CCMH: Bringing Science and Practice Together

INTRODUCTION AND ORIENTATION

College student mental health received widespread attention during the 2014-2015 academic year with in-depth commentary appearing in numerous major media outlets. These articles examined college student mental health from various perspectives including the experiences of students and parents, counseling centers, the rise of anxiety in higher education, suicide prevention, and even the role of mental health in campus tragedies. Each of these articles raised a predictable set of questions: “Is the demand for mental health services really growing?”, “Are students really more distressed?”, “How are students more distressed?”, and of course, “Why?”

While it can be tempting to pursue quick answers that complement a headline, the frank reality is that the mental health of our college students is multi-faceted, multi-modal, and complexly embedded in overlapping macro/micro cultures; there is no simple answer. However, this year’s report, summarizing five years of high quality and generalizable trend data, sheds some much needed light on these complex questions and offers helpful information for administrators, policy-makers, clinicians, and researchers to consider at each of their unique institutions.

This 2015 Annual Report summarizes data contributed to CCMH during the 2014-2015 academic year, closing on June 30, 2015. De-identified data were contributed by 139 college and university counseling centers, describing 100,736 unique college students seeking mental health treatment, 2,770 clinicians, and over 770,000 appointments.

The following are critical to understand when reading this report:

- 1) **This report describes college students receiving mental health services, NOT the general college student population.**
- 2) This report is not a survey. The data summarized herein is gathered during routine clinical practice at participating counseling centers, is de-identified, and then contributed to CCMH.
- 3) The number of clients will vary by question because not all questions are asked at each center.
- 4) Counseling center members, that contributed data for this report, received IRB approval at their institution.

Standardized Data Set (SDS) and the Counseling Center Assessment of Psychological Symptoms (CCAPS)

The data within this report is made possible by standardized data embedded within electronic medical records (EMR). The SDS is a large collection of standardized questions, answers, and instruments that CCMH makes available to participating counseling centers through EMR vendors. The SDS has been collaboratively designed over time by hundreds of counseling centers and the CCMH Advisory Board, starting in 2006. Use of the SDS enables counseling centers to gather standardized data during routine clinical practice, which can then be contributed to CCMH for this annual report. The most up-to-date SDS definitions are available at <https://ccmh.psu.edu>.

The CCAPS is a standardized multi-dimensional psychometric instrument designed by/for counseling centers that is used for initial assessment and outcome monitoring. The 2015 CCAPS was released in June 2015 with a new normative sample of more than 230,000 students in treatment, a graphical layout, average dose/response curves, clinician alerts, and much more. The CCAPS is available to counseling centers via four electronic medical record (EMR) systems including Titanium Schedule, Medicat, Point and Click, and Pyramed. In addition, the 2015 CCAPS is now available via a dedicated web-interface for both counseling centers that do not use an EMR and those that utilize an unsupported EMR. Please email ccmh@psu.edu for more information about the CCAPS, the CCAPS User Manual, or online training webinars.

Accessing CCMH Data – The New CCMH Data Navigator

For many years, a key goal of CCMH has been to give data back, in an actionable form, to counseling center members, higher education, and the general public. After many years of exploring different strategies that did not work, this goal was finally realized in the fall of 2015 with the brand new CCMH Data Navigator. (We are thankful to the Healthy Minds Study at the University of Michigan for their help and support in this project!)

This year’s data, along with prior years, are now available to members and the general public online via the CCMH Data Navigator. Participating centers will be able to track their data over time and benchmark with other schools. In addition, CCMH is now making aggregate data available to the general public for the purpose of informing the

national discussion on college student mental health with high-quality generalizable data about students seeking mental health services. The CCMH Data Navigator allows the user to examine specific data points over time and to examine any given data point via a wide range of demographic variables.

The CCMH Data Navigator can be found online here: <http://ccmh.psu.edu/data/>

2015 Report Highlights

The 2015 Annual Report represents a decade of work for CCMH and the hundreds of participating counseling centers. In addition to describing more than 100,000 college students seeking mental health services in 2014-2015, this year's report also summarizes mental health trends across five full academic years (2010-2011 through 2014-2015). The following list highlights a number of the key findings in this year's report. Please note that these findings refer to students seen in counseling centers, unless otherwise specified:

1. A supplemental survey of CCMH members in 2015 examined change in institutional enrollment and counseling center utilization over the last 6 years (2009-2010 through 2014-2015). Data from 93 institutions showed, on average, the growth in number of students seeking services at counseling centers (+29.6%) was more than 5x the rate of institutional enrollment (+5.6%). Further, the growth in counseling center appointments (+38.4) is more than 7x the rate of institutional enrollment. (see page 7)
2. The lifetime prevalence rates for prior mental health treatment have remained quite stable over the past five years including prior counseling (1 in 2), prior psychiatric medications (1 in 3), and prior psychiatric hospitalizations (1 in 10). Although these rates are high and should be of concern, the stability of these indices suggest that the rates of prior treatment are not changing and therefore unlikely to be the cause of the increased demand for services. (see page 5)
3. Some types of self-reported distress (measured by the CCAPS) and mental health history variables (measured by the SDS) have remained very stable or even decreased slightly over the last five years, including CCAPS Subscale Scores on Academic Distress, Eating Concerns, Hostility (i.e., frustration), Substance Abuse, Family Distress, as well as SDS variables of prior treatment for drugs and alcohol and lifetime prevalence rates of harassment/sexual assault. (see page 6 for CCAPS and page 5 for SDS)
4. Three types of self-reported distress have demonstrated slow but consistent growth over the past five years including: Depression, Anxiety, and Social Anxiety. In comparison to areas of distress that are flat or decreasing, this finding indicates that college students are reporting increasing levels of distress, and that these specific areas parallel the most common presenting concerns, Depression and Anxiety, as determined by clinicians. (see page 6)
5. The lifetime prevalence rate for non-suicidal self-injury (NSSI) has increased slowly but steadily over the last five years from 21.8% to 25.0% (see page 5). While NSSI does not always represent imminent threat to self, it is usually evidence of poor coping or difficulty with coping and can be disruptive to the campus community.
6. The lifetime prevalence rate for serious suicidal ideation (i.e., "I have seriously considered suicide") has increased substantially over the last 5 years from 23.8% to more than 32.9% (see page 5). This is a considerable change, especially in the context of other indices that are decreasing, flat, or increasing only slightly.
7. Among those who endorsed a history of serious suicidal ideation, the frequency of serious suicidal ideation occurrence within the last month also increased annually over the last three years from 7.2% in 2013 to 8.3% (this item was new in 2012). (see page 5)
8. The lifetime prevalence rate for "attempted suicide" has remained relatively flat for the last five years. (see page 5)
9. The lifetime prevalence rates for (a) thoughts of harming others and (b) causing serious harm to others have remained low and stable over 5 years. (see page 5)
10. Students who endorse mental health histories involving "threat to self" thoughts and behaviors (NSSI, serious suicidal ideation, or suicide attempts) use an average of 27% more appointments than students who do not. (see page 9)
11. 20% of students seen in counseling centers utilize more than 50% of all appointments. (see page 9)

Discussion of 2015 Highlights

Hundreds of university and college counseling centers have collaborated with CCMH over the last decade to build a practice-research-network (PRN) focused on the goal of accurately describing trends in college student mental health using high quality and representative data. The 2015 Annual Report realizes this ambitious goal with five-year trend data representing hundreds of institutions. The goal of this section is to explore and interpret the complex data resulting from these efforts.

