

Validity of the SAT[®] for Predicting First-Year Grades: 2011 SAT Validity Sample

By Brian F. Patterson and Krista D. Mattern

COLLEGE BOARD RESEARCH

Statistical Report 2013-3

Executive Summary

The continued accumulation of validity evidence for the intended uses of educational assessments is critical to ensure that proper inferences will be made for those purposes. To that end, the College Board has continued to collect college outcome data to evaluate the relationship between SAT[®] scores and college success. This report provides updated validity evidence for using the SAT to predict first-year college grade point average (FYGPA) for the 2011 cohort.

Colleges and universities (henceforth, “institutions”) provided data on the cohort of first-time, first-year students enrolling in the fall of 2011. The College Board combined those college outcomes data with official SAT scores and SAT Questionnaire response data. In particular, 149 institutions provided data on 276,829 students, 206,844 of whom had complete data on high school grade point average (HSGPA), which was obtained from students’ responses to the SAT Questionnaire, SAT critical reading (SAT-CR), mathematics (SAT-M), and writing (SAT-W), and FYGPA. As has been shown in previous research ([Kobrin, Patterson, Shaw, Mattern, & Barbuti, 2008](#); [Patterson, Mattern, & Kobrin, 2009](#); [Patterson & Mattern, 2011](#); [2012](#); [2013](#)), the multiple correlation of SAT section scores and HSGPA with FYGPA was strong ($r = .62$). When compared with the correlation of HSGPA alone with FYGPA ($r = .53$), the addition of the SAT section scores to HSGPA represented a substantial increase ($\Delta r = .09$) in the correlation with FYGPA. The patterns of differential validity by institutional and student characteristics and differential prediction by student characteristics also follow the same general patterns, as has been shown in previous research ([Mattern, Patterson, Shaw, Kobrin, & Barbuti, 2008](#); [Patterson, et al., 2009](#); [Patterson & Mattern, 2011](#); [2012](#); [2013](#)).

Table 1.

Distribution of Institutional Characteristics

Institutional Characteristic		%
U.S. Region	Midwest	18
	Mid-Atlantic	22
	New England	11
	South	19
	Southwest	12
	West	17
Control	Public	46
	Private	54
Admittance Rate	Under 50%	23
	50 to 75%	56
	Over 75%	21
Undergraduate Enrollment	Small	20
	Medium	41
	Large	17
	Very Large	21

Note: Number of institutions (K) = 149. Percentages may not sum to 100 due to rounding. Undergraduate enrollment was categorized as follows: small: 750 to 1,999; medium: 2,000 to 7,499; large: 7,500 to 14,999; and very large: 15,000 or more.

- Table 1 shows that the sample of 149 four-year institutions was diverse with respect to region of the U.S., control, size, and undergraduate admittance rate (i.e., selectivity; College Board, 2011a).

Table 2.

Descriptive Statistics for Total Sample

Variable	<i>M</i>	<i>SD</i>
HSGPA	3.61	0.500
SAT-CR	551	97.3
SAT-M	570	98.3
SAT-W	544	98.7
FYGPA	3.00	0.723

Note: Number of students (N) = 206,844.

- When compared to the 2010 cohort, Table 2 shows similar mean performance for high school grade point average (HSGPA) and first-year grade point average (FYGPA) for the 2011 cohort, with means differing by at most 0.01. The mean SAT section scores are also quite similar, differing by no more than four points for any one section ([Patterson & Mattern, 2013](#)).
- When compared with the population of all college-bound SAT takers expecting to graduate in 2011 ($n = 1,647,123$) — whose mean (standard deviation) SAT critical reading (SAT-CR), mathematics (SAT-M), and writing scores (SAT-W) were 497 (114), 514 (117), and 489 (113), respectively (College Board, 2011b) — the sample in this study tended to have performed better in terms of SAT section scores. Given that students in this subsample not only chose to take the SAT — as did the population of over 1.6 million college-bound seniors — but also applied to, enrolled at, and earned grades at a four-year institution, their higher mean SAT section scores followed the expected pattern.

