Predictors of Postsecondary Success

The purpose of this brief is to provide information to state, district, and school personnel seeking support to determine whether their students are on a path to postsecondary success. The College and Career Readiness and Success Center (CCRS Center) has received technical assistance requests from a number of states regarding factors that predict postsecondary success, and this brief summarizes and expands on the information shared with these states. Specifically, we summarize early childhood through early postsecondary education research that identifies student skills, behaviors, and other characteristics that predict future academic and workplace success. We have attempted to focus on a variety of measures drawn from readily available data that schools, districts, and states are likely to have. Through this information, policymakers and practitioners can begin to inform the development and validation of factors to identify students who are not on a path to postsecondary success as early as prekindergarten and as late as their senior year of high school. These factors can inform practice and can be integrated into a longitudinal tracking mechanism to identify and monitor individual students who may need additional resources or supports at any point during their schooling. In addition, tracking and measuring factors of success across prekindergarten to early postsecondary education offer a prime opportunity to develop and evaluate systemwide improvement efforts. For example, these data may help identify particular grades, schools, or subgroups of students (e.g., English language learners) that need additional support, enabling both school and district personnel to develop and monitor the impact of policies, programs, or interventions designed to improve outcomes for targeted groups or for the system in general.

General Approach

We began our review of the research looking for studies that identify measures of postsecondary success. Our goal was to identify factors at all levels of education that predict future academic attainment and economic security. Not surprisingly, we found very few studies that link early childhood, elementary, or middle school characteristics with postsecondary success. Even at the secondary level, the limited research linking secondary characteristics to postsecondary readiness and success focuses primarily on course taking, test scores, and early postsecondary outcomes, such as college enrollment and attainment of industry certification. The fact that state longitudinal data systems have not been in existence long enough to support such analyses is
most likely a significant contributing cause. For this reason, we instead searched for studies across all grade levels that identify factors that predict future, more proximal academic success (e.g., kindergarten readiness correlated with third-grade reading proficiency) and conducted an explicit search for studies examining predictors of career success. In this way, the brief is not a research summary of secondary and postsecondary success factors per se; instead, this brief presents a continuum of key factors at each level of education that are linked to future achievement and attainment. The information provided in this brief offers a starting point that states, districts, and schools may use to develop and test contextually valid and reliable factors that measure progression toward postsecondary success along the PK–16 spectrum.

For the purposes of the brief, we chose to include a broad range of benchmarks of future success and present our findings using three categories: (1) indicators, (2) predictors, and (3) other potential factors.

- **Indicators** are measures with an established threshold. Students who perform at or above the threshold (e.g., students who earn a 3.0 grade point average [GPA] or higher) are more likely to be prepared for their college and career pursuits.

- **Predictors** are measures that are strongly correlated with improved postsecondary outcomes but for which a numeric threshold has not been established.

- **Other potential factors** are skills and attributes that have been identified as important to students’ success and are driven by sound theoretical arguments (e.g., collaborative skills are important for future success) but for which reliable metrics have not yet been developed or tested independently of other factors.

None of the indicators, predictors, or other potential factors are intended to be used independently; rather, they are potentially valuable components of a comprehensive data-informed decision process designed to improve postsecondary success for all students.

To focus our search, we used key search terms, such as *21st century learning skills, predictors of college success, college and career readiness measures, college and career ready predictors, indicators and standards, college admissions criteria, and workforce skills and capabilities,* and included studies that met the CCRS Center’s review criteria.¹ We reviewed more than 80 research studies and summarized and sorted the information by measure type (indicator, predictor, and other potential factors).

Research on this topic is fairly new; thus, there is a need for additional research and evaluation of identified measures. This brief is not intended to serve as a complete or comprehensive guide, and there are two important limitations to consider. First, most of the measures included in this brief have not been directly linked to postsecondary

¹ Those criteria include: published from 2000 forward, published in a peer-reviewed journal, released by the Institute of Education Sciences, What Works Clearinghouse review, National Center for Education Statistics report, or published by an organization with rigorous internal review procedures.
success. Instead, as mentioned previously, the measures have been linked to more proximal academic successes. Second, there is very little research that focuses specifically on special student populations, such as English language learners, students with disabilities, or private or home schooled students (Kearns et al., 2011). Thus, this brief is not designed to identify factors that predict postsecondary readiness and success for specific student subgroups.

