## BCollegeBoard

## Validity of the SAT ${ }^{\circledR}$ for Predicting First-Year Grades: 2013 SAT Validity Sample

Jonathan Beard, associate psychometrician
Jessica Marini, associate research scientist

## Executive Summary

The continued accumulation of validity evidence for the intended uses of educational assessment scores is critical to ensuring that inferences made using the scores are sound. To that end, the College Board has continued to collect college outcome data to evaluate the relationship between SAT ${ }^{\circledR}$ scores and college success. This report provides updated validity evidence for using the SAT to predict first-year college grade point average (FYGPA) for the 2013 cohort. It is important to note that a redesigned SAT was launched in March 2016. All data and references in this document to the SAT refer to the version previous to the 2016 redesigned SAT.

Colleges and universities (henceforth, "institutions") provided data on the cohort of first-time, first-year students enrolling in the fall of 2013. The College Board combined those college outcomes data with official SAT scores and SAT Questionnaire response data, which included students' self-reported high school grade point average, among other things. In particular, 162 institutions provided data on 306,713 students, 221,485 of whom had complete data on high school grade point average (HSGPA); SAT critical reading (SAT-CR), mathematics (SAT-M), and writing (SAT-W) scores; and FYGPA.

As has been shown in previous research (Beard \& Marini, 2015; Kobrin, Patterson, Shaw, Mattern, \& Barbuti, 2008; Patterson, Mattern, \& Kobrin, 2009; Patterson \& Mattern, 2011; 2012; 2013a; 2013b), the multiple correlation of SAT section scores and HSGPA with FYGPA continues to be strong for the 2013 cohort ( $r=.61$ ). When compared with the correlation of HSGPA alone with FYGPA ( $r=.53$ ), the addition of the SAT section scores to HSGPA represented an increase ( $\Delta r=.08$ ) in the correlation with FYGPA. The patterns of differential validity by institutional and student characteristics and differential prediction by student characteristics for the 2013 cohort also follow the same general patterns, as has been shown in previous research (Beard \& Marini, 2015; Mattern, Patterson, Shaw, Kobrin, \& Barbuti, 2008; Patterson et al., 2009; Patterson \& Mattern, 2011; 2012; 2013a; 2013b).

Note that this statistical report is the latest in a series that provides SAT validity evidence. The results continue to add to the previously published reports (Beard \& Marini, 2015; Patterson, Mattern, \& Kobrin, 2009; Patterson \& Mattern, 2011; 2012; 2013a; 2013b). For further detail regarding the methods used, the original research reports are available (Kobrin, Patterson, Shaw, Mattern, \& Barbuti, 2008;

Mattern, Patterson, Shaw, Kobrin, \& Barbuti, 2008). For further details regarding the interpretation of validity research and a summary of recent SAT validity evidence, a validity primer (Shaw, 2015) and synthesis of validity research are available (Mattern \& Patterson, 2014).

About the College Board ..... 24

Table 1: Distribution of Institutional Characteristics

| Institutional Characteristic |  | $\%$ |
| :--- | :--- | :--- |
| U.S. Region | Midwest | 17 |
|  | Mid-Atlantic | 23 |
|  | New England | 12 |
|  | South | 19 |
|  | Southwest | 12 |
|  | West | 16 |
| Control | Public | 46 |
|  | Private | 54 |
| Admittance Rate | Under 50\% | 22 |
|  | $50 \%$ to $75 \%$ | 51 |
|  | Over 75\% | 27 |
| Undergraduate Enrollment | Small | 19 |
|  | Medium | 40 |
|  | Large | 19 |
|  | Very Large | 22 |

Note: Number of institutions $(K)=162$. Percentages may not sum to 100 due to rounding. Undergraduate enrollment was categorized as follows: small: 750 to 1,999; medium: 2,000 to 7,499; large: 7,500 to 14,999; and very large: 15,000 or more.

- Table 1 shows that the sample of 162 four-year institutions was diverse with respect to region of the U.S., control, size, and undergraduate admittance rate.