First, the highlighted findings make it clear that many aspects of college student mental health have actually been stable over the past five years. For example, rates of prior mental health treatment, some types of mental health distress reported by students, and the frequency with which students report thoughts of hurting others (or having hurt another) have all remained essentially flat. These same students have expressed slightly increasing levels of depression and anxiety (see CCAPS Trends), but the increases are small. The relative stability of these variables does not decrease their significance (e.g., 10% of students in counseling centers report a prior psychiatric hospitalization), but it does help to clarify that some aspects of college student mental health are not “getting worse.”

In contrast, a sub-group of mental health variables have demonstrated worrisome increases over the last five years, making it clear that some specific aspects of college student’s mental health are changing and in need of focused consideration. For example, the average demand for counseling center services grew at least 5x faster than average institutional enrollment. In addition, the last five years of data suggest that students seeking services are more likely to endorse “threat to self” indicators such as serious suicidal thoughts and self-injurious behaviors, both of which increase the urgency for everyone involved. Finally, this year’s report finds that the growing percentage of students with “threat to self” indicators are provided with nearly 30% more services. Collectively,

these three trends represent a perfect storm for college counseling centers. Thus many will now ask, “Why is this happening?”

Theories have abounded in recent years to explain the growth of mental health concerns in college ranging from parenting styles to lack of resilience or coping skills. While all of these theories may have value, it is important to test theories with data. An additional theory, which can be examined with our data, is that a myriad of large-scale intervention efforts and institutional changes have had a cumulative and measurable impact in higher education over the last ten years. Indeed, this theory would contend that some of the five-year trends observed in this year’s report are intended outcomes.

While there is no clear starting point, the Garrett Lee Smith Memorial Act (GLSMA) was signed into law in 2004 by the US Congress to reduce the incidence of suicide among college students. Subsequent to this event, tens of millions of dollars were invested in higher education by a wide variety of funders with goals including: suicide prevention, educating campus communities about mental health, reducing stigma, increasing help seeking, and improving the ability of community members (faculty, staff, and students) to identify students-at-risk and refer them for treatment. During this same period, annual surveys of college student’s mental health have become commonplace, potentially impacting student’s knowledge, attitudes, and behavior. Finally, institutionally coordinated behavioral-threat and care-teams have become the accepted gold standard of practice in higher education. The common goal of these efforts is to improve our collective ability to identify students-at-risk in order to refer them to treatment. If these collective efforts have been cumulatively successful, they should hypothetically produce a measurable increase in both the overall demand for mental health services and the percentage of students in treatment who represent risk. While there are many findings in the 2015 report, and many potential interpretations, the

data support this hypothesis rather well. For example, the frequency that students in treatment report having “seriously considered suicide” has increased by 38% in the last five years (relative increase). This change stands out in a field of trends that are generally flat or changing only slightly. It also seems more plausible that this trend resulted from a decade of interventions focused on this very outcome rather than a sudden national decline in student’s resilience. Given the apparent alignment between theory, intervention, and data, it seems reasonable to pause and review our interpretation of, and response to, mental health concerns in higher education.

The findings in this year’s report strongly suggest that a decade of efforts, aimed at building communities that are responsive to the mental health concerns of at-risk students, have been successful and that counseling centers are now bearing a heavy burden from this success. Consequently, it is now imperative that institutions of higher education take action to accommodate the increase in demand for mental health services that we have all worked so hard to create.

2014-2015 Publications and Presentations

Since our founding in 2004, CCMH has operated as a practice-research network (PRN) conducting practice-oriented research (POR) by actively integrating the interests of practitioners, researchers, and administrators to achieve a wide variety of goals that are beneficial to the field.

Over the past year, CCMH has been specifically addressing the scientist-practitioner gap through client-focused research, which is one approach within POR. Client-focused research promotes the careful assessment and tracking of client’s progress in treatment, and also provides empirically validated feedback to therapists to augment their clinical practice. The 2015 CCAPS profile report exemplifies this type of practice oriented research.

CCMH also continues to conduct research that is empirically rigorous and clinically valid. For example, Xiao et al. (2015) recently examined therapist differences in attendance and drop out rates. Janis et al. (2015) explored different methods for calculating the average change curve and feedback provision that were included in the 2015 CCAPS profile report. Youn et al. (2015) sought to understand therapist differences in clients’ outcome across the different CCAPS subscales.

CCMH is excited to share the following POR publications and presentations from the past academic year:

- Castonguay, L. G., & Muran, J. C. (2015). Fostering collaboration between researchers and clinicians through building practice-oriented research: An introduction. *Psychotherapy Research, 25*, 1-5.

- Castonguay, L. G., Youn, S., Xiao, H., Muran, J. C., & Barber, J. P. (2015). Building clinicians-researchers partnerships: Lessons from diverse natural settings and practice-oriented initiatives. *Psychotherapy Research, 25*(1), 166-184.
- Hayes, J. A., McAleavey, A. A., Castonguay, L. G., & Locke, B. D. (in press). Psychotherapist effects with White and racial/ethnic minority clients: First, the good news. *Journal of Counseling Psychology*.
- Janis, R., Youn, S., Xiao, H., Castonguay, L. G., Hayes, J. A., & Locke, B. D. (2015, June). Comparison of expected treatment response and nearest neighbor methods for generating expected recovery curves. Paper presented as part of a panel at the 2015 Society for Psychotherapy Research (SPR), 46th International meeting, Philadelphia, PA.
- McAleavey, A. A., Lockard, A. J., Castonguay, L. G., Hayes, J. A., & Locke, B. D. (2015). Building a practice-research network: Obstacles faced and lessons learned at the Center for Collegiate Mental Health. *Psychotherapy Research, 25*, 134-151.
- Nordberg, S. S., Castonguay, L. G., McAleavey, A. A., Locke, B. D., & Hayes, J. A. (Accepted for publication). Enhancing feedback for clinical use: Creating and evaluating profiles of clients seeking counseling. *Journal of Counseling Psychology*
- Ratanasiripong, P., Wang, C. D. C., Ratanasiripong, N., Hayes, J. A., Kaewboonchoo, O., & Kathalae, D. (2015). Development and cross-cultural validation of the Counseling Center Assessment of Psychological Symptoms—Thai version. *The Counseling Psychologist, 43*, 248-271.
- Xiao, H., Youn, S., Janis, R., Hayes, J. A., Castonguay, L. G., & Locke, B. D. (2015, June). The unpredictable client: Therapist differences in client early attendance and dropout. Paper presented as part of a panel at the 2015 Society for Psychotherapy Research (SPR), 46th International meeting, Philadelphia, PA.
- Youn, S., Castonguay, L. G., Xiao, H., Janis, R., McAleavey, A. A., Lockard, A. J., Locke, B. D., & Hayes, J. A. (2015). The Counseling Center Assessment of Psychological Symptoms (CCAPS): Merging clinical practice, training and research. *Psychotherapy*
- Youn, S., Xiao, H., Janis, R., Castonguay, L. G., Hayes, J. A., & Locke, B. D. (2015, June). Therapist effects in naturalistic settings. Paper presented as part of a panel at the 2015 Society for Psychotherapy Research (SPR), 46th International meeting, Philadelphia, PA.

