Read Naturally

Program description

Read Naturally is designed to improve reading fluency using a combination of books, audiotapes, and computer software. According to the developer’s web site, this program has three main strategies: repeated reading of text for developing oral reading fluency, teacher modeling of story reading, and systematic monitoring of student progress by the students themselves and by teachers. Students work at a reading level appropriate for their achievement level, progress through the program at their own rate, and work, for the most part, on an independent basis. The program has two versions. In one, students use audiocassettes or CDs in conjunction with hard-copy reading materials. In the second version students use the Read Naturally computer program alone. The Read Naturally program is designed to increase time spent reading.

Research

One study of Read Naturally met the What Works Clearinghouse (WWC) evidence standards and one study met WWC evidence standards with reservations. The two studies included 106 students from first and second grades in two elementary schools in Arizona and Georgia. The WWC considers the extent of evidence for Read Naturally to be small for fluency and comprehension. No studies that met WWC evidence standards with or without reservations addressed alphabetics or general reading achievement.

Effectiveness

The Read Naturally program was found to have no discernible effects on fluency and reading comprehension.

1. The study on which this report is based excluded some components of the Read Naturally program. The WWC includes all studies that meet WWC evidence standards and considers variations in level of implementation as inherent in field research. Studies with zero implementation are excluded from a WWC review of an intervention.
2. The descriptive information for this program was obtained from publicly available sources: the program’s web site (www.readnaturally.com, retrieved April 2007). The WWC requests developers to review the program description sections for accuracy from their perspective. Further verification of the accuracy of the descriptive information for this program is beyond the scope of this review.
3. The evidence presented in this report is based on available research. Findings and conclusions may change as new research becomes available.
4. These numbers show the average and range of improvement indices for all findings across studies.
**Developer and contact**
Developed by Candyce Ihnot, *Read Naturally* is distributed by Read Naturally, 750 S. Plaza Dr. #100, Saint Paul, MN 55120. Email: info@readnaturally.com. Web: www.readnaturally.com. Telephone: (651) 425-4058 or (800) 788-4085. Fax: (651) 452-9204.

**Scope of use**
The program was first published in 1991. According to the developer, it has been implemented with special education, Title I, and English language learner students throughout the United States.

**Teaching**
The *Read Naturally* teacher’s manual includes the rationale for the program, descriptions of materials needed to implement the program, instructions for implementing the program, and sample lesson plans for introducing the program to students. As part of the intervention, students read along with an audio recording of passages to build word recognition and accuracy. During the repeated reading phase, students do one minute practice readings to build their mastery of the passage. Once students feel they can achieve their reading speed goal, they alert the teacher. The teacher then conducts a “pass timing” in which four criteria are evaluated (student reaches goal rate, student makes three or fewer errors, passage is read with appropriate phrasing, and comprehension questions are answered correctly).

**Research**
Fourteen studies reviewed by the WWC investigated the effects of *Read Naturally*. One study (Hancock, 2002) was a randomized controlled trial that met WWC evidence standards. Another study (Mesa, 2004) was a quasi-experimental design that met WWC evidence standards with reservations. The remaining 12 studies did not meet WWC evidence screens.

**Met evidence standards**
Hancock (2002) conducted a randomized controlled trial of second-grade students from one school in Arizona. The students were randomly assigned to intervention and comparison groups using block randomization procedures. Students were pretested, matched with a similarly performing peer, and then randomly assigned to a study condition. In all, 48 students were in the intervention group and 46 students were in the comparison group.

**Met evidence standards with reservations**
Mesa (2004) is a quasi-experimental study of first-graders from one public elementary school in Georgia. Teachers identified 12 first-grade students in a single classroom who already knew how to decode certain word patterns. Students were pretested, matched, and divided into two similar groups based on pretest scores, with six students in each group.

**Cost**
Individual *Read Naturally* materials range in price. The audio-cassettes or audio CDs for each level cost $110 and $115, respectively. The computer program costs $99 per level for one computer and $299 per level for a school network version. Additional materials, including timers, posters, glossaries, crossword puzzles, assessment materials, and training are available at additional cost. The specific needs of the students will determine the materials needed and the cost of the implementation.

