence of evaluation can influence organization members. For example, when learning-oriented evaluation is carried out in the organization that never or little has employed this type of evaluation approach, the presence of learning-oriented evaluation creates a level of interests among organization members and makes them be aware of needs for learning and change.
Organizational Influence

Evaluation is performed within an organizational context. Learning through evaluation is critically influenced by the organization’s goals, systems, structures, and culture. Rogers and Hough (1995) claim that focus, methods, and management of evaluation should reflect realistic assumptions about how the organization works. Without understanding of how individual, group, and organizational learning occurs in the organization, learning-oriented evaluation cannot be successfully implemented and its benefits will be significantly reduced.

In addition, several researchers stress that evaluation capacity building is critical in order to “continuously create and sustain overall organizational processes that make quality evaluation and its uses routine” (Compton, Baizerman, & Stockdil, p.1). The success of learning-oriented evaluation influences and is influenced by the organization’s infrastructure that supports continuous learning. Therefore, structures, policies, procedures of the organization need to incorporate and maintain learning through evaluation. Desirable organization systems, structures, and culture make it easy to share evaluation information and make it possible to work collaboratively among different stakeholder groups. These organization features also allow organization members to try new things and to consider mistakes as opportunities for learning. It is obvious that the organization including such desirable systems, structures, and culture is motivated to provide organizational members financial, technological, and human resources for learning.

Moreover, organization members should understand the importance and potential of learning from evaluation. Especially, leaderships at all levels of the organization ought to support and consider evaluation as a means for individual, group, and organizational learning. Organization leaders at top positions need to provide a vision for learning through evaluation and encourage organization members to value and prioritize evaluation. Leaders at the program levels need to realize their responsibility for continuous program improvement and appreciate partnership with an evaluator in creating evaluation information.

Because effective use of learning-oriented evaluation sometimes requires organizational changes, there is an issue of how to deal with organization members’ resistance to changes. Organization members tend to defend the status quo and have negative expectations of a new evaluation approach. According to Taut and Branus (2003), organization members have fears that they can be criticized or lose their jobs as a result of evaluation. These fears are often rooted in lack of trust among organization members and misunderstanding of what learning-oriented evaluation can be and do for them. Therefore, it is essential that the development of learning-oriented evaluation should be based on shared trust, value, and belief that evaluation can be a catalyst for individual, group, and organizational learning.

Key Practical Guidelines for Learning-Centered Evaluation

Learning-oriented evaluation is somewhat similar to other evaluation approaches that also emphasize learning as an outcome of evaluation, such as participatory, stakeholder-focused, empowerment, or utilization-oriented approach. To varying degrees, these approaches position an evaluator as a facilitator of learning from evaluation in which stakeholders learn about themselves as well as the program. However, learning-oriented evaluation for HRD programs is distinguishable from other approaches in that it focuses on increasing the potential of stakeholders and contributing to achieve organizational learning. In this section, I explain crucial strategies for the practice of learning-oriented evaluation. I develop one strategy for each evaluation stage that should be a focus or at least be gained attention.

Purpose and Audience

Identify multiple stakeholders and their information (learning) needs. The main concern of learning-oriented evaluation is to enlighten people involved. Therefore, it is important to include diverse audiences and understand what they want to know and learn through evaluation. Different purposes can be developed depending on the context- the program or intervention being evaluated, problems identified, stakeholders engaged, a type of the organization, and so on. For instance, one purpose of learning-oriented evaluation may be to provide information for decisions needed to be made regarding the program’s improvement and expansion. Another purpose may include gaining a better understanding of the program’s effects on different groups. Whatever the purpose of the evaluation may be, an evaluator needs to ensure that the purpose(s) of the evaluation is formed based on diverse stakeholders’ needs for learning and action. Diverse audiences, such as organization leaders, program directors, staff, trainers, trainees, and community members can be identified. From the beginning of the evaluation, the evaluator needs to facilitate the stakeholders to be informed of different issues and to prioritize them. Thus, they can decide what they need to know and what purpose is appropriate and feasible in a given situation. The purpose(s) of the evaluation chosen should be clearly stated and be effectively shared with the stakeholders.
Questions

Develop a set of questions in negotiations with stakeholders. Evaluation questions are very important, since these determine the boundary as well as the focus of the evaluation. Evaluation questions also help to further define the purpose of the evaluation and can influence decisions about evaluation design and methods for data collection. The evaluator and stakeholders may start from overarching and broad questions. For instance, what do or don’t we know about the program?, What do we need to know?, How does the program work?, How does the program achieve its goals?, and so on. It may be better to develop open-ended questions, because open-ended questions likely are more responsive to change of stakeholders’ needs as well as evaluation environments and produce rich information.

The process of developing evaluation questions calls for intense negotiations with stakeholders. Learning-oriented evaluation seeks to involve diverse stakeholders. So, it is not easy to come to agreement on a set of questions across different groups. While certain things are crucial to some stakeholders, others may not agree with that. Therefore, the evaluator needs to encourage stakeholders to explore their assumptions and values underpinning their support of certain questions. In this case, stakeholders can articulate why particular questions are more important and relevant to the purpose of the evaluation. Furthermore, they can understand what others think and expect from the evaluation. Through these processes, the evaluator and stakeholders can develop deeper understanding and new insights about the program (conceptual use). This also increases the likelihood that meaningful and useful data will be obtained as carrying out the evaluation (Cousins, Donohue, & Bloom, 1996). In addition, stakeholders who attained deeper knowledge and understanding about the program can influence other organizational members’ understanding of the program and the people involved. Both the evaluator and stakeholders need to make key inputs in the negotiations for developing evaluation questions. For example, stakeholders can bring knowledge of the program and the organization, while the evaluator is able to indicate limits to the evaluation given resources available.

Design and Methods

Select the most relevant, effective, and appropriate design and methods for data collection. The main focus in selecting proper evaluation design and methods is on understanding which design and methods will produce the best possible data to adequately answer evaluation questions. According to Preskill and Torres (1999), the evaluator and stakeholders can consider at least four factors in making decisions regarding evaluation design and methods.

- Preferred methods of those experienced in data collection and analysis activities.
- Prior experiences of team members with data collection and analysis activities.
- Unexamined notions, perceptions, or prior knowledge about the organization’s culture
- Perceived methodological, time, or other logistical constraints (p.101).

The evaluator should not employ a particular design or methods without having the expertise to use them. Also, resources and time available for data collection need to be checked before determining a design and methods. In consultation with stakeholders, the evaluator can make decisions about an overall evaluation design – experiment, quasi-experiment, systems analysis, case study, or participatory process, so on – and specific data collection and analysis methods – questionnaires, standardized measures, interviews, and observations, so on. Many researchers recommend that use of multiple information sources and methods is more likely to generate evaluation data that represent accurate and true indications of the program (Patton, 1997; Russ-Eft & Preskill, 2000).

Criteria for Judging Program Quality

Clarify stakeholders’ assumptions of the program quality. There is often confusion or difference among diverse stakeholders about evaluation criteria of the program should be. Even though they agree on a certain constitution of the program quality, for example effectiveness, or productivity, they may have different assumptions about what effectiveness or productivity means. Therefore, Evaluation criteria need to be defined based on shared opinions and similar assumptions of the program quality across different groups of stakeholders.

Developing evaluation criteria is a contextually sensitive matter, so that there is no single and objective standard out there to be used for HRD programs. Evaluation criteria should be mutually defined among the evaluator and stakeholders in a given context. One of the problems that HRD evaluation has faced is that “satisfaction” of customers or trainees has been overused to determine merit and worth of HRD programs. Due to loosely employing Kirkpatrick’s evaluation approach, satisfaction or reaction has become the key criteria to judge HRD programs even when satisfaction is not actually relevant to the quality of the program being evaluated.
Reporting

Share final findings with all stakeholders. Some researchers emphasize on reporting to a certain group of stakeholders, for example intended users (Patton, 1997), influential program staff (Owen, Lamber, & Stringet, 1994; Rossman & Rallis, 2000), premising that use of evaluation findings can be ensured by them. However, when considering the importance of information as a major source for learning, evaluation information should be reported to and shared with all of the stakeholders. This does not mean that every stakeholder needs to have a same type of report. Various versions of reports—short or long, electric or printed—can be used. Even though a thick and comprehensive report can describe findings, recommendations, and implications in details, it is not always necessary for all stakeholders to receive such report, and it takes high cost to produce it. Mattson (2003) studies managers’ perceptions of different types of evaluation reports in terms of their usefulness for decision making. The study shows that managers tend to use evaluation information more when it is reported in a way that is shorter in length and higher in comprehensibility. In addition to written evaluation reports, verbal presentations can be used for reporting evaluation findings. Sometimes, presentations can be more effective in informing and stimulating stakeholders for learning and action, because the evaluator and stakeholders can have chances to directly discuss evaluation information, ask questions, and voice reactions or concerns.

Participation

Create genuine forms of stakeholder participation. Learning-oriented evaluation recognizes the importance of including multiple stakeholders’ views. In this sense, the evaluator needs to provide opportunities over time for diverse stakeholders to better understand benefits and limitations of the program by engaging in the evaluation process. Stakeholders are not only relevant and appropriate sources of evaluation information, but they also play a role in creating evaluation practice as well (Cousins, Donohue, & Bloom, 1996; Greene, 1988). Therefore, the evaluator should work collaboratively with stakeholders in defining and developing many aspects of the evaluation. Diverse stakeholders’ participation increases the likelihood of their commitment to evaluation and use of evaluation findings. Stakeholders’ participation also increases the likelihood that individual, group, and organizational learning take place through collaborative group efforts. Even though it is necessary that multiple stakeholder groups participate in the evaluation process, it is often difficult to achieve this element within realities of the program operations.

Use

Provide ongoing support for stakeholders to integrate learning into their daily work. If learning-oriented evaluation is successfully implemented as intended, use should not be a problem since use is integral to learning through evaluation. In other words, if individual, group, and organization learning occur during the evaluation process, this means that intended use of evaluation is achieved. As already mentioned, in addition to use of evaluation results, there is conceptual or process use that is important and needs to obtain more attention from HRD professionals. Again, stakeholders’ participation in the evaluation process enhances learning and thus increases evaluation use. Moreover, use of evaluation is not the solo responsibility of the evaluator, because the evaluator and stakeholders are partners and co-producers in generating evaluation information as well as forming evaluation practice. Therefore, a collective commitment is required to apply learning into the program operations and outcomes.

Rather than a one time event, evaluation needs to be a force for continuing efforts for learning and action. As a means of integrating learning from evaluation into daily work, Preskill and Torres (1999) propose that the evaluator and stakeholders collaboratively work to develop an action plan for implementation of recommendations based on evaluation findings. According to Preskill and Torres (1999), after sharing evaluation information with stakeholders, the evaluator should encourage stakeholders to consider various action alternatives, choose among them, and develop an action plan to implement the alternative(s) selected. To maximize use of evaluation findings, the evaluator can work with stakeholders to implement program or organizational changes recommended by the evaluation. However, these collaborative endeavors need to be based on other organizational members’ trust and support.

Contribution to HRD Research and Practice

As the importance of evaluation in organizations has increased, there have been academic endeavors that suggest alternative approaches to evaluation of HRD programs. The notion of evaluation for learning has influenced HRD scholars and practitioners to expand their perception of evaluation use and see a clearer link between evaluation and
learning in organizations. However, there are still increasing needs for developing and articulating learning-oriented evaluation in which information and knowledge are socially constructed, and learning is facilitated by people and their social interactions. There is also a little theoretical discussion and practical applications of how this kind of evaluation approach helps to better develop organization members and enhance the quality of HRD programs. In this regard, this study attempt to provide conceptual as well as practical information needed when developing an evaluation for learning. Future research may need to take a deeper look at theoretical background of learning-oriented evaluation. Also, more empirical studies should be conducted to support evaluation as a means of individual, group, and organizational learning. In addition, it is necessary to investigate how and when the organization capacity for learning influences the development of learning-oriented evaluation for HRD programs.

The Constructivist Learning Environment Scorecard: A Tool to Characterize Online Learning

Barbara J. Helland
The Krell Institute

Over the past five years, the number of individuals engaging in online learning as well as the number of online course offering has grown exponentially. At the same time, outcome research on online learning design is sparse. This paper describes the development of a constructivist learning environment scorecard and explores its usefulness in characterizing and comparing online learning courses and subsequently learning outcomes.

Keywords: Adult Learning, Constructivism, Online Learning

Society has shifted from the industrial age and its use of machines for production to the information age with its rapidly increasing volume of accessible information (Toffler, 1990). By the year 2000, the number of online, indexable documents available via the Internet surpassed the 100 billion mark with 3.2 million new pages and more that 700,000 images added every 24 hours. Also in 2000, approximately 55,000 new users per day logged on to Internet; triple the number of users in 1997 (UCLA Internet Report: Surveying the Digital Future, 2000).

In the midst of this information explosion, the 1999 CEO Forum Report on Education and Technology reported that sixty percent of the jobs available at the beginning of the 21st century will require skills currently held by only twenty percent of the workforce. Correspondingly, in 1999, the “Industry Report” in Training Magazine estimated that corporations would spend $62.5 billion on training, a 24 percent increase in five years.

Problem Statement

More and more corporations and educational institutions are offering distance education or e-learning courses. As corporations rush to offer courses online, human resource development practitioners may have to reexamine their assumptions on course design. Distance learning courses should be designed not only to meet business needs but also to reflect the characteristics and needs of their learners—the adult (Rosenberg, 2001). Most online learners are full-time workers who want to improve their skills by participating in continuing education opportunities that fit into their busy schedules (Green, 2000). Furthermore, they are older and have dependents at home (Huang, 2002). These individuals realize that to survive in today’s environment, they must be able to construct their own knowledge by evaluating and applying new information. Thus, human resource development practitioners should also revisit learning theories such as constructivism, with its focus on the learner constructing knowledge.

Like corporations and universities, I have become interested in how to use computers to deliver instruction to geographically dispersed learners. In the ten years that I have been conducting face-to-face workshops for middle and high school teachers, the workshops have transformed from a teacher-led, lecture-based courses to student-centered, constructivist learning environments. To successfully translate these workshops to an online learning environment, I need to identify the critical attributes of the constructivist classroom and what tools or constructs are available to recreate those attributes if the learners only meet online. Much of the current research on the outcomes of online research has been anecdotal reports, surveys or self-reports on small samples (Rudestam & Schoenholtz-Read, 2002). In my review of the literature, I found several models that defined constructivist learning environments or rubrics that measures specific components found in distance learning such as collaboration or interaction. I did not, however, find an instrument that could help me classify a course as a constructivist learning environment. Thus, the purpose of this pilot is to propose an analytical tool, the constructivist learning environment (CLE) scorecard, and explore its usefulness in to characterize online training.

Theoretical Framework

Characteristics of Adult learners

As noted above, adult learners comprise the largest segment of learners in online courses. According to Malcolm Knowles, adult learners are self-directed; bring life experiences, which serve as resources for learning,
into the learning situation; take a problem-centered approach to learning; are ready to learn when they experience the need to learn something because of a work-related or life-related problem or task; and are motivated to learn by internal and external factors (Merriam and Caffarella, 1999, Noe, 1997). Furthermore, because of demands on their time, they appreciate flexibility in their learning environments and respect for their situation in life.

John Dewey postulates that genuine education or learning comes from experiences (Merriam & Caffarella, 1999). However, an experience doesn’t educate if it doesn’t lead to broader and deeper experiences. To understand how experiences lead to learning, Kolb (Jarvis, 1992) defined the four-stages that individuals go through in response to an experience: experience a new event, observe and reflect on what happened, make generalizations about experiences, and use new ideas and concepts in actual practice. Jarvis (1992) expanded Kolb’s cycle by identifying nine responses that can occur from an experience: presumption, non-consideration, rejection, preconscious learning, skills learning, memorization, contemplation, reflective skills learning and experimental learning. Recognizing that we do not always learn from our experiences, Jarvis classifies the first three responses as non-learning. The second set of three responses defines non-reflective learning. As Jarvis notes, people involved in non-reflective learning are trying to fit into their environment and don’t question the underlying culture. In reflective learning, as evidenced in the final three possible responses to an experience, people “stand back, make decisions and evaluate their learning. (p. 76) Jarvis’ reflective learning is similar to Argyris’ (1993) notion of double loop learning. In double loop learning, errors are corrected by changing the governing values or underlying master programs that led to the error. Correspondingly, reflective learning requires the learner to stand back and evaluate their governing principles before the action of learning takes place. Learning begins when the equilibrium between the individual and their environment is disrupted and they are forced to reflect on their past and future actions.

Constructivism

As indicated by the title of the tool, the scorecard is based on the constructivist theory of learning. Constructivism is consistent with adult learning theory because it focuses on the learner making meaning from experiences (Herring, 1997). Bruner (1990) defines “making meaning” as experiencing phenomena, interpreting the experiences based on our current knowledge schema, reasoning about them and reflecting on the experiences. Thus, constructivists believe that knowledge must be constructed from our experiences (Jonassen, Peck & Wilson, 1999).

Social constructivists, as evidenced in the work of Lev Vygotsky, believe individuals make meaning by engaging in dialogues and activities about shared problems or tasks. Vygotsky defined the zone of proximal development to describe how collaboration leads to learning. Smith (1998) used three concentric circles to illustrate Vygotsky’s zone of proximal development. The inner circle represents an individual’s current knowledge and skills based on life experiences. The area in the second circle is the zone of proximal development. This zone is characterized by what the individual could learn with the help of a more experienced individual. The outer circle is the information or concepts that the individual won’t understand no matter how much assistance is provided. Thus, learning or knowledge is a social interaction where the learners are introduced to the culture by more knowledgeable individuals or other learners and making meaning is both an individual activity and a socially interactive exchange (Herring, 1997, Merriam & Caffarella, 1999). The implication that social constructivism has for a learning environment is that it should support dialogues and shared problem solving between learners and it should provide a mechanism for more knowledgeable individuals to help the learners move into their zone of proximal development.

Learning Principles

Huang (2002) proposed six instructional principles based on the constructivist approach to online learning for adults. The following sections present a more detailed discussion of Huang’s instructional principles.

Interactive learning. In an online environment, opportunities must exist to support interactions between the learner and the teacher, between learners and between the learner and the content. Cavallo (2001) explains that content in constructivist learning environment emerges from interactions between teacher and students and between students. This is preferable to instructional designers specifying content because it allows the content to be based in and grow out of the existing culture or real world of the learner.

In a web-based problem presentation/simulation space, the learner creates his/her own path through the interconnected chunks of information. Unfortunately, one side effect of interactive learning within online systems may be information overload. Instead of engaging with the learning material, learners become disoriented and focus on navigational and browsing issues. Information resources in a constructivist learning environment (CLE) must be organized in a meaningful way so that the learners don’t lose sight of their learning objectives (Nunes and Fowell, 1991, Hudson, 2002). Navigational tools are needed to keep the learners focused on the information.

Collaborative learning. Collaborative learning is contrasted with cooperative learning. In cooperative learning, learning is characterized by learners sharing the workload and coming to consensus. Collaborative learning requires the learners to search and evaluate the evidence for different viewpoints. In the CLE, learners are presented
with opportunities to work together to develop, compare, evaluate and understand different viewpoints on an issue. (Bednar, Cunningham, Duffy & Perry., 1992). Specifically, activities must be “designed to include issues of individual differences, diversity in groups and structural inequalities that arise in globalized economy” (Hudson, 2002, p. 60).

**Facilitating learning.** To support collaborative and interactive learning, teachers must create a safe, but not necessarily comfortable, environment that supports critical dialogues and experimentation by the disoriented learners. Learning begins when the individual’s equilibrium within their environment is disrupted (Jarvis, 1992). Students need to feel free to offer written advice or constructive criticism even when they don’t know how it will be received on the other end because they can’t see the reaction. In order to create a safe online learning environment, Hudson (2002) advocates the use of guidelines or covenants to promote critical dialogues where the learners are free to give voice to the thoughts in their head.

In addition to creating a safe environment, another instructional method that can be used to facilitate learning is the creation of cognitive apprenticeships within the learning environment. Employing the technique of cognitive apprenticeship, teachers first serve as experts and model problem solving within the content domain. As the learners gain skills and knowledge, the teachers evolve into coaches that guide learning. For instance, the teachers help learners into their zone of proximal development by involving the learners in tasks that stretch them to go beyond their level of expertise and providing the appropriate level of social guidance and support (Wilson & Cole, 1992). Teachers can force learners to recognize the inconsistencies in their naïve model and challenge them to create better models (Perkins, 1992). Lastly, cognitive tools, such as online tutorials, should be developed to help the learners or cognitive apprentices acquire skills that they may lack to complete the projects in the CLE.

**Authentic learning.** Merriam and Caffarella (1999) identify the attributes that must be present if a learning activity is to be considered authentic. These include solving real-life problems with ill-structured complex goals, evaluating the relevance of information, involving student’s beliefs and values, and participating in collaborative activities. Consistent with adult learning theory, learning must relate to real life needs and the learner’s experiences are a valuable resource for the instructor to draw upon. In the CLE proposed by Jonassen, et al. content, through related cases and information resources, is introduced in the context of the real-world as defined in the problem presentation/simulation or problem manipulation space.

**Learner-centered learning.** Both adult learning and constructivist theories identify new roles for the learner. In the constructivist classroom, learners must be involved in designing their own learning environments, defining content, setting objectives and evaluating their progress toward meeting their objectives. Students learn as they dialogue with each other, by actively participating in learning activities and through observation.

The difficulty in moving from a teacher-centric to learner-centric environment is one of task management. Learners can become overwhelmed when asked to accept responsibility for their learning. The teacher or course designer walks a fine line in defining structure to help the students overcome their feelings of frustration while allowing them to take control of their learning. As noted in earlier sections, the teachers or the navigational elements in an online course can serve as guides to help the students when they become lost. (Duffy & Jonassen, 1992; Rudestam & Schoenholtz-Read, 2002; Hudson, 2002.)

**High quality learning.** Jonassen et al.’s. (1998) term for high quality learning is constructive learning. When engaged in high quality or constructive learning, learners “articulate what they know or have learned and reflect on its meaning and importance in larger social and intellectual contexts.” (p 218) Jarvis’ (1992) reflective learning and Argyris’ (1993) double loop learning are also examples of high quality learning. Within the CLE, high-order thinking skills are called upon to determine the validity and quality of information and for viewing information from multiple perspectives. As noted above, the learning activities must force the learner to question their governing values and reflect on their past and future actions.

**Methodology**

**Constructivist Learning Environment Scorecard**

Wilson (1996) defines a constructivist learning environment (CLE) as “a place where learners work together and support each other as they use a variety of tools and information resources in their guided pursuit of learning goals and problem-solving activities” (p.5). Jonassen, et al. (1999) defined a CLE as technology-based environments where students “can do something meaningful and useful.” For the purposes of my study, a constructivist learning environment (CLE) is defined as a safe place for students to work together and learn from their experiences, and each other, by exploring, experimenting, dialoguing, and reflecting. Combining my definition of a constructivist learning environment with Huang’s instructional principles, I initially used the rubric construct as the foundation for the my instrument. However, as I applied the rubric to an online course that I had
previously taken, I found that the rubric was difficult to use because it was too narrowly focused. Thus, I redesigned my instrument (see Table 1) using the scorecard metaphor because I wanted it to represent a balanced approach for course design based on constructivist learning attributes.

Table 1. Constructivist Learning Environment Scorecard

Evaluation Criteria:
Little or no evidence: 0-1; Limited evidence: 2-4; Some Evidence: 5-7; Compelling evidence: 8-10

This version of the CLE scorecard allows the rater to assign up to ten points based on the level of evidence that the course design exhibited the constructivist/adult learning characteristics for each of the six categories. I established the following point distribution: Little or no evidence – 0-1 point; Limited evidence – 2-4 points; Some evidence – 5-7 points; Compelling evidence – 8-10 points. The end points, compelling evidence and little or no evidence, are representative of each end of the spectrum in each category. For example, in the case of the interactive and collaborative learning components, working in collaboration is at one end of the continuum while working in isolation is at the other. Similarly, the movement is from student-centric to teacher-centric in facilitating and learner centered learning; from project-based or discovery learning to memorization in authentic learning; and from Jarvis’ reflective to non-reflective learning in the case of high quality learning. The differentiation between the middle two subdivisions is based on the degree to which the elements listed under the Characteristics column are proposed and implemented in the course design.

The score generated from the scorecard is actually an identifier that conveys information about individual components. The proposed identifier is defined in the following manner: HHIICCAA.FFLL where HH = High quality score; I = Interactive score; CC = Collaborative score; AA = Authentic score; FF = Facilitating score; LL = Learner-centered score. The facilitating and learner-centered score were placed to the right of the period because they represent roles within the learning environment rather than a type of learning.

Pilot Study

To pilot my scorecard, I applied it to a qualitative study of an online graduate sociology course offered at a large Midwestern university. As described in the course syllabus, the sociology course “addresses the theoretical and applied topics in the sociology of technology.” The instructor designed online course using WebCT and materials from a similar undergraduate sociology course. The course content was available on web pages, in texts and articles an E-Reserve at the university and on a CD mailed to each student registered for the class. As described in the course instructions, the instructor developed self tests to help the students understand the basic concepts. In the initial design, the instructor included two common online constructs, the chat room, a synchronous component that requires the participants to be online at the same time, and threaded discussion group, an asynchronous component that is available to participants any time. The purpose of the chat room was to further clarify the materials and readings and the threaded discussion group was included to let the students share their
opinions about issues covered in the materials. For the purposes of my study, I observed the class participation in the chat sessions and reviewed the transcripts of both the chat sessions and threaded discussion groups.

I asked for volunteers from the sociology students to share their experiences in the course with me via questionnaires that I developed. I solicited their experiences via e-mail three times during the semester and once after the course was over. The first questionnaire was actually two instruments. The first instrument was Felder and Soloman’s (2002) Index of Learning Styles instrument. I chose this instrument to help characterize the students in the study. Although it has not been validated, I chose it because it was available to the public via the web. The second instrument was designed to collect background information on the students participating in the study. The questionnaire was divided into two sections. The first section collected demographic information and assessed the students’ readiness for online learning. The second part was designed to determine the students’ familiarity with technology.

The second questionnaire was designed to touch base with the students after the first month of class to see how much time they were spending on the class and how comfortable they were the technological constructs. I also used the questionnaire to draw them into the design of the course by soliciting their suggestions for redesigning the discussions groups to encourage more participation. The third questionnaire was given at the end of the class and was designed to determine the presence or lack of the creation of a community of learners. Finally a month after the class finished, I send the CLE scorecard out to the participants to determine their reaction to the design of the course.

Results

Of the sixteen people who signed up for the class, five responded to all four surveys. The participants involved in study were between the ages of 25 – 47 living in geographically dispersed regions in the U.S. All but one was working on a Masters of Agriculture degree. None of the respondents were fulltime students and they represented a variety of professions. Based on a review of the time periods when items were posted to the threaded discussion groups, the majority of students in my study logged onto the system during non-working hours. The characteristics of the students in my study were similar with those described by Huang (2002) and Green (2000).

To determine the CLE scorecard category ratings for the course, I reviewed design of the course as described in the course syllabus and instructions and the student responses to the questionnaires as well as their participation in chat and discussions groups.

CLE Scorecard Ratings

Interactive learning. Although the students interacted with each in the chat rooms, the threaded discussions were really designed to support these interactions. According to the participation diagram that I developed for the first unit’s threaded discussion group, the students responded to the instructor, not to each other. Shortly thereafter, the instructor modified the threaded discussion grading so that the students were required to respond to one of the other student’s posting. This modification resulted in some interaction between students as evidenced in subsequent units’ participation diagrams. The chat rooms served as the opportunity for the students to interact with the instructor. As evidenced in the transcripts of the chat sessions, the instructor posed questions that led to lively discussions of the material. Based on these observations, there was compelling evidence that the course was designed to support interactive learning and it received nine points on the scorecard.

Collaborative learning. In the chat session after the first discussion group assignment, the instructor indicated that the participation in the discussion groups was not meeting his expectations. This observation was based on the students’ posting patterns. According to the course syllabus, the threaded discussions had been included in the course design to create a team-like environment where the students could share their ideas and perspectives. The description of the threaded discussions in the course instructions was the only indication that I had that the instructor expected some collaborative learning. I felt that this represented limited evidence in support of collaborative learning and only awarded two points in this area.

Facilitating learning. On the second questionnaire, one student commented that the environment in the threaded discussions did not support free expression of ideas. This student felt bullied by others in the course, primarily because of the student’s profession. Reviewing the chat sessions and discussion groups provided evidence to support this student’s observation. The student offered a different perspective, but some of the other students chose to “bully” rather than to understand. In addition, another student observed that “a lot of times people are afraid of sharing their opinions or ideas, especially if there are classmates dominating the chat session.” The course syllabus or instructions did not offer any guidelines for appropriate behavior in either the chat sessions or threaded discussion groups. I felt that there was little evidence that the course was designed to create a safe environment that promoted dialogue.
The instructor, on the other hand, tried to serve as a facilitator and guide. He created structure for the course so that the students knew when the discussion groups and chat sessions were scheduled. There were separate threaded discussion groups for each unit and a beginning and end for each discussion. He guided the threaded discussions by posting thought-provoking questions that were designed to encourage collaboration and reflection on the part of the students. He continually requested feedback from the students on the design of the course. However, there was little chance for the students to take leadership roles in setting or resetting course objectives or goals, sharing their experiences or providing supplementary materials.

Within the learning environment of the course, the instructor served as a guide to the learner. He did not set or ask the students to establish guidelines to create a safe environment. Because these two actions tended to counteract each other, I averaged the scores for each part and only found some evidence that the instructor was acting as a constructivist learner-centered facilitator and awarded six points for facilitating learning.

**Authentic learning**. The CD that the students received contained a simulation that required the students to become change agents and develop a strategy to insure the adoption of a new technology in a hypothetical village. This game was similar to the “SimCity” type of computer games without the fancy graphics. The students had to apply the skills and knowledge they gained in other course units in order to develop their strategy.

There was some evidence that the course materials were presented in the context of the real world, but, as evidenced in the assignments, the real world was limited to the immediate area around the university. Students from other states experienced some difficulty relating to the material. For these reasons, I only awarded five points for authentic learning.

**Learner-centered learning**. The instructor asked for input and feedback from the students during several of the chat sessions. Their suggestions were used to restructure the threaded discussion groups. According to the participation diagrams of the threaded discussion groups, the most involved conversations were still in response to the instructors questions. Even though two points were awarded for taking leadership in the chat sessions, I found little indication in the transcripts that the students assumed this role. Because I found very little evidence that students designed their own learning, I awarded it one point in the learning center learning category.

**High quality learning**. Based on my observations, the rapidity of the online chat sessions did not allow for reflection. The threaded discussion groups were included in the course design so that the students would evaluate and reflect upon their learning. For the most part the student responses to the instructor’s questions demonstrated some reflection and thought. However, in relation to either the instructor’s or student’s posts, there was little evidence that the students reached the level where they questioned their own governing principles. As evidenced in the transcripts, none of the students changed their position on the technology studied in the course. Based on these observations, I found that there was some evidence that the instructor had designed the course to promote high quality learning and awarded it five points.

As an additional assessment of the usability of my CLE scorecard, I asked the participants who responded to the third questionnaire to fill out my CLE scorecard and compared their responses to mine (see Table 2). Our scoring pattern was similar expect in the case of authentic learning. Since all of the respondents were working on their Masters of Agriculture, they felt the course as designed was authentic and addressed the issues that they face in real life. As expected, the student who felt bullied gave the course the lowest score for facilitating learning. Finally, because they all felt the course met their expectations, they considered that they had experienced high quality learning.

**Discussion**

The pilot study in this paper was primarily undertaken to test the design and development of the CLE scorecard. As noted above, the advantage of using an identifier rather than a score is that the identifier maintains the information from each individual component in the scorecard. Thus, this instrument could also be used to compare elements in
many courses or to establish a baseline if the goal is to modify an existing course. In the pilot study, I examined the course syllabus and instructions as well as the transcripts from chat sessions and threaded discussion groups to establish the final, mixed rating for each component in the scorecard. In order to identify what course elements were successful, prior to the start of the course, I should have generated an identifier based on the evidence found the class syllabus and course instructions. Once the course was over, I should have generated a second identifier based on the evidence gathered from the transcripts of the chat sessions and threaded discussion and the student questionnaires. The comparison of the two characterizations would more accurately identify the learning areas that needed refinement or more study. Even though I didn’t generate a pre- and post-identifier for the class in my pilot study, I felt that the CLE scorecard was useful in that it identified possible connections between the categories. For instance, the lack of course elements that encouraged the students to work collaboratively may have contributed to learners relying on the instructor to guide their learning.

In pilot study, I also used the identifier, as seen in Table 2, to compare my characterization of the course with the students’ reaction to the course. However, the students’ level of expertise and understanding of the categories in the scorecard was limited because the information in the CLE scorecard was the only description that I gave the students for each category. The disparity in our ratings is probably attributable to inter-rater reliability. Further pilot studies are needed to refine the definitions for each category so that consistent identifiers are generated by different raters using the scorecard. To gather this information, I intend to modify the CLE scorecard and include an area for the rater to document the evidence or lack of evidence for each component.

As I used the CLE scorecard with the sociology course, I began to question my initial assumption that all of the categories carried equal weights. Based on my literature review, I believed each component contributed equally in creating a constructivist learning environment. However, even as I created the algorithm to generate the identifier, I separated facilitating learning and learner centered learning from the other learning categories. I felt that these two categories represented the roles of the student and the instructor/course designer within the constructivist learning environment. Upon reflection, the pilot study raised several questions such as: does a constructivist learning environment exist if one of the elements, for example, authentic learning, is missing? Can learners still “make meaning?” Correspondingly, does a constructivist learning environment exist if only one element is present, for example high quality learning? The answers to these questions may depend on the purpose of the training. Perhaps every course does not need to have a rating of ten for each component. For instance, all components may be necessary, but if skill development is the goal of the course, then authentic learning may be the most relevant learning attribute. Overall, I’m encouraged with the CLE scorecard, but realize that more testing is needed to address the issues raised in this study.

**Applications to HRD**

I designed the CLE scorecard, in part, to provide a tool that would help course designers develop courses and training based on learning theories. Successful employees in today’s global, information-age corporations rely more on cerebral skills than on manual skills, are able to work collaboratively in teams, and are asked to solve ill-posed problems. The constructivist learning theory with its focus on shared problem solving and making meaning by reasoning and reflection on experiences more closely mirrors the training needs of the 21st century workplace than more traditional learning theories. Thus, the CLE scorecard, based on the characteristics of adult learners and the constructivist learning theory, has several applications to human resource development. Strategically integrated HRD practitioners (Gilley & Maycunich, 1998) can use the CLE scorecard to provide a discussion framework when managers approach them with a training need. However, based on my limited pilot study, I believe that a more important use of the scorecard is in conjunction with assessments of learning and transfer to the job to identify instructional elements that are successful or that need further modification. The CLE scorecard can provide HRD practitioners with an action research-based method for making training decisions and modifications.

Organisational Factors Influencing the Assessment of Formal and Informal Learning

Nicholas R. Clarke
University of Greenwich

Increasingly the different ways in which learning can be conceptualised alongside debates within the field of HRD regarding its nature and purpose, potentially lead to confusion regarding how learning is to be assessed in the workplace. This paper identifies some of the complexities associated with assessing learning in today’s workplace and presents empirical findings suggesting that different aspects of an organisation’s training and development system are likely to differentially determine the extent to which either formal or informal learning is assessed.

Keywords: Learning, Assessment, Evaluation.

The ascendancy of ‘Learning’ to the position it now occupies as one of the most dominant themes within the management literature is predicated on the assumption that it may well be the most significant factor upon which organisational success is contingent (Barrie & Pace 1998; Easterby-Smith et al 1998). Recent empirical findings are also beginning to confirm the importance of providing suitable opportunities for developing individuals and for enhancing learning as being related to better organisational performance when measured as either an individual HR practice or as part of a bundle of HR practices within ‘high performance work systems’ (Ichinowski et al 1997; Storey 2002). Given such developments, the question of whether we can actually measure or assess whether learning has occurred in organisations takes on added significance. Potentially contributing to the difficulties in assessing learning within organisations is the variety of ways in which learning is conceptualised, which can give rise to considerable confusion on a practical level. Indeed although ‘learning’ is increasingly seen as occupying a central component within HRD, it is a multi-faceted construct, the different components of which have yet to be satisfactorily integrated within a comprehensive, functional model to underpin HRD at either a theoretical or practical level. Instead, different approaches to understanding the nature of learning has led to increasing controversy about both the nature and purpose of HRD itself (Garavan 2000; McGoldrick et al 2001). Central to these debates are differing perceptions of learning either as a process unique and confined to the individual, contrasting with those that conceptualise learning as embedded within socio-cultural practices. Concepts of learning are also differentiated as either formal or informal, as well as occurring at either the individual or organisational level. Not only do these approaches suggest that the actual target of assessment in relation to learning may be very different in each case (e.g. the individual versus the social context), but they also bring to the fore very different epistemological assumptions and practices to underpin any assessment of learning. As Easterby-Smith et al (1998) state, ‘how you categorize and measure something depends on how you look at it’ (p267). Complicating assessment further, is whether learning can be said to have occurred as a result of a change in cognition or whether a change in behaviour is required. In this respect there are two contrasting schools of thought within the HRD field. The first, the ‘learning perspective’, suggests that the focus of HRD should be to enhance both the organisation’s and the individuals within it, capacity to learn. The performance perspective on the other hand is concerned with ensuring that learning should be translated into behaviour or performance that is associated with meeting organisational goals (McGoldrick et al 2001). Given that the need to assess or evaluate learning programmes and activities has traditionally been recognised as a key component of the HRD practitioner’s role (Wexley & Latham 2002), these differing perspectives are of no small significance (Ruona et al 2002). Much of the literature relating to training evaluation however suggests that this tends to be given very little priority within organisations (Philips 1997; The Industrial Society 1994; Training 1999). Recent findings in relation to workplace learning more widely suggest that problems with the assessment of informal learning may pose similar problems. Woodall (2000) for example in a study examining workplace learning concluded that,

“Most organisations made use of personal development plans, but this was usually as a follow-up mechanism to a formal off-the-job development programme or as part of a competence-based approach. Yet there appeared to be little facilitation of PDPs, and few resources devoted to supporting guided reflection: scant use was made of learning logs and diaries, personal development planning workshops or developmental counselling” (p27).

Copyright © 2004 Nicholas R. Clarke
Yet although we have some understanding of those factors that seem to impede training evaluation, we actually know very little about those factors which seem to drive the assessment of learning in organisations. Furthermore despite an increasing reliance by organisations on different forms of workplace learning, the extent to which the drivers of the assessment or evaluation of training are similar to the assessment of informal learning in organisations is a relatively unexplored area. Given this context this paper considers how different conceptualisations of learning as either formal or informal may impact on our understanding of how to undertake effective assessment and presents empirical findings suggesting that particular organisational factors are differentially associated with the assessment of both forms of learning within the workplace.

Assessing Formal & Informal Learning

Traditionally much of the activity directed towards learning in organisations relied to a considerable extent on off-the-job methods, typically those such as training courses, seminars and educational programmes. Critics however have commented that formalised approaches to learning can often be removed from the realities of the workplace and as such suffer in terms of transferring learning to use on the job, and may often be seen as lacking relevance to learners’ needs. Informal learning by contrast, refers to that learning which occurs on the job falling under the general rubric of workplace learning or development, and includes mechanisms such as mentoring, coaching, job rotation, job-shadowing and special projects or assignments (Marsick & Watkins 1997). Also included is learning gained as employees go about their daily work referred to as incidental learning or learning by trial-and-error. Such learning is increasingly being recognised as possibly the most important type of learning within organisations (Coffield 2000) and evidence suggests that such informal methods are becoming increasingly prevalent (Dench 1993). Although a clear definition of workplace learning has yet to emerge, it would appear to be centred around a number of key concepts (Erut 2000; Raelin 2000). That is it is (1) concerned with reflection on and learning from experience; (2) as a result of the former significantly based on real-life problem-solving; and (3) acknowledges that much learning is also a function of a collective activity situated within a specific social context. In this respect work-based learning recognises learning from both socio-cultural and individual perspectives and does not necessarily exclude more formal learning methods, where more deliberate activities designed to focus on self-reflectivity and examining theories in action are seen as important (Erut 2000; Pedler 1991). In terms of assessment, formal learning has the longest tradition within HRD and as such there exists a multitude of methods that are generally well known to HRD practitioners. Most of these have their origins within the adult education and training disciplines and include amongst others knowledge tests, simulations, and case studies, usually given to learners before and after they have participated in a formal learning activity (Wexley & Latham 2000). By its very nature however measuring or assessing informal learning outcomes can pose significant problems. Informal learning is often both unplanned and ad hoc and thus is not amenable to those traditional approaches used to measuring formal learning, since specific outcomes are difficult to specify a priori. For the most part, writers within this area have seen learning as a means to improve the well-being of individuals within organisations and have tended to reject the learning-performance paradigm. Instead the focus has been on the need to develop mechanisms suggested as facilitating informal workplace learning (Marsick & Watkins 1997; Raelin 2000). Here then the focus of assessment shifts from outcomes, to assessing learning conditions or opportunities for informal learning to take place. A number of authors for example, have argued that if organisations wish to encourage informal learning, then individuals need support in maintaining an openness towards new experiences, support in reflection, and support in translating the learning into practice (Marsick & Watkins 1997). However much of the writing here is often limited, in that there is generally a significant lack of empirical support to justify the claims made regarding those mechanisms or conditions suggested as supporting informal learning. Nonetheless questions remain as to whether merely measuring learning capacity for workplace learning is in itself sufficient. Clearly from a performance perspective this would not be. But similarly even from a learning perspective there are significant limitations with simply measuring learning capacity. The major problem being whether all learning could necessarily be seen as either effective or valuable learning. Research has shown for example that inaccuracies can often occur in learning from experience as a result of human biases and distortions (Feldman 1986). Furthermore it can be difficult for individuals to accurately identify cause-and-effect relationships within such complex organisational environments again leading to inaccuracies in the knowledge gained (Tsang 1997). Such arguments suggest that whether from a strictly learning or performance orientation, there should be some attempt to determine the actual impact of work-based or informal learning, although qualitative approaches for assessing learning are likely to be far more appropriate in this instance. Clearly determining those conditions which support informal learning are important not least since they go to the heart of our understanding of how people learn in differing contexts (Elkjaer 2000). However this does not detract from those arguments for the need to assess learning outcomes of both formal and
informal types of learning, although the mechanisms used may differ in each case. These could include for example, the specific use of workplace diaries or journals and learning logs (Luckinsky 1990) as well as more formalised mechanisms such as action learning groups for reflecting upon and analysing the learning gained (Pedler 1991).

It would seem then that different sources of workplace learning require a flexible and variegated approach to assessment, yet much of the literature would seem to suggest that despite the tools and approaches outlined above, the evaluation or assessment of learning is far more difficult to achieve in practice (Bassi et al 1996; Philips 1997; Woodall 2000). Research suggests that a major problem lies in the fact that most evaluation is undertaken for the primary purpose of improving instruction, rather than demonstrating actual outcomes in terms of individual performance (Brandenburg, 1982). Other explanatory factors might also include the lack of necessary knowledge and skills with which to conduct training evaluations (The UK Industrial Society 1994). Research by Grove & Ostroff (1990) in the US identified five key barriers that appeared to explain why training evaluation was often not carried out very effectively within organisations. They suggested that this was often due to (1) Senior management often not insisting or requesting information on the impact of the training that was provided; (2) The lack of expertise amongst HRD professionals regarding how to carry out training evaluations; (3) A lack of clear training objectives attached to training programmes so that actually knowing what to evaluate against is difficult if not impossible; (4) The limited budgets available to training departments means that resources are preferred to be devoted to training provision rather than training evaluation; and finally (5) that the risks associated with evaluation may be too great given that the evaluation data might reveal that the training had little impact. Much of the research which has identified barriers to undertaking training evaluation would seem to suggest then that the characteristics of the training and development system play a significant role in determining whether training is evaluated. However the extent to which the characteristics of an organisation’s training and development infrastructure influence the assessment of workplace learning more widely is a relatively unexplored area. It is therefore in this respect that this paper seeks to enhance our understanding of the assessment of learning in the workplace by examining how differing elements of the training and development system may potentially influence the assessment of either formal or informal types of learning.

The Study

Following Mabey & Thompson (2000) in their study examining the determinants of management development in UK organisations, a systems approach was also adopted here to map the potential training process or infrastructure variables likely to influence the assessment of both formal and informal learning in organisations (Figure 1). Based on the findings relating to barriers to training evaluation, as well as the training and development literature more widely concerning factors influencing training evaluation, the model posits the key elements of an organisation’s training and development system considered important in the assessment or evaluation of learning (Goldstein 1993; Stewart 1999; Wexley & Latham 2002)

Policy Variables

Policy variables include (1) organisation-wide training policy, (2) on-the-job learning policy, and (3) organisation-wide training & development strategy and (4) paid staff study leave. Training and development policies should outline the commitment of the organisation to learning and expectations that learning methods will be utilised to improve performance. A training and development strategy operationalises the policy in terms of the amount and sources of development to be provided in order to meet the learning goals of the organisation (Buckley & Caple 1995; Rothwell & Kazanas 1989; Stewart 1999). Both policies and strategy reflect the importance placed on learning by the organisation and provide clear objectives for learning which will facilitate its assessment. These are therefore posited to be associated with a greater likelihood that different forms of learning will be assessed.

Practices Variables

Practice variables include (5) organisation-wide staff appraisal, and (6) the use of personal development plans, are acknowledged within the training and development literature as important practices to identify learning needs and facilitate learning (Eaton 1999; Taylor & Edge 1997). Both these practices are used to identify learning goals and provide feedback on performance and are therefore considered to be key tools used to provide data regarding the effectiveness of learning undertaken by individuals. Organisations with these practices are therefore more likely to be undertaking learning assessment.

Staffing Variables

Staffing variables include (7) a senior manager with responsibility for training & development, and (8) training & development staff, are posited here to be important elements of an organisation’s training and development system that will influence whether assessment of learning is undertaken. A senior manager with responsibility for learning is likely to recognise the importance of assessment and be in a better position to secure resources to be
allocated to this. Similarly where organisations employ training staff there should be a greater recognition of the importance of the assessment of learning (Celinski 1983; Reid & Barrington 1997). Together then these two staffing variables are posited to drive learning evaluation or assessment.

**Learning Outputs and Assessing Learning**

The extent to which the organisation provides opportunities for both formal and informal learning is also posited here to influence the need to assess the learning taking place. The more the organisation is actively involved in providing opportunities for staff to undertake learning, the more likely assessment is to be accorded greater status. Given that the extent to which formal and informal learning is assessed may well differ in any one organisation, these two differing types of assessment are identified separately. Finally the model posits that the extent to which organisations assess their learning is considered to have a direct impact on learning outcomes, indicated here by the extent to which (1) staff training & development programmes achieve their objectives and (2) training and development impacts on organisational goals.

**Methodology**

In order to investigate the organisational influences on the assessment of learning, data was obtained from a national survey of specialised healthcare organisations (hospices) in the UK. A total of 161 questionnaires were sent to hospices throughout Britain together with a covering letter explaining the aims of the research and a guarantee of anonymity. 120 questionnaires were returned a response rate of 74% which is considered a good response. Questionnaires were addressed to either the chief executive or the director of nursing requesting that a member of the senior management team with either responsibility for or knowledge of training and development within the organisation respond. Of those completing questionnaire, 37.5% (45) were nursing directors, 27.5% (33) were chief executives, 4.2% (5) were medical directors, 10% (12) were HR personnel and 21% (25) categorised themselves as other (such as education/training specialists). 12% (14) were male and 88% (105) were female. The mean age of respondents was 47 (SD 8.36).

**Measures**

A number of measures were included in order to examine the posited relationships contained in the model.

1. Measures of the eight training process variables were obtained by a simple dichotomous categorical coding of either yes or no. Yes was coded as 1 and a dummy variable of 0 was coded to negative answers.
2. The amount of formal learning was measured by asking respondents the amount of days off the job training received by employees during a year on a scale of 1 to 4, where 1= 0-2 days, 2= 3-4 days, 3= 5-6 days and 4 =7 days or more.
3. The amount of informal learning was measured by asking respondents to allocate 100 points between a range of 12 learning sources including supervision, training, team meeting and mentoring that were used within the organisation for developing the knowledge and skills of staff. The measure of informal learning was obtained by summing all those categories classed as informal learning.
4. The extent to which formal learning is assessed in the organisation was measured by asking respondents to indicate the extent to training is evaluated on a likert-scale, from 1-4, where 1 =never and 4=always.
5. A measure of the assessment of informal learning was obtained by summing the number of mechanisms respondents indicated they formally used on a regular basis to assess such learning from a choice of 7 options including learning logs, workplace diaries, guided reflection, and development counselling.
6. Size of the organisation was used in the study as a control variable and based on the number of employees.
Findings

Data from the survey suggests that the assessment of training and development figured prominently within these organisations, with 98% (117) of these organisations stating that they used appraisal and 88% (105) personal development plans as a means of assessing learning on-the-job. Other methods were used to a far lesser degree with 24% (29) making use of developmental counselling, 16% (19) workplace diaries, 18% (21) learning logs.

*p<.05; **p<.01; ***p<.001

A series of regression analyses were undertaken to examine relationships between training process and training output variables on the extent of the assessment of both formal and informal learning. In both instances size was entered as a control variable, followed by each of the learning process variables entered as a block, followed by the amount of formal and informal learning variables entered together as a second block, and regressed against the extent of assessment of each form of learning. The key results are presented in table 1. In relation to informal learning, organisational size was found to have a positive effect, with a beta coefficient of .215 (p<.05) and an Rsquared value of .051. The presence of a senior manager with responsibility for training and development within the organisation and the use of personal development plans for all staff, were the only two variables to be positively associated with its assessment, accounting for approximately a further 11% and 3.5% in the value of Rsquared. As suggested in the model, the greater the amount of informal learning opportunities provided is positively associated with the assessment of informal learning, with a beta coefficient of .211, p<.05 and increasing Rsquared by a further 4.4% from .194 to .238. When the same sets of variables were regressed against the extent of assessment of formal learning, organisational size was again found to have a positive effect, but different training process variables were found to have positive associations. Training strategy was found to have the most significant effect with a beta weight of .289, p<.01 and changing Rsquared from .039 to .108. The provision of study leave further determined the assessment of formal learning adding a further 4.0% in variance.

*p<.05; **p<.01

All sets of variables were again entered as blocks: (1) size, (2) training & development processes, (3) the amount of formal and informal learning and (4) the extent of assessment of formal and informal learning, and regressed against the two perceptual measures of the impact of training and development (table 2). Both the use of appraisal and the assessment of informal learning were found to be positively related to a belief that training and development impacted on organisational goals with beta coefficients of .275 and .234 (p<.01) respectively with
values of Rsquare changing from .086 to .140. By contrast, training policy (Beta .231, p<.01) and the assessment of formal learning (Beta .269, p<.01) were found to be positively related to training and development achieving its objectives.

Discussion

The most important finding to emerge from this study was that after controlling for organisational size, four of the eight training and development process variables were significant in determining the extent to which the assessment of training and development actually occurs within these organisations. Interestingly though these differed in their impact on the assessment of either formal or informal learning. In terms of formal learning (such as through training), paid study leave for staff and possessing a training strategy were identified as the key drivers determining whether any assessment or evaluation took place. Whereas in relation to informal learning, a senior manager with responsibility for training and development and the use of personal development plans by the organisation, were the key training process variables determining its assessment. It is interesting then to consider why this should be the case. An organisational training strategy identifies the training and development that is required to be undertaken by the organisation generally over a set period, and according to training theory is informed by organisational-wide training needs analysis. This should outline what the training needs are and how particular training and development activities are supposed to meet these needs. This then results in a clear set of training objectives and expected outcomes identified in the strategy (Wexley & Latham 2002). This being the case it might therefore be expected that an organisational training strategy should facilitate the evaluation or assessment of training and development within the organisation, having specified apriori expected outcomes. Furthermore given that formal learning methods such as training is off-the-job, organisations will need to both plan and budget for staff cover as well as allocate financial resources in order for training to take place, a training strategy is therefore also an important tool in budgeting. With a clear cost element attached, this again suggests why a training strategy influences the assessment or evaluation in the organisation. Supporting this latter point is the finding that paid study leave by an organisation also determines whether the assessment of formal learning takes place. Again it would be expected that paid study leave for staff requires employees to identify the off-the-job learning programme they are undertaking, including its expected learning outcomes, as well as having a clear financial cost identified. Together this suggests that it is both cost and greater clarity of expected outcomes generated by both these training processes, that may be responsible for the greater use of assessment, with organisational investment predicated on the basis of some organisational return.

That training strategy was not associated with the assessment of informal learning is interesting and there may be a number of reasons for this. Firstly, it may indicate that despite the widespread use of informal learning in these organisations, it is undertaken far more on an ad hoc basis responding to the individual learning needs of employees, and as a result is less likely to appear in an organisation’s training strategy. Secondly, the ad hoc nature often associated with informal learning and the fact that it occurs on the job, make the cost element of informal learning far more difficult to quantify. These latter points may well further explain the importance of the two training process conditions that were instead, found to be associated with the assessment of informal learning. Here senior management responsibility for training and development was found to have the most significant influence. The finding that the use of personal development plans by the organisation was also related to the extent of assessment of informal learning would seem to underscore the importance of this mechanism as a means for recording and monitoring the impact of learning gained on the job. It may well also suggest the greater use of such individual plans as a means to assess this form of learning in the absence of other forms of data upon which managers are able to make any judgements. The failure to find any relationships here between the two relevant policy variables (T&D policy & On-the-job learning policy) and either forms of assessment was surprising. Previously Mabey & Thompson (2000) demonstrated that management development policy was the most significant factor in determining the amount of management development provided by organisations. It would seem that although written training and development policy statements may influence its provision, it does not then follow that this then influences assessment. Perhaps of more interest though is that the presence of training staff within the organisation has no effect on whether either forms of learning are assessed or not, despite 63% (76) of organisations stating that they had training staff. It may be that the assessment or evaluation of training and development programmes might not fall within the responsibilities of training staff within the organisation, or they may lack the expertise or resources. Such explanations have been cited previously as perhaps accounting for the lack of training evaluation (Training 1999). There has often also been the criticism that training staff are more interested in providing training and development activities within an organisation rather than actually assessing them. Certainly the failure to find any relationship here suggests that different approaches to understanding both the nature of learning in organisations may be causing

29-3
some confusion on a practical level as to go about assessing it. Indeed the additional finding showing a negative relationship between the presence of training staff, and training and development achieving its objectives seems to provide further support for this conclusion. Together both these findings suggest some concern in that HRD practitioners may not necessarily be assisting organisations to understand the contribution that training and development might be making by failing to undertake appropriate assessment.

Perhaps one of the most significant findings from this study is the extent to which the assessment of training and development in the organisation contributes significantly to perceptions regarding the impact of training and development in the organisation. In particular the finding that the assessment of informal learning rather than formal learning was found to be associated with the perception that learning impacts on organisational goals. It might be the case that the benefits of on-the-job learning are far easier to recognise by managers, with greater relevance for providing staff with knowledge and skills for use on the job. With perhaps less problems associated with transfer it seems likely that the linkages between on-the-job learning, improvements in performance and the contribution towards organisational goals become more transparent. The finding that the presence of an organisation-wide training policy is associated with a belief that training and development achieves its objectives is consistent with previous findings by Mabey & Thompson (2000), who also found a positive relationship between management development policy and a belief that management development achieves its objectives. The findings here are significant however in suggesting that the assessment of both formal and informal forms of learning may well be particularly important in contributing to senior management beliefs regarding the impact of training and development in an organisation. Nonetheless the findings here do need to be placed within the context of the limitations associated with the study which prevent any firm conclusions being drawn regarding any causal relationships between the variables examined. Although the findings here do demonstrate some significant relationships, the data is drawn from a cross-sectional survey of healthcare organisations. A longitudinal study would have offered greater insights into the nature and direction of these relationships. A reliance on self-report data which was collected from in most instances a senior executive manager from within the organisation whose perceptions may well represent a distorted picture of training and development within the organisation is also a limitation. Supplemneting the data here with the perceptions of employees would have offered a more accurate picture of organisational reality. Common source bias might also have accounted for the results obtained here.

**Conclusions**

Different conceptualisations of learning potentially lead to differing approaches to its assessment in organisations but the literature to date on factors influencing the assessment of learning is significantly limited in being heavily training focused. Our knowledge of the extent to which those factors suggested as influencing the assessment of training are relevant for the assessment of workplace learning more widely is therefore rather limited. Findings from this study have provided some key insights into the differential impact of factors associated with an organisation’s training and development that potentially influence the assessment of formal and informal types of learning. Such findings are important in directing HRD practitioners to considering how elements of their training and development system might be developed to serve as useful drivers for the assessment of these different forms of learning. This would seem to be all the more important given the key finding from this study that where organisations undertake assessment of their training and development (both formal and informal learning) then there is a greater belief in the positive impact training and development has, both in terms of it achieving its objectives and more significantly in terms of its impact on organisational goals. This is particularly important since much of the literature relating to informal learning, seems to suggest that merely installing particular organisational conditions will result in quality learning outcomes. These findings would refute such ambitious aspirations and underscore the need for HRD practitioners to assess or evaluate learning outcomes in order to ensure greater recognition of the contribution HRD makes in the organisation. Far more research needs to be undertaken to determine whether these training processes typically determine the assessment of training and development more widely. In particular qualitative studies are required that seek to elucidate a more in-depth understanding regarding the impact of differing training processes. Further research is also required to focus on identifying other key variables that could potentially be harnessed by HRD practitioners to help drive the assessment of different forms of learning.

Development of a Theory of Continuous Socialization for Organizational Renewal

Monica M. Danielson
University of Minnesota

Current literature suggests for sustained competitive success, organizations must have processes in place for continuous learning and adaptation. Any process, then, that appears to hinder agility, should come under scrutiny. Examination of socialization theories revealed an intended outcome of perpetuating the status quo. The purpose of this study was to develop an alternative socialization theory that would facilitate renewal, not encumber it. Dubin’s theory building research method was used to conceptualize and operationalize this theory.

Keywords: Socialization, Renewal, Theory

The literature suggests that organizations, seeking to be agile in the face of change, too often focus only on changing tangible elements of the company, such as products, services, processes, and training programs (Collins, 2001; Goss, Pascale, & Athos, 1993; Nonaka & Takeuchi, 1995; Strebel, 1996). Attention to the organization context, or culture, is at times missing from an organization’s strategy to facilitate renewal (Goss et al., 1993; Kotter, 1995; Schein, 1985). It takes little effort to comprehend that in these organizations, conscious or unconscious socialization to the existing organizational culture could be holding back real change. Those organizations willing to question the very foundation upon which they were built, and every reconstructed foundation built since, are the ones that many say will be the agile organizations, able to respond to and even dictate the market (Gibbons, Limoges, Nowotny, Schwartzman, Scott, & Trow, 1994; Senge, Kleiner, Roberts, Ross, Roth & Smith, 1999; Wheatley, 1999).

Problem Statement

Our current understanding of organizational socialization as a process has been shaped by its conceptualization in the past. There was an understanding that as individuals aged and moved through new stages in their life, they would need to adjust to meet society’s needs. Brim (1966) stated that society demands, “the individual meet these changed expectations, and demands that he alter his personality and behavior to make room in his life for newly significant persons such as his family members, his teachers, his employers, and his colleagues at work” (p.18); in other words, altering personality and behavior to fit existing norms and practices. The dictionary definition of socialization concurs with Brims description, as “a process by which an individual learns the appropriate modifications of behaviour and the values necessary for the stability of the social group of which he is a member” (Oxford English Dictionary, 1989, p. 910). The explicit outcome of successful socialization, then, was the transfer or perpetuation of culture. This understanding of socialization throughout the lifecycle was applied to the work setting in the early 1900s. In combination with other tactics affecting the entry process of individuals, socialization was thought of as a process to increase job satisfaction, organizational commitment, and tenure (Wanous, 1980). The indicators of success for workplace socialization looked very similar to those in other areas of life: learning, adjustment, and culture acquisition (Louis, 1990; Tuttle, 2003a).

The problem being addressed by this study is as follows: An examination of the process of organizational socialization, as it was and is currently conceptualized, reveals an apparent inability to facilitate agility within the organization; instead, its purposes, desired outcomes, and characteristics appear to perpetuate a stable and unmoving organization. Given this problem statement, the purpose of the study was to develop an alternative theory for organizational socialization that would facilitate organizational renewal, not impede it.

Theoretical Framework

Some organizational socialization research and theory suggests that through interactions with incumbents, transitioning individuals learn about how the organization operates. During these interactions, incumbents consciously and unconsciously reward behaviors that align with the existing organizational values, beliefs, culture, practices, and systems, and manage those behaviors that do not align (Louis, 1990; Jones, 1983,1986; Van Maanen & Schein, 1979). Transitioning individuals’ behavior in the future is modified by this new knowledge (Van Maanen, 1976). The majority of organizational socialization theory and research is focused on this learning process that exists
for individuals entering or transitioning within an organization; there is very little research and theory on how the transitioning individual influences organizational incumbents (Jones, 1983; Tuttle, 2003a). Thus, there is significant theory to explain how socialization can perpetuate that which has brought the organization success in the past, but there is very little to explain how an organization would go about socialization if the goal was to change.

A literature search of ABI Inform, Expanded Academic Index, and Psych Info, using organizational socialization, occupational socialization, and socialization as keywords, resulted in 81 relevant articles on organizational socialization (for a description of these articles see Tuttle, 2003a). Twenty-two articles concentrated primarily on theory development. Over half, being 15 of the 22, focused either primarily on detailing the adjustment experience of the individual during socialization, or the organizational tactics to accomplish socialization. In other words, “The inquiry at all times is concerned with how society changes the natural man, and not how man changes his society” (Brim, 1966, p.4). These foundational theory articles have shaped the perspective that how individuals respond to the socialization efforts of the organization is more important than understanding how the individuals themselves affect the process.

In more recent years, there has been an increasing trend focusing on both organizational and individual variables in the socialization process; this is often termed an interactionist perspective (Jones, 1983). The interactionist perspective argues that analysis of the socialization process cannot be complete unless three things are taken into consideration, “(1) the effects of individual differences and (2) the effect of the attributional process involved in organizational learning” (p. 464), and (3) individuals as active participants in their own socialization experience. In essence, “characteristics of the insiders as well as the interactions themselves need to be investigated if research from an interactionist perspective is to proceed” (Reichers, 1987, p. 279).

Interactionist research and theory suggest that some reciprocal influence exists between individuals in transition and incumbents, causing shifts inside the organization as well as inside the individual in transition (Jones, 1983; Wanous, 1980). In fact, some literature suggests that organizations operate with the understanding that they could not exist without acquiring and utilizing the knowledge of the employees (Allee, 1997; Amidon, 1997; Gibbons, et al., 1994; Nonaka & Takeuchi, 1995; Wheatley, 1999). “We can begin to see that organizational intelligence is not something that resides in a few experts, specialists, or leaders. Instead, it is a system-wide capacity directly related to how open the organization is to new and disconfirming information, and how effectively that information can be interpreted by anyone in the organization” (Wheatley, 1999, p. 99). An example of an organization that has socialized its employees to this effect is 3M; the culture is continually shaped by the reinforcement of behaviors consistent with perpetuating individual and organizational learning and knowledge (Nonaka & Takeuchi, 1995):

Individuals are set free to pursue their dream while management bites its tongue and grits its teeth to foster the development of new product ideas. There is even a commandment that serves as a behavioral guide. Known as the ‘eleventh commandment’ within 3M, it says, ‘Thou shalt not kill ideas for new products’ (p. 139)

Research Question

The following research question guided the study: Can an alternative theory of organizational socialization be developed to facilitate continuous organizational renewal and agility?

Methodology

Two considerations guided the approach for this study. First, the theory-building research methodologies of (1) quantitative, (2) grounded theory, (3) meta-analysis, (4) social construction, and (5) case study would each be able to contribute different knowledge to the target phenomenon. Yet, not all are designed to contribute to each stage of the theory-building research process: conceptualization, operationalization, confirmation/disconfirmation, application, and continuous refinement (Lynham, 2002a). Second, the new knowledge developed by this theory should be accessible and immediately applicable to both scholars and practitioners of HRD. Thus, some consideration was given to the utility of the end product resulting from each theory building approach. While less mainstream strategies are gaining support in both practitioner and scholar communities, traditional quantitative/empirical methods remain dominant in the field of HRD and business (Holton & Burnett, 1997).

One theory-building strategy that met the considerations for this study was the quantitative theory-building research method of Robert Dubin (1978), a theory-then-research approach that contains eight steps, progressing through each of the five phases outlined by Lynham’s (2002a) General Method (Figure 1). The first four of Dubin’s eight research steps are as follows: (1) the units of the theory, meaning the elements that interact to create the
phenomenon observed, must be presented and defined; (2) the laws of interaction that state the relationship and effects each unit has upon the others must be determined; (3) the boundaries of the theory must be defined to help focus attention on forces that could affect the interplay of the units; (4) the system states of the theory must be defined because the units, influenced by the forces around them, will interact differently in different situations. These four steps represent the theoretical model. Now the researcher can move to step (5), defining specific propositions about the theoretical model that are to be considered logical and true. The last three steps comprise the testing phase. The researcher must convert each unit or term into (6) an empirical indicator, that can be measured, or, in other words, operationalize each key point of the theory to be tested. The researcher then generates testable (7) hypotheses, or creates research questions to direct the focus of research. Finally, the theory is at stage (8), testing. Once tested, the researcher is able to determine whether or not the results approximate the propositions set out in the fifth stage of development.

Figure 1. Entry & Exit Points for this Continuous Socialization for this Theory Building Research Study, Integrating Lynham (2002a) and Dubin’s (1978) Steps

Manageable boundaries and scope were also determined for this theory. The boundary of for-profit organizations was delineated as the entity this theory would apply to. Without such a boundary, this theory could apply to educational, religious, government, military, corporate organizations and the like. A broad theory building research effort may have found some elements of socialization that were universal across organization types. However, during the literature research process, some distinctions among the different forms of organizations became clear, decreasing the likelihood of one overarching theory of organizational socialization that would encompass all forms of organizations. For the theory’s scope, a manageable portion of the theory building process was chosen. Theories that are considered valid and robust have been subjected to numerous iterations of the theory-building process to mirror more closely the properties of the world (Dubin, 1978). In essence, theory building can be a career-long endeavor (Dubin, 1978). The entry point for this study was at the Conceptual Development phase (Figure 1). The output of these steps is a theoretical model (Dubin, 1978). While these steps and the rest of the process are often separated, this study also began to move the theory to the steps ahead. Specifically, this study developed propositions, empirical indicators, and testable hypotheses for the theoretical model, and set forth a clear research agenda, preparing this theory for testing (Figure 1).

Results

The development of this theory of Continuous Socialization for Organizational Renewal is based on several premises that are core to its purpose and meaning: (1) organizations as open systems (Capra, 1996; Nonaka & Takeuchi, 1995; Wheatley, 1999), (2) the existence of a rapidly changing business environment (Allee, 1997; Drucker, 2001; Marshak, 1993; Nonaka & Takeuchi, 1995; Waterman, 1987; Wheatley, 1999), (3) the existence of for-profit organizations that have renewal as a significant challenge (Allee, 1997; Drucker, 2001; Marshak, 1993; Nonaka & Takeuchi, 1995; Tsoukas, 1996; Waterman, 1987; Wheatley, 1999), and (4) socialization can be consciously structured as renewing process within the organizational system. While the first three premises have become core concepts in the literature, the fourth may need a brief explanation.
Both conscious and unconscious socializing processes occur within organizations, regardless of whether their intent or outcomes are made explicit. The existing theory and research support this assumption for both individual and collective socialization (Feldman, 1976; Jones, 1983; Van Maanen & Schein, 1979; Wanous, 1980). Therefore, regardless of whether effort is expended on tailoring socialization processes within an organization, those processes will continue to occur. The second underlying assumption is that some form of socialization occurs at every boundary transition, or context change, for an individual or a collective. As an individual makes a functional, hierarchical, or inclusionary shift into or within the organization, a socialization cycle will be catalyzed (Van Maanen & Schein, 1979). Similarly, an entire organization may experience a boundary shift, such as a change in strategy to expand geographically into other countries. This strategy requires immense changes throughout the organization; therefore, socialization cycles would be in motion here as well. If socialization occurs at every boundary transition for an individual or for a collective, then it is possible to assume that socialization is continuous and should be planned for as such. The final underlying assumption is that the conscious application of socializing strategies can influence the behaviors of the targets. Again, the research indicates that, with varying socializing strategies, varying outcomes in perceptions and behaviors will result (Allen & Meyer, 1990; Jones, 1986; Klein & Weaver, 2000). In sum, if socialization will always occur and can, to some extent, be molded to alter perceptions and behaviors, then crafting strategies to favor renewal rather than stability should be possible. It is on these four major premises that the theory of Continuous Socialization for Organizational Renewal was developed.

Conceptual Development of the Theory

Conceptual development involves the formation of units, laws of interaction, boundaries, and system states (Dubin, 1978). A brief description of this theory’s units is presented below, highlighting only one step of conceptual development (for a full description of the theory see Tuttle, 2003b). In choosing the units for the theory, an eventual mirroring of the real world is the desirable end-state. However, the initial understanding should not be overly constricted by the desire to ensure close correspondence between concepts and operations; rather, this phase should consist more of “disciplined imagination” (Weick, 1989). The discipline should be in the logical rigor of the concept development, and the imagination should be in the diversity of thought in its development; in this initial phase, logic is the basis for evaluation (Weick, 1989). Later in the process, research determines whether changes need to take place to better mirror the world. The five units of the theory of Continuous Socialization for Organizational Renewal were developed: (1) Socializing Strategies, (2) Negotiated Meaning, (3) Mobilized Knowledge, (4) Internalized Learning, and (5) Externalized Performance (Table 1).

The effective application of these units is hypothesized to contribute to organizational renewal capacity. As individuals or collectives utilize socializing strategies, interactions are facilitated between transitioning and incumbent parties. During such interactions, each party attempts to find an appropriate meaning definition for the new situation, at which point both tacit and explicit knowledge begin to be mobilized and new tacit and explicit knowledge can be generated. It is clearly not feasible for recipients to be altered measurably with each exchange. Incorporation of new knowledge can take several forms, with varying alteration to the core identity or functioning of the individual or collective. Regardless of the level of acceptance, certain pieces of data, information, and knowledge must be incorporated in such a way as to alter future behavior in a desired direction for socialization processes to facilitate organization renewal.

As socialization is hypothesized to be continuous, there is also a system for feedback. With the passage of time, there becomes a shared history and memory within the organization; “These shared meanings and behaviors facilitate coordination of activities, making behaviors understandable and predictable and stable...and they progressively lose their novelty and become part of the objective, taken-for-granted reality of the organization” (Szulanski, 1996, p. 29). What was once new becomes institutionalized. Therefore, this theory of socialization is not only continuous because boundary context changes continually occur, but also because without continuous iterations there is less likelihood for renewing and altering what has become institutionalized (Figure 2).

Operationalization of the Theory

Dubin’s (1978) methodology calls for the development of propositions, or truth statements, about the theoretical model as a next step. The elements of each statement are then given an empirical indicator that can be used for testing the viability of the theoretical model (Dubin, 1978). While the number of truth statements about how a theoretical model operates could be limitless, those that are strategic should be highlighted, meaning those that “state critical or limiting values” for the units involved (Dubin, 1978, p. 168). Eleven strategic propositions were highlighted for the theory of Continuous Socialization for Organizational Renewal (Table 2). Empirical indicators, hypotheses, and one possible research agenda were also proposed (Tuttle, 2003b).
### Table 1. Unit Definitions in Brief for the Theory of Continuous Socialization for Organizational Renewal

<table>
<thead>
<tr>
<th>Unit Title</th>
<th>Unit Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Socializing Strategies</strong></td>
<td>Boundary changes due to changing contexts are catalysts for the next iteration of the socialization cycle. Once a boundary change has occurred, transitioning and incumbent parties can employ strategies to promote interactivity between the two parties. These activities can take place before, during, and after a boundary transition; these are called <strong>priming</strong>, <strong>linking</strong>, and <strong>renewing</strong> stages. Interactivity between transitioning and incumbent parties facilitates the progression of the rest of the socialization cycle.</td>
</tr>
<tr>
<td><strong>Negotiated Meaning</strong></td>
<td>Socialization that is continuous and facilitates organizational renewal creates opportunities for interactivity between transitioning individuals and organizational incumbents where symbols can be exchanged. These interactions do not have to be interpersonal but often are. During these interactions, both parties actively manage symbols to negotiate an understanding of the situation. Transitioning and incumbent parties experiment with communicative acts to negotiate emergent situational role identities.</td>
</tr>
<tr>
<td><strong>Mobilized Knowledge</strong></td>
<td>Continuous socialization that facilitates organizational renewal mobilizes existing and newly generated knowledge, occurring between transitioning and incumbent parties, into additional domains of the organization. Such processes of mobilization need to occur for all types of knowledge on the tacit to explicit continuum, and as a two-way exchange between transitioning and incumbent parties.</td>
</tr>
<tr>
<td><strong>Internalized Learning</strong></td>
<td>Knowledge exchanges between transitioning parties and incumbent parties may result in various levels of incorporation into individual schemas or collective memory. During transitions, the critical learning for individuals/collectives is the importance of awareness in the socialization process as well as knowledge process proactivity in the form of unique generation, reconfiguration, and utilization of new knowledge.</td>
</tr>
<tr>
<td><strong>Externalized Performance</strong></td>
<td>The capacity of purposeful renewal for transitioning parties is the performance outcome of continuous socialization. The drivers of performance for transitioning parties are (1) purposeful and proactive utilization of socializing strategies, and (2) purposeful and proactive participation in knowledge mobilization processes. The performance outcome of increased renewal capacity from the socialization cycle acts as one contributor to organization-level renewal performance.</td>

</table>

**Conclusions**

Both the scholarly management literature and the popular business press have pinpointed the capacity for renewal as a major organizational challenge: “Organizations, like people, are creatures of habit. For organizations, the habits are existing norms, systems, procedures, written and unwritten rules—‘the way we do things around here.’ Over time these habits become embedded like rocks in a glacial moraine” (Waterman, 1987, p. 16). Practices that continue to embed the status quo within the organization, hinder renewal capacity. This study has proposed socialization practices need to be reviewed to ensure that they facilitate organizational agility rather than obstruct it.

Given the way this theory of Continuous Socialization for Organizational Renewal has been conceptualized, there are three critical considerations for organizations moving forward in the acceptance of this theory. First, knowledge must be valued throughout the organization as a way to achieve strategic advantage (Allee, 1997; Amidon, 1997; Nonaka & Takeuchi, 1995; Topp, 2000). It must be valued at the individual, group, and organizational levels. In the industrial or information economies of the past, traditional performance stakes were appropriate: efficient and effective production of goods or services and for some organizations, profit. However, with the transition to a knowledge-based economy, traditional stakes for organizations no longer suffice; performance stakes need to change to new knowledge production (Drucker, 2001; Nonaka & Takeuchi, 1995; Topp, 2000). Second, if the stakes of organizational performance must move to knowledge mobilization, similar expectations must be placed at the individual level of performance. At a simplistic level, rather than measuring performance by efficiency on predetermined role tasks, such as production of widgets, individual performance must be measured in part with the generation and application of new knowledge for value creation within the organization (Drucker, 2001). Third, knowledge mobilization must be supported throughout the organization, not merely with a few individuals or a few roles. Knowledge work can and should occur at all levels within the organization (Drucker, 2001). This theory asserts that interactions between transitioning and incumbent parties are necessary for those mobilization processes to occur. Many authors support the need for such interactions (Brim, 1966; Evan, 1963; Fisher, 1985; Katz, 1980; Reichers, 1987; Nonaka & Takeuchi, 1995). “The vision is one of an integrated system of initiatives designed to create the optimal flow of knowledge within and throughout the organization resulting in stakeholder success” (Amidon, 1997, p.92).

**Contribution to New Knowledge in HRD**

After significant research, it is the opinion of this author that the organizational socialization literature lacks: (1) a consistent focus on the transitioning party as proactive and influential, a consistent consideration of socialization as continuous and iterative, and a consideration of collectives as transitioning parties. This theory proposes that, without those elements, socialization cannot facilitate renewal capacity within the organization. Rather, it will likely
perpetuate “taken-for-granted precedents established in the dim past of an organization’s history” (Van Maanen, 1978, p. 20). Therefore, the developed theory of socialization for renewal attempted to remedy these deficiencies.

**Implications for Socialization Research**

This study raises several implications for research. First, this study has attempted to model quality theory building: by utilizing the well-recognized theory-building research approach of Dubin (1978); by drawing on the scholarly literature from multiple disciplines and taking note of emerging dynamics from the popular business press; by utilizing thought leadership that recognized the complexity of the phenomenon; and finally, by attempting to meet a call to action from the business literature regarding the need for organizational renewal. Second, the introduction of this theory into the socialization literature presents a new line of research inquiry on the topic. Research efforts may attempt to show this theory does not model reality for organizations with renewal capacity. Lastly, opportunities are available for future research to extend this theory to other types of organizations beyond for profit entities. It is also important to note the possibility that some organizations may already have effective socialization practices in operation, which may or may not mirror this theory. As such, there is a clear opportunity for *grounded theory* (Eisenhardt, 1995) to act as another avenue to support or refute this theory.

**Implications for Socialization in Practice**

Even prior to thorough testing, some components of this theory can act as catalysts in companies to assess the alignment between their organizational intent and their current approach to socialization. Current popular business press calls for renewal capacity in organizations (Allee, 1997; Hurst, 2002) but does not explicitly link strategies for accomplishing that feat with practices of socialization. For activities that have socializing capability to do so, it is the position of this author that approaches should be conscious, as “people in a company always organize to support the *actual* values, not the *espoused* values” (Allee, 1997, p. 199). Then following more rigorous testing and refinement, this theory may provide a framework to assist organizations in crafting and implementing new socialization practices. This theory proposes that socializing strategies go well beyond the orientation organizations design for their new members. It proposes that increasing interactions among transitioning parties and incumbent parties will open the doors to increased knowledge mobilization. The theory asserts that not all elements of the organization’s norms, systems, processes, and practices must be completely internalized into each individual in order for continuous renewal to be possible. In fact, renewal may be more likely if each individual incorporates fewer non-relevant organizational habits. Research to support such assertions would provide clear avenues for practitioners to follow in changing the course of their current socialization practices.

Coworker Relationships, Acculturation, and Socialization-Related Job Knowledge

Thomas G. Reio, Jr.
Mike A. Boyle
University of Louisville

There is a lack of clarity about the role of establishing coworker relationships in acquiring socialization-related job knowledge. In this study, 233 adults ranging from 17-59 years old were administered the Workplace Adaptation Questionnaire (Copeland & Wiswell, 1994). Several conceptual models were tested. Results demonstrated that establishing coworker relationships had both a positive direct and indirect (through the acculturation variable) influence on acquiring job-related knowledge. Implications for practice were discussed.

Keywords: Relationships, Socialization, Job Knowledge

Feldman (1976) proposed that the task- and culture-related learning associated with the socialization process (especially in the Accommodation part of the process) was dependent upon first establishing coworker relationships. Feldman claimed that once the employee believed he or she could be friendly with and trust coworkers, they were more likely to learn essential job-related information that would facilitate the development of competent job performance. Likewise, experienced employees reported feeling that if they could not trust the new employee, they would be much less inclined to share information. According to Senge (1990), this inclination not to share information due to the lack of openness will probably limit the employee's socialization-related learning.

The initial access to important organizational information signifies, as Feldman (1976) noted, "initiation to the group" (p. 442). In the hospital participating in his study, it was only after an individual had been initiated to the group was he or she introduced to the job task. Nevertheless, Feldman did observe that it was also possible to be initiated to the task before being initiated to the group, yet it would be much less likely.

Extending Feldman's (1976) work, Copeland and Wiswell (1994) developed the Acquiring Job Knowledge Model. They advanced the idea that socialization-related job knowledge was sequentially acquired by first establishing coworker relationships and then by learning the norms, values, and procedures (becoming acculturated) of the organization. Through factor-analytic techniques they constructed the Workplace Adaptation Questionnaire (WAQ) to test their theoretical model. The instrument was administered to 352 government employees. The item scores of the three learning-related WAQ subscales were summed and subsequently analyzed through hierarchical regression techniques; 25% of the variance in the Job Knowledge variable was explained by the model. Establishing Relationships, the first subscale, accounted for 23% of the variance while acculturation to the company (the second subscale) contributed an additional but significant 2% to the model. Overall, the Acquiring Job Knowledge Model was statistically supported, however the results suggested there may be alternative interpretations.

Although Feldman (1976) and Copeland and Wiswell (1994) claim that establishing coworker relationships is the first step toward the process of acquiring job knowledge, the results of their research lack conceptual clarity. Feldman's Accommodation Model implies that becoming initiated to the task rather than to the group is still quite possible and is thus situational, despite the results of his study. Conversely, not only does Copeland and Wiswell's (1994) Acquisition of Job Knowledge Model disallow for the possible situational nature of acquiring socialization-related job knowledge, it adds a mediating variable (acculturation) to this primarily informal workplace learning process (Wiswell, 1993), yet still explaining but 25% of their theoretical model's variance.

Whereas both of the aforementioned studies provide some empirical support that establishing coworker relationships is the probable first step to acquiring socialization-related job knowledge, there is a need to investigate this learning process further. There are perhaps other paths through which employees acquire pertinent job knowledge.

Purpose and Research Questions

The purpose of this research was to examine Copeland and Wiswell's (1994) theoretical model in particular to clarify the nature of establishing coworker relationships in acquiring socialization-related job knowledge. The specific research questions were:

Copyright © 2004 Thomas G. Reio, Jr. & Mike A. Boyle
1. Does the establishment of coworker relationships directly contribute to acquiring socialization-related job knowledge?
2. Does employee acculturation directly contribute to acquiring socialization-related job knowledge?
3. Does employee acculturation mediate the relationship between establishing coworker relationships and acquiring socialization-related job knowledge?

Method

This research was part of a larger exploratory study of workplace learning in the service industry. A demographic questionnaire and a survey instrument were utilized in this part of the study. Path-analytic techniques were used to test the a priori developed conceptual models.

Participants

Roughly 37% of the sample had less than twelve months tenure, an additional 33% had less than two years on their current job, and the remaining 30% had more than 2 years tenure (none of the partial correlations between tenure and the WAQ scales were statistically significant in this study). Consequently, the typical participant in this study was a white male less than 40 years of age, with at least some college, earning less than $30,000 per year, and possessing approximately 2 years of job tenure. The mean age of the sample was 32.5 years (SD 8.8).

One-way ANOVAs (1 X 4) between the Workplace Adaptation Questionnaire (WAQ) and the four organizations were employed to determine possible significant group differences. Although there was a significant main effect for the WAQ Total Score ($F_3, 229 = 4.54, p < .01$), a Scheffé test (1% level of significance) for comparing means between the groups indicated no significant differences between the group means. Investigation of the correlational patterns (both zero order and partial) between the variables of interest was also examined for consistency between the four groups with no statistical differences detected at the .05 level of significance. On the basis of both the results of the ANOVAs and the correlational analyses, the four sub-samples were combined into one large sample. Thus, the research sample consisted of 233 service-industry employees of various tenure from four organizations similar in corporate philosophies toward customer service and quality.

Instruments

Background information was collected via a questionnaire. The instrument consisted of a variety of questions modeled after those utilized by Morton (1993). The questions solicited data concerning the subject's age, gender, annual salary, education level, tenure, and amount of previous work experience.

The Workplace Adaptation Questionnaire (WAQ; Copeland, 1993; Copeland & Wiswell, 1994) was used as a measure of socialization-related learning. The instrument is a self-reported 19-item instrument, consisting of three subscales developed to measure an employee's socialization-related learning and one to measure satisfaction with learning experiences. This study's modified version of the instrument utilizes an additional three high-loading Job Knowledge questions from the original Copeland and Wiswell study to balance the instrument (now 22 items overall); many of the questions seemed to be biased more toward interpersonal skill knowledge. All questions are based on 5-point Likert scales (1=strongly disagree; 5=strongly agree). The four subscales are as follows: Job Knowledge (JK), Acculturation to the Company (AC), Establishing Relationships (ER), and Satisfaction with Learning Experiences (SLS). JK refers to the extent the respondent reports mastering the tasks of his or her job and consists of eight questions. AC is a five-item subscale that measures an employee's degree of learning the norms, values, and culture of the organization. ER, the third subscale, contains five items that assess the employee's capacity to identify coworkers who could provide useful information or who know their way around the organization. Finally, the four-item SLS subscale evaluates the employee's satisfaction with the learning experiences one has encountered while at the organization (this subscale was not examined in this research).

Cronbach's alpha internal consistencies of the 4-subscale, 22-item instrument were as follows: Job Knowledge .96; Acculturation .86; Establishing Relationships .85; and Satisfaction with Learning Experiences, .81. All three of the socialization-related learning reliabilities were somewhat higher than in the Morton (1993) study. The reliability of the JK subscale may have been noticeably higher because of the lengthening of the subscale for this study (Crocker & Algina, 1986). By adding the three items to the subscale, its total variance was increased by both the sum of each item's variance and its covariances with all other items in the subscale. Such an effect can even be more pronounced proportionally when items are added to a short scale, such as in the original 5-item JK subscale. In this research, the Cronbach's alpha of the internal consistency (reliability) of the 8-item JK subscale was .96; as a 5-item subscale, the reliability dropped to .83, mirroring the subscale's reliability in the Copeland and Wiswell (1994) study. Considering this evidence, it may be advantageous to retain the three new JK subscale questions in an updated version of the WAQ, especially for researchers investigating socialization-related job knowledge. The extra questions would not significantly add to the time required to take the test, and the modified 22-item scale instrument would still easily fit on one page. In addition, the increased reliability of the JK subscale would increase the
likelihood of desirable consistency or reproducibility of what the subscale is supposed to measure, i.e., self-perception of job knowledge associated with the socialization process.

A PCA extraction with varimax rotation then was used to determine the stability of the subscale factors of the modified instrument. Four subscales were identified as was expected, and the three additional Job Knowledge items all loaded positively (> .30) on the JK subscale. The factor loadings for both males (n = 152) and females (n = 81) were virtually the same, and thus consistent with the larger sample population’s (N = 233) results. These results provide further support for combining the four smaller samples into one large sample (Tabachnick & Fidell, 2001).

Table 1 shows the relationships and standard deviations between this study’s variables of interest. The patterns of correlations were much as expected. The ER subscale logically correlated the least the WAQ Total Scale because it presumably does not reflect acquisition of pertinent task knowledge. The equal correlation between the AC and JK subscales and the WAQ Total Scale was somewhat curious, yet when considering that the acculturation process consists of acquiring both interpersonal and technical skills the relationship seems plausible.

Analytic Procedures

Figure 1 represents the Job Knowledge Acquisition Conceptual Model proposed by Copeland and Wiswell (1994). Conceptually, the model represents the notion that an employee acquires job knowledge after first establishing coworker relationships and then by becoming acculturated to the company. Thus, by virtue of the first two steps, one accumulates the knowledge necessary to adequately perform one's job.

Figure 2 represents a hypothesized path model incorporating both Copeland and Wiswell's (1994) original conceptual model and Feldman's (1976) plausible notion of direct employee initiation to job tasks without the benefit of being acculturated as well. The one-way arrows indicate an assumed "causal" direction of influence. Because this is a recursive-path model, it is assumed there are no feedback control loops and that causality is primarily unidirectional. The model suggests that the acquisition of socialization-related job knowledge proceeds in two ways. First, establishing coworker relationships influences job knowledge acquisition directly, and secondly, the effect of establishing coworker relationships on job knowledge is mediated by being acculturated to the company.

The standardized partial regression coefficients were computed for this model using ordinary, least squares multiple regression in which each variable was regressed on its explanatory variables, beginning with the Establishing Relationships variable and moving in sequence to Job Knowledge. All the regression coefficients were computed from a combination of both the correlation matrix of the main study variables and their standard deviations using the EQS 5.4 for Windows routine (Bentler & Wu, 1995).
Figure 1. Job Knowledge Acquisition Conceptual Model
Results

The Copeland and Wiswell (1994) Acquisition of Job Knowledge Model was first tested as it was proposed in the literature, i.e., establishing relationships has no direct influence on job knowledge. The standardized path coefficient for the ER to AC path was .43, and the AC to JK path's standardized path coefficient was .42. In essence, this model allows for solely an indirect relationship between Establishing Relationships (ER) and Job Knowledge (JK) as the Acculturation variable mediates the relationship between ER and JK. Upon checking the fit of the model to the data, the Comparative Fit Index (CFI) was below conventional acceptance (a .90 is needed [Loehlin], 1992); this model was .89 and thus the data disconfirmed the model.

The hypothesized path model for this study with the standardized path coefficients for the theoretical paths is presented in Figure 3. The revised Job Knowledge Acquisition Model allows for a direct as well as an indirect effect of ER on JK. Apparently, there is also a weak direct effect of ER on JK, as the standardized path coefficient was .23 (R² of direct path to JK was 18.6; p < .001). The new standardized path coefficients for the remainder of the model were as follows: the ER to AC path .43, and the AC to JK path .32 (R² of this indirect path to JK was .22; p < .001). Because this is a just-identified model, a CFI could not be calculated, but the model seemed to be much more conceptually appealing. Therefore, while more of the variance of job knowledge was explained by the indirect path of ER to JK, the direct path of ER to JK is also necessary to fully explain the data.
The effect sizes were of great interest. For the direct path, a one standard deviation increase in establishing relationships, on average, holding all else constant, was associated with a .23 standard deviation increase in job knowledge. With the indirect path, a one standard deviation increase in the establishing relationships score, on average, holding all else constant, was associated a .43 standard deviation increase in the acculturation score, which in turn mediated a .32 standard deviation increase in job knowledge.

There was empirical support for each of the research questions. Thus, the establishment of coworker relationships significantly and directly influenced the acquisition of socialization-related knowledge. Second, acculturation significantly and directly impacted the acquisition of socialization-related job knowledge. Finally, employee acculturation indeed served as a mediator between establishing coworker relationships and socialization-related job knowledge.

Discussion

What, then, are the implications of these results for the validity of establishing coworker relationships on job knowledge? First, it must be mentioned that the literature has generally supported the accuracy of these evaluations; hence, the development of the conceptual models. Nevertheless, this study suggests that other factors can exert an influence on the acquisition of job knowledge, one of them is being acculturated to the company. On the other hand, establishing coworker relationships also can directly influence acquiring socialization-related job knowledge.

These results suggest support for the Copeland and Wiswell (1994) Acquiring Job Knowledge Conceptual Model. Establishing relationships with one's peers has a direct effect on acquiring job knowledge as predicted by both Feldman (1976) and Copeland and Wiswell (1994). There is also a suggestion that the acculturation process (being acculturated to the company) plays a role in the relationship between establishing coworker relationships and acquiring socialization-related job knowledge by mediating it. This information helps to clarify the nature of
establishing coworker relationships in acquiring socialization-related job knowledge. While it is indicated that, as Feldman (1976) suggested, that establishing relationships is an important consideration in being initiated to organizational job tasks and acquiring job knowledge, an even more potent consideration is the utility of also considering acquiring job-related knowledge through the acculturation process as well.

The implications for organizational practice are many. As Schein (1988) has argued, despite years of incumbency at the organization, it is important to consider that employees often switch to different offices, branches and divisions of a business, acquire new bosses, encounter new coworkers, go to school, and learn new job tasks and each requires some level of socialization-related learning to realize job task proficiency. Of course, at organizational entry, this process is particularly vital as failure to acquire culture- and task-related learning can lead to an increased rate of employee turnover (Copeland & Wiswell, 1994; Feldman, 1976). Nevertheless, the results of this study which employed participants across a broad range of job tenures, have demonstrated that Schein's notion of the ongoing relevance of socialization-related learning is a relevant one, regardless of time on the job.

Copeland and Wiswell (1994) stressed the importance of new employee training and orientation programs that are designed to increase the fit between the individual, work groups, and the organization. More organizational emphasis on socialization-related learning may be needed for employees of all job tenure, especially considering the increasingly ever-changing nature of today's business climate.

Cultural Effects on Medical Residents Evaluations of Interpersonal Skills and Professionalism

Carol Packard
University of Illinois

This study examines effects that cultural values have on a peer evaluation process within an international medical resident team in the United States. Residents evaluated critical incidents based on required interpersonal skill competencies. An analysis was done to determine perceived differences between actions considered good vs bad clinical practice, and whether these differences broke down along cultural dimensions of Collectivists and Individualists. Results suggest that there is less agreement based on cultural values on what constitutes poor practice.

Keywords: Culture, Evaluation, International Teams

Problem Statement and Purpose

Medical educators have acknowledged for some time that a physician’s interpersonal skills have a significant effect on patient care. Over the last decade, support for this belief has grown as empirical evidence for the link between communication skills, positive physician/patient relations and actual clinical outcomes has accumulated (Campbell, McDaniel, Cole-Kelly, Hepworth & Lorenz, 2002; Cole, 2002; Deveugele et al, 2002; Ferguson & Candib, 2002; Khazoyan & Anderson, 1994; Skelton, Kai, Loudon, 2001; Stewart, 1995). In 1999, the Accreditation Council for Graduate Medical Education (ACGME) rewrote their required residency competencies to include interpersonal skills and professionalism as part of their residency requirements (ACGME Graduation Competencies, 2000). As a result, all American medical residency programs now require the following competencies be demonstrated by residents and formally evaluated by their peers and supervising physicians: (1) patient care, (2) medical knowledge (3) practice-based learning and improvement, (4) interpersonal and communication skills, (5) professionalism, and (6) systems-based practice.

Since these new competencies were introduced and implemented, a survey was given to residency program directors asking them how the implementation of the new competencies was progressing. Directors reported that assistance in developing evaluations for interpersonal skills were among the types of help most frequently requested (Heard, Allen, & Clardy, 2002).

Many American residency programs currently have a large percentage of residents who are foreign born and educated (Council on Graduate Medical Education, 1998). These residents practice medicine in American communities under the supervision of senior physicians, becoming part of a medical team in hospitals and clinics. This is happening while our patient population is also becoming more ethnically diverse. In light of these changing demographics and the implementation of the new required competencies, discussions are beginning within the medical community as to whether people from different cultures have different perceptions and expectations of what constitutes good interpersonal skills, good physician-patient relations, and good professional and ethical judgments (Betancort, Green, Carrilo, 2002; Cooper-Patrick, et al, 1999; Murray-Garcia, Garcia, Schembri, Guerra, 2001). However, there are few empirical studies to systematically determine if this is the case (Helmreich & Merritt, 2001). One such study by Feldman, Mitchell, Mphil, & Cummings (1999) found significant differences in clinical practices due to the different ethical beliefs of internists in China and the United States. In addition, Murray-Garcia et al (2001) asks the question:

"How do racially and ethnically diverse patients define optimal communication, issues of trust, and desirable health outcomes?...Answers to these questions should receive urgent and substantive attention as the physician workforce and medical education policies are refined in the 21st century" (p. 1240).

This study extends Murray-Garcia et al's questions regarding how patients define these concepts to include how medical residents define these concepts, given that formal evaluation of their interpersonal/communication skills, professionalism and ethics are required. Interpersonal skills, as defined by the ACGME, include such

Copyright © 2004 Carol Packard
constructs as "therapeutic and ethically sound relationships", "works effectively with others", and “leader of a health care team". If different cultures define "therapeutic", "ethical" “teamwork", and "leadership" differently, as the literature suggests (Feldman et al, 1999; Skelton et al, 2001), what impact do these different perceptions have on the competency evaluation system within an ethnically diverse team? This study seeks to answer the question of how residents from different cultural backgrounds and perspectives define and evaluate professionalism, teamwork, caring, leadership, and autonomy, and whether these different perspectives result in a significant source of variation within the required performance evaluation outcomes.

Theoretical Framework

There is an increasing body of knowledge demonstrating that interpersonal skills have a significant effect on patient care (Lang, Floyd and Beine, 2000; Stewart, 1995). In addition, the literature includes both descriptive accounts and empirical research studies that support the theory that physician-patient relationships may be influenced by culture (Campbell, 2002; Cooper-Patrick, et al, 1999; Ferguson, 2002; Flores, 2000; Ngo-Metzger et al, 2003). Murray-Garcia (2001) and Stewart (1995) found that patients report more satisfaction in a given medical encounter when their physician is of the same race and/or ethnicity. Illustrating the negative aspects, in a study done with Chinese and Vietnamese immigrants, patients who receive negative reactions from Western clinicians reported their reluctance to discuss their use of Asian medicines, resulting in misdiagnoses and unhappiness with their medical care (Ngo-Metzger et al, 2003). These examples support the proposition that cultural differences exist which affect a person’s evaluation of their clinical care.

Another aspect of cultural differences in the clinical setting lies in the dynamics of the medical team itself. Heimlich & Merritt (1998) make the case for directly linking team communication of emergency room physicians, surgeons and nurses to high-risk safety outcomes. Their studies emphasize the connection between safety, communication, and the three types of cultures that exist in the medical team: national, organizational and professional cultures. All three cultures interact to develop the unspoken code for communications, relationships, and what is considered ethical. Differences can potentially result in team conflict, misunderstandings, and poor clinical outcomes. The ACGME has recognized this dynamic as important, and has thus included teamwork as a part of their clinical competencies (ACGME Graduation Competencies, 2000). In this study, all members of the team share the same professional and organizational culture. National cultures, however, are different. Therefore, it is this aspect of cultural differences resulting from national differences that will be addressed in this study.

To understand how culture affects dynamics in interpersonal relationships, a large number of empirical studies in cross-cultural research use the cultural dimensions of individualism (valuing the individual rights and identity) and collectivism (valuing group norms and obligations) (Ardichvilli & Kuchinke, 2002). These dimensions allow one to examine how basic values affect an individual’s behavioral choices. Globalization has increased factors leading to intracultural variations (Anderson, Li, & Harrison, 2003), examining an individual’s value system, rather than country of origin, may be a better predictor of social behavior, due to intracultural variation and acculturation.

Because formal evaluations of interpersonal skills and professionalism are now required in all American residency programs, it is important that residency training directors understand the cultural influences affecting such evaluations. Thus, this study is grounded in an integration of two established models. The first is the model of skills adopted by ACGME as necessary for the delivery of quality health care; the second includes models of individualism/collectivism and their effect on how individuals’ value systems affect their interpersonal behaviors.

Research Questions

The purpose of this study is to address the question: Do International Medical Resident (IMG’s) demonstrating different cultural attributes evaluate and interpret "interpersonal skills" and "professionalism" differently than their American born and educated colleagues. The study will be guided by the following research questions:

1. Is there a relationship between national origin and cultural profile, as identified by Triandis’s Cultural Profile Survey?
2. Is there a relationship between residents’ cultural profiles as identified by Triandis’s Cultural Profile Survey and the ratings they provide on teamwork, leadership and humanistic medicine as observed through the ratings of critical incidents? That is, do Collectivists interpret critical incidents differently than Individualists?
Methods

Population and Sample
Residents in an Internal Medicine Residency program in central Illinois were chosen as a purposeful sample, since this program is representative of many American residency programs in that it is demographically an international team.

Demographic breakdown:
- Residents – 51
- Gender: 29 males; 22 females
- Country of origin: IMG's 42 USA 13
  (India 23; USA 13; Middle East 9; East Africa 2; Europe 1; Africa/Europe 1; Philippines 1)

Instrumentation
SINDCOL Cultural Profile Questionnaire
Due to intracultural variation and varying levels of acculturation, cultural patterns rather than country of origin are identified and correlated with residents’ interpretations of evaluation terms. The SINDCOL Cultural Profile Questionnaire (Subjective Individualism and Collectivism, Triandis, 1995) was chosen to identify these cultural patterns based on its demonstrated validity in similar cultural studies exploring individual difference (Chiou, 2001; Hofstede, 2001; Triandis, 1995). The coefficient alpha reliability of the Individualist and Collectivists scales are .71 and .69 respectively (Triandis, 1995, p. 204). Each resident completed the questionnaire. Results were matched with the residents’ ratings of critical incidents (see following section below).

Resident Performance Evaluations
In ACGME accredited medical residencies programs, senior residents teach, mentor and work together with the first year residents. First year residents evaluate their seniors on technical, interpersonal and mentoring skills, rating each skill using a 1-5 Likert scale. The interpersonal skill categories are:
- Question 5: Professionalism: Works effectively with nurses & attendings
- Question 6: Relationship with Trainees – provided leadership in a team approach to learning & patient care
- Question 7: Humanistic – demonstrated a caring attitude towards patients and families
- Question 8: Relationship with Trainees - Availability
- Question 9: Teaching skills, autonomy – provided a balance between independence and supervision

Critical Incidents
The Critical Incident Technique (Anderson & Wilson in Whetzel & Wheaton, 1997; Keatinge, 2002,) is a tool that is used to conduct task analysis by identifying desired, effective and/or dysfunctional behaviors. Beech & Norman (1995, cited in Keatinge, 2002) suggests the technique as a research tool to collect observations of human behavior in specified settings. Since this study seeks to identify differences in job task expectations in a specific medical setting, the critical incident technique was chosen to identify task behaviors that might be interpreted differently depending on an individual’s cultural perspective.

At two noon conferences, residents were given instructions on how to write two critical incident summaries based on a given question from their evaluation form. They wrote both a description of how this competency would be behaviorally demonstrated well (“something you would rate as a 5 on the evaluation”), and poorly (“less than 3”). These summaries could be real or hypothetical examples including the following descriptions:
- Situation:
- Actions (residents were instructed to describe the actions only in behavioral terms):
- Reasoning behind actions:
- Outcomes:

The action part of these descriptive summaries were then typed up and included on a “Critical Incident Evaluation Form” (Appendix A contains samples). To ensure that the critical incidents were behaviorally descriptive rather than value statements, member checking was done in a few cases to elicit clearer action statements, and several were modified to delete value-laden words. Three incidents written by Collectivists and three from Individualists were chosen for each category to ensure a balance. Of these six incidents, three had been written as good examples and three were written as bad examples of the competency being rated. The residents were later asked to rate these thirty incidents as they would rate observations for a performance evaluation.
Data Analysis

The SINCOL cultural profile was scored using the directions provided by the instrument’s author (Triandis, 1995). Subjects were identified as either Individualists or Collectivists by totaling their first response choices on 32 scenarios. A third category, C/I, was later added when 12 subjects (30%) scored evenly between the two dimensions. The cultural profile was used to divide the critical incidents into these four categories:

1. Incidents written by Individualists as good examples of the skill being evaluated
2. Incidents written by Individualists as bad examples of the skill being evaluated
3. Incidents written by Collectivists as good examples of the skill being evaluated
4. Incidents written by Collectivists as bad examples of the skill being evaluated

An analysis of variance using SAS’s Mixed Procedure was used to calculate planned comparisons between the above groupings.

Results

To answer the first research question, Is there a relationship between national origin and cultural profile?, 40 residents completed the Cultural Profile Survey (Triandis, 1995), with the following results: all five Middle Eastern residents were collectivist, all three East African were collectivists, no Americans were collectivists, although 45% were split evenly between the two dimensions. The Indian sample showed greater diversity: 55% were collectivists, 10% were individualists, and 35% were split evenly between the two dimensions.

The second research question asked, Is there a relationship between residents’ cultural profiles as identified by Triandis’s Cultural Profile Survey and the ratings they provide on teamwork, leadership and humanistic medicine as observed through the ratings of critical incidents? That is, do Collectivists interpret critical incidents differently than Individualists?

To answer this question, 29 residents completed both the Culture Survey and the Critical Incident Evaluations, allowing comparisons between culture and rating of behavior descriptions. Table 1 summarizes these results:

* N= number of incidents rated

Results show only significant differences for how the two cultural groups rate bad incidents, suggesting that although most residents generally agree on what constitutes a good action, they disagree on what constitutes a bad one. Residents identified as Individualists tended to rate “poor” or bad performance incidents lower than did Collectivists. A surprising finding was that Individualists rated incidents written by Individualists lower than for those written by Collectivists.

Results from four residents who scored evenly on both dimensions (C/I) were different from the other two groups, but were not included in the planned comparisons since they resulted from unexpected findings. Also, their numbers are too small to result in meaningful findings. Their “good” incidents received slightly higher ratings from all groups, with the C/I ratings for C/I “good” incidents being rated significantly higher than for those incident written by either Collectivists and Individualists.
Discussion

This study sought to answer the question of whether residents from different cultural perspectives define and evaluate professionalism, teamwork, caring, leadership, and autonomy differently, and whether these different perspectives result in a significant source of variation within the required performance evaluation outcomes. The results show that while residents generally agree on what constitutes good clinical practice, they did not agree on how to rate those behaviors they believed to be poor clinical practices. A further qualitative examination is planned to discover the reasons for these differences in ratings. Results will be used to further understand how cultural values affect clinical judgments and team relationships in general, and specifically to help improve early team relations and the evaluation process within this residency program.

This study serves as an exploratory study. Due to the small sample size, the power of the statistical significance is limited. To generalize beyond this initial view of this residency program, one would need to replicate this study with this or other similar resident programs. The SINDCOL instrument was chosen for its demonstrated validity and reliability in similar cultural research (Chiou, 2001; Sinha, Vohra, Singhai, Sinha & Ushashree, 2002).

Implications (Contributes to New Knowledge in HRD)

Heimlich & Merritt (2001) warn, “culture can be a problem, but only if its influence goes unacknowledged “(authors’ italic, p. 223). As our physician and patient populations become more culturally diverse, it is important to understand how cultural perceptions affect the clinical competency teaching and evaluation process. By taking cultural differences into account, directors will be better able to diagnose whether the resident's clinical decisions are based on cultural difference rather than the inability to make good clinical judgments in general.

Increasingly, Human Resource Development specialists are being called on to assist in the development, facilitation, and evaluation of international teams. It is, therefore, important to understand the dynamics involved with asking an international team to complete peer reviews and other types of performance evaluations such as the ones required in American residency programs. This study found a difference in how residents from different cultures rated the same incidents. This may be especially important since there was a higher variation for behaviors perceived as negative. It suggests that facilitated discussions on how culture affects workplace decisions and evaluations should be held early within a team development process. Although these are generally good guidelines for all teams, this is especially important for international teams whose members are required to coordinate their activities and are required to complete peer evaluations.

Appendix A: Cultural Effects on medical residents evaluations of interpersonal skills and professionalism

Examples of Incidents from Critical Incident Evaluation Form:

*Professionalism: Works effectively with nurses & attendings*

5.1. *Situation:* patient deteriorates in his condition. Intern doesn’t agree with attending’s approach to the case. Senior agrees with intern.

*Action:* Senior gets involved, calls attending & explains to the attending the situation from the senior’s and resident’s perspective.

(Poor or unnecessary) 1 2 3 4 5 (Excellent)

5.2. *Situation:* Crashing patient at night

*Action:* Senior responded by coming to the floor, seeing patient, contacting attending.

(Poor or unnecessary) 1 2 3 4 5 (Excellent)

5.3. *Situation:* Nurse calls in with concerns regarding a patient.

*Action:* The intern does not reassess the patient, since (s)he (intern) had assessed the patient earlier.

(Poor or unnecessary) 1 2 3 4 5 (Excellent)

*Teaching Skills, Autonomy*

9.1 *Situation:* Intern manages patients.

*Action:* Resident allows intern to manage patients. Intern manages situation independently only asking for help when needed or unsure of self.

(Poor or unnecessary) 1 2 3 4 5 (Excellent)

9.2 *Situation:* Intern had a call from the nurse about a patient who was having acute onset of abdominal pain.

*Action:* Intern immediately calls the senior without first assessing the patient.

(Poor or unnecessary) 1 2 3 4 5 (Excellent)

9.3 *Situation:* Patient has congestive heart failure (CHF).

*Action:* Intern decides on medical regiment for a patient with CHF, with final decision review by supervising resident.

(Poor or unnecessary) 1 2 3 4 5 (Excellent)
Toward a Meta-Theory of Learning and Performance

Darlene Russ-Eft
Oregon State University

This purpose of this paper is to identify implications of various learning theories for workplace learning and performance and HRD. It begins with a review of various theoretical positions on learning including behaviorism, Gestalt theory, cognitive theory, schema theory, connectionist theory, social learning or behavior modeling, social perspective theory, and situated cognition theory. Implications are drawn from these various theories. A theoretical framework is then constructed incorporating these implications, along with suggestions for needed research.

Keywords: Learning Theory, Training and Development, Workplace Learning and Performance

No single theory of learning currently exists. Rather, a multitude of different theoretical positions emphasize different aspects of the individual or situation context. Furthermore, this situation has characterized the literature on learning and performance for a number of years. As Underwood (1964) wrote

There are many approaches which might be used to express the relationships among research findings for all forms of human learning. Undoubtedly, the most elegant way would be in terms of theory. A general theory of human learning … is clearly an ideal solution. No such system is available. (p. 48)

More recently, Merriam (2001), acknowledging that no single theory exists, stated “What we do have is a mosaic of theories, models, sets of principles, and explanations that, combined, compose the knowledge base of adult learning” (p. 3).

Although no such comprehensive system or theory currently exists, there are many connections among the different learning theories. The present paper provides a meta-theory of learning and performance with an attempt to include many of the major theories. It begins with an overview of the major learning theories and their implications. It then presents a systems model of learning and performance in the workplace, along with implications for research and practice. As Senge (1990) stated, a systems model is “a framework for seeing interrelationships …” (p. 68-69). One aspect of this interrelationship is the lack of distinction between learning and performance.

Philosophical, Historical, and Theoretical Background

Discussions concerning human learning began with the early Greek philosophers. Indeed, Reynolds, Sinatra, and Jetton (1996) provide an overview of the theories of the Greek philosophers, as well as current-day learning theories. They suggest that these approaches be positioned along a continuum from environment-centered (where all learning comes from stimulation outside the organism) to mind-centered (where all learning comes from manipulations within the mind of the organism). Such a classification helps to identify similarities and differences among the theories.

If we begin with the Greek philosophers, we see that Alcmaeon, Democritus, and Protagorus held a view that can be labeled the “environment-centered.” They suggested knowledge or learning comes only from the senses and what is observed. In contrast, Socrates rejected the notion that knowledge comes only from perception. He argued that knowledge comes from ideas, concepts, and reasoning. This can be labeled “mind-centered.” Aristotle presented a compromise view in which sensations and perceptions combined with the organization of the mind to create higher-order concepts and processes. Thus, Aristotle provided what might be called an “integrationist” view. Similar distinctions can be made of more current theories of learning.

Behaviorism

The behaviorist approach, derived from the British Empiricists (Locke, 1690, 1995; Mill, 1929) and popular from about 1910 until about 1960, held that all learning comes from behavioral responses to external stimuli. Thus, it provides an example of an environment-centered approach. Watson’s seminal article (1913) stated, “Psychology as the behaviorist views it is a purely objective experimental branch of natural science. Its theoretical goal is the prediction and control of behavior.”

Both Pavlov (1927, 1941) and Watson (1913) focused on classical or respondent conditioning. Pavlov introduced the principle of “frequency” according to which the more frequently an unconditioned stimulus (e.g.,

Copyright © 2004 Darlene Russ-Eft
meat powder) is paired with a conditioned stimulus (e.g., salivation) the greater is the likelihood that the conditioned stimulus (e.g., bell) will elicit a conditioned response (e.g., salivation). Watson added the principle of “recency” indicating that the more recently a response has been made to a particular stimulus the more likely it is to be made again. The idea of reinforcement was added by Thorndike (1932). Specifically, the law of effect states that a connection becomes stronger or weaker depending on its consequences. Furthermore, the law of exercises states that, with practice, a connection will be strengthened, and, with no practice, the connection will be weakened. In addition, the concept of identical elements introduced the notion that transfer of training could be enhanced with greater similarity between the learning situation and the environment in which transfer of that learning is to take place. These ideas were further elaborated and codified through various mathematical equations by Hull (1929, 1943, 1951) and Spence (1956, 1960). Skinner (1938, 1953, 1968) refined these ideas to include various stimulus-response-reinforcement paradigms. According to this view, the learner is the passive recipient of knowledge. Information must be broken down into small units in order to maximize success (and provide reinforcement).

**Schema Theory**

Schema theory emerged in reaction to the machine metaphor of early cognitive theorists. It falls close to the interactionist view but leaning toward mind-centeredness. Following the philosophical notions of Kant (1781/1900) and Wittgenstein (1958), the mind frames perceptions and experiences, actively interacting with sensory information from the environment. Rumelhart and Ortony (1977) and Rumelhart (1980) suggested certain characteristics of schemas: (1) They have variables; (2) They can be embedded in each other; (3) They represent knowledge at various levels of abstraction; (4) They represent knowledge rather than definition; (5) They are active processors; and (6) They are recognition devices, determining the goodness of fit of the incoming information. Such schemas help to organize disparate bits of information into a meaningful system or network (Anderson, 1990). According to schema theory, the individual’s background knowledge influences the processing of incoming information. Thus, trainee-centered approaches, such as strategy instruction, metacognition, and selective attention, are recommended.

**Connectionist Theory**

Connectionism, unlike traditional cognitive models, focuses on nodes and networks. (See Bechtel & Abramson, 1991; McClelland & Rumelhart, 1988; Quinlan, 1991; Rumelhart & McClelland, 1986.) In this case, cognition is the process of changing activation levels of interconnected nodes or neurons within the network. Knowledge is distributed among the nodes and connections. As with behaviorist notions, knowledge is acquired through contiguity and frequency. Back propagation allows for errors to be fed back through the system. Thus, this approach appears at the environment-centered end of the continuum. It emphasizes the importance of proceduralized knowledge, the automaticity of lower level skills, and parallel distributed processing. Rather than teaching isolated facts, network models suggest the importance of chunking information and proceduralizing and automating processes. Such proceduralization and automaticity reduce the cognitive demands or the cognitive load (Paas, Renkl, & Sweller, 2003). Recently, however, Kalyuga, Ayres, Chandler, and Sweller (2003) found an “expertise reversal,” such that techniques that reduce the cognitive load for novices may increase the cognitive load for experts.

**Social Learning or Behavior Modeling**

Initial work on behavior modeling (also called social learning) began when behaviorism was pre-eminent. Bandura (1965a, 1965b) proposed, in contrast to the importance placed on frequency, that most human learning involves no-trial learning. New responses are simply acquired by observing the behavior of other people (i.e., models). The person can, thus, learn new responses without ever having performed the task and without having...
received any reinforcement. Nevertheless, since observation of a model is critical to learning, this approach can be considered environment-centered. Sorcher and Goldstein (1972) reported on the first research on behavior modeling undertaken in an industrial setting. Goldstein and Sorcher (1973, 1974) reported on the use of such programs to reduce the turnover among “hard-core unemployed” employees. Since then, over 50 published studies have examined various aspects of behavior modeling. (See Russ-Eft [1997] for a review of this research.) Elaboration of Bandura’s original notions of “no trial learning” tend to include the following steps as part of the learning or training process: (1) a description of the behaviors to be learned, (2) a model or models displaying those behaviors, (3) opportunities for learners or trainees to practice the behaviors, (4) feedback and social reinforcement following practice (Decker & Nathan, 1985; Robinson, 1982; Taylor, Russ-Eft, & Chen, 2003).

Andragogy and Self-Directed Learning

Merriam (2001) claimed that these two theoretical approaches formed the pillars of adult learning theory. Andragogay, introduced by Knowles (1968), characterized the adult learner as directing his/her own learning, using life experiences in learning, seeing changing roles as learning opportunities, focusing on the practical and immediate application of knowledge, and being internally motivated to learn. Houle (1961), Tough (1967, 1971), and Knowles (1975) explored self-directed learning. Such learning can lead to an increased capacity for self-directed learning, critical reflection and transformational learning (Brookfield, 1986; Mezirow, 1985), and social action (Brookfield, 1993). These theories seem aligned with mind-centered approaches, while recognizing the influence of the context.

Social Perspective Theory

In reaction to the cognitive approaches, a variety of theorists have begun to emphasize the importance of the social and cultural contexts. Given this emphasis on the social, cultural, and historical contexts, such theories fall near the environment-centered end of the continuum. These approaches have been labeled sociocultural perspective (Wertsch, 1991), social constructivism (Palinscar, 1998; Turner, 1995; Turner & Meyer, 2000), sociohistorical theory (Wertsch, del Río, & Alvarez, 1995), and socio-cultural-historical psychology (Cole, 1995). The development of cognition comes from an internalization of social interactions, and knowledge is constructed by and distributed among individuals and groups as they interact with one another. Thus, experiences are shared, and learning and knowledge emerges from participation in social interaction. Vygotsky (1979) suggested that learning occurs when a person internalizes the social experiences of interacting with another person; such internalization results in inner speech and thought processes. These theories point toward the importance of considering the training environment, the organizational context, and the broader social and cultural context. At the very least, such theories contribute to the notions of cooperative learning environments and contextualized activities.

Situated Cognitive Theory

Situated cognition arose from artificial intelligence and cognitive psychology (Brown, Collins, & Duguid, 1989; Clancey, 1993; Greeno, 1991, 1998; Winograd & Flores, 1986). Similar to Vygotsky, situated cognition results from reasoning that occurs when the individual interacts with the social and physical situation. In contrast to Vygotsky, this approach places greater emphasis on internal processes. Thus, knowledge is acquired through the internal processing of the individual as that person interacts with the situation. This theory seems close to an interactionist approach in that emphasis is placed on the mind, in the form of mental models, and on the affordances of the environment. This theory suggests that training should facilitate the development of trainee’s mental models through problem-solving activities, particularly by using ill-defined problems. Anchored instruction means that the instructors or the medium must anchor or situate trainees in simulated contexts, situations representing life experiences, or apprenticeships in real life situations. Thus, not all learning involves the retrieval of stored propositions; rather the emphasis is upon providing rich contexts or situations in which learning can occur.

Summary of Theoretical Suggestions for HRD and Training Practices

Table 1 provides some training implications for each of the previously described theories.

<td></td>
</tr>
</tbody>
</table>

**An Inclusive Meta-Theoretical Framework**

This review of various learning theories helps to identify similarities and differences. Figure 1 depicts a theoretical framework that combines the elements from the various learning theories. By connecting these theories, we can identify further practice and research implications.
Almost all of the learning theories, except perhaps for the behaviorist theory, recognize that learning and performance takes place within a social and organizational context which, in turn, affects the training environment. Furthermore, this training environment leads to the use or non-use of such methods as coaching and fading. The effects of background and context are primarily emphasized in schema theories and social perspective theories.

Critical differences among the theories seem to emerge in what might be labeled as the input phase of the learning process. Various theories possess different conceptions of the trainee and suggest different ways in which information should be presented. Thus, behaviorism posits that the trainee is a passive recipient of information, and therefore the information must be broken into small steps or small bits of information. In a similar way, connectionist theories emphasize the importance of automaticity of lower-level skills, presumably through repetition of procedures. With such automaticity, the learner can engage in higher-level skills, thinking, and problem solving. In contrast, social learning or behavior modeling suggests that the trainee is an observer and can learn simply by observing someone else. It may, nevertheless, require some form of reinforcement and feedback for the learner to display or perform the learned skill or task. Schema, cognitive, self-directed, and situated cognitive theories emphasize the importance of active, involved trainees. The theoretical framework presented in this paper, however, recognizes that new knowledge can be developed and created through all of these different approaches.

Similarities also appear in some but not all of the methods suggested for the transfer phase. Common elements for the transfer phase include frequency, reinforcement or reward, identical elements (according to the behaviorists) or encoding specificity (according to cognitive theorists). Elements such as multiple examples, strategy instruction, metacognitive instruction, ill-defined problems, realistic situations, and learning circles appear in certain theories, such as the cognitive theories, and are missing in other theories, such as the behaviorist theories. Further discussion and exploration of the various elements critical in the transfer phase can be found in Russ-Eft (2002).

HRD Research Implications

The theoretical framework implies that trainees may need information to be presented in multiple ways. It may be that a specific approach may prove more effective for certain types of learning and performance and certain kinds of situations. For example, it may be that the features and benefits of a new product to be learned by salespeople in one day through an e-learning format is best conveyed in small bits of information. In contrast, using a behavior model may be the best method for instructing organizational consultants on new approaches to executive coaching. Alternatively, providing symbolic information and facilitating problem solving may prove most effective in training problem-solving skills to mechanics and computer programmers. These speculations need testing.

The theoretical framework assumes that alternative methods are equally effective in the input phase. Gagne (1970, 1985) and Medsker and Gagne (1996) argue that certain kinds of training may be more effective using a specific theoretical approach. More research is needed to determine whether alternative methods are indeed equally effective or whether certain approaches prove more effective for specific kinds of trainees, certain types of information, and specific situations. As another example, the framework indicates that social and organizational context affects the training environment and that the training environment affects the extent to which coaching and fading takes place. Some research efforts need to examine these relationships. Similarly, it is assumed that the social and organizational context, the training context, and the level of coaching and fading affect the input phase and the extent to which new knowledge is created during training. Again, these relationships need further examination.

If we remove some elements of the social and organizational context, what are the implications for the type of theoretical approach used for the input phase? For example, when uncertainty exists as to the support provided through the social and organizational context or the training context, do multiple input approaches or one particular input approach function better? Might it be that, using behaviorist or connectionist approaches, repetition and reinforcement would lead to learning and automaticity of the response? Such an implication needs further testing.

Various elements appear to affect the transfer phase (such as frequency, reinforcement, identical elements). It is not at all clear whether each of these yields equivalent results. Russ-Eft (2002) provides a more complete taxonomy of elements affecting transfer. Research is needed to determine issues regarding the timing and use of these elements, particularly in relationship to the different types of input methods. For example, learning and transfer may not take place with the behaviorist approach of small steps and bits of information without using both frequency and reinforcement. In contrast, a social learning or behavior modeling approach, suggesting “no trial learning” (Russ-Eft, 1997), may prove equally effective with or without reinforcement. In this case, the behavior or information may be “learned” but may not be “performed” without some reinforcement.

Taking Hope to Work--Extending Hope Theory to Include Performance Communication

Vickie Johnson Stout
Kristye Yvette Raby
Michael Lane Morris
University of Tennessee

The research reported in this paper represents the preliminary stage of Hope theory extension to include performance communication in work contexts. A theoretical framework emerges that provides transformational leaders with the necessary structure and strategy for potentially fostering Hope-based, GAP-oriented transformational performance.

Keywords: Hope Theory, Performance Communication, Transformational Performance

Change within an organization—planned or unplanned—sets off shock waves within individuals, teams, and the organization as a whole. Uncertainty abounds and affects how workers perceive their individual and collective roles, goals, and responsibilities within the organization. Such uncertainty often erodes Hope and subsequently impedes performance. Because organizational change, by its nature, mandates changes in goals and how individuals align with and attain those goals, employee Hope may vary a lot. Consequently, planned organizational change efforts necessitate leader performance communications that foster rather than diminish employee Hope and performance. In pursuit of extending Hope theory to include performance communication, the research reported in this paper represents the preliminary stage of Hope theory extension—formulation of a plausible theoretical framework.

Problem Statement and Research Questions

From the time that this preliminary Hope theory-extending research was initiated well over a year ago to the present, no research-based literature has been found pertaining to strategic facilitation of organizational change and development through Hope-based performance communication. Therefore, the researchers purposed to:
(a) determine how organizational change is facilitated through Hope-based performance communication, and
(b) formulate a plausible theoretical framework for implementing Hope-based performance communication in work contexts. Supportive of the research problem and purposes, the following research questions were posed:
1. What is the nature of organizational change?
2. What is the nature of performance communication?
3. What is the nature of Hope?
4. How do organizational change, Hope, and performance communication interface?

Methodology

For over 10 years one of the researchers has been employed as a university faculty member and concurrently provided eldercare for a chronically ill parent. Throughout the eldercare experience the researcher has reflected upon transferable strategies for (a) sustaining Hope and resilience amidst major life changes, (b) perpetuating her personal and professional development, and (c) innovating because of rather than in spite of, sometimes overwhelming and seemingly competitive and conflicting roles, goals, and responsibilities. As a result of periodically reflecting upon and bundling the lessons learned from her informal three-part study, the researcher formulated a research agenda initiative related to her ever-evolving organizational communication teaching responsibilities. In early 2002, the researcher began a comprehensive literature review about the cognitive construct of Hope. The review entailed a systematic scouring of electronic databases for Hope measurement tools and related publications. Discussions with two colleagues studying change by design, collaboration, and strengths as positive organizational behavior subsequently led all three researchers to concur that, while research has documented Hope’s positive influence on performance in numerous arenas (Zournazi, 2003; Snyder, Ildari, Michael, & Cheavens, 2000; Farran, Herth, & Popovich, 1995), research about Hope’s utility in work contexts is almost nonexistent. The researchers’ discussions prompted them to integrate and extend their related literature reviews and to contact multiple prominent interdisciplinary Hope researchers requesting that they share Hope reference and publication information. At the
time that the researchers prepared this paper, only 10 writings (consisting of book chapters and articles) had been located about Hope’s utility in work contexts. While voluminous quantities of interrelated literature pertaining to Hope, performance management, communication, change management, transformational leadership, and positive psychology literature were reviewed, analyzed, and synthesized, the researchers selectively included narrative and reference citations in this paper in order to comply with the Academy of Human Resource Development’s conference proceedings page-length parameter for paper submissions.

For over a year the researchers have met intermittently to think collaboratively about the extension of Hope theory as it applies to performance in work contexts. Having agreed early on that their mutual professional arena of human resource development is most likely to impact individual Hope states in organizations versus impacting individual Hope traits, the researchers committed to thinking collaboratively about strategic organizational processes whereby individual Hope states could be enhanced and individual performance improved.

Periodically melding insights gleaned from their respective and collaborative literature searches, the researchers discerned connectedness of Hope theory with at least four theories commonly associated with work issues—namely, organizational change, human capital, communication, and transformational leadership—which led them to consider the important connection between organizational change and performance communication. Subsequently, the researchers generated four research questions for which answers would aid in their preliminary extension of Hope theory. Based upon an extensive review, analysis, and synthesis of related literature, responses were found for each of the research questions, which in turn, contributed to the researchers’ formulating a plausible theoretical framework for preliminarily extending Hope theory to include performance communication. Actual testing of the researchers’ framework is in progress and represents a separate, multi-faceted research endeavor.

**Results**

Within the responses to their four research questions, the researchers’ reveal their proposed framework for preliminarily extending Hope theory.

**In response to Research Question 1,**

What is the nature of organizational change?

the researchers found that organizational change is now a given, and “the pace of change is accelerating” (McLagan, 2002), because of the rapid changes consistently occurring in the environment, in technology, in culture, in laws and regulations, and within the organization itself as it seeks to respond proactively to these many changes (Fisher, Schoenfeldt, & Shaw, 2003). But, what is organizational change?

Based upon extensive review of change literature spanning Lewin’s seminal change research (Swanson & Holton, 2001) and continuing through to McLagan’s dynamic action research-based contemporary writings (2002), the researchers operationally defined organizational change as the recognition of a gap between the desired performance objectives and the existing performance of the organization and the implementation of the necessary course of action to fill the gap, as illustrated in Figure 1.

Performance can be service related, product related, innovation related, or anything that the organization does to meet the constituent-requested need. According to Lawler and Mohrman (2003), the organization’s survival depends upon its capabilities to compete with quality, service, technology, innovation, and knowledge management, to mention only a few of the many elements that affect the survival or the failure of the company. Performance is the central focus, the driver, and the motivating factor for organizational change. The necessity to do things more effectively and more efficiently at a lesser cost drives organizational change. Organizations strive to do the right thing with the right people at the right time at the least cost and with the highest level of integrity possible. McLagan and Krembs (1995) indicated that, “change is inevitable in today’s dynamic environment.” Through its transformational leadership, the organization now recognizes that change is anticipated and strategically plans proactive means for utilizing the changes as opportunistic challenges instead of catastrophic barriers.

As organizations develop proactive approaches to the plethora of changes, Becker, Huselid, and Ulrich (2001) stressed the importance of aligning internal strategies and measurements with performance metrics. Additionally, Stout and Raby (Association for Business Communication Conference, 2003), indicated that individuals’ perceptions about goals, roles, and responsibilities must be addressed proactively through any organizational change. Their research further indicated that strategic, purposeful communication was the key to any successful implementation of change.

With change being the rule rather than the exception in today’s environment, Tichy (as cited in Swanson & Holton, 2001) indicated that “these changes are often frightening and threatening while at the same time potentially stimulating and providers of new hope.” Transformational leadership addresses the perceived barriers to implementation, as outlined in the American Society for Training and Development (ASTD) Info-Line.
October) in order to facilitate a successful change. Implementation barriers stem from a wide variety of issues, but many of the barriers relate directly to poor communication (or perhaps non-existent communication) specifically involving the change process and its intended objectives.

Recognizing that successful organizational change completely depends upon the quality and content of communication from the organization, transformational leadership becomes accountable and responsible for providing Hope-based communication.

Figure 1. The Performance Delta Associated with Organizational Change

Responding to Research Question 2, What is the nature of performance communication?

the researchers determined that performance communication (PC) refers to the system of and the formal and informal processes for exchanging information with the purposes of: informing, guiding, and shaping the performance of organizations and individuals. As a purposeful endeavor, PC is a, if not the, primary means whereby organizations develop. PC occurs in both traditional and virtual environments among persons internal and external to an organization, particularly if value chain interfaces count as competitive advantage touch points. PC is inter-organizational (if viewed from a supply-chain perspective), intra-organizational, inter-personal, and/or intra-personal in scope, and PC (a) involves spoken and written messages, and (b) entails use of a comprehensive range of communication skills, including listening, speaking, reading, writing, and nonverbal skills.

When viewed from the perspective of the individual employee in relation with the organization, PC begins from the time that the organization posts or advertises job specification information and the future employee as a prospective candidate makes application for employment, and PC continues throughout the employment lifespan of that individual performing on behalf of an organization.

Characteristically facilitative, PC helps individuals complete their work and improve the way they work with others (Farrell & Weaver, 2000). Figure 2 depicts how PC, if planned for and present, encapsulates and fortifies performance. While written and oral communication performance tools such as business and performance metrics, job descriptions, performance evaluations, strategic plans, manuals outlining policies and procedures, job aids, instructional emails, meetings, and debriefings aid individuals in knowing performance expectations, one-on-one relating between the individual worker and the immediate supervisor serves as a primary means whereby the worker receives and participates in performance communication. According to Jablin and Putnam (2001), . . .future organizational communication research will likely focus on developing new perspectives on old processes, relationships, problems, and issues, including the study of communication structures and networks, leader-follower communication, participation, feedback, information flow and the filtering of messages, the creation and interpretation of messages, and communication media and channels.
Use of the term performance has emerged in the field of organizational communication, thus, moving scholars to ask different kinds of questions and reconsider assumptions about traditional areas of study (Jablin & Putnam, 2001). However, to date, Hope-based PC has yet to appear in organizational communication literature.

Figure 2. Performance Fortified by Performance Communication

Analysis of literature supportive of answering Research Question 3, What is the nature of Hope? indicated that since the early 1950s numerous theorists have emphasized the importance of Hope and its embodiment of expectations for success in attaining goals (Stotland, 1969). The fact that Hope has been given many definitions has resulted in a confusing picture of Hope as a construct (Lopez & Snyder, 2003).

For the purpose of this research, Hope was defined as a cognitive construct that appears as both a trait and a state. Characteristically, Hope involves the actions of trusting in, focusing on, waiting or looking for, desiring, demonstrating boldness and courage, and expecting attainment of a benefit-enriched (value-added) goal (Stout & Raby, 2003). Figure 3 shows that three components comprise Hope, namely, goals, agency, and pathways. Goals represent performance targets pursued by organizations and individuals. Agency or motivation serves as (a) a requisite driver of what is targeted for strategic emphasis and focused on for goal attainment, and (b) a powerful goal attainment enabler which aids in stimulating, channeling, and sustaining cognitive energy toward goal attainment. Pathways pose viable routes to goal attainment. Curiously, once realized, attained goals promote bolstered agency and expanded capacity to perform and commonly evolve into pathways for/to subsequent or complementary goals.

With the transfer of knowledge about the organization’s strategic business and performance expectations (goals), the motivation (agency) of organizational leadership for pursuing selected goals, and suitable/appropriate strategies, tactics, and actions (pathways) for fulfilling the organization’s strategic business and performance expectations (goals), individual employees are better able to craft complementary goals which support organizational development.

As illustrated in Figure 4, goals, agency, and pathways in concert provide a tremendous value-adding template for designing, implementing, and evaluating performance communication and resultant transformational performance so that aggregately, employees are better equipped to perform in value-adding and empowering ways that foster their individual growth in alignment with the organization’s growth and development. Leadership capacity to articulate the organization’s vision, mission, and values represents a strategic capacity for knowledge transfer about performance expectations. In addition, leaders are expected to communicate goal attainment by modeling alignment with and support for the organization’s strategic goals.

Snyder (1994) indicated, “hope is the essential process of linking oneself to potential success.” He further stated that “hope in the minds of people is translated into actions involving the goals in their lives” (Snyder, 1994).
Understanding that people are inherently goal focused provides communicators with strategic tools for preparing messages that increase Hope, increase performance, and enhance organizations. Goleman (as cited in Kouzes & Posner, 1999), in a study about Hope in general and involving more than 7,000 men and women ages 18-70, found that only about 40 percent had Hope or capacity to reach their goals. Based upon Goleman’s research, Kouzes and Posner (1999) speculated that if only 40 percent of working-age adults have the capacity to achieve their goals, then organizations potentially have less than half the hope needed to achieve optimal organizational performance. Snyder and Feldman (2000) encouraged, “a high hope work place. . .one where workers are allowed some freedom to generate their own goals for advancing the interests of the company (and themselves).” A supporting relationship exists between communication and Hope. McDermott and Snyder (1999) indicated, “you can use hope strategies to learn more effective communication, while good communication also nourishes hope.”

In their compelling text, Hope and Hopelessness, Critical Clinical Constructs, Farran, Herth, and Popovich (1995) chronicled published quantitative and qualitative Hope research from 1974 through 1993 with no mention of any research conducted linking Hope and work. They do mention Hope research involving hospitalized suicide attempters, psychiatric patients, college students, nursing home residents, cancer patients, psychiatric inpatients, healthy adults, chronically and acutely ill hospitalized medical patients, outpatients, depressed patients, children, rural mental health outpatients, community based older adults, chronic heart failure patients, persons with AIDS, acute myocardial infarction patients, adolescent substance abusers, adult oncology patients, elderly widows, terminally ill adults, multiple sclerosis patients, HIV-spectrum homosexual men, persons diagnosed with major depression, persons with traumatic spinal cord injuries, elderly stroke patients, and family caregivers of terminally ill patients. The bulk of the research overviewed by Farran, Herth, and Popovich appeared to support a disease-based model for studying Hope rather than a preventative or wellness model. Snyder, Ilardi, Michael, and Cheavens (2000) reported extensive Hope research targeting academic and athletic performance.

Based upon their extensive literature review, the researchers of this preliminary Hope theory extending paper found only 10 writings published since 1993 linking Hope and work, and of those only one reported empirical research involving 59 managers in 21 Midwest fast-food restaurants associated with a large chain franchise company (Peterson & Luthans, 2003). Nine of the 10 writings suggested that Hope should go to work, but the literature included no mention of the vital connections amongst Hope, performance communication, and performance.

Figure 3. Hope-Based Performance Communication Components
In response to **Research Question 4**, 
*How do organizational change, Hope, and performance communication interface?*
the researchers found that the meshing of theory with practice must encompass an organization’s purpose-driven and performance-focused objectives. The theories of organizational change, human capital, communication, and transformational leadership provide the plumb line for the organization as it strives for environmental alignment. Performance represents the common denominator and central focus of these related theories. Further, the integrative element that pervades all of these theories is the value of human capital. Thurow (as cited in Swanson & Holton, 2001), indicated “new industries of the future depend…on brain power.” While theories provide a collective plumb line for organizational effectiveness and performance, such a plumb line must be suspended from or supported by the figurative girders of human capital. Transformational leaders embrace the ideal that successful firms are people-centered, facilitating the understanding and defining of goals, agency, and pathways (the components of Hope) as they relate to performance objectives. Human capital, the most valuable resource of any organization, is “related to all organizational processes and thus [is] important in allowing an organization to gain and sustain a competitive advantage” (Fisher, Schoenfeldt, & Shaw, 2003). Recognizing that Hope directly relates to superior performance, transformational leaders facilitate the organizational change with Hope-based strategic, consistent, and direct performance communication (Stout & Raby, 2003).

Performance communication is absolutely vital in the transition through change. Kelly (as cited in Isaacs, 1999) indicated, “the new economy is about communication, deep and wide.” According to Andrews (2002), “the rise in popularity of the World Wide Web and e-mail has created opportunities and practices that were unimaginable just a few short years ago.” Technology provides the capability for immediate access so that time zones, locations, and schedule coordination are no longer issues. Performance information can be communicated virtually anywhere, anytime, and to anyone in the organization. However, the information must be valuable and authentic, facilitating employees’ with goals, agency, and pathways so that they can harmonize personal goals with organizational goals and fill the gap with Hope-based GAP. Hope separates extraordinary organizations from ordinary organizations. As illustrated in Figure 5, organizational change must be facilitated by performance communication, which is threaded with the components of Hope, Goals, Agency, and Pathways (GAP), necessary to fill the gap to create transformational performance, the ultimate level of performance for which every organization should strive.
Conclusions, Recommendations, and Implications

Conclusions derived from this research are as follows. Organizational change mandates change in business metrics, performance metrics, and performance. Effective performance communication facilitates organizational change. And, as a system process, performance communication lends itself to continuous improvement.

The researchers recommend that future research be conducted to clarify the connections amongst Hope, performance communication, and performance. In addition, research is needed to identify performance communication best practices and to investigate strategies for sharing hope across cultures and environments. Longitudinal research is needed to determine the gains derived by leaders who use Hope-based, GAP-oriented performance communication.

Implications stemming from the present research include the following. Change has a negative connotation, but the fear is not in the change itself but in the perceived unknown. Transformational leaders must recognize the grip and strength the fear, perceived or real, has and its potential effect on the success of any organizational change. Organizations and individuals need to view change opportunistically as a means of filling the gap between existing and desired performance. Because the gap is constituent focused, an organization’s response in filling the gap must also be constituent focused. Organizational change of any kind demands that heroes emerge to provide Hope-based, GAP-oriented performance communication throughout the transition. HRD professionals must step up to the plate and become such heroes. Everyone in an organization has responsibility for performance communication.

Hope-based, GAP-oriented performance communication is a language, which can be learned. Through practice this language can be shared, grown, and replicated within organizations. Change theories such as Lewin’s addressing change as more of a static state through the basic elements of “unfreezing, moving, and refreezing” (Swanson & Holton, 2001) are still applicable to the dynamic state of change today, just in an ongoing, constant organizational realignment with internal and external variables. The interrelated foundational theories of organizational change, human capital, communication, and transformational leadership provide the necessary strategies and approaches for organizational change management. However, for successful change implementation to occur, performance communication that is Hope-based, GAP-oriented must transition the organization through the change. The transcendence of Hopeful thinking transforms leaders, followers, and organizations, and births transformational performance, which in turn expands the potentiality of individuals and organizations.

Contributions to the New Knowledge in Human Resource Development (HRD)

This research builds upon extensive review, analysis, and synthesis of related literature, and proffers a theoretical framework for extending Hope theory to include performance communication. The researchers have commenced
testing the proposed framework to confirm whether and how it (a) provides structure and strategy for leaders to transform themselves and instill Hope in others, and (b) launches transformational performance in the workplace. Many HRD scholars and practitioners should contribute to this new construct of organizational performance. Because of its relevance to HRD, Hope-based, GAP-oriented performance communication deserves a place on the Academy’s research agenda.

A Rationale for HRD-Ethics and its Inclusion as a Theoretical Foundation

Tim Hatcher
North Carolina State University

A rationale is developed for a new HRD-ethics and its inclusion as a core theoretical foundation for HRD research and practice.

Keywords: Ethics, Theoretical foundations, Values

While disciplines other than HRD contribute to an ethical climate in organizations, it is increasingly obvious that lapses in ethical judgment well illustrated by Enron, Tyco, Shell, Union Carbide and others resulted primarily from inadequate people development systems. Disregarding human development and human potential not only places an organization at economic risk but also in moral jeopardy. When HRD-related systems fail ethics suffer. The moral fabric of the system is stained. HRD sans moral responsibility creates a discipline sans heart and soul. Thus, as Stewart (2003b) has fervently stated: “HRD is, in and of itself, an ethical endeavor” (p.83).

Professionals and scholars are concerned about HRD-related ethics. Researchers such as Roberson & Hinton (2000), Woodall and Douglas (2000), and McDonald (1995) identified several HRD specific ethical issues/dilemmas and unethical behaviors. See Table 1 for a summary of HRD ethics research findings. Left unresolved these issues have dire consequences for people and organizations.

Table 1. Summary of HRD Ethics Research Findings

| Use of ‘cure all’ programs | Improper behavior (lack of follow up) |
| Dishonesty regarding program outcomes | Lack of professional development |
| Abuses of trainees | Working within one’s expertise/competence |
| Failure to give credit | Choosing interventions with a high probability of success |
| Conflicts of interests | Hidden agendas |
| Confidentiality | Respecting rights, dignity and worth of all people |
| Ownership of instructional materials | Balancing individual and organizational needs |
| Honesty, integrity, professional/accountability | Addressing diversity |
| Training for training sake | Appropriate use of Technology (copyright, privacy, access to information) |
| Using power appropriately | |
| Discrimination | |

Taken together the items listed in Table 1 illustrate the diverse character of ethical issues surrounding HRD. They also remind us of the profession’s inability to address them and the dearth of policies to insure they are managed. Without a specific and valid moral foundation within which to deal with these specific issues HRD must rely instead on the same business ethics that failed Enron, WorldCom and a host of others.

Human resource development (HRD) as commonly defined is a unique discipline that is organizationally bound. Organizational morality is characterized as business ethics. Thus, HRD research and practice is moderated by and dependent upon business ethics. Business ethics, defined as right and wrong conduct within a business context has recently been criticized as not alleviating immoral business practices (Cornelius & Gagnon, 1999). Neither has business ethics as academic inquiry contributed much to alleviating the unethical concerns listed above. As a result, ‘To what extent has business ethics added moral value to HRD?’ becomes a valid and important question.

“Business ethics continues to have a marginal status in both the theory and the practice of commercial organizations” (Sorrel, 1998, p. 15). Due to its inherent ‘good’ HRD is likely to come under ethical scrutiny (Woodall & Douglas, 2000). Stewart (2003a) added “the basic confusion at the heart of business ethics is the false belief that business decisions and activities can be separated into ethical and non-ethical issues. The two are interrelated” (p. 92). The business approach to ethics has tended to be observational and based on external reflection, with few recommendations for change (Cornelius & Gagnon, 1999). Business ethics has not provided a catalyst for morally sound work-related behaviors nor for the evolution of ethics norms for the HRD profession. This lack of direction is the impetus for changes that include (a) the development of a unique HRD-ethic to replace business ethics, and (b) inclusion of HRD-ethics as a core theoretical foundation for HRD.

Problem and Purpose

The problem addressed in this paper is twofold. First, that ethics, defined as right and wrong/moral and immoral conduct, is viewed in terms of business ethics as the predominate ethic in HRD, and that HRD professionals do not view ethics as a specific metatheory for HRD.

Second, HRD-ethics is not considered as a core theoretical foundation for HRD. Based on these two problems the purpose of this conceptual inquiry is to investigate the applicability and validity of the following two propositions (P) and supporting questions (Q).

P1a: Because of the inability of business ethics to add value to HRD a new HRD-ethic is justified.
Q1a Why is ethics needed?
Q1b Why is a new ethic needed? To what extent is the existing ethic not working?
Q2a Why would adding HRD ethics be important? What are implications for the field? What would it do for research and practice?
Q2b What would a new HRD-ethic look like? How would it be different from business ethics?

P1b: HRD is an ethical endeavor, thus HRD-ethics should be included as a core theoretical foundation.
Q3a Why would adding HRD ethics as a core TF be important? What would it do for research and practice? What are implications for the field?

To accomplish these goals a brief discussion is offered on current ethical theory in HRD followed by a rationale for a new HRD-ethics. Next is a justification for HRD-ethics as a core theoretical foundation. The paper concludes with implications for HRD. Note that implications for HRD are embedded throughout the paper.

Ethical Theory in HRD

A review of current HRD-related scholarly publications revealed a lack of discussion on ethical theory in HRD. This review included scholarly publications from 1998-2003 for the following: Academy of Human Resource Development (AHRD) annual conference proceedings, Human Resource Development Quarterly, Human Resource Development International, Advances in Developing Human Resources, Human Resource Development Review and Performance Improvement Quarterly. A content analysis focusing on ethical theory and ethics and HRD theory revealed that of the hundreds of publications reviewed there were none with a specific focus on ethical theory in HRD and only 4 publications were located that specifically discussed ethics and HRD theory (See Swanson, 1999; Swanson and Holton, 2001; Hatcher, 2003; Stewart, 2003a&b). There were however several publications on ethics and HRD (see Russ-Eft, 2003; Stewart, 2003; Aragon & Hatcher, 2001). A conclusion that can be drawn from this limited review is that ethical theory is of little concern to many HRD scholars and that ethics as theory has played only a minor role in HRD to date.

HRD-ethics: Rationale for a New Ethic

Why is Ethics Needed?

Several scholars suggested that HRD has moral responsibilities and is an ethical endeavor (McLean, 2001; Chalofsky, 2003; Stewart, 2003a&b; Woodall, 1996; Hatcher, 2002); that the processes and outcomes of HRD contain values, morals and ethical implications. Socrates is credited with saying “The unexamined life is not worth living”. To the extent this is true in postmodern society is open for debate. However, with on-going moral dilemmas highlighted in the media the need for ethics, especially within commerce and organizational contexts is increasingly obvious. Several underlying reasons for business ethics are proposed:

1. The public’s expectations that business act ethically.
2. The possibility of harm to people and the environment.
3. To comply with the law. [For example the Sarbanes-Oxley Act]
4. The protection of employees’ safety and health.
5. To promote personal morality (Post, Lawrence & Weber, 2002)

The extent that the above generalizations of ethics are applicable to HRD is questionable. For example, many HRD interventions are not visible to the public and in many organizations HRD is only minimally concerned with legal compliance. Ethics specific to HRD is thus justified and includes the following rationale:
1. The ability of HRD to change work-related systems depends on values and ethics as much as competence.
2. Globalization and technology are changing the construct of leadership from transactional to values-based.
3. Organizations do not change as a result of instrumental means; they change through transformations in the thoughts, actions, attitudes and values of people (Hatcher, 2002).

Why is a New Ethic Needed? To What Extent is the Existing Ethic not Working?

If HRD-ethics amounts to a coherent theory rather than a random collection of ethical problems, codes of ethics, and practical solutions, what then is its conceptual rationale? (Floridi & Sanders, 2002). HRD has provided modest leadership in organizational ethics/morality. It has been accused of being complicit in corporate wrongdoings and HRD has assisted in fostering less than ethical behaviors. Trying to adhere to a business ethic based on neo-classical economics results in practice and scholarship ill conceived to fully address the critical nature of morals and ethics.

Business ethics theory is ineffective in today’s complex work environments. “Some at least of its practitioners have taken the position that theory is of little or no use in the solving of those real-life ethical problems” (Kaler, 1999, p. 207). This may be, in part, due to its theoretical nature and unlike ethics in medicine, law and government, its failure to solve many real-world ethical problems. Dean (1997) added, “There is a gap between the theory and practice of business ethics” (p. 1638). Add to this ineffectiveness an increasingly global and complex context in which business ethics is being asked to provide more values-based solutions and it becomes clear that business ethics is not providing a basis even for minimal ethical conduct.

Globalization and technology have caused new and unanticipated problems and opportunities that outpace contemporary business ethics and theoretical developments. Witness business ethics’ inability to address the breakdown in moral leadership and ethical practices within Enron, WorldCom, Tyco and others. HRDs reliance on business ethics has not served to expand HRD as a moral profession. Business ethics tends to keep HRD compliant and a ‘handmaiden’ of management; limiting its influence beyond the organization, reducing provisions for a humane workplace (Chalofsky, 2003), or depreciating workplace democracy (Dirkx, 1996). “It does appear that an institutional ethical vacuum, or ‘moral hole’ has been created” (Cornelius & Gagnon, 1999, p. 227).

Why Would Adding HRD Ethics be Important? What are Implications for the Field? What Would it do for Research and Practice?

First, it would send a message that an ethics specific and applicable to HRD is as important as business ethics. It would help HRD assume a more professional stance. Beyond codes of conduct or integrity standards, many other professions and disciplines have seen fit to develop their own ethical theories. There are business ethics, engineering ethics, computer ethics, feminists’ ethics, and environmental ethics to name but a few. Additionally, it would provide HRD research and practice and HRD philosophy ethical guidelines and principles specific to HRD. Second, an HRD-ethic would be an explicit lens through which practice and scholarly work can be accomplished. It would provide an ethics base and specific knowledge necessary to identify ethical issues imbedded in complex situations and help professionals select both research and practice strategies for morally sound resolutions. In addition, an HRD-ethic can sensitize public opinion, professionals, scholars and politicians.

While some scholars have criticized normative approaches to values and morals, it is apparent that through recent activities and publications including codes of ethics, conference topics and presentations, and journal publications the HRD profession is currently seeking normative solutions to ethical issues. And while moral philosophers might eschew defining morality, HRD consists of behaviors and practices and thus knowledge (moral boundaries) that scholars and practitioners may well concurs are right and/or wrong. For example, manipulating data to improve test results or coercing employee participation in research. Kaler (1999) added, “There has to be some sort of prior knowledge of the nature of morality. There is a kind of knowledge of what it is that makes situations good or bad and actions right and wrong. It is only by having that knowledge that we be in a position to judge what is and is not a correct resolution of an ethical problem” (p. 210). This knowledge establishes a ‘common morality’ that sets the stage for a distinctive HRD-ethic:

The core idea of a common morality is that all humans – at least all morally serious humans- have a pretheoretical awareness of certain moral norms. The claim is that normal humans intuit or in some other way know that there is something wrong with things like lying or breaking promises or killing people. These purportedly universally shared insights can provide the raw data from which ethical theories are constructed (Veatch, 2003, p.189).

Gilley, Dean, & Bierema (2001) in comparing HRD philosophy and practice pointed out that normative philosophies include allowing the “inner good to unfold, spirituality, and meaning of work” (p. 37). The recent support amongst scholars, HRD professional organizations and in HRD-related publications for inclusion of this “third paradigm” for HRD (the other two being learning and performance) is a conceptual change. The UK appears to be on the leading
edge of this paradigm change. Cornelius & Gagnon (1999) noted that “in the UK literature on ethics HRM..involves promoting ethics for social justice (deontological) rather than for business case reasons (utilitarian) (p. 227). [Note that HRM in the UK includes a potent HRD component]

The moral philosophies and normative ethical guidelines that a profession establishes influence practice and research. Thus, in increasingly complex and global organizations HRD professionals need an ethic that enhances sustainability of individuals, organizations and HRD by transcending the instrumentality of business ethics.

The third implication involves normative development. Most professions have typically had little trouble establishing skills and competencies and using them to attract members. It appears prima facie that a profession that wishes to attract people with deeply held moral values should develop and espouse highly moral ethical norms. But more than simply assigning merit or worth to outcomes or processes, ethics is the milieu in which professional’s establish integrity, and develop solidarity through normative ethical worldviews.

The context in which ethics is applied serves to establish its limitations, boundaries, definitions and points-of-view. As examples, business ethics is viewed through neo-classical economics while environmental ethics establishes right and wrong within an ecological/natural viewpoint. This diversity of ethics provides alternatives about values. It can also influence the ethical worth of an activity or outcome. “Practical moral problems have multiplied and have become exceedingly complex in our rapidly changing world. Applied ethics is the attempt to solve them and consolidate ways of dealing with them, making the best use possible of the resources of ethical theory as well as accumulated human knowledge” (Edel, Flower, & O’Connor, 1994, p.7).

Building ethical theory requires either an evolutionary or utility approach. An evolutionary approach implies that a specific ethic evolves as a profession grows and changes. Establishing and normalizing acceptable and unacceptable behaviors is a process that can occur as a result of describing acceptable behaviors within a specific context. In addition to descriptions it requires systematic observation and accounting of professional conduct and subsequent changes over time. Norms are then established by behavioral feedback primarily in the form of rewards and punishments. This feedback supports behaviors that in turn may become normative guidelines in the form of codes of ethics or regulations. For example, unwanted sexual advances were widespread in the 1970s workplace but are considered unacceptable practices in most modern business environments.

Conversely, a utility approach involves examining and drawing from existing and equivalent ethical theories. For example, “Environmental ethics presents and defends a systematic and comprehensive account of the moral relations between human beings and their natural environment” (Des Jardins, 2001, p. 13). It is the discipline that studies the moral relationship between human beings and nature and also the value and moral status of the environment. While environmental ethics is based on non-anthropocentrism, HRD can draw value from this approach to ethics by considering how being human, most HRD professionals are by nature anthropocentric; the outcomes of practice are increasing productivity and developing people within organizations. And although this is a virtuous goal HRD that considers implications for people alone has the potential to cause harm to other sentient beings, ecosystems and nature. For example, research grounded in economically grounded business ethics conducted in a service firm finds that with new skills fewer workers are needed. The research helps management justify a reduction in workforce that has negative impacts on the tax base of the community and its ability to address critical environmental issues. While simplistic, this example illustrates how theory might limit the potential impact of HRD research.

Values are important in understanding how aspects of environmental ethics might be evaluated for inclusion in building HRD-ethics. Environmental ethics distinguishes between instrumental and intrinsic values for individual organisms, species, and ecosystems. Instrumental means useful for humans to obtain something else of value. In environmental terms, animals, plants and land are valued only because of the benefits they bring to humankind. The environment has intrinsic value when it is valued for itself and not for what benefit it brings to people. Rolston (2003) argued that environmental values are objective; pre-existing humans, continuing in all species and ecosystems, and would continue without Homo sapiens. The conflict of values involves the inability of people within economic organizations to acknowledge the subjectivity of intrinsic values versus the objectivity of instrumental values.

To include nature for its intrinsic value in ethical theory means that “determinations have to be made regarding how these values are carried by natural things and how they are to be traded against other human values and the demands of industry and business for economic growth” (Buchholz, 1993, p. 63). Moral extensionism forces us to include moral value to non-sentient rocks and dirt, even awe-inspiring landscapes. But should we extend ethics only to living beings with “interests, or cognitive equipment” as some philosophers have suggested, or to those creatures with endearing human characteristics? Rather than pose arguments on either side of this debate, it seems reasonable to suggest that the primary lesson from environmental ethics applied to HRD-ethics is that no human welfare, liberty, prosperity, or future exists apart from an ecological rubric in which life must exist. Thus, both the utilization
What Would a New HRD-ethic Look Like? How Would it be Different from Business Ethics?

To insure that a new HRD-ethic adheres to Dubin’s (1976) criteria for theory building it is necessary to justify how the new ethic differs from the old. The following section is designed to address these differences.

We need to reconsider how we use theories in applied ethics. Our job may be less making choice of one theory over another than exploring where a given theory provides help in solving or addressing a particular problem: we select from theories rather than among theories, we draw from theories...it means we regard theories less as providing rival truths and more as instruments or tools to be drawn on to solve problems” (Edel, Flower, & O'Connor, 1994, p.61). Business ethics tends to limit the kinds of questions asked to those around efficiency, effectiveness, performance and production and thus limit the actions taken. Simply acknowledging the gap between statements of fact and statements of value is enough at this juncture, to caution against overreliance on the instrumentality of business as a construct for ethics (Des Jardins, 2001). If the questions being asked are limited, then so too will the answers and the policies, consequences, and outcomes.

Business philosophy is reductionistic, objective and value-neutral in nature, yet much of what HRD is asked to accomplish is subjective and values-laden. The reductionistic/objective tendency disregards and distorts the morally charged relationships that exist between individuals, groups, and organizations. It also ignores values, one of the most important attributes of HRD.

HRD is practice-bound and relies on many ‘tools’ to solve organizational and individual problems around learning and performance. But like all tools, their use depends on the user’s intent and values. The time to examine such values is prior to opening the toolbox. Of course, ethics done in the abstract, ignoring the relative simplicity of strategy, profit, performance or productivity, has limited contributions toward resolving complex moral problems. Another way to view this is to look solely to business for short-term fixes that block looking instead to ethics.

HRD-ethics can initially be defined as a systematic examination of the moral relations of people and work-related systems (organizations). It is based on the following 3 assumptions: 1. The relationship between people and organizations is governed by moral norms (normative), 2. Organizations have moral obligations to people, and 3. Includes both descriptive and normative characteristics.

Descriptive aspects describe, classify, and summarize current values, beliefs and principles that individuals within a group or population hold as important. Normative HRD-ethics then are future-oriented values and principles associated with the development and growth of people in work-related systems. Normative aspects are based on judgments that suggest how people ‘ought’ or ‘should’ behave. For example, “Human rights ought to be insured”. Normative ethics theory unlike descriptive theories would prescribe what morality in HRD ought to be and will bring some order out of the confusion of questions and concerns that seem to abound when we attempt to assign value. While normative theory will not answer all ethical questions it can and does answer questions that descriptive theory cannot, such as ‘What values? On whose perspective should HRD be based?’

The paradigms of HRD are learning, performance and meaning. Business ethics is focused on right and wrong conduct within a performance paradigm and as long as some return or value-add is obvious learning too remains an instrumental value. Yet, for people as employees, meaning like values is of paramount importance. Business ethics has well-established characteristics, i.e., codes of ethics and cases for example. What it fails to accomplish is to provide a truly non-instrumental or non-fiscally-based way to address issues of morality and meaning. The failure of business ethics to sufficiently take into account the importance of meaning is what gives rise to HRD-ethics. Adding values beyond the economic, toward meaning would help to validate HRD-ethics.

An HRD-ethics would also provide the profession a way to better address humanistic issues such as human rights and global contexts. An argument against HRD-ethics is that it has no conceptual foundation; that just because a profession chooses an ethics does not necessarily mean that it has a solid conceptual base. However, a case can be made that HRD-ethics already exists. The definition of ethics being right and wrong conduct implies that descriptive (cases) and normative (codes) characterizations of such conduct is explicit and at least to some extent accepted within a defined context. Both codes and cases exist in HRD literature and practice. The more distinct HRD is as a profession the more defined the context.

Finally, a new HRD ethic is more relevant today. Business ethics was a better fit when HRD was confined more to simply training and a primarily remote and esoteric field of study as a minor part of human resource management (HRM). However, in the current work environment this approach jeopardizes the enhancement of values and moral behaviors. In addition, HRD-ethics can sensitize us to specific HRD-related ethical problems such as human rights. Similar to relativism, HRD-ethics viewed from a relativistic stance provides a lowest-common denominator approach to ethics; that is, that the context of HRD dictates an ethic. The more changes in context HRD is asked to operate within, the more applicable a specific ethic becomes.
Until recently the theoretical foundations of HRD have served the profession well. However, the instability and scientific/technical objectives of contemporary organizations challenge HRD scholars and practitioners to question the foundations that no longer function to insure ethical process or outcomes. The following builds on this inquiry by presenting a rationale for HRD-ethics as a core theoretical foundation.

**HRD-Ethics as a Core Theoretical Foundation for HRD**

*Why Would Adding HRD Ethics as a Core TF be Important? What Would it do for Research and Practice? What are Implications for the Field?*

Ethics has been largely ignored as a theoretical foundation for human resource development, yet HRD is inherently an ethical endeavor (Stewart, 2003b). Ethics has played a secondary role, as a “supporting theory for HRD, but not a core theory” (Swanson & Holton, 2001, p. 100). Swanson’s three-legged stool metaphor with each leg representing either economics, psychology or systems theories, lays on a “ethical rug” that plays a moderating role amongst the three core theories. It is a common belief that theory is critical to HRD. “What we do is too important to wallow in atheoretical explanations” (Swanson & Holton, 2001, p. 67). Yet, ethics remains in a subservient role.

“Without good theory, applied fields, like that of human resource development, would be impoverished domains” (Turnbull, 2002, p. 219). And while theory in HRD is advocated as applied and of practical value (Lynham, 2002), it is doubtful that sound theory should support only techniques that are effective and efficient. Theory should help the profession add sustainable growth and value to individuals, organizations, societies and ecosystems. If we focus only on recognized theories such as economics, psychology and General Systems Theory (GST) as Swanson has suggested, then we are likely limiting ourselves to worldviews that never ask the question ‘What is the right thing to do?’ or ‘Is it moral for a company to move off-shore while executives take bonuses?’

Giving ethics equal footings as a theoretical foundation helps us organize, categorize, predict, develop, and interpret processes and outcomes through an ethical lens. The Academy of Human Resource Development’s *Standards on Ethics and Integrity* (AHRD, 2000) provides such a ‘lens’ through which HRD professionals may view the profession. But more importantly, and of vital importance to research and critical to further establishing HRD as a *bona fide* profession, ethics has the potential as a metatheory to move us beyond its normative value as a scientific task or method and consider HRD as a “moral undertaking” (Stewart, 2003a). HRD-ethics as a theoretical foundation also has the potential to coalesce business, environmentalism, feminism and other theories and contexts under a rubric of HRD as a construct worthy as a profession and providing value to a diversity of stakeholders.

The underlying moral and values-based frameworks in which HRD scholars and practitioners ply their craft are theoretical constructs that can be used in practice. For clarity, *theory* in HRD requires some definition. Theory is the underlying principle of and explanation of how a phenomenon works. It explains concepts and their relationship (Torraco, 1997). Both formal and informal theories help solve problems and address dilemmas or provide explanations for complex research or practice problems in organizations. Dubin (1976) suggested that to build theory requires eight steps: 1. Identify its concepts or units, 2. Create laws of interaction among the concepts, 3. Establish boundaries, 4. Illustrate the conditions or contexts; the system states of the theory, 5. Create propositions or deductions about the theory, 6. Identify how the theory is tested, 7. Draw hypotheses, and 8. Test the hypotheses. The model’s first five steps build and explain theory. The last three steps test and apply theory. To consider ethics as a theoretical foundation, we must determine its constructs and define it before we attempt to test it. Since we are just beginning to conceptualize HRD-ethics theory, we will be limited herein to a general explanation.

HRD is a multidisciplinary field with unique theories that allow for a myriad of approaches and solutions in the complex and often messy world of social interaction. Theories describe and justify why certain practices lead to particular ends across the many contexts that HRD professionals confront. Theories (and philosophies) include, among others, *stakeholder theory*, discussing those who have a stake in the program or its evaluation; *Knowledge construction*, which asks Is anything special about the knowledge HRD professionals construct, and How do they construct such knowledge? Theories of knowledge that include *ontology*, a study of the nature of reality, and *epistemology*, that seeks to find the justifications for knowledge claims; *Methodology*, or how we construct knowledge; and, finally *Knowledge use*, or how we use information and wisdom to change programs and policies. These and other general theories can be categorized under one or more of the common theoretical foundations of HRD, namely psychology, economics or GST.

Even if we acknowledge and accept the applied nature of HRD theories such as psychology or stakeholder theories the limits of the contexts in which these theories are conceptualized and carried out restricts the moral boundaries and ethical potential of HRD. Conversely, ethics as theory provides a common language and answers philosophical questions raised by descriptive and normative ethics. These questions arise from individual as well as professional/occupational moral viewpoints.
Ethical theory makes shared values and beliefs visible and language functional for professionals when faced with controversies or ethical dilemmas. Historically, HRD practitioners and scholars have come to accept that values are salient in research and practice. Making decisions about distribution of resources and interventions such as training are values-laden no matter how much we might wish otherwise. Lincoln and Guba (1985) added that “inquiry is value-bound, specifically, that it is influenced by the values of the inquirer, by the axioms or assumptions underlying both the substantive theory and the methodological paradigm that undergird the inquiry, and by the values that characterize the context in which the inquiry is carried out” (p. 161).

Implications for HRD

An assumption made in this brief discussion of ethical theory is the organization as economic entity; that firms are rationally operated for wealth maximization. Their purpose is to produce goods and services that maximize financial performance. As a result, the predominate ethic within business is one that supports this economic goal. This myopic view offers HRD a narrow approach to ethics. HRD scholars and practitioners enhance skills and knowledge, and improve performance in corporations. They address ethical issues in a principled yet primarily applied and instrumental manner. They also tend to base practice on common and recognized theories. But when HRD theory is questioned as to its ethical foundations it appears to fall short.

A metatheory of ethics as a foundation for HRD may lead professionals to view their practice as a moral imperative versus an instrumental outcome, no matter how economically important the result. Without a metatheory it is unclear how HRD can state or justify a conclusion that an intervention is morally good or bad. Singular points of view such as business ethics limit the scope of our values and result in unidimensional and often-amoral behaviors. A new, more specific approach to foundational ethics will broaden the scope of our values and enhance the profession as moral and intrinsic versus instrumental values-driven. We must examine values before we apply tools/methods. Our ethical conscience underlying methods should include the unconscious values that shape our prejudices and ways of thinking.

With recent ethical faux pas of major economic engines like WorldCom, it is obvious that a myopic, business-oriented approach to ethics is simply not enough. HRD scholars and other professionals are encouraged to examine HRD-ethics as described herein as a possible replacement for business ethics. However, we must temper this assumption by addressing the subservience of HRD in many organizations and recalling the prevailing business/economic ethic within which HRD practitioners and scholars must function. Today, we need a way to understand our moral problems in a way that expedites solutions. This goal calls for an exploration that is “both theoretical and practical and that relates the two” (Edel, Flower, & O’Connor, 1994, p.12).

This paper was a reflection on the nature and justification of HRD-ethics and the discussion of HRD ethics within the broader context of business and metaethical theories. We are still normalizing values and moral conduct within HRD. This normalizing may take time in the hurricane-force change contexts in which HRD finds itself. This should not however curtail us from moving forward with the definition and establishment of an HRD-ethic and its inclusion as a core theoretical foundation for HRD research and practice.

Vicarious Traumatization: The Role of the Human Resource Development Practitioner

Lynn Atkinson Tovar
Elk Grove Village Police Department
Northern University

This qualitative study was conducted to examine the extent to which youth investigators and forensic interviewers demonstrate signs of vicarious traumatization as a result of investigating child sexual abuse and whether their experiences cause life-affecting transformation. The research examines the concept of vicarious traumatization and the officer’s shift in reality in which meanings and beliefs were transformed through critical reflection. The phenomena of vicarious trauma and transformation were explored through the use of narrative grounded theory.

Keywords: Vicarious Traumatization, Law Enforcement, Human Resource Development

This year, as in every year, tens of thousands of children will be sexually abused in the United States and around the world. They will be damaged physically, emotionally, mentally, and spiritually; every aspect of their lives will be affected. So, too, will be those law enforcement officers and forensic interviewers who must investigate these crimes against children. It is no secret that police work is inherently stressful. Patrol officers must face potential violence on a daily basis, leading many to consider police work to be a particularly risky occupation (Blau, 1994: Fain & McCormick, 1988: Hallett, 1966; Reiser & Geiger, 1984). It is less widely recognized that there are specific positions within police departments that are more stressful than average, particularly the investigation of child abuse cases. The additional stress involved in these positions is often overlooked, and the source of this stress is generally examined anecdotally rather than empirically.

Law enforcement managers and human resource development practitioner need to acknowledge their critical role within the police organization in assisting change in behavior and attitudes through the development of training programs on stress related issues. The police organization is accountable for the learning and developmental improvement of their workers’ professional and personal lives. Implementation of focused training programs can impact the organization’s efficiency and effectiveness in the community.

People-Oriented Occupational Stress

Stress is an always-present component of people’s lives. Factors such as the pace of current technology, economic instability, complexity of interpersonal relations, and the ever-growing crime rate have produced a society that must respond to a barrage of problems and changes in a timely manner. Constantly, individuals are asked to take on more responsibilities and become increasingly more efficient at the performance of their job (Senkfor & Williams, 1995). The increased complication comes with the factor of exposure to traumatic events during the course of a day. There is a growing recognition that many members of the law enforcement profession, along with crisis workers such as firefighters, paramedics, ambulance drivers, rescue workers, and emergency medical response teams, may be called upon to deal with disasters and other traumatic events and the consequences. The collective term for these occupations is “critical occupations” because it encapsulates two general aspects of the work experience of emergency and helping professions. It also describes the critical role they play in protecting the community and its members (Paton & Violanti, 1996).

Researchers agree, generally, that people-oriented occupations are more stressful than occupations that require persons to work alone or in small groups with data because data are a more predictable factor than people who are unpredictable (Mathew & Casteel, 1987). Because people-oriented occupations represent a variety of work settings and involve numerous types of interactions, it seems plausible that different work environments impose effects associated with stress. Matthew and Casteel (1987) conducted a study on stress and the workplace, a comparison of occupational fields. The study examined persons in various people-oriented occupational fields and whether there were significantly different results in comparing crisis workers such as in the health and social services fields with workers in banking and industry. These authors found that most people believe their jobs are stressful. However, the study showed that those who work with children, the needy, and the physically ill believe their environment is more stressful, and they have a higher burnout rate. Another comparative study on stress and control involving child
protective service workers found that some people seek out highly stressful environments as a way of testing their competence, building feelings of mastery and self-esteem, or relieving boredom. Learning helps individuals to reduce stress in their lives by being able to control situations effectively. “Being able to understand the stress, its sources and effects, and the successes of various actions over stress enriches the quality of life’s experiences. The learning responses create attitudes and behavior for managing stress and having a more satisfying life” (McLean, 1991, p. 30). Those who do not learn to cope or change behaviors to combat stress frequently move into the final stages of stress known as burnout.

Vicarious Traumatization

The concept of vicarious traumatization, introduced by McCann and Pearlman (cited in Stamm, 1989), provides a theoretical framework for understanding the complicated and often painful effects of trauma work on crisis workers. By definition, “the effects of vicarious traumatization on an individual resemble those of traumatic experiences. They included significant disruptions in one’s affect tolerance, psychological needs, beliefs about self and others, interpersonal relationships, and sensory memory, including imagery” (Pearlman & Saakvitne, 1995, p. 151). The phenomenon of vicarious traumatization can be applied to police officers who are marked by profound changes in the core aspects of the police officer’s self or psychological foundation. These alterations include shifts in the police officer’s identity and worldview; in the ability to manage strong feelings, to maintain a positive sense of self; and to connect to others; in spirituality or sense of meaning, expectation, awareness, and connection; and in basic needs for a schemata about safety, esteem, trust and dependency, control, and intimacy (Pearlman & Saakvitne, 1995).

Vicarious traumatization, (Pearlman & Saakvitne, 1995) refers to a transformation in the police officer’s inner experience resulting from empathic engagement with victims’ trauma material. Through exposure to graphic accounts of sexual abuse experiences, the realities of peoples’ intentional cruelty to one another, and the inevitable participation in traumatic reenactments, police officers are vulnerable through their empathic openness to the emotional and spiritual effects of vicarious traumatization. These effects are cumulative and can be permanent, evident in both the officers’ professional and personal lives. Police officers acknowledge that they entered this type of work by choice and continue because of their commitment to others and the tremendous rewards of helping others and recognize that it affects them personally. It is an occupational hazard that must be acknowledged and addressed.

McCann and Pearlman’s more recent research (cited in Stamm, 1989) in vicarious traumatization focuses primarily on the portion of the theory that describes psychological needs and cognitive schemas. The cognitive portion of the theory is based upon a constructivist foundation. The underlying premise is that humans construct their own personal realities through the development of complex cognitive structures, which are used to interpret events. These schemas or mental frameworks include beliefs, assumptions, and expectations about self and world that enable individuals to make sense of their experiences. McCann and Pearlman’s major hypothesis in their research is that trauma can disrupt these schemas and that the unique way in which particular trauma is experienced depends in part upon which schemas are central or salient for the individual. Vicarious traumatization is unique to trauma or crisis workers because traumatic events such as child sexual abuse are painfully real and part of our larger world and society. If police officers are to help, they cannot protect themselves from acknowledging this reality as they listen to the victims’ stories. Police officers are left with the powerful effects stirred as they face this reality on a daily basis. Police officers become inevitably aware of the potential for trauma in their own lives. Traumatic events can happen to anyone, at any time; however, it is almost intolerable to accept the fact that lives can be permanently changed in a moment when a traumatic event occurs.

Purpose of the Research

I assumed the participants of the study, all youth investigators and forensic child abuse interviewers, would be struggling with emotionally painful and horrific experiences that would totally disrupt their everyday notion of how the world should be. That the participants would be confronting the difficult task of reconciling these disruptions to previously held core beliefs, (e.g., good versus evil, hope versus despair, safety versus vulnerability) and would be struggling with physical, psychological, and social manifestations as well. My interest lay in the various stresses, the transformation of struggling with shifting core beliefs, the ways in which the participants reconstruct their lives in order to be psychologically and physically healthy, and how their organization assisted the police officers through their struggles.

Narratives

The participants in this study relayed their stories individually, and the interactions between storyteller and researcher were recorded and transcribed verbatim. The names of the participants were substituted as numbers to
assure confidentiality for the participants. All participants’ narrative accounts of their most memorable cases are full of the pain and meaning of struggles associated with the theory of vicarious trauma stress that youth investigators and forensic interviewers encounter daily. These accounts represent the exercise of critical reflection through one’s own environment and the process of examining, questioning, validating, and revising their perceptions of the world (Cranton, 1994). One of the questions posed to the participants was, “Tell me about your most memorable case, which could be either positive or negative in nature”. All participants provided negative accounts, reinforcing my feelings that vicarious trauma stress existed in all participants although at varying degrees. The accounts in this study highlighted the daily lives of the participants and their repeated exposure to pain and human destructiveness as a result of their career choice.

**Research Questions**

1. To what degree does repeated exposure to child sexual abuse investigations affect police officers and forensic child abuse interviewers?
2. How does vicarious trauma manifest itself in youth investigators and child abuse interviewers who investigate child sexual abuse?
3. To what extent and in what ways does repeated exposure to child sexual abuse investigations precipitate life-affecting transformations in those who specialize in these types of investigations?
4. Can the human resource practitioner make an impact to officers suffering from vicarious traumatization?

**Methodology**

I employed a qualitative research design utilizing data-collection techniques consistent with phenomenological and grounded theory methodology. I took the approach that designing my research would not begin from a fixed starting point or proceed through a determined sequence of steps. Throughout the research process, I continuously examined and reflected on the data to provide the reader and future literature an understanding of the phenomena under study.

Participants were 11 police officers from five police departments located in the northwest suburban Cook County area outside of Chicago, Illinois, along with four forensic child abuse interviewers from the Children’s Advocacy Center that serves the northwest suburban Third District of Cook County. As the study progressed, I realized the participants emerged into three distinct groups: active youth investigators, former youth investigators, and forensic interviewers. The gender makeup of the participants was equally divided between males and females. The age breakdown coincided with time on the job; naturally, the former youth investigators were 40 years or older with at least 20 years of law enforcement experience. An interesting data result obtained was that all the former youth investigators were promoted from the youth unit and were presently either sergeants or commanders at their respective police agencies. The active youth investigators and forensic interviewers tended to be younger, usually in their 30’s and had fewer years of experience—between 5 and 10 years—at their agencies. The makeup of formal education was diverse, from some participants with no formal higher educational degrees to several participants who had obtained master’s degrees in education, social work and law.

Interviews were conducted at a location of the participant’s choice, which ultimately turned out to be their police stations or office. I feel this assisted with their comfort level during the interviews because it afforded them a feeling of control. The surroundings were comfortable and familiar, putting them more at ease. The participants were told prior to the actual interview that I would be tape-recording our conversations with each interview typically lasting two hours in length. The youth investigators and forensic interviewers who participated in this study represented purposeful sampling. It was a strategy to select a group of people in order to provide important information that might not be obtained by a random selection outside the crisis worker field. The goal was to select experts in the field of child sexual abuse investigations who could provide meaningful information in order to answer the research questions. The selections also adequately captured the heterogeneity in the population, ensuring that the conclusion represented the entire range of variation and the most relevant dimensions of the study and afforded the opportunity to deliberately examine data that were critical to the theories, which were under study.

I believe unstructured interviews and the utilization of open-ended questioning proved to be beneficial for a number of reasons. Questions such as “tell me about your most meaningful case” and “how did the child’s story of sexual abuse make you feel” offered insight with respect to relationships and events from the perspective of those youth investigators and forensic interviewers who had immersed themselves in the world of the phenomena under investigation; vicarious trauma, and transformational learning. The information generated by the data served as a resource upon which hypotheses could be built, permitting the study of phenomena that are not always directly observable. They also allowed me to examine how, if at all, the interviewees were influenced or changed personally by their respective environment. Another advantage associated with this technique was the depth and breadth of responses. Reliability and validity were concerns, but with redundancy and with asking the same questions in
different ways, one is provided the ability to demonstrate each. Finally, this approach afforded me the opportunity to observe the body language of the participant, such as rolling of the eyeballs, long pauses between responses, or voice inflections characteristic of emotions such as contempt, concern, frustration, or sorrow. Data collection techniques included not only interviews but also literature reviews and phenomenological insights. After each interview was tape-recorded, it was transcribed and coded.

For my coding process, I utilized a relatively new software program called Nvivo or NUD*IST, designed in Australia by Lyn Richards (1999) and published by Qualitative Solutions and Research Ltd. This software program creates a project to hold data, observations, ideas, and links among them. Any number of projects can be created, and any number of people can participate in a project. Once a project is opened, the program allows a researcher to move around these processes using menus and icons. The researcher must download all transcribed interviews and develop categories and subcategories as the coding process proceeds. Working with Nvivo meant that my data was live data. I was able to change, grow, and develop my categories continuously as I better understood my data. This process allowed me to rethink, recontextualize, recode, or code-on new categories. To accomplish the goals of coding, the data were broken down into discrete parts, closely examined, and compared for similarities and differences. Questions pertaining to the phenomena, such as what is this and what does this present, were continually pondered. I did have to break through assumptions and uncover specific dimensions. I drew upon personal knowledge, professional knowledge, historical knowledge, and the technical literature on vicarious trauma and transformation learning through critical reflection.

Validity

Validity is the final component of any research study. The validity of my research results was not guaranteed by following a prescribed set of procedures. Rather it depended on the relationship of my conclusions to the phenomena under study and the real world. The term “validity” does not imply the existence of any objective truth to which an account can be compared. However, the idea of objective truth gives grounds for distinguishing credible accounts from those that are not credible. The usefulness and believability of one’s study is the important factor. A researcher’s role is to provide information from the study that can possibly be tested against the world, giving the chance for the phenomena that they are trying to understand to be proven wrong. The key concept for validity is thus the validity threat—a way in which the researcher might be wrong. Therefore, I concentrated on three main areas of my research to eliminate any potential threat to the validity of the study: description, interpretation, and theory.

I chose to apply a narrative approach as an interpretive substantive focus with intent on procedure in data collection. The technique of continuous narrative description reveals the purpose and intentions as human beings and the meanings we make of our experiences. Narratives provide explanations of how episodes, experiences, or events in our lives are meaningfully linked. It should be noted that this method is criticized for its focus on the individual rather than social context. However, it seeks to understand sociological questions about groups, communities, and contexts through the individual’s lived experiences.

Results and Findings

The results indicated that participants did exhibit signs of vicarious trauma; hypervigilance, symptomatic reactions, relationship problems, lack of communication through denial, repression, isolation and disassociation, change in worldviews and a loss of sense of meaning (spirituality). Participant’s statements clearly express the affect of the investigating child sexual abuse on their lives; “I think that is a part of what this job has done to me. You look at society or you look at people with a jaundiced eye, cynical perspective. We don’t always see the best, we see the worst, or we have suspicion about someone first” (Interview 1) “Headaches, the general tightness in the shoulders, I don’t sleep well. I haven’t slept well in a very long time. When I wake up in the morning, I never feel refreshed” (Interview 8). “I think before I got on the job and people would ask, “Do you believe in God”? I would say yeah, I believe in Him, but I just don’t go to church. Now when people ask if I believe, I will say, “If you saw what I saw—and I spent two hours in Children’s Memorial Hospital—and if you saw what I saw…There is no God.” Yeah, I would say it has had an impact on my belief”. (Interview 12) Participants reported their experiences transformed their lives permanently both professionally and personally. As a result, new perspectives, new beliefs, and coping strategies emerged. Participants who were most distant from the repeated exposure were more open in their acknowledgement of the affects and more readily able to critically reflect on their experiences.
Conclusion and Recommendations

The purpose of this qualitative research study was to determine if repeated exposure to human pain and destructiveness would cause vicarious traumatization among youth investigators and forensic interviewers who investigate child sexual abuse. The study also examined whether professional experiences caused transformation to these investigators’ and interviewers’ personal and professional lives and whether that transformation was a result of self-critical reflection. The study produced life-transforming evidence in the form of personal self-statements gained through open-ended interviews and the shared relationship and trust between the participants and myself as researcher. It also demonstrated the need for the HRD practitioners to take a lead role in training on vicarious traumatization and the affects of stress on the person and organization.

It is fairly common knowledge that law enforcement is a stressful profession, and a large number of police work stressors have been identified--aspects of the job believed to trigger stress reaction among employees (Blau, 1994; Brown & Campbell, 1994; Davidson & Veno, 1980; Ellison & Genz, 1983; Reiss, 1996; Terry, 1981). However, less widely recognized is the fact that a particular position within a law enforcement agency can especially be “toxic” or threatening to their professional and personal well being. The additional stress involved in these positions is often overlooked, and the sources for this stress have traditionally been examined quantitatively. In order to understand and to minimize the impact of victim material and lessen the vulnerability of the investigators to vicarious traumatization, it is important to examine the toll that conducting this work takes on the self. How has the work affected personal identity, spirituality, sexuality, relationships, dreams or flashbacks, and emotional responsiveness? When does this work lead to feelings of frustration and hopelessness or to joy and feelings of accomplishment? This study helped identify the personal triggers of vicarious trauma and self-transformation, which is an important part of the self-care and survival for these officers. These particular stories or types of trauma revealed in the research might have been especially difficult to process; however, it is necessary to awaken the law enforcement culture to the realization that some specific job assignments have a higher occurrence of repeated exposure to trauma, which is often more acute and life transforming.

The more the police culture learns about vicarious traumatization stress, the more police decision makers and HRD practitioners may realize the importance of recognizing the needs of the helpers as well as the needs of those victims they try to help. “While this seems plain, it is not necessarily easy to identify, understand, or address the problems or the solutions” (Rudolph & Stamm, 1999, p. 277). After decades of denial from the law enforcement culture, agencies are beginning to open up to the idea of the value of the employee and HRD’s role in addressing the impact of the officer’s work on his or her whole life.

Many of the youth investigators and forensic interviewers described enjoying their experiences with police investigations. In time, however, many of those same youth investigators and forensic interviewers described becoming stressed by internal and external circumstances; their life had changed and they were often not in control. One youth investigator stated, “Every conversation turns to abnormal sex talk; it has become dinner conversation.” Another claimed that stories she had heard would haunt her forever. These findings raise the question of what should be done next and how police decision makers and HRD might find a resolution or solution to the effects of repeated exposure.

At times, it is unclear as to what to advise in dealing with trauma. Should police educators and supervisors suggest analyzing or talking about the pain of trauma or aid in distraction or avoidance? In this study, the participants who are isolating and denying, and therefore not dealing with the trauma, are experiencing greater distress than those who use other coping mechanisms. This indicates that one should confront the trauma or at least accept that it exists. On the other hand, this study also indicated that actual removal from the position assisted in the recognition and acceptance of the effects but also indicated that stress continued to exist on a different conceptual level. Thus, the law enforcement culture must first acknowledge that stress appears to be prevalent and then implement means to prevent, recognize, and cope with stress into the mainstream education and conduct of policing. This implies that HRD has a critical and vital role for the organization and the officers who suffer from repeated trauma.

HRD practitioners must perform several different activities and duties, such as design, develop, and implement learning programs and training activities within an agency. They need to understand the effects of vicarious traumatization in order to make a needs assessment as well as an evaluation of programs involving the law enforcement professional learner. It is critical to the well being of the agency for HRD practitioners and administrators to face the day-to-day events of not only the beat cop but also the specialized investigators who struggle with repeated exposure of trauma in their lives. “The development of the people refers to the advanced knowledge, skills, and competencies and the improved behavior of people within the organization for their personal and professional use” (Gilley, 1989, p. 5). The role for HRD is their commitment to the professional advancement
of people within the agency through career development and understanding to bring about change within the police officers.

HRD needs to focus on the coping mechanism of the learning response, which, unlike other responses, is not a temporary measure. It is preventative rather than remedial (Thomas, 1983). One may overcome stress in an effective and constructive fashion. “It is the thoughtful analysis and examination of methods to deal with a problem” (Reed, 1984, p. 33). Learning is the synthesizing of coping strategies from a battery of resources, which may be used in the future to prevent the reoccurrence of the negative aspects of the stressor and may initiate opportunity for self-improvement through self-reflection. Learning helps police officers to reduce stress in their lives by being able to control the situation effectively. “Being able to understand the stress, its sources and effects, and the success of various actions over stress enriches quality-of-life experiences. Learning responses create attitudes and behavior for managing stress and having a more satisfying life” (McLean, 1991, p. 34).

Violanti (1996) developed a four-phase basic stress-learning model, which many agencies have adopted. The phases are (1) education, (2) prevention, (3) support, and (4) research. A well-rounded stress education program should include identification of stress, the value and techniques of physical exercise, the benefits of proper nutrition, and the exposure to interpersonal communication methods. It is important to begin the education during the first phase of a police officer’s career. However, during the in-service level, instruction on coping strategies should take priority because these officers have most likely already been exposed to the effects of stress. Understanding the relationship of police officers and their fear of acknowledging stress related to their work has several implications for HRD. An HRD practitioner tends to serve increasingly as a change agent and internal consultant within agencies. Those who work within the law enforcement field need to build a trusting relationship with the officers in their day-to-day communications. Trust becomes a foundation in a joint commitment to the agency and the citizens they serve, which results in the proficiency and effectiveness of the police officer. HRD practitioners may need to identify the implications of these day-to-day communications through their trust in the unique culture and the development of specific programs through instructional design, training, and counseling. Schurr and Ozane (1985) suggested that trust “[leads to] a constructive dialogue and cooperation in problem solving, facilitates goal clarification, and serves as a basis of commitment to carry out agreements” (p. 9).

Support from the police officers’ agencies and families is a critical factor in troubled persons’ decisions to seek help. Many law enforcement agencies utilize employee assistance programs, which provide 24-hour service calls and confidential counseling. In addition, psychological debriefings can be an important technique in helping police officers with traumatic events. Providing debriefing soon after an incident allows police officers to vent their feelings and discuss the occurrence in a supportive group setting (Mitchell, 1990). Peer support groups consist of professionals in the same occupation, not psychologists who are primarily there as someone to talk to. These support groups or individuals can assist members involved in a traumatic incident or continued exposure to trauma. Each law enforcement agency is, in a sense, unique and has its own set of stress-related problems. It is therefore necessary to conduct ongoing research into the causes and minimization of stress. More research into the implications of repetitive, vicarious traumatic stress phenomena is also required to augment support and psychological strategies.

Understanding the Formation of Prejudice Attitudes of Police Officers

Lisa M. Snow
Rose Mary Wentling,
University of Illinois at Urbana-Champaign

Prejudicial attitudes and discriminatory practices of the police damage the fiber of our society, and much has been written about the extent of the problem; however, the reasons why these attitudes exist are less clear and much less frequently addressed. This literature review provides an understanding of how and the extent to which prejudice is displayed by the police and what is known about the formation of prejudicial attitudes in the police. The tailoring of training programs to reduce the formation of prejudice attitudes of police officers is also discussed.

Keywords: Prejudice, Police Officers, Training

Racism and discrimination by the police directed at citizens in the United States has been one of the most controversial and talked about subjects of recent history (MacDonald, 2003). Often, the police have been accused of abusing their power and failing to provide adequate service to blacks, Hispanics, and other minority groups due to discrimination and prejudice toward minorities (MacDonald, 2003). Prejudice for the purpose of this paper will be defined as, “the tendency to have prior negative judgment toward...people who are different from some reference group in terms of sex, ethnic background or racial characteristics such as skin color” (Morrison, 1992, p. 34-35). The police are the most visible representatives in our justice system and have the ability to act on their prejudices in the form of exercising police power unfairly against minority groups. This visibility makes the police one of the most outward indicators of prejudice in the justice system (Muwakkil, 2001).

There is an abundance of literature that documents that prejudice does exist in the police profession and is a prevalent and driving force in decision making at all levels of the bureaucracy (Muwakkil, 2001, Reinhold, 1991, Wise, 2001). Prejudicial attitudes and discriminatory practices of the police damage the fiber of our society, and much has been written about the extent of the problem; however, the reasons why these attitudes exist are less clear and much less frequently addressed. The question of whether a prejudice mindset came with the officer to the job or if the officer formed such opinions while on the job seems to be an area where little research has been conducted. The great reduction/elimination of institutional racism within police departments may lie in the prevention of such attitudes forming. In order to develop a preventive strategy, we must understand the causes and not just the outcome of prejudice and discrimination by police departments.