Table 2: Descriptive Statistics for Total Sample

| Variable | $\boldsymbol{M}$ | $\boldsymbol{S D}$ |
| :--- | :--- | :--- |
| HSGPA | 3.65 | 0.486 |
| SAT-CR | 554 | 98.3 |
| SAT-M | 574 | 101.0 |
| SAT-W | 548 | 99.8 |
| FYGPA | 3.04 | 0.714 |

Note: Number of students $(N)=221,485$.

- When compared to the 2012 cohort, Table 2 shows similar mean performance for high school grade point average (HSGPA) and first-year grade point average (FYGPA) for the 2012 cohort, with means differing by at most 0.03. The mean SAT section scores are also quite similar, differing by no more than one point for any one section (Patterson \& Mattern, 2013b; Beard \& Marini, 2015).
- When compared with the population of all college-bound SAT takers expecting to graduate in 2013 ( $n=1,660,047$ )-whose mean and standard deviation (SD) SAT critical reading (SAT-CR), mathematics (SAT-M), and writing scores (SAT-W) were 496 (115 SD), 514 (118 SD), and 488 (114 SD), respectively (College Board, 2013)-the sample in this study performed better in terms of SAT section scores. Given that students in this subsample not only chose to take the SAT-as did the population of over 1.6 million college-bound seniors-but also applied to, enrolled at, and earned grades at a four-year institution, their higher mean SAT section scores followed the expected pattern.

Table 3: Fixed (Raw) Correlation Matrix of SAT, HSGPA, and FYGPA

| Variable | HSGPA | SAT-CR | SAT-M | SAT-W | FYGPA |
| :--- | :---: | :---: | :---: | :---: | :---: |
| HSGPA |  | .45 | .49 | .48 | .53 |
| SAT-CR | $(.20)$ |  | .73 | .85 | .47 |
| SAT-M | $(.22)$ | $(.51)$ |  | .75 | .48 |
| SAT-W | $(.22)$ | $(.70)$ | $(.53)$ |  | .51 |
| FYGPA | $(.34)$ | $(.27)$ | $(.27)$ | $(.32)$ |  |

Note: Number of students $(N)=221,485$. Pooled within-institution, restriction of range corrected correlations are presented. The raw correlations are shown in parentheses.

- Table 3 shows the restriction of range corrected and raw correlations among the four predictors examined in this study: HSGPA, SAT-CR, SAT-M, and SAT-W, as well as FYGPA. In general, SAT sections were more highly correlated with other sections than with HSGPA, and this is most prominent in the correlation of SAT-CR and SAT-W.
- The bivariate correlations shown in Table 3 are similar to what was estimated in previous research (Beard \& Marini, 2015; Kobrin et al., 2008; Patterson et al., 2009; Patterson \& Mattern, 2011; Patterson \& Mattern, 2012; Patterson \& Mattern, 2013a, 2013b).
- Consistent with prior research, the SAT writing section had the highest correlation with FYGPA among the three SAT section scores (Beard \& Marini, 2015; Kobrin et
al., 2008; Patterson et al., 2009; Patterson \& Mattern, 2011; Patterson \& Mattern, 2012; Patterson \& Mattern, 2013a, 2013b).

Table 4: Corrected (Raw) Multiple Correlations of Predictors with FYGPA

| Predictor(s) | Correlation |
| :--- | :--- |
| 1. SAT-M, SAT-CR | $.52(.31)$ |
| 2. HSGPA, SAT-M, SAT-CR | $.60(.42)$ |
| 3. SAT-CR, SAT-M, SAT-W | $.54(.35)$ |
| 4. HSGPA, SAT-CR, SAT-M, SAT-W | $.61(.43)$ |

Note: Number of students $(N)=221,485$. Multiple correlations are based on the raw and corrected correlations presented in Table 3. The raw correlations are shown in parentheses.

- SAT-CR, SAT-M, and SAT-W jointly have a similar multiple correlation with FYGPA (.54) as does HSGPA with FYGPA (.53). It is, however, the inclusion of all four predictors that leads to the strongest linear relationship with FYGPA; namely a multiple correlation of .61 .