Table 3.

Corrected (Raw) Correlation Matrix of SAT and HSGPA

Variable	HSGPA	SAT-CR	SAT-M	SAT-W
HSGPA		.45	.49	.49
SAT-CR	(.20)		.72	.84
SAT-M	(.22)	(.49)		.74
SAT-W	(.22)	(.69)	(.50)	

Note: Number of students (N) = 206,844. Pooled within-institution, restriction of range corrected correlations are presented. The raw correlations are shown in parentheses.

- Table 3 shows the restriction of range corrected and raw correlations among the four predictors examined in this study: HSGPA, SAT-CR, SAT-M, and SAT-W. In general, SAT sections were more highly correlated with other sections than with HSGPA, and this is most prominent in the correlation of SAT-CR and SAT-W. A comparison to the study of the 2010 cohort shows that both the raw and corrected correlations are within .01 of what is reported here ([Patterson & Mattern, 2013](#)).

Table 4.

Corrected (Raw) Correlations of Predictors with FYGPA

Predictor(s)	Correlation
1. HSGPA	.53 (.34)
2. SAT-CR	.49 (.28)
3. SAT-M	.49 (.28)
4. SAT-W	.53 (.34)
5. SAT-M, SAT-CR	.53 (.32)
6. HSGPA, SAT-M, SAT-CR	.61 (.42)
7. SAT-CR, SAT-M, SAT-W	.55 (.36)
8. HSGPA, SAT-CR, SAT-M, SAT-W	.62 (.45)

Note: Number of students (N) = 206,844. Pooled within-institution, restriction of range corrected correlations are presented. The raw correlations are shown in parentheses.

- Similar to what was estimated in previous research, the bivariate correlations of each of the four predictors with first-year grade point average (FYGPA) are shown in the first four rows of Table 4 ([Kobrin, et al., 2008](#); [Patterson, et al., 2009](#); [Patterson & Mattern, 2011](#); [Patterson & Mattern, 2012](#); [Patterson & Mattern, 2013](#)).
- Consistent with prior research, the SAT writing section had the highest correlation with FYGPA among the three sections ([Kobrin, et al., 2008](#); [Patterson, et al., 2009](#); [Patterson & Mattern, 2011](#); [Patterson & Mattern, 2012](#); [Patterson & Mattern, 2013](#)).
- SAT-CR, SAT-M, and SAT-W jointly have a similar multiple correlation with FYGPA (.55) as does HSGPA with FYGPA (.53). It is, however, the inclusion of all four predictors that leads to the strongest linear relationship with FYGPA; namely a multiple correlation of .62.

Figure 1.

Mean FYGPA by SAT score band.

Note: SAT score bands are based on the sum of SAT-CR, SAT-M, and SAT-W.

Sample sizes by SAT score band were as follows:

SAT	<i>n</i>
600–1190	7,506
1200–1490	47,865
1500–1790	85,824
1800–2090	54,621
2100–2400	11,028

- Figure 1 shows graphically the positive relationship between the composite SAT score band (i.e., sum of SAT-CR, SAT-M, and SAT-W, grouped into meaningful categories) with mean FYGPA. In particular, the difference in mean FYGPA between the highest score band (2100–2400) and the lowest (600–1190) was over 1.2. In other words, students in the highest SAT score band earned, on average, an FYGPA of A- compared to students in the lowest SAT score band, who had an average FYGPA of C+.

Figure 2.

Percentage of students earning FYGPA of a B or higher by SAT score band.

Note: SAT score bands are based on the sum of SAT-CR, SAT-M, and SAT-W.

Students whose FYGPA was ≥ 3.00 were considered to have earned a B or better.