**Extent of evidence**
The WWC categorizes the extent of evidence in each domain as small or moderate to large (see the What Works Clearinghouse).
**Research (continued)**

**Effectiveness**

**Findings**

The WWC review of interventions for beginning reading addresses student outcomes in four domains: alphabets, fluency, comprehension, and general reading achievement. The studies included in this report cover two domains: fluency and comprehension. The findings below present the authors' estimates and WWC-calculated estimates of the size and the statistical significance of the effects of Read Naturally on students.

**Fluency.** Two studies reported findings in the fluency domain. The Hancock (2002) study findings for this domain are based on students' performance on the Curriculum Based Measure: Test of Reading Fluency. The study author did not find a statistically significant effect of Read Naturally on the fluency measure, and the effect was not large enough to be considered substantively important according to WWC criteria (that is, an effect size of at least 0.25).

The Mesa (2004) study findings for this domain are based on students' performance on the test of Oral Reading Fluency. The study author presented group mean difference between the Read Naturally group and the comparison group on the fluency measure, but did not evaluate its statistical significance. The WWC found that the effect was not statistically significant nor large enough to be considered substantively important.

**Comprehension.** The Hancock (2002) study findings for the comprehension domain are based on the performance of Read Naturally students and comparison students on the Peabody Picture Vocabulary Test (PPVT), the Word Use Fluency Test, and the Curriculum Based Measure: Cloze Probe. The study authors did not find statistically significant effects of Read Naturally on any of these three measures. The average effect size was not large enough to be considered substantively important according to the WWC criteria.

**Rating of effectiveness**

The WWC rates the effects of an intervention in a given outcome domain as: positive, potentially positive, mixed, no discernible effects, potentially negative, or negative. The rating of effectiveness takes into account four factors: the quality of the research design, the statistical significance of the findings, the size of the difference between participants in the intervention and the comparison conditions, and the consistency in findings across studies (see the WWC Intervention Rating Scheme).

5. The Extent of Evidence Categorization was developed to tell readers how much evidence was used to determine the intervention rating, focusing on the number and size of studies. Additional factors associated with a related concept, external validity, such as the students’ demographics and the types of settings in which studies took place, are not taken into account for the categorization.

6. For definitions of the domains, see the Beginning Reading Protocol.

7. The level of statistical significance was reported by the study authors or, where necessary, calculated by the WWC to correct for clustering within classrooms or schools and for multiple comparisons. For an explanation, see the WWC Tutorial on Mismatch. See the WWC Intervention Rating Scheme for the formulas the WWC used to calculate the statistical significance. In the case of Read Naturally, corrections for multiple comparisons were needed.
The WWC found Read Naturally to have no discernible effects on fluency and reading comprehension

Improvement index
The WWC computes an improvement index for each individual finding. In addition, within each outcome domain, the WWC computes an average improvement index for each study as well as an average improvement index across studies (see Technical Details of WWC-Conducted Computations). The improvement index represents the difference between the percentile rank of the average student in the intervention condition versus the percentile rank of the average student in the comparison condition. Unlike the rating of effectiveness, the improvement index is based entirely on the size of the effect, regardless of the statistical significance of the effect, the study design, or the analyses. The improvement index can take on values between −50 and +50, with positive numbers denoting results favorable to the intervention group.

Summary
The WWC reviewed 14 studies on Read Naturally. One study met WWC standards and another met WWC standards with reservations; the others did not meet WWC evidence screens. Based on these two studies, the WWC found no discernible effects in the fluency and reading comprehension domains. The evidence presented in this report may change as new research emerges.

References
Met WWC standards

Met WWC standards with reservations

Additional source:

Did not meet WWC evidence screens

8. One single-case design study was identified but is not included in this review because the WWC does not yet have standards for reviewing single-case design studies.

9. Confound: this study included Read Naturally but combined it with another intervention so the analysis could not separate the effects of the intervention from other factors.

10. Does not use a strong causal design: for the portion of the sample of interest to this WWC review, there was only one intervention and one comparison unit, so the analysis could not separate the effects of the intervention from other factors.