Summary of Research

In the pages that follow, we summarize the research findings organized by level of education: early childhood (prenatal through kindergarten, elementary (Grades 1–4), middle years (Grades 5–8), high school (Grades 9–12), postsecondary (Years 1 and 2 at both two- and four-year institutions), and adult education.

EARLY CHILDHOOD

At this time, there are no studies that identify early childhood indicators of postsecondary success (see Table 1). There are only a small number of early childhood predictors of postsecondary readiness (e.g., academic and social adjustment) and considerably more other potential factors.

The early childhood predictors that we found are components of a larger set of classroom competencies, or early approaches to learning, which have been researched across grade levels and relate to future readiness (e.g., mathematics and reading scores in the third grade and grade promotion in the fourth grade)( Li-Grining, Votruba-Drzal, Maldonado-Carréno, & Haas, 2010). These predictors include persistence, emotion regulation, and attentiveness (Hair, Halle, Terry, Lavelle, & Calkins, 2006). In addition, participation in school-readiness screenings and preschool programming has been significantly related to future school success. Finally, the following predictors also have been identified as contributing to children’s readiness for school: physical health, social-emotional development, approaches to learning, language, and cognitive development (Hair et al., 2006; Li-Grining et al., 2010).

Some of the other potential factors that we found that relate to school readiness include: working memory skills; the display of positive play interactions with other students, teachers, and family members; and the ability to remain engaged in a task until the task is complete (Coolahan, Fantuzzo, Mendez, & McDermott, 2000; DiLalla, Marcus, & Wright-Phillips, 2004; Fantuzzo & McWayne, 2002; McClelland, Acock, Piccinin, Rhea, & Stallings, 2012). Research on these factors has found these skills are related to spelling and writing scores through age 7, and students who exhibit these skills and behaviors are more likely to be successful in the core subject areas of reading and mathematics from kindergarten to the fifth grade (Gathercole, Brown, & Pickering, 2003).

**ELEMENTARY SCHOOL**

Within the elementary school research literature, we did not find studies that identify elementary school indicators of postsecondary success. However, research did identify two elementary school indicators that predict proximal, future academic success (see Table 2). First, achieving literacy by the third grade is correlated with reading and English language arts (ELA) proficiency on state assessments at the middle grades level (ACT, 2008; Silver & Saunders, 2008). Moreover, students in Grades K–3 who are absent fewer than 10 percent of the time are more likely to be promoted to the next grade and to receive higher grades in core subject areas.\(^2\)

We also found that certain social skills and behavioral predictors are correlated with future academic achievement. The Social Skills Rating System assesses components of student behavior, which have been shown to be linked with relationships and which, in turn, are associated with improved social adjustment and academic achievement (Malecki & Elliot, 2002). The multi-rater tool collects perspectives from teachers, parents, and students and assesses the following social skills: cooperation, assertion, responsibility, empathy, and self-control.

The most common other potential factor at the elementary school level is the demonstration of social competence. Social competence is the ability to develop and maintain interpersonal relationships with others (Cotugno, 2009). However, the definition of social competence is not consistent across studies, nor is its measurement. However, social competence is still considered a potential predictor of both academic and social progress (Rubin & Rose-Krasnor, 1992).

**MIDDLE GRADES**

At the middle grades level, we found a number of indicators of secondary-level success (see Table 3). For example, attendance rates have a relationship with on-time high school graduation. Students who do not exceed the critical threshold of 20 percent absences per year display a lower rate of core course failure and grade retention in the middle grades (Balfanz, 2009). In the fifth and sixth grades, passing all ELA and mathematics courses is correlated with meeting benchmarks on assessments in future grades. Furthermore, beginning in the eighth grade, indicators specify course-taking pathways and benchmark scores on national assessments that relate to future success, such as passing Algebra I and scoring at or above 292 on the National Assessment of Educational Progress (NAEP) in mathematics (Wimberly & Noeth, 2005). ACT and SAT also have established college preparatory exam thresholds for middle grades students that correlate with high school academic success, such as meeting benchmark scores on state-administered proficiency tests in core subject areas and enrollment in honors and accelerated courses (ACT, 2008; Silver & Saunders, 2008).

Predictors of future success for middle grades students include meeting the benchmark scores on cognitive assessments, such as the Grit Scale, a self-assessment that measures student characteristics (e.g., focus, interest levels, commitment, and follow-through) that have been shown to predict student ability to continue the pursuit of academic goals despite uncertainty, risk of failure, or feelings of frustration. High scores on the Grit Scale are correlated with positive outcomes at multiple levels. In the middle grades, high scores are correlated with higher student GPAs, and one study asserts that, in adulthood, high scores also correlate with fewer career changes over time (Duckworth & Quinn, 2009).  