Mental Health Trends

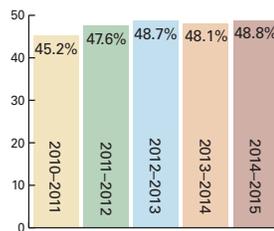

To examine five-year mental health trends among college students in treatment, the following items were simplified to “Yes” or “No”, providing the life-time prevalence of each item.

(NOTE: Some items have changed slightly over time. Items with an asterisk (*) had an answer format change between 2011-2012 and 2012-2013.)

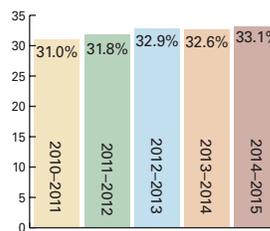

Data Sets

Year	# of Institutions	# of Clients
2010-2011	97	82,611
2011-2012	120	97,012
2012-2013	132	95,109
2013-2014	140	101,027
2014-2015	139	100,736

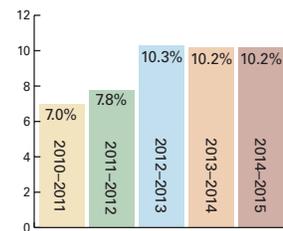

Attended counseling for mental health concerns

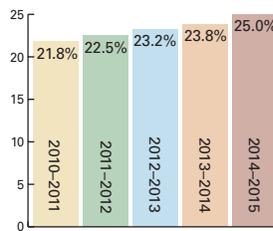

Taken a medication for mental health concerns

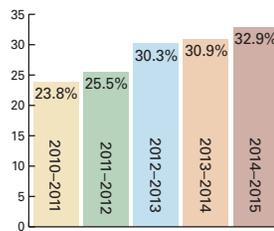

Been hospitalized for mental health concerns*

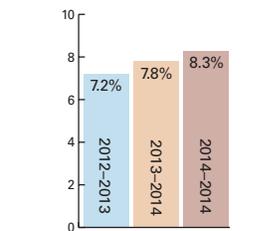

Purposely injured yourself without suicidal intent (e.g., cutting, hitting, burning, hair pulling, etc.)*

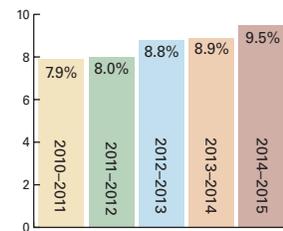

Seriously considered attempting suicide*

Seriously considered attempting suicide (Last time = within the last month or sooner):

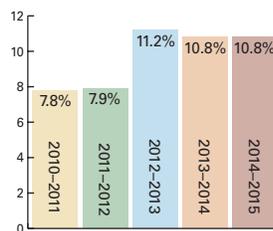

Made a suicide attempt*

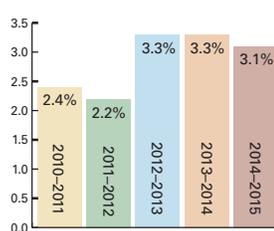

NOTE: New question in 2012.

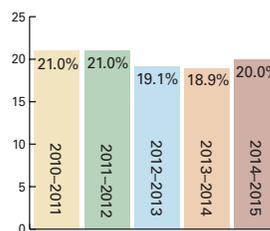

Considered seriously hurting another person*

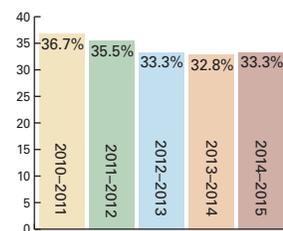

Intentionally caused serious injury to another person*

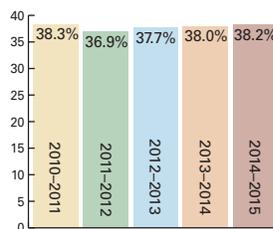

Had unwanted sexual contact(s) or experience(s)*

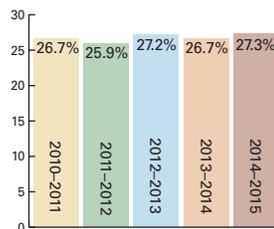

Experienced harassing, controlling, and/or abusive behavior from another person (e.g., friend, family member, partner, authority figure, etc.)*

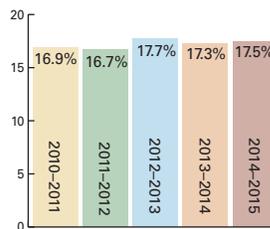

Experienced a traumatic event that caused you to feel intense fear, helplessness, or horror*