Police discrimination is a sensitive and emotionally charged topic. It is a subject, which has many complex facets and has an enormous effect on law enforcement (Tizon & Forgrave, 2001). In order to be seen as sensitive to the issue of police discrimination and prejudice, police administrators take great pains to create policy and procedures to announce they do not approve of prejudice and discrimination (Schott, 2001). Is the problem of prejudice by the police one which exists in isolation, created in the media by high profile cases, or are there legitimate grounds to assume the problem does exist? In order to address the issues of police prejudice, one must first look at the extent of the issue and the impact it has on our society as a whole. This literature review provides an understanding of how and the extent to which prejudice is displayed by the police and what is known about the formation of prejudicial attitudes in the police. The tailoring of training programs to reduce the formation of prejudice attitudes of police officers is also discussed.

The literature review strategy on this topic was developed to first gain a sense of how prejudice concerning the police is viewed by society as a whole by reviewing the literature in research studies, books, reports, internet sources, journal and magazine articles. This strategy was adopted to help frame the problem in terms of the actual extent and impact prejudice has had on society. Due to the extent of the available literature about prejudice incidents involving the police only a select group of highly significant events are discussed. The review then focuses on what is known about the formation of prejudice in general and how this knowledge applies to the police. The literature was reviewed for specific examples of which examine how the police specifically form prejudice.
The Extent of the Problem Related to Prejudice Attitudes

The images of the police beating black demonstrators in the 1950s and 1960s during the civil rights movement were responsible for untold damage to the reputation of the police. The nation watched as black demonstrators were beaten, sprayed with fire hoses and attacked by police dogs. The news footage of the civil rights demonstrations has been played and replayed until it has become a part of our nation’s collective memory. The law enforcers who were entrusted to protect the rights of all citizens were portrayed by their own actions to have racist mindsets. This film footage has increased ten fold in the years following the demonstrations. The Internet, popular journalism, television, and the radio are saturated with stories of racist police officers and institutional racism. On almost any given day somewhere in the U.S., a story about the police abusing their powers for reasons of racism can be heard via the popular media. The most infamous in recent history were the beating of Rodney King, a black motorist who was arrested and beaten following a vehicle chase by Los Angeles Police in March 1991, and the subsequent riots in Los Angeles. This incident, which was widely viewed to be the result of racist police acting on their attitudes, had national impact causing a string of rioting and violence across the country. The Rodney King incident also caused an outpouring of emotion and contempt to be directed towards the police, in the form of public attacks on the very validity of our national system of policing. The Los Angeles Police Department (LAPD) came under intense public scrutiny following the March 3, 1991, beating of Rodney King and subsequent trial of the officers charged in the attack. Following the acquittal of the officers, riots broke out lasting five days and resulting in 40 deaths, 2,382 injuries and an estimated one billion dollars in damages (Kappeler, Sluder, & Alpert, 1998). When one begins to calculate the cost to society that racial unrest precipitated by police action has caused society, a sense of overwhelming enormity is felt. The monetary cost is in the billions while the damage to society is beyond measure.

As a response to the trial and riots in the Rodney King case, the LAPD was studied extensively in an attempt to uncover the causes and develop solutions to the underlying cause of the racial unrest. The Christopher Commission set up in 1991 as a response to the Rodney King incident, studied the LAPD’s response to officer brutality. According to Kappler, Sluder, and Alpert (1998), the LAPD has a subculture of racism and violence; however this department is not alone. Reprinted in Kappler, Sluder, and Alpert, (1998), The Christopher Commission went on to state: “This is a national problem, we have conducted our study with awareness that it might have considerable relevance for other cities, other police departments around the country” (p. 4-8). The Christopher Commission equated the LAPD’s excessive use of force directly to the racist attitudes of its officers and stated that the problem was a national problem rather than just an LAPD problem.

The Christopher Commission (1991) suggested that the LAPD suffers from institutional racism. The term institutional racism has been increasingly associated with law enforcement agencies. Institutional racism means: “Racism, which, covertly or overtly, resides in the policies, procedures, operations and culture of public or private institutions—reinforcing individual prejudices and being reinforced by them in turn” (Institute of Race Relations, 2002, p. 1). Institutional racism tends to exist in a much more subtle and indirect way. It is often more recognizable in the form of racial jokes, prejudices, conversation, and exaggerated stories about minorities (Police Magazine, 1999). Institutional racism can also be more outright as in the example of the LAPD. The term institutional racism appears to be a term more and more associated with the police. Institutional racism also implies that the condition permeates throughout the entire organization. The popular media seems to portray the law enforcement community as a whole as suffering from institutional racism (Police Magazine, 1999). What happens in the larger cities such as Los Angeles and Chicago has an effect on the smaller communities in the form of policy setting and trends. Los Angeles has had an effect on the rest of the country (Kappeler, Sluder, & Alpert, 1998). The literature suggests that the extent of the problem is far reaching perhaps even to the extent of saturation (Muwakkil, 2001).

In the arena of law enforcement prejudice and discrimination, the most devastating scenario is the unjustified killing of a minority suspect. This type of incident often leads to further violence in the form of rioting and at the very least leads to racial unrest within the community. Muwakkil (2001) describes several incidents in which white officers killed minority suspects allegedly without provocation. The incidents occurred throughout the United States, and all sparked some form of racial tension in the community. Muwakkil goes on to state that the police are using deadly force more and more frequently without justification against minorities and are getting away with murder. Muwakkil states:

- Escalating police violence reflects a growing fear of black criminality among the broader population. The skyrocketing rate of black imprisonment and the profits to be made from the prison industry suggest that the criminal justice system and young African-Americans are increasingly becoming each other’s sworn enemies (p. 60).
Muwakkil appears to be suggesting a conspiracy between the police and the prison system to incarcerate young African Americans for the profit of the prison system. While this suggestion may be far-fetched, he does point out incident after incident in which the police seem to be in an adversarial position against minority populations. The facts that rioting and racial unrest have erupted from the killing of minority suspects by white police officers suggests that much of the minority population feels the police are racist and take the life of minority individuals because they have racist attitudes (New York Urban League, 2000). The violence clearly suggests that the public perception is that had the suspects been white, they would not have been killed. This lack of trust from the public that the police are sworn to protect hinders the police in their duties and forms a vicious circle of animosity between the police and the public (Reinhold, 1991).

The misuse of the Bill of Rights takes many forms from improperly arresting an individual on a felony to using police powers to inconvenience an individual by temporarily restricting his or her movements. To stop and detain an individual for a short period of time could seem to be trivial in comparison to arresting an individual for a felony charge; however, stopping an individual solely because of their race is certainly harassment by the police and an improper use of police power (ACLU, 2002). Racial profiling has been extensively discussed in recent years (MacDonald 2003). It is a subject that evokes emotion from both the police and minority groups. The frequency in which racial profiling is discussed in the media is an indicator that the subject is of widespread concern to the population (Delattre, 1996). The controversy surrounding racial profiling is yet another demonstration of the extent of the problem of prejudice by the police.

**Racial Profiling**

One of the most recently controversial topics relating to racism and discrimination within police departments is the subject of racial profiling. Racial profiling has been a repeated topic in the media gaining national attention in recent years. The very term racial profiling seems to insight anti-racist groups and the public in general, as it implies profiling people as criminals on the basis of their race (ACLU, 2002). Citizens have filed lawsuits in reference to racial profiling and police departments across the nation have implemented policies to avoid lawsuits on the basis of racial profiling (General Order P.P.D. 400.81, 2000). The practice of officers using race as a criminal profiling factor has caused immense controversy and reflects yet another aspect of the complex issue of racism and discrimination by the police (Muwakkil, 2001).

The term *racial profiling* is defined as the police targeting someone for investigation on the basis of that person’s race, national origin or ethnicity (Arrest the Racism, 2000). As racial profiling is defined, it appears to be a blatant misuse of authority by the police. Recently the American Civil Liberties Union (ACLU) has taken a strong stand against what they believe to be blatant racism on the part of the police against minority citizens:

Today skin color makes you suspect in America. It makes you more likely to be stopped, more likely to be searched, and more likely to be arrested and imprisoned.

One of the highest priority issues is the fight against the outrageous practice of racial profiling (ACLU, 2002, p. 1).

The fact that the ACLU pays such credence to the subject of racial profiling is telling on the effect it has on society. The police and the minority population are heavily divided on the subject. Minorities say the practice is widespread and rampant, while the police argue that the emotions associated with the issue are not backed by facts Schenecker & Brenner, 2002). The foundation of the racial profiling issue is the idea that racist police are using their police power to violate the 14th Amendment rights of minority citizens (Institute of Race Relations, 2000).

The very public nature of accusations of racism, prejudice, and racial profiling leads one to believe that the police should have some reaction, beyond the policy making of collecting statistics, to the controversy directed at them as individuals and as a profession. The police conduct their business in the public and are therefore subject to the attitudes and trends practiced by the public. The police cannot ignore the demands of the public for long periods of time and still expect to conduct business as usual. The police must react in some way either internally or publicly to the politics of prejudice (Perlmutter, 2001). The way the police respond to this controversy-by choosing either to resolve or not to resolve the conflict- could have a tremendous impact on the direction that police work travels and how the police are perceived as a whole (Levin, 2001).

**The Reactions by the Police to Accusations of Racism and Prejudice**

The police are beginning to react to the chronic charges of police racism in black neighborhoods by looking the other way at crime. According to the *Seattle Times*:

De-policing is passive law enforcement: Officers consciously stop trying to prevent
There is a need for a survey of police attitudes towards racial minorities; whether the police are more prejudiced than other groups within society. According to *Police Magazine* August 2000:

There is a need for a survey of police attitudes towards racial minorities; whether the police are any more prejudiced than the ordinary population, whether racial prejudice is inherent in humanity as a whole and whether minorities do suffer from prejudice against other minorities and the majority population (*Police Magazine, 2000* p. 1).
assumption of the origins of police prejudice needs to be explored in far greater detail before our society can develop a solution (Garrett, 2001).

The formation of prejudice is a subject, which has been widely studied, in the general population. In order to understand how the police may acquire prejudice while on the job it is necessary to build a conceptual framework on the formation of prejudice using the available literature on what is known about how prejudice and stereotypes are formed. This literature must then be viewed in the context of how it might apply to the formation of prejudice in the police as a group.

In 1922 the book *Public Opinion* written by Walter Lippman began the study of stereotypes from a social science perspective (Hinton, 1994). The term stereotype was introduced and defined in Lippman’s landmark publication. The early definition of stereotyping came out of Lippman’s view that individuals look to what society has already defined about groups and then pick out characteristics about the group which fit the picture society has defined. These pictures, as stated by Lippman, are fundamentally false representations of those groups. According to Hinton an implication from this view is that from these false often-derogatory stereotypes leads to the formation of prejudice in individuals (Hinton, 1994).

Following Lippman’s early theory on stereotypes and prejudice a number of theories relating to how prejudice is formed have been developed. Much of the related literature cautions that there are multiple causes in any social phenomena and the formation of prejudice is no exception (Alport, 1954, Fishbein, 1996, & Marger 1991). Fishbein (1996) summarized six theories adapted from earlier research in his book *Peer Prejudice and Discrimination*. The six theories are: Phenomenological Emphasis, Psychodynamic Emphasis, Situational Emphasis, Sociocultural Emphasis, Historical Emphasis, and Emphasis on Earned Reputation.

Aronson (1992) discusses the formation of prejudice using four major causes: (1) economic and political competition or conflict, (2) displaced aggression, (3) personality needs, and (4) conformity to existing social norms. Aronson’s listed theories bear a similarity to those of Allport (1954) and Fishbein’s (1996) listed theories. An interesting theory from both Aronson and Fishbein is that of personality in particular the authoritarian personality being more likely to form prejudice. This is of particular interest in relation to the police (Leippe & Zimbardo, 1991, Aronson, 1992, Fishbein, 1996, Allport 1954, Bethlehem 1985). The police have been presumed by some to be attracted to the job due to a similarity in personality. The police are presumed to possess an authoritarian personality and therefore harbor deep prejudice upon starting on the job (Wortley & Homel, 1995). This idea in relation to the police begins to weaken when one looks at the composition of today’s police forces. They are from diverse backgrounds and upbringings and vary greatly in personality types (Perlmutter, 2000).

The remaining above listed theories offer limited explanations of prejudice in the police as a group. The Aronson theory on economic and political competition, which is similar to Allport’s (1954) Sociocultural Emphasis, could offer some explanation in the political conflict portion of the theory. The police do experience political pressure from minority groups, which may lead to conflict and prejudice; however, the argument weakens when the economic and upward mobility portion of the theory is applied. The police do not compete against minorities for economic stability or upward mobility as a group in the way suggested by Aronson (1992). The theory of displaced aggression is difficult to apply to the police as a group. One must assume that the police are themselves operating as a minority group which may in many cases be true; however, it would be a stretch to say that the police as a group have formed displaced aggression and are then acting upon it.

The police may be responding to existing social norms concerning prejudice. This theory states that individuals form prejudice under social pressure. The police do in fact operate as a social group and do force the adherence of social norms upon the members (Perlmutter, 2000). This theory holds some promise of explanation for the police as a group both before and after they enter the job if institutional racism is occurring among the police subculture, and should be studied further in reference to the police.

The police are well known for developing a strong subculture and in order for an officer to see some success, he or she must join the culture to an extent. It would seem a natural progression that one who enters and embraces a new culture would undergo a transformation of beliefs at least to a small degree. Police officers who contemplate themselves such as David Perlmutter (2000) who wrote *Policing the Media: Street Cops and Public Perceptions of Law Enforcement*, state that the police develop an, “us versus them” mentality, which is reinforced by the wearing of the uniform. The police come to see themselves as separate from the rest of society. According to Perlmutter (2000), the police can also see themselves as having minority status; a group of separates who lack the support or understanding of the rest of society. If the police do feel they are separatists, might they also be developing prejudice against certain minority groups as part of their culture and perceived separation ideas? This idea is supported in part by an article on Institutional Racism for *Police Magazine* (2000), which states minority groups tend to “differentiate zealously between themselves: i.e., their own group and those different from themselves” (p. 2). The police may in turn be differentiating between themselves and the rest of society as if they are a minority.
group, and thus separate themselves from the rest of society. This could cause the police to form a group consensus such as an: “us (the police) against them (society)” attitude.

Another possible cause of police prejudice is the idea that the police form prejudice attitudes through a series of traumatic experiences with minorities they encounter on the job. The police individually and collectively experience trauma on the job. The police are faced time and time again with situations involving high levels of stress and emotion (Kappler, Sludder, & Alpert, 1998). These incidents often involve minorities due to the fact that most traumatic calls occur in the high crime areas, which are predominately occupied by minority groups (Websdale, 2001). According to Allport (1954), trauma can induce the learning of prejudice attitudes: “Traumatic learning is, then, a matter of vivid one-time conditioning. It tends to establish an attitude at once, and this attitude over-generalizes to include all members of a class of objects associated with the original stimulus” (p. 354). Allport goes on to state that, “if over and over again a person has a certain kind of experience with members of a certain group, there is no question of trauma” (p. 315).

Officers are exposed again and again to members of minority groups under the stress of high priority calls. They constantly see individuals at their worst with very little interaction that can be called positive. Officers within the subculture then share their experiences and influence each other. If the officer has been exposed under traumatic incidences to members of a minority group who are hostile to the officer, the officer may be developing prejudice, a dislike of a particular minority group, on the job. The officer may have started police work with little or no preconceived prejudice opinion toward a particular minority group, but may have developed that opinion after a certain amount of time spent as an officer. Thus, society could potentially be creating prejudice officers on the job. If this is a possibility, there exists a means for a cure by prevention. Allport’s Contact Hypothesis (1954) appears to offer the most plausible explanation of formation of prejudice among the police while on the job, when compared to the other theories on prejudice formation.

The majority of researchers who have studied Allport’s contact hypothesis have studied it from the aspect that positive contact between groups should promote a positive relationship between the groups (Nesdale & Todd 2000). Much of the research does in fact support the hypothesis, however some research has failed to support the theory of positive contact and in fact has indicated the reverse is true that prejudice increased with positive contact (Nesdale & Todd, 2000). These findings both supportive and non supportive of Allport’s hypothesis indicate that contact does influence opinion.

The only theory specifically applied to the police in the study of the formation of prejudice was an adaptation of the contact hypothesis. Wortley and Homel (1995), conducted a year long longitudinal study on recruit officers in Australia to determine if there is a rise in prejudice attitudes following contact with aboriginal populations, an Australian minority group. The study, which used quantitative methods, found that officers do have an increased level of prejudice following fieldwork in predominately minority areas. Wortley and Homel argue that the development of prejudice on the job and for the police is consistent with theories on motivational and cognitive development of prejudice. Motivational theory argues that the denigration of minority group members as an attempt by an individual to support beliefs in his or her personal dominance over members of a different group. Prejudice is more likely to develop when the contact between groups is negative or laced with conflict.

Cognitive theories state that prejudice is created because of the perception that socially unacceptable acts are associated with certain groups (Wortley and Homel 1996). If the police are observing socially unacceptable behavior in the particular minorities they deal with on a daily basis they may be equating this behavior to all members of the group. The police come into contact with people typically under circumstances involving antisocial behavior and see people at essentially their worst. This fact could be leading to the development, through negative contact, of prejudice while on the job. We may not be able to control what officers are told in the home, but we can control what they are given during the early impressionable years as an officer, at least during official training. If the officers are armed with the understanding that they will face traumatic events, which could cause them to develop prejudice attitudes and are taught ways to avoid developing such attitudes, part of the cycle could be broken.

One must also take a critical look at the minority groups themselves. If the minority groups are contributing to the formation of prejudice officers, then long-term societal changes could help to eliminate the cycle of prejudice. If an education and training campaign is developed targeted at the public to foster understanding of why the police develop such attitudes, it may be possible to slowly break the cycle. This type of undertaking would certainly prove to be an enormous task; however, societal opinions are proven to change slowly with education and training (Bar-Tal,1989). Nation wide campaigns such as the one currently being undertaken to eliminate drunk driving have greatly increased the consciousness of the public. While there are still drunk drivers, many people now choose not to drink and drive. A campaign explaining to the public in simple terms how the police become prejudice may cause citizens to alter their actions or influence others to think about how they treat the police.
Discussion and Implications

Police prejudice and discrimination is consistently a headline story in our national media. Most recent is the videotaped beating by the police of a black, 16-year-old boy by officers near Los Angeles in June of 2002. It immediately became headline news on every news channel and newspaper in the United States. The incident was termed to be a racial incident by the media due to the fact that officers involved were white while the suspect was black. Another video taped beating soon surfaced of a black man who was being struck by a white police officer while lying face down and arms extended in a classic stance of surrender. The extent of the media coverage demonstrates the interest our society has in the subject. While much will undoubtedly be written on these cases, will the media or researchers look deeper into the underlying questions and causes? Are the police prejudice? Are they more prejudice than the rest of society? Do they learn prejudice on the job, or is it formed before the job begins? These questions deserve further research attention for the purpose of tailoring training programs to reduce the formation of prejudice attitudes, if they do develop on the job.

Police training institutes could and should focus to a much greater degree on diversity education. Most police officers are still white, middle class, and from blue-collar, non-minority neighborhoods and are fighting crime in neighborhoods which are the alter ego of their upbringing. A new and inexperienced officer should receive some training on the types of emotions he or she will face when confronted again and again with hostility in a dangerous physical environment. If research indicates that this type of emotional trauma does facilitate the formation of prejudice attitudes, the attitudes could be diverted from forming through the implementation of proper training, while the officer is still at the academy.

The literature indicates very little research has been done in the area of De-policing and its implications. De-policing should be further explored because of the potential for societal damage in the form of rising crime rates and further discord between the police and minority populations. The characteristics of the officers engaging in de-policing should also be further explored to determine which officers are most likely to practice de-policing. It would be helpful from a preventative standpoint to understand if the officers practicing de-policing have prejudice attitudes or if the officers are cracking under the threat of public scrutiny. Once we can determine if and who de-policing affects, training to counter de-policing can be developed and implemented for high-risk officers.

Current training at many police training institutes focuses a minimum amount of time on diversity issues relating to cultural and ethnic differences. The more progressive training programs are using scenario training on a frequent basis. This type of training has proven very effective; however, very little is done to reconstruct realistic scenarios in a simulated minority neighborhood, where a hostile relationship exists between the police and citizens. These predominately white officers from small communities have never dealt with a group of angry minority individuals who have been offended by or are hostile to the police. These new officers possess the skills to handle domestic disputes, traffic, officer safety, and basic criminal law, but are not prepared in any way for the realities of the emotion and cultural issues they will face with in a poor minority neighborhood. Police training institutes need to focus on developing scenario training that could partly prepare new officers for the types of realistic calls they will face in minority areas, using experienced minority police officers to act as roll players.

In the arena of Field Training the best minority and white officers working in minority neighborhoods should be utilized as field training officers focusing on developing communication skills and teaching the diverse laws and language of the streets particular to each neighborhood, which cannot be taught in a simulated controlled environment. The Field Training Sergeant and officers must be able to identify individuals struggling with issues relating to minority interaction. Once this individual has been identified through his or her actions on the job, an effort must be made to tailor a training program around the individual, such as placing the recruit in a minority neighborhood, during a busy shift and setting aside time for the recruit to reflect and discuss the calls and behaviors of individuals with a high functioning minority officer. The issues of diversity should be addressed head on at the very beginning of training, utilizing the best field officers as mentors and advisors. The current procedure that you allow a new officer to sink or swim, and the belief that talking about emotions is a sure sign of weakness leaves an individual with little to help him or her to develop positive feelings about the citizens he serves. Police prejudice will continue to plague our society, damaging the fibers and foundation, until we can effectively prevent it from starting with each new group of police recruits. The damage police prejudice causes society cannot be overstated or overlooked; but until we actively seek real solutions, we are just spinning our wheels with no end in sight and the very real possibility of hostilities becoming worse.

Motivating Employees During Lean Times: A Review of the Employee Participation Literature

Murray D. MacTavish  
Pennsylvania State University

With the dynamic changes in the global economy, morale of layoff “survivors” suffers as they take on more responsibility. How can managers motivate employees when extrinsic rewards are scarce? This literature review briefly presents the concept of psychological empowerment in the workplace, before engaging in a more detailed exploration of the employee participation literature and how it creates motivating environments through empowering practices. Issues pertinent to Human Resource Development (HRD) practitioners and researchers are addressed.

Keywords: Employee Participation, Empowerment, Motivation

It has been argued that traditional bureaucratic social structures have resulted “in high social costs through disempowerment, reduced labor productivity, and decreased worker satisfaction” (Spreitzer, 1992, p. 36). With the dynamic changes in the business environment brought on by international competition, increasing demands for quality and product development, and the shift from a manufacturing to a service-oriented economy, many organizations have had to alter how they manage work and workers (Judy & D’Amico, 1997). The difficult economic times that followed 9/11 further exacerbated the elimination of management layers and reduction in staff size and was accompanied by changes in management philosophy. The result of these more recent layoffs is an increasing dependence on the remaining employees—often called layoff “survivors”—to take initiative, be creative, and expand their roles by assuming the responsibilities of managers (Lawler, 1986; Quinn & Spreitzer, 1997). Needless to say, morale, climate, and culture have been negatively impacted. This review of the literature related to employee participation and empowerment seeks to assist Human Resource Development (HRD) practitioners in their approach to motivating post-layoff survivors in a lean economy. Critical research challenges and future research needs are also addressed.

Problem Statement

Acknowledging the above changes, the question arises: How are employees motivated to perform and achieve organizational and personal objectives within these new organizational contexts? When extrinsic rewards (i.e., bonuses or even raises) are not necessarily feasible, managers need to look to other, more intrinsic forms of motivation. Ryan and Deci’s (2000/2003) work on intrinsic motivation and Bandura’s (1986) concept of self-efficacy are important components of psychological empowerment (Spreitzer, 1995), a motivational construct. Spreitzer (1996) identified employee participation as positively related to psychological empowerment. A review of the employee empowerment literature will enhance our understanding of this relationship.

Researchers (Cotton, Vollrath, Foggatt, Lengnick-Hall, & Jennings, 1988; Wagner, 1994) have found that involving employees in decision making processes has a positive, but small effect on performance and satisfaction at work. A review of the existing employee participation literature needs to be expanded beyond a satisfaction–performance framework to incorporate motivation research that looks at the factors that explain the variance in intrinsic motivation (Ryan & Deci, 2000/2003) and determine human behavior (Stajkovic & Luthans, 2003). As well, the review of the empowerment literature can explore alternate explanations for the impact of employee participation on performance.

As corporations are challenged with the task of motivating employees amidst dramatic environmental changes, research into the empowering management practice of employee participation in the U.S. and its effects on motivation, satisfaction, and performance will provide useful guidance for their management and for HRD practitioners in U.S.-based contexts.

Theoretical Framework

Employee participation is generally considered to have originated with the work of Coch and French (1948) and is concerned with shared decision making in the work environment (Mitchell, 1973). Even after many studies, the

Copyright © 2004 Murray D. MacTavish
research findings are mixed concerning the benefits of participatory management practices. Researchers (Cotton, Vollrath, Froggatt, Lengnick-Hall, & Jennings, 1988; Wagner, 1994) have found that involving employees in daily information-processing, problem-solving, and decision-making has a positive, but small effect on performance and satisfaction at work. With many different techniques or approaches having been researched, Lawler (1986) changed the perspective from a program- to process-orientation, and studied the level of employee involvement.

Additional research (Locke & Schweiger, 1979; Latham, Winters, & Locke, 1994; Wagner, Leana, Locke, & Schweiger, 1997) has explored participation’s effect from both motivational and cognitive frameworks. The cognitive benefits of employee participation are derived from its facilitation of higher quality decision outcomes through the sharing of knowledge and information by employees who know more about their work than their supervisors. In the motivational framework, performance is improved through participation in goal setting and increased commitment (Wagner et al.). The results, however, remain mixed.

This review of the literature expands the current participation discussion to include a review of the research on psychological empowerment and the incorporation of employee participation as a motivational approach that enhances perceptions of empowerment, leading to increased motivation, satisfaction, and performance. While Conger and Kanungo (1988) proposed that empowerment was the motivational concept of self-efficacy, Thomas and Velthouse (1990) considered it a multifaceted concept in which intrinsic motivation is increased. It is manifested in a set of four cognitions: meaning, competence (synonymous with self-efficacy), self-determination, and impact.

Ryan and Deci’s (2000/2003) self-determination theory identified three psychological needs that are the basis of intrinsic motivation—needs for competence (self-efficacy), relatedness, and autonomy. They concentrated most of their research on autonomy (“feelings of volition,” p. 58), so for the discussion of the research on competence, Bandura’s (1997) concept of self-efficacy—a central component of human agency in his social cognitive theory—will be used. Self-efficacy is an individual’s belief about his or her capability to mobilize resources (motivational and cognitive) and the actions needed to successfully accomplish a specific task within a specific context (Bandura).

Finally, Brockner (1988) found that survivors of a downsizing were likely to experience high levels of stress and reduced levels of organizational commitment and motivation. According to Neihoof, Moorman, Blakely, and Fuller (2001), employee empowerment and job enrichment initiatives may moderate such negative reactions. Spreitzer (1996) confirmed that a participatory work unit climate is an antecedent of psychological empowerment, and that empowered employees are more innovative and effective (performance), and experience less strain; a significant issue in a post-layoff environment.

Research Questions

The purpose of this literature review is to explore the research related to employee participation and to consider the implications of involving employees in decision making processes to HRD theory and practice in post-layoff work environments in the U.S. The following questions were determined:
1. What are the theoretical connections between employee participation and employee empowerment?
2. Does participation positively affect employee satisfaction, performance, and motivation?
3. What research findings can help the HRD practitioners develop methods and programs to increase the motivation and performance of post-layoff survivors?

Methodology

A large proportion of the participation research can be found in the psychological, religious, sociological and social work literature. Empowering disenfranchised populations through community participation is the predominate focus. For the purposes of this literature review, however, I examine the psychological and management literature addressing employee participation in the decision processes in the workplace.

ProQuest, Psyc Info, JSTOR, ERIC, and EBSCO host were used to locate the literature. Of the 113 articles from peer-reviewed scholarly journals (with a few other scholarly and professional journal articles included), 23 participation articles were reviewed. The terms used to conduct the searches included Employee Empowerment, Employee Participation, Employee Involvement, Self-Efficacy and Motivation. Articles focusing primarily on U.S.-based research were included. Articles on empowerment in the healthcare industry or union-related issues were excluded. Thus, the U.S. corporate context is the focus of this review of the participation literature.

Review of the Literature

This literature review briefly presents the concept of psychological empowerment in the workplace. It then engages in a more detailed discussion of the employee participation literature and how management practices that involve
employees in decision making processes create motivating environments which can lead to improved performance.

**Psychological Empowerment**

Psychological empowerment as a relational and motivational construct has increasingly been the focus of organizational researchers (e.g., Conger & Kanungo, 1988; Spreitzer, 1995, 1996; Thomas & Velthouse, 1990), as well as business practitioners (Block, 1987). While there is no commonly agreed upon definition, Conger and Kanungo defined empowerment as a motivational “process of enhancing feelings of self-efficacy among organizational members through the identification of conditions that foster powerlessness and through their removal by both formal organizational practices and informal techniques of providing efficacy information” (p. 474).

Thomas and Velthouse (1990) extended Conger and Kanungo’s (1988) work by proposing a multifaceted process or framework in which empowerment is operationalized in terms of “increased intrinsic task motivation” (p. 666) and is focused on an individual’s interpretations or assessments of the task as the primary source of intrinsic task motivation. They identified four dimensions of task assessments or cognitions: choice (i.e., the degree to which an individual perceives they have choice in initiating and regulating actions), meaningfulness (i.e., the perceived value of the task or goal), competence (i.e., self-efficacy), and impact (i.e., the degree to which behavior accomplishes the purpose of the task). Empowerment is conceptualized as a process whereby individual perceptions of choice, meaningfulness, competence, and impact are increased.

Thomas and Velthouse’s (1990) cognitive model of intrinsic task motivation consists of environmental events (data about task behaviors), task assessments (see above), and behaviors. These primary factors are influenced by global assessments (generalized beliefs about task assessments), the individual interpretative process (attributing, evaluating, and assessments), and empowering managerial interventions (changes in empowerment by changing environmental events). Such environmental interventions are designed to “produce empowerment (increased intrinsic task motivation) through changes in the environmental events that impinge upon individuals, or through changes in these individuals’ manner of interpreting those events” (p. 676). Organizational empowerment interventions such as job enrichment techniques and participative management techniques were hypothesized to increase an individual’s task assessments and motivation.

Spreitzer (1995, 1996) approached employee empowerment from the psychological and social structural perspectives. Using the four cognitions of Thomas and Velthouse’s (1990) model, she developed and empirically validated a multidimensional measure of psychological empowerment in the workplace. Additionally, she explored and identified work unit design characteristics of an empowering system.

Spreitzer (1995) incorporated the four dimensions of task assessments discussed in Thomas and Velthouse’s (1990) model into her partial nomological network of psychological empowerment in the workplace. Through her research on the antecedents of empowerment, she determined that access to information about the organization’s mission and unit performance, self-esteem, and performance-based reward systems are positively related to empowerment. She also discovered from the structural model for the consequences of empowerment, that managerial effectiveness and innovative behavior were moderately related to empowerment. Except for self-esteem, the remaining antecedents and consequences of empowerment can be found in job enrichment and employee participation models. These findings suggest that employee participation in decision-making may lead to empowerment and that these empowered employees are innovative and more effective managers.

Spreitzer (1996) acknowledged empowerment’s common roots with job enrichment theory (Hackman & Oldham, 1980) and drew upon Lawler’s (1992) high-involvement system design for employee participation in decision making to identify the social structural characteristics (content and nature) of an empowering system. A high-involvement, “empowering design provides opportunities for, rather than constraints on, individual mind-set and behavior (Torbert, 1991)” (Spreitzer, 1996, p. 485). According to Lawler (1992), such a system supports the transmission of extensive information, resources, and power throughout an organization to enable employee influence in organization decision making.

Employee participation has both a cognitive and motivational influence (Locke & Schweiger, 1979) on empowerment. Cognitively, high-involvement systems enable employees to use information better and to understand how they can influence organizational activities (Miller & Monge, 1986). From a motivational perspective, such systems facilitate employees’ trust in an organization and increase their sense of control, ego involvement, and identification with it (Locke & Schweiger).

According to Spreitzer (1996), participatory work unit climate, access to information, and sociopolitical support (i.e., approval from or legitimacy granted by organizational constituencies, such as a boss, Kanter, 1983) were positively related to empowerment—all factors found in employee participation strategies. Further, researchers (Conger & Kanungo, 1988; Lawler, 1986; Spreitzer, 1996; Thomas & Velthouse, 1990) believe implementing conditions that increase feelings of self-efficacy and control (e.g., participative decision making), and removing conditions that foster a sense of powerlessness (e.g., bureaucracy) has an empowering effect on employees. With a
foundation in the concept of psychological empowerment and how employee participation can lead to empowerment, the discussion now turns to a review of the employee participation literature.

Employee Participation

Over 50 years ago, Coch and French (1948), in their classic study, showed that employees resist change when they are not allowed to participate in the change process. Other early studies treated participation as a “motivational (commitment) device” (Latham, Winters, & Locke, 1994, p. 50)—a perspective accepted by most behavioral scientists (Latham et al.).

Dachler (1978) noted, “the major problem underlying participation research is that it is nearly impossible to determine what participation entails” (p. 17). For example, participative decision making varies along several dimensions including the degree of participatory choice allowed to employees, the degree of formality, the degree of directness (Locke & Schweiger, 1979) and the content and duration of the particular application (Cotton et al., 1988; Lawler, 1986). In general, participation is defined as joint decision making (Locke & Schweiger) or shared decision making (Mitchell, 1973).

Locke and Schweiger’s (1979) comprehensive review of more than 50 empirical research studies on participation in decision making did not find any relationship between participation and productivity. Participation did, however, increase individual satisfaction, although not uniformly across the studies. Schuler (1980) surveyed 811 employees in two organizations (a large manufacturing firm and public utility company) to discover how participation in decision making works. He found that when employees participate in decisions at work they experience less role conflict and ambiguity, increased performance–reward expectancy (based on an increased awareness of which behaviors will be rewarded), and more satisfaction with their supervisor and with work.

With more sophisticated analytical techniques, such as meta-analysis, Miller and Monge (1986) reviewed 47 articles and book chapters on participation. They tested cognitive, affective, and contingency models of the effects of participation in decision making on employees’ satisfaction and productivity. They concluded that participation has an effect on both, with a somewhat stronger effect on satisfaction. Employee participation in goal setting does not have a strong effect on productivity. From their analysis, there is no evidence to suggest that participation is more effective for managers than for lower-level employees, or the converse. Also, there is no evidence that service, manufacturing, and research organizations differ in terms of the effectiveness of participation. In this study, several of the strongest moderators were methodological variables, such as research setting and type of participant.

Two other researchers have addressed the methodological issues in the participation literature. Wagner and Gooding (1987a, 1987b) performed a pair of meta-analyses on 70 research studies. They first analyzed 118 correlations measuring relationships between participation and a variety of outcomes (i.e., task and decision performance, motivation, satisfaction, and acceptance). The results of their methodological analysis suggest that evidence supporting positive relationships between participation and the various outcomes might be mostly a product of percept–percept artifacts, and that research results may be inflated when using percept–percept data collection techniques (“that is, using data collected from the same respondents using the same questionnaire at the same time,” Lam, Chen, & Schaubroeck, 2002, p. 905). Thus, researchers must be careful to control for the effects of methodological artifacts (Wagner & Gooding, 1987a).

Using the same 70 articles, Wagner and Gooding’s (1987b) other study attempted to resolve the discrepancies among quantitative reviews of the research on participation–outcomes (i.e., task and decision performance, motivation, satisfaction, and acceptance) relationships. They conducted meta-analytic comparisons investigating the moderating effects of four situational variables (i.e., group size, task interdependence, task complexity, and performance standards) on these relationships. To control for the effects of different research techniques, the 118 correlations were nested into paired subgroups and nested within percept–percept and multisource groups. The results show that the four situational moderators failed (except in one instance) to influence percept–percept measures of the relationships. Hence, “the moderating effects of situational variables cannot be attributed solely to biases associated with percept–percept artifacts” (p. 534). With regard to the participation–outcomes, participation has only a modest influence on task and decision performance, motivation, satisfaction, and acceptance. The authors suggest that many of the positive findings published in research can be explained by methodological artifacts.

Even though Wagner and Gooding (1987b) came to different conclusions about the effect of participation on employees, they agreed with Miller and Monge (1986) that methodological issues continue to be a major concern in the interpretation of results of participation research.

Participation, Satisfaction and Performance

Of additional interest to some researchers, Wagner and Gooding (1987b) discovered that the four situational moderators have significant multisource correlations between participation and acceptance ($r = .315)$ and satisfaction ($r = .258$) in situations where participants were required to perform simple tasks. Such findings seem to support Locke and Schweiger’s (1979) proposition that participation might enrich simplified work.
Cotton et al. (1988) added another dimension to the analysis of employee participation when they reviewed 91 articles and concluded that “participation is a multidimensional or multiform concept” (p. 16), and not unidimensional as it has been studied in earlier reviews (Locke & Schweiger, 1979). Thus, participation in decisions has a modest positive effect on satisfaction and performance, though its effects vary according to form. (Cotton et al.). Leana, Locke, and Schweiger (1990) rejected Cotton et al.’s conclusions, noting that generalization was not possible due to the methodological problems within their study. Cotton et al.’s categorization of different forms of participation was unsystematic, the choice of studies in the sample was selective, and there were errors in how many of the research results were reported.

In a later study, Wagner (1994) reanalyzed Cotton et al.’s (1988) research on relationships between participation and performance or satisfaction and compared the findings with the results of 10 other reviews. While some discrepancies were noticed among the 11 articles, they all supported the same conclusion “that participation can have statistically significant effects on performance and satisfaction, but the average size of these effects is small enough to raise concerns about practical significance” (p. 312). Wagner was unable to verify Cotton et al.’s conclusion that different forms of participation had different effects on satisfaction and performance.

It is clear that after more than 50 years of research on participation, no agreement has been reached on the effects of participation on employees. Discrepancies over which type of methodology to use remain unresolved, leaving inconsistent and insufficiently strong quantitative research evidence from which to draw conclusions (Yukl, 1994). Reviewers of the literature on the effectiveness of participation are therefore left with the conclusion that in some instances participation is effective, and in others it may not be—it just depends (Miller & Monge, 1986).

**Participation and Motivation**

Even with the inconclusive results from the participation research, employee involvement and empowerment is still promoted in non-academic publications (Blanchard, Carlos, & Randolph, 2001). The discussion now turns to the empowering effects of participation on intrinsic motivation, beginning with Ryan and Deci’s (2000/2003) work on self-determination, followed by Bandura’s (1997) concept of self-efficacy.

Intrinsic motivation is a “natural inclination toward assimilation, mastery, spontaneous interest, and exploration that is so essential to cognitive and social development” (Ryan & Deci, 2000/2003). Deci and Ryan are interested in a positive motivational approach and argue that intrinsic motivation will flourish in conditions conducive to its expression. From their cognitive evaluation theory, feelings of competency or self-efficacy will not increase motivation without one experiencing a sense of autonomy (self-determination). Such feelings of choice and self-determination have been found to increase intrinsic motivation (Deci & Ryan, 1985). Further, intrinsic motivation is hypothesized to thrive in situations where there is a strong sense of security and relatedness. This speaks to the importance of teambuilding in post-layoff environments.

According to Ryan and Deci (2000/2003), extrinsic rewards can undermine intrinsic motivation. Since they may not readily be available during lean times, intrinsic motivational strategies may be the only option. However, Deci et al. (1989) suggest that higher order needs for self-determination may not be of import to layoff survivors until their lower order needs, such as income and job security, are met. Finally, Lawler (1986) strongly argues for financial rewards commensurate with performance as an extrinsic motivator to participate. As participation shifts power relationships and decision levels, it may require financial motivators to ensure employee buy-in.

Competence or self-efficacy is an individual’s belief in his or her capability to perform a specific task (Bandura, 1997). According to Bandura (1989), competence is comparable to agency beliefs, personal mastery, or effort–performance expectancy. Earlier studies have shown that self-efficacy powerfully influences performance through such mechanisms as effort, persistence, high personal goals and effective analytical strategies (Bandura, 1986).

Past performance attainments, as well as using appropriate task strategies, facilitate self-efficacy by building confidence in one’s ability to do a task (Latham et al., 1994). Latham et al. studied the cognitive, rather than motivational, benefits of participation in decision making, as well as the role of self-efficacy as a motivational mediator. They found that participation in goal setting has a direct effect on self-efficacy and an indirect effect on goal commitment.

**Leading in a Participative Environment**

Creating empowering environments through participative management approaches seems to be an effective strategy to improve organizational performance. This brief discussion looks at how employees can be involved in decision making processes in the organization. Vroom and Yetton (1973) identified four types of decision making styles that differentiate the amount of participation provided to subordinates: (a) autocratic decision making, (b) consultation, (c) joint decision making, and (d) delegation. The autocratic decision making style does not involve participation. While the consultative decision making process incorporates the input of employees, the manager makes the decision alone. In joint decision making, managers and employees meet to discuss and make a decision together. Finally, delegation involves giving “an individual or group, [i.e., self-directed work teams], the authority
and responsibility for making a decision” (Yukl, 1994, p. 157). It is this latter approach that tends to be associated with employee empowerment (Drehmer, Belohlav, & Coye, 2000). Delegation occurs in such activities as job enrichment and self-managing work teams.

Lawler (1986) has identified four critical organizational processes that can influence participation: (a) information sharing, (b) training, (c) decision making, and (d) rewards. Unlike traditional participative management approaches, in Lawler’s high involvement approach, “the degree of employee participation is seen to be a function of both the efforts of the employees to participate and the efforts that management expends to ensure that participation actually does occur” (Coye & Belohlav, 1995, p. 6). Thus, employee involvement is a dynamic interplay between the creation of participatory contexts and employees embracing the opportunities to participate.

From Deci, Connell, & Ryan’s (1989) study, it seems likely that managers perform a significant role in facilitating or inhibiting the empowering process. Some examples of specific impacting behaviors include the degree to which the manager shares power and supports subordinate autonomy, and provides noncontrolling positive feedback. In Spreitzer’s (Quinn & Spreitzer, 1997; Spreitzer, 1992, 1995, 1996) extensive research into employee empowerment, she identified four “key levers” (Quinn & Spreitzer, p. 45) for facilitating employee empowerment in organizations: (a) providing employees with a clear vision and challenge, (b) creating a work environment characterized by openness and teamwork, (c) exercising discipline and control (i.e., clear goals, lines of authority, and task responsibilities), and (d) providing social support and a sense of security (Quinn & Spreitzer).

Results and Findings

Employee participation research results remain inconclusive after over 50 years of studies. Most researchers acknowledge that participation is positively related to satisfaction (Cotton et al., 1988; Locke & Schweiger, 1979; Miller & Monge, 1986; Schuler, 1980; Wagner & Gooding, 1987b). There is less conclusive evidence for the relationship of participation with performance (Locke & Schweiger; Miller & Monge). Methodological concerns have plagued much of the participation research.

While there seems to be statistical significance, the small average effects of participation raise questions as to the practicality of implementing participative management approaches—especially if the costs of implementation, training and maintenance are greater than the gains from involving employees (Wagner, 1994). However, these costs may be unavoidable in lean times when fewer employees must produce at the previous staffing levels.

In support of participation, the empowerment literature suggests that participatory work unit climate is an antecedent of psychological empowerment, and that empowered employees are more innovative and effective (performance), and experience less strain; a significant issue in a post-layoff environment. Creating empowering environments through participative management approaches may moderate layoff survivors’ negative reactions, such as, high stress levels and decreased levels of organizational commitment and motivation (Neihoff et al., 2001). Through increased perceptions of self-determination (Ryan & Deci, 2000/2003) and self-efficacy (Bandura, 1997), layoff survivors will be more intrinsically motivated in the workplace and perform better (Latham et al., 1994).

Successfully motivating layoff survivors requires clear articulation of a vision and challenge; identification of clear goals, lines of authority, and task responsibilities; training to improve employee competence in new roles, including teamwork and decision processes; bi-directional information sharing; a reward system to encourage involvement; and most importantly, with distrusting, worried survivors, open communication channels in which employees can share their ideas and concerns and are listened to in a supportive, secure environment where trust is built (Lawler, 1986; Quinn & Spreitzer, 1997).

Conclusions and Recommendations

Even though there have been productivity gains in recent years, low morale and motivation of the survivors of layoffs can hinder achieving performance objectives. As HRD practitioners look to improve the performance of employees who remain after layoffs, they must not just seek to implement a specific technique; rather, they must work towards the creation of an empowering environment (Drehmer et al., 2000).

Participation has been found to have significant but small effects on satisfaction and performance (Wagner, 1994). It is also positively correlated with psychological empowerment (Spreitzer, 1996). Through participation, employees’ enhanced perceptions of self-determination (autonomy) and competence (self-efficacy)—both dimensions of empowerment—lead to increased intrinsic motivation. (Deci & Ryan, 1985; Ryan & Deci, 2000/2003; Spreitzer, 1996). Further, increased feelings of self-efficacy are positively related to effort, persistence, and performance (Bandura, 1986). Consequently, employees will feel more empowered to meet the performance demands within a limited staff environment if they are invited to participate in their work processes through the delegation of authority. The key to effective participative management approaches is how the leader creates
empowering environments for his or her employees. Lawler’s (1986) employee involvement system involves the distribution of information, training, decision making power, and rewards to the lowest levels in the organizational hierarchy in order to increase worker discretion. Clearly, the behavior of managers is critical to achieving performance goals with fewer staff.

Further empirical exploration to refine the use of models and instruments (Thompson & Kahnweiler, 2002) in empowerment research in organizational settings would strengthen the research data and provide a stronger framework upon which to build. So, too, consideration needs to be given to which research methodologies are the most effective for examining the effects of employee participation. Researchers need to control for the effects of percept–percept bias. Ledford and Lawler (1994) challenge participation researchers to approach research into employee participation from a systems theory approach, using multivariate interventions that acknowledge the complexity of the employee’s world—certainly a more difficult task.

**Implications for HRD**

Effective motivation of employees in lean economic times is important to companies as they seek to remain competitive in the ever-changing and complex global marketplace. Successful managers and HRD practitioners need to be able to understand the dynamic context in which they find themselves, as well as how to lead and manage for results with the reduced workforce.

Survivors of layoffs are likely to experience high levels of worry and stress and decreased levels of organizational commitment and motivation. Managers must be sensitive to these realities and work to provide positive, supportive environments to rebuild trust. By allowing employees to participate in decision processes and encouraging open communication and teamwork, providing appropriate training and feedback, they will be more motivated and their performance will be enhanced. Through empowering practices, such as employee participation, America’s workforce will be motivated and well-prepared to change and grow as the economy continues to rebuild.

An Exploratory Examination of Selected Growth Theories of Individual Motivation and How They Inform Performance in Organizations

Melissa A. Noggle
Susan A. Lynham
Texas A & M University

Human resource development (HRD) professionals are compelled to deal with performance. It is therefore essential that they understand what variables contribute to performance. This paper examines the effects of individual motivation as a specific input to performance from the perspective of three clusters of motivational theories and then shows how this understanding can be used to inform the desired outputs of individual, process and organization level performance, and ultimately, how to create environments which cultivate high-quality performance.

Keywords: Motivation Theory, Growth Theory, Performance

Efforts to understand performance provide constant and complex challenges. It seems that organizations have always struggled with understanding and assessing performance. Many performance-related programs and fads have passed through organizations over the years (Micklethwait & Woodridge, 1996). Some performance interventions have been firmly rooted in theory and research while others have been temporary concoctions which have had limited or unsustainable organizational impacts (Holton, 1999).

Intuitively, HRD professionals recognize that motivation is a critical element of individual performance. Schein (1975) remarked that “…every one of us has his own theory of …what makes people tick…. the actual behavior that we exhibit toward people tends to be a reflection of those deep-down inner assumptions that we make” (p. 21). Motivation is certainly one driver of the inner assumptions of which Schein speaks. We labor with characterizing performance as a product, or outcome, but it is important to understand the ingredients in the performance recipe in order to effectively appreciate the results. The purpose of this inquiry is to examine how three specific theories of motivation can be used to inform the thought and practice of HRD in the context of individual performance within organizations. This paper focuses on how individual motivation to perform can be better understood with the purpose of enhancing the opportunity to achieve goals critical to an organization.

Problem Statement, Theoretical Framework, and Methodology

This is a theoretical, conceptual paper aimed at exploring motivation theory and perspectives. More specifically, it examines how clustering growth theories of motivation according to driving factors can be used to inform the human resource development (HRD) profession about individual and other levels of performance in the workplace. The research questions are:

- Do selected growth theories of individual motivation inform HRD about performance improvement in the workplace?
- If so, how do those theories inform the HRD profession about affecting individual performance improvement in relation to the overall organization?

The study begins with a working definition of the concepts of performance and motivation. Next, it presents an organizing framework for motivation theory which is used to sort this body of knowledge into two major theoretical approaches, each approach of which is shown to have three supporting theoretical perspectives. Using the organizing theoretical framework, three specific motivation theories within the purposive approach and growth perspective are then selected, contrasted and examined in terms of how they can be used to inform performance-related HRD thought and practice. In closing and summary, the contributive value of this examination to new knowledge in HRD is considered.

Motivational theory addresses distinct aspects of individual behavior, including biological, social, and cognitive. This inquiry will explain the motivational theories which characterize growth and are considered purposive rather than regulatory in nature. (Beck, 2000; Levine, 1975). The application of these theories can inform
HRD by identifying which facets of motivation which impact individual performance within organizations and contribute to the development of approaches to capitalize on their effects.

Defining Performance and Motivation

Human resource development (HRD) is concerned with performance (and learning) in multiple domains – individual, group, process, and organizational (Holton, 1999; Rummelr & Brache, 1995; Swanson & Holton, 2001). For the purposes of this paper, the individual domain of performance will be defined as people doing specific jobs or tasks either as individuals or as teams/groups. Individuals perform activities/jobs which contribute to and manage processes and, ultimately, define the organizational performance domain (Swanson & Holton, 2001). Groups are “internal subsystems for which performance goals have been set that are derived from and contribute to the mission of the overall system” (Holton, 1999, p. 31). The term, process, explains the moving parts of the organization and illustrates its work flow (Swanson & Holton, 2001). The domain of process performance is influenced by the organization’s goals, customer needs, skills of individual workers as well as facilities and the efficiency of equipment (Rummelr & Brache, 1995). The domain of organizational performance represents the integration of individuals, groups, and processes with the external environment to form an open, dynamic system. By understanding the taxonomy of the separate performance domains, we can use this knowledge to better understand how motivation influences multi-domain performance, an understanding which will in turn serve to inform HRD as a discipline.

Simply defined, motivation is need or desire which instigates or incites an individual into a specific course of action in order to produce a specific effect (Landau, 1997). Motivation is therefore purposeful action and is distinguishable from a habit which is an acquired mode of behavior that has become involuntary (Landau, 1997). This distinction, between a motive and a habit, is an important factor in the relationship between individual motivation and performance (Bolles, 1975).

Performance is defined as acting in accordance with requirements to execute a duty or promise in order to produce a desired effect (Landau, 1997). The business book, The Hunters and the Hunted, describes how organizations typically measure performance (Swartz, 1994). The text illustrates performance measurements in terms of the following comparisons:

- Present performance versus past performance or standards (comparisons of annual sales, return on investment, budget verses actual expenditures)
- Customer’s perceptions versus their expectations or requirements (complaints, comments, focus groups)
- Organization’s performance versus competitor’s performance (competitive benchmarking)
- Current performance versus ultimate possible performance.

Managers look at performance not as an absolute, but rather as a variance between factors, as indicated in the above comparisons, which allows an organization to quantify the impact of improvement initiatives. If we recognize motivation as a major contributing factor to performance, it is critical to appreciate how motivation affects variance. It can eventually be used to help explain motivation’s impact at the group, process and organizational levels in terms of quality, productivity, and financial performance.

Unfortunately, the term, motivation, is used indiscriminately and we ignore the contextual confinement of the word. There is “difficulty in fitting it [motivational factors] neatly into the framework of types of explanation” (Peters, 1967, p. 29) since these factors are basically individualistic in nature. By understanding how an individual’s motivation influences their performance and what organizational factors can facilitate that motivation, HRD can work to enhance performance at both the operational and strategic levels (Rummelr & Brache, 1995). This knowledge will support the organization’s decision making processes whether the issue is compensation, the launch of a new product, career development for employees, workforce diversity or succession planning.

Categorizing Theories of Motivation

According to Torraco (1996), a theory helps to explain a phenomenon and Beck (2000) adds that “a theory is a representation of real things and places in the world”, a theory “relates those things to each other by a set of rules” (p. 4) as well as guides use through our search for understanding particular concepts or phenomena. Based primarily on research in the field of psychology, theories of motivation can be placed into two main categories, one representing a purposive approach to these theories, and the other a regulatory approach (Beck, 2000; Bolles, 1975). Since we have narrowed our inquiry specifically to the purposive approach, theories within this approach can be examined and used to help guide HRD professionals in capitalizing on individual motivation in order to affect
performance. These theories can be further divided into groups which serve to inform HRD initially from the individual performance domain and can eventually be extrapolated to support the potential performance impact on groups, processes and organizations. A summary of these two approaches to motivation theory, and sub-categories of supporting groups of theories, are presented in Table 1.

</tr>
</tbody>
</table>

As mentioned earlier, Beck (2000) utilizes a two-type approach, regulatory and purposive, to categorize motivational theories. Each is an “equally legitimate approach to motivation [but they] are deeply rooted in different historical traditions” (Beck, 2000, p. 25). The regulatory approach to motivation emphasizes the body’s response to internal pressures or needs such as pain or hunger. The word, regulatory, implies a process of homeostasis which is concerned with the restoration of equilibrium. This approach to motivation relates to the fulfillment of fundamental needs and is basically intrinsic in orientation. This approach can be further divided into subcategories of theories: drive reduction, arousal, and biological. Regulatory-type motivation theories concerned with drive reduction speak to an individual’s effort to reduce intrusions on their biological needs (Levine, 1975), while those dealing with arousal are concerned with the initiation of activity and all of the stages which follow. The biological group of regulatory motivation theories addresses the physiological psychology of individuals. As a result of this category of theories of motivation being concerned chiefly with the internal, physiological aspects of motivation, and for purposes of this paper, we have chosen to confine our inquiry (into individual motivation and how it informs performance) to theories of a purposive-type approach to motivation.

The purposive theoretical approach explains the notion of motivation as more cognitive in nature and specifically highlights the concept of goal-oriented behavior (Beck, 2000; Locke & Latham, 1990; Torraco, 1996). This particular approach does not focus on motivation as obtaining balance through actions, but rather as achieving a specific objective and which can be considered either intrinsic or extrinsic in nature. “The purposive approach emphasizes the goal-oriented nature of behavior” (Beck, 2000, p. 25) and is therefore considered best suited to frame this inquiry. Three sub-categories of theories illustrate the purposive-type approach to motivation: cognitive, social and growth. The cognitive sub-category deals with how an individual’s belief system and thought process affect their motives (Beck, 2000). In contrast, the social theory sub-category enlightens the concept of motivation by revealing how individuals seek validation from external influences such as peer groups, management, occupational fields, and family, as well as from standards or perceived societal expectations (Levine, 1975). Growth theories support why the individual constructs their actions and how they are oriented towards a goal (Vroom, 1964). The sub-category of growth theories provides a most effective rationale for informing HRD regarding the relationship between individual motivation and performance, because by examining these types of theories we can construct knowledge which informs HRD about the correlation between individual motivation and performance. If we understand this concept at the individual level then we can also use that knowledge at the group, process and organizational levels.
These sub-categories of theories of motivation are further depicted in Table 1 above. Following is a closer examination of three particular growth theories of motivation and how they inform individual performance.

A Closer Examination of Three Clusters of Growth Theories of Motivation and How They Inform Individual Performance

The purposive category of motivation theory is supported by many different and distinct theories, all of which seem to have emerged in the mid-twentieth century. As indicated earlier, the first two sub-categories of theory attributed to motivation from this purposive perspective are identified as cognitive and social. Where the cognitive sub-category of theories deals with how an individual’s belief system and thought process affect their motives (Beck, 2000), the social sub-category of theory enlightens the concept of motivation by revealing how individuals seek validation from external influences such as peer groups, management, occupational fields, and family, as well as from standards or perceived societal expectations (Levine, 1975). This paper focuses on the third sub-category of purposive theories of motivation, namely, growth theories. This particular sub-category of theories concentrates on motivational factors which stimulate individuals to achieve or work to satisfy one’s potential in a specific area. As such, these theories offer significant insight for the field of HRD since growth is a vital part of the overall motivational structure of an individual, group, process or organization and the concept of performance implies growth at some level (Beck, 2000; Levine, 1975).

By examining growth theories of motivation, critical motivational elements that drive performance at the individual level can be identified. Torraco (1999) highlighted some of these elements, which influence the motivational framework throughout the different performance domains, as individual personalities, work schedule, cultural differences, and facilities. These growth theories also indicate that some individual characteristics can be developed or modified in order to meet the needs of the organization as a whole, as evidenced in McGregor’s Theory X. Other traits or factors are considered foundational to the individual or environment, and therefore, according to McGregor’s contrasting Theory Y, the organization must adjust to support individual needs in order to be effective (Barrett, 1966; Beck, 2000; Locke & Latham, 1990, McGregor, 1960).

There are a number of growth theories of motivation and these can be grouped into three clusters of supporting theories, namely, expectancy, achievement, and reinforcement theories. Table 2 presents a comparative description of these three clusters of supporting theories by comparing and contrasting them in terms of nine descriptive dimensions—the theoretical perspective of motivation core to each theory cluster; specific supporting theories within each theory cluster; core theorists associated with each cluster; common aims of each cluster of theories; assumptions about motivation essential to each theory cluster; specified limitations of each theoretical cluster; which HRD-related theoretical foundations each cluster is informed by; the performance domains to which each cluster of theories is applicable; and the application-value of each cluster of theories to HRD practice. For purposes of clarification, we have used the tri-part view on the theoretical foundations of HRD offered by Swanson (1999), namely, psychology, systems, and economics, and the whole system perspective of HRD performance suggested by Holton (1999), namely, individual, group/team, process and organization, to inform this comparative examination. The comparative framework used in Table 2 is therefore useful in comparing and contrasting the three clusters of growth theories of motivation that inform purposive-type approaches to the issue of motivation. An exploration of how these three clusters of growth-type motivation theories can serve to inform HRD is briefly discussed in the subsections following and presented in Table 2.

The Expectancy Theory Cluster

The clusters of theories which address expectancy affectively span all three of the HRD theoretical foundations of psychology, systems and economics. The original theorist, Bernoulli, applied expectancy-value to economics during the early eighteenth century (Beck, 2000). In 1964, Atkinson and Vroom separately adapted the theory to explain the concept of motivation from an economic or value-added perspective. The purpose of this application was to explain the reasons for a decision making process strictly based on a value associated with the expected result (Atkinson & Birch, 1970; Vroom, 1964). The underlying premise of this theory cluster is that motivation can be quantified or at least organized in an ordinal fashion based on a value which is established by the specific domain (Atkinson, 1970; Beck, 2000; Levine, 1975; Locke & Latham, 1990). This premise allows these theories to be utilized at the individual, group, process and organizational levels of performance, which provides an effective tool to the field of HRD. Furthermore, this approach to motivation is both strategic and tactical which affords an organization support for short and long term decision making.

The illustration of the relationship between motivation and performance is a simple function. The theorists postulated that the tendency to succeed is the product of motivation to succeed, probability of success, and the associated incentive value of that success (Beck, 2000). Atkinson (1964) proposed a practical, mathematical relationship which provides a roadmap for optimizing performance by understanding its drivers (motivation, level of difficulty and value of the outcome). Although this is a simple dynamic, the factors are not completely under the
control of any one entity and the theories assumes that motivation can be directly correlated to a specific outcome with an assigned value.

As a compliment to Atkinson and Vroom’s theory, Gilbert’s Behavior Engineering Model describes motivation in terms of incentives (financial, personal, and career) which can help refine the concept of expected value. This model looks at performance from a behavior repertory and the environment which supports it (Swanson & Holton, 2001). This interdependence between the individual and their environment creates a management system which Gilbert illustrates as a mathematical equation. Gilbert represents an individual’s potential performance related to specific task as a ratio of exemplary or best performance to normal or typical performance. This ratio frames motivation’s relation to performance, but falls short of identifying specific influences such as: elements which facilitate exemplary performance, measuring or defining typical performance and demonstrating how different types of motivation affect the ratio (Swanson & Holton, 2001).

Of the three clusters of theories of motivation explored in this study, expectancy-value theory provides the strongest framework to inform HRD since it can be applied to all the performance domains and theoretical foundations that are of concern to HRD. When combined with achievement theory, HRD can appreciate extrinsic (value) expectations and intrinsic (achievement) motivations. By understanding how the drivers of motivation operate and relate to performance, HRD can learn how to affectively unleash individual resources, which can have a cascading effect on the facilitation of group, process and organizational performance.

The Achievement Theory Cluster

We can borrow from the personality driven motivational theories to address some aspects of this growth oriented perspective. Murray’s research in the 1930s provided part of the foundation for growth theories with his observation of three motives: need for achievement, need for power, and the need for affiliation (Beck, 2000). The need for achievement is motivated by satisfaction in work itself; sense of completion or competitive as well as response to success or failure. McClelland’s achievement motivation theory built on Murray’s assertion that an individual has the “desire or tendency to overcome obstacles, to exercise power, to strive to do something difficult as well as quickly as possible” (Beck, 2000, p. 326).

The purpose of this theory cluster is to explain the need for people to excel, to compare themselves with a standard of excellence (McClelland, 1975). Achievement theory highlights the tension between intrinsic and extrinsic motivation factors which should be noted as organizations seek to understand individual motivation’s effect on performance. Individuals have internal needs for achievement that are personal. Organizations will benefit from understanding these needs but might not be able to identify a connection with organizational performance. External motivational factors for achievement need to be understood at the individual level since people are not motivated to achieve in the same manner. Scholars have asserted that “people can be taught to think and imagine in ways that increase in the need for achievement” (McClelland, 1975, p. 380) and proposed the concept of learned industriousness implying that individuals can be taught to achieve (Beck, 2000; Levine, 1975; McClelland, 1965). By understanding the application of this theory, organizations can employ methods to capitalize on an individual’s need to achieve to impact performance across all of the domains (individual, group, process, organization).

An incentive or extrinsic motivation factor may initially have an additive effect on an individual’s composite motivation level, meaning that on the surface the duration of the factor’s effect can appear to promote improved performance but may, in reality, only provide a short term stimulus which can eventually transform into a negative effect. The result of this phenomenon may be that an individual’s intrinsic motivation is diluted by the introduction of the extrinsic factor or the residue of the incentive’s effect results in motivation decomposition (McClelland, 1965). The limitations of the achievement theory cluster includes finding the delicate balance between internal and external stimuli and the fact that this approach is best applied to those individuals who consider themselves medium risk takers (Levine, 1975). Achievement theories informs HRD by providing a better understanding of the real impact of extrinsic motivation within a whole systems perspective as well as those factors which cannot be controlled outside the internal psychology of the individual.

</tr>
<tr>
<td><strong>Application-value to HRD</strong></td>
<td>By understanding the concept of expectancy, organizations can develop effective communication methods to connect activities to the expected values, which has strategic implications; The impact of perceived equity can have a major impact on the effectiveness of organizations; Acknowledging this phenomenon is critical to implementing HRD initiatives;</td>
<td>Individuals can learn to think and imagine in ways which increase the need for achievement; Achievement need is stimulated by environmental factors; Integration of individual drivers with organizational needs can capitalize on the dynamics of achievement motives and impact the performance of the organization; (Beck, 2000, Levine, 1975, McClelland, 1975)</td>
<td>Reinforcement has to be integrated into an overall HRD system; Correlating goals, objectives, and outcomes with reinforcement initiatives can communicate sense of trust within an organization and establish a systematic process to motivate individuals along with accomplishing the mission of the organization;</td>
</tr>
</tbody>
</table>
The Reinforcement Theory Cluster

Reinforcement theories are grounded in behaviorism. The idea of reinforcement theory is that behavior can be changed if you imposed modification techniques. This approach to motivation has been applied in HRD especially in the area of programmed instruction (DeSimone, Werner, & Harris, 2002). This specific theory cluster is limited in its use because it implies a specific cause and effect which cannot fully explain complicated motivations of individuals. Other theories related to reinforcement, direct or indirect, seem to explain the influences on individual performance.

McGregor (1960) published his book, *The Human Side of Enterprise*, which introduced Theory X versus Theory Y as two opposing approaches to managing organizations. The tension between Theory X and Theory Y was an individual’s feeling or motivation towards work. Barrett (1966) summarized the concept of Theory Y in his work, *Motivation in Industry*, by asserting that individuals will work towards organizational objectives if they are committed to them. This theory informs HRD by providing a simple psychological basis for an individual’s impact on the ability of an organization to achieve its strategic and operational goals.

Even though it can be applied to the individual, group, process and organizational domains, the theory primarily speaks to the psychological and some of the systems foundations of HRD. The literature indicates that Theory Y is widely applicable, but if it is not successful, it is due to the attitudes, such as distrust, which are embedded in the organization from prior management practices (Schein, 1974). If an organization wants to achieve a particular goal then it needs to tend to the individual’s motivations related to that goal.

Reinforcement type theories which are most applicable to HRD are those related to goal-setting. Locke’s work in correlating training in goal setting as well as establishing specific goals for individuals with performance provide unique quantitative examples (Locke & Latham, 1990). Goal-setting is the basis for a number of performance management systems and understanding how individual motivation is related to goal development and assignment is critical to the success of these types of systems.

Concluding Implications for HRD

The purpose of this paper was to examine which parts of motivational theory can expand the information HRD uses to address the concept of performance. The study’s initial approach was to understand how motivational theories inform HRD in the individual performance domain in order to later examine its compounding effect in the group, process and organizational context. In order to achieve this objective, we considered two distinct categories to motivation theory, regulatory and purposive, together with corresponding sub-categories of theories (biological, drive reduction, arousal, cognitive, social, and growth). The theories of motivation, which were identified by the purposive approach and addressed growth, provided the appropriate foundation from which to examine the phenomenon of motivation from an HRD perspective. The selected theory clusters, expectancy, achievement and reinforcement, were deconstructed in order to identify the elements which could serve to inform HRD in regards to performance.

As indicated in this inquiry, HRD can develop an understanding of how to unleash the power of individual motivation in order to influence performance at the individual, group and organizational levels. We recognize that motivation also impacts the performance of processes, but only through the individuals who provide the motives for achieving objectives and the organization which sets the mission. The interdependence of the performance domains, as they relate to motivation and performance, impacts HRD from many different and distinct perspectives including learning, leadership, capitalizing on diversity, change management, economics, organizational development as well as performance management systems (Rummler & Brache, 1995). While HRD and other disciplines struggle to characterize and assess performance as an output, we need to remember to identify and understand the inputs and drivers (Holton, 1999) of performance. By being able to discern the different influences of motivation on performance, HRD can impact the strategic focus of an organization.

Contributions to New Knowledge

Management of performance is not unlike solving the Rubik’s Cube. Each color, row and column are factors in the solution just as motivation, leadership, economy, or customer requirements are part of the dynamics of performance. Adjusting or concentrating on one factor can affect the puzzle process in either positive or negative ways, thereby, with each action, putting you closer or further away from a solution. Understanding how each move will affect the next helps to unveil the final solution to the puzzle. Likewise, HRD can more readily impact performance by appreciating the impact that strategic and operational actions have on motivation as well as motivation’s effect on the performance at the individual and organizational levels. Even when the puzzle is solved, the environment may
change causing an organization to need to solve the performance puzzle again. By understanding the impact of different factors and developing a systematic approach (strategic HRD) to solving the puzzle, an organization can function at its optimal level without sacrificing the other domains. With each additional insight provided by the theories, HRD can start to develop a more complete image and understanding of the relationship between motivation and performance. This inquiry provides the basis for future applications in HRD practice in the frameworks of performance evaluation, goal-setting, training as well as career planning and development.

HRD must continue the inquiry process in the area of performance inputs in order that we might better understand the outputs of individual performance and their effect on whole system performance. Further study in understanding how to capture and facilitate the inputs, including motivation, will provide a better foundation from which to develop appropriate and effective measurements of performance. Appreciation of the motivational theories highlighted and discussed can lay a foundation for further research in how motivation factors into the performance equation from a workplace perspective. The development of integrative theories between the fields of psychology, business, engineering, education and HRD will serve to further inform HRD from a theoretical viewpoint.

Taking on the Teacher Supply and Retention Challenge:  
A Performance Focused Model for School-University Partnerships

Dorian Martin  
William E. Reeves  
Eric Wilson  
Lisa O’ Dell  
Toby Marshall Egan  
Texas A & M University

In this case study, we describe a strategic initiative that partnered public schools with the fifth largest land-grant university system in the United States to improve statewide recruitment, training, hiring, and retention of K-12 teachers. This effort sought parallel implementation among nine university system institutions in partnership with community colleges and public schools statewide. Related school-university partnership and organizational alignment literature is explored along with the model deployed and current descriptive performance measures.

Keywords: University, Partnership, Organization Development

Over the past century, universities and public school systems have been working together in partnership (Greene & Tichenor, 1999). Many of the partnerships have involved staff development, teacher training, and school leadership. Such school-university connections have engaged in complex development approaches that demand a significant commitment for collaboration on the part of stakeholders. "The most effective partnerships are dynamic and interactive, work toward common goals, and are characterized by a high level of commitment among group members" (Jenkins, 2001, p. 6). Similar to HRD efforts in other contexts, school-university partnerships hold considerable promise for revitalization and development. However, such efforts “must be vigorously supported and advanced by top leadership at public school and college levels" (Essex, 2001, p. 736); therefore, insights from HRD and related practices can make meaningful contributions to the alignment and development of such relationships.

This paper explores a leading school-university partnership in the state of Texas. The partnership under study was initiated by Texas A&M University (TAMU) Board of Regents. The TAMU Regents' Initiative is a comprehensive change approach aimed at educational improvement from PreKindergarten thru to four-year degree completion (PK-16) for children and young adults throughout the state. The core Initiative issues explored in this study involve the addressing of a need that has reached critical levels throughout the United States (US)—the recruitment, training, hiring, and retention of teachers in public school systems. The nine TAMU System institutions were asked to collaborate in raising the numbers of teachers in the state and to explore ways in which teacher preparation and retention could be further explored and practices modified accordingly throughout the TAMU system in collaboration with statewide stakeholders. This effort relies on the alignment of several relationships including university-university, university-community college, and school-university partnerships.

Purpose and Research Questions

The purpose of this paper is to describe a university system-wide effort to address a statewide K-12 teacher shortage in the State of Texas. We outline the history and implementation strategy along with the most recent outcomes associated with the effort. Research Questions include: 1) What successes and challenges will result from a school-university partnership aimed at increasing statewide teacher supply?; 2) What similarities and differences exist between school-university partnership literature and the case study under examination?; and 3) What is the future for such programs and related research?

Method

As previously identified, this paper combines an exploration of available literature on school-university partnerships with an exploration of a related case. Descriptive data is used to measure the differences between variables associated with stated goals at time 1 (the start of the partnership) and time 2 (year three of the partnership). Increases and decreases in variables associated with teacher supply are assessed.

Review of the Literature

This paper explores an effort by a US land grant university system to align individual universities in a system-wide partnership with public schools toward growth of teacher training, hiring, and retention in order to address teacher shortages in the state of Texas. A vital element in the examination of the potential for partnership development between schools and universities is the examination of previous school-university partnerships, their successes and challenges. Awareness of prior partnership attempts may be used in early in partnership development. Although we found only a small number of articles focusing on school-university partnerships and even fewer articles exploring related issues from a research/scholarly perspective, Table 1 outlines the effective versus ineffective practices associated with the establishment of partnerships identified in the literature.

According to those authors who have explored school-university partnerships, “conversations among leaders on both sides of potential partnerships may be more successful if the practices presented are considered in getting a clear plan of action formulated prior to establishing the partnership” (Peel, Peel, & Baker, 2002, p. 44). From this point of view, educational partnerships need to approach the development of relationships in the same manner than that of any well run organization in the public or private sectors, whereby stakeholders collaborate in the development of policies and practices (Gayton, 1997). Well designed and implemented school-university partnerships can lead to movement in a positive direction toward change benefiting both sets of stakeholders (Gayton, 1997). The literature identifying effective and ineffective practices associated with school-university partnerships imply some basic “practices.”

Adopted from Peel et al., (2002)

characterizing more and less successful partnerships. Many of these practices are not unlike those encouraged in the organization development (OD) and HRD literature (Cummings & Worley, 2001; Rothwell, Sullivan, & McLean, 1995). According to Peel and Walker (1995), essential aspects in the establishment of functional school-university partnerships include: development of clear common goals, support of mutual trust and respect, maintenance of open communication, and ongoing clarification of shared responsibility by all stakeholders.
Stages of School-University Partnership Development

In addition to considering school-university partnerships from the perspective of effective versus ineffective practices, some researchers have explored school-university partnerships utilizing developmental stage models. Zetlan and Harris (1992) suggested that the following stages characterize the dynamics of a school-university partnership:

1. People are consumed with hostility.
2. There is a lack of trust as the partners build "mutual confidence."
3. There is a period of truce and equal participation.
4. Mixed approval and short-term successes are recognized.
5. Acceptance by both the school and university as they see the mutual benefits.
6. There is a time of regression due to attrition, faculty promotion, or lack of funding.
7. New members enter with new ideas that lead to renewal.
8. There is a continuation of the collaborative effort.

According to Peel et al. (2002) clear understanding of the stages identified above along with an operational understanding of the essential elements associated with school-university partnership success can lead to more effective implementation. Although the overall stage model presented by Zetlan and Harris (1992) is linear (suggesting that partnerships move consecutively from stages 1-8) the authors emphasized the importance movement from stages one and two toward a more connected and clearly delineated partnership in later stages. Other researcher and practitioners have identified program design and program implementation as key elements in the development of school-university partnerships. According to Tushnet (1996), although the most committed stakeholders may be able to overcome poor program design and implementation, clear outlining and execution of these two elements is viewed to be paramount. Partnerships may begin slipping when necessary steps prior to implementation are not sufficiently clarified and acted upon (Peel & Walker, 1993).

Partnership Financial Issues

Bullough and Kauchak (1997) indicated that universities and public schools face financial constraints due to the enormous size of each organization. Unless both entities are willing to pool their resources and work together in a collaborative manner, the partnership will most likely fail. This problem is especially true of educational partnerships in the rural southern US, which has the highest rural poverty rate in the nation (Davis et al., 1998). In most impoverished communities there is generally a feeling of isolation along with limited resources (Davis et al., 1998). According to Wilcox (2002), partnerships tend to fail when the financial issues overshadow the impending remuneration. Again, a vital need for successful partnerships includes realistic financial commitments from all stakeholders.

It is a reality that partnerships have to maintain adequate funding in order to co-exist. Unfortunately, for many communities in the southern US the funding is just not there (Davis et al., 1998). Therefore, if educational partnerships are going to exist, especially in many impoverished areas, greater financial creativity, flexibility, and an increase in community supporters are needed in order for the partnership to survive.

Leadership

Edens, Shirley, & Toner (2001), emphasize the importance of ongoing leadership in the development of school-university partnerships. The authors observe that a premature departure from central decision-making by top leadership diminishes the likelihood of school-university partnership success. According to Bullough and Kauchak (1997) ongoing representation by top school and university leaders is important to balancing information sharing and investment. In one case, a divestment in time and energy spent by a school representative was diminished leading to a more dominant role on the part of the university. This imbalance leads to partnership misalignment and perceptions that the efforts are initiated singly rather than joint school-university efforts. In such cases, leadership imbalance leads to insufficient formation of goals, unbalanced communication, and unequal responsibility.

Professional Development School Models

One of the most common occurrences of school-university partnerships are professional development schools (PDS) that involve training and other types of development-related exchanges. Often, these development oriented programs involve university leadership in the training of teachers or principals. However, the best PDS efforts involve grassroots connections between teachers and university representatives in the identification and development of innovative approaches to problem-solving (Carlson, 2001). A focus by partners on innovation has led to successful PDS efforts benefiting all stakeholders (Rakow & Robinson, 1997). According to Edens et al. (2001) recent research indicates that over the past decade, school-university partnerships have involved a "series of false starts' and difficult turns leading to divestment by many stakeholders in the school-university partnership concept. Peel et al. (2002) suggests one of the reasons that PDS models tend to fail is because they operate on the fringes. "In order for PDS's to move from the margins to the center of our educational system [partnerships must..."
become the accepted way of doing business in the schools and colleges" (Edens et al., 2001, p. 31). Educational partnerships that were well received and successful involved real empowerment, collaboration, and trust by all stakeholders, as well as shared power by the leadership. As identified earlier, these insights into the elements of successful school-university partnerships overlap with suggestions for successful OD and change efforts in a variety of organizational contexts (Cummings and Worley, 2001; Rothwell, Sullivan, & McLean, 1995).

Teacher Demand in the State of Texas

Because this paper focuses on a school-university partnership approach aimed at increasing teacher supply in the state of Texas, it is important to explore recent trends associated with statewide teacher employment. A mixture of economic, educational, and demographic factors have combined to create teacher shortages in a number of US cities and states. In recent years, the state of Texas has focused its energies on the clarification of the total statewide picture for teacher training, recruitment, and retention. Although often considered to be human resource management issues (McLagan, 1989), recruitment and retention have also been explored in the HRD literature (Bartlett, Egan, Ipe, & Kim, 2002; Bierema, 1999; Vann & Hinton, 1994).

In recent years, the supply of certified public school teachers has not met the demand. This shortage has been the result of a number of factors including lower numbers of certified teachers, growing school populations, and teacher turnover. At present, approximately one-forth of teachers in the state of Texas are not certified or are in the process of becoming certified while working as a full-time public school teacher (Institute for School-University Partnerships, 2002). Nationally, 22% of all new teachers leave the profession in the first 3 years because of lack of support and a 'sink or swim' approach to induction into the profession (US Department of Education, 2002) and 60 percent of Texas teachers quit the profession after the first five years of employment. The National Commission on Teaching and America's Future (1996) estimated that U.S. schools needed to employ more than 2 million new teachers from 1996-2006. This estimate may have been low. Demand is even higher for teacher specializations such as math, science, foreign language, bilingual, and special education are included as considerations.

Given these challenges, the state of Texas has engaged in several approaches aimed at improving teacher induction into the profession, providing effective training and certification, addressing teacher supply issues, and exploring effective approaches for increasing retention rates. One of these efforts is the Texas A&M University (TAMU) Regents' Initiative. This effort has led to the formation of school-university partnerships aimed at comprehensive exploration and action to increase and maintain the numbers and quality of teachers in the state. It is important to note that no scholarly literature associated with teacher supply issues (the focus of the TAMU initiative) were identified in our review of literature. The following sections describe and report results from this TAMU system-wide initiative.

Case Study: The TAMU Regents’ Initiative

The following section explores the history, successes and challenges faced by the TAMU Regents Initiative which is school-university partnership aimed toward increasing supply, quality, and retention of public school teachers in Texas.

History of the Regents' Initiative

In March 1999 the Board of Regents of The Texas A&M University System unanimously passed a resolution establishing the Regents’ Initiative for Excellence in Education. With the passage of this resolution, the Regents became the first higher education governing board in Texas to formally call for renewed attention to this aspect of university programming. Through this action, the Board declared teacher preparation a priority of the A&M System, and advocated long-term, systemic improvements in both the quality and effectiveness of teacher education programs in A&M System universities. The resolution directed the Chancellor to establish measurable standards of excellence for A&M System teacher preparation programs, including production and performance targets. The Board also directed staff to report periodically to the Regents on institutional progress in achieving these goals.

In presenting this case study, it is important to outline the original purpose and rationale for this work within the A&M System. The Regents’ Initiative was undertaken in response to the rapid demographic changes occurring within the state’s population, and in particular, its public school system. Given the A&M System’s substantial interest in the long-term well-being of Texas public schools, as well as its traditional responsibility as one of the state’s leading providers of classroom teachers, the Regents were prompted to reemphasize the A&M System’s teacher preparation commitment.

At the time of passage of the Regents’ Initiative, A&M System universities, like most institutions of higher education in the state, were experiencing declines in teacher production. During the period from 1993-94 to 2000-
01, system-wide production of teachers decreased by over 14 percent. By the end of the 1999-2000 academic year, the A&M System universities were producing 300 fewer teachers compared to annual production rates of seven years prior. During this same time period, Texas public schools grew by over 400,000 students. Faced with such explosive growth and declining university production, Texas schools were experiencing significant shortages of certified teachers. The Initiative was undertaken in part to counter the declining pool of quality teachers, and to improve A&M System production to better meet the needs of its public school constituents.

The five-year goal of the Regents’ Initiative was to increase overall system-wide teacher production by 33 percent, including significant increases in the number of minority teachers and teachers in high-need teaching fields. The established five-year numerical targets were: African American Teachers—228; Hispanic Teachers—671; Bilingual/ESL Teachers—228; Special Education Teachers—433; Math Teachers—328; Science Teachers—514; and Foreign Language Teachers—88, and a total of 3,318 teachers.

In addition to their need for increased production, Texas schools were also faced with more challenging academic standards (in the form of the Texas Essential Knowledge and Skills test), as well as increasingly complex student populations. These academic and demographic changes clearly compel teacher preparation programs to assure that teacher products are better prepared and more accomplished than ever before. In this regard, the Regents’ Initiative has served as a vehicle for simultaneous improvement of the quality of teacher preparation experiences within the A&M System. As a means of continuous quality improvement, the system established performance benchmarks on the state’s teacher certification examination. In developing these program targets, the Chancellor afforded A&M System institutions with a five-year horizon (through January 2005) by which time all are expected to successfully achieve their respective goals. The data presented in this report covers the period from February 1999 (the actual launch date for implementation) through August 31, 2002.

The School-University Partnership Framework

The Regents’ Initiative is a performance-driven improvement model. The initiative focuses on a comprehensive set of 11 performance and/or production benchmarks which measure university progress simultaneously in increasing the quantity and quality of teachers. To achieve the Regents’ Standards for Excellence, institutions are expected to make exceptional progress in all target areas.

The Standards for Excellence and core strategies included in the Regents’ Initiative model provide a template for the type of institutional changes that will promote enhanced teacher quality and productivity.

</tr>
</tbody>
</table>

Since each university’s success will ultimately depend upon its ability to integrate these core strategies during the Initiative, a significant portion of efforts has been devoted to building the essential organizational and leadership infrastructure for long-term success. The program model includes:
- A set of seven program standards for A&M System institutions (which includes productivity and performance targets that exceed the nominal standards required by the state), and
- A set of nine core strategies, to be implemented by each institution in order to achieve the performance standards. The elements of the Regents’ Initiative model are depicted graphically in Figure 1.

The particular strategies incorporated in the Regents’ Initiative model came from the combined recommendations of a variety of system-wide PK-16 working groups such as the Council of School Executives, the Deans’ Working Group, and the Richardson Fellows for School-University Collaboration. Taken together, this constellation of nine core strategies comprises a long-term reform agenda for teacher preparation in the A&M
System. These strategies, which complement each other, are being implemented simultaneously on a university system-wide basis in order to achieve the magnitude of improvement specified in the performance goals. The basic strategies associated with the Regents’ Initiative may be summarized as follows:
- Active executive engagement and leadership in local PK-16 Councils.
- Enhanced community college partnerships.
- Active recruiting of outstanding teacher candidates, coupled with increased scholarship and grant opportunities.
- Ongoing professional development for university faculty involved in teacher preparation.
- Expanded public school partnerships.
- Coaching and mentoring A&M System graduates as they move into the teaching profession.
- Expanded educational research opportunities.
- Aligned university admissions and academic standards with public school graduation and content standards.
- Leadership development for public school and university instructors.

The specific program standards for the Regents’ Initiative include the following production targets:
- Increase annual system-wide production of teachers by 33 percent, to approximately 3,300 teachers annually by 2005.
- Increase annual production of Hispanic and African-American teachers by 64 percent and 90 percent, respectively.
- Increase annual production of math, science and foreign language teachers by 250 percent.
- Increase annual production of special education and bilingual/ESL teachers by 170 percent.

In addition to increasing the number of certified teachers, institutions must also demonstrate increased student performance trends on state certification examinations by 2005. Specific performance standards to be met by each institution are:
- All teacher preparation programs within A&M System universities will meet or exceed minimum performance standards for each demographic subgroup established by the State Board for Educator Certification.
- The percentage of first-year test takers in each demographic subgroup who pass the state-licensing exam will increase by a minimum of 20 percent, or achieve and maintain a pass rate of 90 percent.

The Regents’ Initiative for Excellence in Education, which was established by resolution of The Texas A&M University System’s Board of Regents in March 1999, has begun to reflect tangible improvements at all nine A&M System universities and for partner schools hiring the teacher-participants in the Regents' Initiative affiliated schools.

Results

Over the initial three years of the Regents’ Initiative, system-wide production has increased. This increase marks the first annual increase in A&M System teacher production since the 1993-94 academic year. The total production went from 2,291 in the baseline year of 1999-2000 to 2,742 in 2001-02. This represents a 20-percent increase. Eight of the nine A&M System universities show positive trends in the production of teacher candidates from year 1-3. Of those, Prairie View A&M University has increased its production by 115 percent over the three years of the Initiative.

All nine A&M System universities have achieved 50 percent or more of their respective targets. Furthermore, eight universities have maintained positive trend lines throughout the duration of the Initiative. Three universities have already exceeded their five-year targets for total production. The A&M System has also increased its minority teacher production since the implementation of the Regents’ Initiative for Excellence in Education. Since implementation, the A&M System institutions have experienced a 116-percent increase in the number of African-American teachers produced. The A&M System has also seen a 17-percent increase in the number of Hispanic teacher candidates produced over the three years (Figure 9). The System produced 509 Hispanic teachers in 1999-2000; by 2001-02, annual production had increased to 595. The five-year target is 671.

During the first three years of the Initiative, A&M System institutions have increased total output of bilingual/English as a Second Language teachers by 84 percent. In 1999-2000, the total number of Bilingual/ESL teachers produced was 121; by 2001-02, annual production was increased to 223. Six of the nine A&M System universities have experienced an increase in production from Year 1 to Year 3. Three universities have significantly increased their percentage of ESL production over the three-year period. The A&M System has achieved 98 percent of its five-year goal of 228 in bilingual/English as a Second Language. Furthermore, four universities have exceeded their five-year goals for bilingual/English as a Second Language. Seven of nine A&M System institutions have increased the number of special education teachers produced from Year 1 to Year 3. Five universities have increased their production by over 100 percent over that three-year period. Production of foreign language teacher candidates
also has grown by one-third from Year 1 to Year 3. In 1999-2000, the A&M System universities produced 38 teacher candidates in this high-need area; by 2001-02, that number had increased to 50 candidates. The five-year target is 88. Four of nine universities have shown increases in production from Year 1 to Year 3.

Comparing Current Results to Reviewed Literature

The successful performance results to date of the Regents’ Initiative efforts to increase certified teacher education, employment and retention are closely associated with several elements in the school-university partnership literature. In comparing effective practices outlined in Table 1 to the case study explored here, the following practices have been observed: 1) visionary leadership; 2) willingness to promote change; 3) open and ongoing communication; 4) stable and detail-oriented project leadership; 5) adequate financial support; and 6) acknowledgement of collaboration success. The actions associated with the identified effective practices associated with the Regents’ Initiative are identified in Table 2 below.

<table>
<thead>
<tr>
<th>Effective Practices Observed in the Current Initiative</th>
<th>Actions Associated with Effective Practices</th>
</tr>
</thead>
<tbody>
<tr>
<td>Visionary leadership</td>
<td>The Regents and university administration in collaboration with statewide schools identified the need and invested time, resources, and energy into an ambitious long-term plan aimed at moving the state in a positive direction. Such long-term plans are unusual and representative of vision and commitment by stakeholders.</td>
</tr>
<tr>
<td>Willingness to promote change</td>
<td>Regents, community/school leaders, and university leaders worked to effectively communicate and seek endorsement from key statewide stakeholders. Commitment was maintained throughout the stated</td>
</tr>
<tr>
<td>Open and ongoing communication</td>
<td>Communication between state, university, and school representatives continues regarding the reporting of progress and challenges</td>
</tr>
<tr>
<td>Stable and detail-oriented project leadership</td>
<td>The specificity of the Initiative and the steps needed to get there were well defined, achievable, and measurable. Central school-university partnership leaders were assigned to lead the project and were maintained over an extended period</td>
</tr>
<tr>
<td>Adequate financial support</td>
<td>Financial support for training, programs, administration, and retention efforts were provided to those implementing the Initiative</td>
</tr>
<tr>
<td>Acknowledgement of collaboration success</td>
<td>Regular reports, publicized newsletters, and public presentations to the Regents provided multiple streams for frequent acknowledgment of success.</td>
</tr>
</tbody>
</table>

Although all of the above effective practices have been observed as part of the Regents’ Initiative process, neither the literature supporting these categories, nor the current data available describing the case study under exploration provide information or measures associated with the degree to which these effective practices occur or could occur. Although our exploration of the outcomes associated with this case detail the aforementioned effective practices, space limitations for the current reporting format limit the detail we are able to provide. However, effective practices associated with available literature appear to be relevant and important to the achievement, thus far, of established performance goals. It is important to note that the school-university partnership dynamic is still emerging as schools and community colleges provide ongoing feedback to the TAMU system regarding the effectiveness of outputs associated with the Initiative.

Conclusion

Based on the descriptive findings, the TAMU Regents’ Initiative is working successfully toward accomplishing the goals set forth within the context of the school-university partnership. Under the current available data great strides toward teacher induction into Texas public schools has occurred. However, many of the other elements associated with the reviewed literature and the comprehensive school-university partnership framework set forth by the Regents’ Initiative remain unclear. Anecdotal data (not presented in this paper due to length restrictions) support that many of the effective practices identified in the literature are being demonstrated in the case study described here. Because the University Initiative has not yet completed its five year timeline, there is much more to be learned about this school-university partnership. However, because it is the first known comprehensive approach of its kind to address statewide teacher shortages, the model and the results are encouraging.

State Intervention of National Human Resource Development Policy: Korea Case

Hae-young Lee
Northern Illinois University

Sustained rapid economic growth in Korea has spawned ongoing debates over the role of the state. Given the link between economic growth and the state-led policies influencing human resource development (HRD), public policy on HRD is reflected in state’s interests. The main focus of this paper is to identify the variables and institutional mechanisms of state-led HRD policies that have been put in place as a strategic national agenda.

Keywords: HRD, State-intervention, Korea

Seeking to explain the relationship and interaction of economic development and state influences behind Korea’s industrial achievement, the leadership of government in economics and other social public policies has been playing a vital role and therefore, should be accounted for. This study attempts to identify the factors affecting state institutions that have a great influence on public policies especially human resource development (HRD) policies, and then addresses how proactive HRD policies at a state level are designed to make a difference in helping the state achieve the goals.

Introduction

HRD is an emerging educational and economic agenda in Korea. Many international agencies have conducted or supported research projects on the issues of social capital investment and workforce management. In particular, the Organization of Economic Corporation Development (OECD) routinely conducts research projects and publishes the Country Report and Cross-Country Analysis on the human resource issues such as lifelong education, vocational education, training and development of the workforce, and public schooling. Yet, most of the reports are oriented to the human resource management (HRM) perspective. In addition, many researchers have sought to better understand the impact of different national settings on the management task by conducting literature reviews of organization and cross-cultural management (Bae, J., Chen, S., & Lawler, J. 1998; Clark, Grant, & Heijltjes, 1999; Kim, 1999; Lindholm, 1999; Minehan, 1998; Molnar and Loewe, 1997; Rubens, 1995). However, despite the fact that most researchers have described the conceptual, theoretical, and methodological problems encountered and the solutions proposed, very little equivalent literature of state-level HRD policy exists.

As well known, the definition of HRD is different from that of HRM. Since this study does not intend to elaborate the debate on the definition of HRD, it simply accepts the definition that McLean and McLean have observed in their cross-national studies (2001).

Human resource development is any process or activity that, either initially or over the long term, has the potential to develop adults’ work-based knowledge, expertise, productivity and satisfaction, whether for personal or group/team gain, or for the benefit of an organization, community, nation, or, ultimately, the whole of humanity.

A little research has been conducted to grasp the role and function of national human resource development (NHRD) (Cho and McLean, 2002; McLean and McLean, 2001; Oh, 2002). Those studies focus on the different definitions of HRD across the nation, the significance of NHRD, the role of government, and the vision of NHRD as a national agenda. Thus, it is hard to grasp the dynamic mechanism between and among other economic, political, and social factors that affect the policy-making process of NHRD. According to the definition of the Korea Research Institute of Vocational Education and Training (KRIVET), NHRD can be defined as comprehensive societal efforts to effectively develop and utilize national capabilities as human resources so that it contributes to improving the quality of life and national competencies to survive in a knowledge-based economy of the 21st century (KRIVET, 2000)

This study has attempted to identify the factors that have an impact on state policy and interpret the interventions of the Korean government in relation to NHRD policy. Since the purpose of this study is not to investigate the attributes and causes of the economic development of Korea, the efficiency and effectiveness of state-led policies and practices have been put behind in this paper. Furthermore, the galvanizing issue of globalization or global divide is not the periphery of this study. Simply, neither examining the fundamentals of political economy nor seeking a solution to economy and society in transition is included in the property of this paper.

34-1
The Definition of NHRD Policy

Given the short history of NHRD in Korea, little research has been done on the issue. However, the Ministry of Education and Human Resource Development (MOEHRD) of Korea and several government-sponsored research consortia in Korea such as the KRIVET have been playing a leading role in shaping the strategic policies and implementing the NHRD programs in Korea. This study explores how the Korean government architect and implement public policies of HRD that cope with its economic growth and better performance.

The MOEHRD defines that NHRD policy is a comprehensive plan and practice to cultivate and empower the constituencies as human resource with competence, so that the nation and its people per se mutually benefit in a competitive economic environment (MOEHRD, 2002). It implies that HRD policy is a key engine ensuring sustainable development for both individual and society as a whole as well as being committed to a social and cultural environment. Moreover, the government takes initiatives and social accountabilities in educating and training people, distributing resource, and utilizing and managing the workforce. It might be fair to say that NHRD policy include macro- and micro-perspectives of public policy in nature. In this respect, it is to say that NHRD policy is a governmental intervention to facilitate the creation of tacit capabilities in individuals and firms that lack them by providing institutions for education, training, and research.

The Role of State in Public Policy

Over the past decades, much research has been done on the economic development of newly industrializing economies (NIEs), including South Korea, Taiwan, Singapore, and Hong Kong (Aoki, Kim, & Okuno-Fujiwara, 1997; Chang, 2000; Smith, 2000; Li, 2002; Mytelka; 1998). There are a myriad of factors that can explain the success and failure of the NIEs as late-comers to the international economy. As part of their economic development strategies, most governments of NIEs intervene in the market to affect resource allocation. Some research sustains that the role of government has been playing a critical role in formulating economic structure and boosting the development in many Asian nations, while others criticize the by-products such as in-equilibrium development and the concentration of national wealth. The only function of state policies is to increase a given amount of economic activity by stabilizing social conditions and stimulating inward foreign investment. Furthermore, state policies of industrial growth and social development intend to create new business and jobs, not simply distributing or re-distributing resources and industrial sites within the sovereignty. (Aoki, Murdock, & Okuno-Fujiwara).

There has been little consensus in understanding and analyzing the role of the state in economic development of Korea. Some claim, for instance, that state intervention in industrial structuring and economic process has played a positive role in miraculous economic growth. On the other hand, others posit that state is not a neutral institution; rather, it has its own political and economic interests. These arguments can be found between the so-called market-friendly perspective and developmental state perspective.¹ Diverse as they are in construct of the views and approaches, there is no clear consensus between two major perspectives what the role of state in economic growth is and how it is to be analyzed.

The basic assumption of state-led policy is that economic growth and performance can be enhanced and subsidized by education and other public supports for investment in new industries and technologies. In a small scale of economy, like Korea, “the role of state policy is critical in a way that it must become an arbiter and manager of the inevitable strategic conflicts (Aoki and the associates, p. 212).” It is because in such a small size economy there is always a high possibility that a few organized interest groups might dominate economic activities and even exploit resources. Aoki and the associates conducted a comparison study on the late industrialization countries including Korea, Taiwan, Finland, and Austria. The following is the summary of their observations (1996):

1. In all of the four countries, the state has been very powerful and interventionist, so that the practical organization of new investment has at times resembled that of the planned economies;
2. All have been extremely organized, corporatist economies where strategic decisions of economic and industrial policy have been taken in concert between the state and organized interest groups of business and labor;
3. In all of them, and in spite of the extensive planning, the state and the political establishment have been ultimately committed to the liberal market order and respect of private property as a principle;

¹ According to Aoki and the associates (1996), market-friendly perspective maintain its view that the state should confine its role in public policy, especially economic policies only to fostering coordination, while the developmental-state perspective asserts that the state can play a critical role in substituting for market coordination which often fails at the developmental stage of the economy. They regard developmental-state perspective as a close meaning of state interventionism.
4. In all of them, for various historical reasons, the state has been politically strong and has also been endowed with a large and competent bureaucracy;

5. In international politics, all of them were situated in a contested border-zone between the two ideological blocks of capitalism and communism and all of them were confronted with a threat of loss of sovereignty;

6. In all of them, however, the outcome of World War II had shaken or disrupted the established organization of interests groups, so that a new corporatist network had to be built in the aftermath of the war.

These observations have some implications to the state-led economic policies of the Korean government as follows:

1. the government sustain coherence and balance in planning and implementing its policies;
2. due to lack of resources and international pressure, the government is well aware that the consequences of economic failure are fatal;
3. competent bureaucracy establish public policies independently of organized interest groups.

According to Aoki and the associates (1996), the state-led intervention views “market failures as more pervasive for developing economies and thus looks to government intervention as a substitute mechanism for the resolution of these more prevalent market failures (p. 1).” This view regards the market as an alternative mechanism for resource allocation. In this perspective, the role of government is limited to providing a legal infrastructure for market transactions and providing goods subject to extreme market failure. Chang (2000) also elaborates that state intervention may be able to improve the free market outcomes and even makes it more efficient. In this regard, it is fair to say that the role of government and that of the market are considered as substitutes, providing the solution of market failure. Indeed, many claim that Korean economy is one of the most successful examples of state-led development during the postwar period. (Weiss, 2003)

However, since the turmoil of the late 1990s, the pressures of the market-opening measures and privatization imposed by the International Monetary Fund (IMF) have shrunk the leading and coordinating role of state in Korea. It is significant to note that the Korean governmental efforts forced by the IMF conditionalities after the financial crisis since 1997 have been mostly aimed at reducing the state’s role in liberating financial market and restructuring conglomerate-based industry. Along with the pressures, the impact of globalization in general has forced Korean government to re-consider so-called developmental state model in public policies. Ironically, a thread of evidence presents that the financial turmoil has little impact on the transformation of the state role in public policy. Furthermore, the Korean government has aggressively and successfully played a pivotal role in restructuring traditional industry and promoting new high-technology industry. Therefore, the evidence suggests that the normative question whether or not state intervention is bad or good seems to be troublesome. (Weiss, 2003)

The Influences on the Changes of NHRD Policy

The Advent of New Technologies

Information and communication technologies (ICT) as a spearhead of Knowledge-based new economy not only shortens a physical distance but it also removes communication barriers and the cost of transportations or transmissions. Yet, the question of whether this new economy may contribute to economic growth more than the old economy is too difficult to answer at this time. This new economy brings about the integration of economies in the global village. These forces contain profound influences on not only the behavior of individuals, firms, and nations as a whole but also the environment around them by making adequate and timely alterations to process and quality of products, human-related conditions, and regulations. Overall, this global economic integration results in increasing intense competition among nations, especially developing countries that traditionally depend on export economy, disadvantage in creating new knowledge-based industries, and lack in capital investment.

Since the advent of knowledge-based economy, many nations have responded to the trend by restructuring industry and cultivating a new and creative workforce. Although the Korean economy has successfully recovered from the financial crisis in the late 1990s, it is still in transition from a heavy industry economy to a knowledge-based new economy. It has been proved that labor-intensive industry is no longer able to sustain the growth of the Korean economy. In order to create a new market and thereby promote small and medium-sized information and communication businesses, instead of heavy-industry-based conglomerates, the Ministry of Information and Communication (MIC) reports that “the government is implementing a project to support these enterprises in developing core and applied technologies with a high potential for commercialization (2002).” For it, the Korean government realizes that in the new economy, a quality workforce is quintessential for ensuring sustainable development and surviving in the never-ending global competition as well.

ICT changes the way that education and training systems are structured and functioned. In the new economy, whether or not the basic economy regarding a workforce shaped by the law of supply and demand can
be applied is in doubt. New technologies and intense global competition may change the parameters and values of human resources. Yet, it is fair to say that the economic growth will continue to depend on the labor force and productivity growth. The Korean government is seeking to nurture new industries as a new driving force of economic development, by developing such core technologies. It is planning on investing billions of US dollars in core technology development as well as gradually increasing investment in basic and fundamental technologies in a short and long-term.

The Transformation of Politics and Economy

Korean government has a long history of playing an exclusive role in shaping and aligning public policies, allocating resources and so on. The state-led economic development plans have been stimulating economic growth through exports in Korea. Exports have shifted from primary goods to labor-intensive manufacturing goods, and then to capital, and information and communication technology products. One of the strengths of Korean economy traditionally lays in its well-developed middle and vocational school system and the early development of engineering training. As the industrial structure shifts, the societal demands of schooling have increased. For instance, the growing number of secondary-educated population played a role in expanding higher educational institutions in size. Even though its higher education institutions were not research-oriented, the increasing enrollment in university has been pushed higher since the early 1980s (Mytelka, 1998). Consequently, this requires to create more jobs for technological savvy population.

The Korean government has attempted to attract inward foreign investment (IFI). However, it is proven by the financial crisis in the late 1990s that this IFI increases economic vulnerability in case of unpredicted massive withdrawals. Due to the crisis, the Korean government has learned that an economy that loses foreign investment inflow experiences both domestic loss and competitive losses in the global market. As a result, the government came to recognize again that improvement in domestic conditions permits sustainable economic growth, which in turn attracts foreign investment. In this regard, it is fair to say that the domestic conditions of economic stability, consistent public policies, and quality workforce are all domestic attributes that attract and hold IFI for sustainable economic growth (Li, 2002).

However, because of the mobility of foreign capital and competition with other developing countries, coupled with standardized manufacturing production and information flow, Korea has to demonstrate the quality and productivity that may guarantee IFI and domestic investment as well. Li asserts that “the quality of human capital is another key factor in the success of Asian economies.” (p. 162) Like other NIEs, the investment and development of education and training systems in Korea have assisted the improvements of labor productivity.

As competition rises from neighboring low-wage countries, especially after the financial crisis, labor-intensive production would subsequently erode Korea’s competitiveness in exports and foreign investment. Korea needs a new engine, a responsive one for competing in an international market. The Korean education and training system has adjusted to a rapidly changing industrial structure by changing school curriculum and providing diverse training programs (Park, 2001).

Social and Cultural Changes

Although Korea has recovered relatively quickly from the financial crisis in the late 1990s, this event has had a shocking impact on the management system of firms and the cultural values of society. This event has forced employment restructuring, thus causing increase in unemployment. Lifetime employment no longer exists and the loyalty toward organizations has dramatically decreased. Seniority-based incentive systems have shifted to meritocracy or license-based systems in both public and private sectors. In this context, OECD suggests that the provision and expansion of retraining programs for the newly unemployed and the existing workforce are becoming especially important (OECD, 1998). The Korean government, therefore, has to significant extent obligation to appropriately respond to it.

In addition, the demographic composition of Korea in terms of the workforce has changed. In the Korean labor market, employment and production in manufacturing industries are reducing in size. This tendency is predicted to continue and grow stronger. The statistical prediction was that by the year 2000, the workforce in manufacturing industries would be reduced to 22.8% of the total workforce from 23.3% in 1995. OECD reports (2002) have projected that even within the manufacturing itself, high-tech and knowledge-based industries will be emphasized, causing a new demand for a specialized and highly educated workforce instead of a simple- and semi-skilled workforce. One of the most significant factors that has accompanied the economic growth in the NIEs is the principle of ‘shared growth’. Under this culture, education has brought the accumulation of human capital, which has also contributed to a high-quality workforce. Because of this, economy comes to house and utilize skilled workers. (Aoki, Kim, & Okuno-Fujiwara, 1996)

Also, according to the MIC (2002), the proportion of the aged, female, and the youth is expected to increase. To this end, the number of economically active population also shows a steady increase, which makes the inevitable enforcement of all measures concerning job security and utilization of human resources for those people.
Policy Responses of NHRD

Institutional Formation of NHRD Policy

In order for the Korean government to successfully cultivate quality workforce and proliferate the new industries, a comprehensive and collaborative planning is required to coordinate multiple ministries in the government so that it increases the effectiveness of resource distribution and social accountability. Furthermore, this new strategy is to respond in a timely manner to economic change and meet the demands of the workforce. As a result, MOEHRD (2003) comes up with six strategic industries such as ‘Information technology (IT)’, ‘Biology Technology (BT)’, ‘Nano Technology (NT)’, ‘Space Technology (ST)’, ‘Environment Technology (ET)’, and ‘Culture Technology (CT)’.

In 2001, the Korean government came up with a grand strategic NHRD plan that the ministries and governmental agencies ought to interdependently collaborate on cultivating right and competent brains for strategic industries. For it, the individual ministry must identify which strategic industry or industries it will take in charge of and come up with their own strategic NHRD plans. The Cabinet Committee presided by the President recognized that each department has taken charge in a specific industry in terms of designing and implementing NHRD policies: MIC for IT, MOST and MOCIE for BT and ST, MOST for NT, MOE for ET, and MCT for CT. Each department has come up with a comprehensive planning containing target industries, budget, timetable, implementation process, and joint-council with the private sector. This idea is to overcome the limit of state-led policy and extend policy capacity.

Park (2001) describes that a vocational education and training system in Korea have been conducted by two governmental departments. One is a vocational education, which is under supervision of the Ministry of Education, a former MOEHRD; the other is a vocational training system, which is under the power of the Ministry of Labor (MOL). Later on, the Korean government created a new department of the MOEHRD in 2001. Although the state-led policy emphasizes the role of intra-state mechanism, the Korean government also recognizes that various inter-organizations between government and the private sector play a significant role in resolving possible market failures by exchanging information.

Table 1 demonstrates the brief explanation of two major councils such as ‘the Council on Education and NHRD Policy (CENHRD)’ and ‘the HRD Committee (HRDC)’ that they are committed to shaping and implementing NHRD policy along with the Korean government (2002). This table shows evidence that the Korean government is not solely rationalized by the state-led models. In addition, this effort to form collaborative councils underlines the notion that a well-defined administrative infrastructure reinforces the implementation capabilities of the state.

There is no doubt that successful implementation of NHRD policies requires smooth coordination among the ministries and civilian experts to bridge the caveats and eradicate, or at least lessen the unnecessary overlaps among the sectors. It requires the cooperation of the business sector and the general public. In this respect, the formation of the councils shown above is a good example of the shift of decision-making process to corporate mechanism from an elite or authoritarian type of governance of Korea. The councils consist of ministers or vice-ministers of each ministry who are in a high position to make terminal decisions on policy. The Korean government invites civilian experts and people from civil organizations. Through this relatively open and comprehensive decision-making mechanism, it is believed that the social accountability of public policy would
be enhanced. Due to this, the function of two major councils is to prevent the failures that have oftentimes been caused by the conflict of interests among the governmental agencies. In addition, by working with the private sector and external professionals, the flexibility and timeliness of public policy would be increased.

Policy Approach to NHRD

Since the International Monetary Fund (IMF) bailout, the Korean government has been working hard to create jobs and restructure its industrial structure (MOEHRD, 2003). Given the lack of capital accumulation, and the shortage of knowledge workforce and technologies, the strategy that the government has chosen is ‘Choice and Concentration’. Through searching for new strategic economic engines, the Corporate Korea has attempted to survive in unlimited and undifferentiated global competition with advanced nations and other NIEs. It believes that knowledge-based industries will determine the future of the nation. In this respect, it is convinced that the core workforce with competency will play a critical role in economic recovery and sustainable development. Pepper asserts, “one of the most obvious implications of the changing basis of competitive success is the growing importance of having a workforce with adequate skills (1994, p. 16).”

To address the problems caused by the external and domestic demands to the Korean economy, including the workforce training and development sector, the government has pursued several primary policy measures to increase the competency of the nation. The followings are four dimensions in the NHRD policy that the MOEHRD recently has made a report to the public (2002):

1. Administrative and legal establishment;
2. Effective education and training system;
3. Interwoven mechanism among the existing institutions;
4. Infrastructure for further development.

Based upon the report of MOEHRD (2002), the major projects that each dimension focuses as follows:

1. Administrative and Legal Establishment;
   - Remodeling and empowering coordination of NHRD policy within the government
   - Formulating roadmap of NHRD policy
   - Enacting HRD Law
   - Shaping a grand plan for demand and supply of workforce at national level
   - Promoting HRD policy at local level
2. Effective Education and Training System;
   - Enhancing primary and secondary education
   - Supporting drop-outs
   - Providing quality education for marginalized and rural area
   - Promoting science and technology education
   - Supporting education for the gifted
   - Empowering higher education and R & D
   - Establishing vocational education for all
   - Formulating a grand NHRD plan for strategic business
   - Shaping HRD programs for service industry
   - Training professionals in culture industry
3. Interwoven Mechanism among the Existing Institutions;
   - Encouraging female workforce employment
   - Promoting HRD in private sector
   - Developing HRD programs in public sector
   - Expanding co-op programs
4. Infrastructure for Further Development;
   - Assessing the processes of NHRD
   - Investing and analyzing NHRD projects
   - Employing the evaluation of the effectiveness of NHRD projects
   - Establishing database of NHRD
   - Promoting library network

Based upon the recent proposals and reports by the Korean government on NHRD policy for boosting six strategic industries, this paper explores how the Korean government is carrying out the NHRD policy and its programs to ensure the success of the grandiose agenda. The following is a brief summary of the NHRD polices of the six areas (MOEHRD, 2003):

1. Reforming university curriculum;
2. Extending co-op programs with industries;
3. Promoting a brain-exchange program between the private sector and university;
4. Employing overseas experts;
5. Supporting oversea training programs for graduate students and university faculty;
6. Establishing database and network, domestically and internationally;
7. Supporting R & D and HRM/HRD in the private sector.

With the expansion of the ICT industries and the increasing information and technology orientation of an old economy, the demand for ICT specialists has rapidly increased. By the end of 2005, it is estimated that there would be a shortage of 140,000 such workers (MIC, 2002). In order to improve the quality of education and training institutions, the Korean government will have to invest billions of US dollars in renovating education and training facilities, promoting research activities in higher education, financially supporting private firms for developing software, and encouraging training programs for instructors.

Conclusions and Implications

The Korean government has shifted its public policies from highly interventionist to more open and liberal since the 1990s. As examined in this study, it seems obvious that the Korean government has attempted to coordinate and collaborate with the business sector and the civilian experts from the planning of public policy through the assessment of it. The main purpose of the policy efforts of the Korean government is to mobilize the social support and promote the participation and commitment of the private sector on behalf of successful NHRD policy.

This study has mainly focused on the factors architecting the current NHRD policy and institutional mechanism initiated by the Korean government. Even though the analysis of the NHRD policy of Korea in this paper emphasizes the positive contributions of an extended role of state to economic growth, it must be noted that this study is not totally committed to an anti-market aspect or a rigid interventionism. It may be worthwhile to analyze what can be done by state-led interventions and what determinants of state-led economic policies seem to be conducive to success.

There has been a period of time that a state is the only legitimate entity to sculpt and implement public policies. Yet, the demands for the state attitudes toward public policy, including HRD, require that the traditional state-intervention be defused and instead, advocate the partnership between and among bureaucrats, technocrats, and civilian sectors. As seen above, many ministries and civilian experts are involved in the formation and implementation of NHRD in Korea. This emphasizes the efficiency of communication among the participants in a decision-making process. In many cases, intra-governmental conflict stemmed from policy shift is often crucial to successful implementation. In this respect, the newly-established councils are expected to function as coordinating instruments through planning and assessing the policies.

It is difficult to conduct a scientific analysis of NHRD policy and its management, for it is a complex process involving political, economic, administrative, and socio-cultural factors. As far as the government-issued documents concerned, it is still unclear how the Korean government assesses the large-scale and long-term NHRD policy. In addition, it is significant to note that there is always a big political issue, when there is a big money in public policy. For instance, given that the Korean government is planning to invest a great amount of budget into NHRD over years how to adequately keep the policy priority of resource allocation from political interests is central to the success of NHRD policies.

It is of note that the determinant factors of the economic growth of the late-comers, like Korea, in international market are different from those of the mature economic countries. Important issues emerge from this study of the transformational adjustment of the Korean NHRD policy in association with economic development and industrial restructuring. The notion of transformational adjustment refers to multifold phenomena, a short-term adjustment, and a long-term and substantial restructuring of a nation. It implies that in order for NHRD policies to be efficient and effective, there are several issues that must be examined such as the effect and function of the private sector in designing and implementing the public policy, the domestic capacity fulfilling the given policy goals, and the issue of Research and Development in the business community.

The followings are several topics for future research:

1. To what extent are NHRD policies and practices internally consistent – compatible with each other;
2. To what extent are NHRD policies and practices externally consistent, in that they are likely to produce the kinds of skills and behaviors necessary to compete given the state’s intended strategy and the competitive environment it faces;
3. To what extent are NHRD policies and practices likely to produce the skills, competencies, attitudes, and behaviors necessary to implement the state’s intended strategies?

Needs Assessment for Career Development Programs in the Taiwan Power Company (TPC): A Factor Analysis of Employees’ Career Development Needs for Their Present and Future Positions

Yi-Hsuan Lee
Walter Stenning
Texas A & M University

A needs assessment was conducted for Career Development Programs in the Taiwan Power Company (TPC). The results of the needs assessment were subjected to factor analysis. The purpose of the study was to identify the factors underlying organizational career development interventions toward the employees’ career development needs for present and future positions.

Keywords: Organizational Career Development Programs, Needs Assessment, Factor Analysis

People from all walks of life not only call for material enjoyment, but also psychological contentment (Beach, 1980). Leaders of organizations have thus shifted their focus more to the technological, social, economic, and psychological needs of their workers. Researchers and practitioners have been devoted to creating and designing appropriate career development programs in order to meet the changing needs of individuals and organizations.

Previous researchers have indicated the benefits for organizations to establish career development programs (Beach, 1980; Leibowitz, Farren, & Kaye, 1986). They include: (1) provision of equal employment opportunities, (2) improvement of the quality of working life, (3) retention of high talent personnel, (4) avoidance of the obsolescence skills, (5) increased loyalty of personnel, (6) improved utilization of employees' skills, (7) enrichment of the present job, and (8) an increase in job satisfaction.

Designing an effective career development program requires a system approach (Leibowitz, Farren, & Kaye, 1985). According to Walker and Gutteridge (1979), “the apparent key to making career planning effective is commitment to applying specific practices to satisfy the needs of specific employee groups… General programs rarely get off the ground” (p. 3). Therefore, the design of the career development program must be directly linked back to the specific needs of the target group or to the problems within an organization in order to make adequate justification of the expenditure of time, money, and resources. Human resource development professionals need to find ways to identify the specific needs of employees, managers, and organizations in order to efficiently allocate limited resources.

Theoretical Framework

Organizational Career Development

According to Gutteridge (1986), career development refers to “the outcomes of actions on career plans as viewed from both individual and organizational perspectives” (p. 52). Since the 1970s, career development has been transformed from tools facilitating individual growth to approaches linking with organizational strategies and development. Thus, the purpose of career development is to assist employees in analyzing their abilities and interests in order to match the needs of the individual to the needs of the organization (Gilley, 1997). The term “organizational career development,” as defined by Gutteridge, Leibowitz, & Shore (1993), refers to the process of a planned effort to link the individual’s career needs with the organization’s strategies and development. Gutteridge et al. (1993) propose three assumptions associated with the field of organizational career development. First, development is an on-going process. The career development system is aligned with Human Resource structures and procedures, and the initiatives of the organization. Second, employees, managers, and organizations play varying significant roles in a career development system. Third, system thinking is a principal concept to organizational career development. Within the career development system, the individual is responsible for career planning, including the process of setting up employee career goals, and developing activities to achieve the goals, and the organization is responsible for career management, representing the organizational perspective, and setting activities (Gutteridge, 1986).

Needs Assessment

The specific needs of individuals in career planning should be understood before a career development program can be implemented. The tasks of needs assessment can help provide information required to customize a career development program, and can ensure that the important issues and needs that surface are broad enough to warrant extensive intervention (Leibowitz, Farren, & Kaye, 1986). Hence, conducting a needs assessment is the first step and critical stage in designing a career development program.
Many researchers have suggested a number of frameworks for conducting needs assessment (Altschuld & Witkin, 2000; Hammond, 2000; Kaufman & Triner, 1996; Leibowitz, Farren, & Kaye, 1986; Leigh, Watkins, Platt, & Kaufman, 2000; Steadham, 1980).

The frameworks can be categorized into three phases: (1) preassessment, which explores the context and environment of the perceived problem in order to identify needs before analyzing them; (2) assessment, in which data gathering is the primary activity; and (3) postassessment, in which the major tasks are assessment, clarification, and preliminary prioritization occurred in the second phase. The most common techniques used for conducting needs assessment are interviews and questionnaires (Leibowitz & Schlossberg, 1981). The questionnaires are relatively inexpensive, can reach a large number of people in a short time, give opportunity for expression without fear of embarrassment, and produce data easily summarized and reported (Steadham, 1980; Leibowitz & Schlossberg, 1981). In view of these advantages, the questionnaire survey is the most proper way to conduct needs assessment in a large-scale organization, such as the TPC.

Organizational Career Development Programs

Gutteridge (1986) described the generic practices that must be incorporated into the comprehensive organizational career development system. The six areas of the practices include: (1) employee self-assessment tools, (2) an organizational potential assessment process, (3) internal labor market information exchanges, (4) individual career counseling and career discussion, (5) a job match system, and (6) developmental programs (p. 61). In Russell’s (1991) review of career development literature in the United States over the last 2 decades, 35 different commonly used organizational career development interventions were identified. She modified Gutteridge’s (1986) taxonomy of career development programs, and then formulated her own seven categories of career development programs. They were: (1) self-assessment tools, (2) individual counseling, (3) information services, (4) organizational assessment programs, (5) developmental programs, (6) programs to address issues confronting employees at various career stages, and (7) career programs for special target groups. Hoffman (1997) examined 32 of the 35 career development programs by conducting factor analysis. Factor analysis resulted in seven factors, which accounted for approximately 61% of the total variance. However, the factors resulting from the study were not grouped the same as Russell’s categorization. Additionally, Leibowitz, Farren, and Kaye (1986) suggested some career development programs that can be implemented in the organization. Hence, this study incorporated career development programs from previous studies to form the content of the questionnaire.

Statement of the Problem

For a long time, the Taiwan Power Company (TPC), a state-run enterprise, has played an important role in supplying power to support Taiwan’s economic and industrial development. At present, two critical governmental policies have strongly impacted the organizational structures of TPC: (1) liberalization of the power industry, and (2) privatization of the TPC.

The TPC is now facing several critical issues in the transition to privatization, such as organizational restructuring, and employee demoralization. Improvement of productivity also needs to be addressed. Hence, how to keep employees committed to the organization and how to improve their performances become important to the TPC during the time of privatization.

After conducting a study of the TPC employees’ career planning, education, training, and performance in a publicly owned organization, Chang (1999) indicated that the establishment of a well-designed career development system might lead to higher employee satisfaction, which could further improve productivity and performance. Lin (1998) discovered that more than 78% of the employees in one of the TPC’s departments agreed that they were at career plateaus, and only 49% of the employees were satisfied with their career development.

Considering the significant results of these studies, implementing a career development program is an efficacious approach to enhancing the employee’s organizational commitment and improving the employee’s performance and productivity. Tsay (2001) indicated that a career development program not only assists employees in planning their career according to the organizational working requirements and strategies, but it also improves the employee’s motivation. Hence, it is imperative that training programs should include the career development program. Since the TPC does not include the career development program in their current employee training programs, it is suspected that a sound career development program would be beneficial to the company.

Research Questions

The proposed study intends to investigate white-collar employees’ career development needs in the TPC. A needs assessment was conducted for planning future career development programs for employees in the company. The results of the needs assessment were subjected to factor analysis, since factor analysis is an essential tool in helping a researcher explain the multitude with the greatest parsimony of explanatory constructs.
by identifying the factors which are underlying hypothetical constructs (Shafiee, 1994; Tinsley & Tinsley, 1987; & Hoffman 1997). Additionally, organizational career development researchers (Russell, 1991; Gutteridge, 1986; & Leibowitz, Farren, & Kaye 1986) categorized the career development interventions by their own logics. Hence, the investigation focused on identifying the construct underlying the organizational career development interventions. The purpose of the study was to identify the factors underlying organizational career development interventions toward the employees’ career development needs for present and future positions.

The research questions of the study included:
1. What are the factors underlying the constructs of the organizational career development interventions in the needs assessment questionnaire?
2. What factors are contained in the career development interventions in terms of the employees’ career development needs for present and future position?
3. What are the differences between the factors underlying the organizational career interventions with regard to the present position and future position?

Methodology

Setting
The Taiwan Power Company (TPC), established in 1948, is the agency responsible for developing, generating, supplying, and marketing electric power for almost the entire Taiwan area. The government owns 90% of its stock, and 10% is owned by non-governmental institutions. There are 26 departments in the TPC, including its headquarters in the city of Taipei, and nearly 80 units distributed over the Taiwan area. The mission of the TPC is to offer diverse services to satisfy the needs of customers, to promote the nation’s competitiveness, and to secure its shareholders’ and employees’ reasonable rights.

Population and Sample
The TPC’s operations require a large, talented professional workforce, including over 15,000 white-collar employees and over 12,800 blue-collar employees employed in the summer of 2000. The population of the study was 14,850 white-collar employees. The 14,850 white-collar employees can be further classified in terms of job function and job role based on the statistics provided by the TPC personnel department.

Using the newest general and demographic information about the employees in the TPC that was gathered from computer records at the personnel office in February 2002, the researchers conducted stratified random sampling based on job function (technology, management, and business) and job role (upper-manager, line-manager, and employee), as defined by the TPC’s personnel department.

Data were collected by means of interoffice mail, and human resource representatives at each division distributed surveys to 1,636 white-collar employees. Between July and August of 2002, 1,351 surveys were returned, for an overall response rate of 82.5%. In total, data used in the study were obtained from 1,332 usable survey questionnaires. The final sample consisted of 1,067 male white-collar employees and 240 female white-collar employees. The sample consisted of 12.3 % upper-managers (n=167), 26.9% line-managers (n=364), and 60.5% employees (n=818). Additionally, the sample consisted of the following breakdown by classification: technology 51.6% (n=697), management 26.8% (n=362), and business 20.2 (n=273).

Instrument

Based on the reviewed literature, researchers developed a survey questionnaire, entitled the “Career Development Need Assessment Survey.” The instrument was a paper-pencil questionnaire. A five-point Likert-type scale was selected for the items with a range from 1 (strongly no need) to 5 (strongly needed). The selected-response items were constructed for requesting the demographic information of the participants. Four experts in the field of human resource development and career development were asked to evaluate the content validation of the survey questionnaire. Seven middle managers with more than 10 years’ working experience in the TPC, representing the different departments in the company, were asked to review the content of the questionnaire. The preliminary 33-item questionnaire was pilot tested on 36 employees in the company. Revisions were made based on comments and suggestions from the employees in the company who had administered the questionnaire. The final survey questionnaire contained 33 items with the scale combining two subscales measuring the degree of the needs of the career development interventions toward the respondent’s present position and future position. In the questionnaire, the 33 items are the 33 career development interventions that were taken from prior relevant studies (Russell, 1991; Leibowitz, Farren, & Kaye, 1986, & Hoffman 1997).

Data Analysis

The study was designed to investigate the underlying constructs of the 33 career development interventions and the differences in the patterns of factor formation among present and future positions in regard to the employee’s career development needs toward the 33 interventions. To detect possible differences in the patterns of factor formation among the present and future needs of career development intervention in the first two subscales, a separate factor analysis was performed for the two subscales.
According to Walsh and Beze (2001), factor analysis is used to investigate the underlying structure or basic dimensions of a set of variables, to reduce a set of variables to a smaller one, and to provide evidence to support the construct validity of a measuring instrument. Hence, the responses on all 33 career development interventions were subjected to factor analysis to assess which items were intercorrelated, to establish their internal reliability, to explore the underlying structure in the needs for the 33 items, and to reduce the set of variables in order to simplify further data analysis in the study. The items for both subscales were analyzed using principle component analysis. Factors with eigenvalues greater than 1.0 were retained. The initial factors were rotated with a Varimax procedure for interpretation. The items loading criterion of .30 was used to select which items were interpretable (Gorsuch, 1983, & Tinsley & Tinsley, 1987). Factors that emerged were tested with an Alpha Internal Consistency estimate using the Cronbach Alpha.

**Limitation**

The study was limited by the disadvantages of questionnaire surveys. The questionnaire survey makes little provision for free expression of unanticipated responses (Steadham, 1980). Besides, this research is limited to the study of a power company in Taiwan; hence, the results may not generalize to other kinds of organizations.

**Results and Discussions**

**Factor Identification in Regard to Employees’ Career Development Needs for Present Positions and Future Positions**

The alpha coefficients of the two subscales in the first scale were 0.93 and 0.94, respectively. Synthesized versions of the items included in each factor, item loadings, and factor reliabilities are presented in Table 1 and Table 2.

The six factors accounted for approximately 55 percent of the total variance for present positions and 55% of the total variance for future positions. The factor titles were assigned by the researcher based upon the content of the items and with reference to prior relevant research (Hoffman, 1997; Russell, 1991; & Leibowitz, Farren, & Kaye, 1986).

Alpha internal consistency estimates were generated for each factor, using the Cronbach’s Alpha. The number of items per factor, and the alpha estimate for each factor are also demonstrated in Table 1 and Table 2.

**Discussion**

Factor I (Career Information, Resources, and Assessment Programs) was found to be important by previous researchers. Seven of the nine career interventions in Factor I are the same items as the first factor reported in Hoffman’s factor analytical study of employees’ perceived obligations for career development in the United States. The factor indicated the internal labor market information/placement exchange opportunities in the company (e.g. career ladders, a career resource center, career counseling, and a job posting system). In addition, the career planning workshop, career workbook, assessment centers, and psychological testing were identified as self-directed activities for individual self-assessment in order to allow employees to undertake the career development process in accordance with their own needs and desires, and as methods to assess and offer valuable information for organizations about employee career development (Gutteridge, 1986; Russell, 1991; Hoffman, 1997; & Leibowitz, Farren, & Kay, 1986). The programs related to career information and assessment in the first factor accounted for the most variance (nearly 15%), indicating employees’ needs for more information and resources regarding career development, as well as an interest in self-assessment for knowing more about their career interests and attitudes. This may reflect the fact that the company did not provide developmental programs, which directly related to career development and information. Thus, Factor I was named “Career Information, Resources, and Assessment.”

In a study of 926 employees from a manufacturing firm, Rothenbach (1982) indicated that employees who vary in demographic background have different career interests, and that organizational career programs need to meet the needs of their various employee groups. Factor II (Career Programs for Special Target Groups) reflects this point by representing the career development interventions that are designed for the specific groups or employees at specific career stages in the organization, such as preretired workers and older workers (preretirement counseling workshops, workshops on older worker issues, and incentives for early retirement); terminated employees (outplacement programs); supervisors (career counseling training); and women and minority employees. Career programs for special target groups accounted for the second most dominant variance, and suggest the attached importance of the needs for specific groups in the company.

Factor III (Programs to Assist Employed Spouses and Parents) involves a strong association with work and family initiatives, and addresses the needs of employed spouses and parents, including dependent care services, paid and unpaid leave, job-sharing programs, work-family programs, flexible work arrangements, and policies for the needs of dual-career couples. This factor is consistent with Russell’s (1991) categories for organizational career development interventions to assist employed spouses and parents, and it is the fourth factor reported by Hoffman’s factor analytical study.

Factor IV (Career Programs for Professional Development and Growth) mostly related to the career programs that assist employees in developing and improving their job skills and performances. According to Russell’s (1991) and Gutteridge’s (1986) perspectives, the developmental program included mentoring programs, job rotation programs, tuition refund programs, and internal training programs. Developmental programs comprise skills assessment and the different kinds of training programs needed in order to provide opportunities for professional growth and development and prepare for future positions.

Factor V contains the career development programs associated with potential assessment processes for assessing employees’ career potential (Gutteridge, 1986, & Gutteridge, Leibowitz, & Shore, 1993). Promotability forecasts and succession planning both involve providing developmental activities for high-potential individuals in order to groom them for higher positions or to determine several backups for senior positions. Future forums and career advisers or functional representatives should respond to the employees’ needs for current and future career development opportunities outside and within the organization (Leibowitz, Farren, & Kaye, 1986). Factor V was named “Programs for Potential Assessment Process.”

* Percentage of total variance accounted for appears in parentheses.

Factor VI consists of only one career development program—downward moves for employees. There are three reasons for retaining this factor. Although it only accounted for 3.5% of the variance, the Eigenvalue was greater than 1.0, and the factor loading was 0.79. This program is the only intervention which makes a negative result for employees’ benefits, although it presents to replace the possibility of laying off employees and the policy of organizational streamlining. In addition, the program could be partly explained by the employees’ concerns about the recent economic recession in Taiwan and privatization policies in the organization.

The Comparison of Career Development Needs for Present and Future Positions

The comparison of the results of factor analysis for present position needs and future position needs points to a different pattern of factor information for employees’ present needs and future needs for career development interventions.

The items contained in the first and second factors toward the future needs of career development programs are identical with the results of the present career needs, except for Item 1—training to perform the current job—which emerged in the first factor of the future career needs. Hence, Factor I (Career Information, Resources, and Assessment) and Factor II (Career Programs for Special Target Groups) are stable in the results of the two factor analyses, and indicate that they are the most important factors for employees’ consideration of career development needs in regard to present and future positions. However, Item 1—training to perform the current job—which showed in the fourth factor in present career needs, jumped to the first factor in regard to future position needs and appeal with an increased loading at the same time.
Factor III in the future career needs was found to be Programs for Development and Professional Growth, which was identified as Factor IV in the present career needs. The result could be explained in that the developmental needs are perceived to be more important in the future position than in the present. This may reflect that employees consider professional development to be important in order to meet the needs for future positions.

Factor IV, Programs Related to the Potential Assessment Process, presented in the factor analysis with regard to the future career needs, was different from the present career needs. Two items, psychological testing and assessment centers, moved from Factor I in present career needs to Factor IV in future career needs. The result corresponds with Gutteridge’s (1986) categorization about the career development programs for potential assessment processes. The assessment centers can be used to evaluate the capability of employees to assume managerial responsibilities at higher levels, while the psychological testing can serve as an important technique for executive selection.

The factor related to assisting employed spouses and parents was downward-moved to the fifth factor in future career position needs. This may imply that the need for balancing work and family issues will decrease in future positions.

The program of downward moves for employees presented to be the last factor and consisted of only one component for both present and future career needs. This finding may reveal that employee’s concerns about the organization’s restructure and the current economic recession in Taiwan will have an impact on their present and future career development.

Conclusions

As mentioned earlier, the design of the career development program must be directly linked back to the specific needs of the target group or to the problems within an organization. The study identified the factors underlying the organizational career development programs toward the employees’ career development needs for present and future positions. Most findings can be supported from relevant studies (Gutteridge, 1986; Gutteridge, Leibowitz, & Shore, 1993; Hoffman, 1997; Leibowitz, Farren, & Kaye, 1986; & Rothenbach 1982). The results of the study suggest that a more comprehensive career development program to meet employees’ present and future career needs is necessary. The organizational development system needs to be inspected frequently in order to meet employees’ career development needs. It also suggests that the TPC can give more weight to the programs related to career information, resources, and assessment, and the needs for specific target groups, like older employees, female employees, and supervisors, which cannot be neglected when designing career development programs.

The specific needs within the different job roles and job functions of employees should be investigated in order to customize career development programs. It is suggested that a comparison of employees’ career development needs among other similar scale public sectors and private sectors could be made to identify if the employees’ career needs can be explained by other factors.

The study demonstrated different career needs patterns in terms of employees’ present and future positions. HRD professionals can apply this framework to design more comprehensive career development programs. The study also established a needs assessment framework that HRD practitioners can use to conduct needs assessment for career development programs in similar organizations.

Additionally, organizational career development researchers (Russell, 1991; Gutteridge, 1986; & Leibowitz, Farren, Kaye 1986) categorized the career development interventions by their own logics. Hence, the investigation can contribute to a more valid and reliable construct underlying the organizational career development which is viewed as one of significant function of HRD.

References

The People’s Republic of China (PRC) faces unique challenges and opportunities in developing its tremendous human resources. Since its policy of “reform and open-door” initiated in late 1970s, China has taken a steady move in establishing a nation wide policy of developing human resources and adopting practical measures of implementation. This paper identifies key themes of developing human resources as a national policy and effective measures.

Keywords: Human Talent Development, National Policy, P. R. China

Human resource development (HRD) has been traditionally viewed as a process of training and development for the purpose of organizational performance. In North American, HRD has been regarded as organized training and development efforts for the purpose of improving individual and organizational effectiveness. A widely used definition is: “HRD is a process for developing and unleashing human expertise through organization development and personnel training and development for the purpose of improving performance” (Swanson & Holton, 2001, p. 4). However, McLean and McLean (2001) observed that definitions of HRD around the globe have been determined by contextual factors even though the most common definitions of HRD in the USA have influenced definitions around the world. It has been pointed out that HRD professionals in various countries have different tasks for their work and diverse perceptions of what they should do. Consequently, it is crucial to identify social and cultural contexts that shape the conceptualization of HRD across different nations. Furthermore, HRD conceptualizations in developing countries are normally not well represented in the English literature. Given the increasing presence of globalization and steady impacts of HRD in global economy, it is important to recognize those conceptualizations of HRD from the perspectives of developing countries.

While the dominant US approach to HRD focuses on the organizational outcomes such as performance and growth, HRD has been perceived to have implications not only for organizations, but also for individuals and nations as well in many Asian countries (McLean & McLean, 2001). HRD theory and practice in the US has been built on a market-oriented economic system and individualistic culture (Yang & Zhang, 2003). On the contrast, the People’s Republic of China (PRC) is a country with a strong collectivist cultural tradition and is experiencing economic transition from central-planning system to a market orientation. Therefore, an examination of HRD as a national policy and its role in national economic revitalization in China will reveal valuable insights of social and cultural determinants for HRD scholars and practitioners.

During recent years, most of industrialized countries have been struggling to get economic recovery and China has experienced a steady growth. Compared with two decades ago when the economic reformed started, China's economic growth has witnessed remarkable changes from economic aggregate, growth rate and the mechanism, industries, markets and concepts supporting them. One International Monetary Fund (IMF) expert predicted that China's economy could achieve an eight to ten percent growth rate in a quite long period of time (Anonymous, 2003). Given the current success of economic revitalization in China, there are many research questions worth exploring for a better understanding of HRD policy and its role in a developing country, such as how national HRD policy in China has been formed, what the major social and cultural factors are that determined the formation of HRD policy and strategy in China, what the HRD issues and challenges faced by a developing country are, and what the Chinese characteristics of national HRD policy and strategy are.

The purpose of this paper is to identify strategies of developing human resources at the national level. Specifically, this paper intends to address the following questions:

1. What is the indigenous concept of HRD in China?
2. What are the key issues and challenges face by China in developing its vast human resources as a developing country?
3. What are the main features of national HRD policy and strategy in China?
Chinese Definitions of HRD

The concept of human resource development is relatively new in the P. R. China (Yan & McLean, 1997). There was no concept of human resource before China opened its door to the Western world. It was introduced to China after it has opened door to the world when the “reform and open-door” policy was initiated by Deng Xiaoping. In 1978, Deng launched the reform and decentralized economic decision-making. The reform has moved the economy from a sluggish Soviet-style centrally planned economy to a more market-oriented economy. Consequently, many Western concepts of management such HRD and HRM are brought in and they are coexisting with some old terms. In fact, while the majority of newly created organizations such as private owned enterprises, joint ventures and foreign investment firms tend to use the new term of human resource (HR), most governmental agencies, the ruling communist party and its local organizations, and state-owned-enterprises (SOEs) are keeping old terms (i.e., personnel). Although economic reform has progressed to a great extend as indicated by the fact that the proportion of SOE output has been reduced from three quarters to less than one-third in twenty years, no significant change has been implemented in China’s political structure and dominant ideology. Yang (2002) contended that the contemporary management theories and organizational behaviors in the P. R. China should be understood as conflicts and convergences of three ideologies and cultural values—Confucianism, Socialism, and Capitalism. It is posited that three cultures emphasized different aspects in HRD. First of all, Confucianism emphasized social harmony. The traditional scholarly works places a heavy emphasis on personnel management and utilization. Secondly, socialism emphasizes the development of individual morality and loyalty to the party and its ideology. Lastly, capitalism ideology and managerial practice recognize the role of training and development for the purpose of individual growth and organizational performance.

The socialist concept of human resource tends to remain a strong influential force in the P. R. China. Such ideology and implied managerial approach to human resource resides on its core concept that regards individuals as bolts and nuts of a big machine. It assumes that all of social members are working toward a collective vision, i.e., communism. As a result, division of the labor and working roles and tasks are rigidly designed and assigned by a bureaucratic system with a top-down approach. While the orthodox socialist ideology is gradually fading, many socialist characteristics of human resource practice can still be observed in governmental agencies and SOEs. For example, human resource functions have been divided among three agencies at the government level. One type of agency is called “Organization Department” that exists in all levels of the Communist Party of China (CPC). This agency is in charge of leadership selection, training, promotion, evaluation, and disciplinary actions not only for leaders of its own party and various levels of government agencies but also for managerial personnel in medium to large size SOEs. It has its own system of training and development such as education division and party school virtually at all levels from central government to local counties. The second type of government agency is called “Ministry of Personnel” in central government or “Bureau of Personnel” in the provincial, municipal, and lower levels. This system takes care of human resource functions for professional employees with high education attainment of governmental agencies and SOEs. The third type of government agency is called “Ministry of Labor and Social Security” in central government or “Bureau of Labor and Social Security” at the provincial, municipal, and lower levels. This system is responsible for human resource functions for workers in governmental agencies and SOEs. Its functions include labor employment, unemployment security, vocational training, labor relation, and workplace safety. In sum, the socialist approach to human resource is to build a clear manpower system and to prepare individuals work for a collective vision. Even though the HR role of such approach has been crippled within a context of a fast increasing economy of non-SOE sector, the socialist ideology and its implied managerial practices tend to be evident and will probably continue to exert its influence in the future. Neither HRD nor HRM is a suitable term for the CPC and governmental agencies. Instead, three types of agencies have been created and are still operating in a relatively independent way corresponding to three types of human resources—cadre, personnel, and labor.

The traditional or Confucian concept of human resource is the second most influential force in the P. R. China. China has more than 5,000-years history of recorded civilization and its strong identity. Consequently, traditional thoughts and scholarly works continue to have strong influences on today’s managerial theory and practice. For example, even though HR and HRD are foreign concepts introduced after the “open-door” policy, Chinese has similar terms that describe the development of individual knowledge and expertise. Traditionally, human talent (i.e., “ren-cai” in Chinese) and human asset (i.e., “ren-cai” this term has the same pronunciation as the previous one in Chinese, but means asset) have been widely used. In Chinese, both human talent and human asset have social implications. Individuals who hold certain talents or expertise but with less social responsibility are not regarded as human talent or asset. Yang and Zhang (2003) identified two dimensions of the traditional Chinese concept of human resource that denote the qualities of an individual: “de” (i.e., “morality”) and “cai” (i.e., “competence”).
Under the traditional perspective, human talent and human asset only include two types of individuals: (1) those called “sheng-ren” (i.e., “wise person”) who possesses both strong morality and talent, and (2) those called “xian-ren” (i.e., “person with virtue”) who shows strong morality but probably less competence. Those who possess certain ability or expertise but hold poor personal integrity is normally regarded as “xiao-ren” (i.e., “mean person” or “villain”). They are not regarded as human talent or human asset, and they are treated as the last choice in personnel selection and utilization after “yong-ren” (i.e., “mediocre person”) who is low in both competence and morality.

After launching economic reform, Deng Xiaoping proposed four criterions for selecting and promoting cadres: revolution (morality), youth, knowledge, and professionalization. Contrary to the orthodox socialist approach which placed a heavy emphasis on the loyalty to the party (i.e., revolution), the new criterions regress to the traditional approach that emphasizes the balance between individual morality and competence. If the orthodox socialist ideology can be viewed as having a vision of egalitarian equity that eliminates differences among social classes, and economic development needs a social system that recognizes the individual differences in competence and contribution, then Deng’s new approach can be viewed as a measure of balancing equity and equality, economic development and social disparate. Therefore, the traditional Chinese vision of social harmony is evident in the new reform policy.

The Western or capitalist concept of human resource is the third major influential force in the P. R. China. The influence of the capitalist concept of human resource is evident in those private firms, joint ventures, and firms fully owned by foreign investors. This influence can also be observed in the curriculum of management education programs such MBA and EMBA education. These educational programs have normally copied the models in the Western universities, particularly from the US. Most of the newly created organizations begin to use the term of human resource instead of traditional term—personnel. Related university courses have been changed from Personnel Management/Administration to Human Resource Management. Yan and McLean (1997) observed that “[i]n many ways, there is no distinction at present between HR, HRD, and personnel” (cited in McLean & McLean, 2001, p. 316). Also, there is no clearly distinction between HRD and HRM in university curriculum. Training and development has been incorporated as one function of the whole HR activities. Few texts have been published that combined HRD with HRM. For example, in one of the most popular MBA texts designated for management education, Zhang (2001) defined:

Human resource development and management refers to the utilization of scientific method; implementation of adequate training, organizing, and staffing for those human resources combined with certain physical resources; guidance, control and coordination of human thoughts, mentality and behavior; fully unleashing of human motivation; for the purpose of fully utilizing individual potential, tasks with adequate individual, and ultimately the appropriate combination of human and tasks. The overall task of human resource development and management is to realize organization’s objectives (p. 4).

This definition tends to have combined the Western managerial philosophy with the Chinese one. Some characteristics can be observed. First of all, it emphasizes on the ultimate objectives of organizations. Although it does not identify productivity or performance as the sole objective for organizations, this definition recognizes organizations as open systems. Second, this definition incorporates the traditional Chinese harmony approach that calls for balance between human and physical resources, individuals and tasks, organization and society. Third, the Western influence is evident in this definition as it assumes the best approach to HRD and HRM is through applying scientific methods.

Perhaps one Chinese concept closely related to HRD is human talent development (i.e., “ren-cai-kai-fa’ in Chinese). Human talent development emerged in late 1970s and early 1980s after the reform and open-door had started. In fact, there is a growing field called human talent study that focuses on the characteristics of individual growth and development. Luo (2003) identified several differences between the concepts of human talent study and HRD. First, these two concepts evolved in different contexts. While HRD concept evolved in 1960s in an industrialized country, USA, human talent study started in late 1970s in China as a response to increasing demand of human talent due to the change from the orthodox ideology of class struggling to a pragmatic economic reform. China’s then leader Deng Xiaoping (1977) pointed out that “Modernization cannot be realized though unrealistic talk, it needs knowledge and human talent. There is no way to develop without knowledge and human talent” (p. 40). This is perhaps the earliest statement of human talent. Consequently, a field of study on human talent has been gradually developed. Second, the two fields have different studying focuses. While HRD focuses on developing workforces with certain skills, human talent emphasizes on human talent growth and development. From this perspective, HRD covers broader contexts than human talent study. Third, the two fields have different studying
targets. HRD grew in the context of enterprise and thus mainly focuses on employed workforces, whereas human talent study emphasizes on educating those who have not developed to talent level and on advancing those talents to higher levels. Fourth, HRD and human talent study have different theoretical foundations. Human talent study has two main theoretical foundations, human talent development and human talent utilization. HRD has a heavy emphasis on economic side of human resource and holds an investment perspective of human resource.

Although HRD concept tends to be different from an indigenous Chinese discipline of human talent study, these two fields share several characteristics (Luo, 2003). First of all, they share the same purpose of developing the quality of workforce, unleashing human potential, realizing maximum utility values, and subsequently creating more social wealthy through the means of development. Secondly, both HRD and human talent development emphasize on the means of development. The essence of such development is transforming human potential quality to explicit quality and competency through various development means. Lastly, both of the fields share the same internal and external factors that determine the development. The author listed four major determining factors: individual quality and competency (internal factor), education, environment, and practice (external factors). In sum, the notion of human talent development is the closest indigenous concept in China that evolved as a response to the needs of rapid economic development and it focuses on the development high quality workforce.

Issues and Challenges

Many issues of human resource development in the P. R. China appear to be attributed to historical and developmental factors. Zhang (1999) analyzed these issues from both macro and micro perspectives. At the macro level, HRD in China faces four major issues. First, SOEs and government agencies face a serious issue of brain-drain. Strong HR competition comes from private enterprises, joint ventures, and multinational companies that normally can offer higher compensation. Like many developing countries, China is facing a serious issue of brain-drain. While there is a huge shortage of high tech professionals and qualified management personnel with global perspectives, many Chinese students who achievement advanced degrees in science and engineering choose to stay in the host countries. For example, one report by the National Science Foundation (NSF) revealed that there were 16,550 Chinese students who obtained doctoral degrees in science and engineering (S&E) fields at the US universities from 1988 to 1996 (Johnson, 2001). During this period, Chinese students earned 7.5% of all S&E doctorates in US universities. However, the same report also suggested that 85% of Chinese doctoral recipients planned to remain in the US for employment. The report concluded that China contributed significantly to US scientific personnel. In the domestic market, attracting and retaining capable human resources have become key pressures for enterprises (Benson & Zhu, 2002). Second, higher education system tends to be behind the reform process and cannot meet the changing demand of the market. Xie and Wu (2001) noticed that there is no special fund for technician schools and that they have to depend on the unstable non-business income to operate. Third, there is a serious imbalance of demand and supply in human resource market. While there are increasing demands for hi-tech professionals and quality management, China has abundant supply of relatively low skill level workforces. Fourth, a human resource market system has not yet been established. For example, some traditional personnel measures created under the central planning economy tend to constrain workforce mobility and creativity.

Zhang (1999) maintained that there are five major HRD issues at the micro level. The first issue is low investment in human resource and low return rate. A survey revealed that less than 5% of enterprises have invested more on employee training and development than the previous years. The second major issue comes from the fact of the large population with a considerable amount of annual increase. In China, the imbalance between natural/physical resources and human resource will be a continuous challenge for many years to come. The third issue is that the limited employment opportunity has constrained the HRD. It was estimated that there were over 5 million registered unemployed workers, and there were over 22 million spare employees who need reassignment of positions. In the rural areas, there were over 140 million surplus workforces. The fourth issue is the constraint of the traditional industrial structure for developing high quality professionals. Finally, training and development activities are not flexible enough to meet the need of rapid economic development. Cooke’s (2000) study in the state-owned railway industry revealed that HRD was on the agenda but much of it hinged on moral teaching.

Zhang, Yang, and Zhang (2002) concluded that the major challenges of HRD for China come from three transitions: (1) from a centrally-planned to a market-oriented economy (i.e., challenge of reform), (2) from a rural and agricultural to an urban and industrialized country (i.e., challenge of development), and (3) from a closely self-contained society to an active participant in the global economy (challenge of globalization).
Emerging Themes of HRD as National Policy and Strategy

Even though HRD is a relatively new concept in the P. R. China, systematic and coordinated efforts in developing and unleashing workforce at the national level have always been the emphasis since the CPC came to the power in 1949. Benson and Zhu (2002) noticed that HRD policies in China have changed over time in an attempt to improve the skills of the entire population. They observed that in the 1950s and 1960s, compulsory primary education and improving the literacy rate were the key HRD policies. During the ten years chaos of the Cultural Revolution from 1966 to 1976, formal educational system experienced serious setbacks. Since the economic reform and modernization was launched in late 1970s, the Chinese government paid particular attention to education, science, and technology. Improving national skill level has become a national strategy integrated with China’s overall strategy in economic development and modernization.

Using human talent development and human resource development interchangeably, HRD as national policy and strategy have emerged in recently years. Consensus seems to be established that HRD is one of the vital factors promoting economic development and societal progress (Chen, 2000). There is a growing consensus among Chinese leaders, scholars and business executives that the only competitive advantage that China has is its human resources. China has to be integrated into world’s economic activity. In the 8th Asia-Pacific Economic Cooperation (APEC) meeting in Brunei, then-president Jiang Zemin of the P. R. China initiated a high level meeting on human capacity building. As a result, Beijing hosted an APEC conference on human capacity building (Beijing Initiative) in 2001. The conference theme was “New Economy, New Strategy: Co-operation and Innovation to Build Human Capacity for Common Prosperity.” The purpose was to reach a deeper understanding of the role of human resources in the economic and social development. Jiang outlined Chinese government’s position on human resource: “Human is most valuable among all things in the world. Human resource is the number one resource. Human resource is the key for the progress of science and technology, social and economic development” (cited in Li, 2003, p. 8). Jiang (2001) further pointed out five concrete measures of HRD: (1) establishing new perspective of development and strengthening human capacity building; (2) building lifelong learning system and learning society; (3) utilizing new learning technology; (4) promoting innovation and educating new generation; and (5) strengthening international communication and collaboration. In the “Tenth Five-Year Plan” (2001-2005), a special chapter on HRD has been included for the first time in history (Xie & Wu, 2001).

Huo (2003) noticed several perspectives of HRD have been taken by Chinese government and these perspectives have been gradually implemented. First, HRD has been viewed by the government as a key strategic choice. It has been recognized that human resource is not equal to the amount of population. The country must adopt proactive measures to promote HRD and capacity building. This perspective deviates significantly from Mao Zedong’s thought and measures of promoting mass human reproduction. Among three major types of resources (i.e., natural, physical/capital, and human resources), human resource holds the most competitive advantage. It has been recognized that human resource is the key for sustainable development. Second, there is recognition of the dialectic relationship between human resource development and physical resource development. Physical resource development provides the foundation of social development; HRD determines the depth and breadth of physical resource development. Third, the main task of HRD at the national level is to promote scientific spirit, innovative spirit and capacity. It has been recognized that HRD must be based upon clear and dynamic strategies which can effectively respond to the rapid changes that are taking place. There is a critical need to set objectives, principles and priorities, and formulate and carry out effective policy measures.

Gui (2003), president of China Human Resource Development Association and a member of central committee of the C. P. C., pointed out that HRD as a national policy has to deal with six relationships: (1) the relation between improving the overall quality of the population and educating professionals; (2) training human talents of both natural and social scientists; (3) utilization of human talents educated domestically and internationally; (4) the relation between moral quality and scientific/cultural quality; (5) the relation between material incentives and institutional policies that promote innovative environment; and (6) the relation between higher education and lifelong learning systems. Wen (2000), an official from the Planning Bureau of the Ministry of Personnel, outlined three main trends of policy making of HRD from a macro perspective. The first policy is to expand the overall supply for human resources. It has been noticed that although China has the largest population in the world, the overall quality of the population in terms of formal education is far behind those economically developed nations. For example, Shanghai is one of the most developed areas in China and yet its proportion of residents with higher education is about the level of countries like Japan and Canada early1980s. Therefore, it is necessary to take all measures of education and training to improve the proportion of human talents in the overall population. The second policy is to adjust industrial sections and strengthen human resource structure accordingly. The policy calls for the
improvement of HRD in key industries and the promotion of HRD in hi-tech sectors. The third policy is to speed up the HRD emphasis on educating professionals, especially talents of science and technology.

Wen (2000) identified three levels of HRD as a national strategy. The first level is reserve HRD starting from elementary, secondary school system to higher education that focuses on educating innovative capacity and overall quality for the citizens. The second level is general HRD that focuses on the resolution of current key issue of employment and re-employment. Strategies on this level are implemented along with the economic reforms, including the promotion of employment in service sector along with the adjustment of industrial structure, support for laid-off workers from the SOEs, strengthening of social security system, and guide of human resource transfer from rural areas. The third one consists of high level HRD measures to ensure sustainable concentrated development.

Chen and Zhang (2003) outlined a strategic plan of education and HRD during the first half of the 21st century. The overall goal is to catch up with developed countries within 50 years in many indicators. They proposed three stages for China to catch up and finally exceed the developed countries. Table 1 presents their proposed stages and several selected indicators of economic, education and human resource development. Stage one is projected from 2001 to 2010; and the main objective for this stage is to establish a foundation for sustainable development. The main task for education and HRD is to catch up with those semi-developed countries. This stage of development is comparable to the period of 1900-1950 in the US where its average workforce education was raised from 8 to 9 years. The second stage is from 2011 to 2020 and the main objective is to catch up with those developed nations in education and HRD. This stage of development is comparable to the period of 1950-1970 in the US where its average workforce education was raised from 9 to 12 years. The third stage is from 2020 to 2050 and the main objective is to catch up and surpass those developed countries. This stage of development is comparable to the period of 1970-1995 in the US where its average workforce education raised from 12 to 13 and plus.

Note: For the succinct purpose, only few representative indicators are selected in this paper. Economic development is indicated by gross domestic product (GDP) in Chinese Yuan Renminbi (RMB). On October 15 of 2003, the exchange rate is: 1 RMB $= .12 US$. Education was reflected in three indicators: (1) percentage of 9-year compulsory education, (2) high school attendance rate, and (3) higher education attendance rate. HRD is indicated by the average years of formal education of new workforce and the overall workforce, and the percent of workforce with higher education to the total workforce.

**Chinese Characteristics of HRD as National Policy and Strategy**

Chinese leader Deng Xiaoping invented a term of “Chinese characteristics of socialist way” to describe the reform direction for the country. The Chinese characteristics are evident in many aspects of HRD as a national policy and strategy for social and economic development.

First, HRD as a national policy and strategy for social and economic development is initiated and implemented with top-down approach from central government to local ones and then to enterprises. Government played a key role in establishing HRD policy and related strategies. Unlike many Western countries where HRD has been normally regarded as activities at the enterprise level and the main force pushing HRD efforts usually comes from the competitive market, HRD has got great attention in China largely due to the strong governmental effort. For example, professor Dong, a renowned human resource scholar in China and director of Human Resource Development and Management Research Center at People’s University, suggested that HRM should focus on the internal systems and managerial approaches in the enterprises and that HRD should focus on the external market environment (cited in Zhou, 2001). He maintained that the government has played a strong role in nurturing a human resource market. In order to utilize and develop human resources effectively, the government plays key roles in establishing new market system, eliminating traditional discriminating system, and breaking the old monopoly structure in a number of sectors.
Second, there is a strong emphasis of social implications of HRD. In many Western countries such as the USA, HRD is merely a business activity and largely conducted at the organizational level. In the North America context, there is a debate whether the purpose of HRD is to improve organizational performance (Swanson & Arnold, 1996) or to develop individuals who ultimately contribute to organizational prosperity (Bierema, 1996). Clearly, such debate tends to view HRD as an intervention used for either individual or organizational development. Both arguments of the debate were established on a firm Western individualistic belief that individuals are responsible for their own learning and growth. Rooted in a strong collectivist cultural context, Chinese approach to HRD tends to have strong social and moral implications (Yang & Zhang, 2003).

Third, there is a strong traditional influence of harmony and balanced approach in HRD policy and strategy. Yang and Zhang (2003) pointed out that social harmony was regarded as the ultimate goal in the traditional Chinese society and that preferred managerial approach could be traced back to the Confucianism classic “The Golden Mean.” Such approach calls leaders to bring about equilibrium rather than to create disequilibrium. Here equilibrium implies balance not only between human beings and the environment but also among people in a community or society. Gui’s (2003) outline of six key relationships of HRD in China is a good example of the harmonious approach to HRD in China.

Conclusions and Discussions

The above analysis of HRD as a national policy in the P. R. China provides valuable information about how the concept of HRD has been transplanted in a developing country. China is among the most successful countries that have experienced or experiencing transition from a centrally planned economy to a free market economy. China has set an excellent example for many developing countries in terms of economic growth. There is certainly a need to analyze China’s experiences and thus to offer valuable lessons and illuminations for those countries with similar social and cultural contexts. China’s strategy of human resources development might be considered for adoption in other countries.

This paper contributes to new knowledge of human resource development by focusing on HRD as a national policy and a vital strategy for economic and social development. The paper identifies a number of unique issues and approaches that might be valuable for interested scholars to conduct further study. The Chinese approaches to HRD also might be valuable for those industrialized nations that normally do not have a coherent HRD policy and strategy. Given the increasing impact of global competition, many governments have to deal HRD issues at the national level. Consequently, studies of HRD as national policy and strategy across nations offer much valuable information for both policy-makers and practitioners.

China has its unique social and cultural contexts of HRD and faces unique challenges during the transition from central planning economy to market oriented one. China faces major issues and challenges that result from economic reform, development, and globalization. Unlike those developed countries that have major interest in globalizing their products and services, China has to deal with issues of development and global competition simultaneously. Since the reform was launched in 1978, HRD as national policy and strategy for social and economic development has gradually emerged. The Chinese government has used HRD as crucial strategy to convert its huge population from the status of less educated as a burden to fully developed human resources. The economic success in China during the past twenty years has proved that some strategies and practice are effective and viable for developing countries. We have identified several Chinese characteristics of HRD as national policy and strategy that is firmly rooted in its cultural and social contexts. In sum, the formation and change of human resource strategy in China reflects a reality where a society is experiencing a transition from “life-long employment” to “life-long learning” (Cooke, 200).

Leveraging Diversity—Strategic Learning Capabilities for Breakthrough Performance

Terrence E. Maltbia  
Teachers College, Columbia University  

This paper presents a conceptual model that positions strategic learning and leveraging diversity as enablers to organizational effectiveness. The model represents an early integration of results from a Diversity Practitioner study and concepts drawn from the literature on organizational transformation and transformative learning theory. It argues that a parallel process consisting of outside-in work (organizational transformation) and inside-out work (transformative learning) is needed to achieve the performance gains required of organizations during the 21st century.

Keywords: Strategic Learning, Diversity, Transformative Learning

In the closing decade of the twentieth century many observers proclaimed that the only constant in that highly competitive business environment of the 1990s was continuous and rapid change (Galbraith & Lawler, 1993; Nadler, Gerstein & Shaw, 1992). During that same period, a number of interventions (e.g., Total Quality, Reengineering, Supply Chain Integration, Benchmarking, Enterprise Resource Planning, Customer Relationship Management, The Learning Organization and Change Management) were introduced to help business leaders respond to the competitive landscape, while at the same time preparing their organizations for success in the dawn of the twenty-first century (Camp, 1989; Ciampa, 1992; Conner, 1993; Hammer & Champy, 1993; and Senge, 1990). Yet early evidence suggests that the successful implementation of these interventions has been elusive for a majority of companies. For example, a survey of Fortune 1000 companies reported that more than 67 percent of re-engineering projects did not achieve their stated objectives (Fletcher, 1990). Further, insufficient attention to cultural and other human factors is often cited as the rationale for disappointing results. The model described in this paper represents a powerful integration of concepts and approaches designed to address this implementation gap and enhance organizational effectiveness.

Problem and Purpose Statements

As demographic, market and economic trends continue to evolve the complexity of doing business in the emerging global economy has intensified. Companies today are under tremendous pressure to develop the capabilities needed to create adaptive, flexible and highly responsive organizations to cope with dynamic, often turbulent market conditions. These demands place a premium on designing and successfully implementing organizational interventions that ensure the rate of learning at the individual, group and organizational levels, at least match, if not exceed, the rate of change in the external business environment. Scholars, consultants and practitioners from the disciplines of organizational development, organizational learning, adult learning and psychological development have devised theories and related practices designed to help organizations make the transformation needed to prosper, or even survive, in an environment characterized by mergers, acquisitions, global competition, changing workplace and market demographics, and technological innovations. Further, these theories and practices can be categorized into the three areas of transformative learning, organization transformation and working productively with diversity.

While much is known about each of these categories, heretofore each has preceded in a rather fragmented manner both in terms of research and practice (Cross & Israeli, 2000; Henderson, 2002; and Miller & Katz, 2002). This study sought to discover potential connections among these three schools of thought related to personal and organizational change (i.e., organizational transformation, transformative learning and working productively with diversity) based on an extensive review of this literature and previous diversity practitioner research (Maltbia, 2001). Specifically, the purpose of this study was to integrate key elements from these three approaches to change into a comprehensive model with a focus on building strategic learning capabilities to leverage diversity for breakthrough performance. To achieve this aim, the study sought to respond to three core research questions:

1. What is meant by strategic learning capabilities? / How can they be deployed to leverage diversity in pursuit of organizational effectiveness and breakthrough performance?
2. What outcomes, if any, are associated with building strategic learning capabilities?
3. Does the focus on learning vary by strategic learning capability? If so, how?

Methodology and Summary of Case Study Findings

The findings discussed in this paper are based on a descriptive and exploratory qualitative case study. The two primary forms of data collection included: semi-structured interviews and a post-study literature review. The case study included a sample of 20 diversity practitioners located across the United States and selected for their contribution to the emerging theory and practice of diversity initiatives in or for Corporate America. Twelve external practitioners agreed to participant in the study from a potential “expert” sample of 16 individuals who were identified during the literature review on workplace diversity as “thought leaders” from databases (including: A.S.T.D TRAINLIT, ABI and ERIC), resource guides that list diversity consultants and internal practitioners (e.g., The Diversity Directory, Hunt-Scanlon) and conference brochures (e.g., The Society of Human Resource Development’s Annual Diversity Conference, currently the largest in the United States and The Annual Diversity Forum, sponsored by Linkage Inc., a Human Resources consulting firm based in Boston). Further, the sampling approach used to identify the eight internal practitioners emphasized maximum variation to ensure a diverse set of respondent characteristics (Patton, 1990). Criteria for inclusion in the internal sample consisted of a combination of the following factors: (1) referrals from the expert sample; (2) leaders of award-winning diversity initiatives (such as the Opportunity 2000 award winners); (3) practitioners involved in post “class action” lawsuits or other turnaround situations; and/or (4) practitioners who have led, or worked on, diversity initiatives in more than one organization. This combination of external and internal practitioners was chosen because they collectively represented a sample of individuals with current, yet diverse perspectives on pioneering work that is shaping the emerging field of workplace diversity. Such knowledge is not currently available in other sources of information.

The data gathered from the 20 face-to-face case interviews were supplemented by additional data sources including: a review of selected literature (i.e., workplace diversity, learning from experience and critical pedagogy), pre-interview data inventories (participant’s basic demographic data) and case documents (i.e., written materials including books, articles, diversity strategy, program materials, etc.). All case interviews were audio recorded and supported by extensive researcher notes. The interviews ranged from one and a half to three hours in duration. Data were content analyzed by systematically examining all data sources using eight categories designed to reveal the competency development process for this sample of practitioners (i.e., key experiences, Self-Q-questions the respondents would ask if they were conducting the study and their rationale for each questions, definitions of diversity, role expectations, approaches to diversity practice, and the competencies require of the role including knowledge, skills and attributes). The results from this case study: (1) confirmed a three-phase diversity change process found in the literature, (2) generated a catalog of definitions for the term diversity, (3) clarified the general role requirements of diversity practitioners including objectives and related outcomes, (4) listed the key experiences that reflect the competency development process for the practitioners in this sample and (5) presented a preliminary model that included 19 competencies that reflected the lessons learned from the experience of the study respondent’s engaging in this pioneering work (Maltbia, 2001). Importantly, the study revealed important connections between building strategic learning capabilities and leveraging diversity for enhanced organizational performance. This insight has led to this researcher’s interest in exploring and integrating key ideas from two bodies of literature that inform strategic learning (i.e., organizational transformation and transformative learning theory) and that were not examined in the first stage of this emerging research agenda. The preliminary results presented in this paper reflect this expanded insight based on conducting a post study literature review.

Definition and Discussion of Key Terms and Concepts

The terms and concepts presented in this section represent an integration of ideas drawn from the literature on organizational transformation and transformative learning. These two areas provide a foundation for framing strategic learning and leveraging diversity as enablers to organizational effectiveness.

What is Meant by Strategic Learning Capabilities?

Sanchez and Heene (2000) define learning as a “process which changes the state of knowledge of an individual or organization” (p. 26). Accordingly, changes in the state of knowledge can take various forms ranging from adopting a new belief about a causal relationship, modifying an existing belief or abandoning a previously held belief. In addition, the state of knowledge can be characterized at four levels of “mastery” including reproduction—or basic recall, explanation—or understanding and meaning, application—or ability to act on knowledge appropriately and integration—or a comprehensive understanding that allows the acquirer to selectively choose to apply knowledge in beneficial ways (Sanchez and Heene, 2000). Further, the process of learning is holistic and made up of cognitive (concerned with thinking), affective (concerned with feeling and belief structures) and psychomotor (concerned with action and doing) dimensions (Bond, Cohen & Walker, 1993, p. 12). This holistic
nature of learning brings focus to the importance of creating learning interventions that engage the “whole person,”
that is the head, hand and heart work (Hayles & Mendez-Russell, 1997).

Transformative learning theory, with its theoretical roots in adult learning theory, highlights the importance of
understanding the context for learning. That is, to be effective, the form of learning should align with the nature of
the challenge or situation. Jack Mezirow, the father of transformative learning theory distinguishes between two
forms of learning, instrumental learning and communicative learning. The former focuses on “learning to control
and manipulate the environment or other people, as in task-oriented problem solving to improve performance” while
the later focuses on “learning what others mean when they communicate… and often involves feelings, intentions,
values and/or moral issues” (Mezirow 2000, p. 8). Combining these two forms of learning with Ron Heifetz and
Marty Linsky’s (2002) descriptions of technical and adaptive challenges provide a platform for applying appropriate
learning strategies to various situations. Instrument learning and related strategies seem to align with what Heifetz
and Linsky call “operational challenges,” where people apply their current repertoire of skills, know-how and/or
procedures to the problem or opportunity (p. 14). By contrast, adaptive challenges are not “amenable to authoritative
expertise or standard operating procedure” and as such require a form of co-creation that can only be facilitated by
more communicative forms of learning and interaction (p. 13). Comparatively, communicative forms of learning and
interaction require higher levels of involvement with others and active experimentation to foster new discoveries.

The personal and organizational transformation characteristic of adaptive challenges demand that all involve
learn new ways of thinking, acting and being. Transformative learning, with its focus on examining, questioning,
validating and revising our perceptions of the world (or mental models) is ideally suited to help individuals and
collectives adapt to change in fundamental as well as dramatic ways (Cranton, 1994; Senge 1990). A sample agenda
for integrating transformative learning principles into a broader strategic learning framework might include (1) using
Merizow’s phases of perspective transformation as a foundation for designing learning interventions, (2) applying
Merizow’s guidelines for rationale discourse to approaches designed to develop dialogue skills and enhance
interpersonal interaction, (3) devising learning strategies to foster critical thinking and critical reflection to bring in
the aspect of learning from experience to the process (Brookfield, 1991, Cranton, 1994) and (4) linking the advocacy
and inquiry tools from Action Science to the fore mentioned tools (Argyris, 1993).

Having defined learning, the concept of levels of learning mastery, the three dimensions of learning and two
situational forms of learning, we have built a foundation for understanding strategic learning as a particular type of
learning and its role in building organizational capability, in short, strategic learning capabilities. Strategic learning
is intentional in that it is (1) guided by the strategic objectives of the business and (2) integrated with important
business priorities and related initiatives (Cross & Israrlit, 2000). Strategic learning is grounded in the resource-
based view of organizations that purports the identification of core competencies and the related tacit and explicit
knowledge needed to support such competencies are critical elements of strategy formulation and strategy
implementation (Prahalad & Hamel, 1990). As a result, we are beginning to understand that organizational
capability is a fundamental source of sustainable competitive advantage (Nadler, Shaw and Walton, 1995). From a
strategic learning perspective, it is important to understand the relationship between employee capability and
organizational capabilities. Ulrich, Zenger and Smallwood (1999) define employee capability as the “knowledge,
skill, ability and motives of each individual employee and includes the technical know-how and skills needed to get
the work done (or operational work) and social know-how to address adaptive challenges with others (pp. 58-59).
Organizations can buy, build and/or rent the employee capabilities needed to execute their business strategy.
Organizational capabilities represent the collective skills, abilities and core competencies of the business enterprise
as a system and are the result of experience, knowledge, individual capabilities, relationships, structures and
importantly shared learning (Nadler, Shaw & Walton, 1995, p. 8). Building on the ideas presented in this section, the
meaning of strategic learning capabilities as defined in this paper is presented below:

\[
\text{Intentional and performance driven learning linked to strategy that clearly defines the core competencies necessary for current and future organizational success. Involves identifying critical knowledge and skill areas needed to support organizational core competencies and establishes planning and accountabilities systems that ensure that learning is embedded in the actual work and major business processes of the enterprise.}
\]

What is Meant by Leveraging Diversity?
The meaning of “diversity” as a stand-alone concept is simply “difference.” Both theorists and practitioners
conceptualize diversity as a subject (or the “what”) and/or a verb (or the “how”), capturing both its static
characteristic as well as its dynamic processes (Burke, 1994; Cox, 1993; Gardenswartz & Rowe, 1993; Hayles &
Mendez-Russell, 1997; Loden, 1999; and Thomas, 1996). A survey of the numerous definitions of the term diversity
in the literature, reveal one of two components (or both) are embedded in the various ways of expressing the
meaning of the concept: (1) as a dimension (or group of dimensions), and (2) as action or process (i.e.,
acknowledging, understanding, and valuing differences; effectively managing and leveraging differences).

Diversity as dimensions. The diversity as dimensions framework provides a guide for examining the unique mixture of similarities and differences that characterize human existence (Gardenswartz & Rowe, 1993; Loden, 1996; Loden & Rosner, 1991). The primary dimensions of diversity (also known as social category diversity) encompass inborn characteristics generally determined early in the life span (Jehn, 1999). These elements (i.e., race, ethnicity, country of origin, gender, age, physical and mental ability, and sexual orientation) form an interdependent core of one’s identity that people often use to determine “in-group” (others like us) and “out-group” (those who are different) status. The theoretical foundations for primary dimensions of diversity include the self-categorization theory (e.g., Turner, 1982), the social identity theory (e.g., Tajfel, 1978), the similarity-attraction paradigm as articulated by Byrne (in Thatcher, 1999), and the racial identity theory (Jehn, 1999). Secondary dimensions of diversity (i.e., experience-based or informational diversity) can be viewed as mutable differences that are acquired, discarded, and/or modified throughout the life-span (Jehn, 1999) and, as a result, are less salient to one’s core (e.g., education, occupation, income, parental status, etc.). Organizational dimensions of diversity resulting from one’s work role are influenced by such factors as organizational level, classification (i.e., exempt, hourly, etc.), line of business, work content, location (e.g., corporate vs. field office), seniority, organizational type, mergers/acquisitions and union affiliation. The theoretical basis for secondary and organizational dimensions of diversity is information processing and decision-making theory (e.g., Gruenfeld, Mannix, Williams, & Neale, 1996). Personal dimensions of diversity also exist; these include one’s psychological type, thinking and work styles, motivational profile, conflict style, use of power, value orientation, and learning style. The sum total of the four dimensions of diversity shape people’s identities, the frame or lens through which, they view, experience, and act in the world.

Diversity as action or process. Individuals often ascribe personalized meaning to the concept of diversity. In practice, this is often achieved by placing a word before the term, essentially giving personal or organizational meaning to the concept. This inserted word reflects one’s assumptions about diversity (e.g., valuing, managing, cultural) versus the absolute meaning of the concept—thus, the multiple interpretations of what people actually mean when talking about diversity. This is a significant observation because the way one defines diversity has an impact on, and provides insight into how one actually responds to situations involving diversity and ultimately the outcomes associated with such action. Milton J. Bennett, Co-Director for the Intercultural Communication Institute, provides a developmental interpretation of how people respond to difference ranging from denial (or undifferentiated categories for cultural diversity), defense (or polarized us/them distinctions) to minimization (or subsuming cultural differences into familiar categories); and then developmentally from acceptance (or acknowledging cultural difference as a reality and interesting), adaptation (or cognitive frame-shifting and behavioral shifting based on the cultural context) to integration (or encapsulated marginality, the integrating intercultural abilities into one’s identity). Collectively, these developmentally sequenced responses to cultural diversity provides a tool for helping individuals and groups (1) understand how they respond to difference, (2) recognize the strengths associated with each response, and (3) identify the development tasks and transition issues related to each stage of Bennett’s Development Model of Intercultural Sensitivity (Bennett, 1993).

Organizations also address diversity with a variety of approaches each with a different focus and set of action strategies. Since the inception of the diversity movement over thirty years ago, the approaches have become more layered and complex, with this author contending that leveraging diversity is the most highly developed of these approaches. They include:

1. Equal Employment Opportunity and Affirmative Action which places emphasis on acknowledging the diversity mixtures, often motivated by an attempt to “right past inequities,” it is legally driven and representation focused;
2. Understanding Differences places emphasis on creating awareness from multiple cultural perspectives and interpersonal relationships;
3. Managing Diversity places emphasis on assuring the productive utilization of a diverse workforce as an organizational resource, emphasis on behavior and strategically driven;
4. Valuing diversity goes beyond the utility focus and begins to address making personal connections with diversity and the degree to which an diversity constitutes a valuable resource; and
5. Leveraging Diversity contends that the other four approaches must be in place and is the result of the collective impact of capitalizing on the emergent talent of all people (Herbst, 1997; Thomas, 1991).

Again, specific action strategies and organizational practices align with each approach. Affirmative action aligns hiring and mobility practices to ensure representation, or “opening doors.” The movement from understanding differences, both physical and cultural, to valuing diversity results in “opening minds,” examples include diversity focused communication and awareness training programs. Managing diversity focuses on aligning organizational systems and related behaviors, the artifacts of the culture—unseen but knowable—such as a performance
management, compensation and succession planning system, to foster the productive utilization of diverse talent, or "opening systems." The challenge associated with conceiving, designing, and implementing effective diversity initiatives in organizations is too complex for one single approach (Winterle, 1992). A review of diversity work in pioneering companies reveals three common phases associated with the journey toward creating an environment that attracts, understands, values, and leverages diversity; these are (1) creating awareness and generating knowledge; (2) building skills and capacity; and (3) applying the learning in real work situations, which may involve the transformation of self, others, organizational systems, and structures (Maltbia, 2001). Collectively, these represent the three focal areas of workplace diversity interventions used in organizations today.

What is Meant by Breakthrough Performance?

Performance is at the very core of organizational effectiveness. Simply put, “performance refers to the way in which something or someone functions…” also performance relates to “accomplishment and fulfillment, rather than potential or capability” (Swanson, 1999, p. 1). In organizations, whether at the individual, unit or system-wide level, performance is about intentionality, that is, the ability to act deliberately to achieve results and desired outcomes. Performance can be assessed using five broad categories of metrics or measures including quantity, quality, time, resources and impact. At a very basic level performance in organizations is about “increasing” (e.g., sales, profits, market share, customers, etc.) or “decreasing” (e.g., costs, error, customer complaints, etc.) something, in short quantity related metrics. Quality metrics reflect the overall effectiveness of performance (or level of satisfaction) and as such is more qualitative when compared to quantity metrics. Time metrics focus on the duration of performance and are often combined with quantity metrics, such as reducing cycle time or improving customer response time. Resource metrics relate to the required investment needed to generate a given level of performance in terms of people and operating costs. Lastly, impact measures focus on the collective effect of a given set of performance actions such as generating shareholder value or customer satisfaction and loyalty.

In today’s rapidly changing and unforgiving global markets, the incremental gains that result from continuous improvement are necessary but not sufficient to meet the increasing demands of customers and other key organizational stakeholders, nor respond effectively to fierce competitors. Continuous improvement is appropriate for a number of operational challenges leaders face, but adaptive challenges call for a break from the past and the generation of completely new business concepts. Gary Hamel (2000) defines the business concept innovation that results in breakthrough performance as the “capability to reconceive existing business models in ways that create new value for customers, rude surprises from competitors, and builds new wealth for investors” (p. 18). Such performance breakthroughs often require, and are the result of, organizational transformation. Transformational change in organizations involves discontinuous and radical changes in how members perceive, think and behave at work. Yet the literature on organizational change of this magnitude points to a high rate of failure in large, structured organizations (Henderson, 2002). The model for building strategic learning capabilities to leverage diversity for breakthrough performance outlined in the next section of this paper integrates important concepts drawn from organizational transformation theory, transformative learning theory and the field of workplace diversity to provide a comprehensive blueprint to help organizational leaders conquer the complexity of today’s markets and take advantage of the opportunities associated with using diversity as a source of competitive advantage.

Preliminary Findings

The model for Building Strategic Learning Capabilities to Leverage Diversity for Breakthrough Performance (see Figure 1) is based on the assumption that leveraging diversity is a process of strategic learning and change intended to enhance performance and facilitate organizational renewal. Organizational renewal is the ability to continuously adapt to the external environment and respond to emerging problems, challenges and opportunities. While not the only factor, winning companies are beginning to understand that leveraging diversity can contribute greatly to creating and sustaining an adaptive enterprise. The model’s basic components include (1) three strategic learning capabilities, (2) three related outcomes associated with each learning capability and (3) three different learning foci needed to generate the desired learning outcomes. First, the model positions leveraging diversity as a form of human performance. Drawing on concepts from Jackson (1991) and Sanchez & Heen (2000), the model asserts that understanding this form of human performance is a function of examining the three dimensions of context, content and conduct. The three strategic learning capabilities for leveraging diversity respond to the “where/when/why/,” the “what” and the “how” of leveraging diversity. They are: (1) achieving and sustaining contextual awareness (know “why” theoretical knowledge); (2) creating conceptual clarity (know “what” or strategic knowledge); and (3) Taking informed action (know “how” or practical knowledge). Each strategic learning capability responds to important diversity and performance related questions.
Contextual awareness involves scanning the external and internal business environments. This capability is necessary in order to clearly articulate the basic rationale for leveraging diversity in a given organization, identify the indicators for assessing progress toward diversity objectives and determining the overall success of diversity initiatives. Conceptual clarity concentrates on the knowledge areas necessary to leverage diversity for enhanced performance and competitive advantage. Conceptual clarity leads to making important strategic choices. These choices are more effective when based on the insight gained through contextual awareness. Taking informed action involves exploring a number of action imperatives and tactics needed to develop a capacity to leverage diversity for business success. There are different outcomes associated with each of the three strategic learning capabilities needed to leverage diversity and each require a different learning focus (Pietersen, 2002). The learning emphasis of contextual awareness is learning for expanded perspective and results in deep insight. The emphasis of conceptual clarity is learning for knowledge by making strategic choices and identifying the “vital few” critical success factors, that is, “what we must know and what must go well to succeed” and realize our intentions. The outcomes associated with creating conceptual clarity include focus and alignment. Focus allows for making important decisions related to how to deploy scarce resources while alignment ensures that every element of the organization (i.e., measurement and reward systems, organizational structures and processes, culture and employees skill and motivation) support the strategic priorities. Finally, emphasis of taking informed action is on learning from experience and results in planned experimentation that provides a platform for performance excellence. Taking informed action allow organizations to implement strategic choices and related plans fast, while taking advantage of the next shift in the external business environment. The reflective potential of learning during and from experience provides a capacity to repeat this cycle of learning for perspective, knowledge and informed action, over and over again, and can result in personal and organizational renewal and transformation.

The continuous cycle of learning and change reflected in the model is characterized by a dynamic process of outside-in work and inside-out work. Outside-in work centers on the achievement of business objectives and is performance focused. Outside-in work addresses both operational and adaptive challenges often triggered by the external environment. The key activities related to outside-in work include (1) environment scanning to identify issues and alternatives; (2) defining strategic choices and devising a shared vision of the future, (3) creating business plans to realize the vision and (4) identifying and closing gaps related to the alignment of organizational systems to ensure effective implementation. Many of the practices related to outside-in work are informed by the organizational transformation literature where the organization is the unit of analysis. While important work, organizational transformation interventions often lack tools for fostering the personal transformation needed to help people adapt to the intensity of change required by the process or demanded to sustain progress over time. Inside-out work focuses on the individual with an emphasis on the transformation of set limits and assumptions that often serve as barriers to organizational transformation. Inside-out work has to do with generating the self-awareness that one needs to understand one’s beliefs, values and worldview and how each influences action. Just as the outside-in work guided by the strategic learning model provides a process of renewal for companies, the inside-out work guided this same process model, provides a vehicle for personal development and growth. The key activities related to inside-out work include: (1) conducting a personal assessment to generate insight about one’s capabilities; (2) translating these insights into personal performance and development plans; (3) aligning development and performance objectives with the strategic needs and priorities of the business; and (4) implementing personal performance plans while
obtaining feedback from knowledgeable others. Many of the practices related to inside-out work are informed by transformative learning theory.

**Implications for Practice**

The goal of combining outside-in work with inside-out work is to align organizational transformation efforts with those of personal development and transformative learning. To become strategic business partners, senior human resources executives, organization development, training and learning and other professionals dedicated to the development of human resources, must be able to demonstrate how various HR systems and practices influence organizational performance, in short what is HRD’s value proposition. The *Building Strategic Learning Capabilities to Leverage Diversity for Breakthrough Performance* model provides such leaders with a framework for making tight connections between business strategy and human capital interventions. The framework purports that plans for building each of the three strategic learning capabilities should include interventions that effectively integrate outside-in work and inside-out work.

Developing the three strategic learning capabilities (discussed in this paper) from both an outside-in and inside-out perspective results in improved communication and effectiveness in the cross-cultural situations that characterizes today’s global business environment. The expanded description of the model (Maltbia, in press) provides organizational leaders responsible for, or interested in, gaining full access to the talent and potential of their collective human capital with a comprehensive approach for linking strategic learning and diversity with the strategic priorities of the business. Importantly, the approach provides guidance for helping people in organizations construct new, more inclusive responses to the conflict often associated with addressing differences, which is critical to ensure the requisite variety is present to foster the innovation needed to adapt to today business challenges.

Lastly, the framework aligns with emotional competence, a factor shown to contribute positively to effective performance (Cherniss & Goleman, 2001). The strategic learning capabilities of *contextual awareness* and *conceptual clarity* align with the emotional competencies associated with *self-awareness* (or the inside-out) and *social awareness* (or outside-in work). The strategic learning capability of *taking informed action* aligns with the emotional competencies associated with *self management* (or inside-out aspect of this capability) and *relationship management* (or the outside-in aspect of this capability).

Viewing Older Workers’ Social and Human Capital Capacity Development to Evolve an Adaptive Future Workforce

Donald L. Venneberg  
Vida D. Wilkinson  
Gary D. Geroy  
Colorado State University

The current worker surplus in the United States may be followed by another round of skilled worker shortages by the end of this decade. The shortage will be driven by the beginning retirement of the skilled cohort of Baby Boomers followed by the much smaller Generation X workforce cohort. This paper provides a model for a reconsideration of the use of the human and social capital capacity of older workers to fill this gap.

Keywords: Older Worker, Social Capital, Human Capital

Notwithstanding the current mode of employee downsizing by companies and institutions in reaction to the soft economy in the United States the last few years, the long term the availability of a talented pool of workers to fill future organizational needs may be limited (Challenger, 2003; Herman, Olivio & Gioia, 2003; Kaihala, 2003). Herman, et al., for example, estimate that there will be a widening gap between future organizational workforce needs and the availability of workers from today through 2015. One of the key factors influencing this disequilibrium in the system is the upcoming retirement of the Baby Boomer generation comprised of 76 million persons born between 1946 and 1960, which currently make up approximately 60 percent of the prime age (25-54) workforce in the U.S. (Kaihala, 2003). These workers will be largely replaced over the next decade by a much smaller workforce cohort, Generation X with 51 million persons born between 1961 and 1980.

The human and social capital capacity represented by older workers over 55 remain a largely untapped source for consideration for future workforce needs in the early 21st Century. In order to retain these older workers, organizations will need to consider flexible workplace schedules and other incentives for older workers to stay on the job beyond normal retirement age. From a societal perspective, the fact that the Baby Boomer cohort is expected to enjoy better health and longevity than their predecessors, encouraging people to stay in the workforce longer and thus draw less on the inter-generational transfer benefits of social security and retirement should also be a consideration by both government policy makers and organizations (Peterson, 1996; Strauss & Howe, 1997; Dychtwald, 1999).

It is not just a problem of the dearth of quantity that organizations will face, but one of stability as well. Many members of the Generation X cohort often do not have the strong organizational loyalty values held by their predecessors (Howe & Strauss, 1993; Zempke, Raines & Filipczek, 2000). This lack of loyalty results not only from this generation being the first latchkey kids, and therefore used to making their own way in the world, but also due to the way they were treated in the workplace in their early working years as interchangeable parts and the last hired – first fired. Their organizations have often shown them no loyalty and they, in turn, now tend to show little loyalty to their organizations.

Problem Statement

The gap of needed workers in the U.S. in the past has somewhat been made up by increased productivity due to technology innovations, outsourced work to overseas employees, and immigrated workers, particularly in the technology and service sectors. However, there are limits on this approach. Increased concern about security in the wake of the terrorist attacks on September 11, 2001 has resulted in a tightening of immigration rules. In addition, some organizations are becoming increasingly concerned about the loss of direct control over outsourced systems and processes controlled by overseas companies when it is necessary to make changes that support new business directions (Kleinhammer, Nelsen & Warner, 2003). Workers who have been particularly impacted by offshore outsourcing of jobs are beginning to organize and seek redress from both state legislatures and Congress. There is the possibility that this action might lead to more protectionist laws and regulations. If these concerns for security and flexibility and loss of jobs by U.S. workers further limit outsourcing of critical functions to overseas providers,

the need for organizations to “grow their own” workforce by both attracting and retaining current workers talent and knowledge, will come to the fore sooner than later.

The growing group of older workers from the Baby Boomer generation will be able to contribute both their experience and their skills to organizations to fill the gap. In order to effectively utilize the social and human capital assets represented by this group of workers, however, organizations will need to reevaluate how they value the skills and the experiences this group offers.

Research Purpose

The purpose of this paper is to develop a theoretical model for organizations to understand the dynamics of how they value individual and organizational investment in workers human and social capital capacity. The model will provide a special focus on valuing older workers in order to effectively provide for future workforce needs.

Theoretical Framework

Human Capital Capacity of Older Workers: A View to Understanding the Choice Dimension

Valuing human capital investment. Part of the problem with valuing older workers comes from the way human capital investment has traditionally been evaluated in the United States. Geroy and Venneberg (2003) described human capital metrics as a longer horizon view for structuring the investment in human capital than the traditional matrix approach of using a gap analysis to determine human resource needs. In their construct, they set forth two guiding principles: (1) that human capital capacity is composed of skills, knowledge and the influence of attitude and other intrinsic variables, and (2) that human capital capacity is both passive and active. Passive capacity is that knowledge that the individual gains and is available for potential/future use. Active capacity is knowledge that the individual gains and is available for immediate use. In economic terms, passive capacity represents the stock of knowledge available and not yet utilized, while active capacity is the explicit information currently flowing through the organizational system.

Individualism and the preference for active or passive human capital capacity. Geroy and Venneberg (2003) also noted that the value of individualism varied by generational cohort, which affected the strength of the preference by workers from these generational cohorts for the accumulation and use of both active and passive human capital capacity (see Figure 1).

Figure 1. Preferences of Generations for Individualism and Capacity   (Geroy & Venneberg, 2003)

As illustrated in Figure 1, the soon to be older workers from the Boomer cohort are beginning to prefer more stability than individualism in their work lives. They are therefore more prone to accept the organization’s desire to build active capacity for new tasks. Unlike the Generation X workers, the Baby Boomers are also less prone to push
for opportunities to develop passive capacity to use for moving to other organizations. Organizations would benefit from continuing to engage the Boomer generation of workers and extend the stability they offer to the workplace.

Social capital capacity, individual and organizational human capital investment preference, and the older worker. Lin (2001) offers an operational definition of social capital that includes both resources and outcomes: “investment in social relations by individuals through which they gain access to embedded resources to enhance expected returns of instrumental or expressive actions” (p. 6). Instrumental action is the obtaining of resources not currently possessed by the worker. Expressive action is the maintenance of resources currently possessed by the worker.

We further posit that social capital capacity is also passive and active. Passive social capital capacity is that espoused by Burt (2000) in his structural hole argument. Burt defines social capital in terms of the information and control advantages of being a broker in relations between people otherwise disconnected in social structure. In other words, these relationships are non-redundant sources of information, are available to the individual for future use, and are more additive than overlapping. Active social capital capacity is principled by network closure that Coleman (2000) maintains is necessary in order for organizational information to be accessible for all individuals. Depending on the desired outcome, having access to appropriable active and passive social capital capacity is an asset to individuals and/or organizations.

Social capital may be seen as a counterbalancing force with human capital. Human capital theory emphasizes education and the measurement of an asset, whereas social capital theory emphasizes the non-economic objectives of learning and social norms that motivate participation (Fine & Green, 2000). In other words, social capital is the contextual complement to human capital (Burt, 2000).

