An Investigation of “Circle of Friends” Peer-Mediated Intervention for Students with Autism

Abstract

The dramatic rise in children diagnosed with autism spectrum disorder (ASD) is accompanied by a substantial increase in public school inclusion. A growing body of research supports the need for teachers proficient in evidence-based practices to support such students. One strategy involves using peer support networks like Circle of Friends (CoF) for ASD adolescents. A collective case study was used to investigate experiences of stakeholders relative to a CoF community. Four themes emerged from a cross-case analysis: the influence a CoF partnership has on inclusion, social skills improvement, empowerment, and sense of well-being. For the purposes of this article, findings relative to inclusion are discussed. CoF fostered an attitude of peer acceptance for classmates with ASD and helped alleviate feelings of fear peers experienced toward ASD classmates. CoF peers developed empathy and understanding for the CoF target student, and those qualities extended to students outside the circles. CoF seemed to have fostered true social inclusion, altering traditional divisions between special education and typical education populations. Peer acceptance generalized outside the school setting, even in the absence of CoF adult facilitators, and fostered long-term, genuine friendships. Findings from the larger study led to the development of an interactive website to foster a virtual learning community to enhance this ongoing partnership. The website might promote a deeper understanding of peer support networks for improved social skills, increased school involvement, decreased isolation, and decreased bullying in youth with ASD, as well as a successful community agency-public school partnership model.

Keywords: autism, inclusion, peer-mediated intervention, Circle of Friends, social skills, community of practice
Introduction

Peer-mediated intervention (PMI) is a treatment approach in which typically developing peers are trained to implement behavioral interventions and facilitate social skills development in special needs populations (Newton, Taylor, & Wilson, 1996). It has been identified as an established treatment with favorable outcomes and an essential component of any comprehensive educational program for children with autism spectrum disorder (Chan et al., 2009; Humphrey & Symes, 2010; National Autism Center, 2009). However, few teachers include PMI in programming for this population (Carter & Pesko, 2008; Hughes et al., 2011). Currently, a need exists for additional research on PMI in adolescent ASD populations (Bellini, Peters, Benner, & Hopf, 2007; DeRosier, Swick, Davis, McMillan, & Matthews, 2011; Locke, Ishijima, Kasari, & London, 2010). The current study explored the experiences and perceptions of participants in an ongoing partnership between a community nonprofit agency partnership with three public high schools to support implementation of the PMI model called Circle of Friends (CoF) for adolescents with ASD.

Background and Research Problem

ASD is a pervasive developmental disorder characterized by deficits in social interactions and communication skills and is one of the fastest growing health conditions in children in the United States today, with 1 in 88 children receiving the diagnosis (Centers for Disease Control, 2010). The increase in autism diagnoses has been accompanied by a steady rise in the number of students with ASD receiving their education in general education inclusion settings (U.S. Department of Education, 2006). CoF is an educational approach that facilitates the inclusion of children with disabilities in the school community by engaging the peer group in proactively supporting the individual with special needs. By providing access to peers in an authentic social
context, social skills acquisition is facilitated through mentoring by more socially competent classmates.

The community-partnering agency in this study provided training and support for the (CoF) PMI model implemented in three public high schools. The larger research study was an examination of the experiences of facilitators, parents, and nonprofit community agency directors implementing CoF groups. It also explored how the contributions of the community-partnering agency providing professional development, funding, and ongoing support influenced CoF implementation.

**Conceptual Framework**

A constructivism framework is built on the belief that learners construct knowledge based on a combination of previous experiences and social interactions in authentic surroundings (Vygotsky, 1978). One learning theory rooted in a social constructivist framework is Vygotsky’s social development theory. Vygotsky (1978) noted that social interaction precludes development; consciousness and cognition are the end products of socialization and social behavior. Cognitive development is depends on the zone of proximal development—the distance between a student’s ability to perform a task with the assistance of adults or peers and the ability to perform it independently. Social interaction is required for learning to take place.

**Literature Review**

The literature review provides an overview of three topics. These topics include social skills and relationships in adolescent ASD populations, school environments and adolescents with ASD, and PMI and CoF.
Social Skills and Peer Relationships in Adolescent Autism Spectrum Disorder Populations

ASD is considered a pervasive developmental disorder characterized by deficits in three major areas: “reciprocal social interaction, communication, and restricted, repetitive interests and behaviors” (American Psychiatric Association, 2000, p. 70). The resulting lack of social competency can hurt development by “(1) increasing behavior problems that result from not having the appropriate skills for social interaction, (2) increasing the likelihood of maladaptive behavior later in life, and (3) decreasing the positive developmental support and learning opportunities found in successful peer relationships” (Frea, 1995, p. 53).