Sample sizes by SAT score band were as follows:

SAT	<i>n</i>
600–1190	7,506
1200–1490	47,865
1500–1790	85,824
1800–2090	54,621
2100–2400	11,028

- Figure 2 shows graphically the positive relationship between the percentage of students earning at least a B (i.e., 2.0 FYGPA) in their first year of college with the composite SAT score band. In particular, almost four-and-a-half times the number of students in the highest SAT score band (2100–2400) earned at least a B, relative to those in the lowest (600–1190).

Figure 3.

Incremental validity of the SAT: Mean FYGPA by SAT score band controlling for HSGPA.

Note: SAT score bands are based on the sum of SAT-CR, SAT-M, and SAT-W.

HSGPA ranges were defined as follows:

“A” range: 4.33 (A+), 4.00 (A), and 3.67 (A-);

“B” range: 3.33 (B+), 3.00 (B), and 2.67 (B-); and

“C or Lower” range: 2.33 (C+) or lower.

Sample sizes by HSGPA and SAT score band were as follows:

SAT	HSGPA		
	C or Lower	B	A
600-1190	1,046	4,790	1,670
1200-1490	2,678	25,823	19,364
1500-1790	1,406	29,270	55,148
1800-2090	337	9,523	44,761
2100-2400	34	867	10,127

- Figure 3 shows the relationship of composite SAT score band with mean FYGPA at different levels of HSGPA. For each level of HSGPA, higher composite SAT score bands are associated with higher mean FYGPAs, thus demonstrating the value of SAT above and beyond HSGPA in the prediction of FYGPA.
- Consider, for example, two students with HSGPAs in the A range; the one whose SAT composite was 600-1190 was expected to earn an FYGPA of 2.5, which translates to roughly a B-, while the other student, whose SAT composite was 2100-2400, was expected to earn an FYGPA of 3.6, which translates to roughly an A-.

Table 5.

Descriptive Statistics of Study Variables by Institutional Characteristics

Institutional Characteristic	<i>k</i>	<i>n</i>	SAT-CR		SAT-M		SAT-W		HSGPA		FYGPA		
			<i>M</i>	<i>SD</i>	<i>M</i>	<i>SD</i>	<i>M</i>	<i>SD</i>	<i>M</i>	<i>SD</i>	<i>M</i>	<i>SD</i>	
Control	Private	81	58,411	580	97.7	595	97.5	579	100.0	3.67	0.477	3.15	0.599
	Public	68	148,433	539	94.8	559	96.8	530	94.7	3.58	0.507	2.94	0.759
Admittance Rate	Under 50%	34	49,522	595	95.0	616	94.6	597	98.8	3.74	0.435	3.16	0.602
	50 to 75%	84	131,711	542	93.6	561	94.9	532	92.7	3.59	0.504	2.97	0.742
	Over 75%	31	25,611	513	91.9	523	88.3	502	88.1	3.43	0.528	2.83	0.783
Undergraduate Enrollment	Small	30	9,137	530	96.1	535	92.0	521	93.5	3.51	0.537	2.96	0.684
	Medium	61	40,043	550	104.5	559	104.6	545	106.6	3.54	0.542	3.02	0.736
	Large	26	50,257	549	99.3	568	100.6	543	100.4	3.58	0.503	2.98	0.723
	Very Large	32	107,407	554	93.4	577	94.3	546	94.9	3.65	0.473	3.00	0.722
Total		149	206,844	551	97.3	570	98.3	544	98.7	3.61	0.500	3.00	0.723

Note: *k*: number of institutions, *n*: subgroup sample size. Undergraduate enrollment was categorized as follows: small: 750 to 1,999; medium: 2,000 to 7,499; large: 7,500 to 14,999; and very large: 15,000 or more.

- Table 5 provides summary statistics on the key study variables by institutional characteristics.
- It shows that, in general, mean SAT section scores, HSGPA, and FYGPA were higher:
 - at private institutions, compared to public institutions; and
 - at increasingly selective institutions (i.e., those that admit fewer applicants).
- In terms of undergraduate enrollment (i.e., institution size):
 - small institutions had the lowest mean SAT section scores and HSGPAs, while very large institutions had the highest mean SAT section scores and HSGPAs; and
 - there is no discernable relationship between institution size and mean FYGPA.