11. Does not use a strong causal design: the study did not use a comparison group.

For more information about specific studies and WWC calculations, please see the WWC Read Naturally Technical Appendices.

12. Does not use a strong causal design: this study was a quasi-experimental design but did not use achievement pretests to establish that the comparison group was equivalent to the intervention group at baseline.

13. Complete data were not reported: the WWC could not compute effect sizes.

### Appendix A1.1  Study characteristics: Hancock, 2002 (randomized controlled trial)

<tbody>
<tr>
<td><strong>Study citation</strong></td>
<td>Hancock, C. M. (2002). Accelerating reading trajectories: The effects of dynamic research-based instruction. <em>Dissertation Abstracts International</em>, 63(06), 2139A. (UMI No. 3055690)</td>
</tr>
<tr>
<td><strong>Participants</strong></td>
<td>The study involved 94 second-grade students who attended a single school. Out of this group, 48 students received the intervention and 46 were in the comparison group. The students were randomly assigned into intervention and comparison groups using block randomization procedures. All students in the second-grade were administered several initial measures. Student scores were rank-ordered within each classroom, and then each student was matched with a similarly performing student. Students were then randomly assigned to the intervention group and the comparison group within matched pairs. No information was reported regarding student ethnicity or gender, but 11% of the students in this school qualified for free or reduced-price lunch. There was no attrition.</td>
</tr>
<tr>
<td><strong>Setting</strong></td>
<td>The study took place in one elementary school in the Kyrene school district in Tempe, Arizona.</td>
</tr>
<tr>
<td><strong>Intervention</strong></td>
<td>In addition to the regular curriculum (including reading instruction), the intervention group received 25 minutes of supplemental instruction using <em>Read Naturally</em> four times a week for 11 weeks. In each lesson, the first five minutes were spent on oral reading of a selected passage with a teaching assistant. The reading was timed for one minute and the total number of words read correctly was recorded on a graph. The last 20 minutes involved repeated oral reading of curriculum stories either individually or with a cassette tape. Once students practiced a passage eight times (three times with a cassette and five times individually), they did a timed reading with the teacher. If the student achieved mastery (100 words read correctly with three or fewer errors), the student moved onto another passage. Otherwise the cycle was repeated.</td>
</tr>
<tr>
<td><strong>Comparison</strong></td>
<td>In additional to their regular curriculum (including reading instruction), the comparison group students received supplemental instruction using <em>Connecting Math Concepts</em> curriculum (Level B). This program used worksheets, workbooks, coins, and games, and taught basic mathematics skills such as place value, money counting, time, addition, subtraction, and multiplication.</td>
</tr>
<tr>
<td><strong>Primary outcomes and measurement</strong></td>
<td>The author used the Peabody Picture Vocabulary Test (PPVT-III), the Word Use Fluency Test (WUF), and the Curriculum Based Measure: Cloze Probe and Test of Reading Fluency. The author used initial reading skills as a covariate to account for baseline differences between groups (see Appendices A2.1–2.2 for more detailed descriptions of outcome measures).</td>
</tr>
<tr>
<td><strong>Teacher training</strong></td>
<td>Six teaching assistants were trained over five days. Teaching assistants were observed modeling lessons during the training sessions and provided with written feedback. Teaching assistants were also observed once a week during the first phase, and at least once every three weeks during the second phase, receiving feedback as necessary.</td>
</tr>
</tbody>
</table>
### Appendix A1.2  Study characteristics: Mesa, 2004 (quasi-experimental design)