Specific social disabilities in adolescents with ASD are well documented: difficulty following shifts in conversation, reading body language, and nonverbal communication; difficulty understanding nonliteral language; obsession of a single area of special interest when conversing with others; and difficulty understanding both emotions and dramatic relationship cues (Gillberg, 2001; Stokes, Newton, & Kaur, 2007). Adolescents with ASD have difficulty showing empathy as well as understanding the perspectives of others (Demurie, D Corel, & Roeyers, 2011) and experience a significantly greater incidence of obsessive compulsive disorder, anxiety, fear, and phobias (Bradley, Ames, & Bolton, 2011; Simonoff, Pickles, & Charman, 2008). In addition to irritability, temper tantrums, and mood swings, individuals with ASD may exhibit aggressive behavior which has been reported in up to 45% of this population (Farmer & Aman, 2011; Gabriels, Cuccaro, Hill, Ivers, & Putten & Vlaskamp, 2010). Further, compared to typically developing peers, adolescents with ASD experience substantial deficits in memory storage and retrieval (Southwick et al., 2011).
School Environments and Adolescents with Autism Spectrum Disorder

Increasingly, adolescents with ASD are being educated in inclusive classroom environments, but effective inclusion for children with ASD is complicated and often misunderstood (Humphrey & Lewis, 2008). Currently, inclusion refers not only to the physical placement of students, but also to the quality of their interactions (Farrell, 2001). A growing body of research indicates that the ASD population rarely develops typical peer relationships in the school setting. Orsmond, Krauss, and Seltzer (2004) investigated the peer relationships and social lives of 235 adolescents with ASD and discovered the prevalence of having friendships, peer relationships, and participation in social activities was low, comparable to previous research. Adolescents with ASD report having less access to peers and friends, likely because of the nature of their social deficits (Stokes et al., 2007). They initiate fewer interactions with classmates than both peers without ASD and peers with developmental disabilities (Hendricks & Wehmen, 2009; Riechow & Volkmar, 2010).

In addition, adolescents with ASD are at increased risk of becoming victims of bullying (Little, 2002; Wainscot, Naylor, Sutcliffe, Tantam, & Williams, 2008). This is especially true in adolescence when understanding social cues becomes even more complicated (Little, 2002; Wainscot et al., 2008). Adolescents with ASD are three times more likely to be bullied than their typically developing peers (Humphrey & Symes, 2010; Interactive Autism Network, 2012). Even more disturbing, the victimization rate may be much higher. Because they sometimes have problems distinguishing friendly overtures from victimization, bullying is often underreported among this population (Moore, 2007; National Autistic Society, 2006). Students with ASD are less likely to report bullying because poor social understanding prevents them from realizing they are actually being treated poorly by peers at school (National Autistic Society, 2006).
Without positive peer interactions, hostile school environments exacerbate the difficulties teenagers with ASD have in developing healthy social relationships and normalized social function.

Teachers and other school staff also have an effect on the social interactions between students with ASD and their non-autistic peers. Adults often fail to acknowledge that teenagers with ASD have impairments in social competency and may assume that because a student with high functioning ASD is academically capable, he or she must also be capable of interacting appropriately with peers (Moore, 2007).

**Peer Mediated-Intervention and Circle of Friends**

PMI is a treatment approach in which typically developing peers are trained to interact with students on the autism spectrum. PMI may involve peers in the instructional process, behavioral interventions, and/or social interaction facilitation (Bass, Mulick, 2007; Chan et al., 2009; DiSalvo & Oswald, 2002; U.S. Department of Education, 2006). Because PMI provides greater access to peers, positive, proactive feedback in a supportive structure may help improve social competency skills. Kamps et al. (2002) found that repeated interactions in a natural school context between trained peers and students with ASD resulted in greater generalization of social skills than in control groups consisting of untrained peers and strangers. As peers are readily available in the school setting and can learn peer support strategies fairly easily, PMI is worthy of consideration by teachers (Cushing, Clark, Carter, & Kennedy, 2005).