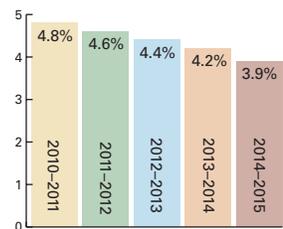

Felt the need to reduce your alcohol or drug use*

Others have expressed concern about your alcohol or drug use*

Received treatment for alcohol or drug use*

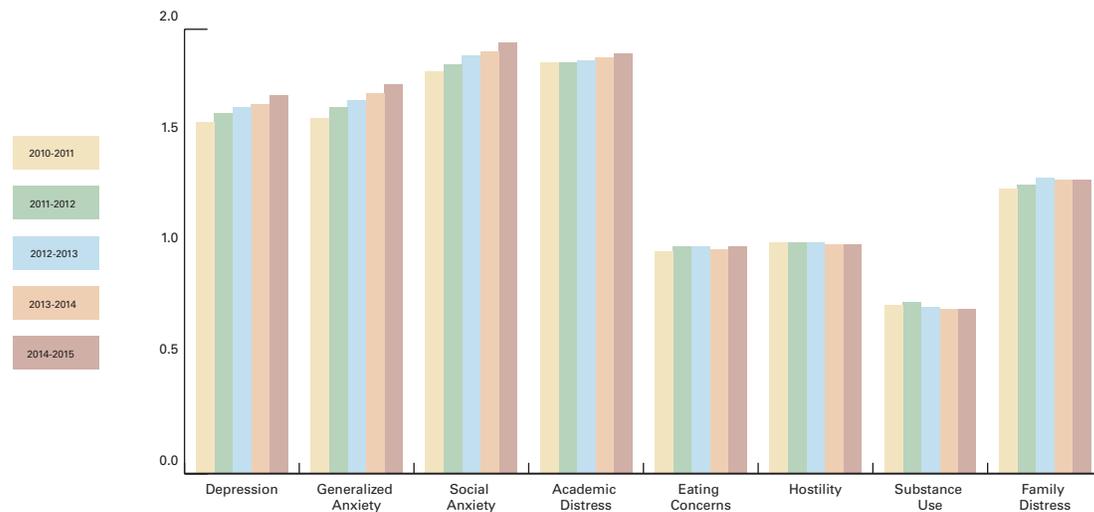

CCAPS Trends

The Counseling Center Assessment of Psychological Symptoms (CCAPS) is a multi-dimensional assessment and outcome monitoring instrument used by members of CCMH. The 2015 CCAPS was released in June of 2015 and includes two versions: the CCAPS-62 (62 items, 8 subscales) and the CCAPS-34 (34 items, 7 subscales). Both the CCAPS-62 and CCAPS-34 also include the Distress Index, an overall measure of a client's general psychological distress using items from several CCAPS subscales. Students respond to the items on a 5-point likert scale from 0 (Not at all like me) to 4 (Extremely like me).

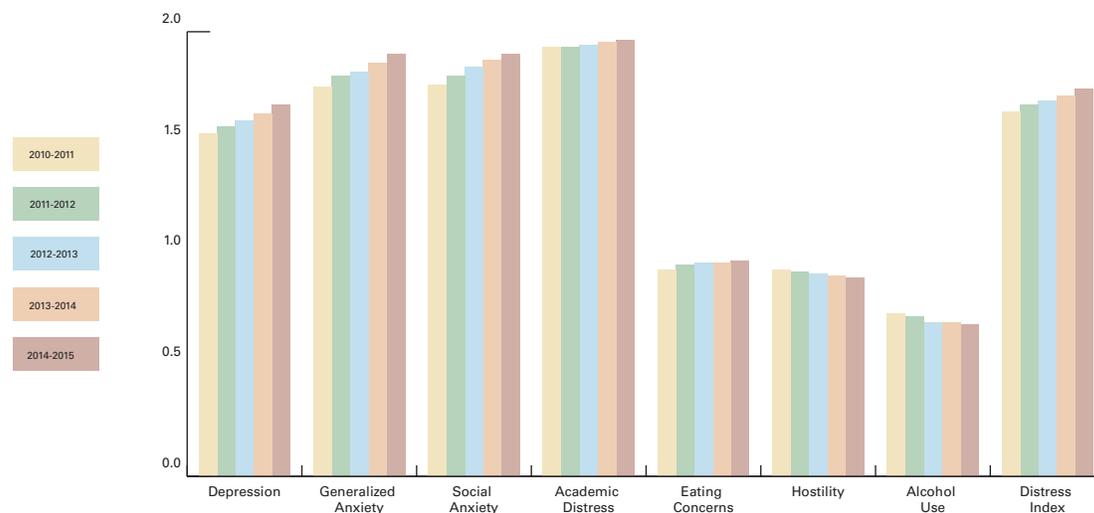

To explore whether student self-reported distress is changing over time, we examined the average raw subscale scores over the last five years for both the CCAPS-62 and the CCAPS-34. The charts below indicate that the average raw scores have gradually increased for Depression, Generalized Anxiety, and Social Anxiety. On the other hand, flat or decreasing raw scores are noted for Academic Distress, Eating Concerns, Hostility (i.e., frustration), Substance/Alcohol Use, and Family Distress.

These findings indicate that not all areas of student distress are worsening and some may even be decreasing. However, Depression, Generalized Anxiety, and Social Anxiety are showing slight but consistent increases. These increases are consistent with the most common presenting concerns in counseling centers. (see CLICC-Check All That Apply, page 11)

CCAPS-62 Trends: Average Raw Subscale Scores (2010 to 2015)

CCAPS-34 Trends: Average Raw Subscale Score (2010 to 2015)

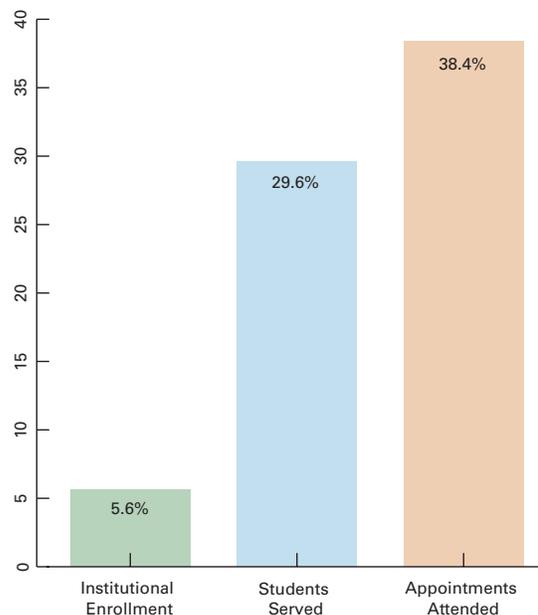

Changes in Counseling Center Utilization from 2009-2010 to 2014-2015

It is widely believed that the demand for mental health services in college is growing at an unprecedented pace. This belief is based on widespread anecdotal reports from clinicians, student surveys, surveys of counseling center directors, and a handful of data-driven reports from individual counseling centers.

To examine this question systematically from a national perspective, CCMH conducted a supplemental membership survey in November 2015 that asked counseling centers to provide the following specific data points over the last five academic years between 2009-2010 and 2014-2015: (1) total institutional enrollment during the Fall semester, (2) total number of students seeking services at the counseling center, and (3) the total number of attended appointments in the counseling center. Ninety-three CCMH members (out of a total of 120 responses) were able to provide complete data for both 2009-2010 and 2014-2015 academic years. These 93 cases were used for the following five-year trend analysis.

The number of enrolled students, students seeking counseling services, and attended appointments were averaged across institutions, and the percentage of change was calculated for each data point. Results indicated that, on average over the last 5 years, institutional enrollment grew by 5.6%, the number of students seeking services increased by 29.6%, and the number of attended appointments increased by 38.4%. In other words, the number of students treated by counseling centers grew at more than 5x the rate of institutional enrollment and the number of attended appointments grew at more than 7x the pace of institutional enrollment. To check for the influence of outliers (schools with dramatic and unusual growth or loss), the three top/bottom schools with greatest growth/greatest loss were removed and analyses were re-run. Results shifted only slightly, indicating that the results were not dramatically skewed by individual schools with dramatic and unusual change. Descriptive statistics (pg. 8) indicate a wide range of sizes, utilization rates, and change rates.