Figure 1: Mean FYGPA by SAT score band

Note: SAT score bands are based on the sum of SAT-CR, SAT-M, and SAT-W. Sample sizes by SAT score band were as follows:

| SAT | $\boldsymbol{n}$ |
| :--- | ---: |
| $600-1190$ | 8,296 |
| $1200-1490$ | 49,387 |
| $1500-1790$ | 87,931 |
| $1800-2090$ | 62,788 |
| $2100-2400$ | 13,083 |

- Figure 1 shows graphically the positive relationship between the composite SAT score band (i.e., sum of SAT-CR, SAT-M, and SAT-W, grouped into meaningful categories) with mean FYGPA. In particular, the difference in mean FYGPA between the highest score band (2100-2400) and the lowest (600-1190) was 1.14. In other words, students in the highest SAT score band earned, on average, an FYGPA of Acompared to students in the lowest SAT score band, who had an average FYGPA of C+.

Figure 2: Percentage of students earning FYGPA of a B or higher by SAT score band

Note: SAT score bands are based on the sum of SAT-CR, SAT-M, and SAT-W. Students whose FYGPA was $\geq 3.00$ were considered to have earned a B or better. Sample sizes by SAT score band were as follows:

| SAT | $\boldsymbol{n}$ |
| :--- | ---: |
| $600-1190$ | 8,296 |
| $1200-1490$ | 49,387 |
| $1500-1790$ | 87,931 |
| $1800-2090$ | 62,788 |
| $2100-2400$ | 13,083 |

- Figure 2 shows graphically the positive relationship between the percentage of students earning at least a B (i.e., 3.0 FYGPA or higher) in their first year of college with the composite SAT score band. In particular, over three and a half times the number of students in the highest SAT score band (2100-2400) earned at least a B, relative to those in the lowest (600-1190).

Figure 3: Incremental validity of the SAT: Mean FYGPA by SAT score band controlling for HSGPA

Note: SAT score bands are based on the sum of SAT-CR, SAT-M, and SAT-W. HSGPA ranges were defined as follows:

| "A" range: | $4.33(A+), 4.00(A)$, and $3.67(A-)$ |
| :--- | :--- |
| "B" range: | $3.33(B+), 3.00(B)$, and $2.67(B-)$ |
| "C or Lower" range: | $2.33(C+)$ or lower |

Sample sizes by HSGPA and SAT score band were as follows:

|  | HSGPA |  |  |
| :--- | ---: | ---: | ---: |
| SAT | C or Lower | B | A |
| $600-1190$ | 942 | 5,188 | 2,166 |
| $1200-1490$ | 2,372 | 25,825 | 21,190 |
| $1500-1790$ | 1,149 | 26,880 | 59,902 |
| $1800-2090$ | 255 | 9,702 | 52,831 |
| $2100-2400$ | 21 | 920 | 12,142 |

- Figure 3 shows the relationship of composite SAT score band with mean FYGPA at different levels of HSGPA. For each level of HSGPA, higher composite SAT score bands are associated with higher mean FYGPAs, thus demonstrating the value of SAT above and beyond HSGPA in the prediction of FYGPA.
- Consider, for example, two students with HSGPAs in the A range. The one whose SAT composite was 600-1190 was expected to earn an FYGPA of 2.6, which translates to roughly a B-, while the other student, whose SAT composite was 21002400, was expected to earn an FYGPA of 3.6 , which translates to roughly an A-.

Table 5: Descriptive Statistics of Study Variables by Institutional Characteristics