CoF is a specific form of PMI based on a social constructivist approach (Frederickson & Turner, 2003). CoF is defined as an educational approach which facilitates the inclusion of children with disabilities in the school community by engaging the peer group in proactively supporting the individual with special needs (Kalyva & Avramidis, 2005). The goal of the CoF
group is to provide an environment in which children with ASD can increase social interactions in order to facilitate positive social skills development. It is a “systemic approach that recognizes the power of the peer group—and thereby of pupil culture—to be a positive as well as a constraining or exacerbating influence on individual behavior” (Newton, et al., 1996, p. 42). Taylor (1997) outlined the process of forming CoF in the following four stages:

1. Establish prerequisites. This involves choosing a supportive school, providing teachers training along with a commitment of resources to meet weekly with the CoF, and finally, communicating with parents.

2. Meet with chosen typically developing peers to discuss the focus child’s strengths and challenges, discuss the requirements of the peer mentor role, and end by inviting peers to voluntarily participate in the CoF.

3. Establish the circle with a group of six to eight typically developing peers who agree to a collaborative problem solving approach.

4. The typically developing peers then meet on a regular basis with the adult facilitator to review progress, identify difficulties, and plan ways to solve problems.

Methodology

The purpose of this study was to understand stakeholders’ interpretations of the CoF phenomenon. A multi-site collective case study design (Merriam, 2009; Stake, 1995; Yin, 2003) was chosen to understand the unique perspectives of three different cases: group facilitators, parents of children with ASD, and the community-partnering agency program directors. The question guiding the larger study was, “What are the experiences of group facilitators, parents, and partnering outside agency leaders in three high schools implementing CoF?” The adult facilitators were all school employees who worked in some capacity with youth with special
needs, either as special education teachers and directors, speech pathologists, or guidance counselors. The parents included in this study had a child with ASD who participated in a CoF in one of the three high schools. The director and program manager from the partnering agency were chosen to participate because their involvement in the project provided insight into the dynamics of a school-community agency partnership.

Interviews were conducted by phone using broad, open-ended questions, intended to allow the interviewees to speak freely and provide depth of insight; 5 open-ended interview questions were asked of parents, 7 for CoF facilitators, and 10 for the partnering agency director and program manager. These questions emerged from the literature review, which revealed that while PMI is emerging as an effective strategy to teach children with ASD, teachers rarely implement the practice. The questions were chosen to provide insight into the perspectives of the facilitators who have implemented it, as well as parents who have experienced the phenomenon. Responses to interview questions were recorded, transcribed verbatim, and analyzed by hand coding (Miles & Hubermann, 1994). A combination of predetermined and emerging codes was used. Data were analyzed for multiple perspectives on the major themes that emerged. Several measures were used to enhance trustworthiness. Data were continually compared to specifically defined codes, and triangulation, member checking, and reflexivity were also used.

Findings

Four main themes emerged from a cross-case analysis of the data of the larger study. Those themes that emerged were the influence a CoF partnership initiative has on inclusion, social skills improvement, empowerment, and sense of well being. Findings are congruent with Vygotsky’s (1978) claim that social interaction precludes development; consciousness and
cognition are the end products of socialization and social behavior. For the purposes of this article, the findings relative to inclusion are discussed.

**Peer Acceptance and Less Fear toward Classmates with Autism Spectrum Disorders**

Based on interviewee feedback, CoF fostered an attitude of peer acceptance for classmates with ASD. Every research participant reported an increase in peers’ understanding of classmates with autism and other disabilities. They believed this acceptance was an outcome of specific CoF lessons designed to teach them about autism and promote positive interactions. As noted by one facilitator,

I think the peers learn a lot. I think a lot of the peers are unaware of autism, Asperger’s, kids who, you know, kids on the spectrum. By looking at them, you can’t tell that they have a disability. So they kind of get labeled the weird kid, and I think having an understanding of why they behave the way they do is extremely beneficial to peers.

Another facilitator stated, “I think it’s been great for them. I think it opens their eyes and makes them more aware of other kids with disabilities. Really, what we’re doing is teaching them a framework for being a really nice person.”

Adults describe social interactions and peer comfort levels with odd behaviors that didn’t exist before CoF groups were formed. One facilitator shared,

She (the target student) could say those strange things that she says and they understood she was being funny, that she’s a little different, that she’s silly. When there were conversations going on in the group, she was part of it, and it wasn’t just her talking. She was definitely part of the group. So they (the peers) were really focusing on the funny things she says and encouraging her
to talk about her animals, and it really just brought her out. I mean, she
looked forward to the group all week long.