Change Rates between 2009-2010 and 2014-2015 for Counseling Centers and Institutions (N=93)

Descriptive Statistics Table (N=93)

	Minimum	Maximum	Mean	Std. Deviation
Institutional Enrollment	946	60,821	19,506.4	13,384.1
Students Served	222	4,525	1,529.9	1,099.3
Appointments Attended	411	30,656	7,716.5	6,053.6
2014 Utilization (% of student body served in the counseling center)	1.3%	26.3%	9.5%	4.9%
Change in Institutional Enrollment	-22.2%	37.1%	5.9%	10.4%
Change in Students Served	-15.9%	210.1%	31.8%	31.4%
Change in Appointments Attended	-30.9%	363.5%	44.3%	46.3%
Change in Utilization	-20.4%	212.2%	24.9%	29.3%

These results indicate that the demand for counseling center services is dramatically outpacing the growth of institutional enrollment. While this survey did not examine staffing level changes over time, we know that it is rare for counseling centers to experience a 30% increase in staffing in just five years, and that most counseling centers did not meet the IACS-recommended paid staff-to-student ratios in 2009 (see the 2010 AUCCCD Survey). A number of conclusions can be drawn from these survey results:

- 1) A hypothetical average counseling center that met IACS recommended staff-to-student ratios in 2009, and also received consistent annual funding increases tied to enrollment growth based on a known historical utilization rate, would be substantially understaffed five years later in 2014.
- 2) The average increase in demand for services, without commensurate increases in resources, will make it difficult to provide responsive mental health services. Counseling centers that have not been equipped to respond to this trend may have to reduce other critical services such as education and training of campus stakeholders, consultation services for faculty and staff, participation in research, treating students with less severe concerns, and the training of future mental health providers.
- 3) These results suggest that institutions should evaluate funding decisions based on observed clinical demand (the number/rate of students seeking services) rather than historical patterns of utilization that may no longer be reliable.
- 4) Counseling center utilization is likely to increase even when institutional enrollment decreases.
- 5) The average relationship, across 93 institutions, between student change in enrollment and change in students served in the counseling center was 1-to-5. In other words, between 2009-2010 and 2014-2015, a 1% increase in institutional enrollment was associated with a 5% increase in the number of students served in the counseling center.

Counseling Center Resource Utilization by Students

One way to inform allocation of resources within centers is to examine how counseling center services are being used. With this in mind, 2014-2015 data was examined to determine how resources are distributed among students seeking services. The following points describe how various types of counseling center appointments are utilized by students across participating centers in 2014-2015:

- One (1) is the most common number of appointments per client/per year.
- Clients averaged 5.86 appointments with a range of 1-117 appointments.
- 20% of clients accounted for over 50% of all appointments.
- 10% of clients accounted for 36% of all appointments, averaging 20.96 appointments.
- 5% of clients accounted for 23% of all appointments, averaging 26.14 appointments.
- 1% of clients accounted for 6.5% of all appointments, averaging 38.13 appointments.
- 10 clients utilized a total of 878 appointments.

Average Number of Attended Individual Sessions

A common question among counseling centers is, “What is the average number of counseling sessions attended by clients?” To examine this question we reviewed the 2014-2015 appointment data for initial clinical evaluations and any individual counseling session:

- Total number of attended appointments (initial and individual counseling): 373,495
- Total number of clients who attended appointments in A: 79,331
- Average number of attended counseling sessions per client (A divided by B): 4.71

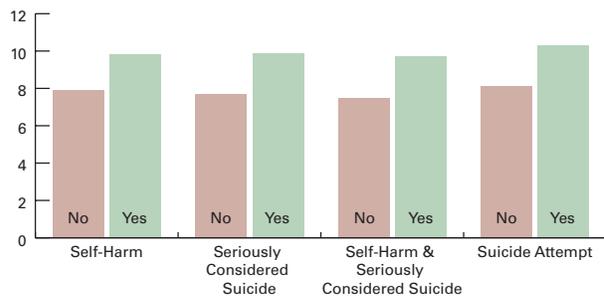

This preliminary analysis, of actual appointment attendance data across 139 institutions and approximately 370,000 appointments, indicates that clients attend slightly less than 5 sessions of individual counseling on average (including an intake, but excluding other types of appointments).

Impact of “Threat to Self” History on Appointment Usage

To explore whether the growing levels of non-suicidal self-injury (NSSI) and serious suicidal ideation (see MH Trends) are having a clinical impact on counseling centers, we compared the total number of appointments (of any attendance value) for clients who endorsed these indicators and those who did not using five years of combined appointment data from 2010 through 2015.

Average number of appointments for clients with and without a history of “threat to self” thoughts and behaviors.

This graph illustrates that students with a history of “threat to self” thoughts or behaviors use an average of 27% more services than students who do not.

Standardized Data Set (SDS)

The Standardized Data Set (SDS) is a set of standardized materials used by counseling centers during routine clinical practice. The SDS contains 8 major sections, which include demographic questions, background information, and instruments that collect information related to the treatment provided to students receiving services. These sections include:

Demographics:

Client Information
Provider Data
Center Information
Participating Institutions

Instruments:

Clinician Index of Client Concerns
Critical Incident Form
Termination Form
CCMH Appointment Categories

The following sections of this report summarize the SDS data collected in 2014-2015. Please note that five of the SDS sections are included within the 2014-2015 data set. The Termination Form was implemented July 2015 and will be included in next year's report.