Table 6.

Corrected Correlations of SAT and HSGPA with FYGPA by Institutional Characteristics

Institutional Characteristic		k	n	SAT-CR	SAT-M	SAT-W	SAT*	HSGPA	SAT*, HSGPA
Control	Private	81	58,411	.54	.53	.58	.60	.56	.67
	Public	68	148,433	.47	.48	.51	.53	.52	.60
Admittance Rate	Under 50%	34	49,522	.52	.52	.56	.59	.52	.64
	50 to 75%	84	131,711	.47	.49	.52	.54	.54	.62
	Over 75%	31	25,611	.48	.48	.52	.54	.54	.62
Undergraduate Enrollment	Small	30	9,137	.55	.55	.59	.62	.58	.69
	Medium	61	40,043	.49	.49	.53	.55	.55	.63
	Large	26	50,257	.49	.51	.54	.57	.55	.64
	Very Large	32	107,407	.48	.48	.52	.54	.52	.61
Overall		149	206,844	.49	.49	.53	.55	.53	.62

Note: *k*: number of institutions, *n*: subgroup sample size. *: SAT refers to the inclusion of all three sections in the relevant multiple correlation. The correlations were corrected for restriction of range within institutions and pooled. Undergraduate enrollment was categorized as follows: small: 750 to 1,999; medium: 2,000 to 7,499; large: 7,500 to 14,999; and very large: 15,000 or more. For raw correlations by institutional characteristics, see Appendix B.

- Table 6 shows the correlations of various combinations of the predictors with FYGPA by key institutional characteristics.
- The correlations of the six combinations of predictors with FYGPA are generally:
 - Higher at private than public institutions
 - Highest at the most selective institutions (i.e., those that admit fewer than 50% of applicants), relative to less selective ones
 - Highest at small institutions, relative to larger ones
- Across institutional categories, the multiple correlation of SAT with FYGPA was at least as high as the correlation of HSGPA with FYGPA.
- For all institutional subgroups, the combination of SAT section scores and HSGPA represented an increase in at least .05 for the correlation with FYGPA over either predictor alone.

Table 7.

Descriptive Statistics of Study Variables by Student Characteristics

Student Characteristic		n	SAT-CR		SAT-M		SAT-W		HSGPA		FYGPA	
			M	SD	M	SD	M	SD	M	SD	M	SD

Total		206,844	551	97.3	570	98.3	544	98.7	3.61	0.500	3.00	0.723

Note: *n*: subgroup sample size.

- Table 7 shows that female students tended to outperform males on SAT-W, HSGPA, and FYGPA, while the opposite was true for SAT-CR and SAT-M.
- Some differences exist across racial/ethnic identities, with white and Asian students having higher mean SAT section scores, HSGPA, and FYGPA relative to African American and Hispanic students.
- When considering best spoken language, students whose best language was English had the highest SAT-CR and SAT-W scores, whereas students whose best language was something other than English had the highest SAT-M scores and slightly higher HSGPA and FYGPA means.
- Students who reported higher household incomes had higher mean SAT section scores and FYGPA, but there was no apparent relationship with HSGPA.
- As with household-income level, mean SAT section scores and FYGPA increased as highest parental education level increased; with respect to mean HSGPA, there was a positive relationship with highest parental education level.

Table 8.

Corrected Correlation of SAT Scores and HSGPA with FYGPA by Student Subgroups

Student Characteristic		<i>k</i>	<i>n</i>	SAT-CR	SAT-M	SAT-W	SAT*	HSGPA	SAT*, HSGPA
Gender	Male	145	92,780	.46	.49	.50	.53	.52	.60

Overall		149	206,844	.49	.49	.53	.55	.53	.62

Note: *k*: number of institutions, *n*: subgroup sample size.*: SAT refers to the inclusion of all three sections in the relevant multiple correlation. The correlations were corrected for restriction of range within institutions and pooled. Institutions with fewer than 15 students in any subgroup were excluded. For raw correlations by institutional characteristics, see Appendix C.