Older workers generally have a large store of social capital, represented by their broad networks of social relationships with both those outside the organization and those within the organization. However, these relationships which could be leveraged by organizations for the furtherance of organization ends are often undervalued or overlooked altogether. The relationship between human and social capital capacity of older workers in organizations is shown in the model in Figure 2.

Figure 2. Human and Social Capital Growth and Investment Preference Model
As indicated by line A in the model, an individual’s preference for investment in their active human capital capacity starts at the typical beginning school age and growth occurs in a direct linear fashion through the formal schooling period and through early-to-mid career in the workforce (Becker, 1993; Geroy & Venneberg, 2003). There is disagreement over whether social capital capacity grows in a curvilinear fashion (Lin, 2001) or if it is more interactive and circular (Field, Schuller, & Baron, 2000). In either circumstance, social capital is about the diffusion of relationships. We propose to resolve this issue by viewing the growth of social capital as cyclical, alternating between passive (area C-1) and active (area C-2) capacity, with the overall growth trend as linear (line C).

The social capital capacity growth trend parallels the trend of human capital capacity building. However, the development of social capital capacity begins at birth with family socialization, and continues beyond the period of human capital building, as indicated by the leveling off of the human capital line. As an individual attains career goals, he or she reaches the point of “self-actualization” (Maslow, 1970) and begins to expand his or her social capacity for pursuit of other interests (e.g. community involvement, volunteerism, hobbies and recreation) beyond the end of his or her career.

We contend that organizational investment in workers human capital capacity starts tapering off when workers are between the ages of 45 and 55 (line B). This ever widening gap between the individual’s human capital capacity investment and the organization’s investment results in the leveling off of the individual’s human capital capacity, as reflected in line B in the model. It is this gap (area D in the model) that creates the divergence of individual and organizational goals for continued contribution to the organization. Some theorists have viewed this disinvestment as a reflection of the carryover of early 20th Century views of employees as labor and a cost to be contained, versus the late 20th Century view of employees as assets for increasing company effectiveness (Kochan, Orkilowski & Cutcher-Gershenfeld 2002). Others see the disinvestment a result of beliefs or myths held by managers in organizations that workers become less flexible and able to learn for and adapt to change as they age (Costello, 1997; Goldberg, 2000).

The myths and beliefs about older workers carry over into workplace policies through the false norming phenomena, similar to that described by Perkins (2003) on college students’ misperceptions of the norm for alcohol consumption on college campuses. When people misperceive the true norms of an organization or community, decisions on how to act in that organization or community are often wrong with respect to true organizational or community norms. With respect to the capacity of organizations or individuals in organizations: A false norm is a norm to which organizations and individuals respond that is beyond their current or readily/reasonably achievable capacity (in both passive and active terms), sufficiently outside their transformation and transactional ability to be reasonably accomplishable without undue risk, or loss of sustainability. (Geroy & Venneberg, 2003, p. 93)

An Out-of-balance Mix and Distribution of Talent and Knowledge

Aside from the decline in sheer numbers, there is a concern that the mix of the workforce, in terms of experience balanced with knowledge of new technologies and processes may not be maintained in the future workforce. In addition, it is expected that organizations may be increasingly in the role of “winners” and “losers” because of the phenomena of brain drain, or the exit of employees who hold any skill, competency, or personal attribute that may be considered a highly needed and valuable organizational asset (Rosenblatt & Sheaffer, 2001). A significant element of the issue is that organizations choose to ignore the impending problem of having a smaller, less stable workforce, based on a concept of employees as replaceable parts (Herman, et. al., 2003).

The idea of a flexible workforce, or treating their people as independent contractors, further fostered the idea that a stable workforce was not of much importance. Particularly during the 1990’s, most organizations took the just-in-time approach to filling their employee needs by hiring to fill vacancies as they occurred, and suffering the high turnover that was occurring. The analysis of future needs for employees has been done by the traditional method, which focused primarily on skills needed for task accomplishment. There has been little or no focus on developing and retaining a set of employees who could both react to outside forces for change and, more importantly, generate and implement ideas for change.

This lack of regard by organizations for their existing human capital is viewed as the primary determinant of productivity loss (Dess & Shaw, 2001). The authors also argue that this lack of regard for people by organizations results in a loss of social capital as well:

…existing approaches estimate the effect of the departure of a long-tenured individual on organizational performance by (1) comparing the human capital accumulations of the departing employee with the replacement and estimating the corresponding short-term productivity loss and/or (2) by estimating the short-term savings (e.g., lower pay) of the new employee versus replacement. Although valuable, the approaches neglect to consider the value of the departing individual’s social capital, his or her placement in the key social networks, and the corresponding and possibly long-term disruptions in these systems. (p.450)
This ignores the value of the already existing human capital resident in the experience of older workers. It also ignores the cost of the loss of human capital from employee turnover and brain drain, and the resultant loss of social capital as well, due to the failure to retain and develop people in communities for local and regional workforce needs. However, the attraction and retention of talent in the knowledge economy will likely be more salient issues than downsizing and restructuring (Dess & Shaw, 2001).

We therefore challenge organizations to recognize the value of the social capital capacity that older workers possess, and to take active steps to retain these older workers and leverage their capacity for organizational ends. To develop a retention strategy for older workers, it is first helpful to understand some of the factors that cause older workers to disengage from active participation in, or leave, an organization.

**Why Older Workers Leave, Stay or Return to Organizations or the Workplace**

**Exit, Voice and Loyalty.** Hirschman (1970) developed a model of how organizations and political entities and their customers and members or citizens react to decline or disruption in the face of competition. For customers, members or citizens, the actions in response to decline or disruption are categorized as exit, voice or loyalty. One option for members or employees of organizations who are not effectively served by the organization is to exit the organization by quitting. These choices are driven partly by pay, but are mainly driven by the responsiveness of the organization to the needs of employees for recognition of the contribution they make or can make to the organization. The contribution by older workers is largely based on their social capital capacity. Of course, organizations themselves can affect the exit of an employee by firing them.

For Hirschman (1970), a preferable alternative is voice, or the willingness and ability of employees to object to and try to influence change in organization policy. There are, Hirschman recognizes, some limits on how much voice can be tolerated in most organizations, without itself causing deterioration in effectiveness. Exit and voice can be substitutes for each other. If the options for exit are many, such as when the labor market is loose, the probability is lessened that voice will be exercised before the employee simply exits the organization for another job.

The concept of loyalty, in Hirschman’s (1970) lexicon is the mediating element between voice and exit. Unlike the concept of the loyal employee a “yes man” (or woman), loyalty for Hirschman means that the employee has a sense that he or she can influence decisions directly through the exercise of voice or, at least, be assured that something will happen to improve matters. Also, true loyalty only exists if the possibility of exit exists. If one is not able to exit, the concept of loyalty loses it meaning. Thus, for example, retirement systems which have a defined benefit based on age and a minimum number of years of service can impose “golden handcuffs” on older workers to stay in an organization for which they have lost a sense of loyalty, in order to reach the point where they can retire.

**Factors influencing baby boomers staying in or leaving organizations.** A 2002 survey by AARP of 1,500 Americans ages 45 and up (the Boomers) showed that they’ll only continue to work beyond the “normal” retirement age because of economic need, such as a reduced value in stock portfolios and other assets that had been counted on for retirement (AARP, 2002). The AARP study also found several other factors, however, which might influence Boomers to stay in the workplace longer:

- Older worker-friendly workplaces that provide flexible work hours; opportunities for part-time employment or bridge employment;
- Defined-benefit retirement plans which increase the risk of retiring early, especially in uncertain economic times;
- Raising the retirement age and;
- The generational values of Boomers which reflect an interest in working beyond normal retirement.

**Social-cultural bias of youth versus experience.** In the US, there is an enduring built-in age bias to its youth-oriented culture (Goldberg, 2000) and, at times, outright age discrimination in hiring, promotion and layoffs or firing in organizations (Johnson & Neumark, 1997; AARP, 2002). The impact of this youth culture is that older workers are often devalued in the workplace. When managers are considering training and development for their employees, particularly for future capacity, it is the older worker who is usually left out. This is largely because of the belief that they won’t be with the organization long anyway or the belief that they have reached their level of capability, resulting in a silver ceiling (Dychtwald, 1999) stopping upward mobility in the organization.

Traditionally, organizations resist the development of a strategy to retain older workers. They question the capacity of older workers to keep up with the rapid pace of change in a highly competitive global marketplace. Further there is a belief that older workers lack the capacity to effectively gain knowledge and skills from company sponsored training (Goldberg, 2000).

Older workers can learn new processes and tasks. However, they often require a different approach to learning which is more hands on and allows more time for reflection and integration than younger workers (Imel, 1991; Costello, 1997; Goldberg, 2000; Stein, 2000). Thus, training programs will need to be changed to accommodate the
different learning style of older workers. In addition, consideration will have to be given to the different personal
and work values of different generational cohorts in the workplace to develop and maintain effective
multigenerational work teams and avoid generational value conflict (Goldberg, 2000; Zempke, et. al., 2000;

Organizational policies and values. The devaluation of older workers also plays out in the tendencies of
companies, institutions and government agencies to encourage older employees to retire or accept “buy-outs” or
early retirements to leave the organization. Also, the reinforcement of a workaholic style by many companies has
accelerated the “burnout” rate of workers, encouraging them to leave or retire earlier that they might otherwise have
done in a more work-schedule flexible environment (Goldberg, 2000). A visual depiction of the forces acting to
keep older workers in the workforce and those forces that act on them to leave the workforce is shown in Figure 3.

Figure 3. Forces Acting to Cause Older Workers to Stay or Leave the Workforce

Consideration for generational values in the workplace. The need to increasingly manage and effectively
leverage a multi-generational workforce, and reduce conflict within it, has been raised increasingly in the literature
(Shea, 1994; Goldberg, 2000; Zempke, et. al., 2000; Lancaster & Stillman, 2002). The strength of the diversity of
ideas that employees from different generations bring to the table is not unlike the strength gained from multi-
cultural and multi-ethnic diversity in the workforce. For example, Andreadis (2002) contends that:
One of the most valuable experiences that people especially young people, can have is to meet, live and work with
people from different countries, religions and sectors. This experience generally results in a re-examination of ones’
values, attitudes and biases and establishes the basis for genuine understanding and collaboration. (p.147)
Working in intergenerational teams may also help increase the understanding of the different stages of work life by
helping to eliminate myths about the contributions and productivity of older workers (Rocco, Stein, & Lee, 2003).
Unfortunately, the recognition of the strength of multi-generational workforce, particularly with regard to older
workers, is often not considered by many organizations or communities.

Conclusions and Recommendations

The key for organizations facing the shrinking pool of skilled workers to meet their future workforce needs is to
focus on retaining older workers. To do this, organizations need to focus on closing the gap in the right side of the
model (area D) shown in Figure 2. Organizations thus need to continue to invest in building the human capital
capacity of older workers. Also, they need to encourage older workers to stay beyond the traditional retirement age
by offering benefit incentives to work longer, changing the nature of the workplace to better accommodate their
needs, and by providing a workplace climate which values age diversity. Additionally, organizations need to continue to give older workers meaningful roles, such as mentoring, where they can continue to creatively contribute to organization goals.

Another key change organizations will need to take to retain older workers is to stop disinvesting in training for them. As suggested by Goldberg (2000), older workers have equal capacity to learn new tasks and to exhibit creativity. However, organizations will need to adapt their mode of training to accommodate the learning styles of older workers. Training and development programs need to appeal to older workers on a different basis to motivate them to change than the appeal for younger workers. Value sets of workers differ, both on an individual and generational basis (Dychtwald 1999; Zempke, et al., 2000; Lancaster & Stillman 2002), which results in the need to appeal to and aim learning toward those value sets.

Implications for HRD

Managers and human resource development professionals need to review organization policies which impact human capital capacity investment in older workers. This review need to focus on both enhancing those policies which encourage investments in older workers and those that work against this investment. Older workers remain a largely untapped source for meeting future workforce needs in the early 21st Century. This viable group contributes both their experience and their skills to organizations. In turn, organizations need to value the skills and experiences this group offers.

Older workers also can provide their social capital capacity amassed over their working life to contribute to the well being and objectives of organizations. What is overlooked by organization managers is that older workers have a built-in large store of passive and active human and social capital capacity in terms of tacit knowledge and experience about “how things work”. This represents untapped potential for mentoring and guiding new workers into the organization’s culture. One way for organizations to think about the passive capacity inherent in the tacit knowledge of older workers is as infrastructure that can be used as a base for training younger workers. From a social capital perspective, older workers are most likely to have broader networks, both internal and external to organizations. In particular, older workers can serve as valuable mentors for younger employees trying to learn how to successfully work within an established organization. Learning the organization’s cultural nuances and developing a network of people within and outside the organization can help younger workers succeed. We believe older workers can well fulfill the mentoring function because of the social networks they have already developed, and the rich working experiences and effective role models they could offer to a younger workforce.

Effectively managing change is one of the most critical challenges organizations today face. Increasing the readiness for change (RFC) of employees may be one of the most important interventions an organization can initiate. This study investigated the relationship of employee RFC and margin in life (MIL). It studied the relationship of various demographics to employees’ MIL. Results suggest there is a significant correlation between MIL and RFC, age, educational level, and length of employment.

Keywords: Readiness for Change, Change, Margin in Life

Effectively managing change is one of the most critical challenges organizations today face. History shows that organizations that continually and consistently rise to meet that challenge are those that are most successful. According to McNabb and Sepic (1995), change is the process of "altering people's actions, reactions, and interactions to move the organization's existing state to some future desired state" (p. 370). Because of the constant changes confronting employees, some degree of adjustment and improvement can and should occur continuously. Often changes result, however, in dissatisfied or distressed employees. When anxiety is high, performance is lowered and job satisfaction is reduced. Staff resistance to the desired change is often excessive and immediate (McNabb & Sepic, 1995). In fact, it is often suggested that it may be easier, at times, and less costly to start a completely new organization than it is to change the culture of an existing one. McNabb and Sepic purported that a key goal of a company is to "introduce desired changes, while keeping anxiety, resistance, and subsequent stress to an absolute minimum" (p. 372). Many of these change challenges reflect complicated human dynamics between individuals, departments, and even with outside organizations and the environment (Backer, 1995).

In the human resource development (HRD) arena, change is discussed at various levels. Organizational change interventions cannot be successful unless individual change takes place. Individual change cannot effectively occur unless employees are prepared and ready. Increasing the overall readiness for change (RFC) of all employees may prove to be one of the most effective interventions an organization can initiate. Employee RFC is a challenge for any organization and is often neglected in planning and implementing (Backer, 1995). It is essential that individuals work through their fears, resistances, and anxieties about changes. This process is one that increases an individual's RFC. Identifying individual change readiness characteristics can help business professionals in prescribing and implementing more effective change interventions. One of the reasons this topic is of such importance to research is not only because of its complexity but also because of its applicability to the work of practitioners in various fields. Backer (1995) explains that

Individual readiness for change is involved with people's beliefs, attitudes, and intentions regarding the extent to which changes are needed and their perception of individual and organizational capacity to successfully make those changes. Readiness is a state of mind about the need. It is the cognitive precursor to behaviors of either resistance or support…readiness for change is not a fixed element of individuals or system. It may vary due to changing external or internal circumstance, the type of change being introduced, or the characteristics of potential adopters and change agents. Thus, interventions to enhance readiness are possible…change can occur under conditions of low readiness, of course, but behavioral science research indicates that the probability of success is reduced when low readiness leads to low motivation to change or to active resistance. (p. 22-24)

By designing and implementing research in this area, we can assist organizations with tools to increase their employees' RFC which, in turn, will benefit both the organization and the individual.

Hanpachern (1997) conducted an interesting study comparing an individual's overall margin in life (MIL), and many of its work and nonwork aspects, with an individual's RFC level. Even though the study resulted in some significant correlations between work aspects and individual RFC, it contained a number of limitations in its research methodology that prevents it from significant generalizability. We were also interested in studying the relationships between MIL and RFC and chose to utilize the general framework of Hanpachern’s work while...

making extensive changes to the MIL scale, sample and population, and other methodological components. Because the relationship between work and nonwork domains continues to be of great interest to researchers and employees (Kirchmeyer, 1995), we felt continuing to give attention to these domains in our study was important.

**Purpose and Research Questions**

The purpose of this survey questionnaire study was to investigate the concepts of McClusky's theory of margin including both the work and nonwork aspects of MIL and their relationship to readiness for change. We wanted to determine if employees who have higher MIL levels are more open and prepared for change. If we felt that supportive findings were discovered, implications for types of change interventions may surface. In addition, the cost-benefit of designing and implementing person-focused, small group, or large group interventions that can assist employees in increasing their margin in life (work and non-work aspects) may be strengthened. Another purpose of this study is for overall discovery. Armenakis, Harris, and Mossholder (1993) stated that "readiness assessments may be for the purpose of discovery as much as for the purpose of confirmation" (p. 688).

The ultimate goal of this study is to learn more about whether employees’ levels of RFC are influenced by their MIL and various demographics by exploring the following research questions:

1. Is there a relationship between overall MIL and RFC scores?
2. Is there a specific relationship between MIL work and nonwork scores and readiness for change scores?
3. Are the demographic variables of gender, age, marital status, educational level, number and age of children, and length of time with company related to MIL scores?

**Theoretical Framework and Literature Review**

A review of the literature can assist in developing a theoretical framework for this research study. First, the results of Hanpachern's (1997) study will be discussed after which literature on the following topics will be reviewed: the importance of creating readiness and reducing resistance to change efforts; the participative method of change interventions; readiness for change characteristics and factors; the manager's role and employee empowerment; the influence of nonwork aspects on employee performance; and the applicability of the transtheoretical model for employee overall readiness for change.

MIL was developed from McClusky's theory of margin, which he first presented in a 1963 publication (Merriam & Caffarella, 1999). Merriam and Caffarella (1999) explained that it is a theory of adult potential. His theory is grounded in the "notion that adulthood is a time of growth, change and integration in which one constantly seeks balance between the amount of energy need and the amount available" (p. 279-80). Hanpachern, Morgan, & Griego (1998) defined this theory, its components, and MIL in the following passage.

The basic concepts in this theory are load, power, and margin. Load is any intangible thought feeling, physiological function, or concrete task that dissipates energy when mentally entertained or physically implemented. High load puts responsibilities or burdens on an individual. Power is any source of energy or any resource that can be used to balance the load; it is positive and creates joy, pleasure, strength, or richness for a person. MIL is determined by load and power according to the formula: [Margin = 1-Load/(Load + Power)]. If load is higher than power, margin is less than .5. In that case, a person's energy is channeled into self-maintenance. By decreasing load, increasing power, or doing both, a person acquires margin, or the ability to act. If people have a high level of MIL (greater than .5) they will have a higher level of satisfaction and feel that more options are open to them, resulting in freedom of choice. A larger MIL equips people to handle emergencies and changes in life. (p. 340)

Hanpachern et al. (1998) make fairly bold conclusions in their article reporting the results of their MIL/RFC research study. They reported significance in all of the work aspects of margin even though the readiness correlations only ranged from .20-.34 (p<.05; p<.01). They did not find significance in any of the nonwork aspects of margin but the overall MIL produced a .28 correlation (p<.01). They concluded from their statistics that the theory of margin can be extended for use in the organization development (OD) field and that MIL can help identify workers’ RFC. In their study, work factors (especially management-leadership relations and job skills and knowledge) predicted readiness for change. They explained that "although the nonwork factors themselves were not predictors of readiness in this study, the factors of self, family, and health were generally rated as more important than the work factors. The nonwork factors also had more power than load, indicating positive MIL." (p. 349). Even though significance was noted in many correlations, their bold conclusions in the report were not supported in whole by the statistical findings. Their sample was also such that generalizations outside the one Rocky Mountain company
cannot be professionally made. The results, however, were very interesting and can be utilized for the purpose of discovery as Armenakis, Harris, and Mossholder (1993) suggested.

Much of research in the area of RFC is housed in the behavioral sciences fields which studies both organizational and individual levels of change. This literature does support the concept that RFC is significant in the business arena as well as many others. Arsenakis et al. (1993) emphasized the importance of creating readiness as a precursor to organizational change. They examined the influence strategies available to help general readiness. They argued that an organization should be actively creating readiness. Backer (1995) reported that failure to analyze and deal with readiness issues can actually lead to "abortive organization development efforts" (p. 21). He explains that resistance to change is directly related to not providing an effective unfreezing process before attempting a change. He theorized that Lewin's unfreeze element of his change theory is a major element of RFC. If proper and complete unfreezing or readiness does not occur, long-term successful change cannot occur.

There has been discussion of the relationship between RFC and resistance to change. Arsenakis et al. (1993) argued that RFC is distinguished from resistance to change. "Readiness is the cognitive precursor to the behaviors of either resistance to, or support for, a change effort" (p. 681). Trahant (1996) argued that employees' resistance to change is an important component in successful organizational change interventions. He explained that "managing change effectively requires a sophisticated appreciation and understanding of the multiple variables at play. People and processes must be in tight alignment in order to support goals" (p. 37).

Some of the survey questions used in Hanpachern's (1997) study related to the literature suggesting that the participative method of change interventions is important in order to overcome resistance to change. This means that employees participate more successfully in change if they are included in the decision-making process for the change intervention. However, Locke, Schweiger and Latham (1986) noted that, even though evidence does support participation, in decision-making there is some evidence that it is not always a precursor for successful change interventions. Of 50 employee-participation studies reviewed, 26% found that participation resulted in lower productivity. Locke et al concluded that "participation is useful only under certain circumstances, a key requirement being that the subordinate has expertise to bring to the decision-making process" (p. 65).

McNabb and Sepic (1995) introduced a model from their research that identified the relevant factors determining readiness for change for an individual and an organization. These include organizational culture, organization climate, organizational policies, and organizational performance outcomes. According to their model, these are directly linked to readiness for change. It was suggested that the "effective integration of culture, climate, and policies determines the ability of an organization to carry out its mission and to accept and integrate change" (p. 372). "Inertia, manifested as a resistance to change in the operating philosophy of an organization, has been shown to be a powerful force" limiting the adoption of change (p. 381). Backer (1995) presented elements defining efforts to enhance change readiness which include contextual factors, message characteristics, and communication approaches that can be used to deliver them; attributes of change agents; interpersonal and social dynamics of the organization in which change is to take place; and specific enhancement interventions. He presented a model for this enhancement that included three stages: assessing readiness, contextualizing readiness, and enhancing readiness. This literature does support Hanpachern's (1997) and Stevenson's (1982) decision to include a number of work aspect MIL domains, subscales, and individual survey items in their questionnaires.

Cabana, Rand, Powe, Wu, Wilson, Abboud, and Raubin (1999) identified 5,658 articles and selected 76 published studies to review regarding additional RFC characteristics. Each of these studies included at least one barrier to adherence of physicians to clinical practice guidelines, practice parameters, clinical policies, or national consensus statements in an attempt to develop an approach toward improving adherence. These barriers appeared to decrease physicians' RFC and to increase their reluctance to change at least in this specific context. These barriers included lack of awareness, lack of familiarity, lack of agreement, lack of self-efficacy, lack of outcome expectancy, inertia of previous practice, and external barriers (e.g., cumbersome, confusing). Even though their results were not generalized to other employment occupations, further research may show that reducing these barriers may be helpful for other occupations in other types of organizations. These barriers relate directly or indirectly to a number of questionnaire items as well as to the majority of the work aspects of margin Hanpachern (1997) presented.

Hanpachern (1997) showed correlation between an employee's relationship with management/leadership, job knowledge and skill, job demands, social relations, and in his/her MIL. Burke (1997) found that an employee's RFC is reduced when role and task responsibility ambiguity regarding the employer's expectations is present. The employee is more likely to experience feelings of job insecurity as well as possible reduced motivation. Another reason the readiness may not be present is that the employee is not receiving feedback. This naturally contributes to insecurity and reduced motivation. Pronk (1999) studied the hypothesis that willingness to communicate is directly associated with an individual's readiness to change behavior. The results of the study demonstrated this to be the case. Schleusener (1999) studied the RFC of individuals in organizations. "A hierarchical regression analysis of the
elements of the supported employment model on empowerment of individuals in six different departments showed that readiness for change and self-efficacy for teamwork were significant contributors to empowerment" (p. iii).

There is also literature available supporting the findings that nonwork aspects of MIL (i.e., self, family, and health) have an effect on an employee's productivity and stress. A study by Kirchmeyer (1992) provided support that participation in nonwork domains can enrich human resources available for work. The aim of another study by Kirchmeyer (1995) was to test a conceptual framework for managing the work-nonwork boundary. She surveyed men and women who faced considerable demands in both work and nonwork domains because many often report high levels of interdomain conflict. It was found that there is spillover to work from nonwork aspects. Even though the connection was implied, more research is needed to solidify a specific link of these boundaries to readiness for change. Cohen (1995) conducted research to examine the relationship between work commitment form (i.e., organization commitment, occupational commitment, job involvement, Protestant work ethic, work involvement) and nonwork domains. Even though the return rate was only 47%, it was found, with the use of correlational analysis (i.e., regression analysis), that nonwork domains affect all work commitment forms examined in this study, especially organizational commitment. Work commitment forms have been shown to predict important work outcomes such as "turnover, turnover intentions, performance, organizational citizenship behaviors, absenteeism, and tardiness" (p. 240). It was also noted that the way in which organizations react toward nonwork domains of their employees can increase or decrease work commitment. Research in each one of the nonwork aspects of the MIL survey also provides evidence of a positive relationship on an individual's power and load as defined previously.

Another perspective on RFC can be found in the transtheoretical change model that has been extensively researched during the past 20 years. It was originally developed to study the process of smoking cessation but has expanded to include many other change efforts. The model integrates two interrelated dimensions of change, stages of change and processes of change, along with the constructs of self-efficacy and decisional balance. The stages of change dimension is represented when an individual is ready to change (Barrett, 1997). The five stages of change are precontemplation, contemplation, preparation, action, and maintenance (Barrett, 1997; Block & Keller, 1998; Morena, Johnson, Freels, Parsons, Crittenden, Flay, & Warnecke, 1998). Characteristics of readiness for change are present in both the contemplation and preparation stages. Block and Keller (1998) proposed a segmentation approach (Prochaska & DeClemente's transtheoretical model and Roger's protection motivation theory) to suggest that people at different stages of readiness for change are differentially affected by levels of these predictor variables (i.e., vulnerability, severity, response efficacy, and self-efficacy) which is supported by their research. They do admit, however, that they cannot determine with the correlational statistics, the direction of the correlation. Morena et al. (1998) discussed the debate surrounding the measure of stage of readiness to change and the transtheoretical model. They concluded that their research results indicated that the measure of readiness for change showed high levels of stability and reliability in their specific setting. Further study of the literature in this area will help solidify some of the elements (e.g., health, self, social relations) discussed and designed for this study.

The reviewed literature assisted in the development of a theoretical framework for this research study. The literature does support the importance of RFC as well as a high MIL in overall human productivity. It has also supported the design choices in Hanpachern's (1997) study of the eight work and nonwork aspects of margin and also supports the items in our revised and simplified MIL scale that has yet to be presented.

Research Methods

In this section, information on five topics will be provided: participants and sample selection (size and process), measures/instrumentation, data collection procedures, data analysis procedures, and limitations. This research study involved a survey questionnaire being given to employees in corporate settings. It can be classified as a correlation relational study because two or more different kinds of data will be gathered from the same groups of subjects to test for relationship between the independent and dependent variables. It is concurrent because the independent and dependent variables occur at the same time.

Participants and Sample Selection

The population of this study was the group of individuals that conformed to specific criteria and to which we intend to generalize the results of this research study. This target population included the populations of four organizations (three for-profit and one non-profit) within the state of Utah with numbers of local employees ranging from approximately 200 to over 2,000. These organizations varied greatly in industries, products, and services. One organization distributed surveys to all employees while another distributed surveys to all employees within six predetermined departments. A third conducted a random sample of all supervisors, management, and leadership within the organization. Finally, we ran a random sample of about two-thirds of all employees for the fourth company. A total of 758 surveys were given to employees and 464 were returned for a return rate of over 61 percent.
Measures/Instrumentation

We had originally explored doing a complete replication of Hanpachern's (1997) study; but after some troubling pilot test results, we substantially changed the MIL scale for our study. For our revised study, RFC served as the dependent variable, overall, work, and nonwork MIL served as independent variables, and the intervening demographic variables included gender, age, marital status, educational level, number of children, age of children, and length of time with company.

We used two instruments for this research project. First, we used Hanpachern’s original 14-item RFC scale (with slight alterations) which was based in part on McNabb and Sepic (1995) and several unpublished studies. The stem question asked “My willingness or openness to…” and some sample items include the following: 1) work more; 2) create new ideas; 7) change the way I work because of the change is; and 12) support change is. Participants were asked to circle one of seven numbers on a Likert scale (1=very unlikely; 7=very likely). Schleusener (1999) explained that Hanpachern identified three dimensions of readiness for change: promoting change, participating in changes, and resisting change. These dimensions serve as subscales. Promoting includes 4 items, participating includes 6, and resisting change includes the remaining 4 items used in this scale. Hanpachern pilot tested three versions of this scale and Cronbach's alphas was measured to be .82 which indicates good internal consistency (Hanpachern, 1997; Hanpachern et al., 1998; Schleusener, 1999). Our slightly adjusted instrument had a Cronbach’s alpha of .81 which is very consistent.

Second, we formed the MIL scale by studying Hanpachern’s MIL Revised scale which had already been modified from the original published survey by Stevenson in 1982. The MIL Revised scale consisted of 50 questions design to measure many aspects of life in relation to work and nonwork. The work aspects of margin are divided into five categories including job knowledge and skill, job demands, social relations in the workplace, management-leadership relations, and organizational culture. The nonwork aspects of margin are divided into three categories which include self, family, and health. Our simplified instrument included nine questions in total, with only one question focused on each of the work and nonwork areas discussed. Participants were asked to read each statement carefully and then circle the number (on the list provided below) that best represented their feelings and views.

1 = Takes a lot of my energy – it physically or mentally drains – a load on my shoulders
2 = Takes some of my energy – it somewhat drains me – somewhat of a load on my shoulders
3 = Neither takes energy nor provides joy, pleasure, strength, or richness for me.
4 = Provides or creates some joy, pleasure, strength, or richness for me – gives me some energy/power in life.
5 = Provides or creates a lot of joy, pleasure, strength, or richness for me – gives me energy/power in my life.

The participants were asked to answer the following nine questions by circling one of the numbers (1-5) provided above.

1. My job…
2. Balancing my work and family…
3. My physical and mental health…
4. My relationship with my boss…
5. My social relationship in the workplace…
6. My current job knowledge and skills…
7. The demands of my job…
8. My commitment to this organization…
9. My family…

The Cronbach’s alpha for this scale was .73 which is lower than Hanpachern’s version (alpha = .85) but still within an acceptable range. The new version of the MIL instrument was pilot tested (n=44) to ensure internal consistency which was found. Even though Stevenson (1982) and Hanpachern (1997) established validity, stability, and internal consistency on their instrument, because of the substantial changes in the current form, establishment will need to be re-explored.

Data Collection Procedures

A key contact at each organization was used to distribute surveys. This individual had a list of the employees to be given surveys and the survey number each should be given. We kept a list of survey numbers given to each organization, and we recorded which surveys were returned. Researchers did not have a list of employee names so confidentiality was maintained. Numbers were used to identify organizations. After about 10 days we asked the organizational contacts to provide a general reminder to all participants to return surveys. Additional copies of surveys were given to the contacts so that they could provide additional copies to employees who may have misplaced their original copy. In three of the organizations, an envelope with a pre-addressed and stamped envelope was provided so they could mail them directly to us. One organization asked participants to seal them in an envelope and drop them off in a large drop envelope located in each of their departments. The following week a researcher
picked up the sealed envelopes. Again, a total of 758 surveys were distributed to employees and 464 were returned for a return rate of over 61 percent. After the data collection phase, results were entered into SPSS for analysis.

Data Analysis Procedure

We used Pearson correlations and multiple regressions to explore the relationships between MIL and RFC. The Pearson correlation coefficient was used to test magnitude and direction of the relationship. Multiple regressions were used to determine the correlation between the criterion variable and a combination of demographics (Gall et al., 1996). Along with other regression tests, the unstandardized B coefficient will be reported.

Limitations

There are five primary limitations for this study:

- First, our study was limited to only specific aspects of MIL. It did not and could not address all variables that can increase an individual's power or all of the variables that can decrease an individual's load;
- Second, an individual's RFC can be influenced by variables not measured in this study. A questionnaire survey cannot accurately control many variables within an organization's culture or for an individual's situation;
- Third, participants may not have a clear understanding of power and load even though it will be briefly addressed on the questionnaire. There was not time nor finances for interviews, so the participants were limited to just a brief written description;
- Fourth, a questionnaire cannot probe deeply into respondents' opinions and feelings which would be helpful in taking a more comprehensive look at RFC and its relationship to MIL;
- Fifth, the study will be limited to 758 employees in four organizations. A larger and fully randomized sample would have improved generalizability.

Results and Discussion

Table 1 contains a table of the demographics of the participants who returned their surveys. As is shown, male and female respondents were nearly equal; and most employees were between the ages of 21 and 54 (see additional demographics below).

The first research question asked if there was a relationship between overall MIL and RFC scores. The Pearson’s correlation coefficient (r=.298) did show that there was a significant correlation at the .01 level between an individual’s MIL and his or her RFC responses. This supports Hanpachern’s (1997) findings (r=.28, p<.01) already discussed. This means that individuals who perceive they have more power than load (MIL) also believe they are more open and ready for change.

The second question focused on a specific relationship between MIL work and nonwork scores and readiness for change scores. This question is asking us to look deeper within the MIL score to see if there are correlations between the six work MIL work items and RFC as well as the three nonwork MIL items and RFC. As for the work MIL items, there is a significant correlation (p=.01) of .288 between work MIL and RFC. This means that employees’ perceptions of work related load and power does have a relationship with their RFC. In other words, the more power or the higher MIL related to work (relationship with boss, commitment to company, relationship with coworkers, and such)—the more the employee is open and ready for the changes that he or she may confront or be asked to make at work. There is also a correlation (although very low) of RFC and nonwork MIL (family, work-
family balance, physical and mental health) ($r = .181$). This means that there is a relationship between the power employees may feel from their families/health that may be related to their RFC as well.

The final question revolves around the demographic variables of gender, age, marital status, educational level, number of children, and length of time with company and their relationship with their MIL. Unlike Hanpachern’s study, which found no relationship between demographics and MIL, it appears that there is a significant relationship between MIL and age of employee ($p = .045$), education level ($p = .002$), and the length of time an employee has been working with the company ($p = .041$) (see Table 2) in our study. In general terms, the older the employee is the higher MIL level he or she perceives (more power than load). Another interesting finding was that education level was very significant and it looks like there is actually a negative relationship between the level of education and MIL. This means that employees with less education perceive themselves as having higher levels of MIL. This may be because people with more education typically have more responsibility, tend to be salaried instead of hourly (hence often work more hours), and may have more complex jobs. These individuals may feel more of a load than those who are not as educated. Finally, it appears that those who have been with the company the shortest periods of time have higher level MIL levels. The past literature provides no findings to explain why this would be the case. Literature does find that new employees often adapt better to change than employees who have worked longer (Hogarty, 1996). Maybe new employees also feel a lighter load because they are not fully entrenched into an organizational culture that may become more of a burden or load the longer an employee works for the same company.

Conclusions, Recommendations, and Contributions

Identification of factors that influence readiness for individual change are important to identify. Changing individual employees is a complex task, especially when they are not open or supportive of change efforts. This study found that employees who have higher MIL levels (meaning they feel more energy, strength, joy, and power from their work and nonwork lives and environments) may be more open and ready for changes the organization may require of them. Furthermore, employees who feel good and are not burdened down by various work (job in general, job demands, relationship with boss, workplace social support, job knowledge and skills, and commitment to the organization) and possibly nonwork (family, balancing work and family, physical and mental health) appear to be ready to make the changes that may be needed by the organization. This provides some support for organizations to offer assistance or help to employees so that they can have more energy to commit to change efforts. Interventions may include assisting employees with balancing work and family responsibilities (flexible schedules, childcare assistance, job-sharing, training, and more), offering wellness programs, organizing communication improvement activities with management and employees, providing continual help related to improving job knowledge and skills, adjusting job demands when appropriate, and providing programs to improve organizational commitment, increasing employee autonomy, and more.

Continued research in the area of RFC is essential. Even though the concepts have been around for many years (e.g., Kurt Lewin) and much has been done in the general area of change, little research has been done in HRD and management arenas related to readiness for change at the individual level. Research focusing on identification of RFC factors and resistance to change constructs is needed. In addition, research is needed on specific interventions that can result in increased RFC. Finally, research needs to be continued in the area of the transition from workplace readiness to the actual change movement.
What are the implications to HRD? It is probably obvious. HRD is all about change. Change is foundational to both organization development and training and development. Many focus on organizational change, but individual change can be just as important to understanding and facilitate. Practitioners who do not understand individual readiness will develop and implement change interventions that will not be as successful (short-term and long-term) as those who design interventions to prepare employee to be open and ready for change when it is needed. Overall, we (HRD professionals) can be more effective and efficient if we understand readiness for change and its antecedents, determinants, moderators, outcomes, connections, and complexity.

Cross-Cultural Multi-Theory Perspectives in Research: Dialogue Based on Theory and Data from the US and the Netherlands on Action Learning Programs

Rob F. Poell
Tilburg University

Lyle Yorks
Victoria J. Marsick
Columbia University

Jean Woodall
Kingston University

This innovative session consists of a panel discussion on different approaches to researching and understanding action-learning programs, based on collaborative empirical work. Panel members compare their use of a critical-pragmatist approach and an actor-network approach. These different but complementary approaches are compared regarding their focus on managers vs. shop floor employees, the role of the set facilitator, implementation and continuation of learning following the program, and the integration of work and (self-directed) learning.

Keywords: Action Learning, Cross-cultural Comparison, Dutch-US Collaboration

The idea for this innovative session emerged at a prior AHRD conference where several papers on action learning were presented. Talking about the differences and commonalities among the perspectives, two US researchers and a Dutch researcher decided to conduct a joint collaborative study into their respective approaches to organizing action-learning programs. For this study, the Dutch researcher re-analyzed a US-based action-learning program case for which data were collected previously by the US researchers. In turn, the US researchers re-analyzed Dutch action-learning program cases for which data were initially gathered by the Dutch researcher. While the US researchers refer to their own perspective as a critical-pragmatist one (Yorks, O’Neil, & Marsick, 1999; Yorks, 2003), the Dutch researcher operates from an actor-network perspective on action learning (Poell & Van der Krogt, 2003). The researchers used their respective theoretical frameworks in this collaborative project to explore to what extent they could make sense of action-learning data gathered previously by the other party. These are elaborated upon below.

The Actor-Network Perspective on Action Learning

The actor-network perspective gives central stage to organizational actors operating in a learning network. Actors can be regarded as individuals or collectives of people who act on the basis of their views and interests, such as, employees, supervisors, managers, trainers, HRD professionals, work preparation staff, professional associations, trade unions, and so forth. Learning programs are created by interactions among actors, in the context of an existing work and learning structure. Although this context influences the actions taken by actors, they do not necessarily act completely in line with existing structures. Their actions are influenced by individual and collective views and interests of other actors, too. This line of thinking was developed by Van der Krogt (1998), who translated Mintzberg’s (1989) ideas about work organization to the various ways in which learning is organized.

Core activities in any learning program include orientation, learning and optimizing, and continuation. First, the orientation phase comprises mobilizing all parties concerned, analyzing the core tenets of the learning theme, placing the learning program in the context of the broader learning and work context of the organization, and drawing up a (psychological-social) learning contract. Second, the learning and optimizing phase is where the key learning activities take place, are coordinated by the various participants, and are connected to their every-day learning activities. During the execution of the program, attempts can be made to optimize the way it is running. These efforts are targeted at tuning the emerging program to the learning views as well as the work views of the participants and at ensuring it remains relevant to the developments occurring in the work of the learners. Third, in the continuation phase individual learners resume their every-day learning activities and the learning system of the organizations gets updated with the ‘learning knowledge’ developed in the program (Poell & Van der Krogt, 2003).

Copyright © 2004 Rob F. Poell, Lyle Yorks, Victoria J. Marsick, & Jean Woodall
There are at least four ideal typical ways in which these phases can be organized. These are referred to as the liberal-contractual, vertical-regulated, horizontal-organic, and external-collegial type, respectively.

1. The individual responsibility of learners is core to a liberal-contractual learning program. This type is very much informed by the self-directed learning ability of individual group members (Brookfield, 1986). Each individual member uses the team context to facilitate and enrich their own learning process, for which they are self-responsible (Candy, 1991).

2. The vertical-regulated learning program sees educators and other experts, in consultation with line managers, play a crucial role in the preparation, execution, and evaluation of the activities of the learning group. This type is evident in the training-for-impact approach taken by Robinson and Robinson (1989) and the notions about structured on-the-job training of Jacobs and Jones (1995).

3. In the horizontal-organic learning program, learners work together as a relatively autonomous team, assisted by a process supervisor, in solving complex work-related problems to which there is no standard approach. This type has the early work on organizational learning by Argyris and Schön (1978) as a key reference point. More recently, literature on communities of practice (Wenger, 1998) seems to draw rather heavily on this type of learning.

4. The external-collegial learning program has a learning group of professionals allow themselves to be inspired by innovative insights and new methodologies developed within their own professional branch but outside their own individual organizations. This type assumes that professionals are reflective learners (Schön, 1983), in need of continual expertise development within their professional peer group (Daley, 1999).

The actual way in which the key elements of a learning program (orientation, learning and optimizing, and continuation) take shape, somewhere in between the four ideal types, depends partly on work characteristics and partly on actor characteristics. Actors can always deliberately create a learning program that deviates from the 'normal' organizational routine. Nevertheless, the actor-network perspective postulates particular relationships between the organization of work and learning programs. The comparative cross-cultural research project that is central to the current session brings this particular perspective to the work of Yorks, Marsick, and their colleagues.

The Critical-Pragmatist Perspective on Action Learning

The critical-pragmatist perspective refers to a lens for theorizing about adult learning that combines elements of both critical theory and pragmatism. The approach taken here reflects Jack Mezirow’s (1991) seminal writing on the transformative dimensions of adult learning. Mezirow draws on elements of Dewey’s pragmatism and its emphasis on learning from experience, and the critical social theory of Habermas, particularly the role of critical reflection in emancipatory learning. Mezirow’s work was foundational for the development of an empirically based taxonomy of action learning program models (Yorks, O’Neil, and Marsick, 1999).

The Yorks, O’Neil, and Marsick taxonomy classifies action learning programs as incidental, scientific, experiential, and critically reflective based on the assumptions about learning that underlie the program and makes statements about both the kind of learning that is most likely fostered and the impact on the organization.

1. Action learning programs that fit the general description of the tacit school assume that significant learning will result if program participants are carefully selected, some team building is done at the beginning of the program, and information regarding the project or challenges the group is addressing.

2. The scientific school places a strong emphasis on problem setting as well as problem solving, is highly rational applying the scientific model to social and workplace problems. Consequently this approach involves a cautious data-driven centered on reformulating the problem. A secondary hoped for outcome is incidental learning around how to continue to learn from work and experience. Placing importance on learning from peers, a learning coach initially plays a minimalist role in helping the group learn the process.

3. The experiential school is strongly influenced by the experiential learning cycle as developed by theorists such as Kolb (1984) and Mumford (1993). An emphasis is placed on the role of reflection as an important part of the learning process, with a learning coach actively designing practices to this end. In addition to working on the presenting problem participants also work on personal developmental learning goals using the action-learning project as a vehicle for this learning.

4. The critical reflection school focuses on experiential learning, taking reflection to a deeper level by focusing on the premises that underlie the thinking and behavior of participants. Mezirow refers to this as process as critical reflection.

The taxonomy is useful to making judgments about the feasibility of a particular approach for different organizational settings and as basis for researching these kinds of programs. The basis for the taxonomy is labeled a critical-pragmatism approach because it uses critical reflective approaches to experiential learning as the lens for examining the approach and focus on informal and formal learning experiences. Recently Yorks (2003) has extended
the taxonomy to include forms of communities of practice. This comparative cross-cultural research project brings this lens to the studies carried out by Poell and his colleagues.

Session Description and Content

The session is designed as a panel discussion about the core themes that emerged from the comparison of the two perspectives. These include: focusing on action-learning programs of managers vs. shop floor employees, the role of the action-learning set facilitator, the attention paid to implementation and continuation of learning following the program, and the extent to which work and (self-directed) learning are integrated. Scholars who are interested in action learning and in applying a cross-cultural perspective are cordially invited to join in this session and debate with the panelists about the implications of this US-Dutch collaborative work.

Presenters/Panelists

The panel will consist of Lyle Yorks, Victoria Marsick, and Rob Poell, who are all researchers in the field of action learning. The discussion will be led by Jean Woodall, an expert in cross-cultural research.

Purpose

The purpose of the discussion is to find out to what extent the critical-pragmatist approach of the US researchers and the actor-network approach of the Dutch researcher are different and complementary. By doing so, the session aims to encourage critical thinking among the audience about the different perspectives one can apply to action learning.

Goals

1. Participants understand the core elements of the critical-pragmatist and actor-network approaches to action learning, their differences, and their complementarities.
2. Participants challenge their own thinking about action learning by confronting it with at least these two different perspectives.
3. Creation of an outline of a framework for conducting and assessing the value of participating in collaborative data analysis from alternative perspectives useful for researchers interested in pursuing this kind of inquiry.

Format, Style, and Timetable

The panel discussion will be interactive in nature. Depending on the number of participants in the session, the panel discussion may continue into small groups during the session. The style of the interaction will thus be open and personal. The audience will be provided with sample vignettes and short excerpts from interview transcripts to illustrate tensions or multicultural issues that could be used as a springboard for discussion. These will be handed out at the beginning of the session so attendees can read them over and scan them during the panel introduction. Examples will also be brought into the overview presentations.

The timeframe is as follows: the panelists each present their approach to action learning and some of the discussion points that emerged from the cross-cultural data comparison (15 minutes). The discussant raises some further issues from her reading of the US-Dutch collaboration, using a cross-cultural framework (10 minutes). At least four themes (mentioned under Session Description and Content) are then discussed with the audience, moderated by the discussant (or by all presenters if the session splits into small groups) (50 minutes). The final part of the discussion is devoted to the question of what merit there is in using different perspectives on action learning, both for the audience and for further development of theory and research in that area (15 minutes). Ideas that emerge from the discussion will be captured on easel sheets for distribution to those attending, providing a record of the conversation.

Career Development Within HRD: Foundation or Fad?

Marieke S. van Dijk
University of Minnesota

This article examines the evolving nature of Human Resource Development (HRD) as reflected in changes in one of the component parts often associated with HRD – career development (CD). Recent developments within career development such as a focus on employability, the boundaryless career, and free agent workers are discussed. New directions for career development, including the role of informal learning, integrative life planning, and the focus on systems theory as a link between both fields, lead to the conclusion that CD can and should be a foundation for HRD.

Keywords: Career Development, Foundations of HRD, New Directions in HRD

Human resource development (HRD) scholars and practitioners have frequently identified career development (CD) as one of the key components, or critical areas, underlying the field (McLagan, 1989; Swanson & Holton, 2001; Weinberger, 1998). Moreover, Ralphs and Stephan (1986) surveyed HRD departments in Fortune 500 companies and reported that the four main HRD activities in those organizations were considered to be: organization development, training and development, human resource planning, and career development. More recently, Bartlett, Kowske and Anthony (2003) examined Web sites of 247 of the Fortune 500 companies and found that over half mentioned career development, even if only briefly. This evidence seems to lead to the conclusion that career development is of interest to HRD scholars and practitioners and, thus, one of the foundational components of HRD.

However, in examining HRD research, and as mentioned by other authors, career development does not receive much attention from HRD scholars (Boudreaux, 2001; McDonald, Hite & Gilbreath, 2002; Upton, Egan & Lynham, 2003). A review of conference proceedings of the Academy of Human Resource Development of the last three years revealed only two articles related to career development in the 2003 proceedings, one in 2002, and three in the 2001 conference proceedings. Moreover, in a foundational text on HRD, Swanson & Holton (2001) acknowledged, “career development is often overlooked as a contributor to HRD” (p. 312).

An examination of curriculum content in HRD and HR programs paints an even worse picture. Kuchinke (2002) reported that career development is taught in less than half of the core or required curricula of graduate HRD programs in the USA. An analysis of content areas covered in U.S. American graduate HR programs showed that career management or development is required at only one of the 76 universities surveyed and one other program offered it as an elective course (Madsen, Musto & Hall, 2003). In conclusion, even though career development is often defined as a foundational component of HRD, it is underrepresented in the literature in the field as well as in the education of our future scholars and practitioners.

One reason for this, as reported by Upton, Egan and Lynham (2003), might be the lack of literature with a focus on the common ground between HRD and career development. Another reason could be that HRD is more focused on performance improvement and learning on the organizational and systems levels than on the individual level (Upton, Egan, & Lynham, 2003). Furthermore, macro-level forces, such as technological and economic forces, coupled with changing workforce demographics, changed the nature of work and modified the concept of career drastically over the last ten or so years (ACES, 2000; Brown, 1996, 1997, 1998a, 1998b; Feldman, 2002; Hall, 1996; Howard, 1995; Judy & D’Amico, 1997; Sullivan, 1999). As a result, the responsibility for the development of careers has shifted from an organizational centric design to an individual centric design. Individuals must now take control of their own career development (Leana, 2002; Sullivan, 1999; Swanson & Holton, Upton, Egan & Lynham, 2003). These changes in the nature of work have had a significant impact on the theory and practice of career development.

It appears that in the midst of all this change, HRD scholars and practitioners have lost sight of an important field to draw upon for their theory building and development of practice. Although individuals are ultimately responsible for their own career development in the new workplace, organizations remain the context in which this development has to take place. This author agrees with Conlon (2003) that “organizations create the climate and influence career decisions for the individual, whether by design or not” (p. 489). Therefore, I will argue that career development should be a foundation for HRD and not some fad that is insignificant to the discipline.

The purpose of this paper is to examine the evolving nature of HRD as reflected in changes in one of its components - career development. First, a short overview of career development, including definitions, history, and

Copyright © 2004 Marieke S. van Dijk
the specific focus on adults, will be provided. Next, the changing nature of work and its impact on the focus and availability of career development opportunities in organizations is discussed. In addition, this article explores how these changes in the nature of work have resulted in new visions on the concept of career and the employer-employee relationship. Furthermore, foci for career development within the new employee-employer relationship are highlighted. As a final point, recommendations for future directions in research in the field of career development and its relationship with HRD are presented.

**Career Development: Definitions and Focus**

*Definition*

Upton, Egan, and Lynham (2003) examined 30 different definitions of career development that covered 48 dependent variables. These variables ranged from individual outcomes, e.g. achieved career objectives and development of a self-concept to organizational and societal outcomes, e.g. increased organizational performance and aligned organizational talent with individual career needs. One of the definitions of career development listed by Upton, Egan, and Lynham (2003) is the definition by Boudreaux (2001). She described career development in terms of fit between organizational and individual goals, noting that “Career development focuses on the alignment of individual subjective career aspects and the more objective career aspects of the organization in order to achieve the best fit between individual and organizational needs as well as personal characteristics and career roles” (p. 806).

This definition of career development will be used in this article because the focus of this definition is on both the individual and the organization. Many of the definitions described by Upton, Egan, and Lynham (2003) were more geared to the self-development of an individual, but missed the organizational perspective. Since performance improvement on both the organizational and individual level is central to HRD, Boudreaux’s (2001) definition seemed an appropriate definition for career development within the context of HRD.

*History and Focus*

Historically, career development practice stems from vocational guidance. The shift from an agricultural economy to an industrial system increased the need for people to identify and access emerging jobs. Career development in that time focused on helping the individual choose their profession. It was not until the Twentieth-century that career development also started to include the effectiveness of career development interventions across a wide range of organizational settings and populations (Herr, 2001). Therefore, the term career development has come to describe two sets of theories, or conceptual domains.

The first set of theories focuses on the development of career behavior across the life span and concentrates on matching individuals to jobs and providing occupational information. This approach is also called career counseling or career planning. The second set of theories, sometimes called organizational career development or career management, explains how career behavior is changed by certain (organizational) interventions. Career management is an organizational level approach that addresses human resource needs of the organization and connects these with individual career plans and development needs (ACES, 2000; Boudreaux, 2001; Gutteridge, Leibowitz & Shore, 1993; Hall, 1996; Herr, 2001).

Career development, as used in this article, will focus on organizational career development. Career planning theories focusing on choosing a first career for high school or college students are not as relevant to HRD since this target group traditionally falls outside the boundaries of HRD. On the other hand, theories with regard to adult development are especially relevant to HRD because these give scholars and practitioners insight in the different career stages through which adults progress (Swanson & Holton, 2001). Organizational career development theories should focus the interaction between individual and organization, and can also be regarded as change theories on an individual level, which make them central to HRD (Swanson & Holton, 2001).

**Beyond the Individual and the Organization: Forces Influencing Career Development**

According to systems theory, the forces at work in the macro environment inevitably have an effect on the individual employee within the organization (Swanson & Holton, 2001). Advancements in technology, changing workforce demographics, and expanding global markets influence the skills one needs to advance in a career, but also the way a career is developed (Coovet, 1995; Feldman, 2002; Howard, 1995; Madsen, 2001; Sullivan, 1999; Van der Spiegel, 1995). For example, economic conditions and the health of particular sectors of the economy influence individual’s career opportunities and constraints. Moreover, as Feldman (2002) noticed, “the effect of macro-level forces may even be greater on individual’s perceptions of the desirability of various career opportunities” […] than the influence of the immediate nuclear family on career development (p. 8). Leana (2002) also acknowledged that external markets have become the primary factor in career development decisions. From
training opportunities to the very existence of jobs, it all depends on external market forces. In this section, three important forces that influenced the field of career development over the past few years will be discussed. These are the gap in career development opportunities between professionals and nonexempt employees, the winner-take-all economy, and the potential national role for career development.

**Professional vs. Nonexempt Employees.**

One of the basic principles of career development should be that career development is for everyone, not just for high potentials (McLean, 2002). However, McDonald, Hite, and Gilbreath (2001) called attention to the fact that nonexempt employees are often overlooked in career development and HRD. Access to developmental activities has traditionally been limited to managerial talent, who are viewed as the most valuable human resource. There seems to be an explicit assumption that nonexempt employees do not have careers—they have jobs. Even now, the assumption prevails that nonexempt employees have no significant long-term aspirations that need to be addressed by career development staff. McDonald, Hite & Gilbreath (2001) illustrated the falsity of this assumption and identified three themes important for nonexempt employees, that deserve the attention of both career development and HRD specialists. These are: (1) the work itself (e.g. challenge, variety, accomplishment) (2) climate issues (e.g. relationship with colleagues, being appreciated, having input), and (3) security/ compensation/ benefits (e.g. job security, good pay/benefits, flexible work schedules).

Moreover, with the current mass lay-offs, the fear of finding a job in the first place has prevailed over concerns about career opportunities, but this will change in the future. Even then, when unemployment numbers drop, the problem of employee matching remains. The “right” people for the job may not be those who are seeking employment (Howard, 1995; Judy & D’Amico, 1997). Yet, it is this group of employees – usually nonexempt workers- that is often overlooked in career development and HRD efforts (Leana, 2002; McDonald, Hite & Gilbreath, 2001; McLean, 2002). In summary, future efforts of career development specialists should focus on raising awareness that career development is important for everyone, not just for high potentials and upper management.

**Winner-take-all Markets**

Lack of career development opportunities for certain groups of employees might also be due to the so-called winner-take-all markets, as described by Leana (2002). In these markets, those at the top receive astronomical rewards often at the expense of those slightly below the top tier. “Such markets operate like those for professional athletes were the difference between being first place or second is enormous in terms of the rewards being received, even if there are no real discernable differences between the two in actual skill and talent” (Leana, 2002, p. 279). One of the consequences for career development is that in order to compete in a winner-take-all market, only the best of the best will be considered to compete at the top in certain professions. This is an important fact to take into consideration when choosing a vocation or changing careers.

As said before by McDonald, Hite & Gilbreath (2001) career development and HRD specialists should increase their attention to release the untapped potential within the workforce in the non-managerial jobs in order to decrease this gap. If HRD and career development truly want to make a contribution on a national level – as will be discussed in the next section – they must not accept the widening of the gap between the “haves” and “have-nots”.

**A National Role for Career Development**

Career development and HRD share a common characteristic that goes beyond their focus on matching individual and organizational needs. That is, both fields have the potential to influence the economic health and the knowledge and skills of its workforce on a national scale. As Herr (2001) states: “the importance of career development in the twenty-first [century] will grow as a world-wide, sociopolitical force designed to facilitate the economic health of nations and the purpose and productivity of individuals”(p. 209). Moreover, the Association for Counselor Education and Supervision (ACES) identified that a philosophy of career development is “preparing people for work to help nations build or keep the competitive economic edge in the global market place (p. 5). This claim reveals a close link between career development and HRD. Looking at the definition of HRD by McLean and McLean (2001), we see many similarities in the contribution and objectives of both fields that include benefits on a national level. McClean and McClean’s (2001) definition of HRD is: “Human Resource Development is any process or activity that, either initially or over the long term, has the potential to develop adults’ work-based knowledge, expertise, productivity and satisfaction, whether for personal or group/team gain, or for the benefit of an organization, community, nation or, ultimately, the whole of humanity” (p. 322).

Future research is needed to explore in more detail how career development and HRD are influenced by society and how both fields, in turn, can influence the development of knowledge and skills for the benefit of nations as a whole. This expansion of the definition and role of HRD and career development beyond the individual and organizations shows great promise in getting HRD and career development on the national agenda.
The Changing Nature of Careers

The review above demonstrates that macro change forces influence career development. The most significant change seems to be the shift in responsibility for career development. Organizations no longer take the responsibility to protect their employees from market fluctuations, expecting their workers to take control of their own careers (Leana, 2002; Upton, Egan & Lynham, 2003; Feldman, 2002). Concepts that try to work within the new boundaries of the employer-employee relationship—employability and the boundaryless career—will be discussed in this section.

Employability

With the shift in responsibility for career development from the organization to the individual, the concept of employability is receiving increasing attention in the literature (Baruch, 2001; Brown, 1996, 1998; Howard, 1995; Short & Opengart, 2001). What the term means is that the organization will give employees tools to expand their employability (i.e. make them attractive to other employers), so it will be easier to find a job in case of downsizing (Baruch, 2001). The positive consequence of employability is that it creates self-reliant workers and a career resilient workforce (Brown, 1996). Employees take charge of their own careers; they contribute skills aligned with business needs and are committed to continuous learning (Brown, 1996). The question remains, is this a voluntary movement or is it an offer one can not refuse since one’s job is at stake? Fear for one’s job is a very strong motivator (Baruch, 2001). Introducing employability as a new concept assumes that organizations in the past did not offer tools for their employees to remain up to date with regard to their knowledge and skills. This is not the case; organizations have always been providing training and development for their employees. Baruch (2001) warns that although employability might be beneficial for individuals—it is advantageous to be employable in turbulent markets—employability cannot be a replacement for organizational commitment. Employability is a concept that needs further research within the context of career development and HRD. It seems evident that the responsibility for career development lies with the employee now, and this will not change in the near future. The question remains, what is the role of the organization in facilitating the employability of their employees?

Boundaryless Careers

Traditional careers where people climbed the organizational ladder gaining income, power, security and status are gone (Feldman, 2002; Hall, 1996; Sullivan, 1999). Instead, “many individuals are traveling career paths that are discontinuous and go beyond the boundaries of a single firm” (Sullivan, 1999, p. 464). The idea of a ‘job for life’ has been replaced with ‘survival of the fittest’ as downsizing has forced employees to develop their own career plans (Loughlin & Barling, 2001, as cited in Conlon, 2003). Changes in the psychological contract between organizations and employees have given rise to the idea of boundaryless or protean careers (Sullivan, 1999). Since organizations cannot offer job security any longer, people need to take charge of their own careers. Consequently, careers are being viewed as boundaryless in the career development literature (Arthur and Rousseau, 1996). Boundaryless careers, as described in Sullivan (1999) have the following characteristics. They (1) transition across occupational boundaries, (2) transition across organizational boundaries, (3) transition across the boundaries between roles, (4) transition across boundaries within roles (e.g. increased responsibilities), (5) have changed meanings of employment, relationships, and (6) depend on network relationships. Even though the majority of people might still have a “traditional” career at the moment, the concept of the boundaryless career will most probably play an important part in the future of career development and HRD. More knowledge is needed on how career development specialists can assist employees in dealing with this new type of career.

Free Agent Workers

Free agent workers seem to make up the other side of the coin for boundaryless careers. Free agents are those employees “who focus on their long-term employability security within the new career model, without seeing themselves as bound to any one organization” (Short & Opengart, p.813). Thus, free agents are most likely employees who have a boundaryless careers (Imel, 2001; Short & Opengart, 2001). Much can be learned from free agents and future research will have to provide insight on what the specific needs and demands are of free agent workers with regard to career development. The development of networks has been proposed as a career development strategy for free agents, but more research is needed (Imel, 2001).

New Directions for Career Development in Organizations

Even though the responsibility for career development has shifted from the employer to the employee, this does not mean that the organizations do not have any responsibilities anymore for the development of their workforce. Organizations create a climate, one that supports learning or not, and influence career decisions of employees through several different means (e.g. pay and benefits). In short, career development should remain a shared
responsibility (Boudreaux, 2001; Brown, 1997). Economic forces may have caused training and development budgets to be cut severely, but there are other possibilities that career development and HRD can explore to achieve the best fit between individual and organizational needs as well as personal characteristics and career roles, such as informal learning and learning opportunities within the workplace.

**Role of Informal Learning**

Informal learning techniques are convenient and accessible. Coupled with findings that as much as 70% of employees’ learning needs are fulfilled by informal learning, the concept needs further attention from scholars (Power, Hubschman, & Doran, 2001). Informal learning can take place in many different settings, even in more formal activities, such as “lessons learned” sessions, developmental assignments, and on-the-job coaching (McCauley & Hezlett, 2001; Power, Hubschman, & Doran, 2001). Power, Hubschman, & Doran (2001) have proposed a model to re-create career development via informal learning. In this model the HRD professional acts as “the filter or catalyst who assists, through the reframing process, employees in enhancing their career development skills in improved goal setting and visioning, resulting in whole person learning for the employee and enhanced performance for the organization” (p. 826). In times of economic down turn, when development budgets are small, informal learning shows great promise to continue to create a learning culture and social support for learning in a more informal setting.

**Learning Opportunities and Learning Behavior**

With the expanding role of informal learning, organizations need to ensure there are ample learning opportunities created for employees within the organization (McCauley & Hezlett, 2001; Power, Hubschman, & Doran, 2001). Van der Sluis & Poell (2003) examined the impact of learning opportunities and learning behavior at work and found that “career development depends both on the work environment in terms of learning opportunities and on individual characteristics in terms of learning behavior” (p. 174). Individual learning behavior has an impact on career development, which is in line with the traits of the new free agent workers, as discussed above. Van der Sluis & Poell (2003) also found a link between a supportive job environment and the career satisfaction of employees. They conclude that employees appreciate feedback on their performance and are more aware of their own responsibility for their learning and professional development. In sum, the role of learning theory in career development should be a focus of future research on the crossover between individual and organizational learning.

**Integrative Life Planning**

Professional organizations (ACES, 2000; NCDA, 2000) urge career development specialists to see career development as a developmental process that is lifelong and contextual in nature. Changes in the world of work result in new attitudes about work, family, and leisure. Career development professionals need to understand that these issues are often link with other parts of their lives, which blurs the line between career counseling and personal counseling, and calls for a broader definition of career development. Hansen (1997) has proposed the term “integrative life planning” to expand career development beyond trait factor theories and matching people with jobs, to include other work and life roles. This definition of career development is linked closer to the purpose and objectives of HRD with its holistic focus and the greater emphasis on work and organizations. New developments in theory building and practice in this area should be encouraged.

**Systems Theory: The Missing Link Between Career Development and HRD?**

Like HRD, career development is an applied field with a multi-disciplinary theory base (Boudreaux, 2001). In previous efforts to link career development and HRD, the focus was on identifying these theoretical frameworks in career development that can inform HRD theory and practice; these include: trait-factor theory, social learning theory, adult development theory, and behavioral theory (Boudreaux, 2001; Upton, Egan & Lynham, 2003). Although HRD scholars need to be informed by these theories, organizational change models and systems thinking might provide a stronger basis for arguing why career development lies at the heart of HRD (Russel, 1991, Patton & McMahon, 1998).

A systems perspective might provide a new insight in the relationship between career development and HRD. Elements of systems thinking, such as interconnectedness of parts, relatedness, and a notion that the whole is more than the sum of its parts were already present in some career development theories, such as Hansen’s (1997) model of integrative life planning. Nevertheless, Patton and McMahon (1998) are the first who proposed a meta-theoretical framework using systems theory for the integration of different career theories and the development of a relationship between theory and practice with a focus on the individual. They portrayed the field of career development as a self-organizing, open system that constantly changes from within, but is also changed by the ongoing interaction with other systems.
Patton and McMahon’s (1998) systems theory framework of career development focuses on the individual as a learning system, and includes elements such as: skill, world-of-work knowledge, workplace, employment market and education institutions – elements that are very much related to HRD. Although no specific comparison between HRD and career development theories is made in this framework, I would recommended this as an area for future research.

As Patton and McMahon (1998) stated “A systems theory perspective recognizes the contribution to career development theory and practice of other disciplines” (p. 167). This can also be applied in a HRD setting, where a systems career development approach can aid to our understanding of the development of a meaningful integration of systems and organizational level development with individual development in the workplace” (Upton, Egan & Lynham, 2003, p. 728)

**Directions for Future Research**

The purpose of this paper was to argue that career development should be a foundation for the field of HRD. In order to strengthen the ties between the fields and to create a body of literature with a focus on the commonalities between the fields, much future research is needed. In summary, future research should focus on six main areas: (1) the consequences of the changing nature of work and careers on career development, (2) effectiveness of different career development interventions, (3) a holistic approach towards career development, (4) the role of learning in the development of careers, (5) societal and national issues, and (6) systems thinking.

**Consequences of the Changing Nature of Work and Careers**

This includes examining external or environmental factors associated with learning, development and performance such as the impact of technology and cross-cultural implications of career development (ACES, 2000; Boudreaux, 2001; Sullivan, 1999). In addition, emerging concepts like employability, free agent workers and the effects of boundaryless careers need further attention (Boudreaux, 2001; Sullivan, 1999; Upton, Egan & Lynham, 2003).

**Effectiveness**

This includes examining how different employment relationships affect individual and organizational outcomes (Sullivan, 1999; Upton, Egan & Lynham, 2003). Another important research area is to examine the effectiveness of organizational programs and newer learning methods that focus on developing the skills needed for success in non-traditional career paths (Sullivan, 1999). Research on the proposed link between career development interventions and individual and organizational performance improvement needs more attention. As Boudreaux (2001) argued, future career development research and practice must be linked more closely to performance outcomes.

**Holistic Approach**

Future research must take a more holistic approach to career development, acknowledge its contextual nature, and the interplay between work and life issues (Hansen, 1997). Research should include the relationship between different career development interventions and activities with all corresponding facets of personal identity (Hall, 1996). This holistic approach to career development should also include examining systems dimensions of learning and performance and looking for connections between employee preferences and competencies, and HRD practices (Upton, Egan & Lynham, 2003).

**Learning Theory**

Future research should focus on the role of learning theory in career development. Informal learning and specific individual development practices with a focus on learning will be a very important part of future career development practice (McCauley & Hezlett, 2001; Power, Hubschman, & Doran, 2001; Upton, Egan & Lynham, 2003; Van der Sluis & Poell (2003). Learning theory shows promise to tighten the interrelationships between career development and HRD, which needs to lead to an examination of interchanges between individual career development interests and organizational needs (Upton, Egan & Lynham, 2003).

**Societal and National Issues**

The increasingly widening gap between the “haves” and “have nots” should be of great concern in future career development and HRD research. With expanding definitions of both HRD and career development (Herr, 2001; McLean & McLean, 2001) come greater responsibilities as well. Although this is a big aspiration, career development and HRD should focus on the whole of humanity and not forget about the people with the least skills, who often need attention the most to develop their expertise (ACES, 2000; Leana, 2002; McDonald, Hite & Gilbreath, 2002).

**Systems Thinking**

The focus on systems in both career development and HRD shows potential for bringing the two fields closer together. Career development can be seen as a sub-system of HRD. The nature of systems is that the sub systems
influence each other. More research is needed on how HRD influences career development and the other way around. Patton and McMahon’s (1998) systems framework for career development provides a good starting point to investigate this relationship further.

**Conclusion**

Due to macro economic, technological and demographical changes, career development has changed dramatically over the past years. This raised the question: should career development still be considered a component of HRD, or is there a new paradigm we should be looking at? Although, career development as a field is still mostly focused on career choice, developmental stages and career counseling (ACES, 2000; Hansen, 1997; Herr, 2001; McDonald, Hite & Gilbreath, 2002) a holistic approach to career development has been proposed that shows a closer relationship with the outcomes and objectives of HRD (Hansen, 1997). Further investigation into systems theory as the missing link between both fields promises to be fruitful. Patton and McMahon’s (1998) systems framework provides a good starting point to elaborate on the holistic approach as proposed by Hansen (1997) and can provide a better insight in the nature of the relationship between career development and HRD.

A major change in the nature of career development has been the shift in responsibility from the organization to the individuals. Employees are expected to become free agents, self-directed learners, who take charge of their own career (Feldman, 2002; Leana, 2002; Sullivan, 1999; Swanson & Holton, Upton, Egan & Lynham, 2003). Research shows, however, that career development depends “both on the work environment in terms of learning opportunities and on individual characteristics in terms of learning behavior” (Van der Sluis & Poell, 2003, p. 174). As a result, the future role for HRD and career development professionals should be to help organizations create meaningful learning opportunities and encourage learning behavior at all levels of the organization, for all employees, not just high potentials (McLean, 2002). Career development and HRD practitioners can assist employees with goal setting and developing a career vision, resulting in whole-person learning for the employee and improved performance on the individual, systems, and organizational level (Conlon, 2003; Hansen, 1997).

Career Development Challenges for the 21st Century Workplace: A Review of the Literature

Thomas J. Conlon
University of Minnesota

Career development theories have focused on the human lifespan, traits, vocational choice, assessment tools, values and self-understanding to guide adults in their career decisions. However, many of these early theories have questionable value in today’s diverse workforce and where business practices have changed to reflect emerging economic competitiveness in a global economy. This paper reviews literature on career development and contemporary business trends. Career development implications and research questions for the 21st century workplace are identified.

Keywords: Career Development, Career Planning, 21st Century Workplace

The 21st Century workforce looks and feels considerably different from the past century when the first career development theories emerged (Bierema, 1998). Career development practice, like 100 years ago, will always be necessary as long as students, adults or employees are seeking careers and employers seeking labor. Beyond this commonality, however, career development’s practices and theoretical relevance have changed and will look different in the 21st Century (Herr, 2001). This paper briefly identifies career development theories and theorists, with more detail on contemporary workplace issues in the literature which impact career development. While focusing primarily on a North American career development context, commonalities may impact other industrialized nations and growing economies of the world. It also highlights issues likely to evolve in the 21st Century workplace and propose questions for future research.

Methodology, Methods and Scope

The research problem is how to assist individuals and organizations in career development practices that are consistent with a 21st century workforce and workplace. The methodology is a literature review to develop a grounding in past and current career development definitions, practices and workplace issues, with the purpose of identifying likely career development issues in the 21st century workplace and proposing future research questions or conclusions for empirical or qualitative testing. No studies or tests based on these findings are within the scope of this study. A large amount of career development research also focuses on career counseling and assessment, including for children and students. The scope of this review is to focus primarily on the adult worker and workplace characteristics rather than professional career counselor practices seen in schools and job placement organizations.

The method of this study was to conduct a literature review, using both library and electronic sources of scholarly journals, books, U.S. Government data, career development-related websites and other relevant publications during 2002 and 2003. Sources were chosen based on scholarly relevance, including key journals in the career development field (Career Development Quarterly; Journal of Career Development) and related HRD or business management journals. This paper assumes the view that career development is, and will likely remain, a part of HRD. Therefore, scholarly works of HRD, including journals, recent Academy of Human Resource Development conference proceedings and books were included in the research. To identify broader business trends in both a scholarly and practitioner context, the World Wide Web’s Google.com search engine was used, testing different words such as career development, workplace trends and the 21st century workplace. Electronic scholarly sources were sought using similar words under ProQuest and ERIC. Finally, manuscripts themselves often revealed additional sources for research, which were pursued using one or more of the methods noted above. A collection of sources were then categorized by themes reflected in the findings of this paper, supplemented with the author’s conclusions and recommendations.

The limitations of this study may be the shortage of global literature, particularly in developing nations or in cross-cultural contexts. However, as country-specific studies (many in Asia) were found, the decision to focus more on broader career development contexts (which generally reflect a North American and, to a lesser extent, a European tradition) limits the scope of these findings. Since the findings have not been tested, they are not generalizeable but do provide a grounded framework for future researchers to confirm or refute these findings.

Definitions and Theorists

Career development is a component of HRD (McLagan, 1989; Marsick & Watkins, 1994), although some scholars feel it has, at best, lost its influence, or worst, its place in HRD due to the shift of career development responsibilities from organizations to individuals, where individual choice generally falls outside the traditional bounds of HRD (Swanson & Holton, 2001). McDougall & Vaughn (1996) argue that “career development involves aligning individual subjective and more objective career aspects of an organization to find a match between individual and organizational needs, personal characteristics and career roles.” This author views career development as a mutual role, based on the needs and circumstances of both individuals and organizations.

Career development definitions have evolved over time. Once known as vocational guidance, this definition implies that someone other than the individual (e.g. vocational guidance counselor or an organization) is responsible for the career guidance function, which was largely true for this era (Herr, 2001). This began to shift as Super (1951) defined vocational guidance as “the process of helping a person to develop and accept an integrated and adequate picture of himself [sic] and of his role in the world of work, to test this concept against reality, and to convert it into a reality, with satisfaction to himself and society,” where the career choice gave way to the characteristics of the chooser, or the psychological nature of vocational choice. Super (1954) defined occupation as “the specific activity with a market value that an individual continually pursues to obtain consistent and steady income” while one’s career is “the sequence of occupations, jobs and positions in an individual’s life,” a foundation of his life-span career development theory taking workers through formal education, a career, and retirement.

Pietrofesa & Splete (1975) stated that “career development is an ongoing process that occurs over the lifespan and includes home, school and community experiences related to an individual’s self concept and its implementation in lifestyle as one lives life and makes a living.” Robbins (1993) defines career development as “a means by which an organization can sustain or increase its employees’ current productivity, while at the same time preparing them for a changing world,” thus supporting an organizational role that is consistent with HRD. Applebaum, Ayre & Shapiro (2002), while acknowledging an employee’s responsibility for career management, see the organization’s human resource professionals who “define and implement career management programs within organizations, including succession and retirement planning facing all organizations.” This view distinguishes career development from career management, which falls more into human resource management rather than HRD functions. Noe (1996), however, argues that organizations can best use their resources to train managers in skills to support employee development rather than career management programs for improved employee performance.

Parsons (1909), who first proposed people’s traits could be matched with work conditions and vocations, brought career development to the forefront during the U.S. industrial revolution. Holland (1985) viewed career development as a person-environment fit and developed many career assessment tools that are still used today. Gottfredson (1996) saw career development in an individual’s development role; Krumboltz (1996) in a social cognitive learning context. Brown (1996) focused on the broader life roles of individuals. Others have made contributions within one or more of these contexts as well. Future theorists must study current and future workers and workplaces to determine how changes have confirmed past theories, or created need for new theories reflecting today’s realities.

The Workplace Today

Osipow & Fitzgerald (1996) stated that “careers are influenced by conditions that emerge in one’s early years, especially gender and family socioeconomic status,” an implicit recognition that early career development theory was designed for a white, male, and middle-class workforce (Betz & Hackett, 1986; Perrone, Sedlacek & Alexander, 2001; Isaacson & Brown, 2000; Opengart & Bierema, 2002; Fitzgerald & Betz, 1994). Career practitioners need to understand that cultural differences in today’s more diverse workforce impact their vocational behavior (Leong & Brown, 1995).

Up through the 1960s, the employer-employee relationship was characterized as a parent-child relationship: narrowly-defined jobs; community status and job security were provided in exchange for employee hard work, loyalty and good performance. By the 1990s, a new contract had firmly taken hold and is in effect today. In this era, the employee-employer role is a partnership, where employers provide opportunities and tools for employee development, but the employee takes responsibility for career management and exercises opportunities. They must continually update their skills and be self-reliant (Collard, Epperheimer & Saign, 1996).

In 1985, the National Vocational Guidance Association formally changed its name to the National Career Development Association, formally reflecting new theories, assessment practices and inclusiveness of additional perspectives and populations (Herr, 2001).
Eight themes emerged in reviewing comparisons between the past, present and likely the future workplace.

1. **Demographics.** Longer life expectancy, rising retirement ages, along with economic, social and psychological reasons, has increased the number of elderly in the U.S. workplace (Henretta, 2000). The traditional two-parent family with the father as sole breadwinner declined from 60% in 1955 to 11% of families in 1980 (Robey & Russell, 1984). Within the early 21st Century, the U.S. labor force will contain about 30% people of color, and, combined with women of all races, will become the new majority of U.S. workers (U.S. Department of Labor, 1995). Generation Xers, born roughly from 1961-1981 and who are the workforce’s younger workers, have grown up in a time where divorce rates doubled from 1965 to 1977, single parent homes became the norm, and where over 40 percent of them come from a broken family (O’Bannon, 2001). Between 2000 and 2010, women will outpace men in U.S. labor force growth 15.1 percent to 9.3 percent; white workers share of the workforce will drop from 73.1 percent to 69.2 percent; and workers over age 55 will increase from 12.9 to 16.9 due to the aging baby boom population (U.S. Department of Labor, 2003).

2. **Old vs. new economy.** One-third of Fortune 500 companies existing in 1980 were gone by 1990, and another third of the remaining firms were targeted for hostile takeovers. U.S. exports rose from 11% in 1960 to 31% in 1990, and continue to rise (Whitman, 1999). Knowledge workers are currently 40% of the U.S. workforce, but are expected to form at least 90% of the workforce by 2010 (Drucker, 1999). Between 2000 and 2010, U.S. employment is expected to grow from 146 million to 168 million, primarily in the fastest growing services industry (3 out of every 5 new jobs, mostly in business, health and social service), as well as more modest growth in durable good manufacturing. In this same time period among occupations, professional jobs will grow the fastest (26 percent increase), followed by service (19.5 percent), transportation (15.2 percent), management, construction, and sales occupations. Non-durable goods manufacturing will continue its current decline due to increased job automation and international competition. Nearly two-thirds of projected job openings by 2010 will offer lower pay and benefits, yet require on-the-job-training arising mostly from replacement needs (U.S. Department of Labor, 2003). Zemsky, Shapiro, Iannozzi, Cappelli & Bailey (1998) found 78% of U.S. companies were using lower-paid contract or contingent workers (project-based, temporary or independent contractors), with 40% of them expecting such use to grow. Today’s workplace reflects the impact of globalization, where worldwide competition to once-domestic markets has created new demands for higher productivity and lower costs to remain competitive with cheap labor outside the U.S.

3. **Career patterns.** Leach & Chakiris (1988) note the traditional linear career development model of education, employment and retirement likely accounts for less than one-third of all U.S. careers, and new ways of looking at adults’ developmental diversity are needed such as free-form (part-time work, entrepreneurial, consulting or volunteer) or mixed-form (transitions between linear and free-form, or unemployed/underemployed). Many job titles did not exist when current older workers made their initial career decisions (Robey & Russell, 1984). Women and minorities don’t typically follow a linear or life-span career as their career development is disproportionately influenced by their differential experience of home, school and workplace. Women’s lives are also more closely characterized by social interaction and personal relationships, thus affecting their career development with interruptions not reflected in traditional career development theories (Hughes & Smith, 1985; Eastmond, 1991; Sharf, 1997). As the U.S. workforce continues to diversify, people with differing individual value systems and unique needs will also enter occupations with varying expectations and rates of success (Isaacs & Brown, 2000), making career development a more customized process.

4. **Workplace justice.** Has career development been caught in the ideological debate over globalization, job access, employment discrimination and opportunity? As these characteristics dramatically increase in future decades, the impacts of globalization, discrimination, technology, workplace laws and a lack of dignity may pose new career development challenges (Herr, 2001; Santos, Ferreira & Chaves, 2001). Critics of globalization see the 21st Century as ‘the new ruthless economy,’ characterized by a growth in inequality, a shift in power from labor to capital, and a proliferation of low-wage employment (The New York Review of Books, 1996). The 21st century must also adapt to meet social justice needs of the new immigrants, poor youth, victims of discrimination, disability, economic status and others who face obstacles in their career development (Hartung & Blustein, 2002). Theories need updating that consider gender, age, race, social class, sexual orientation, socio-economic status and English language proficiency (Bierema, 1998) as well as in training and development opportunities (Knoke & Ishio, 1998). Career development must also take into account people with disabilities, who also have been underrepresented in traditional workforces (Szymanski & Hershenson, 1998).
5. **Lifestyle & welfare trends.** The average U.S. American today stays on the same job for fewer than four years (Kurian, 1994). Downsizing and outsourcing of the U.S. workforce has created a more stressful worker (Gowing, Kraft & Quick, 1997). And as employees experience greater career uncertainty, their focus shifts from employment security to employability security (Gould & Levin, 1998). Job seekers increasingly will emphasize the quality of work life as work-life balance issues become more important in an era of job turnover. While individual job seekers no longer think in terms of one career path or job family as they did in Parsons’ or Super’s day, organizations will still play a small yet different career development role by creating multiple career paths (Lock & Hogan, 2000). Career counseling will continue to become less and less about jobs and more about life themes, values, strengths, family patterns and personal identity development, requiring more skills of future career counselors (Severy, 2002). Career counselors will also need to expose students, peers or clients to non traditional jobs in non traditional places and communicate that future workers will be non-linear, non-singular, non-traditional and non-secure. Developing social skills, technological expertise and broad-based experience in counselors will also be key, be they in an organization, school, or on their own (Herr, 2001).

6. **Employer responsibilities.** Is it in the employer’s best interest to provide career development, and in what form? How has it changed through they years? Organizations now focus on the advancement of a few carefully selected employees for career growth as cost-cutting, downsizing and flatter organizational structures have reduced or eliminated career development functions (Cox & Cooper, 1988). But Gutteridge (1986) argues that career development should be a broader organizational concern to “help ensure a continued supply of qualified, talented personnel” and that employees expect career advancement benefits, while Applebaum, Ayre & Shapiro (2002) note succession and retirement planning require organizations to remain involved in career development. On a more basic level, 25% of U.S. organizations of over 50 employees had to provide formal training in basic reading, writing and arithmetic skills (Bureau of Labor Statistics, 1995). Career counseling has become an integral part of human resource development programs as employers recognize the need to blend individual and organizational goals (Peterson & Gonzalez, 2000). As formal learning and career development continues to decline in organizations, we will likely see informal learning filling the gap: the rise of networking, trial-and-error, and growth from personal experience. However, HRD practitioners, in or outside of organizations, can assist employees with goal setting and developing a career vision, resulting in whole-person learning for the employee and improved organizational performance. (Powell, Hubschman & Doran, 2001). Pencil-and-paper career assessment tools are being replaced by the internet and will continue to grow, but with technological advance come new issues: privacy, ethical use of data, user readiness, methods of administration and equity of access (Sampson & Lumsden, 2000; Oliver & Whiston, 2000). The shift will go from employee-sponsored career training or actions to the creation of multiple career paths. The difference is one must generally seek it out themselves (Lock & Hogan, 2000).

7. **Employee & individual responsibilities.** Are individuals primarily responsible for their own career development? Or is it a blended responsibility? Loughlin & Barling (2001) argue that the notion of a ‘job for life’ has been replaced with a ‘survival of the fittest’ as downsizing has forced employees to develop their own personal career plans and portfolios. Koonce (1995) notes that decentralization, constant change, and new learning environments have forced employees to accept the responsibility and challenge for developing their own careers by upgrading skills, preparing a personal career plan and customizing that plan to fit the organization’s plan. As a result, younger workers whose parent’s careers may have ended or changed due to organizational downsizing will be more demanding and less willing to make sacrifices to their employers, not to mention a loss of employee loyalty to their organizations, especially when work-life balance issues arise. The non-union service sector has largely replaced the traditionally unionized manufacturing sector (and private sector unionism in general), making retraining and further education necessary to remain employable. Employees who actively embrace change and are tolerant of ambiguity are more likely to prosper in today’s highly turbulent organizational environments (Patterson, 2001).

8. **Education & training.** The power of informal learning should not be underestimated, as up to 90% of organizational learning takes place through informal work networks (Marsick & Watkins, 1991). Will careers be shaped more by personal mentoring relationships within organizations, rather than a planned career track? Education curriculum and career development must address basic skills while matching relevance to future careers in a knowledge-based economy, especially where traditional distinctions of training, learning, educational and performance are blurring and traditional job roles are shifting to performance roles. Learning has also shifted from the classroom to the point or moment of value, and
specific job descriptions have given way to performance expectations (Harkins & Kubik, 2001). Palomba and Banta (1999) believe colleges must be accountable for career success of their students, not only academic success, and that employers are requiring additional competencies beyond basic skills, many of which are lacking in students (Newton, 2000).

**Career Development in the 21st Century: A Conceptual Domain (w/diagram)**

Based on the literature, this author proposes the following theoretical domain comparing career development between the 20th and 21st centuries, to create a foundation for future research on career development’s role and effectiveness in the 21st century workplace:

<table>
<thead>
<tr>
<th>Career Development Domain</th>
<th>20th Century</th>
<th>21st Century</th>
</tr>
</thead>
<tbody>
<tr>
<td>Demographics</td>
<td>Largely White &amp; Middle Class, but shifting towards greater workforce diversity (Harris-Bowlsbey, 2003).</td>
<td>Ethnicly, Racially, Gender Diverse with non-traditional family structures and role.</td>
</tr>
<tr>
<td>Old vs. New Economy</td>
<td>Shift from Manufacturing to Service and information Economy (Blocher, Heppner &amp; Johnson, 2001); technology emerging, Productivity and loyalty valued.</td>
<td>Work crosses national borders, knowledge workers in highest demand. Adding value key to return on investment</td>
</tr>
<tr>
<td>Career Patterns</td>
<td>Linear, generally within one career in lifespan, job security good (in exchange for employee loyalty), but economic shifts and global competition force changes.</td>
<td>Flatter organizations, multiple careers in lifespan, non-traditional work setting (e.g. telecommuting). Growth in entrepreneurship as downsizing, restructuring forces career changes.</td>
</tr>
<tr>
<td>Workplace Justice</td>
<td>Unionization and increased regulatory environment largely shaped domestic reforms, but this began to disappear.</td>
<td>Now a decentralized, global economy; wider economic gaps between workers and upper management. (Hansen, 2003). Focus on global business ethics practices.</td>
</tr>
<tr>
<td>Lifestyle &amp; Welfare Trends</td>
<td>Work and life largely separate, yet generally compatible. More stable and traditional family and career structures</td>
<td>Work-life balance essential to career satisfaction; careers must appeal to this need</td>
</tr>
<tr>
<td>Employer Responsibilities</td>
<td>Provide a career path and opportunity for all employees within the organization, for its own benefit. Supervise employees closely.</td>
<td>Offer development opportunities for career growth, in or out of the organization. Management serves as coach and facilitator rather than traditional supervisor (Fisher, 1993).</td>
</tr>
<tr>
<td>Employee/Individual</td>
<td>Loyalty, hard work and often times seniority led to career growth within the organization.</td>
<td>Seize development opportunities, continued education, change organizations for career growth.</td>
</tr>
<tr>
<td>Responsibilities</td>
<td>Mostly completed before joining the organization; more structured training</td>
<td>Ongoing expectation of all employees, much of it outside the organization to stay current and maintain marketability</td>
</tr>
<tr>
<td>Career Development Role</td>
<td>Largely organizational role</td>
<td>Mutual, but primarily individual role</td>
</tr>
</tbody>
</table>

**Conclusion, Implications and Future Research**

As demographics show, the U.S. workforce is more diverse and likely to continue, reflecting population and societal trends. Many cultures view work and cultural roles quite differently, such as new immigrants coming from a collectivist or teamwork orientation to the U.S., generally viewed as more individualistic in business and cultural practices (Palladino Schultheiss, 2003; Hartung, 2002). Future research can assist career development by exploring
the role of cultural values, choice methods and outcomes in the career decision-making process. As globalization creates more cross-national and cross-cultural commerce, research will be needed that look beyond traditional North American and European career development models. Career development practice will grow worldwide as a sociopolitical force designed to facilitate the economic health of nations and the purpose and productivity of individuals. (Herr, 2001). Other questions to address or test include: Has an employer’s hands-off approach to career development caused higher turnover, or reduced costs? Is career development an HRD or Human Resource Management role? In what contexts? In a global economy, can a single career development theory address career growth in multinational organizations, or will cultural and business conflict intervene? What are the experiences of workers who have worked in such organizations? Are there differences in career development roles between entrepreneurs and members of larger organizations? Is career development a social justice and ethical issue, and whose responsibility is it?

The HRD profession stands to gain when it reinforces its historical role of linking an individual’s career development to organizational performance, and where organizations see career development’s value in improving productivity, employee morale, and recruiting and retaining the best people.

Perceived Effectiveness and Application of Organizational Career Development Practices

Carroll M. Graham
Fredrick Muyia Nafukho
University of Arkansas

This paper discusses the results of a study involving data gathered from a heterogeneous sample of organizations within a four-states region of the Midwestern United States. The main objective of this research was to determine the frequency and prevalence of career development practices and their perceived effectiveness among human resource executives. The results of the study show the demographics, status, and selected practices of the organizational career development systems utilized by the respondents.

Keywords: Career Development Practices, Career Development, Career Development Programs

The days of the organization creating a parent-like environment to loyal employees are quickly moving into the pages of history. New strategies requiring various approaches are replacing the contented attitudes and practices to which we had grown so accustomed (Gutteridge & Otte, 1983). The business world is experiencing a metamorphosis precipitated by revolutionary changes in technology, diverse consumer demands, globalization of our economy, corporate downsizing, rightsizing, restructuring, and increased competition. Coincidentally, “psychologists, sociologists, educators, economists, and management scholars are trying to understand how a person selects, works within, and makes decisions to change the focus of his or her working life” (DeSimone, Harris, & Werner, 2002, p.452). Furthermore, practitioners of human resource development are experiencing multiple challenges in the pursuit of perfecting the working person’s career. The practitioner’s role in organizational career development is now viewed as a “strategic process in which maximizing an individual’s career potential is a way of enhancing the success of the organization as a whole” (Sherman, Bohlander, & Snell, 1998, p.258). Because career development provides orientation to human resource development practices, it is vital that we gain an understanding of its importance and find ways to enhance the growth of the careers of every employee in the workforce. “A career consists of a sequence of work-related positions occupied by a person for the course of a lifetime. Traditionally, careers were judged in terms of advancement and promotion upward in the organizational hierarchy. Today, they are defined in more holistic ways to include a person’s attitude and experiences” (Cummings & Worley, 2001, p. 413).

The quest for knowledge to facilitate the development of careers has never been greater than it is in today’s business world. Considered one of three major functions within the discipline of human resource development, career development may be defined as a “an ongoing process by which individuals progress through a series of stages, each of which is characterized by a relatively unique set of issues, themes, and tasks” (Greenhaus, 1987, p. 9). Career development may be viewed as a two-part process: career planning and career management. Career planning involves an individual’s actions to determine skills, knowledge, abilities, values, and sometimes personality traits necessary, not only for the selection of a career, but to ensure and facilitate success once the career is chosen. Career planning may be a solitary action or a counselor may assist the individual in a more formalized set of procedures. Career management, on the other hand, involves the deliberate application of steps necessary to achieve the career plan, and maintain the career, and is usually administered in conjunction with the needs of the individual and the needs and support of the organization (DeSimone, et al., 2001).

The journey towards retirement usually entails three to five career changes in one’s passage into retirement. During that period adults may progress through traditional or modified approaches of career development (Greenhaus, Callanan, & Godshalk, 2000). Leibowitz, Farren, & Kaye, (1986) stated, “The effectiveness of a career development system lies in its consideration of the interaction, interdependence, and integration of all the elements within an organization” (p. 5). For a career development system to be effective, it must “have clearly defined responsibilities to the employees, the managers, and the organization; offer them a variety of development options; and form the link between current performance and future development, which includes the notion of the best “fit” or “match””(Leibowitz, et al., 1986, p. 5). The results of this study offer important insights into developmental career practices in this region of the Midwestern United States. Conclusions are drawn from this research that inspire human resource development practitioners to link developmental planning with organizational strategies and enhance the growth of individuals and organizations alike.

**Problem Statement and Purpose**

Career development practices and activities selected and utilized by human resource development practitioners vary from a minor few to multiple possibilities when addressing the growth of employees’ careers and ultimately the growth of the organization. A principal goal of this study was to gain a greater knowledge of the *preference and frequency of use* of career developmental tools and their application by various organizations within a four-states area of the Midwestern U.S. Due to the limited knowledge available regarding the prevalence and use of career development tools and practices in the aforementioned geographical area, the study sought to answer the following research questions: 1). What were the prevalent career development practices utilized by organizations studied? 2). Which practices did the HR managers in the study perceive as effective or ineffective? 3). Which career development categories, and accompanying practices were more frequently used? 4). What were the HR managers’ perceptions regarding the effectiveness of the categories and the accompanying practices?

**Theoretical Implications in Career Development**

As early as 1985, researchers have indicated the youthful existence of career development theory and research within the field of social sciences. Some have emphasized positive developments, claiming unity within the ranks in specific areas, while others voiced significant concern regarding the lack of cohesiveness in the many theoretical applications in the practice of organizational career development. As noted, “The field is fractionated, partly because it falls between the various academic disciplines that inform it” (Hall, 1986, p. 3). Theorists in the sociological and anthropological areas primarily focus on the organization’s role in career development (Glaser, 1968; Perrucci & Gerstl, 1969; Van Maanen, 1973). In other areas, such as occupational psychology, the direction of career development has been related to assessing personality traits, values, skills, and interests of the individual. Basically, this theoretical position asserts that an accurate inventory of the aforementioned variables and subsequent use of this information to match the individual to a compatible occupation is a viable approach to successful career development (Osipow, 1983; Holland, 1973; Super, 1980).

Schein (1978) pointed out the biases that organizational psychologists exhibit towards the development of personnel in lower levels within organizations, as compared to managerial psychologists who favor career development practices targeted for managerial resources. He expressed doubts about the latter developmental theory due to his belief that organizations would soon be focusing needs on individuals with technical and functional expertise (Hall, 1986). Offering another view, Leibowitz, et al., (1986) stated, “The most successful career development programs are most often based on one or more theories grounded in those disciplines” (p. 71). Additionally, Leibowitz, et al., (1986) claim, “No one theory will work for all settings, for all purposes, or for all professions. They range on a continuum from individually based perspectives to organization conceptualizations. They represent many different viewpoints” (p. 70). Familiarities of theory, knowledge of the target group, theory acceptance within the organization, and utility or usefulness during the proposed intervention, are considerations a practitioner may want to adhere to in career development practices. Using theories as guides and adapting several theoretical approaches during career development serves as an advantage to the practitioner (Leibowitz, 1986). Several scholars believe the theoretical support for formal career development continues to be lacking or weak (Arthur, Hall & Lawrence, 1989; Gunz & Jalland, 1996). While Baruch (1999) states, “Much of the literature on career development has focused on the individual view whereas there is an acute lack of theoretical formulation of organizational practices” (p. 432). Fundamentally, most practitioners, and some theorists and scholars are continuing to use a multiple-theory approach, based primarily on the individual view of organizational career development.

In the early 1990s, the American Society for Training and Development (ASTD) undertook to sponsor a proposal to study career developmental tools in large organizations in the United States, Australia, Singapore, and throughout various European countries. The ASTD-sponsored study solicited responses from mostly large organizations due to the greater occurrence of career development systems within that population. The resulting information provided valuable knowledge on the types, effectiveness, and frequent uses of specific career development practices (Gutteridge, Leibowitz, Shore, 1993).

The ASTD fully explains the role of career development programs in organizations. The study identified the following career development practices as the most frequently used: “Organizational Potential Assessment Practices; Internal Labor-Market Information Exchanges; Employee Self-Assessment Tools; Individual Counseling or Career Discussions; Job-Matching Systems; or Development Programs” (Gutteridge, et al., 1993, p. 4). In the case of the organizations studied in this study, the main objective was to establish the kind of career practices used and how effective these practices were as perceived by the HR executives studied.
Method

Target Population

The target population for the study consisted of HR executives based in Midwestern United States. Organizations within this geographical area enjoy significantly greater successes than those of some other areas of the United States. In addition, moderate climatic conditions, and surpluses in labor indicate continued growth and development of commerce within this region. The participating organizations surveyed in this study were located in small to midsize communities with populations ranging from 4500 to 250,000 inhabitants. Annual sales or budgets of these organizations ranged from under $25 million to $1 billion or over, with employees numbering greater than 400 to over 25,000. The study was extended to include smaller organizations, which are common within the targeted four-states area. Approximately 65% of these diversified organizations employ 500 to 4,999 persons. Included were organizations from retail/wholesale trade, energy (public utilities, petroleum, chemicals), education, services, diversified/conglomerate and high tech organizations. The initial census of the human resource executives who met the criteria above resulted in 29 HR executives. The questionnaires were administered to the 29 executives however, 27 (93%) HR executives completed the questionnaires. Of the 27, one questionnaire was incomplete and could not be used. The remaining 2 (7%) did not complete the questionnaires.

Sample Size and Sampling Techniques

To ensure an appropriately diverse population from which to survey, the names of twenty-nine organizations typically characteristic of the aforementioned geographical region were selected and complied in a contrived manner. Human resource executives were selected after examining organizations listed in the online database Reference USA at Pittsburg State University Library, and determining the location, size, type, number of employees, and approximate annual sales or budgets. The majority (69%) of the sample represented industrial/consumer manufacturing and health care organizations. This sample indicates a wide, but acceptable range of small, mid-size, and large organizations that were representative of the target area studied in this research.

Instrumentation

A research questionnaire entitled “Questionnaire for Human Resource Executives on Career Development Practices” was designed based on a review of the literature and a previous study conducted by ASTD. The survey questionnaire included information related to demographics, frequencies and preferences of career development categories, and practices utilized. The instrument also included Likert type items that measured the perceived effectiveness of the various career development practices of the organizations in the study. The content and face validity of the instrument was established by giving it to research experts in the field of human resource development and research methodology at Pittsburg State University for examination. Their comments were incorporated and helped in preparing the final instrument.

Data Collection Procedures

As opposed to utilizing a direct-mailing approach to gathering data, and with the goal of ensuring a high response rate, data collection involved traveling to each location, tendering questionnaires to human resource executives, and providing specific definitions for any unfamiliar terminology within the questionnaire. An aim of this research was to ensure uniform interpretation of the various human resource development practices cited within the questionnaire, and to ultimately gather accurate data from which to analyze and draw conclusions. Twenty-nine human resource executives were asked to complete surveys, with twenty-six responding immediately or returning the survey by mail after conferring with colleagues. While one respondent completed the instrument and handed it to the researcher.

Results

Data in Table 1 show that most (57.7%) of the organizations involved in this study are manufacturing and health care, while annual budgets or sales ranged from under $25 million to over $1 billion. Eight or 30.8% of the respondents reported their organization’s budgets or sales in the $100 million to $499 million range, with 19.2% of the participants reporting an annual budget or sales of $1 billion or over. Four (15.4%) respondents reported less than 500 employees, while eleven (42.3%) of the respondents reported 500 to 900 employees. Additionally, 23.1% of the organizations reported 5,000 to 9,999 employees, and four respondents (15.4%) reported 10,000 to 49,999 employees.

The study also revealed that a majority of the respondents (96.2%) indicated an existing career development system. Data in Table 2 show career development programs provided by the organizations studied. As data in Table 2 show, twenty-one respondents (80.2%) believed the employee was primarily responsible for career development. Table 2 also shows three of the most successful career development practices employed by the executives in the study. In-House Training and Development programs were rated as being effective or very effective by 76.9% of the respondents. Twenty-five (96.2%) of the respondents utilized Tuition Reimbursements. Eleven (42.3%) reported that Tuition Reimbursements was a very effective career development practice in their organizations. Another 26 (100%) of the respondents, utilized employee Orientation Programs, with 22 (84.6%) declaring its use as effective to very effective. Employee self-assessment: Computer Software had only 9 (34.6%) of the respondents.

Additional results include information from the six categories of career development practices researched in this study. The categories of Self-Assessment Tools and Internal Labor-Market Information Exchanges showed minimal to moderate use by the respondents. Practices offered in these categories included, but were not limited to some of the following: Career Workbooks, Computer Software, and Career Resource Centers. Smaller organizations tended to use these practices less frequently.

In the category of Individual Counseling Or Career Discussions, the practices of Supervisory or Line Manager Discussions and Personnel Staff Discussions, as career development practices, were popular with more than 75% of the respondents declaring its use. Both practices were given ratings of effectiveness exceeding 53%. The findings in the category of Job-Matching Systems lead these researchers to conclude that this is one of the two most popular and successful career development categories studied in this research. Significant is the frequent use of four practices, Job Posting, Skills Inventories or Skills Audit, Replacement or Succession Planning, and Internal Placement System, in which at least 15 (50%) of the respondents reported their use. The use of Job Posting as a career development practice indicates it is the most popular with 24 or 92.3% of the respondents indicating its usage, and 22 or 84.7% declaring it to be effective to very effective.

In the category of Development Programs, several practices were noted as being frequently used and perceived as effective to very effective. A summary of this final category shows nine distinct practices (including those previously mentioned in Table 2). Following are selected highlights from this category: Nineteen or 73.1% of the respondents utilized the practices Job Enrichment and Job Rotation. External Seminars or Workshops, followed closely with 63% of the respondents rating this practice as effective to very effective. Also noteworthy in this category, is Mentoring Systems, where sixteen or 61.5% of the respondents confirmed its use, and thirteen rate its use as effective to very effective.

Discussion

This research was driven by the need to establish career development processes used to promote and manage strategic processes among its employees for the purposes of enhancing career and organizational development. The study examined the career development processes used by the respondents. A majority of the human resource managers studied reported that the tuition reimbursement programs were very effective in promoting career development of the employees. This was followed by provision of In-house training and development programs. Subsequent to appropriate needs assessment and analysis, organizations should link developmental planning and shared vision in a collaborative effort to ensure the maximum benefit of all employees in an organization. For example, when using the practice of Tuition Reimbursement, outcomes should be reviewed to determine if this practice is applied developmentally to the shifting needs of the organization and those of the employees.

Specific training should be made available to employees who may serve as coaches in career development. Emphasis should be placed on the importance of their coaching behaviors, the influence they have over the development of others, and on-the-job approaches to practices that ultimately affect organizational growth. Stressing job enrichment, and a “language” of career development with appropriate dialogue, and the identification of attractive competencies, will also serve to boost career development. Important also is highlighting diverse career development approaches, seeking feedback via needs assessments while stressing quality and employee-induced responsibility for their achievement in this area.

Additionally, organizations should determine ways to measure and evaluate in a holistic manner the impact of career development to both the employees and the organizations themselves. Human resource executives should also publicize career development practices and commend the successes of those who excel at these practices. Also, there is a need to continuously monitor the global career development practices picture. The study of the career development practices of successful local organizations is also important. While doing this, practitioners should be aware of the unlimited possibilities abroad (Gutteridge, et al., 1993; Leibman, Bruer, & Maki, 1996).

Conclusions

In conclusion, based on the results of this study, the data reveals that respondents used practices from two categories, 1) Development Programs, 2) Job-Matching Systems, more than others. The category of Development Programs was practiced more often than the other previously mentioned five categories and the ratings of effective-to-very effective were also reported more frequently than within other categories. Human resource executives in the study perceived four practices, job enrichment or job design, job rotation, tuition reimbursement, and employee orientation as more effective than others. Significant practices in the second-most popular category of Job-Matching Systems were job posting, skills inventories or skills audit and replacement or succession planning. These practices
were also rated as effective to very effective. In addition, the results of this study allow interested stakeholders and practitioners of human resource development to make meaningful generalizations about career development practices in similar populations.

**Recommendations for Further Research**

Based on the results of this study, recommendations for additional research would be to determine what frameworks or models are being utilized in the category of Developmental Programs (specifically in the noted successful practices) to achieve the higher frequency, prevalence, and effectiveness ratings reported by the respondents. Additionally, in the category of Self-Assessment Tools, which showed minimal to moderate use by the respondents, it is recommended that further research be conducted to assess the viability of Computer Software as a developmental practice, and whether or not this practice is more valuable than revealed by this study. Data should be gathered that could determine its strength or weakness as a practice and its generalizability to other populations.

It is also recommended that data be gathered in the category of Individual Counseling or Career Discussions on the procedures used in the practice of Supervisor or Line Managers as an effective career development tool. Due to the close interaction of the employee and supervisor, this practice could be developed and expanded to further assist employees in their career development. Also, the positive response of the practice of Employee Orientation Programs, under the category of Developmental Programs, should be researched further to determine the most effective means for deployment as an aid to career and developmental growth. Finally, an organization’s success is the end result of the developed or underdeveloped people it employs. Career development practices should be emphasized by unreservedly offering any information to employees that encourages professional and personal growth. Career development programs must go beyond the scope of the job itself and prepare workforces to be competent and adaptable as the new economy and people experience the effects of change (French, 1998). Therefore, it is strongly recommended that organizations continue to monitor and review current literature on career development tools and practices, and tailor programs in a manner that will advance employees in an accelerated and successful process through the inevitable changes of the future (Leibman, et al., 1996).

**Limitations**

A potential limitation of this study concerns the generalizability of the findings given that the study involved a contrived sample of the stated population. Though every effort was made to select a heterogeneous sample characteristic of the organizations from the four-states area, one could argue that the outcome may have changed with different participants. Due to the study’s travel-requirement design, time and finances were also a limiting factor in sampling a larger number of organizations and ultimately reinforcing the generalizability of the study.

**Implications for Human Resource Development**

Implications for practitioners of human resource development concerning the use of organizational career development practices to enhance employee career development can be derived from the reported study. Organizational leaders should encourage management to conduct needs assessments, analyze, design, implement, and evaluate career development programs in their established businesses. Based on the reported study, specific organizational career development practices were considerably more successful than others and may hold greater appeal to the employee in terms of overall effectiveness and utility. In larger organizations, with many employees, pilot programs may need to be tested prior to costly and extensive engagement or reforms of career development activities. The current trends of employee empowerment, individual responsibility for career development, and alignment of business strategies with new competency requirements, lend itself to organizational career development. In addition, current emphasis on total quality management, technological changes, organizational restructuring, and the knowledge that career development may be achieved through job enrichment, require practitioners to pay closer attention to this method of organizational growth and development. The employee will also benefit by developing transferable competencies that ensure continued employment regardless of changes within their organizations or the global marketplace. However, on the negative side, employees may resist programs they deem unnecessary. When job security is a primary issue, loyalty to the organization may decline, while fear and cynicism may escalate (Gutteridge, et al., 1993).

Involvement in the Investigative Phase of a Merger and Acquisition: Perceptions of HRD Professionals

Consuelo L. Waight
University of Houston

This qualitative study describes the involvement of human resource development (HRD) professionals in the investigative phase of merger and acquisition. Telephone interviews were completed with 38 HRD professionals in 12 organizations that had undergone merger and acquisitions (M & As) between 1996 and 1999.

Keywords: Human Resource Development, Mergers and Acquisitions

For the purpose of this study the terms mergers and acquisitions are used interchangeably because the result is the same – one company takes control of another (Halperin & Bell, 1992), thus the firms’ activity is sometimes referred to as an M & A (Forbes Financial Glossary). Today, M & As are characterized by lesser hostility and more strategic orientations (Gaughan, 1996). Mergers and acquisitions are now responding to an increasingly competitive global marketplace, economies of scale, deregulation, technological change and shareholder wealth maximization (Bleeke, Ernst, Isono & Weinberg 1993, Kudla & McNish 1999; Mergers & Acquisitions, 2000). For organizations and employees, however, M & As are the beginning of a period of uncertainty and unpredictability (Buono & Bowditch, 1989; Lee, 1997; Marks & Mirvis, 1997) as behavioral, psychological and performance issues become crystallized during the M & A process (Csoka, 1997; Ernst & Young, 1994). With HRD being rooted in systems, economic, psychology and performance theories, HRD professionals are equipped to impact human resource issues that arise from M & As. Little do we know, however, of what HRD professionals do. Larsson and Finklestein (1999) in a study on integrating strategic, organizational and human resource perspectives on M & As identified strategic management, economics, finance, organizational and human resource management as perspectives and theoretical lens from which M & As had been studied. Human resource development, however, was not mentioned. Of all the studies reviewed for this study, Slama (1991) was the only researcher that recommended that the HRD professional should have specific competencies and skills to facilitate the integration process. Jeris, Johnson and Anthony (2002) conducted four case studies on HRD involvement in merger and acquisition decisions and strategy development. Their most compelling insight was that HRD professionals were not involved in the actual decision to merge or acquire because of the secrecy and urgency surrounding the deal. This study extends the work of Jeris et.al by providing knowledge and awareness about when HRD professionals become involved in the M & A process and what they do specifically at the investigative phase.

The investigative phase is but one of four phases that are part of any M & A process. In reviewing the make-up of M & A models, it was evident that their content were highly similar, the only difference being the number of phases that are used to describe the various models (Csoka, 1997; Hewitt & Associates, 1998; Watson & Wyatt, 1999, Galpin & Herndon, 2000). Upon review of five models, the M&A model used by Watson & Wyatt in their 1998 study on assessing and managing human capital was selected to explore what HRD professionals do during these phases. The 1998 Watson & Wyatt M & A model encompassed the initial planning, investigative, negotiation and integration phases. Some of the activities that could occur at the initial planning phases include identifying business strategy, define acquisition criteria, identify target markets and companies, select target letter, issue letter of intent and develop M & A plan. At the investigative phase it is important to focus on due diligence of financial, people/cultural, legal, environment, and operations. Other activities include set preliminary integration plans and decide negotiation parameters. The negotiation phase can include setting the financial, legal and structural deal terms, securing key talent and integration teams. Lastly the integration phase can include finalizing and executing integration plans on organization, people, process and systems. While these phases highlight different activities, they are all interdependent for a successful M & A. Due to page limitations, only the investigative phase will be discussed in this study.

Purpose of the Study

The purpose of this exploratory study was to describe the involvement and contributions of HRD professionals during M & As through the perceptions of HRD professionals. This study focused on two research questions.
1. In what phase(s) (initial planning, investigative, negotiation, and integration) of the M & A process are human resource development professionals involved?

2. What do human resource development professionals do in the investigative phase?

**Overview of Research Design**

This basic study is based on a phenomenological design. The focus of phenomenological research is people's experience (HRD professionals and business managers) in regard to a phenomenon (merger and acquisition) and how they interpret their experiences (Patton, 2002). Semi-structured telephone interviews were conducted with 38 HRD professionals working in 12 organizations that underwent M & As between 1996 and 1999.

**Population and sample.** The population of this study was all HRD professionals in Fortune 500 companies that underwent M & As between 1996 and 1999. Thirty-eight HRD professionals were selected from 12 companies. The selection of HRD professionals was dependent on their experience with M & As, especially if they were involved in the most recent M & A. Human Resource Development professionals were employees responsible for the fostering a work-related learning capacity at the individual, group, and organizational level of organizations for the purpose of improving performance (Swanson, 1995; Watkins, 1989). As such, HRD professionals had titles such as strategic business partner, training and development manager, human resource manager, and workforce development consultant. The 12 companies were purposefully selected based on their completion of M & A process, especially the integration phase. During the integration phase the systems, processes and people in the organization are critical foci; thus, feedback and learning are used continually to adapt and implement the integration plan (Galpin & Herndon, 2000). These 12 companies also faced workforce issues as they merged and they all had human resource departments with active HRD functions. Thus, they provided a unique, rich, test bed to explore the HRD professional’s involvement in M & As.

**Data collection.** Overall 38 in depth telephone interviews were conducted. Before the telephone interview was conducted the researcher asked for permission to tape the interview, if granted the researcher recorded the interview. Of the 38 HRD professionals, 35 agreed to be recorded and three opted not to be recorded. To ensure reliability among the data transcriptions, the researcher asked a work colleague to choose three HRD professionals from a master list of study participants. The researcher wrote emails to the three selected individuals asking them to review the attached interview transcriptions for accurate representation of what they had shared during their interviews. Of the transcripts that were sent to the study participants, only five minor word changes were recommended in three of the transcripts.

**Instrumentation.** The interview guide for the HRD professionals included two major sections that paralleled the study’s research questions. A study advisory committee of four HRD educators from the University of Illinois reviewed the interview guides for validity. In addition to the advisory committee, the researcher tested the interview guides with four HRD professionals and two business managers working in organizations that underwent a M & A. The individuals included in the pilot study were included as part of the study. During the interview, the researcher paid keen attention to the responses given to the questions to ensure that the interviewees were interpreting the questions based on the intent. The pilot study with HRD professionals showed that it was necessary to change the order of some of the items on the interview guide, so that the interview could flow more smoothly. One item was deleted from the original interview guide because it was redundant.

**Data analysis.** Participants’ descriptive content responses to the research questions were read, and categorized by research question. Each research question contained a main premise, which was used by the researcher to reduce large amounts of data into smaller number of analytic units or themes. After analyzing each participant’s response for each research question’ main premise (each research question was looked at across all participants), the researcher color-coded the themes. Upon identifying the recurrent themes, the researcher created descriptive tables for each theme. In this way the researcher identified data that supported each theme. The researcher then identified frequency of themes occurrence, and created a framework that detailed from the most frequent to less frequent activities. Percentages were also attached to the frequencies.

To help validate the researcher’s analysis of the data, the researcher asked three doctoral candidates to analyze data sets from three random HRD professionals and two business managers. Upon completing the analysis, their findings were compared with the researcher’s analysis of the same five study participants. There was unanimous agreement between the researcher and the doctoral candidates regarding themes identified in the data text.
Results

Research question number one addressed the phases where HRD professionals became involved in the M & A process. To address this question HRD professionals and business managers were asked to identify in which of the four M & A phases (initial planning, investigative, negotiation, integration) they were involved in during the M & A process.

Human resource development professionals were involved in all four phases of the M & A process (see Table 1). Thirty-eight (100%) HRD professionals indicated that they were involved at the integration phase. Nineteen (50%) professionals said they were involved at the investigative stage. Eleven (29%) said they were involved at the negotiation phase and nine (24%) were involved at the initial planning phase. Human resource development professionals identified the integration and investigation phases as the phases where they were most involved. The negotiation and initial planning phases received the lowest involvement. Due to page limitation, only the investigative phase will be discussed.

Research question number two addressed the activities that HRD professionals performed in the investigative phase. The study participants identified 67 broad activities, which were content analyzed and categorized into 10 major investigative phase activities. Table 2 lists the 10 major activities in rank order by frequency. Due to space limitation only the first four activities will be described.

Note. Multiple responses were permitted.

Of the nineteen HRD professionals all (100%) of them worked within HR teams to collect, analyze and report (due diligence) on systems and processes relevant to compensation and benefits, training, leadership, staffing, hiring, and retention. All HRD professionals concurred that the end results of the analyses were chosen systems, processes, policies, and/or procedures that best fit the organizations’ needs and which fostered cost-reduction opportunities. As
one HRD professional stated, “everything within HR was changing, I was responsible for training but I was involved in communicating everything - during a merger process you don’t work alone, you work together to accomplish the integration as quickly as possible”. HRD professionals said that the primary purpose for due diligence was to identify potential for wealth creation, thus, pin pointing what could positively and negatively affect the M & A was important. In respect to training systems and processes, HRD professionals stated that they were involved in researching job mapping models, new hire orientation programs, leadership styles, team training programs and performance appraisals processes. HRD professionals stated that in addition to reviewing systems and processes, they also had to analyze and interpret policies and procedures from both the acquiring and target organization. One HRD professional described, “we brought representatives from each of the companies and shared how we handled the different HR activities in each of the companies and more importantly we discussed common terms that may have meant different things, for example, we shared compensations, benefits, training and overall organization structures, and we looked at how they differed and if they differed then we started to talk about cost implications and the changes that we wanted to make and the things that we felt were best practices in each of the companies. Another HRD professional related, “so, in terms of the staffing and selection process, company X had a pretty sophisticated performance appraisal system that involved ranking employees every year, so every employee in company X had a ranking. About 6 months before the merger was finalized during the time frame that we knew that there was intent to merge, part of the preparation for the staffing and selection process was to apply a similar ranking system to company Y employees so as to try to create some data for the Company Y employees that was comparable to data that existed on company X employees. This was important so that when we started the staffing and selection process, the managers from both companies could have a common definition on ranking and rating categories for employees and that managers understood how competitive an employee might be. This was important for employees also so that they had a common language and understanding of the staffing and selection process”. Overall, HRD professionals shared that during the M & A knowledge about all HR components is critical because you are part of teams that are looking at all components of HR and their interrelatedness.

Ten (53%) HRD professionals assisted with analyzing organizational cultures. HRD professionals worked closely with other HR professionals in analyzing and reporting similarities and difference between organizational cultures. HRD professionals reported analyzing organizational cultures by reviewing organizations’ histories, missions, visions, values, and by reading and asking employees questions about organizations’ structures and leadership styles. One HRD professional shared her finding, “Company X was a huge bureaucracy with lots of institutionalized obstacles to executing strategies. Company Y, on the other hand, was an entrepreneurial culture with much less bureaucracy and a strong value to execute strategies quickly”. Another HRD professional related, “we had a limited group of people to speak with, but during conversations with VPs and seniors VPs, and work colleagues we found out that company X had a stronger culture based on company stock and probably stronger leadership culture. The chairman had earned and developed a lot of respect in the organization; people didn’t refer to him as ‘Mr’, but rather by his first name. Employees had a strong relationship with their chairman and saw him as a true leader”. HRD professionals said that a crucial question during the organizational culture analysis was, “what is your company known for”. This question yielded the following responses: diversity, customer-focus, learning, entrepreneurial, bureaucratic, company stock, having institutionalized obstacles to executing strategies and leadership. HRD professionals stated that analyzing organization cultures was a viable experience for them and also for the organizations, because it yielded powerful information that influenced their integration approach; especially that of communication and change management.

Nine (47%) HRD professionals indicated that they assessed employee issues such as sexual harassment complaints, and employee performance. HRD professionals said that in some cases the absence of good documentation made assessment difficult. HRD professionals said that it was critical that these salient employee issues be clarified, documented and assessed because in the case of sexual harassment complaints, this could have legal implications, which could affect the value of the M & A if not identified before the negotiation. Assessment of employee performance, on the other hand, was needed to identify talent, skills gap and performance improvement programs based on the projected organizations’ needs. Performance appraisal records were mainly used to conduct performance assessments.

Eight (42%) HRD professionals analyzed the training functions in the acquiring and target organizations. HRD professionals mentioned that training during M & As was imperative as it played an essential role in consolidating policies, procedures, systems, processes and organizational cultures. One HRD professional described, “Oh yes, the training side of things –a fundamental part of the organization because we were combining two organizations – so we wanted to see where we had the best practices so as not to reinvent the wheel”. Another HRD professional highlighted the importance of training by saying, ” training and development is one of the most critical part of our organization development plan – everything from technical training to management training to leadership
development all come under the training group and HR. HR works with business leaders on development analysis so as to map out training requirements. Training and development helps the individual to be a successful part of the merger and acquisition. It helps them assimilate to our culture very much quickly, it takes them right into the flow”. Overall, training was seen as instrumental in communicating changes and empowering employees. In analyzing training, HRD professionals looked at the effectiveness and efficiencies of the training processes by reviewing the budgets, number of people served, purposes and goals, outcomes and impact on the bottom-line. The existence of the training strategy and its alignment with other HR functions and business units was fundamental. In one organization, training was not successfully aligned with business, this misalignment resulted in 80 percent of training and development downsized during the M & A. HRD professionals said that their analysis methods entailed focus groups with employees, round table discussions with training units, reviewing of training reports and talking to training directors and business managers. HRD professionals also reported the end result of their analysis was choosing a training model and practices that would benefit the new organization and employees.

Five (26%) HRD professionals assisted in analyzing talent retention structures. Talent retention was a major goal for organizations that used M & A as a continuous business strategy. HRD professionals reported that the priority was to retain talent and knowledge rather than train new employees, thus, ensuring a viable retention structure before the deal was signed was essential. HRD professionals said that they worked closely with the selection and staffing, recruitment and compensation professionals from their organization and the target organization. As a team they assessed critical elements of retention structures such as job mapping, incentives, and compensation.

Four (21%) HRD professionals assisted the staffing professionals in analyzing staffing processes. It must be noted that one HRD professional was given leadership role in analyzing the staffing processes, though she was in a leadership position she still worked closely with staffing professionals. HRD professionals said that staffing processes were changing in their organizations and in-depth research was conducted on staffing approaches internally and external to the organizations. One model that was researched extensively by three organizations was “zero-based staffing”. One HRD professional said, “ My company has undergone many mergers, but this was the first time that every job in the organization became vacant– zero-based staffing was a big cultural change for this company, the trust and commitment that existed among employees was torn”. HRD professionals said that there were a series of meetings where different staffing models were reviewed and discussed until a process was defined that matched with the nature and global scope of their businesses. HRD professionals said that once approval for the process was received from senior management, they along with staffing professionals educated the managers from their organizations and the target organizations about the process. Their goal in educating managers was for managers to take ownership of the staffing process and be prepared to introduce it to their employees once the deal was signed.

Four (21%) HRD professionals analyzed leadership development programs. HRD professionals mentioned that they worked closely with HRD professionals and vice presidents of HR from the target organization in reviewing each other’s leadership programs. HRD professionals said that vice presidents of HR were involved in the leadership analysis because they would be the ones that would eventually work with the chosen leaders. Overall, the team looked at leadership measurements, how they benchmark leadership practices, and their overall leadership styles and development programs through brainstorming sessions. One HRD professional reported, “ The leadership development analysis was a friendly process despite the fact that none of us knew if we would have a job at the end of the process”.

Three (16%) HRD professionals said that they assisted in the creation of an integration plan. The integration plan was a reflection of all HR areas that would play a role in reorganization of employees. HRD professionals said that this type of integration plan avoided silo communication and performance among the HR team. Integration plans addressed areas such as organizational design, communication and training, methodology, and relationship with the managers and employees. Human resource tasks and personnel were then assigned to each of these areas. HRD professionals said that in doing timelines for the integration plans they considered state government, federal government and, labor union’s regulations. These regulations either increased or decreased the pace of integration. One HRD professional worked in an organization that underwent multiple M & As per year, thus this company had an integration template, which was only customized to the needs and nature of the specific given M & A.

Two (11%) HRD professionals assisted in with the development of a due-diligence model. HRD professionals work collaboratively with HR professional as they brainstormed to identify a model that showed business units how to research the organization and how to document their findings. The models allowed business units to map the employee population, take inventory of assets, identify best practices, identify talent and choose which functions should be kept, outsourced or terminated. HRD professionals said that the models helped business units to compare
and document an array of information necessary for integration. One HRD professional said that they brought in consultants to help them implement the model throughout the entire organization.

One (5%) HRD professional reported assisting with analyzing a career development program. HRD professional said that she worked with selection and staffing professionals from both the acquiring and target organization to ensure a cost-effective career development program that provided equal opportunities for all employees. The HRD professional said that she was considered the expert in career management.

Summary & Discussion

Of the 38 HRD professionals, 19 were involved in the investigative phase of the M & A process. The HRD professionals identified 10 activities. What is most significant, however is that the activities identified by HRD professionals are all human capital related; this shows that organizations are not only involved in finance related but also human capital due-diligence during a M & A. The results also show that organizations are becoming more cognizant of the importance of organizational cultures, and are looking for help on how to integrate symbolic elements of both organizations. Given the activities that were identified in this study and given that organizations are now operating in a knowledge economy, it would certainly be a bewilderment to find that the investigation of human capital issues, the backbone of any business strategy, is still being avoided.

The results of this study also show that during the investigative phase, HRD professionals are involved in important decision making activities such as assessing organizational cultures, and HR systems and processes relevant to compensation and benefits, training, leadership, staffing, hiring, and retention. Galpin and Herndon, (2000) stated that findings of the investigative phase are used to set negotiating parameters, determine bid prices and provide the basis for integration recommendations. Schmidt (2000) related that during the pre-deal stage the challenge is to find a partner with a good strategic fit. In the due diligence the focus is ensuring the soundness of the deal and establishing the economic value proposition. All stakeholders’ issues need to be explored fully during this phase. This means determining the nature and implications of differences in operating philosophies, attitudes towards social responsibility, reward programs, management practices and corporate cultures. Ashkenas, DeMonaco and Francis, (1998) further explained that cultural assessments, identifying business and cultural barriers to integration success, selecting integration manager, assessing strengths and weaknesses of business and function leaders and developing communication strategy were some activities that occurred during the investigative stage. Likewise, Daniel and Metcalf, (2001) identified getting familiar with the target company, its businesses and markets, understanding culture, employee competencies, key talent, compensation/incentive programs, employee benefits, policies and practices, and employee relations/labor issues. In addition Daniel and Metcalf mentioned understanding the acquisition strategy, knowing the timeline, minimizing disruptions by being proactive, developing acquisition questions, understanding areas of discipline overlap, prepare recommendations and reviewing the analysis with senior management as possible due-diligence activities that human resource professionals may become involved.

The results of this study also provide insight into dynamic role of HRD professionals during the investigative phase. HRD professionals worked with other HR professionals and business managers from their organization and the target organization. This finding shows that M & A activities are team-oriented and HRD professionals need to be prepared to work in different projects during a M & A, especially during the investigative phase. The notion that HRD professionals will be solely working on HR related activities is non-existent during a M & A. Clemente and Greenspan’s (1999) study on HR involvement in M & A found that 92 percent of the 83 percent of 413 HR professionals involved in the investigative phase rated their involvement with the due diligence team as very important. The findings of this study on the make-up of teams and the activities teams perform also heighten the importance of due-diligence teams.

In conclusion this study provides basic but important information about the need and importance of HRD involvement in M & As. The study shows that if HRD professionals are versatile with the overall HR/HRD practices and processes they will play a major role in the investigative phase of M & As.

Implications

The results of this study indicate that HRD professionals need a broad perspective of HR because during a merger and acquisition, HRD professionals become involved in varied human capital related activities. The results also show that knowledge and skills on assessing organizational cultures is critical. HRD programs, then, need to focus on providing some knowledge of other HR functions upon which HRD professional could build once they are in the
workplace. HRD programs must also focus on what they are teaching about organizational cultures, are they going beyond theories and providing cultural audit tools that can be customized during M & As.

Limitations and Future Directions

It must be noted that this study was exploratory and basic and more research needs to be done to advance the role of HRD professionals in the M & A process. This study was limited to the perceptions of 38 HRD professionals working in 12 organizations. In several cases HRD professionals who were part of the M & A between 1996 and 2000 were not employed in the given company. This type of situation posed limitations on the number of people that could be reached. One company, for example, downsized 50 percent of their workforce and 80 percent of training and development during their M & A. Despite this limitation, the study opens doors for more research on the involvement of HRD professionals in the M & A process.

More research needs to be done to further explore the activities that HRD professionals performed in the four phases. Specifically more research on HRD professionals’ roles in assessing organizational cultures, training programs, and HR systems and processes needs to be done. Case studies, for example, on models used by HRD professionals in assessing organizational cultures during a M & A would take this study to a deeper level. More research on what hinders or assists HRD professionals’ involvement in the M & A process could also help to better understand the role of the HRD professionals in the M & A process.

Organizational Identity and Its Implication on Organization Development

Yueh-Ysen Lin
University of Minnesota

Organizational identity is defined as a set of statements that organization members perceive to be central, distinctive, and enduring to their organization (Albert & Whetten, 1985). It is influential to behaviors of both leaders and members in many aspects within an organization. By reviewing current theoretical and empirical literature, this article integrates several research directions of organizational identity in order to delineate the relationship between organizational identity and organizational development and change. Implications and possible directions for future research are discussed as well.

Keywords: Organizational Identity, Planned Organizational Change, Organization Development

For the last decade, organizational identity has emerged as a new focus in organizational research. Organizational identity is defined as an enduring, distinctive, and central statement perceived by an organization’s members (Albert & Whetten, 1985) to answer questions such as “Who are we?” “What are we doing?” “What do we want to be in the future?” Research of organizational identity focuses on several dimensions, such as the formation of organizational identity, and its relationship to organizational culture and image (Ashforth & Mael, 1989; Gioia, Schultz, & Corley, 2000; Hatch & Schultz, 2002), multiple identities and identity management (Albert & Whetten, 1985; Pratt & Foreman, 2000), and identity and organizational change (Brown & Starkey, 2000; Dutton & Dukerich, 1991). Organizational identity is important since it affects actions, interpretation, and decision making of organizational members and the management. Several studies also show that organizational identity has a huge impact on organizational change processes.

This paper attempts to address the following questions. What is organizational identity? How does organizational identity affect organizational change? Is it a barrier that hinders an organization’s change plan? Can it be a means for organizations to facilitate planned change processes? In this paper, I focus on the influence of organizational identity on planned change process, or organization development (OD), which is referred to any kind of planned, system-wide, managed, and behavioral-scientific change effort initiated by the management or change agents in order to improve an organization’s effectiveness and performance through planned interventions (Beckhard, 1969). A planned change process is different from other kinds of organizational change processes (i.e. life cycle, evolution, dialectic, see Van de Ven & Poole, 1995) by some distinctive characteristics, such as its goal orientation, adaptation through strategic choices, and single organization as the unit of change (Van de Ven & Poole, 1995).

The purpose of this paper is to delineate the relationship between organizational identity and planned organizational change. By reviewing current literature and research regarding organizational identity, this paper presents a general picture about organizational identity and its influential role within an organization. It also articulates the importance of organizational identity to organizational planned change processes. This paper contains three sections. First, the definition of organizational identity, its influence on organizations, its formation, as well as its relationship with organizational culture will be introduced. Second, the influence of organizational identity on organizational change process, both positive and negative, will be discussed. Last, a holistic framework of the relationship between organizational identity and planned organizational change is proposed. Possible directions for future research are addressed in the conclusion section, as well.

Organizational Identity

Definition of Organizational Identity

Albert and Whetten (1985) define organizational identity as a set of statements that organization members perceive to be central, distinctive, and enduring to their organization. The definition reveals three critical criteria: centrality, distinctiveness, and durability. Centrality means that the statement should include features that are important and essential to the organization. Identity as a statement of central characters defines what is important and essential to the organization. (Albert & Whetten, 1985).

The criterion of distinctiveness emphasizes that the identity statement should be able to distinguish the organization from others. A distinctive identity statement usually includes organizational ideology, management philosophy, and culture. It helps the organization locate itself in a specific classification. The character of durability

Copyright © 2004 Yueh-Ysen Lin

37-2
emphasizes the enduring nature of organizational identity. It implies that organizational change is difficult to start because the loss of organizational identity will have strong impact on the organization (Albert & Whetten, 1985). **Influence of Organizational Identity**

According to the definition, an identity statement is collectively and cognitively held by organization members to answer questions such as “Who are we?” “What business are we in?” and “What do we want to be?” Organizational identity influences both leaders and members within an organization. For organizational leaders, organizational identity is influential on their decision making activities within an organization. Typically, identity questions surface and attract the management’s attention when they cannot find easier, more specific, and more quantifiable solutions regarding specific organizational issues (Albert & Whetten, 1985). By defining the organization’s identity, organizational leaders establish a fundamental base that serves as the guide for them to engage in decision making activities (Albert & Whetten, 1985).

Organizational members are affected by an organization’s identity as well. Since social identity theory suggests that individuals have the natural tendency to identify with social groups and define themselves with the connection with these groups (Pfeffer & Salancik, 1978), organizational members’ answers to identity questions have strong influences on their judgment of and identification with their organizations (Albert & Whetten, 1985). This identification in turn affects the establishment and maintenance of members’ self-esteem (Humphrey & Brown, 2002). Organizational identity provides organizational management and members with a key lens for their interpretation and sensemaking about occurring events for their organizational life (Dutton & Dukerich, 1991; Elsbach & Kramer, 1996). The results of member interpretation and sensemaking direct members’ behaviors and actions within the organization (Dutton & Dukerich, 1991).

**Formation of Organizational Identity**

Based on the identity interaction model and individual identity theory (Cooley, 1922; Erickson, 1968; Goffman, 1959; Mead, 1934), Albert and Whetten (1985) argue that interaction and comparison with other organizations are keys to the formation of organizational identity. Similar to individual identity, the formation of organizational identity is a process of ordered interorganizational comparisons (Albert, 1977). During the processes, members constantly compare their own organization with target organizations and obtain evaluative information from other parties which, in turn, affect members’ definition and identity of their own organization.

Identity scholars hold different opinions regarding the relationship between organizational identity and organizational culture. For example, Albert (1998) argues that a particular organizational culture may, or may not, be part of organizational identity, depending upon the relevance and importance of culture to the identity question. Yet, some researchers clearly propose a dynamic relationship between identity and culture to explain the formation of identity (Ashforth & Mael, 1989; Gioia et al., 2000; Hatch & Schultz, 2002). For instance, Ashforth and Mael (1989) argue that the important values in organizational culture are critical determinants to the psychological process of identity formation. Only when individuals identify with the central, distinctive characteristics of the culture will they be willing to attach to a social group. This psychological process of attachment, in turn, reinforces individual identity as well as the solidity of organizational identity (Ashforth & Mael, 1989).

Hatch and Schultz (2002) propose another dynamic model to illustrate the relationship between organizational identity, culture, and image (see figure 1). According to the model, members express their understandings of their organizational culture through organizational identity, which in turn, affects the perception of others outside the organization about the organization. The outsiders’ perception, or organizational image, in turn, affects the organizational identity, which again is reflected in the central elements of the organizational culture.

Despite the dynamic arguments of the formation process of organizational identity challenges the criterion that durability, it is considered as a better condition for organizational change, since it provides the organization with the flexibility and adaptability to respond to the environmental demands. The influence of identity on organizational change will be detailed discussed in the following section.

**Figure 1  Hatch & Schultz’s (2002) Organizational Identity Dynamics Model**

![Organizational Identity Dynamics Model](image)
Organizational Identity and Resistance to Planned Organizational Change

Since organizational identity represents an ostensible set of central, enduring, and distinctive statements with which members define their organization, it provides an important psychological anchor for members in time of upheaval (Gustafson & Reger, 1995). Organizational identity, however, is also a possible source of resistance to change (Dutton & Dukerich, 1991; Gustafson & Reger, 1995). For example, from a psychodynamic perspective, Brown and Starkey (2000) examined the relationship between organizational identity and organizational learning. Analogous to individual identity theory, organizational members have the tendency to maintain their collective self-esteem and identity by not questioning their existing self-concept (Brown & Starkey, 2000). Learning and receiving new information are likely to evoke organizational members’ feelings of anxiety and trigger some kind of defense mechanisms. This is particularly true when the new self-concept is inconsistent with the existing beliefs and self-image (Brown & Starkey, 2000). As a result, these defense mechanisms hinder organizational learning by influencing how members of the organization search, interpret, use, and store new information.

From a more concrete viewpoint, organizational identity influences management and members within an organization in several ways; from organizational leaders’ actions and decision making regarding change initiatives, to members’ interpretation of organizational events and actions. Moreover, organizational identity affects members’ comparison processes and evaluation of strategies and actions as well. These influences are discussed in the following sections.

Organizational Identity as Action Guidelines

Organizational identity serves as guidelines leading managers’ actions and decision making in relation to planned change process. For example, Fox-Wolfgramm, Boal, and Hunt (1998) conducted a longitudinal study to examine banks’ adaptation processes to a new governmental regulation, which had a strong impact on the banks strategies and operations. The research focused on two types of banks, one termed a prospector and the other a defender (Miles & Snow, 1978). Broadly speaking, a prospector organization is more dynamic, more decentralized, but less formalized and specialized than a defender. Prospector organizations usually have broader product lines, tend to focus on innovation and emerging market opportunities, and emphasize creativity over efficiency. On the contrary, defender organizations are characterized as less dynamic and place less emphasis on innovation. Defender organizations also tend to focus on efficiency over creativity and innovation (Miles & Snow, 1978).

Given the different characters of the two types of bank organizations, Fox-Golframm et al. (1998) expected different responses between the two banks to the new regulation. Since the prospector bank has features of flexibility and dynamics, and is open to environmental change, it is expected to adjust itself faster without needing much external stress and confronting much internal resistance. On the other hand, the defender bank was expected to be less effective and to encounter more resistance in responding to necessary change during the adaptation process, given its more formalized and less dynamic features.

Surprisingly, the results showed that both banks encountered resistance, though for different reasons. For the defender bank, the top management resisted in taking action because they felt the new regulation did not fit with their “hometown identity”. The prospector bank felt that they had already met the requirement. This study supports Gioia and Thomas’s (1996) conclusion, which argues that, under conditions of change, top management team members’ perceptions of organizational identity play a critical role in their sensemaking process and issue interpretation.

Organizational Identity as an Interpretative Lens

In addition to the influence on management’s decision making and sensemaking processes, the second way that organizational identity affects organization members is its provision of a lens through which members interpret events occurring within the organization. In a case study of the New York Port Authority’s dealing with the homelessness problem, Dutton and Dukerich (1991) examined how organizational identity and image affects its members in making sense and interpreting their organization’s responses to a nontraditional and emotional strategic issue. They found that the importance of organizational identity is shown in three dimensions: issue interpretation, emotion, and action.

In the dimension of issue interpretation, organizational identity serves as a reference point for organization members to assess the importance of an issue which, in turn, becomes predictors of members’ willingness to invest in the issue. If the scope of the issue continuously expands over time, or the issue threatens the core components of the organizational identity, or the organization takes actions that seemed to members as inconsistent with their identity, organization members tend to “judge the issue as more important and the organization as more committed to it” (Dutton & Dukerich, 1991, p.545). In other words, organizational identity defines to what extent the issue is likely to threaten the organization and helps the organization to resolve the issue by transforming it into an opportunity (Jackson & Dutton, 1988). Additionally, organizational identity also affects the meanings that members
give to an issue, which in turn, leads to different solutions for the issue (Dutton & Dukerich, 1991).

Beside issue interpretation, organizational identity also provides directions for explaining members’ emotional expression about an issue. That is, members are expected to have positive emotions when actions taken are congruent with their organizational identity, while negative emotions is more likely to be generated when the actions are inconsistent with their identity. Moreover, identity also affects the pattern of organizational actions through its serving as guidelines for members to find acceptable solutions, to understand how actions are shaped, and to evaluate the success of actions (Dutton & Dukerich, 1991).

**Organizational Identity as Cognitive Schema**

In addition to serving as guidelines for management actions and a lens for member interpretation, organizational identity serves as a cognitive schema composed of beliefs and assumptions of organizational processes (Fiol & Huff, 1992; Reger et al., 1994). This schema influences how members encode and store new information, as well as how they draw inference from events with ambiguous or missing information (Reger et al., 1994). Since organization members use the cognitive schema to integrate prior and new knowledge, they tend to focus on new information consistent with their existing schema (Fiske & Neuberg, 1990), and ignore incongruent information. The tendency of focusing on congruent information is called “cognitive inertia,” referring to the “resistance to changes that deviate from existing schemas or frames” (Reger, et al., 1994, p566).

Reger et al. (1994) use the concept of cognitive inertia to explain the high failure rate of total quality management (TQM). Traditionally, a successful TQM implementation within an organization focuses on a “paradigm shift,” requiring a total, radical change in members’ basic philosophy in the organization (Dobyns & Crawford-Mason, 1991; Munroe-Faure & Munroe-Faure, 1992). This kind of change intervention can only be understood and interpreted by members using their existing schema; yet, it is very likely that the new concepts of of such intervention are not part of members’ current cognitive schema. Thus, the radical change challenges members’ assumptions and the identity of the organization and, in turn, results in members’ uncomfortable feelings and resistance to the intervention. This resistance makes large-scale change such as TQM difficult to achieve (Reger et al., 1994). This argument again affirms the important influence of organizational identity on organizational change interventions.

**Organizational Identity as Comparison Reference**

Organizational identity not only affects managerial actions, as well as member interpretations and actions, but also serves as a reference point for comparison. As mentioned in the previous section, organizational members compare their organizational identity with actions taken by the management to judge the legitimacy of the action (Dutton & Dukerich, 1991). Likewise, members also compare their current identity with the envisioned organizational identity. Envisioned organizational identity, refers to an ideal or desired identity that represents what the management want the organization to be in the future (Reger et al., 1994). This envisioned identity can be reinforced through the creation of visions by organization leaders. Fox-Golfgramm et al. (1998) argue that the congruence between the current and envisioned identity has a strong influence on the permanent success or not of a change intervention. That is, members’ resistance to a change intervention is more likely to occur if inconsistency exists between the current and envisioned identity (Fox-Golfgramm at al., 1998).

In addition to the envisioned identity, organizational image is another target for members to make comparison with. As defined previously, organizational images have to do with how organizational members believe outsiders think about their organization (Dutton & Dukerich, 1991). Thus, members’ perception of organizational images affects their own view of themselves as well as of the organization. On the one hand, when the perceived image and identity are consistent, members tend to accept the status quo and, thus, no change will occur. On the other hand, when incongruence exists, changes may, or may not, occur because organizational members need to make further judgment to see if the discrepancy is important and worthy their efforts on change (Gioia et al., 2000).

The external pressure for change provides organizational members yet another target to compare with their identity and image (Dutton & Dukerich, 1991; Fox-Golfgramm et al., 1998). More specifically, when the pressure for change is in opposition to members’ organizational identity and image, either current or envisioned, the resistance for change is likely to be higher than it is when the pressure and identity are congruent (Dutton & Dukerich, 1991).

In summary, organizational members make comparisons continuously, but the influence on organizational change varies across types of comparison. For example, the inconstancy between envisioned and current identity is likely to generate resistance; however, the consistency between the two leads to inertia, which possibly reduces the likelihood of successful change (Reger et al., 1994). Therefore, it is important to understand the influence of organizational members’ comparing organizational identity with other targets, such as vision or envision identity, image, and external force for change. As long as the relationship is understood, the organization is more capable to achieve expected goals by appropriate managerial manipulation.
Identity and Success of Organizational Change

Notwithstanding organizational identity affects members’ willingness to and acceptance of change interventions, it still can be a key steppingstone to achieve successful organizational change when well utilized. Several main themes have been created to explore the positive influence on and application to organizational change processes. Some argue that identity is not enduring; rather, organizational identity is characterized by instability (Gioia et al., 2000), plasticity (Fox-Golfgramm et al., 1998), or even multiplicity (Albert & Whetten, 1985; Pratt & Foreman, 2000). Some propose that ongoing identity change is a means for organizations to successfully change (Brown & Starkey, 2000; Gioia et al., 2000). Others consider identity as a multi-layer construct with both core and peripheral parts, so that organizational change can happen without changing core identity (Gustafson & Reger, 1995). Still others propose to take advantage of the discrepancy between either current and envisioned identity, or current identity and image, to create the impetus for change (Reger et al., 1994). Even though most of these views are proposed on theoretical bases, rather than empirical studies, they still provide rich and insightful implications for future researchers and practitioners in the field of organizational change. These four themes are discussed in the following sections.

Instability and Plasticity of Organizational Identity

By definition, one of the essential features of organizational identity is its temporal continuity. Change, discontinuity, or loss of identity is very likely to create a painful situation and threaten the organizational health (Albert & Whetten, 1985). Later researchers, however, challenge the notion and propose that identity might be less than enduring and more instable and flexible (Gioia & Thomas, 1996).

With the case of defender and prospector banks, Fox-Wolfgramm et al. (1998) propose that organizational identity in fact has a feature of plasticity. The plasticity of identity has two survival functions. First, it allows the organization to easily adjust its niche width, by quickly expanding business scopes in turbulent environments, but effectively refocusing when the environment is stable. Second, the plasticity of organizational identity makes it more flexible to easily handle and satisfy the needs and expectations of diverse stakeholders. Further, Fox-Wolfgramm et al. (1998) argue that, within limits, the flexibility and plasticity of organizational identity allow organizational adaptation and change without fundamentally changing members’ organizational identity. This particularly illustrates the adaptation process of prospector bank to the new regulation by simply incorporating new elements with their existing ones. The defender bank, however, seemed to have less plasticity than the prospector (Fox-Golfgramm et al., 1998). This difference stresses the diverse influence of organizational identity on organizations with different strategy orientations.

On the other hand, Gioia et al. (2000) have a different interpretation of the instability and adaptability of organizational identity. Through the examination of relationship between identity and image, they argue that “the seeming durability of identity is actually contained in the stability of the labels used by organizational members to express who or what they believe the organization to be, but that the meaning associated with these labels changes so that identity is actually mutable (p.64).” Gioia et al. (2000) further use Hewlett-Packard (HP) as an example to illustrate the mutability of organizational identity. They cite Collins and Porras’s (1994) article which states that the “H-P way” has been used as an expression of core values of HP’s identity for decades, yet the underlying meaning of the specific values and actions has changed several times (Gioia et al., 2000, cf. Collins & Porras, 1994). Hence, Gioia et al. (2000) propose that the instability and mutability of identity is primary a result of its ongoing interrelationships with the more fluid organizational image. Moreover, they suggest that the instable and adaptive feature actually help organizations increase their flexibility in response to the changing environmental demands (Gioia et al., 2000).

Multi-layered Organizational Identity

Gustafson and Reger (1995) adopt a different perspective, seeing organizational identity as a construct with the inner and outer layers. The inner layer refers to the core, intangible, abstract attributes of identity that addresses questions such as how things are done. This core layer of identity focuses on specific organizational contexts and reflects in organizational culture and values that directly influence the production processes, the firm, and the environment. On the other hand, the outer layer of organizational identity refers to the tangible, substantive, and concrete attributes that answer questions such as what is done. Different from the core attributes, the substantive attributes focus on particular time and environmental conditions.

According to Gustafson and Reger (1995), the best way to promote organizational change is to renew the organizational identity but still maintain a stable sense of “who we are”. Therefore, under turbulent circumstances, organizations with a stable core identity coupled with a changeable substantive identity are more likely to successfully respond and adapt to the changing environment. In that ideal case, the stable core identity helps organizational members ensure a clear and solid sense of stability, while the changeable substantive identity
provides them with flexibility to accept necessary changes. Nevertheless, holding a set of changeable identity does not necessarily mean that change is easy, rather, it is just relatively easier when compared to the change of the core identity (Gustafson & Reger, 1995).

Multiplicity of Organizational Identity

A stream of identity research focuses on the multiplicity of organizational identity, suggesting that an organization might have multiple sets of identities that are either compatible, neutral, or conflict with each other (Albert & Whetten, 1985). Since it is argued that organizations with multiple identities are considered more adaptive to environmental change (Albert & Whetten, 1985; Pratt & Foreman, 2000), an organization is likely to consider shifting from mono identity to dual identity over time, in particular when environmental complexity is increasing with mix of opportunities and constraints (Albert & Whetten, 1985).

Multi-identity organizations exist in two forms. Within holographic organizations, different sets of identities are shared by across all the units within the organization. The advantage of a holographic organization is that congruence and agreement among units is easy to reach with few conflicts. This kind of organization, however, has a significant deficiency. Its lack of diversity is very likely to debase the accuracy of its decision making and actions (Albert & Whetten, 1985).

On the contrary, each unit within an ideographic organization tends to hold different identity respectively and, thus, the multiple identity of the organization is a totality of the identities of each unit (Albert & Whetten, 1985). Generally, an ideographic organization benefits from its diversity of opinions and perspectives, which helps the organization and its members better monitor the changing environment and formulate appropriate actions and strategies for organizational adaptation. This diversity, however, leads to more conflicts and more difficulties in obtaining commitment and consensus to an action (Albert & Whetten, 1985).

Since organizations can either benefit from or be harmed by possessing multiple identities, it is important for organizations to find a way that can maximize the advantages and minimize the disadvantages at the same time. According to Pratt and Foreman (2000), organizations with an optimal numbers of identities will have the best adaptability and competitive advantage. They present the notion of “identity management” and suggest that, according to the current identity plurality and identity synergy of an organization, organizational leadership can manage their organizational identity in four ways: compartmentalization (preserving all identities without seeking integration and synergy), deletion, integration (fusing multiple identities into a distinct new one), and aggregation (retaining all identities and forging links among them). With the of identity management practices, organizations can attain the optimal condition and maintain the best effectiveness of multiple identities.

Changeability of Organizational Identity

Brown and Starkey (2000) examined the relationship between organizational learning and identity from a psychodynamic standpoint. In addition to their discussion that existing organizational identities are likely to hinder the learning process, Brow and Starkey (2000) also suggest that organizational learning can be promoted by fostering the changeability of the organizational identity in three ways. First, to better adapt to the changing environment, organizations should frequently conduct critical self-reflectivity. This frequent self-reflectivity can continuously force the organization to question its current identity and to cultivate alternative perspectives in order to attain the necessary change and evolution to a more adaptive identity. Second, dialogue about future identity should be integrated into an organization’s strategic management so that the leaders can reexamine the current identity constantly (Brown & Starkey, 2000). Last, organizations should foster and attain an attitude with which organizational members can be more willing to face threats to their organizational identity and accept the necessary change for a more mature identity (Brown & Starkey, 2000).

Identity Gap and Organizational Change

Reger et al. (1994) name the discrepancy between current and envisioned organizational identity as “identity gap”, referring to the “cognitive distance between the perception of the current and the ideal identity (p.574).” In the previous section, it was argued that the inconsistencies between current and envisioned identities increase member’ resistance to change. Yet, other researchers consider the discrepancy as way to provide motivation to change current identity (Cantor & Kihlstrom, 1987; Higgins, 1989). For example, Huff, Huff, and Thomas (1992) suggest that the widened gap between current and ideal identity creates “organizational stress” (p.58), which triggers members’ dissatisfaction and perceived imperfection about organization-environment fit. In order to reducing the uncomfortable feeling evoked by the inconsistence, organizational members tend to seek ways to diminish the perceived gap. This tendency further becomes an impetus for the organization to change (Higgins, 1987).

According to Reger et al. (1994), the influence of identity gap on the likelihood of organizations’ acceptance of change depends upon the width of the gap. Specifically, if identity gap is too narrow, organizational members tend to perceive change as unnecessary. In that case, members’ belief of a sufficient alignment between current and ideal states results in high inertia hindering organizational change (Reger et al., 1994; Higgins, 1989). Conversely, if the
identity gap is too wide, organizational members tend to perceive change as unattainable. As a result, the over-widened identity gap leads to high stress, which in turn, increases members’ resistance to change (Higgins, 1987). Given that both overly-narrow and overly-wide identity gaps result in members’ low acceptance of change, a notion of “change acceptance zone” is proposed to articulate those situations when a moderate identity gap creates the optimal driving force for organizational members to perceive and proceed with the necessary change (Huff et al., 1992; Reger et al., 1994).

Expanding on the notion of a change acceptance zone and the ideas of core/substantive identity attributes, Reger and colleagues suggest a new tectonic change mode that allows organizations to proceed to change by creating moderate identity gap (Gustafson & Reger, 1996; Reger et al., 1994). Different from incremental change which focuses on small but continuously modifying a specific component of identity, and revolutionary change which tends to create a huge identity gap and radical change process, tectonic change refers to change with a moderate scope, pace, and duration. The main strength of this tectonic change model is that, by creating moderate identity gap step by step, it allows an organization to destruct its undesired or outdated substantive identity without radically affecting its core identity.

Conclusion

In this paper, the concept of organizational identity and its influence on organizational process as well as organizational change were introduced and discussed. This is a relatively new but rich field for organizational researchers, and that is why this topic leads in such diverse directions. Most of the literature and concepts of organizational identity are developed and established more on a theoretical base, rather than empirical studies. Thus, it is of the most importance to fuel more researchers’ interests in focusing on empirical studies on this topic. In so doing, the idea of organizational identity and its values can be more applicable to practitioners and future researchers.

A Framework of Organizational Identity and OD Interventions

According to the discussion in previous sections, the influence of organizational identity on planned change process is twofold. On the one hand, organizational identity serves as a frame of reference for organization management and members to interpret organizational events. Resistance to change arises at either the level of management or individual members when there is inconsistency between identity and the interpretation of events. On the other hand, organizational identity can be a means of manipulation to facilitate the success of planned change. This function is particular significant during the stage of goal setting and envisioning.

Here I propose a holistic framework (see figure 2) by integrating previous research findings of organizational identity into a planned change model in order to explain how organizational identity affects the change process in different stages at different organizational levels. I use a teleological model proposed by Van de Ven and Poole (1995), which suggests that a planned organizational change is a circulate process composed of dissatisfaction, searching/interaction, goal setting/envisioning, and plan implementation. Two assumptions should be addressed. First, I assume that an organization’s identity statement consists of both core and peripheral portions. The core part of the identity statement is more enduring and hard to change, while the peripheral part is more plastic and flexible. Second, given that organizational identity is a perceived construct with core and peripheral elements, I assume that the management and members of an organization might hold different identity statements based on from which level or angles they see the organization.

Based on this framework, resistance to a planned change effort can occur at either the management level or the organizational member level. At the management level, the management uses organizational identity as a frame of reference to search the meanings and interpretations when encountering a dissatisfaction situation. Resistances to take any actions are likely to arise from two aspects. First, when there is perceived consistency between the situation and the management’s organizational identity, they are likely to stay unchanged since the management feel that there is no need to change. On the other hand, if there exists a discrepancy between the situation and current identity, the cognitive inertia results in the management’s being unwilling to change, in particular when they are satisfied with the organization’s status quo. The mechanism to push the management to cope the resistance in order to take further action is the strength of the crisis.

At the organizational member level, the explanations for the resistance of change are similar to the ones at the management level. Nonetheless, the ways that these resistances are managed are different. According to the framework, organizational identity also serves as a frame of reference for organizational members to make sense of the implementation of a change intervention. Both perceived consistency and discrepancy between identity and the intervention are likely to lead to either acceptance of change or resistance to change. More specifically, when organizational members perceive inconsistency, there are three possible mechanisms to force members to accept the
change intervention. First, the inconsistency creates a reasonable and moderate identity gap which reduces members’ sense of possible negative impact and difficulty of the change. Second, even though the gap between their organizational identity and the management’ action is huge, organizational members are still willing to change as long as they interpret the huge gap as the extent of seriousness of the issue. The last mechanism has to do with the organizational stress and cognitive dissonance. Why organizational members experience an identity gap, which lead to their uncomfortable and dissonant feelings; they will try to take action to change in order to reduce the experienced dissonance.

When resistance to change appears at the organizational member level, no matter from false alignment or cognitive inertia, the management needs to find out solutions in order to diminish the resistance. Three ways are proposed to help resolve the issue. First, the management can create a change acceptance zone and moderate identity gap by proposing a not-too-far envisioned identity or vision. By using this means, it sometimes might be necessary to break a goal of change into a set of subgoals, so that the implementation of a change intervention can be advanced on an incremental base. In addition, the management can cultivate the plasticity and flexibility of organizational identity by enriching its peripheral attributes. In so doing, organizational members can have more adaptability to respond to change activities inconsistent with their core identity.

This is a holistic model to illustrate the relationship between organizational identity and planned organizational change. There are still many issues that are worth of further research and examination. For example, what are the contingent factors that determine which mechanism are appropriate to be adopted under a specific circumstance? What is the threshold for a crisis to trigger management’s response to their resistance and action for further plan implementation? These are empirical questions and need further attention in order to strengthen this framework.

Change and Higher Education: A Multidisciplinary Approach

Julia Storberg-Walker
Richard Torraco
University of Nebraska

Higher education now finds itself in a new era and environment in which it is confronted with an array of challenges and forces for change. This paper identifies the key forces for change in higher education, assesses these forces using an established change model (the action research model), and illustrates how change literature from management, human resource development, and economics have the potential to contribute to successful change management in higher education environments.

Keywords: Higher Education, Change, Action Research

Given a long history of relative stability and steady growth, higher education now finds itself in a new era and environment in which it is confronted with an array of challenges and forces for change. Significant change at this point in the evolution of higher education appears eminent due to powerful environmental forces related to technology, competition, and the workplace/workforce (see Kezar and Eckel, 2003; Welsh and Metcalf, 2003; Kemelgor, Johnson and Srinivasan, 2000). These new forces are causing significant shifts directly impacting higher education goals, processes, and decision-making.

Despite the likelihood of substantial change that has swept through most other sectors of the economy in recent years, some doubt the ability of higher education to deal with this magnitude of change. Arthur Levine (2003) laments that providers of higher education “will ignore or move glacially as higher education decision making is prone to do, into the digital era” or that “traditional higher education will rush into, or worse yet, will be pushed headlong into the new digital economy and abandon what is sacred about higher education, those things that no other social institution is capable of providing” (p. 26).

This paper examines change in higher education at a critical point in its evolution. To organize the inquiry, we use an established change model (the action research model) that is widely used for planned change processes. Action research has been theoretically and empirically validated in traditional organizational forms. We use the model to identify where (at what points in the change process) and why (what are the substantive differences between higher education and traditional firms) planned change in higher education may be more challenging than in traditional firms. From that basis, we then use the model to illuminate the differences and gaps between traditional change management and the nature of change management in higher education environments.

The Action Research Model of Planned Change

Since the 1940s, studies have found that “research needed to be closely linked to action if organization members were to use it to manage change” (Cummings & Worley, 1993, p. 8). These findings laid the foundation for contemporary organization development and have guided the theory and practice of planned change for the past 60 years. Action research applies behavioral science knowledge to organizational problems, seeks involvement of organizational members at each stage of the process, and provides feedback throughout the process in order to adapt and recalibrate the action plan. The specific steps in action research have been described differently (see, for example, Shepard (1960), Cummings & Worley (1993), French & Bell (1999), and Rothwell, Sullivan & McLean (1995)): for this paper, Shephard’s recursive four-phased model is selected because it is the most generic model of planned change. This model can incorporate the more detailed elements from the other action research models and it provides the minimal requirements for planned change through action research.

Shephard’s (1960) model “highlights the relations among goals (objectives), planning, and action” (French & Bell, 1999, p. 132). The central focus is research with the purpose of informing current and future action.

The steps are 1) identify the objective; 2) plan the change process; 3) take action; 4) evaluate; and then repeat. The outcome of evaluation may lead to new planning (step 2 in the sequence) or lead to new objectives (step 1 in the sequence). The process is continual, iterative, and is grounded by organizational objectives. We use Shephard’s (1960) four steps to illuminate the unique challenges for planned change initiatives in the higher education environment.
The paper is organized in three sections. The first section provides the background of the contemporary higher education environment. Two broad categories are discussed: 1) the key factors shaping the environment of higher education, and 2) the forces and catalysts for change. Within each category, we illustrate how these factors and forces can shape and influence Shepard’s (1960) planned change process. The key factors effecting higher education include 1) governance structures; 2) diverse stakeholders and constituents; and 3) culture. These factors serve as important conduits and mediators of how any planned change process would occur in institutions of higher education. The forces and catalysts for change include 1) fiscal and budgetary constraints; 2) rapid growth in the use of information technology; and 3) market forces including the increasing competition for students.

The second part of the paper offers select theories and concepts found within change literature from a variety of disciplines. Scholarship on change from management, HRD, and economics were selected to illustrate the potential contributions of these disciplines. The review is not meant to be comprehensive; rather, the authors provide examples from these disciplines that directly relate to the key factors of the higher education environment.

The third and final component of this paper seeks to reconcile the higher education-specific change models reported in the literature with the examples presented in part two. Specifically, we seek a better understanding of the dimensions of change in higher education that are reflected in the following research questions: 1) how do the factors of and forces on higher education impact the planned change process?; 2) what do other disciplines offer that may inform the planned change process for higher education?; and 3) how can HRD effectively advise higher education institutions on change? Through this analysis we hope to gain a better understanding of the ways in which institutions of higher education experience change and, using the lens of change theory from management, HRD, and economics, how higher education might more effectively manage change in today’s environment of turbulent, more market-driven culture.

Change—A Higher Education Perspective

Key Factors in Higher Education

Several unique factors permeate the higher education environment which are integral to the nature and purpose of higher education. These factors include organizational leadership and governance structures, diverse stakeholders and constituents of higher education, and institutional culture (Duderstadt & Womack, 2003; Welsh and Metcalf, 2003; Kezar and Eckel, 2002). Organizational leadership, diversity, and culture substantially shape any change process that begins with identifying and building consensus on objectives. The governance structure of higher education, combined with numerous institutional leaders, managers, and academics, resembles more like the governance and leadership of democratic country than the governance and leadership of a typical business organization. Organizational politics, coalition building, and the differential power of both leaders and constituents play a much greater role in higher education organizations than in the traditional view of the firm.

By applying Shepard’s (1960) model of planned change to this reality, we find that the first step of the process—creating and agreeing on objectives—can be seen as difficult, if not problematic, for higher education providers. In addition, the subsequent steps in Shepard’s (1960) model (e.g., planning, taking action, and fact-finding) all take on a different flavor when one suggests that higher education institutions are more similar to a democratic country than to a business organization. Planned change on a national scale in democratic countries has been labeled as inefficient, shortsighted, lead by special interests, etc. etc. etc. Shepard’s model illuminates the gap between planned change in business organizations from planned change in a higher education institution.

Diverse stakeholders and constituents. The dynamics of change in higher education are inevitably influenced by its diverse array of internal and external constituencies. Internal constituencies of higher education institutions include students, faculty, staff, administrators and governing boards. External stakeholders include parents, the public and their elected leaders in government, business, labor, the press and other media, foundations, and other public and private institutions in the community. A key challenge for leaders responsible for change in higher
education is managing the complex roles and relationships between the university and its diverse constituencies, particularly when these relationships are changing rapidly.

Shepard’s (1960) model provides a way to identify the potential consequences of diverse stakeholders and constituents on a planned change process. Like the governance structure impact described above, the diverse stakeholders and constituents described by Welsh and Metcalf (2003) are less likely to come to an easy agreement about objectives. On a positive note, however, their study found that the planning and action taking steps will be more likely to succeed when faculty perceive they are embedded in the planned change process. In most situations, because of the diverse stakeholders and constituents, planned change in higher education institutions will generate coalition building, organizational politics, and the exercising of power in order for the process to continue.

Institutional culture. Recent studies have examined the effects of institutional culture on change in higher education. Smart, Kuh and Tierney (1997) examined the influence of institutional culture, mission, preferred decision-making approaches, and collective bargaining status on institutional effectiveness in two-year colleges. Kezar and Eckel (2002) examined the effect of institutional culture on change strategies by assessing the degree to which change processes are enhanced by following culturally sensitive change strategies and/or thwarted by violating cultural norms. They found that change strategies seemed to be successful if they were culturally coherent or aligned with the institution’s culture. Institutions that violated their institutional culture during the change process experienced difficulty. The authors recommend that campuses conduct audits of their institutional cultures before engaging in the change process.

It is widely accepted, in both scholarly and practitioner journals, that culture represents a significant force in any planned change process. Shepard’s (1960) model should be congruent with an organization’s culture in order to increase the probability of successful change. Each step of the planned change process seeks to be aligned with the culture in order to be successful. In higher education environments, however, studies have found distinct subcultures generated from the loose coupling of institutional sub-units (Weick, 1976). The consequence of these subcultures is problematic for one overarching planned change process, and it means that each step should be culturally sensitive to a number of sub-units in order to impact system-wide changes. Imagine how difficult it would be to identify, let alone align, a process with multiple cultures within one organization. Again, Shepard’s (1960) model illuminates the potential problems associated with planned change in higher education environments.

Forces Influencing Change in Higher Education

This section examines three major forces for change currently impacting the higher education environment. These forces are 1) fiscal and budgetary constraints; 2) the growth of information technology; and 3) market forces with the resulting increased competition for students. Each of these forces directly impacts the first step of Shepard’s (1960) model of planned change. In other words, identifying objectives in the higher education environment is shaped simultaneously by each of these forces—and any one of these forces alone has been demonstrated to cause substantial changes in the operation and management of traditional business firms. Following is a brief description of these forces for change currently facing higher education providers.

Fiscal and budgetary constraints. The rising cost of higher education during a period of stagnant economic growth and declining public support has raised concern about both the access to and quality of higher education. During the past twenty years state appropriations as a proportion of the total revenue of public colleges and universities declined by nearly 25%, despite continued growth in college enrollments. During the same period the net tuition per full-time student increased by over 60 percent. Efforts to balance rising costs with the availability of educational services by increasing tuition continue to meet with public resistance. While higher education is exploring ways to reduce its dependence on government appropriations and to diversify its resource base through new, entrepreneurial and market-driven strategies, change on college and university campuses across the nation continues to be driven by fiscal constraints.

The growth of information technology in higher education. Among the most compelling forces for change in higher education today is information technology and the rapid growth in its use to transform learning. Several noted higher education leaders and observers recently have proclaimed the importance of recognizing the significant impact that information technology is having on basic processes of teaching and learning that are so fundamental to higher education (Brown & Duguid, 1995; Duderstadt, Atkins & Van Houweling, 2002; Katz and Associates, 1999; Pittinsky, 2003). These authors discuss the nature of information technology, its relevance and applications to higher education, and most important to change initiatives in higher education, they lay out the compelling opportunities and challenges presented by information technology. These works communicate a coherent and consistent message to leaders and change agents that higher education must take full advantage of the emerging technological possibilities afforded by these advancements.

Market forces and increased competition for students. Reflecting a more market-driven environment in higher education, students are exercising more discretion in selecting educational programs and there is increased
competition for students among higher education institutions. The monopolies over advanced education that universities once enjoyed due to geographical location and credentialing through the awarding of degrees are now being challenged by greater dependence on market forces and less on regulation. Technology is allowing new competitors to bypass the traditional barriers to entering the higher education marketplace such as large capital costs and accreditation. As a result, higher education is evolving from a loosely federated system of colleges and universities serving traditional students from local communities to, a global knowledge and learning industry driven by strong market forces.

Summary of first section. This section has illustrated how a planned change process (Shepard’s, 1960) is influenced by the unique factors of and forces on higher education. The four-step model has illuminated how these unique features of higher education can pose challenges to any planned change process. The authors believe that in order to deal with these challenges, we need to look at change from multiple perspectives. The next section describes planned change from three different perspectives: management, HRD, and economics. Shepard’s (1960) model is again used to identify the specific contributions and/or thinking from each perspective.

Change: Management Perspective

Management scholars have contributed greatly to our understanding of organizational change. Some management scholars view change as incremental and continuous; others view it as episodic and discontinuous. Regardless of the researcher’s perspective of change, most scholars and practitioners agree that human systems are characterized by some type of continuous change. In this perspective, Shepard’s (1960) model of planned change is continuously iterative. In other words, organizations and even sub-units within organizations are continually involved in some ongoing change process.

However, and it is a big however, current management thinking argues that change that is determinant and predictable is the exception in organizations, since much of what organizations confront on a regular basis cannot be anticipated in advance. Management scholars assert that planned change has an important albeit limited role in organizational life, even though it is a role that is often constrained and altered by the unpredictability of events. This perspective argues that events unfold in ways that cannot always be shaped by human deliberation and intervention. Based on this view of the unpredictability of change, management scholars agree that change is more complicated in today’s knowledge economy. The increasing pace and complexity of all types of organizational change lead Garud and Van de Ven (2000) to observe that it is more productive to view change as “nested sequences of events that unfold over time in the development of individuals, organizations, and industries” (p. 4). Change is appropriately characterized by a duality wherein organizations are shaped by a continual flow of events that they, in turn, help to shape.

Thinking of change as ‘unpredictable’ and as ‘nested sequences of events’ suggests that Shepard’s (1960) model may have limited application in today’s knowledge economy. Management scholars and practitioners are searching for new theories of change that can inform the chaotic reality of organizational life. Is the notion of planned change itself an artifact of another era? Or, what utility can a model like Shepard’s (1960) have in today’s knowledge economy?

Van de Ven and Poole (1995) identified four ideal theories of change—teleological change, dialectic change, life cycle change, and evolutionary change. These theories represent fundamentally different bases for change. Each theory focuses on a different set of generating mechanisms and causal cycles to explain the change processes that unfold. These four ideal theories of change can be used to understand how change is “driven” by underlying motors or generating mechanisms. Each theory involves a change process based on a different cycle of change events that is governed by a different “motor” that drives change. These motors determine the scope and nature of change and can be inferred from a systematic analysis of the sequence of events underlying the development of phenomena. An explication of these motors provides a way to systematically explore change processes. In doing so, we can generalize insights between institutional settings in which change is driven by similar motors. Moreover, we can generate additional insights by combining motors to explore more complex processes.

From this perspective, Shepard’s (1960) model could be applied on top of each of the four ‘motors’ of change and could be used to manage the process of change after it was generated by a particular motor. That is to say, the motors are deeply embedded in the socio-technical processes of organizations, and once the motors have been identified, a planned change model could guide the decision-making and management of the change process itself. It is assumed that Shepard’s (1960) model would be congruent with any motor of change.
Change: HRD Perspective

Like the contributions of management described above, HRD provides its own unique contributions to the change agenda. Human resource development (HRD) claims a long and rich history in theorizing and researching about how organizations develop, grow, and change (see French and Bell, 1999; Rothwell, Sullivan and McLean, 1995, Cummings and Worley, 1993). The components of HRD are usually understood to include training and development, organization development, and career development (McLagan, 1989). For this research project, the focus is on the role of organization development (OD) and its relationship to organizational change.

In modern times, the term ‘organization development’ is broadly understood to focus on ten key dependent variables (Egan, 2000) that enhance organizational effectiveness. Variables that are most relevant for this research project include 1) initiating and managing change; 2) supporting adaptation to change; and 3) engaging organization culture change. Each of these variables is critical for successful planned change.

Shepard’s (1960) model of planned change is a foundational model that represents the values, beliefs, and assumptions of HRD. The HRD profession places a high value on collaborative, reeducative interventions; likewise, Shepard (1960) advocates for collaboration for each step of the process. OD professionals are understood to be guided by a normative-reeducative philosophy when working to facilitate change and focus on creating collaborative decision making environments during times of change. These values, combined with HRD’s foundational reliance on learning theories, provide a different and complementary perspective of change not always found in the management perspective. Shepard’s (1960) model can therefore be used as a framework for planned change from the HRD perspective. The diverse contributions to planned change from HRD, including multiple methods to create change, outcome-based interventions for change, individual change as a prerequisite for organizational change, and cultural change as a primary goal for organization development (OD) interventions, all fit nicely into Shepard’s (1960) four step process.

For example, the multiple methods OD professionals use to facilitate change can include action research (e.g., Shepard’s (1960) model), appreciative inquiry, or critical research, among others. Each method is supported to a greater or lesser degree by a research history supporting to the efficacy of the method, and each method could use Shepard’s (1960) model to inform and manage the process of change. Another example of how Shepard’s (1960) model could be used to manage the process of change is for transformative change processes on the individual and organizational level. Henderson (2002) offered a comprehensive literature review on the major change research and theorizing for HRD. The article compared “prominent theories of change that have been proposed in the four arenas (including) organizational development, organizational learning, adult learning, and psychological development” (p. 187). From this article, it is apparent that learning and psychological development hold a more prominent role in understanding organizational change in HRD than other disciplines, including management and economics.

Shepard’s (1960) model is easily adapted to individual and organizational change processes. Individuals embedded within organizations could be guided by the model in order to grow and develop; likewise, organizations could build upon individual change and manage the process using Shepard’s (1960) model at the organization/strategic level. The main contribution of Henderson’s work to the HRD field, and to planned change in general, is that he illustrates the connection between transformative learning at the individual level with transformative change at the organization level. In this perspective, effective change begins at the individual level: individual transformative learning is required for organizational change. If an organization does not place a high priority (with appropriate resources) on individual transformation, then organizational change interventions may fail.

Change: Economic Perspective

In today’s environment, economic theory and concepts are increasingly impacting educational providers. For example, the New York Supreme Court drew heavily on economic-based research to decide on public school funding (Belfield & Levin, 2001); stock market analysts use traditional economic forecast models to sell stock in publicly-held degree-granting providers (Ortmann, 2001); and European higher education used the economic construct of the ‘market’ in order to “generate serious initiatives in deregulating higher education, in developing performance-based models of resource allocation, in fostering…competition and efficient management structures, and even in considering the ‘privatization’ of higher education” (Weiler, 2001, p. 1).

In light of the prevailing influence of economics on the policy, management, and strategy of higher education, not all scholars think this is appropriate. For example, Winston (1999) found that there are several significant economic differences between firms and degree-granting institutions. These differences were identified by economic theory and include: 1) market differences (for-profit vs. non-profit) with resulting information differences
(perfect information vs. asymmetric information); 2) the huge impact of ‘customer-input technology,’ (e.g., students are an input, a component of the quality process, and an output) (Winston, 1999); and 3) wealth differences impact higher education providers differently than the wealth differences of for-profit enterprises. “Schools that get a lot of donated resources from endowments and legislatures and gifts and their capital stocks can and do sell their educational services, in their commercial role, at a lower price for higher production cost and quality” (p. 18).

According to Winston, this means that “the key economic characteristics of higher education… paints a picture of a real world of higher education in which very different educational quality is produced in very different schools at very different cost and sold at very different prices—gross and net—to students with very different input characteristics who get very different subsidies and are often selected from very long queues of applicants, leaving a lot of unsatisfied demand. All of this exists in a world of massive ignorance about what is being bought and sold” (Winston, p. 22-23). These economic characteristics are very different than the economic characteristics of firms and are key to understanding the possible and potential changes in higher education providers. Since this study is focused on understanding change in higher education, the implications of these differences need to be accounted for in any new theory of change.

Change, from the economic perspective, is understood as responses to market conditions. Shepard’s (1960) model could be used to guide and manage the change process that emerges out of market changes; however, scholars like Winston question whether or not traditional economic concepts that are appropriate for firms mean the same thing in the world of higher education. The economic literature suggests that change is not really the focal area of greatest interest; rather, the meaning and application of economic concepts and analyses is under debate. These concepts and analyses continue to be applied to higher education providers despite increasing agreement that higher education providers face unique economic situations.

Comparative Analysis and Implications for Future Research

The changes facing higher education providers are transformational in scope and impact every level of the organization. Higher education providers themselves, of course, work towards implementing and managing change. Change in higher education is typically characterized by collegiality, extended dialogue, consensus, an emphasis on educative excellence, and respect for academic tradition. Change is evolutionary, deliberate, and incremental rather than revolutionary and quantum in nature. The complex governance structure, diverse constituencies, and cultures of higher education contribute to a pace of change that is considerably slower than what is typical in the private sector.

Given the above description of how change typically happens in higher education, Shepard’s (1960) model can easily explain the reality described above. The model suggests, because it is centered on the relationship between objectives and action, that organizations with complex structures and diverse opinions would change differently than organizations with simple structures with heterogeneous opinions. The reason for this is because identifying objectives is quicker and easier for the latter, and slower and challenging for the former.

But we want to do more than explain the current ways that higher education providers implement change processes. We want to identify areas that are particularly challenging to higher education and see how management, HRD, or economics can contribute towards neutralizing the challenges. Following is a chart that recaps the theoretical, methodological, or conceptual contributions of each discipline. These contributions can be viewed as strengths unique to each discipline; for example, the scholarship on the tempo of change is a strength of management, and the scholarship on diversity is a strength of HRD, etc.

When we connect the concepts and strengths from the three disciplines above with the explicit needs of higher education, it becomes clearer how the wide scope of needs is benefited by a multidisciplinary approach. Further, Shepard’s (1960) model has been shown to effectively partner with many of the management and HRD contributions: in other words, Shepard’s model can incorporate many, of the concepts, practices, or theories from these two perspectives. However, the emerging understanding that change is unpredictable and chaotic places great limitations on any model of planned change. Further research on identifying the relationship between planned change and chaos may contribute towards this problem. And finally, from the economics perspective, the issue is not of which change process is best; rather, the issue is to decide what economic information is appropriate for the unique environment of higher education. The misapplication of economic concepts and theories to understand and direct change in higher education is something to be concerned with.

Conclusion

This paper has provided an analysis of the tumultuous environment currently facing higher education. Organizations of higher learning are unique in many ways, and Shepard’s (1960) model of planned change has illustrated the deep differences between providers of higher education and traditional for-profit firms. In order to contribute to the change agenda of higher education, this research presented select research from three disciplines: management, HRD, and economics. The research was selected based upon its potential to directly contribute to the needs of higher education. The research is not meant to be a comprehensive review of all research that may be applicable to higher education; rather the authors believe that this ‘slice’ offers the potential for future multidisciplinary research.

Conceptualizing a Theory of Scenario Planning

Thomas J. Chermack
University of Minnesota

Scenario planning literature reveals a gap regarding its theory and theory development. This research addresses the theory gap by developing a conceptualization of a theory of scenario planning. To do so, this research uses recent techniques for theory building in applied disciplines. Specifically, this research identifies the units, laws of interaction, boundaries, and system states of a potential theory of scenario planning. While research is preliminary in nature, its intent is to work toward a theoretical understanding and validation of scenario planning practices.

Keywords: Scenario Planning, Theory, Theory Building

In constant pursuit of methods for increasing organizational effectiveness and profitability, organizational leaders have sought to understand the environments in which they operate. Several methods, including strategic planning, open systems planning, integrated strategic change and transorganizational development have surfaced to help organizational leaders achieve such alignment (Mintzberg, 1994). Scenario planning is an additional tool that has gained increased attention during the last 20 years as an effective method for identifying critical future uncertainties and investigating “blind spots” in organizations (Schwartz, 1991).

Problem Statement

Scenario planning appears to have utility in planning for the future (Schwartz, 1991; Ringland, 1995; van der Heijden, 1997). In a world that changes far too rapidly for prediction to be accurate, scenarios are gaining credibility as effective tools to prepare for an uncertain future, alter mental models, test decisions, and improve performance in a dynamic environment (Chermack, Lynham, & Ruona, 2001). The popular application of scenarios has resulted in a variety of approaches and methods for conducting the scenario building process. However, a critical piece is missing -- the theory base on which scenario planning methods stand. While it is logical that the same outcome can be achieved using different methods, guiding or underlying theory would point the professional toward that outcome.

The problem is that there is presently no theory of scenario planning and, thus, scenario planning practices are neither fully understood nor fully validated.

Methodology

Given this problem, theory building research will be a valuable contribution to the scenario planning literature, as well as its practice. This study uses Lynham’s (2002a) General Method of Applied Theory Building Research as its overall methodology (see Figure 1). Lynham’s general theory building research method will be supplemented by the use of Dubin’s (1978) specific eight-step theory building research method (Figure 2).

Dubin’s Eight step theory building methodology (1978) consists of (1) developing the units of the theory, (2) specifying the laws of interaction describing the relationships among the units, (3) determining the boundaries within which the theory is expected to function, (4) identifying the system states in which the theory is expected to function, (5) specifying the propositions, or truth statements about how the theory is expected to operate, (6) identifying the empirical indicators used to make the propositions testable, (7) constructing hypotheses used to predict values and relationships among the units, and (8) conducting research to test the predicted values and relationships. Dubin’s (1978) method can also be divided into two components (1) the development of the theoretical model and (2) the theory research. The completion of steps one through four results in a theoretical model -- the “conceptualization”. Once the theorist begins specifying propositions and empirical indicators (Step five and six) the model becomes a theory and thus the remaining steps deal with the theory research.

Because of the preliminary nature of this research, the intent of this article is to present a conceptualization of a theory of scenario planning. That is, steps one thru four of Dubin’s (1978) methodology will be used to fill the “conceptualization” phase of Lynahm’s (2001) General Method.
The development of the units of the theory refers to the building blocks of the theory. The units of the theory are the things that constitute the subject matter under examination. Specifying the laws of interaction among the units of the theory requires that relationships among the units be made clear. A change in one variable may result in changes in other variables and these changes are to be made explicit in Dubin’s step two. Step three defines the domain in which the theory is expected to operate. The identification of the boundaries of the theory is important in clarifying the aspects of the real world that the theory is attempting to model. Specification of system states is completed in step four of Dubin’s method. System states represent the conditions under which the theory is expected to operate. There can be numerous varying system states for the theory, or there can be few, but each system state is distinctive. Step five requires the specification of propositions. Propositions introduce the idea of prediction into the theory building equation (Dubin, 1978). An important consideration in this context is that the proposition must conform only to the logic designated by the theory builder for distinguishing truth and false statements.

Units of a Theoretical Model of Scenario Planning

Dubin (1978) stated that “in principle there are no limitations on the selection of units to be employed in a theoretical model. The theorist has unlimited opportunities to employ units of his [or her] choice” (p. 78). The units of a theoretical model of scenario planning are selected based on the scenario planning literature. The units of a theoretical model of scenario planning are thus, 1) scenario stories, 2) learning, 3) mental models, 4) decisions and 5) performance (see Figure 3). Each unit warrants further discussion.

Figure 3. The Units of a Theoretical Model of Scenario Planning

Unit 1 -- Scenarios
Scenarios have been defined as: “tools for ordering one’s perceptions about alternative future environments in which one’s decisions might be played out. Alternatively: a set of organized ways for use to dream effectively about our own future” (Schwartz, 1991, p. 4). Scenarios carry the characteristics of narratives or stories. Van der Heijden (1997) identified the following characteristics of scenarios: (1) the scenario is a narrative that links historical and present events with hypothetical events in the future, (2) each scenario should carry an integrated structure or storyline as a whole that can be expressed in a simple diagram, (3) each scenario is internally consistent, that is, the succession of events do not contradict each other and they are plausible, (4) scenarios reflect predetermined elements, or “those events that have already occurred (or which almost certainly will occur) but whose consequences have not yet unfolded” (Wack, 1985a p. 4), and (5) variables are clearly expressed along with leading indicators or signposts are identified.

Unit 2 -- Learning
Learning is selected as a unit of the theory of scenario planning based on supporting evidence in the scenario planning literature (Schwartz, 1991; van der Heijden, 1997; de Geus, 1988) and the logic that learning is a driver of performance (Swanson & Holton, 2001). The usefulness of learning in a system of scenario planning is embedded in the assumption that a core goal of any planning system is to re-perceive (Wack, 1985c) the organization and its environment, and the ability to re-perceive requires that individuals and groups learn something new about the organization and its environment as well as to raise up the present and past perceptions of the organization (Wilson, 2000; Godet, 2000).

Unit 3 -- Mental Models
Mental models are selected as a unit of the theory of scenario planning because of their prevalence in the scenario planning literature and their reported significance (Senge, 1990; Weick, 1979, 1990; Wack, 1985c; Morecroft, 1992). The learning that takes place in scenario planning is often a result of changing the assumptions that are taken for granted regarding many aspects of the organization and its environment (Senge, 1990). Mental models encompass those assumptions, and thus re-perceiving the organization and its environment is thought to occur through learning that forces participants to reexamine their assumptions and alter their mental models (Wack, 1985a). Senge (1990) defined mental models as “deeply ingrained assumptions, generalizations, or even pictures or images that influence how we understand the world and how we take action. Very often, we are not consciously aware of our mental models or the effects they have on our behavior” (p. 8).

Unit 4 -- Decisions
A decision is an act or process of arriving at a single determination after considering multiple options. To decide, then, as an action, is to select as a course of action or to come to a choice -- to choose one among many. Plainly, a decision is “an act or process of reaching a conclusion or making up one’s mind” (Oxford English Dictionary, 2001). In the business context, decisions must have considerable forethought, however, one of the pitfalls of strategic planning has been in its inflexibility, causing planned decisions that do not account for changes within the environment (Morecroft, 1983; Mintzberg, 1995). The challenge in this situation becomes providing the decision-maker with an adequate amount of the right information at the right time. Scenarios are advocated as one
means of providing this kind of information in this way. A key assumption with regard to decisions in this context is that decision-making is conceived of as a process requiring multiple decisions rather than a single decision (Brehmer, 1990; 1992).

Unit 5 -- Performance

Performance has been defined as: “the valued productive output of a system in the form of goods or services” (Swanson, 1999, p. 5). Performance improvement is seen as the primary outcome of the planning system in this research. The other units of a theory of scenario planning are seen as performance drivers (Swanson, 1999). To clarify, scenarios, learning, mental models, and decisions are things that affect performance, but do not embody performance themselves. Performance in the context of planning can be focused or general. For example, such performance outcomes might include a focused outcome such as increased shareholder value, or a more general outcome such as better or ongoing fit with and assessment of the business environment (Ansoff, 1965; Mintzberg, 1980, 1994).

Laws of Interaction

The laws of interaction among the units of a theoretical model of scenario planning include five categoric laws and four sequential laws (where “A categoric law of interaction is one that states that values of a unit are associated with values of another unit” (Dubin, 1978, p. 98), and a sequential law of interaction is defined as a law that is “always employing a time dimension. The time dimension is used to order the relationship among two or more units” (Dubin, 1978, p. 101).

All units are linked with categoric laws, as a change in any unit will provoke a change in at least one other unit. All units are also linked with sequential laws to denote the importance of the time element in scenario planning. The model does not include any determinant laws and designates scenario stories as catalyst units. Catalyst units are independent units whose presence is required for other interaction in the theoretical model. A graphic depiction of the laws of interaction is displayed in Figure 4.

Figure 4. The Laws of Interaction in the Theoretical Model of Scenario Planning

Boundaries

The determination of the boundaries of a theoretical model of scenario planning requires that the theorist identify the domain or multiple domains in which the theory is expected to operate (Dubin, 1978). The boundaries locate the theoretical model in the environment that it concerns. In identifying the boundaries, the theorist must also make the
logic used to determine those boundaries explicit. There are 4 boundaries for the theoretical model of scenario planning: 1) a process boundary, 2) a planning system boundary, 3) and performance system boundary, and 4) an organizational and contextual environment boundary. The boundaries of a theoretical model of scenario planning are identified and depicted graphically in Figure 5.

Figure 5. The Boundaries of a Theoretical Model of Scenario Planning

All boundaries in the theoretical model are open boundaries (as denoted by the dashed lines in Figure 5.) indicating that the system constantly exchanges information and resources with each exterior domain. Planning in the organizational context will generally be thought of as a system (Mintzberg, 1994). This means that organizations consist of the general components that constitute a system, namely, inputs, processes and outputs. Following the logic of general system theory and earlier work on scenarios as part of a larger planning system, scenario building is positioned as a process within the planning system (Swanson, Lynham, Ruona & Provo, 1998).

System States

Dubin (1978) stated “a state of a system may be defined by three features: 1) all units of the system have characteristic values, 2) the characteristic values of all units are determinant, and 3) this constellation of unit values persists through time” (p. 144). In order to determine the system state, it is necessary for the values of all units to be known.

Scenario planning is conceptualized as a system itself. Naturally then, the scenario planning system will vary and transition among several states. In order to illustrate the differing states of the system, the theory proposed will adopt (0,1) coding. By this, it is intended that 0 indicates none of the thing or characteristic under examination (for example, if the unit “scenarios” were coded 0, this would be taken to indicate that the scenarios have not been developed). The laws of interaction have indicated that a theory of scenario planning occurs along a time sequence. That is, actions with regard to specific units precede actions with regard to others. As the system transitions from state to state, the unit values shift from 0 to 1. According to Dubin (1978) the states in which the values are undefined are the transition states of the theory.

As the theoretical model of scenario planning moves through its sequence of states, the unit values shift from 0 to 1. This demonstrates that as each unit value shifts, the model transitions from one state to the next. There are six system states in the theoretical model of scenario planning: 1) System State One -- Non-operation, 2) System State
Two -- Scenario generation, 3) System State Three -- Reflection and learning, 4) System State Four -- Revealing and altering mental models, 5) System State Five -- Improving decision-making, and 6) System State Six -- Assessing implications and performance

Figure 7 shows the theoretical model of scenario planning in a state of non-operation, or prior to the development of scenarios. This is system state one. In it, the values of each unit are known to be zero. System state one is also defined by the fact that its values persist over some course of time. This course of time, also known as its state life (Dubin, 1978) is undefined as the time allotted to generate scenarios varies, as does the approach and preparation for scenario planning.

System state one can be defined using Dubin’s (1978) logic by the following statement:

*If all unit values in a theoretical model of scenario planning are equal to zero, then the model is in a state of non-operation under the conditions that no scenarios have been developed.*

Figure 7. System State One in a Theoretical Model of Scenario Planning -- Non-operation

Scenarios constitute the catalyst unit (Dubin, 1978) that sets the theory of scenario planning into operation. When the scenarios are developed, the theory proposed is operating. That is, the theory proposed attempts to explain what the phenomenon of scenario planning is, and how it works from the point of engagement in scenario planning (Torraco, 1997).

The theoretical model of scenario planning is set in motion through the generation of scenarios with relevance to a particular situation or issue (Schwartz, 1991). Here the importance of distinguishing between scenario building and scenario planning becomes clear: Scenario building is a process used to generate plausible options and expand thinking about the possibilities of the situation or issue under consideration. Scenario planning is the entire system that generates scenarios, and in addition, uses them to provoke learning, alter mental models, examine potential decisions, and “windtunnel” (van der Heijden, 1997) the organization and its resources.