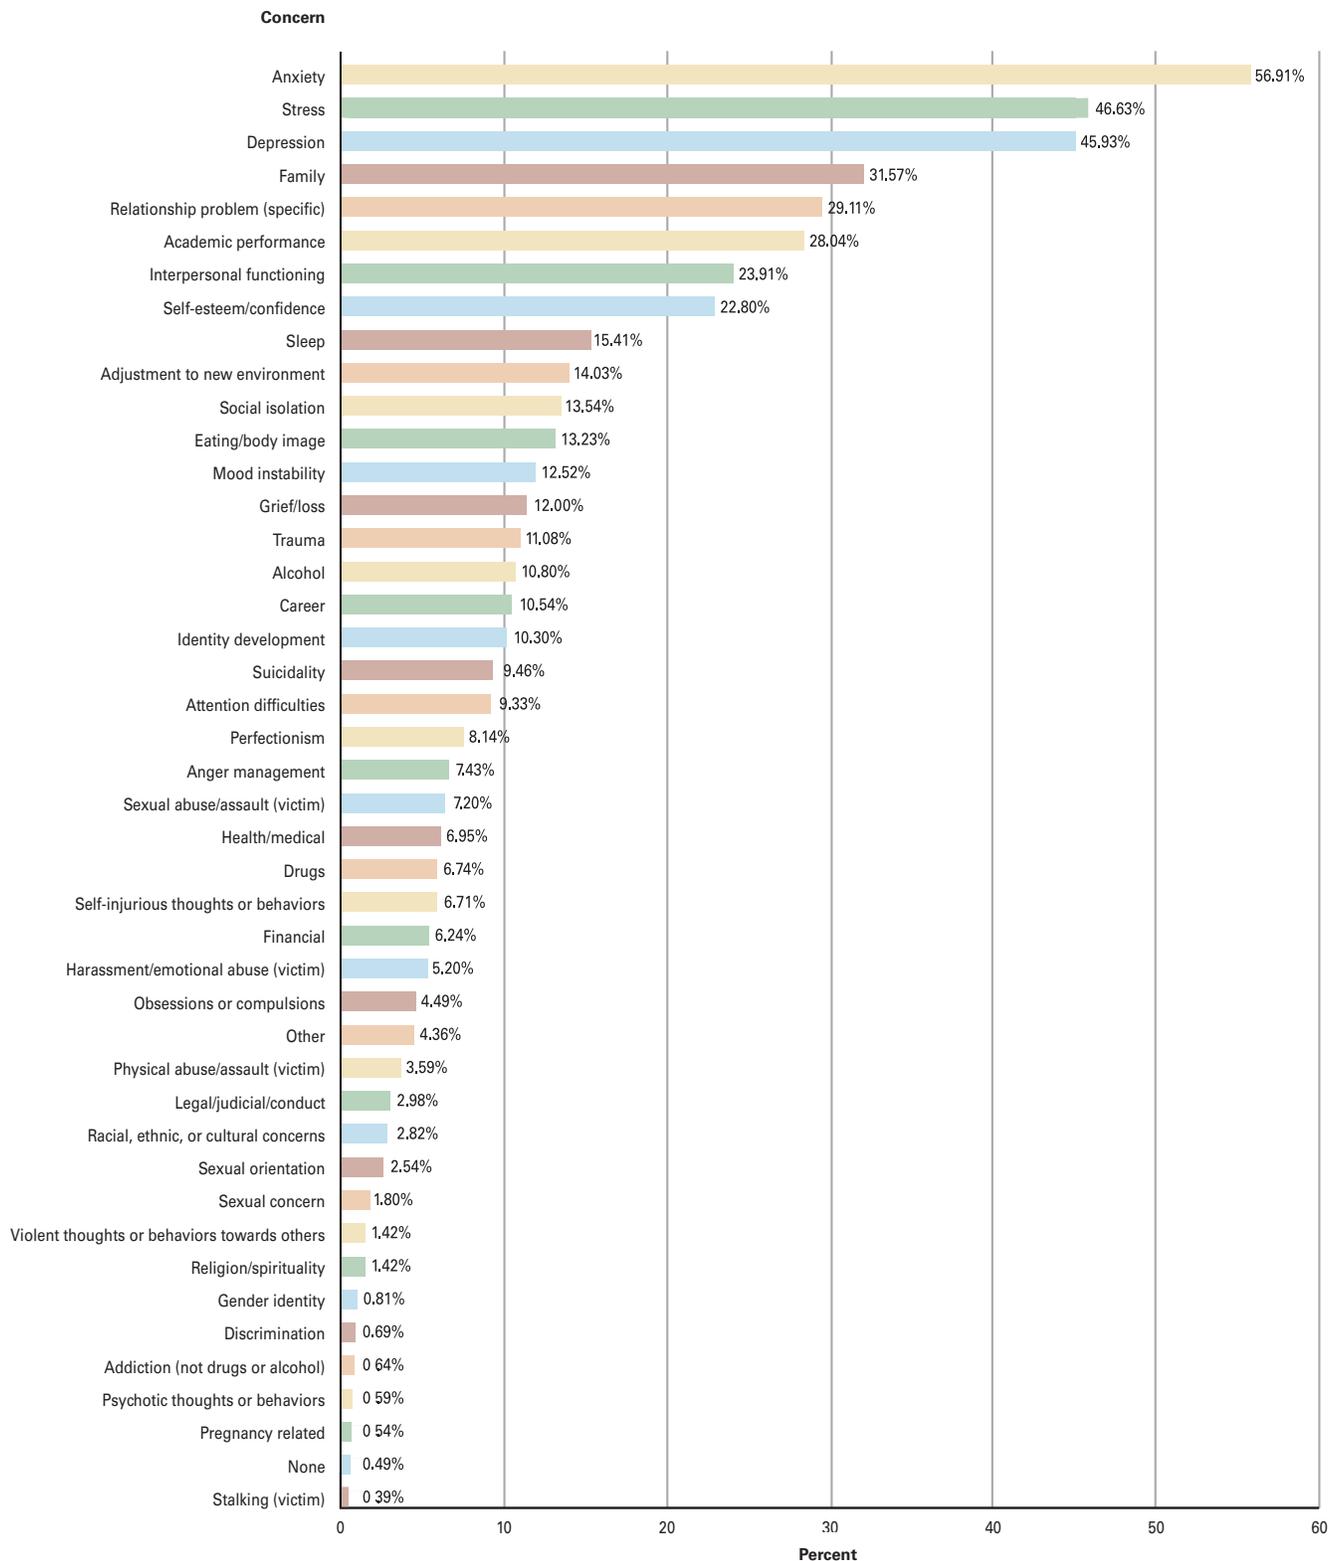

Clinician Index of Client Concerns (CLICC)

The CLICC was designed by CCMH to capture and facilitate reporting on the most common presenting concerns of counseling center clients, as assessed by the clinician, at the point of “intake”, or equivalent appointment. The resulting data enable individual centers, and CCMH, to quickly and easily report on the most common client concerns in addition to supporting a wide variety of research. The CLICC includes 44 concerns and asks the clinician to (a) check all that apply and (b) to identify the ‘top concern’ of those selected. This dual approach captures the complexity of each client while also highlighting the ‘primary’ concern of each individual client.