<table>
<thead>
<tr>
<th>Characteristic</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Participants</td>
<td>Twelve students from a single class were selected to participate because they had mastered certain decoding patterns. These students were matched into pairs based on their pre-intervention test scores (STAR Reading Test); one student was assigned to the intervention group and one to the comparison group.¹</td>
</tr>
<tr>
<td>Setting</td>
<td>The study took place in one elementary school in Georgia.</td>
</tr>
<tr>
<td>Intervention</td>
<td>Students in the group left their regular class for <em>Read Naturally</em> (2001) computer instruction for 45 minutes, four days a week for three weeks. Students used the program independently unless they had a question or were attempting to pass a level, in which case they interacted with the teacher. The <em>Read Naturally</em> group worked with minimal teacher’s supervision.</td>
</tr>
<tr>
<td>Comparison</td>
<td>The comparison group did not receive any special instruction and remained in the class with the regular classroom teacher.</td>
</tr>
<tr>
<td>Primary outcomes and measurement</td>
<td>The author administered the Oral Reading Fluency test. Two other outcomes, the STAR Reading Test and the Comprehension Reading Test were also used in the study, but have not been included in this review because sufficient information was not provided to evaluate face validity and reliability of these tests (see Appendices A2.1–2.2 for more detailed descriptions of the outcome measure).</td>
</tr>
<tr>
<td>Teacher training</td>
<td>No information on teacher training is provided.</td>
</tr>
</tbody>
</table>

¹ The pretest equivalency of the two groups on the Oral Reading Fluency measure was verified by the WWC.
### Appendix A2.1  Outcome measures in the fluency domain

<table>
<thead>
<tr>
<th>Outcome measure</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Oral Reading Fluency</td>
<td>The test measures the number of words read per minute minus any errors. The passage was a 113-word passage (as cited in Mesa, 2004).</td>
</tr>
<tr>
<td>Curriculum Based Measurement: Test of</td>
<td>Students were given passages from Level B of the Test of Reading Fluency, which are based on several published curricula and are designed to represent general grade-level reading material. The total number of words read correctly was recorded (as cited in Hancock, 2002).</td>
</tr>
<tr>

ns = not statistically significant  
na = not applicable

1. This appendix reports findings considered for the effectiveness rating and the average improvement index.
2. The standard deviation across all students in each group shows how dispersed the participants’ outcomes are: a smaller standard deviation on a given measure would indicate that participants had more similar outcomes.
3. Positive differences and effect sizes favor the intervention group; negative differences and effect sizes favor the comparison group.
4. For an explanation of the effect size calculation, see Technical Details of WWC-Conducted Computations.
5. Statistical significance is the probability that the difference between groups is a result of chance rather than a real difference between the groups.
6. The improvement index represents the difference between the percentile rank of the average student in the intervention condition versus the percentile rank of the average student in the comparison condition. The improvement index can take on values between −50 and +50, with positive numbers denoting results favorable to the intervention group.
7. The level of statistical significance was reported by the study authors or, where necessary, calculated by the WWC to correct for clustering within classrooms or schools and for multiple comparisons. For an explanation about the clustering correction, see the WWC Tutorial on Mismatch. See Technical Details of WWC-Conducted Computations for the formula the WWC used to calculate statistical significance. In the case of Hancock (2002) and Mesa (2004), no corrections for clustering or multiple comparisons were needed.
8. The WWC-computed average effect sizes for each study and for the domain across studies are simple averages rounded to two decimal places. The average improvement indices are calculated from the average effect size.
9. The Read Naturally group mean equals the comparison group mean plus the mean difference. The computation of the mean difference took into account the pretest difference between the study groups.

**ns** = not statistically significant  
**na** = not applicable

1. This appendix reports findings considered for the effectiveness rating and the improvement index.  
2. The standard deviation across all students in each group shows how dispersed the participants’ outcomes are: a smaller standard deviation on a given measure would indicate that participants had more similar outcomes.  
3. Means are adjusted for pretest. The authors used initial reading skills as a covariant.  
4. Positive differences and effect sizes favor the intervention group; negative differences and effect sizes favor the comparison group.  
5. For an explanation of the effect size calculation, see Technical Details of WWC-Conducted Computations.