As each unit is incorporated and affected, the theoretical model transitions through six system states as depicted in Figures 8, 9, 10 and 11.

**System State Two -- Scenario Generation**

System state two denotes that scenarios have been created and incorporated into the next state of the planning system. In this state the unit value for scenarios is 1 and all remaining units are zero (referring to Figure 7, the unit value for “scenarios” becomes 1 and the others remain 0). This state is characterized by the use of scenarios to provoke learning in the organization context.

System state two can be defined using Dubin’s (1978) logic by the following statement:

*If scenarios are used in the planning system then, the value of the unit (scenarios) transitions from 0 to 1 under the conditions that a process of scenario building has been completed by the planning team.*

**System State Three -- Learning and Reflection**

System State 3 indicates that the scenarios have been used to trigger learning among the participants in the planning system (referring to Figure 7, the unit value for “scenarios” and “learning” are 1 and the others remain 0). System state three can be defined using Dubin’s (1978) logic by the following statement:

*If learning occurs in the scenario planning system, then, the value of the unit (learning) transitions from 0 to 1 under the conditions that the scenarios are used to provoke dialogue, interaction and thoughtful reflection by the planning team.*

**System State Four -- Revealing and Altering Mental Models**

The unit value shift in mental models indicates that scenarios have triggered learning among the planning participants, and that learning has altered the experiences, learning, assumptions, biases and beliefs of the participants (referring to Figure 7, the unit value for “scenarios”, “learning” and “mental models” are 1 and the others remain 0).
System state four can be defined using Dubin’s (1978) logic by the following statement:

*If mental models are altered in the scenario planning system, then the value of the unit (mental models) transitions from 0 to 1 under the conditions that learning has provoked new insight, revealed assumptions, and allowed participants to re-view their thinking about the organization and its positioning.*

**System State Five -- Improving Decision-Making**

System state five presents the theoretical model of scenario planning in a state characterized by decision-making. In this state, scenarios have been used to provoke learning, mental models have been altered, and the decisions have been pushed against multiple hypothetical situations (referring to Figure 7, the unit value for “scenarios”, “learning”, “mental models” and “decisions” are 1 and the others remain 0).

System state five can be defined using Dubin’s (1978) logic by the following statement:

*If decision-making is improved in the scenario planning system, then the value of the unit (decisions) transitions from 0 to 1 under the conditions that changed mental models have provided increased, more diverse, more robust and more challenging decision options.*

**System State Six -- Examining Implications and Performance**

At the state in which the value of the decision unit transitions from 0 to 1, there are two potential paths of feedback that may result from the next transition. In the first, the decisions directly impact organization performance. This state occurs when the focal issue that prompted engagement in scenario planning is one of explicitly improving organization performance. In this case, engagement in scenario planning has been focused on a specific issue of uncertainty and assessments of increased performance and preparation around that focal issue can be made. This state is characterized using Dubin’s (1978) logic in the following way:

*If firm performance is improved in the scenario planning system, then the value of the unit (performance) transitions from 0 to 1, under the conditions that improved decision-making has resulted in better organizational fit with the environment, and has exposed organizational decision-makers to hypothetical but plausible future states that have fostered the development of signposts and anticipatory memory.*

The second state is characterized by outcomes from the decisions unit being fed back into the learning unit. In this sense, the original reasoning for engaging in scenario planning may simply be one of ongoing monitoring or assessment of plausibilities. In this case, scenario planning is not targeted specifically at improving performance; rather, it is targeted at continuous learning about strategic options. However, it is inherent that firm performance is affected by such learning. When the theoretical model has reached a state in which all units have moved from 0 to 1, feedback from decisions becomes an input to the learning or scenario units and begins the process again from either point.

**Conclusions**

This article has proposed a conceptualization of a theory of scenario planning according to the first stage of the General Method of Theory-Building Research in Applied Disciplines set forth by Lynham (2002). Additionally, this manuscript has provided a detailed outline of the theory construction process advocated by Dubin (1978) and applied it to scenario planning phenomenon. While Dubin’s (1978) quantitative theory building method has been used in this case, the phenomenon of scenario planning lends itself to any and all of the methods detailed by Lynham et al (2002).

Logically, the next steps would be to complete the application of Dubin’s (1978) theory building methodology, namely, identifying empirical indicators, specifying hypotheses, and then testing the hypotheses. These steps would result in the confirmation or disconfirmation of the theoretical model. Ultimately, the confirmation of scenario planning practices through research is sought. While Dubin’s methodology is highly quantitative in its approach to theory building, it also provides the specification of multiple research hypotheses at its conclusion -- something currently missing in the scenario planning literature. This research is acknowledged as one approach to theory construction, and it does not attempt to hold other methods as invalid. This manuscript aims to take a first step in developing theory that underpins scenario planning -- and in some ways, of equal importance -- to provoke discussions about scenario planning theory in general.

Agency Theory: Implications for Human Resource Development

Mesut Akdere
Ross E. Azevedo
University of Minnesota

The purpose of this paper is to review and examine the development of agency theory and explore its implications for HRD. Understanding its foundations and implications for HRD is important both for HRD scholars and practitioners as they are striving to motive productivity of employees in today’s complex and dynamic workplace environment in which the ways business is conducted are changing. This paper contributes to our understanding of how organizational principals and agents interact.

Keywords: Agency Theory, HRD, T&D

Agency theory is framed as the ubiquitous agency relationship, in which one party (the principal) delegates work to another (the agent), who performs that work. Agency theory attempts to describe this relationship using the metaphor of a contract (Jensen & Meckling, 1976). Narrowly defined, an agency relationship is a contract in which employers (principals) engage employees (agents) to perform a service on their behalf that involves delegating some decision-making authority to the agents (Joyce, 2000). There has been an increasing scholarly interest in the applications of agency theory to everyday business and management situations (Dalton, Daily, Ellstrand & Johnson, 1998; Eisenhardt, 1989; Lane, Cannella, & Lubatkin, 1998). With the assumption that people act as economically rational, self-interested, and opportunistic utility maximizers, agency theory allows us to predict both how organizational contracts will influence management behavior and how the choice of contract will be affected by different exogenous variables (Hendry, 2002).

This paper focuses on the agency theory literature encompassing a spectrum of academic disciplines and professional fields. Agency theory has been used by scholars in accounting (Demske & Feltham, 1978), economics (Spence & Zeckhauser, 1971), finance (Fama, 1980), marketing (Basu, Lal, Srinivasan, & Staelin, 1985), political science (Mitnick, 1986), organizational behavior (Eisenhardt, 1985, 1988; Kosnik, 1987), and sociology (Eccles, 1985; White, 1985). However, despite its widely applications and practice in other disciplines, agency theory has not been significantly studied in the field of HRD. In fact, there is little reference of agency theory (Swanson & Holton, 2001; Fogarty & Dirsmith, 2001; Kuchinke, 2000; Reio & Wiswell, 2000) in the existing HRD literature. As a field that posits itself strategically with the organization, the scholars and practitioners in the field of HRD need to study this phenomenon that has been applied to work domains where tasks are highly unstructured, outcomes are difficult to evaluate, and agents enjoy a great deal of discretion regarding to their activities (Eisenhardt, 1989; Tosi & Gomes-Mejia, 1989; Gomes-Mejia & Balkan, 1992a).

Agency theory prescribes the use of performance incentives for agents (a firm’s employees) when their principal (its owner) cannot observe their actions (Eisenhardt, 1989; Jensen & Meckling, 1976). In agency theory, agents’ behaviors and the outcomes of their performance are distinguished typically by designating the latter as the financial consequences of agents’ behaviors. Given efficiency as a criterion, the distribution of information about agent behavior and its costs determine the viability of both hierarchical and incentive forms of control (Baiman, 1982). In economics, finance, and strategic management literatures, agency theory represents a dominant theoretical frame of reference for the study of relationship between ownership and performance (Shleifer & Vishny, 1997). Therefore, this paper suggests that agency theory, largely drawn from economics literature, can greatly contribute to the field of HRD as well as its sub-fields. Personnel Training and Development (T&D) and Organization Development (OD) when synthesized and reframed with existing theories and perspectives in these fields. The paper attempts to achieve the following: to provide an in-depth review of agency theory from a multi-dimensional perspective; to understand the working relationship between the principal and the agent; and using the existing body of knowledge present the implications of the theory for the field of HRD. Agency theory provides an appropriate structure for increasing organizational effectiveness and performance.

Agency Theory

Initially introduced in the information economics literature to provide a model for the relationship between one party (principal) who delegates work to another (agent), agency theory received attention in the organizational control

Copyright © 2004 Mesut Akdere & Ross E. Azevedo

Agency theory attempts to define organizational economics by providing a major revolution in organizational theory, expanding and redefining our understanding of the nature and purpose of organizations (Hesterly, Liebeskind, & Zenger, 1990). Barney and Ouchi (1986) have argued that agency theory represents one of the more influential theories on organizations that have arisen from economics. The growing importance of agency theory management research has not been without criticism (Donaldson, 1990, 1995). The proponents of agency theory argue that a revolution is at hand and that “the foundation for a powerful theory of organizations is being put into place” (Jensen, 1983, p. 324). Its opponents call it trivial, dehumanizing, and even “dangerous” (Perrow, 1986, p. 235). Nevertheless, the use of agency theory to gain insight into the nature and purpose of organizations and managerial behavior continues to grow.

Agency theory structures provide applicability in a variety of settings, ranging from macro level organizational issues such as compensation policy to micro level dyad issues related to the expressions of self-interest. In organizations, agency theory has largely been applied to compensation (Conlon & Parks, 1988; Eisenhardt, 1985), acquisition and diversification strategies (Amihud & Lev, 1981), board relationships (Fama & Jensen, 1983; Kosnik, 1987), vertical integration (Anderson, 1985; Eccles, 1985), and innovation (Bolton, 1988; Zenger, 1988). Overall, the domain of agency theory focuses on relationships that are the basic agency structure of a principal and an agent who interact in the workplace with different goals and different attitudes toward organizational risk. In the simplest sense, an agency relationship exists between two or more parties when:

“one, designated as the agent, acts for, on behalf of, or as representative for the other, designated the principal, in a particular domain of decision problems. ... Essentially all contractual agreements, as between employer and employee or the state and the governed, for example, contain important elements of agency.” (Ross, 1973, p.134).

Agency theory offers that participants of an organization such as owners, employees, managers, and other suppliers of capital, interact through a nexus of implicit and explicit contracts (Jensen & Meckling, 1976; Fama & Jensen, 1983) as they contribute to the organization and in return receive compensation for it (Stinchcombe, 1965; Eisenhardt, 1985, 1989; White, 1985; Mitnick, 1986). Employers are seen as principals who contract with and depend on the actions of the managers as the agents. The term “contract” is used to mean the agreement between the principal and the agent that specifies the rights of the parties, ways of judging performance, and the payoffs for them (Fama & Jensen, 1983).

One of the assumptions in agency theory is that contracting occurs atomistically between employees and the organization. The amount and nature of incentives and consequently compensation are largely determined by job characteristics and individual risk preferences of employees. Monitoring work effort of employees is one of the significant job characteristics associated with different pay methods. Thus, agency theory from this perspective, views the organization as an agent negotiating contracts atomistically with every individual employee with assumably equal bargaining power.

Agency theory has been important for understanding the organizational performance and design of compensation strategy. From an agency theory perspective, social relationships are composed of interactions between a principal and an agent. In essence, the principal delegates work to the agent (Eisenhardt, 1989; Fama & Jensen, 1983). However, like any other organizational interaction, there are problems associated with agency theory. In the case of agency theory, a problem in this relationship arises from incongruence between the goals of principal and agent as a result of the difficulty in monitoring or verifying agent behaviors and organizational decisions (Eisenhardt, 1989; Nilakant & Rao, 1994; Zajac & Westphal, 1994). Goal incongruence is based on the assumption that principals and agents are both utility maximizers. Thus, agents will pursue their own interests, which may diverge from the interests of principal (Jensen & Meckling, 1976). Agent may shirk or engage in self-serving behaviors, such as using work time and organizational resources for personal gains. The more autonomy and independence the agent enjoys and the greater the specialized knowledge required performing the task, the more significant this “moral hazard” becomes (Holmstrom, 1979). Eisenhardt (1989) suggested that this assumed
incongruence, or goal conflict, may be reduced in situations in which there is a high level of socialization, such as a “clan-oriented” firm or where behavior is not self-directed (Ouchi, 1979).

Agency theory is an outgrowth of research on risk sharing conducted by economists (Boyd, 1994; Eisenhardt, 1988; Gomes-Mejia & Balkin, 1992b; Lamberti, Larcker, & Weigelt, 1993). Agency theorists propose that the fundamental goal of organizations is to minimize costs and maximize efficiency. The assumptions of agency theory are that agents are: motivated by self-interest, rational actors, and risk-averse. Therefore, it is proposed that principals can motivate agents by controlling their monetary incentives (Amernic, 1984; Eisenhardt, 1989; Gomes-Mejia & Balkin, 1992a, 1992b). An agency problem occurs, however, when a principal is unable to adequately monitor or assess an agent’s behavior (Amernic, 1984; Lambert et al., 1993). This situation results when the agent’s task is less programmable (Eisenhardt, 1989), when accomplishing the task entails risks, or when the goals of the principal and agent are in conflict.

**Implications of Agency Theory for the Field of Human Resource Development**

Agency theory provides a concise way to address the topic of organizational control as it might be directed to the HRD function (Eisenhardt, 1989; Jensen & Meckling, 1976). Agency theory’s basic model is framed as two parties engaged in a hierarchical relationship (Arrington & Francis, 1989). One party, principal, gives the other party, agent, authority to act on her or his behalf (Fox, 1984). In most cases, HRD practitioners, be they OD professionals or trainers, are given the responsibility to act on behalf of the organization by the Vice President of Human Resources, the principal. From this perspective, they, engage in a principal (the Vice President of Human Resources) and agent (themselves) relationship.

Agency theory offers a set of analytical tools and concepts, including information asymmetries, task programmability, divergence of interest, and contrasting process and outcome measures. Such tools are important for HRD in performance, knowledge management, and systems assessment practices, and financial measurement. HRD has been traditionally criticized for not providing some tangible measures for its activities. Less than five percent of the HRD programs that are carried out in organizations are financially assessed, which constitutes a fundamental problem for the HRD profession (Swanson, 2001). Utilizing agency theory through HRD processes and practices will be one way of addressing this fallback. Agency theory highlights the idea that principals and agents often have divergent goals and divergent capacities to influence corporate behavior and outcomes (Milgrom & Roberts, 1992). OD agents and top management divergences are commonplace in many OD interventions, which, in fact, are very critical to the success of the entire process. Agency theory may contribute to enhancing such programs by facilitating a structured approach to the analysis of economic motivations and incentives of managers and employees (Eisenhardt, 1989), equally important components of HRD.

Examples of applications of the principal-agent paradigm exist almost between any given levels of an organization. In a workplace setting, the employer serves the role of a principal, while an employee acts as an agent. A military commander, acting as principal, may strive to influence the performance of the soldiers under her command. Alternatively, a teacher may structure his/her grading criteria to increase student participation and achieve student learning. In the classic example of the principal-agent relationship, a landlord oversees the activities of a tenant farmer. Similarly, in a training setting, organizations may structure their training strategies as such to ensure the objectives of the training programs are accomplished. T&D literature emphasize the importance of incentives in motivation of the trainees and success of the programs (Shalo, 2003; Hilton, 1992; Tharenou, 2001; Seyler, Holton, Bates, Burnett, & Carvalho, 1998; Monk, 1996; Tannenbaum, Mathieu, Salas, & Cannon-Bowers, 1991). Such structuring may include knowledge assessment on the topic that has been studied during the training and offering various monetary and social incentives to those who achieves certain level of learning and performance as a result of a training program (Johnson & Cheatwood, 1992). In a different T&D setting, the Vice President of Human Resources is the principal directing their agents, the agent Human Resource managers, to operate training programs for the betterment of the organization. In turn, the managers act as principals in giving their trainers—the agents—the charge to carry out the front-line effort. Last in the chain, the employees are the ultimate agents as they move to use their training provided by the trainers/principals on the job. In another example, the top management of a firm may try to influence an OD practitioner by offering him/her some additional incentives to ensure organizational change takes places within their respective frameworks (Rothwell, Sullivan, & McLean, 1995; French & Bell, 1999).

Although various organizational theories focus in career ladders and the structure of compensation (Doeringer & Piore, 1971; Williamson, 1985), agency theory explicitly addresses the optimal form of rewards to motivate productivity for managers and other employees (Alchian & Demsetz, 1972; Eisenhardt, 1989). As improving performance is an important component of all HRD processes (Swanson, 1995; Holton, 2002), agency theory (as
proved in other established disciplines) may function as a means to contribute to performance improvement at individual, group, and organizational levels. Agency theory explains the employment relationship as a contract in which agent or employee supplies labor to the employer or principal in exchange for income and other rewards. Consequently, economic rationality, information asymmetries, and differences in the risk attitudes of workers and firm are among the main assumptions of this model. The values and principles of economics constitute the basic foundations of the organizations in which HRD professionals function and HRD processes take place.

Agency theory also presents areas of interest for HRD researchers. Researchers in other disciplines have argued that agency theory can be used to examine all aspects of organizational behavior including the relationship between employees and their organizations (Jensen, 1989). As a field striving to advanced through research HRD can further empirically study agency theory, which is considered to be “a major advance beyond the usual sociological methods of organizational analysis” Jensen (1983, p. 324).

Agency theory reestablishes the importance of incentives and self-interest in organizational thinking (Perrow, 1986) and it reminds us that much of organizational life, whether we like it or not, is based on self-interest (Eisenhardt, 1989, p. 63). Thus, agency theory addresses to the core of the organizational life, which is greatly impacted by the concept of self-interest (Rosanas & Velilla, 2003; Irvin, 2002; Calabrese & Roberts, 2001; Clohesy, 2000; Powell & Mainiero, 1999; Frey, 1998; Hausken, 1996a, 1996b). HRD practices and implications are unavoidably a part of the organizational life in the workplace. What distinguishes agency theory differs from most other organizational theories is its primary unit of analysis, the individual. Performance in HRD is also directed toward determining employee effectiveness at the individual level and contributing to efficiency of other levels (group and organization) (Rummler & Brache, 1995; Swanson & Holton, 2001). As Eisenhardt (1989, p.63) points out, the central focus of the theory is “the goal conflict inherent when individuals with differing preferences engage in cooperative effort...” From this perspective, agency theory implies a varied of applications to different organizational contexts and relationships. The increasing interest and application of agency theory is a direct result of its utility to transform almost any aspect of an organization’s activities into a contractual relationship between different parties and application.

The agency theory challenge for HRD is to revise the way we think about the HRD functions and practices in organizations and how they relate to the other aspects of organizational life. The ideas of contract, incentive, and self-interest may initially seem foreign to those of us in HRD who look at organizational relationships with a more traditional fashion. Implicitly, however, these have always been present whether we chose to recognize them or not. As an interdisciplinary field, HRD can reap significant benefits from agency theory, as has been the case for many other applied disciplines (Demske & Feltham, 1978; Spence & Zeckhauser, 1971; Fama, 1980; Basu, Lal, Srinivasan, & Staelin, 1985; Mitnick, 1986; Eisenhardt, 1985, 1988; Kosnik, 1987; Eccles, 1985; White, 1985). As a young discipline, HRD needs to be in constant progress. Agency theory, on the other hand, like any other organizational theory, raises the possibility of great benefits, significant challenges, and potential risks. The only way to determine these is to implement, practice, and study the phenomenon under question within the framework of agency theory and assess the answers it provides.

References

In an effort to properly understand economics as a foundation of HRD, this article reviews economic theories and models pertinent to HRD theory building and practices. By examining neoclassical and institutional schools of contemporary economics, especially the internal labor market theory, we argue that economic theories not only provide a foundation, but also have important implications to research and analytical approaches to the field of HRD. Broadening our research directions may be fruitful and provocative in expanding HRD’s theoretical base as well as practical applications in organizations.

Key words: Neoclassical Economics, Institutional Economics, Internal Labor Market

Economics, together with system theory and psychology, is considered one of the core foundations for the field of human resource development (HRD) (Rothwell & Sredl, 1992; Swanson & Holton, 2001). Yet, our understanding of economics as an HRD foundation has been narrowly confined in scarce recourse, human capital theory, and sustainable resource theory (Swanson and Holton, 2001). A wealth of economic theories has not received much attention in the HRD literature. Perhaps, this is because traditionally, HRD theory has drawn less theoretical results from economics than the fields of education, psychology, sociology and other behavioral sciences (Odiorne, 1970). To better understand the foundations of HRD and further advance HRD theory building and practice, it is imperative to explore and examine foundational theories developed by economists over the many decades. The purpose of this article is to review economic theories as pertaining to HRD foundation and introduce some of the less known economic theories and research to the HRD field. Specifically, it is to answer the following questions: What are the major theories in economics that may represent a foundation for HRD? And what are the implications of the economic theories and approaches to HRD researchers and practitioners?

Strictly speaking, economic theory that constitutes a foundation for HRD is regarded as one of its sub-fields, labor economics. Labor economics, as defined by Ehrenberg and Smith (1994), is the study of the workings and outcomes of the market for labor. Specifically, it is primarily concerned with the behavior of employers and employees in response to the general incentives of wages, prices, profits, and nonpecuniary aspects of the employment relationship, such as working conditions. There are two major rivalry paradigms or schools of thoughts in this area: neoclassical economics and neoinstitutional economics. Together, they should be considered as general economic foundation of HRD.

The Neoclassical Economic Theory

The term neoclassical economics is referred to the fact that the theory was derived from or an extension of the classical economics established by Adam Smith (1723-1790), David Ricardo (1772-1823), and other early 1900s economists. The principal founder of the neoclassical economics was Alfred Marshall (1842-1924), who rigorously developed and popularized the diagram of demand and supply, also known as the Marshallian cross.

A commonly held believe in HRD field regarding the economic foundation is human capital theory proposed by Becker (1962) and Mincer (1962). To clarify and identify the economic foundation of HRD, this section reviews two major hypotheses in labor economics literature: human capital hypothesis and screening/filtering hypothesis.

Human Capital Hypothesis

In the neoclassical economic paradigm, HRD and training is examined under a competitive labor market assumption. As such, individuals acquire human capital in a variety of ways, including education, training, migration, and job-search activities (Ehrenberg & Smith, 1994; Kaufman, 1994). The important feature of this acquisition, however, is that it is an investment, in the sense that the individual foregoes current income for increased earnings potential in the future (Becker, 1962). Assuming that individuals wish to maximize the present value of their lifetime earnings, they will accumulate human capital up to the point where the marginal benefits--the discounted expected incremental income that arises from the investment -- equals the marginal cost of acquiring it. Labor market outcomes are determined by the interaction of supply and demand. The supply side is explained according to the human capital hypothesis while marginal productivity theory underlies the demand side. In its most extreme form,
human capital hypothesis proposes that all productivity differences between individuals reflect differences in the amount of human capital they possess.

On the demand side, profit-maximizing organizations will employ individuals up to the point where the wage equals the value of the marginal product, with technology and capital taken as exogenous parameters. Competition will then ensure that wage differentials reflect the value of the extra output made possible by the higher level of HRD activities, such as training or education (Ben-Porath, 1967). In essence, the human capital hypothesis, at least during its inception period, is a theory of occupational choice. Individuals choose between jobs that offer different amount of training opportunities. Those who choose jobs with training receive lower current earnings but higher future earnings than those who enter jobs with less training.

Within the standard human capital model, HRD and training activities are assumed to take place primarily on the job and simply an extension of the schooling decision. This is only valid if the training involved is general, in the sense that the individual’s productivity gain can be applied in any job and not just in a specific firm. Such an assumption is, of course, highly restrictive and has been relaxed by Becker’s model (1964) of general versus specific training. The notion that some skills can increase productivity only in the firm or on the job where the training is received provides a theoretical framework in understanding training behavior and is widely accepted by HRD professionals (e.g., Rothwell & Sredl, 1992). In practice, however, most skills contain both general and specific elements. The distinction is only useful as a convenient analytical tool. It does, however, raise the question of what determines the mix between general and specific training that organizations provide.

Human capital model, as discussed above, was first proposed in labor economics to analyze individual education and training decision-making process. Economic studies in the earlier years were almost exclusively focused on economics of education, measuring wage/earning profiles of education and training (e.g., Mincer, 1974 and Lynch, 1989). In recent years, economists have shifted to measure the social returns, or macroeconomic impact created by human capital investment, including economic performance and competitiveness at national level (Sturm, 1993).

The human capital model, however, has been questioned by many economists. Critics point out that this model will only generate an efficient amount of HRD and training activities under very restrictive assumptions. In particular, a competitive labor market, comprised of maximizing individuals and firms, will be efficient only if the following conditions are true: all individuals have access to capital at the social rate of interest, job changing is costless, and there are a large number of firms demanding the particular skills concerned. As a result, doubts have been expressed that a model based on such restrictive assumptions can have any value in explaining what happens in the real world (Osterman, 1984). Imperfect capital markets and uncertainty about future incomes can give rise to significant underinvestment in learning by individuals (Kaufman 1994). Limited labor mobility may encourage firms to bear part of the costs of general training, or reduce the premium paid to employees with specific skills to reduce turnover (Osterman, 1984). Collective bargaining can affect pay structures in favor of unskilled workers, reducing the return to training or pushing up the pay of trainees, thus reducing the amount of training or the skill intensity of training (Freeman & Medoff, 1984). These are just a few examples of how market imperfections can distort the efficient provision of HRD and training that would result under the conditions assumed by human capital theorists.

Screening/Filtering hypothesis. Compared to human capital hypothesis, the screening/filtering hypothesis is much less known in the field of HRD. This hypothesis challenges human capital model. It argues that most job skills are not acquired before individuals enter the labor market. Rather, they are obtained through on-the-job training and learning by doing (Thurow, 1975). Therefore, it is questionable that education and training, as an investment, will provide individuals with cognitive and technical skills that directly enhance productivity (Arrow, 1973), especially under the restrictive assumptions by the human capital hypothesis. The alternative model considers hiring employees is an uncertain investment. This uncertainty arises because employees’ productivity is unobservable at the time of hiring, and can only be gauged after they have been employed on a specific job for a period of time.

The screening/filtering model assumes that education and training contributes no way to increased performance and productivity, neither cognition nor socialization. Instead, education and training only serves as a screening or filtering device to sort out individuals with different abilities (Arrow, 1973). Such screening information is actually what is needed by organizations for identifying employees, regarded as signaling (Spence, 1973). Under screening/filtering hypothesis, the labor market is not primarily an auction market where individuals of different educational levels sell their skills, but is instead a training market, where firms have training slots to be filled at the bottom of the job ladder and individuals compete to be hired (Thurow, 1975). To employers, the decision of which person to hire is not based on a consideration of who has the highest productivity because it is unknown at the time of hiring, but on who is most trainable. Organizations must screen or sort the applicants into a queue based on their signal and indices (Spence, 1973, 1974). To potential employees, the competition is to obtain access to the firm’s job ladder, setting off a race among individuals to acquire the signals, such as the background characteristics and credentials that employers value the most. The signals may include, among other things, level of education attainment and willingness to undertake on-the-job training.
The screening or filtering model, although different from the human capital model, is not entirely in contradiction to it. From the organizations point of view, an employee screened to be more valuable will be paid more. Thus, the screening function of education and training does play a value added role. Extra earnings from additional years of education, however, are not the returns from the individuals’ human capital investment, but a payment to their pre-existing ability and intelligence that education and training signal. Therefore, this theory predicts an investment in education may yield a high private rate of return if it moves the individual up in the queue for higher paying job.

Through mathematical derivations, Arrow (1973) shows the competitive equilibrium condition and signaling mechanism for the screening model. Some empirical studies also seem to support the screening hypothesis. Miller and Volker (1984) hypothesize that if returns are strictly related to productivity, then economics majors who took jobs that utilized their academic training should be paid more than those who took jobs unrelated to their field of study. Their study, however, finds no difference in the starting salaries of the two groups studied, leading the conclusion that employers were using a college degree as a screening device. A number of other empirical studies (e.g., Hungerford and Solon, 1987; Weiss, 1989) also argue that education has “sheepskin effects”, which result in “paper chase” by potential employees (Berg, 1970).

In neoclassical theory, very little attention has been directed to the question of why some employees have access to HRD and training activities while others do not? Why do some organizations offer more training than others? And what determines the type of training they offer? To understand how labor markets function, it is therefore deemed necessary to understand how institutions and market imperfections develop and change through time, and how they affect and are affected by employees and organizations.

The Institutional Economic Theory

The main rival to the neoclassical economic theory with regard to HRD and training in labor economics is the institutional school. As early as the emergence of human capital theory, a group of economists has taken up the topic of institutional labor market (e.g., Kerr, 1954; Dunlop, 1966). Institutional economists reject neoclassical theory as sterile exercises in deductive logic and scholarly apologias for laissez faire. They sought to develop a “new economics” with a more psychologically informed, humanistic representation of the human agent, models of markets that recognized the growth of trusts, and a view of the economic process that made it possible for institutions to promote social welfare (Fine, 1956; Lutz and Lux, 1988).

Principles of institutional economics. Institutionalists oppose the notion of economic man by their rival. They deny that people maximize in pursuit of their economic goals. Instead, they believe a theory of motivation known as satisficing (Kaufman, 1994), meaning that individuals pursue a goal only until they reach a minimum satisfactory level, regarded as good enough, even if it is not the best they could do. They also argue that people’s decisions are less rational than economic man model. The reason is that human brain is too limited to effectively process all the data and to make all the complex calculations that are required to arrive at optimal and consistent decisions.

Institutionalists accept the maximum efficiency proposition by neoclassical theory, but added two more: economic outcomes must satisfy minimum standards of equity or justice, and must contribute toward human development and self-realization (Commons, 1934). They believe that economic theory should be modeled as purposive and self-interested with the following conditions. 1. Human rationality is limited by “stupidity, ignorance, and passion” (Commons, 1934) or “bounded rationality” (Simon, 1982). Decision-making thus may not maximize utility (Kaufman, 1994), and 2. Many human emotions arise from interactions or comparisons with others, thus making behavior interdependent (Tversky and Kahneman, 1991).

In addition, institutional theory realistically believes that labor markets contain significant imperfections, such as limited and asymmetric information, significant costs of mobility, and limited numbers of buyers (firms). These factors give employers market power over wages and working conditions and non-competitive outcomes for employees. Thus firms often do not bear the full cost of production, leading to a misallocation of resources and shifting of costs to workers and communities (Stabile, 1993).

Furthermore, wage rates often are unable to equilibrate demand and supply, thus clear labor markets. An important reason is that the wage rate performs a dual role in labor markets—it allocates labor, as in neoclassical theory, but also is used by firms to motivate employees (Palley, 1995). The wage rate that meets one objective often does not meet the other, leading to nonmarket-clearing outcomes.

Apparently, institutionalists take an interdisciplinary approach to labor market analysis. As pointed out by Dunlop (1988), “an understanding of labor markets and compensation requires a recognition that the work place is a social organization, at least informally, and that labor markets take on significant social characteristics that do not characterize commodity and financial markets and that are not readily encapsulated in ordinary demand and supply analysis (p. 50).” Under such humanistic economics, it should not be a surprise to see the development of the internal labor market model, which will be discussed subsequently.
Internal Labor Market

Internal labor markets are concerned with the allocation of labor within an organization among different job positions, including the availability and nature of training. According to the institutional economists, internal labor market is defined as “an administrative unit…within which the pricing and allocation of labor is governed by a set of administrative rules and procedures (Doeringer & Piore, 1971, p. 1)”1. This is to be distinguished from the external labor market in the neoclassical world, where pricing, allocating, and training decisions are controlled directly by economic variables. On the other hand, these two markets are interconnected, and movement between the two occurs at certain job classifications that represent ports of entry and exit to and from the internal labor market. The remainder of the jobs within the internal market is filled by the promotion or transfer of workers who have already gained entry. Consequently, these jobs are shielded from the competitive forces in the external market. It is important to point out that the internal labor market is indeed the subject of HRD research and object of HRD practice.

Training in an institutional world reflects three economic structures: 1. The internal labor market structure that simultaneously forms and rations employees’ skills, 2. The firm’s organizational structure, including training and HRD process, which shape the demand for and use of employees as labor, and, 3. The macroeconomic structure, especially the institutions shaping unemployment and investment that governs the economy (Brown, 1994). The first two structures are interrelated, and they function within the context of the third.

Within the internal labor market, there are no market supply and demand curves for given positions (Doeringer & Piore, 1971). An employee’s productivity is related to the job he or she does and is not the result of human capital decision-making process (Brown, 1994). In other words, for a given level of skill and effort, an employee’s productivity depends on his or her job, since the job determines the worker’s access to resources and training. The system of job ladders and internal promotion permits the development of skills through on-the-job training. Job placement thus determines the worker’s long-run productivity, bargaining power, and earnings. Within this framework, the labor market can be seen as comprising favorable jobs in structured internal labor markets, and disadvantaged jobs in unstructured internal labor markets, such as part-time employees. Access to favorable employment opportunities is not based on the productivity-related characteristics that individuals possess, but on social acceptability and custom (Doeringer & Piore, 1971). This is reinforced by the fact that training is an integral part of the job and requires the cooperation of coworkers and the acceptance of group norms and organizational culture.

In the institutional economic world, the internal labor market is generated by several factors that are familiar to all HRD researchers and practitioners, which are not envisioned in neoclassical world. They are, skill and job specificity, on-the-job training, and culture and customary laws (Doeringer and Piore, 1971).

Skill and job specificity. The specificity of a job, according to the institutionalists, is defined by its skill content. Jobs and associated technology require a set of skills, and each of the skills may be more or less specific. Even the simplest tasks are facilitated by familiarity with the physical environment specific to the workplace in which they are performed. Moreover, performance in some production and most managerial jobs involves a team element, and a critical skill is the ability to operate effectively with the given members of the team. The skills of team interaction are specific in the sense that skills necessary to work on one team may not be quite the same as those required by another.

On-the-job-training (OJT)1. Since formal education is often used as a screening device for selecting people with certain aptitudes and social backgrounds. OJT then provides either the larger proportion of skills actually utilized in the job performance or is a prerequisite for the successful utilization of formal education.

The institutional economists believe that the informality of OJT makes it difficult to identify the precise nature of the process (Doeringer and Piore, 1971), but the following elements appear to be involved. First, training typically occurs in the process of production, partly through trial and error. It is the production process that disciplines the learning process and provides indications of success or failure. Both monetary and psychological rewards and penalties stimulate the mastering of the skills. Second, when instruction of one kind or another is required, it is usually provided by a supervisor, by the incumbent worker, or by workers on neighboring jobs. The participants in the training process therefore assume dual roles: one in the production process, as supervisors or subordinates, the other in the learning process, as instructors or students. Third, the very process of OJT tends to blur the distinction between jobs. Each job in the progression line develops skills requisite for the succeeding job and draws upon the skills required in the job below it.

Organization culture and custom. Organizational culture and custom is one of the major factors important to understand internal labor markets. Institutional economists argue that organizational culture and custom at the workplace is an unwritten set of rules based largely upon past practice or precedent. These rules can govern any aspect of the work relationship from discipline to compensation. When employment is stable, the same employees come into regular and repeated contact with one another. The result is the formation of social groups or communities within the

1 Different from the concept of OJT familiar to HRD professionals, OJT here, and in other related economic literature, refers to any training sponsored by employers, including classroom learning, structured and/or unstructured OJT, or even learning-by-doing work experience, so long as it takes place while one is employed with a firm. For a detailed discussion on the terminology differences in the two fields, see Wang (1997).
internal labor market. Communities of this type tend to generate a set of unwritten rules governing the actions of their members and the relationship between members and outsiders. Eventually, these rules assume an ethical or quasi-ethical environment. Adherence to these rules tends to be viewed as a matter of right and wrong and the community acts to retaliate against behavior that is at variance with them.

The tendency of individuals to form the types of social groups that generate these customary laws is rooted in certain basic principles of group and individual psychology. What described as group custom may appears to be the aggregate of habits common to the individuals comprising the group. In a group situation imitation clearly facilitates the development of modes of behavior common to the members of the group.

In short, internal labor market determines the existence of an internal training market, especially OJT and organizational culture. The system of job ladders and internal promotion permits the development of skills through either formal or informal employer sponsored training and HRD interventions, while the rules that allocate labor within the organization ensure the willingness of incumbent experienced workers to train their juniors by removing the threat the latter might pose to their job security and earnings.

Comparison of Neoclassical and Institutional Paradigms

The relevant economic theories discussed above are based on different assumptions. This section compare the contrasting assumptions made by the two different schools as relevant to the field of HRD.

In the institutional model, imperfect competition or non-market clearing outcomes are assumed, implying that underemployment is a basic characteristic of labor market. All training and HRD related activities take place under this assumption. On the other hand, neoclassical model assumes a full employment paradigm produced by the competitive market forces, which determines the subsequent training activities.

Under the institutional paradigm, job allocations and training opportunities are determined by a set of institutional rules and customs, whereas they are dictated by price (or wages) in neoclassical world. Employees’ productivity is associated with the jobs they occupy, which result in the access to resources, including training and HRD opportunities and not necessarily associated with their skill levels under the institutional umbrella. But for neoclassics, employees’ productivity is a result of individual human capital decisions, which is the result of past investment decisions and current on-the-job training.

Regarding the process of training, institutionalists’ assumption is that on-the-job training increases the value of employees to the firm, and the training is embedded in the work process as well as taught by supervisors or coworkers. In opposition, the neoclassical economists assume training is differentiated by type of skills, i.e., specific versus general, which determines who, the firm or employees, pays for the investment and receives the return.

As for the result of training, institutionalists assumes training produces job-related skills as well as networks and socialization that form the correct behavior and value system in an institution. Although neoclassical theorist agrees that training produces job-related skills, they deem that the formation of behavior and value systems are exogenous to the skills acquisition process and are not essential conditions for making the training decision.

To summarize the differences, Table 1 lists the contrasting assumptions by the two schools.

Implications to HRD Practice Theory Building

With over a century-long theory building and empirical development process, economic literature has brought to the field different schools of economic theories and a rich array of analytical tools. Undoubtedly, HRD researchers and practitioners can learn from economic theories and the theory building experience to further advance HRD theories and practices. Specifically, understanding the neoclassical vs. institutional paradigms and the distinction between human capital model and screening model can create new impetus for HRD theory building.
The implications of the economic theories to HRD can be examined from at least two aspects. That is, HRD foundations and research and analytical approaches.

Implications to the Foundations of HRD

Human capital theory as a foundation of HRD has been so well accepted by HRD professionals that any further discussion of its importance to HRD may appear to be redundant. To the same degree, we argue that institutional economic theory, especially internal labor market model, also constitute a significant portion of the economic foundation for the field of HRD.

It is difficult to dispute the organizational realities that institutional economics highlight. From the economic perspective, there is little question that labor markets are imperfect, that there is an internal labor market that is equally potent, and that education and training also operate as a screening mechanism. In addition, there is also little question that organizational culture plays a vital role in shaping HRD practices and strategies in an organization.

The institutionalist perspective is reinforced by Holton & Naquin’s (2003) analysis of HRD evaluation practices from a decision making perspective. In that paper, they review the decision making literature which has clearly showed that rational-economic decision making processes are not utilized in practice and are too limited to capture the complexity of organizational decisions, particularly under conditions of risk and uncertainty such as is present with HRD interventions. Decision making researchers have clearly moved beyond the somewhat simplistic rational-economic theories to more complex bounded rationality and subjective expected utility models. Naturalistic decision researchers have proposed even more divergent models as well. Holton and Naquin’s (2003) conclusion was that evaluation models built solely on ROI (rational-economic) may be too limited or widespread application and that new theory building is needed to build more integrated models.

It is striking that two independent analyses using two different theory bases not usually incorporate in HRD theory reach the same basic conclusion. Namely, that HRD theory grounded solely in neo-classical economics or rational-economic decision making are likely too limited. Both analyses suggest broad directions that are likely to be fruitful and provocative expanding HRD’s theoretical base as well as practical application in organizations. These discussions, however, should not be read as disputing the value of human capital (neoclassical) economics as a foundation for HRD, or suggesting that institutional economics replace it. Rather, we suggest that HRD theory grounded only in neoclassical economics may be too limited for universal application. More comprehensive theory is needed to integrate both neoclassical and institutional economics into HRD foundational theories.

Further, the internal labor market perspective covers all major components of HRD. These components, as defined and identified in HRD literature, include training and development, organization development, and career development (e.g., McLagan, 1989; Watkins, 1989; Marsick & Watkins, 1994; Swanson, 1994). Although economists study these components with different purposes, their analyses of organizations as internal labor markets can certainly strengthen HRD professionals’ understanding of the nature of the workplace.

From the discussions in previous sections, it is not difficult to associate the factors identified by internal labor market model with the major HRD components. Training and development and career development relates more or less to the skills and job specificity and OJT concept as defined by economists, although their definitions are somewhat different from those in HRD. The in-depth analysis of skills and job specificity by institutional economists some thirty years ago can be extended to all training and development arenas in HRD domain, even though the specific OJT activities and environment discussed by the economists may have been changed due to the technological development over the past thirty years. Osipow & Fitzgerald (1996) noted that career development is “the evolving sequence of a person’s work experiences over time.” The major component of career development indeed involves advancement in specific skills and competencies with regard to particular job requirements. More recent development in HRD practice in employee competency management may also be considered as an intuitive response of organizations to the demand of internal labor market.

In the mean time, organization development (OD) or change management can be easily linked to the factor of culture and custom specified in the internal labor market model. Indeed, one of the key focuses of OD interventions is on organizational culture (Swanson & Holton, 2001). In fact, economists’ conclusion that training not only produces job related skills, but also builds institutional networks, behavior, and value system has been practiced in HRD through various interventions for many years.

Implications to HRD Research and Analytical Approach

An equally important implication of economic theories to HRD lies in its research and analytical approaches. The most striking feature of any economic system is its overall complexity. Thousands of organizations engage in producing millions of different goods. Millions of individuals work in different professions and purchase a wide variety of products and services. Neoclassical economists are able to abstract from the vast complexities of real-world economies and develop rather simple models that capture the ‘essentials’ of the economic process. Even though some of the assumptions may not be realistic, such as perfect information and free entry to market, the resulting theories does not distract our understanding of how market economies operate. In contrast, institutional economists adopted different but salient analytical approaches. They emphasize on fact-gathering, focus on the importance of realism of assumptions,
rrely on the virtues of a “go and see” participant/observer method of investigation, and value the necessity for an interdisciplinary approach to theory-construction (Boyer & Smith, 2001). The similar contrasting approaches may also be developed by HRD researchers and practitioners to increase our understanding in organization and performance dynamics.

In addition, some existing economic analytical approaches used by economists may be readily available for HRD professionals in conducting HRD research inquiries. Considering the HRD measurement inquiry, an urgent challenge faced by existing ROI measurement approach is to separate the true HRD program impact from other intervening variables (Wang, Dou, and Li, 2002; Wang and Li, 2003). It may be necessary for HRD researcher and practitioners to look into economic approaches in order to advance the measurement methods and address the business requirement in ROI measurement. One of the strengths of the neoclassical economics is that it allows one to separate intervening variables (Wachter and Wright, 1990) so that researcher can identify individual factor’s contribution to a specific economic outcome. However, few efforts have been made to apply the economic approach to addressing the measurement challenge. We may expect the final breakthrough on HRD evaluation and measurement coming from the integrated research in both HRD and economics.

On the other hand, the distinction between human capital and screening/filtering models may in fact present an alternative to HRD and the program evaluation and ROI measurement. Unless HRD researchers and practitioners develop valid and reliable methodologies to measure the effectiveness and economic returns of an intervention, HRD programs may well be considered as screening devices, instead of human capital investment. For instance, if no sufficient evidence to show economic return from a management and leadership development program, one may conclude that the program serves as a screening device to filter the future leaders. After all, a one-month leadership development course or a two-week executive coaching program may in fact be screening-based, targeted program, and the return in dollar term may be negligible.

Lastly, the importance of contributing roles by rivalry theories and their prolong debate during a theory building process is critical for a field to become mature. The previous discussions demonstrate that the development of economics to date is the outcome of a century-long debate and disagreement between (neo)classical and institutional theories, among other schools. The experience from economists provides an excellent example for HRD researchers to further advance the theories and practice.

Conclusions

To expand HRD professionals’ understanding in economics foundation of HRD, we reviewed critical economic theories and models that pertinent to HRD theories and practice that are often overlooked by HRD researchers. The review of neoclassical and institutional theories and human capital and screening models has suggested that economics not only constitute a general theoretical foundation of HRD, but also can be used to support HRD research and theory building process. HRD theory grounded solely in neoclassical economics or rational-economic decision making are likely too limited. Broadening our research directions may be fruitful and provocative in expanding HRD’s theoretical base as well as practical applications in organizations.

A Critical Evaluation of Adult Learning Theories and Implication for Human Resource Development

Baiyin Yang
University of Minnesota

Based on a newly developed holistic theory of knowledge and learning, this paper critically evaluates several contemporary theories of adult learning. Most existing adult learning theories tend to narrowly define knowledge and learning and fail to offer adequate explanation for adult learning. Implications for HRD theory, research, and practice are discussed.

Keywords: Adult Learning, Holistic Theory, Theory Building

Problem Statement

In the field of human resource development (HRD), a new conception extends the previous dual perspective of performance or learning and it postulates that the field includes three key areas: learning, performance, and change (Gilley & Maycunich, 2000). Because HRD as a professional field works with all kinds of adults in various organizations for the purpose of facilitating their learning, performance, and change, the question of how adults learn and its subsequent relation with their behavioural performance and change tends to be a critical theme for HRD scholars and practitioners as well. Although there tend to be various definitions of learning and HRD, recent HRD texts all recognize the unique role of adult learning theory (DeSimone, Werner, & Harris, 2002; Gilley & Maycunich, 2000; Swanson & Holton, 2001). One may be able to argue that adult learning theory should be recognized as one of the key foundations of HRD.

However, the contribution of adult learning theory to HRD theory and practice has never been fully explored. Conventional HRD literature regards three major disciplines as foundations of the field (i.e., psychology, economics, and systems theory) and does not identify adult learning theory as one of the foundations (Swanson & Holton, 2001). In addition, although there have been an increasing body of literature on adult learning theories in the field of adult education, no systematic effort has been offered to critically evaluate the existing theories under a synthesis perspective (Merriam, 1993; Merriam & Caffarella, 1999). The purpose of this paper is to critically examine major contemporary adult learning theories from a newly developed holistic perspective.

Research Questions

The purpose of paper is two fold. First, the paper is to critically examine major contemporary theories of adult learning in terms of assumptions of knowledge and learning. Second, this paper is to demonstrate the utility and application of a newly developed holistic theory toward an integrative perspective of learning theory. Specifically, the following research questions were used to guide the study:

1. What are the key propositions of major contemporary theories of adult learning?
2. What are the merits and limitations of major contemporary theories of adult learning form the perspective of a holistic learning theory?

Methods

Two major research methods were used in this study, literature review and conceptual analysis. First of all, the researcher identified major contemporary theories of adult learning and then critically examined their key assumptions and propositions. Major texts and journals were searched in the fields of adult education and HRD. Sources of this literature review included major texts in the fields (DeSimone, Werner & Harris, 2002; Gilley & Maycunich, 2000; Knowles, Holton & Swanson, 1998; Merriam, 1993; Merriam & Caffarella, 1999) and preeminent journals (Adult Education Quarterly, Human Resource Development Quarterly, International Journal of Lifelong Education, and Human Resource Development Review).

Once major contemporary theories were identified, the researcher engaged an intensive conceptual analysis. A framework of theory as explicit knowledge proposed by Yang (2003) was used to guide the analysis. Yang (2003)
suggested that explicit knowledge is reflected by those theories, models, and conceptual frameworks and that all of them have three layers—foundation, manifestation, and orientation. The first layer is a stratum of foundation or premise, which serves as the basis for our knowing and determines the boundary of a theory. It also indicates a theorist’s epistemological belief system. The second layer is manifestation that represents the outcomes of our knowing, i.e., major propositions of a theory. The third layer is the orientation of our knowing which defines the direction and tendency of knowing action. This layer indicates the driving forces of our knowing process and thus reflects the advocacy of the theory.

**Theoretical Foundation**

The theoretical foundation of this paper is a newly developed holistic theory of knowledge and learning (Yang, 2003). The holistic theory defines knowledge as a social construct with three distinctive and interrelated facets—explicit, implicit, and emancipatory knowledge. Knowledge is viewed as human beings’ understanding about the reality through mental correspondence, personal experience, and emotional affection with outside objects and situations. The explicit facet consists of the cognitive component of knowledge that represents one’s understandings of the reality. *Explicit knowledge refers to clear and certain mental apprehension that is transmittable in formal and systematic format.* It is the codified knowledge that identifies true from false.

The implicit facet is the behavioral component of knowledge that denotes the learning that is not openly expressed or stated. In most cases we know more than we think we know (Polanyi, 1967). *Implicit knowledge is personal and context-specific familiarity.* It is either something hard to formalize and communicate, or the familiarity that has yet to be articulated.

The emancipatory facet is the affective component of knowledge and is reflected in affective reactions to the outside world. *Emancipatory knowledge is one’s understanding based on emotional affection and thus it is value-laden.* It is indicated by feelings and emotions people have toward the objects and situations around them. Emancipatory knowledge defines one’s view of what the world ought to be, and it is the product of seeking freedom from natural and social restraints. It reflects one’s internal affective and motivational states.

**A Dialectic Perspective of Three Knowledge Facets**

Yang (2003) posits that all of the three facets are present in all learning processes, even though not all of them need to experience a change. Furthermore, the holistic theory calls for a dialectical perspective of the three knowledge facets. On one hand, we need to acknowledge some intrinsically different characteristics of the three knowledge facets. If we examine each of the three knowledge facets at a time, they tend to be different and contradictory. The results will be like observing different faces of a coin. On the other hand, we should understand the complementary nature of these three knowledge facets. They are interacting with each other and indivisible when we take a holistic perspective. They occur by default whether we recognize them or not. All of the three facets are necessary components of the whole.

The holistic learning theory asserts that the construct of knowledge consists not only of the three facets but also of three knowledge layers (Yang, 2003). The knowledge layers include: foundation, manifestation, and orientation. The first layer is a stratum of foundation or premise, which serves as the basis for our knowing and determines the boundary of explicit knowledge. Foundation includes those tacit assumptions that have been taken for granted and are not normally requiring proof. We have to accept certain assumptions in order to know and act. This layer indicates our epistemological beliefs. The second layer is manifestation that represents the outcomes of our knowing. The third layer is the orientation of our knowing which defines the direction and tendency of knowing action. So the third layer indicates the driving forces of our learning process.

**Learning as Dynamic Interactions among Knowledge Facets**

The holistic learning theory not only identifies characteristics of the three knowledge facets and layers, but also points out that it is learning that unifies different facets. Each of the three facets of knowledge provides a support needed for the other facets to exist. Explicit knowledge will exist only as meaningless facts, figures or bytes of information without the support of other facets (i.e., when two other facets are disconnected). We normally use “body of knowledge” to denote theories, models, and empirical findings but fail to realize that these things only represent explicit facet of knowledge. By the same token, learning is also influenced by emancipatory knowledge that defines the objectives and missions that guide our actions. Implicit knowledge also connects with the two other facets. It will appear as random, idiosyncratic, and isolated practical experiences without the support from the two other facets. Similarly, emancipatory knowledge will be simply emotion or affection when the explicit and implicit facets are removed in learning process. In sum, the holistic theory contends that knowledge exists in dynamic dialectic interactions among all three facets.
The holistic theory suggests that knowledge is created and transformed through the interactions among three knowledge facets (Yang, 2003). These relations are indicated by nine modes of learning: participation, conceptualization, contextualization, systematization, validation, legitimization, transformation, interpretation, and materialization. Participation is a process of learning from practice and thereby creating implicit knowledge from experiences. Conceptualization is a process of articulating implicit knowledge into explicit concepts. It converts familiarities into tangible explanations by proposing new concepts or theories. Contextualization is a process of embodying explicit knowledge into implicit knowledge. Systematization is a process of systematizing explicit conceptions into a system with logic and reasoning. This learning mode generally involves combining different bodies of explicit knowledge in a consistent format. Validation is a process of examining and possibly modifying underlying values, desires, judgments, perceived importance and worth, and other kinds of fundamental learning based on explicit knowledge. Legitimization is a process of justifying explicit knowledge based upon emancipatory knowledge. Transformation is a process of converting an old meaning scheme (i.e., values, feelings, ethics, etc.) into another form. Materialization is a process of transferring emancipatory knowledge into tacit knowledge. Those who utilize what has been learned from participatory action research to improve the quality of their daily life are in the process of materialization. Interpretation is a process of making a meaning scheme explicit from tacit learning and direct experiences.

Learning as Individual and Social Activity

The holistic theory further suggests that learning is not only an individual activity but also a social phenomenon as well (Yang, 2003). An individual learner has to interact with his or her immediate social group or organization within certain social/cultural contexts. The holistic theory posits that a group or organization has to have three major components—critical knowledge, technical knowledge, and practical knowledge. Critical knowledge is the dominated emancipatory knowledge in an organization or a group of people. The sum of implicit knowledge of organizational members makes up practical knowledge. Practical knowledge exists in organizational processes and practices. Similarly, any organization has certain technical knowledge that represents those believed to be true explicit knowledge by its members and has been incorporated into its system. Technical knowledge normally exists in systems and structures.

Further more, the holistic theory defines group/organizational learning as a process of change in the dimensions of collective beliefs (i.e., shared technical knowledge), social norms (i.e., prevalent practical knowledge), and shared values (i.e., dominant critical knowledge) among group members. In other words, organizational knowledge is viewed as collective understandings among members through their technical, practical, and emancipatory facets of knowledge. Organizational learning involves changes of technical, social, and political dimensions of the organization. Figure 1 depicts the dynamic interactions among the three knowledge facets at individual and group/organizational levels.

Figure 1. Dynamic Interactions Among Three Knowledge Facets at Individual and Social Levels (©Yang, 2003)
Contemporary Adult Learning Theories

The literature of adult education provides a number of concepts and theories of adult learning (Merriam & Caffarella, 1999). Though no unifying theory of learning has emerged because of the complexity and diversity of adult learning experiences, the holistic theory provides an integrative framework to examine some of the contemporary adult learning theories. The holistic theory of knowledge and learning suggests three distinct and related knowledge facets and dynamic interactions among the facets. Most of the contemporary learning theories have established their learning models based on part of knowledge facets and related interactions.

Andragogy

Knowles (1968, 1980) proposed a concept of andragogy to distinguish adult learning from pre-adult schooling. The concept has been defined as “the art and science of helping adults learn” (1980, p. 43). The concept of andragogy has based on six core assumptions or principles of the adult learning: (1) adult learners need to know why, what, and how to learn; (2) adult learners are self-directing regarding self-concept; (3) adult learners enter into educational activity with both great volume and quality of prior experiences; (4) adult learners are ready to learn in relation to their developmental tasks and social roles; (5) adult learners are motivated to learn regarding to orientation of application; and (6) adult learners are motivated to learn by internal factors rather than external ones (Knowles, 1969, 1980; Knowles, Holton & Swanson, 1998, p. 4). In addition to the core adult learning principles, andragogy has been extended to include two factors that influence adult learning—goals and purpose for learning, and individual and situational differences (Knowles, Holton III, & Swanson, 1998).

Central to the concept of andragogy are its major propositions or assumptions about adult learner. In the light of the holistic theory of knowledge, these assumptions have focused on certain facets of knowledge. The concept of andragogy places emphasis on the characteristics of adult learners and posits that their life experiences can be valid source of learning. Consequently, this concept calls for active involvement of learner in educational activity. Discussions and small group activities are normally used to help adult learners. From the perspective of the holistic theory, andragogy emphasizes the role of the implicit facets of knowledge (learners’ experience as resource for learning, social roles and developmental tasks, and immediacy of application) and thus views adult learning as action or behavior oriented. However, it fails to recognize the important role of other facets. The actual role of the instructor is not well defined in andragogy. Some instructors call themselves facilitators, yet others assume the role of experts. The role of facilitator may be appropriate when learners have rich experience and need to articulate implicit knowledge to explicit or emancipatory knowledge. On the other hand, an expert role may be adequate when there is a consensus that explicit or technical knowledge needs to be delivered in an efficient way such as health and safety training.

Andragogy recognizes the role of learners’ need, self-concept, and internal motivation in adult learning. These three assumptions are within affect domain and thus related to emancipatory knowledge. However, andragogy fails to acknowledge the ultimate role of emancipatory facet of knowledge in adult learning. Because pre-adult learners have no legal rights to determine right from wrong, their learning in the domain of emancipatory knowledge tends to be passive. That is to say, pre-adult learners and some adult learners in special settings such as correctional education have to accept values and ethics normally determined by others. In most adult learning settings, learners are legitimate citizens and thus have the right of self-direction. It is vital for educators to recognize the role of self-concept and thus help adult learners to fully reach their developmental potentials. In HRD practice, goals and objectives are normally negotiated between individuals and organization, employees and employer.

One recently added factor in andragogy, goals and purposes for learning, clearly recognize the role of emancipatory facet knowledge in adult learning (Knowles, Holton & Swanson, 1998). However, it also implies that it is merely a technical process to determine learning needs and objectives. In fact, educational and training is not simply a mechanical process starting from needs assessment, to design and deliver of content, to evaluation. In many cases, HRD activities have to be involved with organizational politics (Cervero & Wilson, 1994). The holistic theory suggests that an individual’s emancipatory knowledge (indicated as perceived needs and motivation) interacts with the critical knowledge at the group and organizational level. Consequently, educators and HRD professionals need to pay attention to organizational politics and particularly the impacts of organizational critical knowledge.

Another newly added factor in the concept of andragogy is individual and situational differences. This factor recognizes the social and cultural impacts on learning and learners’ differences. Because andragogy does not recognize the nature of the three knowledge facets and that learning is a dynamic interaction among the facets, it fails to distinguish the roles of the three knowledge facets and their interface with situational factors. In sum, the extended andragogy model resembles the holistic theory depicted in Figure 1 in recognition of learning as interaction between individual and situation.
Self-Directed Learning

Self-directed learning is another popular concept of adult learning. Self-directed learning is “a process of learning in which people take the primary initiative for planning, carrying out, and evaluating their own learning experiences” (Merriam & Caffarella, 1999, p. 293). There are rich empirical studies and theoretical frameworks in this area. Merriam and Caffarella (1999) conclude that “the goals of self-directed learning can be grouped into three major aims: (1) to enhance the ability of adult learners to be self-directed in their learning, (2) to foster transformational learning as central to self-directed learning, and (3) to promote emancipatory learning and social action as an integral part of self-directed learning” (p. 290). Most self-directed learning models promote learner-centered and controlled learning activities, which will ultimately result in change of learners’ emancipatory knowledge, but few of them recognize the vital role this knowledge facet plays in adult learning. Such approach to learning has been established on an individualist value system and assumes that human beings will find freedom as long as they find out right self-directions. The holistic theory of knowledge and learning challenges such assumption and posits that individual direction and action are normally determined by one’s value and belief system. Merriam and Caffarella (1999) conclude that the majority of self-directed learning models reflect only the first goal. Thus self-directed learning tends to promote for individual freedom based on an established value system (shared critical knowledge). However, it fails to recognize that learning can be viewed as a social and political process where learners do change their emancipatory knowledge.

The second and third goals of self-directed learning tend to promote transformational and emancipatory learning, but fail to fully recognize the dynamic relationships among different facets of knowledge. The holistic theory allows us to better understand the relations among key constructs of self-directed learning concept. In his attempt to build a comprehensive model of self-directed learning, Garrison (1997) suggests that three dimensions (self-management or contextual control, self-monitoring or cognitive responsibility, and motivation or entering/task) are central to a meaningful and worthwhile self-directed learning. Contextual control dimension indicates learners’ taking control of and shaping the contextual conditions. Self-monitoring describes learners’ ability to monitor their cognitive and metacognitive processes, to use a repertoire of learning strategies, and to think about their thinking process. Motivation determines learners’ decision to enter or exit a self-directed learning activity. Three dimensions in fact reflect three domains of the knowledge facets respectively under the view of the holistic theory. The contextual control dimension represents learner’s implicit knowledge in a particular learning context, the self-monitoring or cognitive responsibility dimension seems to indicate explicit knowledge, and the motivation dimension corresponds to the emancipatory facet of knowledge. Therefore, the holistic theory of knowledge and learning covers major dimensions of self-directed learning. Further more, the holistic theory provides reciprocal relations among the three dimensions and clearly spells out how each of these dimensions interacts with others. For example, Garrison’s (1997) model specifies the influences of motivation on self-monitoring and contextual control, but fails to acknowledge the mutual impacts of the latter two dimensions on the first one. In reality, learners’ motivation for a self-directed learning activity may change as a result of enhanced self-monitoring ability or frustration of out-controlled contextual condition.

Reflective Practice

The concept of reflective practice proposed by Schön (1983, 1987, 1991) challenges the positivist epistemology of professionals’ practice. It posits that knowledge inherent from practice is artful doing. In order to overcome the limit of technical-rationality which separates the theory from practice, Schön proposes the concepts of reflection-in-action, theories-in-use and knowing-in-action. Theories-in-use is tacit patterns of spontaneous behavior. Reflection-in-action refers to learning by doing and developing the ability to continuous learning and problem solving skills. Knowing-in-action refers to the know-how revealed and constructed in intelligent action. Schön posited that learning is an iterative process that moves through stages of: (1) initial assessment of a situation of action with spontaneous and routinized responses; (2) routine responses produces a surprise (i.e., unexpected outcome) that does not fit prior knowledge; (3) surprise leads to reflection within an action-present; (4) reflection-in-action causes critical questioning the assumption of knowledge-in-action; and (5) reflection gives rise to on-the-top experiment. Schön maintained that reflection-in-action can generate knowledge to new situations but not in a way by giving rise to general principles. Reflection-in-practice adds new knowledge “by contributing to the practitioner’s repertoire of exemplary themes from which, in the subsequent cases of his practices, he may compose new variations” (1983, p. 140).

Closely related to the concept of reflection-in-action is so called reflection-on-action. While reflection-in-action determines what we are doing while we are doing during a particular situation, reflection-on-action involves thinking through the situation after we have done. This mode of reflection tends to be analytic and explicit. It is a process in which “we consciously return to the experiences we have had, reevaluate these experiences, decide to do
differently” (Merriam & Caffarella, 1999, p. 235). This process resembles conceptualization and contextualization in the holistic theory.

From the perspective of the holistic theory, the reflective process between theory and practice exemplifies the dynamic relationship between explicit and implicit knowledge. Reflection-in-action tends to learn from professional practice and thus construct implicit knowledge. Schön uses terms such as “theories-in-use,” “knowledge-in-action” and “knowing-in-action” to describe the implicit facet of knowledge. They all represent “a process we can deliver without being able to say what we are doing” (Schön, 1987, p. 31). The holistic theory acknowledges that implicit knowledge is embedded in practice or learners’ experiences; it further points out the difference between experience and implicit knowledge. One study has confirmed such distinction and shown that the amount of experience a person possessed did not have correlation with using reflective practice (Ferry & Ross-Gordon, 1998). Reflection-in-action thus can be viewed as only one of the viable ways of learning implicit knowledge for professionals.

Although reflection-in-action offers a viable explanation of effective professional practice and challenges technical rational perspective of professional education, several limitations are evident from the holistic perspective. First, the role of emancipatory knowledge in learning is not well recognized by many authors in this area. What are the influences of emotion and emancipatory knowledge such as learning need and motivation on reflective process? How can practitioners gain effective reflective skills? Are reflective processes (reflection-in-action and reflection-on-action) sufficient to educate proficient professionals?

Second, theory of reflective practice fails to acknowledge the essential role of explicit knowledge and a closely related learning mode, systematization. While it is necessary to recognize the tremendous values of implicit knowledge gained from professional practice and to acknowledge the fact that existing technical knowledge originally comes from implicit and practical knowledge, theory of reflective practice tends to devalue the role of theory and basic science. Professionals such as medical doctors could learn medical knowledge and gain their expertise directly through practice via apprenticeship several hundred years back. However, it is almost impossible to educate medical professionals in this traditional way due to the exponential exploration of knowledge base. Further more, technical knowledge such as theories and basic science have inherent merit as they provide learners with systematic and fundamental explicit knowledge that otherwise will not be able to develop by themselves or take more time to develop. Therefore, it is necessary to recognize values of both explicit and implicit knowledge gained from basic science and practice respectively.

Third, the reflective theory implies that most (if not all) professionals need to and are capable to engage in reflection-in-action. This is based on an assumption that most professional situations are not clear and well defined as described in basic scientific texts, contexts are ever changing, and thus there is a mismatch between explicit theory and real practice. Nevertheless, there are also many situations where problems are clear and well defined. In such situations, simply transmitting basic technical knowledge and skills can be effective. Even if a new issue occurs that challenges the existing technical knowledge and calls for new approach, simple learning from practice via reflection-in-action does not necessarily provide an adequate solution. We should not artificially create a division between basic science and implicit knowledge gained from professional practice because each of them has its own role for the development of a profession.

Professional education concerns both rigorous theory and relevant practical knowledge. The holistic theory of knowledge suggests that these two domains reflect technical and practical knowledge respectively. In other words, theory and practice are only parts of the broad knowledge base. Therefore, the holistic theory provides a framework that can be used to resolve the dilemma of rigor and relevance currently confronting the field of professional education. More importantly, we should set aside the dualistic view of theory and practice and focus on investigating valid forms of learning that generate different facets of knowledge.

Similar to the theory of reflective practice, Kolb (1984) proposed an experiential learning model that describes a process of learning from experience. This model views learning as a cyclical process that consists of four phases: (1) concrete experience, (2) reflective observation, (3) abstract conceptualization, and (4) active experimentation. From the perspective of the holistic theory, these four phases represent the learning modes in the interactions between explicit and implicit knowledge facets. This model delineates learning only at individual level and thus excludes the social and cultural factors that determine individual learning. In addition, this model fails to recognize the distinct role and value of emancipatory knowledge.

More recent notion of critically reflective practice extends the previous concepts and touches on the domain of emancipatory knowledge (Brookfield, 1995; Mezirow, 1998). This notion does not clearly distinguish three knowledge facets and layers and their respective roles in critical reflection. The holistic theory of knowledge and learning shows the relationships among different facets of knowledge and suggests that reflection is no more than the interactions within and among three knowledge facets. Critical reflection involves changes in the foundation
Transformational Learning

Transformational learning occupies the center in the adult learning literature (Merriam & Caffarella, 1999) and it is “vitally important to HRD” (Swanson & Holton III, 2001, p. 171). Mezirow (1991) is the primary architect and leading advocate for a theory of transformational learning. This theory describes how adult learners interpret their life experiences and make meaning. Transformational learning is defined as “the process of becoming critically aware of how and why our assumptions have come to constrain the way we perceive, understand, and feel about our world; changing these structures of habitual expectation to make possible a more inclusive, discriminating, and integrative perspective; and finally, making choices or otherwise acting upon these new understandings” (Mezirow, 1991, p. 167). Central to this theory are the concepts of meaning schemes and meaning perspectives. Meaning schemes are “specific beliefs, feelings, attitudes, and value judgments,” whereas meaning perspectives are “broad, generalized, orienting perspectives” (p. 163). Learning involves a change of either a meaning scheme or entire meaning perspective. Perspective transformation is a process of personally emancipating through which learners are freed from previously held beliefs, attitudes, values, and feelings that have constricted and distorted their lives.

Under the view of the holistic theory, meaning schemes fall into the manifest layer of three knowledge facets and meaning perspective included two other layers, foundation and orientation. Here the foundation layer of explicit knowledge corresponds to epistemic assumptions, foundation layer of implicit knowledge represents social and cultural assumptions, and the emancipatory layer characterizes psychic assumptions. Therefore, perspective transformation is a process where learners’ knowledge basis and tendency change under the view of original theory. The holistic theory differentiates three facets of knowledge and thus adds to new understanding of transformational learning. The holistic theory posits that transformational learning appears only if learners’ emancipatory knowledge changes. Consequently, some learning activities can be reflective and involve changes of meaning perspective within the domains of explicit and implicit knowledge, but they may not be regarded as transformational learning because emancipatory knowledge has not gone through any profound change.

Therefore, the transformational learning should involve deep changes in the domain of emancipatory knowledge. Simply changing or adding explicit and implicit knowledge in the existing meaning perspective with little or no change in the emancipatory domain may be identified as instrumental or additive learning. Even if the foundations of explicit and implicit knowledge (i.e., framework of reference for these two knowledge facets) have been changed, transformational learning do not necessarily occur. Thus, failure to define the concept of transformational learning is one of the major limitations in the existing literature. Another limitation of the current conceptualization of transformational theory comes from unclear definitions of instrumental and transformational learning. Because three knowledge facets have not been differentiated clearly in the existing literature, the relationship between instrumental and transformational learning has not been adequately explored. The third limitation of Mezirow’s (1991) original propositions of the transformational theory is its dependency on rational and cognitive process (Merriam & Caffarella, 1999). The original theory posits that rationality and critical-reflection is the key to leading the transformation. Under the view of the holistic theory, reflection involves mutual dialogue and change among different knowledge facets and layers. Therefore, if we define reflection as a process of interacting among knowledge facets and layers and critical-reflection as the process of examining foundation and orientation layers, then critical reflection may not necessarily lead to transformational learning. More importantly, the holistic theory suggests that transformation can take place through not only cognitive reflection (i.e., via the explicit facets) but also other factors such as simply taking action or remaining silence, which are in the behavioral domain.

Implications for HRD Research and Practice

The above examination of major contemporary theories of adult learning has implications for HRD research and practice. The holistic theory of knowledge and adult learning has several implications for research and theory-building in HRD. First, the holistic theory provides an effective framework to examine the existing learning theories. It suggests that learning occur as dynamic interactions among cognition, motivation, and social contexts. While each of the existing major theories of adult learning tends to narrowly focus their constructs in limited facets or layers of knowledge, the holistic theory calls for an integrative approach to workplace learning. While it is possible that most educators and scholars understand the value of a holistic approach, they are constrained by the lack of an integrative framework. The holistic theory challenges the prevailing works within each of three knowledge facets and also provides a strong analytic tool to examine or re-examine common concepts and theories in adult learning and HRD fields. For example, andragogy has been a widely used approach in training but little research has been conducted to examine whether the core principles of adult learner can be held or not. The holistic theory suggests three layers of...
knowledge facets (i.e., foundations, manifestation, and orientation) that thus it provides an effective tool to evaluate these assumptions. From the perspective of the holistic learning theory, some core learning principles in andragogy are merely assumptions that need further investigation. For instance, assumptions of learners’ intrinsic motivation and prior knowledge may not be held and depend on the characteristics of learners and the situation.

Second, the holistic learning theory not only provides an integrative framework to examine the existing theories but also suggests directions for future research and theory building. The holistic theory maintains that it is the dynamic interactions among knowledge facets and layers at both individual and social levels that determine learning. Therefore, future studies should be conducted to further reveal the mechanisms of the interactions between individual and social factors. Again using andragogy as an example, this concept mainly focuses on learner’s individual characteristics and fails to recognize the impacts of social and organizational factors. Another adult learning concept, self-directed learning, also treats individual learner as the key focus. Under the perspective of the holistic theory, it can be reasoned that the more congruence between individual learners’ emancipatory knowledge (e.g., perceived learning needs and motivation) and an organization’s critical knowledge, the more effective learning will occur. Therefore, the above examination of the major theories of adult learning from a holistic perspective implies a number of valuable research hypotheses that worth exploring in future research.

Third, the holistic theory of knowledge and adult learning has implications not only for individual learning but also for organizational learning, change and development. Henderson (2002) compared several prominent change theories in the disciplines of organizational development, organizational learning, adult learning, and psychological development. It was revealed that change theories at individual level and organizational level are disconnected. Theories on organizational transformation and change tend to be descriptive and often fail to address the process for individual change. Many theories assume that individuals in the organization will adapt to the environment and system change. Therefore, these theories do not concern the internal change at the individual level. While theories on individual learning and change provide rich and detailed descriptions of individual transformative process, evidences also demonstrated a linkage between individual transformative learning and organizational change. Such evidences tend to support an integrative and holistic view of individual and organizational transformation. However, future studies needed to examine the role knowledge and its different facets and layers in transformational change. Studies in organization development area need to examine the dynamic interactions between individual and organizational knowledge, and their influences on individual and organizational transformation.

The above analyses also have implications for HRD practice. By examining both merits and shortcomings for each of the major contemporary theories of adult learning, this paper provides valuable information for HRD practitioners. While most practitioners tend to appreciate the holistic approach to learning, the above analyses of existing theories provide integrative perspective that can serve as a new model for HRD practice. For example, the above examination of andragogy revealed that core principles of this concept are mixed with both assumptions and propositions. HRD practitioners should be aware of limitations of some principles because they are assumptions that may not be held in all situations. In situations such as training for safety and firefighter where learners lack prior knowledge and the existing technical is valid, the training contents and procedures can not and should not be negotiated when consensus goals are set. Then andragogy implied principles of mutually setting up learning objectives and helping them assess the outcomes tend to be limited in such situations.

Conclusions

Based on a newly developed holistic theory of knowledge and learning, this paper critically evaluates several contemporary theories of adult learning. Most of the existing adult learning theories tend to narrowly define knowledge and learning and fail to offer adequate explanation for adult learning. Implications for HRD theory, research, and practice are discussed. Research is needed to examine the dynamic interactions among knowledge facets and layers at both individual and organizational levels. Further more, HRD practitioners should be aware of both merits and limitations of existing learning theories.

Training and Development: An Examination of Definitions and Dependent Variables

Usha Valli Somasundaram
Toby Marshall Egan
Texas A & M University.

We explore training and development through the lenses of scholars and practitioners who have provided definitions and frameworks for exploring this area which is essential to human resource development (HRD). Thirty-five definitions of training and development are identified and analyzed. Themes from the analysis are explored, conclusions discussed, and recommendations for future exploration forwarded. The intent of this exploration is to add to the ongoing discussions regarding definitions, theory-building and ongoing development of the HRD field.

Keywords: Training and Development, Knowledge, Skills

Employee training and development has emerged as a major educational enterprise over the past three decades. This increase is associated with a demand in the workplace for employees at all levels to improve performance in their present jobs to acquire skills and knowledge to do new jobs, and to continue their career progress in a changing world of work (Armstrong, 2001; Craig, 1987). Numerous organizational adages suggest that people are the key to any successful business operation. This emphasis is not empty as it is becoming increasingly clear that no human enterprise can succeed without properly skilled and knowledgeable human resource development professionals (Goldstein & Ford, 2002). Ongoing employee development is critical to the short and long term success of every business profit or non-profit (Becker, 1962; Pittam, 1987).

Although definitions frequently include learning experiences provided to employees to bring about changes in behavior that promote the attainment of the goals and objectives of the organization, the definitions in the literature range from quite narrow to broad and all-encompassing. More often, the definitions use the term human resource development (HRD), rather than training and development, to identify the function (Tracey, 1992). “What should training be called?” This question has larger implication than may be immediately apparent. The issue amounts to much more than a question about semantics or definitions. Confusion over the name of the training field perpetuates a perception that, in general, training lacks focus (Rothwell, 1996). This call for focus is one of the reasons we chose to explore more closely the definitions of training.

We believe the exploration of training and development definitions is a natural question given the ongoing dialogue regarding definitions of HRD. Although some are describing the definitional explorations going on in the HRD field to be representative of confusion, we view this ongoing clarification as a natural part of any human endeavor. Those who seek definition and redefinition are not, in our opinion, adrift or confused but rather are interested in thoughtful comparisons between the past, present, and future. The logic in focusing on training definitions in the midst of this environment of definitional exploration is associated with a definition of HRD forwarded by McLagan (1989) in which she suggests that training and development is a significant portion of HRD along with career development (CD) and organization development (OD). Earlier discussions regarding definitions of OD (Egan, 2002) and CD (Upton, Egan, & Lynham, 2003) have added to our understanding of these two elements associated with HRD. Given prior explorations, we felt that training and/or training and development should also be explored.

Purpose of the Paper

The purpose of this article is to explore the various definitions available in the literature on Training and Development and Training to examine the area of focus, dependent variable and the core elements of the definition. The article is based on the following questions:
1. What are the available definitions of training and development?
2. What are the dependent variables, area of focus and core elements of the definitions?
A Brief History of Training and Development

Training and development in public and private enterprise is a vital department to the organization. Organizational challenges today appear unparalleled in history (Tracey, 1974). According to Tracey (1974), the oldest form of training in industry in Western society is the apprenticeship system which was developed in the Middle Ages by the trade guilds and during the Elizabethan period apprenticeship began to decline. The industrial revolution speeded the decline of the apprenticeship tradition. However, apprentice training likely remains as an important source for the development of skilled workers in the United States (US) as the number of apprentice in training in all trades at the end of fiscal 1947 was 192,954 but buy the end of fiscal 1970 the number had grown to 279,693, an increase of 44.9 percent (Manpower report from the President, 1972). More recent data, located by researchers, indicated the trend is still an important component for the development of workers in the Twenty-first Century. The US Department of Labor Office of Apprenticeship Training, Employer and Labor Services reported 482,823 individuals involved in apprenticeships in 2002.

The popularity of the training laboratory and other forms of sensitivity training increased tremendously in the 1960s and the need for management training was recognized more than ever (Miller, 1987). In the 1970s organization development became more popular and most talked about training technique or practice. Introduction to competency based learning came into popular use in the last half of the 1970s (Miller, 1987).

Training became more popular by the 1980s through behavior modeling which was used in the early 1970s and its greatest use was for management training, and skills training. There was renewed emphasis on career development in the first half of the 1980s (Miller, 1987). It was noted that employers spend $30 billion on formal training and approximately $180 Billion on informal on-the-job training each year (Carnevale, Gainer & Villet, 1990).

Now the demands of industry and commerce are continually changing and are reflected in the activities of the training department and the training and development programs. New approaches, skills, competencies, operations and procedures require either new training term or modifications of existing ones as the term “training” is very complex (Rae, 1997). These changes indicate the importance of renewing and clarifying the focus not only of specific training efforts, but of training and development overall. One way to reinvigorate dialogue regarding HRD-related area such as training and development is to explore related definitions (Swanson, 2001).

Three Perspectives as Context for Exploring HRD-related Definitions

There have been many articles exploring definitions of HRD and related topics such as CD and OD. The following section explores three recent discussions regarding the relevance of HRD-related definitions to the development of the field.

Exploring Definitions as Part of the Theory-building Journey

Swanson (2001) emphasized the importance of theory building as essential to the growth and ongoing viability of HRD and related enterprises. “Seemingly elementary investigations into definitions and documentation of a range of ideas within a single realm of HRD are fundamental to theory-building stepping-stones. Recent examples in the literature (articles focusing on HRD-related definitions)...add to our understanding of the HRD phenomenon” (Swanson, 2001, p. 301). Swanson emphasized the increasing demand for HRD-related theory that can expand the current horizons of scholarship and practice, and that can prevent practitioners and scholars from wallowing in a theoretical explanations and practice. From this point of view, refinement and exploration of HRD-related definitions, like training and development, can make important contributions to the field (Swanson, 2001).

Exploring Definitions as Culturally Unique Phenomena

McLean and McLean (2001) support the concept of HRD and related definitions while, at the same time, emphasizing that the increasingly global and complex nature of HRD does not support a single definition, but multiple perspectives. From this point of view, influences such as government and legislation, national contexts, religious belief systems, and other cultural factors play an active and varied role in the framing of HRD and related definitions around the world. McLean and McLean (2001) and McLean (2000) support the notion of ambiguity in HRD and related definitions as well as the notion forwarded by Mankin (2001) that “practitioners and academics should embrace HRD as an ambiguous concept as it is this ambiguity that provides HRD with its distinctiveness” (p. 80). McLean and McLean’s (2001) introduction of their own definition of HRD affirm the importance of HRD definitions while, at the same time, emphasizing the notion that attempts to remove ambiguity from definitions is “futile and cannot happen” (p. 323).

Refusing to Engage in the Exercise

Although many have engaged in the practice of exploring HRD-related definitions, (Chermak & Lynham, 2002; Egan, 2002; Holton, 1998; McLean, 1999; McLean & McLean, 2001; Upton, Egan & Lynham, 2003; Watkins & Marsick, 1995; Weinberger, 1998), not all are in agreement that this practice or “approach does a particular disservice to the development of those who wish to become HRD professionals, as the notion of HRD practice is dynamic, ambiguous and ill determined” (Lee, 2001). From this point of view, definitions are viewed as “scientism”—a conviction to the notion that reductive rationalistic scientific thinking has supremacy over other paradigms or ways of thinking. In refusing to define HRD and related areas, Lee (2001) seeks to be absent from the reinforcement of a particular, limited worldview. Lee’s narrative emphasized the importance of individuals coming to experience HRD and related areas without control or influence from a dictatorial professor or a power structure which could limit the manner in which those participating in the phenomena from providing language and description to their own experiences.

Method

A review of literature, analysis and synthesis was used to answer the research questions for this study. Keyword searches for “Training and Development” and “Training” were conducted using internal search engines at a library of a major university in the central United States. Books were considered for use when written by Training & Development scholars and a majority of a book’s references were from refereed journals and scholarly works. Electronic data bases including ERIC, ABI Inform, and electronic journal databases like JSTOR were searched to identify maximum number of definitions for training and training and development. Searches yielded 147 resources and the vast majority of the sources were from U.S. sources which may be a limitation of the study. Articles and books were closely examined for definitions on “training and development” or “training”, “development” and thirty five distinct definitions from the year 1961 to 2002 were utilized for this study. All definitions explored for the purpose of this article were from the academic literature, and definitions developed by organizations have not been included.

Examining definitions of Training and Development:

The definitions were examined for areas of focus, core element and a dependent variable or outcome. All of the definitions had at least one area of focus, core element and dependent variable and some definitions had more than one area of focus and dependent variable. The major categories developed form the area of focus and dependent variable are:

- Develop or gain knowledge
- Develop or gain skills
- Improve performance
- Improve organizational efficiency.

The dependent variables listed above overlapped with the area of focus and core elements in the definitions. About twenty four definitions focused on skills, twenty-one focused on performance, thirteen on knowledge, ten on learning, five on attitudes, one evaluation and one on productivity. Of the thirty-five definitions six definitions focused on all the three major categories – Knowledge, skills, and performance. From the list of definitions it was evident that the term “training” is defined most of the time and the “development” part was left out. Only nine definitions were for the term “training and development” and the rest 26 were focused “training”. To understand the three major areas of focus, and dependent variable - knowledge skills and performance and their contribution to training and development has been discussed below.

Knowledge

According to Swanson and Holton (2001) knowledge is defined as the intellectual mental components acquired and retained through study and experience. The definition of knowledge is complex and can be interpreted in many different ways. Knowledge is the cognitive capacity of the organization (Wang, Hielmervik, & Brendel, 2001). Knowledge is the understanding of relations, and is therefore essential in making operations effective, building business process or predicting the outcomes (performance) of business. Finally, Goldstein’s (1986) definition of knowledge refers to “an organized body…factual or procedural nature, which, if applied makes adequate job performance possible” (p. 22)
Skills

Sims (1998) classified Skills into three types: technical skills which is an understanding of and proficiency in a specific kind of activity, particularly one involving methods, process, procedures or technique. It is occupation related, concrete and functional. The second type is Human skills which is the ability to work effectively as a group member and to build cooperative effort within the team/group. And the third type is conceptual skills which involve the ability to see the enterprise as a whole; it involves recognizing how the various functions of the organization depend on one another and how changes in any one part affect all the others and it extends to visualizing the relationship. Goldstein (1986) refers to skills as "the capability to perform job operations with ease and precision" It usually refers to the psychomotor types of activity. Like all fields, Training and development is affected by demographic, political, economic and social trends. So training needs to focus on the development of skills and human relations (Sims, 1998).

Performance

Although many training and development departments have been activity oriented, focus on enhancing human performance is important as it is implicitly result-oriented. "Out of work place upheaval emerged the high performance work organization – a catchall phrase for companies in a perennial search for better results" (Galagan, 1994). For trainers that should signal an important message: shift focus from training activities (input) to the performance of individuals and organizations (output) (Galagan, 1994). Goldstein (1986) refers ability as cognitive capabilities necessary to perform a job function. Ability cannot function alone but require the application of some knowledge base.

Conclusion

A number of HRD scholars have explored HRD-related definitions (Upton, Egan & Lynham, 2003; Chermak & Lynham, 2002; Egan, 2002; Holton, 1998; Mclean, 1999; Watkins & Marsick, 1995; Weinberger, 1998). The intent of this paper was to explore training and development through the lenses of scholars and practitioners who have provided definitions and frame works for exploring this area which is essential to human resource development (HRD) and to add to the ongoing discussions regarding definitions, theory-building and ongoing development of the HRD field. The thirty-five definitions of training and development were analyzed for dependent variables, core-elements and areas of focus. It is very clear from the analysis that the definitions do have a focus in them from the above discussions. Training is viewed, by leaders in business and industry has changed dramatically in recent years. Training is now recognized as not just a major contributor to company productivity and profitability but also as critical for the survival of an organization in the global market place. In the quest of a sustainable competitive advantage companies have finally come to realize that, what sustains is the knowledge that is in people in the organization which can be processed as skills and experienced as performance.

The Realities of Clarifying and Redefining the Trainer Role

Geri McArdle
Barry University

Nancy Edwards
Florida Gulf Coast University

The role of the HRD practitioner has shifted over the past ten years. This qualitative study proposes a redefinition of the trainer role. The study findings are based on the experiences and perceptions of six internationally recognized trainers in the field of HRD.

Keywords: Trainer Roles, Trainer Competencies, HRD Practitioner

With technological changes, global expansion, economic and financial shifts, the rapidly changing workplace, and the need for greater accountability in the marketplace, the training practitioner has experienced shifts resulting in roles that are different from the training industry’s trainer role and trainer competencies delineated in the McLagan Models of Excellence Study (1989). According to Dare and Leach (1999), the competencies identified in this research study were adopted as a definitive competency model by the American Society for Training and Development (ASTD) and continue to provide the basis for preparation of Human Resource Development (HRD) professionals.

Fourteen years have passed since this landmark research study was conducted and much has changed in the industry and marketplace. Trainers are now referred to as performance analysts; instead of working full-time in large corporations, they join consulting organizations that outsource their expertise. Instead of working in their traditional roles of instructors, mentors or coaches, they assist managers to become instructors, mentors, or coaches with their employees (Powell, Hubschman and Doran 2000). However, there is little research available that explores the evolution into more strategic positioning within organizations. The purpose of this study was to investigate this role shift from the perspective of six internationally known HRD practitioners.

Theoretical Framework

During the 1980s two definitive research studies defined the trainer role and the role’s impact on organizational development. The first study conducted by Pettigrew, Jones, and Reason (1982) examined the trainer roles from the perspective of the type of role the trainer played in the organization. This study established a five-role typology describing the roles of the training specialist. According to this research, the five roles performed by the training specialists were: 1) the passive provider; 2) the provider serving in a range of roles from course administrator to management development; 3) the provider managing the training function with several reporting specialist trainers; 4) the provider in transition acting as change agent; and 5) the recognized change agent. While agreeing with these roles, other practitioners eventually added an additional role, that of “internal consultant (Solman,1994).

It was in the other definitive study, conducted by Coopers & Lybrand (1985), that the “change agent” role was defined by management. This study was conducted to record managerial attitudes towards employee training. It suggested that trainers faced difficulty in practicing their craft during the 1980s when trying to progress from HRD practitioner or trainer to the change agent role. The findings indicated that the managers’ perceptions about the change agent role hindered the practitioners’ ability to assert themselves in this role. In fact, the trainer skill portfolio of the 1980s never did progress beyond the initial role categories defined by the Pettigrew et al study (Steward, 1996).

Today, the literature abounds with interest in the area of Pettigrew et al.’s (1982) “role transition” category. According to Steward and Hall (1999), the role of training has increasingly become the “mainstay” of many organizational change interventions. Nijhof and deRik (1997), after conducting a survey of trainers in the United Kingdom, asserted in their study on trainer roles that the role of change agent is the most important role. A recent study conducted by Hallier and Butts (1999) suggested that a large number of employers accept the importance of training for organizational success, and that most trainers have successfully transformed themselves into change agent.

The Human Resource Management versus Human Resource Development Debate

The Society of Human Resource Management (SHRM) does not identify training as a “stand alone” function in an organization but rather as one of five functional areas performed by the human resource department. Much of the debate about the role of the trainer and trainer competencies revolves around the definition of the role “trainer” and whether this人员 function should assume a more strategic role (Proctor and Currier, 1999; Ulrich, 1997). A study conducted by Torrington, (1998) suggested that since the late 1980’s the personnel role took on a new urgency as HRD practitioners had opportunities to extend their strategic influences. Yet, a role stigma still persists as to the unanswered question of whether or not a personnel function is, or should be, making “decisions which have a major and long-term effect on the behavior of the firm as opposed to day-to-day operating decisions” (Purcell, 1989, p. 67).

That both practitioners and academics share this ongoing debate over role definition is illustrated in research conducted by Storey (1992). The study classified trainers into four categories: handmaiden, regulator, advisor, and change maker. There are distinct parallels to be made between Storey’s roles and Pettigrew et al.’s training typology. The parallel exists, according to Haillier and Butts, (2000), as to how the roles are defined. The “handmaiden” role, according to Storey’s research, was identified as a non-interventionary role of influence, and the “regulator” role was seen as interventionary and looked upon as a role of influence. Correspondingly, a distinction exists between non-intervention and intervention at the strategic level between the role of advisor and changemaker. These roles and functions, like Pettigew et al.’s training framework, were viewed as relatively independent roles that reflected considerable variation. The importance and influence of these roles are defined by the organization’s management with respect to how they view personnel issues.

Changing Role Today

During the 1990s, HRD practitioners attracted considerable attention to themselves in their roles as “change maker” or “strategic interventionists.” Yet the role of change maker had been called into question. Writers such as Wilkenson and Marchington (1994) and Ulrich (1997) suggested that the limited personnel function actually evolved into multiple roles that represented a blend of operational and strategic organizational priorities. A study conducted by Proctor and Currie (1999) discussed research in health services and how the personnel function could possess a host of possible roles that reflected a combination of innovative and regulative priorities.

If one considers the research conducted by Pettigrew et al. (1982), the role typology presents independent roles and lumps the issue of influence or role into one role function, namely, the “role in transition.” In doing this, it is assumed that attempts by trainers to expand their role or increase their influence will only be salient when the organization is ready to accept training’s change agent role.

Role perception and role reality is a critical issue that limits the usefulness of the Storey’s existing typology. Pettigrew et al. (1982) highlighted the general problem of legitimizing the trainer role and noted that trainers cannot act independently of the managerial climate. Proctor and Currie (1999) presented evidence that while personnel specialists can often find considerable ways to maneuver into roles, trainers have fewer possibilities. One must conclude here that although Pettigew et al.’s role descriptions represented a useful foundation for defining trainer roles, like Storey’s model, they fail to capture the variation in experience of trainers attempting to advance their function’s role from different positions, redefining of responsibilities, and varying organizational and role contexts.

Today, organizations are faced with fierce competition, shortages of resources and change. Managers, once seen as “implementers” and now seen as “change agents,” are expected to assume the role of developing the organization and people. Given this “new” agenda, there has been a change in perception concerning management trainers, their required competences, and the range of relevant knowledge and skill that they should possess (Analoui, 1994). Another significant shift in the role of the trainer is the focus on improving performance, involving both employees and the organization as a whole. Berge, deVerneil, Berge, Davis, and Smith (2002) argue that the HRD professional plays a pivotal role in assisting the organization to link performance with business outcomes.

Research Questions

The purpose of this study was to investigate whether the HRD trainer role had been redefined. We used a descriptive, qualitative approach to explore the following questions with the six master trainers:

1. How do you define your trainer role?
2. How has your role changed since 1999?
3. To what extent do you have influence in organizational decisions?
Methodology

In this study, we relied on a qualitative, exploratory approach. The three primary research questions were used to focus attention on the complexity and contextuality of the role of the trainer, and the shift in role as perceived by six experts identified in *Training & Development Magazine*, October 1999. This group of six master trainers was identified by the magazine editor as individuals who had made significant contributions to the HRD practice.

As already noted, Pettigrew et al’s typology (1982) is mainly a framework of observable role content, therefore this typology of training was used to guide the collection and analysis of the data. The objective of the study was to explore whether a shift in the definition and role of the trainer did occur based on perceptions of experiences as practitioners during the last five years. While the basic aim of the research was to sketch out the trainer role and perceived changes in the trainer role, the study was an exploratory investigation that inductively allowed for ideas to emerge.

Semi-structured interviews were used evolving around the three research questions. The interviews were conducted during August and September, 2003. Each of the six master practitioners was individually interviewed during a one-on-one telephone conversation. These interviews were conducted using a standard protocol framed by a number of core question areas (e.g., definition of their current role, skills and competencies, observed role changes during the past five years, and their perceived influence and status), while also encouraging the masters to discuss issues critical as to how they experienced attempts to advance their role and influence. An informal consent form was developed for each participant to sign, and was sent with a letter of invitation to participate in the study. Before sending the consent form and the letter, each master was contacted by email to determine their interest in participating in the research. Five of the six masters responded, and indicated their willingness to participate. During this initial contact email, the participants were provided a brief overview of the research project and the questions, and were asked for their permission to send the invitational letter and the consent form. Once the consent form was returned, the participant was contacted by email to determine a mutual date and time for the interview. Each of the participants was interviewed individual by telephone; the average conversation was approximately 30-40 minutes. During the interview, each participant was asked the following three questions in sequence: (1) How do you define your trainer role? (2) To what extent has your role changed? (3) To what extent do/did the changes affect you and your practice? Three additional questions were added as a result of the first initial interview; they were: (4) To what extent has your practice changed? (5) How are you doing things differently since the article was first written about you and your practice? (3) What advice would you give others?

All five of the taped interviews were transcribed verbatim to systematically analyze the data. The interview transcripts were emailed to the participants and the participants were asked to review the information to check for internal consistency. Once all the transcripts were returned, the researchers organized and constructed the interview data in a matrix format. This matrix was design as a two-column, six-cell construct. Each interview question appeared on the left and the corresponding interviewee responses matching up. This matrix was then translated into a narrative presenting a convincing explanation of the trainer role shift on based on these qualitative data and antidotes. After organizing the responses to each of the questions for each participant in a table format, the researchers obtained inter-subjective agreement (Lincoln and Guba, 1985) by asking two independent reviewers to code most of the data, thereby reducing bias, and confirming results and validating the themes.

Findings

The aim of this research study was to establish whether six master HRD practitioners experienced a shift in the training role and trainer competencies, organizational influence; if a shift occurred, what initiated the change. The interview data presented the researchers with rich portrayals of the participants’ practice of their craft, including anecdotal remarks that described how they continued to influence change in organizations. The researchers were surprised that the themes that emerged from the interviews mirrored the same trainer roles as defined by Pettigrew’s (1982) typology.

Two distinct issues emerged from these data. First, how closely the participants’ role behavior sets matched the typology. And second, it is interesting to note that each of the study participants are external consultants to various organizations, yet they can influence organizational change. In examining the transcripts of the five interviews, the researchers identified five themes that were corresponded to the five role typology developed by Pettigrew et al, (1982. These are:

1. the passive provider
2. the provider having a range of roles from course administrator to management development
3. the provider managing the training function with several reporting specialist trainers

...
4. the provider in transition acting as change agent
5. the recognized change agent.

Originally, Pettigrew et al. (1982) constructed the above typology based on the functions of an internal trainer or consultant in mind. Based on the findings of this study, the training role can be filled by an internal or external consultant, or can be “outsourced.”

Analysis of the Data

Role Shift

All five of the master HRD practitioners experienced a role shift. Master “A” shifted his role from training presentations to “one-on-one” coaching. Master “B” never had defined her role as a ‘traditional trainer;” she is a change agent, and her role has evolved to into growing her own business, and becoming a strategic business partner with her clients. Master “C” has always been a trainer-coach, working primarily with individuals. He continues in this role, but now focuses on individual change. Master “D” has been trainer for over 30 years, and has always been ahead of his time as a strategic thinker and initiative. As a trainer, he is recognized as a change agent, providing clients with the ability to manage their own future. Master “E”’s role of presenter has evolved slowly over time until 9/11. Today she is concerned with helping individuals and organizations to think in the present.

Change in Craft

The themes that emerged suggested that the majority of the masters continually look for alternative ways of training and working with people to prompt change. Master “A” saw that he changed from a “passive provider” to a “change agent”, working with individuals. Master “B”’s focus is to engage in strategic discussions with executives at the highest ranks of her client organizations. Master “C” focuses on promoting individual and collective “vertical alignment.” Master “D” has evolved personally and professionally, moving from the traditional training role to strategic planner and coach, promoting “solutions” and not “fixes.” Master “A” stated that although her role of presenter is “pretty much the same, after 9/11, I concentrate more in the present, and coach others to do the same.”

Advice for Trainers

Role shifts are a phenomena that occur because of the market shifts. The most significant theme that has emerged is that of understanding how the business works and how organizations remain profitable. Training and education in corporate America is all about achieving business objectives, and recognizing that employees belong on the balance sheet as human capital.

Conclusions and Recommendations

The findings addressed the purpose of the study which was to explore the perceptions and realities held by the five master practitioners, and to provide an understanding around the concept of “trainer role shift” or “role transition.” There were several differences that emerged that the researchers did not expect. One point was the term “trainer.” Each of the interviewees established a different job context. Their job context is very different from the traditional trainer definition, that of an instructor. The second point that emerged during the analysis is the degree to which the interviewees could exert influence within their client organizations. A final point is positional: all were external consultants. Although all were very different with respect to practice, philosophy, skill and competence, they were all identified as “trainers.”

This study adds dimension and greater meaning to the various roles that trainers play. However, it is important to extend and compare these findings to a larger population of internal and external trainers. Further a comparison of the “new guard of trainers” and the “master trainer,” would be helpful to determine if the role has evolved and shifted into a new role definition.

Contributions to the Field

Our analysis of the findings suggested that the HRD trainer role is evolving. The role of the trainer is defined by marketplace demand, and the way in which the practitioner responds to those needs. This particular study poses the question of whether the traditional framework that defines the role of trainer is accurate in today’s marketplace. While we have suggested some directions that might be pursued in the analysis of the role of the trainer, the development of future conceptualizations that help to illuminate the trainer role and trainer influence in organizations is needed.

Cross Cultural Differences in Online Learning Motivation

Doo H. Lim
University of Tennessee

Globalization and technology are two of the many drivers that impact today’s education locally and internationally. The purpose of the research study was to identify how online learners in Korea and the U.S. perceived online learning motivation differently and what learner characteristics and cultural orientation affected the online learners’ learning motivation. Major findings revealed there was a significant difference in learning motivation between the U.S. and Korean online learners. The study also discusses how cultural orientation affects the learning motivation of online learners for each country.

Keywords: Online Learning, Learning Motivation, Cross-cultural Study

For higher education, twenty first century has started with the burgeoning of online education everywhere. As the usage of Internet increases, the application of online technologies to improve educational efficiency and effectiveness has been growing rapidly. For many researchers studying issues in traditional classroom environment, identifying different types of learning motivation and their impacts on students’ learning have been a major field of study. As found from previous research studies, learner motivation tends to increase individual’s energy and activity level during learning (Goslin, 2003; Maehr, 1984), lead individuals to certain learning goals (Dweck & Elliot, 1983; McCombs & Whisler, 1997), and promote and persist certain learning activities throughout a course (Franken, 2002; Stipek, 1988). Several researchers have reported learning motivation as the single most important factor that predicts students’ learning achievement (Goslin, 2003; Vallerand & Senecal, 1993; Wlodkowski, 1985).

Parallel to the high interest in learning motivation in traditional classroom environment, identifying certain learning motivation types that are effective for online learning environment has been an important research issue for online learning researchers. Even though many studies have sought to assess online learners’ motivation for successful online learning experience, little have been found to compare online learner’s learning motivation across countries and different cultures. Identifying cross cultural and individual differences in online learning motivation is believed to a valuable research study topic since instructional designer and trainers in global learning environment need such findings to develop effective online instructions that transfer well between countries. This study seeks to assess how online learners’ motivation in Korea and the U.S. differ and what cultural and learner characteristics affect the online learners’ learning motivation.

Theoretical Framework of Online and Cross Cultural Learning Motivation

Motivation Variables

Numerous researchers have studied the effect of learning motivation on instructor-led classroom and other types of instruction such as computer-based and online instruction. The concept of motivation is defined as the organized pattern of a person’s goals, beliefs, and emotions that the person is striving for (Ford, 1992). Motivation is a force to arouse, give direction to, continue, and choose a particular behavior (Wlodkowski, 1985). In an effort to specify motivation types valid for online learning, a thorough investigation of learning motivation theories and instruments was conducted. From the review, the researcher has identified six motivation types that meet the purpose of this study. They are reinforcement, course relevance, interest, self-efficacy, affect, and learner control. First, reinforcement is one type of the learning motivation that maintains and increases the probability of the response it follows (Vargas, 1977). According to social learning theorists, an individual’s belief about the contingency of reinforcement influences learner behavior and learners will attain a high degree of learning achievement through instructional rewards such as grades and instructional feedbacks (Rotter, 1990; Lepper & Malone, 1987). Vroom (1964) adopts a similar motivation construct through Expectancy Theory, claiming that certain behaviors are followed by desirable outcomes or incentive awards. Pajares and Miller (1994) explain learner’s behavior through the concepts known as stimulus-outcome relations and behavior-outcome relations. Common examples of reinforcement motivators in online instruction are grades, instructor feedback, peer support, and technical support. Other theorists also have noted reinforcement as an important learning motivation (Graham, 1994; Lepper & Malone, 1987; Weiner, 1994). Relevance, the second type of learning motivation in this study, refers to the value...
cross-cultural differences in motivation through the concept of meaning system. According to Grant and Dweck (2001), each culture has its own achievement-relevant beliefs, goals, and values. These researchers found that Asian students were oriented more toward effort attributions and performance goals, characterized by pressing immediate high performance than mastery of learning over time compared to American students. Li (2000) claims the Asian culture views learning as a process of self-perfection by seeking lifelong commitment, diligence, endurance of hardship, persistence, and concentration whereas the Western culture emphasizes thinking processes and learner's psychological characteristics such as learning style and intelligence. Even though the findings from these research studies may not prove all different faces of the learning behavior and orientation between the Asian and Western cultures, they are considered worthwhile to provide initial clues to assess certain cultural factors that influence the learning motivation of online learners in different cultures.

**Purpose and Methodology**

The purpose of the research study was to identify how online learners in Korea and the U. S. perceived online learning motivation differently and what cultural differences and learner characteristics affected the online learners' learning motivation.

The subjects for this study included 236 graduate and undergraduate students (34 undergraduate and 61 graduate students from Korean universities and 78 undergraduate and 63 graduate students from a U.S. university respectively) who took online courses in 2001 and 2002. Survey data for Korean students were collected from four universities in Seoul, Korea whereas the data for the U. S. students were collected from a southeastern university. All students were majoring education related studies such as higher education, human resource development,
instructional technology, teacher education, and instructional systems design. Gender distribution of the respondents was composed of 62 male and 174 female students (17 male and 78 female students from Korean population and 45 male and 96 female students from the U.S. population respectively).

In order to develop a survey instrument for this study, several learning motivation instruments used by educators and researchers were investigated. Those were Educational Participation Scale (Boshier, 1976), Instructional Material Motivation Survey (Keller, 1987), Motivated Skills Card Sort (Knowdell, 1981), Motivated Strategies for Learning Questionnaire (Pintrich, Smith, Garcia, & McKeachie, 1993), and Productivity Environmental Preference Survey (Price, Dunn, & Dunn, 1979). Of these six learning motivation instruments currently in use, two were selected for possible use in this study: the Instructional Material Motivation Survey and the Motivated Strategies for Learning Questionnaire. Each of these instruments was thoroughly reviewed for its applicability and statistical reliability. From the review of the item reliability and the content validity of each item of these instruments, 20 items that were related to the six motivation types and having a minimum item reliability alpha of .79 were selected to address the purpose of this study. In addition to the 20 items, 4 question items were newly developed to assess learner control in online learning environment. As a result, an online questionnaire composed of 24 question items was developed to measure online learner’s motivation in the six sub categories (course relevancy, course interest, affect/emotion, reinforcement, self-efficacy, and learner control). Some examples of the 24 items include questions like asking “It is important for me to choose subjects that relate to my studies and/or my job.” “I prefer course material that arouses my curiosity.” “It is important for me to voice my opinions during class without fear of embarrassment.” “When compared to other students, I am certain that I will do well on the lesson assignments.” “It is important for me to have control over when and where I study.” The instrument used a five point Likert type scale to measure the level of learning motivation (1 for “strongly disagree” to 5 for “strongly agree”) and the data collection was completed via online. Regarding the reliability of the instrument used for data collection, a reliability alpha was .92 for the overall motivation scale.

Basic descriptive statistics was used to analyze the level of online learning motivation perceived by all students. T-test was utilized to measure gender difference in the learning motivation. One-way analysis of variance was carried out to verify the effect of student characteristics on the learning motivation. Multi-way analysis of variance was conducted to assess the effect of cultural differences on the six motivation types.

Findings

Overall, a significant difference in average motivation score was observed between the groups of the two countries (p<.001). Online students in the U.S. showed a significantly higher motivation mean score than those in Korea. The mean scores of the six motivation types are summarized in Table 1. Regarding the importance of each motivation type, course relevancy marked the highest mean score followed by learner control, reinforcement, course interest, self-efficacy, and affect/emotion. When students’ motivation mean scores of the six sub categories were compared, Korean students indicated learner control as the second highest motivation type followed by course interest, affect/emotion, reinforcement, and self-efficacy while American students indicated self-efficacy as the second highest motivation type followed by reinforcement, course interest, learner control, and affect/emotion. To verify the difference in each motivation type between the two countries one-way analysis of variance (ANOVA) was conducted. Among the six motivation types, all motivation types except affect/emotion were found to show significant mean differences between the two countries. For the five motivation types with significant differences, Korean students scored significantly higher only for learner control while American students scored significantly higher for the other four motivation types (course relevancy, course interest, reinforcement, self-efficacy). To detect gender differences t-test was performed. As shown in Table 2, female students were found to have a significantly higher motivation mean score for learner control than male students. No differences were found between different academic status groups (graduate and undergraduate students).

To assess the influence of employment status (full time, part time, not employed) and web learning experience on learning motivation, one-way ANOVA was carried out. In asking the web learning experience, the research asked if the subjects have taken classes through blended mode (web based, computer based, or classroom instruction) or web based instruction only. The mean scores, their standard errors, and the p values from the one-way ANOVA are listed in Table 3 and 4. From this analysis it was identified the mean scores of self-efficacy were significantly different among the student groups with different employment status (fulltime, part time, and not employed). Regarding the influence of web learning experience on motivation, those students with web learning experience had significantly higher mean scores for reinforcement and self-efficacy than those students with mixed learning experience through online instruction, classroom, and CD-ROM.

In order to assess what motivation types are affected by the students’ characteristics and cultural orientation, multi-way ANOVA was performed. From this analysis only two motivation types were found to exist as they were affected by the students’ academic status across countries. First, American undergraduate students’ mean score for affect and emotion was found to be significantly higher than that of Korean undergraduate students. Second, graduate students’ perception about the importance of affect and emotion did not significantly differ between the two countries. Third, for self-efficacy, American undergraduate and graduate students’ mean scores were significantly higher than those of Korean students. Table 5 shows the results of the multi-way ANOVA.

Discussion

National Differences in Learning Motivation

This study has sought to investigate the differences in motivation types between online learners in Korea and the U.S. and what learner characteristics affected the online learners’ learning motivation. One major finding from this study was that American students indicated significant higher motivation scores for the four motivation types (course relevancy, course interest, reinforcement, and self-efficacy) than Korean students. Korean students scored significantly higher only for learner control. This result leads to a meaningful discussion of the influence of different cultural orientation on learner motivation. As Grant and Dweck (2001) assert, Asian students are oriented more toward effort attributions and performance goals while American students are emphasizing mastery of learning over time and enjoying the learning process itself. The four motivation types that American students scored significantly higher than Korean students can be explained in this regard since the content of the survey questions of the four motivation types were asking the importance of learning content, learning process, and learner’s ability to learn. Similarly, the Korean students’ significant higher mean score for learner control can be explained in this respect in that Korean students’ orientation toward more effort attributions and performance goals might have affected the tendency toward more favor of the control of their own learning processes. Regarding gender difference in computer use, this study found that female students scored significantly higher for their control of learning process using computer.
computers and Internet than male students. Compared to the general notion that male students have a more positive attitude and higher literacy when using computers than female students (Bannert & Arbinger, 1996; Brosnan, 1998; Shashaani, 1994), this study revealed a unique finding regarding the gender difference in online learning environment. If female students prefer more control of their learning than male students, different learning options should be allowed for female students to study online learning programs to result in better learner satisfaction and learning outcomes.

It was interesting to know that undergraduate students of the U.S. scored significantly higher for affect/emotion variable than Korean students. This means American students feel more accomplishment when completing online lessons, prefer voicing personal opinions during class, enjoy learning, and enroll in classes to obtain a sense of belonging as indicated from the related question items of the survey instrument. The collectivistic value of Asian cultures is another source to interpret this finding. As Chen et al. (1995) states, Asian students tend to avoid voicing their opinions and keep passive and quiet during class as they are influenced by the authoritarian learning context of Asian culture. Likewise, similar explanation can be used to the finding that American graduate and undergraduate students’ significant higher mean scores on self-efficacy than Korean students. American students’ tendency toward focusing more on mastering and understanding course content and materials might have increased their beliefs in self-efficacy (Salili et al., 2001). From these findings, it is advisable to explain the cross-cultural differences in online learning motivation through the concept of meaning system. As Grant and Dweck (2001) claim, culture has its own achievement-relevant beliefs, goals, and values and this meaning system tends to influence online learners’ learning motivation.

**Implications for Cross Cultural Online Learning**

The remaining question is then how to fully utilize the study findings to improve current practices in online learning and to develop online programs that transfer and travel well across different cultures. Considering the exponential growth and needs of online learning programs and degree programs offered internationally, identifying effective instructional principles and strategies promoting higher learning motivation in cross cultural settings would be one of the key priorities that instructional designers of global learning environment should address. From the study findings, several recommendations could be drawn for this purpose. First of all, one major finding of the study is that all students, regardless the differences in national orientation, gender, academic and work background, and online learning experience, considered course relevancy as the most important motivational factor for their online learning. As several research studies suggested, values residing in learning content and material decide the level of motivation (Atkinson, 1964; Deci, 1977; Herzberg et al., 1959). To enhance the values of learning and elicit meaningful learning for application, one primary recommendation is that online content developers and instructors should make online instruction in such ways providing ample opportunities to apply learners’ own learning experiences during learning processes. One strategy might be customizing assignments and class projects to incorporate learners’ cultural examples and experiences, which will expand the application opportunities into their own cultural contexts. Stressing relevance in learning content to cultural and personal occasions will be another strategy to promote learner motivation and result in better learning outcomes and learner satisfaction. More specifically, some motivational strategies also deem viable to accommodate diverse cultural differences for meaningful learning. Among the studied motivation types, course relevancy, reinforcement, affect/emotion are controllable variables while others are not. To promote learning motivation for online learning occurred across cultures, facilitating these controllable motivation variables is considered an effective instructional strategy. For reinforcement, providing timely and frequent feedback and support is one possible way to engage students in the learning processes while keeping their learning motivation at a higher level. The weakest aspect of online instruction has been said the lack of instructor-student relationship through “eye to eye” communication that creates emotional involvement of online learners in the learning process. To resolve this kind of problem, facilitating direct communication experience among students and with instructors through alternative communication channels such as chat, threaded discussion, and audio/video conferencing would be a good strategy. To increase online learners’ learning motivation through reinforcement some rewarding mechanisms other than grades should be utilized in managing online instruction. For instance, checking students’ learning progresses and sending frequent emails for feedback and encouragement are good ways to increase students’ awareness level in taking online instructions. Sharing good examples of students’ assignments or accomplishments might be another way to support reinforcement motivation.

**Implications for HRD**

For researchers in education, learning motivation has been an ongoing research agenda to verify the diverse faces when applied in different learning situations and contexts. Online learning in cross cultural learning environment is
one new addition that makes the faces of learning motivation more diverse. This study revealed several meaningful findings in cross cultural online learning motivation. Some findings were common to the two different cultures while others were unique to each one’s own cultural context. One implication for HRD from this study is that a good e-learning design addressing diverse motivational issues will work for people in many cultures while different motivation variables may exist as they affect online learners of those cultures with different degree. The importance of transfer factors in instructional design is another implication that has been arising from the study findings. Either in online or traditional classroom, designing instructional programs meeting the transfer needs at organizational as well as cross cultural learning environment must be one of the top priorities any instructional designers should seek for.

The Relationship Between National Culture and the Usability of an E-Learning System

Steve Downey

Tim Wentling
Andrew Wadsworth
University of Illinois at Urbana-Champaign

This study sought to measure the relationship between national culture and the usability of an e-Learning system by using Hofstede’s cultural dimensions and Nielson’s usability attributes. The study revealed that high uncertainty avoidance cultures found the system more frustrating to use. The study also revealed that individuals from cultures with low power distance indicators (e.g., people more accepting of uneven power distribution) rated the system’s usability higher than individuals from high power distance cultures.

Keywords: E-Learning, National Culture, Usability

Social, technological, and economic drivers are transforming education around the world. As globalization encompasses local economies like never before, the development of a skilled workforce becomes a genuinely international concern. Human capital is becoming the chief source of economic value and education and training are becoming lifelong endeavors for millions of workers (Stokes, 2003; Urdan & Weggen, 2000). This is because business success depends more and more on high-quality employee performance, which in turn requires high-quality training. Corporate executives are beginning to understand that enhancing employee skills is key to creating a sustainable competitive advantage. In the quest to remain competitive in today’s labor-tight market, companies are exploiting advances in technology to train employees more rapidly, more effectively, and at less expense than in the past (Berg, 1998; Urdan & Weggen, 2000).

Advances in information technology and falling trade barriers facilitate business around the globe. As borders become less meaningful, global competition intensifies. International expansion and accelerating mergers and acquisition activity have led to larger and more complex corporations. Today’s businesses have more locations in different time zones and employ larger numbers of workers with diverse cultural backgrounds and educational levels than ever. Thus, more information has to be delivered in increasingly larger organizations, challenging internal planning, logistics, and distribution. Corporations worldwide are now seeking more innovative and efficient ways to deliver training to their geographically-dispersed workforce (Hill, 1997; Hites, 1996; Urdan & Weggen, 2000). A growing technology-based training solution that addresses the global training needs of corporations is e-Learning.

Today’s workforce has to process more information in a shorter amount of time. New products and services are emerging with accelerating speed. As production cycles and life spans of products continue to shorten, information and training quickly become obsolete. There is an urgency for trainers to deliver knowledge and skills more rapidly and efficiently whenever and wherever needed. In the age of just-in-time production, just-in-time training becomes a critical element to organizational success (Rosenberg, 2001; Urdan & Weggen, 2000). E-learning solutions facilitate the delivery of the right information and skills to the right people at the right time (Ruttenbur, Spickler, & Lurie, 2000). However, without an effective interface an e-Learning system can not be efficient. A properly designed interface is able to draw the learners’ attention, motivate them toward interaction with the system, and help them achieve their goals without confusion and fatigue (Faiola, 1989, Galitz, 1989; Jacques, Preece, & Carey, 1995). This also contributes to the quality and usability of the system (Tufte, 1992).

The term usability generally refers to the ease of use and operational suitability of the interactive displays and controls that serve as the user interface to a computing system (Murphy, Norman, & Moshinsky, 1999). Usability is the measure of the quality of the user experience with interacting with something whether a website, a traditional software application, or any device the user can operate in some way or another (Nielsen, 1997). According to Nielsen (1997), usability is one of the most important aspects of web design, but often the most neglected. Many web usability problems may arise due to variations in behaviors and cultural differences. Such variations may be found in color, graphics, phrases, icons, character sets, pictures, symbols, date and time format, and so forth (Onibere, Morgan, Busang, & Mpoeleng, 2000). Users from different cultures may understand the same websites in totally different ways. Some metaphors, navigation, interaction, or the web-site appearance might be misunderstood and confuse, or even offend the users (Evers & Day, 1997; Marcus & Gould, 2000; Mahemoff & Johnston, 1998).
According to Reeves (1997) not enough is known about the ramifications of cultural inclusivity of cognitive design of on-line learning systems and that further research is needed. Collis, Parisi, and Ligorio (1996) similarly concluded that there is little existing research on instructional design for cross-cultural on-line learning programs. Wild and Henderson (1997) called for investigative research on cultural appropriateness of web-based instructional delivery. When coupling the growth of e-Learning with globalization, it becomes imperative to gain a better understanding of the relationship between the user’s cultural differences and usability of e-Learning systems. This study therefore, focuses on the relationship between national culture and the usability of an E-Learning System.

For the sake of eliminating possible confusion, it should be pointed out that usability studies are not contingent upon the content within the e-Learning system (e.g., the lessons). They are, in fact, measures of the system’s design and ease of use, not the quality of the instructional materials therein. Bearing that in mind, it is time to focus on the overall purpose of this study.

Purpose of Study

The purpose of this study was to explore the relationship between national culture and the usability of an e-Learning system. The following research questions guided the study:

1. What is the relationship between power distance and the usability (learnability, error rate, and user’s satisfaction) of an e-Learning system?
2. What is the relationship between individualism and collectivism and usability (learnability, error rate, and user’s satisfaction) of an e-Learning system?
3. What is the relationship between femininity/masculinity and the usability (learnability, error rate, and user’s satisfaction) of an e-Learning system?
4. What is the relationship between uncertainty avoidance and the usability (learnability, error rate, and user’s satisfaction) of an e-Learning system?

Methodology

This section describes the methodology aspect of the study. Included in these descriptions are discussions on the study’s variables, population and sample, instrumentation, data collection and data analysis procedures.

Study Variables

The theoretical frameworks that were used to guide this study are Hofstede’s cultural dimensions, and Nielson’s usability attributes. Hofstede (1980, 1997) identified cultural dimensions that the researchers thought may influence user interface and web design. These national dimensions are: power distance, individualism versus collectivism, masculinity versus femininity, and uncertainty avoidance. Hofstede’s cultural dimensions have been used and tested by several researchers to explore influence on user-interface and systems design (Bernard, 2000; Dunbar, 1991; Ever and Day, 1997; Marcus & Gould, 2000). Nielson (1993) defines the usability of a computer system in terms of the following attributes: learnability, errors, and satisfaction. Nielsen’s usability attributes are used by many researchers to guide usability studies (Borges, Morales, & Rodriguez, 1995; Instone, 1997; Kurosu & Kashimura, 1995; Rajani & Rosenberg, 1999). This particular study required the examination of usability and cultural variables in order to determine potential relationships between national culture and the usability of an e-Learning system.

Usability Variables

Learnability (ease of learning), error (types and rate of errors), and satisfaction (user satisfaction) were the three usability attributes that were used to guide the usability aspect of this study (Nielson, 1993). The three relevant attributes for this study are further explained below.

Learnability. This is measured the time users took to reach a specified level of proficiency. In this study it was used to measure the time it took to perform various tasks and also measured their rates of error in performing the tasks. The rates of error were measured by comparing the number of users clicks with the expected number of clicks required to accomplish a particular task (Calculation of expected number of clicks is explained under Data Analysis Procedure section. Thus learnability had two parts: learnability time (LT) and learnability clicks (LC).

Error. This variable measured the number of errors that occur while users were engaged in a task. An error rate was not used in this study as a separate variable. Rather, error was incorporated into the learnability attribute and was measured by comparing users actual clicks to expected clicks required to perform a particular task.

Satisfaction. This final usability variable measured how pleasing the system was to users. It represented the degree to which a user's perceived personal needs and the need to perform specific tasks are adequately met by a
system (Goodhue & Straub, 1991). Data regarding user satisfaction was collected using a post-task questionnaire to determine the participant’s level of satisfaction with the system. Means and standard deviations were calculated for satisfaction. Each participant had one score for satisfaction.

Cultural Variables

The country index scores for the four cultural variables (power distance, individualism/collectivism, masculinity/femininity, and uncertainty avoidance) in this study were based on Hofstede’s (1980, 1984, 1997) work on cross-cultural values. The four dimensions on which country cultures differ were revealed through theoretical reasoning and statistical analysis. The following cultural variables: power distance (PD), individualism/collectivism (INDCOL), masculinity/femininity (MASFEM), and uncertainty avoidance (UA) were used to guide the cultural aspect of this study (Hofstede, 1980). Each cultural variable is described below. Please note, the scores associated with each of these variables represent relative, not absolute, positions of individual members of each country.

**Power distance.** PDI is defined “as the extent to which the less powerful members of institutions and organizations accept and expect that power is distributed unequally” (Hofstede & Bond, 1984, p. 419). The Power Distance Indicator typically has a value between 0 (Low) and 100 (High), but values below 0 and above 100 are technically possible. Thus scores near 0 reflect less acceptance of the unequal distribution of power while scores near 100 reflect greater acceptance of unequal distribution of power within one’s culture. In accordance with Hofstede’s work, a value less than 50 represented Low PDI and a value of 50 or more represented High PDI.

**Individualism and collectivism.** INDCOL focuses on the relationship between the individual and groups. Highly individualistic cultures believe that the individual is the most important unit while highly collectivistic cultures believe that the group is the most important unit (Hofstede, 1997). Scores typically are between 0 (Strong Collectivist) and 100 (Strong Individualist), but values below 0 and above 100 are technically possible. A value less than 50 represented COLL and a value of 50 or more represented IND.

**Masculinity and femininity.** MASFEM represents one of the dimensions of national culture. “Femininity stands for a society in which social roles overlap; both men and women are supposed to be modest, tender, and concerned with the quality of life” (Hofstede, 1997, p. 261). While masculinity culture have very distinct expectation of male and female roles in society. The variables values typically are between 0 (Strongly Feminine) and 100 (Strongly Masculine), but values below 0 and above 100 are technically possible. A value less than 50 indicated FEM and a value of 50 or more indicated MAS cultures.

**Uncertainty avoidance.** UA focuses on the extent to which a culture feels threatened or anxious about ambiguity and how hard individuals will work to avoid it. These variables focus on how cultures adapt to change and cope with uncertainty. The variables values typically are between 0 (Low Uncertainty Avoidance) and 100 (High Uncertainty Avoidance), but values below 0 and above 100 are technically possible. A value less than 50 represented Low UA and a value of 50 or more represented High UA.

Population And Sample

The population for this study was composed of the 30 attendees in an international workshop on training improvement held in Penang, Malaysia. This population was selected for this study because of the attendee’s diverse cultural backgrounds and their underlying interest in all forms training and instructional delivery. The sample of this study consisted of the 24 attendees who volunteered to participate in the study. Those who did not volunteer to participate in the study were unavailable to complete all stages of the study and therefore could not produce usable data sets for analysis. Of the 24 attendees who did participate, they represented 14 different countries from Africa, Asia, Europe, and North America. These countries included: Canada, China, Denmark, Ethiopia, France, India, Indonesia, Italy, Libya, Malaysia, Singapore, Thailand, United States, and Zimbabwe. Table 1 shows the distribution of study participants among the cultural variables by nationality. Nationality was determined by greatest length of time a given participant lived in single national; it is not necessarily the country in which s/he was born.

Of the 24 participants in this study, 10 (42%) were female and 14 (58%) were male. They represented 14 different countries from Africa, Asia, Europe, and North America. All study participants with the exception of three had spent the first 15 years of their lives in the country that they were currently living in. Two (8%) participants were in their late 20s, nine (38%) were in their 30s, 11 (46%) were between 40-49 years of age, and two (8%) were over 50. Of the 24 study participants, 6 (25%) had a Bachelors Degree, 10 (42%) had a Masters Degree, and 8 (33%) had a Doctorate Degree. Their major areas of study varied from Economic, Computer Science, Curriculum and Instruction, Physics, Educational Administration, and so forth. All but two of the participants were academic professional in the educational arena. The two who were not were a full time student studying education and an office administrator for a large university in Southeast Asia. Fifteen (63%) of the participants had 18 or more years
of experience in education; six (25%) had between 16 and 17 years, and three (13%) had between 10 and 15 years of experience. All of the 24 study participants had basic computer skills (e.g., regular use email and a web browser).

**Instrumentation**

Three instruments were used in this study with each instrument collecting information regarding unique aspects of the study. Separate descriptions are provided for each of the instruments which include: User Background Form, User Tasks & Observation Guide, and the Post-Tasks Questionnaire.

The **User Background Form** captured demographic information regarding each user’s nationality, educational level, major area of study, and computer experience. This questionnaire was piloted and used in previous research, including a study on e-Learning and national culture.

The **User Tasks & Observation Guide** consisted of ten tasks commonly performed by users of the e-Learning system utilized in the study. They included such tasks as logging into the system, locating specific instructional modules within the system, locating the course syllabus, and electronically submitting a class assignment. The 10 tasks purposefully were ordered so that processes learned during one task would not directly impact the performance of later tasks. Clarity of language used in the task statements was established through a multistage review process utilizing international students representing of many of the 14 national cultures encountered in this study.

The **Post-Tasks Questionnaire** consisted of a 21 item, Likert-scale based, survey that was completed by the study participants immediately upon completion of the 10 aforementioned tasks. The questionnaire targeted the study participants’ opinions regarding issues such as satisfaction with navigation schemes, color selections, information presentation, page layout and overall usability. Essentially, this instrument measured the usability attribute of satisfaction. The instrument, itself, was generated through a multiple expert review process to ensure validity, clarity of language, and usability of data captured.

**Data Collection Procedures**

Each study participant spent approximately one hour completing the data collection process for this study. To begin the process, participants sat at a workstation equipped with the necessary software and hardware to complete each of the 10 tasks required of the users. At the workstation along with the participant was an observer who instructed the participants on their task and monitored their performances using the User Tasks & Observation Guide described above. The observer handed each participant a printout stating task to be completed. Together, the participant and observer read the printout to ensure proper understanding of the task statement. Once the participant understood what was being asked of him/her, the observer would say “begin” and start monitoring the participants’ performance. Upon completion of the task, the observer recorded the results for that task in the observation guide.
Upon completion of the 10 tasks, the study participants moved to another table at which time they completed the Post-tasks Questionnaire and the User Background Information Form.

Data Analysis

Data gathered via the above instrumentation were analyzed using several techniques. Demographic information collected using the User Background Information Form was reviewed and categorized using simple frequency counts and statistical means. The remaining data from the User Tasks & Observation Guide and Post-tasks Questionnaire were utilized in a series of correlational calculations necessary to measure the relationships between participants’ usability performances and their cultural dimensions.

Findings

The following section describes the key findings emerging from this study. This section presents the findings or results of the study by organizing them around the four research questions of the study.

There were four cultural variables and two usability variables (Error Rate is a Learnability measure) utilized in this study. The relationships between the cultural variables and the usability variables were measured through the use of correlational calculations involving each of the cultural factors and multiple measures for both system learnability and user satisfaction. In addition, supplementary calculations were conducted in order to investigate underlying factors that may influence each of the above variables.

Question 1: What is the Relationship Between Power Distance and the Usability of an E-Learning System?

Question one was answered by computing the correlation between participants country scores for PDI and the learnability and satisfaction usability scores. The learnability variable was comprised of two measures: total time taken to complete the tasks and number of clicks made (an indication of error). Table 2 presents descriptive statistics for the six variables. Table 3 presents correlational results that are associated with research question one.

</tbody>
</table>

* = statistical significance at p<.05

Table 3 reveals that a positive correlation exists between power distance and all three usability variables. However, only one of the relationships are statistically significant. Of the two learnability sub-variables, time on task had a correlation of r=.248 and clicks made had a correlation of r=.42 with PDI. The second one, clicks, was significant at the .05 level. This means that the higher the power distance score for an individual’s culture (e.g., greatest acceptance of unequal distribution of power), the higher their time and clicks in the e-Learning tasks. The correlation between satisfaction and power distance (r=.19) was also positive but not statistically significant. Table
also reveals that individuals from cultures with low power distance indicators (e.g., people who are more accepting of uneven power distribution) rated the overall usability higher than individuals from high PDI cultures.

**Question 2: What is the Relationship Between Individualism and Collectivism and Usability of an E-Learning System?**

Question two was answered by computing the correlation between the Individualism/Collectivism variable and the two usability variables; learnability and satisfaction. Table 4 reveals that the only statistically significant relationship was with the individualism/collectivism scores and Satisfaction. Individuals from collectivist societies found the system more satisfying to use versus those from individualistic societies, r = -0.420.

</tr>
</tbody>
</table>

*= statistical significance at p<.05

**Question 3: What is the Relationship Between Femininity/Masculinity and the Usability of an E-Learning System?**

With regard to the femininity/masculinity factor, there was no significant relationship with any of the three usability variables. For all three variables the relationship was negative but very small.

<table>

</tr>
<tr>
<td>Masculinity and Satisfaction</td>
</tr>
</tbody>
</table>

**Question 4: What is the Relationship Between Uncertainty Avoidance and the Usability of an E-Learning System?**

The cultural factor of Uncertainty Avoidance did not produce statistically significant relationship with any of the three usability variables. However, there was a strong correlation between UA and Learnability Clicks (p=.08). Given that UAI measures how willing individuals are to accept risk or change, it is not surprising to find that participants who were from cultures that were least likely to accept risk were also the ones who made the most errors in navigating the e-Learning system.

**Discussion and Implications**

Three strong correlations where found among the findings; two of these correlations were statistically significant and the third approached the .05 threshold but fell slightly short. In the first, individuals from cultures with high Power Distance Indicator scores tended to make more errant mouse clicks while using the system. Cultures with
high Power Distance Indicators, as represented the study’s participants, include those from China, India, Indonesia, Malaysia, and Singapore, among others. These are cultures in which individuals tend to be more accepting of uneven power distributions. These same five countries appear again on the list of cultures with low IND/COL scores. That is to say, individuals from these cultures tend to have more collectivist tendencies versus individualistic. Participants from these collectivist cultures showed strong, statistically significant, levels of satisfaction with the system they used. Last, the same five countries showed strong correlations between their low uncertainty avoidance score (e.g., they were less averse to change and taking risks) and their higher errant click rates.

When viewed in a purely statistical light and given the relatively small sample size, these three findings appear to provide little enlightenment with regard to conducting cross-cultural training and e-Learning activities. However, when one considers the nature of the cultures represented by the participants in this study, one gains a greater understanding of how the findings can truly impact an organization’s international operations. In each case, participants represented countries and cultures where there are historic precedents and general tendencies for strong centralized authority figures, whether in the form of teachers, office leaders, or governmental regimes. These cultures also were witness to relatively recently (e.g., the last 50 years) and radical changes in their lifestyles due to the influence of these strong authority figures. For example, compared to their immediate neighbors, Singapore, Malaysia, and Indonesia represent the most technology forward countries in Southeast Asia. In fact, Singapore is one of the most technologically connected nations in the world (ITU, 2003). This is due in large part to their government’s determined efforts to put Singapore at the forefront of the technology movement. Last, these cultures tend to be very group/social oriented, often doing what is best for the group regardless of how it might impact them as individuals.

Bearing this mind, organizations conducting training or e-Learning operations in cultures where power-centric, collectivist, and change accepting societies exist must give consideration to a few logistics. First, trainers need to consider the level of leadership expected by the learners. Learners from cultures where strong authority figures are common (e.g., those from high power indicator cultures) will expect greater leadership and guidance from their instructors. As a result, training might take on a more traditional teacher-centered approach, whereas individuals from other cultures may desire a more student-centered approach. Another factor to consider is the level of group interaction and support offered to students. Training conducted in strong collectivist cultures might employ strategies where group work, collaboration, and socially oriented approaches are more prevalent. Conversely, training and e-Learning activities in more individualistic societies might give the learners greater freedom in terms of creativity and expression of knowledge gained (e.g., alternative assessments) or possibly employ more competitive learning environments (i.e., normative testing and grading practices).

In today’s increasingly global market, many e-Learning systems designers are faced with the task of insuring that their systems are equally as usable in foreign countries as in the United States. Given the impact that culture has on people’s behavior, truly functional global e-Learning systems should reflect the cultural orientation of its users and not just be a translation of an American interface.

Expatriate Practices in Taiwan’s Multinational Companies

Chi-jung Fu
Hui-chin Chu
Shu-Te University

The study was to investigate expatriate practices in Taiwan’s multinational firms. By quantitative survey via E-mail, 83 HR managers participated to the present study. Issues such as HR manager’s perceptions and personal characteristics, expatriate job functions, expatriate selection criteria, and expatriate training were discussed. The results indicated that selection criteria, and expatriate training were affected by the expatriate job functions. The perceptions and characteristics of the HR managers played a significant role in expatriate practices.

Keywords: Expatriate Selection Criteria, Expatriate Training, Perceptions and Characteristics of HR Managers

Two decades ago, Brislin (1981) has already seen a future trend that many workers will have to leave their homes and work in another country, and the opportunities of being exposed in a multi-cultural working environment would be increased dramatically. Now the prediction has become a fact. Globalization, increased foreign investment, and organizational reengineering drastically changed the business structures and the workforce nowadays (Zakaria, 2000). Organizations need to adopt new standards and a new approach on selecting, training, and motivating their employees. For promoting organizational effectiveness, multinational businesses make great efforts on training and developing their employees the ability of multi-cultural adaptability (Pucik, 1998).

Taiwan has already become one of the biggest foreign investment countries (Han, Koa, & Wu, 2002). Young (1996) stated that Taiwan has started foreign investment since 1988. In recent years, Taiwanese businesses started doing investment in Mainland China because of its low labor cost and the same culture and language (Tzoa, 1998). Though the total amount of foreign investment has dropped; according to the figures released by Taiwan’s Industrial Development & Investment Center (2002), the investment to Mainland China is still increasing. This shows that Taiwan’s multinational businesses still have long-term needs of expatriates to work in Mainland China.

The cost of expatriates is three times more than the personnel cost in parent company, but the outcomes were mostly not cost effective (Wederspahn, 1992). Many expatriates failed to carry out their missions overseas because they encountered problems that they were not able to overcome. Mendenhall & Oddou (1985) found that the failure rate of expatriate program was 40%. Some even reported that the failure rate was more than 50% (Arvey, Bhagat, & Salas, 1991). In order to help those expatriates to successfully accomplish their missions, training is a must thing to do (Selmer, 2000). Ashamalla and Crocetto (1997) also believed that the expatriate training prior to sending expatriates overseas could reduce the failure rate. They then stated that appropriate selection strategy and training is crucial for expatriate management. However, Selmer (2000) found that not many business leaders considered taking it seriously. Moreover, not all the researchers supported that expatriate selection and training were effective. Gaugler and Thornton (1989), Goffin, Rothstein, and Johnston (1996), and Kealey and Protheroe (1996) also stated that they were skeptical about the effectiveness of expatriate selection and training.

Lacking of sufficient understanding of the culture, expatriates were not able to effectively manage the subsidiaries and even caused conflicts between management and workers. That is why there were many failed cases of expatriate management (Han, et al., 2002). Most of the research studies focused on expatriate individuals such as the problems they have encountered, and their characteristics and so forth. For providing knowledge on practical aspect of expatriate management, therefore, this present study focused on the relationships among HR manager demographics, expatriate assignments, expatriate selection, and expatriate training.

Copyright © 2004 Chi-jung Fu & Hui-chin Chu
Research Framework and Hypotheses

Among expatriate cases, there were more than 30% expatriates did not accomplish their missions. The reasons were directed into two areas: poor expatriate selection, and insufficient expatriate training (Hogan & Goodson, 1990; Mendenhall & Oddou, 1985). Besides that, Fu (1998) found that HR manager’ perceptions and their personal characteristics did play a crucial role in expatriate management. Therefore, the purpose of this present study is to examine the relationships among the expatriate assignments and the demographics of human resource managers on expatriate selection and training.

Expatriate selection. Ku (1993) believed that personality is one of the most important criteria of selecting expatriates. He found out that the more positive the personalities the expatriates have, the better they adjust to cross-cultural settings. Therefore, for promoting the success rate of expatriate management, the very first important task is expatriate selection. Hogan, Hogan, & Roberts (1996) agreed that expatriate performance is significantly related to expatriate selection strategy, and professional competencies are the main criteria of expatriate selection (Kats & Seifer, 1996).

Will & Barham (1994) believed that expatriates should have the ability to deal with complicated situations and emotional problems, so having an appropriate level of maturity is crucial for working abroad. Family’s attitudes and willingness to go with the expatriates, leadership ability, professional knowledge and skills, interpersonal skills, communication skills, cultural sensibility, ability of maintaining organizational culture, and data collection ability are crucial criteria for selecting expatriates. Chen (1998) stated the language ability, knowledge, learning ability, personality, and interpersonal skills are essential to an expatriate.

Previous experience of working overseas helps the adjustability to another country (Black, 1992). Black (1992) pointed out that only 11% of the expatriates have the experience worked overseas, which means that most of the expatriates’ cultural adjustability (89%) is not verified. However, past experience might have some effect on adjustability, but in other areas, the difference is not obvious. Besides that, the duration of expatriate assignment also factor for expatriate’s adjustability (Tung, 1987; Brewster, 1991). Heller (1980) believed that personal maturity affects cross-cultural adjustability. Therefore, many organizations take age as one of the expatriate selection criteria.

Although effective expatriate selection can promote the success rate of expatriate assignments (Lievens, De Fruyt, & Van Dam, 2001), the appropriateness of expatriate selection has frequently questioned by researchers (Gaugler & Thornton, 1989). Goffin, et al. (1996) pointed out that the selection is not significantly related to actual performance. The argument indicated that there is no consensus conclusion about expatriate selection, and the HR managers’ perceptions toward expatriate selection are not clear. Therefore, it leads to the following two hypotheses:

H1: The demographics of HR managers have no significant effect on expatriate selection criteria.
H2: There is no relationship between expatriate selection and the characteristics of expatriate assignments.

Expatriate training. Lee (1995) believed that training is the most effective way to improve organizational performance, but it is frequently overlooked by the management because of its delay-outcomes. The benefits of expatriate training can be reflected to both organizations and the employees (Hodgetts & Luthans, 1991). To organizations, training can enhance the communication between and control from a parent company to host company; to expatriates, training can improve their competencies, cultural adjustability, and promote commitment.

Baliga & Baker (1985) found that only 25% of the multinational companies provide training for expatriates. Tung (1987) pointed out that 30% of the multinational companies provide expatriate training. Expatriate training is more popular in Europe (69%) and Japan (57%) (Torbior, 1982). Even though many researches proved that training can promote the success rate of expatriate management, Dowling, et al. (1999) found that, from the failure cases, there were still many companies not willing to provide the training. Their reasons are:

1. The management did not believe the effectiveness of training;
2. The time frame between selection and actually working in a host country is too short to offer training;
3. Organizations failed to provide training for urgent assignment; and
4. Many organizations perceived that professional competencies are the only important requirements of expatriates, and the rest will take care of itself as time goes (Hogan & Goodson, 1990; Mendenhall & Oddou, 1985).

Zakaria (2000) classified training programs into six main topics: professional skill training, data collection skills, certain fields learning, culture, cross-cultural training, and interpersonal skill training. Ashamalla & Crocitto (1997) believed that the orientation to expatriates should be training in cross-cultural adjustability, professional competency, language, and management skills.

Landis & Brislin (1983) found that the training of cross-cultural adaptability becomes much more important nowadays because many companies have the multi-cultural workforce. Chen & STARosta (1996) stated that in the global society, the opportunities of dealing with other people with different cultural backgrounds increase, one should develop his/her multi-cultural communication skills. Under this notion, cross-cultural training should not be neglected by any organizations. In fact, even in two countries with similar cultures, expatriates would possibly still have adjustment problems due to the space and geographical differences (Brewster, 1991).

In early years, studies showed that 30% of the failed cases were because expatriates failed to adjust the culture shocks (Henry, 1965). In recent years, similar studies also showed the same results. Without receiving cross-cultural training, many expatriate managers failed on their missions (Black, 1992; Selmer, 1995). Black & Mendenhall (1990) stated that only 30% of the multinational companies provided cross-cultural training to short-term expatriates. Hogan & Goodson (1990) pointed out, in their study to the Japanese multinational companies, that 86% of them provided such training programs to their expatriates, so the failure rate was reduced to only 10%.

In a survey to 200 companies, the researcher found out that the need of cross-cultural training is much more than the need of language training (Lubin, 1992), though language training should be also included in expatriate training package (Zakaria, 2000).

The importance of expatriate’s family attitudes has been studied in early years (Robinson, 1978). Recent researchers (Tung, 1987) found that family attitudes were still an important factor for expatriate success. Huang (1995) states that many Taiwan’s multinational companies adopted a strategy of “learning by doing,” and Tzoa (1995) found in such a way, it is not helpful for expatriates to develop cross-cultural adjustability at all. However, though many researchers agreed that training is the best way of improving cross-cultural adjustability, not all of the researchers agreed that training is the only means for improving such ability (Kealey & Protheroe, 1996). In Taiwan, there are few studies focusing on expatriates, but the relationship between HR manager’s perceptions toward job assignments and expatriate training are not clear. Therefore, it leads to the next two hypotheses as follow:

H3: There is no relationship between HR manager’s perceptions and the importance of expatriate training programs.
H4: There is no difference among HR manager’s perceptions toward the importance of expatriate training programs.

Methodology

Research instrument. The research instrument of the present study “Expatriate Selection Criteria and Training Survey for Taiwan’s Multinational Companies” was developed based on the related literature and consulted with professionals in the field. For promoting the consistency of the survey, the close-ended questions were adopted. There were totally five different sections consisting 45 questions, which included demographic data of the HR managers, expatriate job functions, expatriate selection criteria, and expatriate training programs. Pilot test was conducted to enhance the reliability and validity of the survey instrument. The survey questionnaire was modified accordingly. The reliability test indicated that the minimum Cronbach’s Alpha for the scaled items was 0.85.

Factor analyses were conducted to the scaled items to determine factors in both Selection-criteria and Training-program sections (see Table 1). Four factors were created which are: Work-intention (loyalty and competence), Learning-adjustability (the ability of learning and social adjustment), Gender-maturity (sex and age) and Other (willingness and health condition). Two factors, Employee-training (training about performing the job)
and Family-training (training about expatriate’s family or companions) were formed. Reliability tests were also conducted. A minimum Coefficient Alpha of .75 indicated that scaled items in all factors were considered reliable.

*Population, sample, and data analysis.* Lui (2002) suggests that it is more likely for larger companies to have foreign investment than smaller companies. From the regulations of “Criteria of Listed Companies” released by the Securities and Futures Commission, Ministry of Finance, ROC (2003), all the listed companies are classified as big corporations. The population of the present study was 640 listed companies released by Taiwan Stock Exchange Corporation (2002).

To ensure the responding sample was large enough (78 participants as required) (Creative Research Systems, 2002), the survey questionnaires were mailed via e-mail system to all the population. In which, 98 were returned because of incorrect e-mail address; 286 had never been returned; 173 respondents declared unwilling to participate due to their organizational policies. Therefore, the valid sample was 83 HR managers from 83 companies. In which, 66.3% (54) of them were male. The majority age group (54 participants) ranged from 30 to 40 of age. About three quarters of them (75.5%) received at least a college degree. Most of the managers were married (72.3%), while only 23 managers were single. The majority (42.2%) of the participants had management experience around 2 to 5 years.

**Finding and Results**

*Expatriate selection criteria, and training programs.* There were fifteen variables in expatriate selection criteria. In which, the variables Age and Gender were not considered as important by the participants. The other 13 variables (mean scores greater than 3.0 at p < 0.03 level) were treated as important selection factors. Among 10 variables of training programs, four items (communication training, conflict management training, fundamental management training, and technical training) were treated as important training subjects for the expatriates (minimum mean score of 3.30 at p < 0.02 level).

*Test of hypotheses 1 and 3.* The t-test results in Table 2 indicated that gender and marital status of the HR managers caused differences on expatriate selection criteria. Generally, female HR manager emphasized more on issues related to position levels, locations, length of the duration of the expatriate assignments, and work intentions of selected expatriates than their counterparts with a minimum t of 2.29 (p < 0.02). Married HR managers treated work intentions of the selected expatriates as the more important factor than unmarried HR managers (t = 2.78, p < 0.01). The results of ANOVA on Table 3 indicated that age of the HR managers caused significant perceptual differences toward the importance of expatriate position levels (F = 3.10, p < 0.03); managerial experience of the HR managers caused significant differences on all the factors in expatriate selection criteria (minimum F = 2.87, p < 0.03). According to the test results, the hypothesis 1 was rejected. The characteristics of HR managers have significant effect on expatriate selection criteria.

Table 2 also indicated that there were significant differences between male and female HR managers on their perceptions toward the importance of the expatriate training programs. Female HR manager considered positions, length of the duration of expatriate assignments, locations, and functions of the expatriate assignments more important than their counterparts (a maximum t of 2.31, p < 0.02). Married HR managers treated expatriate training as a more important factor than unmarried HR managers (t = 2.39, p < 0.02). The results of ANOVA on Table 3 also indicated that the HR manager’s age and education background caused different perceptions toward the importance
of expatriate training (a minimum $F = 2.90, p < 0.04$); the managerial experience of the HR managers caused significant different perceptions toward all the factors in expatriate training (minimum $F = 2.47, p < 0.05$). Therefore, the hypothesis 3 was rejected. There are differences among HR manager’s perceptions toward the importance of expatriate training programs.

Data was presented only when \(p\)-values were less than or equal to 0.05.

Test of hypothesis 4. Expatriate job functions were classified into three functions: technical-related, negotiation-related, and managerial related. According to Pearson Correlation test results in Table 5, HR managers emphasized more on training for expatriate programs if the expatriate assignments need more negotiation or managerial knowledge and skills (with minimum \(r = 0.38, \ p < 0.01\); however, technical-related assignments were negatively related to training for related people programs (\(r = -0.33, \ p < 0.01\)). Therefore, the research hypothesis was rejected. There is significant relationship between HR manager’s perceptions toward the importance of expatriate training programs and expatriate assignments.

Conclusions and Discussions

The purpose of the study was to investigate the expatriate HR management in Taiwan’s multinational companies on employee selection and training, and the factors affecting these practices. The study results indicated that expatriate selection was affected by the HR manager’s characteristics and the functions of the expatriate assignments.

Female HR managers believed that employee’s work intentions were very important factor affecting their performance, so did married HR managers. HR managers cared more about employee’s adjustability and learning ability. Expatriate assignment contents were significantly affecting employee selection. If the job was highly related to technical skills, candidates’ work intention, gender, and age were important factors, while if the job was negotiation-related, adjustability and learning ability were crucial for selecting expatriates. Candidate’s work intentions were the most important factor if the job was managerial-related.

This study found, among all the participating organizations, none of them provided family adjustment program to the selected employees, though it was one of the criteria of selecting expatriates. They treated family adjustment as one of the important criteria to select expatriates, but they did not want to provide such training. In another words, selected employees who were going to work abroad were supposed to take care of this issue themselves. It was possibly one of the attributes of increased expatriate failure rate.

This study also found that technical-related assignments had no impact on training program selection. Employees who were selected to work abroad should be competent in this area. Negotiation-related and managerial-related assignments required more training, so they were factors affecting training program selection.
Limitations of the Study

There are two limitations about the present study. Because of the sensitive political issues between Taiwan and Mainland China, respondents might have had concerns to give true answers. The survey questionnaires were sent via e-mail to the HR managers or asked to forward the mail to the HR managers; however, it might be possible that some of the participants were not HR managers.

Contributions to new knowledge in HR field

This study found that the importance of family adjustment was neglected by most of the multinational companies in Taiwan since none of the participating organizations provide family adjustment programs. Family support is one of the key factors for expatriate success; insufficient family support and adjustment caused problems for expatriates that led to their failure of accomplishing their missions abroad (Tung, 1987). The researchers suggested that organizations should take this matter more seriously if they are to promote the expatriate success rate.

From the results, it was found that HR managers did not have sufficient awareness of the importance of cross-cultural adjustability. The training programs mostly focused on professional and managerial competencies, it was possibly because most of the expatriates were sent to work in Mainland China, where the people and the language are the same with Taiwan. It was assumed that employees should not have problems to adjust. The assumption might not be correct since the two countries were under different political and living environments for a long time. Therefore, it is suggested that multinational companies in Taiwan should provide more training program on cross-cultural adjustment.

References

This paper presents the finding of training evaluation strategies in Taiwanese benchmark companies. The purposes of this study were: (1) to explore and understand Taiwanese benchmark companies’ training evaluation methods, (2) to compare and contrast among Kirkpatrick’s Evaluation Model, Swanson’s Performance Learning Satisfaction (PLS) Evaluation Model, and Taiwanese companies situation, then construct an evaluation model to represent benchmark companies in Taiwan.

Key words: Training Evaluation, Benchmark, Taiwan

Today, the importance of evaluating training ranks high among training consultant and top management as a means of justifying training investment (Hashim, 2001). In addition, training evaluation is the most appropriate method of demonstrating the HRD value to their organizations (Preskill, 1997). While HRD professionals have frequently been advised to determine the return on training investments, little is know actual training evaluation practices in Taiwanese organizations. More studies of training evaluation are needed.

According to Garvin (1995), the way to measure the effect of learning can be traced from the following three stages: (a) cognitive: focus on attitudes and depth of understanding, (b) behavior: supplement by direct observation, survey and questionnaires can be used to assess behavioral changes, and (c) performance improvement: by measuring performance to provide the rationale for investing in learning and organization’s ends. From a performance improvement perspective, Swanson (1994) proposed a training evaluation model, in which raise the attention of HR professionals. Swanson’s model was one of pioneer to mention about the importance of performance-based evaluation in training program. On the other hand, Kirkpatrick’s work (Kirkpatrick, 1998) has always received a great deal of attention and well known within the field of training evaluation. Therefore, these two perspectives were chosen to explicit the Taiwanese benchmark companies in training evaluation.

However, in Taiwan, few study using the Kirkpatrick’s model to evaluate the training program (Chang & Tin, 1994; Hwang & Wen, 1995; Lin & Chu, 1997). Most of time, in Taiwan, the evaluation of a training program is based on the trainers’ subjectively evaluation or participants’ satisfaction survey of the program. In other words, due to the difficulty of the training evaluation, in many organizations, evaluation of training either is ignored or is approached in an unconvincing or unprofessional manner.

According to Common Wealth (1999), several benchmark companies as “best practices” leaders not only perform well financially but also win the great fame in society by providing remarkable employee training programs. Some of them attribute their good performance to good training programs and evaluation system. Since benchmarking was described as the practice of learning of leading business (“Harvard Management Update,” 1999), this study intend to provide the experiences of Taiwanese benchmark companies in evaluating training programs. In sum, the objective of this study is through case studies to understand what the benchmark companies really do for evaluating training programs. Further, by comparing and contrasting with Kirkpatrick’s and Swanson’s model, this study proposed a model, which better describe these successful organizations’ training evaluation systems. This paper concludes with a discussion of the implication of the findings for evaluation methodologies. In sum, the purpose of this study included:

1. Explore and understand the Taiwanese benchmark companies’ training evaluation methods.
2. Compare and contrast among Kirkpatrick’s, Swanson’s models and Taiwanese organizations situation, in order to construct a useful model from cross-cultural perspective.
3. Attempt to develop the domain of a evaluation model.

Research Questions

This study addresses the following questions:
1. What are major perspectives of evaluating training programs on which HRD Practitioners of benchmarking companies are based on?
2. What evaluation methods are they used?

Theoretical Framework

Training Evaluation

Evaluation “is the process of appraising something carefully to determine its value” (Ruthwell & Sredl, 1992, p. 411). Training evaluation is often defined as the systematic process of collecting data to determine if training effective (Goldstein & Ford, 2002; Noe, 2000). In addition, the evaluation of training must be studied as a part of an organization subsystem and understood within an organization context.

Most instructional design models for training program evaluation distinguish summative and formative evaluation (Dick & Carey, 1996; White & Branch, 2001). Summative evaluation describes efforts that assess the effectiveness of completed interventions in order to provide suggestions about their use. Formative evaluation is to improve the quality of the program being developed so it will be as likely as possible to achieve the objectives for which it was designed (Beyers, 1995). Despite the summative or formative evaluation form, there are many models have been suggested to help managers and trainers measure and evaluate the efficiency and effectiveness of training programs (Baldwin & Ford, 1989; Holton, 1996; Kaufman, & Keller, 1994; Swanson, & Holton, 1999), however, these models still seldom used wisely due to lack of the practical support by using limited numbers of design and methods (Preskill, 1997).

Performance Improvement Perspective

In HR field, training evaluation must demonstrate improved performance and financial results. It has been a difficult task for HRD to defined what performance is in the workplace. Performance may be measured in terms of individual, process, and organizational perspectives (Rummler and Brache, 1992), or in relation to quantity, time, and quality (Swanson, 1999). However, more and more study pointed out the importance of performance-based evaluation in training program (Swanson, 1994; Greirer, 1996; Weiss, 1998; Wholey, 1999).

From organization performance perspective, Phillips’ (1996) training evaluation model suggested the Return on Investment (ROI) as the fifth level of evaluation to reflect the performance. Kaufman and Keller (1997) also suggested the fifth and sixth level of evaluation, which included the effectiveness of expected outcome after implement training program.

Kirkpatrick’s and Swanson’s Training Evaluation Models

Kirkpatrick’s four level model not only was examed from the theoretical perspective (Miller, 1990) but also examined by positive researchers (Alliger and Janak, 1989). Kirkpatrick’s (1994) four levels include: (a) Level I – Reaction: measures how learners feel about learning/training, (b) Level II – Learning: evaluates what was learned and retained from the learning experience, (c) Level III – Behavior /Application: evaluates the degree to which learners apply what was learned on the job, and (d) Level IV – Results: evaluates the impact that transfer of learning has on the business. Swanson (1994) suggested an evaluation system called Performance-Learning-Satisfaction (PLS) model. The domain of the evaluation can be divided into: (a) performance, including evaluate the business result and financial result, (b) learning, including evaluate knowledge and expertise of participants, and (c) satisfaction, including evaluate participants’ and sponsors’ perception of satisfaction. Although The Results Assessment System (Swanson & Holton, 1999) is revised from PLS model to Performance-Learning-Perception (PLP) models, the PLS model still represented the performance-based evaluation. It seems Kirkpatrick’s and Swanson’s training evaluation models (original PLS model) do have the similarity (Table 1):

Research Method

This is an exploring study, the methods included: in-depth interview, documentation, and observation of seven training center in Taiwanese benchmark organizations. A qualitative case study is an appropriate methodology to study what benchmark organization conduct a training evaluation is and how they apply the evaluation system (Balog, 1995; Stake, 1994; Yin, 1989).

Participants

On three consecutive years, the well-known Taiwanese Commonwealth Magazine (1998, 1999, 2000) list the benchmark companies among 500 companies by using expert nominate methods. After reviewing the ranking of the training benchmark companies on the three consecutive years, twelve companies are qualifying for this benchmark study. After the first contact, seven of them were agree to participant this study. The study last for a year in which included interview and on-site observation. The interviews were conducted during the summer of year 2001. Each company, at least two HR practitioners were involved for the study. Each personal interview lasted for appropriately two hours in length. Open-ended semi-structure questions and probes were used to elicit each participant’s view of training evaluation model in their companies. The interview guide includes the questions like: (a) who conducts training evaluation? (b) What role does top manager play in training evaluation in the respondent’ organizations? (c) For what job categories is training evaluation most often conduct? (d) What training evaluation methods are most frequently used? (e) What training evaluation methods are perceived to be most effective?

Data Collection and Analysis

After the in-depth interview of HR people or training practitioners in the seven benchmark companies, the interviews were verbatim transcribed and coded. Along with companies’ documents, the text was analyzed by the following categories: (a) training content, (b) training evaluation methods and forms, and (c) training evaluation and performance. Through continued to read broadly to gain insights into the data, some patterns were found. And we repeatedly compared the training evaluation patterns of the firms and then further compare to the Swanson’s and Kirkpatrick’s models. This study based on various sources of data, use at least two perspectives to interpret data, and justified by members of a research team, therefore the results were triangulated (Patton, 1990).

Findings

Summary of the seven firms studies had illustrated in Table 2 as follow. The seven benchmark companies in Taiwan all make efforts on their training program. In addition, they all point out the importance of performance improvement perspective on training evaluation. But some of HR professionals argue that measuring ROI for training is not possible; others quietly and deliberately develop ROI measures.

<tr>
<td>ASUS</td>
<td>Founded in 1989, ASUS has grown into a multi-national corporation and successfully become a major player in the international IT scene. With over 19,360 employees worldwide, ASUS has come a long way from being simply a tiny motherboard designer to being recognized as one of the top providers of total technology solutions. In Taiwan, the average age of employees is 29.5 years old. Over 59% of all employees are college-educated. First of all, base on the employees’ competency assessment to conduct a training program. After implementation of the training, the satisfaction survey (seven constructs) was delivering to the employees. Secondly, an action plan was develop to check the employees’ behavior change after the training.</td>
<td></td>
</tr>
<tr>
<td>CMC</td>
<td>CMC founded in 1973. Current capital funds have accumulated to NT$9.7 billion with around 3,000 employees. With the philosophy of &quot;Harmony, Innovation, Top&quot; in management, each member in CMC reflects the belief of &quot;Meet Requirement, Mental Insistence, and Nil Defect&quot; in the quality of products. First of all, base on the employees’ competency assessment to conduct a training program. After implementation of the training, the satisfaction survey (seven constructs) was delivering to the employees. Secondly, an action plan was develop to check the employees’ behavior change after the training.</td>
<td></td>
</tr>
<tr>
<td>IBM</td>
<td>IBM is the world's largest information technology company, as well as the world's largest business and technology services consultancy ($35 billion); the world's largest hardware company ($33 billion) and I/T rental and financing company ($3.4 billion). IBM strives to lead in the creation, development and manufacture of the industry's most advanced information technologies, including computer systems, software, networking systems, storage devices and microelectronics. However, IBM in Taiwan employ the parent company’s policy. The training strategies of IBM are worldwide; they are focused on “high performance culture”. They form a “skilled council” (formed by senior employees who are nominated) in charge in evaluating employees’ needs and provide some suggested activities to decision committee in order to develop suitable training program. There are three levels of training evaluation. Level one: immediately satisfaction evaluation after the training. Level two: employees’ line managers evaluate employees’ performance. Level three: an overall satisfaction survey for training. By using an action plan form, HR department of IBM can facilitate and check the effects of the training result.</td>
<td></td>
</tr>
<tr>
<td>TSMC</td>
<td>In 1987, TSMC launched the Taiwan Semiconductor Manufacturing Company (TSMC) with just 258 employees. Today, they are proud of the fact that they have over 14,000 people in four countries worldwide. From 1997 to 2003, TSMC was voted as Taiwan's number one company for Employee Training and Development by &quot;Commonwealth&quot; Magazine. The training evaluation strategies of UMC are followed by the Kirkpatrick’s model. The most important aim is to look at the behavior change. The following methods indicated the possible evaluation format: a) skills &amp; knowledge tests, b) interview, c) group meeting or presentation: problem-solving, management case sharing, d) interview with line manager, e) survey, and f) feedback or email commend to senior managers.</td>
<td></td>
</tr>
<tr>
<td>UMC</td>
<td>UMC is a world-leading semiconductor foundry, specializing in the contract manufacturing of customer designed ICs for high performance semiconductor applications. Founded in 1980 as Taiwan's first IC company, UMC is the foundry technology leader, receiving more semiconductor patents than any other Taiwanese company in both Taiwan and the U.S. The training evaluation strategies of UMC are followed by the Kirkpatrick’s model. The most important aim is to look at the behavior change. The following methods indicated the possible evaluation format: a) skills &amp; knowledge tests, b) interview, c) group meeting or presentation: problem-solving, management case sharing, d) interview with line manager, e) survey, and f) feedback or email commend to senior managers.</td>
<td></td>
</tr>
<tr>
<td>WINBOND</td>
<td>Winbond Electronics Corporation was established in 1987 in the Hsinchu Science-based Industrial Park, Taiwan. After fourteen years of growth and accumulation of bountiful assets in products and technologies, they become a prestige company in the area. There are over 4400 employees and over 48% of all employees are college-educated. The training evaluation strategies are based on the Kirkpatrick’s model and modified it five steps: (a) programs satisfaction survey, (b) result evaluation by using test or simulation methods, (c) behavior evaluation on the direct employees, (d) around 10% will evaluate the changing behavior, (e) little courses would measure the ROI.</td>

The training evaluation strategies of seven firms are all focus at least on both satisfaction and learning level. Due to the organizational culture, these companies all believe the importance of the training, and assume if they follow the appropriate training program design, therefore, the training should be effective. Therefore, their training evaluation strategies are informal and aim to check the satisfaction of the trainees and what skills and knowledge they acquired.

According to the interview and the researchers analysis, these seven benchmarking firms all more toward modified the Kirkpatrick’s model. In addition, since these seven firms are all relative big companies in Taiwan, the HR professional do have a great idea of how important of the training evaluation. Although these HR professionals attempt to develop a suitable evaluation system to help evaluate the training effectiveness, sometimes, all they can do is checking the satisfaction and learning. Since HR professionals of these companies are coordinate with other line managers, the need to track more carefully to make sure the training result.

Proposed Training Evaluation Model

Summarized the above description and through compare and contrast the evaluation methods of the seven benchmark companies, the researchers found the commonality of using goal setting as their training evaluation guide. An objective-orientation training evaluation model (Figure 1) was proposed as follow.
Figure 1. Goal-Setting Oriented Evaluation Model

Contribution to HRD Practice and Research

Evaluation can add value to the training itself. Through the process of evaluation, learning can be activated and transferred to the workplace (Bartram & Gibson, 1999). This study contributes to the body of knowledge in training evaluation from a performance perspective. It also provides useful information to Taiwanese corporation and has insight about how to use training evaluation to improve performance.

Devolving HRM and HRD to line managers: The Case of Hilton International’s UK Hotels

Gillian Maxwell
Glasgow Caledonian University

Sandra Watson
Napier University

This paper explores line manager responsibility for human resource management (HRM) and human resource development (HRD) in an international hotel organisation. The results identify a strong support system for line managers in relation to training and good relations with HR specialists. However, less evident is senior management support coupled with barriers in relation to philosophical understanding, time and work pressures, which are acting as inhibitors to line management’s commitment to HRM and HRD.

Keywords: HRM & HRD, Line Managers, Devolvement

In 2001 Hilton introduced, from a UK launch, a global quality initiative linking HRM and HRD to their strategic business objectives. The service quality initiative seeks to establish a service brand (Equilibrium) and service culture (Esprit/Hilton moments), with support from an HRM package of employment terms and conditions (Esprit). Esprit is portrayed as being a concept of directing the way employees work. It is defined within Hilton as ‘a promise on how our colleagues are treated within the Company’ (UK HR vice-president). It consists of a range of HR activities that are designed to ensure that employees are able to support the service quality initiative of Equilibrium ‘a promise on how our guests are treated’ (UK HR vice-president).

Esprit has been designed to embrace the key principles of employee recognition, respect and reward. It ‘starts with recruitment but relies more on appropriate [employee] development.... Esprit training aims to change behaviours to deliver Hilton moments’ (UK HR vice-president). Upon successful completion of training, employees become members of Esprit entitling them to access rewards and incentives. Extra rewards can be given to employees who demonstrate excellent customer service. Hotels are provided with annual targets for Esprit membership numbers and these are measured as part of the hotel’s performance indicators. Although initiated by Hilton’s corporate Human Resource department in the UK, Hilton perceive this initiative as being concerned with instilling a service culture throughout the organisation, believing this to be owned by all Hilton employees. Managers’ response to Esprit generally is perceived to be very positive. The UK HR vice-president indicates that ‘There has always been good acceptance of the theory around people however when a name and description is given managers like this and are given clarity.’ However, one of the key challenges concerns embedding Esprit into the organisation. It is ‘about “walking the talk” - managers have to live this concept day in and day out e.g. in the way they speak/behave/interact’. The UK HR vice president reports that ‘very few challenges were experienced around acceptance however there are still some around ownership - Who owns Esprit? Esprit should live in the hotels and they should determine recognition rather than being seen as a Head Office initiative’. In attempting to ensure that Esprit is operationalised effectively, all line managers in hotels are expected to assume responsibility for it through a range of human resource management (HRM) and human resource development (HRD) activities, with support from specialist HR staff. These include selection, training and development, employee motivation and recognition, and performance management.

This paper explores the extent to which the Esprit HR initiative has been embedded into the Hilton organization by examining line managers understanding of their role, including their involvement and commitment to HRM and HRD activities. Within the organisation there is no differentiation between the functions of HRM and HRD. These are seen as being integrated activities within the umbrella title of Human Resources. As a result of this approach, it is necessary to review literature that addresses the role of line managers from both HRM and HRD perspectives.

Theoretical Framework

Relationships between line managers, HRM and HRD are arguably changing (Gibb, 2003) and becoming more fused, despite continuing debate about the focus of HRM (Budhwar, 2000) and scope of HRD (Garavan et al., 1999). Such is the challenge in defining the connections between HRM and HRD, the relationship has been dubbed ‘ambiguous and elusive’ (Mankin, 2003). Perhaps reflecting this challenge, the literature on these two
areas largely treats HRM and HRD separately though they share some characteristics. In building a theoretical underpinning for the empirical work, this paper explores line manager responsibility for HRM and HRD in turn.

Inherent in the concept of human resource management (HRM) is a ‘centre-stage’ role for line managers (Renwick, 2003:262). Since the advent of human resource management (HRM) in the UK in the 1980s there has been some debate about devolving aspects of HRM to line managers (Gennard and Kelly, 1997). This debate intensified in the 1990s as conscious moves were made to attribute HR activities to line managers (Hall and Torrington, 1998). Several researchers assert that line managers assuming some HRM responsibility can positively influence employee commitment and, ultimately, business performance. For example Cunningham and Hyman (1997:9) highlight the role of line managers in promoting an ‘integrative culture of employee management through line management.’ Thornhill and Saunders (1998) signal the role of line managers in securing employee commitment to quality, while increased productivity has also been asserted as a basis for devolution of HRM (IRS Employment Review, 1995).

However, lining up line manager responsibility for HRM has also been noted as being ‘problematic’ (McGovern et al., 1997), not least in the relationship between line managers and HRM specialists (Cunningham and Hyman, 1997) and ‘the ability and willingness of line managers to carry out HR tasks properly’ (Renwick and MacNeil, 2002:407). Some commentators were more positive in seeing the HR role becoming ‘less pigeon-holed’ (Goodhart, 1993). Hall and Torrington’s (1998) research on the progress of devolution of operational HRM activities and its consequences, points to organisations making sustained and deliberate efforts to vest HRM responsibility with line managers. However, ‘the absence of a designated human resource specialist role’ (Thornhill and Saunders, 1998:474) may have negative effects on strategic integration and, consequently, organisational commitment, flexibility and quality.

Similarly, the involvement of line managers in HRD has been the subject of some academic debate and organisational challenges. For example Gibb (2003) asserts that concerns over increased line manager involvement in HRD are valid in that it may limit the use of specialist resources in HRD. Another issue is that while line managers have been identified as ‘one of the key stakeholders with the HRD process’ (Heraty and Morley, 1995:31), difficulties in securing line manager acceptance of HRD responsibilities have been evident (Ashton, 1983). In clarifying the role of line managers in HRD Heraty and Morley (1995) present that activities surrounding identification of training needs, deciding who should be trained and undertaking direct training either fall within the domain of line managers or in partnership with HR specialists. Whereas aspects of HRD concerned with policy formulation, training plans and advising on strategy are more likely to be undertaken by HRD specialists. However, research has identified factors that may enable and inhibit the take-up of line manager responsibility for HRD.

Arguably the most significant enabler of line manager responsibility for HRD is the ‘growing body of literature on the emergence and growth of HRD and in particular HRD with a strategic focus’ (Garavan et al., 1995:4). HRD may be seen as providing the key connection between HRM and business strategy (Garavan et al., 2001). Business-led approaches to HRD can indeed be evidenced (Sparrow and Pettigrew, 1988; Harrison, 1993), lending weight to the theory on HRD. For Torraco and Swanson (1995), HRD is not only supportive of, but central to, business strategy. It is also, as Keep (1989) maintains, central to HRM. Therefore it can be seen that there are important lines to be drawn between HRM, HRD, line managers and business strategy. McCracken and Wallace’s (2000) authoritative model of the characteristics of strategic HRD indicates that all four of these factors can be lined up. In this model they are expressed as: integration with organisational missions and goals; HRD plans and policies; line manager commitment and involvement; and complementary HRM activities.

In terms of enabling HRD at an operational level, de Jong et al.’s (1999:183) research suggests that this is ‘a feasible option’ providing specific conditions are met in organisations. One significant condition may be the credibility of HRD as an organisational activity in general. For despite the relatively recent interest in, and expansion of, HRD in UK organisations, there seems to be a residual issue of credibility of the training and development function in organisations generally (Chartered Institute of Personnel and Development, 2001). Organisational support for line managers in their HRD responsibility is important too in the facilitation of the devolution of HRD responsibility (Heraty and Morley, 1995), as is senior managers’ understanding of training and development issues (de Jong et al., 1999). Trust between line managers and HRD specialists, is another important enabler (Garavan et al., 1993). Lastly, as emphasised by de Jong et al. (1999), line managers acting as role models in demonstrating commitment to HRD in their operational tasks, may be a powerful enabler of HRD.

On the other hand, a number of barriers to the effective delegation of HRD responsibility have been recognised. One potential issue that is conceivably acute in the hotel sector is the pressure of short-term imperatives (Tsui, 1987) that may squeeze out HRD activities for line managers. This factor, in combination with a lack of training in HRD, may minimise the priority of HRD for line managers (Aston, 1984; Brewster and Soderstrom, 1994; de Jong et al.1999). Untrained line managers may avoid a coaching role due to their...
discomfort with it (de Jong et al., 1999). Further, where managers do not reflect a belief in HRD in their operational role the impact of HRD is likely to be reduced (de Jong, 1999), the direct converse of reflecting a belief in HRD being an enabler of HRD, as pointed out earlier.

Research Questions and Methodology

The research questions that underpin this paper are:
1. Do line managers feel commitment to HR activities?
2. What are the key mechanisms that help support line managers with their HR responsibilities?
3. What are the key inhibitors influencing their effectiveness in delivering HR activities?

In order to explore the research questions, a deductive approach was taken in developing the questionnaire, with the content being informed by a literature review and semi-structured interviews with the UK HR Vice-president. The questionnaire was designed to include Hilton-specific questions as a form of action research and theory-derived questions. The questionnaire format encompassed nominal, ordinal, ranking and Likert rating scales, and several open-ended questions. It was piloted in early 2003, on consultation with a regional HR director, a hotel HR manager and an external survey organisation. The population comprises some 760 managers in Hilton hotels throughout the UK. 10 questionnaires were distributed to each hotel for self-selected and anonymous completion in summer 2003. The response rate is 328 questionnaires, 43%. Descriptive statistics are used to analyse the quantitative results. Open-ended question responses have been coded into themes to enable these to be presented using percentage response rates. Quantitative responses are supplemented with qualitative statements where appropriate. The findings are discussed below in terms of line managers’ understanding and views on Esprit, and line managers’ perceived role in relation to HR, including enablers and inhibitors influencing their effectiveness in delivering HR activities. Reference is made to the UK HR VP’s views on key current issues concerning the Esprit tool in order to frame the Hilton perspective on line managers’ issues in HR.

Results and Findings

Respondent Profiles

All 76 hotels are represented in the sample, with 34% of respondents located in Central & North England, 22% from Scotland and Ireland, 29% South of England and 16% in London. The majority of the respondents are female (56%). Unusually, females form the majority of all levels of managers represented in the sample. Thirty percent of the sample comprises senior managers, consisting of general managers and deputy managers, 53% are departmental managers, 9% supervisors and 7% other. Included in other category are assistant managers and deputy departmental managers. Two percent of the respondents did not indicate their position in the organisation. The age profile of the respondents indicates that 52% of the sample is between 26-45 years of age, with 18% in the 18-25 years category and 6% over 45 years of age. Fifty six percent of the respondents have been in their current position for 1-5 years, 15% over 5 years and 27% less than one year. Of those who have been in their current position for less than one year, 39% have been with the organisation for less than one year, representing 10% of the total returns. Forty eight percent of the respondents indicated that they had been with Hilton hotels for 1-5 years and a further 38% over 5 years.

Esprit: Line Managers’ Role and Issues

Prior to examining line managers’ views on their human resource role, it is important to ascertain whether their views on Esprit align with the corporate intention. It is evident, from the questionnaire results, that the managers in this sample do not universally share the corporate understanding of Esprit. The majority of line managers (87%) perceive Esprit as a club for employees. This majority view is represented across all levels of management, and is not dependent on length of service, age or gender. Only 26% of the respondents indicate that Esprit is a concept directing the way employees work, with a further 14% indicating that it is a way of working practices. Ten percent of the respondents indicate that it is both a club and a concept, with a further 8% viewing it as a concept directing the way employees work, a club for employees and a way of working practices. Other views expressed, by 7% of the respondents, focused on Esprit being a reward / benefit package and an incentive or motivational scheme. For example Esprit is ‘an incentive for employees to achieve a company standard resulting in membership of Esprit’. Only four respondents indicated understanding of the beliefs and values underpinning Esprit, as expressed in these responses ‘a belief / culture system’ and ‘positive enforcement of Hilton as a group in the minds of our employees’.

There also appears to be discrepancies regarding ownership of Esprit. The general view expressed is that there is multiple-ownership. Nearly all respondents provided three responses each, generating a total of 865 responses evidence this. However in analysing these based on number of respondents it can be seen that 69% of managers consider Esprit to be owned by Hilton, whilst 54% indicated that it is owned by employees. Almost two thirds of the respondents consider it to be owned by Human Resources (30% Head office HR and 31%
Hotel based human resources). Twenty three percent perceive it to be owned by senior management, whilst 30% expressed the view that it is owned by departmental managers and 22% owned by the individual hotels. Of the 4% who chose other response, all of them expressed the view that everyone in the organisation owns Esprit, reflecting the corporate view of ownership.

**Line Managers’ Role in HR**

In order to obtain an overview of the range of HR activities undertaken by line managers, they were asked to indicate the human resource activities in which they were actively involved, the perceived level of importance in relation to importance to business effectiveness and then to rank the top 5 of these. Table 1 provides a breakdown of the results.

Twenty nine percent of the respondents took the opportunity to provide additional comments on their role in relation to HR activities. Thirty eight percent of the comments relate to training, encompassing analysing training needs, encouraging employees to participate in training, delivery and evaluation. Communications was mentioned by 14% of the respondents predominantly with HR specialists, communicating HR issues to staff and attending HR meetings. Other activities mentioned by respondents include coaching; sickness interviews, teambuilding and payroll management. Complaints regarding workloads and staffing levels were voiced by 10% of the respondents who answered this question, with 5% complaining about HR support within their hotel and head office. Two managers mentioned lack of autonomy and control over recruitment and selection. In contrast 9% of the managers were extremely positive about their role in HR activities, as indicated by the following quotes from two of the managers ‘I feel I have a better/greater opportunity to be more involved within HR because of the hotels and staff itself. It is fantastic not only to be supported by our own team, but the whole ‘hotel team’ as well.’ and ‘I get support and encouragement continuously. I run my department as if I was HR-but with the bonus of all the help I need available-works fantastic’[sic].

**Enabling HR Activities**

One of the key influences on line managers’ attitude to HR activities is the extent to which they perceive it to be considered important by the organisation. In addition to level of importance given to HR at the hotel level, line managers were asked to assess the importance of HR as a general business activity by rating the level of importance attached to HR by the organisation, with 5 being essential and 1 unimportant. Line managers consider that great importance is attached to training and development by unit managers (M=4.20) and the hotel HR manager’s role in supporting you in carrying out HR activities (M=4.13), with less importance being given to head office support (M=3.91) and training & development expenditure compared with capital expenditure (M=3.73). However, 98% of general and deputy managers felt that senior managers and directors at regional and head office put importance on training and development. These results indicate that line managers other than general/ deputy managers consider that HRD is not viewed as being of strategic importance in Hilton (McCracken and Wallace, 2000), but is considered to be important at unit level. The target driven nature of Esprit could influence this view.
In order to gain an understanding of managers’ views on the value of HR, they were asked to rate HR aspects, with 5 being excellent and 1 being poor. The highest mean score was found in relation to the working relationship with the HR manager (M=3.91). Senior managers were more inclined than departmental managers to rate this as excellent. Individual contribution to training and development was rated as excellent by 13% of the managers, 47% indicated that this was very good and 31% that it was good (M=3.65). Twenty five percent of the respondents rated the HR function in the hotel as excellent, 35% very good, 21% good, with 6% indicating this was poor (M=3.63). The scope and benefits available through Esprit were considered to be excellent by 15% of the managers, with only 4% rating these as poor (M=3.45). Seventy four percent rated the managerial team effectiveness as very good or good, with only 10% rating this as excellent and 2% as poor (M=3.41). Almost three quarters (74%) of the respondents indicated that senior management’s understanding of training and development issues was good/very good, a further 11% considered this to be excellent with 3% rating this as poor (M=3.40).

The literature highlighted concerns around line managers’ relationship with HR, managers lack of willingness to undertake training and development and perceived senior managers perceptions of HR. The results in this survey indicate that none of these issues are of concern to line managers. However it is interesting to note that tactical/personal activities were rated higher than team and holistic aspects.

In relation to organisational support for line managers identified by Heraty and Morley (1995) and McGovern et al (1997) as facilitating the devolvement of HR, the most popular responses were personal development (61% of respondents) and the provision of appropriate support material (61%). The maintenance of the profile of Esprit, through conferences and newsletter was considered to have been helpful by 45% of the respondents. Senior management support was considered to have assisted line managers by 42% of the managers. Techniques and ideas, for example, best practice was cited by 35% of the managers and administrative support by 31% of the respondents. This analysis reveals that there is strong evidence of support in the form of training and development and supporting materials, however less evident throughout the organisation is senior management support, seen as being a facilitator by Heraty and Morley (1995).

In an attempt to gauge line managers commitment and involvement in HR, respondents were asked to agree or disagree with statements on values surrounding HR, (5 being strongly agree and 1 strongly disagree). Table 2 provides a breakdown of the mean scores for each of these statements.

</tbody>
</table>

What is particularly interesting is the strong sense of personal responsibility for staff within teams, with managers indicating that they support and feel a strong sense of responsibility for their employees and HR. This is an area that was highlighted in the interviews with the UK vice-president of HR: ‘The challenge is for all managers, supervisors and operations managers to understand that they are responsible for their people, in the same way they also own Esprit.’ However, the lower rating of ‘I reflect the values of Esprit in my day-day role’ may indicate that managers understand this responsibility but are not able to actually practice this on a daily basis (12% of senior managers and 7% of departmental managers felt that they did not reflect the value of Esprit). This reflects one of the key challenges identified by Hilton. This is likely to impinge on the extent to which they act as a role model, which de Jong et al (1999) highlight as an enabler for line managers to undertake HR activities. This may also influence the lower responses given in relation to values and support in teams or across departments for the service initiative of Equilibrium. Although responsibility for HR has the
third highest mean, the perceived value of HR activities in achieving business objectives is less obvious, with 16% of managers strongly agreeing and 45% agreeing. Senior managers rated this higher. The importance of the HR initiative of Esprit is rated higher by supervisors and departmental managers than hotel managers. The level of trust in HR is apparent across all levels of line managers, although 12% of the departmental managers indicated that there is a lack of trust in HR. Garavan et al. (1993). Identify this as an important enabler. In relation to a strategic approach to training and development, which McCracken and Wallace (2000) contend will influence line managers’ commitment and involvement, 62% of senior managers 64% of departmental managers, 54% of supervisors, and 61% of others agreed or strongly agreed with this statement.

Although there is evidence that support mechanisms for line managers to undertake HRD and HRM roles, are in place in Hilton, it is important to discuss the views of line managers regarding the extent to which barriers are present and their impact on undertaking HR activities.

</tbody>
</table>

As can be seen from Table 3 the two main barriers to supporting the HR initiative of Esprit are heavy workloads and short-term job pressures. Heavy workloads are seen as a barrier particularly by departmental managers (89%) and supervisors (90%), whilst general/ deputy managers and supervisors perceive short-term job pressures as barriers. This has been identified in the literature as being a key barrier to devolving HR activities to line managers, by Tsui (1987). Role conflict is identified as being a barrier often or always by 29% of the sample. Discomfort with a coaching role is seen as a barrier by less than 10% of the sample highlighting this as an inhibitor, although 32% of supervisors cited this as a barrier. Of the other skills shortages seen as barriers, time management was seen as a barrier, which supports the issues of heavy workloads and short-time pressures. Although lack of delegation and communication skills, were not seen as barriers by the majority of respondents, a perceived lack delegation ability was reported by 39% of the supervisors and 21% of the departmental managers.

These results concur with further views on training that were explored in the questionnaire. The majority of respondents felt that training would help them to some extent (36%) and to a great extent (38%). A mean score of 3.47 was reported for the total sample, although managers aged between 18-25 years, those in supervisory positions, males and those who have been with the organisation for less than one year, all rated this higher than the average score. In contrast the level of confidence to support training and development is seen to be high across all the managers with 38% indicating that they feel very competent and 57% competent. The mean score for the sample on a 5-point Likert scale is 4.31. Senior managers have the highest mean score at 4.46, whilst supervisors the lowest at 4.18. Male managers are slightly more confident in their ability to support training and development than female managers and managers aged between 26-35 years of age had the highest mean rating of 4.30 when analysed on the basis. More confidence in their ability to support training and development is portrayed by managers who have been in their current position for more than one, but less than ten years.

**Additional Support**

Suggestions from line managers for additional support in their HR role, generated from 65% of the respondents, has been classified into five themes of training (36%), communications (21%), incentives (21%), efficiency (17%), and roles (10%). Concerns surrounding the amount of time available for training and the pressures to complete training within time periods are prominent. For example ‘Set aside time to complete Esprit. It is hard to train staff whilst working in the department as well.’ Suggestions concerning training
resources include updating materials and videos, making training fun, holding workshops and providing shorter training guides, as well as providing a dedicated training room and training scripts. Specific management training surrounding equilibrium and other HR activities are also forwarded as suggestions. Improvements to communication relate to more and pertinent information to Esprit members; suggestions include monthly newsletter, posters and Internet email communications.

Within the theme of roles, concerns are expressed regarding the target driven nature of Esprit (‘reduce target pressure and workloads of management so they can ‘live Esprit and pass on to others without compulsory compliance’). The lack of understanding regarding the philosophy of Esprit is emphasised by the following quotes: ‘Each manager you speak to has a different idea of what Esprit is about. Only knowledge=staff benefit[sic]’ and ‘Emphasise more that it is about how we treat our guests’. The two themes of efficiency (17%) and incentives (21%) relate to improvements in the incentive and membership packages. The main concerns emerging with regard to incentives relate to the breadth, range and availability of incentives. Suggestions include reviewing and enhancing the range of incentives. In addition to these themes, 6% of the managers expressed complete satisfaction with current levels of support to carry out HR activities.

Conclusions and Recommendations

The above analysis has revealed some issues that warrant further commentary. Most importantly, although HR activities are generally seen to be aligned to the business objective of improving customer service, there appears to be a particular need to align managers understanding of the philosophy/concept of Esprit. That there appears to be a lack of shared understanding on the concept of Esprit is a signal finding of the primary research. For Hilton, a number of learning points emerge from the questionnaires, as noted below.

It appears that the rewards/incentive aspects of Esprit are taking a higher priority that the philosophical underpinning of the initiative, which is intended by Hilton to be the driving force of the initiative. The target driven nature of Esprit, where a component of business performance evaluations measure Esprit membership numbers at each hotel, further fuels this.

In addition, the lack of ownership of Esprit by line managers that is evident from this survey, probably linked to lack of understanding, could be acting as an inhibitor to HR activities being seen as a fundamental component of their role. Although there is evidence that line managers do see HR as their responsibility, Esprit values are not being seen across departments within hotels.

The questionnaire responses provide evidence that line managers accept and understand their HR role, but the lack of a shared understanding of the conceptual base of Esprit is resulting in a misdirection of activities.

There are some extremely positive support mechanisms in place to support line managers’ involvement in and commitment to HR, evidenced by the training and support, level of trust in HR and the perceived line manager responsibility for HR activities. However, time and short-term work pressures are hindering line managers’ ability to undertake HR activities.

Line managers are willing to propose many suggestions to improve HR activities across a range of themes, representing a distinct opportunity for Hilton.

Although this research is focused on one organisation, learning points for other organisations can be highlighted from this case study. In developing the service quality initiative, Hilton has seen this as an integrated concept and has emphasised the importance of HR support to improve service quality. Managerial commitment to Esprit has been gained through ensuring that membership numbers are measured as part of business performance. This has helped focus line management attention on HR as a central business activity. Employee involvement in Esprit has been driven by incentives and rewards. This has resulted in Esprit membership numbers being above target across the organisation. However, the extent to which line managers and employees have embraced the philosophical values of Esprit is evidently questionable. The evidence from this survey suggests that there now needs to be attention given to the meaning of Esprit, with a realignment of the focus to ensure that there is a shared conceptual understanding of Esprit. The indications are that line managers would be receptive to this attention as the survey reveals a positive attitude to HR activities and support for Esprit.

Contribution to HRD

This paper makes a contribution to HRD in two distinct areas. Firstly, there is a lack of empirical work addressing understanding of issues around devolvement of HRM &HRD activities to line managers. This paper enhances understanding, by providing line managers’ views on enablers and inhibitors in this case organisation. A further contribution to HRD can be found in relation to identification of the difficulty of balancing business driven involvement with philosophical commitment to HRM and HRD activities.

Acknowledgements. This research project has been sponsored by the University Forum for HRD. Thanks to S. Quail and Dr. L. Farquharson for their contribution to the empirical data collection.
References

A problem-solving instrument was administered to 20 employees and their supervisors to examine the congruence between supervisory ratings and self-ratings of employee problem-solving skill. Analysis of the data found that supervisors rated their employees significantly lower than employees rated themselves on 3 of 7 problem-solving stages, 11 of 20 employee/supervisor pairs differed significantly on their ratings in 1 or more of the stages, and supervisor ratings were more consistent over time than were employee self-ratings.

Keywords: Problem-solving Skill, Self-assessment, Rater-based Assessment

The assessment of an employee’s skill in solving challenging work problems is an increasingly important task for human resource developers. In large part, this is because the ill-structured nature of work in today’s organizations requires more advanced problem-solving skills than ever before (Bereiter & Scardamalia, 1993). Ill-structured work problems are those in which the nature of the problem is not clearly defined or fully known, where multiple and often conflicting opinions exist, and where there is no single, correct solution that can be obtained by following one best path or procedure (Lohman, 2002). Unquestionably, the ability to solve ill-structured problems is a critical competency for the workforce of the 21st Century (Jonassen, 2000).

Given the recognized need to cultivate more advanced problem-solving skills among employees, tools and techniques for assessing this type of problem-solving skill have also become more important. For example, assessments of participants’ problem-solving skills before and after programs that aim to help employees solve work problems more effectively provide valuable information for program evaluation and improvement efforts. While it is clear that such assessments are useful, it is surprising how little attention has been directed toward the construction of these types of assessment instruments (Wasik & Bryant, 1994).

Problem-solving assessment instruments do exist. However, important concerns about their validity and reliability limit their usefulness for assessing the problem-solving skills of employees in organizational settings (Atkins & Wood, 2002; Heppner & Petersen, 1982; O’Neil & Schacter, 1997; Wasik & Bryant, 1994). For example, many existing instruments focus on solving well-defined problems and were designed for use in school and counseling situations. As a consequence, HRD practitioners and researchers have few instruments to choose from when the need arises to assess a employee’s ability to solve problems in the workplace.

Because employees rely on their problem-solving skills to handle increasingly complex and ambiguous work situations, human resource developers must have a means of assessing this higher-level cognitive skill. Such assessments could provide useful information when designing, developing, and implementing a wide range of training, career development, and performance improvement initiatives.

Theoretical Framework for Assessing Employee Problem-Solving Skill

A challenging aspect of work in today’s organizations is dealing with complex and ill-structured problems (Bereiter & Scardamalia, 1993). These types of work problems are poorly defined, lack clear procedures for deriving solutions, and lack one right solution (Lohman, 2002). According to Mayer and Wittrock (1996), solving these types of problems involves a “cognitive process directed at achieving a goal when a solution method is not obvious to the problem solver” (p. 47). This cognitive process requires one to gather and analyze information about a problem situation, induce hypotheses about problem causes and solutions, and test and evaluate solution alternatives to ultimately derive an appropriate solution for the problem (Barrows, 1996).

A number of instruments have been constructed to assess problem-solving skill. However, there are two key issues related to the validity of these instruments that limit their usefulness for assessing the problem-solving skills of adult workers. First, many of the instruments involve solving well-defined problems (Jonassen, 1997). As Heppner and Petersen (1982) report, well-defined problems “may be different or less complex than how people solve real-life, applied” problems (p. 67). It is logical to assume that an assessment of one’s skill in solving well-
defined problems may not accurately reflect a person’s skill in solving the more ill-defined, complex types of problems that people typically encounter in their work.