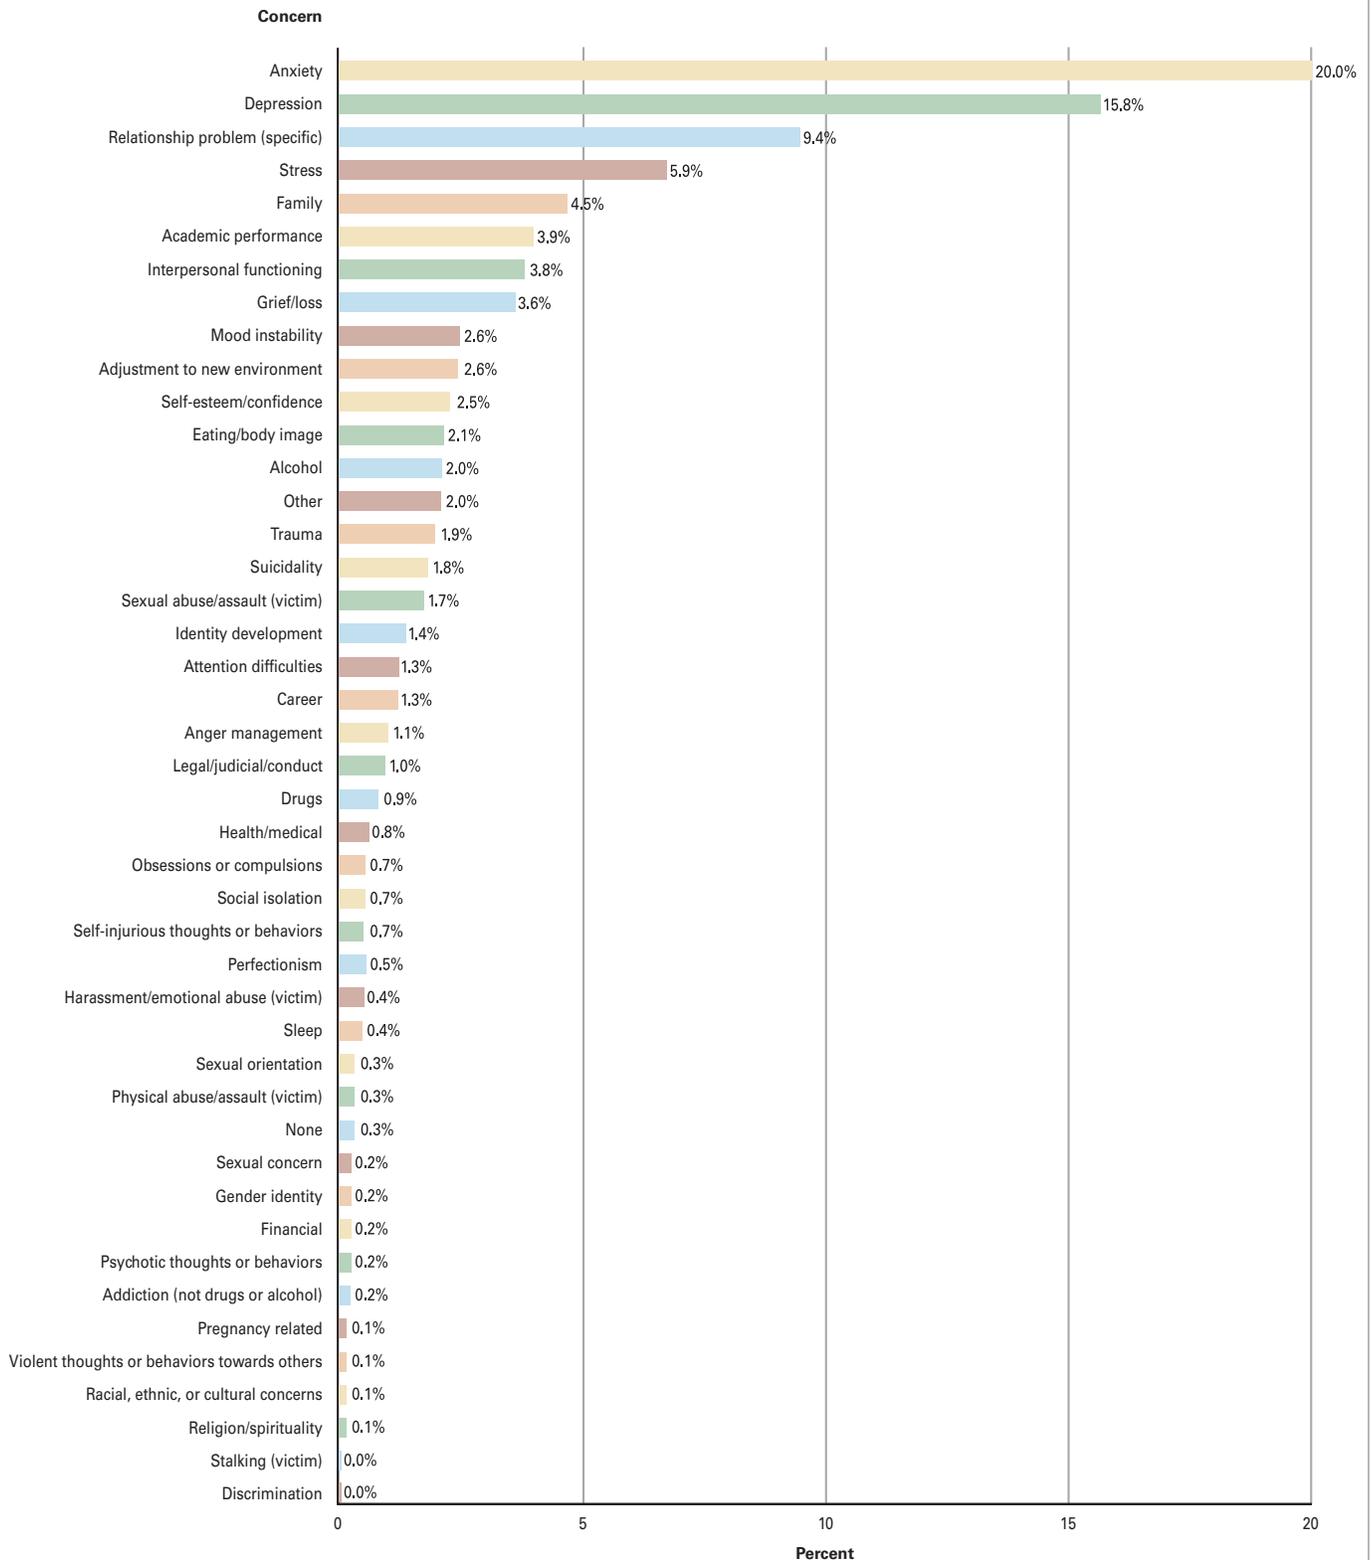

CLICC – “Check all that apply”

First, clinicians are asked to “check all that apply” for each client, such that one client can have many concurrent concerns. As a result, this chart illustrates how often each concern occurs across all clients, regardless of how many concerns a student had or what their top concern was (N=37,856).

CLICC – “Top-most concern”

For this question, clinicians are asked to choose one primary concern (i.e., the top-most concern) per client. As a result, clinicians are asked to choose one primary concern (i.e., the top concern) per client. As a result, this graph illustrates the frequency of each concern as the primary concern for clients (N=37,856).

Client Demographic Information

The SDS contains a number of “core” or required items and a larger number of optional items that are typically asked of students seeking services. Because centers can ask different questions, the total number of responses vary by question.

What is your gender identity?*

	<i>n</i>	Percentage
Woman	53,028	62.6
Man	30,676	36.2
Transgender	292	0.3
Self-Identify	699	0.8

This question is from the Standardized Data Set Question #88

What was your sex at birth?

	Overall (%) <i>n</i> =8,912	Male (%) <i>n</i> =2,939	Female (%) <i>n</i> =5,845	Transgender (%) <i>n</i> =34	Self-Identify (%) <i>n</i> =94

This question is from the Standardized Data Set Question #51

Have you ever served in any branch of the US military (active duty, veteran, National Guard or reserves)?