- Table 8 shows that predictive validity for all predictors and combinations of FYGPA was higher for:
 - Female students than for male students;
 - White students and lower for African American students, relative to the other racial/ethnic identities;
 - Students whose best spoken language was English as compared to the other language groups;
 - Students with a household income level of at least \$80,000 than those with lower incomes; and
 - Students whose parents have higher education levels as compared to lower education levels.
- Across all student subgroups, predictive validity of FYGPA was maximized using the combination of SAT section scores and HSGPA.

Table 9.

Average Overprediction (-) and Underprediction (+) of FYGPA for SAT Scores and HSGPA

Student Characteristic		<i>k</i>	<i>n</i>	SAT-CR	SAT-M	SAT-W	SAT*	HSGPA	SAT*, HSGPA
Gender	Male	145	92,780	-0.113	-0.144	-0.085	-0.112	-0.073	-0.083
	Female	149	114,064	0.092	0.117	0.069	0.091	0.060	0.067

	Graduate Degree	149	63,041	0.034	0.042	0.025	0.018	0.076	0.031
	Not Stated	148	6,374	-0.039	-0.067	-0.039	-0.033	-0.065	-0.023
Overall		149	206,844	0.000	0.000	0.000	0.000	0.000	0.000

Note: *k*: number of institutions, *n*: subgroup sample size.*: SAT refers to the inclusion of all three sections in the relevant regression model. Negative and positive values indicate over- and underprediction, respectively. FYGPA regressions were estimated for each institution separately. Residuals were the difference of predicted and observed FYGPA.

- Table 9 shows that across all predictor sets, FYGPA was:
 - Overpredicted (i.e., observed FYGPA < predicted FYGPA) for males and underpredicted for females;
 - Generally overpredicted for African American, American Indian, and Hispanic students;
 - Generally underpredicted (except for SAT-M alone) for students whose best spoken language was not English; and
 - Overpredicted for students from lower socioeconomic status families (household income levels ≤ \$80,000, highest parental education level of an associate degree or less).
- In terms of the relative differential prediction of HSGPA, SAT sections, and their combination:
 - Using HSGPA alone yielded the least differential prediction across genders and best spoken language groups;
 - Using HSGPA and SAT yielded the least differential prediction across racial / ethnic identities; and
 - Using SAT sections alone yielded the least differential prediction across household income and parental education levels.

Appendix A.

Institutions Providing First-Year Outcomes Data for the 2011 Cohort

Institution Name	
Albany College of Pharmacy and Health Sciences	Indiana University-Purdue University, Indianapolis
Appalachian State University	Indiana Wesleyan University
Austin College	John Brown University
Baldwin Wallace University	John Carroll University
Barnard College	Lafayette College
Boston College	Lasell College
Boston University	Lawrence University
Brandeis University	Linfield College
Caldwell College	Long Island University, Brooklyn
Case Western Reserve University	Long Island University, C. W. Post
Chapman University	Longwood University
Claremont McKenna College	Lycoming College
Clemson University	Marywood University
Coastal Carolina University	Meredith College
Colorado Mesa University	Messiah College
Cornell College	Miami University, Oxford
Daemen College	Missouri State University
Dominican University of California	Moravian College
Drexel University	Mount St. Mary's University
Earlham College	Norfolk State University
East Carolina University	North Carolina A&T State University
Eastern Connecticut State University	North Carolina State University
Eastern University	North Georgia College & State University
Eastern Washington University	Northwestern University
Elms College	Pennsylvania College of Technology
Emory University	Pepperdine University
Florida State University	Philadelphia University
Fordham University	Portland State University
Framingham State University	Presbyterian College
Furman University	Purdue University
Georgia Institute of Technology	Quinnipiac University
Georgia Southern University	Randolph-Macon College
Gonzaga University	Rhode Island College
Grinnell College	Saint Anselm College
Indiana University, Bloomington	Seton Hill University
Indiana University, East	Shenandoah University
Indiana University, Kokomo	Siena College
Indiana University, Northwest	Smith College
Indiana University, South Bend	Southern Connecticut State University
Indiana University, Southeast	Southern Methodist University

Note: The remaining 69 institutions are listed on the following page.