A second validity issue is that most problem-solving instruments have been designed for use with people other than adult workers and in contexts other than the workplace (Blissett & McGrath, 1996). For example, the Wasik Problem-Solving Rating Scale and the Parent Means-End Problem-Solving Instrument were designed for use in school and counseling situations with adolescents and parents (Wasik & Bryant, 1994) and the Personal Problem-Solving Inventory was validated in a university setting with undergraduate students (Heppner & Petersen, 1982). The validity of instruments such as these for assessing the problem-solving skills of adults in the workplace remains unknown.

A reliability concern associated with many problem-solving instruments is that they use self-report as the sole data gathering method. Self-report has been the predominant method of assessing problem-solving skill because it is easy and inexpensive to administer (Wasik & Bryant, 1994). However, previous studies have found self-ratings to be negatively and non-linearly related to performance (Atkins & Wood, 2002) and to have low correlations with the ratings of supervisors, subordinates, and peers (Bass & Yammarino, 1991; Carless, Mann, & Wearing, 1998).

Instruments that are not self-report typically rely on raters other than oneself to assess a person’s problem-solving skill. This method is generally referred to as rater-based. Rater-based assessments of problem-solving skill tend to garner more confidence with respect to validity and reliability than self-report. In large part, this is because trained raters use established scoring systems to evaluate the quality of problem-solving activities and outcomes (Wasik & Bryant, 1994). However, an integral feature of rater-based assessments is that they involve solving a pre-specified problem in a specific area of expertise. It is widely believed that one’s effectiveness in solving a problem is dependent on whether the problem is situated in the person’s technical or professional area (Mayer & Wittrock, 1996). Therefore, a limitation of rater-based instruments which use pre-specified problems is that they cannot be used as standardized means of assessing problem-solving skill across technical or professional areas. This limitation results in the need to design a new instrument each time the problem-solving skill of a different employee group or technical area is assessed. As a consequence, the extensive amount of time and cost associated with developing problems and scoring systems, training raters, and evaluating responses with rater-based instruments tends to deter their wide-spread use in organizational settings (O’Neil & Schacter, 1997).

While traditional rater-based assessments may not be a feasible approach for assessing problem-solving skill in organizational settings, an alternative may be to consider a multi-rater feedback approach. Increasingly, organizations are using multi-rater feedback approaches, which involve the collection and analysis of data from multiple sources, as the basis for employee development and performance evaluation programs (Church, 2000). Extensive research of multi-rater feedback systems, such as 360 Degree Feedback, has shown that employees’ perspectives of their own behaviors and performance tend to differ from the perspectives of others who have knowledge of their work (Atkins & Wood, 2002; Carless et al., 1998). A fundamental assumption of a multi-rater feedback approach, is that “data about one’s specific workplace behaviors, when compared with internal (self) perceptions, can be used as a catalyst for enhancing self-awareness and subsequent behavioral change” (Church, 2000, p. 99). It is possible that a multi-rater feedback approach could be used to assess the problem-solving skills of employees and provide a basis for subsequent employee reflection and development. However, no previous studies have specifically examined the strengths and limitations of a multi-rater feedback approach for assessing employee problem-solving skill.

Therefore, the purpose of this study was to modify an existing multi-rater problem-solving instrument and examine its effectiveness in assessing the problem-solving skills of employees. Wasik’s (1994) Problem-Solving Rating Scale was selected for use in the current study because it uses a multi-feedback approach to assess a parent’s skill in engaging in 28 activities within 7 problem-solving stages. These problem-solving activities and stages are widely recognized as those involved with solving complex, poorly defined problems—just the types of problems that employees deal with in the workplace. The Problem-Solving Rating Scale has two parallel forms. One form involves a parent rating his/her own problem-solving skill and the second form involves a service provider rating that same parent’s problem-solving skill. In the current study, the language of these forms was modified to focus on employee problem solving. The resulting two forms involved a self-assessment in which employees rated the degree to which they engaged in 28 activities within 7 problem-solving stages and a supervisory assessment of the degree to which their subordinates engaged in the same 28 activities. The study addressed three research questions:

Q1: What is the internal consistency of each of the two forms of the problem-solving instrument?
Q2: How consistently does each form of the instrument perform over time (test-retest reliability)?
Q3: Is there a significant difference between ratings of employees and their supervisors with respect to the employees’ problem-solving skill?
Methodology

Sample

The study was conducted with the Midwest regional staff of an educational consulting firm that develops instructional curriculum and materials for public school districts. The sample consisted of 20 employees and 5 supervisors who comprised this regional staff.

Thirteen of the 20 employees were educational consultants, 4 were systems engineers, and 3 were sales representatives. The vast majority of the employees (n = 18) had worked for the firm for less than five years. However, only 2 employees had less than 5 years of professional experience, while 5 employees had between 6 to 10 years of professional experience, and 13 employees had more than 10 years of professional experience. Gender was fairly balanced, with 9 male employees and 11 female employees. Their mean age was 36.5 years (SD = 8.62). An equal number of employees (n = 9) had bachelor’s and master’s degrees. Two employees, both systems engineers, had only high school degrees.

Three of the five supervisors were professional development supervisors, one was a systems engineer supervisor, and one was a sales supervisor. Four of the 5 supervisors had 16 to 20 years of professional experience and more than 10 years of experience with the participating firm. The remaining supervisor had less than 10 years of professional experience and less than 5 years of experience with the participating company. The supervisory group was comprised of 2 males and 3 females with a mean age of 43.6 years (SD = 11.01). Three of the supervisors had master’s degrees, one had a bachelor’s degree, and one had a high school degree. The number of employees reporting to each supervisor varied. Two of the professional development supervisors each supervised one educational consultant. The third professional development supervisor supervised 11 consultants. The sales supervisor supervised three sales representatives and the systems engineer supervisor supervised four systems engineers.

Problem-Solving Instruments

Two forms of a problem-solving instrument were modified and examined in this study. The two forms were originally designed to assess the problem-solving skills of parents (Wasik & Bryan, 1994). In the first form, the Problem-Solving Rating Scale, parents rated their own skill in solving child-rearing problems. In the second form, the Client Problem-Solving Rating Scale, service providers rated parents’ skill in solving the same types of problems.

In the current study, the language of the two forms of the instrument was modified to focus on employee problem solving. For example, item #1 in the original instrument, “I figure out which problems in my life are the most important to work on” was modified to “I readily focus on important problems at work.” The two revised forms of the problem-solving instrument were renamed the Problem-Solving Rating Scale for Employees (PSRS-E) and Problem-Solving Rating Scale for Supervisors (PSRS-S), respectively.

As shown in Table 1, the PSRS-E contains 28 items grouped within 7 problem-solving stages. The items assess employees’ perceptions of the frequency with which they engage in 28 activities within 7 stages of problem solving when dealing with challenging work situations. These seven problem-solving stages are commonly associated with effective problem solving and include: (a) problem identification, (b) goal selection, (c) generation of alternative solutions, (d) consideration of consequences associated with alternative solutions, (e) approach to decision making, (f) implementation of solutions, and (g) evaluation of solutions (O’Neil & Schacter, 1997). In the second form of the instrument, the PSRS-S, supervisors rate their employees on the same 28 problem-solving activities.

Five-point Likert scales, ranging from 1 to 5, were used for all 28 items on both forms of the instrument. Each of the seven problem-solving stages contained four items. Therefore, possible scores for each of the 7 stages ranged from 4 to 20 points. A total problem-solving score was obtained by summing the scores for all 28 items and ranged from 28 to 140 points.

Two educational researchers in a Mid-Atlantic university who possessed extensive knowledge of the problem-solving process reviewed and confirmed the validity of the 28 items and 7 problem-solving stages in the instrument. Field tests were conducted with 20 HRD professionals and public school teachers as well as 6 supervisors in business and higher education to ensure that the content, language, and instructions contained in both forms of the instrument were clear and appropriate for the target audience.

Data Collection Activities

At a professional development conference for the participating firm in January 2003, the principal investigator informed the staff of their company’s participation in the research project. The study’s purpose and activities were described and employees were invited to participate in the study. All staff members agreed to participate.

<tr>
<td><strong>G. Evaluation of Problem-Solving Activities</strong></td>
</tr>
<tr>
<td>25. I seldom follow up after solutions have been implemented to determine their effectiveness.</td>
</tr>
<tr>
<td>26. If goals were not achieved, I reflect on whether the problems were identified correctly.</td>
</tr>
<tr>
<td>27. I accept responsibility for my contributions to successfully solving work problems.</td>
</tr>
<tr>
<td>28. Someone else is generally responsible when solutions to problems are not successful.</td>
</tr>
</tbody>
</table>

Note: Reverse items are noted in italics.

Instructions were provided to the staff for completing the assessment activity. Employees and supervisors then completed their assessments in different conference rooms to diminish any discomfort that the employees might have experienced by their supervisors evaluating them in their presence. Employees completed the self-report activity in approximately 7 minutes, while supervisors completed the assessment of each subordinate in approximately 5 minutes.

Two supervisors and their subordinates agreed to participate in a retest activity. The retest was conducted three weeks after the first administration of the problem-solving instrument with 16 participants (2 supervisors, 11 educational consultants, and 3 sales representatives). The short three-week period minimized the possibility that any differences in scores that were found between the test and retest activity were due to actual changes in employee problem-solving skill and, as a consequence, increased the likelihood that such differences were attributable to the level of consistency of participant’s responses. The assessment activity was sent to the 16 participants via electronic mail. Participants completed their assessments and returned them through the same medium.

Results

Three research questions addressed the internal consistency and stability of the scores over time for each form of the problem-solving instrument as well as the congruence of the supervisory ratings and self-ratings on the assessments of employee problem-solving skill.

Q1: Internal Consistency

Internal consistency provides a measure of the homogeneity of the four items grouped within each problem-solving stage and of all 28 items in both forms of the problem-solving instrument. The internal consistency of each problem-solving stage was substantial to very high on both forms, with correlation coefficients ranging from .63 to .82.
.74 for employees and from .68 to .90 for supervisors. The internal consistency of all 28 items for both forms of the problem-solving instrument was also very high, with correlation coefficients of .93 for employees and .97 for supervisors.

Q2: Stability of Scores

The test-retest activity found that the stability of employee ratings over time was dramatically lower than those of the supervisors. Test-retest scores for employees on four of the seven problem-solving stages had coefficients of stability under .50, a minimum level for establishing reliability in educational research (Nunnally, 1967). Specifically, the coefficient of stability for employee scores was negligible (r = -.03) for Section G (Evaluate Solution), was low (r = .27 and r = .18) for Section B (Select Goal) and Section D (Consider Consequences), and was moderate (r = .41) for Section C (Generate Solutions). In addition, the coefficient of stability for employee scores on all 28 items was only moderate at .47.

In contrast, the coefficients of stability for supervisors’ test-retest scores on the seven problem-solving stages were substantial to very high, with correlation coefficients ranging from .61 to .94. The coefficient of stability for supervisor scores on all 28 items was very high at .91.

Q3: Congruence of Supervisory Ratings and Self-Ratings

Two sets of t-tests statistically examined differences between the supervisory ratings and self-ratings of employee problem-solving skill. The first set of t-tests compared the mean scores of all 20 employees to those of the 5 supervisors on each of the seven problem-solving stages and on the total problem-solving score. As shown in Table 2, the t-tests revealed that the supervisory ratings were significantly lower than the self-ratings on three of the seven problem-solving stages. Specifically, in Section A (Identify Problem), the mean score for supervisors was 14.7 (SD = 0.67) as compared to a mean score for employees of 16.6 (SD = 0.42), yielding a t = 2.342, p < .05. In Section B (Select Goal), the mean score for supervisors was 13.8 (SD = .52) as compared to a mean score for employees of 15.7 (SD = 0.53), yielding a t = 2.560, p < .05. And in Section D (Consider Consequences), the mean score for supervisors was 12.9 (SD = 0.70) as compared to a mean score for employees of 15.7 (SD = 0.46), yielding a t = 3.285, p < .05.

* p < .05
a n = 20
b n = 5

In the second set of t-tests, the ratings of each employee were statistically compared to those of his/her supervisor. Because there were 20 employees in the study, the comparison involved the testing of 20 pairs of scores. As shown in the right-hand column of Table 3, significant differences were found between the scores of 6 employee/supervisor pairs in Stage C (Generate Solution), 5 pairs in Stage G (Evaluate Solution), 4 pairs in Stage A (Identify Problem), 4 pairs in Stage D (Consider Consequences), 3 pairs in Stage F (Implement Solution), and 1 pair in Stage B (Select Goal).

Furthermore, as shown in the second to last row of Table 3, 11 of the 20 employee/supervisor pairs differed significantly in their ratings of the employee’s skill in at least one of the seven problem-solving stages. Specifically, the ratings of 8 of these 11 pairs differed significantly in 1 to 2 problem-solving stages, while the ratings of 3 of the 11 pairs differed significantly in at least 4 of the 7 problem-solving stages. Significant differences were also found for 12 of the 20 employee/supervisor pairs on total problem-solving scores.

Discussion

Analysis of the data in this study found that both forms of the problem-solving instrument had high levels of internal consistency. However, a test-retest activity found that the ratings of supervisors were more stable over time than...

Pairs whose Total Scores Differed Significantly
X X X X X X X X X X X X

Note: A significant difference between the ratings of an employee and his/her supervisor is indicated with an "X"

those of the employees. Further comparison of supervisory and employee ratings revealed that supervisors rated their employees significantly lower than employees rated themselves on three of seven problem-solving stages. A more detailed examination of the 20 employee/supervisor pairs found significant differences in the ratings of 11 of the pairs on one or more of the 7 problem-solving stages and significant differences for 12 of the pairs on their total problem-solving scores. Possible explanations for these findings, their implications for assessing problem-solving skill in the workplace, and areas for future research are presented in this section.

Theoretical Perspectives on Assessing Problem-Solving Skill

The low level of stability that was found for the self-ratings of problem-solving skill corroborates past studies in which self-ratings were found to be highly unreliable (Atkins & Wood, 2002; Carless et al., 1998). While employees’ self-ratings were found to be inconsistent over time, supervisory ratings of employee problem-solving skill were quite consistent. A possible explanation for these findings is that while employees’ perceptions of their own problem-solving skill depended on specific work situations, their supervisors’ perceptions of their problem-solving skill were fairly fixed and rigid. Supervisors typically base their perceptions of their subordinates’ skills on their observations and evaluations of the subordinates’ behaviors and performance over an extended period of time. These perceptions become fairly fixed, altering only when a remarkable situation or number of situations occur that are in such contrast to a supervisor’s prevailing perceptions that they trigger their reconsideration and revision. This explanation is supported by previous studies, such as Greguras and Robie (1998) and Conway and Huffcutt (1997), in which the supervisors’ ratings of employee behaviors and performance were found to be substantially more reliable than the self-ratings of employees or the ratings of employees’ subordinates or peers.

Another interesting finding in the current study was that supervisors rated their employees significantly lower than the employees rated themselves on three of the seven problem-solving stages (problem identification, goal selection, and consideration of consequences). The concept of attribution error may help to explain this finding. Attribution theory, developed by Fritz Heider, contends that people commonly make three attributional errors when trying to explain the behaviors of others as well as themselves: (1) fundamental attribution error, defined as attributing behavior to internal rather than external causes, even when the cause is situational in nature; (2) actor-observer error, which is attributing behavior of others to internal causes and attributing our own behavior to external causes; and (3) self-serving error, defined as taking credit for successes and blaming failures on others, fate, or factors beyond our control (Griffin, 1994; van Heerden, 1999).

Consideration of these attribution errors gives rise to two rival explanations as to why supervisors judged their employees more critically than the employees judged themselves. One explanation is that supervisors committed the fundamental attribution error and attributed causes of their employee’s poor problem-solving performance to internal rather than external causes, such as an employee’s laziness or closed-mindedness. A second explanation is
that employees committed the self-serving error and attributed their successes in problem solving to personal attributes, such as their initiative or open-mindedness, and their difficulties to situational factors beyond their control, such as unreasonable project deadlines or technology problems. Findings from previous research indicating that supervisor ratings are the most reliable (Carless et al., 1998) and that employees tend to over-inflate their own ratings (Atkins & Wood, 2002) provide compelling evidence to suggest that the second explanation—that employees committed the self-serving error—is the more plausible explanation.

Furthermore, the finding regarding significant differences in the scores of many employee/supervisor pairs is consistent with previous reports that a supervisor and employee often differ in their evaluations of the employee’s strengths and need areas (Bass & Yammarino, 1991; Carless et al., 1998). An important contribution of the current study is that it demonstrates how the problem-solving assessment activity can pinpoint specific stages of the problem-solving process where an employee and a supervisor differ in their perceptions of the employee’s strengths and need areas. Examination of such differences in perceptions can enhance an employee’s self-awareness and thereby provide a stimulus for reconsidering current strategies and techniques for solving work problems (Church, 2000; London & Smither, 1995).

Implications for Assessing Problem-Solving Skill in the Workplace

The study’s findings have three important implications for assessing the problem-solving skills of employees. Both forms of the modified problem-solving assessment instrument were found to possess high levels of internal consistency. However, because of the low levels of test-retest reliability found with the self-ratings, a recommendation is that information concerning an employee’s problem-solving skill should be gathered from supervisors and others who are highly knowledgeable of the employee’s work. Problem-solving assessments should continue to include self-ratings because employees’ beliefs and opinions about their skills and abilities influence the ways in which they make sense of and respond to situations (Machin & Fogarty, 1997). However, to assure the reliability of a problem-solving assessment, the self-ratings should be triangulated with the ratings of others whose opinions are valued (Atkins & Wood, 2002; Carless et al., 1998; Miles & Huberman, 1994). Obtaining information from several sources provides multiple perspectives about an employee’s skill in solving work problems and thereby enhances the credibility of the information gathered and an employee’s motivation to act on the feedback and change his or her behaviors (Barr & Raju, 2003).

A second recommendation is to use the problem-solving assessment presented in this study as a means of identifying training needs that pertain to specific stages of the problem-solving process. After the instrument is administered to a group of employees and their supervisors, the mean scores of each employee and his/her supervisor for each problem-solving stage can be examined to determine whether significant differences exist between their perceptions. Those stages in which a majority of the employee/supervisor pairs have significantly different scores represent needs upon which to focus in future training activities.

A related, third recommendation is to use the data from the problem-solving assessment for performance coaching. Employees and their supervisors could use the problem-solving assessment to examine their perceptions of the employee’s skill in each of the seven problem-solving stages. Those stages in which significant differences between their perceptions were found provide clear direction for discussing an employee’s strengths, need areas, and plan of action for becoming a more effective problem solver.

Future Research of Problem-Solving Skill Assessments

The degree to which the findings of the current study apply to other employee groups and professional areas needs to be examined. Therefore, an appropriate next step would be to replicate this study with a larger cross-section of employees and in other organizational contexts. A second area for future research is to examine the strength and direction of the relationship between the stability of employees’ perceptions of their problem-solving skill and changes in the levels of challenge in their work. Examination of this relationship may provide useful information that could be used to reconsider the content and activities of training programs and performance improvement initiatives that endeavor to promote problem-solving skill. Lastly, an investigation of the usefulness of the two modified forms of the instrument created in this study for evaluating HRD programs that aim to enhance problem-solving skill is warranted. Examination of the administration of the problem-solving instrument before and after such programs would lead to ways of evaluating and improving HRD initiatives that aspire to help employees effectively handle complex and ambiguous problems in the workplace.

Contributions to New Knowledge in HRD

An important contribution of the present study to new knowledge in HRD is the construction of an instrument that provides a means of generating diagnostic information concerning employee needs related to effective problem solving. A second contribution of the current study to new knowledge in HRD is greater understanding of the
importance of using a multi-rater feedback approach for assessing problem-solving skill. The current study’s findings demonstrated that a multi-feedback approach provides a richer, more informative assessment of an employee’s problem-solving skill than is found with a traditional self-assessment approach. A third contribution of the current study is that, because the items in the problem-solving assessment focus on the key steps of the problem-solving process rather than on specific work problems, the instrument can be used in a variety of technical or professional areas. These three contributions are important to evolving HRD knowledge because human resource developers must have a valid and reliable means of assessing an employee’s ability to solve complex and ambiguous work problems.

Preferences of Training Performance Measurement: A Comparative Study of Training Professionals and Non-training Managers

Diane D. Chapman  
North Carolina State University

This survey-based study addressed a perceived gap between training performance evaluation practice between training professionals and non-training managers in the manufacturing industry sector. Non-training managers preferred to act on predominantly organizational-level measurements while training professionals favored predominantly job/individual-level measures. While the groups reacted to different training performance measures, both groups relied on on-the-job tests and customer service reports. However, a low response suggests a potential lack of interest for the strategic position of the training function.

Keywords: Evaluation, ROI, Measurement

Training professionals are increasingly being asked to prove the value they add to the organization (Brauchle, 1995; Phillips, 1995; Phillips & Phillips, 2002; Swanson, 1998). Many managers still see training as a non-strategic function, with the perception that it costs more than it returns (Smith, 1996; Swanson, 1998). In order to quell the perception, training evaluation must provide organizational decision-makers with the information they need to decide whether training is providing value (Bowsher, 1998; Groner, 1978).

The majority of research into evaluation practices has focused on the preferences of the training professional (Caudron, 2001; Gutek, 1988; Twitchell, 1997). But, in many organizations, training professionals only provide the evaluation data, whereas, the upper-level manager interprets the results. Upper management receives evaluation reports and data in formats not conducive to their normal decision-making processes (Groner, 1978). Training professionals are then left to assume they are using valuable performance evaluation measurements. Training professionals must supply decision-makers with proper measurements or be eternally viewed as an expense (Bowsher, 1998).

Statement of the Problem and Purpose

Previous research has not thoroughly investigated training evaluation from a non-training managerial perspective. This study investigates the training performance evaluation perceptions and preferences of non-training manufacturing managers and training professionals. The responses of both groups are compared in order to identify the differences and similarities in their perception of the importance of training performance measurement. This investigation is needed in order to find out if the perspective of the non-training managers differs from the accepted perspectives pervasive within the training profession. If a gap exists between the measures important to training professionals and the measures important to other functional managers, training is likely to suffer. Decreased budgeting, diminished organizational influence, and a perceived lack of strategic value might only be a few of the consequences of such a gap.

Research Questions

The research in this study was guided by the following questions:
1. What are the training performance measurements perceived as valuable by managers leading non-training functions and training professionals?
2. Is there a difference in the preferred training performance measurements between managers leading non-training functions and training professionals?

Implications for HRD

Training support, credibility, and budgetary decisions rely on other managerial perceptions in addition to those of training professionals. Little research has been done to find out the perceptions of management about training performance measurement. Training professionals have historically evaluated training based on the information they assumed was valuable to the organization. This study investigated the performance measurement perceptions of both training professionals and non-training managers. The results allow training professionals to find out what training evaluation
methods are preferable in eliciting the support of other managerial staff for their training operations.

Assumptions and Limitations of the Study

The population for the non-training managers part of this study has been limited to manufacturing organizations in the state of North Carolina. This study assumes that the continuation and funding of training projects in business and industry is at least in part dependent upon the management perceptions of effectiveness of that training. Several techniques were employed in this study to guard against the problem of a low response rate. However, they did not increase the response rate to a desirable level and thus there is a limitation to generalizing the findings of this study.

Research Design and Instrumentation

A cross-sectional design was used to conduct this research. The data for this study were collected by use of a survey. Survey items were specifically developed to directly reflect performance measurement practices found in the business literature. Because of the lack of published research of this nature, no standard instruments were found that would allow for the required analysis.

To expand on the evaluation measures found in the training literature, most of which identify procedures specific to training, a master list of relevant business performance measurements found in the literature was developed. The resulting list included over forty measures (Table 1). Items similar in nature were grouped together in order to arrive at a final listing that was less ambiguous, repetitive and overwhelming. This grouping resulted in fifteen types of measurements based on the type of performance information.

The survey instrument consisted of three parts. In part one, respondents were asked to respond to the likelihood of each measure prompting a managerial action using a 5-point Likert scale anchored with extremely unlikely and extremely likely. The second part of the survey instrument identified the value the respondent places on each measure. The same fifteen measures from part one were again posed to the respondents through a series of three rankings. These rankings were gathered to examine the magnitude of value placed on the measures by the respondent, in relation to other measures in the same performance level. In the third part of the instrument was demographic data including professional background, educational experience, age and gender. These were all found to influence the decision-making process (Bronner, 1993; Smith, 1999).

Content validity was established through relevant literature reviews and pre-testing of the survey. An expert panel, consisting of local training professionals not in the sample, was established to provide additional content and face validity for the instrument. This panel was asked to review all aspects of the survey prior to pre-testing. The survey was revised as a result. The survey was pre-tested by randomly selecting a sample of thirty managers from the North Carolina Manufacturer's Directory sampling frame. This established face validity. The final list of measures were: opinions of trainees, opinions of supervisors, exam scores, on-the-job tests, progress/work performance reports, peer ratings, human resources calculations, productivity reports, organizational climate, cost increases, product quality, financial calculations, turn rates, customer service reports, and investor calculations. The measures, groupings, and levels are shown in Table 1.

Population, Sample and Data Collection

In this study there are two populations. The first is managers, without training responsibilities, employed by manufacturing firms in North Carolina from all functional and operational areas of business. The second population consists of professionals with primary training responsibilities employed by manufacturing firms in North Carolina. These training professionals occupy positions in the operation or supervision of a company’s internal training activities. External consultants were excluded from the group.

Two follow-up mailings were used in this study for the group of non-training managers. A confidence level of 95 percent and an accuracy level of .05 were used. The required sample size for the sampling frame of non-training managers was 368 responses and 144 for training professionals. The data collection process began with the selection of 982 managers from the non-training manager sampling frame. Selection was done using a random number table. A website was created to host the survey as an option for responding. The response rates were 15.5% for non-training managers and 28.5% for training professionals. Strategies used to increase responses included postcard reminders, telephone calls and mailed hard copies of the survey. This improved the response rate approximately 10%.

### Data Analysis

Descriptive statistics were used to report frequencies, distributions, and means. T-tests were used for answering research questions one and two by comparing the two groups. T-tests were used to determine if there was a significant difference in the mean responses to each of the measurement questions between the training professionals and non-training managers. Because of the low response rates for the survey, t-tests were run at significance levels of p=0.01 and at p=0.05 for each of the performance measures in survey questions 1 through 15. Survey questions 16 through 18 were analyzed using t-tests in a similar fashion, only these tests help to detect significant differences between the two groups within the three measurement categories of individual, job and organizational described by Rummler and Brache (1995).

### Findings

Ages for the group of non-training managers: mean 46.2. Training professionals: mean 42.3. Gender: non-training managers (76.3% male), training professionals (35.4% male). Education: Non-training managers (47.4%) had bachelor’s degrees and training professionals (52.4%) had master’s degrees. 77.7% of non-training managers and 87.7% of training professionals had at least a bachelor’s degree. Over half of training professionals (60%) had been at their current position from 1 to 5 years. Non-training managers (42.7%), and training professionals (20%), had been at their current job more than 6 years.

**Respondent Employment Information**

Both Training professionals (87.7%) and training managers (88.8%) rated themselves at least partially responsible for managing training. Only 11.2% of the non-training managers reported that none of his or her job included training management. The mean of the responses for the non-training manager group was 26.6 percent of their job and the mean for the training professionals was 53.8 percent of their job.

Most respondents in both groups (96% of non-training managers and 86.1% of training professionals) have had either limited or frequent involvement in the design and delivery of training. Almost 14% of the training professionals had no involvement. Almost half of all non-training manager respondents (48%) were top-level managers. Non-training
managers represented Plant/operations (25.3%) human resources management (14.4%) and marketing/sales management (9.2%). Training professionals represented human resources management (65.1%), general management (2%) and marketing/sales management (2%).

Research Question 1 R1: What are the Training Performance Measurements Perceived as Valuable by Managers Leading Non-training Functions and Training Professionals?

Few training professionals were unlikely to act on either opinions of the supervisor and exam scores. None of the training professionals gave opinions of the trainee’s supervisor (survey question 2) or end-of-training exam scores (survey question 3) an extremely unlikely rating. Whereas, 3.9% of the non-training managers said they were extremely unlikely to react to each of these measures. Conversely, 36.2% of non-training managers were extremely likely to react to supervisor opinions, compared to 53.8% of training professionals. And, 42.1% of non-training managers were likely to react to end-of-training exam scores, compared to 63.1% of the training professionals.

Views on the importance of productivity reports varied between the groups. A larger percentage of training professionals (23.1%) were unlikely to react to productivity reports as non-training managers (11.2%). Non-training managers were much more likely to react to productivity reports (80.2%) than training professionals (58.5%).

Non-training managers were more likely to react to results of organizational climate (65.1%) than were training professionals (49.2%). Nearly twice the percentage of training professionals (32.3%) said it was unlikely they would react to this measure, as compared to non-training managers (17.1%). Non-training managers were more likely to react to cost increases than training professionals. Nearly sixty percent of non-training managers would likely react, compared to only 35.9% of training professionals. More non-training managers (81.6%) than training professionals (61.6%) were likely to react to measures concerning product quality. Training professionals are more likely to react to progress/work performance reports.

Ranking and Differences in the Means

Another way of looking at differences between non-training managers and training professionals is by comparing the means of their ratings on each performance measure. A listing of the means of the ranking of each performance measure is located in Table 2.

Table 2. Ranking of the Means by Performance Measure

</tr>
</tbody>
</table>

When the means scores were ranked for each group, the non-training managers rated on-the-job tests highest, with a mean of 4.36, while training professionals rated end-of-training exam scores as the highest with a mean of 4.49. Customer service was rated second highest by non-training managers while training professionals rated the same measure fifth.

Training professionals rated opinions from the trainee’s supervisor more likely to provoke a response (third highest) than non-training managers who rated it as seventh highest. Training professionals also rated trainee opinions about the value of training higher (4th) than non-training managers (9th). Another discrepancy between the performance measure ratings of the two groups was in the productivity reports measure. Non-training managers rated this measure as fourth highest, compared to training professionals who ranked it ninth.
Frequencies were also run on survey questions 16 through 18, where the respondents ranked the measures within their performance levels. Performance levels are based on Rummler and Brauche’s (1995) three levels of job/individual, process, and organizational. The findings here were similar to the individual ratings of the performance measures. In the job/individual level, both training professionals and non-training managers most frequently gave the highest ranking to end-of-training exam scores. In the process level, both groups most often ranked on-the-job tests with the highest ranking. The greatest variation in the frequency of number one rankings, comes in the organizational level where non-training managers ranked product quality highest and training professionals ranked customer service reports highest.

Research Question 2 R2: Is There a Difference in the Preferred Measurements of Performance Evaluation Between Managers Leading Non-training Functions and Training Professionals?

T-tests were performed on the ratings of each of the fifteen performance measures to test for significant differences between non-training managers and training professionals. Research and null hypotheses were developed for each of the measures and were accepted or rejected based upon a significance level of p=0.05. Due to the small sample size and because some measures may be near significance at p=0.05, t-tests were also performed at significance levels of p=0.01, and p=0.10. Table 3 summarizes the t-test results for significant performance measures.

T-tests were also performed on the mean scores of the rankings in questions 16 through 18, where respondents ranked the performance measures within performance levels (Table 4). Only three measures were found to be significantly different between the two groups of respondents. Those measures were peer ratings, productivity reports, and quality of output.

Conclusions

The study’s findings cannot be generalized to the larger population due to the small response rate.

Training Professionals and Non-training Managers React to Different Types of Training Performance Measures

A gap between training professionals and non-training managers extends to at least eleven of the fifteen performance measures tested in this study. Non-training managers want to understand the impact of training in their own terms (Jedrziewski, 1995; Shelton & Alliger, 1993).

Training Professionals Are More Likely Than Non-training Managers to React to Job/Individual-Level Performance Measures

Training has historically been assessed by such non-performance measures as head counts, time spent training, and reactions to the training from the participants (Marshall & Schriver, 1994). As the profession has matured, training professionals began looking beyond these measures and began using methods more related to performance such as end-
of-training exam scores and on-the-job tests.

*Non-training Managers Are More Likely Than Training Professionals to Rely on Organizational-Level Measures*

While training managers are measuring how trainees scored on their end-of-training exams, non-training managers are looking at measures more directed at the organization-level. Those outside the training function may not understand traditional training evaluation measures or know how to use them (Groner, 1978). A number of top managers are demanding evaluation aimed at the organizational level (Rothwell, 1996).

*Non-training Management Is Not Primarily Concerned With Converting Training Benefits to Dollar Figures*

This study shows that the highest rated performance measure for training managers was end-of-training exam scores. The highest rated measure for non-training managers was on-the-job tests. Training literature regularly heralds the advantages and necessity of converting training benefits into monetary figures (Brauchle, 1995; Phillips, 1996). But, out of the top four measures rated by non-training managers in this study, none concerned any type of dollar cost. The measures of on-the-job tests, customer service reports, quality of output, and productivity reports are all indications of cost effectiveness, but do not require an actual translation into dollars. This is an indication that unlike the claims of the popular training literature, ROI and cost-benefit analysis are not top priorities for managers when it comes to assessing the value of training. Non-training managers reacted more to non-financial measurements than financial ones. In fact, out of the fifteen measures, financial evidence ranked fourteenth on the list.

*On-the-job Tests and Customer Service Reports Are Measures That Are Valued By Both the Training Profession and Business and Industry*

On-the-job tests were ranked first by the non-training managers and second highest by the training professionals. This shows that both groups value this measure highly. This is further evidenced by the failure of the t-tests to show any significant difference between the ratings of the groups.

*The Low Response Suggests a Potential Lack of Interest for the Strategic Position of the Training Function*

The response rates for this study were far less than desirable for both samples. Surveys were not returned at the expected rate, so the possible reasons for this phenomenon must be examined. After reviewing the methodology employed, one notion emerges --the subject of training is not deemed as important to this manufacturing population. The manufacturing sector in this country has had to adapt to increased competition. In order to become more competitive, businesses have had to get “leaner and meaner”. Training shows them no direct value; therefore, they see no reason to give training issues their attention. Obvious strategic issues such as customer service and production are much higher on the priority list. Training is still seen as a nice thing to have or as a reward, not as strategic to making the organization more competitive or furthering managerial careers.

*Recommendations for the Training Profession*

*Training Professionals Need to Take the Lead in Establishing and Using Measures Valued by Non-training Managers*

The training profession cannot afford to wait for the rest of the organization to come to them to bridge the gap in measuring performance. The lack of interest in this study by non-training management may indicate an unfavorable perception of the credibility in the training profession. In order to increase prestige and organizational influence, training management must lead the way. This means using the measures of business and industry to gauge performance and not expecting the rest of the organization to meet the training function half way, but taking the expectations of non-training management and embracing them as their own. If training does not bridge the gap in performance measurement, no one will. Only the training profession has the knowledge, incentive and the understanding of training performance to build the measures that reflect training success or failure.

*Training Professionals Should Concentrate on Explaining Training’s Contribution to Non-financial Performance Measures Rather Than on Converting Training Benefits to Dollars*

The results of this study show that non-training management does not place a priority on financial measures when it comes to assessing training performance. Whether this is a result of a perception that training benefits are intangible, or of a historically low expectation for the profession, is irrelevant. Trainers need to evaluate training based on measures that other decision-makers deem important now. This study suggests that those measures are of a non-monetary nature. Non-training managers placed more value on measures such as productivity, quality of output, and customer service. Although these measures are frequently converted to dollars, non-training management does not seem to require those calculations in order to value the measures. The time spent trying to convert benefits to dollars could better be spent explaining training’s contribution to these measures.

*Training Professionals Need to Bridge the Gap With Non-training Managers by Developing Measures Aimed at the Process and Organizational Levels*

This study found that while non-training managers react more to organizational measures of training performance,
training managers react more to individual or job level measures. This finding exemplifies one of the major reasons that training is still seen as a non-strategic function. If trainers continue to focus on lower-level evaluations, they will not be perceived as having higher-level impacts. It is unlikely that non-training managers can make the connection between a trainee’s performance on an end-of-training exam and the level of customer service that employee exhibits. It is not the responsibility of non-training management to make that connection. Therefore, rather than assuming or expecting non-trainers to see the relationship, training professionals must make the relationship obvious. This can be accomplished by reporting trainee performance in terms of higher-level measures.

*Training Professionals Should Incorporate Measures of Customer Service and On-the-job Training Into Their Training Evaluation Reports to Non-training Management*

Both training and non-training professionals were shown to value the measures of on-the-job training and customer service reports. Therefore, this seems like a great place to begin to bridge the gap in the use of performance measures. By using measures that non-trainers already consider important, the training profession can increase its visibility and impact within the organization. It is much easier to incorporate non-training measures into training than to make non-training people value training-specific measures. It is important to remember that not all organizations place the same weight on the same measures. Therefore, training professionals should investigate what measures are important in their specific organization and make use of them. The results of this study suggest that the aforementioned measures may be a good starting point.

*The Training Profession Needs to Understand the Use and Utility of Performance Measures Commonly Used in Business and Industry*

Training professionals seem to be sticking to traditionally training-specific performance measures despite their perceived lack of use in the organization. Measures such as trainee opinions (reaction) and end-of-training exam scores may have a lot of meaning to the training function, but they have little value to the rest of the organization. Lack of understanding the calculations used in other measures has been a frequently cited reason for the disuse of organizational level performance measures (Davidove, 1993). This is not a suitable excuse. This sort of “inside the box” thinking may be much of what is holding the training profession back. Training managers need to think “outside the training box” and investigate other measures of performance. They need to find out what the valued measures are in their organization and learn to use them.

*Recommendations for the Non-training Managers*

Non-training managers can also assist in bridging the gap in training performance measurement. They can take the time to learn about common training measurements, such as trainee reactions and examinations. By understanding these individual-level measures, they can begin to see the connections between individual performance and organizational performance. While organizational and process level measurements may be more desirable to this group, it is useless developing measures at these more macro levels, if the training cannot be found effective based on the individual trainee.

The purpose of this study was to describe how behaviorally anchored self-assessments have been used to appraise the performance of press operators at a print facility in the Midwest. The study documents employee growth in 30 competency areas over a two-year period. The study identifies congruence between self-assessment and supervisory assessment on 36 job tasks at the end of the two-year period. The study uses content analysis techniques in data collection and analysis. The results showed that over time employees develop and supervisors authenticated competency development. Congruence between self-appraisal and supervisor appraisal was high.

Keywords: Performance Appraisal, Behavioral Anchors, Self-Assessment

Researchers, writers, consultants, HR professionals and practicing managers see performance appraisal as an important tool in managing resources (Buford & Lindner, 2002). It should, theoretically, provide a number of positive benefits. It should improve the quality of administrative decisions in such areas as merit pay, promotion, and termination. For employees the feedback reinforces good performance and suggests areas needing improvement. Performance ratings can be used to identify training needs and validate selection tests. In practice, however, most performance appraisal systems fail to achieve these benefits. Studies have indicated that up to 90% of appraisal systems are ineffective and 40% of employees say that their performance is not appraised at all (Nelson, 2000). Disappointing results from performance appraisal can be attributed to a number of factors (Grote, 1996). Often performance appraisal systems are not aligned with the organization’s mission and strategic plan. At the supervisor level appraising technical performance, especially in manufacturing is often compounded with other performance factors such as initiative and people skills. As a result writing reviews can become highly subjective and time consuming.

When this is the case, performance appraisal contributes little to the accomplishment of objectives. Lack of support by top management is one of the most important causes of poor implementation. When raters are not held accountable they are unlikely to invest the necessary time and effort in setting expectations, counseling employees, providing feedback, and accurately rating performance. Many supervisors find confronting performance issues to be very difficult, particularly when they have to criticize an employee. Performance appraisal is often threatening to employees, especially if they do not understand the rating criteria or if they view the process as unfair. Administrative and developmental purposes may conflict with each other. For example, if an employee knows the ratings will be used to set merit pay in the upcoming budget, he or she will be less concerned with goal setting, skill building, and performance improvement, which do not have immediate implications. Finally, performance ratings used for administrative purposes can result in legal liability under fair employment laws and regulations.

However, these and other problems are attributable mainly to shortcomings in how performance appraisal systems are designed and administered, not because of inherent deficiencies in either the concept itself or in the techniques described in the professional literature, some now over 50 years old. One writer suggested that for many organizations, using these techniques would amount to a significant improvement over what they are doing now (Grote, 1996). Moreover the new focus on strategic HRM has resulted in the development of improved methods and approaches. Interestingly, most successful examples of these “best practices” are found in the public sector (Grote, 2000). It should also be pointed out that legal compliance focuses on job-related performance measures and fair administration, conditions that are necessary to gain the benefits mentioned above even if legal liability were not a consideration.

**Theoretical Framework**

Determining, measuring and verifying competencies needed for a given profession are difficult but necessary tasks. HRD professionals are continually seeking appropriate techniques to document professional growth and performance over time. One method for addressing this problem is to develop and use competency-based and behaviorally anchored rating scales to measure growth. When describing the use of the term competency, Boon and van der Klink (2002) noted that because the term competency is ambiguous, it should be operationally defined. Buford and Lindner (2002) defined competencies as a group of related knowledge, skills, and abilities that affect a major part of an activity. Knowledge is a body of information applied directly to the performance of a given activity. Skill is a present, observable competence to perform a learned psychomotor act. Ability is a present competence to perform an observable behavior or a behavior that results in an observable product. Competencies establish the behavior requirements needed to be successful in a given profession or task.

In this study, behavioral anchors are defined as characteristics of core competencies associated with the mastery of content. Competency-based behavioral anchors are defined as performance capabilities needed to demonstrate knowledge, skill, and ability (competency) acquisition. Nitardy and McLean (2002) stated that “achieving competency is not an end to be achieved, rather it is a road to be traveled. To be effective, one needs to develop continually new competencies…” (p. 962). Competency-based behavioral anchors require considerable time and effort to develop, however, they provide more accurate judgments than item-based scales (Buford & Lindner, 2002). Further, such anchors provide supervisors and other expert raters with behavioral information useful in providing assessments and feedback to learners. Such information can help learners understand their unique bundles of competencies and increase satisfaction, motivation, learning, and ultimately success on the job (Drawbaugh, 1972). Competency-based feedback based on behaviors can provide a foundation for individual learning plans. Behavioral anchors can also be used to describe minimally acceptable knowledge, skills, and abilities on identified core competencies, thus, giving managers tools and information needed to improve curricula, training materials, evaluation processes, and instructional delivery methods.

Performance appraisal instruments based on behaviors are more difficult to develop. Perhaps the major shortcoming of behavioral criteria is that carrying out all the expected behaviors does not necessarily lead to success on the job. For example, an employee may do all the “right things” and still not complete projects on time or within budget.

Behavioral scales are an extension of both the traditionally used item-based graphic rating scale and the critical incident technique and are designed to assess the various behaviors that can be observed when an employee is performing a job (Buford & Lindner, 2002). Such formats reduce the amount of judgment required by the rater in item-based scales. They also quantify the level of performance represented by observed behaviors, an aspect missing from the critical incident approach. The formats used most frequently are behaviorally anchored rating scales (BARS) and behavioral observation scales (BOS).

BARS is the most complex and sophisticated format as well as the most expensive to develop. The construction of BARS generally follows procedures developed by Smith and Kendall (1963). The first step is to collect critical incidents that describe a wide range of behaviors. The critical incidents are then placed in broad categories that serve as performance dimensions. A group of supervisors and possibly experienced job incumbents known as subject matter experts (SMEs) are given the set of critical incidents and categories and asked to match each incident to the category that they believe the incident illustrates (known as retranslation). Incidents that are not assigned to the same category by a high percentage of the SMEs and those that fall frequently into two or more categories are discarded. Another group of SMEs is given the retranslated list and asked to rate each incident on a 5- to 9-point scale, representing a continuum of job performance from outstanding to poor. The only items retained are those on which the ratings are closely “clustered” (do not vary excessively around the group mean). These incidents are used as anchors on the rating scale; hence the term behaviorally anchored.
While BARS is highly job related, there are several disadvantages (Grote, 1996). The most obvious problem is that raters may have difficulty in matching actual observed behaviors with the examples used as scale anchors. There are many more critical incidents that describe performance under the dimension of resolving employee problems than the seven items provided on the scale. As with the critical incident technique, the process requires the rater to keep extensive behavioral records, and few managers have the discipline to do this. Another problem is that scale anchors may overlap such that the same behavior can be rated high in one category and low in another. The rater might observe both good and bad performance on the same dimension. For example, a supervisor who calms down frustrated employees might also cover up drinking on the job. Finally, there is no research that shows that BARS is more accurate and valid than a well-designed graphic rating scale.

A procedure that overcomes these limitations of BARS is called behavioral observation scales (BOS), as set forth by Latham and Wexley (1977). The primary difference is that BOS is developed by attaching a 5-point behavioral frequency scale to each behavioral item. The major advantage of BOS is that raters are forced to make a more complete appraisal of the individual’s performance, rather than emphasize only those items they can recall at the time of the rating and are able to match with one of the scale anchors. A major disadvantage of the BOS format is that behavioral frequencies are not always true measures of performance.

A competency-based behavioral scale contains features of both BARS and BOS. Like BARS, an absolute rating scale is used to define various levels of performance in behavioral terms; however, more complete coverage is provided, similar to the BOS format. This type of instrument is constructed by considering groups of related tasks associated with a particular competency (made up of various knowledges, skills, and abilities). Written statements or critical incidents are used to describe levels of performance in that competency ranging from ineffective to exceptional. SMEs may assist with scaling the behavioral examples, which are not usually “anchored” as in BARS. The number of levels of performance depends on the number of scale points. The rater selects the behavioral statement that “best fits.”

A recent approach to the use of behavioral anchors for appraising employee performance includes self-assessment by the employee (Halbert, 2000). Behavioral anchored self-assessments (BASA) focus on tracking an employee’s competency development over time. A potential benefit of BASA over BARS and BOS is the self-assessment by the employee coupled with the authentication of the SME. Self-appraisals are useful in development because they emphasize personal growth, intrinsic motivation, and goal setting (Buford & Lindner, 2002). They also communicate to the SME or supervisor how the employee perceives her performance. A major problem with self-assessment is that the employee may use standards different from what the organization expects and they lack objectivity in assessing their own performance. Recent research by Yarrish and Kolb (2002), however, found that little to no differences existed between self and supervisor appraisals. To address this potential problem, BASA includes a SME or supervisor authentication as a part of the process. SME assessments are appropriate for several reasons, namely it is the SME who normally assigns and observes and is responsible for the work of the employee. A major problem with SME assessment is rater errors. BASA is an attempt to emphasize the positive aspect of self and SME assessment while minimizing the associated inherent problems.

All behaviorally based scales have several general advantages over other methods. Superiors and subordinates usually are involved in their development. The feedback provided is highly job related, and performance appraisal sessions focus on behaviors that contribute to successful job performance. Lee, Yarrish, and Miller (2002) noted that effective feedback on employee performance is positively related to performance improvements. However, these formats require considerable time and effort to develop. The development procedures must be repeated for each job, which may not be cost-effective for jobs with few incumbents.

Purpose

This study addressed Nelson’s (2000) concern that up to 90% performance appraisal systems fail. Failure of performance appraisal systems is mainly attributed to poor design and poor administration. Behavioral scales used to appraise employee performance may overcome these problems (Lindner & Buford, 2002). The purpose of this pilot study was to describe how BASA have been used to appraise the performance of press operators at a print facility in the Midwest. The study further sought to authentically document the competencies of press operators over time as they progressed from novice to experts. The research questions were: 1) How much growth occurred over a one year period? 2) What is the congruence between employee and supervisory assessments over a one-year time? 3) What are the strengths and weaknesses of the BASA approach as perceived by the organization?
Methods

Content analysis techniques were used to analyze BASA assessment appraisals from five press operators at a print facility in the Midwest (Fraenkel & Wallen, 1996). Caution is warranted against generalizing the findings of this study beyond those participating in the study. Based on a review of literature, the researchers developed an instrument to collect data related to the research questions (Dooley & Lindner, 2002; Jedynak, 2003; Halbert, 2000). The following three coding categories were developed. Competency development was coded as percentage of novice/advanced beginner, competent, proficient, or expert competencies achieved over time. Novice/advanced beginner consisted of four competency items: 1) may be familiar with similar skills or techniques from a related field, 2) can sometimes do simple tasks, 3) becoming familiar with procedures and techniques, and 4) requires close supervision. Competence consisted of six competency items: 1) can run specific jobs confidently, 2) knows how to run a specific press, 3) skills becoming automatic, 4) terminology beginning to fall into place, 5) beginning to understand some methods, and 6) requires some supervision. Proficient consisted of nine competency items: 1) works independently from job start to job finish when all materials are supplied, 2) able to set and run any repeat job with consistent color and registration, 3) run any similar press efficiently, 4) executes many procedures and techniques with automaticity, 5) can describe how work is done and how decisions are made, 6) fluent in job terminology and may assist in writing procedures, 7) knows press well enough to recognize mechanical problems, 8) can troubleshoot and solve problems in general press areas, and 9) tutors novices and beginners effectively. Expert consisted of eleven competency items: 1) highly productive on any press running and job due to experience and automaticity, 2) adapts any QAL press quickly and easily, 3) reliable application of skills and knowledge, 4) knows what to do and what not to do, 5) excellent understanding of methodology, 6) may coach others, 7) lay out job for product fit for press, 8) mechanically maintain and fix press for routine production, 9) exceptional troubleshooting skills, 10) able to suggest improvements to equipment and procedures, and 11) excellent estimating and predictive abilities.

Congruence between self-assessment and supervisory assessment was coded as perfect, high (+ or -), medium (+ or -), low (+ or -), or negligible (+ or -). The direction of congruence (+ or -) indicates whether the employee rated their performance higher (-) or lower (+) than the supervisor. The level of congruence is an indicator of whether the employee has more confidence than competence or visa versa. Strengths and weaknesses of the BASA approach were based on a qualitative analysis of supervisor’s, SME’s, and executive’s comments on how the BASA process was working. A panel of experts at Texas A&M University established content validity. Each employee assessment instrument was read and analyzed independently by two of the researchers. Researcher-generated data were entered onto the data collection instrument. Results generated by the two researchers were compared to determine discrepancies between researchers. Less than one discrepancy per issue existed. When discrepancies existed the two researchers, working together, reanalyzed the data and agreed on the correct code.

Results and Findings

The results of this study were reported in three areas: Competency growth, congruence between self-assessment and supervisory assessment, and strengths and weaknesses of the model. Competency growth over time for each of the five press operators is shown in Table 1. For example, at the end of the first appraisal period, Employee One had reported (and authenticated by her supervisor) that she was proficient on 50% of the novice/advanced beginner competencies, 67% of the competent competencies, 0% of the proficient competencies, and 0% of the expert competencies. By the end of the fourth appraisal period, she reported (and authenticated by her supervisor) that she was proficient on 100% of the novice/advanced beginner competencies, 100% of the competent competencies, 78% of the proficient competencies, and 9% of the expert competencies.

Note. Appraisals were conducted four times over a one year period; <sup>a</sup> Four competency items; <sup>b</sup> Six competency items; <sup>c</sup> Nine competency items; <sup>d</sup> Eleven competency items

Congruence between self-assessment and supervisory assessment for the five press operators is shown in Table 2. For example, at the end of the final appraisal period, Employee One reported she was an expert at performing tasks associated with ink unit. The supervisor reported she was proficient at performing tasks associated with ink unit. The employee’s confidence in their own ability does not match the supervisor’s competence rating. The congruence, however, between the self-assessment and supervisors assessment is high, the employee rated their competence one step higher than the supervisor. Tasks associated with ink unit included: SLI key/stroke, SLI replacing rubber, SLI setting from rollers, SLI operation, SLI squaring, flexo doctor blade, flexo anilox roll, flexo metering roll, flexo height, flexo durometer, flexo squeegee, screen impression and screen squeegee. Employee One reported that she was proficient at performing tasks associated with die stations as did the supervisor. Perfect congruence between self-assessment and supervisory assessment existed.

Note. Reviews were conducted at the completion of the appraisal period; <sup>a</sup> Thirteen task statement; <sup>b</sup> Five task statements; <sup>c</sup> Five task statements; <sup>d</sup> Eight task statements; <sup>e</sup> Five task statements; <sup>f</sup> Five task statements.

Supervisor’s, SME’s, and executive’s of the print facility in the Midwest noted that the BASA process was stable during both the introduction and routine use. The press operators had no difficulty understanding the tool and doing their own assessment. Supervisors, likewise, found the tool easy to use. When there were questions, minor changes to the tool improved the readability and/or content. The minor changes did not make prior assessments any less valid. The use of BASA improved employee relations in the company. It gave employees ownership in their own development in a pragmatic, non-judgmental way. BASA made it clear what employees could do at a given point in time and what they needed to learn. Each developmental stage was linked to a pay grade and salary range so arguments about money were reduced. A visible system linking pay, performance, and employee development also made the supervisor’s job easier. The supervisor had more information and could better schedule the work, as well as training, based on the individual’s skill and knowledge level.
Performance problems were also easier to address since both the employee and supervisor put their assessment in writing and have a performance review discussion. If performance did not match the documented skills, it is easy to have a discussion about the issues. Often, just showing employees their self-assessment resulted in improved performance, i.e. if you claim to be an expert, why are you not performing at that level? The use of BASA was so successful with press operators it was also developed for other production jobs, i.e. finishing operators, production assistants, etc. The same BASAs were also translated into Spanish for use in their Argentina plant.

Conclusions, Recommendations, and Contributions to HRD

Nelson (2000) noted that up to 90 percent of appraisal systems are ineffective. Ineffective performance appraisal systems contribute little to organizational objectives and often have detrimental affects on employee satisfaction, motivation, and productivity. Nonetheless, determining, measuring, and verifying competencies needed by an employee for a given job is critical to organizational effectiveness and efficiency. This study attempted to use an innovative process to appraising employee performance that tracks an employee’s competency development over time and minimizes the detrimental affects listed above. The behavioral anchored self-assessment (BASA) instrument used in the study, demonstrated its effectiveness in overcoming some of ineffectiveness of other types of assessment instruments.

The results of this study, like those reported by Yarrish and Kolb (2002) found little to no differences between self and supervisor appraisals. This process combines the benefits of BARS and BOS (highly job related and based on direct observation) with the benefits of self and supervisor appraisals (emphasizing personal growth, intrinsic motivation, goal setting, and authentication). Congruence between employee appraisals and supervisor appraisals was high to perfect. An implication exists that when self-assessments are coupled with supervisory assessments, employees are more likely to use standards that are in line with what the organization expects and they have objectivity in assessing their own performance.

The BASA process was effective in meeting Nitardy and McLean’s (2002) goal of employees continuing to develop new competencies over time. A limitation of this study was that it only looked at a limited number of employees over two years. Further research should be conducted with larger samples over an extended period of time. An implication exists that the authentication of the self-assessment by the supervisor was an effective form of feedback on employee performance that had a positive impact on employees’ performance and growth over time. This implication is supported by Lee, Yarrish, and Millers (2002) contention that effective feedback on employee performance results in improved employee performance. This study may help HRD scholars and practitioners better understand factors associated with appraising employee performance.

This session presents a series of practical exercises and research resources associated with each quadrant of the Conceptualizations of Research on Emotion (CORE) framework. The underlying theory and rationale for the framework will be presented briefly, including handouts of resources for more in-depth understanding of each component of the framework. The primary focus of the session will be on four interactive exercises specifically designed to represent the emotion perspectives associated with the CORE framework.

Keywords: Emotion, Research to Practice

This session presents a framework of four different perspectives that researchers might take when exploring emotion in the context of various organizational phenomena. Management and HRD scholars have approached the study of emotion in the organizational context from a variety of viewpoints. Associated with each viewpoint, however, are particular sets of theoretical biases. It is our contention that the ways in which researchers in practice and academe conceptualize the nature of emotion, and its role in individual and organizational functioning, can have profound effects. Researchers ask questions and intervene in practice based on how they conceptualize the nature and role of emotion in organizations. Thus, different conceptual frameworks can take us in very different directions.

Earlier work within the AHRD community has described how the framework that serves as the starting point for this session can be used to understand research paradigms (Callahan & McCollum, 2002). The present session extends that dialogue by providing interactive examples of how this framework can be seen in practical application. The purpose of this session is to offer a hands-on approach to understanding the practical implications of various paradigmatic views of emotions as they relate to organizational life. Instead of simply sharing verbal narratives of theory and research, we intend to engage the audience in a series of action/reflection exercises that are designed to provide insight into the existence and implication of differing perspectives of emotions. The outcome of the session is for participants to have a better understanding of how emotion research can be translated to practice in organizational contexts. We begin with a brief refresher of the theoretical framework that will guide the activities of the session.

One axis of the framework describes the relative emphasis on the subjective, or insider’s, experience of emotion versus the objective, or outsider’s, observation of it. The other axis is used to locate the view of emotion in the organizational context as either being something to be controlled and managed, or something that should be helped to emerge to promote optimal organizational functioning. For heuristic purposes, we have chosen to describe “pure” or polar representations of each of the quadrants. We caveat that most approaches to dealing with emotion in an organization will fall nearer the mid-point of the two axes of our framework and, in fact, may share aspects of each of the four quadrants.

Each of the four perspectives offered in the framework can incorporate multiple disciplinary approaches to the study of emotion, including psychology, sociology, anthropology, and more. The Conceptualizations of Research of Emotion (CORE) framework is presented in Figure 1 below:

Copyright © 2004 Callahan, Horrocks, Machala, Opengart, Short, & Turnbull
Following an introductory exercise that highlights the first quadrant of the CORE approach, we will ask participants to rotate between the remaining three application exercises. Each application exercise will be set up in different areas of the session room and facilitated by one or more of the presenters. This will maximize interaction and reflection time for the applications and still provide discussion time at the end of the innovative session.

**Function**

This perspective emanates from the fundamental question of "What is the function of emotion in this organization?" The more traditional, 'functional' approach to emotional issues in organizations is grounded in the biological or organismic (Gallois, 1993; Hochschild, 1983) conceptualization of emotion. This paradigm looks at emotions from a more objective, or "outsider," perspective and perceives emotion as a force that must be managed in order to achieve greater effectiveness. The objective orientation associated with this perspective tends to view emotion as a non-rational, and therefore potentially disruptive, force. Because the biological or organismic focus of this paradigm is more explicit, it may be perceived as a psychological paradigm.

"You are what you…feel"

We open the application of the CORE model by engaging the entire group in an introductory icebreaker that highlights the functional nature of emotion in social contexts. We will ask the session participants to select a type of work experience that elicits either positive or negative emotions for them. They will then proceed to spend approximately five minutes introducing themselves to others in the session. For example, I may say, “Hi, my name is … and computer glitches really frustrate me.” While my colleague might say, “Hi, I’m … and I feel really proud when my boss tells me I did a good job.” We will then debrief the introductions by describing how this highlights the basic existence and role of emotion in the workplace. The essence of this exercise is that emotions are a regular part of our organizational lives that can subtly define us as employees and influence the ways in which we function within the organization.

**Interpretation**

This perspective focuses on how and why organizational members interpret emotional behaviors and their subsequent responses as a result of that interpretation. The 'interpretive' approach to emotional behavior is more closely aligned to the social constructionist (Gallois, 1993; Hochschild, 1983) conceptualization of emotion. This is a more subjective, or ‘insider,’ position; it looks at emotional states as social performances rather than basic states of the individual. This paradigm seeks to understand the nature of emotion in social contexts while still perceiving emotion as a force in the organization that is, or needs to be, managed. From the relational perspective of this paradigm, emotions are created or constructed as part of a common sensemaking process in social structures. In order to maintain or appropriately recreate the common meaning, these emotions must be managed. Much of the early work in the sociology of emotion emanated from this interpretive perspective of the management of emotions in social contexts.

"Blackjack, Baby"

This role-play exercise takes approximately 15-20 minutes. Participants will be given particular emotional expression roles to play as they participate in a mock blackjack game. For example, one participant may be asked to
be particularly demanding of the dealer, another may be asked to be especially warm and friendly in sharing winnings, and so on. After a few rounds of the game, participants will be asked to describe the interactions and their interpretations of the expressed emotions. The outbriefing will include a discussion of how this exercise further highlights the way people interpret and make sense of emotions in social contexts.

**Power**

The power approach often takes a social constructionist perspective, but views emotion as an emergent force that facilitates organizational change as opposed to a force that needs to be managed away in order to achieve organizational change. Very often, this approach is marked by the belief that those in positions of power may abuse their ability to manipulate the emotions of others. However, equally true of this position is the idea that individuals can make powerful choices for personal change when they tap into their emotions.

“Calgon, take me away”

This 15-20 minute exercise emphasizes how individuals can create their own sources of emotional power in order to facilitate the vision for change. This exercise will be based on a brief case study in which participants have the opportunity to make choices about how they will apply power to facilitate, or hinder, not only their own interests but the interests of others in the organization. Participants will be asked to close their eyes, relax, and imagine the implications of their choices. Who is there? How are they interacting? What emotions are they feeling? Did participants feel powerful or powerless as a result of the choices? The visualization process will then continue by asking participants to think about, and record, their strategies to gain or share or relinquish power. The facilitator will conclude the session by synthesizing participant power strategies for application in other settings.

**Structure**

This perspective emerges from a desire to understand both the concrete and abstract organizational structures that influence and are influenced by emotional behavior. Those that follow this approach could be considered 'structural determinists.' This approach looks at emotion from an outsider's more ‘objective’ perspective while continuing to see emotion as a positive force for change. The essence of understanding emotions from a structure perspective is that emotions can be seen as interdependent with structural positions of the organization. Unlike the power perspective, which views emotion as a source of personal or positional power, the structure perspective views emotion as it manifests in different social and organizational structures and systems.

“Whose Job Is It Anyway?”

This 15-20 minutes exercise highlights the ways in which our organizational position influences the way we treat others and the way others treat us. Our emotions are tied up into the structures of social contexts. In this exercise, participants will wear labels that can only be seen by those with whom they interact. These labels include positions such as the CEO, VP, janitor, check out clerk, and so on. Each label will also include a ‘counter’ position for that individual; for example, the CEO may also have a label that identifies her as a single mom, the janitor may have a label that marks him as a Fulbright Scholar, and so on. Participants will be given a task to accomplish and, at the end of the exercise, will be asked to guess what role they had been assigned and to describe how they felt they were treated as a result of that role and, in turn, how they began to treat others.

**Conclusion**

The session will conclude with a wrap up discussion that solicits insights, perspectives, and learnings from participants. The facilitators will synthesize group experiences to show how the CORE framework can help us more fully understand and work with emotions in organizations. Participants will be given handouts that highlight specific research and other resources associated with each of the four presented perspectives of emotion.

Distance Learning Roles and Competencies: Exploring Similarities and Differences between Professional and Student Perspectives

Toby Marshall Egan
Texas A & M University

Mesut Akdere
University of Minnesota

We utilized a Delphi technique to explore roles and competencies as identified and ranked by 106 upper level graduate students specializing in distance education. Student responses were compared to two previous studies utilizing distance education practitioner/scholar respondents. Although the roles identified were similar to previous studies, the highest rated competencies identified by graduate students emphasized technical expertise to a greater degree than did the previous practitioner/scholar studies. Implications for current training and future research and practice are discussed.

Keywords: Distance Education, Competencies, HRD

As the demand for implementation of distance education increases concurrently with increasing interest in academic credentials in distance learning, questions regarding the appropriate preparation focus for distance learning practitioners and scholars persist. Recent studies (Thach, 1994; Williams, 2003) have identified competencies for distance education practitioners utilizing a Delphi technique. These findings indicated the importance of communication and interpersonal skills as key competencies for distance educators. This study explores whether graduate students in programs providing specialized distance learning education would perceive roles and competencies for distance education similarly to professional and scholar perspectives which were recently reported.

Background

Including the early emergence of the correspondence course, distance education has an over 100-year history and, according to Moore and Kearsley (1996), had four distinct historical phases: 1) correspondence study; 2) open universities in the 1970s; 3) broadcast and teleconferencing; and 4) computer conferencing and multimedia. At present, the distance education literature focuses primarily on computer conferencing and multimedia approaches. Use of distance education has increased dramatically over the past decade to the point where well over one third of US universities are utilizing distance instruction (including a significant number of fully online degree offerings) and usage in for-profit and non-profit organizations is increasing at a similar rate (Lewis, Alexander, & Farris, 1997). Many have identified the new “technology-mediated interactive learning” environment as continually enhancing the learning experiences of participants through improvements in technology and delivery strategies (Dede, 1990). Such enhancements include the Internet supported information sharing and retrieval systems such as World Wide Web databases, chat groupware, electronic mail, and threaded discussions. Courses may engage in real-time, or synchronous formats, or asynchronous approaches. Such approaches support human resource development (HRD) efforts in a variety of ways from formal employee education to information sharing and training modules.

Purpose of Study and Research Questions

The evolution of distance learning technology and the limited number of studies examining approaches to distance learning from the perspective of professional roles and competencies limit our understanding of distance learning (Thach, 1994; Williams, 2003). As distance learning education continues to emerge as an important means of teaching and learning to public and private sector organizations and institutions of higher education, training needs for a variety of positions associated with distance learning continue to emerge relatively. Similarly, formal education programs at the graduate level offering specialized training and degree programs in distance learning and related areas have increased.

As the field of distance learning continues to evolve, questions persist regarding the parallel evolution of related roles, competencies, and curricula supporting those developing professional skills in distance learning, in training,
and in formal degree programs. Although the aforementioned studies conducted by Thach and Williams provide us with better insight regarding competencies associated with distance learning as identified by expert professional respondents, a question remains as to whether those currently studying distance learning are being influenced by the perspectives of long-term professionals in the field. This question is important to our understanding both of the perspectives of emerging and new professionals in the field, as well as providing implicit signals as to the ways in which advanced students of distance learning may be trained. The purpose of this study is to develop an understanding of advance graduate students’ perspectives regarding the roles and competencies associated with distance learning. The research questions for this study are:

1) What are advanced distance education graduate student perspectives regarding the roles and competencies of distance educators?
2) How are advanced graduate student responses compared to those of expert scholars/practitioners?
3) What explanations are there for the differences and/or similarities in responses from the current and previous studies?
4) What implications are presented by this study for the field of distance education?

Review of Related Literature

This study focuses on competencies of distance educators. In order to develop and promote an effective learning environment in distance education, the competencies of those who are in charge are critically important for all aspects and processes of such highly complex teaching and learning medium. Regardless of the infrastructure, successes of students, or other factors, the competencies of distance educators are the center of all interactions. In today’s rapidly changing technology, distance educators are constantly challenged to design assignments, projects, and tests that would teach and assess students’ “critical thinking and doing” skills. Other challenges for distance educators are that not all learners are willing to execute the tasks and activities that lead to successful distance learning and the learners often need support and structured learning experiences (Laurillard, 2002; Collins, 1998). Research on distance education indicates that the way learning environments are designed, structured, conceptualized, and developed has profound influences on student learning (Inglis, Ling, & Joosten, 1999; Jarvela, 1995; Roschelle & Teasley, 1995). Therefore, a profile of competencies associated with distance education must balance the demanding objectives of the curriculum and rapidly changing nature of technology.

Similarly, the issue of competency has been studied, examined, and addressed by both the researchers and professionals in the field of HRD (Knowles, 1962; Nadler, 1968; Pinto & Walker, 1978; McLagan & McCullough, 1983; Lindeman, 1991; Swanson, 1994; Rothwell, Sullivan, & McLean, 1995 Rothwell & Cookson, 1997). The competency literature in HRD, however, indicates variations in terms of the conceptualization HRD and its purpose. According to Swanson and Holton (2001), competence suggests that an employee has an ability to do something satisfactory, not necessarily outstandingly or even well (p. 229). Competency in HRD has also been associated with expertise. Expertise is defined as “the optimal level at which a person is able to or expected to perform within a specialized realm of human activity (Swanson, 1994, p. 94). On the other hand, competency is related with credibility of the performer (Rothwell, Sullivan, & McLean, 1995). Similarly, Knowles, Holton, and Swanson, (1998) present self-diagnostic rating scale competencies for the role of adult educator and trainer (p. 217). HRD strategy, training, and professional development considers competencies to be the foundation of all activities which are essential to an organizations’ market value as organizations rely increasingly on the knowledge and skills of their employees (McLagan, 1997). HRD considers competencies to be part of an employee’s human capital, which refers to the knowledge, expertise, and skills one accumulates through education and training.

The studies by Thach (1994) and Williams (2003) were similar in that they explored distance education roles and competencies from the perspectives of expert practitioners and scholars. Williams (2003) argued that ongoing changes associated with technology advancement and the newness of the field required ongoing investigation and further research. The ongoing development of understanding regarding distance education roles and competencies is important to the development of related training and educational programs. Organizations such as the American Society for Training and Development (ASTD) recognized the importance of ongoing clarification regarding roles and competencies associated with general training and development. Two studies, Pinto and Walker (1978) and McLagan and McCullough (1983) were commissioned by ASTD and focused on knowledge skills and attitudes needed for developing the talented training professional capable of high performance. Although often not discrete, but overlapping, competencies are commonly identified as the specific units that clarify professional roles and outputs.

Thach’s (1994) competency study appears to be the first to identify the roles, outputs, and competencies most important for distance education professionals. Respondents were thirty-six distance learning professionals in the
planning, collaboration/teamwork, English language proficiency, writing, organizational, feedback, knowledge of distance learning field, basic technology knowledge, and technology access knowledge. Study respondents identified four distance education roles to be the most important: administrator, instructor/facilitator, instructional designer, and technology expert.

Williams (2003) extended the exploration of roles and competencies in his study utilizing fifteen expert professional respondents averaging over eleven years of experience. Similar to Thach, the results included a menu of roles and related competencies that were determined to be most important by expert respondents (see Tables 1 and 2 below for full list).

Methodology

Similar to previous competency studies, our approach utilized distance education experts to determine roles and competencies. However, unlike other studies, the experts identified were advanced distance learning graduate students. The assumption about "expert" perspectives is altered in this study as compared to others from expert practitioner/scholar to students who have expertise assumed to be influenced from their formal and advanced involvement in distance learning education. The aims of previous studies were to inform the field of distance education regarding core roles, outputs, and competencies needed in the development of distance educators. Although the focus of this research is similar, the exploration is not only focused on the identification of distance education competencies perceived to be important by advanced graduate students focusing on distance education, the study also focuses on a comparison between competencies identified by graduate students and expert practitioners. A Delphi technique was selected to structure the group process in this study.

Historically, several features have characterized the Delphi technique as a relatively small group of participants with anonymity of participants through multiple rounds of surveys and the reporting of group results to individual participants (Turoff & Hiltz, 1996). Participants usually do not meet face-to-face during Delphi process. In some cases the research goals may require participants to be identified, but this is generally atypical (1996). Although typically described as a group decision making process aimed at consensus, the Delphi technique does not encourage false or rapid movement toward agreement by participants. Minority or additional perspectives are typically encouraged, as was the case in this study. By avoiding face-to-face interaction, the Delphi technique may avoid groupthink problems where members may coerce or unduly influence individual participation or group decision-making. The four criteria for experts in this study were that they:

- must be an advanced graduate student in a program featuring an emphasis in distance learning;
- must have related distance learning field experience;
- must have published or be actively writing about distance education with the intent to disseminate related knowledge or information;
- must be willing to participate.

One hundred and thirty-three graduate students from twelve programs in the central US featuring a specialization, minor, or degree program in distance education were identified using the information available on university websites. The final expert panel was comprised of one hundred and six individuals from eleven universities in the central U.S. who participated in all four rounds (79.7%). The time required to collect the data was four months. The expert panel reported an undergraduate grade point average of 3.63 and a graduate grade point average of 3.85. Most had experience in the development and delivery of distance learning contents beyond the scope of their coursework. 47 (44.3%) of the panelists were men and 59 (55.7%) were women.

Modeling the studies by Thach (1994) and Williams (2003), the round one survey asked graduate student experts to accept or reject twelve roles presented with descriptions or make modifications to the role descriptions provided. Respondents were asked to add any additional roles, if needed. After the completion of round one each respondent was provided with a summary of the responses as part of the round two questionnaires. A menu of fifty-seven competencies identified in the distance education literature was provided to experts with a request that they select those most relevant. Respondents were also asked to write additional competencies as they saw fit. In round three, respondents were asked to rate the summarized competency list in terms of their criticality and frequency. Round four involved respondent review of their individual ratings in comparison to the group mean.

It is important to note that the number of participants used in this study is large for a traditional Delphi. It was felt by the researchers that given the population used in the study, gathering broader perspectives were important as the goal of the study was to ascertain both a breadth and depth of perspectives from student experts in several academic programs. Because of larger numbers the study utilized descriptive measures and used mean scores as the
measure of central tendency. The means were compared to the median scores to determine their similarity as median scores are often utilized in Delphi-based studies with smaller groups. The medians and means tended to be similar.

**Assumptions and Limitations**

This study was limited to advanced graduate students in higher education settings in the central US whose educational focus included distance learning. Participants were required to have access to a computer. The study was limited to student experts who were able to read and respond in typewritten English. The results of this study, therefore, may not be generalizable settings or populations outside of the scope of this study.

**Results**

Three research questions were addressed in this study (above) are similar to the studies by Thach (1994) and Williams (2003).

**Research Question 1: What Are the Roles and Competencies Necessary in Distance Education in Higher Education?**

This question was addressed by questionnaires in rounds one and two. Experts were instructed to review a preliminary list of twelve roles from the literature and a role description and related outputs. Respondents were asked to support or reject each role, to make any adjustments in whole or part to each, and to suggest additional roles. Respondent decisions and modifications regarding the roles identified led to adjustments in the numbers, names, descriptions, and outputs of the roles associated with distance learning. Adjustments were made, and the resulting modifications were put before the group for approval in the subsequent round. The total number of roles increased to fourteen. Similar to the Williams (2003) study, the role of administrator was split into two distinct roles: administrative manager and leader/change agent. Also similar to the Williams study (2003), respondents suggested that the role of Web publisher be expanded to encompass all media. The name of the role was altered to media publisher/editor. The fourteenth role added by the panel was systems expert/consultant. This role referred to individuals who serve as external experts to a distance learning project or organization providing expertise on a contract basis. The following fourteen roles resulted:

- administrative manager
- instructor/facilitator
- instructional designer
- technology expert
- site facilitator/proctor
- support staff
- librarian
- technician
- evaluation specialist
- graphic design
- trainer
- media publisher/editor
- leader/change agent
- systems expert/consultant.

In round two, the panel of experts identified more than fifty competencies for each role ($M = 53.2$ per role). Because of the desire for comparison with previous studies, the panel was asked to attempt to identify the top thirty competencies shared by all roles in rank order with one being the most important (this procedure was similar to the two previous studies under comparison). Similar to Williams, these competencies were identified as general or generic competencies and compared to the competencies identified in the Thach (1994) and Williams (2003) studies (see Table 1). Creating a similar organization scheme to Williams’ study, the competencies were categorized across all three studies using a notation system (see Table 1 below):

- communication and interaction (coded C)
- management and administration (coded M)
- technology (coded T)
- learning and instruction (coded I)

Table 1 reports the general competencies along with the respective rank based on the average number of ranked responses from each respondent.

**Research Question 2: How Do Distance Education Experts Rate the Importance of the Competencies?**

When observing the results from the current study in combination with the Thach and Williams studies, it is interesting to note that 21 of the top 30 competencies identified can be found in all three studies (see Table 2 below). Our study of experienced graduate students’ perceptions of competencies has 21 of 30 competencies in common with the Thach study and 28 of 30 competencies in common with the more recent Williams study. These results would appear to provide some affirmation that a general set of distance education competencies that have emerged from the three studies explored here.

Research Question 3: What are the Similarities and Differences between the Current Study and Those Identified by Thach (1994) and Williams (2003)?

Although there appears to be much agreement between experts regarding many distance education competencies, it is clear that there is much less agreement between the three studies regarding the prioritization of the competencies.

We compared the top ten competencies identified in each study and found that the Thach and Williams study to emphasize communication competencies to be most important, while the current study focused on technology. This strong similarity in priorities set forth by the Thach and Williams studies is not shared by the advanced graduate students. As part of the study, the graduate students were asked possible reasons for the differences described in Table 3. Over 70% of respondents identified the top ten list in the current study to be similar to the emphases forwarded in their respective course curricula. Although not discussed at length in the other two studies, it would appear that the professional respondents may have emphasized communication related competencies because of their proximity to the realities of the day-to-day work. Many of the graduate students may have been left to make interpretations based on their experiences and the foci of their respective courses and programs.

Conclusions and Recommendations

This study sought additional clarification regarding perceptions of distance education competencies through an examination of advanced graduate student perceptions in comparison with the perceptions of professionals from two previous studies with very similar foci and research protocols. Participants in the study were asked to identify and rank roles and competencies associated with distance education. The study found respondents’ perceptions to be similar to the perceptions of professionals in two previous studies (Thach, 1994; Williams, 2003). Most of the roles identified were found to be similar with the addition, in this study, of a role called systems expert/consultant. Additionally, the competencies identified were found to be similar across all three studies. However, the emphasis in prioritization of the competencies was found to be different in the study we conducted from the previous two studies. Although the previous two studies by Thach and Williams emphasized communication competencies, the advanced graduate students group identified technology related competencies to be the most important.

The results of this study offer additional confirmation regarding roles and competencies associated with distance education. The data collected for this study in comparison with two previous studies move the distance education field closer to clearly delineating roles and competencies important to distance education. At the same time, the differences in prioritization between advanced graduate student and professionals should be examined more closely. The differences in prioritization between the two previous studies and student identification that their prioritization was influenced by course curricula begs the question “are the competencies needed for high performance being appropriately emphasized in university distance education courses or degree program curricula?” Further exploration into this issue is needed.

The Competitive Advantage of Online versus Traditional Education

Jillian A. Peat
Katherine R. Helland
University of Tennessee

This paper examined attitudes concerning the effectiveness of distance learning, and determined the impact these perceptions had on selection decisions. Results partially supported the hypotheses, demonstrating that individuals believed distance education was of lower quality than traditional classes, and this perception impacted their hiring decisions.

Keywords: Distance Education, Employee Selection

The past decade was witness to the revitalization of distance education as the world of academia met the World Wide Web. More specifically, a recent study by the National Center for Education Statistics (NCES) showed that between the time periods of 1994 to 1998, the number of distance education programs increased by 72% (U.S. Department of Education, 1999). The study also found that an additional 20% of the institutions surveyed by the NCES planned to establish distance learning programs and on-line degrees within the next three years, and that an estimated 1.6 million students were enrolled in distance education courses in 1997-98. Furthermore, on-line universities (i.e., University of Phoenix; Western Governors University) are growing in popularity with adults looking to further their education. Despite the attrition often found in distance learning settings, enrollment in the University of Phoenix’s online-MBA program grew 51% in 2001 (Mangan, 2001). The willingness of educators and students to embrace e-learning means it is easier to obtain a degree without setting foot on campus (Caudron, 2001).

Distance education, typically defined as structured learning in which the instructor and student are separated by time and space, uses the latest technology to bridge the gap between participants in education. (Ham, 1995; McIsaac & Gunawardena, 1996). Despite the rapid growth in technology-mediated learning to meet increased student demand, the quality of higher learning via distance education has been called into question. Specifically, there is a common perception among the public that distance learning is not as effective as traditional face-to-face education (Dede, 1996; Harrison, 2001). However, according to empirical evidence, there is no significant difference between traditional and technology-mediated learning (Arbaugh, 2000; Verduin & Clark, 1991). For instance, Russell (2002a) listed 365 distance education studies that found little difference in the quality of education received through distance learning versus classroom learning. That is, students taking distance learning courses performed as well as students taking courses via traditional methods (e.g., Gagne & Shepherd, 2001). Thus, Russell (2002b) argued that negative perceptions concerning distance learning are unfounded.

Nevertheless, researchers and practitioners agree that the successful implementation of any technology depends on factors related to the users’ attitudes and opinions (Webster & Hackley, 1997). Accordingly, several researchers (O’Malley & McCraw, 1999; Shea, Motivallla, & Lewis, 2001) have examined perceptions of distance learning and the various behaviors related to these perceptions such as not enrolling in distance education courses or verbally objecting to the implementation of such programs. For example, Anakwe and Kessler (2001) found that students who held favorable perceptions of Internet-based courses were more likely to enroll in distance education programs than students who held unfavorable perceptions. Dooley and Murphrey (2000) also showed that the rate of adoption of distance education technologies was influenced by administrators’ beliefs about the advantages of distance education, the degree to which the programs were perceived as compatible with the students’ needs, and perceptions about the difficulty of the technology.

While several studies have examined college students’ perceptions (e.g., O’Malley & McCraw, 1999), few have assessed employers’ perceptions regarding distance learning. Gray (2001) surveyed 247 employers from different companies about their hiring practices and all but a handful said they had not considered hiring an MBA with an online degree. However, Gray (2001) argued that there is a major difference between “had not considered” and “would not consider.” Furthermore, of the handful of employers that considered hiring MBA’s with on-line degrees, several stated that they preferred students with degrees earned by distance learning because it shows that these students are self-starters. Because this study only assessed whether employers considered hiring students with on-line degrees, the relationship between perceptions of on-line degrees and actual selection decisions was

Copyright © 2004 Jillian A. Peat & Katherine R. Helland
unknown. This examination is also important in that, to the researchers’ knowledge, no previous research attempt has been made to examine both employers’ and students’ perceptions of on-line learning and to assess whether these perceptions bear any weight when evaluating candidates and making selection decisions for a specific job.

Therefore, the main purpose of this study is to add to the current stream of distance learning literature by examining perceptions of distance learning and to assess whether these perceptions bear any weight when making selection decisions. Without the support of employers, the value of degrees earned online (i.e., obtaining a job or promotion) is limited. We believe that employers’ perceptions impact the practical utility of the degree. In particular, despite some evidence that distance education may be equivalent to or more effective than classroom instruction, leading to improved satisfaction with courses, greater learning, and increased transfer of materials learned (Russell, 2002b), these factors will not adequately impact hiring decisions if individuals in the workplace have not adopted this as “reality”. Thus, it is essential to assess perceptions of distance learning and willingness to hire individuals with online degrees.

Perceptions of Distance Education

Since the beginning of distance education, every form of mass communication technology (e.g., film, radio, television, and the Internet) has been used to transmit instruction and education from afar (Clark, 1994). Clark (2001) maintained that “each of these ‘new’ media have experienced similar problems providing credible evidence of solid educational success” (p.1). Furthermore, as technology changes, advocates of the latest and greatest teaching medium have a tendency to assume that their “new” technology is unique (Clark, 1995). Regrettably, advocates of on-line learning have failed to learn from past mistakes and have fallen into the same trap as earlier advocates of “new” technology. Like their predecessors, supporters of Internet-based learning are having difficulties in persuading the public that distance learning via the Internet is equivalent to face-to-face learning. As previously noted, Dede (1996) and Harrison (2001) found evidence that the public’s general perceptions of distance education are unfavorable and related to negative perceptions about technology.

Recent studies have shown that interest in technology (Massoud, 1991), computer-related confidence (Rosin & Well, 1995), and computer-related self-efficacy (Zhang, 1998) influence an individual’s attitudes, perceptions, and beliefs about technology. For instance, Zhang (1998) demonstrated that computer self-efficacy (i.e., students’ perceptions of their computer skills) was related to attitudes toward computer usefulness. Also, Davis (1989) found that perceived technology usefulness was positively associated with use and intention to use technology. Similarly, Anakwe and Kessler (2001) found that the perception of technology usefulness was related to intention to enroll in on-line courses. Consequently, they argued that, “the distance learner must believe that distance technologies are useful if they are to positively evaluate the potential of distance learning to them” (p.4). Thus, it is hypothesized (H1) that perceived technology usefulness will be related to perceptions of distance learning and on-line degrees.

Anakwe and Kessler (2001) also found a student’s intention to enroll in distance learning courses to be related to technology familiarity. The authors assessed familiarity by asking participants to report the average number of hours they spend on various media during a typical workday (e.g., World Wide Web, e-mail, and chat rooms). Additionally, Jackson, Chow, and Leitch (1997) found that prior use of technology was an important determinant of intentions to use technology. Therefore, it is hypothesized (H2) that the number of hours spent using technology in a week will be related to perceptions of distance learning and on-line degrees.

Perceptions of Academic Qualifications and Selection Decisions

Cognitive researchers are quick to point out that individuals perceptions are reality. Thus, if an individual perceives that an on-line degree is not comparable to traditional face-to-face learning, then for that individual his or her perception is “truth”. According to Fishbein and Ajzen (1975, p.5), “human beings are usually quite rational and make systematic use of the information available to them”. As noted by Ashford and Cummings (1993), individuals selectively attend to information that supports their hypotheses. In addition, the most immediate cause of behavior is an individual’s intention to engage in or refrain from the behavior (Ajzen & Fishbein, 1980), and intentions are partially determined by an individual’s attitude toward the behavior. Therefore, individuals who perceive distance learning as ineffective may attend only to information that supports their beliefs, and a negative perception toward a phenomenon such as distance education may predispose a person to act negatively toward that phenomenon (Pinder, 1998).

According to a meta-analysis conducted by Olian, Schwab, and Haberfeld (1988), academic qualifications account for 35% of the variance in selection decisions. Furthermore, Singer and Bruhns (1991) found that both work experience and academic qualifications impacted hiring decisions. Although their results indicated that the effect of academic qualifications was relatively larger than that of work experiences for students, the manager sample showed work experience had a greater effect than academic qualifications.

For decision makers, biographical data (e.g., academic qualifications, work experience) in the form of resumes and application blanks are the most commonly used information in personnel selection (Ash, Johnson, Levine, &
McDaniel, 1989). Research has shown that recruiters make distinctions regarding the importance of items among biographical data, and differences in the data can influence judgments of employment suitability (Brown & Campion, 1994). For an employer who has unfavorable perceptions of online degrees, academic qualifications should be a salient factor influencing hiring decisions. Therefore, it is hypothesized (H3) that individuals who hold negative perceptions regarding online degrees will be more likely to reject a candidate who earned his or her degree from an online university.

Method

Participants and Procedure

Two hundred one students (56% males and 44% females) attending a large southeastern university and 26 recruiters (60% males and 40% females) attending a university career fair participated in this study. The average student age was 21 years ranging from 18 to 25 years of age. The average employer age was 32 years ranging from 20 to 59 years of age. The student sample consisted of individuals currently pursuing a major in Business with many concentrating in human resources or general business (24%) and currently working in various entry-level managerial positions. Some HRD literature suggests that managers make more accurate selection decisions than other individuals lacking experience in hiring individuals (Gaugler, Rosenthal, Thornton, and Bentson, 1987). However, Weiner and Schneiderman (1974) and Mullins (1982) found that few differences exist between experienced samples and inexperienced samples with respect to interview ratings and hiring decisions. Consequently, both samples were examined.

Participants reviewed two job descriptions, two resumes, and two cover letters that were created by the authors. The job descriptions described an entry-level financial analyst opening for an undergraduate applicant and an upper-level Director of Talent Development opening for an MBA candidate. Participants were asked to review both the qualifications of an undergraduate and MBA candidate for two reasons: 1) participants were traditional undergraduates, thus they may hold more negative perceptions about students who pursue their bachelor’s degree in a manner that differs from their own experience and 2) the majority of students who enroll in distance education programs pursue advanced degrees rather than a bachelor’s degree (Daniel, 1995; Shea, Motowill, & Lewis, 1998). All participants received both job descriptions that included a job announcement, candidate requirements, and job responsibilities. Two resumes and cover letters were also constructed for each job including reference to either a traditional or distance institution; however, each individual reviewed only one resume and cover letter per job description. The sole difference between the two resumes and cover letters was the current educational institution (i.e., Bridgewater State College or Bridgewater College of Distance Education; Campbell University or Campbell School of Distance Education). Schools were chosen that would likely be unfamiliar to the participants, so that biases about actual schools would not affect the results, and gender-neutral names (i.e., Chris; Pat) were chosen for the applicants to avoid gender-related effects.

For the student sample, all relevant survey variables were collected in an introductory management class. Each student read both job descriptions (Financial Analyst and director of Talent Development) and was randomly assigned two resumes and cover letters (one for each job description). For the employer sample, all relevant survey variables were collected at the beginning of a job fair. Like the student sample, employers were also given both job descriptions and randomly assigned two resumes and cover letters. A manipulation check ensured that participants recognized the type of institution attended. After reading both sets of job descriptions, respondents completed all measures.

Measures

Demographic measures. Students and employers completed demographic items concerning gender, student status, education level, age, job title, major, etc.).

Hiring decisions. Respondents’ intent to hire the applicant was assessed by a single question (e.g., “Would you hire Chris Michaels for the financial Assistant Job?”). The instructions requested that they circle either “yes” or “no” and then provide rationale for their decision. Participants also specified their perceptions of the quality of education and work experience for each candidate on a Likert scale ranging from 1 (poor) to 5 (excellent).

Perceived technology usefulness. Respondents completed the perceived technology usefulness measure developed by Davis (1989). Each participant was asked to rate the usefulness of 10 technologies in everyday life (e.g., Internet, World Wide Web, e-mail, videoconferencing, chat rooms, etc.) from 1 (not at all useful) to 5 (very useful). The items were factor analyzed with a DIRECT OBLIMIN rotation that revealed one underlying factor with a reliability of .74.

Technological familiarity. Respondents were asked to indicate the number of hours spent during an average work week engaging in four online activities (e.g., e-mailing, conversing in chat rooms, surfing the Internet,
researching information on the Internet) using responses of “0-5 hours”, “6-10 hours”, “11-15 hours”, “16-20 hours”, or “21+ hours”. The reliability measure for this scale was .73.

Perceptions of distance learning. Perceptions of distance learning were measured by asking each participant to rate the effectiveness in education of 10 technologies (e.g., Internet, World Wide Web, e-mail, videoconferencing, chat rooms, etc.) from 1 (not at all effective) to 5 (very effective). The items were subject to a factor analysis using a VARIMAX rotation that revealed three factors (Table 1). The first factor (Fundamental Technology Effectiveness; \( \alpha = .57 \)) measured the effectiveness of technologies commonly used in the classroom that have been available for many years (i.e., telephone). The second factor (Basic Computer Technology Effectiveness; \( \alpha = .71 \)) measured computer technologies frequently used in everyday life (i.e., e-mail). Finally, the third factor (Advanced Computer Technology Effectiveness; \( \alpha = .71 \)) measured less popular computer technologies (i.e., videoconferencing).

Additionally, a one-item scale measured perceptions of degrees by asking participants to indicate if a degree earned from an on-line university is equivalent to a degree from a traditional university by selecting: 1 (no, on-line is better), 2 (yes), or 3 (no, traditional is better).

Results

In partial support of the first hypothesis, perceived technology usefulness was associated with students’ perceptions of distance learning. Specifically, perceived technology usefulness was positively correlated with a student’s perception of Fundamental Technology Effectiveness \( (r = .41, p < .01) \), Basic Computer Technology Effectiveness \( (r = .30, p < .01) \), and Advanced Computer Technology Effectiveness \( (r = .41, p < .01) \); See Table 2). Furthermore, perceived technology usefulness was positively correlated with an employer’s perception of Advanced Computer Technology Effectiveness \( (r = .53, p < .01) \); See Table 3). However, perceived technology effectiveness was not significantly associated with a student’s perception of on-line degrees and an employer’s perceptions of Fundamental Technology Effectiveness, Basic Computer Technology Effectiveness, and on-line degrees (See Table 2 and Table 3). Thus, the first hypothesis was partially supported.

Results also partially supported the second hypothesis that time spent on-line would be related to perceptions of distance learning. For the student sample, the total amount of time spent on-line during a typical week was positively correlated with the Basic Computer Technology Effectiveness subscale \( (r = .16, p < .05) \); See Table 2) and negatively correlated with perceptions of on-line degrees \( (r = .18, p < .05) \). That is, students who spend more time e-mailing, conducting research on the Internet, talking in chat rooms, and surfing the web are also likely to hold positive views of on-line degrees. Time spent on-line was not significantly related to student’s perceptions of basic technology and basic computer technology effectiveness, nor was it significantly related to employers’ perceptions of Fundamental Technology Effectiveness, Basic Computer Technology Effectiveness, Advanced Computer Technology Effectiveness and on-line degrees (See Table 2 and Table 3).

Note: * p < .05. ** p < .01. N = 26.

Finally, the third hypothesis was partially supported by the results. Specifically, employers who reported that on-line degrees were equivalent to degrees earned from a traditional university were more likely to hire a candidate who earned a bachelor degree on-line (hire on-line degree candidate; M = 1.80; do not hire on-line candidate; M = 3.00; t = -3.19; p < .01). However, there were no significant differences between employers’ who reported that on-line degrees were equivalent to degrees earned from a traditional university and employers’ who reported traditional
degrees were better than on-line degrees and the likelihood of hiring a candidate who earned a M.B.A on-line (hire on-line degree candidate; \( M = 2.25 \); do not hire on-line candidate; \( M = 3.00 \); \( t = -1.59; p = .14 \)). Furthermore, there were no significant differences between employers’ perceptions of technology effectiveness and their decisions to hire both the candidate who earned a bachelor degree on-line and the candidate who earned a M.B.A on-line. There were no significant findings for the student sample.

Qualitative analyses of the question asking respondents to indicate reasons for their hiring decisions were conducted to gather additional information about participants’ hiring decisions. They showed that 37% of respondents indicated work experience as the primary reason for their decision, whereas only 5% indicated their decision was based on education. The remaining 58% based their decisions on either a combination of education and work experience, resume presentation, or person-job fit. Furthermore, post hoc linear regression analyses using a STEPWISE selection procedure showed that the best predictor of selection decisions was the participants’ perception of the candidate’s quality of work experience. Specifically, quality of work experience accounted for 35% of the variance \( (p<.01) \) in a student’s decision to hire a candidate with an on-line bachelor degree and 31% of the variance \( (p<.01) \) in a student’s decision to hire a candidate with an on-line M.B.A.

Additional exploratory analyses demonstrated that students were equally as willing to hire a student with an online MBA as a student with a traditional degree, \( F(1,191) = 1.82, p = .18 \). However, they were less likely to hire a person with an online undergraduate degree than the same student with a traditional degree, \( F(1,198) = 10.29, p<.002 \). There were no significant results for the recruiter sample.

**Discussion**

The main focus of this study was to add to the current stream of distance learning literature by examining recruiters’ and students’ perceptions of distance learning and to assess whether these perceptions affect selection decisions for a specific job. The results of the correlation analyses showed at least partial support for all hypotheses. Specifically, the more useful a student views technology in everyday life the more favorable he or she will perceive the effectiveness of basic technology (e.g., telephones, videotapes, and audiotapes), basic computer technology (e.g., Internet and e-mail) and advanced computer technology (e.g., videoconferencing and Internet conferencing) for educational purposes. Furthermore, the more familiar individuals are with everyday technology the more favorable he or she will perceive the effectiveness of technology in education. Finally, participants with higher perception of an on-line degree are more likely to hire individuals with a distance degree.

Based on the results of this study, Fishbein and Azjen’s (1975) model was partially supported. That is, attitudes about distance learning generally impacted individuals’ intentions to hire an applicant. Specifically, those with higher perceptions of on-line degrees were more likely to hire both graduate and undergraduate students with a distance learning degree. However, perceptions of an on-line undergraduate degree were more negative than perceptions of an on-line graduate degree. One possible explanation for this finding is that more individuals are pursuing advanced degrees from programs that include on-line learning methods, but there are still a few who pursue their bachelor degrees from an entirely on-line university.

The results of this study, replicated Singer and Bruhns (1991) findings that individuals consider more than a candidate’s educational background when making hiring decisions. Post hoc analyses indicated that hiring decisions might be based on the evaluation of both work experience and quality of education. As such, academic qualifications represent only a portion of the variance in selection. Students may have relied on work experience for making hiring decisions since on-line programs are a relatively unknown commodity. That is, the effectiveness of on-line programs, although empirically demonstrated, has not been accepted in the Human Resources community. Thus, students likely consider work experience and education when making hiring decisions. Also, lack of familiarity with the institutions in this study may have led the participants to rely more on work experience and other information beyond education.

Limitations to this study include the reliability of the perceived technology effectiveness subscales and the time spent on-line scale. Additional research should be conducted on these measures. Future research should also include conducting studies using samples of recruiters from a variety of occupations and positions. Researchers should also vary the job types and work experience of the constructed candidates. More specifically, these participants read job descriptions for a Director of Talent Management and a Financial Assistant position. Different results may be found for jobs of varying technical involvement and for individuals with a diversity of work experiences and educational backgrounds. Since participants seemed less likely to discount the on-line graduate degree than the on-line undergraduate degree, additional research should investigate differing perceptions between distance degrees.

Although it has been established that “perception is reality”, the impact on hiring decisions has never before been examined. In this study, the type of education obtained, on-line versus traditional, seems to have some impact
on hiring decisions. Partial support was found for the three hypotheses, demonstrating that perceptions of distance education may influence decisions to hire or reject candidates. Consequently, this study has contributed to the human resource development literature, because it is the first study to examine the relationship between perceptions of distance learning and selection decisions. The usefulness of this research will ultimately be based on the extent to which the phenomena are researched further, thereby developing more parsimonious explanations of the relationship between on-line learning and selection decisions. In summary, this study provides some useful findings to add to the small body of distance education research. The results showed that students who graduate from on-line universities might be perceived differently in terms of their quality of education. Consequently, they may face more job market obstacles than the traditional student.

Adult Students’ Perceptions of Web and Interactive Video Classes

Dale E. Thompson
Cecelia Thompson
Buddy Lyle
Betsy Orr
University of Arkansas

The purpose of this study was to determine students’ perceptions of the delivery system for web and ITV classes at the University of Arkansas, and the students’ perceived level of learning as a result of participation in these classes. Overall, students had positive perceptions about their experiences in distance education at the University of Arkansas. Undergraduate students in this study preferred ITV courses, while graduate students were more positive about courses by web format.

Keywords: Adult Learners, Distance Education, Web Classes

Distance education is described as instructional delivery in which learners and teachers are separated during the learning process by time and/or space (Motamedi, 2001; Epstein, 1999). Distance learning began with correspondence work and has progressed through home study, independent study, computer-assisted learning, online learning and interactive video (ITV) (Berg, 2002).

Distance education in higher education often targets working students who cannot easily travel to campus to participate in traditional programs. In a study by Christensen, Anakwe and Kessler (2001), university students viewed distance education as a “tool to help them fulfill their needs (e.g. graduate on time) and less of a substitute to traditional studies” (p. 270).

The way university classes are delivered to students has changed dramatically and rapidly over the past few years. In the early 1990’s all classes at the University of Arkansas in vocational and adult education were traditional classes presented on campus. Now, many classes are presented by web or interactive video (ITV). The number of students served by the program has significantly increased as the delivery system changed. It is important to know how these students perceive instruction by web and ITV.

The Department of Rehabilitation, Human Resources and Communications Disorders at the University of Arkansas has designed programs with distance education to meet the needs of two groups of adults. One program is a master’s degree in vocational or adult education (VAED), and the other is a Bachelors of Science in Education with a concentration in human resource development (HRD) for employed adults who have completed part of a bachelor’s degree. Courses in both programs are offered by ITV and web.

Graduate courses offered only by ITV are Advanced Methods in VAED, The Change Process, Program Planning and Evaluation, and Training in the Workplace. Graduate courses offered only by web are Foundations of Vocational Education, Foundations of Adult Education, Instructional Materials in VAED, Learning in the Workplace, Curriculum Development, School-to-Work, and The Adult Learner.

Six faculty members offer graduate courses. Two faculty members, one adjunct faculty member and four instructors teach undergraduate courses. Minimal support was provided for learning methods of ITV instruction. A high level of support for development and management of web classes was provided by the Division of Continuing Education.

“Distance education is not for everyone. It often involves more learner dedication and initiative than traditional courses, since students may feel isolated” (Epstein, 1999). This isolation as well as balancing family, work and school obligations can affect students’ perceptions of their experience in distance education courses.

Studies have looked at the difference between traditional classroom-based courses and distance education. In distance education class, students can be in more than one setting. Interaction between students is more structured. In a traditional classroom there is more spontaneous sharing. Instructors must be more structured (concrete sequential) in distance settings. It is more difficult for distance students to have one-on-one communication with the instructor. Distance conversations are never private.

Copyright © 2004 Dale E. Thompson, Cecelia Thompson, Buddy Lyle & Betsy Orr
Motamedi (2001) stated that distance education offers opportunities for students that are different and sometimes superior to traditional classroom-based instruction. Parke and Tracey-Mumford (2000) found with a survey from thirty-one states that distance learning for adult learners is as effective as traditional instruction when appropriate methods are used for instruction and interaction among students and the teacher are built into the program. In a study by Spooner, Jordon, and Algozzine (1999), students’ overall perceptions and ratings of instruction were similar for classes offered on-campus and offered by ITV. Students who took on-line web classes at Tidewater Community College (Office of Institutional Effectiveness, 2001) indicated that they were more likely to use critical thinking in their on-line courses as compared to traditional. They also indicated that there was no difference in their motivation to learn in on-line courses.

Effectiveness of teaching seems to be rated differently by distance education students. In one study, the effectiveness of professors’ teaching was rated higher for traditional classes than for distance education classes by ITV (Anderson & Kent, 2002). In a study by Paulsen, Higgins and Miller (1998), students in ITV classes were satisfied with instruction; however, they preferred traditional classes with the instructor present.

Students seem to have difference experiences when sitting in a class with a professor or participating at a remote ITV site. Bower, Kamata and Ritchie (2001) found that ITV host-site students rated the instructor and course experience higher than remote-site students. Anderson, Banks & Leary (2002) also found that students at ITV remote sites were less satisfied with their instruction than students at the host site. Students at the host site in a study by Carter (2001) rated the class interaction higher than students at the remote sites.

Several other factors seem to affect students’ perceptions. Inman and Kerwin (1999) found that students in ITV classes judged the success of the class based on the availability of helpful materials for interacting in the class, the use of an on-campus orientation session at the beginning of the class, and the availability of the instructor when help was needed. Motamedia (2001) stated that the number of sites, number of students at sites, instructor’s teaching style, interactivity, motivation of students, course organization, attitude of participants and instructor preparation influence the success of ITV. Parke and Tracy-Mumford (2000) found that adult distance learners are highly motivated and self-disciplined, seek assistance when needed and are committed to learning.

**Purposes of the Study**

The primary purpose of this study was to determine the difference in students’ perceptions of the delivery system for web and ITV classes at the University of Arkansas. In addition, the researchers determined students’ perceived level of learning as a result of participation in these classes, students’ engagement in class activities, students’ perceptions of teacher and student interaction during distance education classes, and students’ perceptions of the physical learning environment.

Many students enrolled in Vocational and Adult education at the University of Arkansas take most or all of their classes by web and multiple-site interactive video. With the present emphasis on distance education at the University of Arkansas, there was a need to determine our students’ perceptions of the courses offered by distance education.

Graduate students majoring in adult or vocational education can take all of their coursework by distance education because of a statewide outreach program offered by the University of Arkansas. In this program, there are ten distance education sites located throughout the state. Students located on the main campus must take at least five courses by distance education and have the option of taking some courses in a traditional classroom. However, students located at remote sites complete their entire degree through web and ITV courses. Graduate classes are offered on a rotation basis. However, the students are not in a cohort group.

Undergraduate students in vocational education with a concentration in human resource development participate in a two-year rotation of ITV courses. During this rotation, they complete eight courses, which are only accessible through ITV. The undergraduate students are members of a cohort group. These undergraduate students also complete two or more courses by web.

**Methodology**

**Instrumentation**

A questionnaire for this study was developed based on a review of the literature examining factors that influenced students’ perceptions of distance education. The survey included items about the benefits of distance education, such as convenience of class location and scheduling; negative aspects, such as difficulty of interaction with other students and instructors or anxiety created by use of technology; presentation of class materials such as amount of material covered, organization of content, or variety of class activities; the learning environment required
for both types of learning, such as dealing with distractions during class or study time; level of self-direction required by learners; expectations for classes; and level of learning.

Participants were asked to indicate their level of agreement or disagreement (strongly agree, agree, neither agree or disagree, disagree, strongly disagree) with 33 statements. The first nine statements were for all participants and focused on their overall perceptions of distance education. The next 10 statements were for participants who had taken courses by ITV (interactive audio-video). The next 14 statements were for those who have taken courses by web. The survey also contained demographic factors including gender, age, college major, site location, number of ITV classes taken, and number of web classes taken. They also indicated their preference of ITV or web and made open-ended comments regarding their experience with distance education. (See appendix A)

The instrument was field tested for content, format, and clarity by a group of faculty and vocational and adult education students.

Sample

The survey was administered during the spring 2003 semester to 122 graduate and undergraduate students representing adult and vocational education majors. Web and ITV graduate students at distance sites completed the survey by e-mail. Students in local ITV sites completed a written questionnaire that was distributed by class instructors. Undergraduate students completed questionnaires distributed by an HRD faculty member at a cohort meeting.

Data Analysis

Basic descriptive statistics were computed for all items. SPSS was used to compute t-tests, analysis of variance and factor analysis.

Findings

Most (94, 77.0%) of the students were female and 28 (23%) were male. Nine (7.4%) were under 25 years of age while 45 (37.2%) were 25 to 34 years old. Forty-one (33.6%) were 35 to 44 years of age and 26 (21.5%) were in the 45 to 54-age range. One student was 55 years old or older.

Just over half of the students (63, 51.6%) were undergraduate students in human resource development, while 59 (48.4%) were graduate students in vocational or adult education. Students were located throughout the state of Arkansas. Thirty-seven (30.3%) students were located in Fayetteville at the main campus of the University of Arkansas, and 85 students were participating in the programs at distance sites throughout the state.

Some participants were enrolled in their first distance education class, while others had experienced both presentation formats. The number of ITV classes completed by the participants ranged from 1 to 18. The majority (44, 36.4%) had taken four ITV classes. Twenty-two (18.2%) students had completed eight ITV classes. Only 10 (8.3%) students had finished one ITV class and six students (4.9%) had completed no ITV classes.

Students involved in web classes took from 1 to 9 classes. Thirty-two students (26%) completed one web class, while 22 (18.2%) had taken two. Twenty-eight (23%) took more than two classes. Forty (32.8%) of the participants had never enrolled in a web class.

Seventy-six (62.3%) of the students had taken both ITV and web classes. When these students were asked if they would prefer to take ITV or web classes, approximately half indicated a preference for each with 47.7% choosing ITV and 52.3% choosing web. Undergraduate students indicated a preference for ITV courses, while graduate students preferred web.

Overall, the means for all items indicated satisfaction with web and ITV courses. Students felt their learning was adequate in ITV courses with a mean of 4.60. They indicated that instructors used class time effectively in meeting course objectives (m=4.52). Students felt free to express their ideas and were not deterred by cameras and microphones (m=4.45). They also felt classes were paced properly (m=4.43).

Students indicated that web classes allowed them to think over their responses to class assignments (m=4.46). They felt learning in web classes was adequate with a mean of 4.35. Students indicated that web classes improved their computer skills (m=4.20). Students also felt comfortable posting their thoughts and ideas on the discussion board with a mean of 4.18.

In general, when describing their perceptions of distance education, both ITV and web classes, student indicated that instructors encouraged participation (m=4.80). They would recommend that other students take similar courses with a mean of 4.72. Students indicated that they were required to take control and be responsible for some aspects of the classes (m=4.70). They found that distance instructors were available and felt a sense of accomplishment, both items with means of 4.68.

One-way analysis of variance was computed to compare students’ scores on perceptions of distance education (overall, ITV and web) and age of students. There was no significant difference in perceptions at the .05 level.
Students’ perceptions of distance education (overall, ITV and web) and gender as well as academic standing were compared with t-tests. There were no significant difference between scores on perceptions and gender. A significant difference (p<.01) was found between students’ perceptions of web classes and academic status. Graduate students rated their perceptions of web classes (m=4.06, s.d.=.60) higher than undergraduate students (m=3.67, s.d.=.51). There was a significant difference (p<.05) between students overall perceptions of distance education and academic status. Undergraduate students had a more positive attitude about distance education (m=4.67, s.d.=.38) than graduate students (m=4.46, s.d.=.43). There was no significant difference between perceptions of ITV and academic status.

The items in the questionnaire that focused on overall perceptions of distance education, ITV classes and web classes were factor analyzed by section to examine the relationship between the statements and describe any underlying thematic structure. The factor analysis of the section on overall perceptions of distance education revealed that eight of the nine items accounted for 60.13% of the variance. The two factors reflected the two purposes of the study. The first factor, which accounted for 45.4% of the variance, reflected four items related to the delivery system of ITV and web classes. The factor loading ranged from 0.83 to 0.60. The second factor that accounted for 14.7% of the variance reflected four items related to perceived level of learning. The factor loading for the second factor ranged from 0.80 to 0.56.

Three factors emerged from the factor analysis of the ten items related to ITV. Nine of the items accounted for 72.6% of the variance. The researchers labeled the three factors as classroom environment, student interaction via ITV and level of learning. The six items in factor one (classroom environment) and three (student interaction via ITV) were related to the delivery system and accounted for 57.2% of the variance. Three items in factor two were related to perceived level of learning as a result of participation in ITV classes and accounted for 15.4% of the variance.

Five factors emerged from the 14 items focused on web courses that accounted for 77.06% of the variance. The factors were named sharing information, thinking, independent study, expressing ideas, and computer skills. Four of the five factors were related to students perceived level of learning and accounted for 69.74% of the variance. The fifth factor, computer skills, accounted for 7.3% of the variance and was related to the delivery system for web classes.

In comments from students, their responses indicated that they felt both ITV and web were worthwhile ways to offer classes. Many students commented that they would be unable to obtain and complete their studies without the distance education program. Students indicated that they spent more time reading and studying for web courses than ITV classes but enjoyed the social contacts in ITV classes. The web classes allowed students to work at their own pace and at convenient times. The web class also allowed everyone to express their own opinions.

Some specific student comments were: “Distance education is not my choice.” “Distance education is the only way I could obtain my degree.” “Having been in both ITV and web classes, I feel that both are worthwhile and have their place in higher education.” “I agree with distance education because it gives up more opportunities, but I still prefer a traditional classroom.” “I believe that distance education courses are a tremendous resource, especially for students who don’t live in close proximity to the main campus.” “I enjoy ITV more than web. I am a people person and get easily distracted on the computer.” “I enjoy the ITV classes, but I need the relative freedom of the web classes. I found that I do more work for the web classes. I spend more time on assignments for web classes than class time and assignment times put together for ITV classes.” “I feel web-based classes allow more flexibility for the learner who has job and family responsibilities.” “I felt the opportunity to interact with students from a variety of locations more than compensated for any difficulty presented by the technology of ITV.” “With ITV, there needs to be some form of control over excessive individual response time.” “I have enjoyed both settings. I like the web class because I can work at my own pace and at convenient times. I prefer ITV class because I get to see the instructor and my classmates.” “I love the freedom that web courses allow. I do a lot more reading and studying for my web course.” “In ITV classes, the students spend too much time talking among themselves and not listening to the instructor.” “The web classes better prepare a student for real-life work experiences through research methods required, interaction through discussion board (writing concisely and detailed), and becoming proactive on class work.”

Summary and Conclusions

Although this study compared undergraduate and graduate students in two different programs, the students were all nontraditional students. Most were part-time students taking evening and weekend classes. Almost all were employed in full-time jobs.
Overall, students had positive perceptions about their experiences in distance education at the University of Arkansas. These programs allowed students to continue and complete their education regardless of their location in the state as well as job and family obligations. All of these students were enrolled in a program specifically designed to meet their needs as non-traditional students. Distance education was an integral part of the degree program. Their efforts were supported with an on-campus staff. Undergraduate students had a significantly higher perception of distance education than graduate students.

Undergraduate students in this study preferred ITV courses. These students were enrolled in cohort groups and took eight ITV classes with the same classmates throughout a two-year course rotation. The students in each cohort group developed close friendships and working relationships despite being separated by great distances.

The graduate students were more positive about courses by web format. These courses allowed graduate students to work at their own pace and at convenient times. The web classes allow them to devote more time and effort to the assignments. The challenge of web classes seemed to appeal to graduate students.

This study shows that distance education by ITV or web is clearly meeting the needs and expectations of adult students. Students feel positive about their learning experiences regardless of the mode of instruction.

Based on the results of the factor analysis of questionnaire items, it appears that classes presented by web place more emphasis on learning and less emphasis on the delivery system. The responsibility for studying, researching and learning falls completely on the student when they participate in web classes. They must also assume accountability for time management and scheduling. It is not possible to be a nonparticipant in a web class, because it is an individualized endeavor even when group activities are part of the class format.

Students in this study have taken ITV and web classes from a number of instructors in vocational and adult education. Approximately 80% of the students had taken four or more ITV classes with at least four different instructors. Forty percent of the students had taken at least two web classes from different instructors.

From the results of the factor analysis, it appears that the delivery system and the instructor make a greater difference in ITV classes than in web classes. The structure, format, and requirements of web classes vary little from instructor to instructor because of the course delivery by computer. However, there is great variation in the way ITV classes are presented and perceived by the students. The instructor’s teaching style, class structure, organization of content, utilization of time and resources, and encouragement of student interaction can differ greatly in ITV classes. The technology of the delivery system can inhibit students from expressing their ideas and thought.

The experience of participating in an ITV classes is guided more by the instructor than in web classes. The learning is the result of teacher-student and student-student interaction. The experience of taking web classes is equal for all participants since the student is responsible for their own learning and involvement.

**Distance Education Survey**

This survey examines your perception of distance education courses offered in the Department of Rehabilitation, Human Resources and Communication Disorders. Please answer the following items from your point of view. There are no right or wrong answers. Participation in this study is voluntary and confidential. If you do not wish to participate, do not answer the items. Do not put your name on the survey.

The objectives for this study are to:
Examine students’ perceptions of the different delivery systems of Interactive Television (ITV) and web. The ITV classes are offered once a week at multiple sites.
Determine students’ perceived level of learning and engagement in class activities.
Determine students’ perceptions of teacher and student interaction during distance education classes.
Evaluate the physical learning environment of the distance education labs.
Evaluate students’ course preference.

**Demographics:**

1. Gender
   - Female
   - Male

2. Age
   - 25-34
   - 35-44
   - 45-54
   - 55 or over

3. Area
   - Adult Education
   - Human Resource Development-Undergraduate
   - Vocational Education
   - Other

4. Site/your location

5. How many ITV classes have you taken?

6. How many web classes have you taken?

**Please Respond to the Following Statements by Circling the Number that Reflects Your Opinion.**

5 = Strongly Agree
4 = Agree
3 = Neither Agree nor Disagree
2 = Disagree
1 = Strongly Disagree

1. Distance education classes increase my self-directedness.  
2. My distance education instructors are available and helpful.
3. The quality of my education has not been compromised by distance education. 5 4 3 2 1
4. My distance education instructors encourage student participation. 5 4 3 2 1
5. I enjoyed getting to know fellow class members through distance education. 5 4 3 2 1
6. I had a sense of accomplishment after completing distance education courses. 5 4 3 2 1
7. The method of course presentation kept my interest high throughout the entire course. 5 4 3 2 1
8. I would recommend that other students take similar courses. 5 4 3 2 1
9. ITV and web classes require students to take control and be responsible for some aspects of the class. 5 4 3 2 1

Respond to the Following Statements if you Have Taken an ITV Course.

10. The length of class periods is appropriate. 5 4 3 2 1
11. The ITV classrooms are physically comfortable for students. 5 4 3 2 1
12. The ITV classes provide a comfortable environment for learning. 5 4 3 2 1
13. I feel free to express my ideas and opinions in ITV classes. 5 4 3 2 1
14. ITV classes are paced appropriately. 5 4 3 2 1
15. Being in a classroom with cameras and microphones does not deter my learning. 5 4 3 2 1
16. Being on camera and speaking on a microphone does not make me nervous. 5 4 3 2 1
17. Students located at the site with the instructor do not monopolize the discussion. 5 4 3 2 1
18. My instructors have used classtime effectively in meeting the course objectives. 5 4 3 2 1
19. I feel my learning has been adequate in ITV classes. 5 4 3 2 1

Respond to the Following Statements if you Have Taken a Web Class.

20. Web classes improve my computer skills. 5 4 3 2 1
21. I spend more time working on assignments for my web class than other classes. 5 4 3 2 1
22. I feel comfortable posting my ideas and thoughts on the discussion board. 5 4 3 2 1
23. I take time to think over my responses for my web class. 5 4 3 2 1
24. I feel that my learning has been adequate in web classes. 5 4 3 2 1
25. I don’t miss the additional information that might be shared by the instructor in a more traditional class setting. 5 4 3 2 1
26. I don’t miss seeing my classmates and instructors. 5 4 3 2 1
27. I enjoy reading other students’ assignments on the discussion board. 5 4 3 2 1
28. The discussion board fulfills my need to discuss and share course content with others. 5 4 3 2 1

29. I find it easier to write my thoughts rather than verbalize them. 5 4 3 2 1

30. Web class assignments require more research. 5 4 3 2 1

31. Working independently requires me to find additional resources. 5 4 3 2 1

32. Web classes allow me to be free for my own thoughts and expressions. 5 4 3 2 1

33. Posting assignments to the discussion board allows me to express how I feel about issues. 5 4 3 2 1

Respond to the Following Statement if you Have Taken both ITV and Web Classes

34. If you had a choice, would you prefer ITV or web classes? _____ ITV classes _____ Web classes

35. Feel free to make any additional comments about your experiences with distance education.
Reconceptualizing the Learning Transfer Conceptual Framework: Empirical Validation of a New Systemic Model

Constantine Kontoghiorghes  
Cyprus International Institute of Management

The main purpose of this study was to examine the validity of a new systemic model of learning transfer and thus determine if a more holistic approach to training transfer could better explain the phenomenon. In all, this study confirmed the validity of the new systemic model and suggested that a high performance work system could indeed serve as a catalyst to successful learning transfer.

Keywords: Motivation to Learn, Motivation to Transfer, Learning Transfer

In recent years the topic of learning transfer has become very popular among HRD researchers. Aside from being a relatively new topic that provides numerous research opportunities, its popularity can also be attributed to its importance in terms of HRD practice, as well as the failure rates many ascribe to it. As it has been widely reported in the literature, training investments often fail to deliver the desired and expected outcome. It has been reported that despite the vast amounts of money organizations spend on employee training, only about 10% to 15% of it is actually transferred back to the workplace (Baldwin & Ford, 1988; Broad & Newstrom, 1992; Burke & Baldwin, 1999; Facteau, Dobbins, Russell, Ladd, & Kudisch, 1995). Hence, through different approaches researchers have attempted to offer better explanations of the learning transfer phenomenon and thus provide answers with regard to what factors can facilitate or impede the learning transfer process.

In general, the majority of training transfer research relies on mostly two conceptual models when explaining the learning transfer process. These two conceptual models are based on Vroom’s (1964) expectancy theory and the Baldwin and Ford (1988) transfer of training model. Expectancy theory, as applied to training transfer, suggests that employees will be motivated to attend HRD programs and try to learn from them if they believe: a) their efforts will result in learning the new skills or information presented in the program; b) attending the program and learning new skills will increase their job performance; and, c) doing so will help them obtain desired outcomes or prevent unwanted outcomes (DeSimone, Werner, & Harris, 2002).

Baldwin and Ford’s model asserts that the effectiveness of a training intervention is contingent upon many variables. Training design, trainee characteristics, and work-environment characteristics are considered to be the most important sets of variables. Under the training design dimension one is concerned with principles of learning, sequencing of training content, and training content. Trainee characteristics refer to such personal traits as ability, personality, and motivation. The work environment under the Baldwin and Ford model is viewed in terms of the level of support the trainee receives from his or her supervisor and coworkers when acquiring and using new skills, knowledge, and behaviors. Further, under the work environment dimension one is concerned with the extent to which the trainee has the opportunity to use and practice what he or she has learned in training.

In terms of research, the following factors have been found by researchers to facilitate the learning transfer process: self-efficacy (Ford, Quinones, Sego, & Sorra, 1992; Tannenbaum, Mathieu, Salas, & Cannon-Bowers, 1991); principles of learning used (Decker, 1982); ability (Robertson & Downs, 1979); supervisory and coworker support for training (Clark, Dobbins, & Ladd, 1993; Facteau, Dobbins, Russell, Ladd, & Kudisch, 1995; Kontoghiorghes, 2001a; Tharenou, 2001); the similarity of training content with actual task performed (Axtell, Maillis, & Yearta, 1997; Kontoghiorghes, 2002; Rouiller & Goldstein, 1993); intrinsic and extrinsic rewards for using the newly learned skills and knowledge (Rouiller & Goldstein, 1993; Kontoghiorghes, 2001a; Tracey, Tannenbaum, & Kavanagh, 1995); training accountability (Kontoghiorghes, 2002); job utility—the perceived usefulness of training for attainment of career goals (Clark et al., 1993); career utility—the perceived usefulness of training in facilitating the attainment of job goals (Clark et al., 1993); job involvement (Mathieu, Tannenbaum, Salas, 1992; Noe & Schmitt, 1986); organizational commitment (Facteau et al., 1995; Kontoghiorghes, 2002); motivation to learn (Holton, Bates, & Ruona, 2000; Kontoghiorghes, 2002; Mathieu & Martinez, 1997; Tracey, Hinkin, Tannenbaum, & Mathieu, 2001); and, motivation to transfer (Facteau et al., 1995; Kontoghiorghes, 2002; Ruona, Leimbach, Holton, Bates, 2002; Tannenbaum et al., 1991; Warr, Allan, & Birdi, 1999).

Schematically, the conceptual framework that has traditionally governed learning transfer research is displayed in the non-shaded area of Figure 1 (Kontoghiorghes, 2002). A close look at the diagram will reveal most factors studied under the traditional conceptual framework pertain mostly to trainee characteristics, and attributes that are directly related to the training context or training related outcomes. Furthermore, the work environment is defined
in terms of characteristics that mainly describe the training transfer climate. Hence, one can argue that the conceptual framework of traditional training transfer thinking treats training as a non-systemic phenomenon, independent of the variables that affect performance. Thus, important non-training related organizational factors that directly or indirectly influence performance, and hence the trainee’s belief that training can actually result in enhanced performance, are excluded from current training transfer research designs.

Figure 1. Traditional Vs Systemic Model of Training Transfer

A recent study that attempted to investigate the learning transfer phenomenon in more holistic terms was that conducted by Kontoghiorghes (2002). What differentiated this study from the previous ones is that it took a more systemic approach toward learning transfer and incorporated in its design sociotechnical (STS) and quality management (QM) dimensions that were perceived to affect employee and organizational performance as well. In all, this study incorporated in its design variables from the following learning and organizational dimensions: training transfer climate; learning climate; management practices; employee involvement; organizational structure; communication systems; reward systems; job design; job motivation; organizational commitment; job satisfaction; innovation practices; technology management; teamwork climate; ethical work culture; quality management; and process improvement climate. Given that the ultimate goal of training is to improve performance, the underlying assumption of this study was that motivation to learn and motivation to transfer learning back to the job not only would be influenced by the immediate learning environment but by organizational variables that are perceived to also influence employee and organizational performance. In short, organizational commitment, task cues, and coworker commitment to quality work were found to be the strongest predictors of motivation to learn. Motivation
to learn, a motivating job, and being expected to use the newly learned skills and knowledge on the job were found to be the most important predictors of motivation to transfer. Other STS and QM variables that were found to significantly predict motivation to learn and/or transfer were task autonomy, participative organization, customer loyalty, excellence commitment, opportunities for advancement, and rewards for teamwork.

In summary, the Kontoghiorghes (2002) study suggested that the work environment as it relates to performance, and not necessarily to training transfer climate, could be another critical dimension for training effectiveness. The significance of the work environment can be highlighted by the fact that nine of the eleven predictors of the motivation to learn regression model, as well as five out of six for the motivation to transfer model pertained to organizational environment variables and not the training transfer or learning climate. This finding exemplified the systemic nature of training effectiveness and demonstrated the importance of the organizational climate when addressing the learning transfer issue.

The expanded conceptual framework of training transfer as derived from the results of the Kontoghiorghes (2002) study is depicted in Figure 1 via the shaded component representing the work environment. As shown, the expanded model provides a more holistic interpretation of the learning transfer process and identifies individual and organizational performance as the common link between learning transfer and work environment characteristics. In other words, this new conceptual model for learning transfer provides the answers to the questions of how and why the work environment is an important component of learning transfer. Given that the ultimate desired outcome of training interventions is to improve individual and organizational performance, the more the work environment is conducive to high performance, the more the trainee will believe that his or her learning efforts will result in an attainable and desirable outcome. This in turn will translate into higher levels of motivation to learn during training and motivation to transfer learning back to the job. A limitation of the Kontoghiorghes (2002) study was the fact that the data was collected from a single source with a predominantly salaried female population. Thus, replication of the study in different organizational settings and industries in order to determine the validity of the results and proposed model was recommended.

Purpose of the Study

The main purpose of this study was to replicate the Kontoghiorghes (2002) study in another organization and industry and thus determine the extent to which the previous findings and proposed conceptual model of learning transfer could be validated in a different setting. Furthermore, this study attempted to expand on the earlier study by also identifying the main learning transfer climate and work environment predictors of training transfer, in addition to those pertaining to motivation to learn and motivation to transfer learning back to the job.

Research Questions

This study attempted to answer the following research questions:
1. Which of the organizational and learning climate variables incorporated in the study can serve as key predictors of motivation to learn during training?
2. Which of the organizational and learning climate variables incorporated in the study can serve as key predictors of motivation to transfer learning back to the workplace?
3. Which of the organizational and learning climate variables incorporated in the study can serve as key predictors of training transfer?
4. What is the relationship between motivation to learn, motivation to transfer, and training transfer?
5. To what extent are the results of this study in agreement with those of the Kontoghiorghes (2002) study?

Methodology

Instrument

The instrument of this study consisted of a 109 Likert item questionnaire, which was designed to assess the organization in terms of the earlier described dimensions. Many of the dimensions were assessed with scales that were described in previous literature or research (Buckingham & Curt, 1999; Hackman & Oldham, 1980; Kontoghiorghes, 2003; Kontoghiorghes, 2002; Kontoghiorghes, 2001a; Kontoghiorghes, 2001b; Kontoghiorghes & Dembeck, 2001; Lindsay & Petrick, 1997; Macy & Izumi, 1993; Pasmore, 1988; Rouiller & Goldstein, 1993; Tracey, Tannenbaum, & Kavanagh, 1995; Whitney & Pavett, 1998), while several were designed specifically for this study. The instrument utilized a six-point scale that ranged from “strongly disagree” to “strongly agree”. The first version of the questionnaire, which consisted of 99 Likert items, was originally pilot-tested on a group of 15
participants for clarity. Furthermore, a group of seven experts reviewed the instrument for content validity. Upon revision, the instrument was then administered to a group of 129 members of four different organizations. Reliability tests were conducted and the instrument was further refined and expanded to 108 items. The instrument was next administered to 505 employees of three different organizations. Upon further refinement and expansion the instrument was then used for the purposes of this study. As stated earlier, in its final format the instrument consisted of 109 Likert items.

**Subjects**

The sampling frame of this study consisted of 300 employees of the information technology division of a large automaker in the United States. Given that 198 of the prospective participants returned the survey, the response rate was calculated at 66%. In all, 75.1% of the respondents were males and 24.9% females. In terms of education, 21.2% had a high school degree, 20.7% an associates degree, 43% a bachelors degree, and 14.5% a masters degree. One respondent did not indicate an educational level. In terms of position held in the organization, the frequency distribution identified 2.0% of the respondents as senior management personnel, 7.7% as middle managers, 13.3% as supervisors, 41.3% as salaried professionals, 1.5% as administrative personnel, and 34.2% as contract employees.

**Data Analysis**

With regard to data analysis, the instrument was construct validated through a principal components analysis, which utilized a varimax rotation. The generated factors were in turn used to build stepwise regression models for motivation to learn, motivation to transfer, and training transfer. Thus, through stepwise regression analysis the most important training transfer, sociotechnical, and quality management dimensions for motivation to learn, motivation to transfer, and training transfer were identified, prioritized and described. It should be noted that only factors that had an eigenvalue of 1 or greater were retained for this study.

**Results and Findings**

**Principal Component Analysis**

The principal component analysis that utilized a varimax rotation produced a 13-factor solution that accounted for 68.9% of the total variance. The sample size utilized for the principal components analysis was 178 for which the critical value for significant loadings was calculated at 0.38. Each rotated component had loadings above the critical value, with 0.383 being the lowest factor loading. In all, the factorial solution was able to differentiate between the assessed dimensions and thus construct validated the scales used. The reliabilities of the produced factors as well as the number of items comprising each factor are shown in Table 1. As shown, the majority of the factors had a coefficient alpha in the 0.73 to 0.89 range. The only exception was the Knowledge Management factor (Factor 13; coefficient alpha = .57), which was found to exhibit a relatively low reliability and was thus excluded from further analysis.

**Motivation to Learn Regression Model**

As it is shown in Table 2, the stepwise regression model incorporated in its design four of the possible 12 factors as well as the organizational commitment variable. In all, the independent variables accounted for 37.4% of that total variance. At 4.8% shrinkage is considered very small thus reflecting a cross-validated regression model. Accounting 26% of the total variance the positive learning transfer factor proved to be the strongest predictor of the
dependent variable. The other independent variables selected by the regression model were awareness of how one’s job contributes to the organization’s quality mission, rewards and recognition for new ideas and good performance, the extent to which the employee functions in a system that promotes risk taking and innovation, and the extent to which the employee is committed to the organization.

\(^{c}\) \(F = 20.5, p < 0.001\)

Motivation to Transfer Regression Model

As shown in Table 3, the four independent variables selected by the motivation to transfer learning back to the job regression model accounted for 46.9% of the total variance. Again, as in the case of motivation to learn, a positive learning transfer climate was found to be the strongest predictor. The remaining three variables in the model reflected the extent to which the employee found his or her job motivating and satisfying, was committed to the organization, and was motivated to learn during training. At 2.5% shrinkage is very small and indicative of a cross-validated model.

\(^{c}\) \(F = 38.27, p < 0.001\)

Training Transfer Regression Model

Table 4 depicts the stepwise regression model for the training transfer variable. As shown, the eight independent variables in the model accounted for 49% of the total variance. Once again, a positive learning transfer climate was found to be the strongest predictor in the model and accounted half of the total variance explained. The remaining independent variables in the model pertained to the various work environment dimensions assessed by the instrument. The only exception was the motivation to transfer variable, which accounted for 1.3% of the total variance. It is worth noting that although motivation to learn was included in the selection process it failed to load onto the model. In terms of shrinkage, at 4.9% it is again found to be very small thus providing cross-validation evidence for the regression model.

Conclusions and Recommendations

Taking a close look at the generated regression models of the motivation to learn, motivation to transfer, and training transfer variables will reveal that the strongest predictor of each one of the dependent variables was the factor that pertained to a positive learning transfer climate. This was an expected finding, which in turn validated the importance of a positive training transfer climate when training effectiveness is desired. It is worth noticing that the training transfer factor accounted no less than 50% of the explained variance in each of the respective regression model. However, what is also worth noticing is the critical importance of the work environment, and the organizational culture in particular, when explaining the training transfer phenomenon. In all, the results of this study confirmed those of the Kontoghiorghes (2002) study and demonstrated the systemic nature of training transfer.

In terms of the individual dependent variables, aside from a positive learning transfer climate, motivation to learn was also found to be significantly related to such factors as awareness of how one’s job contributes to the organization’s quality mission, rewards for recognition for new ideas and performance, risk taking and innovation driven culture, as well as organizational commitment. Given that these factors have been often found by research to influence employee and organizational performance, it is safe to conclude that an employee’s motivation to learn during training will not only be affected by the extent to which the work environment is conducive to learning transfer, but to high performance and commitment as well. As far as motivation to transfer learning back to the job is concerned, the results of this study confirmed once again its close association to a positive learning transfer climate and validated the findings of the Kontoghiorghes (2002) study which found it to be highly associated with job motivation and satisfaction as well as organizational commitment. Thus, it is once again safe to conclude that motivation to transfer is closely related to work environment variables that are not usually covered by typical learning transfer research.

The close association of successful training transfer with a high performance organizational culture is exemplified further by the results pertaining to the training transfer regression model. As shown in Table 4, in addition to a positive learning transfer climate and motivation to transfer, successful training transfer was found to be significantly predicted by such factors as organizational commitment, a high performance team environment, job motivation and satisfaction, awareness of how one’s job contributes to the organization’s quality mission, a risk taking and innovation driven culture, as well as a quality driven culture. Collectively these factors characterize a high performance work system and demonstrate that training transfer cannot be studied in isolation. Since the ultimate desired outcome of any training intervention is to improve performance, it can be expected that organizational factors that impact individual or organizational performance to also have a moderating effect on successful training transfer. Thus, exclusion of such organizational factors from training transfer research designs may lead to limited understanding of the training transfer phenomenon.

Contribution to New Knowledge in HRD

As it was stated earlier, one of the main purposes of this study was to examine the validity of a new systemic model for learning transfer. In all, the results of this study suggest that a more systemic training transfer conceptual
framework that incorporates in its design work environment dimensions, which in turn influence individual and/or organizational performance, could indeed better explain the training transfer phenomenon and training effectiveness in general. Moreover, the findings of this study support the argument made by Kontoghiorghes with regard to expectancy theory as applied to training transfer. In particular, it was argued that expectancy theory can be better utilized in the training transfer literature if it is applied at two different but nested levels: the training context level; and, the individual and/or organizational performance level. At the first level, or the training context level, one is concerned with the degree to which the trainee believes that a) his or her efforts will result in actual learning; b) learning can indeed be transferred back to job, given the realities of the training transfer climate; and c) application of new skills and knowledge is directly linked to intrinsic and extrinsic rewards. At the second level, or the employee/organizational performance level, one is concerned with the degree to which the employee believes that a) application of new skills and knowledge can indeed lead to enhanced individual and/or organizational performance, given the realities of the work environment and organizational culture; and b) enhanced individual and/or organizational performance can lead to desired and valued outcomes. In sum, this study contributes new knowledge to the field of HRD by presenting to scholars an expanded and more holistic conceptual framework of the training transfer phenomenon and providing practitioners an additional set of variables to consider when evaluating training program effectiveness.

Limitations and Future Research

The main limitation of this study is that the data was gathered from a single source. Thus, gathering more data from multiple sources in different industries will further assist in the validation of this and the previously conducted study. Moreover, the results of this study once again ascertained the close relationship between the work environment and successful learning transfer. However, not all possible organizational factors that could directly or indirectly influence motivation to learn, motivation to transfer, and learning transfer have been incorporated in this study. Hence, further research that identifies and describes additional organizational factors that could influence the learning transfer process can assist in better explaining of the learning transfer phenomenon.

A Theoretical Framework for Addressing Training Needs Associated with Sexual Harassment Prevention Programs

Mary Lynn Berry
Michael Lane Morris
The University of Tennessee

There has been little research on evaluating sexual harassment prevention programs. Furthermore, no study has examined the learning transfer system with regards to sexual harassment prevention programs. This paper sought to provide a framework for researchers and practitioners alike to organize and understand this particular learning transfer system in an effort to improve prevention programs to more successfully decrease the occurrences of sexual harassment in the workplace.

Keywords: Sexual Harassment, Learning Transfer System, Training Transfer

Despite laws prohibiting sexual harassment and millions of corporate dollars spent training workers about the ramifications of sexual harassment, the problem of sexual harassment has continued to persist (Slobodzian, 2000). This is not surprising since training (in general) has been said to transfer to the work environment only 10-15% of the time. There is a paucity of information in the sexual harassment and transfer training literature examining the transfer system as it relates to sexual harassment. Because of this gap, a theoretical framework is needed.

Theoretical Framework

Major theories explaining sexual harassment and the learning transfer system serve as a foundation on which to build a description of areas within the learning transfer system that can potentially encourage or inhibit transfer of training of sexual harassment prevention programs. A useful approach to developing a theoretical framework should weave the elements pertaining to sexual harassment within the pre-existing general framework of the transfer system. The theoretical framework of the learning transfer system as it relates to sexual harassment would be useful in better understanding how sexual harassment prevention programs should be conducted and improved.

Major Theories Explaining Sexual Harassment

Tangri and Hayes (1997) suggested that no one theory could fully explain the phenomenon of sexual harassment due to the complexity of defining sexual harassment, especially since the topic is so personal. However, a multi-model explanation organized “like the layers of an onion” (p. 113) may be a useful way of analyzing the occurrences of sexual harassment. Natural/Biological Model explains the occurrence of sexual harassment as resulting from a satisfaction of the basic human drives of sex and aggression. Two models are presented under the Natural/Biological Model: The Hormonal Model and The Evolutionary Model. The Hormonal Model suggests that sexual harassment is a result of man’s stronger sex drive. The Evolutionary Adaptation Model suggests that men have evolved and adapted to sexually harass women in their pursuit of reproduction without long-term commitments. The Organizational Models suggest that certain conditions present in an organization make it easier for sexual harassment to occur. Sex-Role Spillover Theory and Organizational Power are presented as components of the Organizational Model. Sex-Role Spillover Theory explains sexual harassment as a result of gender-based expectations that spill over into the workplace. Organizational Power explains sexual harassment as a result of an abuse of organizational power. The Sociocultural Model suggests that male dominance in the work environment is a carryover from the larger society where men are socialized to dominate, lead, and initiate sexual advances and women are socialized to submit, nurture, and be the sexual gatekeeper. Individual Differences explains sexual harassment as a result of individual differences including personal attitudes toward individuals of the opposite sex, hormonal levels, and interpretations of sexual behaviors.

Learning Transfer System

Holton and Baldwin (2000) proposed a framework that includes the learner, the learning event, and the organizational context in the system design of a learning transfer system. This framework describes the individual entering the organization with certain individual characteristics and under certain pre-conditions of the organization. The individual prepares for the learning event prior to participation in the learning event (or training program). After
the learning event has occurred, the learner may review notes, activities, policies, etc. Also at this time, certain organizational supports and sanctions are communicated that influence the individual’s performance. Each of the major sections of this framework is dissected below with conditions that should be taken into consideration when implementing a sexual harassment prevention program within an organization.

**The Learning Transfer System With Regards to Sexual Harassment Prevention Programs**

Terpstra and Baker (in Tangri & Hayes, 1997) organized factors associated with sexual harassment into three main categories: environmental-level variables, organizational-level variables, and individual-level variables. Holton and Bates model of the learning transfer system includes some of these same categories (i.e., organizational interventions including both preconditions and supports, individual characteristics). Hence, some of the same factors or areas that encourage or inhibit the occurrences of sexual harassment also tend to encourage or inhibit learning concerning sexual harassment. The discussion that follows takes into account the major areas proposed by Holton and Bates but incorporates the levels and sublevels that Terpstra and Baker used as a classification scheme.

**Individual characteristics.** The individual characteristics section of the learning transfer system framework examines the characteristics that an individual (i.e., the employee or the learner) brings to the learning event. While most trainers are interested in knowledge, skills, and abilities including baseline competencies of the employee, trainers for sexual harassment prevention programs should be concerned with much more. When looking at the individual characteristics, both the Natural/Biological and Individual Differences Models of explaining sexual harassment are useful in understanding the individual characteristics of the employee as they move through the learning event.

One of the first characteristics of the individual that should be taken into consideration is gender, especially due to the fact that most (but not all) victims of sexual harassment are women and most (but not all) perpetrators of sexual harassment are men. This in turn affects how the training may be perceived and what messages should be sent. Gender is also related to hormone levels, which under the natural/biological model is one explanation of why sexual harassment occurs.

Personal power (or control) and position in the company is also an important individual characteristic to consider. Some employees may be forced into a position where they are powerless against sexual harassment. Actual power and perceived power may differ. Perceived power is discussed later.

The knowledge, skills, and ability of the individual are an important factor in transfer. While a capacity to understand the information is a desired characteristic of an individual, many may not have this characteristic. Further, Fitzgerald, Swan & Magley (1997) reported that many individuals lack the ability to label behaviors as sexual harassment. Societal, organizational (both direct and indirect), and individual explanations were given to explain this phenomenon. Also included under knowledge, skills, and ability is the communication skills (both verbal and nonverbal) that the individual possesses. This is particularly apparent in individuals who have such poor communication skills that additional help may be necessary in order for them to understand what types of communications are and are not acceptable in the work environment as well as how to correctly interpret others’ communications to them without miscommunication taking place.

Learner Readiness (Holton & Bates, n.d.) is a very important variable to consider. Knowledge, skills, and ability of the individual as well as the history of the individual may mediate learner readiness. Some victims may be ready to learn because they want to know what they can do to stop it. Some other employees may not be ready to learn due to the fact they don’t see sexual harassment as a problem for them or others.

The history of the individual (Fitzgerald et al., 1997) is a critical element to a trainer of a sexual harassment prevention program. The history of the individual includes their upbringing (or moral development), prior experiences with sexual harassment including that as a victim, perpetrator, or bystander including the type of behavior, the frequency of the behavior (Fitzgerald et al, 1997), the prevalence of the sexual harassing behaviors, the intensity or severity of the behaviors (Fitzgerald et al, 1997), and the duration of the sexual harassing episodes (Fitzgerald et al, 1997). Furthermore, the interpretations of the type, frequency, prevalence, and intensity of prior sexual harassing experiences should be considered. Finally, prior experiences with sexual harassment prevention programs should be considered as it may affect one’s enthusiasm over a repeat experience, particularly if the individual perceives the training as poorly designed or not needed.

Perceptions and myths or attitudes (Fitzgerald et al, 1997) that a person holds may be critical in their transfer of knowledge presented during the learning event. Perceptions and attitudes vary widely from individual to individual across several different topics. First, a person’s attitude about power possessed by him or herself as well as that of management, supervisors, and co-workers should be considered. Many times employees feel powerless going into training that could potentially reduce learning transfer. Related to power is the concept of vulnerability. Vulnerability may be defined as a lack of power coupled with personal situations (including financial situations) making sexual harassment an option although unwanted. Employees also have individual perceptions of the
sanctions against sexual harassment. For example, some employees may believe that there’s no “teeth” to the sanctions and so they will continue to harass or fail to report the harassment. Other employees might believe that the sanctions are enforced and may be more careful about sexual harassing other employees or believe that they are protected and can’t be the victim of sexual harassment. Another concept related to perception and attitudes is that of ethics. While upbringing or moral development was covered earlier, what is meant by ethics here is the individual’s perception of what society believes about men and women as well as whether certain behaviors are acceptable or unacceptable particularly in the work environment. Finally, individual perceptions of whether or not he or she can get away with sexual harassment should be considered. These attitudes hinge on what the individual believes as right or wrong and what the individual perceives that society believes concerning right and wrong behaviors. These attitudes of “can I get away with it?” do go a step further than general beliefs in right and wrong as many individuals commit acts of disrespect to others even though they know it is wrong.

Resources (Fitzgerald et. al, 1997) available to an individual also need to be considered. Resources may include personal strengths, friends and family that listen and offer counsel, and policies and procedures in effect in an organization. Individuals differ in their perceptions of resources available to them. Some may see resources as unavailable when they are actually available. Training can certainly help to correct this problem, at least in part, if it effectively spells out the company’s policies and procedures regarding sexual harassment.

Individuals also differ in their level of motivation. Individuals may differ in their motivation to attend training sessions as well as to transfer the learning (Holton & Bates, n.d.) whether it includes the cessation of sexually harassing behaviors or the initiation of complaints when appropriate.

Finally, performance self-efficacy (Holton & Bates, n.d.) is an important factor that differs between individuals. Performance self-efficacy may be defined as “the individuals’ general belief that they are able to change their performance when they want” (Holton, 2000, p. 14). Performance is likely highly related to motivation and learner readiness as well as perceptions of personal power.

Organizational interventions. There are two main areas that incorporate organizational interventions: preconditions and supports. Preconditions are those conditions that exist prior to the onset of the learning event. Supports are those behaviors that occur in the work environment after and in response to the learning event. Both of these areas can be better explained using the Organizational Model and Sociocultural Model.

There are many preconditions that exist in any work environment. Every company has its own history and characteristics that make it unique. One such precondition is the sociocultural environment in which the work place is situated. Often, this sociocultural environment will dictate socialization patterns between men and women that can include rules covering almost anything from what is appropriate to wear to marriage rituals. These dictated socialization patterns permeate the work environment’s daily activities and set up a particular culture for the work place.

Another precondition that exists in the work environment is the manifestation of power within the company. While one may consider upper management’s support and control of policy, procedures, and training, of particular interest here is the leadership and power exerted by individuals other than management. For example, non-supervisory employees may usurp control over certain supplies or processes. Controlled processes may also include communication patterns that exist among employees whereby some employees are intentionally left out of the loop.

Organizational climate (Fitzgerald et. al, 1997) is also a precondition that may affect learning transfer in an employee. Organizational climates can differ widely from one organization to another and may range from hostile to friendly, willing to learn to unwilling to learn, flexible to inflexible, etc. Regardless of an employee’s beliefs concerning sexual harassment and his or her willingness to participate in the learning event, the organizational climate that is hostile, unwilling to learn, and inflexible is likely to prevent the employee from moving through the learning event successfully. According to Schein (1992), in newer organizations, the organizational climate is a reflection of the assumptions held by its leaders. Later in the life of the organization, the climate will be a reflection of cultural assumptions. The assumptions of leaders affect the climate via 6 primary embedding mechanisms including:

- What leaders pay attention to, measure, and control on a regular basis.
- How leaders react to critical incidents and organizational crises.
- Observed criteria by which leaders allocate scarce resources.
- Deliberate role modeling, teaching, and coaching.
- Observed criteria by which leaders allocate rewards and status.
- Observed criteria by which leaders recruit, select, promote, retire, and excommunicate organizational members (p. 231)

Secondary mechanisms that reinforce culture include the following:
There are several issues pertaining to gender that affect preconditions in a work environment: gender ratio, sex-role spillover, and the company’s view on women and pay. Gender ratio (Fitzgerald et al., 1997) is a precondition that exists in the work environment that may directly have a bearing on the sexually harassing behaviors that have been committed in the organization’s history. As women have entered the workforce, the gender ratio has changed. However, there still are companies and businesses that are predominately male. Such companies where men far outnumber women may create an environment where women feel particularly vulnerable. Sex-role spillover is another issue that pertains to gender and that sets up certain preconditions in an organization. Sex-role spillover refers to how typical male and females roles are transferred into the work environment. For example, some companies may intentionally or unintentionally move women into jobs that are congruent with their stereotypical gender-based roles such as housekeeping, secretarial, or assistant positions. Likewise, some companies may intentionally or unintentionally ask women to perform tasks (such as cleaning, making copies, making coffee) that are congruent with their stereotypical role. Sex-role spillover in a company can be limiting to those women employed by the organization. Related to both gender ratio and sex-role spillover is the company’s view on women including women’s pay (Petrocelli & Repa, 1998). While the company may not have any evidence of sex-role spillover, their view on women in the workforce may be poor. As in the case of sex-role spillover, a poor view on women can be severely limiting to women in the workplace especially when it involves their pay.

There are three closely linked preconditions that may exist in the work environment that can potentially seriously affect the employee’s success concerning training transfer. First, the presence of a sexually-poisoned work environment (Petrocelli & Repa, 1998) can be particularly debilitating, especially when employees go into the learning event thinking “Things are so bad, this will never work!” or “Why is sexual harassment wrong when the boss always tells dirty jokes during committee meetings even when women are present?” Second is whether the organization is tolerant of sexual harassment (based on work of Hulin and colleagues, in Fitzgerald et al., 1997). Tolerance can be assessed with such questions as: (a) Are complaints taken seriously? (b) Is there risk to the victim for reporting? (c) Is there lack of meaningful sanctions for perpetrators? and (d) Does the organization state that sexual harassment is an actionable, illegal offense? Third is whether there is any other harassment present in the work environment (Fitzgerald et al., 1997). Oftentimes, when one type of harassment is present, others types of harassment are present as well.

Management norms and the degree to which they are either strict or lenient can also affect the work environment (Fitzgerald et al., 1997). These norms may include day-to-day operations as well as those pertaining to program sponsorship and endorsement including whether attendance is mandatory or optional.

The policies and procedures that are implemented in a work environment may be either weak and ineffective or strong and effective (Fitzgerald et al., 1997). This may be a separate issue than the strength of management for the organization. Some policies may be so poorly written that employees know how to get around the gaping loopholes. Some policies may be enforced so poorly that employees know that it might not really be worth the efforts to try to follow the procedures presented to them in company policy statements and during training.

Finally, bystander stress (Fitzgerald et al., 1997) may contribute to the overall preconditions of a work environment. Bystanders include all those who have been witnesses to sexually harassing behaviors. Bystanders may feel certain vulnerabilities concerning their own situation. This feeling of vulnerability may be exacerbated when the bystanders are asked to provide information concerning the sexual harassment situation. Bystander stress (especially on a wide-scale) is preserved in the memory of the organization’s history and may contribute to the overall work environment.

Supports are also an important part of the organization’s intervention on the learner and learning event. Supports may be defined as those actions at the organizational level that serves to reinforce the learning. Supports come in a variety of ways and from a variety of people. Supports may come from management, supervisor, or peers (Holton & Bates, n.d.) or from sources outside the organization including a counselor or legal counsel and even family and friends. Supports from within the organization may also include feedback or performance coaching (Holton & Bates, n.d.) or reminders via Email, bulletin boards, memos, etc and are likely to include positive personal outcomes (Holton & Bates, n.d.) with statements such as “If you treat your co-workers with respect, you can continue in your job”. Supports may also come in the form of sanctions (especially from management or direct
supervisor) such as “If you don’t apply this learning and follow these guidelines, you’ll be fired!” Sanctions include negative personal outcomes (Holton & Bates, n.d.) such as loss of job, pay, benefits, position, etc. if knowledge from the training is not applied on the job (i.e., if sexual harassment continues, especially after training has prohibited it). The success of supports and sanctions that influence positive transfer may be influenced to a degree by openness to change (Holton & Bates, n.d.). A failure to adequately support the training or to offer the appropriate sanctions for not applying the learning by following policies and procedures adopted by the organization may be due, at least in part, to a resistance to change (Holton & Bates, n.d.)

**Learning event.** While the learning event is usually highlighted and typically plays the leading role in the learner’s progress toward positive transfer, research seems to indicate that the learning event actually plays a much less significant role as compared to other factors within an organization (i.e., supervisor and peer support). Nevertheless, the learning event should be planned with appropriate content and good transfer design (Holton & Bates, n.d.) so that learning is maximized during this time. The content should be crafted with purpose, objectives, and topics that are appropriate to the needs of the organization so that they have good perceived content validity (Holton & Bates, n.d.). Common topics for sexual harassment programs include definitions, scope of the problem, effects of sexual harassment on victims, reasons why sexual harassment occurs, and company policy and procedures in place that help prevent the occurrence of sexual harassment. The design of the learning event has more areas of variability but may be critical to setting up a learning environment that is conducive to learning. Design elements include whether the training program is conducted in house or out, characteristics of the group including size and makeup (i.e., co-ed or separate sessions for men and women), format of the training program (i.e., lecture, web-based, activities, etc.), and finally, trainer characteristics. Because the training is important, the use of videos (unless there is some interactive quality to them) is not suggested. Any activities designed for the training should be sensitive to the feelings of the trainees but should involve everyone. Trainers should also be carefully chosen to present the material in a dignified manner.

**Learner interventions.** A learner intervenes into the learning transfer system with some direct participation from his or her part. This participation can come in two phases. First, before and in preparation for the training, the learner may read or study on the topic. This can include the study or reading of brochures, information packets, books, websites, or other sources initiated by the employee or suggested by the organization as interesting sources of information for preparation for the training. Second, after the training and for the purposes of maintaining knowledge, employees can review notes and policies presented during the learning event. Efforts to prepare and maintain learning may be due to two different expectations that learners have:

- Transfer effort—performance expectations is “[t]he expectation that effort devoted to transferring learning will lead to changes in job performance” (Holton, et al, 2000, p. 345).
- Performance—outcomes expectations is “[t]he expectations that changes in job performance will lead to valued outcomes” (Holton, et al, 2000, p. 345).

In other words, some employees may work hard to prepare or maintain learning so that they can apply the learning to their job in order to improve their current performance, and then, as a result of the improvement in performance, they will obtain some value outcome (i.e., job security, raise, benefits, or other intangible outcome). Concerning sexual harassment training, this may mean that some individuals will work to prepare for the training and maintain learning because they see sexual harassment as a very real problem either for themselves or someone they know.

**Performance.** Concerning performance related to training, there are several areas that need to be examined. First, is there opportunity to use the learning (Holton & Bates, n.d.)? Some work environments may experience sexual harassing behaviors only sporadically and trainees who have undergone training on how best to respond to the situation have long since forgotten that which was taught during the training, especially is training and updates occur infrequently. Second, is there a personal capacity for transfer (Holton & Bates, n.d.)? Or, do trainees really understand what’s classified as sexual harassing behavior so that they can refrain from committing the behavior or respond to the behavior effectively. Third, is there near transfer such that trainees understand the content within the training program and can correctly respond to activities or tasks testing them of this knowledge. Fourth, is there far transfer such that trainees either refrain from committing a sexually harassing behavior or correctly respond to sexual harassing behaviors in the work environment weeks and months after the training has completed. 

**Potential Research Questions Resulting from Framework**

When sexual harassment is viewed through the lens of the learning transfer system, a myriad of questions arise that warrant further investigation. Such question include the following:

- What does the learning transfer system actually look like for particular organizations with regards to sexual harassment training? What are the areas of strength? What are the areas of weakness? (Or, which areas may
be hindering the training efforts and thus leading to an increase or steady rate of occurrences of sexual harassment?

- Which of the individual characteristics most impacts the receptivity level of an individual concerning sexual harassment training?
- What are the desired topics, objectives, types of activities, group size, group make-up, and trainer characteristics for sexual harassment training? How frequently should training for sexual harassment prevention be offered?
- What is the best way to get everyone “on board” with the sexual harassment prevention program and also to take it seriously?
- What organizational factors most impact the success of a sexual harassment prevention program and how can these factors be improved?
- How do we really measure the success of a sexual harassment training program?

Conclusions and Recommendations

Sexual harassment is a plague to American businesses and other businesses worldwide as well. The costs of sexual harassment to both the individual and the company are staggering and include emotional, physical, social, and financial costs. In spite of much research on sexual harassment, there has been little study on how to best conduct sexual harassment prevention programs within an organization. Furthermore, there has been no work to examine the learning transfer system with regards to sexual harassment prevention programs. This paper has sought to provide a framework for organizing and understanding the learning transfer system with regards to sexual harassment prevention programs in an effort to improve the prevention programs such that they more successfully decrease the occurrences of sexual harassment in the workplace.

Contributions to New Knowledge in HRD

To date there is no record of any research examining sexual harassment prevention programs through the lens of the learning transfer system. Therefore, this paper is unique in that it provides an initial framework for studying this phenomenon. Further research conducted examining the proposed theoretical framework describing the learning transfer system as it relates to sexual harassment is needed due to the paucity of information linking the two concepts. Such research can be beneficial to Human Resource Development as it provides some direction on how to conduct and improve sexual harassment prevention programs by working with the entire learning transfer system. Additional benefits include (but not limited to) decreased sexual harassment in the workplace including a decrease in claims and costly lawsuits, increased morale and productivity, and increased Return on Investment with regards to the sexual harassment prevention programs.

Strengthening a Comprehensive Model for Explaining HRD Effectiveness

A.A.M. (Ida) Wognum
Bernard P. Veldkamp
University of Twente

Item response theory (IRT) was used to investigate whether this method could be applied to measure HRD effectiveness. Attention was given to handling missing data, interpretation of IRT-scores, and comparison with a comprehensive model for explaining HRD effectiveness. An acceptable fit was shown. The IRT method provided much information about the performance of HRD programs with respect to components of the comprehensive model. It was concluded that the measurement of HRD effects should consist of more specific information, and should depend less on participant's perception on HRD effects.

Keywords: HRD Effectiveness, Performance Improvement, Transfer

Problem Statement

Some years ago a comprehensive, multi-level model of HRD effectiveness was developed based on research into the quality or effectiveness of HRD programs and other learning interventions, and into factors that will enhance the effectiveness level of these programs (Wognum, 2001). In 2001 and 2002 two studies were performed to confirm and further fill this model. By means of these two studies, some of the variables of the HRD effectiveness model were confirmed or added to the model. Both studies, however, have some shortcomings.

One study was done in a large Dutch banking company. In this study the effects of a learning program about communication and cooperation on workplace behavior stood central as well as some effectiveness enhancing factors (Wognum, Veldkamp, Ankersmit & Van de Lagemaat, 2002b). Results, however, were based on a small number of respondents, which has consequences for the analysis techniques used. Also caution is called for when drawing conclusions. A large number of respondents would have underpinned the conclusions more.

The second study was concerned with the analysis of a large set of data on the effects of training programs and on effectiveness-enhancing characteristics (Wognum, Veldkamp, Ankersmit & Van de Lagemaat, 2002a). The study was based on a large sample size, i.e. 4,100 respondents, but the effectiveness measure in this study showed some disadvantages. A first problem has to do with this effectiveness measure. This measure, the Aggregated Impact Indicator (AII-score) is a weighted sum score of several components; i.e. the total satisfaction about the HRD intervention, the realization of expectations, the adjusted effect score calculated from the extent to which the objectives of the HRD assignment have been realized, the making of agreements and the extent to which these are adhered to, and satisfaction with the implementation of the program. The weights of the different components were calculated in a pilot study for a group of 400 respondents. The question remains, if these weights would have been the same when they were calculated for this new sample of 4,100 respondents. A second problem deals with missing data. In HRD research, missing data often occurs due to the practical setting of this kind of research. The AII-score, however, can only be calculated for complete cases, so either missing data have to be imputed or respondents who partly filled in the questionnaire cannot be taken into account in the analyses. A third problem is the amount of information provided by the AII-score. The AII-score expresses effectiveness in a single number. How should it be interpreted? Rankings of HRD programs are often based on these kinds of scores. They have been used for comparing the quality of these programs and the company of the suppliers of these programs, but these rankings have to be handled with care (Mulder, 1998).

To overcome these problems a valid effectiveness measure is needed to effectively determine HRD outcomes and investigate the appropriateness of the formerly mentioned comprehensive, multi-level model of HRD effectiveness. Developing such measure is important because work organizations are still making considerable investments in training and other HRD interventions (Van Buren, 2001), and managers will only be willing to opt for HRD programs that are expected to be effective and produce positive effects on the achievements not only of individual employees but also of separate departments and the entire organization. Research into HRD effectiveness has, as a result, been given significant impetus. Such research, however, has to be based on the use of valid effectiveness measures.

The problem statement thus runs as follows: Does the comprehensive HRD model for explaining the effectiveness of HRD programs fits when using an alternative effectiveness measure in order to investigate the

appropriateness of the model and to study the impact of effectiveness influencing factors on HRD effectiveness?

Some Theoretical Backgrounds

Comprehensive Model for Explaining HRD Effects

Based on research into the area of HRD effectiveness and effectiveness enhancing factors, Wognum has built a model of HRD effectiveness that was presented at the 2001 AHRD conference in Tulsa, Oklahoma (Wognum, 2001). The model of HRD effectiveness, which was adjusted to a certain extent during the presentation at the conference, was made to explain the effects of HRD initiatives, at learning, behavior and results level, from several categories of influencing factors (see Figure 1).

The model fits into the performance paradigm and the theory of HRD effectiveness. According to the performance paradigm, performance improvement is the ultimate outcome of HRD programs and other learning interventions: HRD efforts have to improve the capabilities of individual working in the organization and enhance the organizational systems in which they perform their work. The primary outcome of HRD is, therefore, not just learning, but performance at various levels (Holton, 2000). Employees must put what they have learned into practice in their working situation. In other words, there must be some transfer (Gielen, 1995; Holton, Bates, Ruona & Leimbach, 1998). Improved behavior leads, in principle, to better individual, departmental or company results. Several authors have expressed their concern over the actual accomplished degree of transfer, which have led to various research on factors influencing transfer of HRD interventions and to a number of models attempting to clarify relationships between these factors and transfer (Baldwin & Ford, 1988; Holton, 1996). More research, however, was suggested into the operationalization and impact of transfer enhancing factors (Holton, 1996).

Figure 1. A Comprehensive HRD Effectiveness Model

The HRD effectiveness model, which basically is comparable with the formerly mentioned transfer models, thus has a means-goals ordaining between ultimate effect criteria or outcomes, and supportive, effectiveness enhancing criteria, or drivers (Kaplan & Norton, 1996; Scheerens & Bosker, 1997). It here concerns a systems model of an organizationally and contextually embedded HRD or learning process, with antecedent conditions classified in terms of inputs, processes and contexts of HRD.

Based on this, Wognum distinguished various categories of effectiveness influencing factors. One category concerns Organization and HRD related contextual factors such as the problem situation that serves as starting point for HRD, the company HRD climate, position of the HRD department, and the form the HRD program takes. Strategic HRD alignment, as part of another category of organization processes, leads to decisions on strategic choices concerning on, among others, the intended goals of HRD interventions. Input characteristics include specifications of the target population, and characteristics of individual participants in the learning program. The HRD process itself has to do with learning materials, the trainer, and specifications of the learning program. The model has also a multi-level structure, where the HRD function is embedded in organizations, and individual employees who want to develop themselves are embedded in the HRD function.
By means of the formerly mentioned two studies (Wognum c.s. 2002a; 2002b), some of the variables of the HRD effectiveness model were confirmed or added to the model. For instance, based on Wognum et al. (2002a) the setting or non setting of objectives, which is an outcome of the strategic HRD alignment process, impacted the effectiveness scores. The setting of specific objectives leads to higher scores than the setting of general objectives. Also the function of those who are involved in the studied HRD program, somehow or other, showed a difference in effectiveness scores. Those who are more directly involved in the programs, such as HRD officers, heads of HRD departments and HRD coordinators within HRD departments are more positive about HRD effectiveness than are respondents who are not directly involved in programs, such as directors/works managers, line/departmental/divisional managers, heads of personnel, personnel officers and respondents from the category ‘others’. It was confirmed that the content field of HRD programs (i.e. language versus others) impacted the effectiveness scores, which is probably due to the fact that the content of language programs is more concrete and directly applicable than the content of programs such as management, communication, commerce, and marketing. The second study (Wognum c.s. 2002b) mainly showed the importance of the decision-making or HRD alignment process prior to the learning program. In the studied process in a large Dutch banking company each participant in the program and his or her supervisor selected three competencies to which more attention should be paid during the learning process. Progress in performance on the selected competences was found to be significantly higher than for competencies that were not selected for specific attention. In this study the importance of management support, which is a contextual factor, was also found as important for encouraging transfer and with that, HRD effectiveness. This supports Xiao’s finding that it is particularly the supervisor’s behavior that is of major importance for transfer (Xiao, 1996). Also the learning program was found to be an important factor contributing to a better performance by participants of the program. The latter study also revealed that participants in the HRD program were motivated to take part in the learning program and that motivation increased further during the program. However, more research is needed to find important factors influencing HRD effectiveness. Besides, both studies had some shortcomings that will be explained below.

**Item Response Theory and the Effectiveness Level of an HRD Program**

In educational measurement the Item Response Theory (IRT) has proved to be a useful statistical model for estimating abilities of students (Hambleton & Swaminathan, 1985). An IRT model supposes that an overall score on a test can be predicted (or explained) in terms of one characteristic, denoted by $\theta$. In HRD measurement, this characteristic is effectiveness of the HRD program or learning event. Several components could provide information about HRD effectiveness. Information on these components could be obtained by means of, for instance, items in a questionnaire. Formally stated, an IRT model specifies a relationship between the observable answers of the respondent on the item, the properties of the item, and the effectiveness of the HRD program. Based on all the information on these items the effectiveness score can be estimated.

When the One-Parameter Logistic Model (OPLM) is applied, the relationship can be described as:

$$P_i(\theta) = \frac{\exp(a_i \theta + b_i)}{1 + \exp(a_i \theta + b_i)}$$

where $P_i(\theta)$ is the probability that the respondent who participated in an HRD program with effectiveness level $\theta$ gives a positive judgment to item i of the questionnaire. The parameters $a_i$ and $b_i$ are the item discrimination, and difficulty parameter respectively. The discrimination parameter denotes how well the item discriminate between high effectiveness level and low effectiveness level of HRD involvements. The difficulty parameter denotes how high the effectiveness level of the HRD involvement should be before a respondent will answer positively to the question. Based on the answers of the respondents the effectiveness level $\theta$ is estimated. This estimate is reported as the effectiveness level of an HRD program.

**Research Question**

The main research question in the here presented study is, whether the Item Response Theory procedure for data analysis is applicable in an HRD context and could be used to estimate HRD effectiveness. More specifically the question is whether the comprehensive model for explaining the effectiveness of HRD efforts fits to the data when the IRT procedure is used. Attention is paid to comparison of AII-scores used in former research, and the newly developed IRT-scores. Attention is also paid to the handling of missing data in the IRT procedure, and to the interpretation of IRT-scores.
Method

Sample. To investigate the appropriateness of the model in an applied context, an existing data file was used. This file contains data from 4,100 questionnaires that were completed in the period from 1993 up to and including 2000 in the context of an evaluation commissioned by the Association of Training and Educational Organizations in the Netherlands (Vetron). Vetron is an association of about 40 training companies that satisfy a number of requirements relating to professional competence, continuity, quality and method of working. They offer all kinds of management training, social skills programs, language courses, HRM and other programs to various profit and non-profit organizations in the Netherlands. The data in the existing data file came from clients of the companies that are affiliated to the Vetron. The number of these companies fluctuates, but in the period from 1993 up to and including 2000 an average of forty companies is included in the evaluation. The data were gathered by means of a questionnaire sent to a random sample from the client base of the Vetron companies, on average about 6 months after the HRD activity had been completed. This is because effects of HRD programs on working behavior and results level only become visible after some period. Respondents were informed about the investigation and could fill in the form anonymously. On average, the response percentage was 35%. The main reason for non-response was the fact that respondents were no longer in the employ of the organization involved, due to high turnover rates in the companies.

Data collection. The data of the existing data file were collected by means of a questionnaire, which had been specially developed at that time for the evaluation project (Mulder, 2000). This questionnaire was used to determine the quality of HRD assignments by commercial Vetron companies. The questionnaire contains questions about the respondent, about characteristics of the HRD assignment, about the setting of objectives, about the division of responsibilities, about the attribution of the results to the training company and, finally, questions about making agreements and adhering to these (Mulder, 2000). In accordance with the HRD effectiveness model, the questionnaire measures both characteristics that have a direct impact on HRD effectiveness and characteristics that could possibly be used as explanatory variables. At the level of strategic alignment the setting of general and specific goals were asked. At input level, the target population, learning priorities, and design of the HRD involvements were investigated. It was checked whether agreements were made about these topics, and whether the agreements were satisfied. At the level of the HRD process, the learning materials, the trainer, the length of the training, and the transfer of the training were topic. At rounding off level, evaluation procedures and transfer were evaluated. Finally, three levels of perceived HRD effects were evaluated, i.e. at learning level, working behavior, and results level, and the overall perceptions of the respondents about HRD effectiveness were checked. Based on these questions HRD effectiveness was measured. To validate the instrument, internal consistency, test-retest reliability, and inter-rater reliability were taken into account. For details about validity and reliability of the instrument, see Mulder, Van Ginkel and Nijhof (1994).

Missing data. Although 4,100 respondents returned the questionnaire, only few of them filled in all the questions. For example, one of the characteristics by which HRD effectiveness is calculated is the realization of expectations. Approximately a third of the respondents had not completed this question. A different topic was the effect of the HRD program in the working environment. Only one quarter of the respondents answered this question. The length of the questionnaire and the period between the training and the evaluation is a possible reason for these low response percentages. There are different ways of dealing with missing values. Firstly, the decision can be made to use only complete cases, which means that the data from incomplete cases are not taken into consideration. Implementing this decision would result in 200 complete cases. When the missing data were investigated, no pattern of missingness was found. Therefore it was decided to include cases where at most four out of sixteen questions that measured HRD effectiveness were missing.

Preparation of the data. Before the analyses were conducted, the data file was adjusted on a number of points in order to be able to answer the research question. In the questionnaire, most questions were answered on a 5-point Likert scale, or scored on a scale ranging from 1 to 10. However, when the data were examined it turned out that the categories 1 till 3 hardly contained any respondents. Also for the ten-point scale, the respondents were not evenly distributed. Because of this the responses were dichotomized. For the 5-point scales, the recoded scores were 0 in case the initial score was 1-4 and 1 in case the initial score was 5. The respondent now either scored unsatisfied or totally satisfied. For the ten-point scale the scores were dichotomized by recoding the scores 1-7 in 0 and 8-10 in 1.

Data analysis. First, the parameters of the IRT model were estimated in order to make sure that one latent variable, the effectiveness level, could account for all the answers of the respondents. A statistical software package for estimating IRT models, WOPIN (Citigroup, 2000), was applied. Then, the resulting IRT scores were compared with the AII scores. Rank order statistics indicate the different orderings for the effectiveness of the Vetron companies based on both methods. SPSS was applied for conducting these analyses. Finally, the resulting IRT
estimates were analyzed to find which components provide most information about the effectiveness of the programs, and which components provide fewest.

Results

Fitting the IRT model. In this research, the focus was on questions that had direct impact on HRD effectiveness. Therefore questions about the respondent, about setting of objectives, and about division of responsibilities were not taken into account. Items from the remaining questions are shown in Table 1. Five overall items; overall perception of HRD effectiveness, realization of expectations, and questions about the three output levels of Kirkpatrick, and eight more specific items about input level, HRD process, rounding off, and administration level were used. The more specific questions dealt with parts of the programs. For example, at input level, questions were posed about definition of target population, definition of learning priorities, and design of HRD program.

These questions were grouped in two questions at input level: one about the organization and one about the perceived performance of these parts. Besides, the question of performance perception at output level is composed from perceived results on the one hand, and on enhancing these results on the other hand. It here concerns so-called transfer enhancing measures. The computer program WOPIN (Citogroup, 2000) was used to estimate the parameters of the individual questions. The OPLM model was applied. The best values for these parameters should be found interactively. The initial attempts of fitting the model did not succeed. One general item about change in working behavior had to be removed, because it did not show acceptable fit. But after that, the remaining items showed an acceptable fit. The effectiveness level can account for the scores that were obtained in the survey. The item parameters for the questions are also shown in Table 1. The estimation of IRT parameters was only based on the cases without missing data. In this way, it was guaranteed that imputation of missing data did not influence the estimation of the model.

Interpreting the IRT parameters. From Table 1 it can be deduced that, for instance, questions concerning the organization of the HRD process highly discriminate between HRD programs with a high and lower effectiveness score (discrimination parameter = 7). Questions concerning learning results are more problematic. Because the discrimination parameter is low (2), it can be said that these kinds of questions hardly discriminate between good and bad programs. The same is the case for questions on the perceived HRD effectiveness or marks of HRD programs (discrimination parameter = 3) and the organization of HRD programs (discrimination parameter = 2).

From the analysis of the discrimination parameters, it can also be concluded that the eight specific questions have higher discriminating power. That is, these questions are more able to distinguish the programs with low effectiveness scores from programs with high effectiveness scores. In other words, overall scores about effectiveness are less precise than scores that are based on specific levels of the programs.

From analysis of the difficulty parameters, it can be concluded that realization of expectations is very hard (difficulty = 1.6). In this study, it was the most difficult question to obtain a positive evaluation. On the other hand, the difficulty parameter of the ‘Learning results’ (difficulty = 0.3) was very low. Even poor programs had high scores for learning results. Based on analysis of these questions, it can be concluded that all Vetron companies
provide programs with high learning results, but the respondents expect more. Further analysis at item level reveals that differences between difficulty parameters at specific levels are only small.

Figure 2. Scatterplot of IRT Score and AII Score.

Comparison of IRT and AII-scores. In the theoretical framework, some disadvantages of the AII-scores were discussed. The IRT model is proposed, in order to overcome these problems. The question remains, whether the new method results in different effect scores. Does, for instance, the order in effectiveness level of the Vetron companies change, or does the order remain the same? A scatter plot shows the relationship between both scores for individual participants (Figure 2). The correlation between the IRT-scores and the AII-scores was significant ($\rho = 0.71$, $p = .000$). However, this correlation also indicates a far from identical ordering for both methods. Therefore, the remarks in Mulder (1998) about weaknesses of rankings based on effectiveness scores, can also be made in this study.

An explanation for these differences can be found in the way the components of the Comprehensive model of HRD effectiveness (see Figure 1) are implemented in the measurement model. For the AII-score, a weighted sum of the scores on the different components was calculated, while the IRT model applied a summation logistic function to model the relationships.

IRT and missing data. One of the theoretical advantages of IRT is the possibility to handle missing data. When missing is random, an IRT model can be used to calculate the effectiveness levels, that is the IRT-score, based only on items the respondent answered to, without imputing the missing data. This property of IRT models is also being applied in the context of the Vetron data. In Figure 3, the distributions of the scores based on cases without missings ($n=181$) and cases with less then 5 missings ($n=1082$) are shown. Although the scales of both histograms differ due to different numbers of cases, it can be seen that the distributions of the scores are more or the less the same. In other words, calculation of scores based on at least 9 out of 13 questions hardly influences the score distributions. As a result, the number of cases that can be used without additional data imputations increases from 181 to 1082 cases. This implies that more accurate conclusions can be drawn about effectiveness when IRT models are applied.

Figure 3. IRT Score Distributions Based on Complete Cases ($n=181$) and Cases with Less Then Five Missings ($n=1082$).
Conclusion and Discussion

In this paper a comprehensive model for explaining HRD effectiveness was described (see Figure 1), and a statistical advanced method for measuring HRD effectiveness was introduced (IRT). Both the model and the effectiveness measure were applied in the context of evaluating the HRD programs of Vetron associated training institutes. The data that were collected in several surveys and were based on the several categories of the comprehensive HRD effectiveness model, showed an acceptable fit to the IRT model. Because of this, it can be concluded that IRT is applicable in an HRD context, moreover, that it is applicable in combination with the comprehensive model for explaining HRD effectiveness. Application of the IRT method resulted in more specific information about the different components of the comprehensive HRD effectiveness model. Moreover, questionnaires that are not completely filled in can also be used in the analysis without further imputation of missing data. These findings imply that measurement of HRD effectiveness should consist of more specific information on all components of the comprehensive model.

When the new effectiveness measure was applied, it was shown that overall questions about HRD effectiveness, i.e. questions on a total effect score, or mark, of an HRD program or on output levels of Kirkpatrick, are less informative than questions about specific components such as the organization of the HRD process, and the performance perception during the HRD process. Most evaluation studies into the effects of HRD programs, however, ask for respondents’ perception on the overall effect of the programs in which they participated, and a mark or overall score has been asked to rate the quality of the program. Based on the results, a recommendation for evaluating the effects of HRD programs can be, that questions should ask for so-called hard evidence of the gained effects, for instance on increased figures, or performance results, in stead of depending on participant perception on HRD effects and effectiveness.

Another conclusion that could be made concerns the learning results of the respondents. In Table 1, the difficulty of this item is reported to be very small. Even Vetron companies with a low effectiveness score, could obtain high scores on learning results. Because of this, Vetron companies can be encouraged not only to focus on the learning results, but also to focus on other parts/components of the training. Focusing on issues at input level, like definition of learning of priorities, issues during the HRD process, or at rounding off level can further improve the effectiveness.

In this project, a dataset was used that has been collected in several surveys between 1993 and 2000. The instrument has not been altered in this period of time. In the past decade, new ideas and insights have been gained in the area of HRD effectiveness research. For example, the importance of transfer enhancing measures and factors influencing HRD effectiveness, and the need for hard measurement of effect levels, instead of perception measures. A next step in the development of a comprehensive model for explaining HRD effectiveness is to develop new measurement instruments, based on these new insights, which can be used for the collection of new datasets.

Defining Human Resource Development Technical Knowledge and Job Skills at the Undergraduate and Graduate Levels: Where’s the Beef?

Tomas R. Giberson  
Monica W. Tracey  
Oakland University

This quantitative study seeks to identify the specific technical knowledge and capabilities organizations expect of HRD undergraduate and graduate-level students. Universities offering graduate, and particularly undergraduate, degrees in HRD have little to guide their definition of technical knowledge and job skills undergraduates and graduates must possess to be marketable, and more importantly, effective in the workplace or while pursuing advanced educational degrees. Much of the research and writing to date has focused on “competencies”, attending to the “soft skills” or characteristics of graduates, rather than the actual HR capabilities they can bring to organizations.

Keywords: Human Resource Development, Competencies, Curriculum

Problem Statement

Human Resource Management (HRM) programs at the undergraduate and graduate levels are common in business schools around the globe. An internet search reveals multiple HRM programs, developing generalists with capabilities across the broad areas of HR. Several studies have been conducted and books written that define the broad field of HRM notably that by Nadler (1989), in which HRM is described as activities intended to improve organizational productivity through finding, placing, tracking and holding accountable an organization’s Human Resources. Thus, an organization’s human resources are viewed in a similar fashion to other organizational assets and are “managed” accordingly, matching individual technical knowledge and job skills and competencies with the requirements of a job. Human Resource Development (HRD) is typically identified as a subspecialty of HRM (e.g., Desimone, Werner & Harris, 2002; Nadler, 1989). As a subspecialty of HRM, HRD provides unique opportunities and challenges to universities that desire to offer curricula at the undergraduate and graduate levels.

To summarize the problem, we seek to enhance the education of HRD students by clarifying the technical knowledge and job skills employers expect of graduates of undergraduate and graduate HRD programs. This requires understanding of three distinct stakeholder needs and perspectives: a) that of HRD scholars, educators and professional organizations (“academics” throughout), who define “the field” of HRD; b) that of organizations and employers of HRD undergraduate and graduate matriculates who define “job expectations and what should be learned”; and c) that of HRD undergraduate and graduate students, whose career expectations and experience levels bring them to the field of study, and capacity for learning define “what can be learned.” Evaluating each of these components can lead to a curriculum that integrates the expectations of these three stakeholder groups (see Figure 1.). While each of these perspectives are critical to the development of HRD curricula, primary attention in this study is given to employer expectations of undergraduate and graduate level matriculates, framed by the academic definition of the field.

Theoretical Framework

The growth of HRD as a discipline within HR (Desimone, Werner & Harris, 2002) has spawned several graduate level programs and fewer undergraduate programs. These programs must determine the specific areas of HRD to deliver to undergraduate and graduate students, along with the specific technical knowledge and job skills that must be mastered within these areas upon graduation. This “level setting” is critical for the success of any HRD program, not to mention the success of its graduates. Thus a key challenge in the design of HRD programs includes understanding what is expected among organizations from HRD graduates at the undergraduate and graduate levels in terms of the technical knowledge and job skills (tasks and behaviors within HRD content areas that can be demonstrated by graduates) (Green, 2000), as well as expected competencies (skills that facilitate an individual’s ability to effectively deploy knowledge and skills in specific areas of HRD) (Green, 1999).
Throughout this paper, “technical knowledge and job skills” is used in reference to the tasks and behaviors individuals would be expected to perform in an organizational setting specific to HRD content areas. We have chosen this term to separate conceptually and practically from “competencies” as often applied in other attempts to define requirements of HR professionals (e.g., McLagan, 1989; Rothwell & Kazanas, 1994; McCoy, 1993) and undergraduate curriculum requirements (e.g., Mackey & Thomas, 2002). “Competencies” as typically used in such studies often inter-mix such important but distinctly “soft skills” as, “respect diverse backgrounds, develop trusting relationships, adapt to change, teamwork”, etc. with content-area expertise, such as “training needs analysis, evaluate pay systems, provide career counseling”, etc. (e.g., Mackey & Thomas, 2002). Pedagogically, we believe that such competencies should not be the direct target of undergraduate or graduate programs; rather, these important competencies can and should be developed in conjunction with the development of true technical knowledge and job skills through class projects, activities, team assignments, internships, etc.

Academics may be thought of as responsible for “defining and protecting the field” of study, in part by ensuring the long-term philosophical, theoretical and empirical development of the field. Through these means, the field of HRD continues to refine the specific technical knowledge, job skills, and competencies expected within the three core areas of HRD. The field of HRD is typically described by academics as consisting of training and development, organization development, and career development (e.g., McLagan, 1989). With roots primarily in training and development, the technical knowledge and job skills are understandably more clearly identified and refined (e.g., Keller, 2001, IBSTPI, 2003). HRD textbooks typically address the three primary areas of study (e.g., Desimone, Werner & Harris, 2002) and describe the basic technical knowledge and job skills within these areas. Similarly, professional organizations, such as the International Board of Standards for Training, Performance and Instruction (IBSTPI, 2003) provide guidance regarding the technical knowledge and job skills defining the field, and begin to bridge the gap between academics and employer needs. However, while the technical knowledge and job skills may be known, with some suggestion regarding “basic and advanced” levels of skills (particularly within training and development (International Board of Standards for Training, Performance, and Instruction (ISBTL), 2003)), what is expected of undergraduate and graduate students upon graduation is less clear. For example, an HRD professional may be expected to conduct a long-term strategic organization development intervention, creating change in an organization’s structure, infrastructure, processes and culture. Is it realistic to expect an HRD graduate matriculate to carry this out? This leads to the more general question of, “What roles are an undergraduate or graduate student expected to fill within training and development, career development and organization development”? Thus a key input into the design and development of an HRD curriculum must include a review of this stakeholder group’s work, and frame the input of the next stakeholder group, employer organizations and their expectations of HRD program graduates (see Figure 1).

To date, there have been few, if any studies that specifically set out to identify the technical knowledge and job skills expected of undergraduate and graduate HRD students from the perspective of potential employers. This stakeholder group is critical to ensure the viability of the field generally and an HRD program specifically. Viewed as the “products” of our programs, HRD graduates must be regarded by employers as having the technical knowledge, job skills and competencies required to assist organizations in improving individual and organizational performance. As discussed earlier, there are examples of competency-based studies; however, these do not provide clear guidance regarding the actual “beef” or technical knowledge and job skills graduates should have, and at what level of proficiency. Without recognition by organizations of the value HRD professionals at various levels provide, the field would be relegated to “academics for academic’s” sake, potentially destined for obsolescence.

In addition to clarification of the field and the technical knowledge and job skills desired by potential employers, an HRD program must clearly understand what is realistic to expect of undergraduates who typically do not have much experience in organizations, without watering down the program to attract students lacking interest or desire in other areas. Thus we seek in part to meet the challenge suggested by Kerr (1994), by defining and developing a program that attracts qualified students with an interest in the field of HRD, and providing these students with the technical knowledge, job skills and competencies required to be effective in organizations upon graduation.

The challenge is clear, as research by McLagan (1989) suggests that one of the core areas of HRD, organization development, requires the most general knowledge (and arguably experience) of all the HR functions. To do the academic and employer organizations justice, undergraduates must develop technical knowledge and job skills in the area of organization development, training and development and career development; however, which technical knowledge and job skills at what level of proficiency?
Research Questions

The purpose for this study is to identify the specific technical knowledge and job skills organizations expect of undergraduate and graduate matriculates. The following research questions will be addressed to fulfill the purpose of this study:

1. What do organizations expect of HRD undergraduates in terms of specific technical knowledge and job skills?
2. What technical knowledge and job skills do organizations expect of Master’s level HRD graduates?

Method

In this quantitative survey study, a modified task inventory (Gael, 1983) has been developed. The development of the task inventory began with academic input regarding the specialty areas of HRD. This was accomplished through examination of undergraduate and graduate level syllabi and textbooks, obtaining input from HRD department faculty, a review of relevant professional organizations’ descriptions of technical knowledge and job skills (e.g., IBSTPI, ASTD) and a review of previous studies regarding the topic of HRD competencies. This academic perspective provided the initial framework for the technical knowledge and job skills populating the inventory. The list was further refined by examining job descriptions typically associated with HRD through O*Net (REF). O*Net search terms included: Training and Development Managers; Training and Development Specialists; Instructional Coordinators; Human Resources, Training, and Labor Relations Specialists, All Other; and Human Resources Managers. O*Net arguably provides a description of the “average” job tasks and skills by job title within the United States, and provides a link between the academic perspective of the field and employer organization perspectives regarding what is expected on the job. The task inventory has been modified to include not only job skill descriptions (tasks) but also technical knowledge areas, and some competencies (“soft skills”).

Sample and inventory distribution method. Participants include HR professionals in over 120 employer organizations in the Midwest, as well as members of local chapters of HRD-oriented organizations (e.g., ISPI, ASTD). These individuals and organizations were selected based upon HR knowledge, organization size, relationship with the university, and through professional contacts of faculty members. Many of these individuals have been prepared to receive the inventory.

Participants have the choice of completing the inventory electronically through a secure website, or by completing via paper and pencil and returning the inventory to the principal investigators. The inventory has been sent via US post with self addressed return envelopes. Within each participant package is a letter of invitation, the survey itself, as well as two additional self-addressed envelopes containing similar invitation letters and inventories (thus a ‘snowball’ method to increase the sample size). The letter of invitation includes the rationale for the study with benefit statements, and the university’s human investigation committee’s required information regarding informed consent to participate, basic instructions for completing the inventory, a request to send the additional envelopes to colleagues who may be interested in participating, and instructions regarding how to go to the web-based survey should they prefer that method. Other than being in electronic form, the online version of the inventory is identical in content to the paper and pencil version.

Survey content. The resulting inventory contains 69 job skills (task descriptions) within the core areas of HRD, as well as in human resource planning, staffing and performance management. Finally, 30 technical job skills within the areas of supervision, communication, general business, math, diversity, and legal / ethical (note: the inventory is not included herein owing to space requirements).

Participants will rate each job skill on a one to six scale developed specifically for this study. Participants will read each job skill statement and indicate the combination of education and experience expected before an individual would realistically be able to perform the job skill, and reads as follows: 1. Less than a bachelor’s degree (BA), 2. Less than a BA + experience, 3. BA, 4. BA + Experience, 5. Advanced degree, 6. Advanced degree + experience.

Participants will rate each technical knowledge or competency on a five-point importance scale. Participants will read each job skill statement and indicate how important each knowledge or competency is for a newly graduated HRD professional to possess (1 = not at all important, 5 = critical).

Additionally, the task inventory requests (but does not require) demographic information regarding the participants’ contact information, highest degree received, years of experience, number of employees in the organization, number of employees in the HR Department (if one exists), the job titles within HR that exist in the organization, as well as information regarding the organization’s HRIS system (if exists).
Data management and analysis. Data will be downloaded electronically from the website into SPSS, and hand-entered from mailed submissions. The data will be cleaned to eliminate duplicate submissions. First, the scales for job skills and technical knowledge / competencies will be analyzed for internal consistency using coefficient alpha. Next, job skills will be analyzed by investigating means and standard deviations of each job skill to identify which job skills tend to fall within which education and experience range. The results will be further analyzed through exploratory factor analysis to identify statistical groupings of job skills within and across the core HRD specialty areas. These results will be analyzed to ensure meaningful groupings of job skills. Additionally, multiple analysis of covariance (MANCOVA) and appropriate post-hoc tests will be used to investigate any significant differences in job skill ratings (and factor scores as appropriate) based upon organization size and number of employees in the HR department. The nature of this analysis will be determined based upon the final sample collected (e.g., assuming adequate sample, organizations could be split into “small, medium, and large” organizations for these analyses, similarly HR department size could be split into “large and small”). Finally, technical knowledge and competencies will be analyzed in a similar fashion, investigating means and standard deviations of individual technical knowledge and competencies, explored through factor analysis, and further analyzed through MANCOVA to identify main effects and interactions based upon participant and organization demographics. Such analyses will enable identification of essential expectations of undergraduate and graduate-level matriculates including and removing the effect of organization variables.

Results and Findings

The study is currently in the data collection phase, and by the time of the conference the data will be gathered and analyzed, and will be the focus of our conference presentation.

Conclusions and Recommendations

The results of this study will support procedural decisions as well as initiate several conceptual conversations with regard to core issues within HRD. Procedurally, the results will align undergraduate curricula, producing HRD graduates with the knowledge and skills required for success. Conceptually, the results could initiate conversations among HRD theorists and practitioners regarding the positioning of HRD within the realm of HR, its contribution to business performance, its relationship to emerging fields, such as performance technology, and most importantly its ability to distinguish itself as a coherent field, rather than a collection of already established disciplines.

How this Research Contributes to New Knowledge in HRD

This research contributes to the field of HRD by clarifying the specific technical knowledge and job skills expected of individuals with varying levels of education and experience. This knowledge can and should help guide the development of HRD curricula at the undergraduate and graduate levels, thus improving our ability to develop the future leaders and professionals of the field.

Identifying Benefits of an Internship Program through Appreciative Inquiry Interviews

Debbie L. Mackey
Connie Thomas
University of Tennessee

The internship experience is an important part of a student’s curriculum in the undergraduate program. Bridging the gap between the classroom and the real world is crucial for career success. Graduates of the human resource program were interviewed during the internship process through appreciative inquiry. This qualitative study looked at the benefits of the internship program and how the student perceived the experience as related to the human resource program and their transition into the corporate world.