Note:  

The literature also suggests other potential factors in the middle grades, such as critical thinking and the ability to make informed decisions, which have been correlated with secondary-level academic achievement. For example, one study found a correlation between seventh-grade predictors and 10th-grade academic achievement (Fleming et al., 2005). In addition, social and emotional learning (SEL) skills that have been found to be related to future achievement include emotional expression, support-seeking behaviors, and direct problem-solving and cognitive decision-making skills (Fedorowicz, 1995).

**HIGH SCHOOL**

At the high school level, we found numerous indicators, predictors, and other potential factors due to the breadth of research conducted on this particular school-level transition (see Table 4). The most frequently noted indicators at this level are attendance, GPA, and test scores. Missing no more than 10 percent of school days per grade level is primarily associated with on-track high school graduation (Allensworth & Easton, 2007). Maintaining higher than a 3.0 high school GPA or passing high school exit exams or college entrance...
exams correlated with enrolling in and successfully completing credit-bearing entry-level college courses (ACT, 2012; Mishook et al., 2012). Meeting or exceeding benchmark scores on state and national assessments also are indicative of future success (Cumpton et al., 2012). Specific course-taking pathways and participation in college preparatory programming also have been shown to be correlated with future success. For example, the completion of Algebra I in the eighth grade and Algebra II in the ninth grade is inversely correlated with the need for remediation at the postsecondary level (CRIS Annenberg Institute for School Reform, 2010; Klepfer & Hull, 2012; Lee, 2012, 2013). Scoring a 3 or higher on Advanced Placement (AP) final exams or a 4 or higher on the International Baccalaureate (IB) final exam in any AP or IB course, or participation in dual enrollment programming, is positively correlated with college enrollment and persistence rates in the first two years of a degree or certificate-seeking program (Karp, Calcagno, Hughes, Jeong, & Bailey, 2007; Nagaoka, Roderick, & Coca, 2009; Rumberger & Larson, 1998; Wiley, Wyatt, & Camara, 2010). Similarly, findings from research conducted by SAT and ACT indicate thresholds on their respective college entry exams positively correlate with college- and career-readiness outcomes, such as enrollment in a two- or four-year degree program and completion of credit-bearing, entry-level courses without remediation (ACT, 2010). In addition, the submission of both the Free Application for Federal Student Aid (FAFSA) and a college application, coupled with immediate, full-time enrollment in a postsecondary academic or career-focused program, also are positively correlated with postsecondary persistence (Nagaoka et al., 2009).

Other indicators that have more recently gained attention are participation in college preparatory activities, such as summer transition and orientation programs, as well as high school-to-college bridge programs (Barnett et al., 2012; Mishook, 2012). Some of these programs include the opportunity to earn college credit but focus primarily on conative skill development and easing the transition process. Program activities include meeting with academic advisors and guidance counselors and completing college-readiness lessons or pretests for college entrance exams (Barnett et al., 2012; Mishook, 2012). As with all of the measures described in this brief, it is important to note that this research is based on correlational studies, not causal studies. In addition, none of the studies we reviewed track students beyond the completion of the second year of postsecondary schooling.

At this level, there also are a few predictors of secondary and postsecondary success. For example, low-mobility or school transfer rates between grades have been widely studied and identified as predictors of academic success. One study found that even one school transfer between Grades 8 and 12 is correlated with a dropout rate that is twice as high as observed for students who do not transfer (Rumberger & Larson, 1998).

---

Other potential factors at the secondary level are primarily derived from emergent research. For example, research suggests that students who possess five core SEL skill sets (self-awareness, self-management, social awareness, relationship skills, and responsible decision making) exhibit higher academic performance in college and better manage the anxiety and workload that college courses entail when compared with students who do not possess these skills (Dymnicki, Sambolt, & Kidron, 2013). In addition, these five core skill sets of SEL, as well as other SEL skills, are valuable to prospective employers and have been included in numerous work standards, suggesting that those who exhibit these skills may have an increased likelihood of becoming employed. For example, the National Work Readiness Credential (NWRC) measures skills such as time management, conscientiousness, self-efficacy, cooperative behavior, and openness to new ideas to assess the degree to which potential employees exhibit 21st century workforce skills (ACT, 2011). Demonstration of these skills increases employability for entry-level positions in high-demand jobs because obtaining the NWRC places the work-ready applicant into a referral network of business and industry leaders seeking employees with these specific skill sets (Casner-Lotto & Barrington, 2006).