This facilitator went on to describe the target student’s CoF peers as patient and interested, stating that they were “really good with her” and that they “really seem to enjoy her.” CoF also seemed to help alleviate feelings of fear peers experienced toward classmates with ASD. One facilitator described an isolated target student who had a history of lashing out at peers but after CoF, experienced a newfound accepting environment. This facilitator stated,

I think there were probably a couple of kids who were kind of scared, scared of her in the beginning, but once they came down for lunch a couple of times and they saw she’s completely different when they come to lunch. I don’t think I had anybody who didn’t want to interact with her.

According to this facilitator, the target student moved from thinking students would never like her to experiencing acceptance and friendship. The facilitator observed that she became more comfortable taking social risks.

**Development of Empathy, Understanding, and Fostering True Social Inclusion**

Several facilitators shared that CoF peers not only developed empathy and understanding for the CoF target student, but that those qualities extended to students outside the circles. In one case, a facilitator described a situation in which peers demonstrated sensitivity to the needs of a student who had recently moved to the district. This new student told peers—who happened to be part of a CoF group—that she had been bullied at her former school. Upon learning this, A CoF peer approached her adult facilitator and asked if this new girl could be include in the circle to prevent a similar situation from recurring. As another facilitator put it,
I think it helps peers look at classmates differently. Taking a second before just deciding they’re going to judge someone from a 5-second interaction with them. Taking a step back and really working through some of the issues the other person might be dealing with. I think that a lot of our peers leave, especially when they graduate, with a much better understanding of autism in general and then just have more respect; I want to say more respect for all people, not just people with ASD.

CoF seemed to have fostered true social inclusion, altering traditional divisions between special education and typical education populations. One parent shared, “The first year, he always sat with all the special needs kids at lunch. But then (after CoF), the other peers would say, ‘Come sit with our group.’” Another parent explained the relationship between CoF and social inclusion in the following statement:

I don’t think a lot of these teens would know my son or would know them (other target students) as well or engage them having not experienced Circle of Friends. It’s one thing having a child in the classroom, but it’s another thing to know what their hobbies are and to know, kind of, what they like. It’s a big benefit.

One facilitator confirmed this parent’s perceptions, stating, “They (parents) have that support system they didn’t necessarily have before. They’ve seen their kids talking to other kids without disabilities. They’ve seen them interact with those kids.”
Interestingly, it was reported across case groups the belief that this peer acceptance generalized outside the school setting, even in the absence of CoF adult facilitators. One interviewed parent, who happens to be the leader of a social support group for teens with ASD from different schools, shared the following account. The support group was at a bowling alley for a social outing not associated in any way with CoF. With the exception of this support group leader’s son, none of the youth with ASD had CoF groups in their schools. There happened to be a fundraiser for a local baseball team at the bowling alley that particular night, so the facility was packed with teenagers not associated with the ASD support group. The support group leader other relayed,

There was one young adult from our group that kept going over to a group of typical teens from this baseball group and engaging them and kind of being goofy. I was kind of watching the situation and making sure he was being appropriate. And those teens, you could tell they were from our school (involved in the CoF project) in the way that they handled it. They were so used to having special needs kids in their group, in their environment, that they didn’t miss a beat. It was so cool. And so I went up to them a couple of times and said, “Is everything okay?” and they said, “No, no, he’s fine.” And then probably halfway through the night, one of the young men got up from the team and came over to talk to me and said, “Is that your son, [name]?” I said, “Yeah,” and then he said, “Well, I’m one of the peers from his Circle of Friends.” Here we had this whole group of kids from [participating CoF school], and it was so obvious that they’re used to engaging them, and they all responded so positively, which wouldn’t have been the case (before CoF).
As a parent, that’s the biggest thing I see, that when you’re out in the community, that peers are used to greeting kids, and they’re used to having them around, and making them part of the community. That’s probably the biggest thing that my husband and I see.

This parent went on to ad that the parents of the teens with ASD who did not have CoF at their schools were surprised when they observed these natural peer social interactions. These parents expressed frustration that their children’s schools did not have CoF programs.

While CoF may be viewed as contrived, artificial friendship, at least initially, it appears from this study that some long-term, genuine friendships develop. One parent shared that her daughter received a party invitation from a former CoF peer who moved to another district 1 year later, no longer part of her daughter’s CoF group. Social events to which target students were invited included birthday and holiday parties, movies, and shopping trips. Parents and facilitators also reported that target students formed friendships in gaming and anime clubs outside CoF.