Keywords: Internship, Appreciative Inquiry, Human Resources

Over the past decade the human resource field has changed dramatically, offering challenges to the human resource professional as well as the graduate coming into this field. Indeed, it is one of the tasks of educators to examine and verify that the curriculum as well as related teaching procedures and practices are strongly tied to this evolving discipline. While changes are rapidly taking place in corporations and students are trying to transition into this changing arena, it is imperative that strategies be developed to identify and articulate all the dimensions of a university program. As a student completes coursework and begins to think about becoming a human resource professional, how should they be prepared for the move? Researchers approached this study as teachers of students who will assume leading roles in business and industry in the new millennium. Of course, it was understood that an internship must be an integral part of a smooth transition from school to work. Students must be able to use skills and knowledge they have acquired. Moreover, internships serve the dual purpose of establishing genuine collaboration with business and industry while assisting educators to provide the foundation for planning the curriculum. This scenario presents a unique opportunity for educators to assess and validate the contents of a university-based Human Resource Development (HRD) program.

Why is the internship so vital to the student’s success? How does the HRD department measure this success? Does the curriculum provide the appropriate balance of theory and practice? Should students be involved in identifying components of the curriculum that contributed to the learning process as well as those factors that did not? These questions are pertinent to both the academic and corporate world. Internships can vary in structure and design but research indicates the benefits are great to both the student and company (Brooks & Greene 1998; Gold,). According to the Society of Human Resource Management (SHRM), a well-run internship program is truly a win-win situation for all participants (SHRM, 2003). SHRM has developed a guidebook for internship programs to provide assistance to the student and provide post-secondary opportunities. Students can explore the various areas of a particular aspect of the field and discover a particular interest during the internship. This qualitative study was designed to show the benefits of the internship program in HRD using appreciative inquiry (AI). This assessment approach has continued to gain recognition both in scholarly and practitioner circles (Bushe, 1999). It has been successfully used in a wide range of settings for a variety of reasons to include career development (Knowles, 1999), corporate planning (Zemke, 1999), workplace learning (Baskett, 1993), and shaping communities (Bowling & Brahm, 2001).

Statement of the Problem

Due to the apparent lack of empirical evidence to support the benefits of internships in the human resource development field, the researchers proposed rigorously studying individual learning through on-going analyses and verification of student outcomes using appreciative inquiry. After many years of visiting corporations, designing courses, teaching, planning activities and reviewing literature the researchers’ professional observations led them to construct this qualitative study to determine factors that were key elements in successful experiential learning events. Although an internship is perceived to be a time of learning, mentoring and adding skills for the student, few studies have sought to determine the most important elements to be included in the experience. The National Association of College and Employers surveyed 561 employer/members in 2001 to evaluate internships and cooperative programs. Through this research, internships were found to be the most prevalent experience of the
responding companies. Three-fourths of responding employers sponsored internships and 93% offered internship opportunities (NACE, 2001); however, the research did not explore elements of the internship that contributed to the perceived success of the exercise. It is essential that researchers formulate questions regarding the shared positive future of students and academicians.

Organization and structure of the internship contribute to making the experience successful according to a study done of 300 organizations associated with Career Services at the University of Chapel Hill-North Carolina (UNC-CH). These organizations have established internship programs of at least two years. Recruiting interns, internship structure and salary were reviewed. Networking through the university and previous interns accounted for over half of the internships. Almost 26 percent of the internships were in human resources and 55 percent of those interns were hired after completing the internship (Brooks and Greene, 1998). Although the program is obviously successful, students and graduates were not asked to explore the reasons for the positive aura.

Many companies treat the intern as a “real employee” says Marie Artim of Enterprise (Gold, 2002). NACE identified many companies such as Disney, Enterprise, and International Business Machines (IBM), that offer outstanding internship programs and consider the internship an investment in the future. The internship seemed to answer many career questions for these students; however, they were not asked to elaborate on the energized environment that led to the perceived success of the program.

Certainly, internships are felt to help individuals secure a job, partner with employers in shared visions, improve on existing organizational practices, and manage a particular career; however, an organized attempt to document relevant internship experiences in a formal format has not been attempted. Interviewing students using an issues-focused approach that would allow them to evaluate, evaluate and identify their contributions to organizations was felt to be a vital ingredient in articulating the learning connections between theory and practice. For many years, the dominant theory among human resource theoreticians, educators, and practitioners has been a negative one. The traditional model to initiate program improvement was based on seeking out problems and providing interventions. Appreciative Inquiry, on the other hand, is the opposite of this negative philosophy. Appreciative inquiry can be defined as the study and exploration of what gives life to human systems when they function at their best (Whitney and Bloom, 2003).

**Purpose of the Study**

The purpose of the study was to explore and describe how students perceive, organize, adapt, and benefit from the experiences encountered in a focused internship within the context of the human resource program. Students were asked to examine issues and experiences of the internship as they related to fulfilling their educational goals. The transition between the classroom and the corporate world becomes smooth when the student completes a successful internship. This study was conducted to ascertain what was working well with the program and to make recommendations for future program improvement, using this participatory approach to empower all the parties involved. It was designed to highlight the importance of the special relationship that evolves among the students, faculty, and the corporate world. Since this is a preliminary investigation that is expected to become an ongoing research project, the potential for using appreciative inquiry is an exploratory research vehicle. The study seeks to advance the AI theory that human systems tend to move in the direction of a more positive reality and that students are energized by participating in efforts that tend to positively reinforce learning.

**Theoretical Framework**

This study was framed within the learning and humanistic theory from Gilley and England and the appreciative inquiry process by Cooperrider and Srivastva. Gilley and England (1989, p. 120-121) posited that within organizations, learning can be defined as “knowledge obtained by study and/or experience the art of acquiring knowledge, skills, competencies, attitudes, and ideals that are retained and used, and a change of behavior through experience” (Gilley and England, 2000). The humanistic theory is based on the idea that every individual has potential to learn and each individual should be encouraged to develop to his/her potential (Gilley and England, 2000).

Appreciative inquiry (AI) involves the systematic, cooperative identification of effective components in an organization that focus on positive outcomes. It was developed primarily by David Cooperrider and Suresh Srivastva (1987), professors at Case Western University’s Weatherhead School of Management. More than a decade later, Cooperrider and Whitney (1999), described the process as a “cooperative search for the best in people, their organizations, and the world around them”. This theory is firmly rooted in a variety of fields including chaos theory, organizational development, and action-oriented research. AI is the study and exploration of what gives life
to human systems when they function at their best (Whitney and Trosten-Bloom, 2002). The principles underlying AI are:

- **Constructionism** - Creating reality through patterns of storytelling and self-disclosure
- **Simultaneity** - Learning and change happen simultaneously
- **Poetics** - Human systems are stories that are open to interpretation
- **Anticipation** - Looking forward to a pleasant experience
- **Positive** - Transformation into what should be

The word appreciation means to value, recognize or appreciate. The appreciative inquiry interview is designed to assist in showing the interviewee his/her value in the organization and how success can be achieved through positive change. The inquiry, begins with the framing of what Cooperrider, Sorenson, Whitney, and Yaeger (2000) call the “unconditional positive question”. The process continues through the 4-D Cycle to accelerate the power of appreciative inquiry (Whitney and Trosten-Bloom, 2002). The four parts to the cycle are: discovery, dream, design, and destiny.

- **Discovery** is reviewing events that have taken place, the best of what is, and the identification of exceptional (peak) moments.
- **Dream** is a time for the student participant and/or employee to envision what may be if the “peak” moments were the norm, not the exception; to reflect on hopes and dreams for their work, relationships, organization and the world.
- **Design** can be completed through reviewing statements of what “should be” including elements from discovery and dream; developing ideas to achieve the vision and strategies to implement the plans.
- **Destiny** is the process of actually implementing the plans, establishing new and better conditions while mobilizing resources to accomplish goals. This may be identified as delivery in some references. Barret and Fry, in their introduction to the book, *Appreciative Inquiry and Organizational Transformation*, describe AI “as a type of study that selectively seeks to locate, highlight, and illuminate what are referred to as the life-giving properties of any organization or human system” (2002, p. 6). It is this possibility of using that knowledge to envision and create a better future that drives this research effort. Questions for the present study were developed based on the four phase construct.

**Research Questions**

This study addressed several questions:

1. What are the perceived benefits of an internship program as identified by students who are presently enrolled in a human resource program?
   - Peak performances/highlights
   - Discovery of personal traits
   - Becoming part of an organization
   - Identification of leadership traits in others
   - Key factors in successful internships
   - Lessons learned/reinforced
2. To what extent does an internship contribute to the overall success of an HRD program?
3. What are the factors that facilitate and/or encourage student learning within the internship program?
4. What are the overall benefits of appreciative inquiry interviews?

**Methodology**

The appreciative inquiry interview process was used to obtain observational, reflective comments from each student in the internship program during that particular semester. Specifically, narrative interviewing techniques were used to elicit student comments. The students were placed in a human resource department of a corporation that seemed to match their interest during the internship. Each student was visited and interviewed at the intern site. Appreciative inquiry interviews were structured to permit instructors to inquire about personal experiences during the internship, allow students to elaborate on topics, and to comment on the potential for transformation in the organization they visited (Whitney and Trosten-Bloom, 2003). The questions created for the interview were designed to bring out the positive experiences of the exercise; however, negative comments were not dismissed but explored. Students were asked to provide remedies/solutions for perceived weaknesses in the internships or the HRD program. The results of the study were reviewed and categorized into tables for the purpose of brevity.
Demographics of Interns

Identical interview techniques were used with each intern during the final week of the internship Fall semester. Each intern was visited at his/her intern site and a private office setting or conference room was selected for each interview to avoid any distractions. The students were asked the same questions and in the same order each time. Responses were transcribed. The interview was confidential and students were advised that their comments would never be attributed to an individual student. Each respondent had his/her own unique personal history which must be considered with the findings. Reflections and perceptions were communicated with varying degrees of sophistication. One notable difference in the response rate was in the degree of philosophical analysis contributed by the students. Most of the respondents appeared to have previously considered many of the issues raised by the researcher and readily offered observations while a few had not and simply provided short answers. Attempts have been made to faithfully represent individual perceptions even though the final analysis seemed to dictate a synthesis of the collective findings. There were 17 interns, 13 undergraduate and 4 graduate students enrolled in the HRD internship program. Two of the graduate students were working toward a masters degree and two toward a doctorate. The students were placed in a variety of companies. Ages of the students range from 21 to 35 years. There were 14 females and 3 males. These students were placed in a company or organization in the human resource and/or training department. Each student spent at least one semester at the intern site. Table 1 indicates the different types of intern sites and how many students were at that particular type of internship.

Findings

The findings of the study provided answers to the research questions. By creating this type of approach to survey subjects, not surprisingly, many positive outcomes of the internship each experienced were identified. Their viewpoints during the inquiries focused on program strengths, their personal achievements during the internship, and the identification of purposeful strategies to improve the program. Generally, students identified the best elements of the program and seemed highly energized to discover that their observations would be used to create positive programmatic changes.

The interview process generated a variety of comments from the students. Each particular student placed in an internship experienced various functions of human resources. Many positive reflections were given by the student. The following is a list of questions that were asked of each student:

- Tell me about an exceptional (peak) experience during your internship that made you feel proud of yourself and your performance as an intern. Who was involved? What did they do to make this a remarkable experience? What did you do to make this a remarkable experience?
• Without being humble, what have you discovered about yourself during the internship and how could you use these traits to improve the organization?
• Can you think of a time when your presence was acknowledged by allowing you to participate in the implementation of corporate strategies? Were you impressed by the leadership? Did you feel as if you were a part of a “solution” rather than a “problem”?
• What are some experiences or lessons you would like to add to the internship? How would the program be different if you were in charge?
• How has the internship heightened your knowledge of human resources?

As researchers conducted the interviews, it became increasingly clear that the current HR program, specifically the internship component, was meeting student needs and expectations. Although students were positive in the majority of their responses, they candidly revealed concerns and offered solutions to problems. Students contributed new ideas regarding the integration of new methods/ideas that are being used in the workplace. They also recognized the transferability of their accumulated knowledge and skills as well as how “marketable” they had become. Students expressed an appreciation for the opportunity to work in the “real world” and overwhelmingly agreed that the overall experience had contributed to their education immensely.

The essence of the interviews has been captured by key phrases and clustered into themes in Tables 2-6. Since students were encouraged to give examples, they frequently elaborated on many points. One of the shortcomings of the study is demonstrated by attempts to break down the complex responses into concise statements.

**Conclusions**

This study provided a wealth of information through the appreciative interview process. In general, researchers discovered that students valued the proactive retrieval of their perceptions by the faculty. The participatory interaction seemed to create a bond or partnership as students and teachers exchanged ideas and explored outcomes. Students willingly shared stories of success and failure. They provided key insights into elements of the internships through their unique perspectives. Students used the path to discovery, dreaming, and designing to find their own version of destiny. In the end, the project was deemed to be a huge success. Researchers concluded that research through appreciative inquiry should be done on a regular basis at the completion of an internship to stay abreast of activities in the corporate working world as well as to understand the experience through the eyes of the student. Additionally, by using the appreciative inquiry methodology, focusing on positive, extraordinary moments, the
overall evaluation of the internship component of the program was equally positive. Not only were the students able to delineate the “best” practices, they were able to offer suggestions for program improvement based on their experiences. As students shared the broad variety of experiences they were exposed to, many related that they were able to make informed career decisions as a result. Since several students were offered positions within the organization, the internship surely identifies those marketable qualities they have attained. Although the population for the present study was small, it is felt that ongoing assessments should be conducted to strengthen and/or modify the results. Findings from the study have considerable implications for the future refinement and development of the human resource program. As Liebler (1997) commented, “The process of doing the appreciative interviews is as important as the data collected, for it is through the doing that the internal conversations within organizations are changed.” The process itself revealed that HRD instructors and students shared common ground; indeed, the process required a form of collaboration that transcended the normal teacher/student relationship into a search for unique possibilities for program enhancement.

The use of these findings to generalize beyond the present population would be inappropriate; however, investigation into similar internships may be warranted using appreciative inquiry. In fact, replication with similar interns in a postsecondary HRD program would lend credence to the present study and is encouraged.

Recommendations

Based on the results and limitations of this study, several recommendations for curriculum modification and future research are offered:

1. While the curriculum delineating the events in the internship should remain flexible and responsive to student needs, a clear vision and mission for the course should be constant.
2. Replication of the study should be done on a regular basis. Perceptions of students enrolled in an HRD internship should be gathered each semester to accumulate more data. Considerations should be given to developing a longitudinal study to follow the current students as they expand their careers.
3. Future research efforts should be expanded to include taped interviews of student responses. Comments should be captured and recorded in their entirety. The present study fails to demonstrate the obvious development of communication and higher-order thinking skills the interns gained, which is essential in today’s workplace.

Academic Service-Learning in the HRD Curriculum

Ovilla Turnbull
Susan R. Madsen
Utah Valley State College

Service-learning is a relatively new pedagogy which uses service activities to support traditional teaching methods, giving students a better understanding and ability to remember and carry out functions/skills taught in class. Although its use in an HRD course has rarely been reported in the literature, the teaching methods appear to be ideal for instilling in students the skills and/or traits necessary to be successful in HRD (e.g., intellectual versatility, adult learning insight, and industry understanding).

Keywords: Service-Learning, HRD Competencies, Adult Learning

In the early 1900’s philosopher John Dewey began writing about experiential learning. He firmly believed in the practice and, as Knowles, Holton, and Swanson (1998) explained, “In Dewey’s system, experience is always the starting point of an educational process; it is never the result” (p. 94). Dewey recognized the need to combine experience with traditional teaching methods to more fully prepare students for the real-world workforce. He saw experience as superior to traditional teaching methods because, as Carver (1997) explained, Dewey believed the educational value of an experience is derived from the way the experience contributes to the students’ development (principle of continuity) as well as the immediate nature of students’ relationships with their environment (principle of interaction). It takes into consideration not only the explicit curriculum but also the lessons people acquire by participating in activities…” (p. 145)

Despite Dewey’s vision for the future of formal education and his many writings on the subject, the pedagogy has not taken hold to the extent he had envisioned, especially in the higher educational systems. One way it has been implemented, however, is through the academic service-learning (SL) movement that has grown across the U.S. throughout the 1990’s and into the twenty-first century. Initially, the pedagogy was implemented in a very small number of fields (e.g., nursing), but gradually educators have begun to recognize the value of combining service assignments with the course content to improve student learning, understanding, and knowledge retention in a large variety of disciplines. Much research has been done to examine the efficacy of using academic SL in other types of courses and disciplines, but this article is among the first to report how the pedagogy might be used to improve student learning in HRD courses. It is our argument that educators should consider integrating academic SL projects into human resource development (HRD) courses and throughout the HRD curriculum.

Theoretical Framework

Even though service-learning is said to be a relatively new pedagogy, some claim it has been used on a limited and informal basis for years. Academic SL is a form of experiential learning. It adds reflection to a learning experience to prepare students to enter the workforce after graduation. It provides participants with a hands-on, course-based, credit bearing opportunity to learn course content and other valuable and practical skills in a variety of disciplines. The addition of the word academic to the term service-learning appears to be an important way to dispel myths about the practice. When educators first began using the term SL it was in reference to class projects such as picking up garbage along a highway. SL has evolved, however, into an actual pedagogy that must reinforce course content. Institutions, faculty, students and communities that still foster the former notion about SL may be more inclined to implement a pedagogy known as academic SL.

Educators are sometimes confused between SL and other forms of experiential learning (e.g., internships, co-opts). Even though the definitions of academic SL vary throughout the literature, understanding what it is can help in distinguishing it from other forms. One often cited definition by Rice (as cited in Bush-Bacelis, 1998) is that academic service-learning is a method by which students learn and develop through active participation in thoughtfully organized experiences that meet actual community needs and are coordinated with the academic and local communities (Perkins, 1994)...[academic SL] requires the infusion of the classroom content into the community service experience. The students and professor work together to connect content with the students’ active involvement in the community. Effective learning modules include three main criteria: meaningful service, connection to course content, and active reflection on the service-related learning (p. 20).
This is a useful explanation of service learning in three ways. First, it elucidates that, although students can direct their own projects, the educator’s role is to help students make appropriate connections (theory and knowledge to practice) through reflective activities. Second, it stresses the fact that the projects are designed around a specific community need. Third, it also illustrates the idea that the service should be meaningful, and the projects should be infused into classroom content. In other words, service-learning projects should be academically combined with traditional teaching methods to heighten learning. The term traditional teaching methods refers to the long-established practice of educating via textbook, secondary research assignments, and lecture, yet this form gives little attention to the students’ need to experience the systems and processes that are discussed. Academic SL combines these methods with hands-on experience to cement the learning.

In understanding academic SL, it is also important to understand the term community partners. This term refers to the hosting organization for service projects. These organizations are often (but not always) non-profit, small, and understaffed and therefore have great need for the service provided by the students. This creates a mutually beneficial relationship between the students and the community partners. Bush-Bacelis (1998) explained that the community partner “becomes the context in which students apply [course] principles. Their thinking goes beyond the textbook and classroom as soon as they become involved with the organization. They think more globally and they apply principles” (p. 25).

Much of the theoretical framework for this article comes from the works of David Kolb (1984) who is recognized by a majority of SL researchers (e.g., Carver, 1997; McGoldrick, Battle, & Gallagher, 2000) as a leading theorist in the dialogue. Kolb (1984) defined learning, as “the process whereby knowledge is created through transformation of experience” (p. 38). He also noted that, because learning is a continuous process that is grounded in experience, all learning can be seen as relearning. His theory started with a model for experiential learning, of which service-learning is a part. The model has four steps which, according to Swanson and Holton (2001), include (1) concrete experience—being fully involved in here-and-now experiences; (2) observations and reflection—reflecting on and observing their experiences from many perspectives; (3) formation of abstract concepts and generalization—creating concepts that integrate their observations into logically sound theories; (4) testing implications of new concepts in new situations—using these theories to make decisions and solve problems (pp. 167-168). The model has had widespread use and has also provided the general framework for a large number of studies. However, Swanson and Holton explained that the reason few have tested this theory is because of innate problems with Kolb’s instrument.

Gagne also provided a framework that is practical to use in guiding the implementation of an academic SL component into the classroom (Knowles, Holton, & Swanson, 1998, pp. 15-16). He identified five domains of the learning process, which we have used to illustrate the different components of effective academic SL design.

1. **Motor skills**: developed through practice (using the academic SL pedagogy, the actual project fosters these skills in the learners).
2. **Verbal skills**: the major requirement for learning being its presentation within an organized, meaningful context (these skills are still learned during the in-class lecture portion, they are also developed through practice with the academic SL project).
3. **Intellectual skills**: the learning of which seems to require the prior learning of prerequisite skills (these skills must come from prior learning, as the domain suggests, but the SL experience also increases these skills, which the students take and use in future experiences, e.g. Dewey’s principle of continuity).
4. **Cognitive strategy**: the learning of which requires repeated occasions in which challenges to thinking are presented (this is the portion missing from Kolb’s model; it is, however, present in service-learning through reflection).
5. **Attitudes**: which are learned most effectively through human models and vicarious reinforcement (in general, attitudes are established by the time students reach upper education levels, although research (e.g., Rama, Ravenscroft, Walcott, & Zlotkowski, 2000) has suggested that attitudes toward learning can change when a student understands how the subjects are relevant.)

Although Gagne did not envision experiential learning per se when he developed his theory, it fits nicely with the elements practiced in properly designed academic SL. And, when used in conjunction with the Kolb model, Gagne’s framework illuminates the fundamentals of academic SL.

**Purpose and Research Questions**

The purpose of this study was to investigate the need and applicability of using academic SL within HRD courses. It examined how this pedagogy could help students at all levels of higher education learn and retain HRD-related knowledge and skills. The study explicitly examined the following questions in relation to HRD and academic SL:
1. What learning and benefits do students experience or gain from participating in SL projects and programs?
2. What initial framework can describe the connection between academic SL and HRD education?
3. What are some ideas and guidelines to assist faculty in adding academic SL projects to their course curriculum?

Research Methods

This study was primarily based on an analysis of the literature previously published on academic SL. However, limited data gathered for a larger study will be reported in this article as well.

First, academic SL scholarly articles in the business and educational arenas were located by searching a variety of indexes including ABI/INFORM Global, Academic Search Elite, Business Source Premier, Digital Dissertations, ERIC, ERIC (EBSCOhost), and PsychInfo. Approximately 70 of the most relevant articles were selected for initial review and use. In addition, ten related books were reviewed. Each piece of literature was read thoroughly, underlined, and annotated by both authors. Then all of the highlighted text and notes were typed word-for-word into a word processing document. Next, each author re-read the keyed portions of the articles and categorized or nodded all of the text into carefully selected service-learning themes (e.g., definition, pedagogical differences, reflection, citizenship, examples, theoretical frameworks, student learning, and need). The information was transferred and entered into the computer program NVivo, which allows for easy coding and recalling of themes.

Second, researchers interviewed students who had completed an academic SL project in a human resource undergraduate course during the spring of 2003. As previously stated, a full report of this study is the basis for another article currently being drafted. However, we felt a few selected statements from these interviews would assist readers in understanding student perspectives of academic SL projects in a related field. One or both of us interviewed each student who participated in the course. Importantly, the interviews took place about two weeks after the semester had ended and after the grades were posted. This was done for two reasons: 1) to allow students to be as open and honest as possible, and 2) to allow them time to step back from the stress of the project’s completion. Each interview lasted about one hour and included approximately 16 questions. Relevant questions to this paper included the following: What were your initial perceptions of the project? How did those perceptions change throughout the semester? What did you learning while performing this service-learning project? How did the learning in this class differ from that of other courses? Would you take another service-learning course? Why or why not? Each of the interviews were transcribed and then reviewed by both authors. The key points were pulled out and nodded into common themes that were selected after the interviews. At that point, the names and identifying information of each participating student were concealed and the nodded interviews were entered into NVivo.

Results and Discussion

This section will focus on reporting findings based on the first two research questions. First, the benefits to students who participate in academic SL in HRD curricula will be discussed. Second, a theoretical framework will be presented that takes an initial look at the possible interaction between academic SL and HRD education.

Literature – Learning and Benefits

In our literature review, we discovered a vast number of findings related to topics such as pedagogical differences, self-confidence, motivation, teamwork, challenges, benefits, and more. In the following section, we will discuss the pedagogical differences between academic SL and traditional teaching methods, the motivations for teaching or learning in advanced education, and the collateral and course content student learning that is expected to take place in each well designed academic SL project.

First, an empirical study conducted by Rama et. al. (2000) compared two sections of the same course taught during the same semester, one using service learning, and the other applying traditional teaching methods. According to their findings, “S-L students self-reported an enhanced ability to apply course principles to new situations and an increased ability to solve real problems in the course area […]and an increase in their interest in the subject matter” (p. 670). Even though this study found “no statistically significant difference in final course grades between SL and control students,” findings did show that SL students “scored significantly better on the essay portion of the final exam, and attended class more regularly” (p. 667). The results of the essay portion of the test seem to indicate that the academic SL students gained a deeper understanding of core concepts than students in the control group. The control students could regurgitate facts and figures for the exam, but the academic SL students could formulate coherent answers to questions that required thought and understanding. According to Kenworthy-U’t’ren (2000), even tests, case studies and research papers did not match the learning of an academic SL experience:
Service-learning provides students with a nontraditional, service-oriented social context for management education. It challenges them to confront, sort through, and excel in the dynamic, chaotic, nonlinear environment of a community-based organization. Real-world learning takes place as they simultaneously assume the role of professional consultants producing “goods” that will, in fact, be used. (p. 58) This statement has important implications to HRD. Because through academic SL participation the students gain experience in a variety of industries and organizations, they increase their knowledge of traditional HRD competencies (e.g. technical, business and interpersonal) as discussed by McLagan (1989). For example, they obtain a diversified understanding of the types of companies in which they will be working, gain general understanding of business culture, and come to realize their prospective roles as an HRD professional in implementing interventions.

The literature on academic SL discussed student learning in two primary categories: course content—technical knowledge and skills, and collateral learning—other skills and competencies important for successful employment. First, academic SL projects should not be designed and offered unless they substantiate learning related to actual course objectives. Second, academic SL researchers (e.g. Arnold, 2003; Brown, 2000; Rama et al., 2000) agreed that collateral competencies gained in any well organized, student directed academic SL project could include: conflict resolution, ability to function in a diverse labor force, effective communication, interpersonal skills, leadership, teamwork, problem solving and reasoning, ethics, ability to define problems and establish project mission and objectives, resource allocation, client relations, budgeting, and industry/sector perspective. Though, to our knowledge, few have reported the attempt to implement academic SL into HRD coursework, the research on collateral learning suggests that students would gain useful periphery skills (collateral learning), as well as an ability to employ the models processes (course content) taught in the course. More directly, competencies expected from HRD are those related to course content, and those gained from experience in carrying out the functions of HRD. Interestingly, Zlotkowski (1996) wrote, referring to the types of competencies mentioned above, “such skills, all components of effective critical thinking, cannot be acquired in an abstract fashion. Content and process cannot be separated” (pp. 7-8).

Current Study – Learning and Benefits

The interviewees in our study were HR students who had recently completed a compensation and benefits project. Although the following student statements may reflect competencies needed for these functions, they provide insight into the learning benefits an academic SL can have in HR as well as HRD courses. In addition, we found that the students perceived other non-learning-based benefits for having participated in the academic SL experience. In our interviews, one student explained: “I can sit in a class and learn but if I’m not doing something it is not going to stick and benefit me long term… like at work people can tell me what to do and I’m just dumbfounded. And then they show me once and I think, oh, ok. Now I can actually do it.” Interestingly, at least three of the students stated that, although the class was an elective in a subject about which they previously had no interest, they were now interested in working in the human resources field. One student interviewed explained, “I learn a lot better hands-on than going to class and through reading the chapters” while another said that he would take another service-learning class if he actually cared about learning the course material. It appears that many students who have experienced both academic SL and traditionally taught courses recognized that they learned and remembered more with the academic SL pedagogy.

Other students explained:

- “I learned a great deal about the difficult nature of an organization or business to balance the value of their employees and what they could afford to pay.”
- “I learned how to figure out how to compensate people – when I need to know that for a job I’ll be able to use these skills”
- “I understand compensation because of this project and have more competence in the concepts.”
- “I just got an internship and I told him how I did write job descriptions and task inventories in this experience and he wants me to do it for them”
- “I learned the value of job descriptions and how that is important for training”
- “I learned a lot about the role of HR and how it fits into an organization. I had no idea before the class”
- “I learned that HR is a lot more than just compensation, benefits, and monthly statements”
- “I learned how to do a job analysis and would feel comfortable going about doing it again”
- “It helps you to be able to understand what it takes to work in HR.”
- “You can actually see how it really works – actually do the things – it really enhanced the learning experience”
- “Just talking to people at the site was a learning experience – I’ve never done that and tried to act professional and be confident and organized” (helpful especially for consultants).
• “I learned to deal with people, different personalities and how to relate them or something”
• “The best part is actually now – I would honestly feel comfortable going into an organization and doing something like that”
• “I felt like we were able to put together a quality report, based on the learning we had in class and actually being able to practice it – that’s how I learn better”
• “I feel a lot more confident in my knowledge of compensation and benefits (and the other service learning classes) when compared to my other coursework”
• “The best part was the application of the course content – I think that is pretty much the point”
• “I definitely felt like the project helped me understand the application of course material better than any other”
• “When you are actually doing it, involved with it – it is different because you understand it”
• “When I can remember the information I can use it even after school is over”
• “I can’t believe that I learned as much as I did – Yeah I liked it”
• “Sometimes I sit in a classroom and think I could learn the same thing from a book – I didn’t get that from this”
• “It was learning – it actually surprised me – I ended up learning more than I actually thought I would”

It is interesting to note that behaviorists balk at the idea that learners can have an accurate perception of their own learning. As Knowles, Holton, and Swanson (1998) explained: “The behaviorists have differed among themselves as to what may be inferred in addition to what is measured, but they all exclude self-observation” (p.26). However, much of the basis of this work comes from the student’s own opinions about improvement and learning, as above. On the other hand, one of the elements of humanistic psychology is “evaluation by the learner” which contradicts the behaviorist’s view. According to Knowles et al., this element holds that “the learner knows whether the learning meets personal need, whether it leads toward what the individual wants to know, whether it illuminates the dark area of ignorance the individual is experiencing. The locus of evaluation, we might say, resides definitely in the learner” (p. 14). Nevertheless, these self-reports of student learning and benefits are supported by much of the literature. In addition, one of us (Madsen) taught the academic SL course of the students interviewed; hence, instructor perceptions also confirm findings and statements by the students.

Competencies: Academic SL-HRD Course and Successful HRD Work

The course content and learning for an academic SL HRD course is projected based on course content in a traditionally taught HRD course. According to primary and secondary research for this study, a student’s understanding of concepts and processes taught in a given course are enhanced by the academic SL experience. Well-designed academic SL projects have been found to facilitate student learning in both the technical skills areas (course/textbook) and in the collateral learning area (see left side of Figure 1). This term comes from Dewey who taught that teachers should be involved in developing the “whole” person. In HRD, those skills or traits may not be specifically addressed in a textbook but are still essential for successful HRD job performance. Academic SL has been shown to provide learning for students in both of these areas (see Figure 1).

Specifically, academic SL allows students an opportunity to develop (to some degree) and practice—among other things—teamwork, time management, computer competence, written and oral communication, industry understanding, problem diagnostic capability, and research skills—all of which may be helpful to new graduates beginning a career in HRD. (Actual skills and levels of development may vary depending on the project design and level of student autonomy involved.)

Recommendations and Contributions

To assist HRD faculty in adding effective and sustained academic SL projects to course curriculum there are a number of principles or guidelines that have been recommended (Godfrey, 1999). SL needs to be designed to

1. engage people in responsible and challenging actions for the common good;
2. provide structured opportunities for people to reflect on their service experience;
3. articulate clear service and learning goals for everyone involved;
4. allow for those with needs to define those needs;
5. clarify the responsibilities of each person and organization involved;
6. match service providers and service needs through a process that recognizes changing circumstances;
7. [expect] genuine, active, and sustained organizational commitment;
8. [include] training, supervision, monitoring, support, recognition, and evaluation to meet service and learning goals;
9. ensure that the time commitment for service and learning is flexible, appropriate, and in the best interest of all involved; and
10. be committed to program participation by and with diverse populations. (The Wingspread Principles, p. 366)

Generally speaking, Godfrey (1999) stated that “the theme running throughout is that service-learning pedagogies do not merely append community service onto the curriculum but that they integrate community service within the curriculum.” (p. 365)

Figure 1. Academic SL-HRD Course and Traits/Characteristics for Successful HRD Work

*Note: The competencies listed in the chart come from McLagan (1989).

A lot of literature has been written on the subject of developing good academic SL courses. Some of the most useful literature on the subject includes many authors listed in the references. Additionally, those wishing to learn more about S-L can turn to Campus Compact, a nationwide organization devoted to helping institutions implement this pedagogy into their curriculum. They have meetings and literature to support new and existing SL infrastructures within institutions.

For those who choose to apply the principles of academic SL, it is important to be aware that if the course is designed correctly, the students will initially resist. It is different from anything they have experienced, and requires more self-directed activity than most of the students’ desire. But, Bush-Bacelis (1998) said: “The best advantage for students is that in spite of initial resistance, they are able to connect the readings, class discussions, and other assignments with the real world, full of real people, with real problems that the students try to help solve” (p. 27).

McCarthy and Tucker (2002) believe that the need for academic SL has developed because of increasing focus at institutions of higher learning on extrinsic, reward-based outcomes of education (e.g. for students to leave college with a degree in-hand). This, McCarthy and Tucker say, ignores the intrinsic need to further academic understanding and ability to carry out the functions of a job. In other words, McCarthy says: “Increasingly, the campus is being viewed as a place where students get credentialed and faculty get tenured, while the overall work of the academy does not seem particularly relevant to the nation’s most pressing civic, social, economic and moral problems” (p. 629). Academic SL has evolved since the early 1990’s to address each of these problems and has been adapted to a variety of subjects, which makes it more effective. For this study, we have focused primarily on literature related to business courses and academic SL. Easterling (1997) for example, takes a broad view of how the pedagogy has been implemented into a variety of business curricula at various institutions across the country. He explained:
Service-learning may be successfully pursued in a variety of business courses. For example, at Bentley College, a) accounting students have redesigned billing procedures for a large multisevice city hospital, b) business communications students have created outreach materials for an agency…c) finance students have designed and presented workshops on establishing credit and managing personal finances to clients in a transitional homeless program, and d) operations management students have developed an effective clothing distribution system for clients at the largest women’s shelter in the Boston area" (p. 60).

Specifically, there are many types of academic SL projects that could be designed for HRD courses. For example, Clark (2000) lists seven project ideas that could be used in various HR related courses including one particularly relevant to training and development: “Developing a training program (including demonstration video and illustrated handbook) for new student employees in the university media center (which has very high, unpreventable turnover and must bring new employees up to speed quickly)” (p. 137). Kenworthy (1996), gives an example that is more oriented toward organizational behavior. She explains “Students in an organizational behavior course were responsible for funding, recruiting, developing, promoting and leading a project of interest at an area human services agency. The criteria of the project were, 1) that the students create and take ownership for the project, and 2) that the agency receive substantial assistance from the project” (p. 130). SL projects for an organization development course could include assisting firms and agencies in analysis, design, development, implementation, and/or evaluation of any type of change need and intervention.

Generally, we recommend that business practitioners (profit and non-profit) be aware of academic SL and provide opportunities for students to do course-related SL projects. Also, as more business professionals understand SL, they will begin to value (e.g., in the hiring process) the experiences and preparedness of the students who have completed such rigorous projects. We also recommend that more faculty members in colleges and universities throughout the world design and implement academic SL for a number of reasons. First, it has been shown to be an effective method of teaching a wide range of skills and concepts. Second, more research is needed (both qualitative and quantitative) on this pedagogy specifically in HRD-related courses. We have found only a few literature pieces that address academic SL in any course remotely related to HRD. Finally, a faculty member can utilize academic SL in tenure and promotion and post-tenure documentation. It is well known for being a pedagogy that involved innovative and engaging teaching and learning techniques. A faculty member can conduct and publish research findings on a variety of related research questions and hypotheses. Lastly, because the faculty member spends time interacting with community partners and facilitating community service from students, it also becomes a “service” activity for the faculty members. Academic SL is one of the few teaching methods that incorporate all three primary responsibilities and duties (teaching, scholarship, service) of faculty members into one.

**Conclusion**

Clark, Croddy, Hayes, and Philips (2001) employed an analogy of a coach who uses traditional classroom teaching methods to teach a student to swim. “[The student],” they explained, “will drown the first time he jumps into the water if his coach never takes him out of the lecture hall, gets him wet, and gives him feedback on his performance” (p. 60). The same is figuratively true for an HRD student who enters the workforce with no real experience or understanding of how the systems and processes work in the real world.

Academic SL is a valid and useful pedagogy in a variety of disciplines, and deserves more consideration in human resource related fields, including HRD. It is a way of improving the whole person through course content learning as well as collateral learning. Beltram (1999) explained that “teaching such basic concepts as appropriate time management and pride in a finished product is more easily accomplished when the students know their work is actually being utilized rather than graded and filed away”(p. 19). Clark (1997) clarified the importance of employing these methods in the classroom when he explained that students come to see the relevance of education and the practicality of committing to learning the lessons of the classroom when they experience the link through experience in the “real-world laboratory of the community” (p. 166). Through academic SL, HRD students can gain a deeper understanding of the core concepts taught and a greater appreciation for the realities of work in the field than they can in a strictly classroom setting. The technical competencies that are basic to HRD, according to McLagan (1989), include (among others): adult learning and understanding, which relates to knowing how adults acquire and use knowledge skills and attitudes; career-development theories and techniques understanding, which relates to knowing the techniques and methods used in career development and understanding their appropriate uses; and facilities skill, which is planning and coordinating logistics in an efficient and cost effective manner. Through the experience, the students also gain business competencies such as industry understanding and organization-behavior understanding, and interpersonal competencies like negotiation skills, and group-process skill, and questioning skills that prepare them to succeed in the field (p. 56).
Because book learning and lecture do not translate well to understanding of day-to-day functions and broad responsibilities of an HRD professional, it has become important to look at other methods of education. Although generalization at this early stage would be inappropriate, preliminary findings seem to indicate that students who have service-learning experiences are more confident in their own abilities, as are the educators who work with them. It also appears that other advanced level courses, including HRD, could benefit from the hands-on style of training that occurs in academic SL. For example, because of the broad nature of HRD, and the difficulty of preparing students for specific experiences or challenges they may encounter in their careers, the authors argue that by allowing students to actually perform the required duties for real organizations, the students would concretely learn and be able to use professional development skills vital to success in HRD. It seems ideal for HRD, not only because it instills in students a real perspective of course content, but also because “as a form of experiential education, service-learning develops student’ abilities as change agents, gives them a sense of belonging, and fosters the development of competence” (Carver, 1997, p. 149). More research is needed on the subject, however, before making any definitive conclusions.

Conceptualizing and Measuring Employee Response to Imposed Technological Change

Robert Reardon
University of Georgia

This paper presents preliminary findings from a study to characterize the way that skilled industrial workers respond to technological changes imposed on their workplace. A framework is developed which includes the central construct of employee response, and three predictors; characteristics of the organization, characteristics of the change, and characteristics of the employee. A survey instrument was developed to measure employee response and these predictors. The instrument was then tested in a pilot study.

Keywords: Innovation, Employee Training, Informal Learning

The rate of technological change has increased dramatically over the last twenty years. Workers would often find themselves in the same work environment for much of their work life. Today, computerization and other new technologies create a dynamic environment. Research and literature has focused on voluntary adoption of innovation. Very little work has looked at skilled industrial workers and their response to imposed technological change. An understanding of their responses might help in the design and implementation of technological change in the workplace. This paper describes the process of developing a survey instrument to measure and characterize employee responses to imposed technological change. This process includes survey development and testing through a pilot study.

Problem Statement

Many authors have touched upon responses that may be expected when a skilled industrial worker is faced with an imposed technological change. These include affective responses such as concern (Hall & Hord, 1987). They also report on cognitive responses such as informal learning (Boud & Garrick, 1999; Marsick & Volpe, 1999). Other authors describe social activities such as social networking and opinion leadership (Rogers, 1995; Senge, 1990; Watkins & Marsick, 1994). In the literature there is no comprehensive look at employee response to imposed technological change. Employers would benefit from knowing what sort or responses can be expected when their skilled industrial workers are forced to start using new technology. Building on this, employers would benefit from knowing what inputs affect these responses. These predictors could include characteristics of the change, characteristics of the organization, and characteristics of the individual. These predictors are shown in Figure 1.

Research Objective

The objective of this study is to develop a survey instrument which measures the central construct and the three predictors shown in Figure 1. This instrument will eventually be used in a larger study to investigate the relationships among the input predictors and the factors of employee response.
Theoretical Background

A great deal of research has looked at the adoption of innovations by individuals and organizations. Other researchers have studied how imposed change in educational settings creates a climate of concern among educators.

**Diffusion**

In his seminal text, *Diffusion of Innovation* (1995), Rogers describes factors that affect the rate of adoption of new innovations. This work assumes that there is a choice to adopt or not adopt. A huge amount of research has validated and supported the ideas put forth by Rogers. The concepts of diffusion do not apply to an industrial setting, where the adoption decision is made by management for the individual.

However, this study presumes that the factors that affect the rate of adoption may affect the response of workers when innovation is forced on them. Rogers (1995) describes five attributes of the innovation that affect the rate of adoption. These are relative advantage, compatibility, complexity, trialability, and observability. Rogers states that innovations that are perceived to have a high relative advantage are more quickly adopted than other innovations. For example, it follows that workers that perceive that an innovation with many advantages may respond differently than they would if the innovation was perceived as a waste of time. This study assumes that employee response to imposed technological change may be related to these five attributes.

**Responses**

Other researchers have studied the affective responses of employees when faced with change. Zuboff (1988) has reported on the effects of technology in the workplace. She predicts large changes in organizational structures, with authority and decision-making residing in lower regions of the organization. She reports that these changes create fears in workers, including fear of being replaced by automation and not being qualified for the new workplace. Hall and Hord (1987) have written about change in schools, and how educators proceed through several Stages of Concern. They have developed a questionnaire which assesses how the change is affecting the educators. Hall and Hord assert that each educator progresses through these stages as they adopt and learn a change.

Others have looked at the affective and cognitive responses of information technology (IT) users. Davis (1986) developed a technology acceptance model which was designed to predict the acceptance of new technologies. Other researchers (Dillon & Morris, 1996; Morris & Venkatesh, 2000; Venkatesh & Morris, 2000) have applied this work to look at relations between characteristics of the individual and the acceptance of new technology.

**Learning**

Several different types of learning are available to industrial workers being exposed to new technology. Formal training is often provided to workers when the change is significant. In some cases, formal training is mandated by regulatory agencies, such as the Occupational Safety and Health Administration or the Food and Drug Administration. However, skilled industrial workers can learn about new technologies through informal learning. Some sources assert that 70 to 90% of all workplace learning takes place informally (Stolovitch & Keeps, 1999). Marsick and Watkins (1990) have defined informal learning as unstructured, experiential, and non-institutional. Context is seen as critical to informal learning (Cseh, 1998; Marsick & Volpe, 1999). A highly structured environment will tend to limit informal learning to lessons in “how things are done here” (Marsick, Volpe, & Watkins, 1999).

On the other hand, an organization that is designed to encourage collaboration and learning through social networking is called a learning organization (Watkins & Marsick, 1994). Authors writing of learning organizations describe disciplines needed by employees (Senge, 1990), social networks that are key (V. J. Marsick & K. E. Watkins, 1999), or forms of communications that must be nurtured (Argyris & Schön, 1996). Watkins and Marsick (Watkins & Marsick, 1994) developed a questionnaire, the Dimensions of the Learning Organization Questionnaire (© 1994 Watkins and Marsick) to measure the extent to which organizations were learning organization. The questionnaire’s validity and reliability has been established through further research (Yang, Watkins, & Marsick, 1999).

**Method**

The goal was to have a survey that would take about fifteen minutes to fill out. Most of the items on the survey are 4-level Likert-type items. Each item is a statement and the respondent is asked to strongly disagree, disagree, agree, or strongly agree with the statement.

The items for the predictors were drawn from the literature, but the items for the central construct, employee response, were drawn from numerous sources in an attempt to develop a comprehensive list of employee responses. A panel of content experts reviewed these items to eliminate redundancies and validate the remaining items. Finally, the survey was tested in a pilot study.
Development of the Predictors

Items to measure the three predictors were drawn from the literature. In order to constrain the length of the survey, these predictors are measured with a few items. The items are then summed to give a single measure representing the characteristics of the organization or characteristics of the change. The survey contains seven demographic questions at the end to gather information about characteristics of the individual.

Characteristics of the organization. Watkins and Marsick (1994) developed the Dimensions of the Learning Organization Questionnaire (DLOQ) to measure the seven dimensions within an organization. This survey instrument is reliable and has been validated in the literature (Yang, Watkins, & Marsick, 1998). However, the entire DLOQ would greatly add to the length of this survey instrument.

Yang (Yang et al., 1999) had proposed a selection of seven items drawn from the DLOQ. These seven items could be administered and the results summed to provide a unitary measure of the extent that an organization was a learning organization. These seven items were selected and used without modification to measure the characteristics of the organization.

Characteristics of the change. The literature did not provide a short instrument for measuring the characteristics of the change. However, Rogers (1995), does provide a list of attributes of the change that have an impact on the rate of adoption. Five items for the survey were drawn from Rogers list of attributes and one item was added which stated “The company did a great job preparing for this change.”

Development of the Central Construct

Items for the central construct came from three sources; review of the literature, a brainstorming session with skilled industrial workers, and two qualitative studies by the author. A panel of subject matter experts reviewed the list for validity and redundancy.

Review of the literature. The author scanned many books and journal articles looking for descriptions of things that may be considered employee response to imposed technological change. This review included literature from employee training, organizational development, adult education, educational change, organizational psychology, management and the changes that had been made. The brainstorming session was tape recorded and transcribed.

Brainstorming session. A brainstorming session was held to solicit responses to imposed technological change. The participants were a convenient selection of four workers from a polymer production facility. Two of the participants were experienced plant operators, one white and one African-American. One participant was a white operator with just two years experience. The final participant was a white mechanic with ten years experience. The participants were asked to describe how they react to new technology when it is forced on them in their workplace. The session was supposed to last sixty minutes, but it lasted ninety minutes. The participants talked about how they learned to use new technology and they discussed how they felt about the process, the planners, their coworkers, management and the changes that had been made. The brainstorming session was tape recorded and transcribed. Eight-four items were drawn from the transcript of this meeting.

Qualitative studies. The first study investigated how engineers learn in the face of organizational change (Reardon, 2002). One of the interview questions in the study specifically asked the engineers to describe how they learned about an imposed technological change. The second study (in progress) examined how radio disk jockeys learned to use new technology. The transcripts from these studies were closely examined to identify specific responses to imposed technological change. These two studies yielded 50 items.

Reflection. Finally, the researcher recorded items that occurred as he discussed or thought about this research. These items were from personal observations of specific responses in the workplace. This list had 13 items. When this collection of responses was complete it had 220 items.

At this point in the process it was becoming difficult to generate new items. Many of the last items were repeats of items found in others sources. This was an indication that the item pool was saturated and further efforts would not generate unique items.
Survey Development

The list of items was refined and reviewed. The intention of the review process was to end up with a comprehensive list of items with no redundancies. Once the item refinement was complete a prototype survey was written and reviewed.

Item refinement. The initial list of 220 items was reviewed, reduced and validated in two steps. In the first step, the researcher grouped the items and assigned crude, temporary categories to aid the review of the item pool. The categories were “Feelings,” “Avoidance behaviors,” “Learning,” “Compound,” “Trust,” “Teaching,” and “Burnout”. These categories were not meant to serve any function other than convenience for the items reviews. The purpose of the exploratory factor analysis is to discover the actual categories or factors.

The review process had three goals. First, numerous items were “compound” since they contained more than one response. An example is “I disliked the technological change because I felt that it might eliminate my job.” Compound items were split into appropriate items. Second, redundant items were eliminated. Finally, items that did not match the construct of employee response to imposed technological change were eliminated. After the review process, seventy-two items remained.

Next, a group of four graduate students in adult education was assembled to review the list. This review took place during two sessions two weeks apart. Because of a schedule conflict, one of these students was replaced for the second session. These students were given a definition of an employee response to imposed technological change; “a change in behavior, knowledge, emotional state, or social interactions that is directly linked to the imposed technological change. It can be internal or observable.” These students were asked to review the list in terms of four criteria. First, did the item match the definition? Second, which items are redundant? Third, was the item worded correctly? Finally, were there items that were not included? Of the seventy-two items in the second pool, eighteen items were eliminated. Among the remaining fifty-four items, the group modified several items to improve clarity or eliminate ambiguity. The group did not suggest any new items for the list. This supports the assertion that the list of fifty-four items is saturated.

Crafting of the survey instrument. Once the list of items was developed, a prototype survey was written. The survey is intended to be given to skilled industrial workers. In the experience of the author, most of these workers have high school educations and there is a significant fraction that read at or below the fifth grade level. Therefore the language and structure of the survey instrument is straightforward and short. The instrument consisted of four sections. The first section contained the seven items pulled from the DLOQ and was designed to determine the learning “character” of the organization. The second section contained the six items designed to provide a measure of the perceived characteristics of the change. The third section measured the central construct of employee response and consisted of fifty-four items. The final section included seven demographic questions about age, race, gender, education and experience. These questions were written following the guidelines of the Institutional Review Board of the University of Georgia. The survey instrument was five pages long and consisted of seventy-four items.

Pre-pilot testing. The prototype survey instrument was given to seven individuals. Five individuals were a convenient selection of skilled industrial workers and two were graduate students in adult education. These participants were asked to look for errors or anything that would cause confusion or offense. They were asked to record how long it took to take the survey. This process found one typographic error, but did not reveal any other problems with the instrument. The participants reported that it took ten to twenty minutes to take the survey.

Pilot Study

The survey instrument was tested in a pilot study at a chemical plant with plant operators and instrument technicians. The purpose of the pilot study was to test the survey administration and check the reliability of two of the input constructs: characteristics of the organization and characteristics of the change.

Pilot study setting and population. The survey instrument was administered to a group of forty-four employees at a chemical plant in the southeastern United States. The participants were plant operators and instrument technicians who had been forced to learn a new computer system used to control the chemical operations inside the plant. The participants in the study were 93% male and 87% white. Most of the participants (58%) had stopped their formal education at high school. Eight-four percent of the participants were over forty and the median age was forty-seven. According to the human resource team leader, this plant has a low turnover rate. The plant was built in 1984.

Pilot study administration. One week prior to the start of the survey, each participant received an email describing the purpose and nature of the survey. This email also announced that one of the respondents would receive a $50 gift certificate. The winner would be chosen by random from among the employees that returned surveys.

Each participant received a survey instrument through the plant mail. The surveys were serially numbered and the researcher maintained a cross reference of names and numbers. This cross-reference identified who received
reminders and replacement surveys and was used to determine who was eligible for the drawing. The cross reference was destroyed after the prize drawing.

Each of the survey instruments had a cover letter explaining the survey procedure and the drawing for the gift certificate. This letter also assured the participant that the survey was voluntary and confidential. The survey also included a letter that explained implied consent and provided information about the rights of the participants. Finally, the survey instrument included an addressed and stamped envelope to return the completed survey.

Two weeks after distribution of the initial survey, the researcher sent an email to each participant who had not responded. The email reminded the participant of the survey and its purpose. The email also reminded the participant of the drawing for the $50 gift certificate.

Finally, four weeks after the initial survey distribution, replacement surveys were mailed to all the participants who had not responded. This package was identical to the initial package, except the cover letter was slightly modified to reflect that this was a replacement package.

Results and Findings

The administration of the survey went well. Each mailing resulted in a significant number of responses. In all, 59% of the participants responded. For the most part, the surveys were completely filled out. One respondent omitted one item. Another respondent declined to fill out the demographic items. Other than these omissions, all items were completed on all of the returned survey instruments. There was no evidence that respondents just ran down the page checking all the same responses.

Item Response Variability

In the central construct of employee response all fifty-four items had three or four of the possible four responses. None of the distributions seemed highly skewed. The variance of responses for the central construct appeared sensible, so none of those items will be modified in future studies.

Construct Validity

The validity of each section was established by different means. The DLOQ was the basis for the first section of the survey instrument. This section was intended to measure the characteristics of the organization. Yang, et al, (1998) reviews a study that validated the DLOQ by comparing the answers of 469 respondents to a set of business outcomes. An additional study by Ellinger, et al, (2002) validated the instrument by comparing the results of the DLOQ against other established measures of business success. The second section of the survey instrument was the characteristics of the change section. The items in this section were drawn from Rogers’ research on innovation. Rogers first proposed five attributes that predict the adoptability of an innovation in 1970. Since then, literally hundreds of studies have validated his work. Thirty years later, research is using these concepts when looking at the diffusion of innovations in health care and education. The robust nature of these concepts supports their validity.

The construct validity of the items in the section measuring responses is established in three ways. First, the items were drawn from three sources: the literature, a brainstorming session and two prior research studies. Second, the items were reviewed by a team of graduate students in adult education. Finally, the prototype survey was given to seven participants prior to the pilot study. During the debriefing, none of the participants had trouble with any of the items, and stated that they clearly understood that the central construct was employee response to imposed technological change.

Reliability

It was necessary to determine the reliability of the first two sections. The reliability of the short form of the DLOQ was not discussed in any existing literature. The coefficient alpha of this section drawn from the DLOQ was 0.90. This is an acceptably high value and indicates that the section has internal reliability.

The second section, related to the characteristics of the change, was written for this study. There was no short instrument for measuring the characteristics of the change. So, although these items were drawn from Rogers, there reliability as a tool needed to be established. The coefficient alpha for this section was 0.88.

The deletion of any one item did not substantially raise the coefficient alpha in either of these two sections. This study did not look at coefficient alpha of the central construct. Future research will focus on dividing these fifty-four items into factors. The coefficient alpha for these factors will be an important measure during that research.

Inter-item Correlation (Redundancy)

The inter-correlation of each possible item pair was calculated for all input and output items. Items with inter-correlations greater than 0.75 were examined to make sure that the survey did not include items that were semantic duplicates of each other. None were found.
Conclusions

This pilot study provided valuable information regarding the survey instrument. The sample size was sufficient to draw certain conclusions from the research. This research objective was accomplished since a survey instrument was developed that measures the constructs shown in Figure 1.

The sections of the survey instrument seem to be valid and reliable. Participants completed the survey instrument, apparently with few problems. The administrative procedures described for the pilot study worked well, and the response rate was acceptable.

Limitations

The administrative procedures described here will not work in all places. Some industrial environments still do not use email, so the notices will need to be mailed to the participants. Some industrial environments do not mail things to employees inside the plant, but mail them to their homes. It will be harder to communicate to these types of employees while maintaining a sense of confidentiality.

Not all skilled industrial workers are literate. This survey was written in a simple straightforward way, but it still requires reading skills at or about the eighth grade reading level (the mandated language of the informed consent form was even higher – twelfth grade).

There were not enough responses to do a factor analysis of the central construct. That will be one of the goals of the main research study. During that study, the items of the central construct will be grouped into factors. There may be some reduction in the number of items at that time.

Application to HRD

This paper reports on a new survey instrument that will measure employee responses and three input predictors; characteristics of the organization, characteristics of the change, and characteristics of the employee. This instrument has potential use in theoretical research and practical applications.

Theoretical Implications

Researchers have studied learning organizations and innovations for years as separate research areas. This instrument considers characteristics of the organization, characteristics of the change, and characteristics of the employee as input predictors to employee response. Currently this study is being used in a research study at several manufacturing facilities. The objective of this study is to explore the concept of a model of employee response. This model would link these predictors to employee response and provide a clearer vision of what leads to successful innovation in manufacturing.

Practical Implications

Technological change is a key to success in manufacturing. Companies work hard to reduce costs of manufacture by implementing new technology. The cost of new technology is offset by increases in productivity and the reduction of cost. In order to realize these benefits companies must rely on employees’ effective use of the new technology. Therefore, new technology is closely related to two key functions of HRD - employee training and organizational learning. This survey attempts to measure and characterize the relationship among characteristics of the individual, characteristics of the organization, characteristics of the change, and employee response to imposed technological change. Understanding this will help employers design and implement change in a way that is most beneficial to the company and the employee. This relationship will not be established until after the main study is complete.

Effective Management Communication:  
A Study of Employees’ Perceptions of Online and Face-to-face Communications

Sharon Jeffcoat Bartley  
Virginia W. Kupritz  
The University of Tennessee

Jennifer L. Mills

The benefits of effective face-to-face communication between managers and staff are widely appreciated; however, the costs associated with this mode of communication require organizations to make decisions about when scarce resources should be allocated for face-to-face communication and when electronic communication could be utilized. HRD professionals should be sensitive to different modes of communication in order to communicate effectively with employees. This study examines employees’ perceptions of appropriate times that management can effectively use electronic communication.

Keywords: Online Communication, Face-to-face Communication, Electronic Communication

The ability to work and communicate in a virtual world allows companies to eliminate the restrictive boundaries of time, space and geography and mobilize a virtual workforce. Innovative technologies provide information on demand, hold reservoirs of shared knowledge, and enable real-time communication to occur globally (McAteer, 1994). As technology challenges businesses to keep up with innovations, employers must address the issue of how their employees are impacted by the way information is provided to them. Managers must know how the communication mode affects the message and must act to ensure all communication is effective no matter the mode utilized. However, few studies have addressed the impact of technology on communication between management and employees.

The purpose of this study was to determine employees’ perception about the types of information management could use to effectively communicate with them through electronic communication to augment face-to-face contact with employees. The study addresses these research questions:
1. What type of information can management effectively communicate with employees through electronic communication rather than with face-to-face contact?
2. What type of information is face-to-face contact critical for management to communicate with employees?
3. What type of information is electronic communication critical for management to effectively communicate with employees?

Review of Literature

Alfred G. Smith (1966) defined effective communication as “the success with which the meaning conveyed to the receiver leads to the desired conduct of his part” (p. 16). Effective communication of various types of information relies on contextual cues to provide information at the conscious and unconscious level and facilitate meaning so that the uses of language can be understood (both verbal and nonverbal) along with the particular situation and circumstances (Gundling, 1999; Hall, 1983). The role of context to communicate meaning is a powerful yet subtle tool. A review of the literature reveals that the full implications of context in communicating meaning of various types of information in the workplace are not yet understood. Words, control over format, voice tone, immediate feedback, nonverbal cues (facial expressions and gestures), environmental cues (both social and physical), direct physical exchange (e.g., a handshake), and informal contact (e.g., incidental meeting in the hallway) comprise some of the many contextual cues employees use to communicate and interpret meaning (Gundling, 1999).

Face-to-face communication provides the most contextual cues to communicate meaning of information and is the most personal and immediate of all forms of communication (OMara, 1999). The need for face-to-face contact in the workplace depends upon how much personal contact is required by the work process and depends upon the particular situation and circumstances. While face-to-face contact provides the most personal and immediate way of transacting business, costs associated with face-to-face communication necessitate the need for organizations to

Copyright © 2004 Sharon Jeffcoat Bartley, Virginia W. Kupritz, & Jennifer L. Mills
determine when to use this resource and when the alternative, less costly resource of electronic communication can be substituted (O'Mara, 1999). Current literature suggests face-to-face communication holds the most potential for playing a powerful and influential role in organizations as it relates to leadership, organizational climate, culture and organizational transformation (Gamble & Kellieh, 1999). Face-to-face contact is especially important when communicating types of information across disciplines or across cultures where differences in context play a critical role in understanding the meaning of a situation (Gundling, 1999; O'Mara, 1999; Kikoski, 1999). Face-to-face interaction allows for interruption and feedback while it fosters learning, and is found to be most valuable with information that is difficult to verbalize, complex in nature, or uncertain and ambiguous. Meetings conducted face-to-face with managers and employees enable social context cues to be present, which have shown to build trust among employees and managers in various studies (Scott, 2000). This trust is a critical area in organizational management with a recent study indicating that 47 percent of interviewed employees viewed employee trust as a major problem in the work force (Wright, 1996).

The need for face-to-face communication may be questioned, however, regardless of its benefit or usefulness when effective organizational communications systems are available, because of resources necessary to maintain face-to-face communication. When effective organizational communication systems are available for transmitting various types of information, communication networks have the ability to stretch from office to office, building to building, state to state and ultimately, across the globe. Organizations must constantly evaluate the effectiveness of the communication modes utilized for various types of information as they deal with the realization that while certain modes can provide real time responses, the sense of distance with technology-mediated communication is ever present and presents a handicap in terms of practice, learning, and knowledge sharing (Brown & Duguid, 2000). The use of technological innovations tends to simplify and isolate information that removes much of the context and meaning. Gundling (1999) describes context as the “core intercultural issues when using communication technologies” (p. 30). When context and meaning are removed from a message, the richness of the communication is removed, and only a very basic form of communication occurs (Brown & Duguid, 2000).

Within the virtual work environment, interpretation of messages can suffer because important contextual cues needed to communicate meaning of information are missing (Brown & Duguid, 2000; Kupritz & McDaniel, 1999; Gundling, 1999). If face-to-face contact provides important contextual cues for interpreting and prioritizing information to communicate meaning, then it stands to reason that the greater the uncertainty there is about the meaning and importance of information, the greater the need for contextual cues provided by face-to-face contact.

The medium used for transmission of the message may affect the content of the message as well as its form. Face-to-face interaction can be used as a prototype to evaluate the forms of communication that are growing in popularity today. Three features apparent in face-to-face communications are facial expressions, meaningful non-verbal acts such as gestures and touches, and instantaneous collaboration (Bavelas & Hutchinson, 1997). Today the major modes utilized in technology-mediated communication of information range from email, voicemail, video conferencing, newsletters, bulletin boards, and on-line chats. Each of these modes sends out cues from the sender to the receiver within the message.

In our rapidly evolving world, the increasing demand for innovative technology calls on development of its power, affordability, and usability. Organizations become increasingly more modular and virtual, with joint ventures, strategic partnerships and outsourcing made more prevalent by technology. The overall results of these changes are increased resources, greater efficiency, and faster time to market (Scott, 2000). Electronic communication innovations for transmitting types of information such as email, video conferencing, instant messaging and mobile phones affect the way daily tasks are carried out in the highly competitive world of business today with email one of the most common computer-based communication tools used. As technologies become more and more a part of our lives, assumptions about how to use technology to transmit information need to be challenged so that technology is value adding (McAteer, 1994).

The ability to develop, integrate and use an effective organizational communication system is at the core of effective organizations (Ulrich, 1997). Organizations have a variety of systems in place to move information from one location to another—media management, meeting management, public relation departments, and Human Resource systems—with technology providing new methods to remove barriers of space, distance, and time; however, employees asked about the adequacy of communication within their organization responded that communication is inadequate, with too little information provided (Ulrich, 1997).

An effective organization communication system also requires accommodation for privacy needs (Kupritz, 2000). Research over the past 30 years indicates that privacy is an important concern for employees that should not be overlooked when addressing the needs of an organization. Uses of the term “privacy” in work environments typically reflect the regulation of interaction by which employees utilize information controls to gain temporary limited exchange with others (Sundstrom, 1986).
Methodology

This section describes the study participants, sample size, trustworthiness of data, data collection procedures, and data analysis.

Participants

This study utilized purposeful sampling to identify twenty-four employees whose communication with higher management was through face-to-face interaction as well as through email. Such a sample size in qualitative research supports information richness (Lincoln and Guba, 1985) and the saturation of data or redundancy (Patton, 1990). Redundancy occurs when subsequent responses to questions do not provide additional insights (Kupritz, 2002).

A structured interview was conducted with each of the twenty-four workers who maintain similar job functions within the company, a major U.S. bank with over 600 branches spread over seven states. The organization relies heavily on electronic communication due to the vast physical space between branches and headquarters and the immediate need for information to be forwarded to those locations.

Using a “typical sampling” strategy which highlights what is normal or average (Merriam, 1998; Miles and Huberman, 1994), participants were sought who held professional positions, reported to higher management located within the same office facility as the participants, and had been in their current positions for at least six months. The general work responsibilities of these employees entailed facilitating branch sales activities and providing exceptional customer service, and recognizing and meeting customer needs by proactively selling and cross-selling bank products and services. Work responsibilities also included handling daily operational issues, meeting consumer lending needs, being aware of and taking security precautions at all times, and generating new consumer and business customer business. One of the investigators for the study worked at the same office facility as did the participants and was thoroughly familiar with the various work roles and responsibilities of these employees.

Trustworthiness of Data

The structured interviews emphasized personal constructs of respondents to establish authenticity and trustworthiness through the nature and format of the questions asked, followed by content analysis techniques (see Denzin, 1978; Denzin and Lincoln, 1994; LeCompte and Schensul, 1999). Interview questions were designed to exhaust the range of respondent perceptions about the variables being examined to decrease the likelihood of overlooking significant chunks of a domain (LeCompte and Schensul, 1999; Spradley, 1979, 1980). The questions asked avoided “referential meaning” by asking for “use through contrast, similarity, uniqueness, and the ideal in an effort to exhaust a domain” (LeCompte and Schensul, 1999; Spradley, 1979, 1980).

A pilot study was conducted with office workers from the same target population as the participants in the study to determine content validity and appropriateness of the interview questions. Refinements were made to some of the questions for better clarity and to strengthen the interview process. As part of the pilot study, the office workers also shared with the investigators their personal constructs for the word “productive” which was a crucial word used in the interview questions. Workers defined “productive” as “producing”; “completing a job or task in a productive manner”; “to move forward”; “doing your job in a competent, efficient and accurate manner”; “to effectively use time and resources that are available to complete a desired task in the shortest time possible”; “to do quality work in a timely manner”; “generating work in a successful and timely way”; “completing a task in an efficient amount of time”. Prior to the official interview, each participant reviewed these constructs for accuracy to ensure a shared meaning of language. Respondents agreed that the descriptions accurately conveyed the meaning of “productive.”

After content analysis, cumulative frequencies for similar types of items and attributes were calculated to determine how often similar types were elicited. This allowed the investigators to determine included terms elicited most frequently and to gain a better understanding about the distribution of beliefs across domain categories. Linking qualitative and quantitative data enables confirmation and corroboration of both through triangulation (Rossman and Wilson, 1991), and helps investigators “see the general drift of the data more easily and rapidly by looking at distributions” (Miles and Huberman, 1994, p. 253).

The investigators independently analyzed the data with each item and attribute represented in some domain category. No discrepancies were noted between the two analyses when they were compared. Participants reviewed domain categories and tentative assertions for accuracy with positive feedback. Peers examined the tentative interpretations as well and gave constructive comments. Conducting member checks and peer examination in this manner helps to strengthen authenticity and trustworthiness of findings (Creswell, 1994; Meriam, 1998).

Data Collection Procedures

Structured interviews were conducted with each office worker over a thirty to sixty minute interval. The interviews were conducted in a private conference room with only the participant and interviewer present. Responses were recorded verbatim so that the language and conceptualizations of those involved were preserved.
Interview questions covered a range of topics about work information (addressing situations and circumstances) that management can effectively communicate through email to augment face-to-face interaction with workers. Three of the major questions are presented here to illustrate the nature and format of the questions used in this study: What type of information is as productive to receive by email as face-to-face contact with management? What type of information is not as productive to receive by email as face-to-face contact with management? What type of information is absolutely critical to receive through face-to-face contact from management rather than email?

**Data Analysis**

The investigators conducted domain analyses employing content analysis procedures (see Spradley, 1979). These analyses involved sorting through interview responses and identifying patterns, categories, or themes. A tabular worksheet was developed that displayed semantic relationships. A domain is a set of categories organized on the basis of a single semantic relationship (for example, \(X\) is a kind of \(Y\); \(X\) is a way to do \(Y\)). Possible cover terms and included terms (that is, items and attributes) that appropriately fit the semantic relationships were searched for in the data. Making systematic use of this kind of worksheet helps to uncover domains embedded in the interview responses (Spradley, 1979). For example, included terms dealing with sensitive, confidential matters were grouped under the same cover term: “type of information that is absolutely critical to receive from management through face-to-face contact.” Each item and attribute included under this cover term fit the semantic relationship \(X\) (for example, personal issues) is a type of \(Y\) (information that is absolutely critical to receive from management through face-to-face contact). A system of cultural meanings was uncovered that these office workers use to denote and connote work information that management can effectively communicate through email to augment face-to-face interaction with workers.

**Results**

**Email in Lieu of Face-to-Face Contact**

One-hundred percent of the responses indicated that all the information communicated from management was as productive to receive by email as through face-to-face contact. It is important to note that the information workers received from management through email dealt with operational issues, project updates, security (safety) concerns, and sales information. No responses were elicited about confidential or sensitive information being communicated by email from management. The following verbatim responses reflect common descriptions given by workers for information that is as productive to receive by email as through face-to-face contact with management: “Definitely meeting information.” “Update information (scorecard).” “All of it – absolutely.” “All of it.” “All of it is productive through email.”

**Critical Face-to-Face Contact**

Elicited responses indicated that the bank employees receive a vast amount of information from managers. Critical work situations require face-to-face communication in the opinions of the 24 respondents. Table 1 reports the cumulative frequencies computed for critical work situations that require face-to-face communication.

<table>
<thead>
<tr>
<th>Domain category</th>
<th>Item and attribute grouping</th>
<th>Frequency</th>
</tr>
</thead>
<tbody>
<tr>
<td>Critical work situations requiring face-to-face contact from management</td>
<td>Human Resource confidential issues (reviews, promotions, discipline, legal concerns)</td>
<td>42</td>

<td>Customer information</td>
<td>2</td>
</tr>
<tr>
<td></td>
<td>Robbery</td>
<td>1</td>
</tr>
</tbody>
</table>

Human Resource confidential issues including annual reviews, discipline, and promotions elicited the most frequent response from participants when asked to identify critical work situations requiring face-to-face communication. The following verbatim responses reflect common descriptions given by workers for critical work situations requiring face-to-face communication: “I want face-to-face when it comes to Human Resources issues.” “I never want confidential information on email about me personally or customers.” “That is easy, definitely discipline concerns or actions I want face-to-face.” “I want to actually talk to someone about personnel issues.” “I want my review done in person.” “If I am getting fired.” “Really the only thing that sticks out is performance issues – good or
bad.” “If there were legal concerns.” “I don’t want to get sensitive information through email.” “I don’t ever want to
discuss my performance through email.” “Highly personal stuff.”

**Critical Email Contact**

Certain critical work situations require email communication for employees such as occasions when management must get information to employees and face-to-face communication is not possible or needed. Security (safety) information from headquarters needs to get to every branch and would take days for someone to personally deliver the message. Corporate headquarters houses large sums of information that must be communicated to employees in order for them to perform their jobs. The responses revealed that information not perceived as confidential—meeting times, training times, policy changes, system problems, and things with numerous details—were just as productive and even critical to receive quickly. Table 2 reports the cumulative frequencies computed for critical work situations requiring email from managers.

Workers identified two main situations where it is critical for workers to receive electronic mail from managers: security (safety) issues, and policy and product changes. The following verbatim responses reflect common descriptions given by workers for critical work situations requiring email communication: “Branch alerts.” “Early morning system hits are important to get to ASAP.” “System issues have to be through email because we can’t wait for someone to tell us stuff in person – it would be too late.” “Product changes are critical.” “Special product promotions and product updates.” “Changes that are immediate.” “Alerts are critical. We (sic) received ASAP.” “Alerts and updates are critical.”

**Implications and Discussion**

The findings indicate that HRD professionals should be sensitive to the effectiveness of different modes of communication that management may deem necessary for communication with employees. Through training and development efforts, HRD professionals can help to maximize organizational performance through informed decisions about the appropriateness of communication modes.

The findings indicate that the employees in this study perceive work situations in which information from management to employee is best transferred through face-to-face communication and situations in which information from managers to employee is best transferred through electronic mail. Results indicate employees preferred to receive private information that is personal, sensitive or confidential in a face-to-face format. Employees perceive that concrete information (such as meeting times or training dates) or time-sensitive information (such as security information) is productively transmitted through email.

Interviews with the respondents indicate the organization in this study utilizes the use of email and face-to-face communication appropriately. When asked about the types of email received from managers, respondents reported they did not receive any confidential information in an electronic mail format.

The study indicated employees were very clear that face-to-face communication was critical when issues dealt with confidential matters considered private. The study supports the need for privacy as it relates to human resource issues, personal or confidential information and performance reviews, and is consistent with the importance of privacy needs for the organization and its employees (Kupritz, 2000).

With regard to communication, research indicates face-to-face contact allows for questions, feedback and interpreting contextual cues that enable employees to find meaning in the message. It is not surprising employees want to find meaning in a message being sent from their manager, especially at times when feedback on performance or other sensitive information is being shared. Organizations must be careful to evaluate when face-to-face communication is desired and when other modes of communication are equally effective.

46-2
Participants in the study indicate email communication is not only acceptable but also imperative where immediate communication is critical, such as security alerts that must be provided as soon as possible for all employees. Email messages provide virtually instantaneous access to information. Email messages are also acceptable when no contextual meaning is to be gathered from a message such as, “The staff meeting is on Tuesday at 2 pm.” Such a message will not enhance trust or credibility nor is it personal or confidential.

The organization appears to have synthesized the use of both modes of communication effectively noting the needs and use for both forms. Employees responded that very specific times exist when face-to-face communication is the only mode of communication that will be productive. Managers do not send confidential information through email, but rather handle such matters with face-to-face communication. Employees responded there are equally as many times that email is the only mode of communication that will be productive.

In today’s workforce where technology innovations are perceived as the way to stay in the lead in most industries, the effective use of face-to-face communication and the knowledge management that goes with the use of this mode may actually be the key to success. Employees in this study were spread out over several states and were able to maintain acceptable standards from location to location through use of technological innovations. O’Mara (1999) argues that electronic communication, transmitted in seconds, should be used effectively to augment face-to-face contact which will be treated as a precious resource in the near future.

As a case study, the findings in this investigation cannot be generalized to all HRD situations, organizations or office settings. This study provides a beginning knowledge base for future research. The details gained from this initial study warrants future studies that examine the critical need for both face-to-face and email communication with managers in similar and different settings. Future studies should examine privacy issues related to human resource issues and their relationship with the need for face-to-face communications. It may be that organizations similar in size and disbursement may value face-to-face communication as productive in similar situations but it may reveal different needs for face-to-face communication with managers. Finally, action-oriented research is needed that investigates when face-to-face communication within an organization will enhance knowledge as well as the effective use of information as it is transferred from management to workers.

Technology as a Critical Issue in HRD: Effects on the Organization

Meera Alagaraja
Jamie L. Callahan
Larry M Dooley
Texas A&M University

Organizations today are moving towards adoption of technology in all realms of functioning. This paper examines technology as a strategically implemented HRD function and utilizes Parson’s framework of the organization as a social system. This paper proposes to begin organizing current HRD outcomes of technology within Parson’s framework and to think differently about how technology impacts and relates HRD knowledge and experience at all levels of the organization.

Keywords: Technology, HRD, I-A model of Human Resource Development

Organizations today compete globally for information, people, products, services and technology. Increasingly business organizations are employing technology to improve performance in the workplace. Technology connects people within organizations and the outside world. Within the organization, technology drives organizational communications, standard human resource processes and OD efforts (Church, et al, 2002). Technology has unleashed a way of re-defining HRD initiatives thereby providing opportunities for advancement and growth both for the organization and the people (Tippins, 2002). At the same time it has also presented the field of HRD with challenges that need to be addressed (Kuhnert & McCauley, 1996; McDonagh, 2001). HRD professionals today are faced with the challenges of supporting, implementing and ensuring that the promised gains of technology are realized (Church, et al, 2002).

When we think of the word technology, the first things that come to mind are the more apparent aspects - hardware and software. Technology means something more than ‘hardware’ and ‘software’. The two terms - hardware and software are components that define technology in terms of its physical aspects. Examples of hardware are the hard disk, the monitor, keyboard etc. Software is the interface that allows the end user to communicate its requirements with the hardware. But as we shall see in this paper, this is not the only interface that impacts the use of technology for the purpose of attaining organizations’ goals. Using Parson’s (1956) framework in understanding organizations as social systems, this paper looks at technology as a critical issue affecting HRD as a system supporting organizations.

The paper seeks to address the following questions.

Why technology is a critical issue for HRD in today’s organization?

Can Parson’s framework serve as an organizing framework to capture the criticality of technology in HRD efforts and the consequent impact to the organization as a whole?

Related Literature

The broad nature of this analysis prompts the authors to include practitioner-based information drawn from practitioner publications and literature, in addition to research literature from the Academy of Human Resource Development publications.

Gates (1995) in his acclaimed book, “The Road Ahead”, talks of technology as a revolution just begun. Information that was once difficult to retrieve is now much easier to find. Today, technology helps us find information at our convenience. Good examples for these types of technology answer queries if transportation is running on time or if there are any accidents on the route. Technology also helps us in innumerable other ways such as trading tickets, subscribing to journals, locating good recipes and so forth. Some of the examples provided so far reflect fundamental changes technology has made in our lives – both personal and professional.

Technology is constantly changing. What was considered cutting edge technology a year ago now sets a higher baseline for future innovations. Technology has created new industries and spawned the growth of an entirely new field of engineering. The computer industry is perhaps the best example of how technology is in a constantly in a state of change. Organizations in the computer industry that have been unable to adapt to the changes in technology have been forced to adapt to these changes as the only choice for survival. A classic case much discussed in the business world, is how IBM adapted in order to meet the challenge of Microsoft Corporation.

Copyright © 2004 Meera Alagaraja, Jamie L. Callahan, & Larry M Dooley
Technology has also set the pace for change and innovation in other aspects of our lives. Many of these also have major implications for organizations today.

An important issue for organizations of today is the ability to adapt to growing technology. This is a huge challenge for organizations to tackle the challenges of technology change that is constant. New forms of flexible work arrangements, complex and fluid organizational structures have emerged in the past decade as a result of rapid advancements in technology (Nadler & Gerstein, 1992; Coovet, 1995; Howard, 1995; & Church, 2002). Today technology is driving organizations to focus more on electronic means of communication Technology is at the forefront of a fundamental revolution in getting things done that are seen as worth doing by the organization (Church, et al, 2002). Organizations are striving hard to adapt themselves to these changes that are taking place in a rapid pace. Their capacities to adapt define their path of survival in the global environment. Therefore technology is one of the most critical issues facing HRD related actions today.

Very few articles however dwell on the applications of technology for HRD. There is a gap in the literature on supporting HRD professionals and leaders in an increasingly technological based economy. Since, no such organizing scheme was found during the literature search for pooling technological applications relevant to HRD, the paper proposes an organizing scheme based on Parson’s model of the organization. The paper provides a snapshot of technological applications for HRD for different functions / processes of the organization. HRD professionals need technological tools and resources to use for effective practice. The authors also acknowledge this organizing framework may suggest applications or tools, that may have very short shelf life and be outdated quickly or over time. Thus the resources listed in this paper are to be seen as only a start to provide a scheme for organizing technological applications for effective HRD practice. Because of this reason, the authors have chosen to review recent literature on applications of technology for HRD practice. Much of the literature on HRD and technology has been reviewed from the journals of the Academy of Human Resource Development.

Theoretical Framework

This paper utilizes a framework developed by Parson (1956, 1961) where he describes organizations as social systems. According to him all organizations are essentially subsystems of a larger social system. Changes in the larger social system profoundly impact the internal structure of the organization. As a social system, the organization has four primary goals or functions for system survival: Adaptation, Goal attainment, Integration and Latent Pattern maintenance. These functions are interconnected and are critical processes that can be found in any organization. According to Parson, these four functions can be found at any level of a system – individual, group, organizational, societal etc. Parson’s framework is helpful in understanding technology as a critical HRD issue; its impact on the organization and the external environment has been described in the initial sections of the paper.

The paper proposes to identify technology as a critical HRD issue for the four functions in Parson’s framework. Bolstorff (2002) suggests that in the past HRD has been conspicuously present only in the traditional training role, missing out opportunities for performance improvement at different levels of the organization for implementing technology. If HRD is to realize the technological opportunities for contributing meaningfully to the business as a whole, HRD professionals need to understand their theoretical roots, expand their current understanding of the working of the organization at different levels and help in improved decision-making for performance-based interventions (Bolstorff, 2002). The effective use of technology is critical for the improvement of overall organizational development. Constant innovations in the technological tools make IT necessary for organizational success and survival. Parson’s framework may help in creating awareness and understanding of the criticality of technology as an issue for HRD related efforts and the organization as a whole.

Definitions for four functions of Parson’s framework

Callahan (1999) in her study on Emotion work as Instrumental Action in an organizational context has defined the four functions that represent Parson’s framework. The four functions represent the purpose of action taken to accomplish organizational goals. Two of the functions represent actions orienting the organization to its internal environment namely – pattern-maintenance and integration. Two other functions – Adaptation and Goal attainment or Achievement represent actions orienting the organization to the external environment. For the purpose of this paper, definitions from her study on the four functions are adopted. Adaptation ‘refers to obtaining resources for the organization or the interface with those considered to be either external to the organization or customers of the organization.’ Goal Attainment: ‘refers to working towards overall goals of the system’, here it means the organization as a system. Integration: ‘refers to coordinating resources into the organization in order to create collective means of operating.’ And finally Pattern-maintenance is referred to as “culture” as it contains actions associated with maintenance of organizational culture.
A brief analysis of technology, identified as critical for HRD actions is described at different levels i.e. individuals, groups, the organization, and the external environment. Parson’s framework is used to categorize and make explicit the impact of technology in driving HRD actions and the resulting impact these actions have on the organization at different levels as a whole. An organizing framework for technology is examined using the I-A model of Human Resource Development (Callahan & Dunne de Davila, 2002).

The HRD outcomes have been placed within the four functions of the social system, here the organization. The more the authors tried to locate a particular outcome with a function, and within a subcategory, the more the outcomes...
blended and blurred. So thinking that the outcomes are discretely classifiable is not tenable. For example, learning mediated technology could as well be included in the goal attainment function of the organization, in that it can help improve employees’ performance in order to achieve organizational goals. A degree of arbitrariness therefore characterizes the organizing scheme. At the very best the framework provides a structure as we try to understand and think differently about how these applications relate to each other, and at different levels of the organization

An Analysis of the Framework

Adaptation

The ‘primacy of orientation to the attainment of a specific goal’ as defined by Parsons (1956) is a characteristic specific to an organization. Obtaining organization’s resources for the attainment of its primary goal involves recruitment, training and retaining a skilled workforce. Technology is redefining the way in which HRD professionals seek to select and choose people based on skills for the maximizing their pool of talent. Talent management is taking precedence over financial and other traditional resources of capital as a tool of power.

Meeder & Cude (2002) suggest the need for developing a sustainable model for building a competitive workforce. According to them, organizations need to help employees gain knowledge and skills to remain employable. Competency based learning whether it is self-directed or informal is the need of the hour. Learning mediated technology is important for contributing to successful HRD efforts in building a competitive workforce that has depth and a range of skills. Geographical information systems (GIS) help in providing land information systems, automated mapping and facilities management systems. GIS also supports managerial decision making for operational, tactical and strategic purposes and therefore also fit in other functions of the organization viz., goal attainment, integration and pattern-maintenance (Grimshaw, 2000).

Goal Attainment

Technology is helping HRD shift from being procedural and administrative function to supporting strategic management initiatives. In terms of implication, knowledge management becomes a core organizational activity. According to Rosenberg (2001), knowledge management (KM) is a means to support, create, archive, reference and share information and expertise across the organization. Technological advances are facilitating knowledge to be stored centrally and accessible to employees regardless of their physical location. Knowledge management is helping organizations achieve their goals by enabling employees to link electronically and solve problems. At the organizational level, knowledge management serves to maintain the stability of institutionalized patterns and beliefs. KM serves as a resource for the organization to maintain its ability to meet the expectations of its stakeholders.

Integration

Technology is a critical issue for integration of the organization. In Parson’s terminology it has the capacity “to get things done” for those terms of values seen as “worth doing”. As an institutional structure, technology integrates –

1. The different functions of the organization
2. The individual, group within the organization and the organization as a whole
3. The organization with the other organizations, groups and individuals

HRD professionals need to learn the entirety of business processes given the fact that technology affects all processes within the organization. To do so, a complete understanding of the organizational structure, processes at all levels and factors that affect performance improvement and development at these levels is required. By doing so, HRD professional will then help improve the organization in meeting its goals and help improve business performance. Technological tools allow employees to communicate at any time and geographical boundaries no longer form a barrier for communication (Schrum & Benson, 2002). Gery (2002) states however that technology needs to drive HRD professionals in organizational system development efforts, which have a greater leverage on performance development in the future. HRD professionals need to focus their strategies and initiatives in crafting performance development strategies that takes advantage of the potential that the technology has. Quantitative tools help drive organization development diagnosis and steps needed to make the change (Church & Waclawski, 2001; Kunhert & McCauley, 1996; Macet, 1996; Summers, 2001; Tippins, 2002). This is an area of opportunity because the technology community in the past has focused more on the tools and data than people.
**Pattern-Maintenance**

Lawson and Sleezer (2002) state that the networked world no longer presumes face to face interactions among employees. With newer technologies and tools, employees can keep in touch with each other continuously and more easily. This helps HRD efforts in shared communication. Creating and implementing technological systems can be successful only if the organization has a culture of shared communication. Those organizations that do not have such a culture need to transform their existing ones, in order to fully utilize the power of technology. Management practices need to support sharing of information across the organization. Technology is therefore driving changes in culture, structure and levels of empowerment within the organization. The organization can now provide employees and customers with policies and information, and communicate its shared vision with customers and employees. Technology is also affecting the social structure within the organization. Roles and assignments are being redesigned and flatter organizational structures are the norm. In all, technology is creating the imperative need to have a culture where open sharing of information and communication facilitates maintenance of a unique culture and identity within the organization. In sharing information with all members of the organization, technology helps in maintaining a unique culture and identity within the organization.

**Effects on the organization**

Communication is the single most important factor that has contributed to changes in the concept of the organization. The impact of technology on communication has spun off a host of other changes, internal and external being felt round the globe. Internal structures have changed within the organization. Organizations driven by technology allow for employee empowerment thereby reducing rigid structures and hierarchies among employees. The kind of input and output exchange, important for the organization to carry out its function with society or the larger system termed as the ‘boundary of exchange’ by Parson (1956) is now possible at the push of a button. The impact of technology on this defining characteristic of the organization is instrumental in fundamentally changing the way organizations carry out their functions. HRD is not the exception. New strategies need to be designed and researched for building communities, ensuring that employees are more valued than technology and striving hard to provide a personal touch in a world that is increasingly becoming impersonal (Taulbert, 2002).

**Final Discussions and Conclusions**

Technology is employed by the organization at all levels and functions. It affects all four functions, as they interact with each other (Cherns & Wacker, 1978, pp.838). Each of the four functions utilizes various forms of technology. These forms of technology vary from different organizations and the type of management function being studied. In this paper the authors examined the criticality of technology for the HRD function. But in other management functions, technological applications would be different. Say for example in manufacturing, production technology would lie in the domain of achievement function; product design in the adaptation domain, communication technologies in the integration domain and programmed instruction equipment in the pattern-maintenance domain. It is beyond the scope of this paper however to dwell further into these aspects. It is important however to acknowledge that technological systems and social systems are engaged in mutual cause-effect relationship in most organizations.

**Implications for Future research & Practical applications**

Parson’s framework helps in capturing different elements of the organization as a social system at the individual, group and organizational level. Technology as a critical issue when viewed through this framework advances a different perspective of HRD from the past understanding of the concept of an organization at individual, group and organization levels. Today, the forces of change are fundamentally transforming the way work is done in organizations. It is imperative for those involved with HRD efforts to prepare for these organizational changes. The role of technology at the workplace has thrown in challenges that HRD professionals face in supporting individual, group and organizational learning and performance improvement. Further studies in these areas will begin to help HRD stake its rightful claim for organizational resources in aspects of time, money etc.

The paper provides a mechanism that would be useful for helping both HRD practitioners and researchers on decisions concerning technology. An organizing framework is useful to make sense and make decisions about things within their field. A review of relevant literature revealed a number of conversations about impacts of technology and its applications. This paper serves to initiate a conversation about how technology impacts HRD and about how
we can begin organizing the current concepts and tools of technology. Because this paper presents ideas not previously organized in this way, it raises more questions than answers.

• Is the Parsonian framework an appropriate model for the understanding macro level functions of the organization or would another process or model be better?
• Which of the classification mechanisms would be most appropriate for technology in HRD?
• What is the dividing line between each of the four functions of the framework?
• How do we classify technology applications that apparently fit in many or all of the functions of the organization?

The next step in continuing research on this topic would be to examine other research methods to more stringently examine the definitions and propose relationships between the four functions to create a true taxonomy.

Team Development of Virtual Teams

Sooyoung Kim
University of Illinois

Advanced technologies, globalization, the competitiveness of business, flexible working practices, and other rapid changes in the nature of work have all led to the booming of “virtual teams.” This paper will provide an overview of virtual teams, including a description of their emergence, a definition and typology of the term “virtual team,” an examination of their benefits and pitfalls, and suggestions both for overcoming the challenges and for incorporating business strategies in virtual team building.

Keywords: Virtual Teams, Team Development, Virtual Team Building Strategies

Traditionally, teamwork was conducted by specific people who worked in the same office for the same organization. Today, rapid changes in the nature of work and advanced technologies make it possible for people to work at home. Furthermore, increasing globalization, competitiveness in the business world, flexible working practices, and the need to respond quickly to changing customer demands have all led to the emergence and booming of “virtual teams” (Eom, 1999; Bell & Kozlowsky, 2002). Information technology has played a major role in facilitating the proliferation of virtual teams and has enabled multinational organizations to connect employees from all over the world (Merrick, 1996). Virtual teams have come to suit today’s more flexible and adaptive organizational systems, structures, and processes, conforming well to those changes (Bell et al., 2002). Virtual teams will no doubt play a key role in shaping organizational design and change in the future. However, the distances separating virtual team members and the sophisticated technology often utilized to connect them have both proven to be barriers to their success. Due to time constraints and the rush to implement virtual teams, companies have faced some problems. Previous research has demonstrated that the implementation of virtual teams in the absence of sound planning and design can lead to large problems (George, 1996).

This paper aims to provide an overview of virtual teams, including a description of their emergence, a definition and typology of the term “virtual team,” an examination of their benefits and pitfalls, and suggestions for overcoming the challenges that they present and for incorporating business strategies in virtual team building. The paper will give suggestions on how to enhance effective development of virtual teams to meet business purposes.

Emergence of “Virtual Teams”

According to Townsend (1998), the increasing predominance of flat organizational structures, inter-organizational cooperation as well as competition in market places, changes in employees’ expectations for organizational participation, shifts towards service/knowledge work environments, and increasing globalization have precipitated the creation and growth of virtual teams. New generations of information and telecommunication technology have also functioned as prime facilitators. As a result, more flexible virtual teams have adapted to the current trends in marketplaces by providing the impressive productivity of team-based designs in new environments where teamwork once would have been impossible. Now ubiquitous, virtual teams have been shown to possess their own, unique problems, as well problems similar to those faced by conventional teams; these will be discussed in the “challenges” section below.

Definition and Typology of Virtual teams

Virtual versus Conventional Teams

Virtual teams have unique characteristics that make it possible to differentiate them both from conventional teams and from one another. Virtual teams are defined as the latest form of teams whose members share a common purpose and who use technology to cross time zones, distance, and the boundaries of organizations and/or cultures (Lipnack, 1999b; Noe, 2002). Almost all rely upon digital technology (e-mail, Internet, video conferencing) to interact and complete their projects (Noe, 2002).

Virtual teams and conventional teams are similar in that both groups have tasks, goals, or missions to accomplish (Bell et al., 2002). However, virtual teams differ because of the spatial distance separating their
members and because of the nature of their communication (information, data, and personal). First of all, virtual teams are made up of team members who are from different geographical locations, different organizations or parts of the organization, and who identify as a team for different lengths of time (Bell et al., 2002; Cantu, 1997; George, 1996; Lipnack, 1997). Next, the ability of members to transcend their spatial separation is effected by various communication technologies, ranging from common and simple ones such as email to more advanced, complex and interactive ones such as videoconferencing, groupware, and project management programs (Bell et al., 2002; Geber, 1995). These two different features enhance work effectiveness since virtual teams are able to access unique information and highly specialized expertise through varied and diverse sources as well as through synchronous communication media adopted for a specific task. According to Lipnack (1999b), virtual teams have three primary components: purpose, people, and links. Autonomous, self-reliant but still interdependent people work together under common purpose through links (i.e., connections); this is the case not only for virtual teams but also for “real” or conventional teams. The most useful and appropriate connections, that is, communication technologies, should be employed according to the specific purposes and people involved.

Benefits and Challenges

Benefits

Geographically dispersed virtual teams allow organizations to access and retain the most qualified individuals for a particular project regardless of their location, since they have complementary skills, work under a common purpose, have interdependent performance goals, and share an approach to work for which they hold themselves mutually accountable (Gould, 1999). They enable organizations to respond faster to increased competition and to provide greater flexibility to individuals working from home, those on the road, and those across organizations (Bell & Kozlowski, 2002; Stohr & Peterwson-Qwest, 2002). Using a combination of technology and virtual teams, many companies are increasing technology and knowledge transfer, increasing the speed of solutions, and decreasing delays between customers and suppliers or between geographically dispersed employees (George, 1996).

Virtual teams can also link separate organizations to achieve common goals (Jennings, 1997; Lipnack, 1999a). A practical example from the publishing world demonstrates the potential of virtual teams. Esquire, Men’s Health, and Rolling Stone are three of the four largest men’s magazines, with a combined circulation of about 3 million. Together they equal the circulation of the fourth magazine in this category, Sports Illustrated. They learned to put their competitive instincts aside and cooperate for their mutual benefit. They used virtual teams to cross their physical and corporate boundaries to put together a highly lucrative deal. Another example is the strategic collaboration, partnering, or outsourcing of computer hardware and software developers such as in the case of Intel and Microsoft.

Challenges

Communication technology serves to connect us to information and people around the world, but it also inhibits genuine human or personal interaction, which could be one of the potential pitfalls of virtual teams (Emelo & Francis, 2002). This can create problems, especially for those projects that depend upon interdependent processes between virtual team members. Due to their lack of face-to-face interaction, members of virtual teams must learn to bridge their psychological gap in order to bring about the mutual trust ultimately necessary for effective work.

Other communication problems of virtual teams are as follows: (1) lack of project visibility—i.e., situations in which team members understand their individual tasks, but fail to see how their tasks fit into the whole project; (2) lack of visibility of teammates’ schedules; (3) absence or delay of immediate response; (4) equivocality of message due to constraints of the technology (Gould, 1999).

Software designed just for virtual teams, called “groupware,” such as Lotus Notes and Exchange, is growing increasingly sophisticated. Videoconferencing programs are also available, but so far they have proven to be both expensive and difficult to manage, requiring too much bandwidth to be practical (Gould, 1999). Team members’ different levels of access to team resources may exclude some from fully participating in the group; therefore, the availability of acceptable bandwidth should be established first, and then the most appropriate communication and collaborative technologies should be selected. Time and cultural differences should be taken into account when selecting communication technologies (Robb, 2002).

Due to time constraints and the rush to implement virtual teams, companies may underestimate the need to plan and design around the differences inherent in these teams. Previous research has demonstrated that the implementation of virtual teams in the absence of sound planning and design can lead to large problems (George, 1996).

Creating virtual teams is not as easy as pulling together a cross-functional team to solve a problem. Because the makeup and locations of the team can be quite heterogeneous, unprepared team members experience mistrust,
virtual teams need guidelines that enable the team to set personal as well as team expectations for what they are and mutual trust since they are made up of team members from different cultures, locations, and technical backgrounds. Interaction, effectiveness, and productivity (Cantu, 1997; Lipnack, 1997). Virtual teams should be grounded in both managing and achieving the project's business case. It is essential that all virtual team members understand and share totally the commitment to process and is the "contract of service" between the project manager, the sponsor, the virtual team members and the completely involved in building the project business case. This set of information is built during the planning assumptions and constraints, and of a project execution plan (Thomsett, n.d.). All members of the project should be project risk assessment/risk management plans, of relevant legislation and policies, of project staffing agreements, (i.e., a quality agreement), the evaluation of project costs, the establishment of project development strategies, of a plan for realization of the benefits, the creation of a statement concerning the required quality of the product or ranks in order for all team members to participate with their creativity any time.

First, clear goals and objectives, clear guidelines for expectations, and standards of excellence should be set to improve people's virtual-collaboration skills and efficient virtual team interaction (Larson & LaFasto as cited in Thomsett, n.d.; Lipnack, 1997; Emelo & Francis, 2002).

Second, planning and design are keys to virtual team success (Cantu, 1997). The design of the organization, the team, and the job are the bases for building a successful virtual team. How should virtual teams be built to avoid collision? Organizational, job, and team designs, coordination of work through technology, interaction with stakeholders, and members' re-entry into the host organization should be considered: (1) When it comes to organizational design for virtual teams, the team’s business goals should be defined, team values should be established, an infrastructure for involvement should be developed, and the configuration and boundaries of the team should be designed to enhance productivity; (2) for job design, a realistic job preview (George, 1996) and job accountability (Lipnack, 1997) should be defined, decision-making authority should be given to the team (Mohrman, 1995), compensation issues should be discussed with team members (George, 1996), and feedback for employee development and should be provided; (3) for team design, the team members should be identified first, and identity should be created as a mental model. Purpose, goals, and objectives should be stated and connections between people should be established (Lipnack, 1997).

Third, specialist climate/leadership by expertise on the subject matter should be respected rather than hierarchy or ranks in order for all team members to participate with their creativity any time.

Fourth, it is desirable that all team members participate in all business processes, including the establishment of a project overview and project objectives, the detailed analysis of the project’s expected benefits and the articulation of a plan for realization of the benefits, the creation of a statement concerning the required quality of the product (i.e., a quality agreement), the evaluation of project costs, the establishment of project development strategies, of project risk assessment/risk management plans, of relevant legislation and policies, of project staffing agreements, assumptions and constraints, and of a project execution plan (Thomsett, n.d.). All members of the project should be completely involved in building the project business case. This set of information is built during the planning process and is the “contract of service” between the project manager, the sponsor, the virtual team members and the project stakeholders. It is essential that all virtual team members understand and share totally the commitment to both managing and achieving the project’s business case.

Fifth, personal relationships between team members should be developed to assure mutual trust and to enhance interaction, effectiveness, and productivity (Cantu, 1997; Lipnack, 1997). Virtual teams should be grounded in mutual trust since they are made up of team members from different cultures, locations, and technical backgrounds. Virtual teams need guidelines that enable the team to set personal as well as team expectations for what they are and are not allowed to do. Cultural differences should be taken into account. Response and collaboration are important to achieving superior speed-to-market or complex business problem solutions.

Sixth, team members’ accomplishments should be duly recognized through praise, particularly since they don’t meet face-to-face. Praise should be made public through appropriate communication technologies in order to increase members’ morale. Depending on the characteristics of individual team members, personal recognition should be carried out either through e-mail, a telephone call, or a voice conference call to make praise public and to ensure that everyone hears it at once (Gould, 1999).

When it comes to the procedure of creating and developing virtual teams, Robb (2002) proposed that the first step be to determine which collaborative process best suits the given project. Next, the most appropriate information communication technology should be provided in order to meet the missions, goals, and objectives of the process. The importance of planning and designing the whole process of a project with collaboration of IT and HR before implementing virtual teams should not be overlooked. Consider various cultural and technological factors as well as corporate differences.

Guidelines When Implementing Virtual Teams

How should virtual teams be implemented? Research suggests that companies start with a few easy projects before gradually expanding these tools into enterprise-wide activities, that is, that they pilot-test the implementation of virtual teams (Gould, 1999).

To implement virtual teams, several challenges must be overcome. They can be divided into two big categories: (1) problems in practical business practices and (2) those in communication technologies.

Guidelines in Practical Business Practices of Virtual Teams

Guidelines for the successful development of virtual teams in practical business practices are as follows.

First, clear goals and objectives, clear guidelines for expectations, and standards of excellence should be set to improve people’s virtual-collaboration skills and efficient virtual team interaction (Larson & LaFasto as cited in Thomsett, n.d.; Lipnack, 1997; Emelo & Francis, 2002).

Second, planning and design are keys to virtual team success (Cantu, 1997). The design of the organization, the team, and the job are the bases for building a successful virtual team. How should virtual teams be built to avoid collision? Organizational, job, and team designs, coordination of work through technology, interaction with stakeholders, and members' re-entry into the host organization should be considered: (1) When it comes to organizational design for virtual teams, the team’s business goals should be defined, team values should be established, an infrastructure for involvement should be developed, and the configuration and boundaries of the team should be designed to enhance productivity; (2) for job design, a realistic job preview (George, 1996) and job accountability (Lipnack, 1997) should be defined, decision-making authority should be given to the team (Mohrman, 1995), compensation issues should be discussed with team members (George, 1996), and feedback for employee development and should be provided; (3) for team design, the team members should be identified first, and identity should be created as a mental model. Purpose, goals, and objectives should be stated and connections between people should be established (Lipnack, 1997).

Third, specialist climate/leadership by expertise on the subject matter should be respected rather than hierarchy or ranks in order for all team members to participate with their creativity any time.

Fourth, it is desirable that all team members participate in all business processes, including the establishment of a project overview and project objectives, the detailed analysis of the project’s expected benefits and the articulation of a plan for realization of the benefits, the creation of a statement concerning the required quality of the product (i.e., a quality agreement), the evaluation of project costs, the establishment of project development strategies, of project risk assessment/risk management plans, of relevant legislation and policies, of project staffing agreements, assumptions and constraints, and of a project execution plan (Thomsett, n.d.). All members of the project should be completely involved in building the project business case. This set of information is built during the planning process and is the “contract of service” between the project manager, the sponsor, the virtual team members and the project stakeholders. It is essential that all virtual team members understand and share totally the commitment to both managing and achieving the project’s business case.

Fifth, personal relationships between team members should be developed to assure mutual trust and to enhance interaction, effectiveness, and productivity (Cantu, 1997; Lipnack, 1997). Virtual teams should be grounded in mutual trust since they are made up of team members from different cultures, locations, and technical backgrounds. Virtual teams need guidelines that enable the team to set personal as well as team expectations for what they are and are not allowed to do. Cultural differences should be taken into account. Response and collaboration are important to achieving superior speed-to-market or complex business problem solutions.

Sixth, team members’ accomplishments should be duly recognized through praise, particularly since they don’t meet face-to-face. Praise should be made public through appropriate communication technologies in order to increase members’ morale. Depending on the characteristics of individual team members, personal recognition should be carried out either through e-mail, a telephone call, or a voice conference call to make praise public and to ensure that everyone hears it at once (Gould, 1999).

When it comes to the procedure of creating and developing virtual teams, Robb (2002) proposed that the first step be to determine which collaborative process best suits the given project. Next, the most appropriate information communication technology should be provided in order to meet the missions, goals, and objectives of the process. The importance of planning and designing the whole process of a project with collaboration of IT and HR before implementing virtual teams should not be overlooked. Consider various cultural and technological factors as well as corporate differences.
In addition to these factors, the work must be coordinated through technology and the stakeholders in the project must interact and keep each other updated. Lastly, when the employees finish a project and must re-enter the host organization or another virtual team, planning by both the team members and the host organization is essential (Cantu, 1997).

**Guideline to Communication Technology of Virtual Teams**

Virtual teams need advanced information communication technology to share databases, spreadsheets, proposals, and presentations. Electronic communication through video conferencing, groupware software, newsgroups, bulletin boards, electronic mail, and intranets may be employed by virtual teams. They need a practical and convenient way to discuss options and prioritize alternatives without having to spend their most productive time in expensive face-to-face meetings. Because virtual teams often operate over the telephone or computer, they have less face-time in which to build rapport. Thus, group dynamics are more difficult to manage.

First, virtual teams need training, experience and organizational support in order to communicate virtually with effectiveness (Noe, 2002).

Second, effective and skillful use of information and communication technologies depends on the goals of the project and on the complexity of the task; the most advanced technology is not necessarily the best choice.

Third, collaborative technology is needed for HR practices. The visual dimension adds a very powerful means for team members to establish and maintain trust through team activities (Grundy, 1998). Efficient coordination of work through communication technology is needed for effective team activities: (1) to reduce equivocality of message, if at all possible include face-to-face time to create an effective working environment, especially for interdependent team projects; (2) to enhance visibility of a project or a teammate’s schedule, give team members a sense of how the overall project is progressing by sending copies of the updated project schedule or an electronic view of the project schedule and do not let team members disappear by using the Internet or workgroup calendaring software or by providing electronic mail with a distribution list; (3) to avoid delay, establish a code of conduct; (4) complement text-only communication with the use of the Internet to store charts, pictures, or diagrams; (5) develop trust. Virtual teams require trust to succeed. Leadership on virtual teams will likely be determined by expertise on the matter at hand, not by corporate hierarchy (Gould, 1999); (6) develop a back-up plan (Plan B); (7) to solve time-difference problems, focus more on asynchronous collaboration tools (Robb, 2002). Establish local tech support for team members operating in remote locations so that they may participate fully in group activities.

Finally, virtual teams benefit enormously from face-to-face meetings. Few virtual teams are 100% virtual. If tasks are based mainly on interdependent interaction, face-to-face meetings are worth being held periodically to overcome psychological distance.

**Team Building of Virtual Teams and Business Strategies**

The ways of building and maintaining productive virtual teams need to be explored. The benefits, challenges, and the ways to overcome challenges have been explored. How do we take advantage of virtual teams for business strategies?

A task force team (TFT) is one of the powerful organizational tools for coping with complex, interdependent, and short-term tasks in rapidly changing uncertain business environments and is used to deal with temporary problems and opportunities that cannot be handled as effectively or efficiently by the existing organizational structure. It is a form of horizontal contact designed to solve problems across multiple departments, made up of representatives from each of the affected departments (Cleland, 1996; Galbraith, 1971). A TFT is usually dismissed once its assigned task is completed. It is well known that traditional TFTs have several limitations and problems due to organizational and technical causes. Virtual teams are formed based on cost-effectiveness and product uniqueness without regard for organizational sizes, geographic locations, computing environments, technologies deployed, or process implemented (Eom, 1999). Virtual teams are able to overcome the limitations of tradition teams. Thanks to computer-mediated communication technologies such as e-mail, computer conferencing systems, telewriting systems, multi-media e-mail, and group support systems, virtual teams can communicate and accomplish goals regardless of their members’ physical locations (Eom, 1999), ultimately profiting their host organizations immensely.

**Conclusion and Implications**

Virtual teams are the product of the nature of modern business and advanced technology. Virtual teams will not replace all conventional teams. Rather, they supplement them and add new capabilities. Marketplaces in the 21st century will reward companies who employ virtual teams as these groups’ benefits are increasingly strengthened and
the challenges they pose are overcome. To develop successful virtual teams, solutions both to practical business-practice problems and to communication technology problems should be presented. That is, if team members possess a thorough understanding of the project processes (e.g., clear missions, goals, objectives, and so on) from beginning to end, and if they make efficient and appropriate use of communication technologies that are well-suited to the nature and complexity of the task, then they will meet with success (Kozlowski et al., 1999; Lipnack, 1999a, 1999b).

The increasing predominance of flat organizational structures, inter-organizational cooperation as well as competition in market places, changes in employees’ expectations for organizational participation, and increasing globalization, new generations of information and telecommunication technology all have foreseen the growth of virtual teams. As a result, more flexible virtual teams have adapted to the current trends in marketplaces by providing the impressive productivity of team-based designs in new environments. Interrelationship between team members and communication skills in virtual team setting must be developed. The importance of work force development for virtual teams has emerged accordingly, which can be a focus of HRD in the 21st century.

Leading Virtual Teams: Three Cases

James R. Johnson
Purdue University Calumet

Laurel Jeris
Northern Illinois University

This study investigated virtual team members’ and leaders’ perceptions of the role of the leader, and hindering and helping forces within virtual teams and their host organizations for developing leaders of such teams. It addresses the expressed need of virtual team leaders for the field of HRD to guide leadership development for this emerging organizational form. In response this study situates leadership requirements, identified by the participants, within an overall developmental context.

Keywords: Virtual Teams, Leadership, Multi-site Case Study Research

More than twenty years ago, the term ‘virtual teams’ began to appear in the literature as the result of the intersection of two important trends: globalization and information technology development (Joy-Matthews and Gladstone, 2000). Specifically, virtual teams were found to be the answer to the mounting worldwide economic pressures of the 1980s, while the technology was increasingly available to support virtual teams, even across continents. Synchronous and asynchronous chats, audio and video conferencing, voicemail, corporate email-based intranets, and the worldwide web enabled virtual team communication. Initially the cost pressures of travel, especially air travel, increased the appeal of virtual teams. As organizational experience deepens, team members and leaders have expressed with some frustration, that, “We are making this [how to function effectively] up as we go along” (Johnson & Jeris, 2003, p. 959). This study focuses specifically on what kind of leadership is required for this organizational phenomenon. Is it the same as, or different from that required in face-to-face teams. If it is different, how are virtual teams leaders developmental needs presently met and how do the primary stakeholders describe the ideal development process for future virtual team leaders?

Research Questions

The purpose of this research project was to examine the leadership required in virtual teams. Our central research question was: what specific leadership behaviors, competencies, skills, and attributes contribute to virtual team effectiveness? Our two supporting research questions were:

1. From the perspectives of the leader, and the team members, what are the effective and ineffective leadership behaviors, competencies, skills, and attributes found in virtual teams?
2. What helping and hindering forces to effective leadership exist in virtual teams, and their organizations, and what is currently being done or can to done in the future to enhance strengths and overcome barriers?

Literature Review

This research project targeted virtual team leaders and team members’ perceptions of the leadership required for improving team performance. For this research project, we operationally defined the virtual team as: Two or more people who must interact in order to reach a common goal, and are primarily dependant upon electronic communication because they are not geographically co-located.

Effective Performance of Virtual Teams

Current research findings can be arranged along a continuum of thought regarding the effective performance of virtual teams. At one end there is evidence to suggest that virtual teams are no different from teams working together, face-to-face, every day. For example, Chase’s (1999) study revealed that a “virtual team is just like any other team, only more so” (p.76). Moving slightly along the continuum in the direction of difference is the work of Leury and Raisingham (2000), who found that at least some aspects fostering effectiveness in virtual teams remain unchanged for non-virtual teams and posited that, “Organizations choosing to implement virtual teams should focus much of their efforts in the same direction they would in they were implementing traditional, co-located teams” (p. 532).
A third view moves dramatically toward the opposite perspective and findings indicate that virtual teams are vastly different from face-to-face teams. Joy-Matthews and Gladstone (2000) suggested that practitioners pay attention to the following four discussion points: selection of members, essentiality of proximate contact, employee responses to the virtual structure, and changes in the corporate intranet. Others (Montoya-Weiss, Massey, and Song, 2001) argued that a temporal coordination mechanism is essential to managing conflict in a virtual team. Solomon (2001) asserted that managers of virtual teams need proper communication technology, a clear understanding of the needs of the team, a sense of shared space, and offered nine tips for success. Lipnack and Stamps (1999) proposed that virtual teams have three facets that must be considered: purpose, people, and links. Kelley (2001) cited a study by Maznevski and Chudoba that suggested two pivotal themes in virtual team performance and effectiveness. First, their research indicated that virtual team dynamics were comprised of a series of critical incidents. And second, these incidents had a repeating pattern over time.

In summary, Colky’s recent research (2002) seemed to capture the essence of the work to date on the effectiveness of virtual teams. She found that three factors contributed to virtual team performance: communication, trust, and collaborative learning. At first blush, these elements may strike the reader as restating the obvious. We make that proposition because we experienced that same pessimism. Interestingly, when our interview subjects talked about trust, communication, and collaborative learning, they brought them into the conversation with various exclamations indicating that these ideas have been around a long time. We found that these dimensions served as a starting point for a theoretical framework; we subsequently employed them as conceptual maps in our case descriptions. In this way we hope to build on Colky’s themes and use them as the framework to help us understand the ways in which leadership must deliver these variables to the virtual team.

Communication
The first factor that Colky (2002) described as a key determinant of effective virtual team performance was communication. Potter, Cooke, and Balthazard (2000) wrote that communication is critical to effective teamwork, while being inherently difficult. In virtual teams these non-verbal aspects of communication may be absent and team members must often rely on words alone. Van der Smagt (2000, p.149) indicated that this lack of face-to-face contact places “new and divergent demands” on communication in virtual teams, and that teams must manage the communication processes in new and different ways. To accomplish this, Larouche and Bing (2001) suggested a list of guidelines that virtual teams should follow to help in this: Sending meeting agenda and documents prior to team meetings, member introductions at meetings, and continuous clarification are but a few of his recommendations.

Trust
Colky (2002) identified trust as the second factor in effective, high-performance virtual teams. According to Jarvenpaa, Knoll, and Leidner (1998), “trust is critical in new organizational arrangements where the traditional social controls do not exist, and lies at the heart of success. Once again, virtual teams encounter new processes and are challenged by their very structure and nature to find new ways of operating” (p. 29). Platt (1999) wrote that “trust takes time to build, but no time at all to destroy” (p. 41), and asserted that competence and integrity underlie trust on virtual teams.

Collaborative Learning
The final factor that emerged from Colky’s (2002) research was collaborative learning, also described in the literature as cooperative learning and team learning. A recent issue of Advances in Developing Human Resources, 5 (1), focused on cross-cultural aspects of team learning. Since two of the cases presented here were international in scope, we found this examination very helpful. However, much the same way that Hofstede’s (1980) work was criticized by Jaeger (1986) for limiting his study to a single organization creating the potential for confusing organizational and national cultures, we bring the same concern to the study of virtual teams. Although face-to-face teams and virtual teams confront similar issues in terms of meeting performance objectives, understanding the unique learning context of virtual teams is so undeveloped at this point that to assume what we know about team learning applies equally to face-to-face and virtual teams is clearly premature.

Leadership
How does leadership foster these three factors in virtual teams? What exactly is leadership? Heilbrun (1994) pointed out that rigorous study of the leadership phenomenon began with the work of sociologist Max Weber in the early part of this century and that the study of leadership can be divided into three stages. The earliest stage attempted was to identify traits of leaders, the next stage focused on the behavior of leaders, and the third and current stage centers on the interactions between leaders and those they lead. Heilbrun (1994) went on to say that the future of leadership studies might lie in the understanding that the most significant aspects of leadership lie far beyond the ability to study them.

Many hundreds or even thousands of definitions of leadership exist, ranging from the abstract to the simple. Locke, Kirkpatrick, Wheeler, Schneider, Niles, Goldstein, Welsh, & Chah, (1991) offered one definition: “We define
leadership as the process of inducing others to take action toward a common goal” (p. 2). Bethel (1990) proposed a more precise definition of leadership as simply "influencing others” (p. 6), and Loeb (1994) stated that "leaders ask the what and why questions, not the how question” (p. 242).

While there is no one generally accepted definition of leadership, for purposes of this research project, we adopted the following operational definition of leadership: Leadership in the process of influencing others toward the achievement of a common goal or common set of goals.

Leadership and Virtual Teams

Precious little has been written about leading virtual teams. Switzer (2000) summarized this very well when she wrote that there “is a tremendous amount of literature on leadership, and some literature on virtual teams. Yet, there is very little research on leadership in virtual teams” (p. 3). The following brief summary reveals that research to date has primarily described current issues and problems but has not engaged participants in visioning a future for leadership development. First, Gould (1997), while indicating that “virtual teams are here to stay” (p. 163), made ten research-based recommendations for virtual team leaders. These include: make face-to-face time, keep things visible, minimize communication delays, supplement text-only communication, establish group rules and norms, provide self-assessment time, recognize people, use the available technology, and learn from experience.

Second, Kayworth and Leidner (2001) reported that “effective leaders in our study were attentive to both the relational as well as the task-related features of their jobs” (p. 26).

Third, Bell and Kozlowski (2002) pointed out the multiple benefits of virtual teams, and reminded us that “they also create several leadership challenges” (p. 15). They categorized these challenges into two broad areas: performance management and team development.

Fourth, while referring to leadership as the most fundamental of virtual team dynamics, Pauleen (2002) found in his research that effective virtual team leaders exhibit the capacity to deal with paradox and contradiction. He wrote that they do this by “performing multiple leadership roles simultaneously” (p. 3). In addition, he found that effective virtual team leaders provide “regular, detailed, and prompt communication with their team members and peers” (p. 3).

And finally, Cascio and Sturdyala (2003) reported that the following leadership challenges emerged from their research: the paradox of loose and tight controls, promoting close cooperation, encouraging and recognizing emerging leaders within the team, establishing norms and procedures early, establishing clear work and home boundaries. Further, they noted that “there is one fundamental issue that in many ways supercedes all others, namely, the impact on culture on E-leaders. In a broad sense, culture refers to shared norms about expected behaviors” (p. 374).

Research Design and Limitations

Stake (1995) indicated that a case is "specific, a complex, functioning thing” (p. 2). In this study, in an attempt to understand this complex functioning, several selection criteria were used to solicit participation from the research sites. First, the subjects had to be current members of a virtual team. Second, at least three individuals were to be interviewed for each case: a team leader, and two team members. Third, the virtual team’s organization had to agree to be identified, although team charters and member identity remain confidential. In keeping with the virtual context, all communication with the research subjects, from recruitment to obtaining consent, to conducting the interviews was electronically mediated. Email, phone, and fax served us well; the only exception was having to resort to regular mail as a follow-up to faxed copies of the consent forms to obtain original signatures.

Data Collection and Analysis

We collected data through semi-structured, tape-recorded interviews and held closely to the interview schedule (Merriam, 1988). Interviews were audiotaped, verbatim transcriptions were made, and interview transcripts were independently coded and analyzed using constant comparison. Once the open and axial coding was complete and categories and properties were identified, we pooled the codes, again using constant comparison to derive the findings reported here. In order to minimize the effects of researcher bias, a trusted peer researcher provided feedback on the data analysis.

Site Descriptions

Three virtual teams were investigated: one each from NiSource Inc., Automatic Data Processing, Inc. (ADP), and the Academy of Human Resource Development (AHRD). NiSource Inc. is a Fortune 500 public utility holding company headquartered in Merrillville, IN. Its various operating companies engage in natural gas transmission, storage and distribution, as well as electric generation, transmission and distribution. Its operating companies deliver natural gas and electricity to nearly 3.7 million customers located within the high-demand energy corridor that runs from the Gulf Coast to New England.
ADP is one of the world’s largest providers of computerized transaction processing, data communications, and information-based business solutions. Headquartered in Roseland, NJ, ADP employs 40,000 people and maintains relationships with over 500,000 clients. Its annual revenues in 2002 exceeded $7 billion. ADP’s primary business lines are employer services, claims management solutions, auto and truck dealership systems, and securities processing. The digital nature of their businesses has driven them to adopt virtual teams naturally.

The Academy of Human Resource Development is a world-wide, research-focused organization whose mission is to encourage systematic study of human resource development theories, processes, and practices; to disseminate information about HRD; to encourage the application of HRD research findings, and to provide opportunities for social interaction among individuals with scholarly and professional interests in HRD from multiple disciplines and from across the globe. The AHRD, in fact, operates virtually, having members and volunteer associates across the globe.

Virtual Contexts

Although we have considerable experience in case study research, the lack of face-to-face interaction and observation of the subjects’ work settings placed us in uncharted territory. We found no compass in the literature on case study methods to orient us to the virtual context – not unlike the experience of virtual team members. The boundary-less nature of virtual teams is nearly antithetical to the very boundaries implied by “a case.” As a result of these paradoxes, we tried to be particularly attentive to design and protocol issues. In all cases, the phone interview was the first time the researchers actually spoke to the subjects. Still, it was important to spend some time at the beginning and end of the interviews exchanging personal anecdotes and experiences with virtual teams in a rapport-building process and, not surprisingly, we found our subjects to be very skilled in this arena.

Transferability

We surmise that there might be a virtual context, but how do we describe it, and is it transferable? Erlandson, Harris, Skipper and Allen (1993, pp. 31-33) addressed the issue of transferability and noted that the detailed description of the case, providing rich contextual cues, enables the reader of the study to consider hypotheses for application in another context. The richness of the case description provides the means through which the reader can make this determination. We submit that describing a virtual context in sufficient detail and making decisions about relevant contextual cues is difficult. In this sense we believe the transferability of our findings and conclusions (until case study research on virtual contexts becomes commonplace) to be limited.

Research Findings

Findings of this research are grouped into categories and their properties, and reported by the research question. Categories are defined for purposes of this paper as the broad, overarching terms that respondents used to organize the reports of their experiences. Properties, in this paper, are defined as more finite descriptors of behavior, competency, skill, and attributes that were uncovered. We deliberately cast a wide net with the research questions because we did not want to get into definitional quagmires over how participants described leadership. Experience tells us that people are quite able to first describe actions and, upon further cues, convey the meaning they ascribe to those actions. Consequently, the actual interview questions and cues were overwhelmingly behavioral and focused on requesting examples of incidences/actions that were representative of effective and ineffective leadership. We also grappled with responses that indicated a desire to “sound current” with the literature. In other words, we had to get past themes that have been identified in the literature such as communication, trust, and collaboration (Colky et al., 2002). While we completely respect this work (it has formed our theoretical framework), we believed our respondents experiences could further illuminate these themes.

Research question one asked ‘From the perspectives of the leader, and the team members, what are the effective and ineffective leadership behaviors, competencies, skills, and attributes found in virtual teams?’ The category we derived was responsiveness, which was descriptive of major elements of communication. In other words, the participants’ descriptions of communication were labeled effective if they met the mental schema of responsiveness described by the following properties: availability, support, proper use of technology, and style management. One of our respondents summarized availability when he said (referring to a virtual team leader), “I knew that when I e-mailed [her] that I would get a response no later than 12 hours away but it’s usually more like within an hour or two”, he said. And went on to clarify by saying, ‘I don’t think she left her computer for two months. She took a couple of little vacations I guess you could call it and both times she stayed connected. I think she went to Europe. Yeah, she went to Europe one time. She was still connected.’ When the respondents reported ineffective leadership, it was generally framed in terms of some lack of one of the properties.

Support was identified as another important attribute. One respondent said, “I think everybody really enjoys having her for a supervisor because we know, we’re comfortable in knowing that she’s going to back us, 99 times...
out of 100.” A leader said, “I guess I would also want them to know that they’re comfortable to call or make an
appointment or whatever to discuss any issues they might have or recommendations that they find, improvements or,
cuz I’m not sure that is, um, you know, communicated real well to them.”

The appropriate use of technology was also deemed important. As one respondent put it, “The other piece of
that is that she’s also very good about using technology to keep us informed.” Another leaders said, “I hear that the
communication, the electronic communication was very effective.”

Style-management, or adapting leadership to the personality or work style of the follower was the final behavior
under this property. One respondent summarize this idea when she indicated that, “she certainly knows how to
deliver that in a way that is meaningful, meaningful for me.” Another said, “you run across all different kinds of
people with different personalities. And she seems to be real good coping with, you know, people that are in the
middle or on the extremes.”

In reviewing the category of responsiveness, which adds considerable description to the broad theme of
communication, our participants reported that communication is only truly effective when it meets individual
requirements for timeliness, evidence of support, skilled use of technology, and attention to the personal needs/style
of the team member. In addition, it was clear from the interviews with team members that these mental schema for
effective communication vary from person to person, placing a substantial burden on the leaders to enrich their
knowledge of team members beyond daily electronically-mediated exchanges.

Empowerment emerged as another mediator of effective communication. Properties defining empowerment
included: anticipating the team needs, role clarification, setting performance expectations, mentoring and coaching,
and providing feedback. One respondent characterized anticipation of team needs by responding that she, “I think
the constant with the people who were far away, keeping, building, and maintaining the rapport, and making them
feel as if they were part of the team and always connected, so that there was, I, so I sort of confronted the isolation
before it really happened.” Another said, “The only major difference, from my perspective, is that you cannot afford
to be serendipitous. You have to be very, um, disciplined and kind of premeditated.”

Several respondents addressed the notion of role clarification. One said, “I didn’t have to get a pick and shovel
to find out what I was supposed to do or who was doing what, who was responsible for it. That was all pretty well
laid out.” Another said, “They need to understand when they get up in the morning exactly how their roles and
responsibilities impact and affect the deliverables.”

Setting performance expectations was also cited as an important property. One respondent said, “You need to be
very, very clear up front about what the vision and mission and goals and objectives and success criteria are for the
team and for individual.” Supporting that thought another participant offered, “I mean it’s glaringly apparent that
vision and missions objectives and measurements and metrics and processes have to be very, very clear.”

Several respondents addressed mentoring and coaching. “If we, if I, make a wrong decision, than I want her to
educate me as to what should have been done.” In addition, another view was that, “perhaps working with somebody
who has, who has done this role before in terms of being able to see how he’s done that and what was done to
establish a more effective way of doing it.”

If responsiveness is the “how,” empowerment is the “what.” Our respondents let us know that communication
from leaders was only effective if received according to the properties described above. Specifically, if that
communication did not result in further development of team members’ understanding of their role, contribution to
the team, vision and mission of the organization, specific suggestions for improvement provided in a positive
developmental manner (mentoring, coaching, and feedback), then communication was not effective.

Team members also described concerns beyond those encompassed by the absence of properties described
above. First was the notion that virtual teams leaders tend to take on more work that necessary. One of our
respondents said, while referring to her leader, “I would just like to know more of what some of her needs and
challenges are. I think she takes a lot on her shoulders that, at times, we could probably assist with.”

Second is the idea that implicit in the data from research question one is the concept that giving autonomy can
be highly motivational for many people. The data indicated that excess autonomy may be perceived as a negative for
some virtual team members. One leader said that, “there were a couple of comments, or, or areas that looked like
they weren’t getting … enough of my time.” Another said of his leaders, “I would say probably, if anything, she
may, she may be too autonomous. What I mean by that is we don’t often get feedback from her.” While autonomy
may be highly motivational, it appears to have its dark side in virtual teams.

Research question two asked, What helping and hindering forces to effective leadership exist in virtual teams
and what is currently being done or can be done in the future to enhance strengths and overcome barriers? Team
and organizational helpful forces emerged from the data. Under the broad category of motivation, we identified
properties of fit with personal style, satisfaction with work/life balance, and alignment of personal and
organizational goals. The first helpful team force that many people gain satisfaction from working on a virtual team
since it meets certain personal needs for work/life balance. As one of the respondents phrased it, “I’m an introvert, so that works for me.” Another said that they had a company-wide job satisfaction initiative ongoing and that “part of that initiative is work/life balance, which for me is what working from home is all about.” Although many team members acknowledged that working virtually had its challenges, the flexibility and/or autonomy more than made up for it.

At the organizational level, was the idea that successful virtual teams exist in a culturally-sensitive environment. In all three cases, respondents noted that their organizations had developed the capacity to appreciate cultural differences regardless of the manner in which these characteristics appeared. One of our respondents put it best when she said, “in a virtual team, what we need to be aware of more so is time zones, cultural differences, perspectival [sic] and perceptual differences, linguistic differences that can lead to misunderstandings.” Although conflicts arose as a result of cultural differences, participants alluded to a learning culture that superceded a particular organizational culture.

At the team level, we derived the category of face validity, which encompassed the properties of face-to-face contact, accountability, and dependability. One of our respondents said that virtual team members need to understand that team performance “is going to happen differently than it would face-to-face.” Another leader reported that she would “do a little more face-to-face than we currently do” to improve the teams performance. One of our respondents summarized the things that are being done in his team in this regard by stating that “those connections probably helped because we’ve already had some face-to-face [contact].” Second is accountability. One of our respondents indicated that team members who “did not follow through with what they were supposed to do” were an issue in her team. Another gave an illustration when she said that, “one person who lives abroad was trying to establish his own consultancy practice, and so things were very unpredictable in his own schedule and that was reflected in his ability to respond to the needs of this team.”

Organizational readiness emerged as the single most important category containing a host of potentially hindering forces to the successful implementation of virtual teams. Although highly interconnected to the team level hindering forces, this category holds properties that were much more difficult to specify. Respondents were vague when asked for examples but they were certain that there were some larger forces at play occasionally that made them aware of their vulnerability as virtual team members. As one of our respondents said, “many folks out there are not ready to accept this whole concept” of virtual teams. One of our leaders reported that she has responded to this challenge by implementing a training intervention for virtual team leaders and members. “We have developed and are just releasing remote management; a remote management course for managers, and a remote management course for people who are being remotely managed because there’s pain, you know, out there.”

Visioning Leadership Development

In reviewing the categories and properties that emerged from the data, we were hard pressed to find content that would not be part of conventional leadership development programs with the exception of enhanced technical skills. However, the virtual team leaders who participated in this study noted that this particular leadership role does not lend itself well to a program. Formal instruction (conducted face-to-face) simply does not convey the nuances of the virtual context. These leaders envisioned successful virtual team leadership development on a continuum that begins with becoming a successful leader first in-house by establishing credibility in the face-to-face context and gaining access to sources of power. Second, they asserted that an important developmental requirement was to be a member or a virtual team prior to leading one. Finally, they noted that they saw themselves as change agents for the organization as a whole, constantly advocating for their in-house leader colleagues to understand the subtleties of remote management/leadership because it is so very easy to lapse into a “out of sight, out of mind” frame. One of our respondents summarized the leadership development implications by stating,

The virtual team leader needs to be expert, I think, at written communication and electronic communication. You can have this skill, but you have to be willing to be connected to the computer, so that you can be available to respond in a timely way when other people around the globe are accessible and available. So communication and interpersonal relationships and diplomacy are key. And then of course, all of that leads to keeping people thinking and believing and feeling as if they truly are connected and integral to the overall team project and to the organization.

Conclusions, Recommendations, and Contribution to HRD

This research began with the central research question was: what specific leadership behaviors, competencies, skills, and attributes contribute to virtual team effectiveness? In answer to that question, much important information has emerged from this research project. First, as Colky et al. (2002) uncovered, communication is critical in leading virtual teams. However, this multi-site case study further illuminated communication as having two narrower
categories, responsiveness and empowerment. The second factor, identified by Colky et al. was trust. While we acknowledge that our participants operationalized this in some respects (accountability and dependability), our participants operated out of an overall motivational frame noting that their desire to be members or leaders of virtual teams fit their personal life style and needs for work/life balance. It was within that context that they sought to be accountable and dependable. Collaborative learning was the third construct named in Colky et al., and it is tempting to align our finding of a learning culture with it. But, where the learning is taking place and needs to take place pose some challenges. Clearly, these participants were aware of both strengths and weaknesses in the capacity of their host organizations’ culture to learn from and support virtual teams. Collaborative learning within the team came up only as a function of the members’ interdependence, which varied across the three cases.

Second, several factors emerged, that are not different from face-to-face team leadership. These include anticipating team needs, clarifying needs, setting performance expectations, mentoring and coaching, and providing feedback. These factors appear to support Chase’s (1999) contention that virtual teams are just like face-to-face teams, ‘only more so’ (p. 76).

Finally, this research uncovered some important implications for HRD. First, HRD practitioners may now understand more specifically the meaning of effective leadership in virtual teams. For example, this research uncovered that communication in virtual teams means, among other things, being personally responsive and empowering followers. This alone has widespread implications for hiring and recruiting practices in organizations considering virtual teams.

Second, the major implication of this research to HRD theoreticians is that we now may be able to construct leadership development processes that will be meaningful to our client organization. We are just beginning to understand the notion of leadership in virtual teams.

While this research has important implication to the HRD community, it is just the starting point. In order to be fruitful, much is yet to be done to bore more deeply into this elusive topic.

Two Group Development Patterns of Virtual Teams: Linear Progress and Adaptive Progression

Seung-won Yoon
Western Illinois University

Examining the group processes of seven virtual learning teams and the distribution of observed behaviors from each team found two emerged group development patterns, Linear Progression and Adaptive Progression. Linear progression teams followed the linear sequence of orientation, scheduling, exploration, work and decision, progress check and evaluation, refinement and formatting, and termination. Adaptive progression teams found the evaluation of work progress or the outcome of group work was not satisfactory and made an adaptation to the team progress by revisiting one or more of the previous phases based upon needs identified to finish the project.

Key words: Virtual Teams, Group Development, Computer-Mediated-Communication (CMC)

Advancement in information and communication technologies has triggered growing interest in virtual collaboration and knowledge networks. Types of virtual teams, such as global work teams and special project groups via wireless or teleconferencing tools, are promising because not only are communication technologies becoming more cost efficient, but also becoming more convergent, especially on the Internet to enable group collaboration through multiple communication channels (Penzias, 1995). The digital promise has led companies and higher education to implement virtual teams in their training or instructional practices, believing that proven benefits of traditional group work, such as learning from more knowledgeable members and developing social relationships (Cohen, 1986; Jaques, 1984; Johnson & Johnson, 1987), will be immediately applicable to the virtual team settings. Lowered cost and advances in information and communication technologies will extend the use of virtual teams.

Problem statement

Most research on group development of virtual learning teams has been studied without the guidance of theory. One very widely used model in HRD to explain group development is Tuckman’s stage model: forming, storming, norming, and performing (Tuckman, 1965). According to this view, in order to become an effective team, a team must progress each group development phase: forming; storming; norming; and performing in a linear fashion and build upon the previous step without skipping any phase. Since the mid 1980’s, alternative models that questioned the linear development of a group emerged, mostly from the field of psychology and management, to emphasize the dynamics and self-managing-capacity of small groups (McGrath, 1984, 1991). Mid-transition model (Gersick, 1988, 1989) believes that team members interact actively at the beginning to establish work protocols, the interaction then tapers off until members realize the need to improve their work practices and go through the mid transition to modify the initial work process. The interactions then slack off again until team interactions explode at the final stage to complete the group task. Unlike the previous two models, recurrent model (McGrath, 1984, 1991) claims that groups do not perform one single task for one discrete purpose. According to this view, groups may perform multiple sets of activities to address both the social and the production-related tasks. Therefore, the group development process is recurrent. More recent views on small groups see them through the lens of a complex adaptive system (McGrath, Arrow, & Berdahl, 2000). Unlike the previous group development perspectives, this view maintains that group development is an adaptation process where group level dynamics, such as norms and member roles, are continually shaped and constrained by individual members and contextual factors such as organizational support, member changes, and task demands. According to this framework, group development is bi-directional and nonlinear because group dynamics such as norms and member roles also influence individuals and contextual factors, whose dynamics are repeated until the group termination (McGrath, Arrow, & Berdhal, 2000).

Each model or view commonly attempts to describe the development patterns of small groups and explain how group members work together to accomplish group tasks. However, each view differs from each other in viewing how the team addresses group developmental needs in a linear, mid-transitioning, recurring, or adaptive manner. In addition, the group development focus slightly differs in each view in spite of using the same term, group development.
development. For instance, group development in the Mid-transition model is specific to the phases in the accomplishment of a given task (Seers & Woodruff, 1997), whereas, Tuckman’s model includes socio-emotional aspects in addition to groups’ work protocols. This leads to the lack of generalizability between different group development studies.

**Theoretical Framework**

A systems perspective that views small groups as a complex, adaptive, and self-organizing system (McGrath, Arrow, & Berdahl, 2000) served as the conceptual framework and the methodological guideline for this study. Complexity theory has been adopted as a theoretical framework to understand a system in complex situations (Axerlod & Cohen, 1999; Simon, 1999). Complexity does not mean perceived cognitive difficulty, but rather signifies that new properties emerge from the system when individual parts within the system interact. Individual parts do not inherently have those properties. This description closely matches how virtual team members operate within a virtual team. The central theme related to the process of group development behind this view is that groups develop as a function of changing conditions over time. The lack of verbal clues and technological barriers require diverse management skills, such as the ability to determine the best technology to facilitate communication, and the ability to engender trust and productivity even when there is no direct supervision (Solomon, 2001). When knowledge networks abound in online settings, virtual teams can explore various problem-solving paths that face-to-face teams cannot take. However, these increased network nodes make it difficult to predict paths or patterns for problem solving (Clippinger, 1999).

This view allows one to see the group as a dynamic and adaptive entity that interacts with its members embedded within the team, and also with the larger systems such as organizations within which the team is embedded. As for the aspect of group development, this framework maintains that all groups need to address two generic functions (i.e., completing group tasks and fulfilling member needs) in order to accomplish the group goal. This view is aligned with small group studies that consider group development as bifocal: group development as related to task and socio-emotional dimensions (O’Connor, 1985; Tuckman, 1965; Wheelan, 1994, 1996). This view also reflects the common needs of virtual learning team members to address both needs to complete a group task and develop group affinity over time.

Perceiving the virtual teams as capable of self-managing and adapting to changing environments implies a significant challenge for research paradigms in group development studies. Groups in the past also used communication technologies to deliver and share information, but the role was rather supplemental to face-to-face interactions. However, current online communications greatly differ from those of the past because the Internet provides a cost effective way to network people and manage work processes crossing the time and space boundaries. Before the Internet, there were communication technologies such as fax, telephone, and satellite systems that allowed people to communicate at different times and locations, but the cost and adoption of the previous technologies were not at a par with face-to-face interactions. In modern work teams, employees utilize information technologies to improve coordination, flexibility, dynamics, and responsiveness without being restricted by physical proximity (Lucas, 1996). This networked and flattened form of organization is radically different from the previous hierarchical forms of organizations because responsiveness to rapidly changing environments is preferred over the stability of the hierarchical decisions. Each individual in those networked work teams can initiate actions, thus distinct group behaviors appear in complex systems. Clippinger (1999) maintains that the way complex systems operate is neither deterministic nor linear. Within virtual teams, group development will be embodied by how the group members have interacted with and adapted to their changing circumstances. Rather than identifying definitive group development patterns, group development in network-path-rich virtual teams will be more interested in finding regularities and a repertoire of actions that enable the system to stay within a reasonably stable structure and to evolve to more effective actions for reusable responses toward an environment.

**Research Questions**

Without preemptive knowledge about what virtual team members do, and based upon understanding from the literature that virtual team members utilize synchronous and asynchronous communication technologies, the researcher originally formulated research questions to examine the group development of virtual teams by asking what they do synchronously and asynchronously in order to address the need for accomplishing work and supporting the team members. However, examining the group communication logs, students’ email messages, and posted messages indicated that virtual learning teams in this study heavily utilized synchronous communication, whereas asynchronous tools were merely used to post draft works and exchange documents. In addition, the coding system
development processes led to the identification of a third domain that was crucial for group development in virtual learning teams. Observed behaviors for the third domain were not performed to accomplish work or develop member relations, which were two major group development functions identified from the group development literature. The researcher named the third domain as Management, which captured members’ behaviors related to managing the group meeting, scheduling, and addressing technology issues. Based on these adjustments, research questions were modified as below:

1. **What are the major behaviors that virtual team members perform?**
   a. What behaviors do virtual team members perform for work needs?
   b. What behaviors do virtual team members perform for social needs?
   c. What behaviors do virtual team members perform for management needs?

2. **How are the major behaviors for different group functions distributed over time?**
   a. How are the major work-related behaviors distributed over time?
   b. How are the major social-related behaviors distributed over time?
   c. How are the major management-related behaviors distributed over time?

3. **What are the major group development/patterns of virtual learning teams?**
   a. Which forces shape and constrain the emergence of group development patterns?

**Research Design**

This study was naturalistic and explorative in that the participants were observed through a typical online distance course environment without any arrangements manipulated for this research. Group development patterns were explored by using the comparable multiple-case study design with simulated virtual work groups (McGrath, Arrow, & Berdhal, 2000). Participants of this study were seven newly formed virtual learning teams working on a final group project in a twelve-week online graduate-level course. All of the thirty-three participants were full time Human Resource Development (HRD) professionals.

The explorative nature of this study required accuracy in interpreting communication behaviors and group development processes. In view of that, this study used the combined method, specifically the phase design model suggested by Creswell (1994) to corroborate findings from different data sources. First, interaction analysis was conducted from archived communication logs to answer the question, “what kinds of messages are exchanged in these small groups between whom” (italics added, Sykes, 1990, p. 208). In so doing, reliability on coding schemes was ensured by comparing the results with another coder. At the second phase, summary statistics were used to examine distributions of member behaviors over time. The summary data were used as a leading point to the next phase of identifying major group development patterns of virtual learning teams. Lastly, the researcher investigated which forces were influential on the emergence of group development patterns in virtual learning teams using the forced field analysis (Udinsky, Osterlind, & Lynch, 1981). The analytical framework of force field analysis nicely fit the purpose of identifying influential forces for groups to move from the status quo (i.e., formulation of teams) to the desired status (i.e., successful group development in terms of work completion, member relations, and effective group/meeting management). This study also collected members’ background information through a pre-course survey to explore how member backgrounds impacted group development.

**Results and Findings**

*Research Question 1: What Are the Major Behaviors that Virtual Team Members Perform?*

Team members exchanged the largest amount of messages for work (59.3%), followed by social (26.3%), and management purposes (14.4%). Wheelan’s (1992) definition of work statements, “those that represent purposeful, goal-directed activity and task-oriented efforts” (p. 363), was immensely helpful to distinguish work-related behaviors from other domain-related behaviors, particularly from management-related behaviors. The Social domain was defined as members’ efforts to build relationships with other team members. The Management domain was defined as efforts directed to manage the overall group processes and group meetings, which were distinguishable from explicit task-oriented efforts.

*Performed behaviors for work needs.* Ten behavioral dimensions were identified under the Work domain. The most frequently observed behavioral dimension was sharing (21.3%), which included behaviors such as sharing facts/resources (i.e., sharing objective information) and sharing opinions/ideas (i.e., sharing subjective information). Perhaps the most interesting finding was that the proportion of responding behaviors (10.7%) was lower than that of requesting behaviors (14.4%). Responding behavior was defined as an immediate and direct response to a request
made. This indicates a poor management of the group synchronous chat. Having worked for four years as a teaching assistant and a technical support staff member in online classes, the researcher frequently observed that the message flow of a group synchronous chat was messy, particularly when team members were addressing multiple issues rapidly. Typing a complete sentence takes a lot longer than delivering the same message verbally, and in an online group chat, people tend to read the last threaded messages while typing. Therefore, responses are often distanced from what was originally asked, and read more like an independent thought. This pattern contributes to blurring the beginning and the ending point of a topic, and when a new topic is introduced, the environment gives an impression as if everyone is talking about his or her own thoughts. Consenting behaviors such as agreeing or disagreeing on processes, format, and opinion, etc. were the third most frequently performed behaviors (14.2%). Virtual learning team members also frequently discussed how the team would go about working on the project (14.1%). Classification efforts regarding task, project requirements, and the format of the team’s outcome were also commonly observed (11.5%). The Agenda dimension identified statements related to starting, shifting, and closing a topic during the meeting, and the proportion of those statements was comparatively low at 3.4 percent of the entire work-related statements. The Impediment dimension was unique and important in that even though the proportion was not high (3.2%), it was the only negative behavioral dimension that interfered with the team’s work accomplishment. The fact that the proportion of impeding behaviors was similar to that of agenda-related statements indicates that these behaviors were not uncommon during the group meetings. Lastly, time-pacing statements were not frequently observed in this study (1.0%). This may be due to the fact that all team members had direct access to the due date information from the course website. Another possibility is that the participants in this study were purposively sampled individuals in an advanced degree program who were sensitive about what was due.

Performed behaviors for social needs. Analyzing the chat records showed that the social domain did not include any other behavioral dimension other than building a relationship. In other words, the conceptual level of the social domain and the dimension of relationship building were identical. All performed behaviors for the social domain were directed at building relationships and included: Greetings (27.6%), Sharing personal life (18.7%), Sharing work and professional interests (18.2%), Discussing the course (15.4%), Pairing and member support (11.4%), and Sharing fun and jokes (8.7%).

Performed behaviors for management needs. As previously stated, the Work and the Social domain did not capture a large amount of behaviors virtual learning team members performed for group development purposes. Group development implies that there is a point for a group to start its life until the termination. In this regard, group development is a maturation process to complete the goal of the group. Most work groups, including the learning teams, not only accomplish a group task and foster member relations, but also deal with the maturation processes to move forward. The Management domain was identified by behavioral efforts made to make such an advancement (i.e., facilitating the overall group development processes and the group meetings). Among the observed behaviors (see Table 8), scheduling was the most frequently performed (35.7%), followed by facilitation (29.2%), reinforcement (17.5%), technology (15.6%), and conformity (2.0%). The high proportion of scheduling showed that virtual learning teams spent a significant portion of the group meeting time on scheduling purposes. Also, the proportion of technology-related behaviors such as reporting and resolving a problem indicated that virtual learning teams needed to resolve technology-related problems and issues during the group development processes.

Research Question 2: How Are the Major Behaviors for Different Group Functions Distributed over Time?

At the beginning, the social domain explained the largest proportion of observed behaviors (42.6% during the first four weeks), followed by work (34.1%) and management (23.1%). The high proportion of the social domain during the early stage of group development might indicate that virtual learning team members try hard to enhance the social presence in an on-line environment before focusing their interactions on work. However, as team members started gathering necessary information for the project and sharing individuals’ work progress during the regular group meetings, the work domain became the dominant focus of performed behaviors (65.5% at time 2 and 68.7% at time 3). The management domain remained the lowest at all three times and its proportion showed a decreasing pattern over time.

Examining the distribution of observed behaviors within each domain showed that the proportion of work, social, and management-related behaviors also changed over time. Within the work domain, the proportion of work process-related behaviors continuously decreased over time (20.4%, 16.4%, and 12.5% at time 1, 2, and 3, respectively). This implied that once work patterns are in place, team members started talking less about them. Sharing, requesting, responding, and clarifying behaviors continuously increased over time to show that virtual team members became more engaged in idea collaboration.

Interesting findings were also found in the members’ relationship building behaviors. Sharing personal life and hobby was the most frequently performed at time 1 (29.0%), but it became less frequent in time 2 and 3 (10.3% and 8.6%, respectively). Discussing the course and sharing work and professional interests were commonly found at
time 1, but those behaviors reduced greatly over time. On the other hand, sharing fun and jokes (5.2%, 13.1%, and 19.2% at time 1, 2, and 3) and pairing and supporting members (13.1%, 19.5%, and 24.6% at each time) showed a considerable increase over time. This indicates that members’ relationship development patterns gradually changed from formal to informal over time. Analyzing the distribution of management-related behaviors showed that virtual learning teams in this study recurrently coordinated contingent meetings in order to accommodate traveling team members during group work. Scheduling was expected to decrease over time, but it remained the most frequently addressed management issue (35.2%, 34.9%, and 36.9%). One interpretation about this is that most participants in this study were full time working professionals and most teams had one or two members traveling on business during the group work. With one exceptional case in team G, most contingent scheduling efforts turned out to be extremely difficult and frustrating to team members. The one who reported about his or her absence tended to give only limited information about the absence, and often did not include what alternative times would work or not. As a result, contingent scheduling efforts were followed by repetitive notification of scheduling conflicts. Technology issues were frequently addressed at the beginning (22.9%), and the proportion decreased over time (11.2% and 8.9% at time 2 and 3).

Research Question 3: What Are the Major Group Development/Patterns of Virtual Learning Teams?

Examining the chat logs and the distribution of observed behaviors found two emerged group development patterns in virtual learning teams, Linear Progression and Adaptive Progression. Two teams (team D and G) developed in linear progression and both teams followed the linear sequence of orientation, scheduling, exploration, work and decision, progress check and evaluation, refinement and formatting, and termination. Five teams developed in adaptive progression (team A, B, C, E, and F) and the initial group development of adaptive progression was the same until the progress check and evaluation phase. However, adaptive progression teams found the evaluation of work progress or the outcome of group work was not satisfactory for team members. Those teams made an adaptation to the team progress by revisiting one or more of the previous phases based upon needs identified to finish the project. Team E made an adaptation by merely adding two more group meetings (revisiting to the scheduling phase) and did not go through any further exploration of work processes or change work/decision making patterns. In team B, adaptation involved setting up additional group meetings, establishing a new work procedure to manage the meeting by agenda, and shifting the interaction focus to work (revisiting to the scheduling and the exploration phase). Team B made a similar adaptation, but the timing and the intensity greatly differed. The change took place during time 3 right before the project due date. As a result, frustration by team members was intense. The degree of adaptation was the greatest in team C, which revisited all three previous phases. When the team switched to a new organization and found that the work progress should be expedited, the team set up additional group meetings and came up with new work procedures (i.e., splitting the reading and mandating to read before the group meeting). This change resulted in the team’s work pattern to observe enhanced sharing and increased group consensus. Team F also needed to switch to a new organization due to difficulties in obtaining necessary information. Without such a change, the group development of team F would have been described as linear because the team’s progression was sequential. However, switching the project organization enforced the team to explore new solutions to complete the project in time. The team selected phone interviews and a group phone conference and complete the work. Since the team already established clearly shared work and sharing procedures, team members did not set up additional group meetings.

Forces that shaped or constrained the emergence of group development patterns. A combination of forces (i.e., member characteristics, member presence and commitment, emergent group norms, and access to necessary information) influenced a virtual learning team to develop either in linear progression or adaptive progression (see figure 1). Through the force field analysis, the researcher found that member-related characteristics were the primary underlying cause to the successful development of groups, but without being transformed into group norms, the impact on group development was minimal. To illustrate, team A, B, D, E, and G recognized one member’s knowledge and experiences related to the project, but only team D and G utilized the expertise from the beginning throughout the course for the purpose of setting up the work procedure, initiating idea solutions, and synthesizing shared perspectives. When members encountered the postponement of project work, other members’ topic digression, and differing but never-compromising views regarding the goal of the project, members’ expertise did not transform into a shared work procedure to push the project progress.
Figure 1. Influential Forces Impacting the Group Development of Virtual Learning Teams.

Analyzing the pre-course survey result showed that members’ work experiences or personality could not predict the emergence of the group development pattern. Members who had relevant work experience or had a personality preference to structure tasks tended to lead the meeting and set up a work pattern for the team, but there were also teams whose most experienced person worked only as a contact person or team members rotated in managing the group meeting. More important was the transformation of member characteristics to the group level so that sharing work procedures, sharing goals, sharing individual members’ work, discussing members’ views and drawing group consensus, identifying further actions to advance the work, exchanging member support, and utilizing technologies for effective sharing could push team members to address the needs for work, member relations, and management. Second, this study found that virtual learning teams planned and established work procedures based upon project timelines, managed meeting agenda, and performed asynchronous work around provided tasks. As a self-managing team, virtual learning teams identified subtasks and set up due dates for sub-tasks to complete the project. When team members did not perform any action items, that slowed down the work progress of the team. Virtual learning teams’ moving ahead of schedule resulted in greater opportunities for sharing, clarifying, and identifying future action items to advance the project. In summary, time and task on this study played the role of a benchmark, pressure, and goal for the purpose of virtual learning team’s group development.

The results of force field analysis also identified forces that negatively impacted the group development of virtual learning teams. Similar to positive forces, member-related characteristics were the primary cause of these: member absence, inactive participation, topic digression, little contribution to the group work, etc. When the presence of these negative forces was stronger, the pressure on the team to adapt the team’s progression was greater. Obtaining access to necessary information turned out to be one major influential force in this study. Team F observed a strong presence of positive forces and saw few negative forces throughout the course, but experiencing difficulties in obtaining information from the lack of cooperation from the project organization affected the team to develop in adaptive progression. However, it did not impact the quality of group development of the team because even after the change, the team continued to demonstrate high level of work collaboration, member support, and meeting management. Switching to another organization only resulted in a change in the manifestation of group development pattern.

Conclusions

Three functions: Work, Social, and Management are important for successful group development. From the beginning of team formation until the termination of the team, team members’ exchanged messages indicated that performed behaviors were targeted to accomplish work (i.e., work), build up member relations (i.e., social needs), and manage the group meeting or the overall group processes (i.e., management). Examining the frequency of all
observed behaviors showed that completing task was the most frequently performed (59.3%), followed by building relationships among the team members (26.3%) and managing the team (14.4%). This shows that virtual learning team members consider the primary purpose of group work as completing the group task. At the beginning, the social domain explained the largest proportion of observed behaviors (42.6% during the first four weeks), followed by work (34.1%) and management (23.1%). The high proportion of the social domain during the early stage of group development might indicate that virtual learning team members try hard to enhance the social presence in an on-line environment before focusing their interactions on work. However, as team members started gathering necessary information for the project and sharing individuals’ work progress during the regular group meetings, the work domain became the dominant focus of performed behaviors (65.5% at time 2 and 68.7% at time 3). The management domain remained the lowest at all three times and its proportion showed a decreasing pattern over time indicating that the efficiency of management gradually improved over time.

In addition to three conceptual domains related to group development, this study identified two group development patterns, linear progression and adaptive progression. Each group development pattern could be distinguishable based upon how a virtual learning team progressed through several developmental phases: orientation, scheduling, exploration, work and decision, evaluation, formatting for submission, and termination. Linear progression teams moved along those phases in a step-by-step manner, whereas adaptive progression teams needed to make a backward movement in moving along those phases to adapt to a contingent situation, which was typically detected during the evaluation phase. Which development pattern a virtual learning team’s group development displayed was not as important as how clear the shared goal and work procedures were, how much sharing team members had to draw group consensuses, how much member support and assistance the team maintained, and how effectively and efficiently the team addressed those over time. Although one team in this study developed in adaptive progression due to the need for switching the project organization, group development of this team was highly successful and demonstrated high effectiveness and efficiency in managing all three functions. Importantly enough, effectiveness and efficiency in work, member relations, and group management (including the group meetings) characterized the group development of linear progression teams. This is likely since those two linear progression teams could develop in linear progression owing to the team’s successful management of positive forces. Virtual learning teams that poorly addressed establishing a shared goal and work procedures, did not share agenda and lacked agenda during the meeting, had little sharing of ideas and opinions, had slow work progress by individual members, and did not actively utilize technologies did not make a smooth transition between each phase. These teams observed unsatisfactory evaluation on the team’s work progress and outcomes. Evaluation results were also unsatisfactory when teams observed frequent member absences and had no procedures to address member absence, inactive participation, or topic digression by members. Technologies did not seem to be the most influential toward the development of virtual learning teams. Teams resolved most technical problems through the course.

**Contribution to Research and Field of HRD**

Findings and interpretations between different group development studies are difficult to compare, largely due to the lack of details about (1) examined groups, tasks, time, and contexts of the research setting and (2) the validation of used coding scheme. To better understand the group development of virtual learning teams, development of a comparison framework for these issues is crucial. This study provided a comparison framework on those issues. For member characteristics, this study selected newly formed virtual learning teams whose members never worked together, were geographically dispersed, and were expected to maintain relationships after their project work was done. Types of groups and member composition are important variables in need of clarifications in conducting research. Task characteristics within this study were a real-world project that included a planning and a brainstorming task (McGrath, 1984). This study examined the group development of virtual learning teams in a semester-long advanced degree course. Future studies should clarify the scope and types of these issues to enhance the generalizability between group development studies. As stated previously, most research on group development of virtual learning teams has been studied without the guidance of theory. To better understand the relationship between group development and other variables, guidance from a theoretical framework is most important. This study examined the group development of virtual learning teams from the complex adaptive systems (CAS) perspective and confirmed that virtual learning teams showed the characteristics of self-managing teams from the CAS perspective in that they adapted to the complex online environment in linear or adaptive progression.

Developing a valid coding system and refining an existing coding system is a venue in needs of further exploration to better understand the group development of virtual learning teams. As Weingart (1997) stated, self-reports on group processes are useful to understand the perspective of informants, but answers may differ from what people actually do. So much can be learned about group development by examining what team members as a group
do. Given the nascent knowledge of virtual learning teams, improvement of existing coding systems are in high demand. Constructing a valid and reliable coding system is an ongoing process, and replication efforts are necessary to enhance the validity, reliability, and generalizability of a coding system. The validity and reliability of the developed coding system will never be finalized. Instead, it will be continuously refined with enhanced power to accurately capture the group development processes and reduce the complexity to understand the phenomenon.

Findings about group development from one source can be compared with those from another source to enhance the accuracy in interpretation.

Virtual teams are growing phenomena of interests for the field of HRD. As facilitators of work groups that include virtual teams, when contingent issues abound in virtual environments, we cannot rely on a predictive stage model to guide the group development of virtual work groups. Instead of finding a unitary one-way causal model, more important and realistic task will be to find regularities and a repertoire of actions that enable the virtual team members to stay within a reasonably stable structure and to evolve to refine effective actions to successfully complete a group task and enhance the member relationship. As virtual learning teams are being widely implemented for the improvement of learning in educational and training contexts, renewed interests in small group studies, whose results and research design are comparable among similar studies, are expected.

Graduate Business Students Perceptions of the Qualities and Behaviors of Ethical Leaders: An Approach to Ethical Leadership Development

Catherine Marsh
North Park University

Professors in graduate business schools continue to struggle with how to most effectively prepare students to take on the mantle of ethical leadership. In light of recent events in which business school graduates have become involved in high profile ethical scandals, asking the same people to debate this topic may not be appropriate. This study asks business students from a small midwestern Christian university to wrestle with the topic.

Keywords: Leadership Development, Ethics, Social Responsibility

As the daily news carries allegations of corrupt behavior in all arenas of life, the world’s attention is focused on the behavior of leaders in government, business, social and even religious institutions. The Catholic Church continues to settle multi-million dollar claims against its priests for sex abuse (The Chicago Tribune, 10/3/2003). A recent scandal surrounds the administration of George W. Bush which is accused of knowingly leaking the cover of a CIA agent’s identity as revenge against her husband who questioned the intelligence of going to war with Iraq. In the business world, executives are resigning over increasing alarm and public outcry over their multi-million dollar salaries – the latest fatality being the head of NASDAQ, Dick Grasso, who was forced to step down in September after his $139.5 million retirement package was revealed (The Wall Street Journal, 9/18/2003).

So where do we stand as academics? The question although not new (Bowie, 2001), warrants continued consideration. Is there a way in which the field of Human Resource Development can influence the current moral milieu? With human and organizational values (Paine, 2003) as the common denominator of ethical dilemmas, and with recent studies confirming the relationship between CEO values and ethical practices in organizations (Hood, 2003) professionals in the field of HRD should step up to the challenge. Consider the implications of the recent Aspen Institute study of about 2000 graduates of the top 13 business schools:

The study found that B-school education not only fails to improve the moral character of the students, it actually weakens it. The study examined student attitudes three times while they were working toward their MBA’s: on entering, at the end of the first year, and on graduating. Those who believed that maximizing shareholder value was the prime responsibility of the corporation increased from 68% upon entrance to 82% by the end of the first year (Gioia, 2002).

Due to the failure of the Business School approach to ethics (The Economist, 9/6/2003), HRD’s foundation on principles of Adult Education, rather than its affiliation with Business Education may be the basis from which to develop curricula in Business Ethics. Some educators would have us believe that Business Ethics is an oxymoron, and arguments abound that ethics cannot be taught (Thurow, 1987and Bunke, 1988 as cited by Murphy & Boatright, 1994). Still others insist that a person’s moral fiber is cast in stone from childhood (McCabe, Dukerich, & Dutton, 1991 as cited by Monson & Bock, 2003). There are also those who stress that ethics and social responsibility are about emotions, not facts and cannot be studied or measured scientifically to which Tom Donaldson counters, “Some of the most important work in economics and philosophy to emerge over the past three decades is rigorous, logical, and theoretically elegant, but not at all dependent on observation or experiment (Donaldson, 2003).” One such theoretically elegant scheme is seen in the emerging body of literature on conscientization – the process of developing consciousness that has the power to transform reality - originally associated with the work of Paulo Friere (1972).

Kenneth Goodpaster discussed conscientization in his keynote address at the 2003 AHRD Conference. The type of leadership behavior seen in recent scandals is what Goodpaster refers to, as “TELEOPATHY -- the unbalanced pursuit of purpose in either individuals or organizations.” Conscience, Goodpaster believes, is the best response to teleopathy. Further, the implication for business leaders is to develop two new roles: a conscience building role on internally and a citizenship role externally (Goodpaster, 2003). If Goodpaster is correct in his assessment, perhaps insight on the development of ethical leadership can be gained by exploring models of consciousness. While Goodpaster suggests a two-dimensional model based on the internal and external world, Ken Wilber expands the same concept to include four domains. Wilber’s transcendental view indicates that development
can occur at the individual and community level of the internal and external world (Wilber, 1997). Due to Wilber’s extensive research into the area of consciousness, this study will conclude by suggesting “The Four Faces of Truth (Wilber, 1997)” as a possible framework for further HRD research.

The following study is a foray into discovering new approaches to conscientization (developing ethical leadership competence) of adult business school students. Assumptions of the study are based upon principles of Adult Education which clarify learning: it is a life-long adventure; it can be self directed (Knowles, Houle, Tough in Merriam, Caffarella, 1999); it is motivated by internal as well as external factors (Knowles in Merriam, Caffarella, 1999); it is grounded in experience (Kolb, Jarvis, Barnett, Boud, Keogh, Walker in Merriam, Caffarella, 1999); it can be brought about by developing practices of critical reflection (Brookfield, Mezirow, Friere in Merriam, Caffarella, 1999); and it can allow for spiritual and mystical dimensions to emerge as it crosses cultural differences in values and perceptions (Wilber in Merriam, Caffarella, 1999).

**Problem Statement and Research Questions**

The main problem addressed in this paper is: How can we expand our understanding of alternative approaches for teaching business ethics? The framework for the study is based on David Solomon’s central goals of a virtue ethic (Solomon, 1988). Unlike other theories such as Kantian deontology, which is based on the assessment of action, or utilitarianism and consequentialism, which are based on the value of the consequences of action, virtue ethics examines the virtues and vices by which character is formed. According to Solomon, virtue ethics has three tasks: to develop and defend a) some conception of the ideal person, b) some list of the virtues necessary to become a person of that type, and c) some view of how persons can come to possess the relevant virtues. Therefore this study poses the following research questions: 1) How is the ethical leader described? 2) What distinguishes an ethical leader from a person that is not an ethical leader? 3) How can we utilize the insights garnered from these questions in a business school curriculum?

**Method**

The study was designed to solicit input from graduate business students. While we are aware that current ethics instruction is not equipping students to face the challenges they encounter in the business world, it is not possible to fully understand why their needs are not being met without turning to the students themselves. During two sessions of the graduate class in **Organizational Behavior and Ethics**, taught at North Park University in Chicago, Illinois, students were asked to respond to a survey that contained the following open-ended questions.

1. When you think of an ethical leader, what qualities do they possess that has identified them as ethical?
2. How does this leader behave?
   How does this behavior set them apart from someone you would not identify as an ethical leader?
3. What is this person’s background?
   What experiences would you consider to have added to their ethical practices?
4. What suggestions do you have for how ethics can be developed or taught in a business school curriculum?

It was made clear that the answers would in no way affect the students’ grades. The students were given one hour of class time to complete the questionnaire. The forty-five students surveyed represent a diverse population in regards to age, nationality, ethnicity, and gender, as well as a number of degree programs including the Master of Business Administration, the Master of Management, the Master of Nonprofit Management, Master of Community Development and a number of seminary degrees including the Master of Divinity and the Master of Christian Ministry.

The answers were analyzed, categorized in alignment with Solomon’s three tasks of virtue ethics, and finally, implications for future research were determined. In the analysis and categorization stages of the study, an attempt was made to assess whether the students were operating from a consequential/teleological, conconsequential/utilitarian or virtue perspective. There were instances where similar behaviors were associated with several qualities, which forces a decision regarding with which quality to link the behavior.

Findings

Questions 1 and 2 - First Task of Virtue Ethics: Some conception of the ideal person. When you think of an ethical leader, what qualities do they possess that has identified them as ethical? How does this leader behave? How does this behavior set them apart from someone you would not identify as an ethical leader? Answers: The answers to questions one and two were coded by quality observed and associated behavior that identified the leader as ethical. In certain instances qualities with overlapping associated behaviors were combined, such as Honesty and Integrity. There was a consensus surrounding a number of critical qualities, although the associated behaviors were varied. The asterisked qualities were included frequently, but were not present in all responses. Occasional answers that did not represent consensus or appeared infrequently are not listed on the following chart.

</table>
The answers to the first two questions on the questionnaire project an image of ethics that progresses beyond the utilitarian perspective traditionally associated with the business world (Rachels, 2003). Although a utilitarian perspective is represented through behaviors aimed at legal compliance or attaining specific results, such as creating codes of ethics and aligning compensation plans, a less consequentially based, and either a more value centered or strongly deontological image clearly emerged. The students describe an ethical leader as one who is value driven - value centered, with sense of responsibility and a desire for justice, fair play and equity (Rawls as acknowledged by Ciulla, 1998) – deontological. The ethical leader has a global, holistic perspective that honors and respects differences in culture, in thought and in life style (Rawls as acknowledged by Ciulla, 1998) - deontological. The leader is a role model whose actions reflect the company’s values (Hopen, 2002) and influences the integration of ethics into organizational life (Petrick, Quinn, 2001). The leader is courageous and takes responsibility, regardless of the consequences – value centered. The ability to take this leap appears to come from perspective that includes promoting long-term over short-term profit. Clearly, the leader is not tyrannized by the timing of the Quarterly Earnings Reports (Goodpaster, 2003). An ethics architecture is incorporated, and the code of ethics, while important, is not the prominent vehicle for the creation of a strong ethical culture (Hatcher, 2003) (Sims, Brinkman, 2003). The success of the business comes not from catering to the whim of the shareholders but from attending to the needs of the workforce, through such mechanisms as flexible work scheduling, and establishing family friendly work practices. Further, by actively promoting retention and ongoing employee development an organization can gain competitive advantage, as was done by Southwest Airlines when it was the only airline to retain its employee and the only airline to remain profitable following 9/11 (Hatcher, 2003). As business leaders become clear on the results of sound ethical practices, what may have been considered a deontological approach will become a utilitarian one, as it will be done in anticipation of the business outcome/consequences.

**Question 3 – Second Task of Virtue Ethics: Virtues necessary to become a person of the type described by questions 1 and 2.** What is this person’s background? What experiences would you consider to have added to their ethical practices? **Answers:** There was much less overall information given in answer to question three and no clear pattern of consensus, yet while some answers were fairly predictable – such as experience serving on boards - many answers encourage an expanded understanding on the making of a leader. **Answers included:**

---

### Table 2. Perceived Qualities and Behaviors of Ethical Leaders (continued)

<table>
<thead>
<tr>
<th>Integrates Rational and Intuitive Processes*</th>
<th>Makes decisions based on intuitive understanding as well as rational thought&lt;br&gt;Does not rely exclusively upon reason when making business decisions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Does Not Put Self Above Others*</td>
<td>Does not demand a high salary at the expense of jobs&lt;br&gt;Takes delight in seeing his/her employees win&lt;br&gt;Encourages Career Growth and Development&lt;br&gt;Invests in Human Assets&lt;br&gt;Is Not Threatened by the Success of Others&lt;br&gt;Represents Shareholder Needs</td>
</tr>
<tr>
<td>Socially Responsible</td>
<td>Demonstrates Concern for the Environment&lt;br&gt;Hires locally&lt;br&gt;Expands the Concept of Shareholder beyond Investor to Include the Greater Society&lt;br&gt;Encourages employees to be involved in community projects</td>
</tr>
<tr>
<td>Spiritual*</td>
<td>Is concerned with the emotional and spiritual well-being of employees&lt;br&gt;Nurtures a sense of community at work&lt;br&gt;Exemplifies servant leadership</td>
</tr>
<tr>
<td>Work/Life Balance</td>
<td>Supports Flexible Work Scheduling&lt;br&gt;Establishes Family Friendly Work Practices</td>
</tr>
<tr>
<td>Collaborative</td>
<td>Encourages Collaborative Efforts&lt;br&gt;Works Toward Win/Win Resolution of Disputes&lt;br&gt;Encourages Dialogue&lt;br&gt;Aligns compensation and rewards to support teamwork&lt;br&gt;Creates an environment of trust cooperation</td>
</tr>
</tbody>
</table>
Table 3. Possible Background and Experiences of Ethical Leaders that Differentiate Them from Other Leaders

<table>
<thead>
<tr>
<th>BACKGROUND and EXPERIENCES</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Has Worked on Many Different Levels within the Organization or Industry</td>
</tr>
<tr>
<td>• Has Held Leadership Positions in School, Church or Community Organizations</td>
</tr>
<tr>
<td>• Has Put Time into Formal Education</td>
</tr>
<tr>
<td>• Has Studied Beyond the Field of Business</td>
</tr>
<tr>
<td>• Has Spent Extensive Time Developing Some Form of Spiritual Practice such as Yoga or Meditation</td>
</tr>
<tr>
<td>• Regularly Worships According to His/Her Religion</td>
</tr>
<tr>
<td>• Has Served on Boards of Charitable Organizations</td>
</tr>
<tr>
<td>• Has the Ability to Speak More Than One Language</td>
</tr>
</tbody>
</table>

Some of the answers were startling in that they pushed traditional boundaries. While church participation was mentioned, development of spiritual practices was included as an additional item. Formal education merited mention, but included in the formal learning were courses beyond the field of business. Extensive travel was a part of the experience, but more than that, living in another culture and speaking more than one language were seen as important. These experiences underscore the relevance of a global perspective, cross cultural awareness and spiritual development as emergent virtues.

Question 4 – Third Task of Virtue Ethics: Some view of how persons can come to possess the relevant virtues.

What suggestions do you have for how ethics can be developed or taught in a business school curriculum? Answers:

The following chart lists the students’ suggestions regarding new requirements for Leadership Programs in Graduate Business Schools. This question received the fewest responses, and quite a few students commented on the increased levels of difficulty they had experienced as they progressed through the questionnaire.

Table 4. Suggestions Regarding the Conscientization of Leadership

<table>
<thead>
<tr>
<th>METHODS BY WHICH THE ETHICAL LEADERS MAY BE DEVELOPED</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Require an internship with a company in a country other than that of the national origin of the student</td>
</tr>
<tr>
<td>▪ The student should live with a local family, rather than housing with students who share the same national origin.</td>
</tr>
<tr>
<td>▪ The internship should be no less than one year in length</td>
</tr>
<tr>
<td>• Graduate business students should be required to study, or pass out of, one language other than their national language.</td>
</tr>
<tr>
<td>• Require business students to take at least one community development course with a service component.</td>
</tr>
<tr>
<td>• Require Credit Hours in non-business courses such as philosophy, theology, or sociology.</td>
</tr>
<tr>
<td>• Provide credit hours for independent studies designed by students for the development of spiritual disciplines.</td>
</tr>
<tr>
<td>▪ The practices could come from any religious tradition</td>
</tr>
<tr>
<td>▪ At least 100 real time hours would be required to satisfy this requirement</td>
</tr>
<tr>
<td>• Offer personal development retreats, conducted by the University, over breaks and holidays.</td>
</tr>
<tr>
<td>• Offer combined travel and learning opportunities that include visiting corporations in the country visited</td>
</tr>
</tbody>
</table>

As with the answers to Question 3, a strong emphasis on personal internal growth through spiritual development is mentioned, and living and working in another culture is heavily weighted. Learning through experience is a definite recommendation of the students who participated in this study and a link between the development of ethical behavior and the process of conscientization has been suggested.

Limitations

A major limitation of this study is that the student participants were surveyed by a professor with whom they were currently studying. The outcomes may reflect the responses they believed she would want to receive, rather than accurate accountings of their true thoughts. The sample also reflects the bias of students who chose to attend a small
Christian University of the Evangelical tradition. Additionally, one of the world’s most celebrated Bonhoeffer scholars, Burton Nelson, is a member of the university’s seminary faculty, and the tendency of this study to reflect a Kantian deontological approach to ethics may have been influenced by Nelson’s teaching. Further, one hour may not have allowed for sufficient time to generate responses to the final question. Group interviews may also provide a more inductive atmosphere for creative thinking.

Conclusions and Implications for Future HRD Research

This research study is a small beginning to looking at new ways to teach ethics to individuals who will be placed in positions where they are frequently confronted by ethical dilemmas. Much of what has been reported here points to the necessity of learning through experience and the commitment of the learner to developing an inner discipline/spiritual practice. The ideas that have been presented reflect the thinking of a highly diverse group of respondents that have rich and quite unique cultural and professional backgrounds.

Finally, Ken Wilber’s Model on The Four Faces of Truth (Wilber, 1997) provides a possible conceptual framework for further research on ethical leadership development as conscientization.

Figure 1. Ken Wilber’s Model - The Four Faces of Truth: An Integral Approach

<p>| INTERIOR | EXTERIOR |</p>
<table>
<thead>
<tr>
<th>Left Hand Paths</th>
<th>Right Hand Paths</th>
</tr>
</thead>
<tbody>
<tr>

<td>truth</td>
</tr>
<tr>
<td>sincerity</td>
<td>correspondence</td>
</tr>
<tr>
<td>integrity</td>
<td>representational</td>
</tr>
<tr>
<td>trustworthiness</td>
<td>prepositional</td>
</tr>
</tbody>
</table>

This model forces balance and integration as the exploration into the issue of conscientization continues. Keeping sights focused on the internal and external life of the individual and the organization may allow HRD practitioners to develop new insights not previously considered. While we have been adequate at developing the external path (behaviorally by gaining awareness through feedback surveys and inventories for leadership and to a lesser degree socially through creating the organizational architecture that embraces organizational learning), we have barely begun to explore the internal path. The students’ responses to the questionnaire used in this study begin to get at how to develop leadership along the internal path. On Intentional/Subjective Quadrant, answers that point to developing internal awareness and spiritual depth may point us in the appropriate direction, whereas suggestions involving living and working internationally may provide some answers to the question of conscientization in the Cultural/Intersubjective Quadrant.

The Relationship Between Ethical Climate and Job Satisfaction in Small Businesses

Clyde T. Conine, Jr.
Macon State College

Robert W. Rowden
Mercer University

While considerable research has focused on ethics in large firms, little is known about the impact of ethical climate in the small firm. Small businesses are essential to the economic growth of the U.S. economy. Numerous factors have been associated with job satisfaction. This study examines ethical climate and job satisfaction in small firms, and establishes a framework for an empirical investigation of the relationship between these two variables in small businesses.

Keywords: Ethical Climate, Job Satisfaction, Small Businesses

The bankruptcies of Enron and WorldCom and the news of other scandals have created a heightened cynicism about corporate America. The public’s trust in the markets has been undermined by the obvious greed and insensitivity of industry executives, politicians, and Wall Street employees. Along with the renewed cynicism comes a rekindling of interest in the topic of ethics, especially business ethics. This study examines how ethics, or specifically ethical climate, might influence the way employees feel about their jobs and different aspects of their jobs. Victor and Cullen (1988) developed the Ethical Climate Questionnaire (ECQ) to examine the ethical climate in organizations.

A cursory review of any of the HRD-related literature over the past few years clearly shows an interest in research on business ethics and job satisfaction, although not necessarily coinciding. As recently as Spring 2003, Darlene Russ-Eft (2003), Editor of *Human Resource Development Quarterly*, stated:

Research might be taken to determine the scope of ethical dilemmas and problem situations arising in different types of organizations, the circumstances leading to such problems, and the individual and organizational characteristics related to such problems. The identification of such descriptive analyses could provide the basis for some HRD interventions. …It may also be necessary for organizations and HRD practitioners within those organizations to consider providing learning and performance interventions focused on ethical issues. …As HRD researchers and practitioners, we might examine the impacts of ethical and unethical decision making. (p. 2)

Job satisfaction is a subjective perception and numerous factors have been associated with it. In simple terms, job satisfaction is how people feel about their jobs and different aspects of their jobs. There are important reasons why organizations should be concerned with job satisfaction. First, the humanitarian perspective is that people deserve to be treated fairly and with respect. Job satisfaction is to some extent a reflection of good treatment. It also can be considered and indicator of emotional well-being or psychological health (Haccoun & Jeanrie, 1995). Second, the utilitarian perspective is that job satisfaction can lead to behavior that affects organizational functioning. Differences among organizational units in job satisfaction can be diagnostic of potential trouble spots (Beatty, 1996). Each reason is sufficient to justify concern with job satisfaction. Combined they explain the attention that is paid to this important variable. The Spector Job Satisfaction Survey (Spector, 1997) uses a multidimensional approach to measure the level of job satisfaction in organizations, and it has been utilized in research involving large and small businesses.

Small businesses are critical to the economic well being of the United States. Small businesses (employing 100 people or less) are responsible for about 80% of the jobs created in the United States and those small ventures generate more than 51% of the U.S. Gross Domestic Product (Nelson, 2002). Most people tend to get their initial job training from small businesses, and the 1997 Inc./Gallup survey found that workers in small businesses have higher levels of job satisfaction than those in larger firms (Hopkins & Seglin, 1997).

Problem Statement

The purpose of this study was to review the literature on the relationship between ethical climate and job satisfaction, and to establish a framework for an empirical study on the relationship between these two variables in small businesses. Some studies have examined job satisfaction in small businesses and other studies have examined...
ethics in small businesses. The focus of this study is the relationship between job satisfaction and ethical climate (defined later) in small business settings. Corporations, large companies, and selected professions have been the focal point for examining the relationship between the two variables, job satisfaction and ethical climate. Several studies discussed later in this paper show a link between job satisfaction and ethical climate in various corporations, professions, and locations. There is a noticeable absence of similar research in the small firm. Thus, it would be very interesting and informative to see if this relationship is evident in small firms. Given the importance of job satisfaction to organizational functioning and the importance of small business to our economy, there should be considerable interest in any variable that might impact the level of job satisfaction in these small firms. Recent events and the renewed interest in business ethics make this study a timely topic for Human Resource Development (HRD) practitioners and scholars.

Theoretical Framework

The theoretical constructs for this study are ethical climate, job satisfaction, and small businesses.

Ethical Climate

Victor and Cullen (as cited in Peterson, 2002) defined ethical climate as the shared perceptions of what is ethically correct behavior and how ethical issues should be handled in the organization. Pulling from Kohlberg’s (as cited in Victor & Cullen, 1988) research on moral atmosphere and Schneider’s (as cited in Victor & Cullen, 1988) on work climate, Victor and Cullen (1987) developed the Ethical Climate Questionnaire (ECQ). Their typology of ethical climate used ethical criteria and locus of control as the two primary dimensions. The ethical criteria dimension was based on Kohlberg’s three major ethical standards: self-interest, caring, and principle. Kohlberg believed that people develop morally through three sequential stages that reflect the major ethical systems (egoism, utilitarianism, and deontology). Thus, an assumption of the ECQ is that ethical climates in organizations also reflect these ethical standards. To indicate Kohlberg’s ethical standards and corresponding ethical systems, Victor and Cullen used egoism, benevolence, and principal as the three ethical criteria.

Kohlberg also proposed three different levels of ethical concern: a person’s own ethical beliefs, concern for a social system and, finally, concern for something larger than the individual or the organization (e.g., humanity). These represent the sources that one uses to determine appropriate ethical behavior. Victor and Cullen (1988) labeled these levels of analysis as individual, local, and cosmopolitan. In other words, the referent for one’s definition of appropriate ethical behavior could come from his or her own personal ethical beliefs, some organization (e.g., policies & procedures), or something larger and outside the organization (e.g., legal or economic system).

The hypothesized ethical climate, therefore, became a 3 x 3 matrix. The three ethical criteria (egoism-E, benevolence-B, principle-P) are on the vertical axis, and the three loci of analysis (individual-I, local-L, cosmopolitan-C) are on the horizontal axis. The nine hypothesized ethical climates were labeled self-interest-EI, friendship-BI, personal morality-PI, company profit-EL, team interest-BL, rules and standard operating procedures-PL, efficiency-EC, social responsibility-BC, laws and professional codes-PC. Initially the ECQ included 26 items. A more recent version (Cullen, Victor, & Bronson, 1993) included 36 items, four for each of the nine possible ethical climates.

Victor and Cullen (1990) subjected the theoretical ethical climate types to factor analysis and identified six interpretable ethical climates: professionalism, caring, rules, instrumental, efficiency, and independence. In the 1990 study, Victor and Cullen labeled the benevolence ethical criteria as “utilitarian.” The ECQ is the most widely recognized instrument for examining ethical climate. Numerous studies have investigated the instrument for examining the ethical climate of various organizations. Some of these studies are reviewed later in this summary of literature.

Job Satisfaction

Job satisfaction is an area of inquiry concerned with both sorts of influence: the influence of the work organizations on people, and the influence of people on work organizations. As early as 1918, Thorndike explored the relationship between work and satisfaction (Berry, 1997). The study of affect (emotional response) emerged as an area of study in the 1930s, principally in the United States. The Western Electric Hawthorne plant studies conducted by Roethlisberger and Dickson (1939) also concluded that the workplace’s social organization and the individual’s interaction with that organization determined worker adjustment. Later studies began looking at job satisfaction factors such as emotional tendencies, attitudes, and the work environment. By the 1970s, Locke (1976) advanced what came to be a highly influential definition of job satisfaction. He defined it as “a pleasurable or positive emotional state resulting from the appraisal of one’s job or job experiences” (p. 1300).
Other definitions, models, and theories followed. Lawler (as cited in Berry, 1997), for example, developed the motivational framework that deals with how a person measures job satisfaction based on what they got versus what they feel they deserve. Therefore, dissatisfaction occurs when a person receives less or more of what was expected. He defines job satisfaction as a unidimensional construct; that is, workers are generally satisfied or dissatisfied with their job. Bandura (as cited in Berry, 1997) developed a theory known as the social influence hypothesis. His hypothesis describes a social effect where individuals want what they perceive others around them want. Another influential theory to explain job satisfaction was proposed by Landy (as cited in Berry, 1997) and is known as the opponent process theory. He suggests that the primary reaction (the immediate emotional response) combined with the secondary reaction (the later emotional response) creates a stabilized equilibrium. More recently, Brief (1998) has defined job satisfaction as “a psychological tendency that is expressed by evaluating a particular entity—whether overt or covert, cognitive, affective, or behavioral—with some degree of favor or disfavor” (p.1). And, Weiss (2002) defined it as “a positive (or negative) evaluative judgment one makes about one’s job or job situation” (p. 6). He argues that job satisfaction is multidimensional; that is, a worker may be more or less satisfied with his or her job, supervisor, pay, workplace, and so forth.

Until the 1997 Inc./Gallup survey (Hopkins & Seglin, 1997), little attention has been paid to worker job satisfaction in small businesses. This study found that workers in small businesses were generally more satisfied with their work than were workers in larger businesses. Rowden (2002) conducted the first known empirical study to establish the extent of workplace learning in small business, and to delineate the relationship between workplace learning and job satisfaction. A large part of the job satisfaction was attributed to the availability of learning opportunities on the job. Rowden and Conine (2003) found similar results in a study on the relationship between workplace learning and job satisfaction in U. S. small commercial banks.

**Job Satisfaction and Ethical Climate**

Some studies have examined the ethics of small business owners and managers (Hornsby, Kuratko, Naffziger, LaFollette, & Hodgetts, 1994; Smith & Oakley, 1994; Vyakarnam, Bailey, Myers, & Burnett, 1997). However, the study of ethical climate and the relationship between ethical climate and job satisfaction in small businesses remains an uncharted area. The literature discussed below provides related research that examines this relationship in select groups, locations, or corporations (e.g., IT managers, Nurses, Indian managers, managers in Singapore). These studies were selected because they provide a theoretical basis for this study, and they offer a study framework that should be easily adapted to the small business environment. Further, several of these studies have utilized the widely recognized ECQ and the six ethical climates identified by Victor and Cullen (1990).

Okpara (2002) gathered data from 320 IT managers in various businesses located in Nigeria. Using the ECQ as a measure of ethical climate and the Job Descriptive Index to measure job satisfaction, Okpara reported, “climate significantly influenced satisfaction with promotions, supervisors, and work. It also significantly influenced overall job satisfaction” (p.1). Similarly, Joseph and Deshpande’s (1997) study of 226 nurses employed by a large nonprofit hospital indicated that a caring climate had a significant influence on overall job satisfaction, and a rules climate led to nurses who were more satisfied with pay, promotion, and supervision. This study also used the ECQ. Another study by Deshpande (1996) used the ECQ and a measure of job satisfaction with 252 middle level managers in a large non-profit corporation. Deshpande reported that “one implication of this study was that managers can influence overall job satisfaction and satisfaction with promotions, supervisors, and work by ensuring that the organization has a professional climate” (p. 658). This study also indicated that pay satisfaction appears to be independent of ethical climate. Two other studies by Deshpande (Viswesvaran, Deshpande, & Joesph, 1998; Viswesvaran & Deshpand, 1996) indicated similar relationships between job satisfaction and ethics among middle level managers in India.

Koh and Boo (2001) surveyed 237 managers from a random sample of 400 students enrolled in an MBA program. Again, using an adaptation of the ECQ and the Managerial Job Satisfaction Questionnaire, the authors found “a significant and positive link between all three measures of organizational ethics and job satisfaction” (p. 320). Using the same jobs satisfaction questionnaire and an ethical optimism scale, Vitell and Davis (1990) found there is a likely relationship between job satisfaction and ethical behavior. Similarly, Schwepker (2001) found that even salespeople, who are often separated from the organization, associated a positive ethical climate with increased job satisfaction. Other studies have found similar relationships using comparable measures like ethical climate and the quality of working life (Armstrong, Kusuma, and Sweeney, 1999), ethical conflict and organizational commitment (Schwepker, 1999), and ethical fit and turnover (Sims, & Galen, 1994). Finally, a questionnaire survey in 1999 by the Hudson Institute and Walker Information, involving 2,293 employees from business, non-profit, and government entities, concluded that “over half (55%) of those rating their organization highly ethical are also truly loyal—this compares with just 24% of those neutral about the ethics at work, and just 9% of those who flat do not believe their organization is ethical” (p.4).
Small Businesses

By any measure, small businesses are critical to the economic well-being of the United States. They create new companies (and the new jobs that go with them); bring new and innovative services and products to the marketplace; and provide business ownership opportunities to diverse (and traditionally underrepresented) groups. Not only do these small businesses create a wide variety of jobs for the employment sector, they also keep the U.S. economy churning (Headd, 2000).

Small businesses are playing an increasingly important role in the world economy as well. Small businesses (those employing 100 people or less) are responsible for about 80% of the jobs created in the United States and those small ventures generate more than 51% of the U.S. gross domestic product (Nelson, 2002). Not only do small businesses play a critical role by efficiently reallocating resources and injecting new ideas into the economy with business starts and stops, but their diversity and composition provide the work force many opportunities (Kickul, 2001). Yet, of the more than 600,000 small businesses started each year in the U.S., 80 to 85% fail in the first five years (Small Business Handbook, 2000). The economic well-being of some regions of the United States is dependent upon small businesses where the majority of businesses (88%) employ fewer than 200 people (U.S. Department of Commerce, 2000-01).

Even so, it seems that defining what constitutes a small business is not without difficulty. The U.S. Small Business Administration defines a small business as one having fewer than 500 employees in the manufacturing and mining sector, and 100 employees for all wholesale trade industries (Headd, 2000). Storey (1994) reports that the European Commission breaks the definition into three components based on number of employees: micro-enterprise between 0 and 9 employees; small enterprise with 10 to 99 employees; and medium enterprise with 100 to 499 employees. A later report by the European Commission redefined its original categories as: micro-enterprise between 0 and 9 employees; small enterprise with 10 to 49 employees; and medium enterprise with 50 to 249 employees (Curran, Blackburn, Kitching & North, 1996). The U.S. Department of Commerce (2000-01) discusses small businesses in terms of businesses with fewer than 200 workers. Others, for example Megginson, Scott, Trueblood, and Megginson (1995), define small businesses as those with 100 or fewer workers. Despite the varied definitions and regional differences, the most consistent definition of a small business seems to be a business with fewer than 200 employees.

Regardless of how small to mid-sized businesses are defined, they are a dynamic force in the economy, bringing new ideas, processes, and vigor to the marketplace. They fill niche markets and locations not served by larger businesses. Small firms are often younger than large firms, more likely to be outside major urban areas, and more apt to be in industries with lower economies of scale such as service. Small firms can represent a life stage before economies of scale are reached (or hoped-for future growth is attained), or they can be stable anchors in the marketplace. These age, location, and industry effects constitute the basic differences between small and large businesses and can lead to different workforce needs and different resources to attract workers of various education levels and occupations (Anderson & Skinner, 2000).

Research Questions

The purpose of this study was to review the literature on the relationship between ethical climate and job satisfaction, and to establish a framework for an empirical study on the relationship between these two variables in small businesses. The specific research questions that should guide this study are:

1. What is the ethical climate in small businesses?
2. To what extent does the ethical climate relate to job satisfaction?

Methodology

A quantitative study is deemed to be an appropriate way to address the research questions. Since a survey provides a means to capture large amounts of data over a wide range of possibilities, two survey instruments will be used to gather data for this study. The Spector Job Satisfaction Survey (Spector, 1997) was selected because it uses a multidimensional approach, has been validated in numerous studies, and permission for use is granted for research purposes. The 27 items on the Spector Survey will measure nine separate aspects of job satisfaction. The Spector Job Satisfaction Survey will be combined with the Ethical Climate Questionnaire (ECQ) developed by Victor and Cullen (1990). Using a Likert scale, the 26 items on the ECQ will measure six separate ethical climates. As mentioned previously, the ECQ has been used extensively in research on ethical climate and has been validated in several studies. In order to establish a high degree of reliability, the instruments will be pre-tested on a select sample of small business employees.
The study sample will be small businesses with fewer than 200 employees. A cross-section of various types of small businesses (e.g., service, retail) will be located through a variety of methods including personal contacts, colleagues and friends, and “cold calling.” The surveys will be distributed to all employees in the companies, and workers will place their completed surveys in sealed drop-boxes that will be provided by the researchers and collected by the same, with the organization never having possession. The target will be to collect 300+ surveys from 10 to 15 small firms. All employees in each company will be asked to complete a survey. The unit of measure will be the 300+ surveys completed by employees from the companies. In a similar study on job satisfaction and workplace learning, we collected 372 surveys from 10 small firms, with a return rate of 76%. Thus, this goal seems to be reasonable and should provide an extremely adequate sample size for an exploratory correlational study.