	Overall (%) n=80,827	Male (%) n=29,147	Female (%) n=50,720	Transgender (%) n=285	Self-Identify (%) n=675
Yes	1.7	3.1	0.9	2.5	1.5
No	98.3	96.9	99.1	97.5	98.5

This question is from the Standardized Data Set Question #98

Did your military experience include any traumatic or highly stressful experiences which continue to bother you?

	Overall (%) n=1,232	Male (%) n=807	Female (%) n=410	Transgender (%) n=5	Self-Identify (%) n=10
Yes	31.1	33.7	25.9	40.0	30.0
No	68.9	66.3	74.1	60.0	70.0

This question is from the Standardized Data Set Question #53

Provider Data

The Standardized Data Set includes some basic demographic information about providers at participating counseling centers. The 2014-2015 dataset represents over 2,771 unique providers. Answer totals vary by question since some counseling centers do not gather this data, or a counselor chose not to answer one or more questions.

Gender

	<i>n</i>	Percentage (%)
Male	263	30.7
Female	590	68.8
Transgender	2	0.2
Prefer not to answer	2	0.2

Age

	Age (years)	<i>n</i>
Average Age	43.1	782
Modal Age	32	35

Race/Ethnicity

	<i>n</i>	Percentage (%)
African-American/Black	68	8.0
American Indian or Alaskan Native	3	0.4
Asian American/Asian	58	6.9
Caucasian/White	619	73.3
Hispanic/Latino/a	51	6.0
Native Hawaiian or Pacific Islander	0	0.0
Multi-racial	29	3.4
Prefer not to answer	5	.6
Other	12	1.4

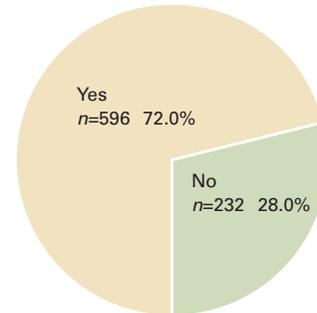

Highest Degree (descending sort)

	<i>n</i>	Percentage (%)
Doctor of Philosophy	320	37.6
Master of Arts	121	14.2
Doctor of Psychology	110	12.9
Master of Science	85	10
Master of Social Work	80	9.4
Doctor of Medicine	32	3.8
Bachelor of Arts	30	3.5
Master of Education	23	2.7
Doctor of Education	13	1.5
Other	12	1.4
Bachelor of Science	12	1.4
Nursing (e.g. RN, RNP, PNP)	5	0.6
Education Specialist	4	0.5
Doctor of Osteopathy	3	0.4

Highest Degree-Discipline (descending sort)

	<i>n</i>	Percentage
Counseling Psychology	304	36.1
Clinical Psychology	266	31.6
Social Work	88	10.5
Other	71	8.4
Counselor Education	54	6.4
Psychiatry	26	3.1
Marriage and Family Therapist	15	1.8
Community Psychology	6	0.7
Nursing	5	0.6
Educational Psychology	5	0.6
Higher Education	1	0.1
Health Education	1	0.1

Are you licensed under your current degree?

Position Type: (descending sort)

	<i>n</i>	Percentage (%)
Professional Staff Member	631	73.9
Pre-Doctoral Intern	67	7.8
Doctoral Level Trainee (not an intern)	48	5.6
Master's Level Trainee	39	4.6
Other	37	4.3
Post-Doctoral Level (non-psychiatric)	30	3.5
Psychiatric Resident	2	0.2

Center Information

The information below describes the 139 colleges and universities that contributed data to the 2014-2015 CCMH data set.

Does your counseling center currently have an APA accredited pre-doctoral training program?

	<i>n</i>	Percentage (%)
Yes	42	31.1
No	93	68.9

Is your counseling center currently accredited by IACS (International Association of Counseling Services)?

	<i>n</i>	Percentage (%)
Yes	65	48.1
No	70	51.9

Which services are integrated with your counseling center? (check all that apply)

	<i>n</i>	Percentage (%)
Career Services	13	9.6
Disability Services	7	5.2
Drug & Alcohol Treatment Program	39	28.9
Employee Assistance Program	2	1.5
Learning Services	4	3.0
Health Services	19	14.1
Testing Services	21	15.6
Other	13	9.6

What psychiatric services are provided by your center?

	<i>n</i>	Percentage (%)
None	40	29.9
Part time, in house	61	45.5
Full time, in house	13	9.7
Part time, off campus consultant	6	4.5
Other	14	10.4

Does your center have an annual individual psychotherapy limit?

	<i>n</i>	Percentage (%)
Yes	49	36.6
No	85	63.4

If you answered "yes" to session limit, please enter your individual psychotherapy session limit*

	<i>n</i>	Percentage (%)
8	2	4.1
10	9	18.4
12	20	40.8
14	2	4.1
15	6	12.2
16	4	8.2
17	1	2.0
18	1	2.0
20	3	6.1
24	1	2.0

*No school that provided information entered less than 7 sessions

Check each service for which you charge a standard fee (don't check services that are initially free—e.g., first 8 sessions)

	<i>n</i>	Percentage (%)
Intake	2	1.5
Individual Counseling	6	4.4
Group Counseling	6	4.4
Psychiatric Evaluation (initial meeting)	25	18.5
Psychiatric Follow-up (ongoing client)	25	18.5
Formal Assessment: Psychological	14	10.4
Formal Assessment: Career	12	8.9
Formal Assessment: Disability	5	3.7
Other	17	12.6

Institutional Data

Data for the 2014-2015 CCMH data set has been contributed by 139 colleges and universities that hold membership with CCMH. Demographics for these institutions are listed below.

Campus Characteristic	<i>n</i>	Percentage (%)
Type of Institution		
Public	85	63.0
Private	45	33.3
Combined	5	3.7
Location of Campus		
Northeast (CT, ME, MA, NH, NJ, NY, PA, RI, VT)	36	28.1
Midwest (IL, IN, IA, KS, MI, MN, MO, NE, ND, OH, SD, WI)	35	27.3
South (AL, AR, DE, DC, FL, GA, KY, LA, MD, MS, NC, OK, SC, TN, TX, VA, WV)	42	32.8
West (AK, AZ, CA, CO, HI, ID, MT, NV, NM, OR, UT, WA, WY)	15	11.7
Enrollment		
Under 1,500	4	3.0
1,501-2,500	12	8.9
2,501-5,000	14	10.4
5,001-7,500	12	8.9
7,501-10,000	15	11.1
10,001-15,000	20	14.8
15,001-20,000	16	11.9
20,001-25,000	16	11.9
25,001-30,000	6	4.4
30,001-35,000	10	7.4
35,001-40,000	3	2.2
40,001-50,000	5	3.7
50,001 and over	2	1.5

Campus Characteristic	<i>n</i>	Percentage (%)
Athletic Division		
None	9	6.8
Division I	75	56.8
Division II	22	16.7
Division III	26	19.7
Grade Scale		
0-4	132	97.1
1-5	0	0
0-100	2	1.5
Other	2	1.5