POSTSECONDARY AND BEYOND

Indicators of postsecondary success include high GPA, adequate credit load, and passing general education courses without the need for remediation within the first two years of college (see Table 5) (Moore & Shulock, 2009; Roderick, Nagaoka, & Coca, 2009). Maintaining a 3.0 GPA or higher and attending college full-time, as defined by earning 30 credits within the first year, are correlated with on-time degree completion (Leinbach & Jenkins, 2008). Similarly, college students enrolled in four-year institutions who take remedial courses are more likely to drop out of college or transfer to a two-year institution (Attewell, Lavin, Domina, & Levey, 2006; Bettinger & Long, 2004). For students transferring to four-year institutions from community colleges, completing foundational or “gateway courses” in mathematics and English and one college-level science course within the first two years has been strongly correlated with future postsecondary success as well (Moore & Shulock, 2009). For adult education, two indicators for success have been identified: obtaining a GED and receiving a Comprehensive Adult Student Assessment Systems (CASAS) composite score above 256 (Wachen, Jenkins, & Van Noy, 2010). The CASAS assessment was designed to measure adult mathematics, reading, writing, listening, and speaking skills in order to identify career pathways that are best suited to students’ abilities.

The predictors of postsecondary success include participation in college and career orientation and baccalaureate transfer programs and maintaining a combination of full-time enrollment and part-time employment status (Leinbach & Jenkins, 2008). Some research has found that involvement in extracurricular activities and membership in on-campus student organizations predict success in the form of sustained positive academic, psychological, and civic engagement (Aud, Ramani, & Frohlich, 2011; Fredricks & Eccles, 2006).

Other potential factors that relate to postsecondary success are limited to the area of adult education and are largely dependent on data provided by workforce innovation agencies. Findings from research conducted on the Integrated Basic Education and Skills Training (I-BEST) model suggest that adult students who enroll in postsecondary programs with the intentions of pursuing a vocational career fare better in achieving their career-oriented goals when compared to other adult students enrolling in postsecondary programs strictly for academic purposes (Wachen et al., 2010).10

---

**REFLECTIONS ON THE REVIEW OF LITERATURE**

In our review of the literature, we identified potential directions for research that may prove useful in informing both policy formulation and practical application. First, as previously mentioned in this brief, research on benchmarks for postsecondary success is emergent, and there is a dearth of reliable indicators of postsecondary success. Second, there is little, if any, research on special student populations. Therefore, the field would benefit from more empirical research. Third, the research that we reviewed is correlational and not causal; thus, indicators, predictors, and other potential factors should not be considered causes of future outcomes. Finally, from what we have gleaned from the review of the research, these studies tend to test factors independently of, rather than in conjunction with, other proposed factors of success. There is little evidence to suggest that postsecondary predictors are being used together to provide students with a comprehensive snapshot of their own level of preparedness as they move through each grade level (Conley, 2007). If postsecondary predictors are used collectively, states, districts, and schools can develop self-assessment tools or checklists that can serve as personal tracking guides for students as they progress through school.
RECOMMENDATIONS

Based on our review of the research and our experience working with states, districts, and schools using data to inform decision making, we have developed a list of recommendations for consideration when using postsecondary success indicators, predictors, and other potential factors:

1. Continue building comprehensive, user-friendly state, district, and school data systems that allow data linkages across prekindergarten to workforce in order to identify indicators for readiness and success that are applicable across grade levels and in both career-related and academic postsecondary environments.

2. Create measures that correlate with postsecondary success and other proximal outcomes, and test the measures with multiple cohorts of students who have moved or are moving through your system. This testing will ensure these measures are valid and reliable in your local context. Examine potential differences, by student subgroups, to make sure the measures work for all students in your schools, and adjust as necessary if there are subgroup differences.

3. Integrate measures of readiness and success into your data systems, and use these measures and data systems to identify and intervene with struggling students and to evaluate the effectiveness of interventions and school reform initiatives.

The development of a reliable set of indicators will provide states, districts, and schools as well as students and their families with the ability to map and track students along a trajectory that leads to long-term and transferable success. The set of indicators also will inform the development of tools that will allow students and their families to see where students are on a trajectory toward a particular goal. We can begin with local validation efforts that utilize indicators that have undergone rigorous review in a variety of contexts. Further, additional research on predictors and other potential factors will refine measurement and improve data-based decision making.