The data will be analyzed using SPSS for desktops. First, simple descriptive statistics (means, measures of variation) will be employed for the surveys from each company to determine the dimensions of ethical climate and the facets of job satisfaction. In order to assess the relationship between ethical climate types and job satisfaction, the Pearson Product Moment Correlation will be utilized.

**Implications for HRD**

This study will have some important implications for HRD scholars and practitioners. A study of 330,000 employees in 72 companies by International Survey Research suggested that “employee values and opinions must be continually monitored against certain thresholds to pinpoint departmental or company-wide beliefs that may lead to questionable behaviors, thus enabling companies to intervene before those behaviors are rewarded and replicated throughout the organization” (PR Newswire, 2002, p. 1). HRD practitioners might serve a vital role in this monitoring process. HRD interventions might help managers communicate the ethical values of the company and reinforce the necessity for ethical behavior in all business transactions. This study might support the idea that HRD practitioners and business managers may be able to affect job satisfaction by influencing the ethical climate in small businesses. It may indicate that a code of ethics or company policies might help ensure an ethical climate and increase job satisfaction. Organizational Development (OD) interventions might lead to changes in a firm’s ethical climate to create a more satisfying and effective work environment. OD relies heavily on training to communicate the knowledge necessary for the change process. Regardless of the exact implications arising from this study and similar ones in the future, it should make a valuable contribution to the field of HRD.

Ethics Teaching and Training Practices in the Workplace: A Review of Approaches Used in Academic and Corporate Institutions and the Special Challenge of Multiculturalism

Judith A. Kolb
Dee Frisque
Hong Lin
Pennsylvania State University

This paper investigates the diverse body of literature devoted to ethics teaching and the training practices used to address ethical issues in the workplace. It includes a special focus on multicultural environments and provides recommendations for future research.

Keywords: Ethics, Ethics Training, Multiculturalism

Discussions on ethics are commonplace today and guide a whole new generation of professionals on ethical behavior in the workplace (Palmer & Zakhem, 2001). The proliferation of ethics books, courses, scholarly research studies, and training programs provide evidence that interest in this area is growing (Joseph, 2001; May & Pauli, 2002; Palmer & Zakhem, 2001). Human resource professionals play a critical role in promoting ethical conduct for the well being of individuals and the organization (Hatcher & Aragon, 2000) and are crucial to the creation of “ethical and responsible organizations” (Hatcher, 2002, p. 9). As more Human Resource Development (HRD) professionals are asked to extend themselves beyond their daily responsibilities and wear a number of different hats in the workplace, chances are they will encounter ethical challenges in these roles (McLean, 2001). These new roles and responsibilities will generate discussions on “what to do” or “how to manage” a laundry list of ethical challenges.

Problem Statement

A number of ethics-related research articles have appeared in the HRD/Workplace Learning and Performance (WLP) literature. McLean (2001) suggests that ethics research helps to show human resource professionals how it affects practice, as well as to “encourage ethical behavior in the field” (p. 221). However, lacking are comprehensive ethics literature reviews for the training and development field. The main purpose of this paper is to review the current literature on ethics teaching and training, discuss the issues and concerns that have surfaced and what corporations and universities are doing to address these concerns, some of which are particular to a multicultural environment, and posit some new directions and areas for future research. Multiple viewpoints are cited whenever appropriate.

Theoretical Framework

Ethical theories developed centuries ago by philosophers have been used as methods to approach ethical problems. Two classic and widely recognized ethical theories, developed in the 18th and 19th centuries, are utilitarianism and deontology. According to Fredrick and Atkinson (1997) “our ethical intuitions have been shaped or influenced by these two dominant theories, and that it is worthwhile to look at these positions in order to understand their vast appeal, examine the presuppositions behind them, and to consider their limits insofar as they attempt to systematize ethical decision making” (p. 2). Utilitarianism was proposed by David Hume (1711-1776), but developed by philosophers Jeremy Bentham (1748-1832) and John Stuart Mill (1806-1873) (Rachels, 1993). Utilitarianism, also known as consequentialist theory, is often referred to as “outcome-based” (Macrina, 2000, p. 21). It encompasses three principles: (a) to make the world a better place, (b) to produce good consequences, and (c) to do what is best for everyone (Rachels, 1993). Bentham and Mills argue that people should set aside personal interests and make decisions that benefit the whole. Therefore, an individual confronted with a moral decision would choose an action that generated the greatest amount of happiness for everyone involved. Consequential theorists suggest that we focus on the consequences of our actions.

The second major ethical theory, Deontology, is known best from the work of German philosopher Immanuel Kant (1724-1804) (Rachels, 1993). The hallmark of Deontological theory, sometimes called Kantian ethics, is the
concept of good will. For Kant, good will refers to duty, and it is only when we act out of duty that our actions have moral worth (Tsalkis & Fritzche, 1989). Kantian ethics has three main principles: (a) duty, (b) fairness for all, and (c) respect (Rachels, 1993). Kant emphasized what he termed “categorical imperative” which translates into applying universal laws that hold true in all circumstances for everyone to guide moral decisions. It is from reason alone, not consequences that we arrive at making moral and ethical decisions. For Kantians, it is simply their duty to do what is right. Doing one’s duty gives an action its moral worth (Rachels, 1993).

Brogan et al. (1931) provided individual summaries regarding course content that should be included when teaching ethics. One predominant theme in these summaries was that background material in moral philosophy theories helped individuals make ethical decisions and develop critical thinking skills. Trevino and Nelson (1999) also recommended using moral philosophy theories as a guide to teach ethics. Macrina (2000, p. 18) admits that traditionally, people in the “hard” sciences are often skeptical about the value of discussing philosophy, a “soft” science discipline. However, Macrina (2000) argues that this attitude is changing, and that many scientists now agree that moral philosophy serves as a compass to provide directions to individuals when faced with ethical issues in their disciplines.

There is no agreement in the literature on a preferred approach. The challenge facing academic and corporate institutions is how to best provide ethics teaching and training that embraces multiculturalism in the workplace. The work environment is no longer homogenous and increasingly, due to technology, our marketplace is the world. Hence, the demand to embrace multiculturalism with some degree of universality is needed to prepare professionals to understand a broad range of ethical behaviors necessary to compete in a global economy. In practice, however, implementation of universalistic values that emphasize broad cultural or moral norms is not without criticism. Some argue that ethics teaching and training should focus on relativistic values, an approach in which ethical issues are viewed from specific examples and cultural context (Cowton & Dunfee, 1995).

**Definitions**

Ethics has been defined a number of ways in the literature. Macrina (2000) defines ethics as “a branch of philosophy that is concerned with morality and seeks to provide guidance as to how we ought to live” (p. 18). Davis (1994) defines ethics as “any set of morally permissible standards of conduct each member of some particular group wants every other member of the group to follow even if everyone else’s following them would mean having to follow them too” (p. 5). Trevino and Nelson (1999) define ethics as “principles, norms, and standards of conduct governing an individual or group” (p. 12). This collection of definitions reflects the multitude of different theories, methods, and approaches found throughout scholarly and non-scholarly ethics literature. In this paper we selected the Trevino and Nelson (1999) definition as a basis for ethics teaching and training in corporations and universities in which individual responsibility is central to ethical behavior in the workplace.

**Why the Resurgence in Ethics?**

When the January 2001 Gallup Organization survey asked the public to name the most important problems facing the country, unethical and immoral behavior, lack of integrity, and dishonesty were at the top of the list (Newport, 2001). These same problem areas have been identified in the ethics literature as serious concerns by scholars (Butterfield, Trevino, & Weaver, 2001; Grover, 1993). The 2001 Gallup survey also asked the public to rate the honesty and ethical standards of people in various professions (Newport, 2001). Only 2 percent of respondents classified professionals such as business executives, journalists, and government officials in the very high rating category. The negative public view and mistrust of these professionals is disconcerting (Hagmann, 1999).

Ethics has become a topic of wide discussion in the corporate world and institutions of higher education (Palmer & Zakhem, 2001). Universities and corporations use a host of teaching and training methods to influence ethical decision making (Mathison, 1988; Sanyal, 2000; Trevino, 1992). Several federal agencies have established initiatives that focus on the importance of providing ethics training programs. For example, some researchers argue that the 1991 United States Federal Sentencing Commission Guidelines are what is needed to spur corporations and universities to invest in ethics training in the workplace (Dalton, Metzger, & Hill, 1994). The passage of the Federal Sentencing Commission Guidelines encouraged corporations and universities to implement formal ethics training programs (Guelcher & Cahalane, 1999). The guidelines were established to outline the penalties that employers might face if their organization were found guilty of misconduct activities (Guelcher & Cahalane, 1999; Weaver, 1999). A key component is that an institution that has an ethics training program in place prior to a cited offense may have sentencing fines for a misconduct violation reduced up to 60 percent (Guelcher & Cahalane, 1999). The Sentencing Commission did not make the development of ethics programs mandatory; however, it was readily apparent to corporations and higher education institutions that it was in their best interests to develop programs and thus reduce the extent of punishment imposed in the event of violations (Dalton, Metzger, & Hill, 1994). In the 2001 Ethics Resource Center Survey on Integrating Ethics and Compliance Programs, ethics officers reported that crises such as public scandals, government sanctions, or legal actions helped decision makers realize the need to provide
ethics training. Guelcher and Cahalane (1999) argue that most ethics programs are set up either as compliance based to “police people” or as value based by which employees “self-police” (p. 328). Many institutions have not yet developed ethics programs, claiming that the guidelines are ambiguous and unclear. Dalton et al. (1994) agree that portions of the guidelines are not defined clearly, but that the “spirit” of the guidelines is clear: to encourage the development of ethics programs (p. 10).

Emerging demands for ethics teaching and training presents opportunities and challenges. In general, academic and corporate environments rely on a variety of approaches, tools, and practices when providing ethics teaching and training.

Methodology

The Pennsylvania State University Library Access System (LIAS), which contains 350 databases, was used to conduct a comprehensive literature search on our topic. A search was performed on multiple online databases such as Business ABI/Inform Global, Proquest newspapers and magazines, Proquest Psychology Journals, dissertation abstracts, and Social Science Abstracts. These databases were searched using a number of terms (i.e., ethics, business ethics, multiculturalism, ethics training, global ethics, moral philosophy) typed in the “keywords: field.. Other resources included the online Ethics Resource Center newsletter and various internet search engines (Jeeves, Google, Lycos). As articles from refereed journals and scholarly books were collected, the references cited in these sources were also examined and added if appropriate. Additionally, we used several studies from recent proceedings of professional meetings. The literature review for this paper is organized around three research questions. Resources not viewed as pertinent or a proper fit for this paper were eliminated. A total of 56 resources are included in this article. The review is intended to be comprehensive, but not exhaustive.

Research Questions

1. What is happening with ethics training in corporations?
2. What is happening with ethics teaching and training in higher education?
3. How does multiculturalism affect ethics teaching and training in corporate and academic environments?

RQ1: What is happening with ethics training in corporations?

In the annual 2001 Industry Report, 1652 companies were surveyed and provided the frequency in which ethics training was offered in their organizations (Galvin, 2001). The data revealed that 24 percent provided ethics training on a regular basis, 17 percent provided ethics training on an as needed basis, and 38 percent did not provide ethics training at all (Galvin, 2001). However, as a rule, ethics training programs continue to be developed for professionals in most corporations (Harrington, 1991; King & Mayhew, 2002). Corporations have established ethics training programs, ethics offices, and departments, and may rely upon lawyers, consultants, compliance officers, and internal or external trainers to teach and train employees on ethics. For example, proactive corporations such as McDonnell Douglas, Boeing, and Bell Atlantic provide corporate-wide ethics training programs for all employees (Harrington, 1991; Seidenberg, 1999).

Leadership commitment plays an important role in the success of ethics programs. Weaver (1999) investigated the relationship of compliance and value orientations in ethics programs by examining employee perceptions, attitudes, and behaviors associated with a diverse set of outcomes. He found that value-orientation ethics programs made a greater contribution to the measured outcomes than compliance-orientation ethics programs. The value-orientation programs had top management commitment and emphasized support and trust for employees. The compliance orientation programs were influenced by management control and enforcement of rules and monitoring of employee behavior.

Typically, corporations depend on management to communicate company values to employees. In the 2003 Ethics Resource Center’s National Business Ethics Survey, workers indicated that top management keeps promises and commitments. Furthermore, Jacqueline Gates, Vice President of the Office of Ethics, Compliance, Diversity, and Organization Development at Bell Atlantic, underlined the importance of leadership commitment in ethics training. Jackson (1997) advocates a similar approach with international ethics training. He contends that such training should be a supported, integrated program and not just a token workshop. Further, this is consistent with the advice given by training and development professionals that training should be integrated with organizational goals (Rothwell & Sredl, 2000).

Among the ethics training efforts that organizations make, there exists a underlying concern that employees become ethically sensitive across cultures. The diversity of the American workforce (Odenwald, 1993; Rothwell & Sredl, 2000) and the expanding global market (Barker & Cobb, 1999) contribute to such training needs. In general,
multinational corporations attempt to balance support of global integrity issues and compliance with their corporate
codes of ethics (GMAC Global Relocation Services, National Foreign Trade Council & SHRM Global Forum,
2003).

RQ2: What is happening with ethics teaching and training in higher education?

Universities have responded to the ethics problem on many fronts and use teaching and training as a common
denominator for educating professionals about unethical conduct. A highly visible response is the development and
integration of ethics into the curriculum. Despite the widespread development of ethics courses for students, higher
education has not given similar attention to professionals in the academy such as faculty, staff, and administrators
(Baumgarten, 1982; Guelcher & Cahalane, 1999). Additionally, based on a review of the literature, few studies were
uncovered with research findings on ethics training for professions in higher education. Most studies in higher
education focus on teaching ethics to students in various disciplines (Gawthrop & Uhlemann, 1992; Wynd & Mager,
1989).

Whereas higher education has been slow to implement ethics training programs, it has not been immune to
unethical practices and wrongdoings (Guelcher & Cahalane, 1999). We read reports about faculty members
admitting to falsification of research data that results in a trail of retracted papers (Malakoff, 2000). A university
staff employee is prosecuted for embezzling funds over an extended period of time (Kerstetter, 2001). As ethical
violations become more commonplace in higher education, the risk of unfavorable public reputation may spur
institutions to consider preventive maintenance to avoid future pitfalls. Guelcher and Cahalane (1999) suggest that
professionals in high level administrative positions have a responsibility to protect the reputation of the institution.
These researchers argue that one way to do this is to provide ethics training programs.

A variety of strategies are being examined in higher education institutions to address workplace ethics training
for professionals. One strategy is providing clear, concise, and strong statements from the president of the institution
that support and value ethical behavior in the workplace. Research suggests that when ethics training is supported by
leaders of the organization, employees are more likely to make ethical decisions in the workplace (Gunsalus, 1993;
Guelcher & Cahalane, 1999; Trevino, 1998). Another strategy that is becoming more prevalent is the development
of ethics and compliance offices. These offices provide legal and regulatory requirements established by the federal
government.

Universities also have responded to the need for ethics programs by creating institutes and centers. Examples
include the Illinois Institute of Technology Center for the Study of Ethics in the Professions, the Harvard University
Center for Ethics and Professions, the Bentley College Center for Business Ethics located in Massachusetts, and The
Pennsylvania State University Rock Ethics Institute. The focus, goals, and missions for Institutes and Centers are
highly diverse. At the Illinois Institute of Technology Center for Study of Ethics in the Professions, the focus is to
provide professional ethics teaching and training to engineers, scientists, architects, and other professionals. In
1990, the Center received a grant from the National Science Foundation to develop professional ethics workshops
and to teach faculty at 4-year institutions how to introduce professional ethics into technical courses (Davis, 1993).
The Center is also a clearinghouse for professional codes and lists over 850 codes of ethics on its internet website. In
contrast, the mission of the recently established Rock Ethics Institute, located at The Pennsylvania State University,
is to promote ethical awareness in the university community and public and professional sectors through teaching,
research, and outreach (“Rock Ethics Institute,” 2003.). The Institute offers conferences, seminars, and workshops.
RQ3: How does multiculturalism affect ethics teaching and training in corporate and academic environments?

Like corporate America, colleges and universities have steadily become more and more diverse, populated with
students from different cultures, races, and ethnic backgrounds. Hong (1998) reported that major institutions such as
UCLA, Harvard, and Northwestern have large Asian American undergraduate student populations. Meanwhile,
international students are enrolled in greater proportions at the higher academic levels; they comprise 2.7 percent of
all bachelor's degree students, 11.4 percent of graduate students, and 33 percent of all doctoral students (The
Princeton Review, 2003). Approximately one-fifth of all the doctoral degrees awarded by U.S. institutions and one-
third of doctorates in engineering, mathematics, and the physical and biological sciences are earned by international
students (The Princeton Review, 2003). In response to the demographic changes of their student bodies, institutions
of higher learning are beginning to look at comprehensive ethics programs that integrate the shared beliefs and value
systems of students on their campuses (Guelcher & Cahalane, 1999). Similarly, as faculty incorporate discussions
about ethics in their curriculum, they consider the diversity of the student body when making choices about how to
approach this subject. Kolb (2003) used the analysis of hypothetical ethical situations or vignettes in classroom
training with U.S. and international graduate students. She chose an issues and options approach for discussion
because this approach “allows for cultural differences in appropriate norms of behavior and encourages students to
consider and discuss ethical issues and possible ramifications of behavioral choices” (p. 70). The use of hypothetical

48-3
situations in ethics teaching and/or research has also been reported by others (Moon & Woolliams, 2000; Sanyal, 2000; Wilson, 2003).

As university campuses and classrooms become multicultural, faculty find teaching ethics in a culturally-mixed class difficult (Cowton & Dunfee, 1995). In a telephone survey with more than 40 faculty from the United Kingdom, Asia, and North America, Cowton and Dunfee (1995) found that over half the faculty surveyed indicated that less than 10 percent of their ethics teaching focused on global issues. Many teachers found their students “to be insufficiently attuned to the international diversity of cultures and values” (p. 334). On the contrary, however, some teachers found their students “relativistic and tended to deny any objective approaches to business ethics” (p. 334).

The American workforce has encountered similar effects with the increased attention to diversity efforts (Odenwald, 1993; Rothwell & Sredl, 2000; Thomas, 1991). A 2002 study of senior human resources and relocation executives from more than 180 multinational companies indicated that their companies are more carefully selecting people for international assignments. These companies expect their expatriates to be supportive of global integrity issues as well as to comply with their corporate Code of Ethics. To achieve this end, forty-seven percent of the participants surveyed said their companies have been conducting briefings about integrity in the workplace. Forty-six percent said their companies have updated the corporate code of ethics in response to concerns about accounting and integrity issues (GMAC Global Relocation Services, National Foreign Trade Council & SHRM Global Forum, 2003). Indeed, most Western companies’ codes of ethics are never tied to cross-cultural challenges, and managers do not know how to “successfully maneuver the disturbing gray zones that lie at the intersections of different cultures.” (Donaldson & Dunfee, 1999, p. 44). Similar findings were found by Weaver, Trevino, & Cochran (1999) in the study of Fortune 500 industrials and 500 service corporations that revealed ethics education and training for most employees occurs occasionally. The study found that on average that ethics training was delegated to human resource staff who had received relatively no training on ethical issues.

To help navigate cross-cultural differences in managing business ethics in a global environment, Barker and Cobb (1999) discuss the need for multinational corporations to recognize the differences between the cultures in which they do business, and the need for the multinational corporations to include in their management and staff training segments on dealing effectively with people from cultures other than one’s own. Hodel and Widmer (1998), in addressing the differences between Asian and Western culture, stress the importance of employees’ understanding the ethics of others and discuss the need for a global ethics understanding. It is more imperative to train management employees to have a better understanding of cultural values of foreign countries (Gopalan and Thomson, 2003) and to practice culturally appropriate ethics management (Weaver, 2001). Such training can facilitate managers’ decision-making process when dealing with various conflicts and misunderstandings from different cultural backgrounds (Gopalan & Thomson, 2003).

Conclusions and Recommendations

Clearly ethical preparedness is seen as having a high priority in corporations and academic institutions as evidenced by the proliferation of ethics programs, seminars, workshops, and formal and informal ethics courses. While the contents of these programs may vary, research suggests that program success requires strong support from institutional leaders. If we rise to the challenge raised by Hatcher (2002), HRD/WLP professionals will not only be involved in administering and executing ethics training programs, but will take a leadership role in creating an ethical and sustainable workplace. In this paper, we discuss ethics teaching and training approaches used by academic and corporate institutions to bridge the gap between theory and practice for addressing ethical issues in the workplace. This literature review raises a number of interesting questions for future research. One way to advance the leadership agenda is to collect data relevant to these and related questions.

1. What are the outcomes of corporate values-based and compliance-based programs that have been in place for several years? What measures have been used to judge success? What measures are desired?

2. On the university side, what programs for faculty and staff currently exist and what programs are desired? What is the university’s desired outcome for such programs? What is the participant’s desired outcome? Have actual outcomes been measured? If so, how and to what result?

3. In what specific ways have leaders demonstrated commitment to ethics programs? What is the effect of leadership on employee commitment and other outcome markers? What is being done to help leaders provide leadership on this issue?
4. What percentage of employees are able to articulate the values of the corporation? What happens when organizational values clash with individual values? To what extent are interpretations of ethical issues dependent upon the cultural background of the employee involved in the situation? What are companies doing to help employees manage difficulties that arise from cultural differences in ethical decision-making?

5. What is the background and training of the instructors who provide ethics training? What is their comfort level with the topic? What help do they need? What measures are they using to measure outcomes of their training?

6. How do outcomes differ between organizations in which all employees are exposed to ethics training and those in which only select groups, such as professional staff, receive training?

7. How do multinational corporations infuse international values and beliefs into their codes of ethics when such codes are primarily based on Western standards? What best practices can corporations adopt?

**Implications**

If ethics training is not to become another requirement to be checked off, HRD/WLP professionals need to be involved at the policy level, ensuring that values and ethics awareness becomes part of a company’s overall strategic plan. This means questioning the value of piecemeal training programs that might spring up in response to the latest headline or legal ruling. To achieve lasting results, institutions ideally will embrace ethics teaching and training practices as a continuous growing, learning, and changing process and not a finished product. As the workplace becomes increasingly diverse, ethics teaching and training must include new ways to reach these audiences. In this regard, individual accountability and multicultural perspectives may be the glue for ethical preparedness in academic and corporate institutions.

The Effect of Flexible Learning Schedule on Online Learners’ Learning, Application, and Instructional Perception

Doo H. Lim
University of Tennessee

Learning style has been an important area of study to improve learner satisfaction and learning outcomes. This study examined the effect of flexible learning schedule on learning and application of learning made by a group of undergraduate students. Results revealed flexible learning schedule influenced students’ learning. Various reasons why respondents in the study attained high or low degree of perceived learning and application of learning are provided. Discussions about instructional conditions and strategies to enhance learning and application of learning were included.

Keywords: Online learning, Learning Preferences, Learning Application

Identifying different types of learning styles and their impacts on student learning has been a major field of study in distance education (Ehrman, 1990; Riding & Cheema, 1991; Smith, 1997). From numerous research studies, satisfying online learner’s learning style and preference was considered a critical success factor for online instruction (Bickle, 1996; De Raad, 1996; Goff & Ackerman, 1992; Vermunt, 1998; Wolfe & Johnson, 1995). Among many studies focusing on cognitive style and learning preferences, learner’s control of learning process was a frequently studied topic in distance education because the online delivery medium has transferred control of learning from instructor to each individual learner (El-Tigi & Branch, 1997). While traditional classroom instruction requires learner to follow certain sequence bounded by time, content, and place, online instruction allows flexible learning modes so students can control their learning path, pace, and contingencies of instruction (Hannafin, 1984). The more the learners can control individual learning environment, the greater chances the learners will motivate their own learning (Steinberg, 1989).

As more adult learners seek for college education delivered through distance education methods, satisfying the learning needs and preferences of this learner population has become a major issue in online instruction. Higher education institutions such as colleges and universities, however, have not been fully meeting the adult learners learning needs to have more accessible, flexible, and convenient ways to take classes. According to MacDonald, Stodel, Farres, Breithaupt, and Gabriel (2001), the characteristics of adult learners who will be best served by the benefits of online instruction are: a) working adults, b) adults who cannot afford long leaves of absence, c) single parents or economically disadvantaged adults, and d) those who need an alternative way to study degree programs for economic, social, personal, or practical reasons. Online instruction, in this regard, has been considered a viable option to satisfy such unique learning needs of adult learners.

Among various conditions for adult learners to control their own learning, learner’s self control of the time, sequence, and pace of learning were identified as the major learning preferences needed to be addressed in higher education (Lin & Hsieh, 2001). Even though many studies have verified the effect of self-control over the learning sequence and path during online learning, very few empirical research studies have conducted to identify the effect of self-control of learning schedule on the learning, application of learning, and instructional experience of online learners. Here, the term ‘application of learning’ refers to the degree to which learners use and apply learned knowledge and skills during instruction or to current and future jobs.

Questions for Investigation

The purpose of this study was to examine if online learner’s learning, application of learning, and instructional quality perceived by a group of undergraduate students who took an online course with flexible learning schedule differ from those perceived by the other group of students who took the same course with fixed learning schedule. Several research questions were developed to investigate the purpose of this study.

1. Do learning and application of learning differ between the flexible and the fixed learning schedule group?
2. What instructional factors and conditions promote or hinder learning and learning application of the different schedule groups?

Copyright © 2004 Doo H. Lim
Methodology

This study utilized quantitative research methods. To assess learning and learning application differences between the different schedule option groups of the online course, a group of undergraduate students were asked to participate in this study. The subjects for the study included 102 students (34 male and 68 female) who took an online course at a southeastern university. Among the 102 students, 55 students chose the fixed learning schedule and 47 students chose the flexible learning schedule. Regarding employment status, 16 students were fulltime students, 38 students had part-time jobs, and 48 students had fulltime jobs.

A questionnaire was developed to obtain the students’ perceived degree of learning, learning application, and instructional quality of the online course. The questionnaire included question items composed of the eighteen learning objectives of the course. The students were asked to participate the pre and post survey conducted online at the beginning and at the end of each semester. The data sets were collected for all terms including Spring, Fall, and Summer terms between year 2000 and 2002. The online questionnaire used a five point Likert-type scale to measure the degree of learning (1 for "do not understand" to 5 for "completely understand") and application of learning (1 for "none" to 5 for "frequently use").

Regarding the validity of the instrument used for the data collection, it was tested from a previous study that used the same construct that verified the construct validity (author 2000). Overall, a reliability alpha was .95 for the learning and .96 for the learning application scale respectively. Basic descriptive statistics was used to analyze the degree of learning, application of learning, and instructional quality perceived by the students. Paired t-test was used to compare population mean scores for the learning increase before and after the course between groups. Qualitative analysis was conducted to categorize the reasons that promote or hinder learning and application of learning responded by all students.

Context of the Online Course

The online course was developed to teach curriculum content in program evaluation for undergraduate students. The online course included thirteen learning modules and the workload of one module was equivalent to that of one week’s classroom instruction. Four sub learning sections comprised one learning module. All students were asked to attend the first and last class meeting for course orientation and group project presentation respectively. At the first meeting each student was allowed to choose a learning schedule option among the two: weekly fixed schedule and self-paced flexible schedule. The self-paced flexible schedule provided four to five learning modules for a longer period of time (4 to 5 weeks) so students could manage his or her learning schedule accommodating individual work, other studies, and family duties. After selecting a schedule option, students in each schedule option were divided into peer groups composed of three to five students. Each peer student group was involved in a group project and various online discussion activities for group engagement and learning.

Results

Degree of Learning and Application

It was identified that the students attained a significant increase in learning overall. For all students, the mean score of the perceived learning was 3.15 before the instruction. The population post mean score measured after the instruction was 4.01. Mean difference between the pre and post assessment was found to be significant at .05 level using paired t-tests.

* Significant at <.05 level.

When the students’ perceived application of the eighteen learning objectives during the semester was calculated, the population mean score identified was 3.83, which implies that the students could use and apply their
learning to a fairly high degree. Further analysis was conducted to compare the learning increase between the different schedule option groups. From this analysis, the p-value for the mean difference between the comparison groups, as a whole, was not found to be significant. When the mean differences were calculated for the regular spring/fall semesters, however, the p-value of learning differences between the different schedule option groups was found to be significant. The difference in learning application mean scores was not a significant one between the comparison groups.

It was identified the most frequently replied comments about the likeness of the flexible learning schedule were the convenience of the flexible schedule to take the online course followed by the students’ control of time and learning processes. Psychological reasons such as less stressful and rushed were another benefits indicated by the students. One example of the negative effect of the flexible schedule was procrastination during taking the online course.

Reasons for High or Low Perceived Learning and Application

From the students’ responses of the reasons for high or low learning and application experienced during the online course, various reason categories could be analyzed. In answering the survey questions, the students were allowed to provide the three most influencing reasons supporting or hindering their learning and application. As collectively, the reasons in instructional ineffectiveness were identified as the most influential factor (70%) negatively affecting the students’ learning for the online course. From the various reasons under instructional ineffectiveness category, “lack of instructional clarity to explain the learning content” and “difficult learning content” were found to be the most influential reasons accounted for 60% of the responses in instructional ineffectiveness.

Some reasons seemed to influence the students’ learning positively. Similar to the reason categories found for low learning, those reasons in instructional effectiveness were most frequently answered by the respondents as they influence learning (46%). Among them, some reasons were more frequently replied than others as they positively affected students’ learning. They were “clear and concise learning content,” “usefulness of class assignment and projects,” and “review and repetition of learning.” From these findings, the clarity of learning content was identified as the most influential factor for the students’ learning in this study. As one contrasting pattern of students’ responses, the students with flexible learning schedule perceived personal motivation as a more important factor for their high learning (12 responses) than the students with fixed learning schedule (1 response) did. Personal learning effectiveness, on the contrary, was found to be more important factor positively affecting learning for the students with fixed learning schedule.

Various reasons were found to positively or negatively influence students’ application of learning during online learning. Some reasons seemed to affect students’ learning application positively as well as negatively. Those are “opportunity to use learning,” “because of high or low learning,” and “relatedness to students’ jobs and tasks.” These reasons accounted for 74% and 88% of all responses for the reasons of low and high learning application respectively. Two reasons were found to more negatively affect the learning application of the students with fixed learning schedule than that of the students with flexible learning schedule. Those are “not enough opportunity to use during class” and “lack of motivation to apply learning.” “Opportunity to review learning through quizzes,” “applicable learning content to my work,” and “personal interest” were found to more positively affect the application of learning for the students with fixed learning schedule while “personal motivation to apply” was found to more positively affect the application of learning for the students with flexible learning schedule.

Discussion

Effect of Flexible Learning Schedule on Students’ Learning and Application

From the data analysis, it was identified that allowing the flexible learning schedule in online instruction seemed to significantly affect students’ learning for regular semester terms, but not for the short terms during the summer. The ‘no significant learning difference’ finding for the summer term students may be due to the indistinguishable scheduling condition during the summer, which provided 2 or 3 learning modules weekly for the fixed learning schedule group students while 4 learning modules were allowed for the flexible learning schedule group students. Among many reasons, convenience of flexible learning schedule (to work, other studies, and personal matters) and the freedom to control students’ learning time and learning processes according to their personal learning preferences were found as the influential factors affecting students’ learning for the flexible learning schedule group. This finding supports many previous research studies (Blickle, 1996; De Raad, 1996; Goff & Ackerman, 1992; Vermunt, 1998; Wolfe & Johnson, 1995) claiming satisfying student’s learning style and preference is a critical success factor for online instruction.

Instructional Factors and Conditions Affecting Learning and Application

This study identified the most influential variable for students’ learning as instructional effectiveness that accounted for 70% of the reasons for low learning and 46% of the reasons for high learning replied by all students.
When further analysis was conducted to classify the diverse responses constituting the reasons in instructional effectiveness, several sub categories of instructional factors and conditions were emerged. Those were: a) clarity of instructional content and appropriate instructional level (66% and 35% of the reasons in instructional effectiveness for low and high learning respectively), b) usefulness of instructional activities (46% of the reasons in instructional effectiveness for high learning), c) instructional feedback and interaction (17% of the reasons in instructional effectiveness for low learning), and d) appropriate amount of learning content and workload (15% of the reasons in instructional effectiveness for low learning). For learning application, opportunity to apply learning during or outside the instruction was the most influential factor answered by all students. These findings elicit some meaningful discussions to design and deliver quality online instruction for college students. The first issue is the instructional clarity in delivering online instruction. Compared to traditional instruction, online instruction lacks immediacy to correct or clarify unclear instructional contents and communications. The problem of instructional unclearness is also influenced by each individual student’s different level of instructional readiness or subject knowledge in taking online courses. To solve this kind of instructional problem, instructors of online courses are strongly advised to adjust the difficulty level of each segment of instructional content and apply instructional variation to meet students’ learning level as collectively. This task can be done in actual instructional settings or through a peer review composed of other instructors and a sample of students.

Selecting good instructional activities satisfying the students’ learning needs is another task to enhance online instruction. Several instructional strategies are deemed effective for this purpose. First, to make students’ learning experience meaningful, the learning content must be “applicable.” As Baldwin and Ford (1988) recommend, this kind of learning condition can be achieved by making learning content identical or at least similar to the actual application settings where students would be involved. Second, to address the issue of making applicable learning, online instructors need to promote reflective activities that assist learners to apply their learning to personal situations during instruction, which will eventually result in far transfer (Clark & Taylor, 1992). Some recommended learning activities promoting applicable learning are: a) a step-by-step guided practice after a segment of instruction, b) follow-up individual practice to reinforce the guided practice, and c) independent practice through class assignments that have similar construct with different application content to result in far learning transfer.

Promoting quality interaction during student learning has been another instructional design issue in online instruction (Jones & Jo, 1998) and was not an exception in this study. Among many practices recommended by other researchers addressing this issue, some are passive while others are proactive. Typical examples of the passive interactions would be providing immediate feedbacks on students’ questions and timely technical support when they encounter computer or network problems during learning. It is generally recommended that instructors should provide these kinds of feedback and support within 24-hour time frame to satisfy learners or no later than 48 hours to avoid students’ complaints. Some effective proactive interactions that the researcher has applied to online instruction were: a) asking short questions checking the understanding of major learning content at frequent intervals during instruction, b) sending students’ learning progress report on a regular base to promote students’ motivation for learning achievement, and c) asking students to take a learning review quiz at the beginning of each learning module to promote longer retain of the previously learned content.

Conclusion

This study has identified learning and application made by a group of undergraduate students who took an online course in program evaluation. Several meaningful findings were revealed for the effect of the fixed or flexible learning schedule on learning and application in an online learning environment. While many research studies in HRD have addressed organizational and performance issues, this study focused on instructional issues in online learning environment to solve learning and application of learning issues. Values of the study results to new HRD knowledge are empirically verifying how flexible learning affects online learners learning and application of learning in general. Some instructional design issues to increase students’ learning and application were identified and discussed. Even though this study revealed how the flexible learning schedule affected students’ learning and application of learning in online learning context, the study findings are limited to online learning environment occurred in college settings. For the generalization of this finding, another set of studies using a broader population are strongly recommended.

The Development of a Research Instrument to Analyze the Application of Adult Learning Principles to Online Learning

Sharon Colton
Monterey Peninsula College

Tim Hatcher
North Carolina State University

This study used the Delphi research method to develop the Online Adult Learning Inventory, an instrument to apply the principles of adult learning to Web-based instruction. Twelve experts in the fields of adult learning and online course development working with the researchers constructed the instrument and validated its content.

Keywords: Andragogy, Online Learning, Delphi Method

Method: Qualitative Delphi method

Distance learning is now an important venue where significant adult learning occurs (Brookfield, 1995). “Depending on the type of Internet technology a distance course employs, adults will tend to learn differently” and “…the use of the Web may require a new commitment to andragogical principles” (Cahoon, 1998, p.29, 34). As a research area for consideration, Bates, Holton and Seyler (1996) put forth the challenge to establish normative criteria based on adult learning principles (p.18). Course developers need to focus on learning theory in the design of instruction so that they can create lessons that are meaningful and focus on their requirements as an adult (Fidishun, 2000).

Numerous citations (Cahoon, 1998; Brookfield, 1995; Bates, et al. 1996; Simonson, 1997; Ryan, Carlton, & Ali, 1999) reflected the need for further research in computer-mediated instruction for adults and suggested that computer design principles for adults may be different (Bates, et al. 1996). Reeves strongly argued that, “…it is imperative that criteria for evaluating various forms of CBE (computer-based education) be developed that will result in more valid and useful evaluations” (Reeves, 1995. p. 2). He also recommended that any evaluation instrument be subject to “rigorous expert review” (p. 11). This challenge and the difficulty in designing a valid instrument was met by employing “rigorous expert review” by utilizing experts in the fields of andragogy, instructional design, and Web course development to construct the content and structure of the instrument.

There are some rating systems for Web page style (Jackson, 1998; Waters, 1996; Cyberhound, 1996) and rating systems for various applications of adult learning principles (Conti, 1979), measures of self-directed learning readiness (Guglielmino, 1992), and Competencies for the Role of Adult Educator/Trainer (Knowles, Holton, & Swanson, 1998, p. 140). In addition Wentling and Johnson (1999) developed the Illinois Online Evaluation System to judge online instructional efforts in general. Thus, this study’s central problem was that no evaluation instrument that specifically deals with the application of adult learning principles (ALP) to Web-based courses and training had been identified. Until now, course developers faced a problem because there was no validated list to aid in applying adult learning principles to course development or its formative or summative evaluation. The Online Adult Learning Inventory (OALI) was developed by the authors and a panel of twelve experts in order to fill that gap.

The problems and research questions addressed in this study provided the structure, content, and purpose in creating an instrument to apply adult learning principles to Web-based instruction and training and included:

(a) What are examples of specific instructional methods and techniques that demonstrate the application of adult learning principles to fully-mediated World Wide Web-based distance education courses or training as reported in the literature?

(b) To what extent can an instrument be developed by a Delphi expert panel to measure the application of adult learning principles to fully-mediated World Wide Web-based distance education courses or training, either as an ex-post facto evaluation (summative) or as an in-process formative evaluation?

(c) To what extent is there consensus among Delphi panel experts in the fields of adult education and Web-based course development to validate specific instructional methods and techniques that demonstrate the application of adult learning principles to fully-mediated World Wide Web-based distance education courses or training?

Copyright © 2004 Sharon B. Colton & Tim Hatcher
The purpose of this study was to develop a validated instrument to help educators, trainers, researchers, and instructional designers evaluate and apply the use of adult learning principles to fully-mediated World Wide Web-based distance education courses. The theoretical framework of this study was based on a synthesis of andragogy, instructional design theory, and adult development theory. The instrument constructed in this study provides an additional formative and/or summative evaluative tool to assess Web courses or to apply adult learning principles to course or training design. The instrument can be printed or downloaded from the following website: http://www.mpc.edu/sharon_colton.

Method

This study was exploratory in that it relied on qualitative and quantitative consensus-building by a Delphi panel of experts to construct and validate content. The content in question was adult learning principles applied to fully-mediated World Wide Web-based distance education courses. Research methods for validity included (a) a thorough review of the literature to construct an item pool of instructional methods and (b) Delphi expert panel consensus. The mean, mode, standard deviation, interquartile range, and skewness of the data were calculated from the voting procedures for determination of consensus. Evidence of reliability was indicated by the interrater reliability coefficient from a field test. In addition, a review of readability was conducted to improve the readability of the instrument and the Gunning Fog Index (1983) for readability was calculated.

There is a great deal of discussion in the literature concerning the principles of adult learning, particularly those principles described by Malcolm Knowles. The literature is rich in evidence of instructional methods for web-based courses but far fewer methods that applied principles of adult learning to Web-based instruction. Of those methods, some were supported by research and others were developed in the conceptual literature. However, in the literature there was no validated list of instructional methods that apply specific adult learning principles to fully-mediated World Wide Web courses or training. There was a gap to where the instrument could not be fully constructed just from the information in the literature.

Participants

The Delphi panel members were rigorously chosen in accordance with established criteria and represented excellence in the fields of adult and distance learning as well as instructional design. Each panel member had prior working knowledge of adult learning principles and had experience with developing and/or teaching a Web-based course or training program, or involvement in distance education programs. Potential panel members were selected from the literature based on the number and quality of their publications or experience in the field, particularly during the past nine years, a time when Web-based distance learning became feasible. Each potential panel member was rated as to their perceived usefulness to the study based on their specific area of expertise. Fifteen potential panel members were invited to participate with twelve agreeing to participate. Turoff and Hiltz (1995) suggested ten participants to be the minimum. They were asked to sign a consent form prior to participation and give consent for their names to be published in the completed research.

After completion of the Delphi process and an agreed-upon instrument was drafted, a field test was conducted to give an indication of the reliability of the instrument. An invitation was sent to all online course developers or course evaluators at a West Coast community college to participate in a field test and tutorial on the principles of adult learning. Fourteen of the faculty members agreed to participate and signed letters of informed consent. They were recruited to use the draft instrument to evaluate a specified instructional Web site. Results of the field test were computed to indicate reliability.

Apparatus

Computer-based, primarily mainframe-based, Delphi procedures have been used since the 1970s (Turoff & Hiltz, 1995). Today, however, the technology is available to conduct an anonymous asynchronous threaded discussion easily on the Web “…where the merger of the Delphi process and the computer presents a unique opportunity for dealing with situations of unusual complexity” (Turoff & Hiltz, 1995 p.9). Research indicates this combination opens the possibility for greater performance from the Delphi panel of experts than could be achieved from any individual, something that rarely happens in face-to-face groups (Turoff & Hiltz, 1995, p.8, p.11).

A website was constructed that consisted of a homepage that was referred to as the “Welcome” page, assignments, calendar, and threaded discussion forum with attached documents. In addition, the researcher had access to a user analysis of the discussion on the Web site. Documents were attached to the discussion forum that included draft instruments, text of previous discussions, and voting forms. The welcome page included the following internal links: the topic, a short explanation of the Delphi method, and short biographies of the
researchers. The voting form when completed by a Delphi expert panel member was automatically e-mailed to the researcher. The penname of the expert was included in the voting form.

Procedure

The following figure (Figure 1: Diagram of the methods) gives a display of the overall methods used in this study (Miles & Huberman, 1994). The review of literature, as shown below, provides the structure for, and was key to, the remaining research methods.

*Figure 1. Diagram of the Methods.*

The overall research process commenced with a review of the literature. Preliminary content was collected for the instrument using established quality filters, criteria for selecting the expert panel were established, and appropriate and established research methods were selected. The principles of adult learning were reviewed, as were web-based instructional methods with. Selection criteria for panel members were based on a review of the literature, potential panel members were selected based on the criteria.

Members of a mid-western university and college staff were asked to review the preliminary draft instrument for appropriate wording and ease of understanding. Revision was made to the wording based on their suggestions.

Set-up of the discussion forum: The discussion forum was set up on a Web site with the latest revision of the instrument and other data attached to the site. Pen names for anonymity and passwords were selected for the participants.
Round one of the Delphi procedure was the establishment of adult learning principles by discussion and vote for possible consensus. The experts were given a draft instrument with adult learning principles, as derived from the literature, and were asked if the principles and structure of the instrument were relevant to online learning or needed to be revised. They were asked to keep in mind that this list of principles in its final form will serve as the structure of the instrument. Prior to voting, the list of adult learning principles was revised based on suggestions by the expert panel. Voting ended the round. Results of round one were displayed on the discussion forum. Mean, median, mode, standard deviation, and interquartile range were calculated. Based on the suggestions and a statistical analysis of the vote, the instrument and its structure and sequence of adult learning principles were again revised.

Round two of the Delphi was the establishing and sorting of an item pool completed by a vote. Expert panel members were asked to list one or more instructional methods that apply to an agreed-upon adult learning principle to Web instruction or training for adults. Results of the listing of instructional methods were displayed on the discussion forum. Discussion followed and a vote was conducted on the large item pool or list of instructional methods, which apply the various adult learning principles to Web courses, using a Likert scale of 1 to 4. (1 - does not apply, 2 - moderately applies but not strongly enough to use in the instrument, 3 - applies enough to be included in the instrument, and 4 - outstanding application and definitely to include in the instrument). Descriptive statistics were calculated, e.g., mean, median, mode, standard deviation, skewness index, interquartile range, and rank to indicate consensus. Edits were made by the researcher to the list of instructional methods based on the results of the vote, comments on the voting ballot, correspondence, and references from the literature where necessary.

Round three of the Delphi was a follow up discussion and a second vote on the revised list of instructional items either to include in the instrument or consider for elimination. Statistics were calculated as before. Items not having reached consensus to be included in the instrument were eliminated from the final instrument. Additional edits were made to the list of instructional methods based on the comments of the expert panel.

A field test was conducted using fourteen community college faculty who had knowledge of Web course development and/or evaluation. Comments by the participants related to the draft instrument were recorded. Results were analyzed for an indication of inter-rater reliability using standard correlation procedures for estimating agreement corrected for chance. The inter-rater reliability statistic gave an indication of the reliability and consistency of the instrument. Participant comments and results of the analysis were used for the final revisions of the instrument. The Gunning FOG Index (1983) was then computed for an indication of the reading level.

Results

Quantitative data were obtained from the voting process of the Delphi expert panel and from the field test of the instrument. Qualitative data consisted of theory and excerpts from the literature and over 100 pages of discussion by the expert panel members along with additional personal correspondence from individual panel members.

Table 1 is a summary of the content validity results for the instructional items in each section of the instrument. “Mean” is the range of the means calculated for each item in the section. “St Dev” is the range of the standard deviations in the section. “IQR” is the interquartile range of each item in the section. A Likert scale of 1 to 4 was used (1 - does not apply, 2 - moderately applies but not strongly enough to use in the instrument, 3 - applies enough to be included in the instrument, and 4 - outstanding application and definitely to include in the instrument). All final content items on the instrument were validated by the expert panel.

After the Delphi was complete, a field test was completed with 14 faculty participants who evaluated an online (WebCT) college course using the instrument. The average measure intraclass correlation that is essentially the same as the Cronbach alpha internal consistency reliability coefficient was computed. The expected range is from zero to
1.0. The correlation figures of from .8018 to .9360 indicated moderate to high reliability. The results are summarized in the following table (Table 2. Indication of reliability):

<table>
<thead>
<tr>

The reading level or grade levels of items range from high school to graduate school.

The list of adult learning principles edited for applicability to Web-based courses or training was approved by the expert panel. All 43 instructional items in the final instrument received a mean score of 3.11 to 3.89, all with an interquartile range of 0 or 1. The criterion for consensus to include an item in the instrument was a mean of 3.0 or higher and an interquartile range no greater than 1. All 43 final items met the criteria for consensus. See Table 4 for a summary of the results of instructional methods by each ALP.

The Online Adult Learning Inventory is content valid based on the Delphi techniques summarized here. The average measure intraclass correlation results gave moderate to high positive values that communicated that the raters were seeing the same thing when they applied the instrument to the distance education course they evaluated, an indication of a moderate to high level of reliability. The final instrument as validated by the expert panel is available on the following Website in PDF format: http://www.mpc.edu/sharon_colton.

Discussion

This exploratory study added a validated tool, the Online Adult Learning Inventory, for the evaluation of Web courses or training in the workplace to promote excellence in adult learning. Dubois (1997) describes the impact of the Information Age on education where “the majority of higher education students will be at least 25 years old and where lifelong learning will be ubiquitous” (p. 2). Businesses can also apply this tool to adult training and educational courses delivered at a distance by the World Wide Web, a mode that is becoming increasingly common (Brown, 1999). To date, no other instruments have been developed specifically for fully-mediated World Wide Web courses or training to apply adult learning principles to the instruction.

Strengths of the Research

The final design of the instrument, the Online Adult Learning Inventory (http://www.mpc.edu/sharon_colton), has both edited principles of adult learning appropriate to online courses and training and practical lists of instructional methods that apply the adult learning principles to the development or evaluation of online courses. The completed OALI has only seven subscales and 43 instructional items. The following is an example item from the OALI:

D. Because of their prior experiences, adults tend to develop mental habits and biases and may need to reassess their beliefs in order to adopt alternate ways of thinking.

1. Orientation activities are provided at the beginning of the course that allow learners to develop the skills necessary to complete the course (e.g., “introduce yourself to the discussion forum,” “send me an e-mail saying you were able to log on”).

The merging of these two constructs offers an innovative and practical tool to address the critical need for online learning to adhere to sound adult learning principles. The two parts of the instrument serve secondarily as an
educational tool for students, trainers, and educators, as a review of how adults learn differently from traditional college age youth.

Also, the Web-based method was a rigorous and highly innovative approach to instrument development and validity that included a threaded discussion forum, and yielded rich data that may not have been garnered through a traditional paper-based Delphi process. This may have resulted in a stronger degree of validation by the expert panel. In addition, the Delphi technique was deemed the most appropriate method due to the developmental, exploratory and contemporary nature of the research.

Limitations of the Research

The principle barrier to designing an instrument for measuring adult learning principles in web-based environments is the high level of difficulty in establishing its validity and reliability. To overcome this barrier, this study utilized experts in andragogy and Web course development to develop the instrument. However, the Delphi panel, although recognized experts in andragogy and Web course design, did not include all experts in these fields. Also, the field test was conducted on a relatively small sample of the potential audience, thus only an indication of reliability could be estimated.

Implications for HRD Research and Practice

The Online Adult Learning Inventory, as developed in this study, is new to the field of training, adult learning, distance education, and instructional design. Future Web course or training developers can use the instrument to construct online learning that is more appropriate to the needs of adult learners and to evaluate and improve the online learning environment for their adult learners. It answers the need expressed by Cahoon (1998) in Adult Learning and the Internet to develop a checklist for guidelines for web-based course development and evaluation. Bates, et al. (1996) put forth the challenge to establish normative criteria based on adult learning principles. Prior to this study, no evaluation instrument that specifically dealt with the application of adult learning principles to Web-based courses had been identified. The instrument will enable course developers and trainers to apply principles of andragogy, or adult learning principles, to the instructional design of a Web-based course. Human resources training designers and adult educators can use the instrument to apply the principles of adult learning or andragogy to their work in developing instruction or training that meet the learning needs of their adult audiences. For students of instructional design or adult education, the instrument also serves as a tutorial in describing the principles of adult learning and in selecting instructional methods that apply these principles to Web-based course development.

The Web-based Delphi process used for this study is also new to the field of research design. This study demonstrated the power of technology in enhancing a classic Delphi research process, in facilitating discussion among participants separated by time and place, and providing a venue for voting, all while preserving the anonymity of the participants. It yielded rich qualitative and rigorous quantitative data resulting in a content validated instrument, possibly resulting in a more in-depth content validation, applicable to educational, business, industrial, and government research as well as bringing the tenets of andragogy into the 21st century.

A Path Analytic Study of the Determinants of College Students’ Motivation to Use Online Learning Technologies

Reid Bates
Samer Khasawneh
Louisiana State University

The objective of the present study was to model and test the extent to which previous success, online learning technology anxiety, and instructor-provided training influenced online learning technology efficacy beliefs, and subsequent motivation to use online learning technologies in the college classroom. The results, based on a sample of 280 students supported the hypothesized causal model. Implications and suggestions for future research are discussed.

Keywords: Online Learning Technology, Motivation, Self-Efficacy

Online learning technologies such as BlackBoard, Semester Book, or Web Board have become increasingly popular in a variety of instructional environments because they make available a range of components that are seen as capable of enhancing learning. These components can include authoring and assembly tools (e.g., multimedia, HTML, XML) that can be used to create learning content; storage and distribution components such as test and resource banks; synchronous and asynchronous interactive components (e.g., email, chat rooms, discussion boards) that allow learners and instructors to build ‘real-time’ collaborative learning environments; and learning management elements that can be used to direct and administer the learning process (Robson, 2002).

The incorporation of these technological elements into online learning systems is believed to provide a number of significant instructional advantages. For example, these systems are seen as having the ability to overcome the time and place constraints on instruction found in traditional classrooms (Harasim, 1989); make available to students a greater breadth of information about course topics; provide a means to more closely monitor and facilitate student progress; encourage more ‘chair-time’ and ‘time-on-task’; encourage more active participation and interaction; and provide instructors with an increased range of instructional techniques and options.

The introduction of these technologies has also meant that the acquisition of skills using online learning technologies is becoming increasingly important to the success of college and university students. For example, nearly 30% of instructors in colleges and universities utilize some form of instructional technology for course delivery (Goggin, Finkenberg, & Morrow, 1997). Many campuses have computer literacy requirements for their students, and recruiting and retaining technology-competent students is often seen as a key for advancing the reputation of faculty, students, and institution as a whole (Chisholm, Carey, & Hernandez, 2002).

However, there are also questions about how students react to these technologies. For example, some suggest that as many as one-third of college students suffer from technophobia (DeLoughery, 1993), or a fear of computer and information technology. Such fear may be compounded by the instructional demands of online learning technology (OLT) that requires students to use a range of technologies such as e-mail, internet search engines, chat rooms, databases and so on (Kinzie & Delcourt, 1991). Multiple demands of this kind can leave students feeling shocked, confused, at a loss for personal control, angry and withdrawn (Sproull, Zubrow, & Keisler, 1986). These kinds of reaction can easily impair students’ belief in their capacity to use and learn from the technology, and undermine their willingness to use them in the future.

Indeed, much of previous research related to computer-based instruction and information technology has tended to focus solely on user attitudes and anxiety and how these constructs are associated with individual difference variables (e.g., gender). However, many of these studies were criticized because they lacked adequate theoretical grounding that would allow for the development of more concrete insights into the causes of individual reactions (Henry & Stone, 1994). On the other hand, one promising area of research, grounded in social learning theory (Bandura, 1982), has focused on self-efficacy as an antecedent to students’ motivation to use online learning systems. Using this theoretical foundation, the present study seeks to develop and test a path model describing a number of antecedent variables that influence the efficacy beliefs of college students about using OLT and their subsequent motivation to do so.

Copyright © 2004 Reid Bates & Samer Khasawneh
Background

Bandura (1986) defined self-efficacy as a person’s confidence in his or her abilities to use and execute personal skills for the purpose of reaching a goal or performing effectively in a given domain of activity. Efficacy beliefs are self-regulatory mechanisms that can influence the motivation (e.g., effort and persistence in using educational information technologies) (Bandura, 1991). Self-efficacy has been related to students’ motivation to work harder (Linnenbrink & Pintrich, 2002), and is predictive of people’s tendency and motivation to engage in a task (Bandura, 1986; Schunk, 1989).

Individual efficacy appraisals occur most often when people encounter novel, unpredictable or demanding tasks (Bandura, 1982). Thus, students encountering OLT for the first time or applying these technologies to new learning tasks will likely generate and process efficacy information relative to these systems. The resulting efficacy beliefs act as regulatory mechanisms that can influence their “choices about what technologies to adopt, how much to use them, and how much to persist in the face of obstacles to successful use of such technologies” (Compeau & Higgins, 1999, p. 155). In general, research examining self-efficacy’s role in individual perceptions and use of computer technology confirms these expectations and has shown that individuals continually make decisions about accepting and using computer technology, and that efficacy beliefs play an important role in these decisions (Venkatesh & Davis, 1996).

A good deal of research over the past two decades has demonstrated that efficacy beliefs influence behavior and performance through effects on direction, intensity, and persistence of effort, three core elements of motivation (Pajares, 1997). Because motivation is primarily concerned with how behavior is activated and maintained, the motivation to use online learning and other information technologies is clearly essential to student learning and success in technology supported courses (Geiger & Cooper, 1996; Graham & Weiner, 1996; Linnenbrink & Pintrich, 2002; Liaw, 2002; Pintrich & Schunk, 2002). From a self-efficacy perspective, this suggests that the optimally effective use of OLT will occur in classrooms in which students come with or build positive beliefs about what they are able to do with that technology, set goals for themselves, and plan courses of action for using the technology. In short, they must approach online learning technology as their “problem solving tool of choice” for carrying out course-related learning activities (Holzinger, 1992).

The information on which efficacy beliefs are built can come from a variety of sources. One of the most important is that related to prior mastery experiences (Agarwal & Stair, 2000; Bandura, 1982; Compeau & Higgins, 1995a). Social cognitive theory suggests that previous performance successes, particularly in novel, challenging or difficult situations, help build and reinforce positive efficacy beliefs. Ineffective performance or failures, on the other hand, tend to create doubt and undermine self-beliefs of capabilities (Wood & Bandura, 1989). Thus it is reasonable to expect that college students approach course-related online learning situations with various prior experiences related to the technology being used. Their earlier success in those experiences will be attended to and closely evaluated. The resulting information will be used make judgments about present capabilities, judgments that will likely affect their motivation to use the technology.

Along these same lines, the successful use of OLT often requires that students understand and apply highly sequenced strategies to complete assignments and meet learning demands. Training can help students learn these strategies and provide opportunities for early successes. Both of these outcomes can lead to the development of positive efficacy beliefs (Torkzadeh & Dwyer, 1994). It is therefore likely that students who receive early on in a course some type of training from their instructor about how to use relevant dimensions of OLT may develop and report more positive efficacy beliefs than students who do not receive such training.

Individual psychological states represent another potentially important source of efficacy information. Strong emotional reactions to a task such as that associated with computer use are believed to provide cues about the level of success or failure that can be anticipated in completing that task (Pajares, 1997). For example, Rohner and Simonson (1981) have defined computer anxiety as the “mixture of fear, apprehension, and hope that people feel when planning to interact or when actually interacting with a computer” (p. 551). Thus when task demands associated with OLT use produce such reactions, students may interpret these to indicate they do not have adequate skills or capabilities to complete the required learning tasks successfully. On the other hand, when anxiety reactions are no longer present (e.g., after the student develops some expertise) the recognition that he or she is no longer reacting negatively could lead to heightened efficacy beliefs.
The Model

The objective of the present study was to model and test the extent to which previous success, OLT anxiety, and instructor-provided training influenced online learning technology efficacy beliefs, and subsequent motivation to use OLT in the college classroom. The research model hypothesized a positive link from previous success to self-efficacy and a positive link from training to self-efficacy. Anxiety is hypothesized to be a function of two constructs: previous success with OLT and instructor-provided training, both of which will presumably reduce anxiety reactions. Anxiety is likely to be negatively associated with online learning efficacy beliefs. Figure 1 presents the hypothesized relationships.

Figure 1: A model of College Students’ Motivation to use Online Learning Technology

Methodology

Design

To assess the adequacy of the model and fit to the data, path analysis using LISREL 8.51 (Joreskog & Sorbom, 1993) was used in this study. The application of path analysis provides a way to a) model and estimate multiple and interrelated causal relationships, b) represent unobserved variables or concepts in these relationships and account for measurement error in the estimation process; and c) test a set of relationships concurrently (as a unit) instead of only focusing on bivariate relationships (Hair, Anderson, Tatham, & Black, 1998). One advantage of LISREL is that it provides tests of relationships between constructs that are not attenuated by measurement error (Loehlin, 1987). In addition, statistics representing the goodness of fit between the model and the data can, given supporting theory, provide guidance to model modification and improvement.

Subjects

Subjects in this study were 288 students enrolled in a variety of courses at a large public university in the Southern US. In terms of student status, the sample was diverse, composed of approximately 9% freshman, 8% sophomores, 16% juniors, 33% seniors, 30% Masters students, 3% Ph. D. students, and 2% non-matriculating students. Twenty-seven percent of the students were under 21 years of age, 57% were 21 to 29, and 16% were 30 or older. Eighty-two percent were full-time students. The sample was largely female (72%).

Procedure

Data reported here were collected from students during the last two weeks of the 2001 spring semester. Data were collected from 19 courses that were using a popular educational information technology (Blackboard) as a part of instruction. The graduate and undergraduate courses represented various fields of study including English, Speech and Communications, Business Administration, Social Work, Library Science, and Human Resource Development. Permission to include a particular class in the study was first obtained from the course instructor who was contacted in person or by telephone. Once permission was obtained, one of the authors visited the class, explained the nature and goal of the study, and asked for volunteers to participate in the study. Surveys were distributed and collected in the class at that time.

Instrumentation

A 29-item survey was used in this study. The instrument was developed from several sources. The first part of the instrument, the OLT self-efficacy measure, was adapted from a computer self-efficacy measure developed and tested by Compeau and Higgins (1995; Compeau, Higgins, & Huff, 1999). The Compeau and Higgins scale was modified in the present study to more specifically reflect efficacy beliefs related to the use of online learning technologies. These modifications were important in our effort to infer causal relationships because self-efficacy judgements have the greatest explanatory power when matched to specific tasks and situations. Items in this measure consisted of a stem (“I could complete the online learning requirements of a college course using online
learning technology . . .’) and a series of eight phrases that completed the stem (e.g., ‘. . . if I had never used technology like it before’). Respondents were asked to rate each completing phrase along a ten-point scale that used three anchors (1 = not at all confident; 5 = moderately confident; 10 = totally confident).

The authors developed the other scales used in the study with the assistance of several content judges who had expertise in the use of educational information technology. Scale items were drafted by the authors and submitted to the content judges for review. Based on their feedback, items were added, dropped or reworded where necessary. A preliminary questionnaire was pilot tested with a group of 38 students and instructors. Feedback from this pilot test led to minor modifications in the wording of several items.

Exploratory factor analysis was conducted to provide some evidence of construct validity for the measures. Factor analysis has been recognized as a “powerful and indispensable method of construct validation” (Kerlinger, 1986, p. 247) that “is at the heart of the measurement of psychological constructs” (Nunnally & Bernstein, 1994, p. 111). Factor analysis is a data reduction technique that examines the intercorrelations among variables to identify underlying (latent) variables, or factors, that explain the pattern of correlations within a set of observed variables. In short, it is used to identify a small number of factors that explain most of the variance observed in a much larger number of variables. A central question when using factor analysis for construct validation concerns which method to use, exploratory factor analysis (EFA) (also called common factor analysis and principle axis factoring) or confirmatory factor analysis (CFA). Although there are no generally accepted decision rules, most researchers agree that the use of CFA requires the presence of a strong theoretical framework underlying the hypothesized latent variables and indicators. EFA, on the other hand, has no such requirement even though the latent variables may be drawn from a theoretical framework, as were the variables examined in this study. In addition, EFA makes no assumptions about the number of factors (hence its exploratory nature), but can be used in a confirmatory manner when testing for a loosely constructed model believed to underlie data. Some researchers believe the two methods should be used as progressively more rigorous tests suggesting that the measurement models tested in CFA should be based on prior EFA (Bentler and Chou, 1987). In the present study, exploratory common factor analysis was used to identify the underlying latent structure of the data. Statistically, EFA is considered more appropriate for scale development in general (Hurley et al., 1997) and, in particular, more useful in early stages of scale development because it shows the extent to which items cross-load across different factors, and it represents only the common variance of each item (i.e., it excludes error variance). CFA, on the other hand, does not show cross-loadings and does not exclude error variance (Kelloway, 1995).

The results of the factor analysis closely paralleled the hypothesized variables and the following scales and items emerged: OLT self-efficacy (8 items), motivation to use OLT (4 items), previous success with OLT (8 items), OLT anxiety (5 items), and instructor-led training (4 items). All of these scales used a five-point Likert-type scale with values ranging from 1 (strongly disagree) to 5 (strongly agree). Estimates of reliability using Cronbach’s alpha were acceptable for all scales (see Table 1).

Data Analysis

The Pearson product moment correlation coefficient was the statistical measure used to determine the strength of the associations among the hypothesized variables (Table 1). An alpha level of .05 was used to determine the significance of relationships. The maximum likelihood method was used to estimate parameters in the path model. To assess the overall fit of the hypothesized model to the data, six fit indices were examined. These fit indices provided insight into the degree to which the overall path model predicted the observed covariance matrix accurately while minimizing error. Perhaps the most essential measure of overall fit is the chi-square statistic (Joreskog & Sorbom, 1984). Because the chi-square fit indicator index is sensitive to sample size and violations of the assumption of multivariate normality alternative fit indexes were used to complement the chi-square index (Tabachnick & Fidell, 1996). These indexes were the goodness of fit index (GFI) (Bentler, 1980), the adjusted goodness of fit index (AGFI) (Bentler, 1983), the comparative fit index (CFI) (Bentler, 1990), the nonnormed fit index (Byrne, 1998), and the root mean square error of approximation (RMSEA) (Byrne, 1998).

In general, obtaining a non-significant chi-square value suggests model adequacy and fitness to the data. Large chi-square values indicate a poor fit while small chi-square values indicate a good fit. A value of .90 or above for the GFI and AGFI is usually recommended for an acceptable level of fit (Hair et al., 1998). Finally, RMSEA values below .05 indicate very good fit while an RMSEA values between .05 and .08 indicate a moderate fit. Any values above .08 indicate poor fit (Joreskog & Sorbom, 1993). The last two fit indices (CFI and NNFI) are considered incremental fit indices because they measure the proportionate improvement in fit of the proposed model relative to a baseline represented by the null model. These measures have the advantage of being less influenced by sample size when compared to other indices such as GFI. Generally values above .90 are considered sufficient (Byrne, 1998).
Results

Correlations
The correlation matrix shown in Table 1 indicated that previous success was associated with OLT self-efficacy \( (r = .54, p < .01) \); anxiety was negatively associated with training \( (r = -.52, p < .01) \), previous success \( (r = -.62, p < .01) \), and OLT self-efficacy \( (r = -.57, p < .01) \); and OLT self-efficacy was positively associated with motivation to use OLT \( (r = .36, p < .01) \). Training and self-efficacy showed no meaningful correlation.

Path Analysis
The initial model was moderately consistent with the data \( (X^2 (3) = 8.78, p = .03) \). In this model, the chi-square value was significant. A significant chi-square value indicates that the proposed path model does not completely fit the observed covariances and correlations (Hair et al., 1998). However, the chi-square by itself should not be used as the sole indicator of model fit due to its sensitivity to sample size and violations of multivariate normality. Therefore consideration of other fit indices is considered essential. For example, the values for GFI (.99), AGFI (.94), CFI (.99), and NNFI (.97) indicated that the model fit the data sufficiently (Byrne, 1998). The RMSEA (.08) value indicated that there was a minimal amount of error associated with the tested path model (Byrne, 1998). The standard errors of all the estimates were small enough to say that the estimates are relatively precise. The t-values for the paths were above the absolute value of 1.96 indicating that paths were significant at the .05 level (Joreskog & Sorbom, 1989). Finally, the modification indices provided by LISREL did not suggest any significant changes to improve the model, implying that this model fits the data relatively well. The intercorrelations of the measures presented in Table 1 indicated none exceeded .80, a level commonly regarded as indicative of problems in these kinds of analyses (Hair et al., 1998).

Six separate paths were tested in this model. The results of the path analysis are summarized in Figure 2 which displays the standardized path coefficients (beta weights), as well as the explained variance \( (R^2) \) for the dependent variables. As can be seen, all six of the hypothesized paths were supported \( (p < .05) \).

Figure 2. A model of College Students’ Motivation to use Online Learning Technology/Tested

\[
\begin{align*}
\text{Previous Success} & \rightarrow OLT \text{ Self-Efficacy} \ (R^2 = .29) \\
OLT \text{ Anxiety} & \rightarrow OLT \text{ Self-Efficacy} \\
\text{Instructor-Provided Training} & \rightarrow OLT \text{ Self-Efficacy} \\
\end{align*}
\]

\[
p < .05 \quad \text{Note: The path from OLT anxiety to OLT self-efficacy had an R}^2 \text{ value of .33.}
\]

The results of the path analysis are summarized in Figure 2 that displays the standardized path coefficients (beta weights), as well as the explained variance \( (R^2) \) for the dependent variables (OLT anxiety, OLT self-efficacy, and motivation to use OLT). The model shows that previous success was related to self-efficacy \( (\beta = .10) \) and anxiety \( (\beta = -.23) \). Training was related to anxiety \( (\beta = -.41) \) and self-efficacy \( (\beta = .43) \). Anxiety was related to self-efficacy \( (\beta = -.20) \). Finally, self-efficacy was related to motivation \( (\beta = .17) \) (see Figure 2). Overall, this model had an adequate predictive power as shown by the \( R^2 \) statistic. From this model, 13% of the variance in
motivation was explained by self-efficacy. Furthermore, 29% of the variance in self-efficacy was explained by previous success. Previous success explained 38% of the variance in anxiety, while 33% of the variance in self-efficacy was explained by anxiety.

Discussion

This study represents one of the few efforts to more precisely evaluate the antecedents and causal role of self-efficacy in college students’ motivation to use OLT to complete course-related learning activities. According to social cognitive theory, antecedent variables such as students’ previous success with OLT, instructor feedback, anxiety, and pre-course training are important because they provide cues used in making self-efficacy judgements that, in turn, can influence student motivation levels. The results are consistent with the conceptualization of self-efficacy as a mediator between previous success with OLT, OLT anxiety, and instructor provided training and motivation to use OLT. Specifically, previous success with OLT was associated with higher levels of self-efficacy and lower levels of OLT anxiety; instructor provided training contributed positively to efficacy beliefs and negatively to OLT anxiety; and OLT anxiety was negatively associated with efficacy beliefs. OLT self-efficacy, in turn, was positively associated with motivation to use OLT. These findings are congruent with a social learning perspective on the development and role of self-efficacy as contributor to the direction, intensity, and persistence of effort related to the use of OLT in the college classroom.

How this Research Contributes New Knowledge in HRD

A major criticism in the design and implementation of online learning systems is that such efforts are often done with little reference to theories of behavior or the principles of learning. For example, Salas and Cannon-Bowers (2001) have suggested that a science of e-learning has yet to evolve and that, until it does, many issues about how to best support and use these systems to enhance learning will remain unanswered. In short, we are only beginning to understand how these systems can best be designed and what factors influence the ability of learners to use these technologies as learning tools. This study represents a theory-based effort to evaluate several fundamental antecedents to the development of OLT self-efficacy beliefs among college students, to examine the role that those beliefs play in student motivation to use online learning systems. The results are consistent with the notion that one of the strongest sources of self-efficacy beliefs is an individual’s direct experience with the same or a similar phenomenon. They suggest that, for both trainers in organizational classrooms as well as instructors in higher education settings, attention must be paid early on to setting conditions that enhance the development of positive efficacy beliefs. This includes both efforts to reduce OLT-related anxiety and the development of OLT-related expertise through positive prior experiences or training.

Unfortunately, it is tempting for instructors, when developing instruction with these technologies, to focus on the instructional ‘bells and whistles’ the technology provides and, as a consequence, to overlook the need to develop students’ confidence and capacity to effectively use the technology for learning. This research suggests at least two ways in which this could represent a fatal flaw in the use of online learning technology. First, the value of facilitating student success with OLT is seen in the causal linkage from previous success with OLT to self-efficacy and subsequent motivation, and in the ability of previous success to minimize anxiety reactions to OLT. Secondly, pre-course training was examined in this study to more directly test the role of instructor support activities in fostering self-efficacy beliefs and subsequent motivation to use online learning systems. Pre-course training showed a significant relationship with online learning self-efficacy and a negative relationship with anxiety. Thus students who reported receiving some type of instructor-provided training in the application of OLT to learning activities at the beginning of their courses reported more positive efficacy beliefs about their capacity to use OLT to meet learning demands and significantly less anxiety about doing so than did students who did not receive such training. Although little research has addressed instructor support activities in online learning contexts, these findings suggest that even minimal activities aimed at preparing students to use OLT to meet course learning demands may pay substantial dividends in terms of reducing anxiety, a potential block to the development of positive efficacy beliefs. Thus, preparatory activities such as familiarizing students with the technology, discussing how it will be used to meet learning objectives, and providing opportunities to experience some early successes with the technology appear to be important strategies contributing to the formation of positive attitudes, building strong efficacy beliefs, and motivating students to use OLT.

The findings of this study extend previous research by demonstrating the importance of self-efficacy in enhancing learning-related motivation in environments characterized the use of online learning technologies.
Findings suggest that instructors and trainers should consider the importance of students’ anxiety, confidence and motivation when designing classes employing some form of online technology in the teaching and learning process. Moreover, instructors and trainers should consider how to prepare students to use instruction-related technologies prior to class, and how preparatory activities can best be designed to enhance efficacy beliefs and reduce anxiety.

Using Appreciative Inquiry to Build and Enhance a Learning Culture

Rachelle Lehner
Wendy Ruona
University of Georgia

Appreciative Inquiry (AI) has emerged as a powerful organization development philosophy that builds on past successes to impel positive change. AI is a highly participative, holistic approach to change that values the wisdom of members of the organization and amplifies positive forces. This session will introduce AI as a tool to enhance participant experience and learning culture in adult educational settings. Participants will learn introductory concepts of AI by experiencing a “mini-inquiry” and group conversation.

Keywords: Appreciative Inquiry, Appreciative Pedagogy, Teaching Method

This innovative session will introduce some core concepts of Appreciative Inquiry (AI). It will include an overview of AI’s development during the past 20 years, its undergirding principles, and the presentation of a process for AI. We will then explore the use of AI in educational settings—by reviewing evidence of how it has begun to be used in educational settings as well as group conversation about its potential. Each of these topics is briefly discussed below.

Introduction to Appreciative Inquiry

David Cooperrider and his mentor Suresh Srivastva of Case Western Reserve University developed Appreciative Inquiry in the early 1980s. While conducting a traditional OD assessment of the Cleveland Clinic seeking what was wrong with the organization, Cooperrider was surprised at how much was “right” and the enthusiasm organization members had in telling these positive stories. This prompted Cooperrider to further consider the merits of investigating positive forces in organizations through his dissertation (Cooperider, 1986) and AI was born (Watkins & Mohr, 2001; Zemke, 1999).

AI is an OD (organizational development) methodology that “is a collaborative and highly participative, system-wide approach to seeking, identifying, and enhancing the ‘life-giving forces’ that are present when a system is performing optimally in human, economic, and organizational terms” (Watkins & Mohr, 2001, p. 14). In contrast with traditional OD methods which seek out problems in the organization and work to fix them, AI involves systematic discovery of what gives ‘life’ to a living system when it is most alive, most effective, and most constructively comparable…. (it) involves, in a central way, the art and practice of asking questions that strengthen a system’s capacity to apprehend, anticipate, and heighten positive potential. (Cooperider & Whitney, 2000)

AI fundamentally seeks out what has worked well in the past and guides participants through a process to build on these successes.

AI is a fundamental shift in thinking so it must be viewed as more than a “tool, technique, or intervention” (Watkins & Mohr, 2001, p. 21). AI is a philosophy with a supporting methodology. It revolves around five key principles:

(a) The constructionist principle: This principle recognizes and accepts the social constructionist stance toward reality and social knowledge. That is, that what we believe to be real in the world is created through our social discourse.

(b) The simultaneity principle: This principle states that the “first question is fateful” in that the organization will turn its energy in the direction of that first question of an inquiry. As a result, the seeds of change are embedded in that question.

(c) The poetic principle: This principle emphasizes the value of story telling as a way to gather more holistic information that includes not only facts, but also feelings that affect a person’s experiences.

(d) The anticipatory principle: This principle emphasizes that behavior and decisions about actions are based not only on what we were born with or learned from in our environment, but also on what we anticipate. That is to say that what we think or imagine will happen in the future.

Copyright © 2004 Rachelle Lehner, & Wendy E.A. Ruona
The positive principle. Finally, this principle is a foundational belief that a positive approach to any issue is a valid basis for learning and just as contagious as a negative approach can be. This makes the positive stance an antidote to cynicism.

**Phases of Appreciative Inquiry**

The practice of AI typically occurs in five phases: define, discover, dream, design, and destiny (Watkins & Mohr, 2002). Each of these phases is described below.

**Define.** AI is a marked departure from traditional OD, which focuses on identifying and solving problems. Therefore, it is very important that the organization make an educated decision to proceed. It is vital that the organization understand the focus of the inquiry will be on the positive. Without this agreement, a consultant will be in a constant battle with the organization—which may expect problems to be identified and solved as opposed to the holistic approach to improving/changing the organization that AI offers. Once that agreement has been made, an AI practitioner will work very hard with the client to effectively define the focus of the inquiry given the needs and context of the organization.

**Discovery.** The discovery phase is about “appreciating and valuing the best of what is” (Hammond, 1998, p. 24). This phase has two parts. First, interviews provide opportunity to gather stories of the organization’s life giving forces. Life giving forces are those things that spur it in a positive direction; without these forces, the organization would cease to succeed. The construction of the interview protocol is critical. How the questions are framed guide the nature of the stories received. Watkins and Mohr (2001) provide a generic interview protocol that models the “spirit of AI… [and is] easily modified to fit whatever topic the organization has chosen to focus on” (p. 83). Using the interview protocol, members of the organization can interview each other in pairs or select representatives can conduct the interviews. Data from the interviews should be collected in a manner that can be shared with others in the organization. One effective way of doing this is to have each interview pair/group combine with other pairs/groups to share what they have learned from each other.

The second part of discovery involves participants of the intervention actively engaging in identifying common themes from the interviews/stories. These themes should reflect the life-giving forces heard in the shared stories, and are the basis for the next phase of the AI process.

**Dream.** This phase involves the creation of a shared vision of the future. It “encourages the participants to think about ‘what could be’ by challenging them to think outside the traditional boundaries of what has been done in the past” (Johnson and Leavitt, 2001, p. 131). During this stage participants are asked to write provocative propositions about “what might be” (Hammond, 1998, p. 24). Provocative propositions are metaphorical images of the new organization based on the themes identified. This is an opportunity for participants to be extremely creative in making their point. Provocative propositions should speak to the soul and ignite energy—they can be represented in words, art, drama, etc.

**Design.** Once the organization has dreamt together about what could be, it is time for participants to operationalize those dreams and begin to “speculate on how the organization will look and agree upon driving concepts and principles” (Zemke, 1999, p. 31). This phase examines the provocative propositions and identifies organizational supports needed to work towards that ideal. Participants “speculate on how their organization will look and act once they have articulated the organizational visions [provocative propositions]” (Hagevik, 2000, p. 39). Hammond (1998) calls this “dialoguing what should be” (p. 24).

**Destiny.** Commonly understood as delivery or implementation, the Destiny phase is about sustainability and “innovating what will be” (Hammond, 1998, p. 24). During this phase action plans are implemented to bring the design to life. This is the enactment of the Dream, and involves continuous monitoring, feedback processes, and adapting as the process unfolds.

**Appreciative Inquiry in Practice**

AI has found practical application in many areas. A sampling of the literature reveals its use in both corporate and personal areas. Some examples are highlighted here:

- Dr. Sandra Hagevik, a career consultant, describes how AI can be used to guide someone’s career path. She asks individuals to focus on what works for them in their career/life rather than the problems with their current career. Dr. Hagevik describes four phases of AI (Discovery, Dreaming, Design, and Destiny) and relates them to the individual (Hagevik, 2000).
- In *Meet the Freight Fairy*, Gordon (2003) describes how Roadway Express uses AI as a tool to involve employees in finding ways for the organization to become more efficient.
- Dr. Courtney Pullen describes his awakening to AI in both his career as a psychotherapist and as a financial planner. He realized that by changing the focus of his questions he could help his clients reach their goals more effectively (Pullen, 2001).
- AI has been used in program evaluation. Faculty and students of the University of South Dakota’s Technology for Education and Training Program embarked on an appreciative evaluation of the master’s and specialist’s degree programs. They took an appreciative approach, conducted web-based interviews and follow-up calls to collect data, identified themes, and made numerous changes to the two programs based on the feedback (Norum, Wells, Hoadley, & Geary, 2002).

**Appreciative Inquiry in the Classroom**

HRD and adult education professionals will likely find great potential in AI as a tool to enhance learning cultures in educational settings. By viewing the classroom (or other non-traditional learning settings) as its own bound system, you can compare it to an organization with inputs and outputs. Many facets of the classroom are flexible and can be designed to meet the needs/desires of students. Among the aspects that can be modified are the seating, the method of content delivery, the types of interaction, etc. Engaging learners in an AI process to design their ideal learning experience will likely lead to more involved students and result in a higher degree of learning transfer.

Guiding students through an AI process, as described in previous sections, will result in themes and provocative propositions that can then be used to structure the rest of the learning experience (i.e. the course, etc…). The instructor using the input from the AI process can do this, or it may involve representative learners working with the instructor. The goal is to implement the destiny phase by creating a learning experience that extends the best experiences learners have had in the past to create and maintain ways to ensure the best possible learning community and optimal learning in the current setting.

A review of the literature revealed very limited evidence related to using AI in educational settings. Two sources were identified that directly addressed using AI in the classroom. Each took a different approach to how they incorporated it.

In the first article, *Appreciative Pedagogy: Constructing Positive Models for Learning*, the authors use the term Appreciative Pedagogy to describe their adaptation of AI in the classroom. Yballe & O’Connor (2000) state, “appreciative pedagogy enacts in the learning endeavor AI’s basic beliefs, values, and social inquiry process” (p. 476). Believing that students come to the classroom with a wide range of experiences on which they can reflect, “appreciative pedagogy trusts in, celebrates, and deliberately seeks out students' experiences of success and moments of high energy and great pride” (p. 476). As in AI, Appreciative Pedagogy “seeks to discover and celebrate” (Yballe & O’Connor, 2000, p. 477) past successes, using them to generate positive visions for the current class. The authors agreed with Cooperrider (2000) that positive visions lead to positive, energizing actions.

The authors do not equate Appreciative Pedagogy with AI. Rather, it is a necessary adaptation due to the nature of the classroom. Different from a large organization, the classroom is “temporary and is relatively closed to its environment” (Yballe & O’Connor, 2000, p. 477). The focus is short-term and pertains more to an individual or small group level than when dealing with a large organization; that is, the impact is not as wide spread. Appreciative Pedagogy can occur in a shorter time frame and be adapted to meet the time frame available. Yballe and O’Connor provide examples of applying Appreciative Pedagogy to envision best teams, presentations, managers, and organizations.

Yballe & O’Connor (2000) report that the outcomes of using Appreciative Pedagogy were similar to those promised from AI. They found that students were more energized and felt safe to speak up in the created environment. Content seemed more meaningful because it was presented in a way that was personally meaningful. Additionally, students had a more hopeful view of the future and demonstrated more trust and confidence in their abilities and experiences, as well as those of others in the class. Finally, students began to see AI (or Appreciative Pedagogy) as a creative and meaningful way to analyze situations (Yballe & O’Connor 2000).

The second article that reports a direct application of AI in the classroom relates to a 5-day executive training program. In *Using Appreciative Learning in Executive Education*, Preziosi and Gooden (2002) define Appreciative Learning as “a positive instructional method that is based upon AI” (p. 10). Appreciative Learning, like Appreciative Inquiry and Appreciative Pedagogy, asks the learner to identify and celebrate the positive experiences that have helped them to succeed. Their 5-day program was facilitator-driven and questions posed to participants were appreciative in nature, encouraging a focus on the successful moments of their career. As in the previously cited case, the researchers reported positive results. There was a heightened energy level and a reduced anxiety level. There was also an increased willingness to speak up and share with the group, and the statements that were made
had “high emotional impact” (Preziosi & Gooden, 2002, p. 14). The authors contend that part of the success of this program lay in the fact that the participants came with experience from which they can tap to build something new. Those experiences create a powerful momentum towards the future!

**Future Implications**

AI is an engaging approach, involving the participants in a collaborative manner in creating positive change. This is congruent with the learner-centered principles of adult education, which call for building on participants’ experience, starting where the participant is, and engaging the participant in the learning. Carrying these principles into HRD, will result in more committed, engaged employees.

The scholarly research on AI is still emerging, and there is even less on AI in the educational settings such as those in which HRD professionals conduct their work. However, the results and outcomes thus far are quite promising and there is a great need for more application and study of AI. Several approaches seem quite promising from the research perspective. For instance, a case study could be conducted with a traditional course that incorporates AI by taking learners through the process of designing a vibrant learning community and then modifying the course design accordingly. Another avenue for future research could be a comparative study of two learning events – one that maintains a traditional format and one that actively incorporates an AI approach. In both cases, it would be interesting to solicit general reactions to the learning event, estimates of whether the amount of work (for the learners and instructors) differed, opinions about the development of community within the learning setting, and a rating of the likelihood of learners and instructors to utilize an AI approach in the future based on this experience. Of course, it would also be valuable to know whether the use of AI actually enhances what people learned and what they do with that learning.

Emotion in Organizational Learning -Implications for HRD

Sharon Turnbull
The Leadership Trust Foundation and Lancaster University Management School

In this article I draw attention to the under-researched domain of emotion in the study of organizational learning and its implications for HRD. The paper identifies four aspects of organization learning in which an emotional dimension is evident. These are: Emotion as a learned response, Emotion as codified meaning, Emotion as affective component of learning, Emotion as display rules. The paper concludes by proposing that further research into each of these four domains will potentially enrich both HRD scholarship and practice through an enhanced understanding of organizational learning and emotion.

Keywords: HRD, Emotion, Organizational Learning

A growing interest in organizational learning amongst HRD scholars has led to a desire for a deeper understanding of the theoretical frameworks that underpin this field, with a view to considering the practical implications for organizations. Despite this burgeoning interest and growing number of empirically-based studies of both emotion and organization learning from a socio-cultural perspective, few scholars have asked how an understanding of emotion might inform interpretive studies of what is deemed learning inside so-called communities of practice or organizational cultures, and what the implications of this might be for our understanding of HRD. It is this gap that the paper sets out to address.

Theoretical Framework

Cultural and Situated Approaches to Organizational Learning

The contribution of both Lave and Wenger's (1991) book, Situated learning – legitimate peripheral participation" and Cook and Yanow's (1993) paper, "Culture and Organizational Learning" have been widely acknowledged as being seminal in the field of Organization Learning, opening up new debates about the conceptualisation and purpose of its study (Nicolini and Mezmar, 1995; Gherardi et. al, 1998; Vince, 1999; Fox, 2000,) as well as being implicated in the "scattering" of "its community of scholars among several streams of thought and internal controversies" (Gherardi, 2000, p. 1059).

These perspectives, often labelled, respectively, the Community of Practice perspective (Brown and Duguid, 1991; Fox, 2000) and the Cultural – Interpretive approach (Yanow, 2000) have added to "the languages of Babel" (Gherardi, 1999) which coexist, sometimes uncomfortably, within the embrace of Organizational Learning. At the time of their publication, they offered a radical challenge to the dominant cognitive conception of learning in organizations, which, rooted in cognitive psychology, held that learning should always be perceived as an intentional act (Huber, 1991) performed in the interest of organizational improvement. Researchers began to ask how meaning becomes shared within social groups, and how the knowing required to operate successfully within a social grouping is transmitted and becomes understood by newcomers to that group. Other lines of inquiry from this perspective have followed, asking, for example, how the situated metaphors adopted by work groups can both facilitate and reveal learning (Gherardi, 2000); how communities of practice enact and learn practices of safety (Gherardi and Nicolini, 2000); and how national cultural differences affect the nature and processes of organizational learning (Taylor and Easterby Smith, 1999).

Whilst the Community of Practice perspective initially developed independently from the "cultural" perspective, there is clearly a conceptual overlap in studying the work group as a culture or as a community of practice (Yanow, 1999).

Both are generative metaphors for the study of the social dimensions of learning, and are ontologically and methodologically compatible (Yanow, 2000), although "culture" comes from the discipline of anthropology, whereas "community" is the language of sociology, community organization and urban planning (Yanow, 1999).
Socio-Cultural Approaches to the Theory of Emotion

In parallel with this marked shift in the organizational learning field away from the problem solving approach towards socio-cultural understanding, or as Gherardi (1999) has put it: "learning in the face of mystery", a shift has simultaneously been taking place amongst scholars of emotion (Domagalski, 1999).

Like learning, the study of emotions also has its roots in psychology, which conceptualised emotions as being located inside the individual body, spilling over involuntarily in response to certain events. Emotions were considered to be the same universally, and an emphasis on positivist research in this field remained relatively unchallenged until the publication of Harré's "The Social Construction of Emotions" (1986). The fundamental challenge made by Harré and his colleagues to traditional emotion theory was that emotions are socially constructed, contextually situated, and therefore that anthropological studies of different cultures reveal quite distinct variations in the language, display, description and experience of emotion. Harré's (1986; 1996) edited collections make convincing arguments for emotions being socially constructed within a cultural context and learned within cultures. The implications of this for the cultural interpretive approach to organization learning and therefore for HRD are clearly far-reaching.

Heelas's (1986) anthropological research into emotion found a clear connection between "emotion talk" and the moral domain. He found evidence of considerable variation in attitudes towards the management of emotions across cultures, suggesting that this occurs through a complex interaction between the moral order, the powers which are ascribed to emotions, and the loci, generation and dynamics of emotion. Drawing on Hochschild (1983) to reinforce the suggestion that emotions are ideological, Heelas suggests that the study of "emotion talk" can function as "a kind of spotlight".

It is this anthropological approach to the social construction of emotion, as illustrated by Harré and Heelas's work, that has informed and framed the analysis and discussion contained in this paper.

It is only very recently that a social constructionist understanding of emotion has been incorporated into the organization studies agenda, initially tending to focus on the "dark side" (Fineman, 2000) of emotions, the subordination of workers in organizations through covert forms of control, and pressures to conform and display emotions appropriate for the organization's performance (e.g. Hochschild, 1983; Ashforth and Humphrey, 1993; Turnbull, 1999; Martin et.al, 2000). Arguably, it was not until the publication of Fineman's (1993) "Emotion in Organizations" (in the same year as Cook and Yanow published their article on culture and organizational learning) that interest in the social construction of emotion as an interpretive approach to studying meaning and relations inside organizations started to become legitimised as part of the research agenda.

The cru of many of the key debates in the field of emotion study, like that of organizational learning has focussed on the constitution of the self. Post-structuralists have rejected the modernist view of the self as "the centre of consciousness" implied by psychodynamic theory (Gherardi, 1995), inquiring instead into the way power relations and the subject are constituted through emotion discourse. Swan's (1994) study of the gendered nature of emotion, as demonstrated through the accounts of women managers, is a useful example of this perspective.

The difficulty of defining emotion, and the ontological and epistemological debates around the topic have contributed to it being seen as complex, hidden and difficult to uncover, one reason, suggests Fineman (1993; 2000), why scholars have avoided researching this area for so long. He has argued, however, that studying organization without attention to the affective domain is to ignore a fundamental aspect of the lived experience in organizations, an argument that I will now apply to the study of organizational learning.

Emotion in Cultural Approaches to Organizational Learning

Not only are emotions an integral part of learning to belong, suggest Putnam and Mumby (1993), they are also a crucial component of building a "community". Much research into group life supports the view that emotion is embedded into the norms, beliefs, and values of social groups. Swogger's (1993) study, for example, found that group members were constantly talking about their "feelings of satisfaction and fulfilment and the personal meaning the group had for them" (1993, p.100). Setting this argument in its broader context, Hosking and Fineman (1990) argue that there are four interdependent processes of organizing: cognitive, social, political and emotional. Implicit in this statement is the notion that newcomers or apprentices to a Community of Practice will need to understand all aspects of these processes in order to become fully functional, and to lose their peripheral status.

In his situated learning study of newcomers in "coercive" settings, Fuhrer (1993) identifies social embarrassment and social anxiety as crucial catalysts in the learning process. He concludes by arguing for an approach to interpreting situated learning that includes the emotional dimension. Fineman (1997) has also raised the issue of emotion in learning in an article in which he introduces the concept of "cognmotion" to suggest that cognition and emotion in organizational learning are often falsely separated. The emotional dimension of the relationship between power and learning is made explicit by Coopey (1998), who argues that workplace learning may be suppressed by anxiety and other emotions associated with revelation and exposure. More recently Vince
(1999; 2000) has also made a similar connection, arguing that an attention to the relationship between power and emotion offers new opportunities for understanding the systemic and strategic aspects of organizational learning.

Despite these persuasive arguments for an emotional dimension to be included in the study of organization learning, however, the subject of emotion is entirely missing from the early book on Communities of Practice, with Lave (1991). Lave and Wenger (1991) portray those at the periphery as emotionless seekers after the knowledge of the old-timers. Rivalries and envy are erased from these commentaries on Communities of Practice, and the rhetoric becomes one of truth-seeking (Obholzer, 1994)

Wenger does acknowledge in his later book (1998) that participation in social communities "is a complex process that combines doing, talking, feeling, and belonging. It involves our whole person, including our bodies, minds, emotions, and social relations' (1998, p. 56). This brief allusion to the affective component of participation is touched upon once more later in the book. However, the importance of emotion is not developed further by Wenger, and as has been shown, has received little attention from subsequent organizational learning scholars. Marsick and Watkins (1997) note this omission in their own research into informal and incidental learning. It is this omission that this paper will now seek to address.

Methodology- A Social, Cultural and Emotional Reading of Wenger's (1998) Alinsu vignettes

In the following discussion, I will illustrate the way that a spotlight on emotion can illuminate understanding of some of the main premises of the cultural-interpretive approach to organizational learning, by drawing on data from Wenger's (1998) ethnographic account of claims processors in Alinsu. Wenger uses two vignettes (pp. 18-38) to illustrate how situated learning takes place within social groups. Throughout these vignettes his accounts are laden with emotional language, but in his analysis this is entirely disregarded.

My analysis focuses on the story of Ariel who has recently joined a team of claims processors in an insurance company. Their work, to calculate and process customer claims, follows formal procedures as laid down by the company, but much of the knowledge required to become efficient is tacitly held by the community of practice. As a newcomer, Ariel is keen to learn from her colleagues how to calculate these claims accurately and efficiently, how to fit in with the group she has joined, and to deal appropriately with the customer telephone calls which constantly interrupt her computerised routines. Each claims processor is monitored by a department which randomly checks her work, rejecting mistakes and rewarding accuracy.

The methodology for this research involved a textual analysis of Wenger's vignettes. Highlighting throughout the text each observable manifestation of emotion, by type, function, context, apparent impact on learning and to whom it was attributed, I sought responses to the following questions:

- What types of emotion were present in the vignettes?
- What function did these emotions appear to be playing?
- What did the emotions appear to mean to those feeling or displaying them?
- What types of events were generating emotional responses, behaviours or displays?
- How did these appear to be impacting on both individual and collective learning?

Conscious that I was interpreting Wenger's account second hand, and therefore that the data had already been filtered by Wenger's ways of seeing, my purpose was not to throw light on the Alinsu case specifically, but to discover how the study of emotion in a community of practice might illuminate our understanding of organizational learning. To make these connections more clearly, I then returned to some of the key concepts contained in the cultural-interpretive approach to Organizational Learning, to ask how the emotional experiences and displays demonstrated in these vignettes might be re-interpreted through this lens, and thus how they may add insight to the domain of organizational learning and HRD.

Findings

The findings of this analysis revealed four aspects of emotion in organizational learning. The data suggested that Ariel and her colleagues in the community of practice were continuously learning to:

1. deal with the impact of their emotional responses on their learning.
2. feel and experience emotions.
3. ascribe meaning to the experience of these emotions.
4. display emotions for the purpose of becoming accepted members of the community.
I have summarised these aspects of emotion in organization learning as:

1. Emotion as affective component of the learning process.
2. Emotion as a socially learned response.
3. Emotion as codified meaning.
4. Emotion as display rules.

Each of these will be illustrated below.

**Emotion as Affective Component of the Learning Process**

In the vignette, there are many examples of Ariel and her colleagues having to deal with the impact of their emotional responses on their learning. The first expectation that Ariel places upon herself is that she should quickly become competent. Gherardi (1999) has pointed to the concept of learning-in-practice and the shared focus on newcomers becoming "competent" in the practice. This competence includes responding with the appropriate behaviours and emotions to events, as well as mastering the technologies associated with the practice.

In the vignette, Ariel's initial lack of competence in the practice of the community leads her to experience shame and humiliation. Finding that she has made mistakes the previous day, which have now appeared in her inbox as "voids", Ariel exclaims to herself:

"Shit! Two more voids with only two days left this week"...She hates voids; they are frustrating and humiliating" (p. 20)

Emotions here play a regulatory role in Ariel's learning, as she anticipates the possible reactions of others on hearing of her mistakes. Her emotions are mixed. She appears to be both angry with herself, irritated by the system, and surprised at having made the mistakes. Fear of failure is a recurring emotion for Ariel. Indeed, this emotion might arguably be seen by her managers as constructive, to the extent that it encourages her to check her work, but counter-productive where it encourages her to apply procedures even to the detriment of her organization as illustrated below:

"She uses a calculation sheet to figure out what the deduction is...choosing the larger amount of the two. It has occurred to her that it would be more advantageous for Alinsu to take the smaller one, but the procedure says to take the larger one." (p. 23)

In the vignette, it is evident that the claims processors are learning to experience a range of emotions within this community of practice, that each emotion is deemed appropriate for a given context, and that this contributes to the learning process. For example, Ariel's anxiety not to make mistakes becomes embarrassment and frustration when she discovers that some of her processed claims have been returned by the inspectors as 'void'. However, this embarrassment turns to relief, when she shares her feelings firstly with Maureen, the back-up trainer and an old-timer from whom she "gets some comforting grumbling about people in the quality review unit" (p. 21) and then with her supervisor, another old-timer who "shakes her head in solidarity"(p. 21).

As Ariel starts to feel the blame attached to her mistakes dissipating as a result of clear signals from her colleagues, her emotions of humiliation become those of comfort and relief as she experiences the solidarity of her colleagues, thus enabling her once again to concentrate on the work she has ahead of her. Shared learning appears to have taken place, and henceforth Ariel might more accurately anticipate when it is appropriate to feel embarrassment, or when an alternative emotion is more fitting, enabling her to empathize with others experiencing similar feelings of rejection in the future.

**Emotion as a Socially Learned Response**

Gherardi (1998) has noted that despite the desire to socialise newcomers into a community, experienced members are often reluctant to give away the power associated with their experience and knowledge. The scenario described below provides an example of how collective emotional responses are learned in the Alinsu case, the essential connection between emotion and power relations in organizational learning (Vince, 2001) and the influence of 'emotion talk' (Heelas, 1986) on the shared experience of emotion in the group.

The motivation and loyalty of the claims processors is being put to the test one day when the supervisor warns them that henceforth, long telephone calls will be monitored, since the management suspect that some of them may be giving the "toll-free 800 number to their acquaintances". On receiving this warning, the group start to respond, and a shared feeling of 'hurt' as a result of what is considered by her staff as a breach of trust emerges in the room:
"Harriet senses the tension that her remark has brought to the meeting...there is some grumbling and a few defensive remarks". (p. 25)

By lunch-time this hurt has turned into shared indignation:
"And now they are going to monitor long calls! Everyone knows that there are business calls that are long. Beliza reminds everyone of that 45-minute phone call that drove her crazy. Surely "they" will recognise that this is unfair." (p. 29)

As a result of a single statement of managerial intent we now see a major change in the shared emotions felt in the room. The focus is now on the unfairness of the management's attitude. Emotions run high as the group shares its indignation and starts to question the nature of their relationship with their managers.

As a newcomer, Ariel and her colleagues are quickly learning that when a lack of trust is displayed, emotions of hurt are deemed appropriate. However, as the group shares this emotion, it strengthens and turns quickly to indignation. This indignation has the potential to be replaced in the longer term by cynicism or resignation.

**Emotion as Codified Meaning**

In the first example, Ariel's feelings of embarrassment dissipate when she sees that her colleagues are not displaying shock, disappointment or anger but on the contrary are supportive and warm. Her emotions of relief and comfort as she interprets the displays of solidarity and empathy shown by others, prompt her to ascribe new meaning to the situation, and in this case to learn about the membership and collective identity that binds the group as they engage in collective learning (Gherardi,1999). This is an example of Heelas's (1986) "emotion talk" suggesting how people should or should not feel in particular circumstances.

In the second example, the anger mobilised through "emotion talk" by the group members appears to be important in constructing an implicit moral understanding within the community about what is considered right and wrong, and what behaviours are considered acceptable in response. The claims processors' emotional responses of hurt and indignation imply a shared moral code associated with expectations of trust relationships in their workplace. The processors' emotions as a result of the breach of trust subsequently become noticeably stronger, shifting from hurt to indignation. As they share these emotions, they become overlaid with moral justification and meaning, again illustrating Heelas's claim that emotion talk and the moral domain are closely interconnected.

Yanow (1993) suggests that part of organizational learning is about learning the "logic" of the practice. In the vignette, Wenger describes the embarrassment experienced by the claims processors in dealing with customers whose claims have been denied, particularly as the claims processors are not privy to the logic behind the decision-making process on which claims calculations were based. Not only are customers often upset at receiving benefits in a seemingly random fashion, but the processors feel ill-equipped to explain how benefits are calculated:

"It's embarrassing when you call and you say, 'Well, I don't know how, but that's how much money you got. Sorry.' I mean it's embarrassing not to have the information". (p. 37)

In this extract, the embarrassment of the claims processors is laden with meaning. It is about the inequities of the system, their lack of power as a result of lack of knowledge, and the fact that they must handle the customers' claims with insufficient knowledge to give them a satisfactory response. At the same time, the processors must not only learn how to diffuse the emotions of their customers, as well as how to deal with their own embarrassment.

**Emotion as Display Rules**

Both Gherardi (1999) and Yanow (1993) have echoed Heelas (1986) in suggesting that learning the rules of a professional language game are important within cultures or communities of practice. This includes knowing when emotion display must be controlled, as when Ariel is dealing with a difficult customer. On the morning described in the vignette, Ariel has one such encounter as a direct result of following the correct procedures of her job that require her to withhold some information from a customer in order to protect the privacy of this customer's ex-husband:

"After a long struggle, Ariel put the person on hold, just to take a breath. She was so angry, her body was shaking". (P. 21)

Here Wenger describes some of the physiological symptoms often metaphorically associated with anger. Ariel knows that she is expected to control this anger in her work, hence the need for distancing herself from the customer and giving herself time to achieve composure. It is likely that in observing the behaviours of old-timers she sees that their ability to control emotions of anger are much more developed than hers, and in taking breath she is seeking to
develop this control herself. In order to achieve competency in this practice Ariel must learn the accepted emotion display and language. A public display of anger with the supervisor when she was seen to breach the trust of the clerks was shared and accepted as appropriate behaviour within the community. Ariel's privately experienced anger with the difficult customer was also seen as acceptable, but the norms of the group disallowed these feelings from being showed publicly. These tacit yet crucial feeling rules can be seen here to be serving a number of moral and social functions for the community of practice.

In the vignette, Ariel illustrates her wish to blend into her new work group by dressing appropriately: "She makes up, but discreetly, and dresses cleanly but not aggressively" (p.18) Even in the process of making this decision it is clear that the anticipation of emotions (Rosenberg, 1990) have played a part in her choice, as she imagines the feelings of humiliation or embarrassment that would follow being inappropriately dressed.

Another common theme in the work of the cultural interpretive organizational learning theorists is the idea of gaining membership. Gherardi (1998) stresses that every practice is built upon social processes, and illustrates the tacit nature of the 'situated' curriculum. She describes the process of gaining membership as potentially including rivalry, conflict, jealousy and competition - all situations with the potential to generate emotions. As Ariel's performance improves she begins to experience a sense of pleasure and achievement as she starts to feel part of the group. When she achieves her target, she feels the need to share this sense of pride with her colleagues: "I already made production," Ariel says triumphantly". The sharing of pride as a learned positive display of emotion in response to this situation indicates that Ariel feels that she is starting to gain membership.

The presence of both emotion display and talk in the community of practice of the claims processors has been demonstrated as being important in the construction of these shared meanings and membership. The analysis of the Wenger vignettes has served to illustrate the value that studies of the micro-social using an anthropological lens to explore emotion can bring to the study of organizational learning. However, it is clear that the significance of these emotions for situated learning and for HRD is still under-researched and needs to be explored further through new empirical research.

Conclusions and Implications for HRD

In the previous section I drew out a range of conflicting emotions shared by Ariel and her colleagues, to illustrate how these emotions appear to be contributing to the learning and creation of meaning within the community. Some of these emotions (fear of failure, embarrassment at receiving "voids" etc., pride, comfort) are acting as controls to compel the members to work towards the company's productivity goals. Others, such as anger, frustration, hurt, and boredom may be counterproductive in terms of productivity, yet are seen to be contributing equally strongly to learning about feeling rules, behavioural norms, acceptable emotional displays, and issues of power control, identity and meaning. Both sets of emotions are equally important for newcomers learning how to become competent in this constantly evolving set of networks which constitute the community of practice. These contribute to learning the logic of the practice, gaining membership, generating collective identity, developing a relationship between the human and non human actors, and generating a common language through conversation.

Given that the Alinsu case takes place in a snapshot in time, however, we are left with a number of important questions for scholars and practitioners of HRD arising from studying the emotions presented in the case. For example, how might the hurt and indignation experienced by Ariel and her colleagues when faced with a challenge to their integrity evolve over time and affect the power relations in this "community"? How might the embarrassment experienced by newcomer Ariel as a result of her lack of competence in the task contribute to the social dynamics of the group, for example by creating a wave of sympathetic feelings or solidarity amongst her colleagues? How might we understand the emotion generated by the power of the computer system in the work lives of the processors, and their preference not to look beyond their experience of the system to discover the managers, programmers, accountants, technologies etc. all of which have contributed to developing the behaviours of the system which drives their work? How might future changes to the structure, technology, group membership, or task affect the group emotionally, and consequently the learning in the community? How might unexpected events generate emotional responses that change what is considered by the group to constitute competence and full membership?

I have contended in this paper that emotion talk and emotion display are both essential components of organizational learning, and that the ways that organizational members construct and communicate emotion will influence not only their understanding of the activities in which they are engaged, but also the practices they adopt, the goals they set, and the identities that give meaning to their work. Emotion research in organizational learning to inform the scholarship and practice of HRD will therefore, following Harré's (1986) anthropological studies into the social construction of emotion, need to refocus on the language games and narrative forms available in a culture or
community of practice; the moral order which controls the meaning and use of emotional terminologies; the social functions that emotion displays and talk perform in the dramaturgical episodes of that culture or COP; the rules which determine how emotion and action take place, and the role played by emotion in organizational power relations and identity shaping.

The interpretive-cultural approach to studying organizational learning has greatly altered and illuminated the conceptualisation of organizational learning. At the same time, the study of emotion in organizations has been greatly enriched by the social constructionist ideas of anthropologists following Harre. A fuller understanding of how emotion talk affects the moral order and power relations inside organizations and consequently the social elements of learning is now needed by the HRD community in order to inform the design of effective organizational interventions.

Women Managers: Learning about Emotional Expression in the Workplace

Rose Opengart  
The University of Georgia

This qualitative study addressed the content and process of learning about emotional expression in the workplace. Analysis revealed: 1) the necessity of maintaining a "poker face;" 2) the use of emotions as a power tool; 3) the double-bind for women; 4) the need for authenticity; and 5) the importance of the situation for determining appropriate emotional expression. Women learned 1) through others 2) informally and incidentally; and 3) as part of upbringing.

Keywords: Emotions, Emotional Intelligence, Employee Development

Traditional learning theories assume a universality of learning experiences, creating a lack of information and understanding about women's learning (Hayes et al., 2000). Organizational learning is embedded within organizational culture, a culture which still values and rewards masculine traits (Gatenby & Humphries, 1999; Oakley, 2000). Thus women are expected to learn behaviors within male-defined parameters. One such behavior is the appropriate expression of emotions, that is, expressions and responses. If women’s emotional expressions are evaluated within a male culture, such as manufacturing, the appropriateness of emotional expression will be evaluated within a male framework. Emotional intelligence; ability with emotion, and emotion work; ability to control or change emotions, may be perceived as inadequate because of the incompatibility between how they were taught to act as women and how they are expected to behave in the workplace. This negative perception could affect women’s career development and success.

Ability with emotions is crucial to career success (Cherniss, 2000; Goleman, 1998). Given the importance of emotional skill to one’s career it is beneficial to identify the content and process by which women learn about emotional expression in the workplace. This knowledge provides a foundation for managers to evaluate and support employee development. The purpose of this study was to identify what women managers learn about emotional expression in the workplace and how this knowledge is acquired. The research questions included:
1. What do women managers learn about expressing emotions in the workplace?
2. How do women learn what emotions are appropriate to express at work?

Relevant Literature

The areas of literature reviewed include feminist theory, women in management, women's and organizational learning, emotion work, emotional intelligence, and interpersonal psychodynamics. These areas were selected because each was relevant to this study of women learning and behaving within an organizational context.

Feminist Theory

Feminist theory served as a framework for this research, particularly the liberal, radical, psychoanalytical, and existentialist philosophies. Feminist theory examines society as male-centered and addresses how power is reproduced. Women's unique experiences are distinct from men’s and acknowledged as gender-related (socially constructed) rather than specifically female. This perspective reframes stereotypical feminine weaknesses into strengths and provides an opportunity to hear voices other than those currently available (Bem, 1993).

Women in Management

Women are still strongly encouraged, if not pushed, into careers traditionally associated with and defined as belonging to women (Bierema, 1998; Hayes, 2000). Gender based stereotypes have been shown to serve as barriers to women in management (Oakley, 2000). Subsequently, successful women leaders choose to conform to traits associated with males (Bierema, 2003; Caffarella & Olson, 1993). This expectation to act both like a woman and like a man puts women in a double-bind, “a situation where a person cannot win no matter what she does” (Oakley, 2000, p. 324).

Women's Learning/Organizational Learning

The assumption in traditional learning theories, such as Kohlberg (1973), Maslow (1970), and Erickson (1982) is that development is universal and progresses through stages. These theories were developed using only male subjects (Caffarella & Olson, 1993), resulting in a tendency to discount women’s learning experiences (Merriam, 1998). Gendered patterns of learning and development include connected knowing and learning, necessity for

Copyright © 2004 Rose Opengart
voice, and the influences of social context (Belenky, et al.,1986; Bierema, 1994; Caffarella & Olson, 1993; Hayes & Flannery, 2000). Giving voice to, developing voice, and reclaiming a voice enable women to develop, learn, and obtain more power (Belenky, et al.,1986; Hayes & Flannery, 2000). Women's learning literature discusses culture, a social context that dictates norms, gender roles, and behaviors (Bierema, 2001; Hayes & Flannery, 2000), and a relationship between women's self-identity, self-esteem, and learning.

Organizational learning is a cognitive and social activity, illustrating the importance of relationships for women's learning and career success (Bierema, 1998; Gherardi, 1998). Much organizational learning occurs informally and incidentally through a process that is not highly conscious, is unintentional, predominantly experiential, reflexive, and linked to the learning of others (Marsick, Volpe, & Watkins, 1999). Previous research in informal learning in organizations indicates that employees learn from contextual triggers, critical incidents, from others, and from their experiences (Cseh, 1998; Ellinger, 1997).

Emotion Work

Emotion work examines emotion from a sociological and cultural perspective. Hochschild (1979) described it as the effort to change or control emotions in oneself or in others in order to meet social guidelines. Emotion is exchanged for a wage, for example, positive emotional display is required for influencing customers. Hochschild’s definition refers to organizational expectations and boundaries for employees’ acceptable emotional expression (Hochschild, 1979). The use of emotions in less exploitative ways may have positive effects and may be used as a tool of social influence by individuals for their own benefit (Fabian, 1999; Rafaeli & Sutton, 1991).

The gendered nature of emotion work is evident in the frequency with which women are placed into emotionally expressive positions and the expectancy for women to perform more emotion work than men (Callahan & Schwandt, 2000; Hochschild, 1983; Parkin, 1996). Evidence exists for an interaction between a leader’s gender, expressed emotion, and perception of effectiveness (Lewis, 2000).

Emotional Intelligence

The term emotional intelligence, coined by Salovey and Mayer (1990), refers to "the ability to monitor one's own and others' feelings and emotions, to discriminate among them, and to use this information to guide one's thinking and actions" (Salovey & Mayer, 1990, p. 189). Goleman (1995, 1998) popularized the concept and applied it to the workplace, discussing its importance for career success and leadership abilities.

Whereas Goleman’s (1995) and Bar-On’s (1988) models address traits and non-cognitive abilities, competencies, and skills, Mayer & Salovey’s (1997) developmental model includes cognitive abilities including emotional perception, identification, expression, integration and management of emotions. Many researchers maintain that aspects of emotional intelligence, rather than traditional IQ, make the biggest difference for success in life (Bar-On, 1997; Cherniss, 2000; Goleman, 1995, 1998). Thus being effective with emotions, or having high emotional intelligence, will presumably advance women’s careers.

Interpersonal Psychodynamics

Psychodynamic theory examines motivational forces that consciously and unconsciously affect one’s behavior (Hirschhorn, 1999). An important aspect of interpersonal psychodynamics in the workplace is emotions and their effect on behavior and interpersonal relations. Anxiety causes people to create social defenses and defensive routines to protect themselves from experiencing feelings (Argyris, 1993; Hirschhorn, 1999).

Men and women are socialized to express emotions based on gender. Unconscious forces maintaining this socialization affects perceptions of effectiveness in the workplace. The psychodynamics and defenses research demonstrates how emotions can manifest themselves in harmful ways. It supports the emotional intelligence literature regarding the idea that the recognition and processing of emotions is critical (Goleman, 1995; Hirschhorn, 1999; Salovey & Mayer, 1990) and that the social and cultural dimensions of emotion are important considerations.

Methodology

A qualitative, exploratory study was undertaken in order to answer the following research questions:

1. What do women managers learn about expressing emotions in the workplace?
2. How do women learn what emotions are appropriate to express during their work?

The four elements of research, a researcher’s epistemology, theoretical perspective, methodology, and methods, should inform each other. The epistemology, the “way of understanding and explaining how we know what we know” (Crotty, 1998, p.3), should inform the theoretical perspective, which should inform the methodology, which should inform the methods (Crotty, 1998).

Epistemology

The epistemology of constructivism holds that all knowledge is constructed out of interactions between human beings and their world, and developed and transmitted within a social context (Crotty, 1998). In this research,
culture and interactions with others produced knowledge and meaning around emotions.

Conceptual Framework

The epistemology of constructivism informed the conceptual framework, that of feminist theory. A conceptual framework specifies who and what will be studied (Miles & Huberman, 1984). A feminist theoretical perspective presumes the importance of gender in relationships and societal processes (Patton, 2002).

Methodology

This research was a qualitative, interpretive study of the process and content of women's emotional learning. Qualitative inquiry is effective for finding explanations of processes (Miles and Huberman, 1984) and assumes that individuals construct their own reality by interacting with their social worlds (Merriam, 1998). The qualitative researcher strives for depth of understanding of a participant’s unique situation, context, and social interaction. In this study it was critical to obtain the participants’ perspectives of emotional expression learning.

Methods

The data collection and analysis methods included the critical incident interview and constant comparative method of analysis. These are discussed along with sample selection, participant descriptions, reliability and validity.

Data collection. In order to ensure the rich, thick description that qualitative research seeks, the sample selection for this study was purposeful and used snowball sampling in order to obtain participants. Purposeful selection begins with establishing criteria essential for selecting participants in order to locate participants who have experienced the phenomena. The snowball strategy of locating participants involves asking referral sources for other individuals who meet the study’s eligibility criteria (Merriam, 1998). Criteria that guided selection included:

1. Workplace and position: Women who were at a management level position in a manufacturing setting.
   Approximately half were in human resources for comparison purposes.
2. Ability to recall events: Women who were able to recall with detail two incidents that were significant to their learning about emotional expression at work.
3. Diversity: Geographic and racial diversity were sought in the participants.

Participants working within a manufacturing setting were selected because this is a traditionally male setting. Therefore, emotional expression was expected to be more problematic for women and requiring an increased level of learning. Management level employees were selected because it was assumed that at that level of success they had learned a great deal. Diversity in respect to race and geographic background was sought in order to consider culturally influenced perspectives and acquire more rich information. Semi-structured interviews were the primary method of data collection. Interviews allowed for in-depth information and exploration of the participant's world and provided a framework for flexibility and further probing as needed (Merriam, 1998; Patton, 1990).

Participant descriptions. Participants included ten women managers, each in different companies. Industries represented included automotive, cereal, health care products, oil, packaging machinery, poultry, and pharmaceutical. Five were human resources managers and five were managers in other areas such as operations. There was also diversity in age, education level, and geographic background. The age range spanned from twenty-seven through fifty-three. Education levels ranged from Bachelor’s, Masters, to one with work toward a Ph.D. The span of experience in management ranged from two to twenty-six years. Geographic backgrounds of the participants covered four distinct areas including Northeast, Southeast, South, and Midwest.

Although the number of managers in this research study was ten, the unit of analysis in this study was the critical incident. Each manager was asked to describe in depth at least two critical incidents, however, many provided more than two. The total number of critical incidents was forty-two (42). Each example involved a man.

Critical incidents. Data were collected in the form of critical incidents, a technique developed by Flanagan (1954) for use during World War II to gather specific incidents of effective or ineffective behavior among fighter pilots. Whereas Flanagan’s (1954) version approached research from a positivist framework, emphasizing objectivity, the critical incident technique can also be successfully used from a constructivist framework (Ellinger & Watkins, 1998). The constructivist approach understands experiences from the participant’s point of view and takes context into account. Ellinger and Watkins (1998) proposed the use of the critical incident technique as a method which not only allows for the counting of incidents, but also enables the researcher “to develop rich narratives of critical incidents that capture both context and meaning from the perspective of the respondents” (p. 288).

The interviews were guided by the following question: Recall two or three critical incidents that occurred at work which were critical to your learning about emotional expression in the workplace. These incidents should be ones that you believe were instrumental in shaping your understanding of what is and is not appropriate emotional expression in the workplace. The participants were asked to describe in detail the context, behavior, effect of behavior, and learning that resulted from this incident. They were then asked to describe the following for each incident: What happened? What or who triggered your reaction? How did you actually feel and what did you
express? What did you learn from this experience about emotions and work? Why did you select these incidents to discuss? Can you give me an example of an incident where you applied your learning? Interviews averaged fifty minutes, were tape recorded and transcribed. Ten interviews were completed, at which point saturation was reached. All of the interviews took place in Georgia in varying locations from urban to rural. All interviews were conducted face to face for a more personal atmosphere.

Data analysis. The constant comparative method of data analysis was used. Analysis of the interviews occurred continually throughout the data collection process in order to examine, compare, reflect, and sort the critical incidents into patterns, followed by categories and subcategories (Flanagan, 1954; Lincoln & Guba, 1985). Analysis included identifying and reflecting on themes and examining details of the hidden agendas around emotional expression and practices that reproduce gender roles.

Reliability and validity. In order to increase the strength of this research, the researcher’s orientations were presented along with participants’ profiles and the basis for selecting them. In addition, there was triangulation for multiple methods of data collection and analysis. Member checking was achieved by presenting participants with themes for feedback as well as maintaining an audit trail throughout the data collection in which to detail research methods (Lincoln & Guba, 1985). These methods helped to ensure the accurate representation of participants’ reality.

Findings

The findings are presented in two sections, with each section addressing a separate research question. Table 1 delineates overall themes representing research question one and table 2 summarizes research question two. The tables provide a brief explanation and example for each theme.

</tbody>
</table>

The Necessity of a “Poker Face”

A stoic expression is the appropriate one at work and suggests a more professional appearance. This theme of “poker face” was particularly important for those working in human resources for purposes of liability.

The Use of Emotions as a Strategy of Influence.

Expression of emotions, or lack thereof, can affect the level of influence one has over another. Men use emotions to increase their power while women’s expression of emotions results in loss of power, particularly from crying.

The Double-bind

Women’s behavior is measured against male standards and interpreted differently than men’s because of gender. They are expected to act like men, but at the same time are evaluated more negatively because they are female.

Importance of Authenticity

Authenticity in emotional expression is so critical for some that they must express true felt emotion. Yet others described being distinctly aware of differences between displayed and felt emotions and perceived it as unavoidable.

Situational Dependence

Participants indicated that emotional expression is dependent upon the situation, including person and event. This illustrates the need to evaluate the situation prior to deciding on appropriate emotional expression.

Learning from Others
The participants described learning about emotional expression at work from others by observation, feedback, or mentoring, from supervisors or co-workers. Women are often emulating the norms as displayed by men.

Informal and Incidental Learning
Participants discussed learning about emotional expression informally and incidentally with age, experience, or through their job role, experientially through trial and error or as a byproduct of another activity. Their learning was often influenced by chance and as an aspect of working.

Learning from Upbringing/Socialization
Emotional learning was integrally tied to learning about gender rules; emotional expression rules applied specifically to women. Those comfortable with these rules had grown up with boys and felt comfortable with men.

Discussion
This study indicated five main conclusions:
1. The rules and acceptability of emotional expression in these manufacturing workplaces were influenced by the employee’s gender and particular situation.
   Display of emotions is dictated by position, context, and gender. Shields (2002) suggested that “beliefs about emotion ... inscribe and reinscribe gender boundaries” (p. 170) or that “to do emotion is to do gender” (p. 170). This study confirmed that women express emotions in conformity with gender roles and that gendered emotional expression maintains gender boundaries.
   Not only does this study confirm that women express emotions in accordance with gender roles, it also supports the literature that women perform more emotion work and that women's jobs may demand more emotion work than do men's (Callahan & Schwandt, 2000; Parkin, 1996). The gendered nature of emotion affects how emotional expression is perceived. Emotional expression is evaluated from a gendered framework, so that a particular emotion may be evaluated and perceived differently based on whether it is a woman expressing the emotion or a man. Men’s emotions are acceptable but women’s are not, as one participant asked: “What’s worse about crying out of anger than putting a fist through a wall?”
   In addition to gender, the significance of the person with whom one was interacting was a crucial factor in the determination of emotions. Issues also arose regarding the importance of impartiality in human resources in order to increase the perception of professionalism. As one HR manager stated, “You have to be the Rock of Gibraltar.”
2. Any male dominated system, such as the manufacturing environment, may create a need for women to perform more emotion work than men by having to emulate male behavior.
   This study confirms previous research that emulating the successful is effective for obtaining success. These women did indicate an awareness of themselves as gendered beings (Caffurella & Olson, 1993), yet lacked action to influence cultural change, indicating the continued acceptance of the ‘hidden curriculum’ (Bierema, 2003).
   As long as an environment is male dominated, male standards and gendered behavior will be the norm. Women will be perceived as lower in emotional intelligence and will feel compelled to do emotion work – to change their emotional expression in order to conform to workplace expectations. One participant described “the expectation that women behave forcefully and assertively is out there . . .you have to show up that way in the right place at the right time.”
3. Emotions are used as a strategy of influence at both the organizational and individual levels.
This study advanced knowledge beyond Hochschild’s (1979, 1983) conceptualization of organizational control of emotions. Emotional expression requirements reinforce the societal power structure (Hayes and Flannery, 2000) that created polarized gender roles. The belief that expression of emotions is unprofessional and irrational allows men the opportunity to use emotion to gain power by causing women to cry. When two people are in a conflict, the one who ends up crying “loses” to the one who stays non-emotional. One participant described a situation like this where she thought to herself, “I will not let you see me cry. I will not allow that because that would be like giving you a victory that I don’t feel like giving you right now.”

On the contrary, men gain power with emotional expression. Research indicates the acceptability and benefit of male managerial anger displays (Lewis, 2000; Sharkin, 1993). The participants described men’s anger as effective in gaining influence and power but women’s emotional expressions as harmful. This phenomenon was summed up by one participant as, “Don’t ever let them see you sweat.”

Women learn about emotional expression primarily through informal and incidental learning, therefore, HRD professionals must help employees learn through methods other than formal classroom training in order to develop employees’ emotional intelligence.

Formal classroom training in emotions was not mentioned, rather, participants learned along with, during, and as a function of living and working. It happened as a byproduct of another activity. These informal and incidental methods of learning (Marsick, Volpe, & Watkins, 1999; Merriam, 1998) support previous research indicating that managers learn informally from others and from experience (Cseh, 1998; Ellinger, 1998).

The participants also engaged in reflective informal learning in many ways utilizing reflection on action (Schon, 1987), trial and error, and reflection with age and experience. Situated learning and attention to context was evident with the importance in identifying, assessing, and determining the most effective emotional expression based on a particular situation. Connected learning (Belenky, et al., 1986; Bierema, 1994; Caffarella & Olson, 1993; Gilligan, 1982; Hayes & Flannery, 2000) was evident in that they learned through other people, women or men, by observing their actions, from feedback, and from knowledge gained through them. Many participants described learning through imitating others, in other words, “You don’t show a lot of emotion in the workplace. Men don’t, therefore you don’t.”

Psychodynamics exist in the workplace that continually reproduce the pathology of emotional expression.

Unconscious motivational forces affect emotional expression and perceptions. Emotions are controlled by those in power who define what is appropriate, imposing a pathology on those that do not fit criteria (Parkin, 1996). Two existing forces that motivate participants to muffle their emotional expression include: 1) The belief that rationality is more effective than emotionality in avoiding anxiety, thus the organizational requirement for rationality is a social defense against anxiety. 2) Gender socialization is reinforced in the workplace in order to maintain societal gender roles and subordination of women. As a result, emotional expression in the workplace continues to be pathologized and emotional expression rules remain undiscussable and unchallenged.

Limitations of the study

The use of critical incidents created an informal context, thus emphasizing informal learning by the participants. The qualitative methodology carries its limitations of bounded generalizability and the potential for research bias.

Contribution to HRD/Implications for Practice and Research

This study has implications for organizations, women, and human resources professionals.

Women

Women need to be aware of gender roles and their impact on behavioral expectations, career development and success. They need to be conscious of decisions and behaviors and their potential implications. They need to advocate for structural change that allows women and men to work free from constraints such as gender roles and double-binds.

Organizations and Human Resource Professionals

Organizations must critically examine practices, policies, and structures to ensure that they do not reproduce gendered power relations. Organizations need to support women in their careers in respect to learning and development, including emotional expression. Organizations can create cultures which would encourage the development of learning opportunities.

To develop employees’ emotional intelligence, informal learning opportunities may be as effective as formal training programs. Professionals in human resources can help their organizations create continuous learning opportunities, encourage dialogue and collaboration, and establish systems to promote and share learning. In addition, mentoring and action learning programs can be developed targeting women’s emotional expression. A mentoring program could involve experienced women managers guiding less experienced women in effective
emotional expression within a particular context and situation. Action learning would provide a simulated emotional situation and experience through which the employees can learn without jeopardizing their performance or career success.

Women and men need to be critical of their own behavior and understand why they behave and talk the way they do. Managers and human resource professionals can take the initiative to educate both genders for a pervasive impact on organizational culture and life.

Future Research

This study raised issues for further research as well as provided support for its methodology in studying emotions. Emotions research needs to continue in order to acknowledge the existence of emotions and emotional expression in the workplace and examine their importance to managerial effectiveness, career development, and success. Establishing a mentoring program, developing a learning organization, and implementing action learning were all suggested under implications for practice. Studying the effects of each of these programs on emotional intelligence and women’s emotional expression would provide needed data for the emotions literature.

Another study would be one that examines the relationship between emotional expression and performance ratings. This is necessary because if data indicates that managers are rating women lower due to emotions, it is important to determine if it is emotional expression, gender role conformity, or actual performance on which they are rated. It is necessary to examine whether gendered expectations of emotional expression affect women's careers.

Research on the potential for informal learning to enhance emotional intelligence is critical. The literature has provided an increasing number of examples in the last decade of formal classroom emotional intelligence training programs (Cherniss, 2000; Cherniss & Goleman, 2001). The women in this study indicated successful learning occurred from informal and incidental learning. This is an area of research that would greatly benefit the emotions literature as well as support the existing informal learning literature.

A noteworthy phenomena in this study is that all the participants’ critical incidents involved men. Future research could examine women’s emotional experiences with other women. A comparison of the types of emotions elicited with other women as compared to with other men could provide interesting information on gender roles, gender consciousness, and employee interaction.

Lastly, a recommendation for future research can be made regarding methodology. The use of critical incidents in this research allowed for participants to provide emotional data that may have been difficult using another research method. If they had been asked directly about how emotional expression affected them, there likely would have been two major problems. The first problem is that they may not remember or be conscious of what and how they learned about emotional expression. Second, it could have proved too emotionally difficult for them. Thus critical incidents permitted them to tell a story, keeping the situation safe and comfortable for them.

Speaking of Competence: Toward a Cross-translation for Human Resource Development (HRD) and Continuing Professional Education (CPE)

Laurel Jeris  
Northern Illinois University

Kathleen Johnson  
Accreditation Council for Continuing Medical Education

This paper compares and contrasts literature on competence that resides in the disciplines of HRD and CPE. Definitions, Purposes, Assessments and Achievements related to the competence conceptual framework are examined for contextual cues and connections between theory and practice in an effort to contribute to greater dialog and interdisciplinary collaboration.

Keywords: Competence, Interdisciplinary, Theory to Practice

Problem and Context

Although researchers and practitioners often lament the dearth of sound theory-to-practice connections in workplace-based HRD and CPE, many of the words used to signify concepts, constructs, and principles become embedded in the language of practice with remarkable agility. Competence is such a term, found in both HRD and CPE literatures, generally indicating a desirable state, but the various forms of the word (competent, competencies, competently) and their meanings do not translate well across disciplinary boundaries. Further, the once distinct purposes, goals, and contexts of CPE and HRD have blurred. As Cervero (2000) noted, more CPE is provided in the workplace than through any other venue and at least 25% of the American workforce claims membership in the professions (p. 3). There is a pressing need for HRD professionals and CPE program planners to speak the same language because, in many settings, their roles are now combined. Accordingly, this paper seeks to begin a cross-translation of the term competence. We borrow the phrase, cross-translation, from researchers who develop instruments for cross-cultural applications; it means more than matching forward and back translations and encompasses processes leading to meaning making, such as historical analyses of literatures in their originally situated contexts, e.g., HRD and CPE (Brislin, Lonner, and Thorndike, 1993). Moreover, Norris (1991) noted, “As tacit understandings of the word [competence] have been overtaken by the need to define precisely and operationalise concepts, the practical has become shrouded in theoretical confusion and the apparently simple has become profoundly complicated” (p. 332).

Theoretical Framework

There is a move afoot in both the CPE and the HRD research communities, and interest on the part of frustrated professionals in both domains, to develop a more interdisciplinary perspective. This project contributes to an emerging dialog, which began at the AHRD Preconference on CPE in 2001. This paper builds on the work of Daley and Bierma (2002) that explored connections and intersections of CPE and HRD. In their extensive literature review they found no “theoretical analyses of the concepts, principles, and theories that underlie and support each of these two specialties within adult education [in an integrated fashion]” (p. 1). Further, they noted that although adult learning theory underlies programmatic responses, “distinct differences [were found] in the purposes of the educational offerings, the view of the participant as a professional or employee, the outcomes achieved, and in the emphasis on revenue generation and cost benefit” (p.1). In this sense, our inquiry is lacking a readily identifiable theoretical framework in that it is asking epistemological questions regarding the relationship between the realities of evolving practice in two fields, which appear to be merging, and existing theoretical descriptions.

If we think about the situated nature of various terms in these two literatures as philosophical problems for applied fields, then we can begin to think about their aims in relationship to their context, the accompanying teaching-learning dilemmas, and program development issues and problems – all highly relevant issues for practitioners, stemming from theory that has not kept pace with changes in practice.

A perplexing problem, particularly in practice, is the varied cultural connotations of the term, competence.
Drawing on the work of Trompenaars and Hampden-Turner (1998), Cseh (2003) recently discussed the dilemma of “achievement versus ascription” (p.30). That is: To what degree is competence defined by cultural literacy including various group identities such as race, gender, age, class (ascription), and to what degree is it defined by demonstrable behaviors in the field (achievement)? This dilemma is confounded by the extent to which ascription provides access to education and career opportunities that enable achievement. As much as the behavioral and skill based performance assessments portend to be “neutral and objective,” the ascriptive elements remain present and troubling for today’s increasingly diverse workplaces.

At first glance, a recent article by Stoof, Martens, Van Merrienboer, and Bastiaens (2002) nearly rendered our project as superfluous. It offered a constructivist approach for defining and using the concept of competence by the subjects within a given context. However, Fenwick’s (2000) critique of the constructivist view in which she stated, “...constructivism falsely presumes a cut universe in which subjects are divided from the environment and from their own experiences, and reflection is posited as the great integrator, bridging separations that it creates instead of reorienting us to the whole” (p. 249), focused us once again on our intention to create a starting point for cross-translation. The theoretical framework developed by Stoof et al. acknowledged and explored the same boundary issues that concern us. The results of our literature review provide an accessible database of concepts associated with term competence and a practical tool for cautiously experimenting with the constructivist approach to defining and developing HRD and CPE notions and practice related to competence. In this sense, we see our work as complementary.

Still, we continue to be troubled by the issues raised in Fenwick’s critique regarding the positioning of context in the constructivist view. Recent work calling for renewed attention to the centrality of context and the power relations that reside within it (Hansman & Wilson, 2002), support Fenwick’s (2000) concerns that, . . . “in the constructivist view, the learner is still viewed as fundamentally autonomous from his or her surroundings. The learner moves through context, is in it and affected by it, but the learner’s meanings still exist in the learner’s head and move with the learner from one context to the next” (p. 250). Given the current tenuous nature of employment in any organization and the rapidly increasing regulation of professional practice through standards, certification, and mandatory CPE, a framework that does not theorize power relations as part of knowledge construction is problematic. Resituating existing language and concepts related to the term competence in their original contexts of HRD and CPE highlights each field’s cultural practices including the use of power. Many of our decisions related to article selection and data display were informed by these concerns and our desire to stay as close to the two practice contexts as possible.

Research Questions

In an iterative fashion, we found direction and support from the “logistic” approach to philosophical inquiry, which as McKeon (1965) noted, “seeks to trace knowledge back to the elements of which it is composed, the processes by which they are related and the contexts in which they emerge” (p. 94). Subsequently we developed the following research question: In the literature from the fields of HRD and CPE, what are the definitions, purposes, assessments, achievements, applicability, and concerns of the term competence (broadened to include the variations of the term noted earlier)?

Methodology and Limitations

Hermeneutical Analysis

Although the particular manner in which we parsed the literature on competence was guided by categories noted in the research question, other factors informed our selections as well. Our practice contexts in higher education, HRD consulting, and accreditation of continuing medical education provided filters (some might say biases) for our selection of perspectives. Accordingly, seeking authoritative sources was mediated by our exposure to them largely through teaching and practice. Clearly, for a starting point, we wanted to focus our review on sources that guide practice. Ease of access was another criterion that we selected as a barometer of utilization, as was frequency of citation in practitioner literature. Not surprisingly, these selection criteria favored broad overviews over single-issue papers. Limiting our search along these lines fit our purpose of staying as close as possible to the cultural, social, and political realities of practice, which allows us to take on the hermeneutical task of selecting from and examining contexts that shape interpretations of texts and their application (Rossman & Ralllis, 1998). As Gadotti noted (1994), the identification of themes that are relevant and meaningful to a group is preparatory work that assists in understanding and revealing a group’s social reality. Further, as Madison (1990) reminded us, striving for hermeneutical understanding depends upon the active engagement of the contexts, texts, ideological frameworks, and especially the positionality of the interpreters. These insights guided our data collection and categorical analysis...
far beyond more conventional methods such as content analysis. Since our overarching purpose is to open a conversation, we have approached this topic from a problem-posing and invitational stance.

In keeping with the technical aspects of cross-translation, what is included in our results section constitutes the first phase (essentially a pilot) of this project. Our data display, sorted by the first five subjects of the central research question, permits readers to examine how various concepts related to the term competence are discussed in HRD and CPE, enabling a dialog across these two domains. While we might have chosen to circulate our findings among a panel of peer reviewers of our choosing, we decided against that option because it might have confounded the effects of our filters. Our preference is to cast a wider net through research and practice conference presentations to get feedback, not only on the validity of our findings but on the research design itself as a learning tool for interdisciplinary collaboration.

**Results of the Literature Review**

The tables included here display our findings according to three criteria: the context (HRD or CPE or both), the focus of the research question on definition, purpose, assessment and achievement. The research question related to concerns is addressed in the Discussion section following the tables.

</tr>
</tbody>
</table>
Norris (1991) and Eraut (1994) compared and contrasted views of competence from both HRD and CPE perspectives. They tended to associate cognitive and behavioral orientations with overall development of skills for the improvement of job performance, and development of expertise (often embodied in an individual striving to become an expert) was often linked to stage-based models of professional development. Our decisions to place a certain comment or view in either the HRD or CPE perspective arose out of the particular context to which they referred. Publication venues and introductory remarks addressing certain audiences provided contextual cues for the remaining sources.

Concerns Related to Definitions and Purposes

With the exception of Eraut (1994) and Boon and van der Klink (2002) authors made little attempt to situate notions of competence either historically or in terms of socio-cultural practices. However, philosophical orientations, such as a behaviorist or a performance orientation, were easy to find and provided the few cues to context beyond the author’s identity and publication venue. The absence of socio-cultural nuances is disturbing in light of the strong bonds between identifying competencies and tying them to practice standards. These standards, once developed, find their way into practice through certification of people and processes, through accrediting agencies (public and private) for all sorts of educational programs, and through qualification examinations and licensure requirements. With all this gate keeping going on, who are the competent people passing through? As we look around us in our conferences, workplaces, classrooms, they appear to be mostly white and from the middle-class. The commodification of competence into certifiable competencies privileges the KSA (knowledge, skills and attitudes) worldview, and turns what Boon and van der Klink (2002) found to be a somewhat flexible concept into a rigid sorting mechanism that may have grave consequences for marginalized groups.

Concerns Related to Assessments and Achievements

A glance at the Table 3, displaying the comments from various sources in relation to the assessment of competence, reveals more questions and concerns than assertions regarding the viability of measuring competence. Similarly, a brief look at Table 4 (Achievements) reveals few statements related to what is accomplished through the application of a competence-based approach to individual development in the workplace from either the HRD or CPE perspective. Although definitions and intended purposes abound, we found few sources that included theorizing the concept in a way that made sound connections between theory and practice, making it difficult to operationalize and test (Patterson, 1983). Whetten (1989) might say that the “So What” is missing for the use of competence-based theories and models in either HRD or CPE.

Returning to our earlier proposition (p. 2), that capturing situated notions of competence and then comparing them across contexts (HRD and CPE) would assist in thinking about their aims in relationship to their context, the accompanying teaching-learning dilemmas, and program development issues and problems, fell short of our expectations. Undoubtedly, one reason for this is the literature we reviewed. However, when we examined applications-based literature in academic and practitioner journals we found it to be instrumental, prescriptive, and lacking either a formative or summative evaluative focus that might have taken the needs of stakeholders and the applications-based literature in academic and practitioner journals we found it to be instrumental, prescriptive, and expectations.  Undoubtedly, one reason for this is the literature we reviewed. Returning to our earlier proposition (p. 2), that capturing situated notions of competence and then comparing them across contexts (HRD and CPE) would assist in thinking about their aims in relationship to their context, the accompanying teaching-learning dilemmas, and program development issues and problems, fell short of our expectations. Undoubtedly, one reason for this is the literature we reviewed. However, when we examined applications-based literature in academic and practitioner journals we found it to be instrumental, prescriptive, and lacking either a formative or summative evaluative focus that might have taken the needs of stakeholders and the influence of context into consideration. This conundrum presents striking evidence of Eraut’s (1994) assertion that contexts of use are distinct and that the contextual boundaries not only exist across disciplines but within them, creating language and experience barriers that are difficult to cross and serve to maintain isolation of academicians, managers, and front-line practitioners from one another (p. 32).

Conclusions and Implications for Theory and Practice

Does the Cross-Translation Stand up to Scrutiny?

Capturing “sound bites” from the literature as we have done here barely scratches the surface of the task, but we offer it to stimulate dialog and reflection in both HRD and CPE as researchers and practitioners continue to grapple with the concept of competence. Just as cross-translations are refined through expert review and rounds of focus groups, expanding understanding of competence will be a continuing project. Daley and Bierema (2002) proposed several areas where joint exploration might benefit both CPE and HRD. They asserted that, “In addition to [the need to become] more critically reflective as a field, HRD needs to expand its focus to include non-profit, service, government, and higher education settings [traditional domains of CPE]” (p. 10). Alternatively, “HRD offers a wider range of strategies for development than CPE . . .” (p. 10), where the classroom-based update model, mandated continuing education, and government regulated accountability to “standards” have become the Holy Grail of professional development.
Although we are guardedly optimistic about greater collaboration between HRD and CPE (tempered by the reality of the current organization of graduate curricula in the two domains), we are less confident of bridging the theory and practice contexts so aptly described by Eraut (1994). We see ourselves standing in one of two rooms connected by a door. One side of the door is labeled “Theory Enabled Practice” and the other side of the door is labeled “Practice Enabled Theory,” but the door is locked. Once a tool (competence) is unleashed, instrumentalism appears to guide application stripping the framework from its origins. Researchers and practitioners in both CPE and HRD would do well to problematize the tool itself and ask, not how well is it working in a given context, but should it be used given its definitions and purposes and what are the effects, both intended and unintended?

Competency-Based Human Resource Development Strategy

Noordeen T. Gangani
Gary N. McLean

Richard A. Braden
West Group

This paper explores issues in developing and implementing a competency-based human resource development strategy. The paper summarizes a literature review on how competency models can improve HR performance. A case study is presented of American Medical Systems (AMS), a mid-sized health-care and medical device company, where the model is being used to improve employee performance and gain a competitive advantage. While there are numerous benefits from using behavior-based competency models, there are also some challenges.

Keywords: Competency Models, Performance Improvement, Organization Development

Competency-based practices are popular among large and mid-sized employers as an integral tool for talent selection, retention, and development. Competencies describe the skills, knowledge, behaviors, personal characteristics, and motivations associated with success in a job. Competency-based practices utilize a competency framework to align the strategic objectives of an organization with its key HR business processes. By applying a systematic approach of measuring individual competencies, it may be possible for an organization to build ongoing snapshots of the overall knowledge capital and skills portfolio of its workforce. Further, organizations may be able to utilize this information to perform individual and organizational analysis, reduce education costs, improve hiring practices, improve retention, improve human resources performance and developmental planning processes, and deploy its human capital more effectively.

Although competencies could be used in various HR functions, the focus of this paper is on staffing and selection, education and training, career development, and performance management.

Purpose Statement

The use of a competency method as the basis for human resource management has become widespread in the United States and is gaining a foothold in international HR practice (Athey & Orth, 1999). In today’s competitive and constantly changing business environment, competency models may be able to help human resource professionals improve the skills set and efficiency level of their workforce to match changing market trends, in order to face competitive business challenges.

This paper highlights some of the major issues of competency-based strategy, with a particular focus on the development and implementation of competency models. The intended outcome of this literature review and case study is to build a conceptual framework for further research regarding the extent to which competencies could be applicable in various HR and HRD functions.

Theoretical Framework

Competencies have many definitions (see the Review of the Literature). A frequently used definition is, “A descriptive tool that identifies the skills, knowledge, personal characteristics, and behaviors needed to effectively perform a role in the organization and help the business meet its strategic objectives” (Lucia & Lespinger, 1999, p. 5). Ranging from selection, retention, and development to organizational strategic planning, competencies are used today in a wide range of functions within human resources (Rodriguez et al., 2002). However, the decision to introduce a competency model into an organization should not be made without due consideration. Organizations will need to devote a significant amount of time for planning and communication, data collection, change planning, and resistance management. This paper highlights some of the issues that HR and HRD professionals may come across while developing and implementing competency-based HRD strategy.

Research Questions

The literature review and case study sought to highlight development and implementation issues of competency-based human resource development processes. Specifically, the study was guided by the following questions:

- What role do competencies play in the field of HRD?
- What should be the scope of application of competency models across many different HR functions?
- What are the challenges HR professionals may face while implementing competency-based HRD strategy?

Methods

Both computer-based and manual searches of published research articles were conducted. HR, HRD, IO psychology, and business literature were reviewed. The computer databases on ABI Inform, Business Source Premier, American Psychological Association, and the American Management Association were used to identify articles, dissertations, and book chapters that included analysis or discussions of the concept of competencies. The review also included examining various companies’ reports, presentations, and material on competency implementation.

The case study evolved out of the involvement of the authors in working with managers in the target corporation (AMS) to create, implement, and evaluate a competency model. The organization has granted permission to include the information contained in this article.

Results

The literature review focused on the research questions posed. The review is organized according to the following categories: definitions of competencies; impetus for introducing competencies; and application of a competency-based HRD strategy—an American Medical Systems (AMS) case example. The AMS case study is further organized in three broad categories: development of competency models for various positions; implementation of competency-based strategy; and challenges that HR professionals might encounter while developing and implementing competency models.

Definitions

Some of the more frequently cited definitions of competencies, in addition to that offered in the Theoretical Framework section, include:

- “Competencies are underlying characteristics of people and indicate ways of behaving or thinking, generalizing across situations, and enduring for a reasonably long period of time.” (Guion, 1991, p. 335).
- “Competencies can be motives, traits, self-concepts, attitudes or values, content knowledge, or cognitive or behavioral skills - any individual characteristic that can be measured or counted reliably and that can be shown to differentiate significantly between superior and average performers, or between effective and ineffective performers” (Spencer & Spencer, 1993, p. 4).
- “A mixture of knowledge, skills, abilities, motivation, beliefs, values, and interests” (Fleishman, Wetrogen, Uhlman, & Marshall-Mies, 1995, p.10.1).
- “A knowledge, skill, ability, or characteristic associated with high performance on a job” (Mirabile, 1997, p. 21).
- “A written description of measurable work habits and personal skills used to achieve work objectives” (Green, 1999, p. 5).
- “A descriptive tool that identifies the skills, knowledge, personal characteristics, and behavior needed to effectively perform a role in the organization and help the business meet its strategic objectives” (Lucia & Lespinger, 1999, p. 5).

Impetus for Introducing Competencies

William M. Mercer Inc. (2001) identified the following as the most common drivers for introducing the use of competencies in an organization:

- **Strengthening HR process.** Improve talent management process through integration of common practices. This could include using competencies to create more powerful recruiting and selection tools and/or training and career development grounded in the specific skills and competencies needed for success in a given organization.
- **Achieving cultural integration and organizational alignment.** Maintain cohesion and alignment following a disruptive organizational change such as merger/acquisition activity, divestiture or downsizing. This typically involves using an organization-wide “core” competency model to give employees a clear, explicit picture of
behaviors that the future organization will require for success and will expect in organizational members and leaders.

**Improving operational effectiveness.** Build a competitive advantage by strengthening core competitive advantage by strengthening core operations. This entails using function-specific or job-specific competency models to “raise the bar” by identifying and reinforcing the behaviors that lead to top performance rather than simply evaluating behaviors required for average performance.

**Driving organizational change.** Fundamentally change the way an organization operates in a new business, new markets, new technologies, etc. This involves creating competency models for selection and development that define the future. It also involves identifying the skills and competencies needed in the new venture area that are not present in abundance in the current employees, traditional business, market or technology (Daniels, Erickson, & Dalik, 2001 pp. 70-77).

### Implementing Competency Models

A synthesis from the literature and key opinion leaders in the target organization (including incumbents, supervisors, cross-functional teams, customers, and visionaries/thought leaders) points to the following suggestions for developing competency models:

- The need to implement the competency model strategy should be derived from a business need.
- Get the support and participation of top management for the development and implementation of the process.
- Educate and communicate to each member of the organization about the objectives, process, impact, and implications of the competency initiative.
- Leverage ownership of and commitment to the process by assuring employees that the competency-based strategy is relevant to and important for their jobs and for their career development.
- Include work content experts from different EEO groups to make the final model a true representation of the entire workforce population.

### Challenges

The challenges facing the field of competency practice are both daunting and exciting; the opportunities for HRD practitioners to reinvent competency methods to meet the challenges of the future are significant (Athey et al., 1999). Organizations have many ways to build competency models and have several options regarding the application and measurement of those models. Based on the literature review, in order to utilize competency-based human development strategy efficiently, business leaders and HR practitioners need to make a number of fundamental decisions and may face several challenges. These challenges may include gaining leadership support for the new initiative; articulating organizational mission to the competency-based HRD approach; building a conceptual framework for the competency models; adopting appropriate methodology for competency model development; communicating the new initiative to the employees; and evaluating the results of competency based strategy on human resources quality improvement.

### Application of a Competency Model—A Case Example

American Medical Systems, Inc. (AMS) is one of the world's premier urology companies, developing, manufacturing, and marketing advanced medical technologies. The company's core products set the standard for quality implantable devices and are regarded as effective therapy for patients suffering from erectile dysfunction, urinary and fecal incontinence, and urinary obstruction.

With the focus on business need, competitive challenges, and growing talent selection and development needs, AMS chose a competency-based strategy for human capital performance improvement. Competency models were developed by utilizing the Development Dimension International (DDI®) software, *Identifying Criteria for Success (ICS®)*, for various U.S. and international positions.

**Development**

Before implementing the competency-based initiative, AMS did a thorough needs analysis by having brainstorming sessions with HR and various other business functions, including global sales and marketing, engineering, manufacturing, customer service, and so on, and built the conceptual model to navigate on the way to the organization development goal, which was to improve the work performance and skills set of its human capital. Emerging from this process were the intended areas for implementing this strategic attempt:

- Competency-based leadership development process
- Behavioral-based interview practice
- Strategic succession management
- Career path and career development system
- Performance improvement and management

Once the purpose of the competency-based application had been identified, the logical place to begin the analysis was to look at the information AMS already had. That information included the type of business, product
mix, organizational structure, number of employees, mission and values, existing job descriptions, training materials, and performance management system. After reviewing background information and research, work content experts were identified. Work content experts were incumbents who were effective in their job, not necessarily superstars; supervisors; cross-functional team members; and visionaries and thought leaders.

The methodology selected to build models for various positions was driven by the ultimate purpose of competency application. The data collection methods included job analysis interviews, focus groups, and current job descriptions of the incumbents. The target population for critical incident interviews included job incumbents, cross-functional teams, supervisors and internal thought-leaders and visionaries.

Based on critical incident interviews, a questionnaire survey was conducted to ensure the validity and reliability of data. DDI software was used to prepare a detailed analysis questionnaire (DAQ). The DAQ was distributed to a random sample of 20% of the incumbents for a sample size of 430. The response rate was 60%. In order to ensure content validity, both importance and frequency of each job task and behavior were confirmed by the DAQ.

To validate the results further and to identify the importance rankings of competencies, a dimension (competency) confirmation questionnaire (DCQ) was distributed to supervisors and visionaries. DDI software was used to prepare the DCQ. The final competency model was a reflection of research data on a particular role gathered from current job descriptions, critical incident meetings, focus groups, and survey responses.

Statistical procedures were used to determine final dimension models for various jobs. The mean, or mathematical average, was used to determine the typical rating for a dimension or activity. For example, in the Dimension Analysis module, work content experts rated the importance of individual dimensions. A mean score was computed for importance of each individual dimension. Computing the mean score for each individual dimension in a dimension analysis answers the question, “On average, how important is this particular dimension to the job being analyzed?” Standard deviation calculations were used in the Dimension Confirmation phase of dimension analysis. These calculations showed how ratings given by different raters for the same dimension were similar to each other. Work content experts were also asked to provide ranking data in the Dimension Confirmation phase of a dimension analysis to help determine whether a particular dimension should be included in the final list of dimensions. Before any mathematical calculations were performed on the ranking data, they were converted to C scores—standard scores that have quasi-equal adjacent points on a scale. Converting ranking data to C scores not only placed the rankings on a linear scale, but also made comparisons of rankings between two different jobs reliable. Finally, in order to assess the content validity, before finalizing the dimension model, the comprehensiveness ratings were also determined by having work content experts (WCE) indicate the percent of job covered by the activities and/or dimensions covered in analysis (DAQ and DCQ). If WCEs selected “high” comprehensiveness rating that means they believed a person who performs acceptably in the dimensions and/or activities will be successful in the job being analyzed. If WCEs selected a “low” comprehensiveness rating, that means they believed a number of dimensions and/or activities important to job performance have not be included in the analysis or that there may be irrelevant dimensions and/or activities in the analysis. (ICS® reference manual, 2000, pp. 2-18)

**Implementation**

Today, HR executives and practitioners are faced with many new opportunities to utilize competency methods to improve individual, team, and organizational performance (Athey & Orth, 1999). The key concern is to leverage existing competency practices to have a significant and measurable impact on business results (Athey et al., 1999). At AMS, the implementation of competencies is still in its beginning stage. Early results indicate that the process is valuable and insightful. Figure 1 summarizes the competencies for human resource development.
The major issue that may occur while implementing the competency strategy is the scope of application of competency models across various HR systems. AMS adopted an incremental change strategy. Figure 2 summarizes the initial areas where competency-based applications are to be exercised.

**Staffing and selection.** Many agencies are using competencies as the foundation for recruitment and selection (Rodriguez et al., 2002). AMS considered staffing and selection as the first step for implementation by putting a behavioral-based interview guide in place for the selection function. Interview guides were prepared based on competency models, using the benefits of DDI software. The competencies were divided into two broad categories: competencies that are relatively easy and those that are relatively difficult to coach. During the interview, more focus and higher weights were assigned to those competencies that are most critical for success in the position and to
those competencies that are difficult to coach. Using competencies as the basis for staffing provided the flexibility and assurance needed to select and place individuals where they can best serve the organization (Rodriguez et al., 2002).

**Education and training.** The education and training function was another area in which to leverage competency-based strategy. The implementation process began with an analysis to identify competency gaps. The result of the gap-analysis exercise was to identify competencies that current incumbents needed to improve. For training and education purposes, competencies were divided into three broad categories: fundamental competencies (essential competencies that all employees share across the board), core competencies (functional competencies that help perform the current job effectively), and visionary competencies (competencies that prepare an individual for the next level or future job). Various sets of online and in-house competency-based programs were designed. Specific emphasis was placed on training evaluation by developing training transfer and performance impact assessment systems. Figure 3 summarizes the competency-based education and training systems.

*Figure 3. AMS’s Competency-Based Training & Education System*

**Career development.** The third application area was career development. Here, the competencies were used to identify the long-range potential of employees. AMS believes that high-caliber and high-potential employees who consistently exhibit effective leadership competencies will progress in satisfying career paths. This process will be validated and closely monitored against business results and performance evaluations, while competency-based training and education functions allow employees to enhance their leadership competencies. Formal competency-based training programs will be designed and conducted via classroom-based learning, computer and interactive video-assisted training, to e-learning. The aim of this initiative is to provide creative, convenient, and technologically advanced learning opportunities to employees to support them in their career development.

**Performance management.** The success of any company depends on how well it is able to align the goals and objectives of individual employees with the goals and objectives of the organization. A company can strengthen the connection between its strategic plan and the work the employees perform with a competency-based performance management system. The next step for competency implementation at AMS is performance management. Competencies provide the basis to identify performance gaps. Taking the lead from there, competency benchmarks will be used to anchor the rating scale for the multi-rater performance review process. These competency ratings will be combined with ratings on the achievement of other business results and goals.
Challenges Faced by AMS

Following are some of the major issues that AMS encountered while developing and implementing competency models.

1. What are the pressing strategic business needs that are driving the competency-based strategy?
2. Should AMS use generic competency models or develop its own?
3. How should key stakeholders and internal opinion leaders be involved in the process of developing and implementing a competency-based strategy?
4. How broad and extensive should the data collection be?
5. How much evidence is sufficient to justify inclusion of competencies in the model?
6. What should be the scope of application of competency models across many different HR functions?
7. How could a behavioral descriptors format best suit the implementation?
8. Who will drive the implementation?
9. What will it take to implement strategy successfully in terms of dollars?
10. What system will be used to evaluate and measure the impact of the competency-based initiative?

Contributions to HRD Knowledge

This literature review and case study contribute to HRD knowledge by examining the importance and applicability of a critical OD and performance improvement strategy. This study provides deeper understanding that, despite the impressive benefits; the decision to introduce competency models into the organization should not be taken without due consideration. Instead, organizations will need to be prepared to devote a significant amount of time for planning and communication, data collection, change planning, and resistance management. This paper opens new avenues for research, particularly in identifying numerous areas of competency-based strategy implementations.

A Mediated Hierarchical Regression Analysis Of Factors Related To Career Research Productivity Of Human Resource Education And Development Postsecondary Faculty

Heather A. Williams  
The University of Southern Mississippi

Joe W. Kotrlik  
Louisiana State University

This study sought to determine factors that drive an HRED postsecondary faculty member to be a high producer of research. A HRED faculty career research productivity mediated model was designed and evaluated based on theory and previous literature. The model consisted of environmental variables (control variables), perceived organizational priorities (independent variables), personal interests/abilities (mediator), and research productivity (dependent variable measured by a weighted career research productivity score).

Keywords: Research Productivity; Postsecondary Faculty; Hierarchical Regression

Publications in postsecondary education have existed for some time as a standard by which individual faculty member’s tenure is granted (along with teaching and service), a measure against which institutional programs are judged and rated, grant funding is obtained, and a method by which a discipline’s progress is tracked (Campbell, Gaertner, & Vecchio, 1983; Cargile & Bublitz, 1986; Hasselback & Reinstein, 1995; Ingram & Petersen, 1991; Schultz, Mead, & Khurana, 1989; Vasil, 1996). Within higher education, it has been stated that faculty members with a successful publishing record and expertise in research are often admired by other faculty and students as on the cutting edge of their field and are regarded as knowledgeable about most issues in their field (Levine, 1997). In addition, these highly productive faculty members are seen as more powerful educators and often serve as a frame of reference for junior faculty members and others who are developing their own research agenda. In addition, research within a discipline is important as a conduit of thought and progress toward an understanding of phenomena within the discipline.

Problem Statement

Due to the value postsecondary institutions have and currently place on research productivity in the granting of promotion and tenure to faculty, as well as the basis of the recognition/rating of departments and/or universities for their research productivity; the ongoing growth of the HRD discipline; and the paucity of research on factors explaining research productivity specifically of HRED faculty members, a need existed to investigate what drives an HRED postsecondary faculty member to be a high producer of research. In this study HRED is composed of HRD, adult education (AE), organizational behavior (OB) disciplines.

Theoretical Base

Motivation theory, specifically drawing from cognitive motivation theory works by Thierry and Bandura, was utilized as the theoretical framework for this research. This allowed the investigation of both individual and institutional factors to be considered as potential drivers or motivational antecedents to the research productivity of HRED faculty.

Works by Thierry and Bandura discuss the fact that educational institutions are more individualistic and have potentially different outcomes with the application of motivational theory. These authors address the individual aspect of cognitive motivation and take into account environmental factors. Thierry’s (1998) focus on cognitive theory posits that when a person is actively processing information, that person will perceive signals, interpret signals, store the information in memory and retrieve the information when needed; therefore influencing some behavior. Cognitive motivation involves an individual’s cognitive processing of multiple factors - including self (interests, skills, abilities, desires, and needs) and environment (verbal and nonverbal rewards and punishments).

Copyright © 2004 Heather Williams & Joe Kotrlik

Bandura (1977) states that cognitive theories explain behavior in terms of “central processing of direct,
vicarious and symbolic sources of information” (p. 192). People engage in behaviors when they judge their coping skills are sufficient, as well as determine the level of effort to expend and level of persistence. Therefore, it is efficacy that serves as a base of motivation, but is not the sole determinant of behavior. Component capabilities (i.e., incentives) must be present. Efficacy expectations are a major determinant of people’s choice of activities, effort expended, and persistence when appropriate skills and adequate incentives are present.

Considering this theoretical background, a HRED Faculty Research Productivity Model was developed in an attempt to determine factors that drive HRED faculty members to demonstrate high research productivity. This mediated model takes into consideration information provided by cognitive motivation theorists, accounts for the altruistic environment of a university, and the uniqueness of a postsecondary faculty member. Within this model, environmental variables are controlled, perceptions of organizational priorities are considered motivational antecedents, and personal interest/abilities are assumed to mediate the relationship between the motivational antecedents and the research productivity of HRED faculty members. The model is presented in Figure 1 and variable descriptions follow the model.

**Figure 1. HRED Faculty Career Research Productivity Model**

![HRED Faculty Career Research Productivity Model Diagram]

**HRED Faculty Career Research Productivity Model**

Environmental variables were controlled for in this model. The variables considered environmental were Carnegie rank, age, and time spent teaching. These variables were selected as environmental because they are part of the environment that the person once in the job has the least amount of control over. They represent the priorities of the institution that do not have to be assumed, e.g., a particular Carnegie rank has a particular research focus. Time spent teaching is generally controlled by the administrators of the institution, and there is no need for a faculty member to attempt to perceive what their teaching load will be because it is assigned to him or her. These two variables are part of what Campbell (1990) discusses as job specific variables. Age is present in the model as a controlled variable due to previous research stating that age has an effect on research productivity.

Perceived organizational priorities variables were the motivational antecedents in this model. The variables included presence of institutional funding for research, opinion of research resources provided by the institution, and agreement with the statements “Research/publications should be the primary criterion for promotion of college teachers at this institution,” and “At this institution, research is rewarded more than teaching.” These variables are surrogates of motivation because no direct measures of motivation were available in this data set. These variables served to address Bandura’s (1977) references to vicarious experience, verbal persuasion, and psychological states. For example, what is rewarded in an institution can be observed through modeling and/or observation, as well as verbally reported. Also, the more or less satisfaction/agreement one possesses due to the promotion of certain activities within his or her work environment, the more or less emotional arousal that individual will exhibit which may then affect his or her performance, behavior or actions. These variables are present also due to discussion by Thierry (1998) of an individual’s perception of and interpretation of signals. Additionally, the discussion by Bandura (1977) and Staw (1984) pertaining to rewards influencing behavior or outcomes is demonstrated by the variables selected.

Personal abilities/interests was represented by preferred time spent in research. This variable served as a mediator in the model and acted as a surrogate to one’s personal abilities/interests. This variable was selected because it represents both Staw’s (1984) discussion of the altruistic environment, and advancement of self-goals, and of Bandura’s (1977) performance accomplishments. It is the personal aspect of research productivity. Whereas the organizational priority variables serve as the person’s processing of the environment, this is the person's processing of preference and skill level within him/herself. This variable is presented as a mediator due to discussion by Bandura (1977) stating that of the four factors potentially influencing personal efficacy (performance
accomplishments, vicarious experiences, verbal persuasion, and emotional arousal), the factor of performance accomplishments provides the greatest influence.

Research productivity was selected as the dependent variable for this study and was represented as career research productivity score. This variable was selected to represent a person’s outcome, action or behavior - i.e., the demonstration of the end result of the individual taking in and processing environmental and personal variables and then reacting.

**Purpose And Objectives**

It was the purpose of this research effort to investigate what drives an HRED postsecondary faculty member to be a high producer of research. The objectives of the study were 1) describe HRED faculty members on selected demographic/professional variables, 2) describe the career research productivity of HRED faculty members in various outlets, and 3) determine if selected variables explain a significant proportion of the variance in the career research productivity of HRED faculty members.

Faculty research productivity was defined in this research effort as any scholarly research produced by a faculty member that contributes to the knowledge base of a discipline. For the purposes of this study, research productivity included articles/creative works in refereed/juried media; articles/creative works in nonrefereed/nonjuried media; reviews of books, articles, or creative works; books, textbooks, monographs, and reports; and presentations and exhibitions.

**Methodology**

The National Center for Education Statistics (NCES) conducted three national studies of post-secondary faculty in the years 1988-89, 1992-93, and 1998-99. The database from the 1988-89 study was not used in this study because the instrumentation and data collection procedures were modified significantly after the 1988-89 study; therefore, only the data from the 1992-93 and 1998-99 databases were utilized. Since no significant difference existed between the career research productivity scores of the faculty in the two datasets \( r =-1.21, \) df=279, \( p=.23 \), the procedures presented below will be based on the combined data set (i.e., both the 1992-93 and 1998-99).

**Population and Sample**

The target population and frame for this study was all HRED full-time and part-time instructional and research faculty in colleges and universities across the United States who possessed academic and/or research responsibilities during the 1992-93 and 1998-99 school years. The sample consisted of 155 HRED faculty members (49 HRD, 59 AE, and 47 OB faculty members) for the 1992-93 survey, and 136 HRED faculty members (31 HRD, 53 AE, and 52 OB faculty members) for the 1998-99 survey for a total sample size of 291. It should be noted that of the 291 total sample size, duplication of respondents might have occurred from the 1992-93 and 1998-99 surveys. This information was not available from NCES to determine the extent of potential duplication. However, due to the randomness of the sample selection procedure and the large pool in the HRED target population and frame, it was assumed that duplication of respondents was not a substantial concern.

**Representativeness of Population**

To determine if this sample was representative of the population and to control for non-response error, research productivity scores were compared by sample response mode (mail versus phone follow-up) as recommended by Borg (1987) and Miller and Smith (1983) utilizing \( t \)-test procedures with an \( \alpha \) level set a’ priori at 0.05. The results of the \( t \)-test \( (r=.41, \) df=251, \( p=.68 \) revealed that no significant difference existed in the career research productivity score between the mail and phone respondents, and it was concluded that the sample was representative of the population.

**Instrumentation**

Face and content validity of the instrument were evaluated by NCES in the design of their study. NCES claimed that the instrument possessed face and content validity. To verify the face and content validity of the instrument, a panel of experts consisting of 40 HRED faculty members from across the nation was asked to review the questions and instructions. These individuals were selected on the basis that they had participated in research efforts utilizing survey research and would therefore possess an understanding of the concepts of validity as it applies to HRED faculty research productivity. The panel determined that the instrument possessed face and content validity, which supported the validity claimed by NCES.

To investigate reliability of the instrument, an internal consistency coefficient was calculated for the faculty opinion of institutional research resources scale, which is the only scale used in this study. A Cronbach’s \( \alpha \) of .72 was calculated for this scale as recommended by Carmines and Zeller (1979). According to Robinson, Shaver & Wrightman’s Standards of Reliability (1991), this scale possessed extensive reliability, which supported the
reliability findings by NCES in which it was reported that all variables had acceptable reliability based on test-retest procedures.

**Data Analyses**

Descriptive statistics were used to describe the demographic and professional variables, and the career research productivity data. A mediated hierarchical regression analysis was used to determine if selected variables explained a significant proportion of the variance in the career research productivity of HRED faculty member. Mediated regression was selected because it was determined by review of previous research that perception of personal interest/abilities may account for all or some of the relationship between the independent and dependent variables. In addition, this procedure allowed full and partial mediation to be tested for this model.

The two categorical variables (presence of institutional funding, Carnegie rank) to be utilized in the regression were dummy coded. This procedure was performed due to the inability of SPSS to properly handle nominal variables as independent variables in regression equations. Institutional funding categories included presence of (coded as 1) or absence of research funding (coded as 0). The variable Carnegie rank was collapsed from 9 categories (public research, private research, public Ph.D./medical, private Ph.D./medical, public comprehensive, private comprehensive, private liberal arts, public two-year and other) to 2 categories (high research rank and low research rank). The collapsing of the categories was based on the mean career research productivity scores and mean time spent in research value. Those categories with individual mean values above those of the overall mean career research productivity and time spent in research values were included in the high research rank group, while those with below average individual mean values were placed in the low research rank group. Therefore, the high research rank institutions included public research, private research, public Ph.D./medical, private Ph.D./medical, public comprehensive, and private comprehensive; while low research rank institutions included private liberal arts, public two-year and other.

Regression assumptions and influential observations were evaluated. Assumptions and tests conducted were based on research by Hair et al. (1994) and Bates, Holton, and Burnett (1999). First, an initial regression was run, followed by tests for violation of regression assumptions, multicollinearity, and individual and multiple influential observations. Cases appearing to contribute to the violation of assumptions or acting as influential observations were removed (10 cases). Removing these cases reduced the CRPS overall data set to 281 cases or respondents. Once these cases were removed, regression assumptions were again evaluated, and no violation of assumptions was present and the condition of multicollinearity did not exist.

To perform mediated hierarchical regression, the alpha level was set a’ priori at 0.05 with an entry level of 0.05. The recommended ratio of observations per variable of 10:1 was adhered to (Hair et al., 1994). The four steps to determine if mediation existed and if mediation was partial or full were based on the hierarchical regression procedures reported by Hair et al. (1994), Bates and Khasawneh (2002), and Baron and Kenny (1986). The steps were: Step 1: entered control variables as block one, entered independent variables (X) as block two and regressed variables on the dependent variable (Y); Step 2: entered control variables as block one, entered mediator variable (Z) as block two, and regressed variables on the dependent variable (Y); Step 3: entered control variables as block one, entered independent variables (X) as block two, and regressed on the mediator variable (Z); and Step 4 was conducted if steps 1 - 3 produced significant models: entered control variables as block one, entered mediator variable (Z) as block two, entered independent variables (X) as block three, and regressed on the dependent variable (Y). The results of step 4 determine the type of mediation - if a significant model resulted, partial mediation existed; however, if a nonsignificant model resulted, full mediation existed.

**Findings**

**Objective 1: HRED faculty members selected demographic and professional characteristics.** Less than one-fourth (14.4%) of the respondents received funding for research of some type (mainly from their institution). The total current research funding average was $6739. Tenure was possessed by 25.4% of respondents, while 14.4% were on tenure track. The average number of years tenured was 9.25 years. The most common principal activity reported was teaching (79%), followed by research (5.2%). Approximately half (48.8%) of the respondents were engaged in research, writing, and/or creative works, mainly applied research.

**Objective 2: Career research productivity of HRED faculty members.** Five research productivity items (presentations/exhibitions, refereed and nonrefereed articles/media, books/textbooks/monographs/reports, and published reviews) were identified in the review of literature and used as the basis for the career research productivity score (presented in Table 1). Respondents reported having a greater number of presentations than any other form of research output, followed by refereed articles/juried media, and nonrefereed articles/juried media.
Table 1. Items Composing Career Research Productivity Scores of HRED Respondents

</tbody>
</table>

Note. N=281.

The formula used to calculate the career research productivity (CP) was CP = (.123*career presentations/exhibitions) + (.483*career refereed articles/juried media) + (.127*career nonrefereed articles/nonjuried media) + (.15*career books, textbooks, monographs, reports) + (.117*career published reviews). The weights were determined by a validation panel that weighted each of the 5 items used to calculate the score. The CP value was then processed one step further to obtain the career research productivity score (CRPS), i.e., CRPS = CP/years since received highest degree. The values used to compute research productivity scores were those reported by respondents in reference to the type and quantity of research each had produced over their career. The mean career research productivity score was .50.

Objective 3: Explaining the variance in the career research productivity of HRED faculty. The descriptive statistics for the variables utilized in the model are presented in Tables 2 and 3. The items “Research is rewarded more than teaching at this institution,” and “Research should be promotion criteria at this institution” were individual Likert type items with 4-point scales (1=very dissatisfied, 2=somewhat dissatisfied, 3=somewhat satisfied, 4=very satisfied). The institutional research support scale (α=.72) was composed of the following Likert type items - library holdings, secretarial support, availability of research assistants and office space - with the same 4 point rating as the independent items list in the previous statement.

<sup>a</sup>Carnegie rank was divided as described in the data analyses section of this manuscript.

The evaluation of the HRED Faculty Research Productivity Model utilizing CRPS as the dependent variable is broken down into the four steps of testing a mediated model. The results of each step are presented with “C” representing the control variable, “X” representing the independent variables, “Z” representing the mediating variable, and “Y” representing the dependent variable. Steps 1 – 3 in the hierarchical regression produced statistically significant models (Step 1 (C+X=Y) - p<.001, R²=.309; Step 2 (C+Z=Y) - p<.001, R²=.383; Step 3 (C+X=Z) - p<.001, R²=.258). Due to the significance of the models in Steps 1 through 3, Step 4 was conducted which also produced a statistically significant model (Step 4 (C+Z+X=Y) - p=.029, R²=.412).

A partially mediated model exists due to the significant result (p=.029) of Step 4, and the R² value demonstrates a large effect size (Cohen, 1988) denoting the model’s strength and practical significance. Therefore, personal interest/abilities (measured by preferred time spent in research) alters the relationship between perceived organizational priorities and career research productivity score. The regression model summaries are presented in...
Table 4, standardized betas are presented in Table 5, and correlation matrix for Step 4 is presented in Table 6.

**Conclusions**

The blocks of variables - environmental, perceived organizational priorities, and personal interest/abilities - are significant predictors of the dependent variable (career research productivity score) suggesting the existence of a partially mediated relationship. These results indicated that, after controlling for personal interests/abilities, the significant relationship between the independent variables (perception of organizational priorities) and dependent variable was reduced, but not to nonsignificance.

The HRED Faculty Research Productivity Model was proposed as a mediated model based on cognitive theory. This model is supported by the analyses conducted in this study. HRED faculty members process multiple factors including their environment, organizational priorities and self (interests/abilities), storing this information and producing some outcome, action or behavior, i.e., the quantity of career research output. Research by Thierry (1998) and Bandura (1977) is supported by this model. Organizational priorities may represent incentives or component capabilities as stated by Bandura (1977) that are encouraging individuals to produce more research over their careers, i.e., HRED faculty may be evaluating organizational priorities in a long range sense to achieve benefit over their careers. HRED faculty with higher personal interests/abilities in research produced a higher quantity of
research over their careers. This variable may represent performance accomplishments (Bandura, 1977) or internal focus on an individual (Staw, 1984), again contributing to increased career research output.

Overall, an HRED faculty member’s perception of their abilities/interests is driving their research productivity, and their perception of organizational priorities is contributing to the determination of the amount research output. These factors, therefore, influence the choice of effort to expend, choice of level of effort to expend, and choice to persist in the expenditure of that level of effort (i.e., motivation - to spend time in research, produce and continue to produce research).

By examining the beta weights of the predictor variables, their relative importance in a study is evaluated. Carnegie rank, “Research should be the primary criterion for promotion of college teachers at their institution,” time spent teaching, and the mediating variable “preferred time spent in research” possessed significant beta values for this model. Negative moderate correlations existed between low Carnegie rank (private liberal arts and public two-year, and other) and career research productivity score, demonstrating that HRED faculty members of lower ranked Carnegie institutions produced less research than did those HRED faculty from higher ranked Carnegie institutions; therefore, it is appropriate to consider Carnegie rank as a control variable in this model, as well as to recognize its potential influence on the career research productivity of the members of institutions within certain ranks.

“Research should be the primary criterion for promotion of college teachers at their institution” possessed a moderate positive correlation with career research productivity. As the opinion that research should be the primary criterion for promotion at that institution increased, research productivity increased. It is logical that the individuals agreeing with this statement would have higher career research productivity scores.

Time spent teaching possessed low negative correlations with career research productivity score and is therefore of significance for career research productivity because, as expected, as time spent teaching increased, the career research productivity decreased. Time spent teaching may vary over one’s career, which may demonstrate a long term relationship between increased time spent teaching and decreased career research productivity.

The significance of preferred percent of time spent in research as a mediating variable is highlighted by the substantial correlation between this variable and career research productivity. Preferred time spent in research is a surrogate variable to represent the individual’s perception of his or her research interests, skills and abilities. Therefore, a HRED faculty member’s perception of their personal interests/abilities in research is a crucial factor to their success in career research productivity.

Variables possessing non-significant beta values can also contribute to the value of a research effort and deserve to be discussed. For this effort, these variables include age, research was rewarded more than teaching at their institution, presence of institutional funding, and opinion of institutional research resources. These variables have been found by previous research to significantly contribute to research productivity. Age possessed a negative negligible association with the career research productivity that supports research by Williamson and Cable (2003) who stated that age was not a significant predictor in early career research productivity. “Research was rewarded more than teaching at their institution,” possessed a moderate positive correlation with career research productivity demonstrating this variable may not have been a salient variable to HRED faculty members. “Presence of institutional funding” possessed a low association with career research productivity; however, this variable’s significance in this model may have been increased if more institutions would have provided funding. Lastly, the variable “satisfaction with institutional resources” was not correlated with career research productivity.

**Recommendations/Implications and Contribution To New Knowledge In HRD**

Institutions housing HRED faculty and desiring to increase faculty members’ research output, should utilize research as the primary promotion criteria. These institutions should ensure that this is communicated to their faculty. If these institutions are lower Carnegie rank universities (e.g., private liberal arts or public two-year), their desire for faculty to produce research should be clearly communicated to override the general assumption that their institution is one of a Carnegie rank that would not expect research production. These institutions should also strive to reduce teaching loads if increased research productivity is desired, or possibly create combined research/teaching classes where students and professors work together to throughout the course with the end product of publishable research created as a joint effort between the professor and students.

Further, to assist in the development of current HRED faculty’s personal interests/abilities in research and therefore to increase research productivity, these institutions should also set up programs to increase current faculty members’ personal interests/abilities in research. For example, a mentoring program could be developed to assist faculty in increasing their research abilities. Institutions could also encourage participation in research conferences by provision of funding.
Institutions establishing hiring structures to select individuals who will be high producers of research should evaluate the personal interest/abilities in research of their applicants. This can be accomplished through the evaluation of previous research produced by the applicants - both publications and presentations, or if the applicant is a recent graduate, previous research publications and presentations, advisor's research productivity, and the scholarly output of the graduate’s degree granting department can be evaluated (Williamson & Cable, 2003).

This study contributes to new knowledge in HRD through the presentation of and evaluation of a new model combining previous theory and research from education, psychology and organizational behavior. Also, this model serves as a building block for future HRD research to consider prevalent factors affecting productivity in a university setting, which as Staw (1984) states differs from a traditional business/industry setting. This study provides a preliminary set of guidelines for colleges and universities to utilize when striving to build a research productive environment. It also serves as a part of a puzzle to build stronger research programs in HRD departments across postsecondary institutions noting that further research is needed through the study of leading researchers in HRD as well as leading research institutions. Lastly, through the increase of research productivity of HRD faculty, new and uncharted areas may be addressed increasing the value of HRD in both academic and practical worlds.

Variables Influencing Time Spent in Research of Human Resource Education and Development Faculty Members

Heather A. Williams
The University of Southern Mississippi

Joe W. Kotrlik
Louisiana State University

This study sought to determine variables that influence HRED postsecondary faculty to spend more time in research than fellow HRED postsecondary faculty. Reviewing theory and literature led to the design and evaluation of a mediated model investigating the influence of environmental variables (control variables), perceived organizational priorities (independent variables), and personal interest/abilities (mediating variable) on the amount of time spent in research.

Keywords: Time Spent in Research, HRED Postsecondary Faculty, Mediated Model

Numerous institutions’ promotion and tenure systems as well as reward systems are based on research, teaching and service (Kotrlik et al., 2002; & Read, Rae, & Raghunandan, 1998). In the past, the type of institution was the determining factor as to how weights per factor were distributed; however, a trend toward greater emphasis on research across all types of institutions has arisen and increased over time (Seldin, 1984). Evidence of this trend is supported by research from Perry, Clifton, Menec, Struthers, and Menges (2000) who stated that Liberal arts colleges are pushing faculty members to produce more to ensure promotion and tenure. Additionally, Henthorne, LaTour, and Loraas (1998) reported many “teaching oriented” schools are requiring publications in refereed journals for tenure and promotion; while McNurlen and West (2000) reported findings from several studies that research productivity was valued over the quality of teaching and service.

Aside from the duties of establishing promotion, tenure and reward structures, institutions are also faced with the challenge of upholding their ranking, establishing their prestige, and improving their economic status (Blackburn et al., 1991; Ohio State Legislative Office of Education Oversight, 1993). Blackburn et al. (1991) stated that it is hoped that the increase in significance placed upon research productivity will enhance an institution’s reputation and economic status. Perry et al. (2000) reported findings from a study by Boyer (1990) that research activity is increasingly viewed “as a key element in status attainment of postsecondary institutions” (p. 167).

Creamer (1998) addressed these issues in stating, “faculty publishing and productivity are often used as an index of departmental and institutional prestige” (p. 1). While Henthorne et al. (1998) also discussed institutional rank and performance stating that bench marking of an institution’s research productivity allows demonstration of that institution’s ranking and performance. DeMeuse (1987) reported program quality is commonly judged by the productivity of its faculty members. And Olsen (1994) reported that increases in productivity lead to high prestige for the university and the student alike.

Porter and Umbach (2000) reported that institutions are concerned with increasing teaching loads due to a potential loss in grant revenue. Grant revenue is an important source of an institution’s budget; therefore, research derived from funding is an important factor for an institution to consider. The Ohio State Legislative Offices of Education Oversight (1993) report stated that public institutions receive state funding based on enrollment and in order to maintain enrollment, institutions must attract and retain students. An institution’s prestige, that is, the presence of known faculty members (for their research), higher quality graduate programs, and exceptional departments are more likely to attract quality students, and therefore maintain adequate state funding.

Just as individuals and institutions are assessed based on their research output, so is a discipline (Henthorne et al., 1998). Disciplines build and disseminate knowledge through productivity of research (Dundar & Lewis, 1998). Faculty members may stay current in their discipline through conducting research (Ohio State Legislative Office of Education Oversight, 1993). Progress of newly formed disciplines is also judged through evaluation of a discipline’s research productivity (Williams, 2000). This calls attention to the faculty members within that discipline who are not only participating in its development, but also instructing those who will further develop the discipline in years to come. Research also serves to provide progress toward an understanding of phenomena within the discipline.

Problem Statement

Research productivity has been viewed as a valuable entity reaching as far back in postsecondary history as the early 1910's (Cattell, 1910). Due to the value postsecondary institutions place on research productivity, the ongoing growth of the HRD discipline, and the paucity of research on factors explaining time spent in research by HRED faculty members, a need exists to investigate what drives an HRED postsecondary faculty member to spend time in research (Bailey, 1992; & Liddle, Westergreen, & Duke, 1997). This study will complete this investigation through the use of past research on faculty members' research productivity and two National Center for Educational Statistics (NCES) data sets (National Study of Postsecondary Faculty Studies, 1992-93 and 1998-99).

Background

Numerous research efforts have been conducted in related disciplines addressing faculty research productivity. Resulting from these studies is a key set of variables that have been shown to be related to research productivity including institutional support, funding, teaching load and level, time spent, faculty opinion of the environment, interest in research and characteristics of the research environment.

“Institutions play a significant role in determining both individual and departmental productivity” (Dundar & Lewis, 1998, p. 613). Institutional support has been measured as the number of teaching/research assistants assigned to a faculty member, the hours of assignment, the ratio of such hours allocated per faculty member, institutional and departmental support for research, administrative support, quality of computing facilities, size of libraries, and funding. The variable funding was found to be of major importance in a study by Snyder, McLaughlin, & Montgomery (1990). They stated that in order to have successful research faculty members, research activities must be properly funded. Teodorescu (2000) found the amount of research funds received in the past three years to be an important correlate in the majority of countries in his study. Dundar & Lewis (1998) also found that financial support was highly correlated to productivity.

The type of institution has been reported to be correlated to research productivity (Bailey, 1992). Radhakrishna et al. (1994) reported previous research determined that faculty members in major research institutions published more than faculty members at four-year colleges. Bailey (1992) found an increase in research productivity from Liberal Arts II Colleges through Research I Universities. Related to type of institution, Bland and Ruffin (1992) found several characteristics of one’s environment to be associated with research productivity including clear goals, research emphasis, culture, positive group climate, assertive participative governance, decentralized organization, frequent communication, accessible resources, sufficient size, age and diversity of the research groups, appropriate rewards, concentration on recruitment and selection, leadership with research expertise, and skill in initiating appropriate organizational structure and participatory management practices.

Noser et al., (1996) investigated teaching loads and teaching level. Teaching load and teaching level were found to be significantly related to research output. Faculty members with lower teaching loads and those who taught primarily at the graduate level demonstrated the highest mean research scores. Butler & Cantrell (1989) found that the valance of a reduced teaching load was positively related to research production.

Choices faculty members make about how they spend their time may affect productivity (Cohen & Gutek, 1991). Faculty members’ time can be spent or allocated for numerous duties: teaching, research, service, committee work, editing, advising, and administration. A report conducted by Oklahoma State Regents for Higher Education (1993) stated faculty members felt they spent too much time in administrative roles and not enough time in personal development activities.

Williams et al. (2001) found teaching, research, service and administrative time percentages explained a significant proportion of the variance found in research productivity. Bailey (1992) found an increase in research productivity was supported by amount of time spent on research activities. Liddle et al. (1997) studied operationalization of time spent in relation to publication productivity, and their study found time spent in research activities, time spent advising, and total hours worked significantly correlated with increased production of research, with the majority (78%) indicating they would prefer to spend more time in research. Teodorescu (2000) found time spent on research significantly affected productivity in four countries including the United States. Conversely, Kotlrik et al. (2001) and Bartlett et al. (2001) found that time allocated to research did not significantly explain research productivity.

Faculty opinion may influence productivity whether it is an opinion of job satisfaction, research/training environment, funding adequacy, or freedom to collaborate. DeMeuse (1987) found a strong relation between subjective opinions of program quality and the number of articles that a university published using Journal of Applied Psychology articles. Blackburn et al. (1991) reported characteristics of employing institution were not
related to research productivity. Additionally, Williams et al. (2001) found organizational culture/support for research did not explain a significant proportion of the variance in research productivity.

Lastly, interest in research has also been investigated. Blackburn et al. (1991) found this variable did not predict productivity. However, Behymer (1974) found research interest to be the best predictor of research productivity and Gottlieb et al. (1994) found personal preferences predicted productivity. Ramsden (1994) found early interest in research to be correlated with research performance. Nosier et al. (1996) found attitude toward research to be related to research productivity.

Theoretical Framework

Cognitive motivation theory was utilized as the theoretical framework for this research effort which allowed the investigation of both individual and institutional factors to be considered as potential drivers or motivational antecedents to the time spent in research by faculty members. Campbell’s (1990) discussion workplace performance, Staw’s (1984) discussion of work motivation theory, and Thierry’s (1998) and Bandura’s (1977) discussions of the individualist nature of educational environments were referenced and utilized to develop a HRED Faculty Research Productivity Model - where research productivity is operationalized as time spent in research.

The HRED Faculty Research Productivity Model is a mediated model constructed for the purpose of identifying factors driving HRED faculty to spend time in research in which environmental variables are controlled, perceptions of organizational priorities are considered motivational antecedents, and personal interest/abilities are assumed to mediate the relationship between the motivational antecedents and the time spent in research by HRED faculty members. The model is presented in Figure 1.

Figure 1. HRED Faculty Research Productivity Model

Purpose and Objectives

The purpose of this research effort is to investigate what drives an HRED postsecondary faculty member to spend more time in research than other HRED faculty members. The objectives of this research effort are to 1) describe HRED faculty members on selected demographic/professional variables; 2) describe differences in faculty members’ actual time spent versus their preferred time spent teaching, at research, on professional growth, at administration, on service activity, and on consulting; and 3) determine if selected variables explain a significant proportion of the variance in the amount of time spent in research of HRED faculty members.

Methodology

The National Center for Education Statistics (NCES) conducted three national studies of post-secondary faculty in the years 1988-89, 1992-93, and 1998-99. The database from the 1988-89 study was not used in this study because the instrumentation and data collection procedures were modified significantly after the 1988-89 study; therefore, only the data from the 1992-93 and 1998-99 databases were utilized. Since no significant difference existed between the time spent in research by the faculty in the two datasets (t=1.01, df=289, p=.32), the procedures presented below will be based on the combined data set (i.e., both the 1992-93 and 1998-99).

Population and Sample

The target population and frame for this study was all HRED full-time and part-time instructional and research faculty in colleges and universities across the United States who possessed academic and/or research responsibilities during the 1992-93 and 1998-99 school years. The sample consisted of 155 HRED faculty members (49 HRD, 59 Adult Education (AE), and 47 Organizational Behavior (OB) faculty members) for the 1992-93 survey, and 136 HRED faculty members (31 HRD, 53 AE, and 52 OB faculty members) for the 1998-99 survey for a total sample
size of 291. It should be noted that of the 291 total sample size, duplication of respondents might have occurred from the 1992-93 and 1998-99 surveys. This information was not available from NCES to determine the possibility of duplication. However, due to the randomness of the sample selection procedure and the large pool in the HRED target population and frame, it was assumed duplication of respondents was not a substantial concern.

**Representativeness of Population**

To determine if this sample was representative of the population and to control for non-response error, research productivity scores were compared by sample response mode (mail versus phone follow-up) as recommended by Borg (1987) and Miller and Smith (1983) utilizing t-test procedures with an alpha level set a’ priori at 0.05. The results of the t-test ($t=1.35$, $df=251$, $p=0.16$) revealed that no significant difference existed in the time spent in research between the mail and phone respondents, and it was concluded that the sample was representative of the population.

**Instrumentation**

Face and content validity of the instrument were evaluated by NCES in the design of their study. NCES claimed that the instrument possessed face and content validity. To verify the face and content validity of the instrument, a panel of experts consisting of 40 HRED faculty members from across the nation were asked to review the questions and instructions. These individuals were selected on the basis that they had participated in research efforts utilizing survey research and would therefore possess an understanding of the concepts of validity as it applies to HRED faculty research productivity. The panel determined that the instrument possessed face and content validity, which supported the validity claimed by NCES.

To investigate reliability of the instrument, an internal consistency coefficient was calculated for the faculty opinion of institutional research resources scale (the only scale used in this study). Cronbach’s alpha of .72 was calculated as recommended by Carmines and Zeller (1979). According to Robinson, Shaver & Wrightman’s Standards of Reliability (1991), this scale possessed extensive reliability, which supported the reliability findings by NCES in which it was reported that all variables had acceptable reliability based on test-retest procedures.

**Data Analysis**

Descriptive statistics were used to describe the demographic and professional variables, and time spent data. A mediated hierarchical regression analysis was used to determine if selected variables explained a significant proportion of the variance in the time spent in research of HRED postsecondary faculty members. Regression assumptions and influential observations were evaluated. Assumptions and tests conducted were based on research by Hair et al. (1994) and Bates, Holton, and Burnett (1999).