6. Statistical significance is the probability that the difference between groups is a result of chance rather than a real difference between the groups.  
7. The improvement index represents the difference between the percentile rank of the average student in the intervention condition versus the percentile rank of the average student in the comparison condition. The improvement index can take on values between −50 and +50, with positive numbers denoting results favorable to the intervention group.  
8. The level of statistical significance was reported by the study authors or, where necessary, calculated by the WWC to correct for clustering within classrooms or schools and for multiple comparisons. For an explanation about the clustering correction, see the WWC Tutorial on Mismatch. See Technical Details of WWC-Conducted Computations for the formula the WWC used to calculate statistical significance. In the case of Hancock (2002), a correction for multiple comparisons was needed.  
9. The WWC-computed average effect sizes for each study and for the domain across studies are simple averages rounded to two decimal places. The average improvement indices are calculated from the average effect size. For a single study included in the comprehension domain, the study average is equal to domain average.
Appendix A4.1  Read Naturally rating for the fluency domain

The WWC rates an intervention's effects in a given outcome domain as positive, potentially positive, mixed, no discernible effects, potentially negative, or negative. For the outcome domain of fluency, the WWC rated Read Naturally as having no discernible effects. It did not meet the criteria for other ratings (positive effects, potentially positive effects, mixed effects, potentially negative effects, and negative effects) because no studies showed statistically significant or substantively important effects.

Rating received

No discernible effects: No affirmative evidence of effects.
- Criterion 1: None of the studies shows a statistically significant or substantively important effect, either positive or negative.
  - Met. No studies showed a statistically significant or substantively important effect, either positive or negative.

Other ratings considered

Positive effects: Strong evidence of a positive effect with no overriding contrary evidence.
- Criterion 1: Two or more studies showing statistically significant positive effects, at least one of which met WWC evidence standards for a strong design.
  - Not met. Only one study met the WWC evidence standards for a strong design, and that study did not show statistically significant positive effects.

AND
- Criterion 2: No studies showing statistically significant or substantively important negative effects.
  - Met. No studies showed statistically significant or substantively important negative effects.

Potentially positive effects: Evidence of a positive effect with no overriding contrary evidence.
- Criterion 1: At least one study showing a statistically significant or substantively important positive effect.
  - Not met. No studies showed a statistically significant or substantively important positive effect.

AND
- Criterion 2: No studies showing a statistically significant or substantively important negative effect and fewer or the same number of studies showing indeterminate effects than showing statistically significant or substantively important positive effects.
  - Not met. No studies showed a statistically significant or substantively important negative effect, but one study showed indeterminate effects.

(continued)
### Mixed effects: Evidence of inconsistent effects as demonstrated through either of the following criteria.

- **Criterion 1:** At least one study showing a statistically significant or substantively important *positive* effect, and at least one study showing a statistically significant or substantively important *negative* effect, but no more such studies than the number showing a statistically significant or substantively important *positive* effect.
  
  **Not met.** No studies showed a statistically significant or substantively important effect, either positive or negative.

- **OR**
  
  - **Criterion 2:** At least one study showing a statistically significant or substantively important effect, and more studies showing an *indeterminate* effect than showing a statistically significant or substantively important effect.
  
  **Not met.** No studies showed a statistically significant or substantively important effect, while one study showed indeterminate effects.

### Potentially negative effects: Evidence of a negative effect with no overriding contrary evidence.

- **Criterion 1:** At least one study showing a statistically significant or substantively important *negative* effect.
  
  **Not met.** No studies showed a statistically significant or substantively important negative effect.

- **AND**
  
  - **Criterion 2:** No studies showing a statistically significant or substantively important *positive* effect, or more studies showing statistically significant or substantively important *negative* effects than showing statistically significant or substantively important *positive* effects.
  
  **Met.** No studies showed a statistically significant or substantively important positive effect.

### Negative effects: Strong evidence of a negative effect with no overriding contrary evidence.

- **Criterion 1:** Two or more studies showing statistically significant *negative* effects, at least one of which met WWC evidence standards for a strong design.
  
  **Not met.** No studies showed a statistically significant or substantively important negative effect.

- **AND**
  
  - **Criterion 2:** No studies showing statistically significant or substantively important *positive* effects.
  