|  |  |  |  | SAT-CR |  | SAT-M |  | SAT-W |  | HSGPA |  | FYGPA |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Institutional Characteristic |  | $k$ | $n$ | M | SD | M | SD | M | SD | M | SD | M | SD |
| Control | Private | 87 | 60,595 | 575 | 98.7 | 593 | 99.3 | 573 | 100.8 | 3.67 | 0.471 | 3.18 | 0.594 |
|  | Public | 75 | 160,890 | 546 | 97.0 | 567 | 100.7 | 538 | 97.7 | 3.64 | 0.491 | 2.99 | 0.748 |
| Admittance Rate | Under 50\% | 36 | 55,747 | 609 | 88.9 | 635 | 87.0 | 610 | 91.4 | 3.85 | 0.374 | 3.26 | 0.537 |
|  | 50\% to 75\% | 82 | 130,737 | 543 | 93.6 | 562 | 96.0 | 533 | 93.5 | 3.63 | 0.483 | 3.00 | 0.741 |
|  | Over 75\% | 44 | 35,001 | 511 | 93.3 | 520 | 93.0 | 501 | 89.7 | 3.41 | 0.529 | 2.86 | 0.775 |
| Undergraduate Enrollment | Small | 31 | 8,364 | 536 | 100.0 | 540 | 98.3 | 526 | 98.2 | 3.54 | 0.530 | 3.03 | 0.688 |
|  | Medium | 64 | 40,876 | 541 | 103.8 | 554 | 104.6 | 536 | 104.4 | 3.55 | 0.521 | 3.03 | 0.733 |
|  | Large | 31 | 53,155 | 550 | 100.8 | 566 | 105.1 | 544 | 104.2 | 3.59 | 0.502 | 3.01 | 0.729 |
|  | Very Large | 36 | 119,090 | 562 | 94.3 | 586 | 95.9 | 555 | 95.5 | 3.72 | 0.450 | 3.07 | 0.701 |
| Total |  | 162 | 221,485 | 554 | 98.3 | 574 | 101.0 | 548 | 99.8 | 3.65 | 0.486 | 3.04 | 0.714 |

Note: $k$ : number of institutions, $n$ : subgroup sample size. Undergraduate enrollment was categorized as follows: small: 750 to 1,999; medium: 2,000 to 7,499; large: 7,500 to 14,999; and very large: 15,000 or more.

- Table 5 provides summary statistics on the key study variables by institutional characteristics.
- It shows that, in general, mean SAT section scores, HSGPA, and FYGPA were higher:
o at private institutions, compared to public institutions; and
o at increasingly selective institutions (i.e., those that admit fewer applicants).
- In terms of undergraduate enrollment (i.e., institution size):
o small institutions had the lowest mean SAT section scores, while very large institutions had the highest mean SAT section scores and HSGPAs; and there is no discernable relationship between institution size and mean FYGPA.

Table 6: Corrected Correlations of SAT and HSGPA with FYGPA by Institutional Characteristics

| Institutional Characteristic |  | $k$ | $n$ | SAT-CR | SAT-M | SAT-W | SAT* | HSGPA | $\begin{aligned} & \text { SAT*, } \\ & \text { HSGPA } \end{aligned}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Control | Private | 87 | 60,595 | 0.52 | 0.52 | 0.56 | 0.58 | 0.56 | 0.65 |
|  | Public | 75 | 160,890 | 0.46 | 0.47 | 0.50 | 0.52 | 0.52 | 0.60 |
| Admittance Rate | Under 50\% | 36 | 55,747 | 0.51 | 0.52 | 0.55 | 0.58 | 0.53 | 0.64 |
|  | $\begin{aligned} & 50 \% \text { to } \\ & 75 \% \end{aligned}$ | 82 | 130,737 | 0.46 | 0.47 | 0.50 | 0.53 | 0.53 | 0.61 |
|  | Over 75\% | 44 | 35,001 | 0.46 | 0.46 | 0.50 | 0.52 | 0.53 | 0.60 |
| Undergraduate Enrollment | Small | 31 | 8,364 | 0.54 | 0.54 | 0.57 | 0.60 | 0.59 | 0.68 |
|  | Medium | 64 | 40,876 | 0.49 | 0.50 | 0.54 | 0.56 | 0.55 | 0.64 |
|  | Large | 31 | 53,155 | 0.47 | 0.48 | 0.51 | 0.54 | 0.53 | 0.61 |
|  | Very Large | 36 | 119,090 | 0.46 | 0.47 | 0.50 | 0.53 | 0.52 | 0.60 |
| Overall |  | 162 | 221,485 | 0.47 | 0.48 | 0.51 | 0.54 | 0.53 | 0.61 |

Note: $k$ : number of institutions, $n$ : subgroup sample size. SAT* refers to the inclusion of all three sections in the relevant multiple correlation. The correlations were corrected for restriction of range within institutions and pooled. Undergraduate enrollment was categorized as follows: small: 750 to 1,999; medium: 2,000 to 7,499 ; large: 7,500 to 14,999 ; and very large: 15,000 or more. For raw correlations by institutional characteristics, see Appendix B.