**Discussion of Findings**

The findings that emerged from the analysis of the data of the larger study—inclusion, social skills improvement, empowerment, and sense of wellbeing—are congruent with Vygotsky’s (1978) claim that social interaction precludes development and that consciousness and cognition are the end products of socialization and social behavior.

Based on participant responses, CoF fostered an attitude of peer acceptance for classmates with ASD. Every research participant reported an increase in peers’ understanding of classmates with autism and other disabilities. This is consistent with DiSalvo and Oswald’s (2002) contention that typical students must first be educated to change their views and beliefs.
about those with autism in order to gain the attention of peers with autism. In their study about
typical peers and peers with Asperger syndrome, Carter et al. (2004) noted that social interaction
allowed the typical peers to enhance their understanding of their peers with Asperger syndrome.

Participants in the current study described social interactions and peer comfort levels with
odd behaviors that did not exist before CoF groups were formed and commented that CoF also
seemed to help alleviate feelings of fear peers experienced toward classmates with ASD. This
finding is in agreement with Frederickson and Turner’s (2003) study of CoF, which noted that
the program is “a useful means of changing other children’s perceptions and judgments about a
focus child” (p. 240). Frederickson and Turner also pointed out that those around a person with
autism must change first in order for change to occur in the one with autism. In addition, Gus
(2000) discussed CoF and maintained the process enhanced typical peers’ understanding of peers
with autism.

Several facilitators shared that CoF peers not only developed empathy and understanding
for the CoF target student, but that those qualities extended to students outside the circles. In one
case, a facilitator described a situation in which peers demonstrated sensitivity to the needs of a
student who had recently moved to the district. Findings in the current study demonstrated that
CoF seemed to have fostered true social inclusion, altering traditional divisions between special
education and typical education populations. Kalyva and Avramidis (2005) investigated a CoF
intervention. They reported that “changes in the interaction patterns indicated that he Circle of
Friends is a powerful intervention that, if carefully applied, can improve the social skills of
children with autism and their ability to communicate, and ultimately facilitate their inclusion in
mainstream settings” (p. 253).
In the current study, across case groups, findings indicated that the peer acceptance generalized outside the school setting, even in the absence of CoF adult facilitators. Kalyva and Avramidis (2005) pointed a similar finding, noting that those in the CoF intervention group had significantly higher successful response and initiation rates after the intervention and follow-up than those in the control group. Similarly, Jung, Sainato, and Davis (2008) argued that peers can often provide opportunities for genuine interaction in ways better than adults are able to: peers also may become examples for language use and social behavior (Kalyva & Avramidis, 2005).

**Implications for Social Change**

All participants believed CoF benefitted students with ASD and their peers, as well as themselves. The themes that emerged from the study indicated that CoF fosters true social inclusion, improved social skills, feelings of empowerment, and a greater sense of wellbeing. A blueprint for successful CoF implementation also became apparent. Results of the larger study were used to guide the development of a website for use by stakeholders in this project. The partnering agency has a stated goal to support any school in the state interested in implementing CoF groups for students on the autism spectrum. With this goal in mind, the site will alleviate challenges communicated by study participants, provide support, and simplify future project implementation with an increased number of schools.

Findings have the potential to improve the lives of youth with autism and the adults for whom this virtual community is created. Without proper intervention, students with ASD may be physically integrated into the regular education but denied social inclusion. Without proper education, their peers misunderstand, socially ignore, or even bully them. Without training and support, well-meaning teachers often fail to meet the social needs of this population as parents watch helplessly. By creating a virtual learning community to support this CoF partnership,
teachers will receive the training and ongoing collaborative professional development needed to properly implement an intervention designed to promote true social inclusion for youth with ASD. This also enables the community agency leaders to serve additional schools, because having all documents in a central location will make the CoF program manageable. Parents, as a result of observing their children in new social situations, will be able to set and meet new social goals in partnership with their child’s teachers. Enhancing accountability and knowledge of CoF for the partnering agency board of directors will increase the likelihood that this program will continue to receive support in the future.

Findings will have the potential to impact social change beyond the local level. Having a visual model of a replicable partnership could provide a blueprint for other communities seeking creative ways to serve children with ASD. Having research supporting the intervention on the website will provide an evidence base for parents, teachers, and administrators trying to convince others outside this partnership to consider CoF. This project can serve as a method to increase visibility for this evidence supported intervention, ultimately benefiting children with ASD beyond the scope of this partnership.