Appendix A. (continued)

Institution Name	
St. Edward's University	University of San Francisco
St. John Fisher College	University of Southern California
St. Michael's College	University of Southern Indiana
State University of New York, New Paltz	University of Texas at Austin
Stephen F. Austin State University	University of Texas at Dallas
Stetson University	University of Texas-Pan American
Stonehill College	University of Utah
Syracuse University	Vanderbilt University
Texas A&M International University	Virginia Wesleyan College
Texas A&M University	Washington State University, Pullman
Texas Christian University	Washington State University, Vancouver
Texas State University, San Marcos	West Chester University
Texas Woman's University	Western Washington University
The Ohio State University, Columbus Campus	Wheaton College (Illinois)
The Pennsylvania State University	Whittier College
Transylvania University	Wilkes University
University of California, Santa Cruz	Willamette University
University of Cincinnati	Wingate University
University of Dayton	Institution A
University of Delaware	Institution B
University of Denver	Institution C
University of Georgia	Institution D
University of Houston	Institution E
University of Illinois, Urbana-Champaign	Institution F
University of Iowa	Institution G
University of Mary Hardin-Baylor	Institution H
University of Mary Washington	Institution I
University of Massachusetts Dartmouth	Institution J
University of North Carolina at Greensboro	Institution K
University of North Texas	Institution L
University of Oregon	Institution M
University of Portland	Institution N
University of Puget Sound	Institution O
University of Rhode Island	Institution P
University of Richmond	

Note: The remaining 80 institutions are listed on the previous page. There were 16 institutions that wished to remain anonymous, hence the listing of Institutions A through P.

Appendix B.

Raw Correlations of SAT and HSGPA with FYGPA by Institutional Characteristics

Institutional Characteristic	k	n	SAT-CR	SAT-M	SAT-W	SAT*	HSGPA	SAT*, HSGPA	
Control	Private	81	58,411	.33	.30	.37	.40	.37	.49
	Public	68	148,433	.26	.27	.32	.34	.33	.43
Admittance	Under 50%	34	49,522	.31	.28	.35	.38	.30	.44
Rate	50 to 75%	84	131,711	.27	.27	.33	.35	.35	.44
	Over 75%	31	25,611	.29	.28	.35	.37	.40	.47
Undergraduate	Small	30	9,137	.37	.34	.42	.45	.44	.54
Enrollment	Medium	61	40,043	.28	.26	.34	.36	.37	.46
	Large	26	50,257	.28	.28	.33	.36	.35	.45
	Very Large	32	107,407	.28	.27	.33	.35	.32	.43
Overall		149	206,844	.28	.28	.34	.36	.34	.45

Note: *k*: number of institutions, *n*: subgroup sample size. *: SAT refers to the inclusion of all three sections in the relevant multiple correlation. The correlations were corrected for restriction of range within institutions and pooled. Undergraduate enrollment was categorized as follows: small: 750 to 1,999; medium: 2,000 to 7,499; large: 7,500 to 14,999; and very large: 15,000 or more. For restriction of range corrected correlations by institutional characteristics, see Table 6.

Appendix C.

Raw Correlation of SAT Scores and HSGPA with FYGPA by Subgroups

Student Characteristic		<i>k</i>	<i>n</i>	SAT-CR	SAT-M	SAT-W	SAT*	HSGPA	SAT*, HSGPA
Gender	Male	145	92,780	.26	.29	.30	.34	.33	.43