- Table 6 shows the correlations of various combinations of the predictors with FYGPA by key institutional characteristics.
- The correlations of the six combinations of predictors with FYGPA are generally:
o Higher at private than public institutions
o Highest at the most selective institutions (i.e., those that admit fewer than $50 \%$ of applicants), relative to less selective ones
o Highest at small institutions, relative to larger ones
- Across many institutional categories, the multiple correlation of SAT with FYGPA was at least as high as the correlation of HSGPA with FYGPA.
- For nearly all institutional subgroups, the combination of SAT section scores and HSGPA represented an increase in at least .07 for the correlation with FYGPA over either predictor alone.

Table 7: Descriptive Statistics of Study Variables by Student Characteristics

| Student Characteristic |  | $k$ | n | SAT-CR |  | SAT-M |  | SAT-W |  | HSGPA |  | FYGPA |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | M |  | SD | M | SD | M | SD | M | SD | M | SD |
| Gender | Male |  | 160 | 100,258 | 562 | 98.7 | 598 | 99.6 | 547 | 100.6 | 3.61 | 0.502 | 2.95 | 0.751 |
|  | Female | 162 | 121,227 | 548 | 97.5 | 554 | 97.8 | 548 | 99.2 | 3.68 | 0.470 | 3.12 | 0.672 |
| Racial/Ethnic Identity | African American | 162 | 18,016 | 492 | 90.8 | 494 | 90.1 | 478 | 90.2 | 3.42 | 0.542 | 2.67 | 0.784 |

Note: $n$ : subgroup sample size.

- Table 7 shows that female students tended to outperform males on SAT-W, HSGPA, and FYGPA, while the opposite was true for SAT-CR and SAT-M.
- Some differences exist across racial/ethnic identities, with white and Asian American students having higher mean SAT section scores, HSGPA, and FYGPA relative to African American and Hispanic students.
- When considering best spoken language, students whose best language was English had the highest SAT-CR and SAT-W scores, whereas students whose best language was something other than English had the highest SAT-M scores and slightly higher HSGPA and FYGPA means.
- Students who reported higher household incomes had higher mean SAT section scores and FYGPA, but there was no apparent relationship with HSGPA.
- As with household-income level, mean SAT section scores and FYGPA increased as highest parental education level increased; with respect to mean HSGPA, there was a positive relationship with highest parental education level.

Table 8: Corrected Correlations of SAT Scores and HSGPA with FYGPA by Student Subgroups

| Overall |  | 162 | 221,485 | 0.47 | 0.48 | 0.51 | 0.54 | 0.53 | 0.61 |

Note: $k$ : number of institutions, $n$ : subgroup sample size. SAT* refers to the inclusion of all three sections in the relevant multiple correlation. The correlations were corrected for restriction of range within institutions and pooled. Institutions with fewer than 15 students in any subgroup were excluded. For raw correlations by institutional characteristics, see Appendix C.

- Table 8 shows that predictive validity for all predictors and combinations of FYGPA was higher for:
o Female students than for male students;
o White and Asian American students relative to the other racial/ethnic identities;
o Students whose best spoken language was English only as compared to the other language groups;
o Students with a household income level of at least $\$ 80,000$ than those with lower incomes; and
o Students whose parents have higher education levels as compared to lower education levels.
- Across all student subgroups, predictive validity of FYGPA was maximized using the combination of SAT section scores and HSGPA.

Table 9: Average Overprediction (-) and Underprediction (+) of FYGPA for SAT Scores and HSGPA

| Student Characteristic |  | $k$ | n | SAT-CR | SAT-M | SAT-W |  | HSGPA | SAT*, HSGPA |

|  | Not Stated | 162 | 14,938 | -0.047 | -0.067 | -0.044 | -0.036 | -0.064 | -0.019 |
| Overall |  | 162 | 221,485 | 0.000 | 0.000 | 0.000 | 0.000 | 0.000 | 0.000 |

Note: $k$ : number of institutions, $n$ : subgroup sample size. SAT* refers to the inclusion of all three sections in the relevant regression model. Negative and positive values indicate over- and
underprediction, respectively. FYGPA regressions were estimated for each institution separately. Residuals were the difference of predicted and observed FYGPA.