  **Met.** No studies showed statistically significant or substantively important positive effects.

---

1. For rating purposes, the WWC considers the statistical significance of individual outcomes and the domain-level effect. The WWC also considers the size of the domain-level effect for ratings of potentially positive or potentially negative effects. See the [WWC Intervention Rating Scheme](#) for a complete description.
## Appendix A4.2  Read Naturally rating for the comprehension domain

The WWC rates an intervention’s effects in a given outcome domain as positive, potentially positive, mixed, no discernible effects, potentially negative, or negative.¹

For the outcome domain of comprehension, the WWC rated Read Naturally as having no discernible effects. It did not meet the criteria for other ratings (positive effects, potentially positive effects, mixed effects, potentially negative effects, and negative effects) because no studies showed statistically significant or substantively important effects.

### Rating received

No discernible effects: No affirmative evidence of effects.
- **Criterion 1:** None of the studies shows a statistically significant or substantively important effect, either *positive or negative.*
  - **Met.** No studies showed a statistically significant or substantively important effect, either positive or negative.

### Other ratings considered

#### Positive effects: Strong evidence of a positive effect with no overriding contrary evidence.
- **Criterion 1:** Two or more studies showing statistically significant *positive* effects, at least one of which met WWC evidence standards for a strong design.
  - **Not met.** Only one study met the WWC evidence standards for a strong design, and that study did not show statistically significant positive effects. **AND**
  - **Criterion 2:** No studies showing statistically significant or substantively important *negative* effects.
    - **Met.** No studies showed statistically significant or substantively important negative effects.

#### Potentially positive effects: Evidence of a positive effect with no overriding contrary evidence.
- **Criterion 1:** At least one study showing a statistically significant or substantively important *positive* effect.
  - **Not met.** No studies showed a statistically significant or substantively important positive effect. **AND**
  - **Criterion 2:** No studies showing a statistically significant or substantively important *negative* effect and fewer or the same number of studies showing *indeterminate* effects than showing statistically significant or substantively important *positive* effects.
    - **Not met.** No studies showed a statistically significant or substantively important negative effect, but one study showed indeterminate effects.

(continued)
### Mixed effects

Evidence of inconsistent effects as demonstrated through either of the following criteria.

- **Criterion 1:** At least one study showing a statistically significant or substantively important *positive* effect, and at least one study showing a statistically significant or substantively important *negative* effect, but no more such studies than the number showing a statistically significant or substantively important *positive* effect.
  
  **Not met.** No studies showed a statistically significant or substantively important effect, either positive or negative.

- **Criterion 2:** At least one study showing a statistically significant or substantively important effect, and more studies showing an *indeterminate* effect than showing a statistically significant or substantively important effect.
  
  **Not met.** No studies showed a statistically significant or substantively important effect, while one study showed indeterminate effects.

### Potentially negative effects

Evidence of a negative effect with no overriding contrary evidence.

- **Criterion 1:** At least one study showing a statistically significant or substantively important *negative* effect.
  
  **Not met.** No studies showed a statistically significant or substantively important negative effect.

- **Criterion 2:** No studies showing a statistically significant or substantively important *positive* effect, or more studies showing statistically significant or substantively important *negative* effects than showing statistically significant or substantively important *positive* effects.
  
  **Met.** No studies showed statistically significant or substantively important positive effect.

### Negative effects

Strong evidence of a negative effect with no overriding contrary evidence.

- **Criterion 1:** Two or more studies showing statistically significant *negative* effects, at least one of which met WWC evidence standards for a strong design.
  
  **Not met.** No studies showed a statistically significant or substantively important negative effect.

- **Criterion 2:** No studies showing statistically significant or substantively important *positive* effects.
  
  **Met.** No studies showed statistically significant or substantively important positive effects.

---

1. For rating purposes, the WWC considers the statistical significance of individual outcomes and the domain-level effect. The WWC also considers the size of the domain-level effect for ratings of potentially positive or potentially negative effects. See the [WWC Intervention Rating Scheme](#) for a complete description.
## Appendix A5  Extent of evidence by domain

<table>
<thead>

</table>

na = not applicable/not studied

1. A rating of “moderate to large” requires at least two studies and two schools across studies in one domain, and a total sample size across studies of at least 350 students or 14 classrooms. Otherwise, the rating is “small.”