To perform mediated hierarchical regression, the alpha level was set a’ priori at 0.05 with an entry level of 0.05. The recommended ratio of observations per variable (10:1) was adhered to (Hair et al., 1994). $R^2$ was presented to represent effect size and was interpreted using the descriptors by Cohen (1988). Four steps were conducted to determine if mediation existed and if mediation was partial or full based on hierarchical regression procedures reported by Hair et al. (1994), Bates and Khasawneh (2002), and Baron and Kenny (1986).

**Findings**

**Objective 1: Describe HRED faculty members on selected demographic/professional variables.** Gender was divided approximately evenly among males (49.8%) and females (50.2%). The number of teaching assistants ranged from 0 to 9. Less than one-fourth (14.4%) of the respondents received research funding of some type (mainly from their institution). Tenure was possessed by 25.4% of respondents, while 14.4% were on tenure track. The most common principal activity reported was teaching (79%), followed by research (5.2%). Approximately half (48.8%) of the respondents were engaged in research, writing, and/or creative works, mainly applied research.

**Objective 2: Describe differences in faculty members’ actual time spent verses their preferred time spent teaching, at research, on professional growth, at administration, on service activity, and on consulting.** HRED respondents reported preferring to spend less time teaching and in administrative duties, and more time in research and professional growth; however, time spent teaching demonstrates only statistical significance and not practical significance as seen by the negligible Cohen’s $d$ value (.12), while other differences between preference and actual time spent in administration, research and professional growth demonstrate practical significance (Table 1).

Objective 3: Determine if selected variables explain a significant proportion of the variance in the amount of time spent in research of HRED faculty members. Following the evaluation of the regression assumptions and influential observations, 13 cases were removed due to the presence of outliers. Removing these cases reduced the TSR data set to 278 cases or respondents. Once these cases were removed, regression assumptions were again evaluated and no violation of assumptions was present. Also, the condition of multicollinearity was not present. Once the TSR overall data set was corrected, descriptive statistics of model variables were calculated. Tables 2 and 3 present the descriptive statistics for the TRS overall data set.

The evaluation of the HRED Faculty Research Productivity Model utilizing TSR as the dependent variable is broken down into the four steps of testing a mediated model. The results of each step follow with “C” representing the control variable, “X” representing the independent variables, “Z” representing the mediating variable, and “Y” representing the dependent variable. Step 1 (C+X=Y) produced a statistically significant model (p=.000), $R^2=.330$; Step 2 (C+Z=Y) produced a statistically significant model (p<.000), $R^2=.786$; and Step 3 (C+X=Z) produced a statistically significant model (p<.000), $R^2=.289$. Due to the significance of the models in Steps 1 through 3, Step 4 (C+Z+X=Y) was conducted and produced a statistically significant model (p=.009), $R^2=.794$. See Table 4 for the Model Summary, Table 5 for variables that entered into each step of the equation, and Table 6 for Step 4's correlation matrix.

Conclusions

HRED faculty members’ preferences concerning how their time is spent differed from how they actually spent their time in teaching, research, professional growth and administration. Throughout the sample, HRED faculty members preferred to spend more time in research and professional growth, and less time in administration.

The blocks of variables - environmental, perceived organizational priorities, and personal interest/abilities - are significant predictors of time spent in research suggesting the existence of a mediated relationship. A partially mediated relationship exists, indicating that after controlling for personal interests/abilities, the significant relationship between the independent variables (perception of organizational priorities) and the dependent variable, time spent in research, was not reduced to nonsignificance.

The HRED Faculty Research Productivity Model was proposed as a mediated model based on cognitive theory. This model received support by the analyses conducted in this study. HRED faculty members processed multiple factors including their environment and organizational priorities and their self (interests/abilities), storing this information and producing some outcome, action or behavior, i.e., the amount of time spent in research. Research by Thierry (1998) and Bandura (1977) is supported by this model. In this HRED Faculty Research Productivity Model, the faculty member’s perception of organizational priorities and personal interest/abilities significantly affect the amount of time spent in research. Organizational priorities may represent incentives or component capabilities as stated by Bandura (1977) that are encouraging individuals to spend more time in research. Staw (1984) states that for variables to influence productivity in a postsecondary educational environment, they must be of value to the faculty members and governed by the norms of self rather than controlled by the system.

HRED faculty with higher personal interests/abilities in research spends more time in research. This variable may represent performance accomplishments (Bandura, 1977) or internal focus on an individual (Staw, 1984). The moderate to very strong positive correlations between this variable and the dependent variables highlights the significance of preferred percent of time spent in research as a mediating variable across all dependent variables. Preferred time spent in research is a surrogate variable to represent the individual’s perception of his or her research interests, skills and abilities. Therefore, a HRED faculty member’s perception of their personal interests/abilities in research is a crucial factor to their success in research productivity.
Additionally, significant beta weights demonstrate the relative importance of percent of time spent teaching, research should be the primary promotional criteria, research is rewarded more than teaching, and preferred amount of time spent in research. The most influential variable in the model was preferred time spent in research, which again supports the value of personal interests and abilities in research driving time spent in research. The remaining three variables with significant betas demonstrate the value of an organization’s priorities on research and how the faculty perceives these; e.g., as time spent teaching increases, time spent in research decreases; and as research is rewarded more than teaching and used as a primary promotional criterion, time spent in research increases.

Recommendations and Contribution To New Knowledge In HRD

If it is the goal of an institution to increase the time its HRED faculty spends in research, it is recommended that the institution should review its time allocation policies, clarify and communicate their perspective on research, and recruit or build individuals with interests in research. Institutions can reduce time spent in administrative duties and teaching, while increasing time spent in research and professional growth. Professional growth programs can include mentorship, workshops, or conferences specifically designed to build research capabilities and interests. These programs can also assist faculty in furthering their capabilities to carry out research in areas of interest by providing funding and placing research as a priority in promotion and tenure. Additionally, evaluation of and recognition of the preferences of faculty’s time spent in various activities by administrators could allow for more appropriate allocation of duties possibly creating a faculty that is more productive in all areas of faculty responsibility.

Further, institutions with this goal can design hiring structures to select individuals who have personal interests and abilities in research. This may be accomplished by combining advertisement of research as primary promotional criteria and as the primary factor of the reward structure, and selection based on past publication and presentation records. If the applicant is a recent graduate, his or her previous research productivity (publications and presentations), advisor’s research productivity and the department’s scholarly output of their academic origin can be evaluated (Williamson and Cable, 2003).

Lastly, this model presents a starting point for institutions housing HRED faculty who desire to increase their faculty member’s time spent in research. Also, this is the first model of its kind in HRD addressing HRED faculty productivity and therefore, it serves as a bridge between traditional management productivity literature and postsecondary productivity literature.

Learning and Context: Connections in Teacher Professional Development

Barbara J. Daley
University of Wisconsin, Milwaukee

This qualitative interpretivist study analyzes the interrelationships between, the knowledge gained in teacher professional development programs and the context of employment. Findings indicate that teachers construct a knowledge base by moving back and forth between continuing education programs and their professional practice. This process of knowledge construction is affected the structural, human resources, and political frames of the contexts in which teachers are employed. Implications for research and practice are drawn.

Keywords: Learning, Context, Teacher Professional Development

Professional development for teachers has increasingly become an important issue as the standards movement (Thompson, C. & Zeuli, J., 1999) gains momentum across the United States. With an increased emphasis on assessing teacher performance based on professional standards, professional development programs are experiencing greater scrutiny. The implied expectation is that professional development programs should assist teachers in meeting the national performance standards. However, numerous authors have indicated that the present teacher professional development programs are not meeting the goals of facilitating teacher learning and application of new content in their classrooms. Darling-Hammond (2000) indicates that the “issue is having professional development that is sustained, content-rich and curriculum-embedded instead of what we call the sort of ‘drive-by-workshop’ or ‘spray-and-pray’ approach to professional development” (p. 8). Numerous authors have called for a new approach to professional development for teachers, including Alvarado (1999) who states, “The new professional development must be different and much more powerful, and it will involve solving problems and collaborating at levels that we have never even contemplated” (p. 36).

However, before we can begin designing new professional development programs and systems for teachers, we must first understand how teachers learn in the context of their practice. We need to be able to answer these questions: How do teachers develop their practice? What are the relationships between information presented in teacher professional development programs and the use of that information in the school or employment context? What impact does the context of teaching practice have on the development of knowledge?

The use of knowledge in professional practice is an important issue within the field of human resource development (HRD) and teacher professional development for a variety of reasons. First, schools, employers, and professionals in the United States spend billions of dollars annually on professional development programs. According to Rowden (1996) “Employers spend over $50 billion per year on formal employee training and education. Approximately $180 billion per year is spent on informal, on-the-job training” (p. 3). Despite this huge investment of capital in professional development programs, few assurances exist that the knowledge learned in these programs is linked to the context of practice.

Second, researchers in the field of HRD and continuing education have long been active in the study and analysis of professional learning (Cervero, 1992; Houle, 1980), continuing professional education (Cervero, 1988), transfer of training (Broad & Newstrom, 1992), and evaluation of continuing education programs (Ottoson, 1997). Yet, very little of the knowledge base within the field of HRD and continuing education or the research in professional and organizational learning has been incorporated into the analysis and development of teacher professional development programs. The fields of HRD and teacher professional development may well have a great deal that they can learn from each other. Each field may benefit from the development of a cross-disciplinary approach to enhancing the practice of teaching in a school context.

Conceptual Framework and the Purpose of the Study

Explored in this study were the interrelationships of two major concepts: knowledge and context. Knowledge, for the purpose of this study, was viewed as a social construction of information that occurred through a process of constructivist learning and perspective transformation. Constructivists (Brunner, 1990; Novak, 1998) believe that individuals create knowledge by linking new information with past experiences. Within a constructivist framework,
the learner progressively differentiates concepts into more and more complex understandings and also reconciles abstract understanding with concepts garnered from previous experience. New knowledge is made meaningful by the ways in which the learner establishes connections among knowledge learned, previous experiences, and the context in which the learner finds himself. Thus, constructivists believe that learning is a process of probing deeply the meaning of experiences in our lives and developing an understanding of how these experiences shape understanding. Within a constructivist framework, learning activities are designed to foster an integration of thinking, feeling, and acting while helping participants learn how to learn (Novak & Gowin, 1984).

Learning in the context of professional practice is also informed by the growing body of work in the area of situated cognition (Brown, Collins, & Duguid, 1989; Lave & Wenger, 1991), which can be conceptualized as having four interrelated learning aspects: (1) learning that is situated in the context of authentic practice, (2) transfer limited to similar situations, (3) learning as a social phenomenon, and (4) learning that relies on use of prior knowledge (Black & Schell, 1995). In this view, Brown, Collins and Duguid tell us, the authentic “activity in which knowledge is developed and deployed, is not separable from, or ancillary to, learning and cognition. Nor is it neutral. Rather, it is an integral part of what is learned” (1989, p. 32).

To examine the context of professional teaching practice, Bolman and Deal's (1997) framework was selected. Bolman and Deal (1997) demonstrated that schools and organizations can be viewed through four different lenses or frames, including the structural, human resources, political, and symbolic frame. The structural frame draws on concepts from sociology and emphasizes formal roles, defined relationships, and structures that fit the organizational environment and technology. Within the human resources frame, it is believed that organizations have individuals with needs and feelings that must be taken into account so that individuals can learn, grow, and change. The political frame analyzes the organization as comprised of groups competing for power and resources. The tools of this frame are bargaining, negotiation, coercion, and compromise. Finally, the symbolic frame (similar to organizational culture) abandons rationality and sees organizations as tribes with cultures propelled by ceremonies, stories, heroes, and myths. Bolman and Deal (1997) believe that organizations can be understood, analyzed, and changed by using different lenses and/or frames as ways to approach organizational issues. This framework was selected for the research reported here because it provides different lenses by which the researcher can examine and analyze the context in which teachers conduct their practice. The framework also provides a manageable way for the researcher to analyze the context of teachers practice.

The development of professional teaching practice has been looked at from three perspectives in the literature: program development and effectiveness, individual teacher development, and new ways to foster teacher learning. Research on program development and effectiveness indicates that the process is complex, ever changing, and involves multiple strategies and various components at various times (Loucks-Horsley, Hewson, Love & Stiles, 1998). For example, Castetter (1976) found that six factors lead to successful programs, including the development of program requirements, development need, performance targets, development plans, unit-development programs, and evaluation. Additionally, research indicates that while 85 percent of teachers report receiving less than eight hours a year of professional development in specific areas, professional development programs of longer duration are more effective (NCES, 1993-94). The impact of professional development programs on promoting individual teacher development has also been examined. Ashton, Buhr & Crocker (1984) found that high efficacy teachers had high academic standards, focused on academic instruction, articulated well-developed student expectations, developed on-task behavior, and created a supportive classroom environment. Finally, new ways to foster teacher learning have been proposed. Proposals include aligning professional development programs with national teaching standards, creating professional development programs that are continuous, rather than single offerings, and increasing both variety in subject matter and pedagogical expertise.

The literature cited here indicates that understanding teacher professional development requires an understanding of the interrelationships of knowledge and context. And yet, as Porter, et al indicate, “despite the amount of literature, relatively little systematic research has been conducted on the effects of professional development on improving teaching or on improving student outcomes” (Porter, Garet, Desimone, Yoon, &Birman, 2000, p. 6).

Specific Questions the Study was Designed to Address

This study used an interpretivist framework to search out the relationships and meanings that knowledge and context have for each other. This study was not testing a hypothesis or looking for a linear cause and effect relationship. Rather, this study provides an analysis of complex interrelationships for the purpose of understanding multiple causality. The following research questions were advanced to guide this inquiry. (1) What makes knowledge
meaningful in the context of teaching practice? (2) How is the construction of knowledge affected by the different frames (structural, political, human relations, symbolic) of the context in which teachers practice?

Data Collection and Analysis

To analyze the above research questions, teachers working in an urban school system were interviewed 9-12 months following their attendance at a university sponsored teacher development program. A “purposive sample” (Lincoln & Guba, 1985) of 18 teachers was recruited, including eight elementary teachers, seven middle school teachers and three high school teachers ranging in age from 25-45. Additionally, 11 teachers were Caucasian and seven were African American, of which eight were men and 10 were women. Data in this study were collected through semi-structured interviews and document analysis. Following human subjects’ approval, data were collected from participants who had attended a continuing professional education (CPE) program or class on topics that were pertinent to their teaching role. Participants were then questioned to determine what they had learned or not learned, how they incorporated or did not incorporate that information into their practice, and what aspects of their practice they determined to be significant in fostering their learning. Participants were also questioned about the context of their practice including the organizational structure, human resources, politics, and culture. The interview guide used in this study was designed around the two aspects of the conceptual framework.

Verbatim transcripts were created from the tape-recorded interviews. Subsequently, two data analysis strategies were employed. First, the researcher created a concept map (Novak, 1998) that depicted the connections the study participant described among learning, context, and professional practice. Novak and Gowin (1984) define a concept map as, “a schematic device for representing a set of concept meanings embedded in a framework of propositions” (p. 15). Concept maps are created with the broader, more inclusive concepts at the top of the hierarchy, connecting through linking words with other concepts than can be subsumed. This tool helped the researcher understand the conceptual relationships expressed by study participants and provided an indication of the structure of knowledge developed by each individual. The maps were used to assist the researcher in tracing the interrelationships between the concepts under study. Concept maps were also returned to teachers for their review of the accuracy of the representation of their interview.

Second, a category system was created and all data were coded within categories. The categories were used to identify thematic areas articulated by participants. The category system was developed following a review of all concept maps in the study along with the data generated in the individual verbatim transcripts. An iterative review process was used and the category system was refined three times during the process of data coding. The interview transcripts were then coded into a computerized data analysis software program.

Two quality control mechanisms were employed in this study. First, member checks were employed during the interview process to determine accuracy of information. Second, all study participants reviewed the concept map created from their interview for accuracy and completeness. Concept maps were mailed to study participants and after they reviewed the map for accuracy, they returned the maps with any changes to the researcher.

Findings

Study results indicate that teachers who attend professional development programs use this new information to continually construct and reconstruct their knowledge base. Teachers described how their knowledge base was constantly changing and that experiences, attendance at professional development programs, and dialogue with colleagues all contributed to the continual growth of their knowledge base. For example one teacher indicated:

*As a teacher, one gets kind of caught up in their own little world of doing what they do. You teach —you don't look at the big picture. Continuing education classes that I've taken have allowed me to see that big picture more. So it gives you a better sense of what the whole educational system is about - it expands what you know and what it means.*

Teachers in this study described how their knowledge base is reconstructed and changed each time they learn something new. The new information learned in professional development programs was added to a teacher’s knowledge base through a complex process of thinking about the new information, acting on the new information, and identifying their feelings about the information. Teachers indicated that the new information had to connect to other concepts before it was meaningful to them, and part of the process of making knowledge meaningful was to use it in practice in some way. Thus, transferring information to practice was essential to the process of knowledge construction because often in this process of using information, teachers again changed what the information meant to them based on the results they observed.
How Knowledge Becomes Meaningful in Professional Practice

For knowledge to become meaningful in professional teaching, practicing teachers actively engaged in a process of thinking about the information learned, identifying feelings about the information and taking some action with the new information. These findings support the constructivist theories of learning discussed earlier.

**Thinking.** Teachers actively described how professional development programs helped them learn content that they used in their teaching practice. For example, teachers interviewed in this study had learned content related to math, science literacy, family school communication, teaching strategies, teaching with technology, and curriculum development. Teachers were not only able to describe what they learned but also indicated how they use the information they learned. For example teachers indicated that they learned the following:

> I really learned that it takes a family to initiate and continue the child's development and education. I really feel that it's a huge component, whether it is a single-parent home, a two-family home, or even adopted/foster. I mean, we learned about all different types of family situations. And it was a real eye-opener.

> Well, I learned that it's a lot easier to connect my academic areas with drama than I thought it was going to be. That's for sure. And I learned some specific techniques and strategies that I could use to incorporate drama in my classroom using drama as an introductory activity to allow students to activate their background knowledge and participate in something in a different way. For example, I was doing a unit on energy and had the students play different roles as if they were designing roller coasters. And we got together a roller coaster development team and acted out what that would be like if they were on that team and we were trying to pitch an idea for a roller coaster that they had. So that required them to get into a character—and develop some ideas and ways that they could go about pitching their roller coaster.

What we see in these statements is that teachers were constantly thinking about the information they learned. They thought about it, discussed it with peers and administrators, and often tried out an activity before the knowledge became meaningful to them in their practice.

**Feeling.** Teachers in this study also explained that for the knowledge they learned in professional development programs to become meaningful, it had to be linked to some feelings they had about the information. Teachers described how continuing education programs were often a review, and they felt good about the review as it refreshed their memory:

> . . . for me the class was a lot of review. I attended [name] college and that program focused a lot on balanced literacy and whole language, so a lot of the stuff in the professional development class reinforced that information and refreshed my memory on a lot of stuff I had forgotten about. Helped me remember to do more journaling and why it's important.

Teachers discussed how they felt refreshed following continuing education programs, as if they had gained new insight. They indicated that professional development programs facilitated an open-minded approach and helped prevent negative attitudes. For example, consider the teachers who indicated:

> . . . The programs helped me understand where other people's views are coming from and also helped me take a closer look at myself, you know, a self-reflection of looking at it and saying, you can't just decide that just because a certain district is using a certain curriculum that that's the best curriculum there is. There are so many options out there in the world that you have to really think about the curriculum that you're using. It made me really think about that and be more open to new ideas.

Teachers also indicated that professional development increased their confidence and enhanced their creativity:

> I think a lot of professional development programs have helped me to think outside of the box. They helped me be willing to try things and to try different things. A lot of the continuing education classes that I have taken have been the different ones with the nature centers and the zoo, and it helped me create field trips to be an educational thing rather than only an outing for the day.

Teachers indicated in this study that a major role of professional development programs was not only to keep them up to date, but to help support teachers in being willing to try new ideas and to foster a creative approach to teaching. These findings support the work of McDaniel and McCarthy (1989) who suggest that professional development programs that “stimulate, motivate, inspire and challenge can assist teachers in renewing their confidence in the potential of teaching and thus, raise their teaching efficacy (cited in Whitworth, 1999, p. 2).

**Acting.** In addition to thinking and feeling, the third element that fosters knowledge becoming meaningful in a teacher’s practice, is action. Action may be implementing something they learned in their classroom as these teachers indicate:
I started doing some of that writer's workshop with my little one. And what I want to start soon with my kids is sort of a reader's workshop for kindergarten and getting my parents involved and sending home books in small groups and then having the kids come in and talk about them in class.

We had a math night and a reading night where we invited the parents to come in, and we had dinner. And then we had a "make it take it" night to help them make learning projects that they could do with their own children.

These teachers took specific ideas they had been exposed to in a professional development program and used them in their classroom. Often the use of these ideas was similar to what had been presented in the professional development program, but teachers were also very clear that they took the “seed of the idea” and then modified it to fit their own situation.

Teachers acted on the information in another way. Often this involved sharing knowledge or getting involved in planning for changes at the school. Teachers would find that they could use the knowledge gained in professional development programs to influence a planning process or a decision-making process. For example:

. . . we just got DI'ed (direct instruction) in our school, which was a major curriculum issue. We've mostly been talking a lot about the mathematics investigation curriculum, so I actually got engaged in a lot of different conversations about what we're doing in the class and what's being discussed in class. So I'd say that there was a lot of cross-reference there to the program I attended. I felt the need to say something about the curriculum.

For the teachers in this study, knowledge from professional development programs became meaningful as they engaged in a process that involved thinking, feeling and acting on new information. Teachers did not take something they learned in a program and simply apply it in their classroom. Rather, they analyzed the information and then were motivated or inspired to try a particular action with the information. At this point, then, the knowledge was more meaningful and more integrated into professional teaching practice.

Context
The complex process of knowledge construction and learning within teaching practice described in the previous section of this paper occurred in a particular practice context as well. The structural, human resources, political and symbolic frames described by Bolman and Deal (1997) offer a way to analyze the impact of the context on teachers' knowledge construction.

Structural frame. Teachers in this study described two types of organizational structures in their schools. Some described a decentralized structure, where they were assigned to grade level teams and given the authority and autonomy to control their teaching practices through the team. In this situation, teachers felt that they could use a great deal of information from professional development programs because in conversation with other team members, they would decide how to use, modify and/or adapt the information to their school and grade level.

In contrast, some teachers described a more traditional bureaucratic system. In these systems, it was most often the principal and assistant principal who were in charge, and teachers felt that any changes they wanted to make had to be approved at that level. Additionally, teachers described how, in these organizations, they were often cut out of decision-making processes and this impacted their ability to use new information in their practice. For example, one teacher indicated that:

The staff is beautiful in itself, but really the administration and the staff have to work together, and it's just not happening. The staff are being told a lot of things they must do, and they're not being included in the decisions, which really needs to be done. Because, the teachers are the school. And they know what's going on best in their classrooms and it's hard for the administration to know exactly what's going on every single moment of the day within how many classrooms.

An additional structural factor that teachers described as impeding their use of information from professional development programs was the school's curriculum and the process used for student assessments. The structure of the curriculum and the volume of assessments seemed to prevent teachers from attempting to incorporate too many new ideas into their teaching. Teachers indicated:

Some of what got in the way of using the information is the pressure to get through—especially at the middle school level—performance assessments. You know, a lot of the drama activities would be really cool to do and to incorporate into project-based learning, which would be any teacher's dream to do. But the fact of the matter is I need to push my kids through six assessments before the end of the year. So a lot of it [the professional development program] I felt like, "Ok, how would I ever get to this?"

Human resources frame. Within the human resources frame, teachers describe two predominant factors that seem to impede their use of new information from professional development programs: the role of orientation and the role of other teachers.
In this study, teachers described that the way they were welcomed and oriented to their school had a large impact on their willingness to use new ideas in practice. Some teachers described orientation and mentor programs that assisted them in making the transition from being a new graduate to becoming a teaching professional. In these settings, teachers described feeling nurtured and assisted with the process of implementing new ideas. However, the overwhelming majority of teachers recalled that they received little or no orientation to their school. Many teachers explained that they were hired at the last minute, given a quick presentation on benefits and salary, and then assigned to a classroom and “turned loose.” One teacher described how he spent the week before classes began putting together desks in his classroom, and then on the first day of class realized he had nothing prepared for the students but, he stated, “they did have a place to sit.” The lack of orientation programs or programs that socialized teachers to the profession left teachers feeling devalued, as if their role was one of “discipline and classroom management” rather than teaching. These teachers indicated that they were hesitant to suggest new ideas because the environment was “just about getting the work done.”

The second factor that teachers described in the human resources frame as impacting their use of new information in practice was the role of other teachers, specifically veteran or experienced teachers. Teachers often indicated a hesitancy to talk with other teachers about new ideas or new ways of doing things, not because they felt colleagues would actively block them from implementing something new, but because of a feeling that others were not interested. Consider the words of this teacher in the study:

*I would say the thing that mostly gets in the way is other teachers because a lot of times they don't want to hear—well, if the teacher's a new teacher, then they want to soak up everything. But if it's an older teacher—in the building I'm in right now there are a lot of seasoned teachers—they'd rather do things the way they've been doing them. Teachers themselves, they would be the ones that would stop me from sharing. I think that people that have been doing this longer than 10 years are comfortable in the way they're doing things, and they are just real hesitant for change.*

Political frame and symbolic frame. Bolman and Deal (1997) make a clear distinction between the political frame of the organization and the symbolic frame. And yet, in this study that distinction is not quite clear. Often it seemed in teachers descriptions that the culture or symbolic frame of the organization arose from the political frame. As such, the findings presented here are related directly to the political frame.

In describing organizational politics, teachers clearly described the impact of both internal politics and external politics on their use of knowledge from professional development programs. In terms of internal political issues, teachers described coalitions between some administrators and teachers saying, “Well, it is the favorites that get to do things.” Teachers also described the allocation of resources as an issue impacting what they did in their classrooms. Teachers indicated that at times they did not even suggest something they had learned because they knew their school or district just “did not have the money for that.” Finally, teachers described that the power vested in administration impacted not only what they did in their classrooms, but how they used new information in teaching.

*I was surprised at how the reality of the politics of teaching work. I didn't really realize that there was, you know, so much power in administration. Although there are many different situations and I'm looking forward to moving to one where things are equal in making decisions in the school. But I didn't know that there was so much politics going on in the schools. It makes a difference in what I can and cannot do.*

In addition, teachers described how the external politics of school reform, standards, and state mandates impact their use of knowledge from continuing education programs. What teachers described was a feeling of being overwhelmed with the changes, mandates and reforms. They also described a frustration with not being included in the development of the reforms, standards, and mandates. Teachers clearly felt that the things that were being imposed on them were out of their control and that their input into these changes was not welcomed. Teachers described how they would “go through the motions” of attending mandated educational programs, and then return to their classrooms and “do what I know would work.” Teachers’ feelings about mandated reforms seems to have created a vicious cycle of passive resistance to knowledge in education programs. Consider this teacher’s statement:

*We've started doing some of the reforms at my school. Now that they have this balanced literacy in the district, a lot of the teachers, even in my school, are getting like, "You know what? I'll wait this out. This will be a thing for three to five years until the next big thing comes along, so I'll do as little as I can to appear like I'm following the rules until this burns itself out." So they'll go to the meetings and not really pay attention. They'll meet with the balanced literacy coordinator, but they won't really know where this fits. There's no real "buy-in" to this reform or to this new program that they're doing because they just feel like, "eh, it'll be gone in a few years."*

The above statement is a very common description of how external political issues impact teachers’ use of new knowledge. As this teacher indicates, there is suspicion about the change, uncertainty about the value of the new
information, and distrust in a new program that may not be around long enough to invest time and energy in learning about it. When the external politics came along, one teacher explained, “I would just keep my head down and do what I know works in my classroom.”

**Implications for Future Research and Connecting HRD with Teacher Professional Development**

This exploratory study initiated an examination of the connections between teacher professional development and the context of teaching practice. More research in this area is needed, specifically, research that includes a larger sample of teachers and a more longitudinal focus. Additional research is also needed on how teachers develop their practice. In this study there were many references to teachers with numerous years of experience being unwilling to change their practice. What factors contribute to this? What differences exist between teachers who spend time and effort developing their expertise and those who do not? What impact does the context of the school have on this process? A greater understanding of the processes involved in teacher development has the potential to improve not only the delivery of programs to teachers, but also the impact of those programs on student outcomes.

Current teacher professional development programs are often based on an “update model” that relies on a one-way transmission of information. It is clear from this study that teacher professional development programs need to be based on a constructivist and transformative model that will foster the integration of knowledge, context, and teaching practice. To create these types of programs, a number of changes are needed. First, those who are planning teacher professional development can benefit from understanding alternative approaches to program design. HRD can offer alternative ways to look at teacher professional development. In this framework, an inquiry approach to professional practice development is advocated.

Second, professional development programs where teachers use an action learning (Marsick & Watkins, 1999; Marquardt, 1999) approach to analyze cases in their practice and determine not only the action to be taken but the learning that coincides with the action have great potential in teacher professional development. Even though action learning was not the focus of this study, it is clear that these types of programs can assist teachers in developing their critical reflection skills so that they can more clearly understand their own assumptions, beliefs, and philosophy of teaching and thus more fully integrate new knowledge in their practice. Additionally, an action learning approach may be helpful teachers clarify the issues that arise in urban teaching contexts and how they can more effectively incorporate the urban context in the classroom.

Third, action learning approaches have the potential to more closely align the professional development for teachers with the current changes, mandates, and reforms within the school context. Action learning focuses on the identification of problems in context, group questioning related to the problems and alternative approaches, a commitment to taking action to solve the problem, and a commitment to learning through a reflective process (Marquardt, 1999). The intent here is to take action to implement programs and/or solve problems while at the same time learning and developing professionals in the process.

Fourth, HRD researchers and practitioners have a great deal to offer schools in the areas of training, development, organizational learning, organizational change, and performance improvement. As this study indicates, few teachers have participated in training programs that were designed with the organization or school in mind. A partnership program between schools and businesses with an HRD focus may well benefit both organizations.

Finally, these implications support the recommendations of the Wisconsin Center for Education Research: “One dilemma professional development programs face is whether to focus on philosophical issues, such as changing teachers’ view of learning, or to focus on more pragmatic issues, such as the use of specific instructional approaches and curriculum materials. . . It’s important, therefore, to maintain a balance between a practical and philosophical perspective, with the understanding that at different times the process of professional development might focus more on one or the other, but that neither is sufficient alone” (p. 2). Action learning offers a methodology to focus on both the practical and philosophical.

Professional Training Programs as Tools for Effective Staff Development: A Case Study

Khalil Dirani
University of Illinois at Urbana Champaign

This study focuses on the influence of professional training programs on trainees’ development. A training program was evaluated through exploring trainees’ perceptions of its influence on their skill development. The findings suggest that while professional training programs may be relevant to trainees’ needs for career development and life-long learning, such programs fail to tackle problems specific to a trainee’s organization. In particular, it is often hard to integrate generic training ideas into specific workplace settings.

Keywords: Professional Training Programs, Trainees, Training Environment.

There is general recognition among human resource scholars that investments in training and development are associated with a range of individual and organizational benefits. The literature shows that this interest has been well documented. A substantial body of Human Resource Development (HRD) literature posits training as a vital and comprehensive component in individual and organizational development (Keep, 1989; Prais, 1995; Swanson, 1995). The goal usually is set by the organization to enhance the individual productivity and competitiveness (Swanson, 1995; Lang & Wittig-Berman, 2000). The literature also indicates that many factors were identified to have influence on training and training transfer (Holton & Baldwin, 2000). In contrast to the normative HRD training interventions, Prais (1995) suggests that work environment affects employees’ decisions to apply what they learned at training interventions. Measuring the effectiveness of training is very complex. HRD literature had devoted little empirical attention to the effect of on-the-job training on employees’ performance and development. In particular, there is a gap in the literature on studying the employees’ perceptions of the impact of generic, formal training on individuals’ skills and performance in their workplace. Such is the focus of the present study. This study is one component of an evaluation of a professional training program aimed at staff development and professional improvement.

Research Questions

This study explores three issues:
(a) Trainees’ attitudes toward the training activities they were involved in
(b) Trainees’ perceptions of the impact of the training activities on their career development.
(c) Challenges related to the training program environment brought about by trainees’ goals, interests, and learning styles.

Literature Review

The ability to learn and to convert learning into practice creates extraordinary value for individuals, teams and organizations (Ashton & Green, 1996). This interest in training and learning is associated with two different purposes. The first is the organizational development and growth through contribution to production, effectiveness, and innovation (Swanson & Arnold, 1996; Lang & Wittig-Berman, 2000); the second is the development of individuals through contribution to their knowledge, skills, and capacity to further their own learning both as employees and citizens (Barrie & Pace, 1998; Dirkx, 1997). The scope of this paper is more directed towards individual learning and development. Kolb (1984) defines learning as “the process whereby knowledge is created through transformation of experience” (p.38). Argyris and Schon (1978) explain that learning embraces cognition; thought, insight or detection, and action behavior or correction. Dirkx (1997) argued that learning occurs when the learner creates or re-organizes concepts, frameworks, and capabilities as a result of linking new and existing knowledge. Knowles’ andragogy (Knowles, 1970) suggests that adult learners are concerned with the learning process within the context of the learning purpose and situation (see also Knowles, Holton, & Swanson, 1998). Learning, thus involves the acquisition of skills, knowledge, habits and attitudes in such a way that behavior is modified (Kolb, 1984).

**Training Systems**

In wanting workers to perform new tasks and become more effective and replace outdated work habits (Cogner, 1992; Ricks, 1997), organizational leaders often require their employees to participate in training. Professional training programs are primary training tools for achieving organizational goals. Following the principles systems theory (Rummelr & Brache, 1995), a professional training program would act as independent system, with a primary role of supporting its own existence. However, the same program would be considered a subsystem with regard to the different organizations it is serving. This subsystem has a role of supporting the goals of the overall system (Kuchinke, 1998).

**Simple Exposure versus Deliberate Practice**

While workplace activities may form part of the context within which individual learning takes place, the process of learning never formally starts or stops (Watkins & Marsick, 1993). Some learning may make very little difference to the perspective of the individual whereas more significant learning may lead to a re-conceptualization of the individual’s assumptions and values. These kinds of learning could be categorized as single-loop and double-loop learning (Argyris & Schon, 1978; Senge, 1990). This sense-making process is strongly influenced by practice (Watkins & Marsick, 1993). What is more, the HRD literature makes an important distinction between exposure and deliberate practice (Ericsson & Smith, 1991). VanLehn (1989) argues that individuals need exposure to a large enough set of case experiences to begin developing a reliable repertoire of principles and a valid conceptual understanding of what they are experiencing. Similarly, some scholars advocate the notion that simple exposure to an area does not suffice. Rather individuals need to undergo extended periods of active learning to reach exceptional levels of performance (Ericsson & Charness, 1994). On the other hand, Pratt (1988) suggests that education in the form of training workshops can heighten individuals’ appreciation for guidance, strengthen motivation to develop different capabilities and facilitate the development of skills needed to build these capabilities.

**Trainees Background**

Work settings nowadays demand flexibility, communication skills, and teamwork. However, helping trainees to achieve these goals is complicated by the fact that trainees come from many different background environments, and bring their individual experiences to bear, share, reflect and learn while simultaneously working together on a challenging yet unfamiliar task (Cogner, 1992). This suggests that the emphasis in knowledge-creating organizations should be on finding new ways to encourage people to think creatively and feed their thoughts back into the organization (Cohen, 1990; Montesino, 2002).

**Learning Styles**

Adult learning theory suggests that individuals differ in their learning styles. There are numerous ways by which we learn (Watkins & Marsick, 1993). Multiple instructional techniques increase the likelihood that at least one, if not several, methods will be compatible with an individual’s style (Bryson, 1936; Merriam & Brockett, 1997). Multiple learning methods are essential to a well-designed program (Cogner, 1992) because they can contribute to helping learners seek out developmental experiences after the workshop has ended (Holton, 1996; Russ-Eft, 2002). Nowadays, being able to benefit from formal training experiences is essential for the success of the professional development of employees more than ever. An ability to maximize learning in such contexts is not limited to accruing benefits for the development of short-term individual competencies but for the growth of such competencies over the long haul as well (Holton, 1996).

**Effective Workshops**

Contrary to the practitioner myth of engaging learners with interesting activities, research shows that participants most satisfied with a program are not necessarily those who learned the most (Alliger & Janak, 1989; Dixon, 1999). Training outcomes are more likely to have a positive effect on employee attitudes where employers develop formal, structured approaches to training (Heyes & Stuart, 1996). In addition, because participants gain knowledge and expertise at training workshops does not mean that they will use it in the workplace (Gielen, 1995). Heyes (1998) suggests that the impact of training provision on performance outcomes is dependent on how and in whose interest skills are deployed at the workplace.

**Transfer of learning**

Keep (1989) argues that training investment constitutes a powerful signaling device to reassure employees that they are valued by their employers, which in turn enhances employee motivation and commitment to the organization. In addition, Keep suggests that social and political processes at the level of the workplace shape the distinction between skill acquisition and skill development, a distinction conventionally referred to as the problem of transfer of training (see also Russ-Eft, 2002). A wide variety of trainee characteristics are likely to impact the effectiveness of training. Noe (1986) identifies personality and motivational factors and develops an expectancy model that hypothesizes the process by which trainees’ attitudes concerning their jobs and careers and their perception of the work environment influence training outcomes. The effectiveness of a training program can also be
influenced by events prior to training (Baldwin & Magjuka, 1991), post-training activities (Baldwin & Ford, 1988; Orpen, 1999), and transfer motivation (Holton, 1996). This latter transfer motivation could be explained on the basis of theories of human behavior including expectancy theory, equity theory, and goal-setting theory (Yamnill & McClean, 2001).

Methodology

This research adopted a single case study design. It was conducted between September and December 2002 in the context of a training services program offered by an HRD department in a large Midwestern state university. The training is referred to as Foundations program. The foundations program provides a training and development opportunity for professionals aimed at improving productivity, increasing effectiveness, polishing performance and fulfilling personal goals. Some of the workshops offered in the program contribute toward the completion of a non-degree certificate in professional development. A key component of this program is its emphasis on training and development activities in the form of one-day off-the-job workshops that aim to impact on-the-job performance. Thus, the program provides an ideal case for examining the issue of training effectiveness and transfer.

The research utilized a multi-method approach combining qualitative and quantitative methods. Qualitative procedures included attending and observing four different workshops. Observations were focused by the use of a set of guidelines to maintain focus on the issues at hand. To avoid imposing the researcher’s interpretations of these observations on what participants could have attributed to their experiences, there was a need to validate the researcher’s interpretations. Such validation was ensured by conducting five interviews with a randomly selected group of participants. Five lengthy semi structured interviews were conducted with the program director, one trainer, and three participants. The first interview was with the program director to investigate the formal structures, processes and general background of the program in general, and the Foundations training workshops in particular. The second interview was with a trainer and aimed to investigate the background, preparation and perception of the program, and attitudes towards the trainees and opinion about some factors that affect the training process. Finally, three participants, one male and two females, were interviewed to get their perceptions of the Foundations training workshops in terms of helping them develop new skills.

Quantitative procedures were used to assess the immediate training outcomes in terms of the adoption of new and different attitudes and practices (i.e., transfer). To this end, a questionnaire was designed to gather data on three broad issues: Trainees’ experiences of training and training instructors at the workshops, and trainees’ perceptions regarding training outcomes and work environment factors that trainees think they affect training transfer. To get a better understanding of the participants’ responses, the questionnaire included some background and contact information, a number of Likert type items and some free response items. The questionnaire was administered to all 120 participants attending workshops in the Foundations program. The questionnaire was distributed directly to all participants at the end of each workshop and it was made clear that participation was voluntarily and confidentiality guaranteed. A total number of 101 questionnaires were completed (82.5% response rate). Analysis of the quantitative questionnaire was through descriptive statistics.

Two major limitations should be noticed in this study. First, the findings of this study could be subject to other interpretations due to the environment surrounding the research as well as the observer’s subjectivity. We cannot rid ourselves of this subjectivity, nor should we wish to; but we ought, perhaps, to pay it more attention (Cheater, 1987). Most significantly, though, analysis of the perceptions and experiences of employees towards training activities will help develop our understanding of the range of factors that mediate and impact on the effectiveness of training. Further research is clearly needed on the complex question of training transfer and effectiveness, particularly in terms of the influence of the wider HRD environment and the dynamics by which training programs help translate training into positive outcomes for productivity in the workplace. Such research would need to examine the financial and productivity benefits (Green, 1997), as well as the long-term benefits for the company and the workforce in terms of cultural and behavioral change. In terms of the second limitation, while the depth of investigation gives a thorough understanding of one single study, it is likely that it is only specific to the case at hand and thus limited to generalization.

Results

This study yielded a broad perspective on issues related to training programs. The issues explored related to trainees’ experiences with, and attitudes towards, the training activities they were exposed to and how such training interventions affected trainees’ career development. The findings showed that the training workshops were well structured, convenient for the trainees and consistent with their needs for career development and life-long learning.
Background and Experience of Participants

To have a better understanding of the trainees’ purposes for attending the workshops, we asked them in the survey to provide information regarding their background and their experiences with the Foundations training program. The trainees reported a median of 10 years of work experience. To our question about “the number of workshops already completed,” 101 respondents reported a median of four workshops. When asked whether they were seeking a certificate through attending the workshops, 78% of respondents answered in the positive and 23% in the negative.

Trainees’ Attitudes toward the Training Program

Qualitative data collected aimed at understanding trainees’ purposes from training, effectiveness of the Foundations program, and applicability of information back at work. In-depth investigations showed that the premise and main motive of a trainee to getting a certificate was to get promoted. The majority of the trainees belonged to this category according to the program administrator: “Supervisors encourage employees to take certain classes because they think these classes would help the employees when they have their employee annual review and are also critical to get the employees promoted.” In addition, the following comments from different trainees eloquently represented this category: “I am here because my boss wanted me to take these workshops, these [workshops] are critical for my promotion. I will be reporting on this when I go back” (W3, C3), and “Going to training is associated with both my (work) performance review and salary increase” (W2, P15).

The Training and Development component of HRD has had a long tradition of utilizing instructional and information technology in doing its work. The Foundations program was no exception. Foundations workshops made greater use of a wide array of media, and utilized new tailored, experience-based learning methods. Many media were used, including audiotapes, filmstrips, slides, opaque and transparency projections, and videotapes. Still some trainees had difficulty with taking notes while engaged with one of the media used: “I want a print out of the chalkboard in the video.”

Trainees’ Perceptions of the Impact of the Program

Questions #3 through #6 of the survey were Likert scale questions. Respondents were asked to rate the degree of their satisfaction with regard to four topics. On a continuum from “Highly Dissatisfied” to “Highly Satisfied,” we asked respondents to rate their degree of satisfaction with regard to the relevance of the workshops to their personal development and with regard to the applicability of these workshops back at the job. We also asked trainees to rate their degree of satisfaction with regard to the topics’ appropriateness and with regard to quality of information provided by trainers. Table 1 presents trainees’ responses to these questions. The table gives a basic picture of the trainees’ satisfaction regarding information offered and regarding interaction with trainers.

HU = Highly Unsatisfied; U = Unsatisfied; N = Neutral; S = Satisfied; HS = High Satisfied

The trainees surveyed in all four workshops reported high satisfaction with the relationship of the training workshops and their personal learning experience. In response to question #3 “degree of personal satisfaction (relevance or applicability) of the workshop to the trainee,” 75% of respondents indicated that they were “highly satisfied” or “satisfied” with the content and relevance of the workshops to their personal development. Twenty percent of the respondents were “Neutral” and only six percent were not satisfied with such relevance. With regard to professional development, the literature suggested that the contents of generic workshops would not count towards the professional development of the trainees. The data collected in this research showed something different. The trainees indicated high satisfaction with respect to the applicability of the subjects discussed (such as flexibility, communication skills, and teamwork) professionally.
In response to question #4 “degree of relevance or applicability of the workshop to the trainee’s professions,” 85% of the respondents indicated they were “highly satisfied” or “satisfied” with the relevance of the workshops to their professional development. Ten percent of the respondents were “Neutral” and only five percent were not satisfied with the content of the workshops as being relevant to their personal development. These views are evident in quotes, such as “It was very informative and I now see things in a different perspective” (W4, C17) and “Very nice and thorough, pleasant and effective. Content was excellent, I would not drop anything” (W3, V12).

Question #5 asked about the “quality of the information provided by the instructor.” While the majority of respondents showed satisfaction or high satisfaction with the quality of information provided by the trainers (92%), some respondents were neutral (8%). Only three respondents demonstrated dissatisfaction with quality of information and problems addressed by instructors. Respondents included such comments as, “We were applying diversity while learning about it. The instructor was able to make us think creatively and helped us to relate the activities we did to our work” (W1, D2), and “This was an excellent workshop. The trainer really knows his stuff” (W4, D2).

Question #6 inquired about “The extent you attempted to involve yourself in seeking in-depth understanding of this material and to consider its application to your own needs and objectives.” Again participants responded positively to this subject. We noticed that the main marked answers were “Satisfaction” or “High Satisfaction” (88%). Few trainees marked “Neutral” (7%) and not many (6%) were dissatisfied.

**Challenges in Addressing Participants’ Needs in Professional Training Environment**

The study also tried to understand how the different environments surrounding the learning experience of the trainees shaped the effectiveness of the Foundations program by analyzing data from interviews, surveys, and observations of workshops. Results from the interviews showed that the more a learning environment is responsive to the needs of trainees, the higher is the probability of the trainees’ success in implementing their new acquired knowledge. The following quotes from different workshops provide good evidence in this regard: “It would be great for all departments and businesses to present and share this (knowledge) with their employees” (W4, C13) and “I learned a lot; Management in all departments should be required to attend this workshop” (W3, V3).

Some trainees went on to link what they learned, not only to their organization, but also to society in general. The following comments illustrate this category: The information shared in this workshop can be used outside the workplace as well” (W4, C2) and “Very good information, very good presenter, among the top presenters so far. I think the topic is important to our society.” (W3, V11).

The results also revealed two meandering conclusions. First, and in accordance with Keep (1989) investments in Foundations training workshops constituted a powerful signaling device to reassure employees that they were valued by their employers. This in turn enhanced employee motivation and commitment to the organization. Second, it was understandable that the Foundations program was recognized as a system by itself. At the same time the program served as a training division or subsystem for diverse organizations. Different organizations made use of the Foundations program resources to develop their employees, personally and professionally. There are numerous reasons in any system why things happen and do not happen. Figuring these out requires more than superficial analysis or metaphoric analogy (Swanson & Holton, 1998).

Not all trainees had a positive experience with the training workshops. First, some trainees were not satisfied with the topics discussed, “I felt the information only scratched the surface of the topic. Course should have been designed to force more participation” (W2, V2). Second, contrary to the established view that training interventions should begin with a pre-training assessment; only one of four trainers observed administered a pre-training informal assessment. She e-mailed the trainees attending her workshop one week prior to the scheduled training intervention and asked them to give her some feedback regarding their expectations about the workshop. She added, “Think about what you want to learn from this workshop. What is most important to you In general” (W2, V2). In general, trainers were more interested in delivering their workshops more than in assessing the specific needs of the participants and their organizations. This might be due to the fact that trainees come from different organizations and had different backgrounds.

A third challenge common to the training workshops was the fact that they were nonspecific in nature. When asked about this “one-size-fits-all” issue, the program administrator commented: “We do not target our content to a certain area but to a broad base. Anyone could get a lot from what we give” (11, Oct. 03). Thus, these workshops were tailored to the needs of the individual, and not to specific management needs, and most notably, not to the specific demands of the different organizations. The Foundations training program failed to tackle specific problems that concern individuals back at their office and the activities discussed in these workshops did not lend themselves to be easily integrated to the workplace setting. This idea was illustrated in the following comment: “I needed more time to digest/practice applying these concepts. Much of the information was geared to workplaces that can more easily measure productivity (products produced, no. of contacts made, etc.). I guess the service that my unit provides
can best be measured in terms of customer satisfaction (survey results) or errors made. I do not feel that I have the
time to collect this information and still do my job though” (W2, P15).

A forth challenge that emerged was the different learning styles of the trainees. Conventional wisdom says that
you can keep some trainees satisfied all the time but you can’t keep all trainees satisfied all the time. The following
comments illustrate this category: More strategies and conversation about actually solving some problems” (W4,
C10), “Instructor needed to keep the workshop interesting; it became very boring in the afternoon” (W4, C21), and
“Part of material presented was repetitive” (W4, C25).

Finally, the trainees learning experiences in this program were based on a one-time experience, a single
workshop. To truly develop a skill or behavior, learners require repeated or multiple exposures. The Foundations
program workshops attempted to cover a range of skills within just a few days. In the course of four workshops, as
many as six to eight categories, such as empowerment, diversity and communication skills were covered. As a
result, participants received only a single opportunity to practice a particular skill and receive feedback. With so
little exposure, the different experiences simply build awareness rather than true understanding and skill
development.

Conclusions and Recommendations

The research evidence discussed in this study suggested that determining training purposes and training
effectiveness on performance outcomes are complex processes. This raises questions about what factors are likely to
influence the effectiveness of training. Finding answers to such questions will be important if we are to understand
how, and whether, performance improvements will result from training interventions.

Results also showed that trainees’ satisfaction at a training workshop did not mean that the workshops were
necessarily perceived to be effective. Nor this meant that participants perceived that they had learned and would change
when they go back to their jobs. Moreover, managers might have different opinions than employees regarding training workshops. For example, managers might want training workshops to be more strategic in focus and better integrated with the ongoing objectives of the firm, and not focus on the personal and career development of the employees. For that reason, investigating the interests of employees and managers regarding the purpose of training is further needed. Researchers as well need to investigate work environment factors influencing the transfer and effectiveness of training, such as management and peer support (Russ-Eft, 2002).

Implications for HRD

HRD professionals need the expertise and credibility to play the leading role in building and sustaining knowledge producing environments where the creation, sharing and application of knowledge are a dominant concern throughout the organization. To arrive at such objectives, HRD professionals should find ways to improve employee expertise based upon a continual search for better insights, strategies and procedures related to the mission of the organization. They should be more involved in guiding and directing the trainees towards the workshops that best serve their needs. Thus, short-term training interventions would gain a part to play in building future organizational capacity, but only a part. The greater need is for HRD strategies that are well integrated with current business and HR strategies and are focused on developing and embedding a fast responsive culture. These strategies should include pre-training discussions with the trainees and proper feedback and follow-up after training.

Additionally, comments from the trainees emphasized the importance of management support for the professional training interventions. Without visible involvement by managers, learners do not perceive the behavioral change as strategically important to their organization. In that HRD professionals should act as constructive and positive agents (Cohen, 1990). They must be prepared to work with both the supervisors and trainees to transfer the new acquired experiences at training into shared knowledge and performance at work. They should no longer operate in a silo (Sloman, 2002).

An Examination of the Relationship Between Emotional Intelligence and Leadership Style

Lisa A. Weinberger
University of Minnesota

The intention of this study is to broaden the knowledge base of HRD through the investigation of the relationships between emotional intelligence, and leadership style. This study was conducted using a correlational research design. Two surveys were administered: The MSCEIT (Mayer, Salovey, & Caruso, 2002) and the MLQ5x (Bass & Avolio, 2000) to the 151 managers of CSW and their subordinates. No relationship was found between the various dimensions of emotional intelligence and leadership style.

Keywords: Emotional Intelligence, Leadership Style

Organizations today continually need to undergo rapid change to maintain their competitive edge. That rapid change requires an organization that has employees and leaders who are adaptive, work effectively, constantly improve systems and processes, are customer focused, and who share the need to make a profit. The continuous environment of turmoil and change has been coined the “permanent white waters” of modern life (Vaill, 1996). A key element in driving and managing these “white waters” in an organization is believed by many to be leadership. “Great leaders move us. They ignite our passion and inspire the best in us. When we try to explain why they are so effective, we speak of strategy, vision, or powerful ideas. But the reality is much more primal: Great leadership works through the emotions” (Goleman, Boyatzis, Mc Kee, 2002, p. 3).

Emotional Intelligence has been identified, through the popular press and some researchers as that critical element needed for effective leadership. Goleman (1998, p. 94) has said that, “the most effective leaders are alike in one crucial way; they all have a high degree of what has come to be known as emotional intelligence.” Others have said, “By now, most executives have accepted that emotional intelligence is as critical as IQ to an individual’s effectiveness” (Druskat & Wolff, 2001, p.81). The challenge with these statements is twofold, (1) the study of leadership and what makes leaders effective has been found to be much more complicated than a single dimension like emotional intelligence; and (2) organizations have incorporated many of these emotional intelligence beliefs into their work systems and performance expectations without it being shown that it truly can accomplish what some authors are claiming. The study of leadership, its effectiveness and its impact on organizational performance is a key interest to Human Resource Development (HRD) scholars (Hamlin, 2003; Holton & Lynham, 2000; Kuchinke, 2000; Zehner & Holton III, 2003).

The intention of this study is to broaden the knowledge base of HRD through the investigation of emotional intelligence, and leadership style. The problem is the recognition that while a significant amount of research on leadership exists (see Yukl, 1998; Yukl & VanFleet, 1992), the emotional intelligence research is comparatively thin and the relationship between the two is smaller yet. What is most troubling is the notion that it is critically important for leaders to be emotionally intelligent for organizational success without the scholarly support behind it.

Theoretical Framework

“One of the most universal cravings of our time is a hunger for compelling and creative leadership” (Burns, 1978, p.1). Beginning in the 1980’s, many of the conceptions of leadership recognized the importance of emotions as a basis of influence (Yukl, 1998). It is those emotional, value-based aspects of leadership that are believed to influence the achievements of groups and organizations. Much of this leadership research, with its recognition on the importance of emotion, concentrated on the characteristics and effects of charismatic and transformational leadership (Bass, 1985; Kanungo, 1998; Tichy & Devanna, 1990).

The development of effective leaders is recognized as a high priority for business organizations. One only needs to look at some of the more popular recent publications in the areas of leadership and organizational success such as Good to Great (Collins, J., 2001) which speaks to those critical components for an organization to be “great”, as defined in cumulative stock return as compared to the general market and Results Based Leadership (Ulrich, Zenger & Smallwood, 1999), which speaks to the importance of connecting leadership skills with real business results. These business books use “unconventional wisdom” as their foundation. They are challenging the status quo, and reinforce the notion that “leadership ranks among the most researched and debated topics in the organizational sciences” (George, 2000, p. 1028).

Copyright © 2004 Lisa A. Weinberger
Recently, there have been a number of articles in the popular press espousing the benefits of emotional intelligence to organizations, leaders and individual contributors. This has contributed to a significant influx of popular books and seminars on the topic and consultants ‘training’ individuals to become more emotionally intelligent. Though there exists large amounts of research on leadership (see Stogdill, 1974; Yukl, 1998; Yukl & Van Fleet, 1992 for examples), there is comparatively little for emotional intelligence. And though the popular press speaks to the importance of emotional intelligence and leadership, there is little researched support for their premise.

Primarily two perspectives of emotional intelligence have emerged over the past decade: one that is based more on a mixed perspective, which defines emotional intelligence largely through personality characteristics; the second perspective is an ability perspective, which defines emotional intelligence as a set of distinct abilities. Since there has been more research in the area of personality characteristics and leadership, this study evaluated the relationships between emotional intelligence from an ability perspective and leadership style. The ability model of emotional intelligence is framed as a type of intelligence, hence it is intended to co-exist with, supplement, and clarify existing models of leadership – not replace them (Caruso, Mayer, & Salovey, 2002). Though the model is too new to have extensive data in support of its predictive validity, it is believed that it will make significant contributions to our understanding of leadership (Caruso, Mayer, & Salovey). “Leadership, which embraces the emotional side of directing organizations, pumps life and meaning into management structures, bringing them to full life” (Barach & Eckhardt, 1996, p.4).

“Leadership theory and research have not adequately considered how leader’s moods and emotions influence their effectiveness” (George, 2000, p.1028). This study aims to get at part of that question. A wide diversity of approaches to leadership has been proposed, from analyzing what leaders are like, what they do, how they motivate their followers, how their styles interact with situational conditions and how they can make major changes in their organizations are only a few examples (Yukl, 1998; Yukl & Van Fleet, 1992). A great deal of research has been conducted surrounding these many theories and has led to a better understanding of leadership. But understanding how and why leaders have (or fail to have) positive influences on their followers is still a compelling question for researchers (George, 2000). Feelings and moods have been shown to influence the judgments people make, attributions for success and failure and inductive and deductive reasoning. It is likely then, that feelings play an important role in leadership. Other components of leadership, such as charisma, includes the leader regulating the emotions of its team members (Freidman, Riggio & Casella, 1988; Wasielewski, 1985), appears to require the ability to enhance pleasant emotions and de-emphasize unpleasant emotions in others. Charismatic leadership, a form of transformational leadership (Bass, 1985, 1997) may also have its roots in managing emotions (Ashkanasy & Tsee, 1998). These emotion/mood capabilities have been addressed by emotional intelligence. Emotional intelligence describes that ability to join emotions and reasoning, using emotions to facilitate reasoning and reasoning intelligently about them (Mayer & Salovey, 1997). Several researchers have begun to evaluate this role of emotional intelligence and leadership.

Since the publication of Emotional Intelligence (Goleman, 1995), the business writings in this area have exploded. The scholarly support of the claims made in these books however is behind the business leaders perceptions of the impact of high emotional intelligence on their effectiveness and success. This issue of leadership and its effectiveness is core to the field of HRD.

A better understanding of emotional intelligence and its relationship to leadership style can begin to address the gaps currently existing in the literature today and provide a more informed link between theory and practice. This understanding can also better inform the practitioner, and hence their leadership development programs, and staffing within their organizations.

Research Questions

The major research questions are briefly stated as follows:
What is the relationship between the emotional intelligence of leaders and their leadership style?
1. What is the relationship between the emotional intelligence of leaders and their transformational leadership style?
2. What is the relationship between the emotional intelligence of leaders and their transactional leadership style?
3. What is the relationship between the emotional intelligence of leaders and their laissez-faire leadership style?
Research Design

This study was conducted using a correlational research design. Two commercially available survey instruments were administered. One survey, the MSCEIT (Mayer, Salovey, & Caruso, 2002) was administered to all the top managers (N = 151) of a single US based manufacturing organization referred to as CSW. The MSCEIT measured the variable of emotional intelligence. This instrument reported five scores in the areas of: (a) perceiving emotions, (b) facilitating emotions, (c) understanding emotions, (d) managing emotions, and (e) overall emotional intelligence. The second survey, the MLQ5x (Bass & Avolio, 2000) was administered to the subordinates of those 151 managers. This instrument measured the variables of transformational leadership style, transactional leadership style and laissez-faire leadership style. Transformational leadership consists of four factors as measured by the MLQ5x (Bass & Avolio, 2000): (a) intellectual stimulation, (b) individualized consideration, (c) charisma (idealized attributes and idealized behaviors), and (e) inspirational motivation. Transactional leadership consists of two factors as measured by the MLQ5x (Bass & Avolio, 2000): (a) contingent reward, and (b) management-by-exception (which includes management by exception – passive and management by exception – active). Laissez-faire leadership is the negation of or a no leadership factor (Bass & Avolio, 1993). The surveys were collected and then sent to the respective publishers for scoring. The results were entered and analyzed using correlational statistics.

The target population for this study consisted of the managers of CSW; a Midwestern based manufacturing organization that employs 2300 people worldwide. Of that 2300, approximately 2000 were located within the United States. Starting at the top of the organization and working down within the hierarchy, managers (defined as those who have more than three direct reports), located within North America were identified. The total population of 151 managers participated in the study. These managers included executives and directors of CSW, managers across all functions of the organization and supervisors in customer service and manufacturing. This represented about 90% of the companies’ personnel having the title of manager. From CSW human resource records, the 151 managers were made up of 27 females and 124 males.

Limitations

A wide variety of definitions of emotional intelligence exist ranging from a very broad perspective inclusive of many personality characteristics, to a very narrow restrictive perspective. This area of research is relatively new (since the early 1990’s), with most of the work to date, definitional in nature. Only very recently has the research moved into how the construct of emotional intelligence impacts an individual and their relative performance. Within the area of emotional intelligence research, there exist few instruments to study it.

The Mayer Salovey Caruso Emotional Intelligence Test v2 (MSCEIT) is a limitation of this study. This newly published instrument (2002) has not had wide testing in the research community. Consequently, its reported validities and reliabilities must be heeded with caution. It is however, the only emotional intelligence instrument that is performance driven. All other emotional intelligence tests are self-inventories. Although this instrument is not widely researched, it is a starting point for research into the area of emotional intelligence and will add to the body of knowledge in this area.

To measure managers’ leadership style, the Multifactor Leadership Questionnaire, MLQ5x (Bass & Avolio, 1995; 2000) was chosen. The MLQ5x (Bass & Avolio, 1995; 2000) is a widely used instrument in the area of leadership styles. And this instrument has wide face validity within the organization studied, which provided critical support for this research to occur.

An additional limitation to this study was the use of a convenience sample. Though there are advantages to using a single organization due to its homogeneity and minimizing the impact of external validity concerns, there are disadvantages in that the results are limited in their generalizability.

Results

The MLQ5x (Bass & Avolio, 2000) was sent out to the subordinates to gain their perceptions of their manager’s leadership style. A total of 1165 subordinates were asked to participate. 791 completed surveys were returned. In addition, 17 surveys were sent back as undeliverable or a refusal to participate. The total response rate was 68.9%. The 151 managers were sent the MSCEIT (Mayer, Salovey and Caruso, 2002), to evaluate their emotional intelligence. 138 completed surveys were received, 3 managers refused to participate and 10 managers did not respond. A response rate of 93.3% occurred with the management group.

The MSCEIT (Mayer, Salovey & Caruso, 2002) was a performance-based emotional intelligence survey instrument. Each answer was scored against a general consensus score. All scores are reported as normed standard
scores with a mean= 100, and a standard deviation of 15. Scores are obtained on the four emotional intelligence branches and an overall emotional intelligence score. The results of the data analysis found a range including acceptable reliabilities at the overall emotional intelligence level and Branch 1 and relatively low reliabilities for the balance of the dimensions. The overall emotional intelligence factor returned a reliability of .86 (Split ½) compared to the reported reliability of .91 in the test manual. The branch reliabilities ranged from an acceptable (split ½) reliability of .91 (Perceiving Emotions) to low reliabilities of .63 (Facilitating Thought), .56 (Understanding Emotions) and .61 (Managing Emotions). These reliabilities differed somewhat from that reported by Mayer, Salovey & Caruso (2002), which ranged from an overall emotional intelligence reliability (split ½) = .93 to a low reliability at the facilitating emotions (branch 2) of .79. These low reliabilities present a significant limitation to this study. Though the test authors report relatively high reliabilities, the results here bring that into question. To investigate these relationships further, the researcher looked at the intercorrelations of the respective emotional intelligence dimensions. The intercorrelations obtained ranged from a high r = .395 for facilitating thought (as compared to a reported r = .50) to a very low r = .185 for understanding emotions as compared to a reported r = .51. All of the intercorrelations obtained were significantly lower than those reported by the test authors again bringing into question the reliability of the instrumentation.

The nine leadership styles and composite transformational leadership score showed sufficient internal consistency ranging from $\alpha = .74$ (Management by Exception- Passive) to $\alpha = .87$ (Inspirational Motivation) and $\alpha = .94$ for Transformational Leadership. All of these results were within the range reported by Bass and Avolio (2000). The MLQ5x (Bass & Avolio, 2000) did not have the same reliability issues as that of the MSCEIT (Mayer, Salovey & Caruso, 2002). Additionally, the reported intercorrelations of the various components of leadership were well within the range reported by the authors (Bass & Avolio, 2000). In fact, many of the intercorrelations were greater than that reported by the authors, and all were within the expected direction.

Research question 1: What is the relationship between the emotional intelligence of leaders and their transformational leadership style? Research hypothesis 1 (H1) through hypothesis 4 (H4) stated a significant and positive correlation (p<.05) between the four branches of emotional intelligence and transformational leadership as perceived by subordinates. There were no significant results for the entire comparison of the various dimensions of emotional intelligence with transformational leadership. This is completely contrary to what the prevailing literature would have suggested.

The relationship between emotional intelligence and transactional leadership style was explored through the next research question: What is the relationship between the emotional intelligence of leaders and their transactional leadership style? Transactional leadership had not been identified as having a base in emotions, hence the Hypotheses H5-H8 were expected to show no significance in the level of relationship. Those hypotheses were supported.

Conclusions and Recommendations

The purpose of this study was to investigate the relationship between emotional intelligence, leadership style and leadership effectiveness. The general research question asked was: What is the relationship between the emotional intelligence of leaders and their leadership style?

Transformational Leadership and Emotional Intelligence

When comparing the dimensions of emotional intelligence and components of transformational leadership (research question 1), no significant relationships were found, which led to a finding of no support for the first set of hypotheses (H1-H4). The results of this study differed from those of Sosik and Megerian (1999) who evaluated the relationships of emotional intelligence, transformational leadership and leadership effectiveness, and found that managers who were rated more effective leaders by their subordinates possessed more aspects of emotional intelligence. Sosik and Megerian used a trait-based perspective of emotional intelligence, whereas in this study, the author limited the view of emotional intelligence to an ability based perspective. Buford (2001), also using a trait based perspective of emotional intelligence found a relationship between emotional intelligence and transformational leadership. Little relationship, however, has been found between the self-reported leadership practices of nurses and their emotional intelligence (Vitello-Ciciu, 2001) as reported by the MSCEIT (Mayer, Salovey, Caruso, 2002) and no support was found for the effect of emotional intelligence as a predictor of leadership success of top executives (Collins, V.J., 2001)

The findings of this study suggest that the ability-based perspective of emotional intelligence does not have any relationship to perceptions of leadership style. This finding is contrary to what one would expect from reviewing the test manual for the MSCEIT v2.0 (Mayer, Salovey, Caruso, 2002) and the associated citations. A further explanation for these findings could be that the MSCEIT, still in its infancy is not effectively capturing the significant differences in emotional intelligence from one individual to the next.

Transactional Leadership and Emotional Intelligence

A comparison of the perceived transactional leadership styles of the CSW managers and their emotional intelligence (research question 2) showed no significant relationships, as was hypothesized (H5-H8). The primary purpose for the hypotheses of no relationships was due to the lack of research support in this area. This study contributes to that literature void. Similar to the findings for the transformational leadership dimensions, none of the transactional leadership dimensions (contingent reward, management by exception- active and management by exception- passive) had any significant relationships to any of the components of emotional intelligence. One could conclude that indeed no relationships exist and therefore, the importance of emotional intelligence in day-to-day leadership is grossly exaggerated.

Laissez-faire Leadership and Emotional Intelligence

Hypotheses H9-H12 suggested no relationship between Laissez-faire leadership and the various dimensions of emotional intelligence, answering research question 3. Again, the lack of research in this area required the hypotheses to posit no relationship. In this study, the hypotheses were not rejected, as no relationship between these various dimensions was found. This suggests that the emotional intelligence of a leader has no relationship to their lack of leadership tendencies (laissez-faire leadership).

Implications for Practice

The results of the study, relate to the employees who participated in this study. This presents a limitation as to the generalizability of the implications for the study; therefore, it is inappropriate to draw general implications for
practice based on the results of this single study. However, the sample was a homogenous one, and should be considered in light of the limitations that this is a single study. Further replication of this type of study and empirical verification would determine the significance of the recommendations beyond the boundaries of CSW.

CSW has identified emotional intelligence as a key competency for evaluating its leadership and professional employees. The results of this study would suggest that CSW might want to further evaluate that practice and determine whether or not it would still be appropriate to attempt to measure their leaders against this competency. This study limited the view of emotional intelligence to an ability based perspective, one that can be measured using a performance based instrument, the MSCEIT (Mayer, Salovey & Caruso, 2002). Within that restrictive perspective, the lack of significant relationships between the various components of leadership style and emotional intelligence can be significant to this organization. Organizational efforts may be expelled in the wrong areas (that of improving emotional intelligence) and could be used in other areas to provide more significant contributions to the organizations management team. CSW may want to explore the variable of emotional intelligence more closely in light of these results, and determine whether or not this is a critical competency that they can measure and hold their managers accountable to. These results would suggest that that practice is not based on sound data. And those types of practices tend to label organizations as chasing a new corporate ‘fad’, with negative connotations to the employees and managers of CSW.

CSW however, has defined their emotional intelligence concept more broadly than that measured in this study. Their definition is more inclusive of some of the personality characteristics. Hence, another suggestion for this organization is to redefine their emotional intelligence dimension as personality components or be aware of the limitations of their definition and what it really is. It also may be possible that an ability based definition of emotional intelligence has little utility from an organizational perspective, and the broader, personality based definitions may be closer aligned to what many organizations are really seeking. For specifics in language however, understanding exactly what the HRD practitioners and managers are defining and looking for, is and will continue to be critically important.

Though this study’s results cannot be broadly generalized, the results are still important to consider for today’s practitioners. It appears that many of the benefits espoused regarding emotional intelligence to an individual’s leadership success still need to be empirically confirmed. This study showed in this sample, that those relationships do not exist. Hence, further research is needed in the areas of this construct and associated measurement tools before this author would support its use in practice.

**Implications for Theory**

According to this study, there is no relationship between emotional intelligence of managers and their leadership style as perceived by subordinates. This study was intended to address a gap existing in the literature today in providing a more informed link between the theory of the relationship between leadership style and emotional intelligence to the practice. The results of this study would indicate that they are not related. This is one study however, and others would need to be completed to see if this premise holds true.

Researchers in the field of HRD have started looking at the role of emotions and emotional intelligence. It’s been suggested that emotional intelligence might be an aide to leadership development, and leadership effectiveness (Drodge & Murphy, 2002). This study has found that the various dimensions of emotional intelligence of a leader have no relationship to how that leader is perceived to be leading. And although it’s results are contrary to what has been suggested by some researchers in HRD and other disciplines, it is another piece of information to this body of knowledge. In addition to contributing to the knowledge base in HRD, these results add to the knowledge within the emotional intelligence body of work.

The MSCEIT (Mayer, Salovey & Caruso, 2002) was designed to measure emotional intelligence. This instrument, still in its infancy, but commercially available, appears to have some limitations. The reliabilities and intercorrelations found in this study were substantially lower than that reported in the test manual and hence bring in to question the reliability of the instrumentation. The results obtained were marginally acceptable. These low reliabilities bring into question the entire MSCEIT and the results obtained here. Based on this data, additional research and work is needed in the development of the MSCEIT to ensure that repeatable reliabilities can be obtained.

Several conclusions can be drawn from this study to the implications for the theory base. This body of work in emotional intelligence is growing; there have been however, few empirical studies to date. Several recent studies have been completed using the MSCEIT (Mayer, Salovey & Caruso, 2002) with mixed results as to the relative contribution of emotional intelligence to predictions of general personality, life criteria, and leadership. One could conclude from this study that due to reliability results obtained, further work is needed on the MSCEIT, and hence
the relationship results found are not significant to the knowledge base, or this brings into question the importance of emotional intelligence and its relationship to leadership style. Interestingly, though the reliability data found for the MSCEIT was substantially lower than that reported in the test manual, primarily the opposite was found on the MLQ5x (Bass & Avolio, 2000) leadership assessment. Within the population assessed and the results obtained on the MLQ5x (Bass & Avolio, 2000), the reliabilities and intercorrelations of the various leadership dimensions was fairly consistent with that reported in the test manual in most cases.

**Future Research Needs**

This study investigated the relationships between the emotional intelligence of managers and their leadership style as perceived by their subordinates. This study was intended to contribute further to the theory base surrounding emotional intelligence and its application to practice. Due to the incorporation of emotional intelligence concepts into practice, and as yet, limited amount of empirical research in the area of emotional intelligence, the following paragraphs outline some future research needs.

Several areas of potential research for emotional intelligence and its role in the field of HRD have been previously outlined (Weinberger, 2002b). This study was intended to evaluate one of those research agenda’s. Questions on how to measure emotional intelligence have resulted in a lot of dialogue in the literature. Most measurement tools however are self-report in nature. The MSCEIT (Mayer, Salovey & Caruso, 2002) was one of the first attempts at a performance-based instrument. These results would indicate however, that more work is needed in this area. Reliable instrumentation is critical to identifying core relationships between variables and to further explore research agenda’s in regard to emotional intelligence, leadership and management.

The construct of emotional intelligence itself also needs to be investigated further. This construct is viewed very broadly in some bodies of work and very narrowly in others. Part of the challenge lies in the term emotional intelligence, which has many definitions. For clarity purposes, and in order to assist future researchers and practitioners, a closer aligned definition of emotional intelligence would be helpful. These broad arrays of definitions, which are almost on opposite sides of a spectrum approach this construct very differently, with differing assumptions and different methods to measure it. Careful reading is required of the associated research domains in emotional intelligence to determine what perspective the author is coming from.

In addition to clarity around the definition of emotional intelligence, the uniqueness of this construct needs to be investigated further. As has been articulated in other areas, the question of whether or not emotional intelligence is contributing anything unique is an important one to answer. It may be, that these concepts of emotion perception, understanding and managing emotion are captured in other constructs already in use.

Another recommendation for future research is to explore the concept of emotional intelligence from a qualitative perspective. It may be that this construct is difficult to measure in the positivistic perspective and a better understanding may acquired through looking at this construct differently. The nuances around individuals’ behavior and approach to others could be explored through this perspective and would contribute additional knowledge in this body of work.

The topic of emotional intelligence has generated a great deal of interest in the practitioner community and a divergence of perspectives in the research community. A better understanding of this construct from a multitude of perspectives, along with tools to effectively measure it, will contribute significantly to this phenomenon of emotional intelligence and further clarify whether it provides a unique contribution to our understanding of individuals and to the field of HRD.

Safety Leadership Development in the Oilfield: Operationalizing Lynham’s Theory of Responsible Leadership for Performance

James H. Rushing
Baker Hughes

Susan A. Lynham
Texas A&M University

The oil and gas industry’s number of serious injury accidents have plateaued. Human Resource Development’s focus and expertise can credibly contribute to improving performance applying the general theory, “A Theory of Responsible Leadership for Performance” (Lynham, 2000). The theoretical framework of the theory and a proposed methodology for research within the drilling contractor segment is put forth with propositions about its validity and usefulness in relating leadership development to regained improvements in safety performance.

Keywords: Safety, Leadership, Performance

The oil and gas industry is looking for an improvement in safety performance. Historic reductions in the number of serious injury accidents have plateaued in the last few years. Oil and gas producers, drilling contractors and oilfield service providers as an industry have sponsored global and regional initiatives seeking to discover a means for returning to continual improvement. Human Resource Development’s (HRD) focus and expertise in learning and performance improvement for multiple performance domains can make credible, lasting contributions to this effort. Comparing U.S. OSHA-recordable accident statistics for U.S. oil and gas producers (USP) (Gibson, 2001), a representative oilfield services provider, Baker Hughes (BHI) (Rushing, 2003) and drilling contractors (IADC), reveals the greatest opportunity to gain improvement lies with focusing on drilling contractor performance (Table 1). Data on more severe injury accidents that require days away from work (DART) reveal that drilling organizations not only suffer a greater number of serious injury accidents in total, but also a greater number of the most severe injuries. Table 2 illustrates the leveling off of injury accident rates, a key performance indicator, in U.S. and European areas as well as for the entire drilling segment of the industry.

While these rates are appreciably lower than other U.S industry injury accident rates overall, the industry’s high profile, safety policies and management standards demand continual improvement.

Oil and gas companies, drilling contractors and various service provider representatives have formed regional and global initiatives like the United Kingdom’s Step Change in Safety (Step Change) and the Global

Copyright © 2003 James H. Rushing & Susan A. Lynham
Drilling Safety Leadership Initiative (GDSLI) to develop new approaches for further improvement in safety performance. The Behavioral Issues Task Group of Step Change (2002) commented there were large improvements over the previous ten years because of the improved design and quality of hardware and the implementation of effective safety management systems and procedures. However the next step for oil and gas exploration in the UK region of the North Sea involved “taking action to ensure that the behaviors of people at all levels within the organization are consistent with an improving safety culture.” They reported on a series of workshops in November 1999 that concluded that safety leadership and the judicious use of behavior modification programs were among the most important issues for improving safety performance in the oil and gas industry.

The GDSLI formed five regional groups in 1999 to look at improving safety performance: Gulf of Mexico; Latin America; Middle East; North Sea and Onshore US. The Gulf of Mexico group (2001) stated its mission was “to improve safety performance and advance safe work practices in rig operations using a multi-disciplined approach involving operators, contractors, and service providers with the goal of having an incident-free workplace.” It has focused on training expectations, developing and communicating recommended best practices, improving hardware and tool safety and on instilling a “safety first” culture mandate in the industry.

Both groups recognize the same three needs for safety performance improvement: well engineered hardware and tools, implementation of effective safety management systems and procedures, and the need for safety leadership development to improve the safety culture of companies involved in drilling operations. It is the purpose of this paper to explore the possible utility and contribution of “A Theory of Responsible Leadership for Performance” (RLP) (Lynham, 2000) to the oil and gas industry’s quest for renewed improvements in safety performance and leadership development. The purpose of the paper is addressed in five parts. The first considers the problem statement and research questions that guide this descriptive study. The second presents the essence of the guiding theoretical framework to the study, namely, the RLP theory. Next, a brief discussion follows on how the RLP theory could be used to inform the identification of the safety leadership and leadership development needs in the drilling organization. This is followed by some concluding thoughts about next steps in this possible path of inquiry in which the RLP theory framework could be used to describe and develop the safety leadership system-in-focus within the drilling organization. Finally, implications of this descriptive study for future HRD theory, research, and practice are considered, together with possible contributions to new knowledge in HRD.

The Problem, Need, and Research Questions

The oil and gas industry makes for the major context within which this study is framed. This industry is comprised of three major segments, namely, the oil and gas producers (for example, Shell, BP, ExxonMobil), the drilling contractors (for example, Diamond Offshore Drilling, Nabors Drilling, Noble Drilling), and the service provider organizations (for example, Baker Hughes, Schlumberger, and Halliburton). As indicated in Tables 1 and 2 above, industry injury accident rates have leveled off, meaning that the historic reductions in the number of accidents and related injuries have stopped declining, a source of concern to the whole industry. Of the three segments in the industry, the greatest number of injury accidents and therefore the biggest source of concern is within the drilling contractor segment of the industry. Further, Tables 1 and 2 illustrate that within this segment not only the highest number of injury accidents occur, but that the most serious injuries, those requiring days away from work, also occur in this segment. The industry recognizes the need for safety leadership as key to changing the prevailing safety culture and achieving the desired improvement in safety performance. However, drilling contractors can have a limited, and often simplistic, conception of what the current culture is, and what leadership is needed to lead the necessary change.

Recognizing that leadership is vital to effect the necessary improvements in safety performance, a framework is required to explore and better understand the nature of the leadership system and performance outputs that are required for improvement. To this end, this descriptive study proposes that RLP is a useful and generative framework to guide this exploration. For purposes of this paper, and the design and conduct of a future study aimed describing and developing a leadership system-in-focus required to address current and emerging safety leadership needs of the drilling contractor organizations, three research questions were posed by the authors. 1.) What is the essence of the RLP theory? 2.) How might this theory be used to identify the current system of safety leadership, as well as the future system of safety leadership needed to improve safety performance in the drilling contractor segment of the oil and gas industry? 3.) What might the implications of the application of this theory to safety leadership performance needs in the drilling contractor organizations mean for leadership development needs in the drilling contractor segment, and for new knowledge in HRD?
The Guiding Theoretical Framework: Essences of “A Theory of Responsible Leadership for Performance”

Responsible Leadership for Performance (RLP) is a general theory of leadership that addresses the nature and challenges of leadership that is both responsible and focused on performance. Two core premises govern the theory of RLP. The first premise is that leadership is itself a system consisting of purposeful, integrated inputs, processes, outputs, feedback and boundaries. The second premise is that leadership takes place within a performance system, that is, a system of joint, coordinated and purposeful action. The concept of a performance system is used interchangeably with that of an organization. The performance system in focus can be interchangeably thought of as organizations that work together to find and produce oil and natural gas. They possess similar missions, values, goals, and expected outcomes. In RLP, the boundary of the leadership system-in-focus corresponds with the internal and external boundaries of oil and gas producers such as ExxonMobil, drilling contractors such as Diamond Offshore Drilling, and service providers such as Baker Hughes. It is the purpose and nature of the performance system that must govern, direct and determine the purpose and nature of leadership, not vice versa. Leadership can therefore be spoken and thought of as a system of interacting inputs, processes, outputs, and feedback that derive meaning, direction and purpose from the larger performance system within which that leadership occurs. From this perspective, leadership is defined as: a system of interacting inputs, outputs and feedback whereby individuals and/or groups influence and/or act on behalf of specific individuals or groups of individuals to achieve shared goals and commonly desired performance outcomes.

The theoretical framework of RLP is derived from four theoretical components, namely, the units that constitute the variables of the theory, the laws of interaction that govern the relationships among the units, the boundaries that determine the domain over which the theory is expected to apply, and the system states that influence the values of the interacting units.

**Figure 1. The Theoretical Framework of “A Theory of Responsible Leadership for Performance”**

The Units of RLP

Three core elements, also known as units, interact in a systemic way to form the inputs, process, and outputs of the leadership system-in-focus. The three units of RLP are: considerations of constituency (the inputs); a framework of responsibleness (the processes); and domains of performance (the outputs).

**Considerations of constituency** are distinguished by three conceptual dimensions, namely: whether that constituency resides (a) inside or outside the performance system; (b) whether that constituency has high or low authority over the performance system; and (c) whether that constituency has the potential for high or low impact on the performance system. A framework of responsibleness is made up of three conceptual dimensions: (a) effective practices of leadership; (b) ethical habits of leadership; and (c) the application of enduring resources by leadership.
Domains of performance, consists of four conceptual dimensions, namely, (a) the system mission, (b) the work process/es, (c) the social sub-systems, and (d) the individual performer.

The Laws of Interaction in RLP

The three units interact in a systemic way to form the theoretical framework of RLP. Four laws of interaction govern and make explicit the relationship among these units:

1. All three units of The Theory, namely; considerations of constituency, a framework of responsibleness, and domains of performance; are associated with and required for RLP.
2. Each unit of The Theory, namely; considerations of constituency, a framework of responsibleness, and domains of performance; interrelates with each other unit of The Theory.
3. Considerations of constituency precede a framework of responsibleness and domains of performance in “A Theory of RLP.”
4. The units of “A Theory of RLP” can be thought of in terms of inputs, process and outputs; where the unit of considerations of constituency forms the input, the unit a framework of responsibleness forms the process, and the units domains of performance forms the output of The Theory.

The Theoretical Domain of RLP

The theoretical domain over which RLP is expected to apply is bounded in two ways, first by a closed boundary, and second by an open boundary. The first and closed boundary separates that part of the real world in which RLP is expected to hold up from that part of the real world in which it is not expected to apply and which is beyond its scope. Leadership, in RLP is described as a system-in-focus, which means that the system of leadership occurs within and to serve the purpose and goals of a legally defined, human populated performance system. The external environment that includes the constituency is expected to fall within the domain of RLP. The external environment which does not include constituency is considered beyond the scope.

System States of RLP

The fourth aspect of RLP is that of system states. System states indicate conditions under which the values of the RLP units will change. RLP has two system states, one of balance and one of unbalance. The leadership system-in-focus (RLP) is considered in a state of balance when all three units are present and arranged in an interacting system of inputs, processes and outputs. Conversely, when all three units are not present and not interacting, the values of the units can be expected to change significantly and the theoretical system is considered in a state of unbalance.

Knowledge Claims and Empirical Indicators of RLP

Once a theoretical framework has been developed for a theory, the framework can be used to derive knowledge claims about how the theory can be expected to operate. These knowledge claims can also be known as propositions of a theory. There are eight strategic propositions for RLP’s operation:

1. RLP is a theory of leadership as a system-in-focus. Leadership is a purposeful, focused system, not an individual or a process managed by an individual.
2. All systems have a purpose. The purpose of RLP is to serve the needs and desired outcomes of the constituency of a performance system by positively impacting multiple domains of performance in a responsible (effective, ethical and enduring) manner.
3. The content of RLP is derived from all three units of the theory—considerations of constituency, a framework of responsibleness, and domains of performance. If all three units are not present and interacting, then there is not Responsible Leadership for Performance.
4. For leadership to be considered responsible, it must demonstrate, and be judged to demonstrate, effectiveness, ethics and endurance. If one of these three attribute properties is missing from leadership, then that leadership is not responsible.
5. The units of the theory—considerations of constituency, a framework of responsibleness, and domains of performance—are interdependent. If there is change in one unit then it can be expected that there will be changes in the other two units.
6. As responsibleness (effectiveness, ethics and endurance) increases, performance of the whole performance system can be expected to increase.
7. Constituency is a necessary requirement for leadership. Without constituency there is no leadership.
8. Without guiding inputs from constituency, and outputs in the form of performance, the phenomenon of leadership collapses.

Informed by the above propositions, four empirical indicators have been identified for RLP in Table 3. Empirical indicators are a necessary precursor to getting a theory ready for testing and to show how values and measures for the interactions of RLP will later be established by research. Three strategic propositions regarding the
units of RLP were used to inform and identify the empirical indicators identified for RLP - constituency, responsibleness and performance, as well as the concept of RLP as a leadership system-in-focus (Table 3).

<table>

**Table 3. Empirical Indicators for “A Theory of Responsible Leadership for Performance”**

### Application of the Theoretical Framework of RLP to the Drilling Contractor Organization Performance System

The RLP theory provides a theoretical framework for identifying the safety leadership system required for improved performance in the drilling contractor organization. As indicated earlier, this theoretical framework identifies leadership as a system of inputs, processes and outputs. While considerations of constituency form the inputs to the resulting leadership system, a framework of responsibleness and domains of performance constitute the process and outputs respectively of the leadership system-in-focus. A discussion of how the RLP theory can be used to inform the identification of each of these three interacting units/components of the safety leadership system-in-focus follows.

**Considerations of Constituency in the Drilling Contractor Performance System**

The Considerations of Constituency include those persons whom the leadership system-in-focus, in this case the drilling contractor organization, serves whether they be inside or outside the organization, positioned at high or low levels of authority within the performance system and whether they have high or low levels of impact on the performance system. The constituency can include membership from one drilling contractor organization, representation from other drilling contractor organizations for example the International Association of Drilling Contractors and other segments of the oil and gas industry namely oil and gas producers such as ExxonMobil and service providers such as Baker Hughes. Further constituency considerations include regulatory bodies and other economic and political stakeholders in the operating environment of the oil and gas industry.

Within the one drilling contractor organization, further considerations of constituency closest to the hazards encountered is vital to the identification of the essential definition of a successful safety leadership system within the larger performance system of the drilling contractor organization. In this way this unit of the RLP theory informs the proper selection of the full range of constituent membership and needs inherent in the internal and external environment of the drilling contractor organization performance system. This consideration ensures that no key constituent voices and needs remain silent and unconsidered in the development of a safety leadership system-in-focus (i.e. within the drilling contractor organization/s).

Aristotle once said, “If you wished to understand virtue, study virtuous people.” There is a wide disparity in the expectations and experience of oil and gas producers regarding safety performance. Selection of the anticipated oil and gas producer constituency needs to consider that producer’s safety culture, current safety performance, and qualitative differences in drilling operation experience. This process of selection will ensure input that is conducive to the drilling contractor’s desired safety performance improvement efforts and needs.

In RLP, the selection of representative constituency for consultation is critical since an organization’s constituents precede and define the framework of responsibleness and the needs and results of performance required from the organization and its leadership. The constituency also gets to decide if that definition and the performance
expectations are met for the multiple performance domains of the performance system, that is, the whole organization. Responsible leadership recognizes the reciprocity between the leader and constituent.

**A Framework of Responsibleness and the Domains of Performance in the Drilling Contractor Performance System**

According to the theory of RLP once the considerations of the constituency have been identified, the constituency can be used to describe, inform and evaluate what makes for responsible safety leadership and acceptable safety leadership performance at multiple levels within the larger drilling contractor organization.

Constituent voices make explicit and clarify what practices make for effective leadership, what habits make for ethical leadership and what stewardship of resources is required for enduring leadership. This diverse chorus of constituency is needed to inform the essential nature of safety leadership required and the appropriate selection of available performance measures (means and outcome) for the safety leadership system in focus.

The industry recognizes that safety leadership and the judicious use of behavior modification programs are among the most important issues for improving safety in the oil and gas industry (Step Change, 2002). Through the application of RLP to the definition of the safety leadership system in focus, the groundwork is laid to understand and pursue specific safety leadership development and behavior modification needs of the drilling contractor organization.

**Implications of the Application of RLP for Leadership Development**

The successful use of the RLP theory to inform what makes for an acceptable system of safety performance leadership in a drilling contractor organization has implications beyond the single organization. First, the understanding of what makes for responsible leadership for performance and how this knowledge informs the description and development of safety leadership systems as well as improved safety performance may be applied in other drilling contractor organizations in the drilling segment of the oil and gas industry. Second, this understanding and successful application in the drilling industry segment can be used to identify and develop like leadership systems in focus within other segments of the oil and gas industry. Furthermore, comparisons between organizations within a segment of industry and between segments of the industry will generate new knowledge about the nature and requirements of leadership that is both responsible and focused on safety performance improvement. Lastly, this knowledge informs the design, development, implementation and evaluation of future leadership development programs designed to produce leadership competence for continual safety performance.

**Summary and Contributions to New Knowledge**

According to Lewin there is nothing as practical as good theory (Lynham, 2001). This paper explores the possible usefulness and contribution of “A Theory of Responsible Leadership for Performance” to the oil and gas industry’s need for improved safety performance by means of a defined safety leadership system in focus for a drilling contractor organization within the industry. This paper has discussed issues surrounding the application of the RLP theory in a drilling organization context and what implications there are for that organization, others within the same segment and, indeed, the entire oil and gas industry.

Groups within the oil and gas industry point to the importance of safety leadership development to address this performance improvement need. (Step Change, 2002) “A Theory of Responsible Leadership for Performance” (RLP) proposes that leadership can be thought of as a system-in-focus that serves the still larger performance system, which for this paper has been a drilling contractor organization. Drilling contractor organizations experience the greatest number of serious injury accidents and the greatest number of most severe injuries occur within the oil and gas industry and stand to benefit the greatest from improvements in safety performance. RLP has put forth the units and laws of interaction that establish what makes for responsible leadership for performance together with the corresponding knowledge claims and empirical indicators required to confirm the theory in practice. What remains is for the proposed application of the RLP theory in the oil and gas industry to be conducted.

The paper proposes that the theory of RLP is useful for identifying current safety leadership needs for safety performance improvement in the oil and gas industry. The theory can also inform safety leadership development efforts to sustain the desired results in safety performance. It sets up a context to further confirm and refine and develop the theory and therefore demonstrate its usefulness to practice to drilling organizations where industry are pressuring for a sustained managed change that is stable and aligned with other required performance variables for the industry, component organizations, their drilling operations, crews and each individual that works in this challenging environment.

Finally this paper challenges the popular notion that safety performance is strictly a function of behavioral modification. There are broader systemic issues and leadership considerations necessary for the required sustained
improvements in safety performance. HRD’s theoretical foundations in psychology, systems and economics provide a rich resource to draw from in our applied discipline. RLP gleans richly from earlier learning and contributes to HRD’s vision of theory making that can be explored in research and carried through to practice that explicitly improves performance and learning in the multiple domains of the oil and gas industry or indeed any industry.

Research in Higher Education: Graduate Student Perspective

Mesut Akdere
University of Minnesota

Using survey research method, the paper explored the expectation of conducting research for graduate students and assessed their challenges, problems, and the contribution of research to their graduate school experience. The purpose of this paper is also to investigate potential contributions of conducting research by graduate students in the field of HRD. This paper contributes to our understanding of how research and practice interact at the graduate school level. Implications for future research and practice on scholarly work are discussed.

Keywords: Research, Higher Education, HRD

Preparing scholars and researchers in the United States is hard work, both for those providing the preparation and for those receiving it. In this paper, I examine the challenge of conducting research in graduate school, particularly within doctoral programs in American higher education system; contribution of conducting research to the academic and professional development of students; the financial benefits of engaging in research; and the overall value of scholarly inquiry to graduate student. The hallmark of a competitive economy is decentralization whereby market forces shape and guide the production technology and resource allocation decisions (Scott & Anstine, 2001). Technology production and resource allocations are the outputs of research efforts in general. In the US higher education system, the production of graduate degrees across disciplines follows a common general model in which a number of years of required coursework are followed by comprehensive exams and the consequent phase of writing a thesis or a dissertation, and finally defense and successful completion.

Background

Research on graduate students indicates that many of them are challenged by financial issues, personal concerns, curricular requirements, and relationships with faculty (Dolph, 1983; Jacks, Chubin, Porter, & Connolly, 1983; Benkin, 1984; Valentine, 1987; Hirt & Muffo, 1998). The availability of adequate funding is crucial for graduate students in financially securing their academic and personal lives. The availability of support can determine who completes degrees, especially when all requirements except the dissertation have been fulfilled (Benkin, 1984). Dolph (1983) claims that graduate students with some form of funding are more likely to receive their degrees which is the case for all fields across disciplines such as education, sociology, medicine, engineering, management, and humanities (Jack, Chubin, Porter, & Connolly, 1983; Valentine, 1987; Dolph, 1983). Furthermore, graduate students with research assistantships are much more likely to succeed both in degree completion and securing a faculty position as a result of their engagement with scholarly inquiry and consequent publications (Bowen & Rudenstine, 1992). One of the reasons for this may be the fact that graduate students conducting research and publishing in refereed journals work closely with faculty and regularly socialize with their peers and establish valuable networking (Girves & Wemmerus, 1988; Valentine, 1987). In terms of personal concerns significant differences between the expectations and the realities of graduate school result in high levels of discomfort and dissatisfaction among graduate students (Baird, 1978). Curricular requirements are also critical in graduate school experience. For example, programs that develop clear policies and student-friendly procedures such as orientation programs, detailed research proposal guidelines, focused comprehensive exams, and annual reviews of student progress experience lower levels of student attrition (Nerad & Cerny, 1993; Golde, 1995). The last component is the relationship between the faculty and graduate students, which is composed of three influential stages in the graduate school process: (1) transition to the program; (2) acquisition of skills; and (3) conducting research (Tinto, 1993).

Graduate students when conducting research may sometimes be viewed as practitioner researchers as often times these students are already practicing members of a profession. Research conducted by practitioners on their own practice is sometimes similar in principle to other forms of research that fall under conventional definitions, such as case study research or some kinds of quantitative research (Metz & Page, 2002). Although different from theory-based research, practitioner-based research is equally informed and informative; and therefore, it is treated at the same status by being called research. The quality of this type of research derives from the practitioners’ positions as researchers writing about what they practice. As insiders, they are aware of all problems related to the practice of

Copyright © 2004 Mesut Akdere
a field and, most likely, have already developed certain remedies to solve these problems and address such issues. Therefore, there is no barrier for graduate students to center their research on the development of conceptual clarity, theoretical understanding, and the use of empirical data to develop conceptual knowledge and analytic descriptions that are universally generalizable. Overall, research involves societal struggles over power and status and through conducting research, graduate students become aware of the realities of the world and involve with civic engagement.

**Purpose of Study and Research Questions**

The University of Minnesota’s Center for Urban and Regional Affairs (CURA) has two programs that place graduate and professional students in research assistantships with community-based organizations. Neighborhood Planning for Community Revitalization (NPCR) works with neighborhood organizations in Minneapolis and St. Paul metropolitan area, and the Community Assistantship Program (CAP) works with organizations in Greater Minnesota. Both programs place students in part-time research assistantships for a semester to work on issues defined by the community to help the community achieve its goals. In the past five years, these programs have placed over two hundred graduate and professional students with over two hundred community-based organizations throughout the state. This study is conducted in order to assess the impact these research projects have had on the students who have participated in them in terms of gaining research experience through practice, presenting at conferences, getting published in refereed journals, networking within their respected fields, and contributing to the existing body of knowledge in their areas of specialty. The research questions for this study are:

1) How important is research experience to graduate students?
2) What are the outcomes of conducting research?
3) What academic opportunities are offered to the students as a result of these research projects?
4) What influences have these research projects made on graduate students?
5) Is there a relationship between the number of research projects graduate students are involved with and the number of conference presentations and publications in journals?
6) Is there a relationship between the number of research projects graduate students are involved with and their networking opportunities?

**Review of Related Literature**

In some of the graduate programs, coursework does not adequately prepare students to conduct their own research, employ theory in their research or to existing problems, and manage a research project of the depth and scope expected (Hansen, 1990). Furthermore, emphasis on student research is limited during the first two years of graduate study making the transition to the dissertation and publishing efforts much more difficult (Bowen & Rudenstein, 1992). Consequently, balancing assistantship demand with coursework requirements and finding time to conduct research can pose major challenges for graduate students especially if they are striving for getting published (Hirt & Muffo, 1998). Thus, research opportunities leading to conference presentations, reports, and ultimately publications are critically important for graduate students in getting the most out of their graduate school experience. Such research projects may also make contributions beyond the scope of traditional research, be they quantitative or qualitative in nature. In addition to being a source of knowledge generation, these research projects also presents (1) the potential for greater personal, professional, and organizational learning (Miller, 1990); (2) an approach to authentic staff development, professional renewal, and organizational change (Gitlin et al., 1992); and (3) a new way of thinking about knowledge creation, dissemination, utilization, and management in organizations (Carr & Kemmis, 1983). Such research projects can be appropriately rigorous on epistemological, political, or ethical grounds (Cochran-Smith & Lytle, 1990; Carter, 1993; Fenstermarcher, 1994; Richardson, 1994; Huberman, 1996; Hammack, 1997; Anderson & Herr, 1998) through appropriate guidelines both for quality, formalized methodology, and the purpose.

There is a perceived gap between researchers and practitioners in any given field. Many practitioners often do not find that academic research—theoretical or empirical—is very helpful. Clandinin and Connelly (1995) argues that outsider knowledge is often experienced by researchers as a “rhetoric of conclusions,” which enters the practitioner’s professional landscape through informational conduits that funnel propositional and theoretical knowledge to them with little understanding that their landscape is personal, contextual, subjective, temporal, historical, and relational among people. In many applied fields, such as HRD, the complexity of issues, questions, and problems often demands a melding of approaches to achieve innovative problem formulation and successful
problem solving which may, to an extent, be addressed through such research models that bring norms of inquiry and argumentation reflecting the fundamental content and context of multiple disciplines.

The researchers and practitioners in the field of HRD aim to advance the theoretical and practical implications of the knowledge base. Theory, research, development, and practice together compose a vital cycle that allows ideas to be progressively refined as they evolve from concepts to practices and from practices to concepts (Swanson & Holton, 2001). Research is an integral part of the HRD practice and learning, and a fundamental gateway to its development and progress. Knowles, Holton, and Swanson (1998) suggest three aspects of learning are reason, emotion, and action. Graduate students engaged in research efforts go through these steps as they conduct research. Respectively, all research efforts may be viewed as part of a learning process in the graduate school. Furthermore, such research projects may help the field of HRD to bring researcher and practitioner together to achieve sound and reliable research with utility to the field. One of the current challenges of the field is to bridge the gap between research and practice to provide a sound framework for the field.

Methodology

This is a correlational research study in which the investigator attempts to determine how related the variables are. The degree of relation is expressed with a correlation coefficient. The correlational method allows the researcher to analyze how the variables in this study, either singly or in combination, affect the pattern of opinions. This method further provides information concerning the degree of the relationship between the variables in the study.

The target population of this study is the graduate students in the U.S. higher education institutions. The accessible population is the graduate research assistants of the Center for Urban and Regional Affairs (CURA) at the University of Minnesota. By utilizing the CURA database, two hundred and fourteen graduate students were selected. For the purposes of data gathering, a questionnaire was designed for this survey method. Survey design administers the questionnaire instrument to collect data from the participants in the sample about their characteristics, experiences, and opinions in order to generalize and correlate the findings to the population that the sample is intended to represent. The questionnaire was in closed form; multiple-item and 4-point scales were used to rank the items in the questions. Questions regarding demographic variables were also included at the end of the questionnaire. Before conducting the survey, a pilot testing is done among a sample of individuals from the population from which the study intended to draw the survey participants.

The data was collected via two methods: questionnaire mailing and online questionnaire. The participants were sent the questionnaire and given the option of either participating by filling out the questionnaires sent to them or responding to the online questionnaire. The information on how to access to the online survey was provided in the mail-questionnaire. Each participant was given a code to access to the online questionnaire. The code prevented duplication and was further useful in the follow up with nonrespondents.

Descriptive statistics of the variables were presented in order to analyze the independent variables. Statistical analyses were conducted to explore the relationships between the variables. Because the data is significantly skewed, Spearman Correlation Coefficient (r) was conducted to measure the degree of relationships between the variables.

Assumptions and Limitations

The study assumes that conducting research in graduate school is essential in terms of achieving a successful graduate school experience. There is a relationship between the quality and quantity of research engaged and getting published and obtaining a career in academia. A major drawback of the study is the fact that data are collected from only the graduate research assistants of the CURA at the University of Minnesota. Consequently, there is the problem of representation of the entire population.

Results

Six research questions addressed in this study aim to understand the importance and utility of conducting research, getting published, and networking as a result of graduate school experience.

Research Question 1: How Important is Research Experience to Students?

This question asks four different aspects of possible research experience of graduate students. The participants were asked to respond to these items by choosing a value on a 1 to 4-point scale; 1 being the very important, 2 being somewhat important; 3 being not too important; and 4 being not at all important. The first question was about the value of the research component to students’ professional work. The mean for this item is 1.7, indicating that majority of the students feel that research is valuable to their professional work. The second question was about the financial contribution of their research assistantship to their graduate school expenses. The mean for this item is
1.25, showing that a great majority of the participants consider the research assistantship opportunities as an important financial contribution to their graduate school expenses. The third question is about the contribution of these research projects to the students’ academic and scholarly development. The mean for this item is 1.45, indicating that such opportunities are very important in terms of students’ academic and scholarly development. The fourth question is about the contribution of these projects to their professional development. The mean for this item is 1.3, indicating that they are significant to students’ professional development.

Research Question 2: What Are the Outcomes of Conducting Research?

This question inquires about the outcomes that these research projects led for the students. Based on the frequency analysis, the most significant outcome of these projects is that they complement students’ coursework. The ranking continues as follows: fulfilling a requirement for an internship, a practicum, or a field experience; changing students’ career direction; and providing material for a course paper or thesis. These statistics are in the same lines with the existing literature that such projects provide many outcomes for the graduate student development and experience (Baird, 1978; Hirt & Muffo, 1998).

Research Question 3: What Academic Opportunities are Offered to the Students as a Result of These Research Projects?

This question asks students whether any of their research involvement led to an article publication in a journal; a conference presentation; or a graduate thesis or dissertation. The assumption is that these projects present students with at least one of these opportunities. The results indicate that majority of the students (50%) were able to present their research findings in a conference, while 34% of them used their research projects for their graduate thesis or dissertation, and 16% of them were able to publish in a refereed journal. Publishing for a graduate student, of course, is a great challenge and these results confirm this challenge. Nevertheless, these research projects make a significant contribution to the overall academic and scholarly development of graduate students.

Research Question 4: What Influences Have These Research Projects Made on Graduate Students?

This question attempts to explore the influences these projects have on the graduate students. Based on the frequency statistics, the majority of the participants (39%) indicated that their research experience provided useful networking opportunities and resume enhancement that helped in obtaining employment, promotion, or salary increase. This supports the existing literature about that fact that graduate students with research opportunity are able to establish professional networking and enhance their academic credentials (Bowen & Rudenstein, 1992). 33% of the students on the other hand stated that their experience influenced their involvement in their own community and civic affairs. One of the goals of the US higher education is to build bridges between the higher education institutions and the communities that these institutions are located. Consequently, community service is an important component of universities across the country. 19% of the students stated that their experience influenced their choice of profession, while 9% indicated that the projects influenced their academic research and teaching agenda, bringing teaching and research together.

Research Question 5: Is There a Relationship Between the Number of Research Projects Graduate Students are Involved With and the Number of Conference Presentations and Publications in Journals?

Based on the responses from the participants, there is a positive relationship between the number of research projects graduate students conducted and the number of their conference presentations and publications in journals ($r_s = 0.071; p = 0.014$). It is important to note that the more research opportunities graduate students are involved with, the more articles and conference presentations they produce. This finding supports the current body of knowledge on the relationship between the amount of research involvement and publishing and presenting at a conference (Dolph, 1983; Valentine, 1987; Bowen & Rudenstein, 1992).

Research Question 6: Is There a Relationship Between the Number of Research Projects Graduate Students are Involved with and their Networking Opportunities?

To explore the relationship between the number of research projects graduate students are involved with and their networking opportunities, the research findings indicate that there is a positive relationship between ($r_s = 0.062; p = 0.018$). These results support the existing literature in that research involvement is an important part of networking within the academia (Girves & Wemmerus, 1988; Valentine, 1987).

Conclusions and Recommendations

This study aimed to understand the importance of conducting research for graduate students, challenges to getting published, and engaging in scholarly inquiry. Today’s graduate students are tomorrow scholars and practitioners of any given field. As a young field, HRD is no different than other disciplines in this regard. Therefore, HRD should emphasize the importance of engaging in research and producing scholarly work through its academic curricula and
research agenda. HRD programs should equip themselves with means and tools to foster such environments where research is an important component of the graduate school experience and an important utility to bring research and practice together. Short, Bing, and Kehrhahn (2003) suggest that HRD appears to be inner directed and without substantial impact: publications seem to preach to the converted; and HRD research and HRD practice, to some extent, appear divorced from real-time problems in organizations. This study offers ways to look into the issues related to HRD research and programs. Further research is needed to look into how HRD programs may increase research opportunities for students and collaborate with practitioners to address real life problems and issues.

Lessons Learned in a Virtual Team: An Integrative Model for Graduate Student Research Skill Development

Kristie Abston
Vickie Johnson Stout
University of Tennessee

Cindy Crowder
Indiana State University

Value-added learning dimensions resulting from the use of an integrative model for graduate student research skill development are shared by two student researchers, who used virtual teaming in a 10-week online statistics summer course. The researchers collected original data and conducted quantitative and qualitative research. The problems associated with distance education are analyzed. Serendipitous outcomes of this experience and implications from the perspectives of the graduate student researchers and their academic program advisor are discussed.

Keywords: Virtual Teaming, Distance Education, Research Skill Development

This paper presents an investigation into and integration of recent literature on virtual teams, graduate student research, and distance education. To explore empirically the challenges associated with virtual teaming in a graduate-level distance education course, the researchers report on a project completed during a graduate-level statistics course in which the virtual team members: (a) were separated by location, (b) were challenged by a common collaborative project, and (c) used both asynchronous and synchronous communication media.

The statistics course was conducted during a 10-week summer session. This course was the first distance education course attempted by the instructor and the first distance course completed by the researchers. The instructor had taught the course before, but only in the traditional face-to-face format.

The course had synchronous and asynchronous learning activities. The synchronous learning activities were a series of lectures and presentations by the instructor and synchronous analyses and discussions conducted in electronic classrooms through the use of Centra technology. The asynchronous learning activities included small-group homework assignments and the option to form a collaborative team for the large research project.

Each class session typically consisted of a lecture by the instructor coupled with discussion between the students and the instructor. For example, the instructor used presentation visuals simultaneously transmitted to all students to complement the audio presence. During discussion, the instructor and students interacted orally and in writing using Centra technology.

Problem Statement

Given the apprehension commonly associated with statistics and with distance education in general, the problem statement was:

How might the use of virtual teaming in online graduate statistics facilitate an integrative research experience?

The purpose of this research was to determine how virtual teaming in online graduate statistics facilitated an integrative research experience.

Terminology

The following terms were operationally defined for use with this study:

- Collaborative learning: The grouping and pairing of students for the purpose of achieving an academic goal.
- Distance/online education: The delivery of educational opportunities via computer technologies to remote locations both on- and off-campus.
- Research skills: The ability to investigate carefully and systematically some field of knowledge, undertaken to discover or establish facts or principles.

Copyright © 2004 Kristie Abston, Cindy Crowder, & Vickie Johnson Stout

55-2
Statistics: The calculation, description, manipulation, and interpretation of facts or data.

Value-added learning dimension: Learning that goes beyond the standard requirements and allows for greater skill development, which contributes to a competitive learning advantage.

Virtual team: A collaboration of students who are an intact social unit embedded in one or more social systems in which the members of the team are geographically separated and must rely on technology-based communications to accomplish their tasks (Gibson & Cohen, 2003), little or no face-to-face interaction occurs.

Theoretical Framework/Literature Review

The review of literature is presented so that the reader may gain insight into the main topics and variables considered in this study. It provides a summary of distance education’s history, documents the problems associated with this type of education, and explores, through the use of virtual teams, ways to help students develop the skills and competencies needed to be successful in distance education.

Most research on virtual teaming has focused on the development of team effectiveness. Little attention has been given to the development of the individual team members or the human capital they bring to the team. Human capital simply refers to the value that people bring to their work in the form of knowledge and skills (Lipnack & Stamps, 2000) as well as their economic and spiritual value (Fitz-enz, 2000). Virtual teams, such as the one used for this project, increase human capital through acquiring or developing new competencies (Lipnack & Stamps, 2000). From a human capital development perspective, when individuals are given integrative opportunities to perform, they generally exceed expectations.

Technology-savvy graduate students search for a new kind of college experience and expect educational systems to provide learning that is not time- or place-bound because the students, themselves, are bound by their homes, families, and jobs. Due to responsibilities in their lives, these adults cannot relocate to the site of an educational institution, and work responsibilities, particularly for those who work odd schedules or travel frequently, preclude regular class attendance. According to Manzo (1997) more and more adults seek opportunities to advance their education at home. However, many of them do not live within commuting distance of a college or university. Gibson and Graff (1992) found that 77% of the students lived over 51 miles from a college campus, with the majority living between 101 and 200 miles from a college campus. All over the world, colleges and universities are meeting the needs of such students by offering educational degree programs that allowed them to work at home or at work. This type of education has been dubbed distance education.

The longstanding literature on distance education has documented problems associated with its practice. One problem, which has received considerable attention in the literature, is the low quality of learning attainment (Abrami & Bures, 1996). A variety of causes has been attributed to this problem: (a) feelings of isolation (Bullen, 1998), (b) lack of two- and three-way communication (Dede, 1996), and (c) difficulties associated with self-regulation of learning (Zimmerman, 2002). While these causes have been investigated as isolated incidents, it is likely that all of them have led to the problems observed in traditional distance education practice.

Recent research points to collaborative online learning as a method of achieving success and minimizing many causes of distance education problems. Dede (1996) claimed that collaborative online learning aids in the acquisition of complex and higher-level concepts and skills that have been a weakness of traditional non-interactive distance education. Slaven (1990) recommended using collaborative learning to direct student-to-student interactions and minimize both off-task and passive behavior while providing a community environment online. Collaborative learning should include sharing of learning tasks; combining expertise, knowledge, and skills to improve the quality of the learning process; and building or consolidating a learning community. Virtual teams represent a prime means of achieving collaborative learning in distance education environments.

In virtual teams, students structure learning by establishing goals and objectives for activities, organizing and assigning tasks and roles, creating timelines, and attaining group consensus. They use groupware--electronic systems that integrate software and hardware--to enable communication and collaborative work (Khoshafian & Buckwitz, 1995). Some environments use synchronous groupware (those that enable team members to interact at the same time) while other environments use asynchronous groupware (those that facilitate delayed interaction) (Coleman, 1997).

Effectively designed, implemented, and managed virtual teams facilitate better outcomes than an individual could achieve alone. Using the framework developed by Schwarz (1994), it is easy to recognize the important role that team structure (that is, the clarity of group goals, tasks, and roles of team members) plays in determining team effectiveness. Team structure refers to the extent to which team members understand and are committed to team goals, as well as the extent to which their roles on the team are clearly defined (Schwartz, 1994). Clarity and commitment to group goals and clearly defined roles not only enhance satisfaction within the team, they underline...
the importance of team structure for effective student team functioning (Vancouver, Millsap, & Peters, 1994; Stevens & Campion, 1994).

Certain elements, such as trust and respect, are important in the establishment of healthy learner-learner relationships (Kanuka, Collett, & Caswell, 2002). In a virtual community, trust and respect are crucial and can be challenged by the lack of face-to-face interaction. Communication processes are the key underlying mechanisms for establishing trust (Gibson & Cohen, 2003). Through communication, virtual teams create cooperative relationships, receive insightful information about the personalities of team members, and develop common values.

Most distance education systems geographically isolate learners from the teacher and from their fellow students (Rangecroft, 1998). Keegan (1986) purported that the separation of student and teacher imposed by distance removes a vital "link" of communication between these two parties. The link can be restored through the open and prompt communication of a virtual team. With advanced technologies, the concept of community can be applied to formally structured classroom settings in distance education by taking on the issue of how best to design and conduct online programs that fosters social interactions among learners who are physically separated from each other (Rovai, 2002).

Using electronic media in distance learning can inadvertently exclude students who lack computing or writing skills. They may not have access to reliable computers. Students may need assistance developing study survival skills or obtaining study materials and technical assistance. The frustrations resulting from technical problems can affect motivation directly (Goel, 2002). Relationships and communication through virtual teaming provide support for all students.

**Research Questions**

In an attempt to put in perspective what they had experienced and to maximize their lessons learned from virtually teaming to study graduate-level statistics, the researchers purposed the following research questions.

1. What skill development was targeted in the statistics course taken by the researchers in summer 2003?
2. What was the nature of virtual teaming used in conjunction with the statistics course taken by the researchers in summer 2003?
3. What preliminary decision-making launched the generation of value-adding learning dimensions and effects experienced by the researchers in summer 2003?
4. What were the integrative components of the research experience acquired by the researchers in summer 2003?
5. What were the serendipitous outcomes that occurred after the statistics course was finished?

**Methodology**

A qualitative design was used for researching the transcendent outcomes of a quantitative research project conducted in conjunction with a compressed 10-week summer school graduate statistics course. Two graduate student researchers (one master’s level and one doctoral level) enrolled in an online statistics course; both were unaware of the other’s participation in the course until the first day of class. The professor assigned homework and a cumulative project that could be completed either individually or as part of a team, but teamwork was not a requirement. The researchers decided to collaborate as a virtual team for the homework and the project based on similar research agendas that had been disclosed previously through other courses and discussed in a research community established by their mutual academic program advisor.

The quantitative research project involved preparing a research proposal that was due shortly before the project report. The proposal requirements included (a) a descriptive title, (b) a research question to be answered and the rationale for the question, (c) the research question stated as a statistical hypothesis, (d) definitions of the variables of interest and how they would be determined, (e) explanation of the sample used and how data would be collected, and (f) explanation of the statistical procedures to be used to answer the question. Data could be collected from student research, a faculty advisor, previously published theses or dissertations, published articles, an internet database, or other sources. The project report format requirements were (a) an introduction, (b) a literature review or rationale for the study, (c) a description of methodology used, (d) a description of the data analysis and findings, and (e) conclusions and recommendations.

When the quantitative research project was first assigned, the researchers contacted their academic program advisor to inquire about original data. The advisor did not have any data that needed to be analyzed but suggested an original research project. The student researchers agreed on the research topic and proceeded with submitting the necessary human subjects form. Upon approval of the human subjects form, the researchers developed a digital
survey using the *SPSS Suite 11.5 Data Entry Builder* in conjunction with the statistical consulting services on campus. The designated statistical consulting services consultant placed the graduate student researcher generated survey online and provided the researchers with the URL for launching the survey.

The prospective subjects included undergraduate students participating in Human Resource Development online courses during summer 2003. Instructors of those online courses were asked to invite their students to participate in the survey; a link to the survey was provided in an email message. Instructors were asked a second and, finally, a third time to invite their students to participate in the survey. Of the 60 undergraduate students that were invited to participate in the survey, 34 completed the survey for a response rate of 56.7%.

Data were collected using the digital survey via a server hosted by designated statistical consulting services consultant. The data were emailed to researchers periodically as an SPSS file. After the last day of class for the summer session a final data file was emailed to the researchers. For the statistics course project, the researchers used data collected two weeks after the subjects were invited to complete the survey.

Data were analyzed using linear regression analysis, which indicated a strong positive relationship between the variables that were studied as predicted by the research question for the project. The final project report was submitted to the statistics professor. Based on successful completion of the quantitative research project, both researchers obtained the grade of A at the end of the course.

While reflecting upon completion of the quantitative research project and the statistics course, the graduate student researchers, as guided by their academic program advisor, launched a qualitative investigation of lessons learned in their integrative research experience. Subsequently, the researchers sought to put their experience in perspective by comparing and contrasting their lessons learned with those experienced by fellow students in the same statistics course. Accordingly, the researchers created an email survey and subsequently sent the survey to fellow students and the statistics professor using the email tool within their statistics course’s Blackboard website. After one week’s time, the researchers sent a reminder email about the survey to their fellow students and statistics professor. Data were collected on 24 of the 25 students (96%). The data were discussed, analyzed, and interpreted by the researchers, and a case study was completed.

**Limitation**

This in-depth case study depicts the integrative value-added learning dimensions experienced by two graduate student researchers in a 10-week summer school online statistics course. The researchers acknowledge that their lessons learned as graduate student researchers have limited generalizability. No comparable face-to-face statistics course was held during the summer, so using a control group was not possible. While not addressed in this study, future research should investigate differences in research skill development and team effectiveness between online courses and their traditional equivalents.

**Results**

The findings of this research are clustered on the basis of responding to each of the five research questions.

In response to Research Question 1, *What skill development was targeted in the statistics course taken by the researchers in summer 2003?*, the researchers documented that the statistics course covered (a) univariate and bivariate data collection and organization; (b) statistical estimation and hypothesis testing; and (c) analysis of relationships for numerical and categorical data, including Chi-square tests and simple linear and quadratic regressions. Researchers learned these statistical concepts along with beginner- to intermediate-level skills using SPSS Suite 11.5.

In response to Research Question 2, *What was the nature of virtual teaming used in conjunction with the statistics course taken by the researchers in summer 2003?*, the researchers maintained two-way communication between themselves. Ongoing communication transpired among the researchers and their academic program advisor, the statistics professor, the designated statistical consulting services consultant, and other students enrolled in the course on a regular basis. This communication was conducted via email using Blackboard and regular email, telephone, and Centra technology. Figure 1 provides a model illustrative of the interrelatedness that evolved within this virtual team. This model supports integrative research skill development.
The researchers were separated by geography and were enrolled in different levels of the Human Resource Development graduate program. However, their relationship which had been established in previous courses and in the research community to which they belong provided the solid foundation of trust and mutual respect that is so essential for successful collaboration. Researchers and their academic program advisor had a previous relationship based on a research community established by the academic program advisor. The process of creating the research community included clarifying individual mission statements with regard to the research community, which provided a common thread for the researchers. This relationship also allowed for proactive access to the academic program advisor during summer.

Data supportive of answering Research Question 3, what preliminary decision-making launched the generation of value-adding learning dimensions and effects experienced by the researchers in summer 2003? indicated that once the decision was made to conduct original research as a virtual team, additional decision making transpired in an almost chain-reaction-like manner. Having an established relationship and clarified research agendas enabled the researchers to work with their academic program advisor in order to make decisions like choosing a topic, establishing research questions, designing the methodology, selecting instrumentation, and choosing data collection and analysis methods fairly quickly. The relationship also provided the framework for reflecting upon the project at its conclusion and deciding to submit the case study to AHRD.

Post-statistics course data collection revealed that of the 25 students enrolled in the statistics course, 23 students completed the survey for a response rate of 92%. The results indicated that the researchers’ were the only students that (a) participated in a virtual team, (b) conceived a project and collected original data during the course, and (c) used a digital survey to collect the data. Students attended class while at home, at work, and on campus. Two students attended class from other states, and one student attended class while in another country.

Responding to Research Question 4, what were the integrative components of the research experience acquired by the researchers in summer 2003? the researchers made the decision to conduct an original research project which was a huge undertaking. Not only were the researchers learning statistics, they were also learning the proper procedures required for a research study at their institution. Figure 2 depicts the value-added learning dimensions experienced by the researchers. The first step included the completion of a human subjects form. Each researcher learned how to operate several new modes of technology (i.e. Centra, SPSS Suite 11.5). One researcher worked with the designated statistical consulting services consultant in creating the digital survey while the other researcher developed the email survey for the post-project data collection. Once the digital survey data were collected, the virtual team members analyzed the data and
presented the results as their course project to the statistics professor. This entire research project was managed through email communication and teleconferencing.

Figure 2. Value-Added Learning Dimensions Resulting From the Use of an Integrative Model for Graduate Student Research Skill Development.

In response to Research Question 5, What were the serendipitous outcomes that occurred after the statistics course was finished? the researchers shared their statistic course experience with their academic program advisor, and noted that working as a virtual team on the research project provided an opportunity to help others in similar situations. The experience proffered the following individual gains:

a. experience with and confidence building in research project design, data collection, and data analysis and analysis interpretation, and using appropriate statistical techniques and technological tools;

b. empowerment emanating from the creation and ownership of an original data set;

c. realization that the integrative research experience as a whole yielded insights potentially transferable to other graduate student researchers and their academic program advisor;

d. generation of a case study portraying the project;

e. creation of a dynamic integrative model for graduate student research skill development;

f. development of a scholarly research manuscript inclusive of presentation graphics depicting research results;

g. growth and enrichment of a closer, personal, and professional relationship between the researchers and their academic program advisor that has now developed into a face-to-face relationship;

h. initiation of individual research agenda progress; and

i. experience with and confidence building in conducting qualitative and quantitative research.

Conclusions

The outcomes of this project give rise to suggestions of what to do in a similar situation as well as some general conclusions about virtual teaming among distance education students. Conclusions resulting from this research consist of the following:
• Distance education is a viable methodology for the study of statistics;
• Virtual teaming is possible in an online statistics course;
• Diverse research skills in addition to statistics skills can be cultivated via execution of a statistics research project;
• Rich and enriching communication can result from synchronous and asynchronous collaboration;
• The decision to originate a data set spawns multifaceted opportunities to integrate research skills;
• Clarification of individual and collaborative research agendas promotes more efficient virtual teams and provides students with opportunities to integrate course assignments and research interests; and
• Serendipitous outcomes result when students are empowered by opportunities to conduct self-directed research.

Implications

The integrative approach and ensuing learning processes and research skill development through studying statistics merit consideration in terms of potential transfer for use by other graduate students and their academic program advisors.

**From a student perspective**, the development of research skills helps future researchers contribute to the HRD body of knowledge. The entire research project lasted fewer than 10 weeks due to the online statistics course being taught in summer. The compressed schedule did not prohibit original research from being conducted for the course.

**From a teacher/academic program advisor perspective**, the development of personal and professional relationships with students provides opportunities to facilitate student identification and clarification research affinities. Such mentoring can foster the growth of research communities, which, in turn, promote collaboration between and among students and faculty.

This research experience was proof positive as to why students need to be proactive in communicating with their academic program advisor. The relationship between the researchers and their academic program advisor allowed this project to become a reality. Time was of the essence, and the existing relationship allowed maximal efficiency with regard to decision-making and determining the critical path of the project. The academic program advisor provided a safety net for student researchers in this project. The academic program advisor guided and directed the research while allowing the researchers to experience the highs and lows that go along with scientific research. This safety net allowed for graduate student research skill development in a secure environment.

Contributions to HRD

Virtual teaming skills, as illustrated by this integrative research experience, can be developed using student projects as a medium. Temporary project teams created for a specific purpose are experiencing growing prominence in the workplace (Werner & Lester, 2001). In response to this, educators in areas such as public administration (Dickson, 1997), marketing (Deeter-Schmelz & Ramsey, 1998), and management (Bacon, Stewart, & Silver, 1999) have noted the increased use of student teams to promote teamwork skills among college students. These types of activities can prepare students for the kinds of team experiences they will face in employment settings (Dickson, 1997). Cohen (1993) predicts that organizations will continue to integrate teams into their organizational structures and increase their authority. In light of this information, continued studies are needed to determine the characteristics of effective and ineffective virtual teams. As virtual team-based structures increase in organizations, the demand for college graduates with strong virtual teaming skills will also increase. Even though the statistics project reported in this present study was not conducted in a corporate setting, the project had real meaning for the graduate student researcher virtual team members. Both researchers honed their virtual teaming skills as a result of conducting their statistics course research project.

Impact of ISO Certification on Training and Development Activities in the Electronics Industry in Taiwan

Wen-Rou Huang  
Ronald L. Jacobs  
The Ohio State University

This paper explored the impact of ISO 9000 on training and development activities in the electronics industry in Taiwan. A survey approach was adopted. Respondents were asked to indicate whether any changes in training and development activities had resulted from ISO certification. The questionnaire was sent to 247 ISO 9000-certified companies and 37 responses were received for analysis. The findings indicated an increase in training needs assessment, training delivery, and training effectiveness after obtaining ISO 9000 certification. A greater impact on training and development activities at professional, supervisor, and frontline employee levels were reported more than at the executive and managerial levels. In addition, a positive improvement in the quality of the companies’ workforce and products was also reported.

Keywords: ISO 9000, Training and Development, Electronics Industry

Since the release of ISO 9000 by the International Organization for Standardization (ISO) in March 1987, the ISO 9000 family of international standards and guidelines has gained a global reputation as the basis of establishing quality management systems and had great impact on international trade (Mo & Chen, 1995). The International Organization for Standardization is a worldwide federation of national standards bodies, headquartered in Geneva, Switzerland. The organization was founded in 1946 to develop a common set of standards for manufacturing, trade and communications. Today, more than 90 countries are members, each with a representative. Certificates issued worldwide are estimated at more than 95,000 in over 95 countries that have endorsed the ISO 9000 standards till 1994 (Curkovic & Pagell, 1999). By the end of December 1999, it has been reported that at least 343,643 ISO 9000 certificates have been awarded in 150 countries (Quazi & Jacobs, In press), including many developed countries. It is obvious that ISO 9000 is rapidly becoming a nationally and internally accepted quality standard. (Curkovic & Pagell, 1999).

Basically, ISO 9000 is a series of internationally accepted standard of quality management that is used to develop quality management systems and quality improvement processes (Masternak & Kleiner, 1997). ISO 9000 standards consist five separate parts: (1) ISO 9000; (2) ISO 9001; (3) ISO 9002; (4) ISO 9003; and (5) ISO 9004. ISO 9001, 9002 and 9003 are conformance standards for quality assurance and control systems. ISO 9000 and 9004 are the guidelines. More specifically, ISO 9001 certification deals with the management systems used by organizations to design, develop, produce, deliver, install and support their own products (Juran & Godfrey, 1998). ISO 9002 applies to companies that provide goods or services consistent with the specifications furnished by the customer. ISO 9003 applies to final inspection and test procedures only (Curkovic & Pagell, 1999).

ISO 9000 certification is receiving so much attention from many developing or developed countries because it has the potential to make the companies more cost-effective and efficient. In addition, it can be considered as an effective tool to improve quality to enhance competitiveness. Quality not only means the quality of product but also the quality of work, quality of communication, and quality of information. It also means quality of process, quality of division, quality of people, quality of system, quality of company, quality of objectives, and etc (Ishikawa, 1985). In other words, quality includes all aspects of every product or service of value to a customer (Ishikawa, 1985). The main reason that ISO 9000 can be deemed as an effective tool is that ISO 9000 provides many benefits. According to Rothery, one of the benefits is “... controls to ensure quality of production and delivery, and reduces waste, downtime, and labor inefficiencies, thereby increasing productivity” (Rothery, 1993). In other words, ISO 9000 provides “consistency in working procedures, better understanding of processes and responsibilities, better understanding of the management of quality, reduced customer complaints, improved team-work and reduced rejection rates” (Kraschol, Willey & Tannock, 1998).
Statement of Problem

Obtaining ISO 9000 certification has become an important issue in the manufacturing industry in Taiwan, especially the electronics industry. Since the 1960s, the Taiwan government has adopted an export-oriented economic policy to accelerate economic development (Huarng, 1998). Without abundant natural resources, the government has not only devoted itself to transferring its economic structures from traditional industries (such as agriculture) to electronics industries but also actively help the companies quickly internationalizing in order to gain competitive advantages and survive in the international arena. For developing business opportunities in the European Community (EC) and in some other international markets, the Bureau of Commodity Inspection and Quarantine (BCIQ) introduced ISO 9000 to Taiwan in 1989 (Shih & Huarng). In March 1990, ISO 9000 family was adopted to be the CNS 12860 series (Huarng, 1998). According to the statistical records of Bureau of Standards, Metrology and Inspection, 1,495 companies had obtained ISO 9000 certification till 2002.

As mentioned, one of the key elements in the ISO 9000 standards is training. However, not every company has training activities in Taiwan, especially those start-up or smaller companies. One of the reasons is that developing training activities is costive and time consuming, especially if they do not have the resources or experiences. However, we know that ISO 9000 certification does have a lot of benefits such as the potential to improve product and service quality, attain competitive advantages, promote business impacts and etc., that worth companies to pursue. Therefore, the purpose of this study is to explore the extent to which ISO 9000 certification has impacted training and human resource development activities of organizations in electronics industry in Taiwan. This study can serve as reference information for the start-up and smaller companies to develop training activities to pursue ISO 9000 certification and also realize the impact before and after obtaining ISO certification toward training activities.

Specifically, the research questions as the follows were addressed:
1. How does ISO 9000 certification affect the conduct of a formal development plan for each employee level?
2. How does ISO 9000 certification affect the conduct of work document for each employee level?
3. How does ISO 9000 certification affect the conduct of training needs analysis?
4. How does ISO 9000 certification affect the conduct of training delivery methods?
5. How does ISO 9000 certification affect the determination of training effectiveness?

Methodology

A survey research methodology was used in this study. The design of the questionnaire was based on the work of Quazi & Jacobs (In press). Basically, the questionnaire was divided into three parts. Part I seeks information about the status of ISO 9000 in electronics companies in Taiwan. Part II compares the training and development activities “before” and “after” having ISO 9000 certification. Part III is regarding basic information about the companies. The companies were asked to indicate the nature and extent of their training and human resource development activities three years prior to obtaining ISO 9000 certification and three years after the certification.

Before being finalizing, the questionnaire was pre-tested 3 times by at least three engineers who are working at the Quality Assurance department or Quality Control department in the different electronics companies in Taiwan. The Quality Assurance department or Quality Control department in the electronics companies in Taiwan are the ones, which are in charge of product quality management issues or ISO 9000 certification. The final version of the questionnaire was mailed, emailed or faxed to 247 ISO 9000 certified electronics companies in Taiwan. The questionnaires were sent to the managers of Quality Assurance department, Quality Control department to respond. In order to improve the response rate, follow-up calls and direct face-to-face interviews were made beginning from two weeks after the questionnaires were sent out.

Results

Thirty seven (37) completed and usable questionnaires were received from the 247 questionnaires sent out. The response rate was 15 percent. Of the 37 responding companies, 36 companies are private and one company is
owned by the government. Thirty-one are large companies and six are start-up companies. Sixteen companies are computer-related industries and 14 companies are electronics manufacturing.

Among the 37 companies, 21 (56.8%) are certified in the ISO 9001 standard and 6 (16.2%) are the ISO 9002 certification. 10 (27%) companies have both ISO 9001 and ISO 9002 certifications. Almost all the companies have the training activities to support obtaining ISO 9000 certification and consider them helpful. About 81% of the companies hired consultants to assist them in getting certified. 30% of the companies took one year to be certified and 57% took more than one year.

Basically, up to 90% of the companies either agreed or strongly agreed that ISO certification has a lot of benefits such as improving the training and on-the-job training program, improving the relationship with the customers, promoting the quality of products and services, increasing the efficiency of the operation, and etc (see Figure 1). The primary reason which motivates the companies to pursue ISO 9000 certification is that ISO 9000 series can help companies to increase competitive advantages. After ISO 9000 certification, the major change of the organizations is the quality of workforce and products (see Figure 2). As to the training method used to facilitate obtaining ISO certification, more than 68% of the companies included either structured on-the-job training or team training method. Only 19% of the companies included apprenticeship as their training method (see Figure 3).

Regarding the training and development activities before and after ISO certification, the findings are summarized as follows:

How does ISO 9000 certification affect the conduct of a formal development plan for each employee level? As shown in Figure 4, before ISO 9000 certification, the number of sample companies having formal development plan for professionals, supervisors and frontline employees levels is smaller than that for executives and managers levels. After ISO 9000 series, the number is increased for each employee level and the percentage increase for professionals level is the highest. In addition, almost all the sample companies have the formal development plan for executives, managers and professionals levels.

How does ISO 9000 certification affect the conduct of work document for each employee level? As shown in Figure 5, before ISO 9000 certification, the number of sample companies having work documentation for supervisors and frontline employees levels is smaller than that for executives, managers and professionals levels. After ISO 9000 series, the number is again increased for each employee level and the percentage increase for supervisors level is the highest. In addition, almost all the sample companies have work documentation for professionals and supervisors levels.

How does ISO 9000 certification affect the conduct of training needs analysis? As shown in Figure 6, before ISO 9000 certification, the number of sample companies having needs assessment for professionals, supervisors and frontline employees levels is smaller than that for executives and managers levels. After ISO 9000 series, the number is again increased for each employee level. The percentage increase and number of sample companies having work documentation for professionals and supervisors levels are closely equal and the highest.

How does ISO 9000 certification affect the conduct of training delivery methods? As shown in Table 1, before ISO 9000 certification, the training types provided for executives and managers levels are managerial and awareness training in most sample companies while technical, quality, computer and engineering training for professionals, supervisors and frontline employees levels. After ISO 9000 certification, the number of sample companies providing each types of training for each employee level is increased. In addition, more sample companies deliver quality and computer training to executives and managers levels, awareness training to professionals level, and managerial training to both professionals and supervisors levels. As to the frontline employees level, the increase of number of sample companies, which deliver each training type, is similar. Also, over 65% of the sample companies deliver EACH type of training to their professionals and supervisors levels.

How does ISO 9000 certification affect the determination of training effectiveness? As shown in Table 2, before ISO certification, approximately over 65% of the sample companies agreed that the trainee satisfaction, trainee learning, trainee use on the job, business impacts, and cost-benefit analysis can be used to determine the effectiveness of training and development activities. After ISO certification, the number of sample companies that disagreed is decreased substantially. Most of the sample companies either agreed or strongly agreed.

Summary and Discussion

This study examined the impact of ISO certification on training and development activities of a sample of electronics companies in Taiwan. The major purpose of this study is to explore the extent to which ISO 9000 certification has impacted training and human resource development activities of organizations and serve this information as a reference for the start-up and smaller companies. We summarized the results as follows:
For all five research questions regarding the training and development activities before and after ISO certification, we found that the companies have a significant improvement in training needs assessment, training delivery, training evaluation and other human resource development activities after obtaining ISO 9000 certification, which is consistent with the previous study conducted by Quazi and Jacobs (2001). Specifically, it was found out that after obtaining ISO 9000 series, more sample organizations developed their formal development plans for each employee level (executives, managers, professionals, supervisors and frontline employees), especially for professionals level. Furthermore, it was found that the ISO certification has greater impact on training and development activities (such as formal development plan, work documentation, and needs assessment) at professional, supervisor and frontline employee levels than those at executive and manager levels. A substantial increase of the companies was observed to deliver the training and development activities at professional, supervisor and frontline employee levels after the companies were certified.

In general, the number of the companies, which delivered various training types to different employee levels, was increased after their obtaining ISO certification. Specifically, for executives and managers, the number was increased more where they provided quality and computer training compared with other types of training. As to the professional level, the number was increased more in the delivery of managerial and awareness training. As to the supervisor levels, the number was increased more in the delivery of managerial training. The number was increased similarly in the delivery of every category of training for frontline employee level. This may imply that, after ISO certification, proportion of increase of different types of training activities delivered to different employee levels needs to be evaluated accordingly in order to comply the ISO 9000 standards and become cost-effective.

From the survey, we found that more than 35% of the companies strongly agreed and around and less than 10% either strongly disagreed or disagreed that the trainee satisfaction, trainee learning, trainee use on the job, business impacts, and cost-benefit analysis can be used to determine the effectiveness of training and development activities after obtaining ISO 9000 certification.

The finding of this study indicates that there is a great change in the quality of companies’ workforce and products after obtaining ISO 9000 standards. We can know that the perception of benefits of ISO certification related to the change of quality of workforce and product is positive. It means ISO 9000 certification helps improve the quality of the products and services. This result is consistent with the previous study conducted by Quazi and Jacobs (In press).

As to the issue of supervisors’ attitudes toward employees’ applying skills learned from the training to the jobs, we found that the percentage of companies in which supervisors gave feedback to trainees when they used the learned skills is low (14%). As we know, employees need feedback (Noe, 1999). It is one of the five core dimensions (skill variety, task identity, task significance, autonomy and feedback) that impact intrinsic motivation. Receiving feedback has a positive impact on intrinsic motivation toward a job, which leads to high job performance, high job satisfaction and low absenteeism and turnover (George & Jones, 1999). Hence, the feedback from supervisors toward employees’ applying skills learned from the training to the jobs should be further emphasized in the electronics companies in Taiwan.

It would be interesting to know what kinds of training methods facilitate the companies in obtaining ISO certification the most and the fastest. From our preliminary result, more than 68% of the companies included either structured on-the-job training or team training method, which is shown in Figure 8. Only 19% of the companies included apprenticeship as their training method. When we further compared the training methods with the time to obtain ISO certification, similar conclusion can also be reached, i.e. either structured on-the-job training or team training method was included in most of the companies. However, based on the current questionnaire, we do not have enough information to determine the relationship between training methods and the time to obtain ISO certification, i.e. which method facilitates the companies in obtaining ISO certification the most and the fastest. Further survey is required to decouple several factors in order to determine the interactions between training methods and the time to obtain ISO certification.

Limitation

There are two limitations in this study. One is the low response rate and the other is lacking statistical analysis of the data. There are a lot of reasons for such low response rate. One of the reasons is that our questionnaire is written in English. Because of certain degree of language obstacle, many respondents hesitated to reply the questionnaire. Another possible reason is that electronic industry is a very competitive market in Taiwan. The managers/supervisors either in QC or QA department were too busy to answer the questionnaire. Another reason may be that those managers/supervisors were too concerned about the information revealed. As to lacking the statistical analysis of the data, one of the reasons is the low response rate. The other is that, based on the current
design of the questionnaire, the acquired information cannot be used for further statistical analysis. Instead, the finding was categorized for comparison. Despite these limitations, there is still interesting information extracted from this study as described in the Summary and Discussion section. Future research will focus on examining the relationships more statistically.

Conclusions

From this study, we can see that the companies have a significant improvement in training needs assessment, training delivery, training evaluation and other human resource development activities after obtaining ISO 9000 certification. The ISO certification has greater impact on professionals, and supervisors levels compared to other employees levels. Also, delivering proper training types to different employee levels needs to be addressed and evaluated after ISO certification. Most of the sample companies either agreed or strongly agreed that the trainee satisfaction, trainee learning, trainee use on the job, business impacts, and cost-benefit analysis can be used to determine the effectiveness of training and development activities after obtaining ISO 9000 certification. From this survey, we can know clearly the change of training activities before and after the ISO 9000 certification. ISO inevitably affects all aspects of the organization, including the training and human resource development activities (Quazi & Jacobs. In press).

56-1
This paper reports a study designed to examine the key concepts of TQM implementation and their effects on organizational performance. Process Alignment and People Involvement are two key concepts for successful implementation of TQM. The purpose of this paper is to discuss how these two constructs affect organizational performance. The results provide useful insight into the organization that uses TQM as a development program.

Keywords: TQM, Process Alignment, People Involvement

TQM strategies represent a paradigm shift from the earlier strategies of the 1980s in the approach to management science. Studies showed that TQM was positively associated with performance outcome, such as financial performance and profitability (Cummings & Worley, 2001; Lawler et al, 1995) as well as with human outcomes, such as employee satisfaction, employee relations, and customer satisfaction (Lawler et al, 1995). Although many TQM studies have been done to discuss the concept and principles, the key to successful TQM program is not fully understood (Weintraub, 1993). According to Rivers and Bae (1999), successful implementation of TQM require a transportation of organizational information system infrastructure and other management systems so they are aligned with the new TQM environment. Powell (1995) suggested that tacit resources such as organizational culture, commitment, empowerment and business processes drive TQM success. Sahney (1991) pointed out key concepts to implementation TQM, which included: top management leadership, creating a corporate framework for quality, transforming corporate culture, a collaborate approach to process improvement, integration with the process etc. However, for TQM to be successful, management processes must be aligned and integrated within a TQM environment. For example, the bureaucratic system must be transformed, strategies must be aligned, and information system must be integrated to make sure the TQM success. Some studies showed that it is important for top management take a leadership role and shows a strong commitment at the time of implementing TQM (Lee & Asllani, 1997; Rivers & Bae, 1999; Weintraub, 1993). Also Weintraub (1993) pointed out that the quality management process will be successful only when it becomes integrated with every employee’s activities.

Although reports of TQM success are plentiful in the popular literature, there are also reports of problems (Cummings & Worley, 2001; Powell, 1995; Fortune, 1991). Many affecting factors of success TQM practices that result in performance, core processes and people are two major points to drive TQM success.

However, more empirical studies are needed to show the contribution of organizational variables such as structure, strategy, information technology, human resources, leadership, culture, and employee participation on the success of TQM programs (Nadler, 1998; Tushman and O’Reilly, 2002). It is the intention of this study to examine the impact of organizational variables, specifically the alignment of structure, strategy and information technology, and executive commitment and employee empowerment, on TQM programs and the final performance outcomes. Therefore, this study suggested that Process Alignment and People Involvement are two constructs which influence the organizational performance when the organizations perform TQM initiatives. Process Alignment (PALI) consists of three variables – structure, strategic and IT alignment. People Involvement (PINV) consists of two variables – executive commitment and employee empowerment.

The purpose of this research is to examine relationship between two TQM concepts and their impact on organizational performance. Specifically, this study addresses the following research questions:

1. What is the relationship between Process Alignment and Organizational Performance, especially, when organizations practice TQM initiatives? To what extent, do the components of Process Alignment affect Organizational Performance?

2. What is the relationship between People Involvement and Organizational Performance, especially, when organizations practice TQM initiatives? To what extent, do the components of People Involvement affect Organizational Performance?
Theoretical Framework

The theoretical foundation for this study is the TQM, Process Alignment, and People Involvement. Process Alignment can be interpreted as the organizational effort needed to make the processes the platform for organizational structure, for strategic planning, and for information technology (Hammer, 1996; Spector, 1995). The aim of Process Alignment is to arrange the various parts of the company to work in harmony in pursuit of common organization goals, in order to improve performance and sustain competitive advantage (Weiser, 2000). According to Organizational theory, organizations are required to design their structures and systems to align the contingencies of environment, strategy, technology, and so on for survival and success (Daft, 1998; Lewin, 1999). Many previous studies have empirically demonstrated the positive effect of alignment on organizational effectiveness (Lawrence and Lorsch, 1967; Gresov, 1989; Roth et al., 1991). Alignment theory (Semler, 1997) suggested that employee behavior consonant and organizational goal work together through structural change, strategy usage and culture transformation. Specifically, Weiser (2000) stated that in order to link all areas of the organization and serve as an informational lifeline throughout the change and alignment process, the organizational structure needs to be redesigned to cross-functional. Grover et al. (1997) pointed out that IT as a transformational subsystem is imperative in culture transformation. Therefore, when an organization is appropriately aligned, organizational structure, strategic planning and IT correspond to organizational core processes and objectives, ensuring competitive advantage.

In sum, consistency with alignment theory and further IT implementation are related to organizational performance (Davenport, 1993; Grover et al., 1997; Hammer and Champy, 1993; Ostroff, 1999; Spector, 1995; Thompson and Strickland, 1999). The following hypothesis should be conducted:

H 1 Process Alignment is positively associated with Organizational Performance
H 1-1 Horizontal structure is positively associated with Organizational Performance
H 1-2 Strategic Alignment is positively associated with Organizational Performance
H 1-3 IT Alignment is positively associated with Organizational Performance

From previous studies (Lee & Asllani, 1997; Rivers & Bae, 1999; Weintraub, 1993), for TQM to be successful, it must have the commitment and involvement of top management. In addition, scholars (Allender, 1994; Powell, 1995; Waldman, 1994) suggested that employee empowerment which included employee involvement and gave employees greater autonomy is one of principles to continue improvement to guide the implementation of TQM. As a result, the following hypothesis should be conducted:

H 2 People Involvement is positively associated with Organizational Performance
H 2-1 Executive commitment is positively associated with Organizational Performance
H 2-2 Employment empowerment is positively associated with Organizational Performance

Methodology

Questionnaire Developments and Data Collection

The questionnaire consisted of four parts, which related to the evaluation information on general information about the company; how well organizational structure, information technology, and strategy aligned with core processes; commitment of top executive management and employee empowerment; and perceived level of business performance. The scale to measure the above variables were developed based on a review of the previous literature. The five points Likert scale was used for the questionnaire.

Two steps were followed in this study to establish the validity and reliability of the questionnaire. First, data were collected and analyzed on the content and face validity by a panel of experts. The questionnaire was also changed per their suggestions. Second, the revised questionnaire was piloted with 90 post-graduate final year Executive MBA students from the Australian Graduate School of Management. The data collected from the pilot test, with a response rate of 52%, was coded and analyzed using statistical software SPSS to find any unanticipated difficulties and no significant problems were found. Cronbach’s alpha was used to determine the internal consistency of the instrument. All scales were highly reliable and consistent (0.6298 < α <0.8389).

The target population of this survey is the Top 1000 companies in Australia based on market capitalization, as reported by MOS Data Assembly Specialists. As preliminary opinion survey suggested that a top executive would be the most appropriate key informant. The actual number of companies surveyed (950) was fewer than 1000 because of acquisitions and mergers. Several efforts such as a telephone follow-up campaign and a follow-up fax was made to encourage the respondents to complete and return the questionnaire. A total of 333 questionnaires
were received from the 950 questionnaires distributed. 73 questionnaires were discarded. This comprised 62 questionnaires that were returned unfilled, 10 that were incomplete, and one that was undeliverable.  A total of 260 questionnaires were usable, which represents a response rate of 27.4%.  Of 260, the 207 returned respondents adopt TQM (79.6%).

In order to know whether the effect of non-response bias is significant between those who responded early with those who responded late.  We compared the total sales volume, size of organization, type of industry, and practice TQM program between those who responded early with those who responded late.  A Chi square tests and the t tests were performed.  The null hypothesis of this analysis is that an early respondent has the same characteristics as a late respondent.  The observed significant level p for all variables is much higher than 0.05.  This implies that in this research the extent of non-response bias is insignificant, and the results are generalizable to the sampling frame.  The following section reports results from factor analyses and regression analyses.

Analyses and Results

Factor Analyses

In this research, principle component analysis using varimax rotation was employed to explore the data for possible data reduction.  Items in the same factor with a loading factor greater than 0.40 were grouped together.  Table 1-3 shows the results of factor analysis with varimax rotation for Organizational Performance (OPER), Process Alignment (PALI) and People Involvement (PINV).

Using exploratory factor analysis for the 5 Organizational Performance items, the principal component method was employed.  This factor is chosen to explain 49.86 percent of the variances.  The varimax rotation method is used to obtain easier explanations of Organizational Performance.  The highest loading of each item on all common factors is shown in Table 1.

Using exploratory factor analysis for the 18 Process Alignment items.  These were reorganized into four factors: Horizontal Structure Alignment, IT Competency Alignment, Strategy Alignment and Measuring IT & Improvement.  Four common factors are chosen to explain 53.22 percent of the variances of the 18 items since each of their corresponding eigenvalues is greater than one.  The varimax rotation method is used to obtain easier explanations of Process Alignment.  The highest loading of each item on all common factors is shown in Table 2.

Using exploratory factor analysis for the 9 People Involvement items were grouped into two factors: Executive Commitment and Employee Empowerment. The principal component method was employed. Two common factors are chosen to explain 57.34 percent of the variances of the 9 items, since each of their corresponding eigenvalues is greater than one. The varimax rotation method is used to obtain easier explanations of People Involvement. The highest loading of each item on all common factors is shown in Table 3. As shown in Table 1 to Table 3, the results of the factor analysis suggest that the factor structure of the questionnaire is stable and provides strong evidence for the discriminant validity of the measurement instrument.

Correlation Analyses

In this section, correlation analyses were performed to determine the association between components of independent variables: PALI, PINV and the dependent variable: OPER. The results of correlation coefficients and significant levels are depicted in Table 4. All components of PALI and PINV are positively associated with OPER except Measuring IT & Improvement in PALI.

Linear Regression Analysis

Since factor scores are used for three-components of independent variables PALI and two-components of independent variables PINV to one dependent variable, and also factor scores are used for both PALI and PINV as two independent variables to one dependent variable, the correlation coefficients for both components of independent variables PALI and PINV are zero.

The enter procedure is employed and the significant level set at 0.05. Table 5 reported unstandardized regression coefficients. The R-square (adjusted R-square) is 0.244 (0.232), 0.179 (0.170), and 0.132 (0.124) for the three models respectively. Table 5 shows that (1) the effects of Strategy Alignment (SALI), IT Competency Alignment (TALI) and Horizontal Structure Alignment (HORI) on Organization Performance (OPER) are significant at the level of 0.000, 0.001 and 0.008, respectively. Hence, the all three factors are all positively related to Organizational Performance. (2) the effects of Executive Commitment (ECOM) and Employee Empowerment (EEMP) on Organization Performance (OPER) are all significant at the level of 0.000. Hence, the two factors are also positively related to Organizational Performance. (3) the effects of PALI and PINV on OPER are significant at the level of 0.000 and 0.013, respectively. Hence, the two variables are positively related to Organizational Performance.

Table 5. Regression Analysis for Components of Independent Variables: PALI, PICO and Dependent Variable: OPER

\[
\text{OPER} = 0.012 + 0.412 \text{SALI}** + 0.218 \text{TALI}** + 0.165 \text{HORI}** \\
\text{OPER} = 0.002 + 0.217 \text{ECOM}** + 0.323 \text{EEMP}*** \\
\text{OPER} = 0.011 + 0.168 \text{PALI}** + 0.303 \text{PINV}*** \\
\]

Note: *represents the significant level at 0.05; **represents the significant level at 0.01 and ***represents the significant level at 0.001

Discussions and Conclusions

This research found that three components of PALI: Horizontal Structure Alignment, IT Competency Alignment, and Strategy Alignment are each positively associated with Organizational Performance. These findings support previous studies (Lee and Dale, 1998; Ostroff, 1999; Sinclair, 1994; Zairi, 1997). Among components of PALI, only one component (Measuring IT & Improvement) is negatively associated with Organizational Performance. The researchers re-examining the three items of Measuring IT & Improvement factor, found the three items of Measuring IT & Improvement factor hardly represented the concept of Horizontal Structure Alignment, IT Competency Alignment and Strategy Alignment. In other word, Measuring IT & Improvement factor was not included in the concept of PALI. This research also found that components of PINV: Executive Commitment and
Employee Empowerment are each positively associated with organizational performance. These findings are confirmed by the previous research as well (Arthur, 1994; Huselid, 1995; Powell, 1995).

As an aggregate concept, this research found that Process Alignment, including Horizontal Structure Alignment, Strategy Alignment, and IT Competency Alignment, is positively associated with Organizational Performance. To date, many studies have been conducted on the individual components of PALI (Horizontal Structure Alignment, Strategy Alignment and IT Competency Alignment) and business performance. No empirical evidence except the present study, however, was found in the literature to support the relationship between business performance and the aggregate of all three concepts in one study. This research also found that People Involvement, as an aggregate concept, is positively associated with Organizational Performance. Stronger leadership and commitment from top management towards managing core processes, and providing more authority to employees to manage their work, tend to achieve better performance of an organization. No empirical evidence except the present study was found in the literature to support the relationship between these two factors as an aggregate concept and business performance in one study. The research also found that interaction between the concept of PALI and PINV together positively supports the association with organizational performance.

In sum, this research shows that the notion of Process Alignment and People Involvement are related to organizational performance. Core processes and people are two key points of implementing TQM. This paper confirms that from the process management point of view, structure, strategy and IT should be aligned and aggregated together with TQM environment to improve organizational performance. This research also found top management commitment and people empowerment should combine along with TQM to influence organizational performance. At last, based on the result and discussion of our research, one of our future research avenues is to extend the research model by adding a different set of independent variables, and examine its impact on organizational performance.

**Implications for Research and Practice in HRD**

The findings of this research have implications for research and practice. This research contributes to a better understanding of the field of TQM. The results provide useful insight into the organization that use TQM as an organization development program. It also provides empirical evidence for guiding principles that TQM literature advocates: get your strategic objectives aligned with business processes, demonstrate executive commitment and empower your employee. Concentrate on these and while there is no certainty; the chances of achieving successful TQM will be amplified.

Learning lessons from the (dance) floor

Jamie L. Callahan
Texas A&M University

This interactive innovative session provides an overview of findings from a study of a swing dance community. Through a phenomenological study of swing dancers’ experiences, findings of both community and communication emerged as components of both informal and incidental learning associated with swing dancing. A demonstration of swing dance will be followed by audience participation in a series of exercises that highlight how swing dance enhances self-awareness and inter- and intra-personal communication.

Keywords: Swing Dance, Communication, Incidental learning

The confidence I have gained by [swing dancing] has helped my career as well as personal relationships.
“Grace”, Competitive Swing Dancer
Personal communication, August 12, 2003

Playing basketball, improvising with jazz and folk music, sailing, and participating in peyote rituals are examples of activities, typically beyond the scope of the workplace, that have been used as metaphors or vehicles for deriving a greater understanding of organizational experiences (Eisenberg, 1990; Weick, 1998). Swing dancing is another example of such an activity. Eisenberg (1990) was particularly interested in the factors in these activities that led to a state of transcendence that he called ‘jamming.’ However, he was explicit that “women have less easy access to …jamming” (p. 151). This innovative session offers an avenue into the transcendence of jamming through an activity that is open equally to both men and women—swing dancing.

Weick (1998) and other researchers exploring the phenomenon of jazz improvisation (e.g., Kamoche & Pina e Cunha, 2001) were particularly interested in how the activities of improvisation that created the jamming experience could be channeled into usefulness for the organization. The learning of both community and communication associated with swing dance are examples of the link between jamming in dance and increasing competencies that can be used in the workplace. The purpose of this approximately 80-minute innovative session is to give participants a brief glimpse into the concepts of communication, and other topics of organizational interest such as leadership and trust, that swing dancing can impart. For teachers, the activities of this session will be useful in future classroom exercises to demonstrate such concepts as communication and leadership.

The activities in the present session have been used successfully to demonstrate the multi-dimensionality of communication. Interpersonal communication is about more than hearing and responding to words. We ‘listen’ with our ears, our eyes, and our bodies. When we engage in partner dancing, such as swing, leaders and followers listen to the music while they create a mutual picture of the song by feeling and seeing how the other is interpreting the music. While a deeper appreciation for the refinement of this process occurs more easily with accomplished dancers, even beginners can appreciate the role of communication in the dance process. Indeed, awareness of this full-body communication can accelerate the learning of novice dancers.

These activities have proven to be an excellent tool for teaching the principles of leader and follower exchanges. This is particularly relevant for Leader-Member Exchange (LMX) Theory, which is based upon the concept of dyadic interchanges between a leader and follower (Graen & Uhl-Bien, 1995). It is the quality of these dyadic relationships that leads to the formation of in-groups and out-groups in LMX. Learning the basics of partner dancing demonstrates that both leader and follower have responsibilities within the LMX relationship. Swing dancing emphasizes that characteristic of LMX that makes it unique among leadership theories, namely the specific relationship between two individuals who are part of a larger group.

“It Don’t Mean a Thing if it Ain’t Got that Swing!”

This session will begin with a 25-minute introduction that will include an overview demonstration of what swing dancing looks like. Ideally, the demonstration will be done in person by a couple that currently teaches and performs swing dance; if not possible, a video demonstration will be offered. The introduction to the session will include a

Copyright © 2004 Jamie L. Callahan
very brief overview of study findings that highlight how swing dancing has influenced individuals’ lives with a particular focus on improved communication skills within the context of leading and following (Callahan, 2003).

The two themes that appear repeatedly in interviews, observations, and archives are that swing dance is about both the nonformal learning of community and the incidental learning of communication. Swing is about finding a commonality with a partner and with a larger group of individuals. The overview presentation will highlight the ways in which swing dancing improves leadership communication skills by challenging dancers to use multiple senses in the communication process – vision, hearing, and feeling. Swing dancing improved communication by, among other things, increasing self-awareness and fostering sensitivity of others. However, because this is an Innovative Session, and not a research paper presentation, the focus of the session will be to engage the audience in experiencing the essentials of swing dance and in exploring the implications of what they experienced for organizational situations in which they engage.

“The Ability to Swing”

The session facilitator will encourage participants to engage in basic movement to music as a means to become sensitized to connecting hearing and listening to bodily movement. It is the first step in learning how to communicate physically. After getting comfortable with the idea of simply moving to music, facilitators will teach the basic step that forms the foundation for all swing dance styles. Half of the participants will be designated as ‘leaders’ and the other half will be designated as ‘followers’. For the purpose of this session, gender is not an issue for the distinction between leaders and followers; this portion of the session takes approximately 20 minutes.

“The Business of…Dance”

The session will close with an exercise that focuses on individual and team communication. This 15-minute exercise is commonly used in beginning swing classes as a mechanism to heighten awareness of communication within a partnership. The exercise is conducted in an ‘open’ position with a double handhold (i.e., two individuals standing arms’ length apart while being connected to each other by holding hands); it puts into practice the basic step learned in the preceding exercise and emphasizes one person ‘leading’ and another person ‘following’ while using the basic step of the dance. It is low-impact and no special clothing is required.

This exercise has multiple implications for teaching organizational concepts such as communication, trust, leadership, followership, improvisation, and sensemaking—the discussion of these implications as experienced in the session activities is the premise of the session itself. The activities not only highlight the multiple senses that can be engaged to enhance the communication process, but they also highlight the importance of placing self within a context in order to understand the nuances of communication. In other words, communication is a contextualized process that occurs among two or more individuals. This exercise also has implications for learning about the exchange that occurs between leaders and followers; the dance is about the interchange that occurs between a leader and a follower, much as in Leader-Member Exchange (LMX) theory (Graen & Uhl-Bien, 1995).

Following the exercise, participants will be engaged for the final 20 minutes of the session in a discussion of their experiences that can be related to concepts common in organizational life. While the facilitator can certainly guide the discussion through relevance to communication and leadership and a variety of other organizational concepts, a much richer dialogue is likely to ensue if participants are able to actively reflect on their experiences in the session and link their insights to their own scholarly experiences.

Specific Agenda

- Introduction to swing and informing research: 25 minutes
- Movement and listening: 20 minutes
- Leading & following in mutual communication: 15 minutes
- Linking experiences to theories: 20 minutes

Toward an Understanding of Targets’ Reactions to Workplace Abuse

C. Leanne Wells
Virginia Tech

Research on workplace abuse has emerged and proliferated within the past two decades. Current efforts remain focused on defining, naming, and documenting abusive workplace behaviors. This paper reviews the background of this issue, including suggested causes and the impact to individuals and organizations. I assert that the research can advance more quickly by exploring links to more established constructs and theories in other areas of non-physical abuse, specifically domestic violence.

Keywords: Workplace, Emotional Abuse, Power

While arguably not a new phenomenon, workplace abuse received little research attention until the early 1980’s (Leymann, 1996), not gaining an audience in the United States until well into the 1990’s (Davenport, Schwartz, & Elliott, 1999). Conversely, workplace violence has received wide attention and public concern due to increases in frequency and intensity (Johnson & Indvik, 1994; Warshaw & Messite, 1996). However, studies show that workplace violence is quite rare and much less frequent than non-violent behaviors of psychological and emotional abuse in the workplace (Keashly, 2001). As many as one in five or six employees are the targets of workplace abuse, which may last from a few months to several years (Einarsen & Skogstad, 1996; Keashly, Hunter, & Harvey, 1997; Leymann, 1990; Rayner, 2000).

Parameters of Workplace Abuse

Naming and Definitions of Abusive Behavior

A phenomenon with more common than disparate definitions, workplace abuse assumes many names: bullying (Einarsen, 1999; Einarsen & Skogstad, 1996; Rayner, 1999; Rayner, Sheehan, & Barker, 1999; Workplace Bullying and Trauma Institute, n.d.), mobbing (Invernizzi, 2000; Leymann, 1990, 1996), and emotional abuse (Keashly, Trott, & MacLean, 1994; Keashly et al., 1997), as well as verbal abuse, harassment, mistreatment, and psychological abuse (Keashly, 2001) and even personality conflicts, interpersonal conflict, personal harassment, and verbal or psychological abuse (Keashly et al., 1997). In early representations, Brodsky (as cited in Einarsen, 1999) named five types of work harassment generalized to encompass “all those acts that repeatedly and persistently aim to torment, wear down, or frustrate a person, as well as all repeated behaviors that ultimately provoke, frighten, intimidate, or bring discomfort to the recipient” (p. 16). Leymann (1996) coined the term mobbing to denote psychological, rather than physical, terror involving “hostile and unethical communication, which is directed in a systematic way by one or a few individuals mainly towards one individual who, due to mobbing, is pushed into a helpless and defenseless position, being held there by means of continuing mobbing activities” (p. 168; see also 1990). Invernizzi (2000) observed that mobbing resulted in “a potentially high risk of expulsion” (p. 5) of the target from the organization.

Closely aligned with Leymann’s conceptualization of mobbing, yet including physical and non-physical behaviors, are Einarsen’s (1999) depiction of bullying as “hostile and aggressive behaviors... directed systematically at one or more colleagues or subordinates leading to a stigmatization and victimization of the recipient” (p. 17) and Rayner’s (1999) “offensive, intimidating, malicious, insulting or humiliating behaviors, abuse of power or authority which attempts to undermine an individual or group of employees and which may cause them to suffer stress” (pp. 30-31). Emotional abuse in the workplace specifies a psychological framework, even a psychological contract between employer and employee the violation of which results in “cumulative psychological impairment ... for which the employer may be held liable” (Johnson & Indvik, 1994, p. 516). These repeated, hostile verbal and nonverbal—often nonphysical—behaviors typify “interactions between organizational members...directed at a person(s) such that the targets’ sense of him/herself as a competent worker and person is negatively affected” (Keashly, 2001, p. 234; also Keashly et al., 1997) with an aim to “undermine the other to ensure compliance” (Keashly et al., 1994, p. 342).
Despite the multitude of labels and some variability among definitions, workplace abuse remains commonly defined within several parameters. Abusive behavior is frequent, repeated, and enduring (Einarsen & Skogstad, 1996), distinguished from single acts of the same behaviors, which are merely acknowledged – even dismissed – as interpersonal conflict, annoyances, or difficulties (Bray, 1995; Keashly et al., 1994). The target, who experiences some power differential with the actor (Keashly, 2001; Workplace Bullying and Trauma Institute, n.d.), is traumatized by the abuse (Einarsen, 1999: Keashly, 2001; Rayner, 1999; Rayner, 2000;) from a peer, subordinate, or superior (Einarsen & Skogstad, 1996), who typically directs workplace abuse at one or more targets (Einarsen, 1999; Keashly, 2001; Keashly et al., 1994). While targets always experience a degree of trauma, some researchers distinguished this impact from victimization (Einarsen & Skogstad, 1996), which connotes feelings of inferiority and an inability to defend against the abuse.

Even with these agreed commonalities, current definitions of abusive behaviors remain ambiguous by degrees. For some (Keashly, 2001; Liefooghe & Olafsson, 1999), this is viewed as merely a “subjective” lens that offers a less daunting, more fitting means of interpreting and operationalizing the complexity of workplace abuse – an honoring of the experiences and feelings of the targets who are “active interpreters” of the behavior. For others, the inexactness of definition is problematic, suggesting a failure to encompass the full parameters of this multifarious phenomenon and perhaps proving an ongoing limitation of research studies (Rayner et al., 1999). From another viewpoint, it metamorphoses into overgeneralization, combining the most trivial with the most serious offenses (Bray, 1995) and producing a quagmire of debate in naming rather than addressing the phenomenon. Such disagreement may even contribute to abuse, as for some a “failure to report” (Warshaw & Messite, 1996) gives permission to continued abuse.

Some research acknowledged individuals as targets based on gender (Ali, Oatley, & Toner, 1999; Einarsen & Raknes, 1997), race and ethnicity (Chima, 1999; Vasquez, 1998), sexual orientation and community identification (Talbot, 1992), and occupation and occupation status (Richman, Flaherty, & Rospenda, 1996; Shinsako, Richman, & Rospenda, 2001). Other research recognized the abuse of employees by clients, customers, and patients (Arthur, Brende, & McBride, 1999; Duncan et al., 2001). From this point forward, this paper will examine the phenomenon of workplace abuse within the parameters of those behaviors that are non-violent, non-sexual, and non-group-based (e.g., gender, race, sexual orientation); are targeted at one employee by another employee; and incorporate the psychological categories of verbal and emotional abuse.

**Workplace Abuse Behavior**

Some abusive behaviors are easily recognized and defined; others are often “hidden” and perceived as indescribable (Keashly, 2001; Leymann, 1990). Typically, the more direct and aggressive behaviors – those that are visible by multiple people in the organization and have a commonly defined intent – are viewed less ambiguously and labeled abusive by all. Less direct and passive behaviors – those less visible and with less consensus regarding intent – may be experienced as abusive by some and not by others. As acknowledged earlier in this paper, the element of power – real or perceived – actively contributes to abuse. The actor’s power signifies a “restricting [of the target’s] options for responding and coping” (Keashly, 2001, p. 249) and is defined beyond the boundaries of the status or position differential between target and actor. Finally, abusive behaviors are characterized as “unwanted, unacceptable, hostile, controlling, demeaning, humiliating, unfounded or unreasonable, or disrespectful” (Keashly, 2001, p. 249) by the target. Most targets dismiss the actor’s intent (Keashly, 2001), attributing other factors to the abusive behavior and indicating a greater focus on the target’s perception (Einarsen, 1999) in defining actions as abusive.

Dichotomized views of workplace abuse allow for the categorization of behaviors but may not fully reflect the abuse phenomenon, which is seen as an evolving – even escalating – process within various phases (Einarsen, 1999; Leymann, 1990). Notwithstanding, categorization offers a glimpse of the phenomenon’s copious nature. Bray’s (1995) recommendations of physical, emotional, sexual, and spiritual abuse categories are closely aligned with those used in domestic violence (Rafenstein, 2001) and define the actions and context rather than using actor- or target-based definitions that limit the scope of the phenomenon. An emphasis on the context of abuse is also underscored by others as a way of assigning meaning to the behaviors (Liefooghe & Olafsson, 1999) and avoiding pitfalls cited earlier, including overgeneralization of the phenomenon. Some typologies have emerged to categorize workplace abuse behaviors. Leymann (as cited in Davenport et al., 1999) defined 45 behaviors within five categories. Keashly (2001) named just over a score of behaviors, classifying them as passive or direct, physical or non-physical. These typologies, as well as the named actions in other research, clearly evidence the range of workplace abuse behavior. They also illustrate the insidious nature of the abuse and the related difficulties in identifying, responding to, or designing interventions for this phenomenon.
“Causes” of Workplace Abuse

What contributes to the workplace abuse phenomenon? While research seems to investigate the roles of the target, the actor, and the organizational and social systems, there is some resistance to developing a profile of the target (Leymann, 1990; 1996), preferring to imply a “wrong place, wrong time” vulnerability (Rayner, 1999). In support, some studies found no statistical differences between targets and non-targets on factors of gender (Keashly et al., 1994; Leymann, 1996; Rayner, 1999) nor attitude toward abusive behaviors (Rayner, 1999). Still, other studies suggested “at risk” populations, such as older workers (Einarsen & Skogstad, 1996) and subordinates (Keashly et al., 1994), in addition to vulnerable personality factors as discrepant as diminished coping and self-efficacy to overachievement and inflated self-esteem (Einarsen, 1999). Zapf (1999) supported a holistic framework for examining causes of workplace abuse, cautioning against singular perspectives and explanations. His model identified the actor, the target, the social group, and the organization as potential contributors. Like Zapf, targets and witnesses attributed workplace abuse to multiple factors. Actor factors were ones of general disinterest (Leymann, 1996), poor management skills, and mental imbalance (Rayner, 2000), while organizational factors included inadequate organization and work methods (Leymann, 1996), overwork, inadequate training, and a culture that fostered or ignored the abusive behavior (Rayner, 2000). In addition, employees cited organizational and staffing changes, such as restructuring and downsizing, as triggers for abusive behavior (Rayner, 2000; Sheehan, 1999).

Impact of Workplace Abuse

Workplace abuse dismissed because of ambiguity and subjective definitions does not diminish the very real harm to the target’s self worth, value, and well-being. Studies show effects of abuse to be pervasive regardless of the existence of physical harm (Braver, Bumberry, Green, & Rawson, 1992; Crittendon & Ainsworth, 1989). Physical illness, stress, and health problems are commonly cited effects on the target. In fact, one study claimed workplace abuse as the most common contributor of work-related psychological problems (Lipley, 2001). Other consequences included feelings of incompetence and decreased work productivity, commitment, and loyalty (Keashly, 2001); a sense of powerlessness and lowered self-confidence (Rayner, 2000); loss of work and turnover (Rayner, 1999; Sheehan, 1999); chronic stress and burnout (Weber & Jaekel-Reinhard, 2000); reduced job satisfaction with an increased intention to leave the organization (Keashly et al., 1997); increased alcohol use and misuse (Shinsako et al., 2001); post-traumatic stress disorder (Duncan et al., 2001; Warshaw & Messite, 1996); and even depression and suicide (Leymann, 1990; 1996). As indirect targets, witnesses to abusive behavior experience a “vicarious traumatization” (Scott, 1999), suffering stress and worry and making decisions to change jobs.

Response to Workplace Abuse

Somewhat surprisingly, studies showed that many targets either directly confronted the actor or reported the abusive behavior to a manager within the organization (Keashly, 2001; Keashly et al., 1994; Rayner, 2000; Sheehan, Barker, & Rayner, 1999). Those who did not report the abuse typically perceived a lack of available resources within the organization or believed nothing would be done (Keashly, 2001), a supposition supported by some of the research in which confrontation or reporting resulted in labeling the target as a troublemaker and an increase in the abusive behaviors (Rayner, 2000). Interviews with targets of abuse (Keashly, 2001) revealed that an organization’s response was based on whom it deemed accountable for the behavior: the organization (essentially in support of the actor) or the target. While some organizational responses directly addressed the actor’s abusive behavior, most “skirted” the issue by working around the problem, promising but not delivering action, taking no action, minimizing the target’s complaint, and attributing the behavior to a difference in personalities.

To address and reduce the incident of workplace abuse, some researchers sought to empower potential targets by raising general awareness about workplace abuse (Rayner, 2000). Others explored developing the leadership style and management strategies (Invernizzi, 2000), as well as the emotional intelligence skills (Sheehan, 1999) of those in positions of power. Most assigned the organization primary responsibility, calling for organizational policy that addressed abusive behavior and acknowledged the effects of abuse on the health and safety of workers (Rayner, 2000) and suggesting a monitoring of organizational climate and culture, as well as implementing emotion management strategies (Rayner, 1999) and workplace counseling (St. John-Brooks, 1994) to reduce stress and tension. Keashly (2001) advanced organizational responsibility, calling for a principled workplace as defined by legitimate and constructive work criticism; acknowledgment and recognition of workers; and direct, timely, and internal handling of disputes and grievances. Keashly’s sentiments mirror those earlier posited by Leymann (1990) regarding negotiation and arbitration procedures. Of ultimate consideration is the link between a positive, supportive response to disclosures of abuse and successful interventions (Scott, 1999).
Research Opportunities

After nearly two decades, workplace abuse documentation continues to focus on the generalized nature of the behaviors, causes of and reactions to the abuse, and recommended intervention strategies. Even with the concerns regarding ambiguity within this complex domain, few if any constructs and theories have emerged to identify and shape the governing values, action strategies, and consequences (Argyris, Putnam, & Smith, 1985) that could catalyze workplace response and intervention efforts. While workplace abuse literature provides some references to other abuse studies, including phenomenological similarities to the research evolution of sexual harassment and abuse (Bray, 1995; Keashly, 2001) and the escalating stages of domestic or intimate partner violence (Anderson, 2002), other abuse fields have demonstrated more direct links between domains. Harris’ (1995) adapted the Power and Control Wheel and Equality Wheel (Minnesota Program Development, Inc., n.d.), first designed for use with domestic violence education efforts, to examine sexual harassment behaviors in the workplace. Without true parallels to other abuse literature bases, the workplace abuse literature is perhaps limiting the opportunities to benefit from advances and achievements in these comparative fields of study.

One avenue for exploration is to establish a common typology of abusive behaviors, which may show that the behaviors and typologies of workplace abuse can be accurately reflected within the established Power and Control Wheel. Other considerations include an examination of how well the established constructs and theories evidenced in non-workplace abuse literature represent the experiences of targets of workplace abuse. Well-documented in domestic violence literature (Choice & Lamke, 1997; Peled, Eisikovits, Enosh, & Winstok, 2000; Rosen, 1996a, 1996b; Rosen & Stith, 1993; Stark & Flitcraft, 1998; Walker, 1984) is Seligman’s (1975) theory of learned helplessness, which suggests a clear locus of control (Barnett & LaViolette, 1993; Martinko & Gardner, 1982) and attribution (Dweck, 1975) framework. To explain target reactions in domestic violence situations, learned helplessness has been coupled with psychological entrapment, cost/benefit analysis, and reasoned action (Strube, 1988). Thacker and Ferris (1991) explored learned helplessness and reactance in the dyadic relationships of sexual harassment; Ruggiero and Taylor (1997) examined constructs of self-esteem and control within the theories of attributional ambiguity (Crocker & Major, 1989; Major & Crocker, 1993) and personal/group discrimination discrepancy (Taylor, Wright, Moghaddam, & Lalonde 1990; Taylor, Wright, & Porter, 1993); Kaslow et al. (2002) identified hopefulness, self-efficacy, coping skills, social support, and effectiveness as indicators of successful protective factors against abuse. Additionally, the learned optimism theory (Seligman, 1998) has been applied in the research of battered women (Walker, 1994).

Conclusion

This research promises substantive contribution to the field of HRD by informing policy and practice that influence several organization metrics, including but not limited to employee satisfaction, commitment, and loyalty; organizational productivity and success; and trust, empowerment, and conflict resolution. In addition, it will establish clear links between existing abuse research and the workplace phenomenon, building and enhancing what we understand and can predict within an escalating cycle of abuse and violence.

Richey (1994) posits that popularizing a theory – bringing it into the hands of practitioners, as well as influencing researchers in the field – depends on its ability to “address those issues which have been brought to the forefront of professional attention” (p. 6) through a process of identifying and finding solutions for problems, creating choice opportunities for promoting and building the theory, and establishing and building a base of support. Linking and building on established abuse and harassment literature may reduce the existing ambiguity surrounding workplace abuse and speed the development of legal and workplace policy efforts. While common, legal definition – even workplace policy – does not always translate with full clarity into practice (Price, 2000), it is a necessary step in the advancement of workplace abuse inquiry and in providing a framework for response and intervention efforts.
Toward an Understanding of Targets’ Reactions to Workplace Abuse

The Phenomenon

Mobbing

Emotional Abuse

Workplace Abuse

Bullying

Harassment

Mistreatment

Using Coercion and Threats
- Written threats
- Oral threats
- Threats of physical violence

Using Economic Abuse
Damages resulting in personal financial costs

Using Privilege
- Meaningless tasks
- Restrictions on tasks
- Task assignments below or beyond personal qualifications
- Continuous assignment of tasks
- Denial of resources or opportunities
- Inappropriate authority
- Pulling rank
- Unreasonable expectations
- Breaches of confidentiality

Using Emotional Abuse
- Criticism and ridicule
- Yelling, swearing, name calling, scolding
- Gossip, rumor, innuendo
- Impositions
- Demanding judgments
- Forced tasks that impact self-esteem and health
- Questioned decisions

Using Isolation
- Restrictions on opportunities of self-expression
- Denial of contact with others
- Restrictions on communications with others
- “Invisible” and “silent” treatment
- Physical isolation from others

Target Reactions

Using Intimidation
- Constant interruptions
- Damages to home and workplace
- Phone terrorism
- Angry displays with physical gestures
- Retaliation

Using Emotionally Abuse

Using Children

Using Minimizing, Denying, and Blaming
- Forced psychiatric evaluation/examination
- Mentally ill treatment
- Discounting

Rapid Adaptation To An Online Format

Geri McArdle
Barry University

Nancy Edwards
Florida Gulf Coast University

The Internet is providing new opportunities in higher education for the delivery of online courses and degree programs. The advantage of using the Internet to deliver course instruction has been well documented. This paper describes how the authors modified a traditional instructional design model to redesign a graduate-level course to be delivered completely over the Internet when circumstances necessitated a change in modality.

Keywords: Web-Based Instruction, Instructional Design Model, Blended Learning

In the summer of 2001, the authors were developing a new course for a graduate-level program in Human Resource Development. This particular course was an elective for students in the Masters’ level Human Resource Development and Administration program. Several students from the Education & Leadership/Human Resource Development doctoral program were also using the course as an elective. The course, “Diversity in the Workplace,” consisted of two main components. The didactic portion of the course was to be delivered over the Internet using WebCT, as a course management system. For the second component, the class was embarking on a one-week study tour in London, England. Three people were involved with the design of the course: a full-time faculty member, a graduate student enrolled in the HRD doctoral program, and an instructional designer who also enrolled in the doctoral program. The web portion of the course was constructed in a modular format. Each module contained reading assignments and discussion topics for asynchronous discussions on the site bulletin board. Several modules also included additional written work to be sent as individual assignments to the instructor via email. Other modules contained activities and assignments for the study tour component of the course. During the trip itself, there were to be lectures by content experts in London as well as site visits. Assignments for the trip centered on these in-country lectures, as well as the experience of being in a different culture. The class had two face-to-face sessions at the beginning of the course to demonstrate the course technology, and to answer questions about the study tour course format and provide travel information.

Unfortunately, the class was scheduled to take the trip to London on September 21, 2001. After the events of September 11th, many in the class had concerns about flying overseas and cancelled their reservations. While some students were still willing to go through with the plans, it was finally decided to cancel the entire trip. At this point, the course developers had a problem. The course was lacking an essential component: the overseas trip. During the trip, the class was to explore the differences experienced by British corporations in the area of diversity as compared with the United States. The class was also going to be recording their own observations and experiences in this different culture. Students from both the graduate and doctoral programs needed the elective course credits and wanted to continue with the course. Other students who had not been able to register for the trip were also interested in taking the course.

The Design Dilemma

This paper describes how the faculty used the instructional systems design (ISD) and developed a design model to guide their steps in transferring a "blended" course to a virtual delivery format to meet the needs of both undergraduate and graduate students already in enrolled in the course.

The solution was to reformat the course so that it would now be completely online. Time was critical as the new semester was about to begin: what was an “inter-session” course had to be functioning and available for the Fall, 2001 term beginning in October, 2001. The developers had about two weeks to adapt the course for the new format. Following effective design principles, the developers revisited the course and module objectives so that new online learning activities could be developed. Since some of the students had already completed much of the readings and asynchronous discussions, it was decided to make the course more self-paced with students needing to complete all assignments by the end of the upcoming term. The authors wrote a new syllabus, learning modules,
and learning activities. Word spread to the graduate and doctoral students about the new availability of the course, and five more students enrolled.

**Theoretical Framework**

Online courses provide the freedom of time and place sought by students (Cooper, 1999; Downes, 1998; Gubbins, Clay & Perkins, 1999). However, there is much debate about how to design a successful online course. A major concern is the issue of instructional design and its impact on the success of online learning. Carr-Chellman and Duchastel (2001) argue that the ideal online course would be designed using a constructivist, student-centered approach rather than a traditional behaviorist approach.

Most university and college courses in the United States make use of the Internet to provide a course syllabus, online readings, online discussions, and/or group projects (Vrasidas, 2000). According to a recent study conducted by the National Center for Education Statistics (Waits & Lewis, 2003), 55% of all colleges and universities in the United States offered some type of distance education during the 2000-2001 academic year. During this same academic year, there were over 3,000,000 enrollments in distance education courses.

One of the major challenges in designing online learning is deciding the appropriate delivery format to meet the needs of the “distance” learner. Determining the appropriate design structure for creating an online course or module is crucial in promoting interaction and the feeling of social presence (Vrasidas and McIsaac, 1996). One contemporary design concept according to Serwatka (1999) consists of taking a portion of the class that is easily adaptable to the Web, such as the syllabus, reading assignments, discussion boards or tutorials, putting it online, and then having the students access that material prior to attending class. Palloff & Praff (1999), asserted that if one departed from the traditional campus classroom course to using some form of media for delivery, a transitional phase or process must be addressed to ensure ease of transfer for the student and the faculty who are unfamiliar with the online process. This becomes a course design issue as the learning outcomes and the behaviors will be different. Having a transitional period is desirable as it allows the instructors to develop new approaches and skills to create an effective online learning experience.

Online learning or distance learning (DL) is an organizational education program that uses one or more media tools to deliver instruction to students, who for various reasons, are either unable to use the on-campus traditional style of education or have a preference for online (Steiner, 1997). Today most educational institutions have or will add a technology-based distance learning component to their course offerings as a way to offer more class options, increase enrollment, and/or raise revenue (Olsen, 1999). The design of online learning activities, similar to the design of educational multimedia products, requires coordinated teamwork and planning. According to Boyle (1997), good design will be the best possible integration of all the views and know-how of a design team and will also take into account the perspective of a wider community of stakeholders.

A traditional, classroom-based setting allows for spontaneous, “real-time” interactions that can have a critical impact on the attitudes and performance of students. However, online learning communications are predominately asynchronous and mediated by technology, so the opportunity for these spontaneous exchanges are lost. (Hirumi, 2000). Therefore, when designing a course, it is important to sequence and plan learning activities to overcome this shortcoming and challenge learners.

Historically, there has always been some concern surrounding computer-based education with respect to the three kinds of interactivity that may affect learning in online courses: interaction with content, interaction with instructors, and interaction with classmates (Moore, 1989). Although none of the three modes of interaction function independently in practice, (for example, interaction among students is typically supported by instructor facilitation), these interactions, provide useful lenses for thinking about interaction online (Swan, 2001). Research conducted by Carr-Chellman and Duchastel (2001), suggest the ideal online course would center learning assignments around a set of student tasks that have been designed to achieve an established learning objective that students work on either independently or collaboratively.

According to Lee, Owen & Benson (2002), traditional instructional design models that have directed efforts to produce quality learning in face-to-face training environments can now be integrated into a Web-based training delivery.” Thrush (1999) noted that courses with outcomes that are more knowledge-based than skills-based are more successfully transformed onto web-based delivery formats. This paper presents an instructional systems design model that illustrates how a course that was only partly online was able to be transitioned into a totally virtual course in a short period of time.
Instructional Design Process Provides Conceptual Framework

The model developed to migrate the course from partly to totally online delivery was based upon the issues that the authors faced, given the limited time for design, development and delivery of the course. As with every instructional design project, this project also had its own unique goals, audience, content, and budget. The emphasis of the following discussion of the model will be on the design component of the process.

When the course was first created utilizing internet-based, and experiential activities, the designers used the “Instructional Systems Design” (ISD) model developed by Gagne. (Smith & Ragan, 1999). As such, they began by developing goals for the course based on desired outcomes. The learners for this course were already known to the designers, since they were part of a cohort enrolled in a Masters program, as well as a few students from the PhD cohort who were taking the course as an elective. Most of the students were familiar with the online course management system (WebCT) that would be utilized for the internet-based portion of the course.

One of the graduate assistants was a subject-matter expert who had extensive experience in teaching workplace diversity concepts. Her expertise was used in analyzing the content to be included within the course and in determining the course objectives. She also suggested appropriate learning activities to be included that would best assist the students in meeting course objectives. It was decided to assign the bulk of the reading activities and discussion board activities prior to the overseas portion of the course so that students would have the conceptual framework they needed for the experiential activities. The overseas portion of the course included several lectures and tours, coupled with some activities designed to make the students more aware of diversity issues. Learning activities included journaling the experience as well as a final paper.

When the trip was cancelled, the designers had to make a decision as to how to best manage the rest of the course. The course had already begun, and students had completed many of the initial assignments. The Fall term was about to begin, and there was no space or time to schedule a class to include the hours required to complete the course. Students who were already enrolled did not want to lose the potential elective credits. Other students were asking for the opportunity to enroll in the course. The decision was made to migrate the entire course so that it would be completely web-based, and to extend the course through the Fall term. Since the initial assignments were self-paced, this allowed for additional students to enter the course without falling behind.

Web-based Instructional Systems Design

The designers realized that there was very little time to redesign the course before the start of the new quarter. They chose to continue to use ISD concepts to convert the course to completely web-based delivery.

<table>
<thead>
<tr>
<th>ISD Model</th>
<th>“Web” ISD Model</th>
</tr>
</thead>
<tbody>
<tr>
<td>◁ Analyze ◁ Design ◁ Implement ◁ Evaluate</td>
<td>◁ Analyze ◁ Select ◁ Design ◁ Develop</td>
</tr>
</tbody>
</table>

The first steps of the ISD model had already been completed: the course had been designed based on the initial analysis of the course audience, content, and objectives. To convert the course to completely web-based, four new steps were added, as shown above.

The first step was to analyze the current situation. There had already been an orientation meeting to introduce the students to the initial web-based components. The web site had been created and contained the original online modules and discussions. There was also the reality of more students wanting to take the course if it was available to them. As part of the analysis, the designers considered learning activities that would not require a face-to-face setting. These included: experiential assignments, group projects, discussion board, online chat, webquests, and individual projects and research papers. They brainstormed the most appropriate activities given the short timeframe, stated learning objectives, and required contact hours. They also revisited the original evaluation methodologies and desired outcomes.
Step 2 was to select the course parameters. These were selected after considering the population, the technology available, and the appropriate instructional activities. A concurrent decision was to expand the student population to allow new students to join the course, and to also expand the time-frame for the course to the end of the Fall term. The decision was made to convert the course from a linear to a non-linear structure. As such, students could complete the assignments in any order that they wished and in any time frame, as long as all activities were complete by the end of the quarter. This decision was based on the fact that students were at different levels of completion, with some students just beginning the course. A third decision was to have students work on individual, rather than on group, projects.

Step 3 was to design the elements of the course. In determining the best instructional methodologies, the designers analyzed the objectives and initial content and treatment. It was decided that the objectives for the course remained unchanged. However, the focus of the course was expanded so that it encompassed broader diversity issues. This expansion was reflected in the new assignments that were created as well as the inclusion of content material that was more generic. In addition, the Internet portion was changed to include more interactive components.

Step 4 was to develop the course components and assignments and to update the site. The designers developed the additional learning activities and assignments, rewrote the syllabus to reflect the updated material, and created new modules. To minimize confusion, they also created a matrix table of assignments for easy student reference. The former “live” discussions that would have taken place during the study tour were changed to online discussion topics. Two assignments that were originally developed to focus on the diversity aspects of the country visited during the study tour were changed to experiential assignments focusing on cultures with which the individual student was unfamiliar.

From here, the designers returned to the next step on the original ISD schematic as they implemented the course. The revised course consisted of one face-to-face meeting with all students to explain the updated course structure and methodology, and to allow them to become familiar with the technology. The remainder of the course was conducted on the Internet using WebCT. Students completed the assignments at their own pace, with all assignments due by the end of the quarter.

An evaluation of the course revealed that all fifteen students who enrolled in the course were able to complete it; this included five additional students who entered the course after it was revised. For many, it was their first experience with a completely online course. Their evaluations of the course indicated that they found the course easy to use and enjoyed the ability to manage their own time. In addition, the faculty found the students applying the diversity concepts learned in the course to other courses in their program of study.

Lessons Learned

The designers found that using sound ISD principles was instrumental in allowing them to quickly redesign the course in an alternative format. The measurable objectives that were developed up front facilitated the design, development, delivery, and evaluation for the redesigned course.

While this particular course was delivered totally online, students did continue to meet face-to-face for their other scheduled courses. This afforded them the opportunity to meet with the designers and/or faculty for the virtual course if they had any questions or concerns, a circumstance that is often not present for many virtual courses. This may have prevented the isolation and lack of communication with faculty that is sometimes noted with other online courses (Brown, 2000).

Another factor that may have contributed to the success of this course was the demographics of the students themselves. These students were largely within the 25-50 age group noted by Grill (1999) as being more successful as distance learners. Other success factors of these students, also cited by Grill included:

1. being accustomed to a participating in a formal education program (All students were either part of the Masters or PhD program).
2. being highly motivated to complete the course (Elective credits were needed for degree completion).
3. voluntary participation in the course (Since the course was an elective, students had other courses that they could take instead).

The most important lesson learned was that faculty who are willing to be flexible can adapt to unforeseen circumstances. Online learning can provide the means.
Conclusions

This paper presents a simple instructional design process to develop Web-based training. The value for discussing this pragmatic approach is to illustrate that by using the instructional systems design (ISD) model as the basic tool to design any training course, the content and process can be easily adapted to other forms of instructional media for presentation.