- Table 9 shows that across all predictor sets, FYGPA was:
o Overpredicted (i.e., observed FYGPA < predicted FYGPA) for males and underpredicted for females;
o Generally overpredicted for African American, American Indian, and Hispanic students;
o Generally underpredicted (except for SAT-M alone) for students whose best spoken language was not English; and
o Overpredicted for students from lower socioeconomic status families (household income levels $\leq \$ 80,000$, highest parental education level of an associate degree or less).
- In terms of the relative differential prediction of HSGPA, SAT sections, and their combination:
o Using HSGPA alone generally yielded the least differential prediction across genders;
o Using HSGPA and SAT generally yielded the least differential prediction across racial/ethnic identities; and
o Using SAT sections alone generally yielded the least differential prediction across household income and parental education levels.

## Appendix B: Raw Correlations of SAT and HSGPA with FYGPA by Institutional Characteristics

| Institutional Characteristic |  | $k$ | $n$ | SAT-CR | SAT-M | SAT-W | SAT* | HSGPA | SAT*, HSGPA |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Control | Private | 87 | 60,595 | 0.31 | 0.30 | 0.36 | 0.39 | 0.37 | 0.47 |
|  | Public | 75 | 160,890 | 0.26 | 0.26 | 0.31 | 0.33 | 0.33 | 0.42 |
| Admittance Rate | Under 50\% | 36 | 55,747 | 0.28 | 0.27 | 0.32 | 0.35 | 0.28 | 0.40 |
|  | $50 \%$ to 75\% | 82 | 130,737 | 0.27 | 0.27 | 0.32 | 0.34 | 0.35 | 0.44 |
|  | Over 75\% | 44 | 35,001 | 0.29 | 0.27 | 0.34 | 0.35 | 0.40 | 0.47 |
| Undergraduate Enrollment | Small | 31 | 8,364 | 0.36 | 0.34 | 0.40 | 0.43 | 0.44 | 0.54 |
|  | Medium | 64 | 40,876 | 0.30 | 0.29 | 0.35 | 0.38 | 0.39 | 0.47 |
|  | Large | 31 | 53,155 | 0.26 | 0.27 | 0.31 | 0.34 | 0.35 | 0.43 |
|  | Very Large | 36 | 119,090 | 0.26 | 0.26 | 0.31 | 0.33 | 0.32 | 0.41 |
| Overall |  | 162 | 221,485 | 0.27 | 0.27 | 0.32 | 0.35 | 0.34 | 0.43 |

Note: $k$ : number of institutions, $n$ : subgroup sample size. SAT* refers to the inclusion of all three sections in the relevant multiple correlation. Undergraduate enrollment was categorized as follows: small: 750 to 1,999; medium: 2,000 to 7,499; large: 7,500 to 14,999 ; and very large: 15,000 or more. For restriction of range corrected correlations by institutional characteristics, see Table 6.

## Appendix C: Raw Correlations of SAT Scores and HSGPA with FYGPA by Subgroups

| Student Characteristic |  | $k$ | $n$ | SAT-CR | SAT-M | SAT-W | SAT* | HSGPA | $\begin{aligned} & \text { SAT*, } \\ & \text { HSGPA } \end{aligned}$ |

Note: $k$ : number of institutions, $n$ : subgroup sample size. SAT* refers to the inclusion of all three sections in the relevant multiple correlation. Institutions with fewer than 15 students in any subgroup were excluded. For restriction of range corrected correlations by student characteristics, see Table 8.

## About the College Board

The College Board is a mission-driven not-for-profit organization that connects students to college success and opportunity. Founded in 1900, the College Board was created to expand access to higher education. Today, the membership association is made up of over 6,000 of the world's leading educational institutions and is dedicated to promoting excellence and equity in education. Each year, the College Board helps more than seven million students prepare for a successful transition to college through programs and services in college readiness and college success-including the SAT ${ }^{\circledR}$ and the Advanced Placement Program ${ }^{\circledR}$. The organization also serves the education community through research and advocacy on behalf of students, educators, and schools. For further information, visit collegeboard.org.
